- Subtype variables can be specified using %type and %rowtype. %type supports all base types, and %rowtype supports tables but does not support sets.
- Subtypes support base type constructors.
- The specified character set is not supported.
- This command can be used only in A-compatible database.
- If a database is upgraded from a version that does not support subtypes to a version that supports subtypes and the upgrade is not committed, subtypes cannot be used.

Example 1: An unconstrained subtype is used.

```
gaussdb=# DECLARE
    SUBTYPE sint IS INT;
    a sint := 2147483647;
 BEGIN
    DBE_OUTPUT.PUT_LINE('a = ' || a);
 END;
 /
a = 2147483647
ANONYMOUS BLOCK EXECUTE
```

Example 2: Subtypes support typmod, range, and NOT NULL constraints.

```
-- typmod constraint
gaussdb=# DECLARE
    SUBTYPE sdec IS DECIMAL(3,2) NOT NULL;
    a sdec := 1.1;
```

```
    b sdec(5,2) := 322.1;
 BEGIN
    DBE_OUTPUT.PUT_LINE('a = ' || a);
    DBE_OUTPUT.PUT_LINE('b = ' || b);
 END;
 /
a = 1.10
b = 322.10
ANONYMOUS BLOCK EXECUTE
-- NOT NULL constraint
gaussdb=# DECLARE
    SUBTYPE sint IS INT NOT NULL;
    a sint;
 BEGIN
    NULL;
 END;
 /
ERROR:  variables declared as NOT NULL must have a default value.
CONTEXT:  compilation of PL/pgSQL function "inline_code_block" near line 2
gaussdb=# DECLARE
    SUBTYPE age IS BINARY_INTEGER RANGE 0..100 NOT NULL;
    a age := 18;
    b age := 20;
 BEGIN
    DBE_OUTPUT.PUT_LINE('Age of a:' || a);
    DBE_OUTPUT.PUT_LINE('Age of b:' || b);
 END;
 /
Age of a: 18
Age of b: 20
ANONYMOUS BLOCK EXECUTE
```

Example 3: Subtypes nest user-defined data types and use the base type constructor.

```
gaussdb=# DECLARE
    TYPE arrint IS VARRAY(10) OF INTEGER;
    SUBTYPE sarrint IS arrint;
    -- a sarrint := sarrint(1,2,3,4): An error is reported. Only the base type constructor is supported.
    a sarrint := arrint(1,2,3,4);
 BEGIN
    FOR i IN 1..4 LOOP
       DBE_OUTPUT.PUT_LINE(a(i));
    END LOOP;
 END;
 /
1
2
3
4
ANONYMOUS BLOCK EXECUTE
```

Example 4: Subtypes support self-nesting, and the constraint condition is updated.

```
-- range constraint
gaussdb=# DECLARE
    SUBTYPE sint IS INTEGER RANGE 10..99;
    SUBTYPE ssint IS sint RANGE 0..9;
    a sint := 50;
    b ssint := 5;
 BEGIN
    DBE_OUTPUT.PUT_LINE('a = ' || a);
    DBE_OUTPUT.PUT_LINE('b = ' || b);
 END;
 /
a = 50
b = 5
ANONYMOUS BLOCK EXECUTE
```

```
-- typmod constraint
gaussdb=# DECLARE
    SUBTYPE word IS VARCHAR2(5);
    SUBTYPE sentence IS word(50);
    a word := 'Tom';
    b sentence := 'Tom and Jerry';
    c sentence(8) := 'Mountain';
 BEGIN
    DBE_OUTPUT.PUT_LINE('a = ' || a);
    DBE_OUTPUT.PUT_LINE('b = ' || b);
    DBE_OUTPUT.PUT_LINE('c = ' || c);
 END;
 /
a = Tom
b = Tom and Jerry
c = Mountain
ANONYMOUS BLOCK EXECUTE
```

Example 5: User-defined data types nest subtypes.

```
gaussdb=# DECLARE
    SUBTYPE sint IS BINARY_INTEGER RANGE 0..99;
    TYPE tabint IS TABLE OF sint;
    a tabint := tabint();
 BEGIN
    a.EXTEND(10);
    a(1) := 50;
 END;
 /
ANONYMOUS BLOCK EXECUTE
```

10.3 Data Type Conversion

Certain data types in the database support implicit data type conversions, such as assignments and parameters called by functions. For other data types (for example, INT and composite types), you can use the type conversion functions provided by GaussDB, such as the **CAST** function, to forcibly convert them.

Table 10-1 lists common implicit data type conversions in GaussDB.

NOTICE

The valid value range of **DATE** supported by GaussDB is from 4713 BC to 294276 AD.

Table 10-1 Implicit data type conversions

Raw Data Type	Target Data Type	Remarks
CHAR	VARCHAR2	-
CHAR	NUMBER	Raw data must consist of digits.
CHAR	DATE	Raw data cannot exceed the valid date range.
CHAR	RAW	-

Raw Data Type	Target Data Type	Remarks
CHAR	CLOB	-
VARCHAR2	CHAR	-
VARCHAR2	NUMBER	Raw data must consist of digits.
VARCHAR2	DATE	Raw data cannot exceed the valid date range.
VARCHAR2	CLOB	-
NUMBER	CHAR	-
NUMBER	VARCHAR2	-
DATE	CHAR	-
DATE	VARCHAR2	-
RAW	CHAR	-
RAW	VARCHAR2	-
CLOB	CHAR	-
CLOB	VARCHAR2	-
CLOB	NUMBER	Raw data must consist of digits.
INT4	CHAR	-
INT4	BOOLEAN	-
BOOLEAN	INT4	-

10.4 Arrays, Collections, and Records

10.4.1 Arrays

Use of Array Types

Before the use of arrays, an array type needs to be defined:

Define an array type immediately after the **AS** keyword in a stored procedure. The definition method is as follows:

```
TYPE array_type IS VARRAY(size) OF data_type;
```

Related parameters are as follows:

- **array_type**: indicates the name of the array type to be defined.
- **VARRAY**: indicates the array type to be defined.

- **size**: indicates the maximum number of members in the array type to be defined. The value is a positive integer.
- **data_type**: indicates the types of members in the array type to be created.

NOTE

- In GaussDB, an array automatically increases. If an access violation occurs, a **NULL** value will be returned, and no error message will be reported.
- The scope of an array type defined in a stored procedure takes effect only in this storage process.
- The **size** supports only the syntax and does not support the function.
- **data_type** can also be the record type defined in a stored procedure (anonymous blocks are not supported) or set type, but cannot be the array or cursor type defined in the stored procedure.
- When **data_type** is collection, multi-dimensional arrays are not supported.
- NOT NULL syntax is not supported.
- The constructors of the array type can be used only in O-compatible mode.
- The constructor of the array type cannot be used as the default value of a function or stored procedure parameter.
- When **data_type** is set to a type that can define the length and precision, such as varchar and numeric, if a varray array is created in a package and invoked outside the package, the restrictions for the length or precision become invalid.

GaussDB supports access to array elements by using parentheses, and it also supports the **extend**, **count**, **first**, **last**, **prior**, **exists**, **trim**, **next**, and **delete** functions.

NOTE

- If a stored procedure contains a DML statement (such as **SELECT**, **UPDATE**, **INSERT**, or **DELETE**), you are advised to use square brackets to access array elements. Using parentheses will access arrays by default. If no array exists, function expressions will be identified.
- Exercise caution when using the **DELETE** statement to delete a single element. Otherwise, the element sequence may be incorrect.
- When the CLOB size is greater than 1 GB, the table of type, record type, and CLOB cannot be used in the input or output parameter, cursor, or raise info in a stored procedure.

Examples

```
-- Perform array operations in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE array_proc AS
DECLARE
    TYPE ARRAY_INTEGER IS VARRAY(1024) OF INTEGER;--Define the array type.
    ARRINT ARRAY_INTEGER: = ARRAY_INTEGER();  --Declare the variable of the array type.
BEGIN
    ARRINT.extend(10);
    FOR I IN 1..10 LOOP
        ARRINT(I) := I;
    END LOOP;
    DBE_OUTPUT.PRINT_LINE(ARRINT.COUNT);
    DBE_OUTPUT.PRINT_LINE(ARRINT(1));
    DBE_OUTPUT.PRINT_LINE(ARRINT(10));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.FIRST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.LAST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.NEXT(ARRINT.FIRST)));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.PRIOR(ARRINT.LAST)));
    ARRINT.TRIM();
```

```
    IF ARRINT.EXISTS(10) THEN
        DBE_OUTPUT.PRINT_LINE('Exist 10th element');
    ELSE
        DBE_OUTPUT.PRINT_LINE('Not exist 10th element');
    END IF;
    DBE_OUTPUT.PRINT_LINE(ARRINT.COUNT);
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.FIRST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.LAST));
    ARRINT.DELETE();
END;
/

-- Call the stored procedure.
gaussdb=# CALL array_proc();

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE array_proc;
```

10.4.1.1 Use of Array Types

Before the use of arrays, an array type needs to be defined:

Define an array type immediately after the **AS** keyword in a stored procedure. The definition method is as follows:

```
TYPE array_type IS VARRAY(size) OF data_type;
```

Related parameters are as follows:

- **array_type**: indicates the name of the array type to be defined.
- **VARRAY**: indicates the array type to be defined.
- **size**: indicates the maximum number of members in the array type to be defined. The value is a positive integer.
- **data_type**: indicates the types of members in the array type to be created.

NOTE

- In GaussDB, the array automatically increases. If out-of-bounds access occurs, a **NULL** value is returned and no error is reported. After the **varray_compat** parameter is enabled, the index check is added. If out-of-bounds access occurs, an error is reported.
- The scope of an array type defined in a stored procedure takes effect only in this storage process.
- The size information is recorded in the pg_type system catalog. After the **varray_compat** parameter is enabled, the length and index of array operations are checked. If the parameter is disabled, the size information is not used.
- **data_type** can also be the record type defined in a stored procedure (anonymous blocks are not supported) or set type, but cannot be the array or cursor type defined in the stored procedure.
- When **data_type** is collection, multi-dimensional arrays are not supported.
- NOT NULL syntax is not supported.
- The constructors of the array type can be used only in A-compatible mode.
- The constructor of the array type cannot be used as the default value of a function or stored procedure parameter.
- If an array is an element of the set type and **data_type** of the array is set to **varchar** or **numeric** that can define the length and precision, you need to enable the **tableof_elem_constraints** parameter (**behavior_compat_options** is set to **tableof_elem_constraints**) to verify the element length of the array or convert the element to the corresponding precision.
- After the **varray_compat** parameter is enabled (the **behavior_compat_options** parameter is set to **varray_compat**), the array type defined in the anonymous block cannot be used after ROLLBACK is executed or EXCEPTION occurs in the anonymous block.
- After **enable_recordtype_check_strict** is set to **on**, if the member is of the record type and a column of the record type has the not null or default attribute, an error is reported during stored procedure or package compilation.

GaussDB supports access to array elements by using parentheses, and it also supports the **extend**, **count**, **first**, **last**, **prior**, **exists**, **trim**, **next**, and **delete** functions.

NOTE

- If a stored procedure contains a DML statement (such as **SELECT**, **UPDATE**, **INSERT**, or **DELETE**), you are advised to use square brackets to access array elements. Using parentheses will access arrays by default. If no array exists, function expressions will be identified.
- When the CLOB size is greater than 1 GB, the table of type, record type, and CLOB cannot be used in the input or output parameter, cursor, or raise info in a stored procedure.

Examples

```
-- Perform array operations in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE array_proc AS
DECLARE
    TYPE ARRAY_INTEGER IS VARRAY(1024) OF INTEGER;--Define the array type.
    ARRINT ARRAY_INTEGER: = ARRAY_INTEGER();  --Declare the variable of the array type.
BEGIN
    ARRINT.extend(10);
    FOR I IN 1..10 LOOP
        ARRINT(I) := I;
    END LOOP;
    DBE_OUTPUT.PRINT_LINE(ARRINT.COUNT);
```

```
    DBE_OUTPUT.PRINT_LINE(ARRINT(1));
    DBE_OUTPUT.PRINT_LINE(ARRINT(10));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.FIRST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.LAST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.NEXT(ARRINT.FIRST)));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.PRIOR(ARRINT.LAST)));
    ARRINT.TRIM();

    IF ARRINT.EXISTS(10) THEN
        DBE_OUTPUT.PRINT_LINE('Exist 10th element');
    ELSE
        DBE_OUTPUT.PRINT_LINE('Not exist 10th element');
    END IF;
    DBE_OUTPUT.PRINT_LINE(ARRINT.COUNT);
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.FIRST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.LAST));
    ARRINT.DELETE();
END;
/

-- Call the stored procedure to display the result.
gaussdb=# CALL array_proc();

10.4.1.2 Functions Supported by Arrays

NOTE

- The following describes the behavior differences of array functions before and after the GUC parameter **varray_compat** is enabled:
  - If the count, extend, trim, delete, first, last, next, or prior function is applied to an uninitialized array, that is, the array is NULL, the "Reference to uninitialized collection" error is reported after the parameter is enabled. If the parameter is disabled, no error is reported.
  - For the extend(count) and extend(count, idx) functions, if the sum of *count* and the number of existing elements in the array exceeds the defined array size, the "Subscript outside of limit" error is reported after the parameter is enabled. If the parameter is disabled, no error is reported.
  - For the extend(count, idx) function, if the index *idx* is invalid, the "Subscript outside of limit" or "Subscript beyond count" error is reported after the parameter is enabled.
  - For the trim(n) function, if *n* is greater than the number of array elements, the "Subscript beyond count" error is reported after the parameter is enabled. If the parameter is disabled, no error is reported.
  - For the delete(idx) function, if the index *idx* is invalid, the "Subscript outside of limit" or "Subscript beyond count" error is reported after the parameter is enabled. If the parameter is disabled, the original array is returned.
- The following is an example in A-compatible mode. In the function definition description, the content in [] is optional. For example, count[()] can be written as count or count().
- If the error "Cannot change the guc status while in the same session" is reported during the execution of the following example, you need to switch the session and execute the example again.
- In an inner expression, functions of the array type cannot be called in nesting mode.

- extend[([count])]

  Parameter: *count* is of the int4 type.

  Return value: No value is returned.

  Description: Extends one or *count* elements at the end of a varray variable. The default value is **NULL**.

  Example 1: The extend is used to extend one element. The default value is **NULL**.

```
gaussdb=# set behavior_compat_options = '';
SET
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
gaussdb-#     arrint array_integer := array_integer();
gaussdb-# begin
gaussdb$#     dbe_output.print_line(arrint.count);
gaussdb$#     arrint.extend;
gaussdb$#     dbe_output.print_line(arrint.count);
gaussdb$# end;
gaussdb$# /
0
1
ANONYMOUS BLOCK EXECUTE
```

  Example 2: The extend(count) is used to extend the *count* elements. The default value is **NULL**.

```
gaussdb=# set behavior_compat_options = '';
SET
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
```

```
gaussdb-#     arrint array_integer := array_integer();
gaussdb-# begin
gaussdb$#     dbe_output.print_line(arrint.count);
gaussdb$#     arrint.extend(3);
gaussdb$#     dbe_output.print_line(arrint.count);
gaussdb$# end;
gaussdb$# /
0
3
ANONYMOUS BLOCK EXECUTE
```

Example 3: When the **varray_compat** parameter is enabled, an error is reported if the array size exceeds the defined size after the extend is used.

```
gaussdb=# set behavior_compat_options = 'varray_compat';
SET
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
gaussdb-#     arrint array_integer := array_integer();
gaussdb-# begin
gaussdb$#     dbe_output.print_line(arrint.count);
gaussdb$#     arrint.extend(3);
gaussdb$#     dbe_output.print_line(arrint.count);
gaussdb$#     arrint.extend(8); -- error
gaussdb$# end;
gaussdb$# /
0
3
ERROR:  Subscript outside of limit
CONTEXT:  PL/SQL function inline_code_block line 8 at assignment
```

Example 4: When the **varray_compat** parameter is enabled, an error is reported if the array is not initialized.

```
gaussdb=# set behavior_compat_options = 'varray_compat';
SET
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
gaussdb-#     arrint array_integer;
gaussdb-# begin
gaussdb$#     arrint.extend(3);
gaussdb$# end;
gaussdb$# /
ERROR:  Reference to uninitialized collection
CONTEXT:  PL/pgSQL function inline_code_block line 4 at assignment
```

- extend(count, idx)

  Parameters: *idx* and *count* are of the int4 type.

  Return value: No value is returned.

  Description: Extends *count* elements at the end of a varray variable, and the value of the extended element is equal to the value of the given *idx* index element. This function can be used only after **a_format_version** is set to **10c** and **a_format_dev_version** is set to **s1**.

  Example 1: The extend(count, idx) is used to extend the element at the *idx* position.

```
gaussdb=# set a_format_version='10c';
SET
gaussdb=# set a_format_dev_version='s1';
SET
gaussdb=# set behavior_compat_options = '';
SET
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
gaussdb-#     arrint array_integer := array_integer(1,2);
gaussdb-# begin
gaussdb$#     arrint.extend(2, 1);
gaussdb$#     dbe_output.print_line(arrint.count);
```

```
gaussdb$#     for i in 1..arrint.count loop
gaussdb$#         dbe_output.print_line(arrint(i));
gaussdb$#     end loop;
gaussdb$# end;
gaussdb$# /
4
1
2
1
1
ANONYMOUS BLOCK EXECUTE
```

Example 2: extend(count, idx). If the **varray_compat** parameter is enabled and *idx* is out of range, an error is reported.

```
gaussdb=# set a_format_version='10c';
SET
gaussdb=# set a_format_dev_version='s1';
SET
gaussdb=# set behavior_compat_options = 'varray_compat';
SET
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
gaussdb-#     arrint array_integer := array_integer();
gaussdb-# begin
gaussdb$#     arrint.extend(10, 1); -- error index.
gaussdb$# end;
gaussdb$# /
ERROR:  Subscript beyond count
CONTEXT:  PL/SQL function inline_code_block line 5 at assignment
```

Example 3: extend(count, idx). If the **varray_compat** parameter is enabled and the array is not initialized, an error is reported.

```
gaussdb=# set a_format_version='10c';
SET
gaussdb=# set a_format_dev_version='s1';
SET
gaussdb=# set behavior_compat_options = 'varray_compat';
SET
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;

gaussdb-# begin
gaussdb$#     arrint.extend(10, 1);
gaussdb$# end;
gaussdb$# /
ERROR:  Reference to uninitialized collection
CONTEXT:  PL/pgSQL function inline_code_block line 4 at assignment
```

- count[()]

  Parameter: none.

  Return value: int4 type.

  Description: Returns the number of elements in an array.

  Example 1: View the number of initialized array elements.

```
gaussdb=# set behavior_compat_options = '';
SET
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
gaussdb-#     arrint array_integer;
gaussdb-#     len int;
gaussdb-# begin
gaussdb$#     arrint := array_integer(1, 2, 3);
gaussdb$#     len := arrint.count();
gaussdb$#     dbe_output.print_line(len);
gaussdb$# end;
gaussdb$# /
3
ANONYMOUS BLOCK EXECUTE
```

Example 2: When the **varray_compat** parameter is enabled, an error is reported if the array is not initialized.

```
gaussdb=# set behavior_compat_options = 'varray_compat';
SET
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
gaussdb-#     arrint array_integer;
gaussdb-#     len int;
gaussdb-# begin
gaussdb$#     len := arrint.count();
gaussdb$#     dbe_output.print_line(len);
gaussdb$# end;
gaussdb$# /
ERROR:  Reference to uninitialized collection
CONTEXT:  PL/SQL function inline_code_block line 6 at assignment
```

- trim[(n)]

  Parameter: *n* is of the int4 type.

  Return value: No value is returned.

  Description: Deletes an element space at the end of the array if there is no parameter. Alternatively, deletes a specified number of element spaces at the end of the array if the parameter *n* is specified.

  Example 1: Delete *n* elements from an array without enabling the **varray_compat** parameter.

```
gaussdb=# set behavior_compat_options = '';
SET
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
gaussdb-#     arrint array_integer := array_integer(1,2,3);
gaussdb-# begin
gaussdb$#     dbe_output.print_line(arrint.count);

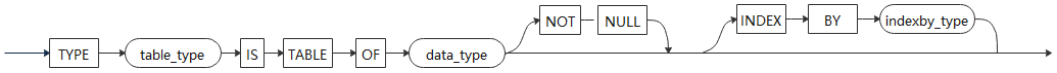
10.4.2 Collections

10.4.2.1 Use of Collection Types

Before the use of collections, a collection type must be defined.

Define a collection type immediately after the AS keyword in a stored procedure as follows.

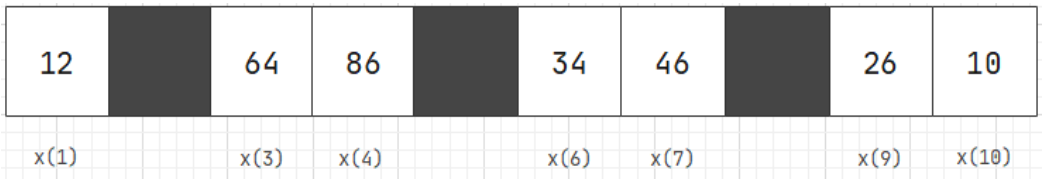


In the preceding information:

- **table_type**: indicates the name of the collection type to be defined.
- **TABLE**: indicates the collection type to be defined.
- **data_type**: indicates the type of members in the collection to be created.
- **indexby_type**: indicates the type of the index set to be created.

Nest-Table Collection Type

Members of a specified data type are stored in a variable-length array. You can use the extend function to expand the storage space and use the trim function to release the storage space. For a collection variable *x* with 10 storage units whose member type is int, members are stored as shown in the following figure.



Members x(2), x(5), and x(8) are invalid, but their storage space is still reserved. You can assign values to them later without re-allocating space.

After a collection type is defined, use table_type as the type name to declare the variable.

```
var_name table_type [:= table_type([v1[,...]])];
```

You can use a type constructor to initialize the variable during or after declaration. If the variable is not initialized, the value of *var_name* is **NULL**.

After the variable is declared and initialized, you can access collection members through an index set or assign values to members. The index set range is [1,*upper*]. The value of *upper* is the size of the current space. If you attempt to access a deleted member, the error message "no data found" will be returned.

NOTE

- In a non-A compatible mode (the value of **sql_compatibility** is not **A**), the collection type cannot be created.
- In GaussDB, a nest-table collection does not automatically increase, and an error is reported when you attempt to access the index set out of the specified range.
- Collections can be defined in schemas, anonymous blocks, stored procedures, user-defined functions, and packages, among which the scopes of the collection types vary.
- **NOT NULL** has no function but only takes effect in the syntax.
- When **data_type** is set to a type that can define the length and precision, such as varchar and numeric, you need to enable the **tableof_elem_constraints** parameter (**behavior_compat_options** must be set to **tableof_elem_constraints**) to verify the length of elements in the collection or convert elements to the corresponding precision.
- If **data_type** is of the array type, the element length verification or precision conversion of the array type is also affected by whether the **tableof_elem_constraints** parameter is enabled.
- The value of the collection type converted from the array type does not support element length verification or precision conversion.
- The value of **data_type** can be a base data type or a record type, collection type, or array type defined in a stored procedure. The ref cursor type is not supported.
- Variables of a collection type cannot be assigned a value of another collection type, even if their member types are the same. For example, *t1* and *t2* are of different collection types defined by **TYPE** *t1* **IS TABLE OF** *int* and **TYPE** *t2* **IS TABLE OF** *int*, respectively. A value of the collection type defined by **TYPE** *t1* **IS TABLE OF** *int* cannot be assigned to *t2*, and vice versa. (This restriction may not take effect when the variables are of the member types because the value assignment logic of variables is affected by the parent type.)
- Only the equal (=) and non-equal operations (<> or !=) between collections are supported. Other relational and arithmetic operations are not supported.
- Use IS [NOT] NULL to compare a collection type with **NULL**. The result of comparison with **NULL** using the equal operator (=) is inaccurate.
- Variables of the collection type can be used as parameters and return values of functions. In this case, the type of the parameters or return values must have been defined in a schema or package.
- When a nest-table collection is used as the input parameter of a function, an array with elements of the same type can be transferred as the input parameter. Multi-dimensional arrays are not supported, and the array index set must start from 1. (This function is outdated and not recommended.) You can run the **set behavior_compat_options = 'disable_rewrite_nesttable'** command to disable the function.
- Operations on XML data are not supported.
- When creating a table, do not use the collection type or any type containing a collection as a column in the table.
- Constructors of the collection type do not support floating point numbers and expressions as indexes.
- For a collection type defined in an anonymous block, after ROLLBACK is executed or EXCEPTION occurs in an anonymous block, the collection type cannot be used.
- If **set enable_recordtype_check_strict** is set to **on;** and the member is of the record type and a column of the record type has the not null or default attribute, an error is reported during stored procedure or package compilation.

GaussDB supports access to collection elements by using parentheses, and it also supports the extend, count, first, last, prior, next, and delete functions.

The collection functions support multiset union, intersect, except all, and distinct.

Index-By Table Collection Type

This collection type stores the index set and corresponding member values in a hash table as key-value pairs. All operations on variables of this type are actually operations on the hash table. Users do not need to expand or release storage space, but only need to assign values or delete members. The operations related to the collection type are described as follows:

1. Type definition

   When defining the index-by table collection type, specify both the member type **data_type** and index set type **indexby_type**. The index set type can only be integer or varchar.

2. Variable declaration and initialization

   After the index-by table collection type is declared, it can be initialized. There are three initialization scenarios: uninitialized, initialized to null, and initialized to specified index set and member values. The effect of uninitialized variables is the same as that of initializing variables to null. If a variable is not initialized or is initialized to null, the variable is not **NULL**. You can assign a value to the variable later. Initializing a variable to specified index set and member values will save the specified index set and member values to the variable as key-value pairs.

3. Variable assignment

   Assignment to variables of the index-by table collection type is classified into member assignment and group assignment. Member assignment allows to assign a value to a member by specifying the index set. If the member does not have a value, the assigned value is used directly. If the member has a value, the member value is updated. Group assignment will clear the original members in the variable and save the new member values. In the group assignment scenario, **NULL** cannot be assigned to variables. Otherwise, an error is reported.

4. Variable value

   You can specify an index set to obtain the member value of the corresponding index in the variable. If the member cannot be found based on the index set, the error message "no data found" is returned.

NOTE

- In a non-A compatible mode (the value of **sql_compatibility** is not **A**), no index-by table collection type can be created.
- Index-by table collection types can be defined in anonymous blocks, stored procedures, user-defined functions, and packages, among which the scopes of the collection types vary. Index-by table collection types cannot be defined in schemas.
- **NOT NULL** has no function but only takes effect in the syntax.
- When **data_type** is set to a type that can define the length and precision, such as varchar and numeric, you need to enable the **tableof_elem_constraints** parameter (**behavior_compat_options** must be set to **tableof_elem_constraints**) to verify the length of elements in the collection or convert elements to the corresponding precision. In the syntax of creating a collection containing elements of the CHAR, VACHAR, NUMERIC, FLOAT, or NUMBER type, the syntax cannot restrict the element range. For example, **create type t1 is table of numeric(5) index by int;** is the same as **type t1 is table of numeric index by int;** and the range restriction does not take effect.
- If **data_type** is of the array type, the element length verification or precision conversion of the array type is also affected by whether the **tableof_elem_constraints** parameter is enabled.
- The value of the collection type converted from the array type does not support element length verification or precision conversion.
- The **data_type** can be a base data type or a record type, collection type, or array type defined in a stored procedure. The ref cursor type is not supported.
- The value of **indexby_type** can only be INTEGER or VARCHAR.
- When **indexby_type** is set to **varchar** and **tableof_elem_constraints** is enabled, the length of the index value is verified when a value is assigned to an index-by table collection type. The verification behavior is not affected by whether **char_coerce_compat** is enabled. If the index length is greater than the defined length, an error is reported. If the **tableof_elem_constraints** parameter is disabled, the index value length is not verified.
- An uninitialized variable of the index-by table collection type is not **NULL**.
- **NULL** cannot be assigned to a variable of the index-by table collection type. Otherwise, an error is reported.
- **NULL** and '' (single quotation marks) cannot be assigned to a variable of the index-by table collection type.
- Variables of the index-by table collection type cannot be assigned values of another index-by table collection type, even if their member type and index set type are the same. For example, *t1* and *t2* are of different collection types defined by **TYPE** *t1* **IS TABLE OF** *int* **index by** *int* and **TYPE** *t2* **IS TABLE OF** *int* **index by** *int*, respectively. A value of the collection type defined by **TYPE** *t1* **IS TABLE OF** *int* **index by** *int* cannot be assigned to *t2*, and vice versa. (This restriction may not take effect when the variables are of the member types because the value assignment logic of variables is affected by the parent type.)
- An index-by table collection type does not support relational and arithmetic operations.
- When a variable of the index-by table collection type is assigned by executing **select... bulk collect into**, the index set must be of the integer type. The index set type cannot be varchar.
- Variables of the index-by table collection type can be used as the parameters and return values of functions. In this case, the type of the parameters or return values must be a collection type defined in the package.
- When an index-by table collection is used as the input parameter of a function, an array with elements of the same type can be transferred as the input parameter. Multi-dimensional arrays are not supported, and the index type cannot be VARCHAR. (This function is outdated and not recommended. You can run the **set behavior_compat_options = 'disable_rewrite_nesttable';** command to disable the function.)

- Currently, the type constructor supports only the collection type and the maximum number of parameters is the same as that of user-defined function parameters. For the index-by table collection type, the index value can only be a constant when the constructor is used.
- Operations on XML data are not supported.
- When creating a table, do not use the collection type or any type containing a collection as a column in the table.
- Constructors of the collection type do not support floating point numbers and expressions as indexes.
- For a collection type defined in an anonymous block, after ROLLBACK is executed or EXCEPTION occurs in an anonymous block, the collection type cannot be used.
- If **set enable_recordtype_check_strict** is set to **on;** and the member is of the record type and a column of the record type has the not null or default attribute, an error is reported during stored procedure or package compilation.

Examples

Example 1: nest-table collection type

```
-- Perform operations on a collection in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE table_proc AS
DECLARE
    TYPE TABLE_INTEGER IS TABLE OF INTEGER;-- Define a collection type.
    TABLEINT TABLE_INTEGER := TABLE_INTEGER();  -- Declare the variable of the collection type.
BEGIN
    TABLEINT.extend(10);
    FOR I IN 1..10 LOOP
        TABLEINT(I) := I;
    END LOOP;
    DBE_OUTPUT.PRINT_LINE(TABLEINT.COUNT);
    DBE_OUTPUT.PRINT_LINE(TABLEINT(1));
    DBE_OUTPUT.PRINT_LINE(TABLEINT(10));
END;
/
CREATE PROCEDURE
-- Call the stored procedure.
gaussdb=# CALL table_proc();
CALL table_proc();
10
1
10
 table_proc
------------

(1 row)
-- Drop the stored procedure.
gaussdb=# DROP PROCEDURE table_proc;
DROP PROCEDURE
-- Perform operations on a nest-table collection in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE nest_table_proc AS
DECLARE
    TYPE TABLE_INTEGER IS TABLE OF INTEGER;-- Define a collection type.
    TYPE NEST_TABLE_INTEGER IS TABLE OF TABLE_INTEGER;-- Define a collection type.
    NEST_TABLE_VAR NEST_TABLE_INTEGER := NEST_TABLE_INTEGER(); --Declare a variable of the nest-table collection type.
BEGIN
    NEST_TABLE_VAR.extend(10);
    FOR I IN 1..10 LOOP
        NEST_TABLE_VAR(I) := TABLE_INTEGER();
        NEST_TABLE_VAR(I).extend(10);
        NEST_TABLE_VAR(I)(I) := I;
    END LOOP;
    DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR.COUNT);
    DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR(1)(1));
    DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR(10)(10));
```

```
END;
/
CREATE PROCEDURE
-- Call the stored procedure.
gaussdb=# CALL nest_table_proc();
10
1
10
 nest_table_proc
-----------------

(1 row)

10.4.2.2 Collection Functions

Collection Operators

- =

  Parameter: nesttable

  Return value: **TRUE** or **FALSE**, of the Boolean type.

  Description: Checks whether two collections are equal.

  Example:

  ```
  gaussdb=# declare
  gaussdb-#     type nest is table of int;
  gaussdb-#     a nest := nest(1,2);
  gaussdb-#     b nest := nest(1,2);
  gaussdb-#     flag bool;
  gaussdb-# begin
  gaussdb$#     flag := a = b;
  gaussdb$#     raise info '%', flag;
  gaussdb$# end;
  gaussdb$# /
  INFO:  t
  ANONYMOUS BLOCK EXECUTE
  ```

- <>

  Parameter: nesttable

  Return value: **TRUE** or **FALSE**, of the Boolean type.

  Description: Checks whether two collections are not equal.

  Example:

  ```
  gaussdb=# declare
  gaussdb-#     type nest is table of int;
  gaussdb-#     a nest := nest(1,2);
  gaussdb-#     b nest := nest(1,2);
  gaussdb-#     flag bool;
  gaussdb-# begin
  gaussdb$#     flag := a <> b;
  gaussdb$#     raise info '%', flag;
  gaussdb$# end;
  gaussdb$# /
  INFO:  f
  ANONYMOUS BLOCK EXECUTE
  ```

- IS [NOT] NULL

  Parameter: nesttable

  Return value: **TRUE** or **FALSE**, of the Boolean type.

Description: Determines whether a collection is **NULL**.

Example:

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest;
gaussdb-#     b nest := NULL;
gaussdb-#     c nest := nest(1,2);
gaussdb-#     flag bool;
gaussdb-# begin
gaussdb$#     flag := a IS NULL;
gaussdb$#     raise info '%', flag;
gaussdb$#     flag := b IS NULL;
gaussdb$#     raise info '%', flag;
gaussdb$#     flag := c IS NULL;
gaussdb$#     raise info '%', flag;
gaussdb$# end;
gaussdb$# /
INFO:  t
INFO:  t
INFO:  f
ANONYMOUS BLOCK EXECUTE
```

- ^=

  Parameter: nesttable

  Return value: **TRUE** or **FALSE**, of the Boolean type.

  Description: Checks whether two collections are not equal.

  Example:

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1,2);
gaussdb-#     b nest := nest(1,2);
gaussdb-#     flag bool;
gaussdb-# begin
gaussdb$#     flag := a ^= b;
gaussdb$#     raise info '%', flag;
gaussdb$# end;
gaussdb$# /
INFO:  f
ANONYMOUS BLOCK EXECUTE
```

- [NOT] IN

  Parameter: nesttable

  Return value: **TRUE** or **FALSE**, of the Boolean type.

  Description: Determines whether a collection is in the collection list.

  Example:

```
gaussdb=# declare
gaussdb-#     type tab is table of varchar(10);
gaussdb-#     tmp1 tab := tab('a', 'b');
gaussdb-#     tmp2 tab := tab('a', 'b');
gaussdb-#     flag bool;
gaussdb-# begin
gaussdb$#     flag := tmp2 in (tmp1);
gaussdb$#     raise info '%', flag;
gaussdb$# end;
gaussdb$# /
INFO:  t
ANONYMOUS BLOCK EXECUTE
```

MULTISET

- MULTISET UNION [ALL | DISTINCT]

Parameter: nesttable

Return value: nesttable

Description: Union of two collection variables. The default value **ALL** indicates that duplicate elements are not removed, and **DISTINCT** indicates that duplicate elements are removed.

Example 1: Calculate the union of two collection variables and do not remove duplicate elements. That is, MULTISET UNION ALL.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1,2);
gaussdb-#     b nest := nest(2,3);
gaussdb-# begin
gaussdb$#     a := a MULTISET UNION ALL b;
gaussdb$#     raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO:  {1,2,2,3}
ANONYMOUS BLOCK EXECUTE
```

Example 2: Calculate the union of two collection variables and remove duplicate elements. That is, MULTISET UNION DISTINCT.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1,2);
gaussdb-#     b nest := nest(2,3);
gaussdb-# begin
gaussdb$#     a := a MULTISET UNION DISTINCT b;
gaussdb$#     raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO:  {1,2,3}
ANONYMOUS BLOCK EXECUTE
```

- MULTISET EXCEPT [ALL | DISTINCT]

  Parameter: nesttable

  Return value: nesttable

  Description: Difference of two collection variables. Take A MULTISET EXCEPT B as an example. **ALL** indicates that elements that both A and B have in A are removed and returned. The number of elements to be removed is calculated. For a specific element, if A appears *m* times and B appears *n* times (m > n), the number of elements removed from A is *m* minus *n*. If m ≤ n, *m* elements are removed from A. **DISTINCT** indicates that elements that both A and B have in A are removed and returned. The number of elements to be removed is not calculated. If specific elements appear in A and B, all such elements in A are removed. **ALL** is the default value.

  Example 1: Calculate a difference set of two collection variables, remove elements that both A and B have in A, and return result. The number of elements to be removed is calculated. That is, MULTISET EXCEPT ALL.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1,2,2);
gaussdb-#     b nest := nest(2,3);
gaussdb-# begin
gaussdb$#     a := a MULTISET EXCEPT ALL b;
gaussdb$#     raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO:  {1,2}
ANONYMOUS BLOCK EXECUTE
```

Example 2: Calculate a difference set of two collection variables, remove elements that both A and B have in A, and return result. The number of elements to be removed is not calculated. That is, MULTISET EXCEPT DISTINCT.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1,2,2);
gaussdb-#     b nest := nest(2,3);
gaussdb-# begin
gaussdb$#     a := a MULTISET EXCEPT DISTINCT b;
gaussdb$#     raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO:  {1}
ANONYMOUS BLOCK EXECUTE
```

- MULTISET INTERSECT [ALL | DISTINCT]

  Parameter: nesttable

  Return value: nesttable

  Description: Intersection of two collection variables. Taking A MULTISET INTERSECT B as an example, **ALL** indicates that all duplicate elements in A and B are obtained, and **DISTINCT** indicates that duplicate elements in A and B are obtained and then duplicate elements in this intersection are removed. **ALL** is the default value.

  Example 1: Calculate the intersection of two collection variables and do not remove duplicate elements. That is, MULTISET INTERSECT ALL.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1,2,2);
gaussdb-#     b nest := nest(2,2,3);
gaussdb-# begin
gaussdb$#     a := a MULTISET INTERSECT ALL b;
gaussdb$#     raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO:  {2,2}
ANONYMOUS BLOCK EXECUTE
```

  Example 2: Calculate the intersection of two collection variables and remove duplicate elements. That is, MULTISET INTERSECT DISTINCT.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1,2,2);
gaussdb-#     b nest := nest(2,2,3);
gaussdb-# begin
gaussdb$#     a := a MULTISET INTERSECT DISTINCT b;
gaussdb$#     raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO:  {2}
ANONYMOUS BLOCK EXECUTE
```

Functions of the Collection Type

NOTE

- In the following function definition description, the content in [] is optional. For example, count[()] can be written as count or count().
- In an inner expression, functions of the collection type cannot be called in nesting mode.

- exists(idx)

Parameter: *idx* is of the INT4 or VARCHAR type.

Return value: **TRUE** or **FALSE**, of the Boolean type.

Description: Checks whether a valid element exists in a specified position.

Example:

```
gaussdb=# declare
gaussdb-#     type nest is table of varchar2;
gaussdb-#     a nest := nest('happy','?');
gaussdb-#     flag bool;
gaussdb-# begin
gaussdb$#     flag := a.exists(1);
gaussdb$#     raise info '%', flag;
gaussdb$#     flag := a.exists(10);
gaussdb$#     raise info '%', flag;
gaussdb$# end;
gaussdb$# /
INFO:  t
INFO:  f
ANONYMOUS BLOCK EXECUTE

gaussdb=# declare
gaussdb-#     type nest is table of varchar2 index by varchar2;
gaussdb-#     a nest;
gaussdb-#     flag bool;
gaussdb-# begin
gaussdb$#     a('1') := 'Be';
gaussdb$#     a('2') := 'happy';
gaussdb$#     a('3') := '.';
gaussdb$#     flag := a.exists('1');
gaussdb$#     raise info '%', flag;
gaussdb$#     flag := a.exists('ddd');
gaussdb$#     raise info '%', flag;
gaussdb$# end;
gaussdb$# /
INFO:  t
INFO:  f
ANONYMOUS BLOCK EXECUTE
```

- extend[(count[, idx])]

  Parameters: *idx* and *count* are of the INT4 type.

  Return value: No value is returned.

  Description: Supports only variables of the nest-table type. One or *count* elements are extended at the end of the nest-table variable. If index set element *idx* exists, *count* index elements are copied to the end of the variable.

  Example 1: A nest-table variable extends 1 element and the extended element value is **NULL**.

  ```
  gaussdb=# declare
  gaussdb-#     type nest is table of int;
  gaussdb-#     a nest := nest(1);
  gaussdb-# begin
  gaussdb$#     raise info '%', a;
  gaussdb$#     a.extend;
  gaussdb$#     raise info '%', a;
  gaussdb$#     a.extend;
  gaussdb$#     raise info '%', a;
  gaussdb$# end;
  gaussdb$# /
  INFO:  {1}
  INFO:  {1,NULL}
  INFO:  {1,NULL,NULL}
  ANONYMOUS BLOCK EXECUTE
  ```

  Example 2: A nest-table variable extends *n* elements and the extended element value is **NULL**.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1);
gaussdb-# begin
gaussdb$#     raise info '%', a;
gaussdb$#     a.extend(2);
gaussdb$#     raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO:  {1}
INFO:  {1,NULL,NULL}
ANONYMOUS BLOCK EXECUTE
```

Example 3: A nest-table variable extends *n* elements and the extended element value is the value of the specified index element.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(9);
gaussdb-# begin
gaussdb$#     raise info '%', a;
gaussdb$#     a.extend(2,1);
gaussdb$#     raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO:  {9}
INFO:  {9,9,9}
ANONYMOUS BLOCK EXECUTE
```

- delete[(idx1[, idx2])]

  Parameter: *idx1* and *idx2* are of the int4 or varchar2 type.

  Return value: No value is returned.

  Description: If there is no parameter, the variable of the nest-table type deletes all elements of the collection type and the space. If the space is used later, the space needs to be expanded. If there is no parameter, the variable of the index-by table type deletes all elements. If there is one parameter, the element in the specified position is deleted (the space is not deleted). If there are two parameters, all elements in the index interval are deleted (the space is not deleted).

  Example 1: Delete all elements and spaces of the collection type from the variable of the nest-table collection type.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1,2,3,4,5);
gaussdb-# begin
gaussdb$#     raise info '%', a;
gaussdb$#     a.delete();
gaussdb$#     raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO:  {1,2,3,4,5}
INFO:  {}
ANONYMOUS BLOCK EXECUTE
```

  Example 2: Delete an element at a specified position from the variable of the nest-table collection type.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1,2,3,4,5);
gaussdb-# begin
gaussdb$#     raise info '%', a;
gaussdb$#     a.delete(3);
gaussdb$#     raise info '%', a;
gaussdb$#     a(3) := 3;
gaussdb$#     raise info '%', a;
```

```
gaussdb$# end;
gaussdb$# /
INFO:  {1,2,3,4,5}
INFO:  {1,2,4,5}
INFO:  {1,2,3,4,5}
ANONYMOUS BLOCK EXECUTE
```

Example 3: Delete elements in a specified interval from the variable of the nest-table collection type.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1,2,3,4,5);
gaussdb-# begin
gaussdb$#     raise info '%', a;
gaussdb$#     a.delete(2,4);
gaussdb$#     raise info '%', a(1);
gaussdb$#     raise info '%', a(5);
gaussdb$#     raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO:  {1,2,3,4,5}
INFO:  1
INFO:  5
INFO:  {1,5}
ANONYMOUS BLOCK EXECUTE
```

Example 4: Delete all elements and spaces of the collection type from the variable of the index-by table collection type.

```
gaussdb=# declare
gaussdb-#     type t1 is table of int index by varchar;
gaussdb-#     v t1 := t1('a' => 1, 'b' => 2, 'c' => 3, 'd' => 4);
gaussdb-# begin
gaussdb$#     v.delete();
gaussdb$#     raise info '%', v.count();
gaussdb$# end;
gaussdb$# /
INFO:  0
ANONYMOUS BLOCK EXECUTE
```

Example 5: Delete an element at a specified position from the variable of the index-by table collection type.

```
gaussdb=# declare
gaussdb-#     type t1 is table of int index by varchar;
gaussdb-#     v t1 := t1('a' => 1, 'b' => 2, 'c' => 3, 'd' => 4);
gaussdb-# begin
gaussdb$#     raise info '%', v('a');
gaussdb$#     v.delete('a');
gaussdb$#     raise info '%', v('a');
gaussdb$# end;
gaussdb$# /
INFO:  1
ERROR:  no data found
CONTEXT:  PL/pgSQL function inline_code_block line 6 at RAISE
```

Example 6: Delete elements in a specified interval from the variable of the index-by table collection type.

```
gaussdb=# declare
gaussdb-#     type t1 is table of int index by varchar;
gaussdb-#     v t1 := t1('a' => 1, 'b' => 2, 'c' => 3, 'd' => 4);
gaussdb-# begin
gaussdb$#     raise info '%', v('b');
gaussdb$#     v.delete('a', 'c');
gaussdb$#     raise info '%', v('b');
gaussdb$# end;
gaussdb$# /
INFO:  2
ERROR:  no data found
CONTEXT:  PL/pgSQL function inline_code_block line 6 at RAISE
```

- trim[(n)]

  Parameter: *n* is of the INT4 type.

  Return value: No value is returned.

  Description: Supports only variables of the nest-table type. If no parameter is specified, the last element space is deleted. If the input parameter is valid, the specified number of element spaces are deleted.

  Example:

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     aa nest := nest(11,22,33,44,55);
gaussdb-# begin
gaussdb$#     raise info 'aa:%' ,aa;
gaussdb$#     aa.trim;  -- No parameter
gaussdb$#     raise info 'aa:%' ,aa;
gaussdb$#     aa.trim();  -- No parameter
gaussdb$#     raise info 'aa:%' ,aa;
gaussdb$#     aa.trim(2);  -- Valid parameter
gaussdb$#     raise info 'aa:%' ,aa;
gaussdb$#     aa.trim(2);  -- The collection element space is less than 2. An error is reported when the
parameter is invalid.
gaussdb$# end;
gaussdb$# /
INFO:  aa:{11,22,33,44,55}

INFO:  aa:{11,22,33}
INFO:  aa:{11}
ERROR:  Subscript beyond count
CONTEXT:  PL/pgSQL function inline_code_block line 11 at assignment
```

- count[()]

  Parameter: none

  Return value: INT type

  Description: Returns the number of valid elements in a collection.

  Example 1: Use the count function for the variable of the nest-table collection type.

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# aa nest:=nest(11,22,33,44,55);
gaussdb-# begin
gaussdb$# raise info 'count:%' ,aa.count;
gaussdb$# aa.delete(3);  -- Delete an element. The element whose index is 3 is invalid.
gaussdb$# raise info 'count:%' ,aa.count();
gaussdb$# end;
gaussdb$# /
INFO:  count:5
INFO:  count:4
ANONYMOUS BLOCK EXECUTE
```

  Example 2: Use the count function for the variable of the index-by table collection type.

```
gaussdb=# declare
gaussdb-# type t1 is table of int index by int;
gaussdb-# aa t1;
gaussdb-# begin
gaussdb$# aa(1) := 111;
gaussdb$# aa(2) := 222;
gaussdb$# aa(3) := 333;
gaussdb$# raise info 'count:%' ,aa.count();
gaussdb$# end;
gaussdb$# /
INFO:  count:3
ANONYMOUS BLOCK EXECUTE
```

```
gaussdb=# declare
gaussdb-# type t1 is table of int index by varchar;
gaussdb-# aa t1;
gaussdb-# begin

gaussdb$# aa('bbb') := 222;
gaussdb$# aa('ccc') := 333;
gaussdb$# raise info 'count:%' ,aa.count;
gaussdb$# end;
gaussdb$# /
INFO:  count:3
ANONYMOUS BLOCK EXECUTE
```

- first[()]

  Parameter: none

  Return value: INT or VARCHAR

  Description: Returns the index of the first valid element in a collection.

  Example 1: Use the first function for the variable of the nest-table collection type.

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# aa nest:=nest(11,22,33,44,55);
gaussdb-# begin
gaussdb$# raise info 'first:%' ,aa.first();
gaussdb$# aa.delete(1);
gaussdb$# raise info 'first:%' ,aa.first;  -- The element whose index is 1 is invalid. The index of the first valid element is 2.
gaussdb$# end;
gaussdb$# /
INFO:  first:1
INFO:  first:2
ANONYMOUS BLOCK EXECUTE
```

  Example 2: Use the first function for the variable of the index-by table collection type.

```
gaussdb=# declare
gaussdb-# type t1 is table of int index by int;
gaussdb-# aa t1;
gaussdb-# begin
gaussdb$# aa(3) := 111;
gaussdb$# aa(2) := 222;
gaussdb$# aa(1) := 333;
gaussdb$# raise info 'first:%' ,aa.first;
gaussdb$# end;
gaussdb$# /
INFO:  first:1
ANONYMOUS BLOCK EXECUTE

gaussdb=# declare
gaussdb-# type t1 is table of int index by varchar;
gaussdb-# aa t1;
gaussdb-# begin
gaussdb$# aa('aaa') := 111;
gaussdb$# aa('bbb') := 222;
gaussdb$# aa('ccc') := 333;
gaussdb$# raise info 'first:%' ,aa.first;
gaussdb$# end;
gaussdb$# /
INFO:  first:aaa
ANONYMOUS BLOCK EXECUTE
```

- last[()]

  Parameter: none

  Return value: INT or VARCHAR

Description: Returns the index of the last valid element in a collection.

Example 1: Use the last function for the variable of the nest-table collection type.

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# aa nest:=nest(11,22,33,44,55);
gaussdb-# begin
gaussdb$# raise info 'last:%' ,aa.last;
gaussdb$# aa.delete(5);
gaussdb$# raise info 'last:%' ,aa.last();  -- The element whose index is 5 is invalid. The index of the last valid element is 4.
gaussdb$# end;
gaussdb$# /
INFO:  last:5
INFO:  last:4
ANONYMOUS BLOCK EXECUTE
```

Example 2: Use the last function for the variable of the index-by table collection type.

```
gaussdb=# declare
gaussdb-# type t1 is table of int index by varchar;
gaussdb-# aa t1;
gaussdb-# begin
gaussdb$# aa(3) := 111;
gaussdb$# aa(2) := 222;
gaussdb$# aa(1) := 333;
gaussdb$# raise info 'last:%' ,aa.last();
gaussdb$# end;
gaussdb$# /
INFO:  last:3
ANONYMOUS BLOCK EXECUTE

gaussdb=# declare
gaussdb-# type t1 is table of int index by varchar;
gaussdb-# aa t1;
gaussdb-# begin
gaussdb$# aa('aaa') := 111;
gaussdb$# aa('bbb') := 222;
gaussdb$# aa('ccc') := 333;
gaussdb$# raise info 'last:%' ,aa.last;
gaussdb$# end;
gaussdb$# /
INFO:  last:ccc
ANONYMOUS BLOCK EXECUTE
```

- prior(idx)

  Parameter: *idx* is of the INT or VARCHAR type.

  Return value: int or varchar type

  Description: Returns the index of a valid element before the given index in a collection.

  Example 1: Use the prior function for the variable of the nest-table collection type.

  ```
  gaussdb=# declare
  gaussdb-# type nest is table of int;
  gaussdb-# aa nest:=nest(11,22,33,44,55);
  gaussdb-# begin
  gaussdb$# raise info 'prior:%' ,aa.prior(3);
  gaussdb$# end;
  gaussdb$# /
  INFO:  prior:2
  ANONYMOUS BLOCK EXECUTE
  ```

  Example 2: Use the prior function for the variable of the index-by table collection type.

```
gaussdb=# declare
gaussdb-# type t1 is table of int index by varchar;
gaussdb-# aa t1;
gaussdb-# begin
gaussdb$# aa('ccc') := 111;
gaussdb$# aa('bbb') := 222;
gaussdb$# aa('aaa') := 333;
gaussdb$# raise info 'prior:%' ,aa.prior('bbb');
gaussdb$# raise info 'prior:%' ,aa.prior('ddd');
gaussdb$# end;
gaussdb$# /
INFO:  prior:aaa
INFO:  prior:ccc
ANONYMOUS BLOCK EXECUTE
```

- next(idx)

  Parameter: *idx* is of the INT or VARCHAR type.

  Return value: INT or VARCHAR

  Description: Returns the index of a valid element following the given index in a collection.

  Example 1: Use the next function for the variable of the nest-table collection type.

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# aa nest:=nest(11,22,33,44,55);
gaussdb-# begin
gaussdb$# raise info 'next:%' ,aa.next(3);
gaussdb$# end;
gaussdb$# /
INFO:  next:4
ANONYMOUS BLOCK EXECUTE
```

  Example 2: Use the next function for the variable of the index-by table collection type.

```
gaussdb=# declare
gaussdb-# type t1 is table of int index by int;
gaussdb-# aa t1;
gaussdb-# begin
gaussdb$# aa(3) := 111;
gaussdb$# aa(2) := 222;
gaussdb$# aa(1) := 333;
gaussdb$# raise info 'next:%' ,aa.next(2);
gaussdb$# raise info 'next:%' ,aa.next(-999);
gaussdb$# end;
gaussdb$# /
INFO:  next:3
INFO:  next:1
ANONYMOUS BLOCK EXECUTE
```

- limit

  Parameter: none

  Return value: null

  Description: Returns null values and only for variables of the nest-table type.

  Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# aa nest:=nest(11,22,33,44,55);
gaussdb-# begin
gaussdb$# raise info 'limit:%' ,aa.limit;
gaussdb$# end;
gaussdb$# /
INFO:  limit:<NULL>
ANONYMOUS BLOCK EXECUTE
```

Collection-related Functions

- unnest_table (anynesttable) or unnest (anynesttable)

  Parameter: any nest-table collection type.

  Description: Returns the result set of all valid elements in a given nest-table. Multiple rows of data are returned.

  Return type: setof anyelement.

  Example:

```
gaussdb=# create or replace procedure p1()
gaussdb-# as
gaussdb$#     type t1 is table of int;
gaussdb$#     v2 t1 := t1(null, 2, 3, 4, null);
gaussdb$#     tmp int;
gaussdb$#     cursor c1 is select * from unnest_table(v2);
gaussdb$# begin
gaussdb$# open c1;
gaussdb$# for i in 1 .. v2.count loop
gaussdb$#     fetch c1 into tmp;
gaussdb$#     if tmp is null then
gaussdb$#         dbe_output.print_line(i || ': is null');
gaussdb$#     else
gaussdb$#         dbe_output.print_line(i || ': ' || tmp);
gaussdb$#     end if;
gaussdb$# end loop;
gaussdb$# close c1;
gaussdb$# end;
gaussdb$# /
CREATE PROCEDURE
gaussdb=# call p1();
1: is null
2: 2
3: 3
4: 4
5: is null
 p1
----

(1 row)
gaussdb=# drop procedure if exists p1();
DROP PROCEDURE

-- Example: nested record types in a nest-table
gaussdb=# create or replace procedure p1() is
gaussdb$#   type rec is record(c1 int, c2 int);
gaussdb$#   type t1 is table of rec;
gaussdb$#   v t1 := t1(rec(1, 1), rec(2, null), rec(null, null), null);
gaussdb$#   v2 t1 := t1();
gaussdb$#   cursor cur is select * from unnest(v);
gaussdb$# begin
gaussdb$#   v2.extend(v.count);
gaussdb$#   open cur;
gaussdb$#   for i in 1 .. v.count loop
gaussdb$#     fetch cur into v2(i);
gaussdb$#     raise info '%', v2(i);
gaussdb$#   end loop;
gaussdb$#   close cur;
gaussdb$# end;
gaussdb$# /
CREATE PROCEDURE
gaussdb=# call p1();
INFO:  (1,1)
INFO:  (2,)
INFO:  (,)
INFO:  (,)
 p1
----
```

```
(1 row)
gaussdb=# drop procedure if exists p1();
DROP PROCEDURE
```

NOTE

If the element type of the collection is record and any element is NULL, the element is not returned. Instead, a non-null record value is returned. All columns of the record are NULL. For details, see the example.

- unnest_table (anyindexbytable) or unnest (anyindexbytable)

  Parameter: any index-by table collection type.

  Description: Returns the result set of all elements sorted by index in a given index-by table. Multiple rows of data are returned.

  Return type: setof anyelement

  Constraint: Only the index-by int type is supported. The index-by varchar type is not supported.

  Example:

```
gaussdb=# create or replace procedure p1()
gaussdb-# as
gaussdb$#     type t1 is table of int index by int;
gaussdb$#     v2 t1 := t1(1=>1, -10=>(-10), 6=>6, 4=>null);
gaussdb$#     tmp int;
gaussdb$#     cursor c1 is select * from unnest_table(v2);
gaussdb$# begin
gaussdb$# open c1;
gaussdb$# for i in 1 .. v2.count loop
gaussdb$#     fetch c1 into tmp;
gaussdb$#     if tmp is null then
gaussdb$#         dbe_output.print_line(i || ': is null');
gaussdb$#     else
gaussdb$#         dbe_output.print_line(i || ': ' || tmp);
gaussdb$#     end if;
gaussdb$# end loop;
gaussdb$# close c1;
gaussdb$# end;
gaussdb$# /
CREATE PROCEDURE
gaussdb=# call p1();
1: -10
2: 1
3: is null
4: 6
 p1
----

(1 row)
gaussdb=# drop procedure if exists p1();
DROP PROCEDURE

-- Example: nested record types in an index-by table
gaussdb=# create or replace procedure p1() is
gaussdb$#   type rec is record(c1 int, c2 int);
gaussdb$#   type t1 is table of rec index by int;
gaussdb$#   v t1 := t1(1 => rec(1, 1), 2 => rec(2, null), 3 => rec(null, null), 4 => null);
gaussdb$#   v2 t1 := t1();
gaussdb$#   cursor cur is select * from unnest(v);
gaussdb$# begin
gaussdb$#   open cur;
gaussdb$#   for i in 1 .. v.count loop
gaussdb$#     fetch cur into v2(i);
gaussdb$#     raise info '%', v2(i);
gaussdb$#   end loop;
gaussdb$#   close cur;
```

```
gaussdb$# end;
gaussdb$# /
CREATE PROCEDURE
gaussdb=# call p1();
INFO:  (1,1)
INFO:  (2,)
INFO:  (,)
INFO:  (,)
 p1
----

(1 row)
gaussdb=# drop procedure if exists p1();
DROP PROCEDURE
```

NOTE

If the element type of the collection is record and any element is NULL, the element is not returned. Instead, a non-null record value is returned. All columns of the record are NULL. For details, see the example.

10.4.3 Records

Record Variables

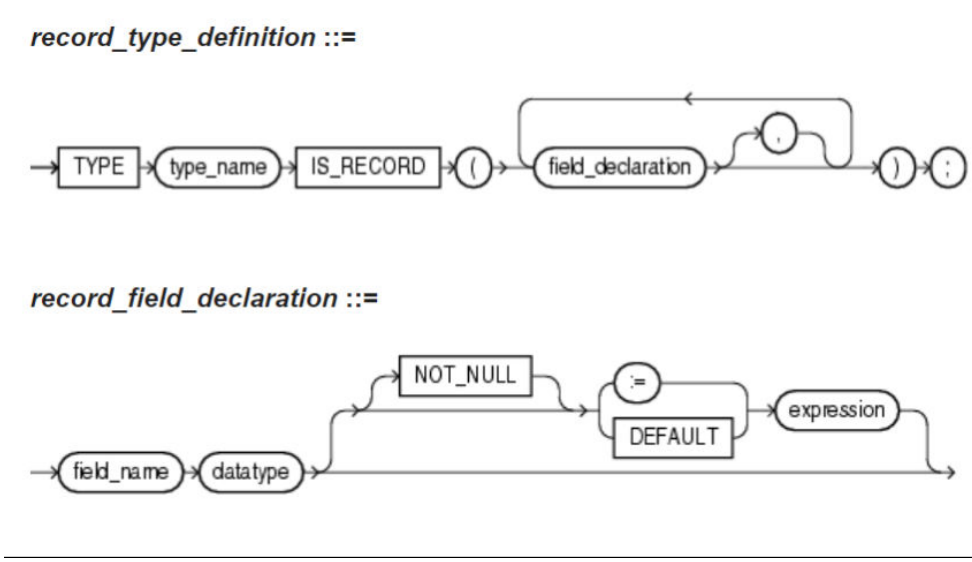
Perform the following operations to create a record variable:

Define a record type and use this type to declare a variable.

Syntax

For the syntax of the record type, see **Figure 10-1**.

Figure 10-1 Syntax of the record type



The above syntax diagram is explained as follows:

- **record_type**: record type
- **field**: record columns

- **datatype**: record data type
- **expression**: expression for setting a default value

NOTE

In GaussDB:

- When assigning values to record variables, you can:
  - Declare a record type and define member variables of this type when you declare a function or stored procedure.
  - Assign the value of a record variable to another record variable.
  - Use **SELECT INTO** or **FETCH** to assign values to a record type.
  - Assign the **NULL** value to a record variable.
- The record type constructor can use => to assign values. The restrictions are as follows:
  - The => function is used when the record type constructor assigns values. This function is supported only when the A-compatible database is used (**sql_compatibility** is set to **'A'**).
  - The record type can be defined in a package.
  - The record type constructor uses the => function to assign values. This function is supported only when => is consecutively used to assign values to input parameters, for example, **record_name(elename1 => val1, elename2 => val2, elename3 => val3)** or **record_name(val1, elename2 => val2, elename3 => val3)**. Discontinuous use of => or => is not supported. For example, **record_name(elename1 => val1, elename2 => val2, val3)** or **record_name(val1, elename2 => val2, val3)**, where the last input parameter is not assigned a value.
- The **INSERT** and **UPDATE** statements cannot use a record variable to insert or update data.
- The constructor of the record type cannot be used as the default value of a function or stored procedure parameter.
- Just like a variable, a record column of the compound type does not have a default value in the declaration.
- If a member has a record type, the default value of the inner record type cannot be not transferred to the outer record type.
- If **set enable_recordtype_check_strict** is set to **on** and the member is of the record type and a column of the record type has the not null or default attribute, an error is reported during stored procedure or package compilation.
- If **set enable_recordtype_check_strict** is set to **on**, a package contains the record type, and a column of the record type has the not null or default attribute, an error is reported during creation or compilation.
- If **set enable_recordtype_check_strict** is set to **on**, the not null function of the record type in the stored procedure takes effect.
- The data type can be the record type, array type, or collection type defined in a stored procedure (anonymous blocks are not supported).
- After the GUC parameter **set behavior_compat_options** is set to **'proc_outparam_override'**:
  - Functions that contain the **out** output parameter and returns data of the record type can be invoked using SELECT and CALL in external SQL statements, and can be invoked using PERFORM and expressions in stored procedures.
  - If the function returns data of the undefined record type, at least one **out** parameter is required. If the function returns data of the defined record type, the **out** parameter is optional. For details, see the example.
  - Functions that contain the **out** output parameter and return data of the composite or record type, ensure that the expected return type of the function is the same as the actual return type.

Examples

```
-- Create a table and insert some data into the table.
gaussdb=# create table emp_rec(
gaussdb(#     empno numeric(4,0) not null,
gaussdb(#     ename varchar(10)
gaussdb(# );
CREATE TABLE
gaussdb=# insert into emp_rec values(111, 'aaa'), (222, 'bbb'), (333, 'ccc');
INSERT 0 3
-- The table is defined as follows:
gaussdb=# \d emp_rec
          Table "public.emp_rec"
 Column |         Type          | Modifiers
--------+-----------------------+-----------
 empno  | numeric(4,0)          | not null
 ename  | character varying(10) |

-- Perform record operations in the function.
gaussdb=# CREATE OR REPLACE FUNCTION regress_record(p_w VARCHAR2) RETURNS VARCHAR2 AS $$
gaussdb$# DECLARE
gaussdb$#     -- Declare a record type.
gaussdb$#     type rec_type is record (name  varchar2(100), epno int);
gaussdb$#     employer rec_type;
gaussdb$#     -- Use %type to declare the record type.
gaussdb$#     type rec_type1 is record (name  emp_rec.ename%type, epno int :=10);
gaussdb$#     employer1 rec_type1;
gaussdb$#     -- Declare a record type with the default value.
gaussdb$#     type rec_type2 is record (
gaussdb$#         name varchar2 not null := 'SCOTT',
gaussdb$#         epno int not null :=10
gaussdb$#     );

10.5 DECLARE Syntax

10.5.1 Basic Structure

Structure

A PL/SQL block can contain a sub-block which can be placed in any section. The following describes the architecture of a PL/SQL block:

- **DECLARE**: declares variables, types, cursors, and regional stored procedures and functions used in the PL/SQL block.
  ```
  DECLARE
  ```

  NOTE

  This part is optional if no variable needs to be declared.
  - An anonymous block may omit the DECLARE keyword if no variable needs to be declared.
  - For a stored procedure, AS is used, which is equivalent to DECLARE. The AS keyword must be reserved even if there is no variable declaration section.
- **EXECUTION**: specifies procedure and SQL statements. It is the main part of a program. Mandatory.
  ```
  BEGIN
  ```
- Exception part: processes errors. Optional.
  ```
  EXCEPTION
  ```
- End. Mandatory.
  ```
  END;
  /
  ```

NOTICE

You are not allowed to use consecutive tabs in the PL/SQL block because they may result in an exception when the gsql tool is executed with the **-r** parameter specified.

Category

PL/SQL blocks are classified into the following types:

- Anonymous block: a dynamic block that can be executed only for once. For details about the syntax, see **Figure 10-2**.
- Subprogram: a stored procedure, function, operator, or packages stored in a database. A subprogram created in a database can be called by other programs.

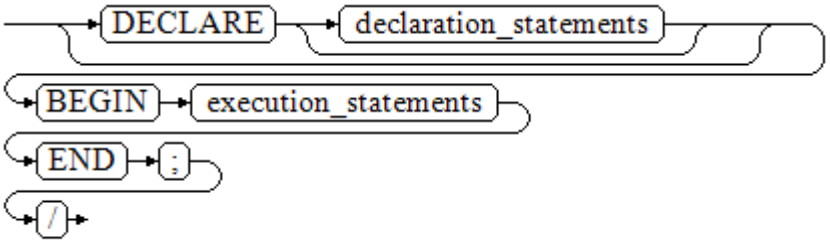
10.5.2 Anonymous Blocks

An anonymous block applies to a script infrequently executed or a one-off activity. An anonymous block is executed in a session and is not stored.

Syntax

Figure 10-2 shows the syntax diagrams for an anonymous block.

Figure 10-2 anonymous_block::=



Details about the syntax diagram are as follows:

- The execute part of an anonymous block starts with a **BEGIN** statement, has a break with an **END** statement, and ends with a semicolon (;). Type a slash (/) and press **Enter** to execute the statement.

  NOTICE

  The terminator "/" must be written in an independent row.

- The declaration section includes the variable definition, type, and cursor definition.
- A simplest anonymous block does not execute any commands. At least one statement, even a NULL statement, must be presented in any implementation blocks.

The following lists basic anonymous block programs:

```
-- Null statement block
gaussdb=# BEGIN
    NULL;
END;
/
ANONYMOUS BLOCK EXECUTE
-- Display information on the console.
gaussdb=# BEGIN
    dbe_output.print_line('hello world!');
END;
/
hello world!
ANONYMOUS BLOCK EXECUTE
-- Display variable content on the console.
gaussdb=# DECLARE
    my_var VARCHAR2(30);
BEGIN
    my_var :='world';
    dbe_output.print_line('hello'||my_var);
END;
/
helloworld
ANONYMOUS BLOCK EXECUTE
```

10.5.3 Subprogram

A subprogram stores stored procedures, functions, operators, and advanced packages. A subprogram created in a database can be called by other programs.

10.5.3.1 Standalone Subprograms

Subprograms created in a schema include stored procedures, functions, and packages created in a schema.

For details, see:

- **CREATE PACKAGE**
- **CREATE FUNCTION**
- **CREATE PROCEDURE**

10.5.3.2 Package Subprograms

Subprograms created in a package include stored procedures and functions created and declared in a package.

For details, see **CREATE PACKAGE**.

10.5.3.3 Nested Subprograms

Subprograms created in a PL/SQL block include sub-stored-procedures or subfunctions declared and created in anonymous blocks, stored procedures, functions, and stored procedures and functions in packages.

Precautions

- This is used in the A compatibility database.
- The maximum number of nesting layers is specified by the **max_subpro_nested_layers** parameter. The default value is **3**, and the value range is 0 to 100. If a nested subprogram contains an anonymous block, the layer of anonymous block is not counted, but the nested subprograms in the anonymous block are counted in the total number of layers.
- Nested subprograms do not support reloading or SETOF.
- Nested subprograms cannot be defined as autonomous transactions. They can call stored procedures or functions that contain autonomous transactions.
- Subfunctions (FUNCTION) cannot be directly called and must have return values. Sub-stored-procedures (PROCEDURE) cannot be called in expressions.
- Nested subprograms cannot be called by PERFORM. Dynamic statements cannot contain nested subprograms.
- Currently, the following modifiers are supported for nested subprograms. Other modifiers are not supported.
  ```
  {IMMUTABLE  | STABLE  | VOLATILE }
  {CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }
  ```
- Only one qualifier can reference a nested subprogram or a variable of a nested subprogram.
- When the return value type of a subfunction (FUNCTION) is the record type customized by the function, subfunc().col cannot be used to access the column attribute of the return value of the subfunction. As a result, an error is reported during execution.
- The declaration of a nested subprogram must be at the end of the declaration part (declare the nested subprogram after the declaration of variables, cursors, and types is complete).

- Nested subprograms can be called only inside declared functions or stored procedures and cannot be used externally.
- The debugger breakpoint is not supported when nested subprograms are used. Step-by-step debugging is supported.
- Other precautions are the same as those for stored procedures and functions.

Syntax

- Syntax format for creating a sub-stored-procedure:

```
PROCEDURE procedure_name [ (parameters) ]
    [{IMMUTABLE  | STABLE  | VOLATILE }
     | {CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }]
    { IS | AS }
    [ declarations ]
BEGIN
    plsql_body
END;
```

- Syntax for creating a subfunction:

```
FUNCTION function_name  [ (parameters) ] RETURN rettype
    [{IMMUTABLE  | STABLE  | VOLATILE }
     | {CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }]
    { IS | AS }
    [ declarations ]
BEGIN
    plsql_body
END;
```

  In the **declarations** part, you can define the nested subprograms of the lower layer.

- Example:

```
-- Create a stored procedure.
CREATE OR REPLACE PROCEDURE proc_test() AS
    -- Declare and define a sub-stored-procedure.
    PROCEDURE proc_sub() IS
    BEGIN
        dbe_output.put_line('this is subpragram');
    END;
BEGIN
    dbe_output.put_line('this is a procedure');
    -- Call a sub-stored-procedure in an execution block.
    proc_sub();
END;
/
    -- Call a stored procedure externally.
BEGIN
    proc_test;
END;
/
-- Output the result.
this is a procedure
this is subpragram
ANONYMOUS BLOCK EXECUTE
```

Declaration and Definition Rules of Nested Subprograms

- Nested subprograms cannot be declared or defined repeatedly. Reloading is not supported.
- The identifier of a nested subprogram cannot be the same as the variable name or keyword.
- Declaration before definition is supported. The definition of subprogram declared first must be found in the subsequent declaration block.

Calling Rules of Nested Subprograms

- Nested subprograms can call themselves to achieve recursive calling effects.
- Nested subprograms can call upper-layer subprograms.
- Nested subprograms can call locally declared lower-layer subprograms, but cannot call nested subprograms in lower-layer subprograms.
- Nested subprograms can call subprograms declared earlier than themselves at the same layer.

Example:

```
-- Call itself.
CREATE OR REPLACE PROCEDURE proc_test(var1 int) AS
    PROCEDURE proc_sub(var2 int) IS
    BEGIN
        dbe_output.put_line('var = ' || var2);
        IF var2 > 1 THEN
            proc_sub(var2 - 1);
        END IF;
    END;
BEGIN
    proc_sub(var1);
END;
/
BEGIN
    proc_test(3);
END;
/
-- Output the result.
var = 3
var = 2
var = 1

-- Call the upper-layer subprogram.
CREATE OR REPLACE PROCEDURE proc_test(var1 int) AS
    PROCEDURE procsub_1(var2 int) IS
    BEGIN
    proc_test(var2 - 1);
    END;
BEGIN
    dbe_output.put_line('proc_test var1 = ' || var1);
    IF var1 > 1 THEN
          procsub_1(var1);
    END IF;

this is a procedure begin
this is subpragram1 begin
--this is subpragram2 begin
--this is subpragram2 end
this is subpragram1 end
this is a procedure end
```

Variables of Nested Subprograms

Variable types include basic types, record types, TABLE OF types, cursor types, and varray types supported by PL/SQL.

- Accessible variables:
  - Variable declared by itself.
  - Variable declared by the upper-layer subprogram.
- Variable access rules:
  - If a variable does not contain a qualifier, the variable is first searched in the program. If the variable name does not exist, the variable is searched at the upper layer, and so on.
  - If a variable has a qualifier, it is searched in the area of the qualifier. Currently, only one qualifier can be called.

10.6 Basic Statements

During PL/SQL programming, you may define some variables, assign values to variables, and call other stored procedures. This chapter describes basic PL/SQL statements, including variable definition statements, value assignment statements, call statements, and return statements.

NOTE

You are advised not to call the SQL statements containing passwords in the stored procedures because authorized users may view the stored procedure file in the database and password information is leaked. If a stored procedure contains other sensitive information, permission to access this procedure must be configured, preventing information leakage.

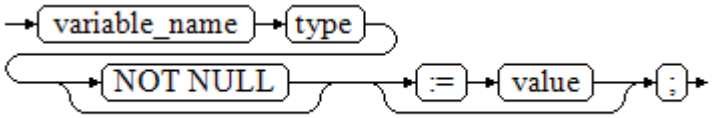
10.6.1 Variable Definition Statements

This section describes the declaration of variables in the PL/SQL and the scope of this variable in codes.

Variable Declaration

For details about the variable declaration syntax, see **Figure 10-3**.

Figure 10-3 declare_variable::=



The above syntax diagram is explained as follows:

- **variable_name** indicates the name of a variable.
- **type** indicates the type of a variable.
- **value** indicates the initial value of the variable. (If the initial value is not given, NULL is taken as the initial value.) **value** can also be an expression.

Examples

```
gaussdb=# DECLARE
    emp_id  INTEGER := 7788; -- Define a variable and assign a value to it.
BEGIN
    emp_id := 5*7784; -- Assign a value to the variable.
END;
/
ANONYMOUS BLOCK EXECUTE
```

In addition to the declaration of basic variable types, **%TYPE** and **%ROWTYPE** can be used to declare variables related to table columns or table structures.

%TYPE Attribute

%TYPE declares a variable to be of the same data type as a previously declared variable (for example, a column in a table). For example, if you want to define the *my_name* variable whose data type is the same as the data type of **firstname** in **employee**, you can define the variable as follows:

```
my_name employee.firstname%TYPE
-- Example
DROP TABLE IF EXISTS employee;
NOTICE:  table "employee" does not exist, skipping
DROP TABLE
CREATE TABLE employee(firstname varchar,secondname varchar);
CREATE TABLE
DECLARE
    my_name employee.firstname%TYPE;
BEGIN
    my_name = 'abc';
    DBE_OUTPUT.PRINT_LINE(my_name);
END;
/
abc
ANONYMOUS BLOCK EXECUTE
```

In this way, you do not need to know the data type of **firstname** in **employee**. In addition, you do not need to change the data type of *my_name* again when the data type of **firstname** changes.

```
TYPE employee_record is record (id INTEGER, firstname VARCHAR2(20));
my_employee employee_record;
my_id my_employee.id%TYPE;
my_id_copy my_id%TYPE;
-- Example
DECLARE
    TYPE employee_record is record (id INTEGER, firstname VARCHAR2(20));
    my_employee employee_record;
```

```
    my_id my_employee.id%TYPE;
    my_id_copy my_id%TYPE;
BEGIN
    my_employee.id := 1;
    my_employee.firstname := 'ab2';
    my_id = 2;
    my_id_copy = 3;
    DBE_OUTPUT.PRINT_LINE(my_employee.id);
    DBE_OUTPUT.PRINT_LINE(my_employee.firstname);
    DBE_OUTPUT.PRINT_LINE(my_id);
    DBE_OUTPUT.PRINT_LINE(my_id_copy);
END;
/
1
ab2
2
3
ANONYMOUS BLOCK EXECUTE
```

%ROWTYPE Attribute

%ROWTYPE declares data types of a set of data. It stores a row of table data or results fetched from a cursor. For example, if you want to define a set of data with the same column names and column data types as the **employee** table, you can define the data as follows:

```
my_employee employee%ROWTYPE
-- Example
DROP TABLE IF EXISTS employee;
DROP TABLE
CREATE TABLE employee(firstname varchar,secondname varchar);
DECLARE
    my_employee employee%ROWTYPE;
BEGIN
    my_employee.firstname := 'ab1';
    my_employee.secondname := 'ab2';
    DBE_OUTPUT.PRINT_LINE(my_employee.firstname);
    DBE_OUTPUT.PRINT_LINE(my_employee.secondname);
END;
/
ab1
ab2
ANONYMOUS BLOCK EXECUTE
```

The attribute can also be used on the cursor. The column names and column data types of this set of data are the same as those of the **employee** table. For the cursor in a package, **%ROWTYPE** can be omitted. **%TYPE** can also reference the type of a column in the cursor. You can define the data as follows:

```
cursor cur is select * from employee;
my_employee cur%ROWTYPE
my_name cur.firstname%TYPE
my_employee2 cur -- For the cursor defined in a package, %ROWTYPE can be omitted.
-- Example
set behavior_compat_options = 'allow_procedure_compile_check';
SET
DROP TABLE IF EXISTS employee;
DROP TABLE
CREATE TABLE employee(firstname varchar,secondname varchar);
CREATE TABLE
CREATE OR REPLACE procedure proc1()
IS
    cursor cur is select * from employee;
    my_employee cur%ROWTYPE;
    my_name cur.firstname%TYPE;
BEGIN
    my_employee.firstname := 'ab1';
    my_employee.secondname := 'ab2';
```

```
    my_name := 'ab3';
    DBE_OUTPUT.PRINT_LINE(my_employee.firstname);
    DBE_OUTPUT.PRINT_LINE(my_employee.secondname);
    DBE_OUTPUT.PRINT_LINE(my_name);
END;
/
CREATE PROCEDURE
```

NOTICE

- **%TYPE** can reference only the type of record variables across packages and cannot reference a column type of the cursor variable.
- If the GUC parameter **behavior_compat_options** is enabled and the value of this parameter contains **allow_procedure_compile_check**, **%TYPE** can reference a column type of the cursor variable.
- **%ROWTYPE** cannot reference the type of a composite variable or a record variable.
- The non-PACKAGE *record%TYPE* cannot be used as the variable type or input/output parameter type.
- *View%ROWTYPE* or **SCHEMA.***view%ROWTYPE* cannot be used as the input/output parameter type.
- The **PACKAGE.***record%TYPE* or **SCHEMA.PACKAGE.***record%TYPE* cannot be used as the input/output parameter type.
- *Table/View*.**column.***column%TYPE* or **SCHEMA.***Table/View*.**column.***column%TYPE* cannot be nested with one or more layers as variable types or input/output parameter type.
- *Record*.**column.***column%TYPE* and **PACKAGE.***record*.**column.***column%TYPE* cannot be nested with a column type of records at one or more layers as the variable type or input/output parameter type.
- The cursor variable of more levels, such as **PACKAGE.***cursor%ROWTYPE* and **SCHEMA.PACKAGE.***cursor%ROWTYPE*, cannot be used as the parameter type or input/output parameter type.

Scope of a Variable

The scope of a variable indicates the accessibility and availability of the variable in code block. In other words, a variable takes effect only within its scope.

- To define a function scope, a variable must declare and create a **BEGIN-END** block in the declaration section. The necessity of such declaration is also determined by block structure, which requires that a variable has different scopes and lifetime during a process.
- A variable can be defined multiple times in different scopes, and inner definition can cover outer one.
- A variable defined in an outer block can also be used in a nested block. However, the outer block cannot access variables in the nested block.

Example:

```
gaussdb=# DECLARE
    emp_id  INTEGER :=7788; -- Define a variable and assign a value to it.
    outer_var  INTEGER :=6688; -- Define a variable and assign a value to it.
BEGIN
```

```
    DECLARE
        emp_id INTEGER :=7799; -- Define a variable and assign a value to it.
        inner_var  INTEGER :=6688; -- Define a variable and assign a value to it.
    BEGIN
        dbe_output.print_line('inner emp_id ='||emp_id); -- Display the value 7799.
        dbe_output.print_line('outer_var ='||outer_var); -- Reference a variable of an outer block.
    END;
    dbe_output.print_line('outer emp_id ='||emp_id); -- Display the value 7788.
END;
/
inner emp_id =7799
outer_var =6688
outer emp_id =7788
ANONYMOUS BLOCK EXECUTE
```

10.6.2 Assignment Statements

Variable Syntax

Figure 10-4 shows the syntax diagram for assigning a value to a variable.

Figure 10-4 assignment_value::=

The above syntax diagram is explained as follows:

- **variable_name** indicates the name of a variable.
- **value** can be a value or an expression. The type of *value* must be compatible with the type of *variable_name*.

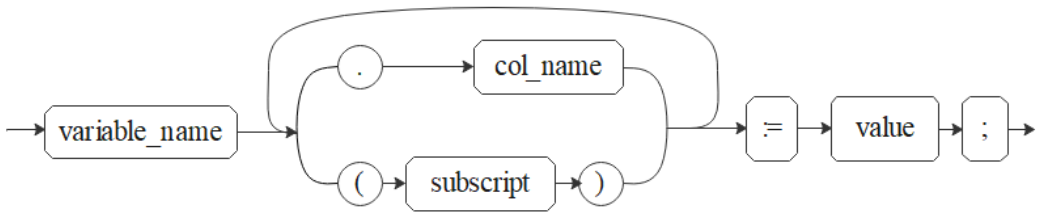
Example:

```
DECLARE
    emp_id  INTEGER := 7788; -- Assignment
BEGIN
    emp_id := 5; -- Assignment
    DBE_OUTPUT.PRINT_LINE(emp_id);
    emp_id := 5*7784;
    DBE_OUTPUT.PRINT_LINE(emp_id);
END;
/
-- The result is as follows:
5
38920
ANONYMOUS BLOCK EXECUTE
```

Nested Value Assignment

Figure 10-5 shows the syntax diagram for assigning a nested value to a variable.

Figure 10-5 nested_assignment_value::=



The syntax in **Figure 10-5** is described as follows:

- **variable_name**: variable name
- **col_name**: column name
- **subscript**: index, which is used for an array variable. The value can be a value or an expression and must be of the INT type.
- **value** can be a value or an expression. The type of *value* must be compatible with the type of *variable_name*.

Example:

```
gaussdb=# CREATE TYPE o1 AS (a int, b int);
CREATE TYPE
gaussdb=# DECLARE
    TYPE r1 is VARRAY(10) of o1;
    emp_id  r1;
BEGIN
    emp_id(1).a := 5;-- Assign a value.
    emp_id(1).b := 5*7784;
END;
/
ANONYMOUS BLOCK EXECUTE
```

NOTICE

In INTO mode, values can be assigned only to the columns at the first layer. Two-dimensional or above arrays are not supported.

INTO/BULK COLLECT INTO

- Values returned by statements in a stored procedure are stored in variables. BULK COLLECT INTO allows some or all returned values to be temporarily stored in an array.
- An empty result set can be returned.

Syntax

```
SELECT select_expressions INTO [STRICT] target FROM ...
SELECT INTO [STRICT] target [FROM ..]
EXECUTE [IMMEDIATE] select_expressions BULK COLLECT INTO target ...
```

The syntax is described as follows:

- **select_expressions**: SQL statement for query. You can use basic SQL commands and INTO clauses to assign the result of a single row or multiple columns to a variable (such as record, row, or scalar variable list).
- **target**: target variable, which can be a record variable, a row variable, or a comma-separated list of simple variables and record/row fields.
- **STRICT** (Optional): If **set behavior_compat_options** is set to **'select_into_return_null'** (disabled by default) and the **STRICT** option is specified, the query must return a non-empty result set. Otherwise, an error is reported: "NO_DATA_FOUND", "TOO_MANY_ROWS" or "QUERY_RETURNED_NO_ROWS". If the **STRICT** option is not specified, the empty result set can be returned.

NOTE

- BULK COLLECT INTO can only assign values to arrays or collections in batches. The collection type uses LIMIT properly to prevent performance deterioration caused by excessive operations on data.
- INTO and BULK COLLECT INTO support only direct nesting of record type value with less than four layers.
- To return an empty result set, you need to enable PostgreSQL compatibility mode during database initialization. Set **set behavior_compat_options** to **'select_into_return_null'**, the compatibility mode is enabled. If the GUC parameter **set behavior_compat_options** is not set, the compatibility mode is disabled.
- For array variables, elements in parentheses () are preferentially identified as index sets. Therefore, expressions with parentheses cannot be written after array variables. For example, **select (1+3) into va(5)** cannot be written as **select into va(5) (1+3)** or **select into va[5] (1+3)**.
- INSERT INTO, UPDATE INTO, DELETE INTO, and EXECUTION INTO cannot return an empty result set.
- Multiple variables are failed to be assigned values because the syntax of the subsequent variables is incorrect.
- BULK COLLECT INTO can be used only in the A-compatible database.
- The IMMEDIATE keyword is used only for syntax compatibility and has no actual meaning.

Example:

```
gaussdb=# DROP TABLE IF EXISTS customers;
NOTICE:  table "customers" does not exist, skipping
DROP TABLE
gaussdb=# CREATE TABLE customers(id int,name varchar);
CREATE TABLE
gaussdb=# INSERT INTO customers VALUES(1,'ab');
gaussdb=# DECLARE
    my_id integer;
BEGIN
    select id into my_id from customers limit 1; -- Assign a value.
END;
/
ANONYMOUS BLOCK EXECUTE
gaussdb=# DECLARE
    type id_list is varray(6) of customers.id%type;
    id_arr id_list;
BEGIN
    select id bulk collect into id_arr from customers order by id DESC limit 20; -- Assign values in batches.
END;
/
ANONYMOUS BLOCK EXECUTE
gaussdb=# CREATE TABLE test(a integer);
CREATE TABLE
gaussdb=# INSERT INTO test VALUES(1);
INSERT 0 1
gaussdb=# CREATE OR REPLACE FUNCTION check_test() RETURNS integer
    language plpgsql
    AS $function$
    DECLARE
        b integer;
    BEGIN
        SELECT INTO b FROM test WHERE a=1; -- Return an empty result set.
            RETURN b;
    END;
    $function$;
CREATE FUNCTION
gaussdb=# SELECT check_test();
 check_test
------------
          1
```

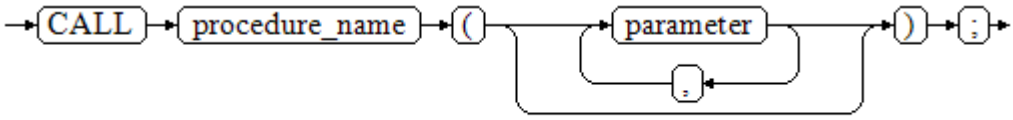
```
(1 row)
gaussdb=#  DECLARE
    TYPE id_list IS varray(6) OF customers.id%type;
    id_arr id_list;
    sql_qry varchar2(150);
BEGIN
    sql_qry := 'SELECT id FROM customers ORDER BY id DESC LIMIT 20';
    EXECUTE IMMEDIATE sql_qry BULK COLLECT INTO id_arr; -- Assign values in batches.
END;
/
ANONYMOUS BLOCK EXECUTE
```

10.6.3 Call Statements

Syntax

Figure 10-6 shows the syntax diagram for calling a clause.

Figure 10-6 call_clause::=



The above syntax diagram is explained as follows:

- **procedure_name** specifies the name of a stored procedure.
- **parameter** specifies the parameters for the stored procedure. You can set no parameter or multiple parameters.

Examples

```
-- Create a table.
gaussdb=# CREATE SCHEMA hr;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = hr;
SET
gaussdb=# CREATE TABLE staffs
(
  section_id INTEGER,
  salary INTEGER
);
CREATE TABLE
gaussdb=# INSERT INTO staffs VALUES (30, 10);
INSERT 0 1
gaussdb=# INSERT INTO staffs VALUES (30, 20);
INSERT 0 1
-- Create the stored procedure proc_staffs.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_staffs
(
section     NUMBER(6),
salary_sum out NUMBER(8,2),
staffs_count out INTEGER
)
IS
BEGIN
SELECT sum(salary), count(*) INTO salary_sum, staffs_count FROM hr.staffs where section_id = section;
END;
/
CREATE PROCEDURE
```

```
-- Create the stored procedure proc_return.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_return
AS
v_num NUMBER(8,2);
v_sum INTEGER;
BEGIN
proc_staffs(30, v_sum, v_num);  -- Call a statement.
dbe_output.print_line(v_sum||'#'||v_num);
RETURN;  -- Return a statement.
END;
/
CREATE PROCEDURE
-- Call the stored procedure proc_return.
gaussdb=# CALL proc_return();
30#2.00
 proc_return
-------------

(1 row)
-- Drop the stored procedure.
gaussdb=# DROP PROCEDURE proc_staffs;
DROP PROCEDURE
gaussdb=# DROP PROCEDURE proc_return;
DROP PROCEDURE
```

10.7 Dynamic Statements

10.7.1 Executing Dynamic Query Statements

This section describes how to execute dynamic query statements. GaussDB provides two methods for dynamic query: EXECUTE IMMEDIATE and OPEN FOR. The former dynamically executes SELECT statements while the latter combines the use of cursors. If you need to store query results in a dataset, use OPEN FOR.

EXECUTE IMMEDIATE

Figure 10-7 shows the syntax diagram.

Figure 10-7 EXECUTE IMMEDIATE dynamic_select_clause::=

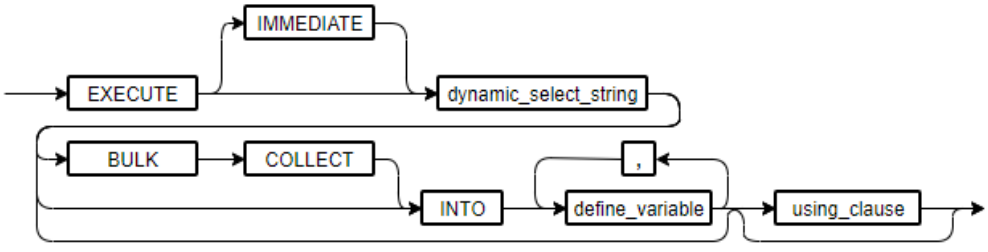


Figure 10-8 shows the syntax diagram for **using_clause**.

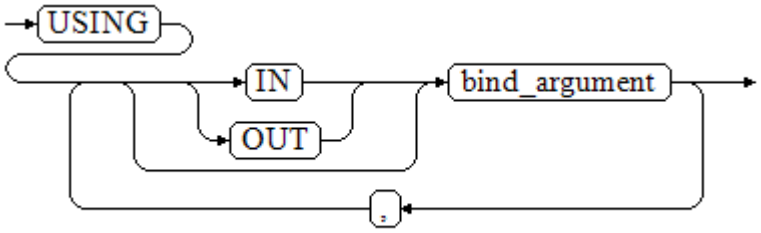
Figure 10-8 using_clause::=



The above syntax diagram is explained as follows:

- **define_variable**: specifies a variable to store query results.
- **USING IN** *bind_argument*: specifies the variable whose value is passed to the dynamic SQL statement. The variable is used when a dynamic placeholder exists in *dynamic_select_string*.
- **USING OUT** *bind_argument*: specifies the variable that stores a value returned by the dynamic SQL statement.

NOTICE

- In query statements, INTO and OUT cannot coexist.
- A placeholder name starts with a colon (:) followed by digits, characters, or strings, corresponding to *bind_argument* in the **USING** clause.
- *bind_argument* can only be a value, variable, or expression. It cannot be a database object such as a table name, column name, and data type. That is, *bind_argument* cannot be used to transfer schema objects for dynamic SQL statements. If a stored procedure needs to transfer database objects through *bind_argument* to construct dynamic SQL statements (generally, DDL statements), you are advised to use double vertical bars (||) to concatenate *dynamic_select_clause* with a database object.
- A dynamic PL/SQL block allows duplicate placeholders. That is, a placeholder can correspond to only one *bind_argument* in the USING clause. When the GUC parameter **behavior_compat_options** is set to **dynamic_sql_compat**, the bind arguments in the USING clause are matched in sequence based on the placeholder sequence. Duplicate placeholders will not be identified as the same placeholder.
- The IMMEDIATE keyword is used only for syntax compatibility and has no actual meaning.

Example:

```
gaussdb=# DROP SCHEMA IF EXISTS hr CASCADE;
NOTICE:  drop cascades to table staffs
DROP SCHEMA
gaussdb=# CREATE SCHEMA hr;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = hr;
SET
gaussdb=# CREATE TABLE staffs
(
  staff_id NUMBER,
  first_name VARCHAR2,
```

```
 salary NUMBER
);
CREATE TABLE
gaussdb=# INSERT INTO staffs VALUES (200, 'mike', 5800);
INSERT 0 1
gaussdb=# INSERT INTO staffs VALUES (201, 'lily', 3000);
INSERT 0 1
gaussdb=# INSERT INTO staffs VALUES (202, 'john', 4400);
INSERT 0 1
-- Retrieve values from dynamic statements (INTO clause).
gaussdb=# DECLARE
   staff_count  VARCHAR2(20);
BEGIN
   EXECUTE IMMEDIATE 'select count(*) from hr.staffs'
      INTO staff_count;
   dbe_output.print_line(staff_count);
END;
/
3
ANONYMOUS BLOCK EXECUTE
-- Pass and retrieve values (the INTO clause is used before the USING clause).
gaussdb=# CREATE OR REPLACE PROCEDURE dynamic_proc
AS
   staff_id     NUMBER(6) := 200;
   first_name   VARCHAR2(20);
   salary       NUMBER(8,2);
BEGIN
   EXECUTE IMMEDIATE 'select first_name, salary from hr.staffs where staff_id = :1'
      INTO first_name, salary
      USING IN staff_id;
   dbe_output.print_line(first_name || ' ' || salary);
END;
/
CREATE PROCEDURE
-- Call the stored procedure.
gaussdb=# CALL dynamic_proc();
mike 5800.00
 dynamic_proc
--------------

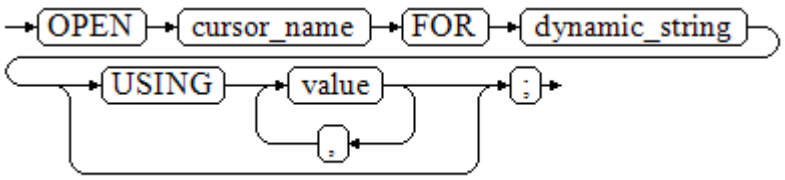
(1 row)
-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE dynamic_proc;
DROP PROCEDURE
```

OPEN FOR

Dynamic query statements can be executed by using OPEN FOR to open dynamic cursors.

Figure 10-9 shows the syntax diagram.

Figure 10-9 open_for::=



Parameter description:

- **cursor_name**: specifies the name of the cursor to be opened.
- **dynamic_string**: specifies the dynamic query statement.
- **USING** *value*: applies when a placeholder exists in dynamic_string.

For the use of cursors, see **Cursors**.

Example:

```
gaussdb=# CREATE SCHEMA hr;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = hr;
SET
gaussdb=# CREATE TABLE staffs
(
  section_id NUMBER,
  first_name VARCHAR2,
  phone_number VARCHAR2,
  salary NUMBER
  );
CREATE TABLE
gaussdb=# INSERT INTO staffs VALUES (30, 'mike', '13567829252', 5800);
INSERT 0 1
gaussdb=# INSERT INTO staffs VALUES (40, 'john', '17896354637', 4000);
INSERT 0 1
gaussdb=# DECLARE
    name          VARCHAR2(20);
    phone_number  VARCHAR2(20);
    salary        NUMBER(8,2);
    sqlstr        VARCHAR2(1024);

    TYPE app_ref_cur_type IS REF CURSOR; -- Define the cursor type.
    my_cur app_ref_cur_type; -- Define the cursor variable.

BEGIN
    sqlstr := 'select first_name,phone_number,salary from hr.staffs
        where section_id = :1';
    OPEN my_cur FOR sqlstr USING '30'; -- Open the cursor. USING is optional.
    FETCH my_cur INTO name, phone_number, salary; -- Retrieve the data.
    WHILE my_cur%FOUND LOOP
          dbe_output.print_line(name||'#'||phone_number||'#'||salary);
          FETCH my_cur INTO name, phone_number, salary;
    END LOOP;
    CLOSE my_cur; -- Close the cursor.
END;
/
mike#13567829252#5800.00
ANONYMOUS BLOCK EXECUTE
```

10.7.2 Executing Dynamic Non-Query Statements

Syntax

Figure 10-10 shows the syntax diagram.

Figure 10-10 noselect::=

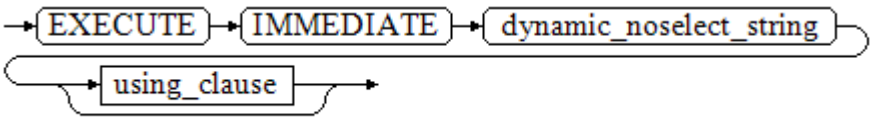


Figure 10-11 shows the syntax diagram for **using_clause**.

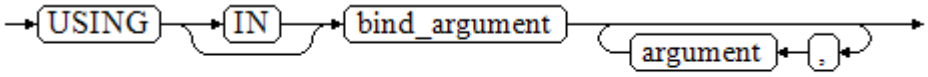
Figure 10-11 using_clause::=



The above syntax diagram is explained as follows:

USING IN *bind_argument* is used to specify the variable whose value is passed to the dynamic SQL statement. The variable is used when a placeholder exists in *dynamic_noselect_string*. That is, a placeholder is replaced by the corresponding *bind_argument* when a dynamic SQL statement is executed. Note that *bind_argument* can only be a value, variable, or expression, and cannot be a database object such as a table name, column name, and data type. If a stored procedure needs to transfer database objects through *bind_argument* to construct dynamic SQL statements (generally, DDL statements), you are advised to use double vertical bars (||) to concatenate *dynamic_select_clause* with a database object. In addition, a dynamic PL/SQL block allows duplicate placeholders. That is, a placeholder can correspond to only one *bind_argument*. When the GUC parameter **behavior_compat_options** is set to **dynamic_sql_compat**, the bind arguments in the USING clause are matched in sequence based on the placeholder sequence. Duplicate placeholders will not be identified as the same placeholder.

Examples

```
-- Create a table.
gaussdb=# CREATE TABLE sections_t1
(
  section       NUMBER(4) ,
  section_name  VARCHAR2(30),
  manager_id    NUMBER(6),
  place_id      NUMBER(4)
);
CREATE TABLE
-- Declare a variable.
gaussdb=# DECLARE
  section       NUMBER(4) := 280;
  section_name  VARCHAR2(30) := 'Info support';
  manager_id    NUMBER(6) := 103;
  place_id      NUMBER(4) := 1400;
  new_colname   VARCHAR2(10) := 'sec_name';
BEGIN
-- Execute the query.
   EXECUTE IMMEDIATE 'insert into sections_t1 values(:1, :2, :3, :4)'
      USING section, section_name, manager_id,place_id;
-- Execute the query (duplicate placeholders).
   EXECUTE IMMEDIATE 'insert into sections_t1 values(:1, :2, :3, :1)'
      USING section, section_name, manager_id;
-- Run the ALTER statement. (You are advised to use double vertical bars (||) to concatenate the dynamic
DDL statement with a database object.)
   EXECUTE IMMEDIATE 'alter table sections_t1 rename section_name to ' || new_colname;
END;
/
ANONYMOUS BLOCK EXECUTE
-- Query data.
gaussdb=# SELECT * FROM sections_t1;
 section |   sec_name   | manager_id | place_id
---------+--------------+------------+----------
     280 | Info support |        103 |     1400
     280 | Info support |        103 |      280
```

```
(2 rows)
-- Drop the table.
gaussdb=# DROP TABLE sections_t1;
DROP TABLE
```

10.7.3 Dynamically Calling Stored Procedures

This section describes how to dynamically call store procedures. You must use anonymous statement blocks to package stored procedures or statement blocks and append IN and OUT behind the EXECUTE IMMEDIATE...USING statement to input and output parameters.

Syntax

Figure 10-12 shows the syntax diagram.

Figure 10-12 call_procedure::=

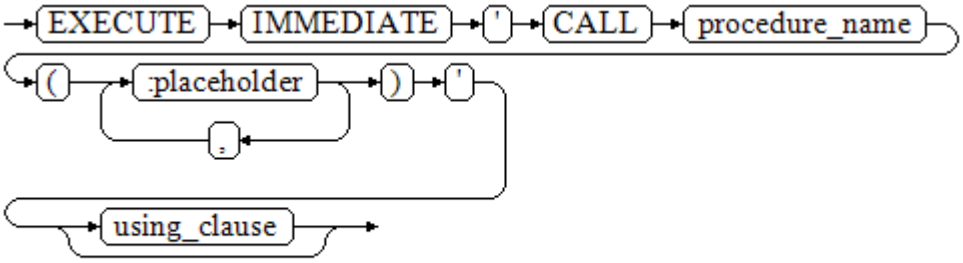


Figure 10-13 shows the syntax diagram for **using_clause**.

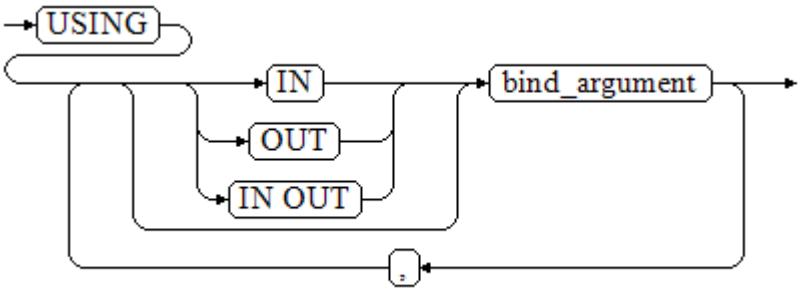
Figure 10-13 using_clause::=



The above syntax diagram is explained as follows:

- **CALL procedure_name**: calls the stored procedure.
- **[:placeholder1,:placeholder2,...]**: specifies the placeholder list of the stored procedure parameters. The numbers of the placeholders and parameters are the same.
- **USING [IN|OUT|IN OUT]bind_argument**: specifies where the variable passed to the stored procedure parameter value is stored. The modifiers in front of **bind_argument** and of the corresponding parameter are the same.

- Overloaded functions or stored procedures with placeholders cannot be called.
- When a stored procedure is called, => cannot be used to skip parameters.

Example:

```
-- Create the stored procedure proc_add.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_add
(
    param1    in   INTEGER,
    param2    out  INTEGER,
    param3    in   INTEGER
)
AS
BEGIN
   param2:= param1 + param3;

gaussdb=# DROP PROCEDURE proc_add;
DROP PROCEDURE
```

10.7.4 Dynamically Calling Anonymous Blocks

This section describes how to execute anonymous blocks in dynamic statements. Append IN and OUT behind the EXECUTE IMMEDIATE...USING statement to input and output parameters.

Syntax

Figure 10-14 shows the syntax diagram.

Figure 10-14 call_anonymous_block::=

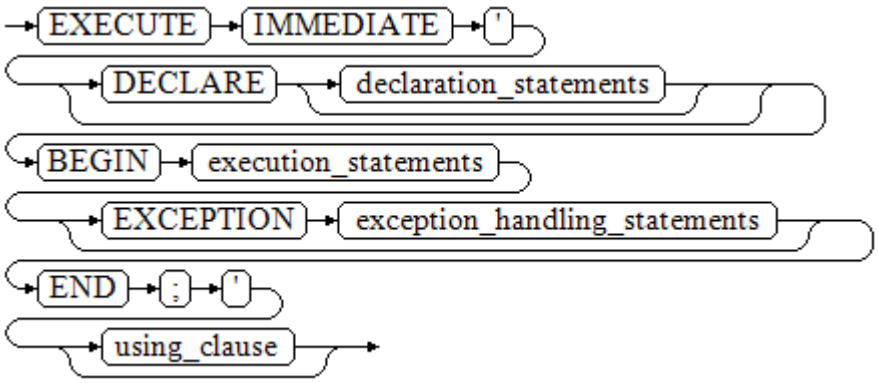

Figure 10-15 shows the syntax diagram for **using_clause**.

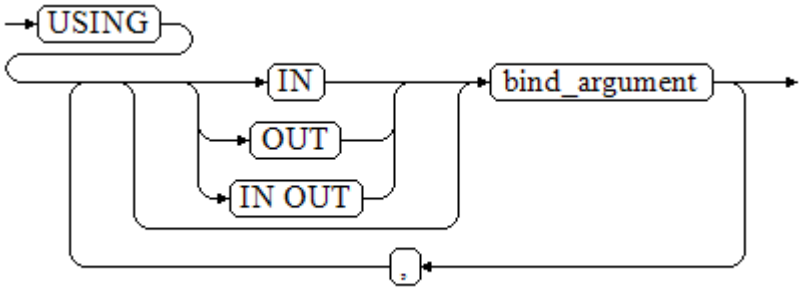
Figure 10-15 using_clause::=



The above syntax diagram is explained as follows:

- The execute part of an anonymous block starts with a BEGIN statement, has a break with an END statement, and ends with a semicolon (;).
- **USING [IN|OUT|IN OUT]bind_argument**: specifies where the variable passed to the stored procedure parameter value is stored. The modifiers in front of **bind_argument** and of the corresponding parameter are the same.
- The input and output parameters in the middle of an anonymous block are designated by placeholders. The numbers of the placeholders and parameters are the same. The sequences of the parameters corresponding to the placeholders and the USING parameters are the same.

  NOTE

  - Parameters can be bound only when SQL statements and stored procedures are called in anonymous blocks. For example, expressions and cursors are used in anonymous blocks, and dynamic statements are called in nested mode in anonymous blocks.
  - Output parameters cannot be bound when the SELECT INTO statement in an anonymous block calls FUNCTION/PROCEDURE that contains output parameters.
  - Variables declared in an anonymous block and binding parameters cannot be used in the same statement at the same time.
  - The PERFORM keyword cannot be used to call a stored procedure when parameters are bound.
  - When a stored procedure is called, only bound parameters can be used as input and output parameters. Expressions (for example, 1+:va) cannot be used as input and output parameters.
  - When the bound input parameter type is refcursor, the modification in the stored procedure is isolated from the input parameter.

Example:

```
gaussdb=# DROP SCHEMA IF EXISTS hr CASCADE;
gaussdb=# CREATE SCHEMA hr;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = hr;
SET
gaussdb=# CREATE TABLE staffs
(
  staff_id NUMBER,
  first_name VARCHAR2,
  salary NUMBER
);
```

```
CREATE TABLE
gaussdb=# INSERT INTO staffs VALUES (200, 'mike', 5800);
INSERT 0 1
gaussdb=# INSERT INTO staffs VALUES (201, 'lily', 3000);
INSERT 0 1
gaussdb=# INSERT INTO staffs VALUES (202, 'john', 4400);
INSERT 0 1

-- Create overloaded functions.
gaussdb=# CREATE OR REPLACE PACKAGE pkg1
IS
  PROCEDURE plus(var1 in int, var2 int, var3 out int);
  PROCEDURE plus(var1 in out int);
END pkg1;
/
CREATE PACKAGE
gaussdb=# CREATE OR REPLACE PACKAGE BODY pkg1 IS
  PROCEDURE plus(var1 in int, var2 int, var3 out int)
  AS
  BEGIN
    var3 = var1 + var2 + 1;
  END;
  PROCEDURE plus(var1 in out int)
  AS
  BEGIN
    var1 = var1 + 1;
  END;
END pkg1;
/
CREATE PACKAGE BODY

-- Create the stored procedure dynamic_proc.
gaussdb=# CREATE OR REPLACE PROCEDURE dynamic_proc
AS
  staff_id     NUMBER(6) := 200;
  first_name   VARCHAR2(20);
  salary       NUMBER(8,2);
BEGIN
   -- Execute the anonymous block.
   EXECUTE IMMEDIATE 'begin select first_name, salary into :first_name, :salary from hr.staffs where
staff_id= :dno; end;'
      USING OUT first_name, OUT salary, IN staff_id;
  dbe_output.print_line(first_name|| ' ' || salary);
END;
/
CREATE PROCEDURE
-- Create a stored procedure to call overloaded functions.
gaussdb=# CREATE OR REPLACE PROCEDURE dynamic_proc1
AS
    v_sql  VARCHAR2(200);
    var1   NUMBER(6) := 1;
    var2   NUMBER(6) := 2;
    var3   NUMBER(6);
BEGIN
    v_sql := 'begin pkg1.plus(:1, :2, :3); end;';
    EXECUTE IMMEDIATE v_sql USING var1, var2, out var3;
    dbe_output.print_line('var3: ' || var3);
END;
/
CREATE PROCEDURE

-- Call the stored procedure.
gaussdb=# CALL dynamic_proc();
mike 5800.00
 dynamic_proc
--------------

(1 row)
gaussdb=# CALL dynamic_proc1();
```

```
var3: 4
 dynamic_proc1
---------------

(1 row)
-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE dynamic_proc;
DROP PROCEDURE
gaussdb=# DROP PROCEDURE dynamic_proc1;
DROP PROCEDURE
```

10.8 Control Statements

10.8.1 RETURN Statements

In GaussDB, data can be returned in either of the following ways: **RETURN**, **RETURN NEXT**, or **RETURN QUERY**. **RETURN NEXT** and **RETURN QUERY** are used only for functions and cannot be used for stored procedures.

10.8.1.1 RETURN

Syntax

Figure 10-16 shows the syntax diagram for a return statement.

Figure 10-16 return_clause::=

The above syntax diagram is explained as follows:

Assign the result returned by a stored procedure or function to the caller.

Examples

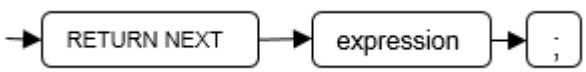
See **Examples** for call statement examples.

10.8.1.2 RETURN NEXT and RETURN QUERY

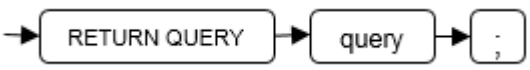
Syntax

When creating a function, specify **SETOF** *datatype* for the return values.

return_next_clause::=



return_query_clause::=



The above syntax diagram is explained as follows:

If a function needs to return a result set, use RETURN NEXT or RETURN QUERY to add results to the result set, and then continue to execute the next statement of the function. As the RETURN NEXT or RETURN QUERY statement is executed repeatedly, more and more results will be added to the result set. After the function is executed, all results are returned.

RETURN NEXT can be used for scalar and compound data types.

RETURN QUERY has a variant RETURN QUERY EXECUTE. You can add dynamic queries and add parameters to the queries by USING.

Examples

```
gaussdb=# DROP TABLE t1;
gaussdb=# CREATE TABLE t1(a int);
gaussdb=# INSERT INTO t1 VALUES(1),(10);

--RETURN NEXT
gaussdb=# CREATE OR REPLACE FUNCTION fun_for_return_next() RETURNS SETOF t1 AS $$
DECLARE
  r t1%ROWTYPE;
BEGIN
  FOR r IN select * from t1
  LOOP
    RETURN NEXT r;
  END LOOP;
  RETURN;
END;
$$ LANGUAGE plpgsql;
gaussdb=# call fun_for_return_next();
 a
---
 1
 10
(2 rows)

-- RETURN QUERY
gaussdb=# CREATE OR REPLACE FUNCTION fun_for_return_query() RETURNS SETOF t1 AS $$
DECLARE
  r t1%ROWTYPE;
BEGIN
  RETURN QUERY select * from t1;
END;
$$
language plpgsql;
gaussdb=# call fun_for_return_query();
 a
---
 1
 10
(2 rows)
```

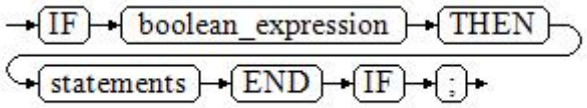
10.8.2 Conditional Statements

Conditional statements are used to decide whether given conditions are met. Operations are executed based on the decisions made.

GaussDB supports five usages of IF:

- IF_THEN

Figure 10-17 IF_THEN::=



IF_THEN is the simplest form of IF. If the condition is true, statements are executed. If it is false, they are skipped.

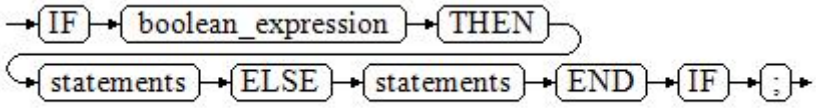
Example:

```
gaussdb=# DECLARE
    v_user_id integer default 1;
BEGIN
IF v_user_id <> 0 THEN
    raise info 'v_user_id is NOT 0';

END IF;
END;
/
INFO:  v_user_id is NOT 0
```

- IF_THEN_ELSE

Figure 10-18 IF_THEN_ELSE::=



IF_THEN_ELSE has an ELSE branch and can be executed if the condition is false.

Example:

```
gaussdb=# DECLARE
    v_user_id integer default 1;
BEGIN
    IF v_user_id <> 0 THEN
        raise info 'v_user_id is NOT 0';
    ELSE
        raise info 'v_user_id is 0';
    END IF;
END;
/
INFO:  v_user_id is NOT 0
```

- IF_THEN_ELSE IF

  IF statements can be nested in the following way:

```
gaussdb=# DECLARE
    v_user_id integer default 1;
BEGIN
    IF v_user_id = 0 THEN
        raise info 'v_user_id is  0';
    ELSE
        IF v_user_id > 0 THEN
            raise info 'v_user_id > 0';
        END IF;
    END IF;
END;
/
INFO:  v_user_id > 0
```

Actually, this is a way of an IF statement nesting in the ELSE part of another IF statement. Therefore, an END IF statement is required for each nesting IF statement and another END IF statement is required to end the parent IF-ELSE statement. To set multiple options, use the following form:

- IF_THEN_ELSIF_ELSE

  Figure 10-19 IF_THEN_ELSIF_ELSE::=

  
  Example:

```
gaussdb=# DECLARE
    v_user_id integer default NULL;
BEGIN
    IF v_user_id = 0 THEN
        raise info 'v_user_id is  0';
    ELSIF v_user_id > 0 THEN
        raise info 'v_user_id > 0';
    ELSIF v_user_id < 0 THEN
        raise info 'v_user_id < 0';
    ELSE
        raise info 'v_user_id is NULL';
    END IF;
END;
/
INFO:  v_user_id is NULL
```

- IF_THEN_ELSEIF_ELSE

  ELSEIF is an alias of ELSIF.

  Example:

```
gaussdb=# CREATE OR REPLACE PROCEDURE proc_control_structure(i in integer)
AS
    BEGIN
        IF i > 0 THEN
            raise info 'i:% is greater than 0. ',i;
        ELSIF i < 0 THEN
            raise info 'i:% is smaller than 0. ',i;
        ELSE
            raise info 'i:% is equal to 0. ',i;
        END IF;
        RETURN;
    END;
/
CREATE PROCEDURE

gaussdb=# CALL proc_control_structure(3);
INFO:  i:3 is greater than 0.
 proc_control_structure
------------------------

(1 row)

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE proc_control_structure;
DROP PROCEDURE
```

10.8.3 Loop Statements

Simple LOOP Statements

Syntax diagram

Figure 10-20 loop::=

label declaration ::=

Example

```
gaussdb=# CREATE OR REPLACE PROCEDURE proc_loop(i in integer, count out integer)
AS
    BEGIN
        count:=0;
        LOOP
        IF count > i THEN
            raise info 'count is %. ', count;
            EXIT;
        ELSE
            count:=count+1;
        END IF;
        END LOOP;
    END;
/
CREATE PROCEDURE

gaussdb=# CALL proc_loop(10,5);
INFO:  count is 11.
 count
-------
    11
(1 row)
```

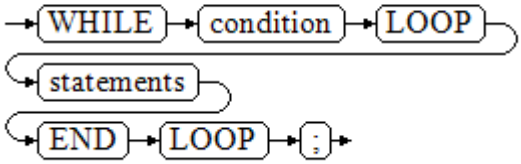
NOTICE

The loop must be exploited together with EXIT; otherwise, a dead loop occurs.

WHILE_LOOP Statements

Syntax diagram

Figure 10-21 while_loop::=



label declaration ::=

If the conditional expression is true, a series of statements in the WHILE statement are repeatedly executed and the condition is decided each time the loop body is executed.

Example

```
gaussdb=# CREATE TABLE integertable(c1 integer) ;
CREATE TABLE
gaussdb=# CREATE OR REPLACE PROCEDURE proc_while_loop(maxval in integer)
AS
    DECLARE
    i int :=1;
    BEGIN
        WHILE i < maxval LOOP
            INSERT INTO integertable VALUES(i);
            i:=i+1;
        END LOOP;
    END;
/
CREATE PROCEDURE

-- Call the stored procedure.
gaussdb=# CALL proc_while_loop(10);
 proc_while_loop
-----------------

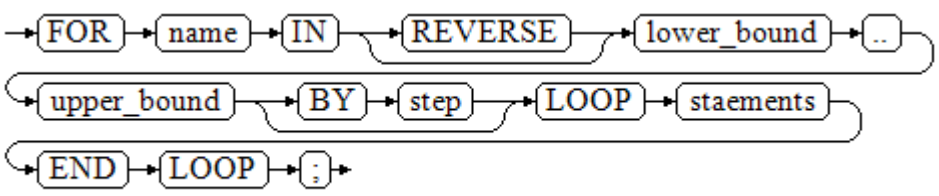
(1 row)

-- Delete the stored procedure and table.
gaussdb=# DROP PROCEDURE proc_while_loop;
DROP PROCEDURE
gaussdb=# DROP TABLE integertable;
DROP TABLE
```

FOR_LOOP (*Integer variable*) *Statement*

Syntax diagram

Figure 10-22 for_loop::=



label declaration ::=

NOTE

- The variable *name* is automatically defined as the integer type and exists only in this loop. The variable name falls between lower_bound and upper_bound.
- When the keyword REVERSE is used, the lower bound must be greater than or equal to the upper bound; otherwise, the loop body is not executed.

Example

```
-- Loop from 0 to 5.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_for_loop()
AS
    BEGIN
    FOR I IN 0..5 LOOP
        DBE_OUTPUT.PRINT_LINE('It is '||to_char(I) || ' time;') ;
    END LOOP;
END;
/
CREATE PROCEDURE

-- Call the stored procedure.
gaussdb=# CALL proc_for_loop();
It is 0 time;
It is 1 time;
It is 2 time;
It is 3 time;
It is 4 time;
It is 5 time;
 proc_for_loop
---------------

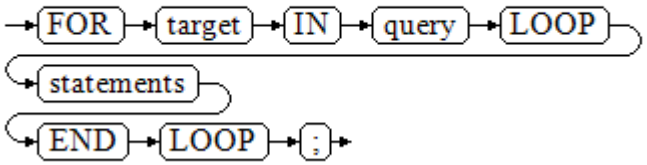
(1 row)

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE proc_for_loop;
DROP PROCEDURE
```

FOR_LOOP Query Statements

Syntax diagram

Figure 10-23 for_loop_query::=



label declaration ::=

NOTE

The variable *target* is automatically defined, its type is the same as that in the query result, and it is valid only in this loop. The target value is the query result.

Example

```
-- Display the query result from the loop.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_for_loop_query()
AS
    record VARCHAR2(50);
BEGIN
    FOR record IN SELECT spcname FROM pg_tablespace LOOP
    dbe_output.print_line(record);
    END LOOP;
END;
/
CREATE PROCEDURE

-- Call the stored procedure.
gaussdb=# CALL proc_for_loop_query();
pg_default
pg_global
 proc_for_loop_query
---------------------

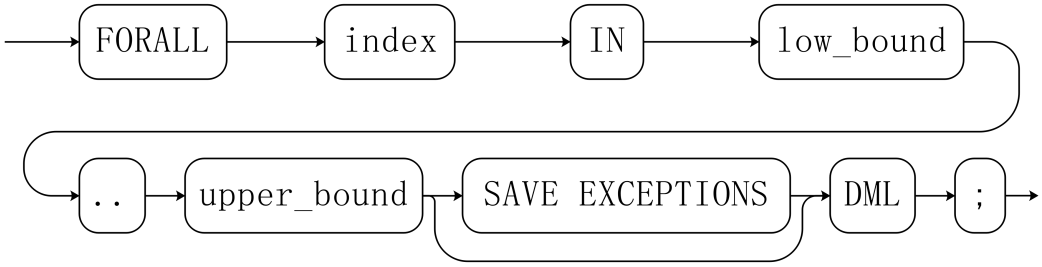
(1 row)

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE proc_for_loop_query;
DROP PROCEDURE
```

FORALL Batch Query Statements

Syntax diagram

Figure 10-24 forall::=



label declaration ::=

NOTE

- The variable *index* is automatically defined as the integer type and exists only in this loop. The index value falls between low_bound and upper_bound.
- If **SAVE EXCEPTIONS** is specified, exceptions occurred during DML execution in the loop body are saved in **SQL&BULK_EXCEPTIONS** and an exception is thrown after the execution is complete. If there is no abnormal execution result in the loop, the loop will not be rolled back in the current subtransaction.

Example

```
gaussdb=# CREATE TABLE hdfs_t1 (
  title NUMBER(6),
  did VARCHAR2(20),
  data_period VARCHAR2(25),
  kind VARCHAR2(25),
  interval VARCHAR2(20),
  time DATE,
  isModified VARCHAR2(10)
);
CREATE TABLE

gaussdb=# INSERT INTO hdfs_t1 VALUES( 8, 'Donald', 'OConnell', 'DOCONNEL', '650.507.9833',
to_date('21-06-1999', 'dd-mm-yyyy'), 'SH_CLERK' );
INSERT 0 1

gaussdb=# CREATE OR REPLACE PROCEDURE proc_forall()
AS
BEGIN
    FORALL i IN 100..120
        update hdfs_t1 set title = title + 100*i;
END;
/
CREATE PROCEDURE

-- Call the stored procedure.
gaussdb=# CALL proc_forall();
 proc_forall
-------------

(1 row)

-- Query the invocation result of the stored procedure.
gaussdb=# SELECT * FROM hdfs_t1;
 title  |  did   | data_period |   kind   |   interval   |        time         | ismodified
--------+--------+-------------+----------+--------------+---------------------+------------
 231008 | Donald | OConnell    | DOCONNEL | 650.507.9833 | 1999-06-21 00:00:00 | SH_CLERK
(1 row)

-- Delete the stored procedure and table.
gaussdb=# DROP PROCEDURE proc_forall;
DROP PROCEDURE

gaussdb=# DROP TABLE hdfs_t1;
DROP TABLE
```

10.8.4 Branch Statements

Syntax

Figure 10-25 shows the syntax diagram for a branch statement.

Figure 10-25 case_when::=

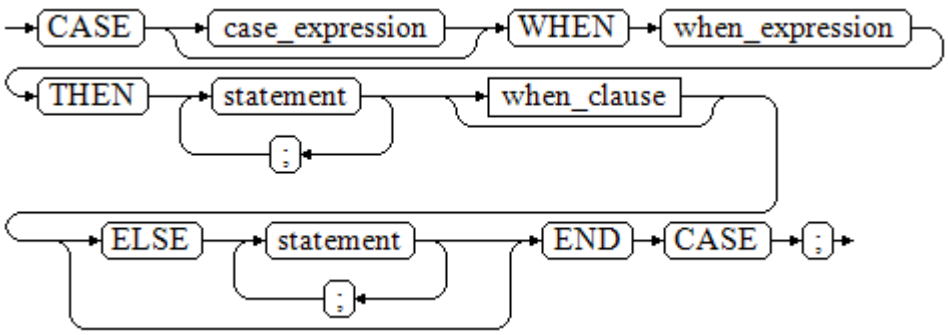


Figure 10-26 shows the syntax diagram for when_clause.

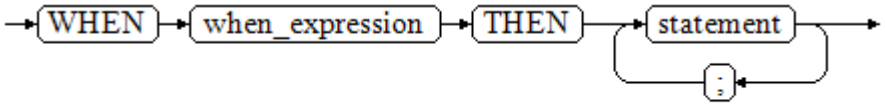
Figure 10-26 when_clause::=



Parameter description:

- *case_expression*: specifies the variable or expression.
- *when_expression*: specifies the constant or conditional expression.
- *statement*: specifies the statement to be executed.

Examples

```
gaussdb=# CREATE OR REPLACE PROCEDURE proc_case_branch(pi_result in integer, pi_return out integer)
AS
   BEGIN
      CASE pi_result
         WHEN 1 THEN
            pi_return := 111;
         WHEN 2 THEN
            pi_return := 222;
         WHEN 3 THEN
            pi_return := 333;
         WHEN 6 THEN
            pi_return := 444;
         WHEN 7 THEN
            pi_return := 555;
         WHEN 8 THEN
            pi_return := 666;
         WHEN 9 THEN
            pi_return := 777;
         WHEN 10 THEN
            pi_return := 888;
         ELSE
            pi_return := 999;
      END CASE;
      raise info 'pi_return : %',pi_return ;
END;
/
CREATE PROCEDURE

gaussdb=# CALL proc_case_branch(3,0);
INFO:  pi_return : 333
 pi_return
-----------
       333
(1 row)

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE proc_case_branch;
DROP PROCEDURE
```

10.8.5 NULL Statements

In PL/SQL programs, NULL statements are used to indicate "nothing should be done", equal to placeholders. They grant meanings to some statements and improve program readability.

Syntax

The following shows example use of NULL statements:

```
DECLARE
   ...
BEGIN
   ...
   IF v_num IS NULL THEN
      NULL; -- No data needs to be processed.
   END IF;
END;
/
```

Parameter description:

- *v_num*: specifies the variable or expression.

Example

```
gaussdb=# DECLARE
   v_num integer default NULL;
BEGIN
   IF v_num IS NOT NULL THEN
      raise info 'v_num is NULL';
   ELSE
      NULL; -- No data needs to be processed.
   END IF;
END;
/
ANONYMOUS BLOCK EXECUTE
```

10.8.6 Error Trapping Statements

By default, any error occurring in a PL/SQL function aborts execution of the function, and indeed of the surrounding transaction as well. You can trap errors and restore from them by using a **BEGIN** block with an **EXCEPTION** clause. The syntax is an extension of the normal syntax for a **BEGIN** block:

```
[<<label>>]
[DECLARE
   declarations]
BEGIN
   statements
EXCEPTION
   WHEN condition [OR condition ...] THEN
      handler_statements
   [WHEN condition [OR condition ...] THEN
      handler_statements
   ...]
END;
```

If no error occurs, this form of enclosing block simply executes all the statements, and then control passes to the next statement after **END**. But if an error occurs within the statements, further processing of the statements is abandoned, and control passes to the **EXCEPTION** list. The list is searched for the first condition matching the error that occurred. If a match is found, the corresponding **handler_statements** are executed, and then control passes to the next statement after **END**. If no match is found, the error propagates out as though the **EXCEPTION** clause were not there at all: Error codes can be used to catch other error codes of the same type.

The error can be caught by an enclosing block with **EXCEPTION**, or if there is none it aborts processing of the function.

The condition names can be any of those shown in SQL standard error codes. The special condition name **OTHERS** matches every error type except **QUERY_CANCELED**.

If a new error occurs within the selected **handler_statements**, it cannot be caught by this **EXCEPTION** clause, but is propagated out. A surrounding **EXCEPTION** clause could catch it.

When an error is caught by an **EXCEPTION** clause, the local variables of the PL/SQL function remain as they were when the error occurred, but all changes to persistent database state within the block are rolled back.

Example:

```
gaussdb=# CREATE TABLE mytab(id INT,firstname VARCHAR(20),lastname VARCHAR(20)) ;
CREATE TABLE

gaussdb=# INSERT INTO mytab(firstname, lastname) VALUES('Tom', 'Jones');
INSERT 0 1

gaussdb=# CREATE FUNCTION fun_exp() RETURNS INT
AS $$
DECLARE
    x INT :=0;
    y INT;
BEGIN
    UPDATE mytab SET firstname = 'Joe' WHERE lastname = 'Jones';
    x := x + 1;
    y := x / 0;
EXCEPTION
    WHEN division_by_zero THEN
        RAISE NOTICE 'caught division_by_zero';
        RETURN x;
END;$$
LANGUAGE plpgsql;
CREATE FUNCTION

gaussdb=# call fun_exp();
NOTICE:  caught division_by_zero
 fun_exp
---------
       1
(1 row)

gaussdb=# select * from mytab;
 id | firstname | lastname
----+-----------+----------
    | Tom       | Jones
(1 row)

gaussdb=# DROP FUNCTION fun_exp();
DROP FUNCTION

gaussdb=# DROP TABLE mytab;
DROP TABLE
```

When control reaches the assignment to **y**, it will fail with a **division_by_zero** error. This will be caught by the **EXCEPTION** clause. The value returned in the **RETURN** statement will be the incremented value of **x**.

NOTE

- A block containing an **EXCEPTION** clause is more expensive to enter and exit than a block without one. Therefore, do not use **EXCEPTION** without need.
- In the following scenarios, the processing exception cannot be captured and the entire stored procedure is rolled back: 1. The node is faulty. 2. The thread of the node involved in the stored procedure exits due to a network fault. In addition, the structure of the source data is inconsistent with that of the target table in the COPY FROM operation. 3. Exceptions occur when EXCEPTION clears subtransactions. (For a stored procedure that contains the EXCEPTION statement, an implicit subtransaction is started when the statement is executed. After the statement is executed, the subtransaction is automatically cleared. During the clearing, exceptions may occur due to memory control.)

Example: Exceptions with **UPDATE**/**INSERT**

This example uses exception handling to perform either **UPDATE** or **INSERT**, as appropriate:

```
gaussdb=# CREATE TABLE db (a INT, b TEXT);
CREATE TABLE

gaussdb=# CREATE FUNCTION merge_db(key INT, data TEXT) RETURNS VOID AS
$$
BEGIN
    LOOP

-- First try to update the key
        UPDATE db SET b = data WHERE a = key;
        IF found THEN
            RETURN;
        END IF;
-- The key does not exist. Therefore, try to insert one. If someone else inserts the same key concurrently, the
unique key may fail to be obtained.
        BEGIN
            INSERT INTO db(a,b) VALUES (key, data);
            RETURN;
        EXCEPTION WHEN unique_violation THEN
        -- Do nothing, and loop to try the UPDATE again.
        END;
    END LOOP;
END;
$$
LANGUAGE plpgsql;
CREATE FUNCTION

gaussdb=# SELECT merge_db(1, 'david');
 merge_db
----------

(1 row)

gaussdb=# SELECT merge_db(1, 'dennis');
 merge_db
----------

(1 row)

--Delete FUNCTION and TABLE:
gaussdb=# DROP FUNCTION merge_db;
DROP FUNCTION

gaussdb=# DROP TABLE db;
DROP TABLE
```

10.8.7 GOTO Statements

A GOTO statement unconditionally transfers the control from the current statement to a labeled statement. The GOTO statement changes the execution logic. Therefore, use this statement only when necessary. Alternatively, you can use the EXCEPTION statement to handle issues in special scenarios. To execute a GOTO statement, the labeled statement must be unique.

Syntax

label declaration ::=

goto statement ::=

Examples

```
gaussdb=# CREATE OR REPLACE PROCEDURE GOTO_test()
AS
DECLARE
    v1  int;
BEGIN
    v1  := 0;
        LOOP
        EXIT WHEN v1 > 100;
                v1 := v1 + 2;
                if v1 > 25 THEN
                        GOTO pos1;
                END IF;
        END LOOP;
<<pos1>>
v1 := v1 + 10;
raise info 'v1 is %. ', v1;
END;
/
CREATE PROCEDURE

gaussdb=#call GOTO_test();
INFO:  v1 is 36.
 goto_test
-----------

(1 row)
```

Constraints

Using GOTO statements has the following constraints:

- Does not allow multiple labeled statements even if the statements are in different blocks.

  ```
  BEGIN
    GOTO pos1;
    <<pos1>>
    SELECT * FROM ...
    <<pos1>>
    UPDATE t1 SET ...
  END;
  ```

- Cannot transfer control to the IF, CASE, or LOOP statement.

```
BEGIN
  GOTO pos1;
  IF valid THEN
    <<pos1>>
    SELECT * FROM ...
  END IF;
END;
```

- Cannot transfer control from one IF clause to another, or from one WHEN clause in the CASE statement to another.

```
BEGIN
  IF valid THEN
    GOTO pos1;
    SELECT * FROM ...
  ELSE
    <<pos1>>
    UPDATE t1 SET ...
  END IF;
END;
```

- Cannot transfer control from an outer block to an inner BEGIN-END block.

```
BEGIN
  GOTO pos1;
  BEGIN
    <<pos1>>
    UPDATE t1 SET ...
  END;
END;
```

- Cannot transfer control from an exception handler to the current BEGIN-END block, but can transfer control to the upper-layer BEGIN-END block.

```
BEGIN
  <<pos1>>
  UPDATE t1 SET ...
  EXCEPTION
    WHEN condition THEN
      GOTO pos1;
END;
```

- To branch to a position that does not have an executable statement, you need to add the NULL statement.

```
DECLARE
  done  BOOLEAN;
BEGIN
  FOR i IN 1..50 LOOP
    IF done THEN
      GOTO end_loop;
    END IF;
    <<end_loop>>  -- You cannot run the GOTO statement to go here unless there is an executable
statement following it.
    NULL; -- The statement added here is used to avoid errors.
  END LOOP;  -- If the previous sentence NULL does not exist, an error is reported.
END;
/
```

10.9 Transaction Management

Calling a stored procedure automatically starts a transaction. When the calling is complete, the transaction is automatically committed, or rolled back upon an exception. In addition to automatic transaction control, you can also use COMMIT/ROLLBACK to control transactions in stored procedures. Running the COMMIT/ROLLBACK commands in a stored procedure will commit or roll back the current transaction and automatically starts a new transaction. All subsequent operations will be performed in the new transaction.

A savepoint is a special mark inside a transaction. It allows all commands that are executed after it was established to be rolled back, restoring the transaction state to what it was at the time of the savepoint. In a stored procedure, you can use savepoints to manage transactions. Currently, you can create, roll back, and release savepoints. If a savepoint for rollback is used in a stored procedure, only the modification of the current transaction is rolled back. The execution process of the stored procedure is not changed, and the values of local variables in the stored procedure are not rolled back.

Syntax

```
Define a savepoint.
   SAVEPOINT savepoint_name;
Roll back a savepoint.
   ROLLBACK TO [SAVEPOINT] savepoint_name;
Release a savepoint.
   RELEASE [SAVEPOINT] savepoint_name;
```

Usage Scenarios

The applicable contexts are as follows:

- COMMIT, ROLLBACK, and SAVEPOINT can be used in PL/SQL stored procedures.
- COMMIT, ROLLBACK, and SAVEPOINT can be used in stored procedures that contain EXCEPTION.
- COMMIT, ROLLBACK, and SAVEPOINT can be used in EXCEPTION statements of stored procedures.
- A stored procedure that contains COMMIT, ROLLBACK, or SAVEPOINT (which means the stored procedure is controlled by BEGIN, START, or END) can be called in a transaction block.
- A stored procedure that contains savepoints can be invoked in a subtransaction. That is, an externally defined savepoint is used in the stored procedure to roll back the transaction to the savepoint defined outside the stored procedure.
- A stored procedure is visible to a savepoint defined in the stored procedure. That is, the modification of the transaction can be rolled back to the savepoint defined in the stored procedure.
- COMMIT, ROLLBACK, and SAVEPOINT, as well as IF, FOR, CURSOR LOOP, and WHILE, can be called in most PL/SQL contexts and statements.
- A stored procedure or function that contains COMMIT, ROLLBACK, or SAVEPOINT can be called in the return values and simple expression calculation of stored procedures.

The following content can be committed or rolled back:

- DDL statements after COMMIT/ROLLBACK can be committed or rolled back.
- DML statements after COMMIT/ROLLBACK can be committed.
- GUC parameters in stored procedures can be committed or rolled back.

Usage Restrictions

COMMIT and ROLLBACK cannot be used in the following contexts:

- COMMIT, ROLLBACK, and SAVEPOINT cannot be called in stored procedures other than PL/SQL, such as PL/Java and PL/Python.
- COMMIT, ROLLBACK, SAVEPOINT and stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in functions.
- After SAVEPOINT is called in a transaction block, stored procedures that contain COMMIT/ROLLBACK cannot be called.
- Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in TRIGGER.
- COMMIT, ROLLBACK, and SAVEPOINT cannot be invoked in EXECUTE statements.
- Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in CURSOR statements.
- Stored procedures that contain IMMUTABLE or SHIPPABLE cannot call COMMIT, ROLLBACK, SAVEPOINT or another stored procedure that contain COMMIT, ROLLBACK, or SAVEPOINT.
- Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in SQL statements other than SELECT PROC and CALL PROC.
- COMMIT, ROLLBACK, or SAVEPOINT cannot be called in a stored procedure whose header contains GUC parameters.
- COMMIT, ROLLBACK, or SAVEPOINT cannot be called in expressions or CURSOR and EXECUTE statements.
- Savepoints defined outside a stored procedure cannot be released in the stored procedure.
- An autonomous transaction and a stored procedure transaction are two independent transactions that cannot use the savepoints defined in each other.

The following content cannot be committed or rolled back:

- Variables declared or imported in stored procedures cannot be committed or rolled back.
- In stored procedures, GUC parameters that take effect only after a restart cannot be committed or rolled back.

Examples

- Example 1: COMMIT/ROLLBACK can be used in PL/SQL stored procedures. Subsequent examples depend on this case.

```
gaussdb=# DROP TABLE IF EXISTS EXAMPLE1;
NOTICE:  table "example1" does not exist, skipping
DROP TABLE
gaussdb=# CREATE TABLE EXAMPLE1(COL1 INT);
CREATE TABLE
gaussdb=# CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE()
AS
BEGIN
    FOR i IN 0..20 LOOP
        INSERT INTO EXAMPLE1(COL1) VALUES (i);
        IF i % 2 = 0 THEN
            COMMIT;
        ELSE
            ROLLBACK;
        END IF;
    END LOOP;
```

```
END;
/
CREATE PROCEDURE
gaussdb=# CALL TRANSACTION_EXAMPLE();
 transaction_example
---------------------

(1 row)
```

- Example 2:

  COMMIT and ROLLBACK can be used in stored procedures that contain EXCEPTION.

  COMMIT and ROLLBACK can be used in EXCEPTION statements of stored procedures.

  DDL statements after COMMIT/ROLLBACK can be committed or rolled back.

```
gaussdb=# CREATE OR REPLACE PROCEDURE TEST_COMMIT_INSERT_EXCEPTION_ROLLBACK()
AS
BEGIN
 DROP TABLE IF EXISTS TEST_COMMIT;
 CREATE TABLE TEST_COMMIT(A INT, B INT);
 INSERT INTO TEST_COMMIT SELECT 1, 1;
 COMMIT;
       CREATE TABLE TEST_ROLLBACK(A INT, B INT);
 RAISE EXCEPTION 'RAISE EXCEPTION AFTER COMMIT';
EXCEPTION
    WHEN OTHERS THEN
 INSERT INTO TEST_COMMIT SELECT 2, 2;
 ROLLBACK;
END;
/
CREATE PROCEDURE
gaussdb=# CALL TEST_COMMIT_INSERT_EXCEPTION_ROLLBACK();
NOTICE:  table "test_commit" does not exist, skipping
CONTEXT:  SQL statement "DROP TABLE IF EXISTS TEST_COMMIT"
PL/pgSQL function test_commit_insert_exception_rollback() line 3 at SQL statement
 test_commit_insert_exception_rollback
---------------------------------------

(1 row)
```

- Example 3: A stored procedure that contains COMMIT or ROLLBACK (which means the stored procedure is controlled by BEGIN, START, or END) can be called in a transaction block.

```
gaussdb=# BEGIN;
    -- For the definition of TEST_COMMIT_INSERT_EXCEPTION_ROLLBACK, see example 2.
    CALL TEST_COMMIT_INSERT_EXCEPTION_ROLLBACK();
END;
 test_commit_insert_exception_rollback
---------------------------------------

(1 row)
COMMIT
```

- Example 4: COMMIT and ROLLBACK, as well as IF, FOR, CURSOR LOOP, and WHILE, can be called in most PL/SQL contexts and statements.

```
gaussdb=# CREATE OR REPLACE PROCEDURE TEST_COMMIT2()
IS
BEGIN
    DROP TABLE IF EXISTS TEST_COMMIT;
    CREATE TABLE TEST_COMMIT(A INT);
    FOR I IN REVERSE 3..0 LOOP
 INSERT INTO TEST_COMMIT SELECT I;
 COMMIT;
    END LOOP;
    FOR I IN REVERSE 2..4 LOOP
 UPDATE TEST_COMMIT SET A=I;
 COMMIT;
```

```
    END LOOP;
EXCEPTION
WHEN OTHERS THEN
 INSERT INTO TEST_COMMIT SELECT 4;
    COMMIT;
END;
/
CREATE PROCEDURE
gaussdb=# CALL TEST_COMMIT2();

procedure.
ROLLBACK
gaussdb=# SELECT * FROM EXAMPLE1;
 col1
------
    3
    1
(2 rows)
gaussdb=# COMMIT;
COMMIT
```

10.10 Other Statements

10.10.1 Lock Operations

GaussDB provides multiple lock modes to control concurrent accesses to table data. These modes are used when Multi-Version Concurrency Control (MVCC) cannot give expected behaviors. Alike, most GaussDB commands automatically apply appropriate locks to ensure that called tables are not deleted or modified in an incompatible manner during command execution. For example, when concurrent operations exist, ALTER TABLE cannot be executed on the same table.

10.10.2 Cursor Operations

GaussDB provides cursors as a data buffer for users to store execution results of SQL statements. Each cursor region has a name. Users can use SQL statements to obtain records one by one from cursors and grant the records to master variables, then being processed further by host languages.

Cursor operations include cursor definition, open, fetch, and close operations.

For the complete example of cursor operations, see **Explicit Cursor**.

10.11 Cursors

10.11.1 Overview

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers pointing to context regions. With cursors, stored procedures can control alterations in context regions.

NOTICE

- When a stored procedure uses returns to return a cursor, if JDBC is used to call the stored procedure, the returned cursor is unavailable. Using **out** to output parameters is not affected.
- When a stored procedure contains COMMIT/ROLLBACK, an explicit cursor caches all data of the cursor to ensure that the cursor is still available after COMMIT/ROLLBACK. If the cursor data volume is large, this process may take a long time.
- After table data is modified in a stored procedure, the cursor related to the table is started, and the data in the FETCH cursor continues after rollback. In this case, an error is reported.

Cursors are classified into explicit cursors and implicit cursors. **Table 10-2** shows the usage conditions of explicit and implicit cursors for different SQL statements.

Table 10-2 Cursor usage conditions

SQL Statement	Cursor
Non-query statements	Implicit
Query statements with single-line results	Implicit or explicit
Query statements with multi-line results	Explicit

10.11.2 Explicit Cursor

An explicit cursor is used to process query statements, particularly when query results are multiple records.

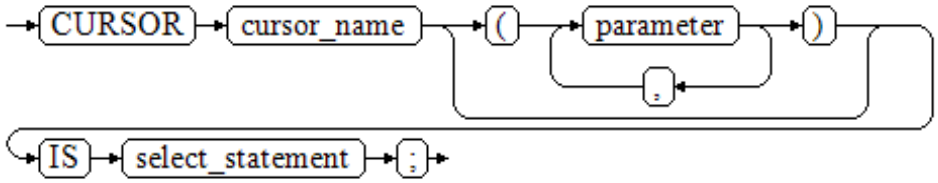
Procedure

An explicit cursor performs the following six PL/SQL steps to process query statements:

Step 1 Define a static cursor: Define a cursor name and its corresponding SELECT statement.

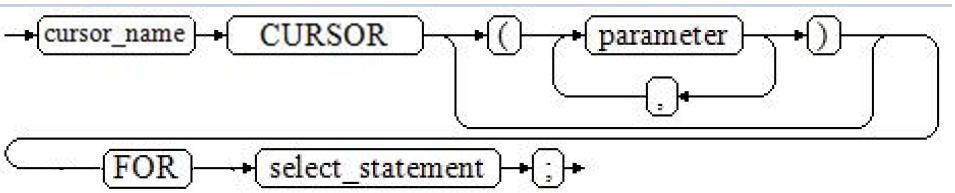
Figure 10-27 shows the syntax diagram for defining a static cursor.

Figure 10-27 static_cursor_define::=



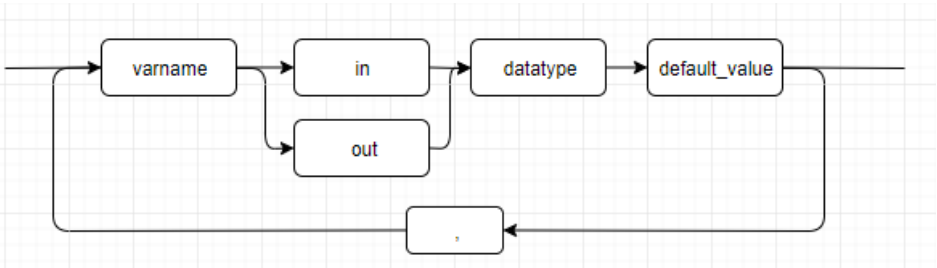
or

Figure 10-28 static_cursor_define::=



Parameter description:

- *cursor_name*: defines a cursor name.
- **parameter**: cursor parameter, which can only be an input parameter. The default value can be defined by **:=**, **=**, or **default**. The format is as follows.



- *select_statement*: specifies a query statement.

NOTE

- The system automatically determines whether the cursor can be used for backward fetching based on the execution plan.
- In syntax, **parameter** can be an output parameter, but its behavior is the same as that of an input parameter.

Define a dynamic cursor: Define a **ref** cursor, which means that the cursor can be opened dynamically by a set of static SQL statements. Define the type of the **ref** cursor first, and then the cursor variable of this cursor type. Dynamically bind a SELECT statement through OPEN FOR when the cursor is opened.

Figure 10-29 and **Figure 10-30** show the syntax diagrams for defining a dynamic cursor.

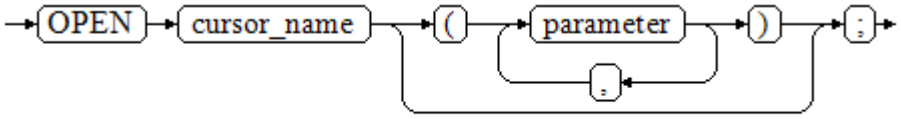
Figure 10-29 cursor_typename::=

Figure 10-30 dynamic_cursor_define::=

Step 2 Open the static cursor: Execute the SELECT statement corresponding to the cursor. The query result is placed in the workspace and the pointer directs to the head of the workspace to identify the cursor result set. If the cursor query statement carries the **FOR UPDATE** option, the OPEN statement locks the data rows corresponding to the cursor result set in the database table.

Figure 10-31 shows the syntax diagram for opening a static cursor.

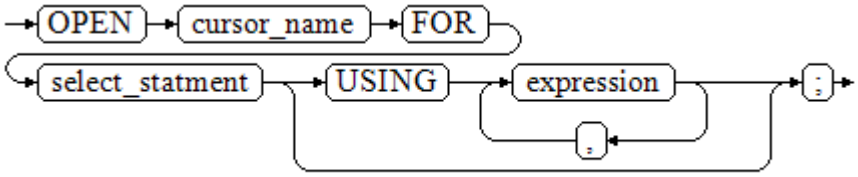
Figure 10-31 open_static_cursor::=



Open the dynamic cursor: Use the OPEN FOR statement to open the dynamic cursor and the SQL statement is dynamically bound.

Figure 10-32 shows the syntax diagrams for opening a dynamic cursor.

Figure 10-32 open_dynamic_cursor::=

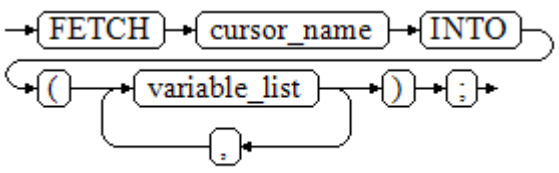


A PL/SQL program cannot use the OPEN statement to repeatedly open a cursor.

Step 3 Fetch cursor data: Retrieve data rows in the result set and place them in specified output variables.

Figure 10-33 shows the syntax diagrams for fetching cursor data.

Figure 10-33 fetch_cursor::=



Step 4 Process the record.

Step 5 Continue to process until the active set has no record.

Step 6 Close the cursor: After you fetch and process the data in the cursor result set, close the cursor in time to release system resources used by the cursor and invalidate the workspace of the cursor so that the FETCH statement cannot be used to fetch data anymore. A closed cursor can be reopened by an OPEN statement.

Figure 10-34 shows the syntax diagram for closing a cursor.

Figure 10-34 close_cursor::=

----End

Attributes

Cursor attributes are used to control program procedures or know program status. When a DML statement is executed, the PL/SQL opens a built-in cursor and processes its result. A cursor is a memory segment for maintaining query results. It is opened when a DML statement is executed and closed when the execution is finished. An explicit cursor has the following attributes:

- **%FOUND**: Boolean attribute, which returns **TRUE** if the last fetch returns a row.
- **%NOTFOUND**: Boolean attribute, which returns **TRUE** if the last fetch fails to return a row.
- **%ISOPEN**: Boolean attribute, which returns **TRUE** if the cursor has been opened.
- **%ROWCOUNT**: numeric attribute, which returns the number of records fetched from the cursor.

Examples

DDL and DML statements are prepared. Subsequent examples in this section depend on this case.

```
gaussdb=# DROP SCHEMA IF EXISTS hr CASCADE;

10.11.3 Implicit Cursor

Implicit cursors are automatically set by the system for non-query statements such as modify or delete operations, along with their workspace. Implicit cursors are named **SQL**, which is defined by the system.

Overview

Implicit cursor operations, such as definition, open, value-grant, and close operations, are automatically performed by the system and do not need users to process. Users can use only attributes related to implicit cursors to complete operations. In workspace of implicit cursors, the data of the latest SQL statement is stored and is not related to explicit cursors defined by users.

Format call: **SQL%**

NOTE

- INSERT, UPDATE, DELETE, and SELECT statements do not need defined cursors.
- In A-compatible mode, if the GUC parameter **behavior_compat_options** is set to **compat_cursor**, implicit cursors are valid across stored procedures.
- After SMP-related GUC parameters are enabled (the GUC parameter **query_dop** is set to a value greater than 1 and **plsql_beta_feature** is set to **enable_plsql_smp**), query statements that do not involve INSERT, UPDATE, and DELETE in cursors can be executed on SMP.
- Implicit cursor attributes are not affected by the commit\rollback operation.

Attributes

An implicit cursor has the following attributes:

- **SQL%FOUND**: Boolean attribute, which returns **TRUE** if the last fetch returns a row.
- **SQL%NOTFOUND**: Boolean attribute, which returns **TRUE** if the last fetch fails to return a row.
- **SQL%ROWCOUNT**: numeric attribute, which returns the number of records fetched from the cursor.
- **SQL%ISOPEN**: Boolean attribute, whose value is always **FALSE**. Close implicit cursors immediately after an SQL statement is run.

Examples

```
-- Delete all employees in a department from the hr.staffs table. If the department has no employees, delete the department from the hr.department table.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_cursor3()
AS
   DECLARE
   V_DEPTNO NUMBER(4) := 100;
   BEGIN
      DELETE FROM hr.staffs WHERE section_id = V_DEPTNO;
      -- Proceed based on cursor status.
      IF SQL%NOTFOUND THEN
      DELETE FROM hr.department WHERE section_id = V_DEPTNO;
      END IF;
   END;
/
CREATE PROCEDURE
```

```
gaussdb=# CALL proc_cursor3();
 proc_cursor3
--------------

(1 row)

-- Delete the stored procedure and the temporary table.
gaussdb=# DROP PROCEDURE proc_cursor3;
DROP PROCEDURE
-- If SELECT implicit cursors need to be executed concurrently, enable the following GUC parameters:
gaussdb=# SET query_dop=4;
SET
gaussdb=# SET sql_beta_feature= 'enable_plsql_smp';

-- Select the name of the employee whose ID is 1 from the employee table hr.staffs.
gaussdb=# CREATE OR REPLACE PROCEDURE prc_cursor_smp()
AS
    name varchar(20);
BEGIN
   SELECT first_name FROM hr.staffs WHERE staff_id = 1 INTO name;
   dbe_output.print_line('result is: '|| name);
END;
/
CREATE PROCEDURE
-- Execute the stored procedure.
gaussdb=# CALL prc_cursor_smp();
result is: Tom
 prc_cursor_smp
----------------

(1 row)
```

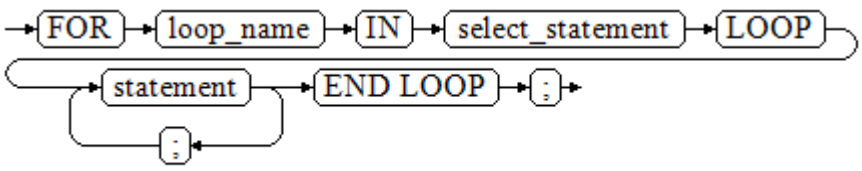
10.11.4 Cursor Loop

Use of cursors in WHILE and LOOP statements is called a cursor loop. Generally, OPEN, FETCH, and CLOSE statements are called in this kind of loop. The following describes a loop that simplifies a cursor loop without the need for these operations. This mode is applicable to a static cursor loop, without executing four steps about a static cursor.

Syntax

Figure 10-35 shows the syntax diagram of the FOR AS loop.

Figure 10-35 FOR_AS_loop::=



Precautions

- The UPDATE operation for the queried table is not allowed in the loop statement.
- The variable *loop_name* is automatically defined and is valid only in this loop. Its type is the same as that in the query result of *select_statement*. The value of *loop_name* is the query result of *select_statement*.

- The specific type of the *loop_name* variable is not parsed during compilation. If the specific type needs to be parsed (for example, *loop_name* is used as the input and output parameters of an overloaded function or stored procedure), a compilation error is reported. To parse the specific type of a variable, set **behavior_compat_options** to **allow_procedure_compile_check**.
- The **%FOUND**, **%NOTFOUND**, and **%ROWCOUNT** attributes access the same internal variable in GaussDB. Transactions and the anonymous block do not support multiple cursor accesses at the same time.
- You can enable the SMP-related GUC parameter (set the GUC parameter **query_dop** to a value greater than 1 and **plsql_beta_feature** to '**enable_plsql_smp**') so that the cursor loop can be executed on the SMP.

Examples

```
-- If cursors need to be executed cyclically and concurrently, enable the following GUC parameters:
gaussdb=# SET query_dop=4;
SET
gaussdb=# SET sql_beta_feature='enable_plsql_smp';
SET
gaussdb=# BEGIN
FOR ROW_TRANS IN
        SELECT first_name FROM hr.staffs
    LOOP
        DBE_OUTPUT.PRINT_LINE (ROW_TRANS.first_name );
    END LOOP;
END;
/
Tom
ANONYMOUS BLOCK EXECUTE

-- Create a table.
gaussdb=# CREATE TABLE integerTable1( A INTEGER);
CREATE TABLE
gaussdb=# CREATE TABLE integerTable2( B INTEGER);
CREATE TABLE
gaussdb=# INSERT INTO integerTable2 VALUES(2);
INSERT 0 1
-- Multiple cursors share the parameters of cursor attributes.
gaussdb=# DECLARE
   CURSOR C1 IS SELECT A FROM integerTable1;-- Declare the cursor.
   CURSOR C2 IS SELECT B FROM integerTable2;
   PI_A INTEGER;
   PI_B INTEGER;
BEGIN
    OPEN C1;-- Open the cursor.
   OPEN C2;
   FETCH C1 INTO PI_A; ---- The values of C1%FOUND and C2%FOUND are FALSE.
   FETCH C2 INTO PI_B; ---- The values of C1%FOUND and C2%FOUND are TRUE.
   -- Determine the cursor status.
   IF C1%FOUND THEN
      IF C2%FOUND THEN
        DBE_OUTPUT.PRINT_LINE('Dual cursor share parameter.');
      END IF;
   END IF;
    CLOSE C1;-- Close the cursor.
   CLOSE C2;
END;
/
ANONYMOUS BLOCK EXECUTE

-- Delete the temporary table.
gaussdb=# DROP TABLE integerTable1;
DROP TABLE
gaussdb=# DROP TABLE integerTable2;
DROP TABLE
```

10.12 Advanced Packages

Advanced packages have two sets of interfaces. The first set is basic interfaces, and the second set is secondary encapsulation interfaces that are used improve usability. The second set is recommended.

10.12.1 Basic Interfaces

10.12.1.1 PKG_SERVICE

Table 10-3 lists all APIs supported by PKG_SERVICE.

Table 10-3 PKG_SERVICE

API	Description
PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE	Checks whether a context is registered.
PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS	Deregisters all registered contexts.
PKG_SERVICE.SQL_REGISTER_CONTEXT	Registers a context.
PKG_SERVICE.SQL_UNREGISTER_CONTEXT	Deregisters a context.
PKG_SERVICE.SQL_SET_SQL	Sets an SQL statement for a context. Currently, only the SELECT statement is supported.
PKG_SERVICE.SQL_RUN	Executes the configured SQL statement on a context.
PKG_SERVICE.SQL_NEXT_ROW	Reads the next row of data in a context.
PKG_SERVICE.SQL_GET_VALUE	Reads a dynamically defined column value in a context.
PKG_SERVICE.SQL_SET_RESULT_TYPE	Dynamically defines a column of a context based on the type OID.
PKG_SERVICE.JOB_CANCEL	Removes a scheduled task by task ID.
PKG_SERVICE.JOB_FINISH	Disables or enables scheduled task execution.
PKG_SERVICE.JOB_SUBMIT	Submits a scheduled task. Job ID can be automatically generated by the system or specified manually.

API	Description
PKG_SERVICE.JOB_UPDATE	Modifies user-definable attributes of a scheduled task, including the task content, next-execution time, and execution interval.
PKG_SERVICE.SUBMIT_ON_NODES	Submits a task to all nodes. The task ID is automatically generated by the system.
PKG_SERVICE.ISUBMIT_ON_NODES	Submits a job to all nodes. The job ID is specified by the user.
PKG_SERVICE.SQL_GET_ARRAY_RESULT	Obtains the array value returned in the context.
PKG_SERVICE.SQL_GET_VARIABLE_RESULT	Obtains the column value returned in the context.

- PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE

  This function checks whether a context is registered. This function transfers the ID of the context to be queried. If the context exists, **TRUE** is returned. Otherwise, **FALSE** is returned.

  The prototype of the PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE function is as follows:

  ```
  PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE(
   context_id      IN INTEGER
  )
  RETURN BOOLEAN;
  ```

  Table 10-4 PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE parameters

Parameter	Description
context_id	ID of the context to be queried

- PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS

  This function cancels all contexts.

  The prototype of the PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS function is as follows:

  ```
  PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS(
  )
  RETURN VOID;
  ```

- PKG_SERVICE.SQL_REGISTER_CONTEXT

  This function opens a context, which is the prerequisite for the subsequent operations in the context. This function does not transfer any parameter. It automatically generates context IDs in an ascending order and returns values to integer variables.

  The prototype of the PKG_SERVICE.SQL_REGISTER_CONTEXT function is as follows:

```
DBE_SQL.REGISTER_CONTEXT(
)
RETURN INTEGER;
```

- PKG_SERVICE.SQL_UNREGISTER_CONTEXT

  This function closes a context, which is the end of each operation in the context. If this function is not called when the stored procedure ends, the memory is still occupied by the context. Therefore, remember to close a context when you do not need to use it. If an exception occurs, the stored procedure exits but the context is not closed. Therefore, you are advised to include this API in the exception handling of the stored procedure.

  The prototype of the PKG_SERVICE.SQL_UNREGISTER_CONTEXT function is as follows:

```
PKG_SERVICE.SQL_UNREGISTER_CONTEXT(
 context_id     IN INTEGER
)
RETURN INTEGER;
```

Table 10-5 PKG_SERVICE.SQL_UNREGISTER_CONTEXT parameters

Parameter	Description
context_id	ID of the context to be closed.

- PKG_SERVICE.SQL_SET_SQL

  This function parses the query statement of a given context. The input query statement is executed immediately. Currently, only the SELECT query statement can be parsed. The statement parameters can be transferred only through the TEXT type. The length cannot exceed 1 GB.

  The prototype of the PKG_SERVICE.SQL_SET_SQL function is as follows:

```
PKG_SERVICE.SQL_SET_SQL(
context_id     IN INTEGER,
query_string   IN TEXT,
language_flag  IN INTEGER
)
RETURN BOOLEAN;
```

Table 10-6 PKG_SERVICE.SQL_SET_SQL parameters

Parameter	Description
context_id	ID of the context whose query statement is to be parsed.
query_string	Query statement to be parsed.
language_flag	Version language number, which specifies the behavior of different versions. • **1**: incompatible version. • **2**: version in A-compatible mode.

- PKG_SERVICE.SQL_RUN

This function executes a given context. It receives a context ID first, and the data obtained after execution is used for subsequent operations. Currently, only the SELECT query statement can be executed.

The prototype of the PKG_SERVICE.SQL_RUN function is as follows:

```
PKG_SERVICE.SQL_RUN(
context_id     IN INTEGER,
)
RETURN INTEGER;
```

Table 10-7 PKG_SERVICE.SQL_RUN parameters

Parameter	Description
context_id	ID of the context whose query statement is to be parsed.

- PKG_SERVICE.SQL_NEXT_ROW

  This function returns the number of data rows returned after the SQL statement is executed. Each time the API is executed, the system obtains a set of new rows until all data is read.

  The prototype of the PKG_SERVICE.SQL_NEXT_ROW function is as follows:

```
PKG_SERVICE.SQL_NEXT_ROW(
context_id     IN INTEGER,
)
RETURN INTEGER;
```

Table 10-8 PKG_SERVICE.SQL_NEXT_ROW parameters

Parameter	Description
context_id	ID of the context to be executed

- PKG_SERVICE.SQL_GET_VALUE

  This function returns the context element value in a specified position of a context and accesses the data obtained by PKG_SERVICE.SQL_NEXT_ROW.

  The prototype of the PKG_SERVICE.SQL_GET_VALUE function is as follows:

```
PKG_SERVICE.SQL_GET_VALUE(
context_id         IN    INTEGER,
pos                IN    INTEGER,
col_type           IN    ANYELEMENT
)
RETURN ANYELEMENT;
```

Table 10-9 PKG_SERVICE.SQL_GET_VALUE parameters

Parameter	Description
context_id	ID of the context to be executed
pos	Position of a dynamically defined column in the query
col_type	Variable of any type, which defines the return value type of columns.

- PKG_SERVICE.SQL_SET_RESULT_TYPE

  This function defines columns returned from a given context and can be used only for contexts defined by SELECT. The defined columns are identified by the relative positions in the query list. The prototype of PKG_SERVICE.SQL_SET_RESULT_TYPE is as follows:

```
PKG_SERVICE.SQL_SET_RESULT_TYPE(
context_id     IN INTEGER,
pos            IN INTEGER,
coltype_oid    IN ANYELEMENT,
maxsize        IN INTEGER
)
RETURN INTEGER;
```

  Table 10-10 PKG_SERVICE.SQL_SET_RESULT_TYPE parameters

Parameter	Description
context_id	ID of the context to be executed
pos	Position of a dynamically defined column in the query
coltype_oid	Variable of any type. The OID of the corresponding type can be obtained based on the variable type.
maxsize	Length of a defined column

- PKG_SERVICE.JOB_CANCEL

  The stored procedure CANCEL deletes a specified task.

  The prototype of the PKG_SERVICE.JOB_CANCEL function is as follows:

```
PKG_SERVICE.JOB_CANCEL(
id  IN  INTEGER);
```

  Table 10-11 PKG_SERVICE.JOB_CANCEL parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	integer	IN	No	Specifies the job ID.

- PKG_SERVICE.JOB_FINISH

  The stored procedure FINISH disables or enables a scheduled task.

  The prototype of the PKG_SERVICE.JOB_FINISH function is as follows:

```
PKG_SERVICE.JOB_FINISH(
id         IN   INTEGER,
broken     IN   BOOLEAN,
next_time  IN   TIMESTAMP  DEFAULT  sysdate);
```

Table 10-12 PKG_SERVICE.JOB_FINISH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	integer	IN	No	Specifies the job ID.
broken	boolean	IN	No	Specifies the status flag, **true** for broken and **false** for not broken. The current job is updated based on the parameter value **true** or **false**. If the parameter is left empty, the job status remains unchanged.
next_time	timestamp	IN	Yes	Specifies the next execution time. The default value is the current system time. If **broken** is set to **true**, **next_time** is updated to **'4000-1-1'**. If **broken** is set to **false** and **next_time** is not empty, **next_time** is updated for the job. If **next_time** is empty, it will not be updated. This parameter can be omitted, and its default value will be used in this case.

- PKG_SERVICE.JOB_SUBMIT

  The stored procedure JOB_SUBMIT submits a scheduled task provided by the system.

  The prototype of the PKG_SERVICE.JOB_SUBMIT function is as follows:

```
PKG_SERVICE.JOB_SUBMIT(
id            IN   BIGINT,
content       IN   TEXT,
next_time     IN   TIMESTAMP DEFAULT sysdate,
interval_time IN   TEXT  DEFAULT 'null',
job           OUT  INTEGER);
```

  NOTE

  When a scheduled job is created, the system binds the current database and the username to the job by default. This function can be called by using **call** or **select**. If you call this function by using **select**, there is no need to specify output parameters. To call this function within a stored procedure, use **perform**. If the committed SQL statement task uses a non-public schema, specify the schema to a table schema or a function schema, or add **set current_schema = xxx;** before the SQL statement.

Table 10-13 PKG_SERVICE.JOB_SUBMIT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	bigint	IN	No	Specifies the job ID. If the input ID is **NULL**, a job ID is generated internally.
content	text	IN	No	Specifies the SQL statement to be executed. One or multiple DMLs, anonymous blocks, and statements for calling stored procedures, or all three combined are supported.
next_time	timestamp	IN	No	Specifies the next time the job will be executed. The default value is the current system time (**sysdate**). If the specified time has past, the job is executed at the time it is submitted.
interval_time	text	IN	Yes	Calculates the next time to execute the job. It can be an interval expression, or **sysdate** followed by a numeric value, for example, **sysdate+1.0/24**. If this parameter is left empty or set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward.
job	integer	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When **pkg_service.job_submit** is called using **select**, this parameter can be omitted.

- PKG_SERVICE.JOB_UPDATE

  The stored procedure UPDATE modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

  The prototype of the PKG_SERVICE.JOB_UPDATE function is as follows:

```
PKG_SERVICE.JOB_UPDATE(
id            IN  BIGINT,
next_time     IN  TIMESTAMP,
interval_time IN  TEXT,
content       IN  TEXT);
```

Table 10-14 PKG_SERVICE.JOB_UPDATE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	integer	IN	No	Specifies the job ID.
next_time	timestamp	IN	Yes	Specifies the next execution time. If this parameter is left empty, the system does not update the **next_time** parameter for the specified job. Otherwise, the system updates the **next_time** parameter for the specified job.
interval_time	text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the **interval_time** parameter for the specified job. Otherwise, the system updates the **interval_time** parameter for the specified job after necessary validity check. If this parameter is set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward.
content	text	IN	Yes	Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the **content** parameter for the specified job. Otherwise, the system updates the **content** parameter for the specified job.

Example:

```
CREATE TABLE test_table(a int);
CREATE TABLE

CREATE OR REPLACE PROCEDURE test_job(a in int) IS
BEGIN
INSERT INTO test_table VALUES(a);
COMMIT;
END;
/
CREATE PROCEDURE

--PKG_SERVICE.JOB_SUBMIT
SELECT PKG_SERVICE.JOB_SUBMIT(NULL, 'call test_job(1);', to_date('20180101','yyyymmdd'),'sysdate
+1');
 job_submit
```

```
------------
     28269
(1 row)

SELECT PKG_SERVICE.JOB_SUBMIT(NULL, 'call test_job(1);', to_date('20180101','yyyymmdd'),'sysdate
+1.0/24');
 job_submit
------------
       1506
(1 row)

CALL PKG_SERVICE.JOB_SUBMIT(NULL, 'INSERT INTO test_table VALUES(1);  call test_job(1); call
test_job(1);', add_months(to_date('201701','yyyymm'),1), 'date_trunc(''day'',SYSDATE) + 1
+(8*60+30.0)/(24*60)' ,:jobid);
  job
-------
 14131
(1 row)

SELECT PKG_SERVICE.JOB_SUBMIT (101, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
 job_submit
------------
       101
(1 row)

--PKG_SERVICE.JOB_UPDATE
CALL PKG_SERVICE.JOB_UPDATE(101, sysdate, 'sysdate + 1.0/1440', 'call test_job(1);');
 job_update
------------

(1 row)

CALL PKG_SERVICE.JOB_UPDATE(101, sysdate, 'sysdate + 1.0/1440', 'insert into test_table values(1);');
 job_update
------------

(1 row)

--PKG_SERVICE.JOB_FINISH
CALL PKG_SERVICE.JOB_FINISH(101,true);
 job_finish
------------

(1 row)

--PKG_SERVICE.JOB_CANCEL
CALL PKG_SERVICE.JOB_CANCEL(101);
 job_cancel
------------

(1 row)

DROP TABLE test_table;
DROP TABLE
```

- PKG_SERVICE.SUBMIT_ON_NODES

  Creates a scheduled job on a node. Only users sysadmin and monitor admin have this permission.

  The prototype of the PKG_SERVICE.SUBMIT_ON_NODES function is as follows:

```
PKG_SERVICE.SUBMIT_ON_NODES(
node_name    IN   NAME,
database     IN   NAME,
what         IN   TEXT,
next_date    IN   TIMESTAMP WITHOUT TIME ZONE,
job_interval IN   TEXT,
job          OUT  INTEGER);
```

Table 10-15 PKG_SERVICE.SUBMIT_ON_NODES parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
node_name	text	IN	No	Job execution node. Currently, the value can only be **'ALL_NODE'**, indicating that the job is executed on all nodes.
database	text	IN	No	Database used by a database instance job. When the node type is **'ALL_NODE'**, the value can only be **'postgres'**.
what	text	IN	No	Specifies the SQL statement to be executed. One or multiple DMLs, anonymous blocks, and statements for calling stored procedures, or all three combined are supported.
nextdate	timestamp	IN	No	Specifies the next time the job will be executed. The default value is the current system time (**sysdate**). If the specified time has past, the job is executed at the time it is submitted.
job_interval	text	IN	No	Calculates the next time to execute the job. It can be an interval expression, or **sysdate** followed by a numeric value, for example, **sysdate+1.0/24**. If this parameter is left empty or set to **NULL**, the job will be executed only once, and the job status will change to **'d'** afterward.
job	integer	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When dbms.submit_on_nodes is called using the SELECT statement, this parameter can be omitted.

Example:

```
SELECT pkg_service.submit_on_nodes('ALL_NODE', 'postgres', 'select
capture_view_to_json(''dbe_perf.statement'', 0);', sysdate, 'interval ''60 second''');
 submit_on_nodes
-----------------
           25376
(1 row)
```

- PKG_SERVICE.ISUBMIT_ON_NODES

  ISUBMIT_ON_NODES has the same syntax function as SUBMIT_ON_NODES, but the first parameter of ISUBMIT_ON_NODES is an input parameter, that is,

a specified task ID. In contrast, that last parameter of ISUBMIT_ON_NODES is an output parameter, indicating the task ID automatically generated by the system. Only users **sysadmin** and **monitor admin** have this permission.

- PKG_SERVICE.SQL_GET_ARRAY_RESULT

  This function is used to return the value of the bound OUT parameter of the array type and obtain the OUT parameter in a stored procedure.

  The prototype of the PKG_SERVICE.SQL_GET_ARRAY_RESULT function is as follows:

```
PKG_SERVICE.SQL_GET_ARRAY_RESULT(
   context_id in int,
   pos in VARCHAR2,
   column_value inout anyarray,
   result_type in anyelement
);
```

Table 10-16 PKG_SERVICE.SQL_GET_ARRAY_RESULT parameters

Parameter	Description
context_id	ID of the context to be queried
pos	Name of the bound parameter
column_value	Return value
result_type	Return type

- PKG_SERVICE.SQL_GET_VARIABLE_RESULT

  This function is used to return the value of the bound OUT parameter of the non-array type and obtain the OUT parameter in a stored procedure.

  The prototype of the PKG_SERVICE.SQL_GET_VARIABLE_RESULT function is as follows:

```
PKG_SERVICE.SQL_GET_VARIABLE_RESULT(
   context_id in int,
   pos in VARCHAR2,
   result_type in anyelement
)
RETURNS anyelement;
```

Table 10-17 PKG_SERVICE.SQL_GET_VARIABLE_RESULT parameters

Parameter	Description
context_id	ID of the context to be queried
pos	Name of the bound parameter
result_type	Return type

10.12.1.2 PKG_UTIL

Table 10-18 lists all APIs supported by PKG_UTIL.

Table 10-18 PKG_UTIL

API	Description
PKG_UTIL.LOB_GET_LENGTH	Obtains the length of a LOB.
PKG_UTIL.LOB_READ	Reads a part of a LOB.
PKG_UTIL.LOB_WRITE	Writes the source object to the target object in the specified format.
PKG_UTIL.LOB_APPEND	Appends the source LOB to the target LOB.
PKG_UTIL.LOB_COMPARE	Compares two LOBs based on the specified length.
PKG_UTIL.LOB_MATCH	Returns the position of the *M*th occurrence of a character string in a LOB.
PKG_UTIL.LOB_RESET	Resets the character in specified position of a LOB to a specified character.
PKG_UTIL.LOB_GET_LENGTH	Obtains and returns the specified length of a LOB.
PKG_UTIL.LOB_READ_HUGE	Reads a part of the LOB content based on the specified length and initial position offset, and returns the read LOB and length.
PKG_UTIL.LOB_WRITEAPPEND_HUGE	Reads the content of a specified length from the source BLOB or CLOB, appends the content to the target BLOB or CLOB, and returns the target object.
PKG_UTIL.LOB_APPEND_HUGE	Appends the source BLOB or CLOB to the target BLOB/CLOB and returns the target object.
PKG_UTIL.READ_BFILE_TO_BLOB	Loads the source BFILE file to the target BLOB and returns the target object.
PKG_UTIL.LOB_COPY_HUGE	Reads the content of a specified length from the specified offset position of the source BLOB or CLOB, writes the content to the specified offset position of the target BLOB or CLOB, and returns the target object.

API	Description
PKG_UTIL.BLOB_RESET	Sets a segment of data in a BLOB to the specified value and returns the processed BLOB and the actually processed length.
PKG_UTIL.CLOB_RESET	Sets a segment of data in a CLOB to spaces and returns the processed CLOB and the actually processed length.
PKG_UTIL.LOADBLOBFROMFILE	Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target BLOB, and returns the target object, read position, and write position.
PKG_UTIL.LOADCLOBFROMFILE	Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target CLOB, and returns the target object, read position, and write position.
PKG_UTIL.LOB_CONVERTTOBLOB_HUGE	Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a BLOB, and writes the BLOB to the specified position of target LOB. *amount* indicates the length to be converted.
PKG_UTIL.LOB_CONVERTTOCLOB_HUGE	Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a CLOB, and writes the CLOB to the specified position of target LOB. *amount* indicates the length to be converted.
PKG_UTIL.BFILE_GET_LENGTH	Obtains and returns the specified length of a BFILE file.
PKG_UTIL.BFILE_OPEN	Opens a BFILE file and returns its file descriptor.
PKG_UTIL.BFILE_CLOSE	Closes a BFILE file.

API	Description
PKG_UTIL.LOB_WRITE_HUGE	Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.
PKG_UTIL.IO_PRINT	Displays character strings.
PKG_UTIL.RAW_GET_LENGTH	Obtains the length of RAW data.
PKG_UTIL.RAW_CAST_FROM_VARCHAR2	Converts VARCHAR2 data to RAW data.
•PKG_UTIL.RAW_CAST_FROM_...	Converts binary integers to RAW data.
•PKG_UTIL.RAW_CAST_TO_BI...	Converts RAW data to binary integers.
PKG_UTIL.RANDOM_SET_SEED	Sets a random seed.
PKG_UTIL.RANDOM_GET_VALUE	Returns a random value.
PKG_UTIL.FILE_SET_DIRNAME	Sets the directory to be operated.
PKG_UTIL.FILE_OPEN	Opens a file based on the specified file name and directory.
PKG_UTIL.FILE_SET_MAX_LINE_SIZE	Sets the maximum length of a line to be written to a file.
PKG_UTIL.FILE_IS_CLOSE	Checks whether a file handle is closed.
PKG_UTIL.FILE_READ	Reads data of a specified length from an open file handle.
PKG_UTIL.FILE_READLINE	Reads a line of data from an open file handle.
PKG_UTIL.FILE_WRITE	Writes the data specified in the buffer to a file.
PKG_UTIL.FILE_WRITELINE	Writes the buffer to a file and adds newline characters.
PKG_UTIL.FILE_NEWLINE	Adds a line.
PKG_UTIL.FILE_READ_RAW	Reads binary data of a specified length from an open file handle.
PKG_UTIL.FILE_WRITE_RAW	Writes binary data to a file.
PKG_UTIL.FILE_FLUSH	Writes data from a file handle to a physical file.
PKG_UTIL.FILE_CLOSE	Closes an open file handle.

API	Description
PKG_UTIL.FILE_REMOVE	Deletes a physical file. To do so, you must have the corresponding permission.
PKG_UTIL.FILE_RENAME	Renames a file on the disk, similar to **mv** in Unix.
PKG_UTIL.FILE_SIZE	Returns the size of a file.
PKG_UTIL.FILE_BLOCK_SIZE	Returns the number of blocks contained in a file.
PKG_UTIL.FILE_EXISTS	Checks whether a file exists.
PKG_UTIL.FILE_GETPOS	Specifies the offset of a returned file, in bytes.
PKG_UTIL.FILE_SEEK	Sets the offset for file position.
PKG_UTIL.FILE_CLOSE_ALL	Closes all file handles opened in a session.
PKG_UTIL.EXCEPTION_REPORT_ERROR	Throws an exception.
PKG_UTIL.RANDOM_SET_SEED	Sets a random seed.
PKG_UTIL.APP_READ_CLIENT_INFO	Reads the client information.
PKG_UTIL.APP_SET_CLIENT_INFO	Sets the client information.
PKG_UTIL.LOB_CONVERTTOBLOB	Converts the CLOB type to the BLOB type.
PKG_UTIL.LOB_CONVERTTOCLOB	Converts the BLOB type to the CLOB type.
PKG_UTIL.LOB_RAWTOTEXT	Converts the raw type to the TEXT type.
PKG_UTIL.LOB_RESET	Clears data of the LOB type.
PKG_UTIL.LOB_TEXTTORAW	Converts the TEXT type to the raw type.
PKG_UTIL.LOB_RAWTOTEXT	Converts the raw type to the TEXT type.
PKG_UTIL.LOB_WRITE	Writes data to the LOB type.
PKG_UTIL.MATCH_EDIT_DISTANCE_SIMILARITY	Calculates the difference between two character strings.
PKG_UTIL.RAW_CAST_TO_VARCHAR2	Converts the raw type to the VARCHAR2 type.

API	Description
PKG_UTIL.SESSION_CLEAR_CONTEXT	Clears the attribute values in **session_context**.
PKG_UTIL.SESSION_SEARCH_CONTEXT	Searches for an attribute value.
PKG_UTIL.SESSION_SET_CONTEXT	Sets an attribute value.
PKG_UTIL.UTILITY_FORMAT_CALL_STACK	Displays the call stack of a stored procedure.
PKG_UTIL.UTILITY_FORMAT_ERROR_BACKTRACE	Displays the error stack of a stored procedure.
PKG_UTIL.UTILITY_FORMAT_ERROR_STACK	Displays the error information about a stored procedure.
PKG_UTIL.UTILITY_GET_TIME	Displays the Unix timestamp of the system.
PKG_UTIL.UTILITY_COMPILE_SCHEMA	Recompiles specified schemas, packages, functions, and stored procedures. If an error is reported when compiling a PL/SQL object, the PL/SQL object is returned and the recompilation stops. This package has been discarded. **pkg_util.gs_compile_schema** is recommended.
PKG_UTIL.GS_COMPILE_SCHEMA	Recompiles specified schemas, packages, functions, and stored procedures. If an error is reported when compiling a PL/SQL object, the exception is captured and the recompilation continues to compile other objects until all objects are compiled or the number of recompilation attempts reaches the upper limit. When the advanced package is executed through JDBC, the SQLSTATE 00000 is displayed, which indicates that the operation is successful. For details about the error code description, see "Standard SQL Error Codes" in *Error Code Reference*.
PKG_UTIL.APP_SET_MODULE	Sets the value of a module.
PKG_UTIL.APP_READ_MODULE	Reads the value of a module.
PKG_UTIL.APP_SET_ACTION	Sets the value of an action.
PKG_UTIL.APP_READ_ACTION	Reads the value of an action.

API	Description
PKG_UTIL.MODIFY_PACKAGE_STATE	Modifies the PL/SQL status of the current session and releases all memory associated with each previously running PL/SQL program from the session.

- PKG_UTIL.LOB_GET_LENGTH

  Obtains the length of the input data.

  The prototype of the PKG_UTIL.LOB_GET_LENGTH function is as follows:

```
PKG_UTIL.LOB_GET_LENGTH(
lob       IN   CLOB
)
RETURN INTEGER;

PKG_UTIL.LOB_GET_LENGTH(
lob       IN   BLOB
)
RETURN INTEGER;
```

  Table 10-19 PKG_UTIL.LOB_GET_LENGTH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	CLOB/BLOB	IN	No	Indicates the object whose length is to be obtained.

- PKG_UTIL.LOB_READ

  Reads an object and returns the specified part.

  The prototype of the PKG_UTIL.LOB_READ function is as follows:

```
PKG_UTIL.LOB_READ(
lob       IN   ANYELEMENT,
len       IN   INT,
start     IN   INT,
mode      IN   INT
)
RETURN ANYELEMENT
```

Table 10-20 PKG_UTIL.LOB_READ parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	CLOB / BLOB	IN	No	Specifies CLOB or BLOB data.
len	INT	IN	No	Specifies the length of the returned result.
start	INT	IN	No	Specifies the offset to the first character.
mode	INT	IN	No	Specifies the type of the read operation. **0** indicates **READ**, **1** indicates **TRIM**, and **2** indicates **SUBSTR**.

- PKG_UTIL.LOB_WRITE

  Writes the source object to the target object based on the specified parameters and returns the target object.

  The prototype of the PKG_UTIL.LOB_WRITE function is as follows:

```
PKG_UTIL.LOB_WRITE(
dest_lob    INOUT   BLOB,
src_lob     IN      RAW
len         IN      INT,
start_pos   IN      BIGINT
)
RETURN BLOB;
PKG_UTIL.LOB_WRITE(
dest_lob    INOUT   CLOB,
src_lob     IN      VARCHAR2
len         IN      INT,
start_pos       IN      BIGINT
)
RETURN CLOB;
```

Table 10-21 PKG_UTIL.LOB_WRITE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	CLOB / BLOB	INOUT	No	Specifies the target object that data will be written to.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
src_lob	CLOB/BLOB	IN	No	Specifies the source object to be written.
len	INT	IN	No	Specifies the write length of the source object.
start_pos	BIGINT	IN	No	Specifies the write start position of the target object.

- PKG_UTIL.LOB_APPEND

  Appends the source object to the target BLOB/CLOB and returns the target BLOB/CLOB.

  The prototype of the PKG_UTIL.LOB_APPEND function is as follows:

```
PKG_UTIL.LOB_APPEND(
dest_lob    INOUT   BLOB,
src_lob     IN      BLOB,
len         IN      INT DEFAULT NULL
)
RETURN BLOB;

PKG_UTIL.LOB_APPEND(
dest_lob    INOUT   CLOB,
src_lob     IN      CLOB,
len         IN      INT DEFAULT NULL
)
RETURN CLOB;
```

Table 10-22 PKG_UTIL.LOB_APPEND parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB/CLOB	INOUT	No	Specifies the target BLOB/CLOB that data will be written to.
src_lob	BLOB/CLOB	IN	No	Specifies the source BLOB/CLOB to be written.
len	INT	IN	Yes	Length read from *src* and appended to *dest*. The default value is null, indicating that all content of *src* is read and appended to *dest*.

- PKG_UTIL.LOB_COMPARE

  Checks whether objects are the same based on the specified start position and size. If **lob1** is larger, **1** is returned. If **lob2** is larger, **–1** is returned. If **lob1** is equal to **lob2**, **0** is returned.

  The prototype of the PKG_UTIL.LOB_COMPARE function is as follows:

```
PKG_UTIL.LOB_COMPARE(
lob1        IN   ANYELEMENT,
lob2        IN   ANYELEMENT,
len         IN   INT DEFAULT 1073741771,
start_pos1      IN   INT DEFAULT 1,
start_pos2      IN   INT DEFAULT 1
)
RETURN INTEGER;
```

  Table 10-23 PKG_UTIL.LOB_COMPARE parameters

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
lob1	CLOB/ BLOB	IN	No	Indicates the character string for comparison.
lob2	CLOB/ BLOB	IN	No	Indicates the character string for comparison.
len	INT	IN	No	Indicates the length to be compared.
start_pos1	INT	IN	No	Specifies the start offset of **lob1**.
start_pos2	INT	IN	No	Specifies the start offset of **lob2**.

- PKG_UTIL.LOB_MATCH

  Returns the position where a pattern is displayed in a LOB for the *match_n*th time.

  The prototype of the PKG_UTIL.LOB_MATCH function is as follows:

```
PKG_UTIL.LOB_MATCH(
lob         IN   ANYELEMENT,
pattern      IN   ANYELEMENT,
start       IN   INT,
match_nth    IN   INT DEFAULT 1
)
RETURN INTEGER;
```

Table 10-24 PKG_UTIL.LOB_MATCH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	CLOB/BLOB	IN	No	Indicates the character string for comparison.
pattern	CLOB/BLOB	IN	No	Specifies the pattern to be matched.
start	INT	IN	No	Specifies the start position for LOB comparison.
match_nth	INT	IN	No	Specifies the matching times.

- PKG_UTIL.LOB_RESET

  Clears a character string and resets the string to the value of **value**.

  The prototype of the PKG_UTIL.LOB_RESET function is as follows:

```
PKG_UTIL.LOB_RESET(
lob         INOUT   BLOB,
len         INOUT   INT,
start       IN   INT DEFAULT 1,
value        IN   INT DEFAULT 0
)
RETURN RECORD;
```

Table 10-25 PKG_UTIL.LOB_RESET parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	BLOB	IN	No	Indicates the character string for reset.
len	INT	IN	No	Specifies the length of the string to be reset.
start	INT	IN	No	Specifies the start position for reset.
value	INT	IN	Yes	Sets characters. Default value: **'0'**

- PKG_UTIL.LOB_GET_LENGTH

  Obtains and returns the specified length of a LOB.

  The prototype of the PKG_UTIL.LOB_GET_LENGTH function is as follows:

```
PKG_UTIL.LOB_GET_LENGTH(
   lob IN BLOB)
```

```
RETURN BIGINT;

PKG_UTIL.LOB_GET_LENGTH(
   lob IN CLOB)
RETURN BIGINT;
```

Table 10-26 PKG_UTIL.LOB_GET_LENGTH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	BLOB/CLOB	IN	No	LOB type

- PKG_UTIL.LOB_READ_HUGE

  Reads a part of the LOB content based on the specified length and initial position offset, and returns the read LOB and length.

  The prototype of the PKG_UTIL.LOB_READ_HUGE function is as follows:

```
PKG_UTIL.LOB_READ_HUGE(
   lob       IN CLOB,
   len       IN BIGINT,
   start_pos IN BIGINT,
   mode      IN INTEGER)
RETURN RECORD;

PKG_UTIL.LOB_READ_HUGE(
   lob       IN BLOB,
   len       IN BIGINT,
   start_pos IN BIGINT,
   mode      IN INTEGER)
RETURN RECORD;

PKG_UTIL.LOB_READ_HUGE(
   fd        IN INTEGER,
   len       IN BIGINT,
   start_pos IN BIGINT,
   mode      IN INTEGER)
RETURN RECORD;
```

Table 10-27 PKG_UTIL.LOB_READ_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob/fd	BLOB/CLOB/INTEGER	IN	No	File descriptor of the specified LOB or BFILE file.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
len	BIGINT	IN	No	Length to read.
start_pos	BIGINT	IN	No	Offset position from which read starts.
mode	INTEGER	IN	No	Read mode (**0**: read, **1**: trim, **2**: substr).

- PKG_UTIL.LOB_WRITEAPPEND_HUGE

  Reads the content of a specified length from the source BLOB or CLOB, appends the content to the target BLOB or CLOB, and returns the target object.

  The prototype of the PKG_UTIL.LOB_WRITEAPPEND_HUGE function is as follows:

```
PKG_UTIL.LOB_WRITEAPPEND_HUGE(
   dest_lob INOUT CLOB,
   len      IN    INTEGER,
   src_lob  IN    VARCHAR2
)RETURN CLOB;

PKG_UTIL.LOB_WRITEAPPEND_HUGE(
   dest_lob INOUT BLOB,
   len      IN    INTEGER,
   src_lob  IN    RAW
)RETURN BLOB;
```

  Table 10-28 PKG_UTIL.LOB_WRITEAPPEND_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB/CLOB	INOUT	No	Target BLOB/CLOB to which data is written.
len	INTEGER	IN	Yes	Length of the source object to be written. If the value is **NULL**, the entire source object is written by default.
src_lob	VARCHAR2/RAW	IN	No	BLOB/CLOB from which data is to be written.

- PKG_UTIL.LOB_APPEND_HUGE

  Appends the source BLOB or CLOB to the target BLOB/CLOB and returns the target object.

  The prototype of the PKG_UTIL.LOB_APPEND_HUGE function is as follows:

```
PKG_UTIL.LOB_APPEND_HUGE(
   dest_lob INOUT BLOB,
   src_lob  IN    BLOB)
RETURN BLOB;
PKG_UTIL.LOB_APPEND_HUGE(
   dest_lob INOUT CLOB,
   src_lob  IN    CLOB)
RETURN CLOB;
```

  Table 10-29 PKG_UTIL.LOB_APPEND_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB/CLOB	INOUT	No	Target BLOB/CLOB to which data is written.
src_lob	BLOB/CLOB	IN	No	BLOB/CLOB from which data is to be written.

- PKG_UTIL.READ_BFILE_TO_BLOB

  Loads the source BFILE file to the target BLOB and returns the target object.

  The prototype of the PKG_UTIL.READ_BFILE_TO_BLOB function is as follows:

```
PKG_UTIL.READ_BFILE_TO_BLOB(
   fd IN INTEGER
)RETURN BLOB;
```

  Table 10-30 PKG_UTIL.READ_BFILE_TO_BLOB parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
fd	INTEGER	IN	No	Source BFILE file to be read.

- PKG_UTIL.LOB_COPY_HUGE

  Reads the content of a specified length from the specified offset position of the source BLOB or CLOB, writes the content to the specified offset position of the target BLOB or CLOB, and returns the target object.

  The prototype of the PKG_UTIL.LOB_COPY_HUGE function is as follows:

```
PKG_UTIL.LOB_COPY_HUGE(
   lob_obj    INOUT BLOB,
   source_obj  IN    BLOB,
   amount      IN    BIGINT,
   dest_offset IN    BIGINT DEFAULT 1,
   src_offset  IN    BIGINT DEFAULT 1
)RETURN BLOB;

PKG_UTIL.LOB_COPY_HUGE(
   lob_obj    INOUT CLOB,
   source_obj  IN    CLOB,
   amount      IN    BIGINT,
   dest_offset IN    BIGINT DEFAULT 1,
   src_offset  IN    BIGINT DEFAULT 1
)RETURN CLOB;
```

Table 10-31 PKG_UTIL.LOB_COPY_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob_obj	BLOB/CLOB	INOUT	No	Target BLOB/CLOB.
source_obj	BLOB/CLOB	IN	No	Source BLOB/CLOB.
amount	BIGINT	IN	No	Length of the data to be copied (in bytes for BLOBs or in characters for CLOBs).
dest_offset	BIGINT	IN	No	Offset position of the target LOB to which the data is loaded.
src_offset	BIGINT	IN	No	Offset position of the source LOB from which the data is read.

- PKG_UTIL.BLOB_RESET

  Sets a segment of data in a BLOB to the specified value and returns the processed BLOB and the actually processed length.

  The prototype of the PKG_UTIL.BLOB_RESET function is as follows:

```
PKG_UTIL.BLOB_RESET(
   lob       INOUT BLOB,
   len       INOUT BIGINT,
   start_pos IN    BIGINT DEFAULT 1,
   value     IN    INTEGER DEFAULT 0
)RETURN RECORD;
```

Table 10-32 PKG_UTIL.BLOB_RESET parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	BLOB	INOUT	No	LOB to be reset.
len	INTEGER	INOUT	No	Length to reset, in bytes.
start	INTEGER	IN	No	Specifies the start position for reset.
value	INTEGER	IN	Yes	Sets characters. Default value: **'0'**.

- PKG_UTIL.CLOB_RESET

  Sets a piece of data to spaces.

  The prototype of the PKG_UTIL.CLOB_RESET function is as follows:

```
PKG_UTIL.CLOB_RESET(
   lob       INOUT CLOB,
   len       INOUT BIGINT,
   start_pos IN    BIGINT DEFAULT 1
)RETURN RECORD;
```

Table 10-33 PKG_UTIL.CLOB_RESET parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	CLOB	INOUT	No	LOB to be reset.
len	INTEGER	INOUT	No	Length to reset, in characters.
start	INTEGER	IN	No	Reset start position. The default value is **1**.

- PKG_UTIL.LOADBLOBFROMFILE

  Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target BLOB, and returns the target object, read position, and write position.

The prototype of the PKG_UTIL.LOADBLOBFROMFILE function is as follows:

```
PKG_UTIL.LOADBLOBFROMFILE(
   dest_lob     INOUT  BLOB,
   fd           IN     INTEGER,
   amount       IN     BIGINT,
   dest_offset  INOUT  BIGINT,
   file_offset  INOUT  BIGINT
)RETURN RECORD;
```

Table 10-34 PKG_UTIL.LOADBLOBFROMFILE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB	INOUT	No	Target BLOB as the INOUT parameter.
fd	INTEGER	IN	No	File descriptor of the source BFILE object.
amount	BIGINT	IN	No	Length of the data to be copied (in bytes for BLOBs or in characters for CLOBs).
dest_offset	BIGINT	INOUT	No	Offset position of the target LOB to which the data is written as the INOUT parameter.
src_offset	BIGINT	INOUT	No	Offset position of the source BFILE file from which the data is read as the INOUT parameter.

- PKG_UTIL.LOADCLOBFROMFILE

  Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target CLOB, and returns the target object, read position, and write position.

  The prototype of the PKG_UTIL.LOADCLOBFROMFILE function is as follows:

```
PKG_UTIL.LOADCLOBFROMFILE(
   dest_lob     INOUT  CLOB,
   fd           IN     INTEGER,
   amount       IN     BIGINT,
   dest_offset  INOUT  BIGINT,
   file_offset  INOUT  BIGINT
)RETURN RECORD;
```

Table 10-35 PKG_UTIL.LOADCLOBFROMFILE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	CLOB	INOUT	No	Target CLOB as the INOUT parameter.
fd	INTEGER	IN	No	File descriptor of the source BFILE object.
amount	BIGINT	IN	No	Length to copy (in characters for CLOBs).
dest_offset	BIGINT	INOUT	No	Offset position of the target LOB to which the data is written as the INOUT parameter.
src_offset	BIGINT	INOUT	No	Offset position of the source BFILE file from which the data is read as the INOUT parameter.

- PKG_UTIL.LOB_CONVERTTOBLOB_HUGE

  Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a BLOB, and writes the BLOB to the specified position of target LOB. *amount* indicates the length to be converted.

  The prototype of the PKG_UTIL.LOB_CONVERTTOBLOB_HUGE function is as follows:

```
PKG_UTIL.LOB_CONVERTTOBLOB_HUGE(
   dest_lob    INOUT  BLOB,
   src_clob    IN     CLOB,
   amount      IN     BIGINT,
   dest_offset INOUT  BIGINT,
   src_offset  INOUT  BIGINT)
)RETURN RECORD;
```

Table 10-36 PKG_UTIL.LOB_CONVERTTOBLOB_HUGE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
dest_lob	BLOB	INOUT	No	Target LOB.
src_clob	CLOB	IN	No	CLOB to be converted.
amount	BIGINT	IN	No	Length to convert, in characters.
dest_offset	BIGINT	INOUT	No	Offset position of the target LOB to which the data is written as the INOUT parameter.
src_offset	BIGINT	INOUT	No	Offset position of the source CLOB from which the data is read as the INOUT parameter.

- PKG_UTIL.LOB_CONVERTTOCLOB_HUGE

  Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a CLOB, and writes the CLOB to the specified position of target LOB. *amount* indicates the length to be converted.

  The prototype of the PKG_UTIL.LOB_CONVERTTOCLOB_HUGE function is as follows:

```
PKG_UTIL.LOB_CONVERTTOCLOB_HUGE(
   dest_lob    INOUT  CLOB,
   src_blob    IN     BLOB,
   amount      IN     BIGINT,
   dest_offset INOUT  BIGINT,
   src_offset  INOUT  BIGINT)
)RETURN RECORD;
```

Table 10-37 PKG_UTIL.LOB_CONVERTTOCLOB_HUGE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
dest_lob	CLOB	INOUT	No	Target LOB.
src_blob	BLOB	IN	No	BLOB to be converted.
amount	BIGINT	IN	No	Length to convert, in bytes.
dest_offset	BIGINT	INOUT	No	Offset position of the target LOB to which the data is written as the INOUT parameter.
src_offset	BIGINT	INOUT	No	Offset position of the source CLOB from which the data is read as the INOUT parameter.

- PKG_UTIL.BFILE_GET_LENGTH

  Obtains and returns the specified length of a BFILE file.

  The prototype of the PKG_UTIL.BFILE_GET_LENGTH function is as follows:

```
PKG_UTIL.BFILE_GET_LENGTH(
    fd INTEGER
)RETURN BIGINT;
```

Table 10-38 PKG_UTIL.LOB_GET_LENGTH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
fd	INTEGER	IN	No	File descriptor of the specified BFILE file.

- PKG_UTIL.BFILE_OPEN

  Opens a BFILE file and returns its file descriptor.

  The prototype of the PKG_UTIL.BFILE_OPEN function is as follows:

```
PKG_UTIL.BFILE_OPEN(
    file_name TEXT,
    open_mode TEXT)
RETURN INTEGER;
```

Table 10-39 PKG_UTIL.BFILE_OPEN parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file_name	TEXT	IN	No	Name of the specified BFILE file.
open_mode	TEXT	IN	No	Open mode, which can only be set to **r**, that is, the read mode.

- PKG_UTIL.BFILE_CLOSE

  Closes a BFILE file.

  The prototype of the PKG_UTIL.BFILE_CLOSE function is as follows:

```
PKG_UTIL.BFILE_CLOSE(
    fd INTEGER)
RETURN bool;
```

Table 10-40 PKG_UTIL.BFILE_CLOSE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
fd	INTEGER	IN	No	File descriptor of the specified BFILE file.

- PKG_UTIL.LOB_WRITE_HUGE

Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.

The prototype of the PKG_UTIL.LOB_WRITE_HUGE function is as follows:

```
PKG_UTIL.LOB_WRITE_HUGE(
   dest_lob  INOUT BLOB,
   len       IN INTEGER,
   start_pos IN BIGINT,
   src_lob   IN RAW
)RETURN BLOB;

PKG_UTIL.LOB_WRITE_HUGE(
   dest_lob  INOUT CLOB,
   len       IN INTEGER,
   start_pos IN BIGINT,
   src_lob   IN VARCHAR2
)RETURN CLOB;
```

Table 10-41 PKG_UTIL.LOB_WRITE_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB/CLOB	INOUT	No	Target LOB as the INOUT parameter, to which the content is to be written.
len	INTEGER	IN	No	Length of the data to be written (in bytes for BLOBs or in characters for CLOBs)
start_pos	BIGINT	IN	No	Offset position for writing data to *dest_lob*
src_lob	RAW/VARCHAR2	IN	No	Source LOB.

- PKG_UTIL.IO_PRINT

  Outputs a string.

  The prototype of the PKG_UTIL.IO_PRINT function is as follows:

  ```
  PKG_UTIL.IO_PRINT(
  format       IN   TEXT,
  is_one_line  IN   BOOLEAN
  )
  RETURN void;
  ```

Table 10-42 PKG_UTIL.IO_PRINT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
format	TEXT	IN	No	Indicates the character string to be output.
is_one_line	BOOLEAN	IN	No	Specifies whether to output the string as a line.

- PKG_UTIL.RAW_GET_LENGTH

  Obtains the length of RAW data.

  The prototype of the PKG_UTIL.RAW_GET_LENGTH function is as follows:

```
PKG_UTIL.RAW_GET_LENGTH(
value       IN   RAW
)
RETURN INTEGER;
```

Table 10-43 PKG_UTIL.RAW_GET_LENGTH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
raw	RAW	IN	No	Indicates the object whose length is to be obtained.

- PKG_UTIL.RAW_CAST_FROM_VARCHAR2

  Converts VARCHAR2 data to RAW data.

  The prototype of the PKG_UTIL.RAW_CAST_FROM_VARCHAR2 function is as follows:

```
PKG_UTIL.RAW_CAST_FROM_VARCHAR2(
str       IN   VARCHAR2
)
RETURN raw;
```

Table 10-44 PKG_UTIL.RAW_CAST_FROM_VARCHAR2 parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
str	VARCHAR2	IN	No	Indicates the source data to be converted

- PKG_UTIL.RAW_CAST_FROM_BINARY_INTEGER

  Converts BIGINT data to RAW data.

  The prototype of the PKG_UTIL.RAW_CAST_FROM_BINARY_INTEGER function is as follows:

```
PKG_UTIL.RAW_CAST_FROM_BINARY_INTEGER(
value       IN   BIGINT,
endianess   IN   INTEGER
)
RETURN RAW;
```

  Table 10-45 PKG_UTIL.RAW_CAST_FROM_BINARY_INTEGER parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
value	BIGINT	IN	No	Indicates the source data to be converted
endianess	INTEGER	IN	No	The value is an integer in lexicographic order. Currently, the value can be **1** (BIG_ENDIAN), **2** (LITTLE_ENDIAN), or **3** (MACHINE_ENDIAN).

- PKG_UTIL.RAW_CAST_TO_BINARY_INTEGER

  Converts RAW data into BINARY_INTEGER.

  The prototype of the PKG_UTIL.RAW_CAST_TO_BINARY_INTEGER function is as follows:

```
PKG_UTIL.RAW_CAST_TO_BINARY_INTEGER(
value       IN   RAW,
endianess   IN   INTEGER
)
RETURN INTEGER;
```

  Table 10-46 PKG_UTIL.RAW_CAST_TO_BINARY_INTEGER parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
value	RAW	IN	No	Indicates the source data to be converted
endianess	INTEGER	IN	No	The value is an integer in lexicographic order. Currently, the value can be **1** (BIG_ENDIAN), **2** (LITTLE_ENDIAN), or **3** (MACHINE_ENDIAN).

- PKG_UTIL.RANDOM_SET_SEED

  Sets a random seed.

  The prototype of the PKG_UTIL.RANDOM_SET_SEED function is as follows:

```
PKG_UTIL.RANDOM_SET_SEED(
seed        IN   INT
)
RETURN integer;
```

Table 10-47 PKG_UTIL.RANDOM_SET_SEED parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
seed	INT	IN	No	Sets a random seed.

- PKG_UTIL.RANDOM_GET_VALUE

  Returns a 15-digit random number ranging from 0 to 1.

  The prototype of the PKG_UTIL.RANDOM_GET_VALUE function is as follows:

```
PKG_UTIL.RANDOM_GET_VALUE(
)
RETURN NUMERIC;
```

- PKG_UTIL.FILE_SET_DIRNAME

  Sets the directory to be operated. It must be called to set directory for each operation involving a single directory.

  The prototype of the PKG_UTIL.FILE_SET_DIRNAME function is as follows:

```
PKG_UTIL.FILE_SET_DIRNAME(
dir  IN  TEXT
)
RETURN BOOL
```

Table 10-48 PKG_UTIL.FILE_SET_DIRNAME parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dirname	TEXT	IN	No	Directory of a file. It is a string, indicating an object name. **NOTE** File directories need to be added to the system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. Functions that involve **location** as parameters also comply with this rule.

- PKG_UTIL.FILE_OPEN

  Opens a file. A maximum of 50 files can be opened at a time. This function returns a handle of the INTEGER type.

  The prototype of the PKG_UTIL.FILE_OPEN function is as follows:

  ```
  PKG_UTIL.FILE_OPEN(
  file_name    IN  TEXT,
  open_mode    IN  INTEGER)
  ```

  Table 10-49 PKG_UTIL.FILE_OPEN parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file_name	TEXT	IN	No	File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the OPEN function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).
open_mode	INTEGER	IN	No	File opening mode, including **r** (read), **w** (write), and **a** (append). **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- PKG_UTIL.FILE_SET_MAX_LINE_SIZE

  Sets the maximum length of a line to be written to a file.

  The prototype of the PKG_UTIL.FILE_SET_MAX_LINE_SIZE function is as follows:

  ```
  PKG_UTIL.FILE_SET_MAX_LINE_SIZE(
  max_line_size in INTEGER)
  RETURN BOOL
  ```

Table 10-50 PKG_UTIL.FILE_SET_MAX_LINE_SIZE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
max_line_size	INTEGER	IN	No	Maximum number of characters in each line, including newline characters. The minimum value is **1** and the maximum is **32767**. If this parameter is not specified, the default value **1024** is used.

- PKG_UTIL.FILE_IS_CLOSE

  Checks whether a file handle is closed.

  The prototype of the PKG_UTIL.FILE_IS_CLOSE function is as follows:

```
PKG_UTIL.FILE_IS_CLOSE(
file in INTEGER
)
RETURN BOOL
```

Table 10-51 PKG_UTIL.FILE_IS_CLOSE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle

- PKG_UTIL.FILE_READ

  Reads a line of data from an open file handle based on the specified length.

  The prototype of the PKG_UTIL.FILE_READ function is as follows:

```
PKG_UTIL.FILE_READ(
file     IN   INTEGER,
```

```
buffer   OUT  TEXT,
len      IN   BIGINT DEFAULT 1024)
```

Table 10-52 PKG_UTIL.FILE_READ parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	INTEGER	IN	No	File handle opened by calling the OPEN function. The file must be opened in read mode. Otherwise, the **INVALID_OPERATION** exception is thrown.
buffer	TEXT	IN	No	Buffer used to receive data
len	BIGINT	IN	Yes	Number of bytes read from a file

- PKG_UTIL.FILE_READLINE

  Reads a line of data from an open file handle based on the specified length.

  The prototype of the PKG_UTIL.FILE_READLINE function is as follows:

  ```
  PKG_UTIL.FILE_READLINE(
  file    IN  INTEGER,
  buffer  OUT TEXT,
  len     IN  INTEGER DEFAULT NULL)
  ```

Table 10-53 PKG_UTIL.FILE_READLINE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	INTEGER	IN	No	File handle opened by calling the OPEN function. The file must be opened in read mode. Otherwise, the **INVALID_OPERATION** exception is thrown.
buffer	TEXT	IN	No	Buffer used to receive data
len	INTEGER	IN	Yes	Number of bytes read from a file. The default value is **NULL**. If the default value **NULL** is used, **max_line_size** is used to specify the line size.

- PKG_UTIL.FILE_WRITE

  Writes the data specified in the buffer to a file.

  The prototype of the PKG_UTIL.FILE_WRITE function is as follows:

  ```
  PKG_UTIL.FILE_WRITE(
  file IN INTEGER,
  buffer IN TEXT
  )
  RETURN BOOL
  ```

Table 10-54 PKG_UTIL.FILE_WRITE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle
buffer	TEXT	IN	No	Text data to be written to a file. The maximum buffer size is 32767 bytes. If no value is specified, the default value is 1024 bytes. Before the writing is performed, the buffer occupied by PUT operations cannot exceed 32767 bytes. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- PKG_UTIL.FILE_NEWLINE

  Writes a line terminator to an open file. The line terminator is related to the platform.

  The prototype of the PKG_UTIL.FILE_NEWLINE function is as follows:

```
PKG_UTIL.FILE_NEWLINE(
file IN INTEGER
)
RETURN BOOL
```

Table 10-55 PKG_UTIL.FILE_NEWLINE parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
file	INTEGER	IN	No	Opened file handle

- PKG_UTIL.FILE_WRITELINE

  Writes a line to a file.

  The prototype of the PKG_UTIL.FILE_WRITELINE function is as follows:

```
PKG_UTIL.FILE_WRITELINE(
file IN INTEGER,
buffer IN TEXT
)
RETURN BOOL
```

Table 10-56 PKG_UTIL.FILE_WRITELINE parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
file	INTEGER	IN	No	Opened file handle
buffer	TEXT	IN	No	Content to be written.

- PKG_UTIL.FILE_READ_RAW

  Reads binary data of a specified length from an open file handle and returns the read binary data. The return type is RAW.

The prototype of the PKG_UTIL.FILE_READ_RAW function is as follows:

```
PKG_UTIL.FILE_READ_RAW(
file      IN INTEGER,
length    IN INTEGER DEFAULT NULL
)
RETURN raw
```

Table 10-57 PKG_UTIL.FILE_READ_RAW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle
length	INTEGER	IN	Yes	Length of the data to be read. The default value is **NULL**. By default, all data in the file is read. The maximum size is 1 GB.

- PKG_UTIL.FILE_WRITE_RAW

  Writes the input binary object of the RAW type to an open file. If the insertion is successful, **true** is returned.

  The prototype of the PKG_UTIL.FILE_WRITE_RAW function is as follows:

  ```
  PKG_UTIL.FILE_WRITE_RAW(
  file IN INTEGER,
  r    IN RAW
  )
  RETURN BOOL
  ```

Table 10-58 PKG_UTIL.FILE_NEWLINE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle
r	RAW	IN	Yes	Data to be written to the file **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- PKG_UTIL.FILE_FLUSH

  Data in a file handle must be written into a physical file. Data in the buffer must have a line terminator. Refresh is important if a file must be read when it is opened. For example, debugging information can be refreshed to a file so that it can be read immediately.

  The prototype of the PKG_UTIL.FILE_FLUSH function is as follows:

  ```
  PKG_UTIL.FILE_FLUSH (
  file IN INTEGER
  )
  RETURN VOID
  ```

Table 10-59 PKG_UTIL.FILE_FLUSH parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle

- PKG_UTIL.FILE_CLOSE

  Closes an open file handle.

  The prototype of the PKG_UTIL.FILE_CLOSE function is as follows:

  ```
  PKG_UTIL.FILE_CLOSE (
  file IN INTEGER
  )
  RETURN BOOL
  ```

  Table 10-60 PKG_UTIL.FILE_CLOSE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle

- PKG_UTIL.FILE_REMOVE

  Deletes a disk file. To perform this operation, you must have required permissions.

  The prototype of the PKG_UTIL.FILE_REMOVE function is as follows:

  ```
  PKG_UTIL.FILE_REMOVE(
  file_name IN TEXT
  ```

```
)
RETURN VOID
```

Table 10-61 PKG_UTIL.FILE_REMOVE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
filen_ame	TEXT	IN	No	Name of the file to be deleted

- PKG_UTIL.FILE_RENAME

  Renames a file on the disk, similar to **mv** in Unix.

  The prototype of the PKG_UTIL.FILE_RENAME function is as follows:

  ```
  PKG_UTIL.FILE_RENAME(
  src_dir IN TEXT,
  src_file_name IN TEXT,
  dest_dir IN TEXT,
  dest_file_name IN TEXT,
  overwrite BOOLEAN DEFAULT FALSE)
  ```

Table 10-62 PKG_UTIL.FILE_RENAME parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
src_dir	TEXT	IN	Yes	Source file directory (case-sensitive) **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
src_file_name	TEXT	IN	Yes	Source file name
dest_dir	TEXT	IN	Yes	Target file directory (case-sensitive) **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
dest_file_name	TEXT	IN	Yes	Target file name
overwrite	BOOLEAN	IN	No	The default value is **false**. If a file with the same name exists in the destination directory, the file will not be rewritten.

- PKG_UTIL.FILE_SIZE

  Returns the size of a specified file.

  The prototype of the PKG_UTIL.FILE_SIZE function is as follows:

```
BIGINT PKG_UTIL.FILE_SIZE(
file_name IN TEXT
)RETURN BIGINT
```

Table 10-63 PKG_UTIL.FILE_SIZE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file_name	TEXT	IN	No	File name

- PKG_UTIL.FILE_BLOCK_SIZE

  Returns the number of blocks contained in a specified file.

  The prototype of the PKG_UTIL.FILE_BLOCK_SIZE function is as follows:

  ```
  BIGINT PKG_UTIL.FILE_BLOCK_SIZE(
  file_name IN TEXT
  )RETURN BIGINT
  ```

  Table 10-64 PKG_UTIL.FILE_BLOCK_SIZE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file_name	TEXT	IN	No	File name

- PKG_UTIL.FILE_EXISTS

  Checks whether a file exists.

  The prototype of the PKG_UTIL.FILE_EXISTS function is as follows:

  ```
  PKG_UTIL.FILE_EXISTS(
  file_name IN TEXT
  )
  RETURN BOOL
  ```

Table 10-65 PKG_UTIL.FILE_EXISTS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file_name	TEXT	IN	No	File name

- PKG_UTIL.FILE_GETPOS

  Specifies the offset of a returned file, in bytes.

  The prototype of the PKG_UTIL.FILE_GETPOS function is as follows:

```
PKG_UTIL.FILE_GETPOS(
file IN INTEGER
)
RETURN BIGINT
```

Table 10-66 PKG_UTIL.FILE_GETPOS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle

- PKG_UTIL.FILE_SEEK

  Adjusts the position of a file pointer forward or backward based on the specified number of bytes.

  The prototype of the PKG_UTIL.FILE_SEEK function is as follows:

```
VOID PKG_UTIL.FILE_SEEK(
file IN INTEGER,
start IN BIGINT
)
RETURN VOID
```

Table 10-67 PKG_UTIL.FILE_SEEK parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle
start	BIGINT	IN	No	File offset, in bytes.

- PKG_UTIL.FILE_CLOSE_ALL

  Closes all file handles opened in a session.

  The prototype of the PKG_UTIL.FILE_CLOSE_ALL function is as follows:

  ```
  PKG_UTIL.FILE_CLOSE_ALL(
  )
  RETURN VOID
  ```

  Table 10-68 PKG_UTIL.FILE_CLOSE_ALL parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
None	None	None	None	None

- PKG_UTIL.EXCEPTION_REPORT_ERROR

  Throws an exception.

The prototype of the PKG_UTIL.EXCEPTION_REPORT_ERROR function is as follows:

```
PKG_UTIL.EXCEPTION_REPORT_ERROR(
code INTEGER,
log TEXT,
flag BOOLEAN DEFAULT FALSE
)
RETURN INTEGER
```

Table 10-69 PKG_UTIL.EXCEPTION_REPORT_ERROR parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
code	INTEGER	IN	No	Error code displayed when a running exception occurs.
log	TEXT	IN	No	Log information displayed when a running exception occurs.
flag	BOOLEAN	IN	Yes	Reserved. The default value is **false**.

- PKG_UTIL.APP_READ_CLIENT_INFO

  Reads the client information.

  The prototype of the PKG_UTIL.app_read_client_info function is as follows:

  ```
  PKG_UTIL.app_read_client_info(
  OUT buffer TEXT
  )RETURN TEXT
  ```

Table 10-70 PKG_UTIL.APP_READ_CLIENT_INFO parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
buffer	TEXT	IN	No	Client information returned.

- PKG_UTIL.APP_SET_CLIENT_INFO

  Sets the client information.

  The prototype of the PKG_UTIL.APP_SET_CLIENT_INFO function is as follows:

```
PKG_UTIL.APP_SET_CLIENT_INFO(
str TEXT
)
```

Table 10-71 PKG_UTIL.APP_SET_CLIENT_INFO parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
str	TEXT	IN	No	Client information to be set.

- PKG_UTIL.LOB_CONVERTTOBLOB

  Converts a CLOB to a BLOB. **amount** indicates the conversion length.

  The prototype of the PKG_UTIL.LOB_CONVERTTOBLOB function is as follows:

```
PKG_UTIL.lob_converttoblob(
dest_lob BLOB,
src_clob CLOB,
amount INTEGER,
dest_offset INTEGER,
src_offset INTEGER
)RETURN RAW
```

Table 10-72 PKG_UTIL.LOB_CONVERTTOBLOB parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
dest_lob	BLOB	IN	No	Target LOB.
src_clob	CLOB	IN	No	CLOB to be converted.
amount	INTEGER	IN	No	Conversion length.
dest_offset	INTEGER	IN	No	Start position of the target LOB.
src_offset	INTEGER	IN	No	Start position of the source CLOB.

- PKG_UTIL.LOB_CONVERTTOCLOB

  Converts a BLOB to a CLOB. **amount** indicates the conversion length.

  The prototype of the PKG_UTIL.lob_converttoclob function is as follows:

```
PKG_UTIL.lob_converttoclob(
dest_lob CLOB,
src_blob BLOB,
amount INTEGER,
dest_offset INTEGER,
src_offset INTEGER
)RETURN TEXT
```

Table 10-73 PKG_UTIL.LOB_CONVERTTOCLOB parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
dest_lob	CLOB	IN	No	Target LOB.
src_blob	BLOB	IN	No	CLOB to be converted.
amount	INTEGER	IN	No	Conversion length.
dest_offset	INTEGER	IN	No	Start position of the target LOB.
src_offset	INTEGER	IN	No	Start position of the source CLOB.

- PKG_UTIL.LOB_TEXTTORAW

  Converts TEXT data into RAW data.

  The prototype of the PKG_UTIL.LOB_TEXTTORAW function is as follows:

  ```
  PKG_UTIL.LOB_TEXTTORAW(
  src_lob CLOB
  )
  RETURN RAW
  ```

Table 10-74 PKG_UTIL.LOB_TEXTTORAW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
src_lob	CLOB	IN	No	LOB to be converted.

- PKG_UTIL.LOB_RAWTOTEXT

  Converts RAW data to TEXT data.

  The prototype of the PKG_UTIL.LOB_RAWTOTEXT function is as follows:

```
PKG_UTIL.LOB_RAWTOTEXT(
src_lob IN BLOB
)
RETURN TEXT
```

Table 10-75 PKG_UTIL.LOB_RAWTOTEXT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
src_lob	BLOB	IN	No	LOB to be converted.

- PKG_UTIL.MATCH_EDIT_DISTANCE_SIMILARITY

  Calculates the difference between two character strings.

  The prototype of the PKG_UTIL.MATCH_EDIT_DISTANCE_SIMILARITY function is as follows:

```
PKG_UTIL.MATCH_EDIT_DISTANCE_SIMILARITY(
str1 TEXT,
str2 TEXT
)
RETURN INTEGER
```

Table 10-76 PKG_UTIL.MATCH_EDIT_DISTANCE_SIMILARITY parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
str1	TEXT	IN	No	First character string.
str2	TEXT	IN	No	Second character string.

- PKG_UTIL.RAW_CAST_TO_VARCHAR2

  Converts RAW data into VARCHAR2 data.

  The prototype of the PKG_UTIL.RAW_CAST_TO_VARCHAR2 function is as follows:

  ```
  PKG_UTIL.RAW_CAST_TO_VARCHAR2(
  str RAW
  )
  RETURN VARCHAR2
  ```

  Table 10-77 PKG_UTIL.RAW_CAST_TO_VARCHAR2 parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
str	RAW	IN	No	Hexadecimal string

- PKG_UTIL.SESSION_CLEAR_CONTEXT

  Clears the session context.

  The prototype of the PKG_UTIL.SESSION_CLEAR_CONTEXT function is as follows:

  ```
  PKG_UTIL.SESSION_CLEAR_CONTEXT(
  namespace TEXT,
  ```

```
client_identifier TEXT,
attribute TEXT
)
RETURN INTEGER
```

Table 10-78 PKG_UTIL.SESSION_CLEAR_CONTEXT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
namespace	TEXT	IN	No	Namespace of an attribute.
client_identifier	TEXT	IN	No	Usually the value of this parameter is the same as that of **namespace**. If this parameter is set to **null**, all namespaces are modified by default.
attribute	TEXT	IN	No	Attribute to be cleared.

- PKG_UTIL.SESSION_SEARCH_CONTEXT

  Searches for an attribute value.

  The prototype of the PKG_UTIL.SESSION_SEARCH_CONTEXT function is as follows:

  ```
  PKG_UTIL.SESSION_SEARCH_CONTEXT(
  namespace TEXT,
  attribute TEXT
  )
  RETURN INTEGER
  ```

Table 10-79 PKG_UTIL.SESSION_SEARCH_CONTEXT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
namespace	TEXT	IN	No	Namespace of an attribute.
attribute	TEXT	IN	No	Attribute value to be searched for.

- PKG_UTIL.SESSION_SET_CONTEXT

  Sets the attribute value.

  The prototype of the PKG_UTIL.SESSION_SET_CONTEXT function is as follows:

```
PKG_UTIL.SESSION_SET_CONTEXT(
namespace TEXT,
attribute TEXT,
value TEXT
)
RETURN INTEGER
```

Table 10-80 PKG_UTIL.SESSION_SET_CONTEXT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
namespace	TEXT	IN	No	Namespace of an attribute.
attribute	TEXT	IN	No	Attribute to be set.
value	TEXT	IN	No	Attribute value.

- PKG_UTIL.UTILITY_GET_TIME

  Prints the Unix timestamp.

  The prototype of the PKG_UTIL.UTILITY_GET_TIME function is as follows:

  ```
  PKG_UTIL.UTILITY_GET_TIME()
  RETURN BIGINT
  ```

- PKG_UTIL.UTILITY_FORMAT_ERROR_BACKTRACE

  Displays the error stack of a stored procedure.

  The prototype of the PKG_UTIL.UTILITY_FORMAT_ERROR_BACKTRACE function is as follows:

  ```
  PKG_UTIL.UTILITY_FORMAT_ERROR_BACKTRACE()
  RETURN TEXT
  ```

- PKG_UTIL.UTILITY_FORMAT_ERROR_STACK

  Displays the error information about a stored procedure.

  The prototype of the PKG_UTIL.UTILITY_FORMAT_ERROR_STACK function is as follows:

  ```
  PKG_UTIL.UTILITY_FORMAT_ERROR_STACK()
  RETURN TEXT
  ```

- PKG_UTIL.UTILITY_COMPILE_SCHEMA

  Recompiles packages, functions and stored procedures under the specified schema.

  The prototype of the PKG_UTIL.UTILITY_COMPILE_SCHEMA function is as follows:

  ```
  PKG_UTIL.UTILITY_COMPILE_SCHEMA (
  schema IN VARCHAR2,
  compile_all IN BOOLEAN DEFAULT TRUE,
  reuse_settings IN BOOLEAN DEFAULT FALSE
  )
  RETURNS VOID
  ```

- PKG_UTIL.GS_COMPILE_SCHEMA

  Recompiles packages, functions and stored procedures under the specified schema.

  The prototype of the PKG_UTIL.GS_COMPILE_SCHEMA stored procedure is as follows:

  ```
  PKG_UTIL.GS_COMPILE_SCHEMA (
  schema_name IN VARCHAR2 DEFAULT NULL,
  compile_all IN BOOLEAN DEFAULT FALSE,
  retry_times IN INT DEFAULT 10
  )
  ```

Table 10-81 PKG_UTIL.GS_COMPILE_SCHEMA parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
schema_name	VARCHAR2	IN	Yes	Specifies the name of the namespace.
compile_all	BOOLEAN	IN	Yes	Specifies to compile all objects. • **false**: Compile the packages, functions, and stored procedures whose status is **false** in the **pg_object** table. • **true**: Compile all packages, functions, and stored procedures in the **pg_object** table.
retry_times	INT	IN	Yes	Specifies the number of retry times.

- PKG_UTIL.UTILITY_FORMAT_CALL_STACK

  Displays the call stack of a stored procedure.

  The prototype of the PKG_UTIL.UTILITY_FORMAT_CALL_STACK function is as follows:

  ```
  PKG_UTIL.UTILITY_FORMAT_CALL_STACK()
  RETURN TEXT
  ```

  Example:

  ```
  -- Delete a schema.
  drop schema if exists pkg_var_test cascade;
  -- Create a schema named pkg_var_test.
  create schema pkg_var_test;
  -- Set the schema and parameters.
  set current_schema = pkg_var_test;
  set behavior_compat_options ='plpgsql_dependency';
  -- Create a package.
  create or replace package test_pkg as
      referenced_var int;
      unreferenced_var int;
  end test_pkg;
  /
  -- Create a function.
  create or replace function test_func return int
  is
  begin
    return 1;
  end;
  ```

```
/
-- Create a stored procedure.
create or replace procedure test_proc
is
  proc_var int;
begin
  proc_var := 1;
end;
/
-- Recompile package functions and stored procedures under pkg_var_test.
call pkg_util.utility_compile_schema('pkg_var_test');
Or
call pkg_util.gs_compile_schema(' ',false,2);
-- Delete pkg_var_test.
drop schema if exists pkg_var_test cascade;
```

- PKG_UTIL.APP_SET_MODULE

  Sets the value of a module.

  The prototype of the PKG_UTIL.APP_SET_MODULE stored procedure is as follows:

  ```
  PKG_UTIL.APP_SET_MODULE (
     str TEXT)
  RETURNS VOID
  ```

  Table 10-82 PKG_UTIL.APP_SET_MODULE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
text	TEXT	IN	Yes	Specifies the value of a module to be set.

  Example:

  ```
  CALL PKG_UTIL.APP_SET_MODULE('set module');
   app_set_module
  ----------------

  (1 row)
  ```

- PKG_UTIL.APP_READ_MODULE

  Reads the value of a module.

  The prototype of the PKG_UTIL.APP_READ_MODULE stored procedure is as follows:

  ```
  PKG_UTIL.APP_READ_MODULE(
  OUT BUFFER TEXT
  )
  ```

Table 10-83 PKG_UTIL.APP_READ_MODULE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
buffer	TEXT	OUT	Yes	Specifies the value of a module to be returned.

Example:

```
DECLARE
    module VARCHAR2(64);
BEGIN
    PKG_UTIL.APP_READ_MODULE(module);
    DBE_OUTPUT.PRINT_LINE(module);
END;
/
set module
ANONYMOUS BLOCK EXECUTE
```

- PKG_UTIL.APP_SET_ACTION

  Sets the value of an action.

  The prototype of the PKG_UTIL.APP_SET_ACTION stored procedure is as follows:

  ```
  PKG_UTIL.APP_SET_ACTION (
     str TEXT)
  RETURNS VOID
  ```

Table 10-84 PKG_UTIL.APP_SET_ACTION parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
text	TEXT	IN	Yes	Specifies the value of an action to be set.

Example:

```
CALL PKG_UTIL.APP_SET_ACTION('set action');
 app_set_action
----------------

(1 row)
```

- PKG_UTIL.APP_READ_ACTION

  Reads the value of an action.

  The prototype of the PKG_UTIL.APP_READ_ACTION stored procedure is as follows:

  ```
  PKG_UTIL.APP_READ_ACTION(
  OUT buffer TEXT
  )
  ```

  Table 10-85 PKG_UTIL.APP_READ_ACTION parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
buffer	TEXT	OUT	Yes	Specifies the value of an action to be returned.

  Example:

  ```
  DECLARE
      action VARCHAR2(64);
  BEGIN
      PKG_UTIL.APP_READ_ACTION(action);
      DBE_OUTPUT.PRINT_LINE(action);
  END;
  /
  set action
  ANONYMOUS BLOCK EXECUTE
  ```

- PKG_UTIL.MODIFY_PACKAGE_STATE

  Modifies the PL/SQL status of the current session.

  The prototype of the PKG_UTIL.MODIFY_PACKAGE_STATE stored procedure is as follows:

  ```
  PKG_UTIL.MODIFY_PACKAGE_STATE (
     flags INT)
  RETURNS VOID
  ```

Table 10-86 PKG_UTIL.MODIFY_PACKAGE_STATE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
flags	INT	INT	Yes	Bit flag of the operation performed on the PL/SQL. When **flags** is set to **1**, the session cache of the PL/SQL that is currently running in the session is released after the top-level PL/SQL is executed. The current value of any package is cleared globally and the cached cursor is closed. On subsequent use, PL/SQL re-instantiates and re-initializes the package globally. Other bit flags are not supported.

Example:

```
CALL PKG_UTIL.MODIFY_PACKAGE_STATE(1);
 modify_package_state
----------------------

(1 row)
```

10.12.1.3 DBE_DESCRIBE

For details about the basic interfaces supported by DBE_DESCRIBE, see **Table 1 DBE_DESCRIBE basic interfaces**.

Table 10-87 DBE_DESCRIBE basic interfaces

Interface	Description
DBE_DESCRIBE.GET_PROCEDURE_NAME	This is an internal function and is not recommended. The name of a stored procedure or function is extracted from the original input of a user.
DBE_DESCRIBE.IS_NUMBER_TYPE	This is an internal function and is not recommended. It is used to determine whether the data type is numeric.

- DBE_DESCRIBE.GET_PROCEDURE_NAME

  This is an internal function and is not recommended. It is used to extract the name of a stored procedure or function from the original input of a user.

  The prototype of the DBE_DESCRIBE.GET_PROCEDURE_NAME function is as follows:

  ```
  DBE_DESCRIBE.GET_PROCEDURE_NAME(
  name IN VARCHAR2)
  RETURNS VARCHAR2;
  ```

  Table 10-88 DBE_DESCRIBE.GET_PROCEDURE_NAME interface parameters

Parameter	Type	Input/ Output Parameter	Whether NULL Is Allowed	Description
name	VARCHAR2	IN	No	Entity name.

- DBE_DESCRIBE.IS_NUMBER_TYPE

  This is an internal function and is not recommended. It is used to check whether the type is numeric.

  The prototype of the DBE_DESCRIBE.IS_NUMBER_TYPE function is as follows:

  ```
  DBE_DESCRIBE.IS_NUMBER_TYPE(
  type_oid IN INTEGER)
  RETURNS BOOLEAN;
  ```

  Table 10-89 DBE_DESCRIBE.IS_NUMBER_TYPE interface parameters

Parameter	Type	Input/Output Parameter	Whether NULL Is Allowed	Description
type_oid	INTEGER	IN	Yes	OID of the type.

10.12.1.4 DBE_XML

Table 10-90 lists all APIs supported by DBE_XML.

Table 10-90 DBE_XML parameters

API	Description
DBE_XML.XML_FREE_PARSER	Frees a parser.
DBE_XML.XML_PARSER_GET_DOC	Obtains the parsed document node.
DBE_XML.XML_GET_VALIDATION_MODE	Obtains the validation attribute.

API	Description
DBE_XML.XML_SET_VALIDATION_MODE	Creates a parser instance.
DBE_XML.XML_PARSE_BUFFER	Parses the VARCHAR string.
DBE_XML.XML_PARSE_CLOB	Parses the CLOB string.
DBE_XML.XML_SET_VALIDATION_MODE	Sets the validation attribute.
DBE_XML.XML_DOM_APPEND_CHILD	Adds the newchild node to the end of the parent(n) node and returns the newly added node.
DBE_XML.XML_DOM_CREATE_ELEMENT	Returns the DOMElement object with the specified name.
DBE_XML.XML_DOM_CREATE_ELEMENT_NS	Returns the DOMElement object with the specified name and namespace.
DBE_XML.XML_DOM_CREATE_TEXT_NODE	Creates and returns a DOMText object.
DBE_XML.XML_DOM_FREE_DOCUMENT	Frees a specified XML DOM object.
DBE_XML.XML_DOM_FREE_ELEMENT	Frees a specified XML DOM object.
DBE_XML.XML_DOM_FREE_NODE	Frees a DOMNode node.
DBE_XML.XML_DOM_FREE_NODELIST	Frees a DOMNodeList node.
DBE_XML.XML_DOM_GET_ATTRIBUTE	Obtains the attributes of a specified XML DOM object.
DBE_XML.XML_DOM_GET_ATTRIBUTES	Returns the attribute values of a DOMNode node as a map.
DBE_XML.XML_DOM_GET_CHILD_NODES	Converts several subnodes under a node into a node list.
DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME	Obtains the list of specified subnodes of a specified XML DOM object.
DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME_NS	Obtains the list of subnodes in the specified namespace of a specified XML DOM object.
DBE_XML.XML_DOM_GET_DOCUMENT_ELEMENT	Returns the first subnode of the specified document.

API	Description
DBE_XML.XML_DOM_GET_FIRST_CHILD	Returns the first subnode of a node.
DBE_XML.XML_DOM_GET_LAST_CHILD	Returns the last subnode of a node.
DBE_XML.XML_DOM_GET_LENGTH	Returns the number of nodes based on the content in the node of the specified type.
DBE_XML.XML_DOM_GET_LOCALNAME	Returns the local name of the given object.
DBE_XML.XML_DOM_GET_NAMED_ITEM	Returns the node specified by name.
DBE_XML.XML_DOM_GET_NAMED_ITEM_NS	Returns the node specified by name and namespace.
DBE_XML.XML_DOM_GET_NEXT_SIBLING	Returns the next node of the specified node.
DBE_XML.XML_DOM_GET_NODE_NAME	Returns the name of a node.
DBE_XML.XML_DOM_GET_NODE_TYPE	Returns the type of a node.
DBE_XML.XML_DOM_GET_NODE_VALUE	Returns the value of a DOMNode node.
DBE_XML.XML_DOM_GET_PARENT_NODE	Returns the parent node of the given DOMNode node.
DBE_XML.XML_DOM_GET_TAGNAME	Obtains the tag name of a specified XML DOM object.
DBE_XML.XML_DOM_HAS_CHILD_NODES	Checks whether the DOMNode object has any subnode.
DBE_XML.XML_DOM_IMPORT_NODE	Copies a node to another node and mounts the copied node to a specified document.
DBE_XML.XML_DOM_IS_NULL	Checks whether the given object is null.
DBE_XML.XML_DOM_ITEM	Returns the element corresponding to the index in a list or map based on the index.
DBE_XML.XML_DOM_MAKE_ELEMENT	Returns the DOMElement object after conversion.
DBE_XML.XML_DOM_MAKENODE	Converts the given object to the DOMNode type.
DBE_XML.XML_DOM_NEW_DOM_DOCUMENT_EMPTY	Returns a new DOMDocument object.

API	Description
XML_DOM_NEW_DOM_DOCUMENT_CLOB	Returns a new DOMDocument instance object created from the specified CLOB type.
DBE_XML.XML_DOM_NEW_DOCUMENT_XMLTYPE	Returns a new DOMDocument instance object created from the specified XMLType type.
DBE_XML.XML_DOM_SET_ATTRIBUTE	Sets the attributes of a specified XML DOM object.
DBE_XML.XML_DOM_SET_CHARSET	Sets the character set for a DOMDocument object.
DBE_XML.XML_DOM_SET_DOCTYPE	Sets the external DTD of a DOMDocument object.
DBE_XML.XML_DOM_SET_NODE_VALUE	Sets the value of a node in the DOMNode object.
DBE_XML.XML_DOM_WRITE_TO_BUFFER_DOC	Writes the given DOMDocument object to the buffer.
DBE_XML.XML_DOM_WRITE_TO_BUFFER_NODE	Writes the given DOMNode object to the buffer.
DBE_XML.XML_DOM_WRITE_TO_CLOB_DOC	Writes the given DOMDocument object to a CLOB.
DBE_XML.XML_DOM_WRITE_TO_CLOB_NODE	Writes the given DOMNode object to a CLOB.
DBE_XML.XML_DOM_WRITE_TO_FILE_DOC	Writes an XML node to a specified file using the database character set.
DBE_XML.XML_DOM_WRITE_TO_FILE_NODE	Writes an XML node to a specified file using the database character set.
DBE_XML.XML_DOM_GET_SESSION_TREE_NUM	Displays the number of DOM trees of all types in the current session.
DBE_XML.XML_DOM_GET_DOC_TREES_INFO	Displays statistics such as the memory usage and number of nodes of the DOM tree of the document type.
DBE_XML.XML_DOM_GET_DETAIL_DOC_TREE_INFO	Displays the number of nodes of each type for a specific document variable.

- DBE_XML.XML_FREE_PARSER

  Frees a given parser object.

  The stored procedure prototype of DBE_XML.XML_FREE_PARSER is as follows:

  ```
  DBE_XML.XML_FREE_PARSER(
  id IN RAW(13))
  RETURNS VOID;
  ```

Table 10-91 DBE_XML.XML_FREE_PARSER parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object

- DBE_XML.XML_PARSER_GET_DOC

  Returns the root node of the DOM tree document constructed by the parser.

  The prototype of the DBE_XML.XML_PARSER_GET_DOC function is as follows:

```
DBE_XML.XML_PARSER_GET_DOC(
id IN RAW(13))
RETURNS RAW(13);
```

Table 10-92 DBE_XML.XML_PARSER_GET_DOC parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object

NOTE

- If the DBE_XML.XML_PARSER_GET_DOC function is empty, null is returned.
- If the parser input by the DBE_XML.XML_PARSER_GET_DOC function has not parsed any document, null is returned.

- DBE_XML.XML_GET_VALIDATION_MODE

  Obtains the parsing validation mode of a specified PARSER. If DTD validation is enabled, **TRUE** is returned. Otherwise, **FALSE** is returned.

  The prototype of the DBE_XML.XML_GET_VALIDATION_MODE function is as follows:

```
DBE_XML.XML_GET_VALIDATION_MODE(
id RAW(13))
RETURNS BOOL;
```

Table 10-93 DBE_XML.XML_GET_VALIDATION_MODE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object

- DBE_XML.XML_NEW_PARSER

  Creates a PARSER object and returns a new parser instance.

  The prototype of the DBE_XML.XML_NEW_PARSER function is as follows:

```
DBE_XML.XML_NEW_PARSER()
RETURNS RAW(13);
```

- DBE_XML.XML_PARSE_BUFFER

  Parses XML documents stored in strings.

  The stored procedure prototype of DBE_XML.XML_PARSE_BUFFER is as follows:

```
DBE_XML.XML_PARSE_BUFFER(
id RAW(13),
xmlstr VARCHAR2)
RETURNS VOID;
```

  Table 10-94 DBE_XML.XML_PARSE_BUFFER parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object
xmlstr	VARCHAR2	IN	No	A string that stores XML documents

  NOTE

  - The maximum length of a character string that can be parsed by the XML_PARSE_BUFFER function is 32767. If the length exceeds the maximum, an error is reported.
  - Different from the database A, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsing, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
  - DTD validation differences:
    - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value **"Ch..."** is not an enumerated value in the brackets. However, the database A does not report this error.
    - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case sensitive. **Baidu** cannot correspond to **baidu**. However, the database A does not report this error.
  - Namespace validation difference: Undeclared namespace tags are parsed. However, the database A reports an error.
  - Difference in parsing XML predefined entities: **'** and **"** are parsed and translated into ' and ". However, predefined entities in database A are not translated into characters.

- DBE_XML.XML_PARSE_CLOB

  Parses XML documents stored in a CLOB.

  The stored procedure prototype of DBE_XML.XML_PARSE_CLOB is as follows:

```
DBE_XML.XML_PARSE_CLOB(
id IN RAW(13),
doc IN CLOB)
RETURNS VOID;
```

Table 10-95 DBE_XML.XML_PARSE_CLOB parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object
doc	CLOB	IN	No	A string that stores XML documents

NOTE

- xml_parse_clob cannot parse CLOBs greater than or equal to 2 GB.
- Different from the database A, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsing, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value **"Ch..."** is not an enumerated value in the brackets. However, the database A does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case sensitive. **Baidu** cannot correspond to **baidu**. However, the database A does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the database A reports an error.
- Difference in parsing XML predefined entities: **'** and **"** are parsed and translated into ' and ". However, predefined entities in database A are not translated into characters.

- DBE_XML.XML_SET_VALIDATION_MODE

  Sets the parsing validation mode of a specified PARSER.

  The stored procedure prototype of DBE_XML.XML_SET_VALIDATION_MODE is as follows:

```
DBE_XML.XML_SET_VALIDATION_MODE(
id RAW(13),
validate BOOLEAN)
RETURNS VOID;
```

Table 10-96 DBE_XML.XML_SET_VALIDATION_MODE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
validate	BOOLEAN	IN	Yes	Mode to be set: • **TRUE**: DTD validation is enabled. • **FALSE**: DTD validation is disabled.

NOTE

- If the input parameter **validate** of the DBE_XML.XML_SET_VALIDATION_MODE function is null, the parsing validation mode of the parser is not changed.
- By default, the DTD validation is enabled during parser initialization.

- DBE_XML.XML_DOM_APPEND_CHILD

  Adds the newchild node to the end of the parent(n) node and returns the newly added node.

  The stored procedure prototype of DBE_XML.XML_DOM_APPEND_CHILD is as follows:

```
DBE_XML.XML_DOM_APPEND_CHILD(
   parentid IN RAW(13),
   childid IN RAW(13)
)
RETURNS RAW(13);
```

Table 10-97 DBE_XML.XML_DOM_APPEND_CHILD parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
parentId	RAW(13)	IN	No	XML DOM object
childId	RAW(13)	IN	No	XML DOM object

- DBE_XML.XML_DOM_CREATE_ELEMENT

  Returns the DOMElement object with the specified name.

  The prototype of the DBE_XML.XML_DOM_CREATE_ELEMENT function is as follows:

```
DBE_XML.XML_DOM_CREATE_ELEMENT(
   id IN RAW(13),
   tagname IN VARCHAR2
)
RETURNS RAW(13);
```

Table 10-98 DBE_XML.XML_DOM_CREATE_ELEMENT parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object
tagname	VARCHAR2	IN	No	Name of the new DOMElement object

- DBE_XML.XML_DOM_CREATE_ELEMENT_NS

  Returns the DOMElement object with the specified name and namespace.

  The prototype of the DBE_XML.XML_DOM_CREATE_ELEMENT_NS function is as follows:

```
DBE_XML.XML_DOM_CREATE_ELEMENT_NS(
   id IN RAW(13),
   tagname IN VARCHAR2,
   ns IN VARCHAR2
)
RETURNS RAW(13);
```

Table 10-99 DBE_XML.XML_DOM_CREATE_ELEMENT_NS parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object
tagname	VARCHAR2	IN	No	Name of the new DOMElement object
ns	VARCHAR2	IN	No	Namespace

- DBE_XML.XML_DOM_CREATE_TEXT_NODE

  Creates and returns a DOMText object.

  The prototype of the DBE_XML.XML_DOM_CREATE_TEXT_NODE function is as follows:

```
DBE_XML.XML_DOM_CREATE_TEXT_NODE(
   id IN RAW(13),
   data IN VARCHAR2
)
RETURNS RAW(13);
```

Table 10-100 DBE_XML.XML_DOM_CREATE_TEXT_NODE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
data	VARCHAR2	IN	No	Content of the new DOMText node

- DBE_XML.XML_DOM_FREE_DOCUMENT

  Frees a specified XML DOM object.

  The stored procedure prototype of DBE_XML.XML_DOM_FREE_DOCUMENT is as follows:

```
DBE_XML.XML_DOM_FREE_DOCUMENT(
    id RAW(13)
)
RETURNS VOID;
```

  Table 10-101 DBE_XML.XML_DOM_FREE_DOCUMENT parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE_XML.XML_DOM_FREE_ELEMENT

  Frees a specified XML DOM object.

  The stored procedure prototype of DBE_XML.XML_DOM_FREE_ELEMENT is as follows:

```
DBE_XML.XML_DOM_FREE_ELEMENT (
    id RAW(13)
)
RETURNS VOID;
```

  Table 10-102 DBE_XML.XML_DOM_FREE_ELEMENT parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE_XML.XML_DOM_FREE_NODE

  Frees a DOMNode node.

  The prototype of the DBE_XML.XML_DOM_FREE_NODE function is as follows:

```
DBE_XML.XML_DOM_FREE_NODE (
    id RAW(13)
)
RETURNS VOID;
```

Table 10-103 DBE_XML.XML_DOM_FREE_NODE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE_XML.XML_DOM_FREE_NODELIST

  Frees a DOMNodeList node.

  The stored procedure prototype of DBE_XML.XML_DOM_FREE_NODELIST is as follows:

```
DBE_XML.XML_DOM_FREE_NODELIST(
   id IN RAW(13)
)
RETURNS VOID
```

Table 10-104 DBE_XML.XML_DOM_FREE_NODELIST parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE_XML.XML_DOM_GET_ATTRIBUTE

  Obtains the attributes of a specified XML DOM object.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_ATTRIBUTE is as follows:

```
DBE_XML.XML_DOM_GET_ATTRIBUTE (
   docid   IN  RAW(13),
   name    IN  VARCHAR2
)
RETURNS VARCHAR2;
```

Table 10-105 DBE_XML.XML_DOM_GET_ATTRIBUTE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
docid	RAW(13)	IN	No	XML DOM object
name	VARCHAR2	IN	No	String

- DBE_XML.XML_DOM_GET_ATTRIBUTES

  Returns the attribute values of a DOMNode node as a map.

  The prototype of the DBE_XML.XML_DOM_GET_ATTRIBUTES function is as follows:

```
DBE_XML.XML_DOM_GET_ATTRIBUTES (
   id RAW(13)
)
RETURNS RAW(13);
```

Table 10-106 DBE_XML.XML_DOM_GET_ATTRIBUTES parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE_XML.XML_DOM_GET_CHILD_NODES

  Converts several subnodes under a node into a node list.

  The prototype of the DBE_XML.XML_DOM_GET_CHILD_NODES function is as follows:

```
DBE_XML.XML_DOM_GET_CHILD_NODES(
   id IN RAW(13)
)
RETURNS RAW(13);
```

Table 10-107 DBE_XML.XML_DOM_GET_CHILD_NODES parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME

  Obtains the list of specified subnodes of a specified XML DOM object.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME is as follows:

```
DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME (
   docid   IN  RAW(13),
   name    IN  VARCHAR2
)
RETURNS RAW(13);
```

Table 10-108 DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
docid	RAW(13)	IN	No	XML DOM object
name	VARCHAR2	IN	No	String

- DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME_NS

  Obtains the list of subnodes in the specified namespace of a specified XML DOM object.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME_NS is as follows:

```
DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME_NS (
   docid   IN  RAW(13),
   name    IN  VARCHAR2,
   ns      IN  VARCHAR2
)
RETURNS RAW(13);
```

  Table 10-109 DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME_NS parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
docid	RAW(13)	IN	No	XML DOM object
name	VARCHAR2	IN	No	String
ns	VARCHAR2	IN	Yes	String

- DBE_XML.XML_DOM_GET_DOCUMENT_ELEMENT

  Returns the first subnode of the specified document.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_DOCUMENT_ELEMENT is as follows:

```
DBE_XML.XML_DOM_GET_DOCUMENT_ELEMENT(
   id  RAW(13)
)
RETURNS RAW(13);
```

  Table 10-110 DBE_XML.XML_DOM_GET_DOCUMENT_ELEMENT parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE_XML.XML_DOM_GET_FIRST_CHILD

  Returns the first subnode of a node.

  The prototype of the DBE_XML.XML_DOM_GET_FIRST_CHILD function is as follows:

```
DBE_XML.XML_DOM_GET_FIRST_CHILD(
   id IN RAW(13)
)
RETURNS RAW(13);
```

Table 10-111 DBE_XML.XML_DOM_GET_FIRST_CHILD parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE_XML.XML_DOM_GET_LAST_CHILD

  Returns the last subnode of a node.

  The prototype of the DBE_XML.XML_DOM_GET_LAST_CHILD function is as follows:

```
DBE_XML.XML_DOM_GET_LAST_CHILD(
   id IN RAW(13)
)
RETURNS RAW(13);
```

Table 10-112 DBE_XML.XML_DOM_GET_LAST_CHILD parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE_XML.XML_DOM_GET_LENGTH

  Returns the number of nodes based on the content in the node of the specified type.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_LENGTH is as follows:

```
DBE_XML.XML_DOM_GET_LENGTH(
   id RAW(13)
)
RETURNS VOID;
```

Table 10-113 DBE_XML.XML_DOM_GET_LENGTH parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object

- DBE_XML.XML_DOM_GET_LOCALNAME

  Returns the local name of the given object.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_LOCALNAME is as follows:

```
DBE_XML.XML_DOM_GET_LOCALNAME (
   id  RAW(13)
```

```
)
RETURNS VARCHAR2;
```

Table 10-114 DBE_XML.XML_DOM_GET_LOCALNAME parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object

- DBE_XML.XML_DOM_GET_NAMED_ITEM

  Returns the node specified by name.

  The prototype of the DBE_XML.XML_DOM_GET_NAMED_ITEM function is as follows:

```
DBE_XML.XML_DOM_GET_NAMED_ITEM(
   id IN RAW(13),
   nodeName IN VARCHAR2
)
RETURNS RAW(13);
```

Table 10-115 DBE_XML.XML_DOM_GET_NAMED_ITEM parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object
nodeName	VARCHAR2	IN	No	Name of the element to be retrieved

- DBE_XML.XML_DOM_GET_NAMED_ITEM_NS

  Returns the node specified by name and namespace.

  The prototype of the DBE_XML.XML_DOM_GET_NAMED_ITEM_NS function is as follows:

```
DBE_XML.XML_DOM_GET_NAMED_ITEM_NS(
   id  RAW(13),
   nodename IN VARCHAR2,
   ns IN VARCHAR2
)
RETURNS RAW(13);
```

Table 10-116 DBE_XML.XML_DOM_GET_NAMED_ITEM_NS parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
nodeName	VARCHAR2	IN	No	Name of the element to be retrieved
ns	VARCHAR2	IN	Yes	Namespace

- DBE_XML.XML_DOM_GET_NEXT_SIBLING

  Returns the next node of the specified node.

  The prototype of the DBE_XML.XML_DOM_GET_NEXT_SIBLING function is as follows:

```
DBE_XML.XML_DOM_GET_NEXT_SIBLING(
    id IN RAW(13)
)
RETURNS RAW(13);
```

  Table 10-117 DBE_XML.XML_DOM_GET_NEXT_SIBLING parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE_XML.XML_DOM_GET_NODE_NAME

  Returns the name of a node.

  The prototype of the DBE_XML.XML_DOM_GET_NODE_NAME function is as follows:

```
DBE_XML.XML_DOM_GET_NODE_NAME(
    id IN RAW(13)
)
RETURNS VARCHAR2;
```

  Table 10-118 DBE_XML.XML_DOM_GET_NODE_NAME parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE_XML.XML_DOM_GET_NODE_TYPE

  Returns the type of a node.

  The prototype of the DBE_XML.XML_DOM_GET_NODE_TYPE function is as follows:

```
DBE_XML.XML_DOM_GET_NODE_TYPE(
   id IN RAW(13)
)
RETURNS INTEGER;
```

Table 10-119 DBE_XML.XML_DOM_GET_NODE_TYPE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE_XML.XML_DOM_GET_NODE_VALUE

  Returns the value of a DOMNode node.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_NODE_VALUE is as follows:

  ```
  DBE_XML.XML_DOM_GET_NODE_VALUE(
  id IN RAW(13))
  RETURNS VARCHAR2;
  ```

  Table 10-120 DBE_XML.XML_DOM_GET_NODE_VALUE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object

- DBE_XML.XML_DOM_GET_PARENT_NODE

  Returns the parent node of the given DOMNode node.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_PARENT_NODE is as follows:

  ```
  DBE_XML.XML_DOM_GET_PARENT_NODE(
  id IN RAW(13))
  RETURNS RAW(13);
  ```

  Table 10-121 DBE_XML.XML_DOM_GET_PARENT_NODE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object

- DBE_XML.XML_DOM_GET_TAGNAME

  Obtains the tag name of a specified XML DOM object.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_TAGNAME is as follows:

```
DBE_XML.XML_DOM_GET_TAGNAME (
   docid RAW(13)
)
RETURNS VARCHAR2;
```

Table 10-122 DBE_XML.XML_DOM_GET_TAGNAME parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
docid	RAW(13)	IN	Yes	XML DOM object

- DBE_XML.XML_DOM_HAS_CHILD_NODES

  Checks whether the DOMNode object has any subnode.

  The stored procedure prototype of DBE_XML.XML_DOM_HAS_CHILD_NODES is as follows:

  ```
  DBE_XML.XML_DOM_HAS_CHILD_NODES(
  id IN RAW(13))
  RETURNS BOOLEAN
  ```

  Table 10-123 DBE_XML.XML_DOM_HAS_CHILD_NODES parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object

- DBE_XML.XML_DOM_IMPORT_NODE

  Copies a node to another node and mounts the copied node to a specified document. If the type of the copied node does not belong to the 12 types specified by constants of XML DOM, an exception indicating that the type is not supported is thrown.

  The prototype of the DBE_XML.XML_DOM_IMPORT_NODE function is as follows:

  ```
  DBE_XML.XML_DOM_IMPORT_NODE(
     doc_id IN RAW(13),
     node_id IN RAW(13),
     deep IN BOOLEAN
  )
  RETURNS RAW(13);
  ```

Table 10-124 DBE_XML.XML_DOM_IMPORT_NODE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
doc_id	RAW(13)	IN	No	Document to which the node is mounted
node_id	RAW(13)	IN	No	Node to be imported
deep	BOOLEAN	IN	No	Specifies whether to perform recursive import. • If the value is **TRUE**, the node and all its subnodes are imported. • If the value is **FALSE**, the node itself is imported.

- DBE_XML.XML_DOM_IS_NULL

  Checks whether the given object is null. If yes, **TRUE** is returned. If no, **FALSE** is returned.

  The prototype of the DBE_XML.XML_DOM_IS_NULL function is as follows:

```
DBE_XML.XML_DOM_IS_NULL (
   id  RAW(13)
)
RETURNS BOOLEAN;
```

Table 10-125 DBE_XML.XML_DOM_IS_NULL parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object

- DBE_XML.XML_DOM_ITEM

  Returns the element corresponding to the index in a list or map based on the index.

  The prototype of the DBE_XML.XML_DOM_ITEM function is as follows:

```
DBE_XML.XML_DOM_ITEM (
   id IN RAW(13),
   index IN INTEGER
)
RETURNS RAW(13);
```

Table 10-126 DBE_XML.XML_DOM_ITEM parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object
index	INTEGER	IN	No	Index of the element to be retrieved

- DBE_XML.XML_DOM_MAKE_ELEMENT

  Returns the DOMElement object after conversion.

  The stored procedure prototype of DBE_XML.XML_DOM_MAKE_ELEMENT is as follows:

```
DBE_XML.XML_DOM_MAKE_ELEMENT(
id IN RAW(13))
RETURNS RAW(13)
```

Table 10-127 DBE_XML.XML_DOM_MAKE_ELEMENT parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE_XML.XML_DOM_MAKENODE

  Converts the given object to the DOMNode type.

  The stored procedure prototype of DBE_XML.XML_DOM_MAKENODE is as follows:

```
DBE_XML.XML_DOM_MAKENODE(
  id    RAW(13)
)
RETURNS DOMNODE;
```

Table 10-128 DBE_XML.XML_DOM_MAKENODE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object

- DBE_XML.XML_DOM_NEW_DOM_DOCUMENT_EMPTY

  Returns a new DOMDocument object.

  The prototype of the DBE_XML.XML_DOM_NEW_DOM_DOCUMENT_EMPTY function is as follows:

```
DBE_XML.XML_DOM_NEW_DOM_DOCUMENT_EMPTY()
RETURNS RAW(13);
```

- XML_DOM_NEW_DOM_DOCUMENT_CLOB

  Returns a new DOMDocument instance object created from the specified CLOB type.

  The prototype of the XML_DOM_NEW_DOM_DOCUMENT_CLOB function is as follows:

```
DBE_XML.XML_DOM_NEW_DOM_DOCUMENT_CLOB(
   content IN  CLOB
)
RETURNS RAW(13);
```

  Table 10-129 XML_DOM_NEW_DOM_DOCUMENT_CLOB parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
content	CLOB	IN	No	Specified CLOB type

- DBE_XML.XML_DOM_NEW_DOCUMENT_XMLTYPE

  Returns a new DOMDocument instance object created from the specified XMLType type.

  The prototype of the DBE_XML.XML_DOM_NEW_DOCUMENT_XMLTYPE function is as follows:

```
DBE_XML.XML_DOM_NEW_DOCUMENT_XMLTYPE(
   content IN  CLOB
)
RETURNS RAW(13);
```

  Table 10-130 DBE_XML.XML_DOM_NEW_DOCUMENT_XMLTYPE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
content	CLOB	IN	No	Specified CLOB type

- DBE_XML.XML_DOM_SET_ATTRIBUTE

  Sets the attributes of a specified XML DOM object.

  The stored procedure prototype of DBE_XML.XML_DOM_SET_ATTRIBUTE is as follows:

```
DBE_XML.XML_DOM_SET_ATTRIBUTE(
   docid   IN  RAW(13),
   name    IN  VARCHAR2,
   value   IN  VARCHAR2
)
RETURNS VOID;
```

Table 10-131 DBE_XML.XML_DOM_SET_ATTRIBUTE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object
name	VARCHAR2	IN	No	String
value	VARCHAR2	IN	No	String

- DBE_XML.XML_DOM_SET_CHARSET

  Sets the character set for a DOMDocument object.

  The prototype of the DBE_XML.XML_DOM_SET_CHARSET function is as follows:

```
DBE_XML.XML_DOM_SET_CHARSET(
   id      IN RAW(13),
   charset IN VARCHAR2
)
RETURNS VOID;
```

Table 10-132 DBE_XML.XML_DOM_SET_CHARSET parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object
charset	VARCHAR2	IN	No	Character set

- DBE_XML.XML_DOM_SET_DOCTYPE

  Sets the external DTD of a DOMDocument object.

  The prototype of the DBE_XML.XML_DOM_SET_DOCTYPE function is as follows:

```
dbe_xml.xml_dom_set_doctype(
   id          IN  RAW(13),
   dtd_name    IN  VARCHAR2,
   system_id   IN  VARCHAR2,
   public_id   IN  VARCHAR2
)
RETURNS VOID;
```

Table 10-133 DBE_XML.XML_DOM_SET_DOCTYPE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
dtd_name	VARCHAR2	IN	No	Name of the DOCType to be initialized
system_id	VARCHAR2	IN	No	ID of the system whose DOCType needs to be initialized
public_id	VARCHAR2	IN	No	Public ID of the DOCType to be initialized

- DBE_XML.XML_DOM_SET_NODE_VALUE

  Sets the value of a node in the DOMNode object.

  The stored procedure prototype of DBE_XML.XML_DOM_SET_NODE_VALUE is as follows:

  ```
  DBE_XML.XML_DOM_SET_NODE_VALUE(
  id IN RAW(13),
  node_value IN VARCHAR2)
  RETURNS VOID
  ```

  Table 10-134 DBE_XML.XML_DOM_SET_NODE_VALUE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object
node_value	VARCHAR2	IN	No	String to be set in the DOMNode object

- DBE_XML.XML_DOM_WRITE_TO_BUFFER_DOC

  Writes the given DOMDocument object to the buffer.

  The stored procedure prototype of DBE_XML.XML_DOM_WRITE_TO_BUFFER_DOC is as follows:

  ```
  DBE_XML.DBE_XML.XML_DOM_WRITE_TO_BUFFER_DOC(
  id IN RAW(13))
  RETURNS VARCHAR2;
  ```

Table 10-135 DBE_XML.XML_DOM_WRITE_TO_BUFFER_DOC parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object

- DBE_XML.XML_DOM_WRITE_TO_BUFFER_NODE

  Writes the given DOMNode object to the buffer.

  The stored procedure prototype of DBE_XML.XML_DOM_WRITE_TO_BUFFER_NODE is as follows:

```
DBE_XML.DBE_XML.XML_DOM_WRITE_TO_BUFFER_NODE(
id IN RAW(13))
RETURNS VARCHAR2;
```

Table 10-136 DBE_XML.XML_DOM_WRITE_TO_BUFFER_NODE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object

- DBE_XML.XML_DOM_WRITE_TO_CLOB_DOC

  Writes the given DOMDocument object to a CLOB.

  The stored procedure prototype of DBE_XML.XML_DOM_WRITE_TO_CLOB_DOC is as follows:

```
DBE_XML.XML_DOM_WRITE_TO_CLOB_DOC(
    id IN RAW(13)
)
RETURNS VARCHAR2;
```

Table 10-137 DBE_XML.XML_DOM_WRITE_TO_CLOB_DOC parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object

- DBE_XML.XML_DOM_WRITE_TO_CLOB_NODE

  Writes the given DOMNode object to a CLOB.

  The stored procedure prototype of DBE_XML.XML_DOM_WRITE_TO_CLOB_NODE is as follows:

```
DBE_XML.XML_DOM_WRITE_TO_CLOB_NODE(
    id          IN  RAW(13)
)
RETURNS CLOB;
```

Table 10-138 DBE_XML.XML_DOM_WRITE_TO_CLOB_NODE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object

- DBE_XML.XML_DOM_WRITE_TO_FILE_DOC

  Writes an XML node to a specified file using the database character set.

  The stored procedure prototype of DBE_XML.XML_DOM_WRITE_TO_FILE_DOC is as follows:

```
DBE_XML.XML_DOM_WRITE_TO_FILE_DOC(
id IN  RAW(13),
file_dir IN  VARCHAR2)
RETURNS VOID

DBE_XML.XML_DOM_WRITE_TO_FILE_DOC(
id IN  RAW(13),
file_dir IN  VARCHAR2,
charset  IN  VARCHAR2)
RETURNS VOID PACKAGE
```

Table 10-139 DBE_XML.XML_DOM_WRITE_TO_FILE_DOC parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object
file_dir	VARCHAR2	IN	No	File to be written
charset	VARCHAR2	IN	No	Specified character set

- DBE_XML.XML_DOM_WRITE_TO_FILE_NODE

  Writes an XML node to a specified file using the database character set.

  The stored procedure prototype of DBE_XML.XML_DOM_WRITE_TO_FILE_NODE is as follows:

```
DBE_XML.XML_DOM_WRITE_TO_FILE_NODE(
id IN  RAW(13),
filename IN  VARCHAR2)
RETURNS VOID
```

Table 10-140 DBE_XML.XML_DOM_WRITE_TO_FILE_NODE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object
filename	VARCHAR2	IN	No	Specified file address

- DBE_XML.XML_DOM_GET_SESSION_TREE_NUM

  Queries the number of DOM trees of all types in the current session.

  The prototype of the DBE_XML.XML_DOM_GET_SESSION_TREE_NUM function is as follows:

  ```
  DBE_XML.XML_DOM_GET_SESSION_TREE_NUM()
  RETURNS INTEGER
  ```

- DBE_XML.XML_DOM_GET_DOC_TREES_INFO

  Queries the DOM tree information of the document type in the current session, such as the memory usage.

  The prototype of the DBE_XML.XML_DOM_GET_DOC_TREES_INFO function is as follows:

  ```
  DBE_XML.XML_DOM_GET_DOC_TREES_INFO()
  RETURNS VARCHAR2
  ```

- DBE_XML.XML_DOM_GET_DETAIL_DOC_TREE_INFO

  Queries the number of subnodes of each type in the transferred document.

  The prototype of the DBE_XML.XML_DOM_GET_DETAIL_DOC_TREE_INFO function is as follows:

  ```
  DBE_XML.XML_DOM_GET_DETAIL_DOC_TREE_INFO(
  id IN  RAW(13))
  RETURNS VARCHAR2
  ```

Table 10-141 DBE_XML.XML_DOM_GET_DETAIL_DOC_TREE_INFO parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

10.12.2 Secondary Encapsulation APIs (Recommended)

10.12.2.1 DBE_APPLICATION_INFO

Interface Description

Table 10-142 provides all interfaces supported by the **DBE_APPLICATION_INFO** package. **DBE_APPLICATION_INFO** applies to the current session.

Table 10-142 DBE_APPLICATION_INFO

Interface	Description
DBE_APPLICATION_INFO.SET_CLIENT_INFO	Writes client information.
DBE_APPLICATION_INFO.READ_CLIENT_INFO	Reads client information.
DBE_APPLICATION_INFO.SET_MODULE	Sets the name of the currently running module to the new module. You can set the module and action.
DBE_APPLICATION_INFO.READ_MODULE	Reads the values of the module and action columns of the current session.
DBE_APPLICATION_INFO.SET_ACTION	Sets the name of the current action in the current module.

- DBE_APPLICATION_INFO.SET_CLIENT_INFO

  Writes client information. The prototype of the DBE_APPLICATION_INFO.SET_CLIENT_INFO function is as follows:

```
DBE_APPLICATION_INFO.SET_CLIENT_INFO(
    str text
)returns void;
```

  Table 10-143 DBE_APPLICATION_INFO.SET_CLIENT_INFO interface parameters

Parameter	Description
str	Client information to be written. The maximum length is 64 bytes. If the length exceeds 64 bytes, it will be truncated.

- DBE_APPLICATION_INFO.READ_CLIENT_INFO

  The prototype of the DBE_APPLICATION_INFO.READ_CLIENT_INFO function is as follows:

```
DBE_APPLICATION_INFO.READ_CLIENT_INFO(
 OUT client_info text);
```

Table 10-144 DBE_APPLICATION_INFO.READ_CLIENT_INFO interface parameters

Parameter	Description
client_info	Client information

- DBE_APPLICATION_INFO.SET_MODULE

  Sets the name of the currently running module to the new module. The prototype of the DBE_APPLICATION_INFO.SET_MODULE function is as follows:

```
DBE_APPLICATION_INFO.SET_MODULE(
    IN module_name text,
    IN action_name text
);
```

Table 10-145 DBE_APPLICATION_INFO.SET_MODULE parameters

Parameter	Description
module_name	Name of the running module. The maximum length is 64 bytes. If the length exceeds 64 bytes, it will be truncated.
action_name	Name of the current action in the current module. The maximum length is 64 bytes. If the length exceeds 64 bytes, it will be truncated.

  Example:

```
CALL dbe_application_info.set_module('module_name','action_name');
 set_module
------------

(1 row)
```

- DBE_APPLICATION_INFO.READ_MODULE

  Reads the values of the module and action columns of the current session. The prototype of the DBE_APPLICATION_INFO.READ_MODULE function is as follows:

```
DBE_APPLICATION_INFO.READ_MODULE(
    OUT module_name text,
    OUT action_name text
);
```

Table 10-146 DBE_APPLICATION_INFO.READ_MODULE parameters

Parameter	Description
module_name	Name of the running module.
action_name	Name of the current action in the current module.

Example:

```
DECLARE
 module varchar2(64);
 action varchar2(64);
BEGIN
 dbe_application_info.read_module(module,action);
 dbe_output.print_line(module);
 dbe_output.print_line(action);
END;
/
module_name
action_name
ANONYMOUS BLOCK EXECUTE
```

- DBE_APPLICATION_INFO.SET_ACTION

  Sets the name of the current action in the current module. The prototype of the DBE_APPLICATION_INFO.SET_ACTION function is as follows:

```
DBE_APPLICATION_INFO.SET_ACTION(
      IN action_name text
);
```

Table 10-147 DBE_APPLICATION_INFO.SET_ACTION parameters

Parameter	Description
action_name	Name of the current action in the current module. The maximum length is 64 bytes. If the length exceeds 64 bytes, it will be truncated.

Examples

```
CALL dbe_application_info.set_action('action_name');
 set_action
------------

(1 row)
```

10.12.2.2 DBE_COMPRESSION

Interface Description

Evaluates the sampling compression rate of a specified data object or obtains the compression type of a specified row of data based on the input parameters.

Table 10-148 DBE_COMPRESSION

Interface	Description
GET_COMPRESSION_RATIO	Evaluates the sampling compression ratio of a specified data object based on input parameters.
GET_COMPRESSION_TYPE	Obtains the compression type of data in a specified row based on input parameters.

- DBE_COMPRESSION.GET_COMPRESSION_RATIO

  Evaluates the sampling compression rate of a specified data object based on the input parameters. The prototype is as follows:

```
DBE_COMPRESSION.GET_COMPRESSION_RATIO (
scratchtbsname   IN  TEXT,
ownname          IN  TEXT,
objname          IN  TEXT,
subobjname       IN  TEXT,
comptype         IN  INTEGER,
blkcnt_cmp       OUT INTEGER,
blkcnt_uncmp     OUT INTEGER,
row_cmp          OUT INTEGER,
row_uncmp        OUT INTEGER,
cmp_ratio        OUT NUMBER,
comptype_str     OUT VARCHAR2,
sample_ratio     IN  NUMBER  DEFAULT 20,
objtype          IN  INTEGER DEFAULT 1);
```

Table 10-149 DBE_COMPRESSION.GET_COMPRESSION_RATIO parameters

Parameter	Description
scratchtbsname	Tablespace to which a data object belongs.
ownname	Data object owner (schema to which the data object belongs).
objname	Data object name.
subobjname	Name of a data subobject.
comptype	Compression type. The options are as follows: ● **1**: uncompressed. ● **2**: advanced compression.
blkcnt_cmp	Number of pages occupied by sampled rows after compression.
blkcnt_uncmp	Number of pages occupied by sampled rows before compression.
row_cmp	Number of compressed rows on a single page.
row_uncmp	Number of uncompressed rows on a single page.
cmp_ratio	Compression ratio.
comptype_str	Character string of the compression type.
sample_ratio	Sampling rate.
objtype	Object type. The options are as follows: ● **1**: table object.

- DBE_COMPRESSION.GET_COMPRESSION_TYPE

  This interface is used to obtain the compression type of a specified row based on input parameters. This interface is an O&M interface and does not check the visibility. That is, if the input CTID is a deleted row, this interface still returns the latest status of the current row on the page. The prototype is as follows:

```
DBE_COMPRESSION.GET_COMPRESSION_TYPE (
ownname         IN  TEXT,
tablename   IN  TEXT,
ctid            IN  INTEGER,
subobjname  IN  TEXT    DEFAULT NULL,
comptype        OUT INTEGER);
```

Table 10-150 DBE_COMPRESSION.GET_COMPRESSION_TYPE parameters

Parameter	Description
ownname	Data object owner (schema to which the data object belongs).
tablename	Data object name.
ctid	CTID of the target row.
subobjname	Name of a data subobject.
comptype	Compression type. The options are as follows: ● **1**: uncompressed. ● **2**: advanced compression.

Examples

```
gaussdb=# alter database set ilm = on;
gaussdb=# CREATE user user1 IDENTIFIED BY 'Gauss_zzy123';
gaussdb=# CREATE user user2 IDENTIFIED BY 'Gauss_zzy123';
gaussdb=# SET ROLE user1 PASSWORD 'Gauss_zzy123';
gaussdb=# CREATE TABLE TEST_DATA (ORDER_ID INT, GOODS_NAME TEXT, CREATE_TIME TIMESTAMP)
  ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER 1 DAYS OF NO MODIFICATION;
INSERT INTO TEST_DATA VALUES (1,'Snack gift basket A', NOW());

gaussdb=# SELECT DBE_COMPRESSION.GET_COMPRESSION_TYPE('user1', 'test_data', '(0,1)', NULL);

```

10.12.2.3 DBE_FILE

The DBE_FILE package provides the capabilities of reading and writing operating system text files for stored procedures.

Precautions

- DBE_FILE requires that files opened using DBE_FILE.FOPEN be encoded using the database character set. If the opened files are not encoded using the expected character set, an encoding verification error occurs when DBE_FILE.READ_LINE is used to read files. DBE_FILE requires that files opened using DBE_FILE.FOPEN_NCHAR be encoded using the UTF-8 character set. If the opened files are not encoded using the expected character set, an encoding verification error occurs when DBE_FILE.READ_LINE_NCHAR is used to read files.
- When DBE_OUTPUT.PUT_LINE is used to print the result obtained by the DBE_FILE.READ_LINE_NCHAR API, ensure that the UTF-8 character set encoding can be converted to the current database character set encoding. If the preceding conditions are met, the result can be properly output. DBE_OUTPUT.PRINT_LINE does not support this function.
- DBE_FILE requires that the character set encoding of the client be the same as that of the database.
- Assume that the database character set encoding is ASCII, the client character set encoding supports Chinese, and the client calls DBE_FILE.WRITE_NCHAR or DBE_FILE.WRITE_LINE_NCHAR to write Chinese content. If the entered content is in UTF-8 encoding format, the written content may not be encoded in UTF-8 format. An error may be reported when the DBE_FILE.READ_LINE_NCHAR is used.

Data Types

- DBE_FILE.FILE_TYPE

Defines the representation of files in the DBE_FILE package. The fields in DBE_FILE.FILE_TYPE are private fields of the DBE_FILE package. Do not change the field value of the type defined in DBE_FILE.FILE_TYPE.

```
CREATE TYPE DBE_FILE.FILE_TYPE AS(
    id INTEGER,
    datatype INTEGER,
    byte_mode BOOLEAN
);
```

Table 10-151 DBE_FILE.FILE_TYPE columns

Parameter	Description
id	File handle
datatype	File data type (CHAR, NCHAR, or binary). Currently, only CHAR and NCHAR files are supported. For a CHAR file, **1** is returned. For an NCHAR file, **2** is returned.
byte_mode	Indicates that the file is opened in binary mode (**TRUE**) or text mode (**FALSE**).

API Description

Table 10-152 lists all APIs supported by the **DBE_FILE** package.

Table 10-152 DBE_FILE

API	Description
DBE_FILE.OPEN/ DBE_FILE.FOPEN	Opens a file based on the specified directory and file name. The corresponding file handle or the DBE_FILE.FILE_TYPE type object encapsulated with the file handle is returned.
DBE_FILE.IS_CLOSE	Checks whether a file handle is closed.
DBE_FILE.IS_OPEN	Checks whether a file handle is opened.
DBE_FILE.READ_LINE	Reads a line of a specified length from an open file.
DBE_FILE.WRITE	Writes data to the buffer of an open file.
DBE_FILE.NEW_LINE	Writes one or more line terminators to the buffer of an open file.
DBE_FILE.WRITE_LINE	Writes data to the buffer of an open file and automatically appends a line terminator.
DBE_FILE.FORMAT_WRITE	Writes data in a specified format to the buffer of an open file.

API	Description
DBE_FILE.GET_RAW	Reads RAW data of a specified number of bytes from an open file.
DBE_FILE.PUT_RAW	Writes raw data to the buffer of an open file.
DBE_FILE.FLUSH	Writes data in the buffer to a physical file.
DBE_FILE.CLOSE	Closes an open file handle.
DBE_FILE.CLOSE_ALL	Closes all file handles opened in a session.
DBE_FILE.REMOVE	Deletes a disk file based on the specified directory and file name. You must have sufficient permissions to perform this operation.
DBE_FILE.RENAME	Renames a disk file, which is similar to the mv command of Unix.
DBE_FILE.COPY	Copies data in a continuous area to a new file. If **start_line** and **end_line** are omitted, the entire file is copied.
DBE_FILE.GET_ATTR	Reads and returns the attributes of a disk file.
DBE_FILE.SEEK	Adjusts the position of a file pointer forward or backward based on the specified number of bytes.
DBE_FILE.GET_POS	Returns the current offset of a file, in bytes.
DBE_FILE.FOPEN_NCHAR	Opens a file of the NCHAR type based on the specified directory and file name.
DBE_FILE.WRITE_NCHAR	Writes data of the NVARCHAR2 type to the buffer of an open file of the NCHAR type.
DBE_FILE.WRITE_LINE_NCHAR	Writes data of the NVARCHAR2 type to the buffer of an open file of the NCHAR type and automatically appends a line terminator.
DBE_FILE.FORMAT_WRITE_NCHAR	Writes data of the NVARCHAR2 type to the buffer of an open file of the NCHAR type in a specified format.
DBE_FILE.READ_LINE_NCHAR	Reads a line of a specified length from an open file of the NCHAR type.

- DBE_FILE.OPEN/DBE_FILE.FOPEN

  Opens a file. You can specify the maximum line size. A maximum of 50 files can be opened in a session. This function returns a file handle of the INTEGER type. The function of DBE_FILE.FOPEN is similar to that of DBE_FILE.OPEN. It returns an object of the type defined in DBE_FILE.FILE_TYPE.

The prototypes of the DBE_FILE.OPEN and DBE_FILE.FOPEN functions are:

```
DBE_FILE.OPEN(
   dir          IN TEXT,
   file_name    IN TEXT,
   open_mode    IN TEXT,
   max_line_size IN INTEGER DEFAULT 1024)
RETURN INTEGER;

DBE_FILE.FOPEN(
   dir          IN TEXT,
   file_name    IN TEXT,
   open_mode    IN TEXT,
   max_line_size IN INTEGER DEFAULT 1024)
RETURN DBE_FILE.FILE_TYPE;
```

Table 10-153 DBE_FILE.OPEN/DBE_FILE.FOPEN parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dir	text	IN	No	Directory of a file. It is a string, indicating an object name. **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to read and write files in the file path specified by **safe_data_path**.
file_name	text	IN	No	File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the OPEN function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
open_mode	text	IN	No	File opening mode, including: • **r** (read text) • **w** (write text) • **a** (append text) • **rb** (read byte) • **wb** (write byte) • **ab** (append byte) **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
max_line_size	integer	IN	Yes	Maximum number of bytes in each line, including newline characters. The minimum value is **1** and the maximum is **32767**. If this parameter is not specified, the default value **1024** is used.

- DBE_FILE.IS_CLOSE

  Checks whether a file handle is closed. A Boolean value is returned. If an invalid file handle is detected, the **INVALID_FILEHANDLE** exception is thrown.

  The prototype of the DBE_FILE.IS_CLOSE function is as follows:

```
DBE_FILE.IS_CLOSE(
   file IN INTEGER)
RETURN BOOLEAN;

DBE_FILE.IS_CLOSE(
   file IN DBE_FILE.FILE_TYPE)
RETURN BOOLEAN;
```

Table 10-154 DBE_FILE.IS_CLOSE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	integer or dbe_file.file_type	IN	Yes	File handle or DBE_FILE.FILE_TYPE object to be checked. If the value is empty, the DBE_FILE.IS_CLOSE API returns empty.

- DBE_FILE.IS_OPEN

  Checks whether a file handle is opened. A Boolean value is returned. If an invalid file handle is detected, the **INVALID_FILEHANDLE** exception is thrown.

  The prototype of the DBE_FILE.IS_OPEN function is as follows:

```
DBE_FILE.IS_OPEN(
   file IN INTEGER)
RETURN BOOLEAN;

DBE_FILE.IS_OPEN(
   file IN DBE_FILE.FILE_TYPE)
RETURN BOOLEAN;
```

Table 10-155 DBE_FILE.IS_OPEN parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	integer or dbe_file.file_type	IN	Yes	File handle or DBE_FILE.FILE_TYPE object to be checked. If the value is empty, the DBE_FILE.IS_OPEN API returns false.

- DBE_FILE.READ_LINE

  Reads data from an open file and stores the read result to the buffer. It reads data to the end of each line excluding the line terminator, to the end of the file, or to the size specified by the **len** parameter. The length of the data to be read cannot exceed the value of **max_line_size** specified when the file is opened.

  The prototype of the DBE_FILE.READ_LINE stored procedure is as follows:

```
DBE_FILE.READ_LINE(
   file   IN  INTEGER,
   buffer OUT TEXT,
```

```
   len    IN  INTEGER DEFAULT NULL)
RETURN TEXT;

DBE_FILE.READ_LINE(
   file   IN  DBE_FILE.FILE_TYPE,
   buffer OUT TEXT,
   len    IN  INTEGER DEFAULT NULL)
RETURN TEXT;
```

Table 10-156 DBE_FILE.READ_LINE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	integer or dbe_file.file_type	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN. The file must be opened in read mode. Otherwise, the INVALID_OPERATION exception is thrown.
buffer	text	OUT	No	Buffer for receiving data.
len	integer	IN	Yes	Number of bytes read from the file. The default value is **NULL**. If the default value **NULL** is used, **max_line_size** is used to specify the line size.

- DBE_FILE.WRITE

  Writes buffer data to the buffer corresponding to a file. The file must be opened in write mode. This operation does not write a line terminator.

  The prototype of the **DBE_FILE.WRITE** function is as follows:

```
DBE_FILE.WRITE(
   file   IN INTEGER,
   buffer IN TEXT)
RETURN BOOLEAN;

DBE_FILE.WRITE(
   file   IN DBE_FILE.FILE_TYPE,
   buffer IN TEXT)
RETURN VOID;
```

Table 10-157 DBE_FILE.WRITE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	integer or dbe_file.file_type	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN. The file must be opened in write mode. This operation does not write line terminators.
buffer	text	IN	Yes	Text data to be written to the file. The accumulated write length of each line cannot be greater than or equal to the value of **max_line_size** specified when OPEN or FOPEN is used. Otherwise, an error is reported when the file is refreshed. If this parameter is left empty, the API directly returns an empty value. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- DBE_FILE.NEW_LINE

  Writes one or more line terminators to the buffer corresponding to a file. The line terminators are related to the platform used.

  The prototype of the **DBE_FILE.NEW_LINE** function is as follows:

```
DBE_FILE.NEW_LINE(
   file      IN INTEGER,
   line_nums IN INTEGER DEFAULT 1)
RETURN BOOLEAN;

DBE_FILE.NEW_LINE(
   file      IN DBE_FILE.FILE_TYPE,
   line_nums IN INTEGER DEFAULT 1)
RETURN VOID;
```

Table 10-158 DBE_FILE.NEW_LINE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	integer or dbe_file.file_type	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.
line_nums	integer	IN	Yes	Number of line terminators written to a file. The default value is **1**. If this parameter is left blank, line terminators are not written.

- DBE_FILE.WRITE_LINE

  Writes buffer data to the buffer corresponding to a file. The file must be opened in write mode. This operation automatically adds a line terminator.

  The prototype of the **DBE_FILE.WRITE_LINE** function is as follows:

```
DBE_FILE.WRITE_LINE(
   file   IN INTEGER,
   buffer IN TEXT,
   flush  IN BOOLEAN DEFAULT FALSE)
RETURN BOOLEAN;

DBE_FILE.WRITE_LINE(
   file   IN DBE_FILE.FILE_TYPE,
   buffer IN TEXT,
   flush  IN BOOLEAN DEFAULT FALSE)
RETURN VOID;
```

Table 10-159 DBE_FILE.WRITE_LINE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	integer or dbe_file.file_type	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.
buffer	text	IN	Yes	Text data to be written to the file. The length of each line (including the newline character) cannot be greater than the value of **max_line_size** specified when OPEN or FOPEN is executed or the default value. Otherwise, an error is reported when the file is refreshed. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
flush	boolean	IN	Yes	Determines whether to flush the data in the buffer corresponding to the file to the disk after WRITE_LINE. The default value is **FALSE**.

- DBE_FILE.FORMAT_WRITE

  Writes formatted data to the buffer corresponding to an open file. It is a DBE_FILE.WRITE API that allows formatting.

  The prototype of the DBE_FILE.FORMAT_WRITE function is as follows:

```
DBE_FILE.FORMAT_WRITE(
   file   IN INTEGER,
   format IN TEXT,
   arg1   IN TEXT DEFAULT NULL,
   . . .
   arg6   IN TEXT DEFAULT NULL)
RETURN BOOLEAN;

DBE_FILE.FORMAT_WRITE(
   file   IN DBE_FILE.FILE_TYPE,
   format IN TEXT,
   arg1   IN TEXT DEFAULT NULL,
   . . .
   arg6   IN TEXT DEFAULT NULL)
RETURN VOID;
```

Table 10-160 DBE_FILE.FORMAT_WRITE parameters

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
file	integer or dbe_file.file_type	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.
format	text	IN	Yes	Formatted string, containing the text and format characters \n and %s. If this parameter is left blank, no data is written.
[arg1 . . .arg6]	text	IN	Yes	Six optional parameters. The parameters and the positions of characters to be formatted are in one-to-one correspondence. If the parameter corresponding to a character to be formatted is not provided or the parameter is empty, an empty string is used to replace %s.

- DBE_FILE.GET_RAW

  Reads RAW data from an open file, stores the read result in the buffer, and returns the result from *r*.

  The prototype of the DBE_FILE.GET_RAW stored procedure is as follows:

```
DBE_FILE.GET_RAW(
   file   IN  INTEGER,
   r      OUT RAW,
   length IN  INTEGER DEFAULT NULL)
RETURN RAW;

DBE_FILE.GET_RAW(
   file   IN  DBE_FILE.FILE_TYPE,
   r      OUT RAW,
   length IN  INTEGER DEFAULT NULL)
RETURN BOOLEAN;
```

Table 10-161 DBE_FILE.GET_RAW parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER or dbe_file.file_type	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.
r	RAW	OUT	No	Buffer for receiving RAW data.
length	INTEGER	IN	Yes	Number of bytes read from the file. The default value is **NULL**. If the value is **NULL**, the maximum length of the RAW type is used to specify the size.

- DBE_FILE.PUT_RAW

  Writes raw data to the buffer corresponding to a file.

  The prototype of the DBE_FILE.PUT_RAW function is as follows:

```
DBE_FILE.PUT_RAW (
   file  IN INTEGER,
   r     IN RAW,
   flush IN BOOLEAN DEFAULT FALSE)
RETURN BOOLEAN;

DBE_FILE.PUT_RAW (
   file  IN DBE_FILE.FILE_TYPE,
   r     IN RAW,
   flush IN BOOLEAN DEFAULT FALSE)
RETURN VOID;
```

Table 10-162 DBE_FILE.PUT_RAW parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
file	INTEGER or dbe_file.file_type	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.
r	RAW	IN	No	RAW data to be written to a file. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
flush	BOOLEAN	IN	Yes	Determines whether to flush data to disks after PUT_RAW. The default value is **FALSE**.

- DBE_FILE.FLUSH

  Writes data in a buffer to a physical file. The buffer data must have a line terminator. This function can write the data in the buffer to the corresponding physical file in time.

  The prototype of the DBE_FILE.FLUSH function is as follows:

```
DBE_FILE.FLUSH(
   file IN INTEGER)
RETURN VOID;

DBE_FILE.FLUSH(
   file IN DBE_FILE.FILE_TYPE)
RETURN VOID;
```

Table 10-163 DBE_FILE.FLUSH parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	INTEGER or dbe_file.file_type	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.

- DBE_FILE.CLOSE

  Closes an open file handle. When this function is called, if there is cached data to be written, exception information may be received. If the handle is normally closed, **TRUE** is returned.

  The prototype of the DBE_FILE.CLOSE function is as follows:

```
DBE_FILE.CLOSE(
    file IN INTEGER)
RETURN BOOLEAN;

DBE_FILE.CLOSE(
    file IN DBE_FILE.FILE_TYPE)
RETURN BOOLEAN;
```

Table 10-164 DBE_FILE.CLOSE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	integer or dbe_file.file_type	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.

- DBE_FILE.CLOSE_ALL

  Closes all file handles opened in a session. This function can be used for emergency cleanup.

The prototype of the DBE_FILE.CLOSE_ALL function is as follows:

```
DBE_FILE.CLOSE_ALL()
RETRUN VOID;
```

- DBE_FILE.REMOVE

  Deletes a disk file. To use this function, you must have the required permission.

  The prototype of the DBE_FILE.REMOVE function is as follows:

```
DBE_FILE.REMOVE(
   dir       IN TEXT,
   file_name IN TEXT)
RETURN VOID;
```

Table 10-165 DBE_FILE.REMOVE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dir	TEXT	IN	No	Directory of a file. It is a string, indicating an object name. **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
file_name	TEXT	IN	No	File name.

- DBE_FILE.RENAME

  Renames a disk file. This function is similar to the mv command of Unix.

  The prototype of the DBE_FILE.RENAME function is as follows:

```
DBE_FILE.RENAME(
   src_dir        IN TEXT,
   src_file_name  IN TEXT,
   dest_dir       IN TEXT,
   dest_file_name IN TEXT,
   overwrite      IN BOOLEAN DEFAULT FALSE)
RETURN VOID;
```

Table 10-166 DBE_FILE.RENAME parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
src_dir	TEXT	IN	No	Directory of the source file (case-sensitive) **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
src_file_name	TEXT	IN	No	Source file to be renamed
dest_dir	TEXT	IN	No	Target directory (case-sensitive). **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
dest_file_name	text	IN	No	New file name
overwrite	boolean	IN	Yes	Whether to overwrite the file. If the parameter is left empty or not specified, the parameter is not overwritten. If no rewriting is performed and a file with the same name already exists in the destination directory, an error is reported.

- DBE_FILE.COPY

  Copies data in a continuous area to a new file. If **start_line** and **end_line** are omitted, the entire file is copied.

  The prototype of the DBE_FILE.COPY function is as follows:

```
DBE_FILE.COPY(
   src_dir        IN TEXT,
   src_file_name  IN TEXT,
   dest_dir       IN TEXT,
   dest_file_name IN TEXT,
   start_line     IN INTEGER DEFAULT 1,
   end_line       IN INTEGER DEFAULT NULL)
RETURN VOID;
```

Table 10-167 DBE_FILE.COPY parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
src_dir	TEXT	IN	No	Directory of the source file **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
src_file_name	TEXT	IN	No	Name of the source file to be copied.
dest_dir	TEXT	IN	No	Directory of the destination file **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
dest_file_name	TEXT	IN	No	Target file **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
start_line	TEXT	IN	No	Number of the line where the copy starts. The default value is **1**.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
end_line	TEXT	IN	Yes	Number of the line where the copy ends. The default value is **NULL**, indicating the end of the file.

- DBE_FILE.GET_ATTR

  Reads and returns the attributes of a disk file.

  The prototype of the DBE_FILE.GET_ATTR stored procedure is as follows:

```
DBE_FILE.GET_ATTR(
    location    IN  TEXT,
    filename    IN  TEXT,
    fexists     OUT BOOLEAN,
    file_length OUT BIGINT,
    block_size  OUT INTEGER)
RETURN RECORD;
```

Table 10-168 DBE_FILE.GET_ATTR parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
location	TEXT	IN	No	File directory **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
filename	TEXT	IN	No	File name.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
fexists	boolean	OUT	No	Whether the file exists.
file_length	BIGINT	OUT	No	File length (unit: byte). If the file does not exist, **NULL** is returned.
block_size	INTEGE	OUT	No	Block size of the file system (unit: byte). If the file does not exist, **NULL** is returned.

- DBE_FILE.SEEK

  Adjusts the position of a file pointer forward or backward based on the specified number of bytes.

  The prototype of the **DBE_FILE.SEEK** function is as follows:

```
DBE_FILE.SEEK(
   file          IN INTEGER,
   absolute_start IN BIGINT DEFAULT NULL,
   relative_start IN BIGINT DEFAULT NULL)
RETURN VOID;

DBE_FILE.SEEK(
   file          IN DBE_FILE.FILE_TYPE,
   absolute_start IN BIGINT DEFAULT NULL,
   relative_start IN BIGINT DEFAULT NULL)
RETURN VOID;
```

Table 10-169 DBE_FILE.SEEK parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	INTEGER or dbe_file.file_type	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.
absolute_start	BIGINT	IN	Yes	Absolute offset of a file. The default value is **NULL**.
relative_start	BIGINT	IN	Yes	Relative offset of a file. A positive number indicates forward offset and a negative number indicates backward offset. The default value is **NULL**. If both **absolute_start** and this parameter are specified, the **absolute_start** parameter is used.

- DBE_FILE.GET_POS

  Returns the current offset of the file in bytes.

  The prototype of the DBE_FILE.FGETPOS function is as follows:

```
DBE_FILE.GET_POS(
   file IN INTEGER)
RETURN BIGINT;

DBE_FILE.GET_POS(
   file IN DBE_FILE.FILE_TYPE)
RETURN BIGINT;
```

Table 10-170 DBE_FILE.GET_POS parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER or dbe_file.file_type	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.

- DBE_FILE.FOPEN_NCHAR

  Opens a file. You can specify the maximum line size. A maximum of 50 files can be opened in a session. This function returns a DBE_FILE.FILE_TYPE type object that encapsulates a file handle. This function opens a file in national character set mode for input or output.

  The prototype of the DBE_FILE.FOPEN_NCHAR function is as follows:

```
DBE_FILE.FOPEN_NCHAR(
   dir           IN TEXT,
   file_name     IN TEXT,
   open_mode     IN TEXT,
   max_line_size IN INTEGER DEFAULT 1024)
RETURN DBE_FILE.FILE_TYPE;
```

Table 10-171 DBE_FILE.FOPEN_NCHAR parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dir	TEXT	IN	No	Directory of a file. It is a string, indicating an object name. **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to read and write files in the file path specified by **safe_data_path**.
file_name	TEXT	IN	No	File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the FOPEN_NCHAR function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).
open_mode	TEXT	IN	No	File opening mode, including: • **r** (read text) • **w** (write text) • **a** (append text) • **rb** (read byte) • **wb** (write byte) • **ab** (append byte) **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
max_line_size	integer	IN	Yes	Maximum number of bytes in each line, including newline characters. The minimum value is **1** and the maximum is **32767**. If this parameter is not specified, the default value **1024** is used.

- DBE_FILE.WRITE_NCHAR

Writes buffer data to the buffer of a file. The file must be opened in national character set or write mode. This operation does not write a line terminator. The text string is written in the UTF-8 character set format.

The prototype of the DBE_FILE.WRITE_NCHAR function is as follows:

```
DBE_FILE.WRITE_NCHAR(
   file   IN DBE_FILE.FILE_TYPE,
   buffer IN NVARCHAR2)
RETURN VOID;
```

Table 10-172 DBE_FILE.WRITE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	dbe_file.file_type	IN	No	Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR. The file must be opened in write mode. This operation does not write line terminators.
buffer	NVARCHAR2	IN	Yes	Text data to be written to the file. The accumulated write length of each line cannot be greater than or equal to the value of **max_line_size** specified by **FOPEN_NCHAR**. Otherwise, an error is reported when the file is refreshed. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- DBE_FILE.WRITE_LINE_NCHAR

  Writes buffer data to the buffer of a file. The file must be opened in national character set or write mode. This operation automatically adds a line terminator. The text string is written in the UTF8 character set format.

  The prototype of the DBE_FILE.WRITE_LINE_NCHAR function is as follows:

```
DBE_FILE.WRITE_LINE_NCHAR(
   file   IN DBE_FILE.FILE_TYPE,
   buffer IN NVARCHAR2)
RETURN VOID;
```

Table 10-173 DBE_FILE.WRITE_LINE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	dbe_file.file_type	IN	No	Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR.
buffer	NVARCHAR2	IN	Yes	Text data to be written to the file. The length of each line (including the newline character) cannot be greater than the value of **max_line_size** specified by **FOPEN_NCHAR** or the default value. Otherwise, an error is reported when the file is refreshed. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- DBE_FILE.FORMAT_WRITE_NCHAR

  Writes formatted data to the buffer of an open file. It is a DBE_FILE.WRITE_NCHAR API that allows formatting.

  The prototype of the DBE_FILE.FORMAT_WRITE_NCHAR function is as follows:

```
DBE_FILE.FORMAT_WRITE_NCHAR(
   file   IN DBE_FILE.FILE_TYPE,
   format IN NVARCHAR2,
   arg1   IN NVARCHAR2 DEFAULT NULL,
   . . .
   arg5   IN NVARCHAR2 DEFAULT NULL)
RETURN VOID;
```

Table 10-174 DBE_FILE.FORMAT_WRITE_NCHAR parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	dbe_file.file_type	IN	No	Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR.
format	NVARCHAR2	IN	Yes	Formatted string, containing the text and format characters \n and %s.
[arg1. . .arg5]	NVARCHAR2	IN	Yes	Five optional parameters. The parameters and the positions of characters to be formatted are in one-to-one correspondence. If the parameter corresponding to a character to be formatted is not provided, an empty string is used to replace %s.

- DBE_FILE.READ_LINE_NCHAR

  Reads data from an open file and stores the read result to the buffer. It reads data to the end of each line excluding the line terminator, to the end of the file, or to the size specified by the **len** parameter. The length of the data to be read cannot exceed the value of **max_line_size** specified by **FOPEN_NCHAR**.

  The prototype of the DBE_FILE.READ_LINE_NCHAR stored procedure is as follows:

```
DBE_FILE.READ_LINE_NCHAR(
   file   IN  DBE_FILE.FILE_TYPE,
   buffer OUT NVARCHAR2,
   len    IN  INTEGER DEFAULT NULL)
RETURN NVARCHAR2;
```

Table 10-175 DBE_FILE.READ_LINE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	dbe_file.file_type	IN	No	Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR. The file must be opened in read mode. Otherwise, the INVALID_OPERATION exception is thrown.
buffer	NVARCHAR2	OUT	No	Buffer for receiving data.
len	INTEGER	IN	Yes	Number of bytes read from the file. The default value is **NULL**. If the default value **NULL** is used, **max_line_size** is used to specify the line size.

Examples

```
-- Add the /tmp/ directory to the PG_DIRECTORY system catalog as a system administrator.
CREATE OR REPLACE DIRECTORY dir AS '/tmp/';
-- Execution result:
CREATE DIRECTORY
-- Use the DBE_FILE advanced package.
DECLARE
    f INTEGER;

10.12.2.4 DBE_HEAT_MAP

Interface Description

Returns information such as the last modification time of a row in the target data block based on the input parameters. The information is used to browse the basis for determining cold and hot rows. This interface is an O&M interface and has no visibility check. That is, if the input CTID is a deleted row, this interface still returns the latest status of the current row on the page.

Table 10-176 DBE_HEAT_MAP

Interface	Description
ROW_HEAT_MAP	Obtains information such as the last modification time of a row based on the schema to which the object belongs, data object name, data object partition name, and CTID.

- DBE_HEAT_MAP.ROW_HEAT_MAP

  Obtains information such as the last modification time of a row based on the schema to which the object belongs, data object name, data object partition name, and CTID. The prototype is as follows:

```
DBE_HEAT_MAP.ROW_HEAT_MAP(
owner IN VARCHAR2,
segment_name IN VARCHAR2,
partition_name IN VARCHAR2 DEFAULT NULL,
ctid IN TEXT);
```

Table 10-177 DBE_HEAT_MAP.ROW_HEAT_MAP parameters

Parameter	Description
owner	Schema to which a data object belongs.
segment_name	Data object name.
partition_name	Data object partition name. This parameter is optional. The default value is **NULL**.
ctid	Data row ID.

Examples

```
gaussdb=# ALTER DATABASE set ilm = on;
gaussdb=# CREATE Schema HEAT_MAP_DATA;
gaussdb=# SET current_schema=HEAT_MAP_DATA;

gaussdb=# CREATE TABLESPACE example1 RELATIVE LOCATION 'tablespace1';
gaussdb=# CREATE TABLE HEAT_MAP_DATA.heat_map_table(id INT, value TEXT) TABLESPACE example1;
gaussdb=# INSERT INTO HEAT_MAP_DATA.heat_map_table VALUES (1, 'test_data_row_1');

gaussdb=# SELECT * from DBE_HEAT_MAP.ROW_HEAT_MAP(
    owner          =>  'heat_map_data',
    segment_name  =>  'heat_map_table',
    partition_name  => NULL,
    ctid           =>  '(0,1)');
     owner     |  segment_name  | partition_name | tablespace_name | file_id | relative_fno | ctid  | writetime
---------------+----------------+----------------+-----------------+---------+--------------+-------+-----------
 heat_map_data | heat_map_table |                | example1        |   17291 |        17291 | (0,1) |
(1 row)
```

10.12.2.5 DBE_ILM

Interface Description

Implements ILM policies, ILM policy evaluation, and interface for stopping compression jobs.

Table 10-178 DBE_ILM

Interface	Description
EXECUTE_ILM	Evaluates the specified data and ILM policy based on parameters. If the evaluation is passed, the corresponding compression job is generated.
STOP_ILM	Stops a compression job that is being executed based on parameters.

- DBE_ILM.EXECUTE_ILM

  Evaluates the ILM policy based on parameters. The prototype is as follows:

```
DBE_ILM.EXECUTE_ILM (
schema_name         IN     VARCHAR2,
object_name         IN     VARCHAR2,
task_id             OUT    Oid,
subobject_name      IN     VARCHAR2 DEFAULT NULL,
policy_name         IN     VARCHAR2 DEFAULT ILM_ALL_POLICIES,
execution_mode      IN     NUMBER DEFAULT ILM_EXECUTION_ONLINE);
```

  Table 10-179 DBE_ILM.EXECUTE_ILM parameters

Parameter	Description
schema_name	Schema to which an object belongs.
object_name	Object name.
task_id	Descriptor ID of the generated ADO task.
subobject_name	Name of a data subobject.
policy_name	Policy name. You can query the GS_ADM_ILMOBJECTS view to obtain the policy name. The default value **DBE_ILM.ILM_ALL_POLICIES** indicates all policies on the object.
execution_mode	Execution mode. The online mode (ILM_EXECUTION_ONLINE) or offline mode (ILM_EXECUTION_OFFLINE) is not involved in this phase.

- DBE_ILM.STOP_ILM

Stops an ILM policy that is being executed based on parameters. The prototype is as follows:

```
DBE_ILM.STOP_ILM (
TASK_ID               IN NUMBER DEFAULT -1,
P_DROP_RUNNING_JOBS     IN BOOLEAN DEFAULT FALSE,
P_JOBNAME         IN VARCHAR2 DEFAULT NULL);
```

Table 10-180 DBE_ILM.STOP_ILM parameters

Parameter	Description
TASK_ID	Descriptor ID of an ADO task.
P_DROP_RUNNING_JOBS	Determines whether to stop a task that is being executed. The value **true** indicates that the task is forcibly stopped, and the value **false** indicates that the task is not stopped.
P_JOBNAME	Task name.

NOTE

When there are a large number of concurrent requests and you run DBE_ILM.STOP_ILM, the system may display the message "Resources are busy, please try again later." In this case, try again later.

Examples

```
gaussdb=# ALTER DATABASE set ilm = on;
gaussdb=# CREATE Schema ILM_DATA;
gaussdb=# SET current_schema=ILM_DATA;
BEGIN
    DBE_ILM_ADMIN.DISABLE_ILM();
    DBE_ILM_ADMIN.CUSTOMIZE_ILM(1, 15);
    DBE_ILM_ADMIN.CUSTOMIZE_ILM(2, 30);
    DBE_ILM_ADMIN.CUSTOMIZE_ILM(11, 1);
    DBE_ILM_ADMIN.CUSTOMIZE_ILM(12, 10);
    DBE_ILM_ADMIN.CUSTOMIZE_ILM(13, 1024);

10.12.2.6 DBE_ILM_ADMIN

Interface Description

Implements ILM policies, and controls ADO background scheduling and concurrency control parameters.

Table 10-181 DBE_ILM_ADMIN

Interface	Description
CUSTOMIZE_ILM	Customizes ILM policy attributes based on input parameters.
DISABLE_ILM	Disables background scheduling.
ENABLE_ILM	Enables background scheduling.

NOTE

When there are a large number of concurrent requests and you run DBE_ILM_ADMIN.DISABLE_ILM or DBE_ILM_ADMIN.ENABLE_ILM, the system may display the message "Resources are busy, please try again later." In this case, try again later.

- DBE_ILM_ADMIN.CUSTOMIZE_ILM

  Customizes ILM policy attributes based on input parameters. The prototype is as follows:

```
DBE_ILM_ADMIN.CUSTOMIZE_ILM (
  parameter           IN      int8,
  value               IN      int8);
```

Table 10-182 DBE_ILM_ADMIN.CUSTOMIZE_ILM parameters

Parameter	Description
parameter	Sequence number of a parameter.
value	Parameter value.

Table 10-183 DBE_ILM_ADMIN.CUSTOMIZE_ILM parameters

Parameter ID	Parameter Value	Description
1	EXECUTION_INTERVAL	Specifies the frequency of executing an ADO task, in minutes. The default value is **15**. The value is an integer or floating-point number greater than or equal to 1 and less than or equal to 2147483647. The value is rounded down.
2	RETENTION_TIME	Specifies the retention period of ADO-related history records, in days. The default value is **30**. The value is an integer or floating-point number greater than or equal to 1 and less than or equal to 2147483647. The value is rounded down.

Parameter ID	Parameter Value	Description
7	ENABLE	Specifies the background scheduling status which cannot be modified in this interface. Otherwise, the message "Invalid argument value, ENABLED should be change by calling DBE_ILM_ADMIN.ENABLE_ILM and DBE_ILM_ADMIN.DISABLE_ILM" is displayed. Instead, use disable_ilm() and enable() to modify it.
11	POLICY_TIME	Specifies whether the time unit of ADO is day or second. The time unit second is used only for testing. Possible values are: ● **0**: ILM_POLICY_IN_DAYS (default value) ● **1**: ILM_POLICY_IN_SECONDS
12	ABS_JOBLIMIT	Specifies the maximum number of ADO jobs generated by an ADO task. The value is an integer or floating-point number greater than or equal to 0 and less than or equal to 2147483647. The value is rounded down.
13	JOB_SIZELIMIT	Specifies the maximum number of bytes that can be processed by a single ADO job. The unit is MB. The value is an integer or floating-point number greater than or equal to 1 and less than or equal to 2147483647. The value is rounded down.
14	WIND_DURATION	Specifies the maintenance window duration, in minutes. The default value is 240 minutes (4 hours). The value is an integer greater than or equal to 0 and less than 1440 (24 hours).
15	BLOCK_LIMITS	Specifies the upper limit of the instance-level row-store compression rate. The default value is **40**. The value ranges from 0 to 10000, in block/ms, indicating the maximum number of blocks that can be compressed per millisecond. **0** indicates that the rate is not limited.

- DBE_ILM_ADMIN.DISABLE_ILM

  Disables background scheduling. The prototype is as follows:

  ```
  gaussdb=# DBE_ILM_ADMIN.DISABLE_ILM();
  ```

- DBE_ILM_ADMIN.ENABLE_ILM

  Enables background scheduling. The prototype is as follows:

  ```
  gaussdb=# DBE_ILM_ADMIN.ENABLE_ILM();
  ```

  Note: To make background scheduling take effect, you need to enable the GUC parameter **enable_ilm** on the management and control plane.

Examples

```
gaussdb=# CALL DBE_ILM_ADMIN.CUSTOMIZE_ILM(1, 15);
 customize_ilm
---------------

10.12.2.7 DBE_LOB

API Description

Table 10-184 lists all APIs supported by the DBE_LOB package.

NOTE

- In database A, the byte content of the space is 00. However, in GaussDB, the byte content corresponding to the space is ASCII code 32.
- In a centralized environment, the maximum size of a CLOB, BLOB, and BFILE is 32 TB.
- LOBMAXSIZE supports a maximum of 1073741771 bytes.

Table 10-184 DBE_LOB

API	Description
DBE_LOB.GET_LENGTH	Obtains and returns the length of a specified LOB. The object cannot be greater than 2 GB.
DBE_LOB.LOB_GET_LENGTH	Obtains and returns the length of a specified LOB or BFILE object.
DBE_LOB.OPEN	Opens a LOB and returns a LOB descriptor.
DBE_LOB.READ	Loads a part of LOB content to the buffer based on the specified length and initial position offset.
DBE_LOB.LOB_READ	Reads a part of LOB (including BFILE) content to the buffer based on the specified length and initial position offset.
DBE_LOB.WRITE	Copies content in the buffer to a LOB based on the specified length and initial position offset.
DBE_LOB.WRITE_APPEND	Copies content in the buffer to the end part of a LOB based on the specified length.

API	Description
DBE_LOB.LOB_WRITE_APPEND	Copies content in the buffer to the end part of a LOB based on the specified length.
DBE_LOB.COPY	Copies content in a LOB to another LOB based on the specified length and initial position offset.
DBE_LOB.LOB_COPY	Copies content in a LOB to another LOB based on the specified length and initial position offset.
DBE_LOB.ERASE	Deletes content in a LOB (less than or equal to 1 GB) based on the specified length and initial position offset.
DBE_LOB.LOB_ERASE	Deletes content in a LOB based on the specified length and initial position offset.
DBE_LOB.CLOSE	Closes a LOB descriptor.
DBE_LOB.MATCH	Returns the position of the *M*th occurrence of a character string in a LOB.
DBE_LOB.COMPARE	Compares two LOBs (including BFILE objects) or a certain part of two LOBs.
DBE_LOB.SUBSTR	Reads a LOB substring and returns the read substring.
DBE_LOB.LOB_SUBSTR	Reads a LOB or BFILE substring and returns the read substring.
DBE_LOB.STRIP	Truncates the LOB of a specified length. After the execution is complete, the length of the LOB is set to the length specified by the **newlen** parameter.
DBE_LOB.LOB_STRIP	Truncates the LOB of a specified length. After the execution is complete, the length of the LOB is set to the length specified by the **newlen** parameter.
DBE_LOB.CREATE_TEMPORARY	Creates a temporary BLOB or CLOB.
DBE_LOB.APPEND	Adds the content of a LOB to another LOB.
DBE_LOB.LOB_APPEND	Adds the content of a LOB to another LOB.
DBE_LOB.FREETEMPORARY	Deletes a temporary BLOB or CLOB.
DBE_LOB.FILEOPEN	Opens a database BFILE file and returns its file descriptor.
DBE_LOB.FILECLOSE	Closes a BFILE file that is opened by **FILEOPEN**.
DBE_LOB.BFILEOPEN	Opens a database BFILE file.
DBE_LOB.BFILECLOSE	Closes a BFILE file that is opened by **BFILEOPEN**.

API	Description
DBE_LOB.LOADFROMFILE	Loads the database BFILE file of the specified length in the specified location to the BLOB in the specified location.
DBE_LOB.LOADFROMBFILE	Loads the database BFILE file of the specified length in the specified location to the LOB in the specified location.
DBE_LOB.LOADBLOBFROMFILE	Loads an external database file of the specified length in the specified location to a BLOB (less than or equal to 1 GB) in a specified location.
DBE_LOB.LOADBLOBFROMBFILE	Loads the database BFILE file of the specified length in the specified location to the BLOB in the specified location.
DBE_LOB.LOADCLOBFROMFILE	Loads an external database file of the specified length in the specified location to a CLOB (less than or equal to 1 GB) in a specified location.
DBE_LOB.LOADCLOBFROMBFILE	Loads the database BFILE file of the specified length in the specified location to the CLOB in the specified location.
DBE_LOB.CONVERTTOBLOB	Converts a CLOB file to a BLOB file (less than or equal to 1 GB).
DBE_LOB.CONVERTTOCLOB	Converts a BLOB file to a CLOB file (less than or equal to 1 GB).
DBE_LOB.LOB_CONVERTTOBLOB	Converts a CLOB file to a BLOB file.
DBE_LOB.LOB_CONVERTTOCLOB	Converts a BLOB file to a CLOB file.
DBE_LOB.GETCHUNKSIZE	Obtains the maximum size of LOB data that can be stored in the chunk structure in the database.
DBE_LOB.LOB_WRITE	Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.
DBE_LOB.BFILENAME	Constructs and returns the DBE_LOB.BFILE object based on the directory and file name.

- DBE_LOB.GET_LENGTH

  Obtains and returns the size of a specified LOB. The maximum size of the object is 2 GB.

  The prototype of the DBE_LOB.GET_LENGTH function is as follows:

```
DBE_LOB.GET_LENGTH (
    blob_obj IN BLOB)
```

```
RETURN INTEGER;

DBE_LOB.GET_LENGTH (
   clob_obj IN CLOB)
RETURN INTEGER;
```

Table 10-185 DBE_LOB.GET_LENGTH parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB whose length is to be obtained

- DBE_LOB.LOB_GET_LENGTH

  Obtains and returns the length of a specified LOB or BFILE file. The maximum size of the object is 32 TB.

  The prototype of the DBE_LOB.LOB_GET_LENGTH function is as follows:

```
DBE_LOB.LOB_GET_LENGTH (
   blob_obj IN BLOB)
RETURN BIGINT;

DBE_LOB.LOB_GET_LENGTH (
   clob_obj IN CLOB)
RETURN BIGINT;

DBE_LOB.LOB_GET_LENGTH (
   bfile IN DBE_LOB.BFILE)
RETURN BIGINT;
```

Table 10-186 DBE_LOB.LOB_GET_LENGTH parameters

Parameter	Description
blob_obj/ clob_obj/bfile	BLOB/CLOB/BFILE whose length is to be obtained

- DBE_LOB.OPEN

  Opens a LOB and returns a LOB descriptor. This procedure is meaningless and is used only for compatibility.

  The prototype of the DBE_LOB.OPEN function is as follows:

```
DBE_LOB.OPEN (
   lob INOUT BLOB);

DBE_LOB.OPEN (
   lob INOUT CLOB);

DBE_LOB.OPEN (
   bfile     INOUT DBE_LOB.BFILE,
   open_mode IN    TEXT DEFAULT 'null');
```

Table 10-187 DBE_LOB.OPEN parameters

Parameter	Description
lob/bfile	Opened BLOB, CLOB or BFILE.

Parameter	Description
open_mode	Operation mode. Currently, the range is [R,W,A,RB,WB,AB].

- DBE_LOB.READ

  Reads a part of LOB content to the output buffer based on the specified length and initial position offset.

  The prototype of the DBE_LOB.READ function is as follows:

```
DBE_LOB.READ (
   blob_obj IN  BLOB,
   amount   IN  INTEGER,
   off_set  IN  INTEGER,
   out_put  OUT RAW);

DBE_LOB.READ (
   clob_obj IN  CLOB,
   amount   IN  INTEGER,
   off_set  IN  INTEGER,
   out_put  OUT VARCHAR2);
```

  Table 10-188 DBE_LOB.READ parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to be read
amount	Length of read content **NOTE** If the length to read is less than 1 or greater than 32767, an error is reported.
off_set	Start position for reading the LOB content, that is, the offset bytes to initial position of the LOB content. If the offset is less than 1 or greater than the LOB length, an error is reported. The initial position is 1.
out_put	Target buffer for storing the read LOB content

- DBE_LOB.LOB_READ

  Reads a part of LOB/BFILE content to the output buffer based on the specified length and initial position offset.

  The prototype of the DBE_LOB.LOB_READ function is as follows:

```
DBE_LOB.LOB_READ(
   blob_obj IN    BLOB,
   amount   INOUT BIGINT,
   off_set  IN    BIGINT,
   out_put  OUT   RAW);

DBE_LOB.LOB_READ(
   clob_obj IN    CLOB,
   amount   INOUT BIGINT,
   off_set  IN    BIGINT,
   out_put  OUT   VARCHAR2);

DBE_LOB.LOB_READ(
```

```
  bfile   IN    DBE_LOB.BFILE,
  amount  INOUT BIGINT,
  off_set IN    BIGINT,
  out_put OUT   RAW);
```

Table 10-189 DBE_LOB.LOB_READ parameters

Parameter	Description
blob_obj/ clob_obj/bfile	BLOB/CLOB/BFILE object (can be greater than 1 GB) to be read
amount	Length to read as the IN parameter, or actual read length as the OUT parameter. **NOTE** If the length to read is less than 1 or greater than 32767, an error is reported.
off_set	Start position for reading the LOB content, that is, the offset bytes to initial position of the LOB content. If the offset is less than 1 or greater than the LOB length, an error is reported. The initial position is 1.
out_put	Target buffer for storing the read LOB content

- DBE_LOB.WRITE

  Writes content in the source to a LOB based on the specified length and initial position.

  The prototype of the DBE_LOB.WRITE function is as follows:

```
DBE_LOB.WRITE (
   blob_obj INOUT BLOB,
   amount   IN    INTEGER,
   off_set  IN    INTEGER,
   source   IN    RAW);

DBE_LOB.WRITE (
   clob_obj INOUT CLOB,
   amount   IN    INTEGER,
   off_set  IN    INTEGER,
   source   IN    VARCHAR2);
```

Table 10-190 DBE_LOB.WRITE parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is written
amount	Length to write, up to 32767 characters. **NOTE** If the length to write is less than 1 or greater than the length of the content to be written, an error is reported.

Parameter	Description
off_set	Start position for writing content to the target LOB, that is, the offset bytes to the initial position of LOB content. **NOTE** If the offset is less than 1 or greater than the value of **LOBMAXSIZE**, an error is reported. The initial position is 1, and the maximum value is the maximum length of the LOB type.
source	Content to be written

- DBE_LOB.WRITE_APPEND

  Writes content in the source object to the end part of a LOB based on the specified length.

  The prototype of the DBE_LOB.WRITE_APPEND function is as follows:

```
DBE_LOB.WRITE_APPEND (
   blob_obj   INOUT BLOB,
   amount     IN    INTEGER,
   source_obj IN    RAW);

DBE_LOB.WRITE_APPEND (
   clob_obj   INOUT CLOB,
   amount     IN    INTEGER,
   source_obj IN    VARCHAR2);
```

  Table 10-191 DBE_LOB.WRITE_APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is written
amount	Length to write, up to 32767 characters. **NOTE** If the length to write is less than 1 or greater than the length of the content to be written, an error is reported.
source_obj	Content to be written

- DBE_LOB.LOB_WRITE_APPEND

  Writes content in the source object to the end part of a LOB based on the specified length.

  The prototype of the DBE_LOB.LOB_WRITE_APPEND function is as follows:

```
DBE_LOB.LOB_WRITE_APPEND(
   blob_obj    INOUT BLOB,
   amount      IN    INTEGER,
   source_obj  IN    RAW);

DBE_LOB.LOB_WRITE_APPEND (
   clob_obj    INOUT CLOB,
   amount      IN    INTEGER,
   source_obj  IN    VARCHAR2);
```

Table 10-192 DBE_LOB.LOB_WRITE_APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is written
amount	Length to write, up to 32767 characters. **NOTE** If the length to write is less than 1 or greater than the length of the content to be written, an error is reported.
source_obj	Content to be written

- DBE_LOB.COPY

  Copies content in a LOB to another LOB based on the specified length and initial position offset.

  The prototype of the DBE_LOB.COPY function is as follows:

```
DBE_LOB.COPY (
   dest_lob   INOUT BLOB,
   src_lob    IN    BLOB,
   len        IN    INTEGER,
   dest_start IN    INTEGER DEFAULT 1,
   src_start  IN    INTEGER DEFAULT 1);
```

Table 10-193 DBE_LOB.COPY parameters

Parameter	Description
dest_lob	LOB to which the buffer content is to be pasted.
src_lob	LOB from which the buffer content is to be copied.
len	Length of the copied data.
dest_start	Start position for pasting the buffer content to the target LOB (**dest_lob**), that is, the offset bytes to the initial position of LOB content.
src_start	Start position for copying the buffer content from the source LOB (**src_lob**), that is, the offset bytes to the initial position of LOB content.

- DBE_LOB.LOB_COPY

  Copies content in a LOB to another LOB based on the specified length and initial position offset.

  The prototype of the DBE_LOB.LOB_COPY function is as follows:

```
DBE_LOB.LOB_COPY(
   blob_obj    INOUT BLOB,
   source_obj  IN    BLOB,
   amount      IN    BIGINT,
   dest_offset IN    BIGINT DEFAULT 1,
   src_offset  IN    BIGINT DEFAULT 1);

DBE_LOB.LOB_COPY(
   clob_obj    INOUT CLOB,
   source_obj  IN    CLOB,
```

```
  amount      IN    BIGINT,
  dest_offset IN    BIGINT DEFAULT 1,
  src_offset  IN    BIGINT DEFAULT 1);
```

Table 10-194 DBE_LOB.LOB_COPY parameters

Parameter	Description
blob_obj/ clob_obj	LOB to which the buffer content is to be pasted.
source_obj	LOB from which the buffer content is to be copied.
amount	Length of the copied data. **NOTE** If the length to copy is less than 1 or greater than the value of **LOBMAXSIZE**, an error is reported.
dest_offset	Start position for pasting the buffer content to the target LOB, that is, the offset bytes/characters to the initial position of LOB content. The unit is byte for BLOB and character for CLOB. **NOTE** If the offset is less than 1 or greater than the value of **LOBMAXSIZE**, an error is reported.
src_offset	Start position for copying the content from the source object, that is, the offset bytes to the initial position of LOB content. The unit is byte for BLOB and character for CLOB. **NOTE** If the offset is less than 1, an error is reported.

- DBE_LOB.ERASE

  Deletes the content in a BLOB (not greater than 1 GB) based on the specified length and initial position offset. The bytes of the deleted part in the BLOB are filled with 0.

  The prototype of the DBE_LOB.ERASE function is as follows:

```
DBE_LOB.ERASE (
   blob_obj INOUT BLOB,
   amount   INOUT INTEGER,
   off_set  IN    INTEGER DEFAULT 1);
```

Table 10-195 DBE_LOB.ERASE parameters

Parameter	Description
blob_obj	LOB whose content is to be deleted as the IN parameter, or LOB with specified content deleted as the OUT parameter. If this parameter is left empty, an error is reported.

Parameter	Description
amount	Length (in bytes for BLOBs) to delete as the IN parameter, or actual length deleted as the OUT parameter. **NOTE** If the length to delete is less than 1 or this parameter is left empty, an error is reported.
off_set	Start position from which LOB content is to be deleted, that is, the number of offset bytes to the initial position of LOB content. The value cannot be greater than 1 GB. **NOTE** If the offset is less than 1 or this parameter is left empty, an error is reported.

- DBE_LOB.LOB_ERASE

  Deletes the content in the LOB based on the specified length and initial position offset. The bytes of the deleted part in the BLOB are filled with 0, and the characters of the deleted part in the CLOB are filled with spaces. The LOB can be greater than 1 GB and the maximum size is 32 TB.

  The prototype of the DBE_LOB.LOB_ERASE function is as follows:

```
DBE_LOB.LOB_ERASE (
   blob_obj INOUT BLOB,
   amount   INOUT BIGINT,
   off_set  IN    BIGINT DEFAULT 1);

DBE_LOB.LOB_ERASE (
   clob_obj INOUT CLOB,
   amount   INOUT BIGINT,
   off_set  IN    BIGINT DEFAULT 1);
```

Table 10-196 DBE_LOB.LOB_ERASE parameters

Parameter	Description
blob_obj/ clob_obj	LOB whose content is to be deleted as the IN parameter, or LOB with specified content deleted as the OUT parameter. If this parameter is left empty, an error is reported.
amount	Length (BLOB in bytes and CLOB in characters) to delete as the IN parameter, or actual length deleted as the OUT parameter. **NOTE** If the length to delete is less than 1 or this parameter is left empty, an error is reported.

Parameter	Description
off_set	Start position from which the LOB content is to be deleted, that is, the number of bytes relative to the start position of the BLOB content or the number of characters relative to the start position of the CLOB content. **NOTE** If the offset is less than 1 or this parameter is left empty, an error is reported.

- DBE_LOB.CLOSE

  Closes the LOB descriptor that has been opened.

  The prototype of the DBE_LOB.CLOSE function is as follows:

```
DBE_LOB.CLOSE(
   lob IN BLOB);

DBE_LOB.CLOSE (
   lob IN CLOB);

DBE_LOB.CLOSE (
   file IN INTEGER);
```

  Table 10-197 DBE_LOB.CLOSE parameters

Parameter	Description
lob/file	BLOB/CLOB/File object whose LOB descriptor is to be closed

- DBE_LOB.MATCH

  Returns the Mth occurrence position of a string in a LOB or BFILE file. **NULL** is returned for an invalid input. The LOB or BFILE file can be greater than 1 GB, up to 32 TB.

  The prototype of the DBE_LOB.MATCH function is as follows:

```
DBE_LOB.MATCH(
   blob_obj    IN BLOB,
   blob_obj2   IN RAW,
   beg_index   IN BIGINT DEFAULT 1,
   occur_index IN BIGINT DEFAULT 1)
RETURN BIGINT;

DBE_LOB.MATCH(
   clob_obj    IN CLOB,
   clob_obj2   IN VARCHAR2,
   beg_index   IN BIGINT DEFAULT 1,
   occur_index IN BIGINT DEFAULT 1)
RETURN BIGINT;

DBE_LOB.MATCH(
   bfile       IN DBE_LOB.BFILE,
   blob_obj2     IN RAW,
   beg_index   IN BIGINT DEFAULT 1,
   occur_index IN BIGINT DEFAULT 1)
RETURN BIGINT;
```

Table 10-198 DBE_LOB.MATCH parameters

Parameter	Description
blob_obj/ clob_obj/ bfile	BLOB/CLOB descriptor to be searched for, or BFILE (which must be opened using **DBE_LOB.BFILEOPEN** first). If this parameter is left blank, null is returned.
blob_obj 2/ clob_obj2	Pattern to match. It is RAW for BLOB/BFILE objects and VARCHAR2 for CLOBs. If this parameter is left empty, null is returned.
beg_inde x	Absolute offset (in bytes) for BLOB/BFILE objects, or offset (in characters) for CLOBs. The start position for matching is 1. **NOTE** The value ranges from 1 to *LOBMAXSIZE*. If a value out of the range is input, null is returned.
occur_ind ex	Number of pattern matching times. The minimum value is 1. **NOTE** If the value is greater than the maximum number of times that the pattern string can be matched in the LOB, **0** is returned. If the value is out of the range from 1 to *LOBMAXSIZE*, null is returned.

- DBE_LOB.COMPARE

  Compares LOBs or BFILE objects.

  - If the compared objects are equal, **0** is returned. Otherwise, a non-zero value is returned.
  - If the first LOB is smaller than the second, **–1** is returned. If the first LOB is larger than the second, **1** is returned.
  - If any of the *len*, *start1*, and *start2* parameters is invalid, **NULL** is returned. The valid offset range is 1 to *LOBMAXSIZE*.
  - If both the values of **start_pos1** and **start_pos2** exceed the LOB/BFILE length, **0** is returned.

  The prototype of the DBE_LOB.COMPARE function is as follows:

```
DBE_LOB.COMPARE (
   lob1       IN BLOB,
   lob2       IN BLOB,
   len        IN BIGINT DEFAULT 1073741312,
   start_pos1 IN BIGINT DEFAULT 1,
   start_pos2 IN BIGINT DEFAULT 1)
RETURN INTEGER;

DBE_LOB.COMPARE (
   lob1       IN CLOB,
   lob2       IN CLOB,
   len        IN BIGINT DEFAULT 1073741312,
   start_pos1 IN BIGINT DEFAULT 1,
   start_pos2 IN BIGINT DEFAULT 1)
RETURN INTEGER;
DBE_LOB.COMPARE (
   file1      IN DBE_LOB.BFILE,
   file2      IN DBE_LOB.BFILE,
   len        IN BIGINT DEFAULT 1073741312,
   start_pos1 IN BIGINT DEFAULT 1,
   start_pos2 IN BIGINT DEFAULT 1)
RETURN INTEGER;
```

Table 10-199 DBE_LOB.COMPARE parameters

Parameter	Description
lob1/file1	First BLOB/CLOB/BFILE to be compared (which must be opened using **DBE_LOB.BFILEOPEN** first).
lob2/file2	Second BLOB/CLOB/BFILE to be compared (which must be opened using **DBE_LOB.BFILEOPEN** first).
len	Number of characters or bytes to be compared. The default value is **1073741312**.
start_pos1	Offset of the first LOB descriptor. The initial position is 1, and the maximum value is the maximum length of the LOB content.
start_pos2	Offset of the second LOB descriptor. The initial position is 1, and the maximum value is the maximum length of the LOB content.

- DBE_LOB.SUBSTR

  Reads a LOB substring and returns the read substring.

  The prototype of the DBE_LOB.SUBSTR function is as follows:

```
DBE_LOB.SUBSTR(
   lob_loc IN BLOB,
   amount  IN INTEGER DEFAULT 32767,
   off_set IN INTEGER  DEFAULT 1)
RETURN RAW;

DBE_LOB.SUBSTR(
   lob_loc IN CLOB,
   amount  IN INTEGER DEFAULT 32767,
   off_set IN INTEGER  DEFAULT 1)
RETURN VARCHAR2;
```

Table 10-200 DBE_LOB.SUBSTR parameters

Parameter	Description
lob_loc	LOB descriptor whose substring is to be read. For BLOBs, the return value is of the RAW type. For CLOBs, the return value is of the VARCHAR2 type.
amount	Number of bytes or characters to be read. **NOTE** The value ranges from 1 to 32767. If the value exceeds the range, null is returned.
off_set	Number of characters or bytes offset from the start position. **NOTE** The value ranges from 1 to *LOBMAXSIZE*. If the value exceeds the range, null is returned.

- DBE_LOB.LOB_SUBSTR

Reads a LOB or BFILE substring and returns the read substring. The LOB or BFILE file can be greater than 1 GB, up to 32 TB.

The prototype of the DBE_LOB.LOB_SUBSTR function is as follows:

```
DBE_LOB.LOB_SUBSTR(
   lob_loc IN BLOB,
   amount  IN INTEGER DEFAULT 32767,
   off_set IN BIGINT  DEFAULT 1)
RETURN RAW;

DBE_LOB.LOB_SUBSTR(
   lob_loc IN CLOB,
   amount  IN INTEGER DEFAULT 32767,
   off_set IN BIGINT  DEFAULT 1)
RETURN VARCHAR2;

DBE_LOB.LOB_SUBSTR(
   bfile   IN DBE_LOB.BFILE,
   amount  IN INTEGER DEFAULT 32767,
   off_set IN BIGINT  DEFAULT 1)
RETURN RAW;
```

Table 10-201 DBE_LOB.LOB_SUBSTR parameters

Parameter	Description
lob_loc/ bfile	LOB descriptor or BFILE file whose substring is to be read. The file must be opened by DBE__LOB.BFILEOPEN first. For BLOBs/ BFILE files, the return value is of the RAW type. For CLOBs, the return value is of the VARCHAR2 type.
amount	Number of bytes or characters to be read. **NOTE** The value ranges from 1 to 32767. If the value exceeds the range, null is returned.
off_set	Number of characters or bytes offset from the start position. **NOTE** The value ranges from 1 to *LOBMAXSIZE*. If the value exceeds the range, null is returned.

- DBE_LOB.STRIP

  Truncates a LOB based on a specified length. After this stored procedure is executed, the length of the LOB is set to the length specified by the **newlen** parameter.

  The prototype of the DBE_LOB.STRIP function is as follows:

  ```
  DBE_LOB.STRIP(
     lob_loc INOUT BLOB,
     newlen  IN INTEGER);

  DBE_LOB.STRIP(
     lob_loc INOUT CLOB,
     newlen  IN INTEGER);
  ```

Table 10-202 DBE_LOB.STRIP parameters

Parameter	Description
lob_loc	LOB to read as the IN parameter, or truncated object as the OUT parameter. If this parameter is left empty, an error is reported.
newlen	New length after truncation, in bytes for BLOBs or in characters for CLOBs.

- DBE_LOB.LOB_STRIP

  Truncates a LOB based on a specified length. After this stored procedure is executed, the length of the LOB is set to the length specified by the **newlen** parameter. The LOB can be greater than 1 GB, up to 32 TB.

  The prototype of the DBE_LOB.LOB_STRIP function is as follows:

```
DBE_LOB.LOB_STRIP(
   lob_loc INOUT BLOB,
   newlen  IN    BIGINT);

DBE_LOB.LOB_STRIP(
   lob_loc INOUT CLOB,
   newlen  IN    BIGINT);
```

Table 10-203 DBE_LOB.LOB_STRIP parameters

Parameter	Description
lob_loc	LOB to read as the IN parameter, or truncated object as the OUT parameter. If this parameter is left empty, an error is reported.
newlen	New length after truncation, in bytes for BLOBs or in characters for CLOBs. **NOTE** If the value is less than 1, null is returned. If the value is greater than the LOB length, an error is reported.

- DBE_LOB.CREATE_TEMPORARY

  Creates a temporary BLOB or CLOB. This API is used only for syntax compatibility.

  The prototype of the DBE_LOB.CREATE_TEMPORARY function is as follows:

```
DBE_LOB.CREATE_TEMPORARY (
   lob_loc INOUT BLOB,
   cache   IN    BOOLEAN,
   dur     IN    INTEGER DEFAULT 10);

DBE_LOB.CREATE_TEMPORARY (
   lob_loc INOUT CLOB,
   cache   IN    BOOLEAN,
   dur     IN    INTEGER DEFAULT 10);
```

Table 10-204 DBE_LOB.CREATE_TEMPORARY parameters

Parameter	Description
lob_loc	LOB descriptor
cache	Used only for syntax compatibility.
dur	Used only for syntax compatibility.

- DBE_LOB.APPEND

  Appends *source_obj* to the end of the target LOB.

  The prototype of the DBE_LOB.APPEND function is as follows:

```
DBE_LOB.APPEND (
   blob_obj INOUT BLOB,
   source_obj  IN    BLOB);

DBE_LOB.APPEND (
   clob_obj INOUT CLOB,
   source_obj  IN    CLOB);
```

Table 10-205 DBE_LOB.APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is to be written
source_obj	BLOB/CLOB from which the buffer content is to be read

- DBE_LOB.LOB_APPEND

  Appends *source_obj* to the end of the target LOB.

  The prototype of the DBE_LOB.LOB_APPEND function is as follows:

```
DBE_LOB.LOB_APPEND(
   blob_obj   INOUT BLOB,
   source_obj IN    BLOB);

DBE_LOB.LOB_APPEND(
   clob_obj   INOUT CLOB,
   source_obj IN    CLOB);
```

Table 10-206 DBE_LOB.LOB_APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is to be written
source_obj	BLOB/CLOB from which the buffer content is to be read

- DBE_LOB.FREETEMPORARY

  Frees LOB files created by CREATE_TEMPORARY.

  The prototype of the DBE_LOB.FREETEMPORARY function is as follows:

```
DBE_LOB.FREETEMPORARY (
   blob INOUT BLOB);
```

```
DBE_LOB.FREETEMPORARY (
   clob INOUT CLOB);
```

Table 10-207 DBE_LOB.FREETEMPORARY parameters

Parameter	Description
blob/clob	BLOB/CLOB to be freed.

- DBE_LOB.FILEOPEN

  Opens an external database BFILE file and returns its file descriptor. A maximum of 10 BFILE files can be opened in a session. The BFILE type is defined as follows:

  ```
  DBE_LOB.BFILE (
     directory TEXT,
     filename  TEXT,
     fd        INTEGER);
  ```

  The prototype of the DBE_LOB.FILEOPEN function is as follows:

  ```
  DBE_LOB.FILEOPEN (
     bfile     IN DBE_LOB.BFILE,
     open_mode IN TEXT)
  RETURN INTEGER;
  ```

  Table 10-208 DBE_LOB.FILEOPEN parameters

Parameter	Description
bfile	External database file to be opened. For a BFILE file, this parameter specifies the file path , file name, and file descriptor. **NOTE** The *file* variable contains the location of the file directory *directory* and the file name *filename*. • Location of the file directory, which needs to be added to system catalog **20.2.57-PG_DIRECTORY**. If the input path does not match the path in **20.2.57-PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to read and write files in the file path specified by **safe_data_path**. • File name with an extension (file type), excluding the path name. The path contained in the file name will be ignored by OPEN. In Unix, the file name cannot end with the combination of a slash and a period (/.).
open_mode	File open mode, which can only be **r** (that is, read). An error is reported in other modes.

- DBE_LOB.FILECLOSE

  Closes an external BFILE file.

  The prototype of the DBE_LOB.FILECLOSE function is as follows:

  ```
  DBE_LOB.FILECLOSE (
     file IN INTEGER);
  ```

Table 10-209 DBE_LOB.FILECLOSE parameters

Parameter	Description
file	External database file to be closed (that is opened by FILEOPEN).

- DBE_LOB.BFILEOPEN

  Opens an external database BFILE file. A maximum of 10 BFILE files can be opened in a session.

  The prototype of DBE_LOB.BFILEOPEN is as follows:

```
DBE_LOB.BFILEOPEN (
   bfile     INOUT DBE_LOB.BFILE,
   open_mode IN    TEXT DEFAULT 'R');
```

Table 10-210 DBE_LOB.BFILEOPEN parameters

Parameter	Description
bfile	Opened database BFILE file as the INOUT parameter. **NOTE** The *bfile* variable contains the location of the file directory *directory* and the file name *filename*. • Location of the file directory, which needs to be added to system catalog **20.2.57-PG_DIRECTORY**. If the input path does not match the path in **20.2.57-PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to read and write files in the file path specified by **safe_data_path**. • File name with an extension (file type), excluding the path name. The path contained in the file name will be ignored by OPEN. In Unix, the file name cannot end with the combination of a slash and a period (/.).
open_mode	File open mode, which can only be **r** (that is, read). An error is reported in other modes.

Examples

```
-- Obtain the substring of the BFILE (the file content is ABCD).
DECLARE
bfile dbe_lob.bfile;
BEGIN
bfile = DBE_LOB.BFILENAME(dir_name, file_name); -- Obtain the corresponding BFILE.
DBE_LOB.bfileopen(bfile, 'r'); -- Open the BFILE.
RAISE NOTICE 'res:%', DBE_LOB.lob_substr(bfile, 1, 1); -- Obtain and print the substring.
DBE_LOB.bfileclose(bfile);-- Close the BFILE.
END;
/
NOTICE:  res:41
ANONYMOUS BLOCK EXECUTE
```

- DBE_LOB.BFILECLOSE

  Closes an external database BFILE file.

  The prototype of DBE_LOB.BFILECLOSE is as follows:

```
DBE_LOB.BFILECLOSE (
   bfile INOUT DBE_LOB.BFILE);
```

Table 10-211 DBE_LOB.BFILECLOSE parameters

Parameter	Description
bfile	Closed database BFILE file as the INOUT parameter.

- DBE_LOB.LOADFROMFILE

  Loads an external BFILE file to a BLOB and returns the object of the RAW type.

  The prototype of the DBE_LOB.LOADFROMFILE function is as follows:

```
DBE_LOB.LOADFROMFILE (
   dest_lob    IN BLOB,
   src_file    IN INTEGER,
   amount      IN INTEGER,
   dest_offset IN INTEGER,
   src_offset  IN INTEGER)
RETURN RAW;
```

Table 10-212 DBE_LOB.LOADFROMFILE parameters

Parameter	Description
dest_lob	Target BLOB. The BFILE file will be loaded to the specified offset position of the BLOB.
src_bfile	Source BFILE file to be read.
amount	Length of the content to be read from the BFILE file. **NOTE** If the length is less than 1 or greater than 32767, an error is reported.
dest_offset	Offset length of the BLOB. **NOTE** If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
src_offset	Offset length of the BFILE file. **NOTE** • If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported. • If the sum of *amount* and *src_offset* is greater than the length of *src_bfile* plus 1, an error is reported.

- DBE_LOB.LOADFROMBFILE

  Loads an external BFILE file to a LOB.

  The prototype of the DBE_LOB.LOADFROMBFILE function is as follows:

```
DBE_LOB.LOADFROMBFILE (
   dest_lob    INOUT BLOB,
   src_file    IN    DBE_LOB.BFILE,
   amount      IN    BIGINT,
   dest_offset IN    BIGINT DEFAULT 1,
```

```
   src_offset  IN    BIGINT DEFAULT 1)
RETURN BLOB;

DBE_LOB.LOADFROMBFILE (
   dest_lob    INOUT CLOB,
   src_file    IN    DBE_LOB.BFILE,
   amount      IN    BIGINT,
   dest_offset IN    BIGINT DEFAULT 1,
   src_offset  IN    BIGINT DEFAULT 1)
RETURN CLOB;
```

Table 10-213 DBE_LOB.LOADFROMBFILE parameters

Parameter	Description
dest_lob	Target LOB as the INOUT parameter, to which the BFILE file will be loaded. The file must be opened by **DBE_LOB.BFILEOPEN** first. The LOB can be greater than 1 GB, up to 32 TB.
src_file	Source BFILE file to be read. The BFILE file can be greater than 1 GB, up to 32 TB.
amount	Length of the content to be read from the BFILE file and to be written to the LOB. **NOTE** If the length is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
dest_offset	Offset length of the target LOB **NOTE** If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
src_offset	Offset length of the BFILE file. **NOTE** • If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported. • If the sum of *amount* and *src_offset* is greater than the length of *src_bfile* plus 1, an error is reported.

- DBE_LOB.LOADBLOBFROMFILE

  Loads an external BFILE file to a BLOB and returns the object of the RAW type.

  The prototype of the DBE_LOB.LOADBLOBFROMFILE function is as follows:

```
DBE_LOB.LOADBLOBFROMFILE (
   dest_lob    IN BLOB,
   src_file    IN INTEGER,
   amount      IN INTEGER,
   dest_offset IN INTEGER,
   src_offset  IN INTEGER)
RETURN RAW;
```

Table 10-214 DBE_LOB.LOADBLOBFROMFILE parameters

Parameter	Description
dest_lob	Target BLOB, to which the BFILE file will be loaded.
src_file	Source BFILE file to be read.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. **NOTE** If the length is less than 1 or greater than 32767, an error is reported.
dest_offset	Offset length of the BLOB. **NOTE** If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
src_offset	Offset length of the BFILE file. **NOTE** • If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported. • If the sum of *amount* and *src_offset* is greater than the length of *src_bfile* plus 1, an error is reported.

- DBE_LOB.LOADBLOBFROMBFILE

  Loads an external BFILE file to a BLOB.

  The prototype of the DBE_LOB.LOADBLOBFROMBFILE function is as follows:

```
DBE_LOB.LOADBLOBFROMFILE (
   dest_lob     INOUT BLOB,
   src_file     IN     DEB_LOB.BFILE,
   amount       IN     BIGINT,
   dest_offset INOUT BIGINT,
   src_offset  INOUT BIGINT)
```

Table 10-215 DBE_LOB.LOADBLOBFROMBFILE parameters

Parameter	Description
dest_lob	Target BLOB as the INOUT parameter, to which the BFILE file (which must be opened using **DBE_LOB.BFILEOPEN** first) is loaded. The BFILE file can be greater than 1 GB, up to 32 TB.
src_file	Source BFILE file to be read. The BFILE file can be greater than 1 GB, up to 32 TB.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. **NOTE** If the length is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.

Parameter	Description
dest_offset	Offset length of the BLOB. **NOTE** If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
src_offset	Offset length of the BFILE file. **NOTE** • If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported. • If the sum of *amount* and *src_offset* is greater than the length of *src_bfile* plus 1, an error is reported.

- DBE_LOB.LOADCLOBFROMFILE

  Loads an external BFILE file to a CLOB and returns the object of the RAW type.

  The prototype of the DBE_LOB.LOADCLOBFROMFILE function is as follows:

```
DBE_LOB.LOADCLOBFROMFILE (
   dest_lob    IN CLOB,
   src_file    IN INTEGER,
   amount      IN INTEGER,
   dest_offset IN INTEGER,
   src_offset  IN INTEGER)
RETURN RAW;
```

  Table 10-216 DBE_LOB.LOADCLOBFROMFILE parameters

Parameter	Description
dest_lob	Target CLOB, to which the BFILE file will be loaded.
src_file	Source BFILE file to be read.
amount	Length of the CLOB. **NOTE** If the length is less than 1 or greater than 32767, an error is reported.
dest_offset	Offset length of the CLOB. **NOTE** If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
src_offset	Offset length of the BFILE file. **NOTE** • If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported. • If the sum of *amount* and *src_offset* is greater than the length of *src_bfile* plus 1, an error is reported.

- DBE_LOB.LOADCLOBFROMBFILE

  Loads an external BFILE file to a CLOB.

  The prototype of the DBE_LOB.LOADCLOBFROMBFILE function is as follows:

```
DBE_LOB.LOADCLOBFROMBFILE (
   dest_lob    INOUT CLOB,
   src_file    IN    DEB_LOB.BFILE,
   amount      IN    BIGINT,
   dest_offset INOUT BIGINT,
   src_offset  INOUT BIGINT)
```

Table 10-217 DBE_LOB.LOADCLOBFROMBFILE parameters

Parameter	Description
dest_lob	Target CLOB as the INOUT parameter, to which the BFILE file (which must be opened using **DBE_LOB.BFILEOPEN** first) is loaded. The BFILE file can be greater than 1 GB, up to 32 TB.
src_file	Source BFILE file to be read. The BFILE file can be greater than 1 GB, up to 32 TB.
amount	Length of the target CLOB. If the length of a file exceeds this threshold, the file will not be saved to the CLOB. **NOTE** If the length is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
dest_offset	Offset length of the CLOB. **NOTE** If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
src_offset	Offset length of the BFILE file. **NOTE** • If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported. • If the sum of *amount* and *src_offset* is greater than the length of *src_bfile* plus 1, an error is reported.

- DBE_LOB.CONVERTTOBLOB

  Converts a CLOB to a BLOB. The CLOB cannot be greater than 1 GB.

  The prototype of the DBE_LOB.CONVERTTOBLOB function is as follows:

```
DBE_LOB.CONVERTTOBLOB(
   dest_blob   IN BLOB,
   src_clob    IN CLOB,
   amount      IN INTEGER DEFAULT 32767,
   dest_offset IN INTEGER DEFAULT 1,
   src_offset  IN INTEGER DEFAULT 1)
RETURN RAW;
```

Table 10-218 DBE_LOB.CONVERTTOBLOB parameters

Parameter	Description
dest_blob	Target BLOB, which is converted from a CLOB.
src_clob	Source CLOB to be read.

Parameter	Description
amount	Length of the target CLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. If the length is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
dest_offset	Offset length of the BLOB. If **dest_offset** is set to **1**, data is loaded from the start position of the file. The rest may be deduced by analogy.
src_offset	Offset length of the CLOB. If **src_offset** is set to **1**, data is read from the start position of the file. The rest may be deduced by analogy.

- DBE_LOB.LOB_CONVERTTOBLOB

  Converts a CLOB to a BLOB. The LOB can be greater than 1 GB.

  The prototype of the DBE_LOB.LOB_CONVERTTOBLOB function is as follows:

```
DBE_LOB.LOB_CONVERTTOBLOB(
   dest_blob   INOUT BLOB,
   src_clob    IN    CLOB,
   amount      IN    BIGINT,
   dest_offset INOUT BIGINT,
   src_offset  INOUT BIGINT)
```

  Table 10-219 DBE_LOB.LOB_CONVERTTOBLOB parameters

Parameter	Description
dest_blob	Target BLOB, which is converted from a CLOB.
src_clob	Source CLOB to be read.
amount	Length of the target CLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. If the length is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
dest_offset	Offset length of the BLOB. If **dest_offset** is set to **1**, data is loaded from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
src_offset	Offset length of the CLOB. If **src_offset** is set to **1**, data is read from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.

- DBE_LOB.CONVERTTOCLOB

  Converts a BLOB to a CLOB. The BLOB cannot be greater than 1 GB.

  The prototype of the DBE_LOB.CONVERTTOCLOB function is as follows:

```
DBE_LOB.CONVERTTOCLOB(
   dest_clob   IN CLOB,
   src_blob    IN BLOB,
   amount      IN INTEGER DEFAULT 32767,
   dest_offset IN INTEGER DEFAULT 1,
   src_offset  IN INTEGER DEFAULT 1)
RETURN text;
```

Table 10-220 DBE_LOB.CONVERTTOCLOB parameters

Parameter	Description
dest_clob	Target CLOB, which is converted from a BLOB.
src_blob	Source BLOB to be read.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the CLOB.
dest_offset	Offset length of the CLOB. If **dest_offset** is set to **1**, data is loaded from the start position of the file. The rest may be deduced by analogy.
src_offset	Offset length of the BLOB. If **src_offset** is set to **1**, data is read from the start position of the file. The rest may be deduced by analogy.

- DBE_LOB.LOB_CONVERTTOCLOB

  Converts a BLOB to a CLOB. The LOB can be greater than 1 GB.

  The prototype of the DBE_LOB.LOB_CONVERTTOCLOB function is as follows:

```
DBE_LOB.LOB_CONVERTTOCLOB(
   dest_clob    INOUT CLOB,
   src_blob    IN    BLOB,
   amount      IN    BIGINT,
   dest_offset INOUT BIGINT,
   src_offset  INOUT BIGINT)
```

Table 10-221 DBE_LOB.LOB_CONVERTTOCLOB parameters

Parameter	Description
dest_clob	Target CLOB, which is converted from a BLOB.
src_blob	Source BLOB to be read.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the CLOB.
dest_offset	Offset length of the CLOB. If **dest_offset** is set to **1**, data is loaded from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.

Parameter	Description
src_offset	Offset length of the BLOB. If **src_offset** is set to **1**, data is read from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.

- DBE_LOB.GETCHUNKSIZE

  Returns *TOAST_MAX_CHUNK_SIZE*. When LOB data is stored in the database, TOAST is used internally.

  The prototype of the DBE_LOB.GETCHUNKSIZE function is as follows:

```
DBE_LOB.GETCHUNKSIZE(
   lob_loc IN CLOB
)RETURN INTEGER

DBE_LOB.GETCHUNKSIZE(
   lob_loc IN BLOB
)RETURN INTEGER
```

  Table 10-222 DBE_LOB.GETCHUNKSIZE parameters

Parameter	Description
lob_loc	Target CLOB/BLOB.

- DBE_LOB.LOB_WRITE

  Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.

  The prototype of the DBE_LOB.LOB_WRITE function is as follows:

```
DBE_LOB.LOB_WRITE(
   clob_obj INOUT CLOB,
   amount   IN    INTEGER,
   off_set  IN    BIGINT,
   source   IN    VARCHAR2
)
RETURN CLOB;

DBE_LOB.LOB_WRITE(
   blob_obj INOUT BLOB,
   amount   IN    INTEGER,
   off_set  IN    BIGINT,
   source   IN    RAW
)
RETURN BLOB;
```

Table 10-223 DBE_LOB.LOB_WRITE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
blob_obj/clob_obj	BLOB/CLOB	INOUT	No	Target LOB as the INOUT parameter, to which the content is to be written.
amount	INTEGER	IN	No	Length of the data to be written (in bytes for BLOBs or in characters for CLOBs)
off_set	BIGINT	IN	No	Offset position for writing data to *blob_obj/clob_obj*
source	RAW/VARCHAR2	IN	No	Source object

- DBE_LOB.BFILENAME

  Constructs a BFILE based on the directory and file name.

  The prototype of DBE_LOB.BFILENAME is as follows:

```
DBE_LOB.BFILENAME(
    directory IN TEXT,
    filename  IN TEXT)
RETURN DBE_LOB.BFILE;
```

Table 10-224 DBE_LOB.BFILENAME parameters

Parameter	Description
directory	File path **NOTE** Location of the file directory, which needs to be added to system catalog **20.2.57-PG_DIRECTORY**. If the input path does not match the path in **20.2.57-PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to read and write files in the file path specified by **safe_data_path**. • File name with an extension (file type), excluding the path name. The path contained in the file name will be ignored by OPEN. In Unix, the file name cannot end with the combination of a slash and a period (/.).
filename	File name

Examples

```
-- Obtain the length of a string.
SELECT DBE_LOB.GET_LENGTH('12345678');
 get_length
------------
          8
(1 row)

-- DBE_LOB.READ API
DECLARE
myraw  RAW(100);
amount INTEGER :=2;
buffer INTEGER :=1;
begin
DBE_LOB.READ('123456789012345',amount,buffer,myraw);
dbe_output.print_line(myraw);
end;
/
0123
ANONYMOUS BLOCK EXECUTE

10.12.2.8 DBE_MATCH

API Description

Table 10-225 provides all APIs supported by the **DBE_MATCH** package.

Table 10-225 DBE_MATCH

API	Description
DBE_MATCH.EDIT_DISTANCE_SIMILARITY	Compares the difference between two character strings (minimum steps of deletion, addition, and conversion) and normalizes the difference to a value ranging from 0 to 100. The value **100** indicates that the two character strings are the same, and the value **0** indicates that the two character strings are different.

- DBE_MATCH.EDIT_DISTANCE_SIMILARITY

  Compares the difference between two character strings (minimum steps of deletion, addition, and conversion) and normalizes the difference to a value ranging from 0 to 100. The value **100** indicates that the two character strings are the same, and the value **0** indicates that the two character strings are different. The prototype of the DBE_MATCH.EDIT_DISTANCE_SIMILARITY function is as follows:

```
DBE_MATCH.EDIT_DISTANCE_SIMILARITY(
    str1 IN text,
    str2 IN text
)returns integer ;
```

Table 10-226 DBE_MATCH.EDIT_DISTANCE_SIMILARITY parameters

Parameter	Description
str1	First character string. If the value is **null**, **0** is returned.
str2	Second character string. If the value is **null**, **0** is returned.

10.12.2.9 DBE_OUTPUT

NOTE

When DBE_OUTPUT.PUT_LINE is used to print the result obtained by the DBE_FILE.READ_LINE_NCHAR API, ensure that the UTF-8 character set encoding can be converted to the current database character set encoding. If the preceding conditions are met, the result can be properly output. DBE_OUTPUT.PRINT_LINE does not support this function.

API Description

Table 10-227 provides all APIs supported by the **DBE_OUTPUT** package.

Table 10-227 DBE_OUTPUT

API	Description
DBE_OUTPUT.PRINT_LINE	Outputs the specified text with newline characters.
DBE_OUTPUT.PRINT	Outputs the specified text without newline characters.
DBE_OUTPUT.SET_BUFFER_SIZE	Sets the size of the output buffer. If the size is not specified, the buffer can contain a maximum of 20000 bytes. If the size is set to a value less than or equal to 2000 bytes, the buffer can contain a maximum of 2000 bytes.
DBE_OUTPUT.DISABLE	Disables the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE and GET_LINES, and clears the output buffer.
DBE_OUTPUT.ENABLE	Enables the buffer, allows the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES, and sets the buffer size.
DBE_OUTPUT.GET_LINE	Obtains a line of data from the buffer with a newline character as the boundary. The obtained data is not output to the client.
DBE_OUTPUT.GET_LINES	Obtains the character string of a specified number of lines in the buffer as a VARCHAR array. The obtained content is cleared from the buffer and is not output to the client.
DBE_OUTPUT.NEW_LINE	Places a line at the end of the buffer, places an end-of-line marker, and leaves a new line empty.
DBE_OUTPUT.PUT	Places an input string in the buffer without a newline character at the end. After the anonymous block is executed, the line ending with the newline character is displayed.
DBE_OUTPUT.PUT_LINE	Places an input string in the buffer with a newline character at the end. After the anonymous block is executed, the line ending with the newline character is displayed.

- DBE_OUTPUT.PRINT_LINE

  Outputs the specified text and adds a newline character. The function prototype of **DBE_OUTPUT.PRINT_LINE** is as follows:

  ```
  DBE_OUTPUT.PRINT_LINE (
  format IN VARCHAR2);
  ```

  Table 10-228 DBE_OUTPUT.PRINT_LINE parameters

Parameter	Description
format	Output text.

- DBE_OUTPUT.PRINT

  Outputs the specified text without adding a newline character. The function prototype of **DBE_OUTPUT.PRINT** is as follows:

  ```
  DBE_OUTPUT.PRINT (
  format IN VARCHAR2);
  ```

  Table 10-229 DBE_OUTPUT.PRINT parameters

Parameter	Description
format	Output text.

- DBE_OUTPUT.SET_BUFFER_SIZE

  The stored procedure **SET_BUFFER_SIZE** sets the output buffer size. If the size is not specified, it contains a maximum of 20000 bytes. The function prototype of **DBE_OUTPUT.SET_BUFFER_SIZE** is as follows:

  ```
  DBE_OUTPUT.SET_BUFFER_SIZE (
  size IN INTEGER default 20000);
  ```

  Table 10-230 DBE_OUTPUT.SET_BUFFER_SIZE parameters

Parameter	Description
size	Sets the output buffer size.

- DBE_OUTPUT.DISABLE

  Disables the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES, and clears the output buffer. The prototype of the DBE_OUTPUT.DISABLE function is as follows:

  ```
  DBE_OUTPUT.DISABLE;
  ```

- DBE_OUTPUT.ENABLE

  Enables the buffer, allows the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES, and sets the buffer size. If the buffer size is not specified, 20,000 bytes are allowed by default. The prototype of the DBE_OUTPUT.ENABLE function is as follows:

```
DBE_OUTPUT.ENABLE (
   buffer_size IN INTEGER DEFAULT 20000
);
```

Table 10-231 DBE_OUTPUT.ENABLE parameters

Parameter	Description
buffer_size	Upper limit of the buffer size, in bytes. If **buffer_size** is set to **NULL**, the default value (20000 bytes) is used.

- DBE_OUTPUT.GET_LINE

  The stored procedure **GET_LINE** obtains a line of data from the buffer with a newline character as the boundary. The obtained data is not output to the client. The prototype of the DBE_OUTPUT.GET_LINE function is as follows:

  ```
  DBE_OUTPUT.GET_LINE (
     line   OUT VARCHAR2,
     status OUT INTEGER
  );
  ```

  Table 10-232 DBE_OUTPUT.GET_LINE parameters

Parameter	Description
line	Indicates the obtained character string.
status	Specifies whether the calling is normal. If a character string is obtained, the value is **0**. Otherwise, the value is **1**.

- DBE_OUTPUT.GET_LINES

  The stored procedure **GET_LINES** obtains the character string of a specified number of lines in the buffer as a VARCHAR array. The obtained content is cleared from the buffer and is not output to the client. The prototype of the DBE_OUTPUT.GET_LINES function is as follows:

  ```
  DBE_OUTPUT.GET_LINES (
     lines    OUT   VARCHAR[],
     numlines IN OUT INTEGER
  );
  ```

  Table 10-233 DBE_OUTPUT.GET_LINES parameters

Parameter	Description
lines	Outputs an array of multi-line strings read from the buffer.
numlines	Inputs the number of lines to be retrieved from the buffer. The output value is the number of lines actually retrieved. If the output value is less than the input value, there are no more lines in the buffer.

- DBE_OUTPUT.NEW_LINE

  The stored procedure **NEW_LINE** places a line at the end of the buffer, places an end-of-line marker, and leaves a new line empty. The prototype of the DBE_OUTPUT.NEW_LINE function is as follows:

```
DBE_OUTPUT.NEW_LINE;
```

- DBE_OUTPUT.PUT

  The stored procedure **PUT** places an input string in the buffer without a newline character at the end. When the stored procedure ends, the line ending with the newline character is displayed. The prototype of the DBE_OUTPUT.PUT function is as follows:

  ```
  DBE_OUTPUT.PUT (
     item IN VARCHAR2);
  ```

  Table 10-234 DBE_OUTPUT.PUT parameters

Parameter	Description
item	Character or character string to be placed in the buffer.

- DBE_OUTPUT.PUT_LINE

  The stored procedure **PUT_LINE** places an input string in the buffer with a newline character at the end. When the stored procedure ends, the line ending with the newline character is displayed. The prototype of the DBE_OUTPUT.PUT_LINE function is as follows:

  ```
  DBE_OUTPUT.PUT_LINE (
     item IN VARCHAR2);
  ```

  Table 10-235 DBE_OUTPUT.PUT_LINE parameters

Parameter	Description
item	Character or character string to be placed in the buffer.

Examples

```
BEGIN
    DBE_OUTPUT.SET_BUFFER_SIZE(50);
    DBE_OUTPUT.PRINT('hello, ');
    DBE_OUTPUT.PRINT_LINE('database!');-- Output "hello, database!"
END;
/
-- The expected result is as follows:
hello, database!
ANONYMOUS BLOCK EXECUTE

-- Test DISABLE: Disable the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES. The PUT_LINE has no output.
BEGIN
 dbe_output.disable();
        dbe_output.put_line('1');
END;
/
-- The expected result is as follows:
ANONYMOUS BLOCK EXECUTE

-- Test ENABLE: Enable the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES. The output of PUT_LINE is 1.
BEGIN
 dbe_output.enable();
        dbe_output.put_line('1');
END;
/
```

```
-- The expected result is as follows:
1
ANONYMOUS BLOCK EXECUTE

-- Test PUT: Place the input character string a in the buffer without adding a newline character at the end.
a has no output.
BEGIN
 dbe_output.enable();
 dbe_output.put('a');
END;
/
-- The expected result is as follows:
ANONYMOUS BLOCK EXECUTE

-- Test NEW_LINE. Add a new line. The output is a.
BEGIN
 dbe_output.enable();
 dbe_output.put('a');
        dbe_output.new_line;
END;
/
-- The expected result is as follows:
a
ANONYMOUS BLOCK EXECUTE

-- Test GET_LINE: Obtain buffer data and save the data to variables and use PUT_LINE to output the data.
DECLARE
 line VARCHAR(32672);
 status INTEGER := 0;
BEGIN
 dbe_output.put_line('hello');
 dbe_output.get_line(line, status);
 dbe_output.put_line('-----------');
 dbe_output.put_line(line);
 dbe_output.put_line(status);
END;
/
-- The expected result is as follows:
-----------
hello
0
ANONYMOUS BLOCK EXECUTE

-- Test get_lines: Obtain multiple lines of content in the buffer and use PUT_LINE to output the content.
DECLARE
    lines varchar[];
    linenum integer;
BEGIN
    dbe_output.put_line('line 1');
    dbe_output.put_line('line 2');
    dbe_output.put_line('line 3');
    linenum := 100;
    dbe_output.get_lines(lines, linenum);
    dbe_output.put_line('num: ' || linenum);
    FOR i IN 1 .. linenum LOOP
        dbe_output.put_line(lines[i]);
    END LOOP;
END;
/
-- The expected result is as follows:
num: 3
line 1
line 2
line 3
ANONYMOUS BLOCK EXECUTE
```

NOTE

When the character encoding type server_encoding of the server is not UTF-8, if the character encoding in the data is valid UTF-8 encoding, when processing the character encoding, the DBE_OUTPUT.PUTLINE and DBE_OUTPUT.PUT functions convert the character encoding into the server_encoding encoding format based on the UTF8 encoding logic before performing subsequent operations, as a result, the return values of the functions may not meet the expectation or an error may be reported. After the GUC parameter **enable_convert_illegal_char** is enabled, the DBE_OUTPUT.PUTLINE and DBE_OUTPUT.PUT functions process such codes in the same way as when the parameter is disabled. Special characters are not output as placeholders, therefore, you are advised not to use the DBE_OUTPUT.PUTLINE and DBE_OUTPUT.PUT functions for data containing special characters.

10.12.2.10 DBE_PROFILER

The plprofiler provides an API for analyzing applications of stored procedures. It can collect, store, and delete data related to stored procedures.

Overview

Finding performance problems in PL/SQL functions and stored procedures may be difficult. The only query visible in the system or extended view is sent from the client. This is just the outermost stored procedure call. The plprofiler extension can be used to quickly identify the most time-consuming stored procedures and view the time consumption of a single statement.

You can use this tool to create a stored procedure and related table information in a session, call the plprofiler API to profiling the stored procedure, and then execute the stored procedure. In this case, the analysis data of the stored procedure is generated. You can query the system catalog to obtain data. **Table 5 DBE_PROFILER.PL_PROFILING_FUNCTIONS** lists the stored procedures involved in the profiling. **Table 6 DBE_PROFILER.PL_PROFILING_DETAILS** records details about the execution time of each statement in a stored procedure. **Table 7 DBE_PROFILER.PL_PROFILING_CALLGRAPH** records call stack information and the overall execution time of each stored procedure. **Table 8 DBE_PROFILER.PL_PROFILING_TRACKINFO** records the execution time of each phase of the stored procedure. You can call DBE_PROFILER.PL_CLEAR_PROFILING to delete one piece of data or all data stored in the system catalog after profiling.

After pl_start_profiling is executed, the dbe_profiler tool initializes the memory to prepare for data recording, stubs the stored procedures that are executed subsequently, records detailed information at key points, and records the information in the memory. Data in the memory is written to the four system catalogs only after the transaction is committed. When using the dbe_profiler tool in a transaction, note that data in the memory is not written to the system catalog because the transaction is not committed during transaction execution. Data is written to the system catalog only after the commit operation is executed. Similarly, after the rollback operation is executed, all data is deleted.

Permissions

Common users can access the DBE_PROFILER.PL_PROFILING_FUNCTIONS, DBE_PROFILER.PL_PROFILING_DETAILS, DBE_PROFILER.PL_PROFILING_CALLGRAPH and

DBE_PROFILER.PL_PROFILING_TRACKINFO catalogs and have only the permission to query records.

APIs and System Catalogs

Table 1 DBE_PROFILER lists all APIs supported by the DBE_PROFILER advanced package.

Table 10-236 DBE_PROFILER

API	Description
DBE_PROFILER.PL_START_PLPROFILING	Allows users to perform profiling on target stored procedures.
DBE_PROFILER.PL_CLEAR_PROFILING	Deletes one piece of data or all data stored in system catalogs after profiling.

- DBE_PROFILER.PL_START_PLPROFILING

  Allows users to perform profiling on target stored procedures. The function prototype of the DBE_PROFILER.PL_START_PLPROFILING function is as follows:

  ```
  DBE_PROFILER.PL_START_PLPROFILING (run_id varchar2(64)) return void;
  ```

  Table 10-237 DBE_PROFILER.PL_START_PLPROFILING parameters

Parameter	Description
run_id	Execution ID of profiling. The system combines the session ID and execution ID into a character string in the format of sessionid_runid and writes the character string to the table as the unique ID of profiling.

- DBE_PROFILER.PL_CLEAR_PROFILING

  Deletes one piece of data or all data stored in system catalogs after profiling. The function prototype of the DBE_PROFILER.PL_CLEAR_PROFILING function is as follows:

  ```
  DBE_PROFILER.PL_CLEAR_PROFILING (run_id varchar2) return void;
  ```

  Table 10-238 DBE_PROFILER.PL_CLEAR_PROFILING parameters

Parameter	Description
run_id	If this parameter is not left empty, the unique ID of a profiling data record is deleted. If this parameter is left empty, all profiling data records are deleted.

The analysis data generated by the stored procedure is stored in the database system catalog. The catalog information is as follows:

Table 10-239 Catalog overview

Name
Table 5 DBE_PROFILER.PL_PROFILING_FUNCTIONS
Table 6 DBE_PROFILER.PL_PROFILING_DETAILS
Table 7 DBE_PROFILER.PL_PROFILING_CALLGRAPH
Table 8 DBE_PROFILER.PL_PROFILING_TRACKINFO

- Information about the DBE_PROFILER.PL_PROFILING_FUNCTIONS catalog is as follows:

  Table 10-240 DBE_PROFILER.PL_PROFILING_FUNCTIONS

Column	Type	Description
run_id	VARCHAR2(80) NOT NULL	Unique ID consisting of session ID and execution ID.
funcoid	BIGINT NOT NULL	Stored procedure ID.
schema	TEXT NOT NULL	Schema name.
funcname	TEXT NOT NULL	Stored procedure name.
total_occur	BIGINT	Total number of stored procedure execution times.
total_time	BIGINT	Total execution time of a stored procedure.

- Information about the DBE_PROFILER.PL_PROFILING_DETAILS catalog is as follows:

  Table 10-241 DBE_PROFILER.PL_PROFILING_DETAILS

Column	Type	Description
run_id	VARCHAR2(80) NOT NULL	Unique ID consisting of session ID and execution ID.
funcoid	BIGINT NOT NULL	Stored procedure ID.
line#	INTEGER NOT NULL	Line number.
source	TEXT	Stored procedure execution statement.

Column	Type	Description
cmd_type	TEXT	Statement type.
total_occur	BIGINT	Number of statement execution times.
total_time	BIGINT	Total execution time of a statement.
min_time	BIGINT	Minimum execution time of a statement.
max_time	BIGINT	Maximum execution time of a statement.

- Information about the DBE_PROFILER.PL_PROFILING_CALLGRAPH catalog is as follows:

  Table 10-242 DBE_PROFILER.PL_PROFILING_CALLGRAPH

Column	Type	Description
run_id	varchar2(80) NOT NULL	Unique ID consisting of session ID and execution ID.
stack	text[] NOT NULL	Call stack.
self_time	bigint	Stored procedure execution time.

- Information about the DBE_PROFILER.PL_PROFILING_TRACKINFO catalog is as follows:

  Table 10-243 DBE_PROFILER.PL_PROFILING_TRACKINFO

Column	Type	Description
run_id	VARCHAR2(80) NOT NULL	Unique ID consisting of session ID and execution ID.
funcoid	BIGINT NOT NULL	Stored procedure ID.
step_name	TEXT NOT NULL	Execution phase name.
loops_count	INTEGER	Total number of execution times of the execution phase.
max_time	BIGINT	Maximum execution time of the execution phase.

Column	Type	Description
min_time	BIGINT	Minimum execution time of the execution phase.
avg_time	BIGINT	Average execution time of the execution phase.
total_time	BIGINT	Total execution time of the execution phase.

Constraints

- The dbe_profiler.pl_start_profiling cannot be used in a stored procedure. Calling it in a stored procedure does not take effect.
- The dbe_profiler.pl_start_profiling does not support the function of recording transaction failure statistics to the system catalog.
- The length of the input parameter **runid** of dbe_profiler.pl_start_profiling is limited to 64 characters. If the length exceeds 64 characters, an error is reported.
- If the input parameter of dbe_profiler.pl_start_profiling is the same as the value of **runid** in the profiler system catalog, an error is reported.
- The plprofiler does not support anonymous block statements, PACKAGE initialization statements, and statements in nested subprograms.
- Committing and rolling back an autonomous transaction does not affect the data that has been committed by the primary transaction. Therefore, the plprofiler cannot record information about stored procedures that contain autonomous transactions.

Examples

```
-- Step 1 Create tables and stored procedures.
gaussdb=# DROP TABLE IF EXISTS t1;
gaussdb=# CREATE TABLE t1 (i int);
gaussdb=# CREATE OR REPLACE PROCEDURE p1() AS
    sql_stmt varchar2(200);
    result number;
BEGIN
    for i in 1..1000 loop
      insert into t1 values(1);
    end loop;
    sql_stmt := 'select count(*) from t1';
    EXECUTE IMMEDIATE sql_stmt into result;
END;
/
gaussdb=# CREATE OR REPLACE PROCEDURE p2() AS
BEGIN
   p1();
END;
/
gaussdb=# CREATE OR REPLACE PROCEDURE p3() AS
BEGIN
    p2();
END;
/
```

```
-- Step 2 Call the plprofiler API to profile the stored procedures.
gaussdb=# SELECT dbe_profiler.pl_start_profiling('123');
gaussdb=# CALL p3();

-- Step 3 Query profiling information.
-- Query the dbe_profiler.pl_profiling_functions catalog to check the stored procedures involved in profiling.
gaussdb=# SELECT * FROM dbe_profiler.pl_profiling_functions ORDER BY run_id, funcoid;
       run_id        | funcoid | schema | funcname | total_occur | total_time

10.12.2.11 DBE_RANDOM

Interface Description

Table 10-244 lists all interfaces supported by the **DBE_RANDOM** package.

Table 10-244 DBE_RANDOM interface parameters

Interface	Description
DBE_RANDOM.SET_SEED	Sets a seed for a random number.
DBE_RANDOM.GET_VALUE	Generates a random number between a specified **low** and a specified **high**.

- DBE_RANDOM.SET_SEED

  The stored procedure **SEED** is used to set a seed for a random number. The prototype of the **DBE_RANDOM.SET_SEED** function is as follows:

  ```
  DBE_RANDOM.SET_SEED (seed  IN  INTEGER);
  ```

  Table 10-245 DBE_RANDOM.SET_SEED interface parameters

Parameter	Description
seed	Generates a seed for a random number.

- DBE_RANDOM.GET_VALUE

  The GET_VALUE function generates a random number between a specified **low** and a specified **high**. The prototype of the **DBE_RANDOM.GET_VALUE** function is as follows:

  ```
  DBE_RANDOM.GET_VALUE(
  min  IN  NUMBER default 0,
  max  IN  NUMBER default 1)
  RETURN NUMBER;
  ```

  Table 10-246 DBE_RANDOM.GET_VALUE interface parameters

Parameter	Description
min	Sets the low bound for a random number. The generated random number is greater than or equal to **min**.
max	Sets the high bound for a random number. The generated random number is less than **max**.

NOTE

- The only requirement is that the parameter type is numeric regardless of the right and left bound values.
- **DBE_RANDOM** implements pseudo-random numbers. Therefore, if the initial value (seed) remains unchanged, the sequence of the pseudo-random numbers also remains unchanged.
- The generated random number contains 15 valid digits.

Examples

```
-- Generate a random number between 0 and 1.
SELECT DBE_RANDOM.GET_VALUE(0,1);
    get_value
------------------
 .917468812743886
(1 row)

-- For integers within a specified range, add the arguments min and max, and truncate the decimals from the result (the maximum value is not included as a possible value). Therefore, for integers from 0 to 99, you can use the following code:
SELECT TRUNC(DBE_RANDOM.GET_VALUE(0,100));
 trunc
-------
    26
(1 row)
```

10.12.2.12 DBE_RAW

The DBE_RAW package provides interfaces for operating RAW types.

NOTICE

RAW data is represented as hexadecimal characters externally, and stored as binary characters internally. For example, the representation of RAW data 11001011 is 'CB', that is, the input for type conversion is 'CB'.

Interface Description

Table 10-247 provides all interfaces supported by the **DBE_RAW** package.

Table 10-247 DBE_RAW

Interface	Description
DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW	Converts an INTEGER value to a RAW value.
DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER	Converts a RAW value to an INTEGER value.
DBE_RAW.GET_LENGTH	Returns the length of a RAW value.
DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW	Converts a VARCHAR2 value to a RAW value.

Interface	Description
DBE_RAW.CAST_TO_VARCHAR2	Converts a RAW value to a VARCHAR2 value.
DBE_RAW.BIT_OR	Returns a RAW value after bitwise OR calculation.
DBE_RAW.SUBSTR	Returns the substring of a RAW value.
DBE_RAW.BIT_AND	Returns a RAW value after bitwise AND calculation.
DBE_RAW.BIT_COMPLEMENT	Returns a RAW value after bitwise complement calculation.
DBE_RAW.BIT_XOR	Returns a RAW value after bitwise XOR calculation.
DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW	Converts a BINARY_DOUBLE value to a RAW value.
DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE	Converts a RAW value to a BINARY_DOUBLE value.
DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT	Converts a RAW value to a FLOAT4 value.
DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW	Converts a FLOAT4 value to a RAW value.
DBE_RAW.CAST_FROM_RAW_TO_NUMBER	Converts a RAW value to a NUMERIC value.
DBE_RAW.CAST_FROM_NUMBER_TO_RAW	Converts a NUMERIC value to a RAW value.
DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2	Converts a RAW value to an NVARCHAR2 value.
DBE_RAW.COMPARE	Returns the first different position of two RAW values.
DBE_RAW.CONCAT	Concatenates a maximum of 12 RAW values into a new RAW value and returns the value.
DBE_RAW.CONVERT	Converts a RAW value from the source encoding mode **from_charset** to the target encoding mode **to_charset**.
DBE_RAW.COPIES	Copies a RAW value for *n* times, concatenates the values, and returns the concatenated result.
DBE_RAW.OVERLAY	Overlays one RAW data with another RAW data by specifying the start position and length to be overlaid.
DBE_RAW.REVERSE	Reverses RAW data by byte.

Interface	Description
DBE_RAW.TRANSLATE	Converts or discards a specified byte of a RAW value.
DBE_RAW.TRANSLITERATE	Converts a specified byte of a RAW value.
DBE_RAW.XRANGE	Returns a RAW value containing the succession of one-byte encodings beginning and ending with the specified byte-code.

- DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW

  Converts an INTEGER value to a RAW value.

  The prototype of the DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW function is as follows:

```
DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW(
    value     IN BIGINT,
    endianess IN INTEGER DEFAULT 1)
RETURN RAW;
```

  Table 10-248 DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW parameters

Parameter	Description
value	INTEGER value to be converted. **NOTE** The DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW expects to process values of the INTEGER type. For compatibility purposes, this parameter is defined as the BIGINT type. The BIGINT type has a larger range than the INTEGER type, which does not affect the interface use.
endianess	Endianness. The value can be **1** (BIG_ENDIAN), **2** (LITTLE_ENDIAN), or **3** (MACHINE_ENDIAN). The default value is **1**. If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER

  Converts a RAW value to an INTEGER value.

  The prototype of the DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER(
    value     IN RAW,
    endianess IN INTEGER DEFAULT 1)
RETURN INTEGER;
```

Table 10-249 DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER parameters

Parameter	Description
value	RAW value to be converted.
endianess	Endianness. The value can be **1**, **2**, or **3**. The value **1** indicates BIG_ENDIAN, **2** indicates LITTLE_ENDIAN, and **3** indicates MACHINE_ENDIAN. The default value is **1**. If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE_RAW.GET_LENGTH

  Returns the length of a RAW value.

  The prototype of the DBE_RAW.GET_LENGTH function is as follows:

```
DBE_RAW.GET_LENGTH(
    value IN RAW)
RETURN INTEGER;
```

Table 10-250 DBE_RAW.GET_LENGTH parameters

Parameter	Description
value	RAW value.

- DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW

  Converts a VARCHAR2 value to a RAW value.

  The prototype of the DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW function is as follows:

```
DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW(
    str IN VARCHAR2)
RETURN RAW;
```

Table 10-251 DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW parameters

Parameter	Description
str	VARCHAR2 value to be converted.

- DBE_RAW.CAST_TO_VARCHAR2

  Converts a RAW value to a VARCHAR2 value.

  The prototype of the DBE_RAW.CAST_TO_VARCHAR2 function is as follows:

```
DBE_RAW.CAST_TO_VARCHAR2(
    str IN RAW)
RETURN VARCHAR2;
```

Table 10-252 DBE_RAW.CAST_TO_VARCHAR2 parameters

Parameter	Description
str	RAW value to be converted.

- DBE_RAW.BIT_OR

  Returns the value of two RAW values after bitwise OR calculation.

  The prototype of the DBE_RAW.BIT_OR function is as follows:

```
DBE_RAW.BIT_OR(
   str1 IN TEXT,
   str2 IN TEXT)
RETURN TEXT;
```

Table 10-253 DBE_RAW.BIT_OR parameters

Parameter	Description
str1	First character string of the bitwise OR calculation. **NOTE** Due to legacy reasons, this parameter is defined as the TEXT type. However, the DBE_RAW.BIT_OR interface expects to process RAW values. Defining this parameter as the TEXT type does not affect the processing of RAW values.
str2	Second character string of the bitwise OR calculation. **NOTE** Due to legacy reasons, this parameter is defined as the TEXT type. However, the DBE_RAW.BIT_OR interface expects to process RAW values. Defining this parameter as the TEXT type does not affect the processing of RAW values.

- DBE_RAW.SUBSTR

  Truncates a RAW value based on the start position *bit off_set* and length *amount*.

  The prototype of the DBE_RAW.SUBSTR function is as follows:

```
DBE_RAW.SUBSTR(
   IN lob_loc BLOB,
   IN off_set INTEGER DEFAULT 1,
   IN amount INTEGER DEFAULT 32767)
RETURN RAW;
```

Table 10-254 DBE_RAW.SUBSTR parameters

Parameter	Description
lob_loc	Source RAW value. **NOTE** Due to legacy reasons, this parameter is defined as the BLOB type. However, the DBE_RAW.SUBSTR interface expects to process RAW values. Defining this parameter as the BLOB type does not affect the processing of RAW values.
off_set	Start position of the substring. The default value is **1**.

Parameter	Description
amount	Substring length. The default value is **32767**.

- DBE_RAW.BIT_AND

  Obtains the bitwise AND result of two RAW values.

  The prototype of the DBE_RAW.BIT_AND function is as follows:

```
DBE_RAW.BIT_AND(
   r1 IN RAW,
   r2 IN RAW)
RETURN RAW;
```

  Table 10-255 DBE_RAW.BIT_AND parameters

Parameter	Description
r1	The RAW value for the bitwise AND operation with r2. The maximum length is 32767.
r2	The RAW value for the bitwise AND operation with r1. The maximum length is 32767.

- DBE_RAW.BIT_COMPLEMENT

  Obtains the bitwise complement result of a RAW value.

  The prototype of the DBE_RAW.BIT_COMPLEMENT function is as follows:

```
DBE_RAW.BIT_COMPLEMENT(
   r IN RAW)
RETURN RAW;
```

  Table 10-256 DBE_RAW.BIT_COMPLEMENT parameters

Parameter	Description
r	The RAW value for the bitwise complement operation. The maximum length is 32767.

- DBE_RAW.BIT_XOR

  Obtains the bitwise XOR result of two RAW values.

  The prototype of the DBE_RAW.BIT_XOR function is as follows:

```
DBE_RAW.BIT_XOR(
   r1 IN RAW,
   r2 IN RAW)
RETURN RAW;
```

  Table 10-257 DBE_RAW.BIT_XOR parameters

Parameter	Description
r1	The RAW value for the bitwise XOR operation with r2. The maximum length is 32767.

Parameter	Description
r2	The RAW value for the bitwise XOR operation with r1. The maximum length is 32767.

- DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW

  Converts a BINARY_DOUBLE value to a RAW value.

  The prototype of the DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW function is as follows:

```
DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW (
   n         IN BINARY_DOUBLE,
   endianess IN INTEGER DEFAULT 1)
RETURN RAW;
```

  Table 10-258 DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW parameters

Parameter	Description
n	BINARY_DOUBLE value to be converted.
endianess	Endianness. The value can be **1**, **2**, or **3**. The value **1** indicates BIG_ENDIAN, **2** indicates LITTLE_ENDIAN, and **3** indicates MACHINE_ENDIAN. The default value is **1**. If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE

  Converts a RAW value to a BINARY_DOUBLE value.

  The prototype of the DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE(
   r         IN RAW,
   endianess IN INTEGER DEFAULT 1)
RETURN BINARY_DOUBLE;
```

  Table 10-259 DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE parameters

Parameter	Description
r	The RAW value to be converted. The value contains 8 to 32767 characters.

Parameter	Description
endianess	Endianness. The value can be **1**, **2**, or **3**. The value **1** indicates BIG_ENDIAN, **2** indicates LITTLE_ENDIAN, and **3** indicates MACHINE_ENDIAN. The default value is **1**. If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT

  Converts a RAW value to a FLOAT4 value.

  The prototype of the DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT(
   r         IN RAW,
   endianess IN INTEGER DEFAULT 1)
RETURN FLOAT4;
```

Table 10-260 DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT parameters

Parameter	Description
r	The RAW value to be converted. The value contains 4 to 32767 characters.
endianess	Endianness. The value can be **1**, **2**, or **3**. The value **1** indicates BIG_ENDIAN, **2** indicates LITTLE_ENDIAN, and **3** indicates MACHINE_ENDIAN. The default value is **1**. If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW

  Converts a FLOAT4 value to a RAW value.

  The prototype of the DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW function is as follows:

```
DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW(
   n         IN FLOAT4,
   endianess IN INTEGER DEFAULT 1)
RETURN RAW;
```

Table 10-261 DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW parameters

Parameter	Description
n	FLOAT4 value to be converted.

Parameter	Description
endianess	Endianness. The value can be **1**, **2**, or **3**. The value **1** indicates BIG_ENDIAN, **2** indicates LITTLE_ENDIAN, and **3** indicates MACHINE_ENDIAN. The default value is **1**. If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE_RAW.CAST_FROM_RAW_TO_NUMBER

  Converts a RAW value to a NUMERIC value.

  NOTE

  The bottom-layer implementation of the number data type in database A is different from that in GaussDB, and the raw data type is the hexadecimal representation of the binary stream implemented at the bottom layer. Therefore, the function in database A is different from that in GaussDB. You cannot obtain the same number-type data from GaussDB based on the raw data corresponding to the number-type data in database A. For details about the number-type data in GaussDB, see the example.

  The prototype of the DBE_RAW.CAST_FROM_RAW_TO_NUMBER function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_NUMBER(
    r IN RAW)
RETURN NUMERIC;
```

Table 10-262 DBE_RAW.CAST_FROM_RAW_TO_NUMBER parameters

Parameter	Description
r	The RAW value to be converted. The value contains 6 to 32767 characters.

- DBE_RAW.CAST_FROM_NUMBER_TO_RAW

  Converts a NUMERIC value to a RAW value.

  NOTE

  The bottom-layer implementation of the number data type in database A is different from that in GaussDB, and the raw data type is the hexadecimal representation of the binary stream implemented at the bottom layer. Therefore, the function in database A is different from that in GaussDB. You cannot restore the raw data corresponding to the number-type data in database A to the original number type in database A in the GaussDB database. For details about the performance of this function in GaussDB, see the example.

  The prototype of the DBE_RAW.CAST_FROM_NUMBER_TO_RAW function is as follows:

```
DBE_RAW.CAST_FROM_NUMBER_TO_RAW(
    n IN NUMERIC)
RETURN RAW;
```

Table 10-263 DBE_RAW.CAST_FROM_NUMBER_TO_RAW parameters

Parameter	Description
n	NUMERIC value to be converted.

- DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2

  Converts a RAW value to an NVARCHAR2 value.

  The prototype of the DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2 function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2(
   r IN RAW)
RETURN NVARCHAR2;
```

Table 10-264 DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2 parameters

Parameter	Description
r	The RAW value to be converted. The maximum length is 32767.

- DBE_RAW.COMPARE

  Returns the first different position of two RAW values.

  The prototype of the DBE_RAW.COMPARE function is as follows:

```
DBE_RAW.COMPARE(
   r1  IN RAW,
   r2  IN RAW,
   pad IN RAW DEFAULT NULL)
RETURN INTEGER;
```

Table 10-265 DBE_RAW.COMPARE parameters

Parameter	Description
r1	First data to be compared. The value can be **NULL** or the length is 0. The maximum length is 32767.
r2	Second data to be compared. The value can be **NULL** or the length is 0. The maximum length is 32767.
pad	The first byte of **pad** is used to extend the shorter one of **r1** or **r2**. The maximum length is 32767. If this parameter is set to **NULL**, the length is 0, or the default value is used, the extended value is **0x00**.

- DBE_RAW.CONCAT

  Concatenates a maximum of 12 RAW values into a new RAW value and returns the value. If the length after concatenation exceeds 32767, an error is reported.

  The prototype of the DBE_RAW.CONCAT function is as follows:

```
DBE_RAW.CONCAT(
   r1  IN RAW DEFAULT NULL,
```

```
    r2  IN RAW DEFAULT NULL,
    r3  IN RAW DEFAULT NULL,
    r4  IN RAW DEFAULT NULL,
    r5  IN RAW DEFAULT NULL,
    r6  IN RAW DEFAULT NULL,
    r7  IN RAW DEFAULT NULL,
    r8  IN RAW DEFAULT NULL,
    r9  IN RAW DEFAULT NULL,
    r10 IN RAW DEFAULT NULL,
    r11 IN RAW DEFAULT NULL,
    r12 IN RAW DEFAULT NULL)
RETURN RAW;
```

Table 10-266 DBE_RAW.CONCAT parameters

Parameter	Description
r1...r12	The RAW values to be concatenated.

- DBE_RAW.CONVERT

  Converts a RAW value from the source encoding mode **from_charset** to the target encoding mode **to_charset**.

  If the rule for converting between source and target encoding (for example, GBK and LATIN1) does not exist, the parameter **r** is returned without conversion. See the pg_conversion system catalog for details.

  The prototype of the DBE_RAW.CONVERT function is as follows:

  ```
  DBE_RAW.CONVERT(
    r           IN RAW,
    to_charset   IN VARCHAR2,
    from_charset IN VARCHAR2)
  RETURN RAW;
  ```

  Table 10-267 DBE_RAW.CONVERT parameters

Parameter	Description
r	The RAW value to be converted. The maximum length is 32767.
to_charset	Name of the target encoding character set.
from_charset	Name of the source encoding character set. In this encoding, **r** must be valid.

- DBE_RAW.COPIES

  Copies a RAW value for *n* times, concatenates the values, and returns the concatenated result. If the length after copying exceeds 32767, an error is reported.

  The prototype of the DBE_RAW.COPIES function is as follows:

  ```
  DBE_RAW.COPIES(
    r IN RAW,
    n IN NUMERIC)
  RETURN RAW;
  ```

Table 10-268 DBE_RAW.COPIES parameters

Parameter	Description
r	The RAW values to be copied.
n	Number of replications. The value must be a positive number. If the value is a decimal, the value is rounded off.

- DBE_RAW.OVERLAY

  Overlays one RAW data with another RAW data by specifying the start position and length to be overlaid.

  The prototype of the DBE_RAW.OVERLAY function is as follows:

```
DBE_RAW.OVERLAY(
   overlay_str IN RAW,
   target      IN RAW,
   pos         IN BINARY_INTEGER DEFAULT 1,
   len         IN BINARY_INTEGER DEFAULT NULL,
   pad         IN RAW            DEFAULT NULL)
RETURN RAW;
```

Table 10-269 DBE_RAW.OVERLAY parameters

Parameter	Description
overlay_str	Byte used for overwriting. The value cannot be NULL.
target	Source byte string to be overlaid. The value is of the RAW type and contains a maximum of 32767 bytes. The value cannot be NULL.
pos	Indicates the byte from which the overlay starts. The position of the first byte is 1. The value of **pos** must be greater than or equal to 1 and the value of **len+pos** must be less than or equal to 32767. The default value is **1**.
len	Length to be overlaid. The value of **len** must be greater than or equal to 0 and the value of **len+pos** must be less than or equal to 32767. The default value is the length of **overlay_str**.
pad	Padding byte. Only the first byte is valid. The default value is **NULL**. If the value is **NULL**, it is regarded as **0x00** by default.

- DBE_RAW.REVERSE

  Reverses RAW data by byte.

  The prototype of the DBE_RAW.REVERSE function is as follows:

```
DBE_RAW.REVERSE(
   r IN RAW
)
RETURN RAW;
```

Table 10-270 DBE_RAW.REVERSE parameters

Parameter	Description
r	The RAW value to be reversed. The maximum length is 32767. If the value is **NULL**, **NULL** is returned.

- DBE_RAW.TRANSLATE

  Converts or discards a specified byte of a RAW value.

  The prototype of the DBE_RAW.TRANSLATE function is as follows:

```
DBE_RAW.TRANSLATE(
   r        IN RAW,
   from_set IN RAW,
   to_set   IN RAW)
RETURN RAW;
```

Table 10-271 DBE_RAW.TRANSLATE parameters

Parameter	Description
r	Source byte string to be converted. The value is of the RAW type and contains a maximum of 32767 bytes. The value cannot be NULL.
from_set	Bytecode to be converted in the source byte string. The value is of the RAW type. The value cannot be NULL. The bytes in **from_set** in the source byte string are replaced with the bytes in the corresponding positions in **to_set**. If **from_set** contains multiple identical bytes, only the first byte corresponding to the byte is replaced. For example, if **r[x]=from_set[n]**, **r[x]** is replaced with **to_set[n]**. If **to_set[n]** corresponding to **from_set[n]** does not exist (that is, the number of bytes of **to_set** does not exceed **n**), **r[x]** will be discarded.
to_set	Byte code converted from the **from_set** byte. The value is of the RAW type. The value cannot be NULL.

- DBE_RAW.TRANSLITERATE

  Converts a RAW value to a NUMERIC value.

  The prototype of the DBE_RAW.TRANSLITERATE function is as follows:

```
DBE_RAW.TRANSLITERATE(
   r        IN RAW,
   from_set IN RAW DEFAULT NULL,
   to_set   IN RAW DEFAULT NULL,
   pad      IN RAW DEFAULT NULL)
RETURN RAW;
```

Table 10-272 DBE_RAW.TRANSLITERATE parameters

Parameter	Description
r	Source byte string to be converted. The value is of the RAW type and contains a maximum of 32767 bytes. The value cannot be NULL.
to_set	Byte code converted from the **from_set** byte. The value is of the RAW type. The default value is **NULL**. If the value is **NULL**, all bytes in **r** that exist in **from_set** are converted to **pad**.
from_set	Bytecode to be converted in the source byte string **r**. The value is of the RAW type. The default value is **NULL**. If **from_set** is **NULL**, all bytes in the source byte string **r** are converted into equal-length data filled by **pad**. Otherwise, the bytes in **from_set** in the source byte string **r** are replaced with the bytes in the corresponding position in **to_set**. For example, if **r[x]=from_set[n]**, **r[x]** is converted to **to_set[n]**. If **to_set[n]** does not exist, **r[x]** will be converted to **pad**.
pad	Padding byte. Only the first byte is valid. The default value is **NULL**. If the value is **NULL**, it is regarded as **0x00** by default.

- DBE_RAW.XRANGE

  Returns a RAW value containing the succession of one-byte encodings beginning and ending with the specified byte-code.

  The prototype of the DBE_RAW.XRANGE function is as follows:

```
DBE_RAW.XRANGE(
   start_byte IN RAW,
   end_byte   IN RAW)
RETURN RAW;
```

Table 10-273 DBE_RAW.XRANGE parameters

Parameter	Description
start_byte	Start byte. Only the first byte is valid. If the value is **NULL**, it is regarded as **0x00** by default.
end_byte	End byte. Only the first byte is valid. If the value is **NULL**, it is regarded as **0xFF** by default. If **end_byte** is less than **start_byte**, **end_byte** is concatenated to **0XFF**, and then **0x00** is concatenated to **start_byte**.

Permissions

The DBE_RAW schema is a system catalog. Only the system administrator has the permission to create the DBE_RAW schema during database initialization. All users have the permission to use the schema and interfaces under the schema.

Examples

```
DECLARE
v_raw RAW;
v_int INTEGER;
v_length INTEGER;
v_str VARCHAR2;
v_double BINARY_DOUBLE;
v_float FLOAT4;
v_numeric NUMERIC;
v_nvarchar2 NVARCHAR2;
BEGIN
-- Convert an INTEGER value to a RAW value.
SELECT DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW(170,1) INTO v_raw; -- 000000AA
SELECT DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW(170,2) INTO v_raw; -- AA000000
SELECT DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW(170,3) INTO v_raw; -- AA000000
-- Convert a RAW value to an INTEGER value.
SELECT

END;
/
ANONYMOUS BLOCK EXECUTE
```

10.12.2.13 DBE_SCHEDULER

Interface Description

The advanced package **DBE_SCHEDULER** supports more flexible creation of scheduled tasks through scheduling and programing. For details about all the supported APIs, see **Table 10-274**.

Table 10-274 DBE_SCHEDULER

Interface	Description
DBE_SCHEDULER.CREATE_JOB	Creates a scheduled task.
DBE_SCHEDULER.DROP_JOB	Deletes a scheduled task.
DBE_SCHEDULER.DROP_SINGLE_JOB	Deletes a single scheduled task.
DBE_SCHEDULER.SET_ATTRIBUTE	Sets object attributes.
DBE_SCHEDULER.RUN_JOB	Executes a scheduled task.
DBE_SCHEDULER.RUN_BACKEND_JOB	Runs a scheduled task in the background.
DBE_SCHEDULER.RUN_FOREGROUND_JOB	Runs a scheduled task in the foreground.
DBE_SCHEDULER.STOP_JOB	Stops a scheduled task.
DBE_SCHEDULER.STOP_SINGLE_JOB	Stops a single scheduled task.
DBE_SCHEDULER.GENERATE_JOB_NAME	Generates the name of a scheduled task.
DBE_SCHEDULER.CREATE_PROGRAM	Creates a program.
DBE_SCHEDULER.DEFINE_PROGRAM_ARGUMENT	Defines program parameters.

Interface	Description
DBE_SCHEDULER.DROP_PROGRAM	Deletes a program.
DBE_SCHEDULER.DROP_SINGLE_PROGRAM	Deletes a single program.
DBE_SCHEDULER.SET_JOB_ARGUMENT_VALUE	Sets the parameters of a scheduled task.
DBE_SCHEDULER.CREATE_SCHEDULE	Creates a schedule.
DBE_SCHEDULER.DROP_SCHEDULE	Deletes a schedule.
DBE_SCHEDULER.DROP_SINGLE_SCHEDULE	Deletes a single schedule.
DBE_SCHEDULER.CREATE_JOB_CLASS	Creates the class of a scheduled task.
DBE_SCHEDULER.DROP_JOB_CLASS	Deletes the class of a scheduled task.
DBE_SCHEDULER.DROP_SINGLE_JOB_CLASS	Deletes the class of a single scheduled task.
DBE_SCHEDULER.GRANT_USER_AUTHORIZATION	Grants special permissions to a user.
DBE_SCHEDULER.REVOKE_USER_AUTHORIZATION	Revokes special permissions from a user.
DBE_SCHEDULER.CREATE_CREDENTIAL	Creates a certificate.
DBE_SCHEDULER.DROP_CREDENTIAL	Destroys a certificate.
DBE_SCHEDULER.ENABLE	Enables an object.
DBE_SCHEDULER.ENABLE_SINGLE	Enables a single object.
DBE_SCHEDULER.DISABLE	Disables an object.
DBE_SCHEDULER.DISABLE_SINGLE	Disables a single object.
DBE_SCHEDULER.EVAL_CALENDAR_STRING	Analyzes the scheduling task period.

Interface	Description
DBE_SCHEDULER.EVALUATE_CALENDAR_STRING	Analyzes the scheduling task period.

- DBE_SCHEDULER.CREATE_JOB

  Creates a scheduled task.

  The prototypes of the **DBE_SCHEDULER.CREATE_JOB** function are as follows:

```
-- Scheduled tasks of an inline schedule and a program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
job_type TEXT,
job_action TEXT,
number_of_arguments INTEGER             DEFAULT 0,
start_date TIMESTAMP WITH TIME ZONE     DEFAULT NULL,
repeat_interval TEXT                    DEFAULT NULL,
end_date TIMESTAMP WITH TIME ZONE       DEFAULT NULL,
job_class TEXT            DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN                         DEFAULT FALSE,
auto_drop BOOLEAN                       DEFAULT TRUE,
comments TEXT                           DEFAULT NULL,
credential_name TEXT                    DEFAULT NULL,
destination_name TEXT                   DEFAULT NULL
)

-- Reference the created scheduled tasks of the schedule and the program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
program_name TEXT,
schedule_name TEXT,
job_class TEXT            DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN                         DEFAULT FALSE,
auto_drop BOOLEAN                       DEFAULT TRUE,
comments TEXT                           DEFAULT NULL,
job_style TEXT                         DEFAULT 'REGULAR',
credential_name TEXT                    DEFAULT NULL,
destination_name TEXT                   DEFAULT NULL
)

-- Reference the created program and the scheduled task of the inline schedule.
DBE_SCHEDULER.CREATE_JOB(
job_name text,
program_name TEXT,
start_date TIMESTAMP WITH TIME ZONE     DEFAULT NULL,
repeat_interval TEXT                    DEFAULT NULL,
end_date TIMESTAMP WITH TIME ZONE       DEFAULT NULL,
job_class TEXT            DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN                         DEFAULT FALSE,
auto_drop BOOLEAN                       DEFAULT TRUE,
comments TEXT                           DEFAULT NULL,
job_style TEXT                         DEFAULT 'REGULAR',
credential_name TEXT                    DEFAULT NULL,
destination_name TEXT                   DEFAULT NULL
)

-- Reference the created schedule and the scheduled task of the inline program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
schedule_name TEXT,
job_type TEXT,
job_action TEXT,
number_of_arguments INTEGER             DEFAULT 0,
```

```
job_class TEXT             DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN                    DEFAULT FALSE,
auto_drop BOOLEAN                   DEFAULT TRUE,
comments TEXT                     DEFAULT NULL,
credential_name TEXT               DEFAULT NULL,
destination_name TEXT              DEFAULT NULL
)
```

NOTE

The scheduled task created through **DBE_SCHEDULER** does not conflict with the scheduled task in **DBE_TASK**.

The scheduled task created by **DBE_SCHEDULER** generates the corresponding **job_id**. However, the **job_id** is meaningless.

For the create API, the validity of input parameter types is not verified. Successful creation does not mean successful execution. You can query the execution status of the current task in the pg_job system catalog.

Table 10-275 DBE_SCHEDULER.CREATE_JOB interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Name of a scheduled task.
job_type	text	IN	No	Inline program type of a scheduled task. The options are as follows: • **'PLSQL_BLOCK'**: fast anonymous stored procedure. • **'STORED_PROCEDURE'**: stored procedure that is saved. • **'EXTERNAL_SCRIPT'**: external script.
job_action	text	IN	No	Content executed by an inline program of a scheduled task.
number_of_arguments	integer	IN	No	Number of inline program parameters of a scheduled task.
program_name	text	IN	No	Name of the program referenced by a scheduled task.
start_date	timestamp with time zone	IN	Yes	Inline scheduling start time of a scheduled task.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
repeat_interval	text	IN	Yes	Inline scheduling period of a scheduled task. The options are as follows: ● 'interval N second/minute/hour/day/week/month/year' ● 'FREQ=secondly/miuntely/hourly/daily/weekly/monthy/yearly; INTERVAL=N' ● trunc(sysdate+N) + M/24 (indicating that schedule will be started in *M* hours after *N* days)
end_date	timestamp with time zone	IN	Yes	Inline scheduling expiration time of a scheduled task.
schedule_name	text	IN	No	Name of the schedule referenced by a scheduled task.
job_class	text	IN	No	Class name of a scheduled task.
enabled	boolean	IN	No	Status of a scheduled task.
auto_drop	boolean	IN	No	Automatic deletion of a scheduled task.
comments	text	IN	Yes	Comments.
job_style	text	IN	No	Behavior pattern of a scheduled task. Only **'REGULAR'** is supported.
credential_name	text	IN	Yes	Certificate name of a scheduled task.
destination_name	text	IN	Yes	Target name of a scheduled task.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 3, false, 'test');
 create_program
----------------
```

```
(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', NULL, 'sysdate', NULL, 'test');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_job(job_name=>'job1', program_name=>'program1',
schedule_name=>'schedule1');
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
 drop_schedule
---------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

NOTICE

To create a scheduled task of the EXTERNAL_SCRIPT type, the administrator must assign related permissions and certificates and the user who starts the database must have the read permission on the external script.

- DBE_SCHEDULER.DROP_JOB

  Deletes a scheduled task.

  The prototype of the **DBE_SCHEDULER.DROP_JOB** function is as follows:

```
DBE_SCHEDULER.drop_job(
job_name text,
force boolean                   default false,
defer boolean                   default false,
commit_semantics text      default 'STOP_ON_FIRST_ERROR'
)
```

  NOTE

  DBE_SCHEDULER.DROP_JOB can specify one or more tasks, or specify a task class to delete a scheduled task.

Table 10-276 DBE_SCHEDULER.DROP_JOB interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Name or class of a scheduled task. You can specify one or more scheduled tasks. If you specify multiple scheduled tasks, separate them with commas (,).
force	boolean	IN	No	Specifies whether to delete a scheduled task. ● **true**: The current scheduled task is stopped and then deleted. ● **false**: The scheduled task fails to be deleted if it is running.
defer	boolean	IN	No	Specifies whether to delete a scheduled task. ● **true**: A scheduled task can be deleted after it is complete. ● **false**: The scheduled task cannot be executed and is deleted.
commit_semantics	text	IN	No	Commit rules: ● **'STOP_ON_FIRST_ERROR'**: The deletion operation performed before the first error is reported is committed. ● **'TRANSACTIONAL'**: Transaction-level commit. The deletion operation performed before an error is reported will be rolled back. ● **'ABSORB_ERRORS'**: The system attempts to bypass an error and commit the deletion operation that is performed successfully.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 3, false, 'test');
 create_program
----------------

(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', NULL, 'sysdate', NULL, 'test');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_job(job_name=>'job1', program_name=>'program1',
schedule_name=>'schedule1');
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
 drop_schedule
---------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

NOTICE

The **TRANSACTIONAL** option in **commit_semantic** takes effect only when **force** is set to **false**.

- DBE_SCHEDULER.DROP_SINGLE_JOB

  Deletes a scheduled task.

  The prototype of the **DBE_SCHEDULER.DROP_SINGLE_JOB** function is as follows:

```
DBE_SCHEDULER.drop_single_job(
job_name text,
force boolean                   default false,
defer boolean                   default false
)
```

Table 10-277 DBE_SCHEDULER.DROP_SINGLE_JOB interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Specifies the name of a scheduled task or scheduled task class.
force	boolean	IN	No	Specifies whether to delete a scheduled task. ● **true**: The current scheduled task is stopped and then deleted. ● **false**: The scheduled task fails to be deleted if it is running.
defer	boolean	IN	No	Specifies whether to delete a scheduled task. ● **true**: A scheduled task can be deleted after it is complete. ● **false**: The scheduled task cannot be executed and is deleted.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 0, false, 'test');
 create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_job('job1', 'program1', '2021-07-20', 'interval ''3 minute''',
'2121-07-20', 'DEFAULT_JOB_CLASS', false, false,'test', 'style', NULL, NULL);
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_job('job1', false, false);
 drop_single_job
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

- DBE_SCHEDULER.SET_ATTRIBUTE

  Modifies the attributes of a scheduled task.

The prototypes of the **DBE_SCHEDULER.SET_ATTRIBUTE** function are as follows:

```
DBE_SCHEDULER.set_attribute(
name                text,
attribute           text,
value               boolean
)

DBE_SCHEDULER.set_attribute(
name                text,
attribute           text,
value               text
)

DBE_SCHEDULER.set_attribute(
name                text,
attribute           text,
value               timestamp
)

DBE_SCHEDULER.set_attribute(
name                text,
attribute           text,
value               timestamp with time zone
)

DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value text,
value2 text                     default NULL
)
```

NOTE

name specifies any object in **DBE_SCHEDULER**.

Table 10-278 DBE_SCHEDULER.SET_ATTRIBUTE interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	text	IN	No	Object name.
attribute	text	IN	No	Attribute name.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
value	boolean/date/timestamp/timestamp with time zone/text	IN	No	Attribute value. The options are as follows: • Scheduled-task-related: job_type, job_action, number_of_arguments, start_date, repeat_interval, end_date, ob_class, enabled, auto_drop, comments, credential_name, destination_name, program_name, schedule_name, and job_style. • Program-related: program_action, program_type, number_of_arguments, and comments. • Scheduling-related: start_date, repeat_interval, end_date, and comments.
value2	text	IN	Yes	Additional attribute value. Reserved parameter bit. Currently, the target attribute with extra attribute values is not supported.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 3, false, 'test');
 create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.set_attribute('program1', 'number_of_arguments', 0);
 set_attribute
---------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.set_attribute('program1', 'program_type', 'STORED_PROCEDURE');
 set_attribute
---------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------
```

```
(1 row)
```

NOTICE

Do not use **DBE_SCHEDULER.SET_ATTRIBUTE** to leave the parameters empty.

The object name cannot be changed using **DBE_SCHEDULER.SET_ATTRIBUTE**.

- DBE_SCHEDULER.RUN_JOB

  Executes a scheduled task.

  The prototype of the **DBE_SCHEDULER.RUN_JOB** function is as follows:

```
DBE_SCHEDULER.run_job(
job_name text,
use_current_session boolean             default true
)
```

  NOTE

  DBE_SCHEDULER.RUN_JOB is used to run scheduled tasks immediately. It is independent of the scheduling of scheduled tasks and can even run at the same time.

  Table 10-279 DBE_SCHEDULER.RUN_JOB interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Name of a scheduled task. You can specify one or more scheduled tasks. If you specify multiple scheduled tasks, separate them with commas (,).
use_current_session	boolean	IN	No	Specifies whether to run a scheduled task. • **true**: Use the current session to check whether the scheduled task can run properly. • **false**: Start the scheduled task in the background. The execution result is recorded in logs.

  Example:

```
gaussdb=# SELECT dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12); end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
```

```
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.run_job('job1', false);
 run_job
---------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)
```

NOTICE

use_current_session cannot be used to record execution results.

- DBE_SCHEDULER.RUN_BACKEND_JOB

  Runs a scheduled task in the background.

  The prototype of the **DBE_SCHEDULER.RUN_BACKEND_JOB** function is as follows:

```
DBE_SCHEDULER.run_backend_job(
job_name text
)
```

Table 10-280 DBE_SCHEDULER.RUN_BACKEND_JOB interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Name of a scheduled task.

Example:

```
gaussdb=# SELECT dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.run_backend_job('job1');
 run_backend_job
-----------------

(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)
```

- DBE_SCHEDULER.RUN_FOREGROUND_JOB

  Executes a scheduled task in the current session.

  Only external tasks can be executed.

  Return value: text

  The prototype of the **DBE_SCHEDULER.RUN_FOREGROUND_JOB** function is as follows:

```
DBE_SCHEDULER.run_foreground_job(
job_name text
)return text
```

  Table 10-281 DBE_SCHEDULER.RUN_FOREGROUND_JOB interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Name of a scheduled task.

  Example:

```
gaussdb=# create user test1 identified by '*********';
NOTICE:  The encrypted password contains MD5 ciphertext, which is not secure.
CREATE ROLE
gaussdb=# select DBE_SCHEDULER.create_credential('cre_1', 'test1', '*********');
 create_credential
-------------------

(1 row)

gaussdb=# select DBE_SCHEDULER.create_job(job_name=>'job1', job_type=>'EXTERNAL_SCRIPT',
job_action=>'/usr/bin/pwd', enabled=>true, auto_drop=>false, credential_name => 'cre_1');
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.run_foreground_job('job1');
  run_foreground_job
---------------------------------
 Host key verification failed.\r+

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------
```

```
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_credential('cre_1', false);
 drop_credential
-----------------

(1 row)

gaussdb=# drop user test1;
DROP ROLE
```

- DBE_SCHEDULER.STOP_JOB

  Stops a scheduled task.

  The prototype of the **DBE_SCHEDULER.STOP_JOB** function is as follows:

```
DBE_SCHEDULER.stop_job(
job_name text,
force boolean                   default false,
commit_semantics text               default 'STOP_ON_FIRST_ERROR'
)
```

Table 10-282 DBE_SCHEDULER.STOP_JOB interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Name or class of a scheduled task. You can specify one or more scheduled tasks. If you specify multiple scheduled tasks, separate them with commas (,).
force	boolean	IN	No	Specifies whether to delete a scheduled task. • **true**: The scheduler sends a termination signal to end the task thread immediately. • **false**: The scheduler attempts to use the interrupt signal to terminate the scheduled task thread.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
commit_semantics	text	IN	No	Commit rules: • **'STOP_ON_FIRST_ERROR'**: The interrupt operation performed before the first error is reported is committed. • **'ABSORB_ERRORS'**: The system attempts to bypass an error and commit the interrupt operation that is performed successfully.

Example:

```
gaussdb=# SELECT dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.stop_job('job1', true, 'STOP_ON_FIRST_ERROR');
 stop_job
----------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)
```

- DBE_SCHEDULER.STOP_SINGLE_JOB

  Stops a single scheduled task.

  The prototype of the **DBE_SCHEDULER.STOP_SINGLE_JOB** function is as follows:

  ```
  DBE_SCHEDULER.stop_single_job(
  job_name text,
  force boolean                    default false
  )
  ```

Table 10-283 DBE_SCHEDULER.STOP_SINGLE_JOB interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Specifies the name of a scheduled task or scheduled task class.
force	boolean	IN	No	Specifies whether to delete a scheduled task. ● **true**: The scheduler sends a termination signal to end the task thread immediately. ● **false**: The scheduler attempts to use the interrupt signal to terminate the scheduled task thread.

Example:

```
gaussdb=# SELECT dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.stop_single_job('job1', true);
 stop_single_job
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)
```

- DBE_SCHEDULER.GENERATE_JOB_NAME

  Generates the name of a scheduled task.

  The prototype of the **DBE_SCHEDULER.GENERATE_JOB_NAME** function is as follows:

  ```
  DBE_SCHEDULER.generate_job_name(
  prefix text                    default 'JOB$_'
  )return text
  ```

Table 10-284 DBE_SCHEDULER.GENERATE_JOB_NAME interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
prefix	text	IN	No	Prefix of the generated name. The default value is **'JOB$_'**. Scheduled tasks that are repeatedly executed are named as follows: job$_1, job$_2, job$_3 ...

Example:

```
gaussdb=# CALL DBE_SCHEDULER.generate_job_name();
 generate_job_name
-------------------
 JOB$_1
(1 row)

gaussdb=# CALL DBE_SCHEDULER.generate_job_name();
 generate_job_name
-------------------
 JOB$_2
(1 row)

gaussdb=# CALL DBE_SCHEDULER.generate_job_name('job');
 generate_job_name
-------------------
 job3
(1 row)

gaussdb=# CALL DBE_SCHEDULER.generate_job_name('job');
 generate_job_name
-------------------
 job4
(1 row)
```

NOTICE

When DBE_SCHEDULER.GENERATE_JOB_NAME is executed for the first time, a temporary sequence is created in **public** to store the sequence number of the current name. A common user does not have the create permission in **public**. Therefore, if a common user calls the function for the first time in the current database, the function fails to be called. In this case, you need to grant the create permission in **public** to the common user or call the API as a user with the create permission to create a temporary sequence.

- DBE_SCHEDULER.CREATE_PROGRAM

  Creates a program.

The prototype of the **DBE_SCHEDULER.CREATE_PROGRAM** function is as follows:

```
DBE_SCHEDULER.create_program(
program_name text,
program_type text,
program_action text,
number_of_arguments integer          default 0,
enabled boolean                      default false,
comments text                        default NULL
)
```

Table 10-285 DBE_SCHEDULER.CREATE_PROGRAM interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
program_name	text	IN	No	Name of a program
program_type	text	IN	No	Program type. The options are as follows: ● **'PLSQL_BLOCK'**: fast anonymous stored procedure. ● **'STORED_PROCEDURE'**: stored procedure that is saved. ● **'EXTERNAL_SCRIPT'**: external script.
program_action	text	IN	No	Program operation.
number_of_arguments	integer	IN	No	Number of parameters used by the program.
enabled	boolean	IN	No	Specifies whether the program is enabled.
comments	text	IN	Yes	Comments.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 3, false, 'test');
 create_program
----------------

(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

- DBE_SCHEDULER.DEFINE_PROGRAM_ARGUMENT

  Defines program parameters.

  An API with the default value **default_value** will not convert characters to lowercase letters by default. In this version, characters are case sensitive.

  The prototype of the **DBE_SCHEDULER.DEFINE_PROGRAM_ARGUMENT** function is as follows:

```
DBE_SCHEDULER.define_program_argument(
program_name text,
argument_position integer,
argument_name text                  default NULL,
argument_type text,
out_argument boolean                 default false
)

-- With a default value --
DBE_SCHEDULER.define_program_argument(
program_name text,
argument_position integer,
argument_name text                  default NULL,
argument_type text,
default_value text,
out_argument boolean                 default false
)
```

Table 10-286 DBE_SCHEDULER.DEFINE_PROGRAM_ARGUMENT interface parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
program_name	text	IN	No	Name of a program
argument_position	integer	IN	No	Parameter location
argument_name	text	IN	No	Parameter name
argument_type	text	IN	No	Parameter type
default_value	text	IN	No	Default value

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
out_argument	boolean	IN	No	Reserved parameter

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 2, false, 'test');
create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.define_program_argument('program1', 1, 'pa1', 'type1', false);
 define_program_argument
-------------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.define_program_argument('program1', 1, 'pa1', 'type1', 'value1',
false);
 define_program_argument
-------------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

- DBE_SCHEDULER.DROP_PROGRAM

  Deletes a program.

  The prototype of the **DBE_SCHEDULER.DROP_PROGRAM** function is as follows:

  ```
  DBE_SCHEDULER.drop_program(
  program_name text,
  force boolean                    default false
  )
  ```

Table 10-287 DBE_SCHEDULER.DROP_PROGRAM interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
program_name	text	IN	No	Name of a program
force	boolean	IN	No	Specifies whether to delete a program. • **true**: Before a program is deleted, all jobs that use the program are disabled. • **false**: The program cannot be referenced by any job. Otherwise, an error is sent.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 2, false, 'test');
create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

- DBE_SCHEDULER.DROP_SINGLE_PROGRAM

  Deletes a single program.

  The prototype of the **DBE_SCHEDULER.DROP_SINGLE_PROGRAM** function is as follows:

  ```
  DBE_SCHEDULER.drop_single_program(
  program_name text,
  force boolean                    default false
  )
  ```

Table 10-288 DBE_SCHEDULER.DROP_SINGLE_PROGRAM interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
program_name	text	IN	No	Name of a program
force	boolean	IN	No	Specifies whether to delete a program. ● **true**: Before a program is deleted, all jobs that use the program are disabled. ● **false**: The program cannot be referenced by any job. Otherwise, an error is sent.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 2, false, 'test');
create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_program('program1', false);
 drop_single_program
---------------------

(1 row)
```

- DBE_SCHEDULER.SET_JOB_ARGUMENT_VALUE

  Sets the parameters of a scheduled task. The **argument_value** can be left empty.

  The prototype of the **DBE_SCHEDULER.SET_JOB_ARGUMENT_VALUE** function is as follows:

```
DBE_SCHEDULER.set_job_argument_value(
job_name text,
argument_position integer,
argument_value text
)

DBE_SCHEDULER.set_job_argument_value(
job_name text,
argument_name text,
argument_value text
)
```

Table 10-289 DBE_SCHEDULER.SET_JOB_ARGUMENT_VALUE interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Name of a scheduled task.
argument_position	integer	IN	No	Parameter location.
argument_name	text	IN	Yes	Parameter name.
argument_value	text	IN	Yes	Parameter value.

Example:

```
gaussdb=# CALL dbe_scheduler.create_job('job1','EXTERNAL_SCRIPT','begin insert into test1
values(12); end;',2,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.set_job_argument_value('job1', 1, 'value1');
 set_job_argument_value
------------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)
```

- DBE_SCHEDULER.CREATE_SCHEDULE

  Creates a schedule.

  The prototype of the **DBE_SCHEDULER.CREATE_SCHEDULE** function is as follows:

```
DBE_SCHEDULER.create_schedule(
schedule_name text,
start_date timestamp with time zone      default NULL,
repeat_interval text,
end_date timestamp with time zone        default NULL,
comments text                            default NULL
)
```

Table 10-290 DBE_SCHEDULER.CREATE_SCHEDULE interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
schedule_name	text	IN	No	Name of a schedule.
start_date	timestamp with time zone	IN	Yes	Start time of a schedule.
repeat_interval	text	IN	No	Repetition frequency of a schedule.
end_date	timestamp with time zone	IN	Yes	End time of a schedule.
comments	text	IN	Yes	Comments.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', sysdate, 'sysdate + 3 / (24 * 60 * 60)',
null, 'test1');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule2', sysdate, 'FREQ=DAILY; BYHOUR=6;',
null, 'test1');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule3', sysdate, 'FREQ=DAILY; BYHOUR=6;');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
 drop_single_schedule
----------------------

(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule2', false);
 drop_single_schedule
----------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule3', true);
 drop_single_schedule
----------------------

(1 row)
```

- DBE_SCHEDULER.DROP_SCHEDULE

  Deletes a schedule.

  The prototype of the **DBE_SCHEDULER.DROP_SCHEDULE** function is as follows:

```
DBE_SCHEDULER.drop_schedule(
schedule_name text,
force boolean                    default false
)
```

Table 10-291 DBE_SCHEDULER.DROP_SCHEDULE interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
schedule_name	text	IN	No	Name of a schedule.
force	boolean	IN	No	Specifies whether to delete a schedule. • **true**: Any jobs or windows that use this schedule are disabled before the schedule is deleted. • **false**: The schedule cannot be referenced by any job or window. Otherwise, an error occurs.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', sysdate, 'sysdate + 3 / (24 * 60 * 60)',
null, 'test1');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule2', sysdate, 'FREQ=DAILY; BYHOUR=6;',
null, 'test1');
 create_schedule
-----------------
```

```
(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule3', sysdate, 'FREQ=DAILY; BYHOUR=6;');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
 drop_single_schedule
----------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule2', false);
 drop_single_schedule
----------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule3', true);
 drop_single_schedule
----------------------

(1 row)
```

- DBE_SCHEDULER.DROP_SINGLE_SCHEDULE

  Deletes a single schedule.

  The prototype of the **DBE_SCHEDULER.DROP_SINGLE_SCHEDULE** function is as follows:

```
DBE_SCHEDULER.drop_single_schedule(
schedule_name text,
force boolean                   default false
)
```

Table 10-292 DBE_SCHEDULER.DROP_SINGLE_SCHEDULE interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
schedule_name	text	IN	No	Name of a schedule.
force	boolean	IN	No	Specifies whether to delete a schedule. • **true**: Any jobs or windows that use this schedule are disabled before the schedule is deleted. • **false**: The schedule cannot be referenced by any job or window. Otherwise, an error occurs.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', sysdate, 'sysdate + 3 / (24 * 60 * 60)',
null, 'test1');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule2', sysdate, 'FREQ=DAILY; BYHOUR=6;',
null, 'test1');
 create_schedule
-----------------

(1 row)

```

- DBE_SCHEDULER.CREATE_JOB_CLASS

  Creates the class of a scheduled task.

  The prototype of the **DBE_SCHEDULER.CREATE_JOB_CLASS** function is as follows:

```
DBE_SCHEDULER.create_job_class(
job_class_name text,
resource_consumer_group text           default NULL,
service text                        default NULL,
logging_level integer                  default 0,
log_history integer                   default NULL,
comments text                          default NULL
)
```

Table 10-293 DBE_SCHEDULER.CREATE_JOB_CLASS interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_class_name	text	IN	No	Name of a scheduled task class.
resource_consumer_group	text	IN	Yes	Inline resource consumer group of a scheduled task class.
service	text	IN	Yes	Inline database service of a scheduled task class.
logging_level	integer	IN	No	Number of scheduled task records.
log_history	integer	IN	Yes	Number of days for storing scheduled task records.
comments	text	IN	Yes	Comments.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_job_class(job_class_name => 'jc1', resource_consumer_group
=> '123');
 create_job_class
------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job_class('jc1', false);
 drop_job_class
----------------

(1 row)
```

- DBE_SCHEDULER.DROP_JOB_CLASS

  Deletes the class of a scheduled task.

  The prototype of the **DBE_SCHEDULER.DROP_JOB_CLASS** function is as follows:

```
DBE_SCHEDULER.drop_job_class(
job_class_name text,
force boolean                    default false
)
```

Table 10-294 DBE_SCHEDULER.DROP_JOB_CLASS interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_class_name	text	IN	No	Name of a scheduled task class.
force	boolean	IN	No	Specifies whether to delete a scheduled task class. • **true**: Jobs of this class will be disabled, and another class will be set as the default class. Only when such setting is successful, this class will be deleted. • **false**: The class to be deleted cannot be referenced by any job. Otherwise, an error occurs.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_job_class(job_class_name => 'jc1', resource_consumer_group
=> '123');
 create_job_class
------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job_class('jc1', false);
 drop_job_class
----------------

(1 row)
```

- DBE_SCHEDULER.DROP_SINGLE_JOB_CLASS

  Deletes the class of a single scheduled task.

  The prototype of the **DBE_SCHEDULER.DROP_SINGLE_JOB_CLASS** function is as follows:

  ```
  DBE_SCHEDULER.drop_single_job_class(
  job_class_name text,
  force boolean                  default false
  )
  ```

Table 10-295 DBE_SCHEDULER.DROP_SINGLE_JOB_CLASS interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_class_name	text	IN	No	Name of a scheduled task class.
force	boolean	IN	No	Specifies whether to delete a scheduled task class. ● **true**: Jobs of this class will be disabled, and another class will be set as the default class. Only when such setting is successful, this class will be deleted. ● **false**: The class to be deleted cannot be referenced by any job. Otherwise, an error occurs.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_job_class(job_class_name => 'jc1', resource_consumer_group
=> '123');
 create_job_class
------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_job_class('jc1', false);
 drop_job_class
----------------

(1 row)
```

- DBE_SCHEDULER.GRANT_USER_AUTHORIZATION

  Grants the scheduled task permissions to the database user. The user who calls this function must have the SYSADMIN permission.

  The prototype of the **DBE_SCHEDULER.GRANT_USER_AUTHORIZATION** function is as follows:

```
DBE_SCHEDULER.grant_user_authorization(
username              text,
privilege             text
)
```

Table 10-296 DBE_SCHEDULER.GRANT_USER_AUTHORIZATION interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
username	text	IN	No	Database username.
privilege	text	IN	No	Scheduled task permission.

Example:

```
gaussdb=# create user user1 password '1*s*****';
NOTICE:  The encrypted password contains MD5 ciphertext, which is not secure.
CREATE ROLE
gaussdb=# CALL DBE_SCHEDULER.grant_user_authorization('user1', 'create job');
 grant_user_authorization
--------------------------

(1 row)
gaussdb=# drop user user1;
DROP ROLE
```

- DBE_SCHEDULER.REVOKE_USER_AUTHORIZATION

  Revokes the scheduled task permissions from the database user. The user who calls this function must have the SYSADMIN permission.

  The prototype of the **DBE_SCHEDULER.REVOKE_USER_AUTHORIZATION** function is as follows:

```
DBE_SCHEDULER.revoke_user_authorization(
username              text,
privilege             text
)
```

Table 10-297 DBE_SCHEDULER.REVOKE_USER_AUTHORIZATION interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
username	text	IN	No	Database username.
privilege	text	IN	No	Scheduled task permission.

Example:

```
gaussdb=# create user user1 password '1*s*****';
NOTICE:  The encrypted password contains MD5 ciphertext, which is not secure.
CREATE ROLE
gaussdb=# CALL DBE_SCHEDULER.grant_user_authorization('user1', 'create job');
 grant_user_authorization
--------------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.revoke_user_authorization('user1', 'create job');
 revoke_user_authorization
---------------------------

(1 row)
gaussdb=# drop user user1;
DROP ROLE
```

- DBE_SCHEDULER.CREATE_CREDENTIAL

  Creates an authorization certificate. The user who calls this function must have the SYSADMIN permission.

  The prototype of the **DBE_SCHEDULER.CREATE_CREDENTIAL** function is as follows:

```
DBE_SCHEDULER.create_credential(
credential_name         text,
username                text,
password                text            default NULL,
database_role           text            default NULL,
windows_domain          text            default NULL,
comments                text            default NULL
)
```

Table 10-298 DBE_SCHEDULER.CREATE_CREDENTIAL interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
credential_name	text	IN	No	Name of the authorization certificate.
username	text	IN	No	Database username.
password	text	IN	Yes	User password.
database_role	text	IN	Yes	Database system permission.
windows_domain	text	IN	Yes	Domain to which a Windows user belongs.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
comments	text	IN	Yes	Comments.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_credential('cre_1', 'user1', '');
 create_credential
-------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_credential('cre_1', false);
 drop_credential
-----------------

(1 row)
```

NOTICE

The **password** parameter of **DBE_SCHEDULER.CREATE_CREDENTIAL** must be set to **NULL** or **'******'**. This parameter is used only for compatibility and does not indicate any actual meaning. Do not use the OS username corresponding to the installation user to create a certificate.

- DBE_SCHEDULER.DROP_CREDENTIAL

  Destroys an authorization certificate. The user who calls this function must have the SYSADMIN permission.

  The prototype of the **DBE_SCHEDULER.DROP_CREDENTIAL** function is as follows:

```
DBE_SCHEDULER.drop_credential(
credential_name  text,
force            boolean default false
)
```

Table 10-299 DBE_SCHEDULER.DROP_CREDENTIAL interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
credential_name	text	IN	No	Name of the authorization certificate.
force	boolean	IN	No	Specifies whether to delete the authorization certificate. ● **true**: The certificate will be deleted no matter whether it is referenced by any job. ● **false**: No job can reference the certificate. Otherwise, an error occurs.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_credential('cre_1', 'user1', '');
 create_credential
-------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_credential('cre_1', false);
 drop_credential
-----------------

(1 row)
```

- DBE_SCHEDULER.ENABLE

  Enables an object.

  The prototype of the **DBE_SCHEDULER.ENABLE** function is as follows:

```
DBE_SCHEDULER.enable(
name text,
commit_semantics text                default 'STOP_ON_FIRST_ERROR'
)
```

Table 10-300 DBE_SCHEDULER.ENABLE interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	text	IN	No	Object name. You can specify one or more objects. If you specify multiple objects, separate them with commas (,).
commit_semantics	text	IN	No	Commit rules. The following types are supported: ● **'STOP_ON_FIRST_ERROR'**: The enabling operation performed before the first error is reported is committed. ● **'TRANSACTIONAL'**: Transaction-level commit. The enabling operation performed before an error is reported will be rolled back. ● **'ABSORB_ERRORS'**: The system attempts to bypass an error and commit the enabling operation that is performed successfully.

Example:

```
gaussdb=# CALL dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
lse, 'test');
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'stored_procedure', 'insert into
tb_job_test(key) values(null);', 0, false, '');
 create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.enable('job1');
 enable
--------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.enable('program1', 'STOP_ON_FIRST_ERROR');
 enable
--------
```

```
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

- DBE_SCHEDULER.ENABLE_SINGLE

  Enables a single object.

  The prototype of the **DBE_SCHEDULER.ENABLE_SINGLE** function is as follows:

  ```
  DBE_SCHEDULER.enable_single(
  name text
  )
  ```

  Table 10-301 DBE_SCHEDULER.ENABLE_SINGLE interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	text	IN	No	Object name.

  Example:

  ```
  gaussdb=# CALL dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
  end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
  lse, 'test');
   create_job
  ------------

  (1 row)

  gaussdb=# CALL DBE_SCHEDULER.enable_single('job1');
   enable_single
  ---------------

  (1 row)

  gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
   drop_job
  ----------

  (1 row)
  ```

- DBE_SCHEDULER.DISABLE

Disables multiple objects. The value of name is a character string separated by commas (,). Each character string separated by commas (,) is an object. Operations are synchronized only when operation synchronization is enabled.

The prototype of the **DBE_SCHEDULER.DISABLE** function is as follows:

```
DBE_SCHEDULER.disable(
name text,
force boolean                   default false,
commit_semantics text               default 'STOP_ON_FIRST_ERROR'
)
```

Table 10-302 DBE_SCHEDULER.DISABLE interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	text	IN	No	Object name.
force	boolean	IN	No	Specifies whether to disable an object. ● **true**: The object is disabled regardless of whether other objects depend on it. ● **false**: No object can depend on the object. Otherwise, an error occurs.
commit_semantics	text	IN	No	Commit rules. The following types are supported: ● **'STOP_ON_FIRST_ERROR'**: The disabling operation performed before the first error is reported is committed. ● **'TRANSACTIONAL'**: Transaction-level commit. The disabling operation performed before an error is reported will be rolled back. ● **'ABSORB_ERRORS'**: The system attempts to bypass an error and commit the disabling operation that is performed successfully.

Example:

```
gaussdb=# CALL dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
 create_job
------------
```

```
(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'stored_procedure', 'insert into
tb_job_test(key) values(null);', 0, false, '');
 create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.disable('job1');
 disable
---------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.disable('program1', false, 'STOP_ON_FIRST_ERROR');
 disable
---------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

- DBE_SCHEDULER.DISABLE_SINGLE

  Disables a single object.

  The prototype of the **DBE_SCHEDULER.DISABLE_SINGLE** function is as follows:

```
DBE_SCHEDULER.disable_single(
name text,
force boolean                    default false
)
```

Table 10-303 DBE_SCHEDULER.DISABLE_SINGLE interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	text	IN	No	Object name.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
force	boolean	IN	No	Specifies whether to disable an object. ● **true**: The object is disabled regardless of whether other objects depend on it. ● **false**: No object can depend on the object. Otherwise, an error occurs.

Example:

```
gaussdb=# CALL dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.disable_single('job1', false);
 disable_single
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)
```

- DBE_SCHEDULER.EVAL_CALENDAR_STRING

  Analyzes the scheduling task period.

  Return type: timestamp with time zone

  The prototype of the **DBE_SCHEDULER.EVAL_CALENDAR_STRING** function is as follows:

  ```
  DBE_SCHEDULER.evaluate_calendar_string(
  IN calendar_string text,
  IN start_date timestamp with time zone,
  IN return_date_after timestamp with time zone
  )return timestamp with time zone
  ```

Table 10-304 DBE_SCHEDULER.EVAL_CALENDAR_STRING interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
calendar_string	text	IN	No	Date string of a scheduled task.
start_date	timestamp with time zone	IN	No	Start time of a scheduled task.
return_date_after	timestamp with time zone	IN	No	Date when a scheduled task is returned.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.eval_calendar_string('FREQ=DAILY; BYHOUR=6;', sysdate, sysdate);
  eval_calendar_string
------------------------
 2023-09-16 06:05:55+08
(1 row)
```

- DBE_SCHEDULER.EVALUATE_CALENDAR_STRING

  Analyzes the scheduling task period.

  Return type: timestamp with time zone

  The prototype of the **DBE_SCHEDULER.EVALUATE_CALENDAR_STRING** function is as follows:

  ```
  DBE_SCHEDULER.evaluate_calendar_string(
  IN calendar_string text,
  IN start_date timestamp with time zone,
  IN return_date_after timestamp with time zone,
  OUT next_run_date timestamp with time zone
  )return timestamp with time zone
  ```

Table 10-305 DBE_SCHEDULER.EVALUATE_CALENDAR_STRING interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
calendar_string	text	IN	No	Date string of a scheduled task.
start_date	timestamp with time zone	IN	No	Start time of a scheduled task.
return_date_after	timestamp with time zone	IN	No	Date when a scheduled task is returned.
next_run_date	timestamp with time zone	OUT	No	The next date when a scheduled task is returned.

Example:

```
gaussdb=# CREATE OR REPLACE PROCEDURE pr1(calendar_str text) as
 DECLARE
    start_date        timestamp with time zone;
    return_date_after timestamp with time zone;
    next_run_date     timestamp with time zone;
 BEGIN
    start_date := '2003-2-1 10:30:00.111111+8'::timestamp with time zone;
    return_date_after := start_date;
    DBE_SCHEDULER.evaluate_calendar_string(
        calendar_str,
        start_date, return_date_after, next_run_date);
    DBE_OUTPUT.PRINT_LINE('next_run_date: ' || next_run_date);
    return_date_after := next_run_date;
 END;
 /
CREATE PROCEDURE
gaussdb=# CALL pr1('FREQ=hourly;INTERVAL=2;BYHOUR=6,10;BYMINUTE=0;BYSECOND=0');
next_run_date: 2003-02-02 06:00:00+08
 pr1
-----

(1 row)
```

10.12.2.14 DBE_SESSION

Interface Description

Table 10-306 provides all interfaces supported by the **DBE_SESSION** package. DBE_SESSION takes effect at the session level.

Table 10-306 DBE_SESSION

Interface	Description
DBE_SESSION.SET_CONTEXT	Sets the value of an attribute in a specified context.
DBE_SESSION.CLEAR_CONTEXT	Clears the value of an attribute in a specified context.
DBE_SESSION.SEARCH_CONTEXT	Queries the value of an attribute in a specified context.
DBE_SESSION.MODIFY_PACKAGE_STATE	Changes the PL/SQL status of the current session.

- DBE_SESSION.SET_CONTEXT

  Sets the value of an attribute in a specified namespace (context). The prototype of the **DBE_SESSION.SET_CONTEXT** function is as follows:

```
DBE_SESSION.SET_CONTEXT(
    namespace text,
    attribute text,
    value text
)returns void;
```

Table 10-307 DBE_SESSION.SET_CONTEXT interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
namespace	TEXT	IN	No	Name of the context to be set. If the context does not exist, create a context. The value contains a maximum of 128 bytes. If the value exceeds 128 bytes, it will be truncated.
attribute	TEXT	IN	No	Attribute name. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
value	TEXT	IN	No	Name of the value to be set. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.

- DBE_SESSION.CLEAR_CONTEXT

  Clears the value of an attribute in a specified namespace (context). The prototype of the **DBE_SESSION.CLEAR_CONTEXT** function is as follows:

```
DBE_SESSION.CLEAR_CONTEXT (
   namespace text,
   client_identifier text default null,
   attribute text default null
)returns void ;
```

Table 10-308 DBE_SESSION.CLEAR_CONTEXT interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
namespace	TEXT	IN	No	Context specified by the user. The value contains a maximum of 128 bytes. If the value exceeds 128 bytes, it will be truncated.
client_identifier	TEXT	IN	Yes	Client authentication. The default value is **null**. Generally, you do not need to manually set this parameter.
attribute	TEXT	IN	Yes	Attribute to be cleared. The default value is **null**, indicating that all attributes of the specified context are cleared. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated. Note: To ensure forward compatibility, if the parameter value is **'null'**, all attributes of the specified context are cleared.

- DBE_SESSION.SEARCH_CONTEXT

  Queries the value of an attribute in a specified namespace (context). The prototype of the **DBE_SESSION.SEARCH_CONTEXT** function is as follows:

```
DBE_SESSION.SEARCH_CONTEXT (
   namespace text,
```

```
    attribute text
)returns text;
```

Table 10-309 DBE_SESSION.SEARCH_CONTEXT interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
namespace	TEXT	IN	No	Context specified by the user. The value contains a maximum of 128 bytes. If the value exceeds 128 bytes, it will be truncated.
attribute	TEXT	IN	No	Attribute to be searched for. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.

Example:

```
DECLARE
    a text;
BEGIN
    DBE_SESSION.set_context('test', 'gaussdb', 'one');   --Set the gaussdb attribute in the test context to one.
    a := DBE_SESSION.search_context('test', 'gaussdb');
    DBE_OUTPUT.PRINT_LINE(a);
    DBE_SESSION.clear_context('test', 'test','gaussdb');
END;
/
-- Expected result:
one
ANONYMOUS BLOCK EXECUTE
```

- DBE_SESSION.MODIFY_PACKAGE_STATE

  Changes the PL/SQL status of the current session. The prototype of the DBE_SESSION.MODIFY_PACKAGE_STATE function is:

```
DBE_SESSION.MODIFY_PACKAGE_STATE (
    flags int);
```

Table 10-310 DBE_SESSION.MODIFY_PACKAGE_STATE interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
flags	INT	IN	No	Bit flag of the operation performed on the PL/SQL. When **flags** is set to **1**, the session cache of the PL/SQL that is currently running in the session is released after the top-level PL/SQL is executed. The current value of any package is cleared globally and the cached cursor is closed. On subsequent use, PL/SQL re-instantiates and re-initializes the package globally. Other bit flags are not supported.

Example:

```
CALL dbe_session.modify_package_state(1);
 modify_package_state
----------------------

(1 row)
```

10.12.2.15 DBE_SQL

Data Types

- DBE_SQL.DESC_REC

  This type is a composite type and is used to store the description of the SQL_DESCRIBE_COLUMNS API.

  The prototype of the DBE_SQL.DESC_REC type is as follows:

```
CREATE TYPE DBE_SQL.DESC_REC AS (
    col_type            int,
    col_max_len         int,
    col_name            VARCHAR2(32),
    col_name_len        int,
    col_schema_name     VARCHAR2(32),
    col_schema_name_len int,
    col_precision       int,
    col_scale           int,
    col_charsetid       int,
    col_charsetform     int,
    col_null_ok         BOOLEAN
);
```

- DBE_SQL.DESC_TAB

  This type is the TABLE type of DESC_REC and is implemented through the TABLE OF syntax.

  The prototype of the DBE_SQL.DESC_TAB type is as follows:

```
CREATE TYPE DBE_SQL.DESC_TAB AS TABLE OF DBE_SQL.DESC_REC INDEX BY INTEGER;
```

- DBE_SQL.DATE_TABLE

  This type is the TABLE type of DATE and is implemented through the TABLE OF syntax.

  The prototype of the DBE_SQL.DATE_TABLE type is as follows:

  ```
  CREATE TYPE DBE_SQL.DATE_TABLE AS TABLE OF DATE INDEX BY INTEGER;
  ```

- DBE_SQL.NUMBER_TABLE

  This type is the TABLE type of NUMBER and is implemented through the TABLE OF syntax.

  The prototype of the DBE_SQL.NUMBER_TABLE type is as follows:

  ```
  CREATE TYPE DBE_SQL.NUMBER_TABLE AS TABLE OF NUMBER INDEX BY INTEGER;
  ```

- DBE_SQL.VARCHAR2_TABLE

  This type is the TABLE type of VARCHAR2 and is implemented through the TABLE OF syntax.

  The prototype of the DBE_SQL.VARCHAR2_TABLE type is as follows:

  ```
  CREATE TYPE DBE_SQL.VARCHAR2_TABLE AS TABLE OF VARCHAR2(32767) INDEX BY INTEGER;
  ```

- DBE_SQL.BLOB_TABLE

  This type is the TABLE type of BLOB and is implemented through the TABLE OF syntax.

  The prototype of the DBE_SQL.BLOB_TABLE type is as follows:

  ```
  CREATE TYPE DBE_SQL.BLOB_TABLE AS TABLE OF BLOB INDEX BY INTEGER;
  ```

API Description

Table 10-311 lists APIs supported by the **DBE_SQL** package.

Table 10-311 DBE_SQL

API	Description
DBE_SQL.REGISTER_CONTEXT	Opens a cursor.
DBE_SQL.SQL_UNREGISTER_CONTEXT	Closes an open cursor.
DBE_SQL.SQL_SET_SQL	Passes a set of SQL statements or anonymous blocks to a cursor.
DBE_SQL.SQL_RUN	Executes SQL statements or anonymous blocks in a given cursor.
DBE_SQL.NEXT_ROW	Reads a row of cursor data.
DBE_SQL.SET_RESULT_TYPE	Dynamically defines a column.
DBE_SQL.SET_RESULT_TYPE_CHAR	Dynamically defines a column of the CHAR type.
DBE_SQL.SET_RESULT_TYPE_INT	Dynamically defines a column of the INT type.

API	Description
DBE_SQL.SET_RESULT_TYPE_LONG	Dynamically defines a column of the LONG type.
DBE_SQL.SET_RESULT_TYPE_RAW	Dynamically defines a column of the RAW type.
DBE_SQL.SET_RESULT_TYPE_BYTEA	Dynamically defines a column of the BYTEA type.
DBE_SQL.SET_RESULT_TYPE_TEXT	Dynamically defines a column of the TEXT type.
DBE_SQL.SET_RESULT_TYPE_UNKNOWN	Dynamically defines a column of an unknown type.
DBE_SQL.GET_RESULT	Reads a dynamically defined column value.
DBE_SQL.GET_RESULT_CHAR	Reads a dynamically defined column value of the CHAR type.
DBE_SQL.GET_RESULT_INT	Reads a dynamically defined column value of the INT type.
DBE_SQL.GET_RESULT_LONG	Reads a dynamically defined column value of the LONG type.
DBE_SQL.GET_RESULT_RAW	Reads a dynamically defined column value of the RAW type.
DBE_SQL.GET_RESULT_BYTEA	Reads a dynamically defined column value of the BYTEA type.
DBE_SQL.GET_RESULT_TEXT	Reads a dynamically defined column value of the TEXT type.
DBE_SQL.GET_RESULT_UNKNOWN	Reads a dynamically defined column value of an unknown type.
DBE_SQL.DBE_SQL_GET_RESULT_CHAR	Reads a dynamically defined column value of the CHAR type.
DBE_SQL.DBE_SQL_GET_RESULT_LONG	Reads a dynamically defined column value of the LONG type.
DBE_SQL.DBE_SQL_GET_RESULT_RAW	Reads a dynamically defined column value of the RAW type.
DBE_SQL.IS_ACTIVE	Checks whether a cursor is opened.
DBE_SQL.LAST_ROW_COUNT	Returns the cumulative count of obtained rows.

API	Description
DBE_SQL.RUN_AND_NEXT	Reads data of a cursor after a set of dynamically defined operations are performed on the cursor.
DBE_SQL.SQL_BIND_VARIABLE	Binds a value to a variable in a statement.
DBE_SQL.SQL_BIND_ARRAY	Binds a group of values to a variable in a statement.
DBE_SQL.SET_RESULT_TYPE_INTS	Dynamically defines a column of the INT array type.
DBE_SQL.SET_RESULT_TYPE_TEXTS	Dynamically defines a column of the TEXT array type.
DBE_SQL.SET_RESULT_TYPE_RAWS	Dynamically defines a column of the RAW array type.
DBE_SQL.SET_RESULT_TYPE_BYTEAS	Dynamically defines a column of the BYTEA array type.
DBE_SQL.SET_RESULT_TYPE_CHARS	Dynamically defines a column of the CHAR array type.
DBE_SQL.SET_RESULTS_TYPE	Dynamically defines a column of the array type.
DBE_SQL.GET_RESULTS_INT	Reads a dynamically defined column value of the INT array type.
DBE_SQL.GET_RESULTS_TEXT	Reads a dynamically defined column value of the TEXT array type.
DBE_SQL.GET_RESULTS_RAW	Reads a dynamically defined column value of the RAW array type.
DBE_SQL.GET_RESULTS_BYTEA	Reads a dynamically defined column value of the BYTEA array type.
DBE_SQL.GET_RESULTS_CHAR	Reads a dynamically defined column value of the CHAR array type.
DBE_SQL.GET_RESULTS	Reads a dynamically defined column value.
DBE_SQL.SQL_DESCRIBE_COLUMNS	Describes the column information read by the cursor.

API	Description
DBE_SQL.DESCRIBE_COLUMNS	Describes the column information read by the cursor.
DBE_SQL.BIND_VARIABLE	Binds parameters.
DBE_SQL.SQL_SET_RESULTS_TYPE_C	Dynamically defines a column of the array type.
DBE_SQL.SQL_GET_VALUES_C	Reads a dynamically defined column value.
DBE_SQL.GET_VARIABLE_RESULT	Reads the return value of an SQL statement.
DBE_SQL.GET_VARIABLE_RESULT_CHAR	Reads the return value (of the CHAR type) of an SQL statement.
DBE_SQL.GET_VARIABLE_RESULT_RAW	Reads the return value (of the RAW type) of an SQL statement.
DBE_SQL.GET_VARIABLE_RESULT_TEXT	Reads the return value (of the TEXT type) of an SQL statement.
DBE_SQL.GET_VARIABLE_RESULT_INT	Reads the return value (of the INT type) of an SQL statement.
DBE_SQL.GET_ARRAY_RESULT_TEXT	Reads the return value (of the TEXT array type) of an SQL statement.
DBE_SQL.GET_ARRAY_RESULT_RAW	Reads the return value (of the RAW array type) of an SQL statement.
DBE_SQL.GET_ARRAY_RESULT_CHAR	Reads the return value (of the CHAR array type) of an SQL statement.
DBE_SQL.GET_ARRAY_RESULT_INT	Reads the return value (of the INT array type) of an SQL statement.
DBE_SQL.SQL_SET_TABLEOF_RESULTS_TYPE_C	Dynamically defines a column of the tableof type.
DBE_SQL.SQL_GET_TABLEOF_VALUES_C	Reads a dynamically defined column value of the tableof type.

NOTE

- You are advised to use **dbe_sql.set_result_type** and **dbe_sql.get_result** to define columns.
- If the size of the result set is greater than the value of **work_mem**, the result set will be spilled to a disk temporarily. The value of **work_mem** must be no greater than 512 MB.

- DBE_SQL.REGISTER_CONTEXT

  This function opens a cursor, which is the prerequisite for the subsequent **dbe_sql** operations. This function does not transfer any parameter. It automatically generates cursor IDs in an ascending order and returns values to integer variables.

  CAUTION

  Cursors opened by DBE_SQL are session-level variables. Cross-session calling of opened cursors (such as autonomous transactions) is not supported. If a cross-session cursor is called, the behavior is unpredictable.

  The prototype of the DBE_SQL.REGISTER_CONTEXT function is as follows:

  ```
  DBE_SQL.REGISTER_CONTEXT(
  )
  RETURN INTEGER;
  ```

- DBE_SQL.SQL_UNREGISTER_CONTEXT

  This function closes a cursor, which is the end of each **dbe_sql** operation. If this function is not called when the stored procedure ends, the memory is still occupied by the cursor. Therefore, remember to close a cursor when you do not need to use it. If an exception occurs, the stored procedure exits but the cursor is not closed. Therefore, you are advised to include this API in the exception handling of the stored procedure.

  The prototype of the DBE_SQL.SQL_UNREGISTER_CONTEXT function is as follows:

  ```
  DBE_SQL.SQL_UNREGISTER_CONTEXT(
      context_id    IN INTEGER
  )
  RETURN INTEGER;
  ```

  Table 10-312 DBE_SQL.SQL_UNREGISTER_CONTEXT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be closed

- DBE_SQL.SQL_SET_SQL

  Parses SQL statements or anonymous blocks in a given cursor. The statement parameters can be transferred only through the text type. The length cannot exceed 1 GB.

  The prototype of the **DBE_SQL.SQL_SET_SQL** function is as follows:

  ```
  DBE_SQL.SQL_SET_SQL(
      context_id    IN INTEGER,
      query_string  IN TEXT,
  ```

```
    language_flag IN INTEGER
)
RETURN BOOLEAN;
```

Table 10-313 DBE_SQL.SQL_SET_SQL parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
context_id	INTEGER	IN	No	ID of the cursor whose query statement is to be parsed
query_string	TEXT	IN	No	Query statement to be executed for parsing
language_flag	INTEGER	IN	No	Version language. The value **1** indicates an incompatible version, and the value **2** indicates a compatible version.

- DBE_SQL.SQL_RUN

  This function executes a given cursor. This function receives a cursor ID and executes SQL statements or anonymous blocks in a given cursor.

  The prototype of the **DBE_SQL.SQL_RUN** function is as follows:

```
DBE_SQL.SQL_RUN(
    context_id     IN INTEGER,
)
RETURN INTEGER;
```

Table 10-314 DBE_SQL.SQL_RUN parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
context_id	INTEGER	IN	No	ID of the cursor whose query statement is to be parsed

- DBE_SQL.NEXT_ROW

  This function returns the number of data rows that meet query conditions. Each time the API is executed, the system obtains a set of new rows until all data is read.

  The prototype of the DBE_SQL.NEXT_ROW function is as follows:

```
DBE_SQL.NEXT_ROW(
    context_id    IN INTEGER,
)
RETURN INTEGER;
```

  Table 10-315 DBE_SQL.NEXT_ROW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed

- DBE_SQL.SET_RESULT_TYPE

  This function defines columns returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE(
    context_id IN INTEGER,
    pos        IN INTEGER,
    column_ref IN ANYELEMENT,
    maxsize    IN INTEGER default 1024
)
RETURN INTEGER;
```

Table 10-316 DBE_SQL.SET_RESULT_TYPE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed
pos	INTEGER	IN	No	Relative position of the queried columns in the returned result. The value starts from 1.
column_ref	ANYELEMENT	IN	No	Variable of any type. You can select an appropriate API to dynamically define columns based on variable types.
maxsize	INTEGER	IN	Yes	Length of the defined column return type.

- DBE_SQL.SET_RESULT_TYPE_CHAR

  This function defines columns of the **CHAR** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_CHAR** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_CHAR(
    context_id  IN INTEGER,
    pos         IN INTEGER,
    column_ref  IN TEXT,
    column_size IN INTEGER
)
RETURN INTEGER;
```

Table 10-317 DBE_SQL.SET_RESULT_TYPE_CHAR parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed
pos	INTEGER	IN	No	Position of a dynamically defined column in the query
column_ref	TEXT	IN	No	Parameter to be defined
column_size	INTEGER	IN	No	Length of a dynamically defined column

- DBE_SQL.SET_RESULT_TYPE_INT

  This function defines columns of the **INT** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_INT** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_INT(
    context_id IN INTEGER,
    pos        IN INTEGER
)
RETURN INTEGER;
```

Table 10-318 DBE_SQL.SET_RESULT_TYPE_INT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed
pos	INTEGER	IN	No	Position of a dynamically defined column in the query

- DBE_SQL.SET_RESULT_TYPE_LONG

  This function defines columns of a long type (not **LONG**) returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type. The maximum size of a long column is 1 GB.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_LONG** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_LONG(
   context_id IN INTEGER,
   pos        IN INTEGER
)
RETURN INTEGER;
```

Table 10-319 DBE_SQL.SET_RESULT_TYPE_LONG parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed
pos	INTEGER	IN	No	Position of a dynamically defined column in the query

- DBE_SQL.SET_RESULT_TYPE_RAW

  This function defines columns of the **RAW** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_RAW** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_RAW(
   context_id  IN INTEGER,
   pos         IN INTEGER,
   column_ref  IN RAW,
   column_size IN INTEGER
)
RETURN INTEGER;
```

Table 10-320 DBE_SQL.SET_RESULT_TYPE_RAW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed
pos	INTEGER	IN	No	Position of a dynamically defined column in the query
column_ref	RAW	IN	No	RAW variable
column_size	INTEGER	IN	No	Column length

- DBE_SQL.SET_RESULT_TYPE_BYTEA

  Defines columns of the BYTEA type returned from a given cursor and can be used only for cursors defined by SELECT. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the DBE_SQL.SET_RESULT_TYPE_BYTEA function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_BYTEA(
   context_id  IN INTEGER,
   pos         IN INTEGER,
   column_ref  IN BYTEA,
   column_size IN INTEGER
)
RETURN INTEGER;
```

Table 10-321 DBE_SQL.SET_RESULT_TYPE_BYTEA parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed
pos	INTEGER	IN	No	Position of a dynamically defined column in the query
column_ref	BYTEA	IN	No	BYTEA variable
column_size	INTEGER	IN	No	Column length

- DBE_SQL.SET_RESULT_TYPE_TEXT

  This function defines columns of the **TEXT** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_TEXT** function is as follows:

```
DBE_SQL.DEFINE_COLUMN_CHAR(
    context_id IN INTEGER,
    pos        IN INTEGER,
    maxsize    IN INTEGER
)
RETURN INTEGER;
```

Table 10-322 DBE_SQL.SET_RESULT_TYPE_TEXT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed
pos	INTEGER	IN	No	Position of a dynamically defined column in the query
maxsize	INTEGER	IN	No	Maximum length of the defined TEXT type

- DBE_SQL.SET_RESULT_TYPE_UNKNOWN

  This function processes columns of unknown data types returned from a given cursor. It is used only for the system to report an error and exist when the type cannot be identified.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_UNKNOWN** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_UNKNOWN(
    context_id IN INTEGER,
    pos        IN INTEGER,
    col_type   IN TEXT
)
RETURN INTEGER;
```

Table 10-323 DBE_SQL.SET_RESULT_TYPE_UNKNOWN parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
pos	INTEGER	IN	No	Position of a dynamically defined column in the query
col_type	TEXT	IN	No	Dynamically defined parameter

- DBE_SQL.GET_RESULT

  This function returns the cursor element value in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the **DBE_SQL.GET_RESULT** function is as follows:

```
DBE_SQL.GET_RESULT(
   context_id   IN    INTEGER,
   pos          IN    INTEGER,
   column_value INOUT ANYELEMENT
)
RETURN ANYELEMENT;
```

  Table 10-324 DBE_SQL.GET_RESULT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed
pos	INTEGER	IN	No	Relative position of the queried columns in the returned result. The value starts from 1.

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
column_value	ANYELEMENT	INOUT	No	Return value of the query result of a specified column

- DBE_SQL.GET_RESULT_CHAR

  This stored procedure returns the value of the **CHAR** type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the DBE_SQL.GET_RESULT_CHAR stored procedure is as follows:

```
DBE_SQL.GET_RESULT_CHAR(
    context_id    IN    INTEGER,
    pos           IN    INTEGER,
    tr            INOUT CHAR,
    err           INOUT NUMERIC,
    actual_length INOUT INTEGER
);
```

Table 10-325 DBE_SQL.GET_RESULT_CHAR parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
pos	INTEGER	IN	No	Relative position of the queried columns in the returned result. The value starts from 1.
tr	CHAR	INOUT	No	Return value
err	NUMERIC	INOUT	No	Error No. It is an output parameter. The input parameter must be a variable. Currently, the output value is **–1** regardless of the input parameter.
actual_length	INTEGER	INOUT	No	Length of a return value

- The overloading of the DBE_SQL.GET_RESULT_CHAR stored procedure is as follows:

```
DBE_SQL.GET_RESULT_CHAR(
   context_id IN    INTEGER,
   pos        IN    INTEGER,
   tr         INOUT CHAR
);
```

Table 10-326 DBE_SQL.GET_RESULT_CHAR parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed
pos	INTEGER	IN	No	Position of a dynamically defined column in the query
tr	CHAR	INOUT	No	Return value

- DBE_SQL.GET_RESULT_INT

  This function returns the value of the **INT** type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**. The prototype of the **DBE_SQL.GET_RESULT_INT** function is as follows:

```
DBE_SQL.GET_RESULT_INT(
    context_id IN INTEGER,
    pos        IN INTEGER
)
RETURN INTEGER;
```

Table 10-327 DBE_SQL.GET_RESULT_INT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed
pos	INTEGER	IN	No	Position of a dynamically defined column in the query

- DBE_SQL.GET_RESULT_LONG

  This function returns the value of a long type (not **LONG** or **BIGINT**) in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the **DBE_SQL.GET_RESULT_LONG** function is as follows:

```
DBE_SQL.GET_RESULT_LONG(
    context_id IN INTEGER,
    pos        IN    INTEGER,
    lgth       IN    INTEGER,
    off_set    IN    INTEGER,
    vl         INOUT TEXT,
    vl_length  INOUT INTEGER
)
RETURN RECORD;
```

Table 10-328 DBE_SQL.GET_RESULT_LONG parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed
pos	INTEGER	IN	No	Position of a dynamically defined column in the query
lgth	INTEGER	IN	No	Length of a return value
off_set	INTEGER	IN	No	Start position of a return value
vl	TEXT	INOUT	No	Return value
vl_length	INTEGER	INOUT	No	Length of a return value

- DBE_SQL.GET_RESULT_RAW

  Returns the value of the RAW type in a specified position of a cursor and accesses the data obtained by DBE_SQL.NEXT_ROW.

  The prototype of the DBE_SQL.GET_RESULT_RAW stored procedure is as follows:

```
DBE_SQL.GET_RESULT_RAW(
    context_id    IN    INTEGER,
    pos           IN    INTEGER,
    tr            INOUT RAW,
    err           INOUT NUMERIC,
    actual_length INOUT INTEGER
);
```

Table 10-329 DBE_SQL.GET_RESULT_RAW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed
pos	INTEGER	IN	No	Position of a dynamically defined column in the query
tr	RAW	INOUT	No	Returned column value
err	NUMERIC	INOUT	No	Error No. It is an output parameter. The input parameter must be a variable. Currently, the output value is **–1** regardless of the input parameter.
actual_length	INTEGER	INOUT	No	Length of a return value. The value longer than this length will be truncated.

- The overloading of the DBE_SQL.GET_RESULT_RAW stored procedure is as follows:

```
DBE_SQL.GET_RESULT_RAW(
    context_id IN     INTEGER,
    pos        IN     INTEGER,
    tr         INOUT RAW
);
```

Table 10-330 DBE_SQL.GET_RESULT_RAW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed
pos	INTEGER	IN	No	Position of a dynamically defined column in the query
tr	RAW	INOUT	No	Returned column value

- DBE_SQL.GET_RESULT_BYTEA

  Returns the value of the BYTEA type in a specified position of a cursor that is obtained by DBE_SQL.NEXT_ROW.

  The prototype of the DBE_SQL.GET_RESULT_BYTEA stored procedure is as follows:

```
DBE_SQL.GET_RESULT_BYTEA(
   context_id IN INTEGER,
   pos        IN INTEGER
)
RETURN BYTEA;
```

Table 10-331 DBE_SQL.GET_RESULT_BYTEA parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed
pos	INTEGER	IN	No	Position of a dynamically defined column in the query

- DBE_SQL.GET_RESULT_TEXT

  This function returns the value of the **TEXT** type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the **DBE_SQL.GET_RESULT_TEXT** function is as follows:

```
DBE_SQL.GET_RESULT_TEXT(
    context_id IN  INTEGER,
    pos        IN  INTEGER
)
RETURN TEXT;
```

Table 10-332 DBE_SQL.GET_RESULT_TEXT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
pos	INTEGER	IN	No	Position of a dynamically defined column in the query

- DBE_SQL.GET_RESULT_UNKNOWN

  This function returns the value of an unknown type in a specified position of a cursor. It serves as an error handling API when the type is not unknown.

  The prototype of the DBE_SQL.GET_RESULT_UNKNOWN function is as follows:

```
DBE_SQL.GET_RESULT_UNKNOWN(
    context_id IN INTEGER,
    pos        IN INTEGER,
    col_type   IN TEXT
)
RETURN TEXT;
```

Table 10-333 DBE_SQL.GET_RESULT_UNKNOWN parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed
pos	INTEGER	IN	No	Position of a dynamically defined column in the query

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
col_type	TEXT	IN	No	Returned parameter type

- DBE_SQL.DBE_SQL_GET_RESULT_CHAR

  This function returns the value of the **CHAR** type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**. Different from **DBE_SQL.GET_RESULT_CHAR**, the length of the return value is not set and the entire string is returned.

  The prototype of the **DBE_SQL.DBE_SQL_GET_RESULT_CHAR** function is as follows:

```
DBE_SQL.DBE_SQL_GET_RESULT_CHAR(
    context_id IN INTEGER,
    pos        IN INTEGER
)
RETURN CHARACTER;
```

  Table 10-334 DBE_SQL.DBE_SQL_GET_RESULT_CHAR parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed
pos	INTEGER	IN	No	Position of a dynamically defined column in the query

- DBE_SQL.DBE_SQL_GET_RESULT_LONG

  This function returns the value of a long type (not **LONG** or **BIGINT**) in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

Different from **DBE_SQL.GET_RESULT_LONG**, the length of the return value is not set and the entire BIGINT value is returned.

The prototype of the **DBE_SQL.DBE_SQL_GET_RESULT_LONG** function is as follows:

```
DBE_SQL.DBE_SQL_GET_RESULT_LONG(
    context_id IN INTEGER,
    pos        IN INTEGER
)
RETURN BIGINT;
```

Table 10-335 DBE_SQL.DBE_SQL_GET_RESULT_LONG parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed
pos	INTEGER	IN	No	Position of a dynamically defined column in the query

- DBE_SQL.DBE_SQL_GET_RESULT_RAW

  This function returns the value of the **RAW** type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  Different from **DBE_SQL.GET_RESULT_RAW**, the length of the return value is not set and the entire string is returned.

  The prototype of the **DBE_SQL.DBE_SQL_GET_RESULT_RAW** function is as follows:

  ```
  DBE_SQL.GET_RESULT_RAW(
      context_id IN    INTEGER,
      pos        IN    INTEGER,
      tr         INOUT RAW
  )
  RETURN RAW;
  ```

Table 10-336 DBE_SQL.GET_RESULT_RAW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be executed
pos	INTEGER	IN	No	Position of a dynamically defined column in the query
tr	RAW	INOUT	No	Returned column value

- DBE_SQL.IS_ACTIVE

  This function returns the status of a cursor. When a cursor is opened, parsed, executed, or defined, the value is **TRUE**. When a cursor is closed, the value is **FALSE**. If the status is unknown, an error is reported. In other cases, the cursor is closed by default.

  The prototype of the **DBE_SQL.IS_ACTIVE** function is as follows:

```
DBE_SQL.IS_ACTIVE(
   context_id     IN   INTEGER
)
RETURN BOOLEAN;
```

Table 10-337 DBE_SQL.IS_ACTIVE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor to be queried

- DBE_SQL.LAST_ROW_COUNT

  Returns the accumulated count of data rows obtained after the latest NEXT_ROW execution.

  The prototype of the DBE_SQL.LAST_ROW_COUNT function is as follows:

  ```
  DBE_SQL.LAST_ROW_COUNT(
  )
  RETURN INTEGER;
  ```

- DBE_SQL.RUN_AND_NEXT

  Equivalent to calling SQL_RUN and NEXT_ROW in sequence.

  The prototype of the DBE_SQL.RUN_AND_NEXT function is as follows:

  ```
  DBE_SQL.RUN_AND_NEXT(
     context_id IN INTEGER
  )
  RETURNS INTEGER;
  ```

Table 10-338 DBE_SQL.RUN_AND_NEXT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INTEGER	IN	No	ID of the cursor whose query statement is to be parsed

- DBE_SQL.SQL_BIND_VARIABLE

  This function is used to bind a parameter to an SQL statement. When an SQL statement is executed, the SQL statement is executed based on the bound value.

  The prototype of the **DBE_SQL.SQL_BIND_VARIABLE** function is as follows:

```
DBE_SQL.SQL_BIND_VARIABLE(
    context_id      IN int,
    query_string    IN text,
    language_flag   IN anyelement,
    out_value_size IN int default null
)
RETURNS void;
```

  Table 10-339 DBE_SQL.SQL_BIND_VARIABLE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
query_string	TEXT	IN	No	Name of the bound variable
language_flag	ANYELEMENT	IN	No	Bound value
out_value_size	INT	IN	Yes	Size of the return value. Default value: **NULL**. In A-compatible mode, the parameter behavior is the same as that of database A only when the parameter type of the value is VARCHAR or CHAR.

- DBE_SQL.SQL_BIND_ARRAY

  This function is used to bind a set of parameters to an SQL statement. When an SQL statement is executed, the SQL statement is executed based on the bound array.

The prototype of the **DBE_SQL.SQL_BIND_ARRAY** function is as follows:

```
DBE_SQL.SQL_BIND_ARRAY(
    context_id   IN int,
    query_string IN text,
    value        IN anyarray
)
RETURNS void;
DBE_SQL.SQL_BIND_ARRAY(
    context_id   IN int,
    query_string IN text,
    value        IN anyarray,
    lower_index  IN int,
    higher_index IN int
)
RETURNS void;

DBE_SQL.SQL_BIND_ARRAY(
    context_id   IN int,
    query_string IN text,
    value        IN anyindexbytable
)
RETURNS void;
DBE_SQL.SQL_BIND_ARRAY(
    context_id   IN int,
    query_string IN text,
    value        IN anyindexbytable,
    lower_index  IN int,
    higher_index IN int
)
RETURNS void;
```

Table 10-340 DBE_SQL.SQL_BIND_ARRAY parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
query_string	TEXT	IN	No	Name of the bound variable.
value	ANYINDEXBYTABLE	IN	No	Bound array.
lower_index	INT	IN	No	Minimum index of the bound array.
higher_index	INT	IN	No	Maximum index of the bound array.

> **NOTE**
>
> DBE_SQL.SQL_BIND_ARRAY does not support user-defined table types. Use the table types provided in **Data Types**.

- DBE_SQL.SET_RESULT_TYPE_INTS

  This function defines columns of the **INT** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_INTS** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_INTS(
    context_id IN int,
    pos        IN int,
    column_ref IN anyarray,
    cnt        IN int,
    lower_bnd  IN int
)
RETURNS integer;
```

Table 10-341 DBE_SQL.SET_RESULT_TYPE_INTS parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query
column_ref	ANYARRAY	IN	No	Type of the returned array
cnt	INT	IN	No	Number of values obtained at a time
lower_bnd	INT	IN	No	Start index when an array is returned.

- DBE_SQL.SET_RESULT_TYPE_TEXTS

  This function defines columns of the TEXT array type returned from a given cursor and can be used only for the cursors defined by SELECT. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the DBE_SQL.SET_RESULT_TYPE_TEXTS function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_TEXTS(
    context_id IN int,
    pos        IN int,
    column_ref IN anyarray,
    cnt        IN int,
    lower_bnd  IN int,
    maxsize    IN int
)
RETURNS integer;
```

Table 10-342 DBE_SQL.SET_RESULT_TYPE_TEXTS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query
column_ref	ANYARRAY	IN	No	Type of the returned array
cnt	INT	IN	No	Number of values obtained at a time
lower_bnd	INT	IN	No	Start index when an array is returned.
maxsize	INT	IN	No	Maximum length of the defined TEXT type

- DBE_SQL.SET_RESULT_TYPE_RAWS

  This function defines columns of the **RAW** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_RAWS** function is as follows:

```
DBE_SQL.set_result_type_raws(
    context_id  IN int,
    pos         IN int,
    column_ref  IN anyarray,
    cnt         IN int,
    lower_bnd   IN int,
```

```
    column_size IN int
)
RETURNS integer;
```

Table 10-343 DBE_SQL.SET_RESULT_TYPE_RAWS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query
column_ref	ANYARRAY	IN	No	Type of the returned array
cnt	INT	IN	No	Number of values obtained at a time
lower_bnd	INT	IN	No	Start index when an array is returned.
column_size	INT	IN	No	Column length

- DBE_SQL.SET_RESULT_TYPE_BYTEAS

  This function defines columns of the **BYTEA** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_BYTEAS** function is as follows:

```
DBE_SQL.set_result_type_byteas(
    context_id  IN int,
    pos         IN int,
    column_ref  IN anyarray,
    cnt         IN int,
    lower_bnd   IN int,
    column_size IN int
)
RETURNS integer;
```

Table 10-344 DBE_SQL.SET_RESULT_TYPE_BYTEAS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query
column_ref	ANYARRAY	IN	No	Type of the returned array
cnt	INT	IN	No	Number of values obtained at a time
lower_bnd	INT	IN	No	Start index when an array is returned.
column_size	INT	IN	No	Column length

- DBE_SQL.SET_RESULT_TYPE_CHARS

  This function defines columns of the **CHAR** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_CHARS** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_CHARS(
    context_id  IN int,
    pos         IN int,
    column_ref  IN anyarray,
    cnt         IN int,
    lower_bnd   IN int,
    column_size IN int
)
RETURNS integer;
```

Table 10-345 DBE_SQL.SET_RESULT_TYPE_CHARS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query
column_ref	ANYARRAY	IN	No	Type of the returned array
cnt	INT	IN	No	Number of values obtained at a time
lower_bnd	INT	IN	No	Start index when an array is returned.
column_size	INT	IN	No	Column length

- DBE_SQL.SET_RESULTS_TYPE

  This function defines columns returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULTS_TYPE** function is as follows:

```
DBE_SQL.SET_RESULTS_TYPE(
    context_id IN int,
    pos        IN int,
    column_ref IN anyarray,
    cnt        IN int,
    lower_bnd  IN int,
    maxsize    IN int DEFAULT 1024
) returns void;

DBE_SQL.SET_RESULTS_TYPE(
    context_id IN int,
    pos        IN int,
    column_ref IN dbe_sql.number_table,
    cnt        IN int,
    lower_bnd  IN int,
    maxsize    IN int DEFAULT 1024
);

DBE_SQL.SET_RESULTS_TYPE(
    context_id IN int,
    pos        IN int,
    column_ref IN dbe_sql.varchar2_table,
    cnt        IN int,
    lower_bnd  IN int,
    maxsize    IN int DEFAULT 32767
```

```
);

DBE_SQL.SET_RESULTS_TYPE(
    context_id IN int,
    pos        IN int,
    column_ref IN dbe_sql.date_table,
    cnt        IN int,
    lower_bnd  IN int,
    maxsize    IN int DEFAULT 1024
);

DBE_SQL.SET_RESULTS_TYPE(
    context_id IN int,
    pos        IN int,
    column_ref IN dbe_sql.blob_table,
    cnt        IN int,
    lower_bnd  IN int,
    maxsize    IN int DEFAULT 32767
);
```

Table 10-346 DBE_SQL.SET_RESULTS_TYPE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query
column_ref	DBE_SQL.BLOB_TABLE	IN	No	Type of the returned array
cnt	INT	IN	No	Number of values obtained at a time
lower_bnd	INT	IN	No	Start index when an array is returned.
maxsize	INT	IN	Yes	Maximum length of the defined type

NOTE

DBE_SQL.SET_RESULTS_TYPE does not support user-defined table types. Use the table types provided in "Data Types".

- DBE_SQL.GET_RESULTS_INT

  This function returns the value of the **INT** array type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

The prototype of the **DBE_SQL.GET_RESULTS_INT** function is as follows:

```
DBE_SQL.GET_RESULTS_INT(
   context_id   IN    int,
   pos          IN    int,
   column_value INOUT anyarray
);
```

Table 10-347 DBE_SQL.GET_RESULTS_INT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query
column_value	ANYARRAY	INOUT	No	Return value

- DBE_SQL.GET_RESULTS_TEXT

  This function returns the value of the **TEXT** array type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the **DBE_SQL.GET_RESULTS_TEXT** function is as follows:

```
DBE_SQL.GET_RESULTS_TEXT(
   context_id   IN    int,
   pos          IN    int,
   column_value INOUT anyarray
);
```

Table 10-348 DBE_SQL.GET_RESULTS_TEXT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
pos	INT	IN	No	Position of a dynamically defined column in the query
column_value	ANYARRAY	INOUT	No	Return value

- DBE_SQL.GET_RESULTS_RAW

  This function returns the value of the **RAW** array type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the **DBE_SQL.GET_RESULTS_RAW** function is as follows:

```
DBE_SQL.GET_RESULTS_RAW(
   context_id   IN    int,
   pos          IN    int,
   column_value INOUT anyarray
);
```

Table 10-349 DBE_SQL.GET_RESULTS_RAW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query
column_value	ANYARRAY	INOUT	No	Return value

- DBE_SQL.GET_RESULTS_BYTEA

  This function returns the value of the **BYTEA** array type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the **DBE_SQL.GET_RESULTS_BYTEA** function is as follows:

```
DBE_SQL.GET_RESULTS_BYTEA(
   context_id   IN    int,
   pos          IN    int,
   column_value INOUT anyarray
);
```

  Table 10-350 DBE_SQL.GET_RESULTS_BYTEA parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query
column_value	ANYARRAY	INOUT	No	Return value

- DBE_SQL.GET_RESULTS_CHAR

  This function returns the value of the **CHAR** array type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the **DBE_SQL.GET_RESULTS_CHAR** function is as follows:

```
DBE_SQL.GET_RESULTS_CHAR(
   context_id   IN    int,
   pos          IN    int,
   column_value INOUT anyarray
);
```

Table 10-351 DBE_SQL.GET_RESULTS_CHAR parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query
column_value	ANYARRAY	INOUT	No	Return value

- DBE_SQL.GET_RESULTS

  This function returns the value of the array type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  NOTE

  The bottom-layer mechanism of DBE_SQL.GET_RESULTS is implemented through arrays. When different arrays are used to obtain the return value of the same column, NULL values are filled in the array due to discontinuous internal indexes to ensure the continuity of array indexes. As a result, the length of the returned result array is different from that of the Oracle database.

  The prototype of the **DBE_SQL.GET_RESULTS** function is as follows:

```
DBE_SQL.GET_RESULTS(
   context_id   IN    int,
   pos          IN    int,
   column_value INOUT anyarray
);

DBE_SQL.GET_RESULTS(
   context_id   IN    int,
   pos          IN    int,
   column_value INOUT dbe_sql.varchar2_table
);

DBE_SQL.GET_RESULTS(
   context_id   IN    int,
   pos          IN    int,
   column_value INOUT dbe_sql.number_table
);

DBE_SQL.GET_RESULTS(
   context_id   IN    int,
   pos          IN    int,
   column_value INOUT dbe_sql.date_table
);

DBE_SQL.GET_RESULTS(
```

```
  context_id   IN    int,
  pos          IN    int,
  column_value INOUT dbe_sql.blob_table
);
```

Table 10-352 DBE_SQL.GET_RESULTS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query
column_value	ANYARRAY	INOUT	No	Return value

NOTE

DBE_SQL.GET_RESULTS does not support user-defined table types. Use the table types provided in **Data Types**.

- DBE_SQL.SQL_DESCRIBE_COLUMNS

  This function is used to describe column information and can be used only for cursors defined by **SELECT**.

  The prototype of the **DBE_SQL.SQL_DESCRIBE_COLUMNS** function is as follows:

```
DBE_SQL.SQL_DESCRIBE_COLUMNS(
  context_id IN    int,
  col_cnt    INOUT int,
  desc_t     INOUT dbe_sql.desc_tab
)RETURNS record ;
```

Table 10-353 DBE_SQL.SQL_DESCRIBE_COLUMNS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
col_cnt	INT	INOUT	No	Number of columns returned
desc_t	DBE_SQL.DESC_TAB	INOUT	No	Description of the returned column

- DBE_SQL.DESCRIBE_COLUMNS

  Describes column information and can be used only for cursors defined by SELECT. This API is developed for compatibility purposes.

  The prototype of the DBE_SQL.DESCRIBE_COLUMNS function is as follows:

```
DBE_SQL.DESCRIBE_COLUMNS(
    context_id IN  int,
    col_cnt    OUT int,
    desc_t     OUT dbe_sql.desc_tab
)
```

Table 10-354 DBE_SQL.DESCRIBE_COLUMNS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
col_cnt	INT	OUT	No	Number of columns returned

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
desc_t	DBE_SQL.DESC_TAB	OUT	No	Description of the returned column

- DBE_SQL.BIND_VARIABLE

  This function is used to bind parameters. You are advised to use **DBE_SQL.SQL_BIND_VARIABLE**.

- DBE_SQL.SQL_SET_RESULTS_TYPE_C

  This function is used to dynamically define a column of the array type. You are advised not to use it.

  The prototype of the **DBE_SQL.SQL_SET_RESULTS_TYPE_C** function is as follows:

```
DBE_SQL.sql_set_results_type_c(
   context_id IN int,
   pos        IN int,
   column_ref IN anyarray,
   cnt        IN int,
   lower_bnd  IN int,
   col_type   IN anyelement,
   maxsize    IN int
)return integer;
```

Table 10-355 DBE_SQL.SQL_SET_RESULTS_TYPE_C parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
column_ref	ANYARRAY	IN	No	Type of the returned array
cnt	INT	IN	No	Number of values obtained at a time
lower_bnd	INT	IN	No	Start index when an array is returned.
col_type	ANYELEMENT	IN	No	Variable type corresponding to the returned array type
maxsize	INT	IN	No	Maximum length of the defined type

- DBE_SQL.SQL_GET_VALUES_C

  This function is used to read a dynamically defined column value. You are advised not to use it.

  The prototype of the **DBE_SQL.SQL_GET_VALUES_C** function is as follows:

```
DBE_SQL.sql_get_values_c(
    context_id   IN    int,
    pos          IN    int,
    results_type INOUT anyarray,
    result_type  IN    anyelement
)return anyarray;
```

Table 10-356 DBE_SQL.SQL_GET_VALUES_C parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Parameter position

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
results_type	ANY ARRAY	IN OUT	No	Obtained result
result_type	ANY ELEMENT	IN	No	Type of the obtained result

- DBE_SQL.GET_VARIABLE_RESULT

  This function is used to return the value of the bound OUT parameter and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_VARIABLE_RESULT** function is as follows:

```
DBE_SQL.get_variable_result(
    context_id   IN    int,
    pos          IN    VARCHAR2,
    column_value INOUT anyelement
);
```

Table 10-357 DBE_SQL.GET_VARIABLE_RESULT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	VARCHAR2	IN	No	Name of the bound parameter

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
column_value	ANYELEMENT	INOUT	No	Return value

- DBE_SQL.GET_VARIABLE_RESULT_CHAR

  This function is used to return the value of the bound OUT parameter of the **CHAR** type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_VARIABLE_RESULT_CHAR** function is as follows:

```
DBE_SQL.get_variable_result_char(
    context_id IN int,
    pos        IN VARCHAR2
)
RETURNS char
```

  Table 10-358 DBE_SQL.GET_VARIABLE_RESULT_CHAR parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	VARCHAR2	IN	No	Name of the bound parameter

- DBE_SQL.GET_VARIABLE_RESULT_RAW

  This function is used to return the value of the bound OUT parameter of the **RAW** type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE_SQL.GET_VARIABLE_RESULT_RAW** function is as follows:

```
CREATE OR REPLACE FUNCTION DBE_SQL.get_variable_result_raw(
   context_id IN    int,
   pos       IN    VARCHAR2,
   value     INOUT anyelement
)
RETURNS anyelement
```

Table 10-359 DBE_SQL.GET_VARIABLE_RESULT_RAW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	VARCHAR2	IN	No	Name of the bound parameter
value	ANYELEMENT	INOUT	No	Return value

- DBE_SQL.GET_VARIABLE_RESULT_TEXT

  This function is used to return the value of the bound OUT parameter of the **TEXT** type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_VARIABLE_RESULT_TEXT** function is as follows:

  ```
  CREATE OR REPLACE FUNCTION DBE_SQL.get_variable_result_text(
     context_id IN int,
     pos       IN VARCHAR2
  )
  RETURNS text
  ```

Table 10-360 DBE_SQL.GET_VARIABLE_RESULT_TEXT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	VARCHAR2	IN	No	Name of the bound parameter

- DBE_SQL.GET_VARIABLE_RESULT_INT

  This function is used to return the value of the bound OUT parameter of the **INT** type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_VARIABLE_RESULT_INT** function is as follows:

```
DBE_SQL.get_variable_result_int(
    context_id IN     int,
    pos        IN     VARCHAR2,
    value      INOUT anyelement
)
RETURNS anyelement
```

Table 10-361 DBE_SQL.GET_VARIABLE_RESULT_INT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	VARCHAR2	IN	No	Name of the bound parameter
value	ANYELEMENT	INOUT	No	Return value

- DBE_SQL.GET_ARRAY_RESULT_TEXT

  This function is used to return the value of the bound OUT parameter of the **TEXT** array type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_ARRAY_RESULT_TEXT** function is as follows:

```
DBE_SQL.get_array_result_text(
    context_id   IN    int,
    pos          IN    VARCHAR2,
    column_value INOUT anyarray
)
```

  Table 10-362 DBE_SQL.GET_ARRAY_RESULT_TEXT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	VARCHAR2	IN	No	Name of the bound parameter
column_value	ANYARRAY	INOUT	No	Return value

- DBE_SQL.GET_ARRAY_RESULT_RAW

  This function is used to return the value of the bound OUT parameter of the **RAW** array type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_ARRAY_RESULT_RAW** function is as follows:

```
DBE_SQL.get_array_result_raw(
    context_id   IN    int,
    pos          IN    VARCHAR2,
    column_value INOUT anyarray
)
```

Table 10-363 DBE_SQL.GET_ARRAY_RESULT_RAW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	VARCHAR2	IN	No	Name of the bound parameter
column_value	ANYARRAY	INOUT	No	Return value

- DBE_SQL.GET_ARRAY_RESULT_CHAR

  This function is used to return the value of the bound OUT parameter of the **CHAR** array type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_ARRAY_RESULT_CHAR** function is as follows:

```
DBE_SQL.get_array_result_char(
    context_id   IN    int,
    pos          IN    VARCHAR2,
    column_value INOUT anyarray
)
```

Table 10-364 DBE_SQL.GET_ARRAY_RESULT_CHAR parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	VARCHAR2	IN	No	Name of the bound parameter

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
column_value	ANY ARRAY	INOUT	No	Return value

- DBE_SQL.GET_ARRAY_RESULT_INT

  This function is used to return the value of the bound OUT parameter of the **INT** array type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_ARRAY_RESULT_INT** function is as follows:

```
DBE_SQL.get_array_result_int(
    context_id   IN    int,
    pos          IN    VARCHAR2,
    column_value INOUT anyarray
)
```

  Table 10-365 DBE_SQL.GET_ARRAY_RESULT_INT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	VARCHAR2	IN	No	Name of the bound parameter
column_value	ANYARRAY	INOUT	No	Return value

- DBE_SQL.SQL_SET_TABLEOF_RESULTS_TYPE_C

  Dynamically defines a column of the tableof type. You are advised not to use it.

The prototype of the DBE_SQL.SQL_SET_TABLEOF_RESULTS_TYPE_C function is as follows:

```
DBE_SQL.SQL_SET_TABLEOF_RESULTS_TYPE_C(
    context_id IN int,
    pos        IN int,
    column_ref IN anyindexbytable,
    cnt        IN int,
    lower_bnd  IN int,
    col_type   IN anyelement,
    maxsize    IN int
)return integer;
```

Table 10-366 DBE_SQL.SQL_SET_TABLEOF_RESULTS_TYPE_C parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query
column_ref	ANYINDEXBYTABLE	IN	No	Type of the returned array
cnt	INT	IN	No	Number of values obtained at a time
lower_bnd	INT	IN	No	Start index when an array is returned.
col_type	ANYELEMENT	IN	No	Variable type corresponding to the returned array type
maxsize	INT	IN	No	Maximum length of the defined type

- DBE_SQL.SQL_GET_TABLEOF_VALUES_C

  Reads a dynamically defined column value of the tableof type. You are advised not to use it.

  The function prototype of DBE_SQL.SQL_GET_TABLEOF_VALUES_C is as follows:

```
DBE_SQL.SQL_GET_TABLEOF_VALUES_C(
    context_id   IN    int,
    pos          IN    int,
    results_type INOUT anyindexbytable,
    result_type  IN    anyelement
)return anyindexbytable;
```

Table 10-367 DBE_SQL.SQL_GET_TABLEOF_VALUES_C parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Parameter position
results_type	ANYINDEXBYTABLE	INOUT	No	Obtained result
result_type	ANYELEMENT	IN	No	Type of the obtained result

Examples

```
-- Example 1
-- Create a table and insert data into the table.

10.12.2.16 DBE_STATS

The advanced package DBE_STATS implements some capabilities of managing statistics information, including locking, unlocking, rolling back, and clearing historical statistics.

NOTE

The **DBE_STATS** advanced package does not support temporary tables.

API Description

Table 10-368 DBE_STATS overview

API	Description
DBE_STATS.LOCK_TABLE_STATS	Locks table-level statistics.
DBE_STATS.LOCK_PARTITION_STATS	Locks partition-level statistics.
DBE_STATS.LOCK_COLUMN_STATS	Locks column-level statistics.
DBE_STATS.LOCK_SCHEMA_STATS	Locks statistics about all tables in a specified schema.
DBE_STATS.UNLOCK_TABLE_STATS	Unlocks table-level statistics.
DBE_STATS.UNLOCK_PARTITION_STATS	Unlocks partition-level statistics.
DBE_STATS.UNLOCK_COLUMN_STATS	Unlocks column-level statistics.
DBE_STATS.UNLOCK_SCHEMA_STATS	Unlocks statistics about all tables in a specified schema.
DBE_STATS.RESTORE_TABLE_STATS	Rolls back table-level statistics to a specified time point.
DBE_STATS.RESTORE_PARTITION_STATS	Rolls back partition-level statistics to a specified time point.
DBE_STATS.RESTORE_COLUMN_STATS	Rolls back column-level statistics to a specified time point.
DBE_STATS.RESTORE_SCHEMA_STATS	Rolls back statistics about all tables in a specified schema to a specified time point.
DBE_STATS.PURGE_STATS	Clears all historical statistics before a specified time point.
DBE_STATS.GET_STATS_HISTORY_RETENTION	Obtains the retention period of historical statistics.
DBE_STATS.GET_STATS_HISTORY_AVAILABILITY	Obtains the earliest available time of the current historical statistics.
DBE_STATS.CREATE_STAT_TABLE	Creates a statistics table for storing statistics.
DBE_STATS.DROP_STAT_TABLE	Deletes a statistics table for storing statistics.

API	Description
DBE_STATS.EXPORT_INDEX_STATS	Retrieves statistics for the specified index and stores them in the user statistics table.
DBE_STATS.EXPORT_TABLE_STATS	Retrieves statistics for the specified table and stores them in the user statistics table.
DBE_STATS.EXPORT_COLUMN_STATS	Retrieves statistics for the specified column and stores them in the user statistics table.
DBE_STATS.EXPORT_SCHEMA_STATS	Retrieves statistics for the specified schema and stores them in the user statistics table.
DBE_STATS.IMPORT_INDEX_STATS	Retrieves statistics for the specified index from the user statistics table and writes it back to the system catalog.
DBE_STATS.IMPORT_TABLE_STATS	Retrieves statistics for the specified table from the user statistics table and writes it back to the system catalog.
DBE_STATS.IMPORT_COLUMN_STATS	Retrieves statistics for the specified column from the user statistics table and writes it back to the system catalog.
DBE_STATS.IMPORT_SCHEMA_STATS	Retrieves statistics for the specified schema from the user statistics table and writes it back to the system catalog.
DBE_STATS.SET_COLUMN_STATS	Sets column-related statistics, including single-column, multi-column, and expression statistics.
DBE_STATS.SET_INDEX_STATS	Sets index-related statistics.
DBE_STATS.SET_TABLE_STATS	Sets table-related statistics.
DBE_STATS.DELETE_COLUMN_STATS	Deletes column-related statistics, including single-column, multi-column, and expression statistics.
DBE_STATS.DELETE_INDEX_STATS	Deletes index-related statistics.
DBE_STATS.DELETE_TABLE_STATS	Deletes table-related statistics.
DBE_STATS.DELETE_SCHEMA_STATS	Deletes statistics about all tables, indexes, and columns in a schema.

- DBE_STATS.LOCK_TABLE_STATS

  Locks the statistics of a table. After the table is locked, the statistics of the table cannot be updated, and the indexes, partitions, and columns involved in the table are locked synchronously. This API does not return any value.

The prototype of the DBE_STATS.LOCK_TABLE_STATS function is as follows:

```
DBE_STATS.LOCK_TABLE_STATS(
   ownname   VARCHAR2,
   tabname   VARCHAR2
);
```

Table 10-369 DBE_STATS.LOCK_TABLE_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	varchar2	Yes	Name of the schema to which the table to be locked belongs. Null indicates that the current schema is used by default.
tabname	varchar2	No	Name of the table to be locked.

NOTE

- When using this API, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- You can check stat_state in reloptions of the table to obtain the lock status of the table.
- When a table is locked, its statistics cannot be updated.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Create a table.
gaussdb=# CREATE SCHEMA dbe_stats_lock;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA=dbe_stats_lock;
SET
gaussdb=# CREATE TABLE t1(a int,b int);
CREATE TABLE

-- Lock the table and check its locking status.
gaussdb=# CALL DBE_STATS.LOCK_TABLE_STATS(ownname=>'dbe_stats_lock',tabname=>'t1');
 lock_table_stats
------------------

(1 row)
gaussdb=# SELECT relname,instr(reloptions::text,'stat_state=locked',1,1) <> 0  as exist_lock FROM
PG_CLASS WHERE relname='t1' and relnamespace = (SELECT oid FROM PG_NAMESPACE WHERE
nspname='dbe_stats_lock');
 relname | exist_lock
---------+------------
 t1      | t
(1 row)

-- An error is reported after the ANALYZE operation is performed.
gaussdb=# ANALYZE t1;
ERROR:  The statistics is locked, cannot be updated.
```

```
-- Delete a table or namespace.
gaussdb=# DROP TABLE t1;
DROP TABLE
gaussdb=# DROP SCHEMA dbe_stats_lock;
DROP SCHEMA
```

- DBE_STATS.LOCK_PARTITION_STATS

  Locks the statistics of a partition. After the partition is locked, the statistics of the partition cannot be updated, and the indexes, partitions, and columns related to the partition are locked synchronously. This API does not return any value.

  The prototype of the DBE_STATS.LOCK_PARTITION_STATS function is as follows:

```
DBE_STATS.LOCK_PARTITION_STATS(
    ownname     VARCHAR2,
    tabname     VARCHAR2,
    partname    VARCHAR2
);
```

Table 10-370 DBE_STATS.LOCK_PARTITION_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	varchar2	Yes	Name of the schema to which the partition to be locked belongs. Null indicates that the current schema is used by default.
tabname	varchar2	No	Name of the table to which the partition to be locked belongs.
partname	varchar2	No	Name of the partition to be locked.

NOTE

- When using this API, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- You can view stat_state in reloptions of the partition to obtain the lock status of the table.
- When the partition or the table to which the table belongs is locked, its statistics cannot be updated.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Create a table.
gaussdb=# CREATE SCHEMA dbe_stats_lock;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA=dbe_stats_lock;
SET
gaussdb=# CREATE TABLE upart_table(a int, b int, c int) PARTITION BY RANGE(a)
```

```
 (
    PARTITION p1 VALUES LESS THAN(1200),
    PARTITION p2 VALUES LESS THAN(2400),
    PARTITION p3 VALUES LESS THAN(MAXVALUE)
 );
CREATE TABLE

-- Lock a partition. Other partitions and tables are not affected.
gaussdb=# CALL
DBE_STATS.LOCK_PARTITION_STATS(ownname=>'dbe_stats_lock',tabname=>'upart_table',partname=>'
p1');
 lock_partition_stats
----------------------

(1 row)

gaussdb=# SELECT relname,instr(reloptions::text,'stat_state=locked',1,1) <> 0 as exist_lock FROM
PG_CLASS WHERE relname='upart_table';
   relname   | exist_lock
-------------+------------
 upart_table | f
(1 row)

gaussdb=# SELECT relname,instr(reloptions::text,'stat_state=locked',1,1) <> 0 as exist_lock FROM
PG_PARTITION WHERE parentid='upart_table'::REGCLASS;
   relname   | exist_lock
-------------+------------
 upart_table | f
 p2          | f
 p3          | f
 p1          | t
(4 rows)

-- Delete a table or namespace.
gaussdb=# DROP TABLE upart_table;
DROP TABLE
gaussdb=# DROP SCHEMA dbe_stats_lock;
DROP SCHEMA
```

- DBE_STATS.LOCK_COLUMN_STATS

  Locks the statistics of a column. After the column is locked, the statistics of the column cannot be updated. This API does not return any value.

  The prototype of the DBE_STATS.LOCK_COLUMN_STATS function is as follows:

```
DBE_STATS.LOCK_COLUMN_STATS(
   ownname     VARCHAR2,
   tabname     VARCHAR2,
   colname     VARCHAR2,
   partname    VARCHAR2 DEFAULT NULL
);
```

Table 10-371 DBE_STATS.LOCK_COLUMN_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	varchar2	Yes	Name of the schema to which the column to be locked belongs. Null indicates that the current schema is used by default.

Parameter	Type	Whether NULL Is Allowed	Description
tabname	varchar2	No	Name of the table to which the column to be locked belongs.
colname	varchar2	No	Name of the column to be locked.
partname	varchar2	Yes	Name of the partition to which the column to be locked belongs. The default value is **NULL**.

NOTE

- When using this API, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- If **partname** is **NULL**, the list-level statistics are locked by default.
- If the column-level statistics of the table do not exist, the locking can be executed successfully but does not take effect.
- You can view **stastate** in **PG_STATISTIC**/**PG_STATISTIC_EXT** to obtain the lock status.
- Before locking multiple columns, query the **staextname** column in **PG_STATISTIC_EXT** to obtain the aliases of multiple columns and transfer them as the input parameter **colname**.
- If a column is locked or the table or partition to which the column belongs is locked, the statistics cannot be updated. The locked information about the column is not displayed. You need to view the locked information by using logging_module of DBE_STATS at the DEBUG2 level in logs.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Create a table and collect statistics.
gaussdb=# CREATE SCHEMA dbe_stats_lock;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA=dbe_stats_lock;
SET
gaussdb=# CREATE TABLE t1(a int,b int);
CREATE TABLE
gaussdb=# INSERT INTO t1 VALUES(generate_series(1,100),1);
INSERT 0 100
gaussdb=# ANALYZE t1;
ANALYZE

-- After locking a column, check the locking status of the column.
gaussdb=# CALL
DBE_STATS.LOCK_COLUMN_STATS(ownname=>'dbe_stats_lock',tabname=>'t1',colname=>'a');
 lock_column_stats
-------------------

(1 row)

gaussdb=# SELECT staattnum,stastate FROM PG_STATISTIC WHERE starelid='t1'::REGCLASS;
 staattnum | stastate
```

```
-----------+----------
         2 | u
         1 | l
(2 rows)

-- Delete a table or namespace.
gaussdb=# DROP TABLE t1;
DROP TABLE
gaussdb=# DROP SCHEMA dbe_stats_lock;
DROP SCHEMA
```

- DBE_STATS.LOCK_SCHEMA_STATS

  Locks statistics about all tables in a specified schema. This API does not return any value.

  The prototype of the DBE_STATS.LOCK_SCHEMA_STATS function is as follows:

```
DBE_STATS.LOCK_SCHEMA_STATS(
    ownname     VARCHAR2
);
```

Table 10-372 DBE_STATS.LOCK_SCHEMA_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	varchar2	Yes	Name of the specified schema. Null indicates that the current schema is used by default.

NOTE

- When this API is called, all tables on which the current user has the ANALYZE permission in the schema are locked. Tables on which the current user does not have the ANALYZE permission are skipped.
- To call this API, you must have the USAGE permission on the specified schema.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The method of locking schema statistics is the same as that of locking table statistics. The
following describes only the API calling method. For details, see the example of
DBE_STATS.LOCK_TABLE_STA....
gaussdb=# CALL DBE_STATS.LOCK_SCHEMA_STATS(ownname=>'dbe_stats_lock');
 lock_schema_stats
-------------------

(1 row)
```

- DBE_STATS.UNLOCK_TABLE_STATS

  Unlocks the statistics of a table. After the table is unlocked, the statistics of the table can be updated. The indexes, partitions, and columns involved in the table are unlocked synchronously. This API does not return any value.

  The prototype of the DBE_STATS.UNLOCK_TABLE_STATS function is as follows:

```
DBE_STATS.UNLOCK_TABLE_STATS(
   ownname    VARCHAR2,
```

```
  tabname   VARCHAR2
);
```

Table 10-373 DBE_STATS.UNLOCK_TABLE_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	varchar2	Yes	Name of the schema to which the table to be unlocked belongs. Null indicates that the current schema is used by default.
tabname	varchar2	No	Name of the table to be unlocked.

NOTE

- When using this API, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- You can check stat_state in reloptions of the table to obtain the lock status of the table.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The method of unlocking table statistics is the same as that of locking table statistics. The following describes only the API calling method. For details, see the DBE_STATS.LOCK_TABLE_STA... example.
gaussdb=# CALL DBE_STATS.UNLOCK_TABLE_STATS(ownname=>'dbe_stats_lock',tabname=>'t1');
 unlock_table_stats
--------------------

(1 row)
```

- DBE_STATS.UNLOCK_PARTITION_STATS

  Unlocks the statistics of a partition. After the partition is unlocked, the statistics of the partition can be updated. The indexes, partitions, and columns involved in the partition are unlocked synchronously. This API does not return any value.

  The prototype of the DBE_STATS.UNLOCK_PARTITION_STATS function is as follows:

```
DBE_STATS.UNLOCK_PARTITION_STATS(
   ownname     VARCHAR2,
   tabname     VARCHAR2,
   partname    VARCHAR2
);
```

Table 10-374 DBE_STATS.UNLOCK_PARTITION_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	varchar2	Yes	Name of the schema to which the partition to be unlocked belongs. Null indicates that the current schema is used by default.
tabname	varchar2	No	Name of the table to which the partition to be unlocked belongs.
partname	varchar2	No	Name of the partition to be unlocked.

NOTE

- When using this API, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- You can view stat_state in reloptions of the partition to obtain the lock status of the table.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The method of unlocking partition statistics is the same as that of locking partition statistics. The following describes only the API calling method. For details, see the DBE_STATS.LOCK_PARTIION_... example.
gaussdb=# CALL DBE_STATS.UNLOCK_PARTITION_STATS(ownname=>'dbe_stats_lock',tabname=>'upart_table',partname=>'p1');
 unlock_partition_stats
------------------------

(1 row)
```

- DBE_STATS.UNLOCK_COLUMN_STATS

  Unlocks the statistics of a column. After being unlocked, the statistics of the column can be updated. This API does not return any value.

  The prototype of the DBE_STATS.UNLOCK_COLUMN_STATS function is as follows:

```
DBE_STATS.LOCK_COLUMN_STATS(
    ownname     VARCHAR2,
    tabname     VARCHAR2,
    colname     VARCHAR2,
    partname    VARCHAR2 DEFAULT NULL
);
```

Table 10-375 DBE_STATS.UNLOCK_COLUMN_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	varchar2	Yes	Name of the schema to which the column to be unlocked belongs. Null indicates that the current schema is used by default.
tabname	varchar2	No	Name of the table to which the column to be unlocked belongs.
colname	varchar2	No	Name of the column to be unlocked.
partname	varchar2	Yes	Name of the partition to which the column to be unlocked belongs. The default value is **NULL**.

NOTE

- When using this API, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- If **partname** is **NULL**, the list-level statistics and column-level statistics of the cascaded partition are unlocked by default.
- You can view the stastate bit in **PG_STATISTIC**/**PG_STATISTIC_EXT** to obtain the lock status.
- Before unlocking multiple columns, query the **staextname** column in **PG_STATISTIC_EXT** to obtain the aliases of multiple columns and transfer them as the input parameter **colname**.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The method of unlocking column statistics is the same as that of locking column statistics. The following describes only the API calling method. For details, see the DBE_STATS.LOCK_COLUMN_STATS example.
gaussdb=# CALL DBE_STATS.UNLOCK_COLUMN_STATS(ownname=>'dbe_stats_lock',tabname=>'t1',colname=>'a');
 unlock_column_stats
---------------------

(1 row)
```

- DBE_STATS.UNLOCK_SCHEMA_STATS

  Locks statistics about all tables in a specified schema. This API does not return any value.

  The prototype of the DBE_STATS.UNLOCK_SCHEMA_STATS function is as follows:

```
DBE_STATS.UNLOCK_SCHEMA_STATS(
   ownname    VARCHAR2
);
```

Table 10-376 DBE_STATS.UNLOCK_SCHEMA_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	varchar2	Yes	Name of the specified schema. Null indicates that the current schema is used by default.

NOTE

- When this API is called, all tables on which the current user has the ANALYZE permission in the schema are unlocked. Tables on which the current user does not have the ANALYZE permission are skipped.
- To call this API, you must have the USAGE permission on the specified schema.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The method of unlocking schema statistics is the same as that of unlocking table statistics. The following describes only the API calling method. For details, see the DBE_STATS.LOCK_TABLE_STATS example.
gaussdb=# CALL DBE_STATS.UNLOCK_SCHEMA_STATS(ownname=>'dbe_stats_lock');
 unlock_schema_stats
---------------------

(1 row)
```

- DBE_STATS.RESTORE_TABLE_STATS

  Rolls back table statistics to a specified time point. The last statistics collected before the time point are loaded to the system catalog, and the statistics of the lower-level partitions, indexes, and columns that are not locked are cascaded. This API does not return any value.

  The prototype of the DBE_STATS.RESTORE_TABLE_STATS function is as follows:

```
DBE_STATS.RESTORE_TABLE_STATS(
    ownname                 VARCHAR2,
    tabname                 VARCHAR2,
    as_of_timestamp         TIMESTAMPTZ,
    restore_cluster_index   BOOLEAN DEFAULT NULL,
    force                   BOOLEAN DEFAULT FALSE,
    no_invalidate           BOOLEAN DEFAULT NULL
);
```

Table 10-377 DBE_STATS.RESTORE_TABLE_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	Yes	Name of the schema to which the table to be rolled back belongs. Null indicates that the current schema is used by default.
tabname	VARCHAR2	No	Name of the table to be rolled back.
as_of_timestamp	timestamp with time zone	No	Target time point to be rolled back.
restore_cluster_index	BOOLEAN	Yes	Not supported currently.
force	BOOLEAN	Yes	Determines whether to forcibly roll back the statistics when the statistics are locked. The default value is **FALSE**.
no_invalidate	BOOLEAN	Yes	Not supported currently.

NOTE

- When using this API, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- When this API is called, the statistics of its lower-level partitions, indexes, and columns are rolled back at the same time. If the lower-level partitions or columns are locked, the statistics are skipped.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Create a table and collect statistics twice.
gaussdb=# CREATE SCHEMA dbe_stats_restore;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA=dbe_stats_restore;
SET
gaussdb=# CREATE TABLE t1(a int, b int);
CREATE TABLE
gaussdb=# INSERT INTO t1 VALUES(1,1);
INSERT 0 1
gaussdb=# INSERT INTO t1 VALUES(1,1);
INSERT 0 1
gaussdb=# INSERT INTO t1 VALUES(1,1);
INSERT 0 1
gaussdb=# ANALYZE t1;
ANALYZE
gaussdb=# INSERT INTO t1 VALUES(2,2);
```

```
INSERT 0 1
gaussdb=# INSERT INTO t1 VALUES(2,2);
INSERT 0 1
gaussdb=# INSERT INTO t1 VALUES(2,2);
INSERT 0 1
gaussdb=# ANALYZE t1;
ANALYZE

-- View history tables.
gaussdb=# SELECT relname,reltuples FROM GS_TABLESTATS_HISTORY WHERE relname='t1';
 relname | reltuples
---------+-----------
 t1      |         3
 t1      |         6
(2 rows)

-- Display statistics in the current system catalog.
gaussdb=# SELECT relname,reltuples FROM PG_CLASS WHERE relname='t1' AND relnamespace =
(SELECT oid FROM PG_NAMESPACE WHERE nspname='dbe_stats_restore');
 relname | reltuples
---------+-----------
 t1      |         6
(1 row)

-- Roll back to the earliest statistics and check the system catalog.
gaussdb=# CALL
DBE_STATS.RESTORE_TABLE_STATS(ownname=>'dbe_stats_restore',tabname=>'t1',as_of_timestamp=>(
(SELECT MIN(reltimestamp) FROM GS_TABLESTATS_HISTORY WHERE relname='t1') + INTERVAL '1
second'));
 restore_table_stats
---------------------

(1 row)

gaussdb=# SELECT relname,reltuples FROM PG_CLASS WHERE relname='t1' AND relnamespace =
(SELECT oid FROM PG_NAMESPACE WHERE nspname='dbe_stats_restore');
 relname | reltuples
---------+-----------
 t1      |         3
(1 row)

-- Delete a table or namespace.
gaussdb=# DROP TABLE t1;
DROP TABLE
gaussdb=# DROP SCHEMA dbe_stats_restore;
DROP SCHEMA
```

- DBE_STATS.RESTORE_PARTITION_STATS

  Rolls back partition statistics to a specified time point. The last statistics collected before the time point are loaded to the system catalog, and the statistics of the lower-level partitions, indexes, and columns that are not locked are cascaded. This API does not return any value.

  The prototype of the DBE_STATS.RESTORE_PARTITION_STATS function is as follows:

```
DBE_STATS.RESTORE_PARTITION_STATS(
    ownname                 VARCHAR2,
    tabname                 VARCHAR2,
    partname                VARCHAR2,
    as_of_timestamp           TIMESTAMPTZ,
    force                   BOOLEAN DEFAULT FALSE,
    no_invalidate           BOOLEAN DEFAULT NULL
);
```

Table 10-378 DBE_STATS.RESTORE_PARTITION_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	Yes	Name of the schema to which the partition to be rolled back belongs.
tabname	VARCHAR2	No	Name of the table to which the partition to be rolled back belongs.
partname	VARCHAR2	No	Name of the partition to be rolled back.
as_of_timestamp	timestamp with time zone	No	Target time point to be rolled back.
force	BOOLEAN	Yes	Determines whether to forcibly roll back the statistics when the statistics are locked.
no_invalidate	BOOLEAN	Yes	Not supported currently.

NOTE

- When using this API, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- When this API is called, the statistics of its lower-level partitions, indexes, and columns are rolled back.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The method of rolling back partition statistics is the same as that of rolling back table statistics. The following describes only the API calling method. For details, see the example of DBE_STATS.RESTORE_TABLE_STATS.
gaussdb=# CALL DBE_STATS.RESTORE_PARTITION_STATS(ownname=>'dbe_stats_restore',tabname=>'t1',partname=>'p1',as_of_timestamp=>((SELECT MIN(reltimestamp) FROM GS_TABLESTATS_HISTORY WHERE relname='t1') + INTERVAL '1 second'));
 restore_partition_stats
-------------------------

(1 row)
```

- DBE_STATS.RESTORE_COLUMN_STATS

  Rolls back the column statistics to a specified time point. The last statistics collected before the time point to the system catalog are loaded. This API does not return any value.

  The prototype of the DBE_STATS.RESTORE_COLUMN_STATS function is as follows:

```
RESTORE_COLUMN_STATS(
   ownname              VARCHAR2,
   tabname              VARCHAR2,
   colname              VARCHAR2,
   partname             VARCHAR2 DEFAULT NULL,
   as_of_timestamp        TIMESTAMPTZ,
   force              BOOLEAN DEFAULT FALSE,
   no_invalidate        BOOLEAN DEFAULT NULL
);
```

Table 10-379 DBE_STATS.RESTORE_COLUMN_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	Yes	Name of the schema to which the column to be rolled back belongs.
tabname	VARCHAR2	No	Name of the table to which the column to be rolled back belongs.
colname	VARCHAR2	No	Name of the column to be rolled back.
partname	VARCHAR2	Yes	Name of the partition to which the column to be rolled back belongs.
as_of_timestamp	timestamp with time zone	No	Target time point to be rolled back.
force	BOOLEAN	Yes	Determines whether to forcibly roll back the statistics when the statistics are locked.
no_invalidate	BOOLEAN	Yes	Not supported currently.

NOTE

- When using this API, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- If **partname** is **NULL**, the list-level statistics are rolled back by default.
- Before rolling back multiple columns, query the **staextname** column in **PG_STATISTIC_EXT** to obtain the aliases of multiple columns and transfer them as the input parameter **colname**.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Create a table and collect statistics twice.
gaussdb=# CREATE SCHEMA dbe_stats_restore;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA=dbe_stats_restore;
```

```
SET
gaussdb=# CREATE TABLE t1(a int, b int);
CREATE TABLE
gaussdb=# INSERT INTO t1 VALUES(1,1);
INSERT 0 1
gaussdb=# INSERT INTO t1 VALUES(1,1);
INSERT 0 1
gaussdb=# INSERT INTO t1 VALUES(1,1);
INSERT 0 1
gaussdb=# ANALYZE t1;
ANALYZE
gaussdb=# INSERT INTO t1 VALUES(2,2);
INSERT 0 1
gaussdb=# INSERT INTO t1 VALUES(2,2);
INSERT 0 1
gaussdb=# INSERT INTO t1 VALUES(2,2);
INSERT 0 1
gaussdb=# ANALYZE t1;
ANALYZE

-- View the statistics in the history table.
gaussdb=# SELECT staattnum,stadistinct,stakind1,stanumbers1,stavalues1 FROM
GS_STATISTIC_HISTORY WHERE starelid='t1'::REGCLASS ORDER BY statimestamp;
 staattnum | stadistinct | stakind1 | stanumbers1 | stavalues1

 staattnum | stadistinct | stakind1 | stanumbers1 | stavalues1
-----------+-------------+----------+-------------+------------
         1 |    -.333333 |        1 | {.5,.5}     | {1,2}
         2 |    -.333333 |        1 | {.5,.5}     | {1,2}
(2 rows)

-- Roll back to the earlier time point and query the statistics in the system catalog.
gaussdb=# CALL
DBE_STATS.RESTORE_COLUMN_STATS(ownname=>'dbe_stats_restore',tabname=>'t1',colname=>'a',as_
of_timestamp=>((SELECT MIN(reltimestamp) FROM GS_TABLESTATS_HISTORY WHERE relname='t1')
+ INTERVAL '1 second'));
 restore_column_stats
----------------------

(1 row)

gaussdb=# SELECT staattnum,stadistinct,stakind1,stanumbers1,stavalues1 FROM PG_STATISTIC
WHERE starelid='t1'::REGCLASS;
 staattnum | stadistinct | stakind1 | stanumbers1 | stavalues1
-----------+-------------+----------+-------------+------------
         1 |    -.333333 |        1 | {1}         | {1}
         2 |    -.333333 |        1 | {.5,.5}     | {1,2}
(2 rows)

-- Delete a table or namespace.
gaussdb=# DROP TABLE t1;
DROP TABLE
gaussdb=# DROP SCHEMA dbe_stats_restore;
DROP SCHEMA
```

- DBE_STATS.RESTORE_SCHEMA_STATS

  Rolls back statistics of all tables in a specified schema to a specified time point. This API does not return any value.

The prototype of the DBE_STATS.RESTORE_SCHEMA_STATS function is as follows:

```
DBE_STATS.RESTORE_SCHEMA_STATS(
   ownname                VARCHAR2,
   as_of_timestamp          TIMESTAMPTZ,
   force                  BOOLEAN DEFAULT FALSE,
   no_invalidate            BOOLEAN DEFAULT NULL
);
```

Table 10-380 DBE_STATS.RESTORE_SCHEMA_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	Yes	Name of a schema.
as_of_timestamp	timestamp with time zone	No	Target time point to be rolled back.
force	BOOLEAN	Yes	Determines whether to forcibly roll back the statistics when the statistics are locked.
no_invalidate	BOOLEAN	Yes	Not supported currently.

NOTE

- When this API is called, all tables on which the current user has the ANALYZE permission in the schema are rolled back. Tables on which the current user does not have the ANALYZE permission are skipped.
- To call this API, you must have the USAGE permission on the specified schema.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Roll back schema statistics, which is the same as rolling back table statistics.
-- Create a table, insert data, and collect statistics twice.
gaussdb=#CREATE SCHEMA dbe_stats_restore;
CREATE SCHEMA
gaussdb=#SET CURRENT_SCHEMA=dbe_stats_restore;
SET
gaussdb=#CREATE TABLE t1(a int, b int);
CREATE TABLE
gaussdb=# INSERT INTO t1 VALUES(1,1);
INSERT 0 1
gaussdb=#INSERT INTO t1 VALUES(1,1);
INSERT 0 1
gaussdb=#INSERT INTO t1 VALUES(1,1);
INSERT 0 1
gaussdb=#ANALYZE t1;
ANALYZE
```

```
gaussdb=#INSERT INTO t1 VALUES(2,2);
INSERT 0 1
gaussdb=#INSERT INTO t1 VALUES(2,2);
INSERT 0 1
gaussdb=#INSERT INTO t1 VALUES(2,2);
INSERT 0 1
gaussdb=#ANALYZE t1;
ANALYZE

-- View the system catalog.
gaussdb=#SELECT relname,reltuples FROM GS_TABLESTATS_HISTORY WHERE relname='t1';
 relname | reltuples
---------+-----------
 t1      |         3
 t1      |         6
(2 rows

gaussdb=#SELECT relname,reltuples FROM PG_CLASS WHERE relname='t1' AND relnamespace =
(SELECT oid FROM PG_NAMESPACE WHERE nspname='dbe_stats_restore');
 relname | reltuples
---------+-----------
 t1      |         6
(1 row)

-- Perform rollback.
gaussdb=#CALL
DBE_STATS.RESTORE_SCHEMA_STATS(ownname=>'dbe_stats_restore',as_of_timestamp=>((SELECT
MIN(reltimestamp) FROM GS_TABLESTATS_HISTORY WHERE relname='t1') + INTERVAL '1 second'));
 restore_schema_stats
----------------------

(1 row)

-- Check the system catalog again.
gaussdb=#SELECT relname,reltuples FROM PG_CLASS WHERE relname='t1' AND relnamespace =
(SELECT oid FROM PG_NAMESPACE WHERE nspname='dbe_stats_restore');
 relname | reltuples
---------+-----------
 t1      |         3
(1 row)

-- Delete a table or namespace.
gaussdb=# DROP TABLE t1;
DROP TABLE
gaussdb=# DROP SCHEMA dbe_stats_restore;
DROP SCHEMA
```

- DBE_STATS.PURGE_STATS

  Clears all historical statistics before a specified time point. This API does not return any value.

  The prototype of the DBE_STATS.PURGE_STATS function is as follows:

```
DBE_STATS.PURGE_STATS(
   before_timestamp       TIMESTAMPTZ
);
```

Table 10-381 DBE_STATS.PURGE_STATS API

Parameter	Type	Whether NULL Is Allowed	Description
before_timestamp	timestamp with time zone	No	Time node for clearing.

NOTE

Only the initial user can call this API.

Example:

```
-- Create a table and collect statistics twice.
gaussdb=# CREATE SCHEMA dbe_stats_purge;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA=dbe_stats_purge;
SET
gaussdb=# CREATE TABLE t1(a int, b int);
CREATE TABLE
gaussdb=# INSERT INTO t1 VALUES(1,1);
INSERT 0 1
gaussdb=# INSERT INTO t1 VALUES(1,1);
INSERT 0 1
gaussdb=# INSERT INTO t1 VALUES(1,1);
INSERT 0 1
gaussdb=# ANALYZE t1;
ANALYZE
gaussdb=# INSERT INTO t1 VALUES(2,2);
INSERT 0 1
gaussdb=# INSERT INTO t1 VALUES(2,2);
INSERT 0 1
gaussdb=# INSERT INTO t1 VALUES(2,2);
INSERT 0 1
gaussdb=# ANALYZE t1;
ANALYZE

-- View history tables.
gaussdb=# SELECT relname,reltuples FROM GS_TABLESTATS_HISTORY WHERE relname='t1';
 relname | reltuples
---------+-----------
 t1      |         3
 t1      |         6
(2 rows)

-- Clear the earlier history statistics and view the history table.
gaussdb=# CALL DBE_STATS.PURGE_STATS(before_timestamp=>((SELECT MIN(reltimestamp) FROM
GS_TABLESTATS_HISTORY WHERE relname='t1') + INTERVAL '1 second'));
 purge_stats
-------------

(1 row)

gaussdb=# SELECT relname,reltuples FROM GS_TABLESTATS_HISTORY WHERE relname='t1';
 relname | reltuples
---------+-----------
 t1      |         6
(1 row)

-- Delete a table or namespace.
gaussdb=# DROP TABLE t1;
DROP TABLE
gaussdb=# DROP SCHEMA dbe_stats_purge;
DROP SCHEMA
```

- DBE_STATS.GET_STATS_HISTORY_RETENTION

  Obtains the retention period of historical statistics. The retention period set by DBE_STATS.ALTER_STATS_HISTORY_RETENTION is returned. This API does not have input parameters.

  The prototype of the DBE_STATS.GET_STATS_HISTORY_RETENTION function is as follows:

  ```
  DBE_STATS.GET_STATS_HISTORY_RETENTION()
  returns NUMBER;
  ```

  Example:

```
gaussdb=# CALL DBE_STATS.GET_STATS_HISTORY_RETENTION();
 get_stats_history_retention
-----------------------------
                          31
(1 row)
```

- DBE_STATS.GET_STATS_HISTORY_AVAILABILITY

  Obtains the earliest available time of the current historical statistics. The earliest time of all historical statistics in the current database is returned. This API does not have input parameters.

  The prototype of the DBE_STATS.GET_STATS_HISTORY_AVAILABILITY function is as follows:

```
DBE_STATS.GET_STATS_HISTORY_AVAILABILITY()
returns TIMESTAMPTZ;
```

  Example:

```
gaussdb=# ANALYZE;
ANALYZE
gaussdb=# CALL DBE_STATS.GET_STATS_HISTORY_AVAILABILITY();
 get_stats_history_availability
--------------------------------
 2023-08-27 02:07:04.065217+08
(1 row)
```

  NOTE

  All the preceding function prototypes are the C_FUNCTION function prototypes with the same data types and columns, and are named **DBE_STATS.***XXXX*_**C_FUNCTION**.

  The DBE_STATS advanced package API is valid only for ordinary tables.

- DBE_STATS.CREATE_STAT_TABLE

  Creates a statistics table for storing user statistics. This API does not return any value.

  The prototype of the DBE_STATS.CREATE_STAT_TABLE function is as follows:

```
DBE_STATS.CREATE_STAT_TABLE (
   ownname          VARCHAR2,
   stattab          VARCHAR2,
   tblspace         VARCHAR2 DEFAULT NULL,
   global_temporary BOOLEAN DEFAULT NULL
);
```

Table 10-382 DBE_STATS.CREATE_STAT_TABLE parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Schema where the created statistics table is located. Null indicates that the schema is created in the current schema by default.
stattab	VARCHAR2	No	Name of a statistics table.

Parameter	Type	Whether NULL Is Allowed	Description
tblspace	VARCHAR2	Yes	Tablespace where the created statistics table is located. If not specified, the default tablespace is used.
global_temporary	BOOLEAN	Yes	This parameter is not supported currently.

NOTE

- To call this procedure to create a statistics table, you must have the permission to create tables and indexes in the specified schema and tablespace.
- To distinguish ordinary tables from statistics tables, the **statstable** column in **reloptions** of a statistics table is not an empty string after the statistics table is created. Considering that the structure of the statistics table may be upgraded in the future, to implement forward compatibility, **statstable** is assigned the version information of the current statistics table.
- When this table is created, the gs_stattab_*oid*_statid_type_nameinfo_index index is automatically generated for index scanning. *oid* is the OID of the statistics table. If the index is deleted, the export and import APIs are unavailable.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Create a stattab statistics table in dbe_stats_create_drop_schema and manually insert a data record. You can query the data record in the new user statistics table.
gaussdb=# CREATE SCHEMA dbe_stats_create_drop_schema;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = dbe_stats_create_drop_schema;
SET
gaussdb=# CALL DBE_STATS.CREATE_STAT_TABLE(ownname => 'dbe_stats_create_drop_schema', stattab => 'stat_tab');
 create_stat_table
-------------------
(1 row)
gaussdb=# INSERT INTO stat_tab(statid, type, relname) VALUES('123', 't', 't1');
INSERT 0 1
gaussdb=# SELECT statid, type, relname FROM stat_tab;
 statid | type | relname
---------+------+---------
 123    | t    | t1
(1 row)
```

- DBE_STATS.DROP_STAT_TABLE

  Deletes the user statistics table. This API does not return any value.

  The prototype of the DBE_STATS.DROP_STAT_TABLE function is as follows:

```
DBE_STATS.DROP_STAT_TABLE (
   ownname VARCHAR2,
   stattab VARCHAR2
);
```

Table 10-383 DBE_STATS.DROP_STAT_TABLE parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Schema where the statistics table is located. Null indicates that the current schema is used by default.
stattab	VARCHAR2	No	Name of a statistics table.

NOTE

- To call this procedure to delete a statistics table, you must have the permission to delete the table and index in the specified schema.
- Ordinary tables whose **statstable** attribute is empty cannot be deleted using this procedure.
- If an index is created on the user statistics table or other objects that depend on the table are created, all objects that depend on the table are deleted when this procedure is called.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Delete the created user statistics table and the new schema.
gaussdb=# CALL DBE_STATS.DROP_STAT_TABLE(ownname => 'dbe_stats_create_drop_schema',
stattab => 'stat_tab');
 drop_stat_table
-----------------
(1 row)
gaussdb=# DROP SCHEMA dbe_stats_create_drop_schema CASCADE;
DROP SCHEMA
```

- DBE_STATS.EXPORT_INDEX_STATS

  Searches the system catalog for the statistics of the specified index according to and store the result in the user statistics table. This API does not return any value.

  The prototype of the DBE_STATS.EXPORT_INDEX_STATS function is:

```
DBE_STATS.EXPORT_INDEX_STATS (
ownname  VARCHAR2,
indname  VARCHAR2,
partname VARCHAR2 DEFAULT NULL,
stattab  VARCHAR2,
statid   VARCHAR2 DEFAULT NULL,
statown  VARCHAR2 DEFAULT NULL
);
```

Table 10-384 DBE_STATS.EXPORT_INDEX_STATS parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Name of the schema where the index is located. Null indicates that the current schema is used by default.
indname	VARCHAR2	No	Name of the index whose statistics are to be exported.
partname	VARCHAR2	Yes	Name of a partitioned index. If the index has been partitioned but **partname** is **null**, global and partitioned index statistics are exported.
stattab	VARCHAR2	No	Name of the user table that stores statistics.
statid	VARCHAR2	Yes	(Optional) Identifier that points to statistics in stattab.
statown	VARCHAR2	Yes	Not supported currently.

NOTE

- To call this procedure to export index statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- To call this procedure to export statistics to a user statistics table, you must have the SELECT, INSERT, DELETE, and UPDATE permissions on the user statistics table.
- You need to export the reltuples (numrows), relpages (numlblks), and relallvisible (relallvisible) statistics of indexes.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Create a table and collect statistics.
gaussdb=# CREATE SCHEMA dbe_stats_export;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = dbe_stats_export;
SET
gaussdb=# CREATE TABLE t2(a int, b int, c int) PARTITION BY RANGE(a) SUBPARTITION BY RANGE(b)
 (
   PARTITION p1 VALUES LESS THAN(200)
   (SUBPARTITION s1 VALUES LESS THAN (500),
    SUBPARTITION s2 VALUES LESS THAN (MAXVALUE)
   ),
   PARTITION p2 VALUES LESS THAN(500)
   (SUBPARTITION s3 VALUES LESS THAN (500),
    SUBPARTITION s4 VALUES LESS THAN (MAXVALUE)
   ),
   PARTITION p3 VALUES LESS THAN(MAXVALUE)
   ( SUBPARTITION s5 VALUES LESS THAN (500),
     SUBPARTITION s6 VALUES LESS THAN (MAXVALUE)
   )
 );
CREATE TABLE
gaussdb=# CREATE INDEX idx_t2_local_a ON t2(a) LOCAL

```

- DBE_STATS.EXPORT_TABLE_STATS

  Retrieves statistics for the specified table and stores them in the user statistics table. This API does not return any value.

  The prototype of the DBE_STATS.EXPORT_TABLE_STATS function is as follows:

```
DBE_STATS.EXPORT_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  stattab          VARCHAR2,
  statid           VARCHAR2 DEFAULT NULL,
  cascade          BOOLEAN  DEFAULT TRUE,
  statown          VARCHAR2 DEFAULT NULL,
  stat_category    VARCHAR2 DEFAULT NULL
);
```

Table 10-385 DBE_STATS.EXPORT_TABLE_STATS parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Name of the schema. Null indicates that the current schema is used by default.

Parameter	Type	Whether NULL Is Allowed	Description
tabname	VARCHAR2	No	Name of the table whose statistics are to be exported.
partname	VARCHAR2	Yes	Table partition name. If the table has been partitioned but **partname** is **null**, global and partitioned table statistics are exported.
stattab	VARCHAR2	No	Name of the user table that stores statistics.
statid	VARCHAR2	Yes	(Optional) Identifier that points to statistics in stattab.
cascade	BOOLEAN	Yes	Specifies whether to export statistics about columns, indexes, multiple columns, and index expressions. The default value is **TRUE**.
statown	VARCHAR2	Yes	Not supported currently.
stat_category	VARCHAR2	Yes	Not supported currently.

NOTE

- To call this procedure to export table statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- To call this procedure to export statistics to a user statistics table, you must have the SELECT, INSERT, DELETE, and UPDATE permissions on the user statistics table.
- You need to export the reltuples (numrows), relpages (numblks), and relallvisible (relallvisible) statistics of tables. For details about how to export column-level and index-level statistics in cascading mode, see the statistics of the **EXPORT_INDEX_STATS** and **EXPORT_COLUMN_STATS** APIs.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The method of exporting table statistics is the same as that of exporting index statistics. The following describes only the API calling method. For details, see the DBE_STATS.EXPORT_INDEX_STATS example.
gaussdb=# CALL DBE_STATS.EXPORT_TABLE_STATS(ownname => 'dbe_stats_export', tabname => 't2', partname =>null, stattab => 'export_table', statid => 't1_t', cascade => true);
 export_table_stats
--------------------
(1 row)
```

- DBE_STATS.EXPORT_COLUMN_STATS

  Retrieves statistics for the specified columns (multiple columns or expressions) and stores them in the user statistics table. This API does not return any value.

  The prototype of the DBE_STATS.EXPORT_COLUMN_STATS function is:

```
DBE_STATS.EXPORT_COLUMN_STATS (
   ownname  VARCHAR2,
   tabname  VARCHAR2,
   colname  VARCHAR2,
   partname VARCHAR2 DEFAULT NULL,
   stattab  VARCHAR2,
   statid   VARCHAR2 DEFAULT NULL,
   statown  VARCHAR2 DEFAULT NULL
);
```

Table 10-386 DBE_STATS.EXPORT_COLUMN_STATS parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Name of the schema. Null indicates that the current schema is used by default.

Parameter	Type	Whether NULL Is Allowed	Description
tabname	VARCHAR2	No	Name of the table (index name corresponding to the expression) to which the column whose statistics are to be exported belongs.
colname	VARCHAR2	No	Column name or multiple column names (If tabname is an index, **colname** is an expression name.)
partname	VARCHAR2	Yes	Partition name. If the table or index has been partitioned but **partname** is **null**, global and partitioned key, multiple columns, and index statistics are exported.
stattab	VARCHAR2	No	Name of the user table that stores statistics.
statid	VARCHAR2	Yes	(Optional) Identifier that points to statistics in stattab.
statown	VARCHAR2	Yes	Not supported currently.

NOTE

- To call this procedure to export table statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- To call this procedure to export statistics to a user statistics table, you must have the SELECT, INSERT, DELETE, and UPDATE permissions on the user statistics table.
- You can query **PG_STATISTIC** or **PG_STATISTIC_EXT** to export column-level statistics.
- Before exporting the statistics of multiple columns, query the **staextname** column in **PG_STATISTIC_EXT** to obtain the aliases of multiple columns and transfer them as the input parameter **colname**.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Create a table and collect statistics.
gaussdb=# CREATE SCHEMA dbe_stats_export;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA=dbe_stats_export;
SET
gaussdb=# CREATE TABLE IF NOT EXISTS t1 (a int, b int, c int);

gaussdb=# DROP SCHEMA dbe_stats_export;
DROP SCHEMA
```

- DBE_STATS.EXPORT_SCHEMA_STATS

  Retrieves statistics for the specified schema and stores them in the user statistics table. This API does not return any value.

  The prototype of the DBE_STATS.EXPORT_SCHEMA_STATS function is:

```
DBE_STATS.EXPORT_TABLE_STATS (
  ownname         VARCHAR2,
  stattab         VARCHAR2,
  statid          VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  stat_category   VARCHAR2 DEFAULT NULL);
```

Table 10-387 DBE_STATS.EXPORT_SCHEMA_STATS parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Name of the schema. Null indicates that the current schema is used by default.
stattab	VARCHAR2	No	Name of the user table that stores statistics.
statid	VARCHAR2	Yes	(Optional) Identifier that points to statistics in stattab.
statown	VARCHAR2	Yes	Not supported currently.
stat_category	VARCHAR2	Yes	Not supported currently.

NOTE

- To call this procedure to export table statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- To call this procedure to export statistics to a user statistics table, you must have the SELECT, INSERT, DELETE, and UPDATE permissions on the user statistics table.
- You need to export statistics about all tables on which the current user has permission in the specified schema. Tables on which the current user does not have permission are skipped and no error is reported.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The method of exporting schema statistics is the same as that of exporting table statistics. The following describes only the API calling method. For details, see the DBE_STATS.EXPORT_TABLE_STATS example.
gaussdb=# CALL DBE_STATS.EXPORT_SCHEMA_STATS(ownname => 'dbe_stats_export', stattab => 'export_table', statid => 's1');
 export_schema_stats
---------------------
(1 row)
```

- DBE_STATS.IMPORT_INDEX_STATS

  Retrieves statistics for the specified index from the user statistics table of the stattab identifier and writes it back to the system catalog. This API does not return any value.

  The prototype of the DBE_STATS.IMPORT_INDEX_STATS function is as follows:

```
DBE_STATS.IMPORT_INDEX_STATS (
   ownname        VARCHAR2,
   indname        VARCHAR2,
   partname       VARCHAR2 DEFAULT NULL,
   stattab        VARCHAR2,
   statid         VARCHAR2 DEFAULT NULL,
   statown        VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT NULL,
   force          BOOLEAN DEFAULT FALSE
);
```

Table 10-388 DBE_STATS.IMPORT_INDEX_STATS parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Name of the schema. Null indicates that the current schema is used by default.
indname	VARCHAR2	No	Name of the index whose statistics are to be imported.
partname	VARCHAR2	Yes	Name of the index partition. If the index has been partitioned but **partname** is **null**, global and partitioned index statistics are imported.
stattab	VARCHAR2	No	Name of the user table that stores statistics.
statid	VARCHAR2	Yes	(Optional) Identifier that points to statistics in stattab.
statown	VARCHAR2	Yes	Not supported currently.
no_invalidate	BOOLEAN	Yes	Not supported currently.

Parameter	Type	Whether NULL Is Allowed	Description
force	BOOLEAN	Yes	Specifies whether to forcibly import data. The lock status is ignored. The default value is **FALSE**.

NOTE

- To call this procedure to import statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- To call this procedure to import statistics from a user statistics table to a system catalog, you must have the SELECT, INSERT, DELETE, and UPDATE permissions on the user statistics table.
- You need to import the reltuples (numrows), relpages (numlblks), and relallvisible (relallvisible) statistics of indexes.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Create a table and collect statistics.
gaussdb=# CREATE SCHEMA dbe_stats_import;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = dbe_stats_import;
SET
gaussdb=# CREATE TABLE t2(a int, b int, c int) PARTITION BY RANGE(a) SUBPARTITION BY RANGE(b)

- DBE_STATS.IMPORT_TABLE_STATS

  Retrieves statistics for the specified table from the user statistics table of the stattab identifier and writes it back to the system catalog. This API does not return any value.

  The prototype of the DBE_STATS.IMPORT_TABLE_STATS function is as follows:

```
DBE_STATS.IMPORT_TABLE_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   cascade       BOOLEAN  DEFAULT TRUE,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN  DEFAULT NULL,
   force         BOOLEAN  DEFAULT FALSE,
   stat_category VARCHAR2 DEFAULT NULL
);
```

Table 10-389 DBE_STATS.IMPORT_TABLE_STATS parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	varchar2	No	Name of the schema. Null indicates that the current schema is used by default.

Parameter	Type	Whether NULL Is Allowed	Description
tabname	varchar2	No	Name of the table whose statistics are to be imported.
partname	varchar2	Yes	Table partition name. If the table has been partitioned but **partname** is **null**, global and partitioned table statistics are imported.
stattab	varchar2	No	Name of the user table that stores statistics.
statid	varchar2	Yes	(Optional) Identifier that points to statistics in stattab.
cascade	Boolean	Yes	Specifies whether to import statistics about columns, indexes, multiple columns, and index expressions. The default value is **true**.
statown	varchar2	Yes	Not supported currently.
no_invalidate	Boolean	Yes	Not supported currently.
force	Boolean	Yes	Specifies whether to forcibly import data. The lock status is ignored. The default value is **FALSE**.
stat_category	varchar2	Yes	Not supported currently.

NOTE

- To call this procedure to import statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- To call this procedure to import statistics from a user statistics table to a system catalog, you must have the SELECT, INSERT, DELETE, and UPDATE permissions on the user statistics table.
- You need to import the reltuples (numrows), relpages (numblks), and relallvisible (relallvisible) statistics of tables. For details about column-level and index-level statistics imported in cascading mode, see the statistics of the **IMPORT_INDEX_STATS** and **IMPORT_COLUMN_STATS** APIs.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The method of importing table statistics is the same as that of importing index statistics. The following describes only the API calling method. For details, see the DBE_STATS.IMPORT_INDEX_STATS example.
gaussdb=# CALL DBE_STATS.IMPORT_TABLE_STATS(ownname => 'dbe_stats_import', tabname => 't2', partname => 'p1', stattab => 'export_table', statid => 't1_t', cascade => true, force => false);
 import_table_stats
--------------------
(1 row)
```

- DBE_STATS.IMPORT_COLUMN_STATS

  Retrieves statistics for the specified columns (multiple columns or expressions) from the user statistics table of the stattab identifier and writes it back to the system catalog. This API does not return any value.

  The prototype of the DBE_STATS.IMPORT_COLUMN_STATS function is as follows:

```
DBE_STATS.IMPORT_COLUMN_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   colname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT NULL,
   force         BOOLEAN DEFAULT FALSE
);
```

Table 10-390 DBE_STATS.IMPORT_COLUMN_STATS parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Name of the schema. Null indicates that the current schema is used by default.

Parameter	Type	Whether NULL Is Allowed	Description
tabname	VARCHAR2	No	Name of the table (index name corresponding to the expression) to which the column whose statistics are to be imported belongs.
colname	VARCHAR2	No	Column name or multiple column names (If tabname is an index, **colname** is an expression name.)
partname	VARCHAR2	Yes	Partition name. If the table or index has been partitioned but **partname** is **null**, global and partitioned key, multiple columns, and index statistics are imported.
stattab	VARCHAR2	No	Name of the user table that stores statistics.
statid	VARCHAR2	Yes	(Optional) Identifier that points to statistics in stattab.
statown	VARCHAR2	Yes	Not supported currently.
no_invalidate	BOOLEAN	Yes	Not supported currently.

Parameter	Type	Whether NULL Is Allowed	Description
force	BOOLEAN	Yes	Specifies whether to forcibly import data. The lock status is ignored. The default value is **FALSE**.

NOTE

- To call this procedure to import statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- To call this procedure to import statistics from a user statistics table to a system catalog, you must have the SELECT, INSERT, DELETE, and UPDATE permissions on the user statistics table.
- You can query **PG_STATISTIC** or **PG_STATISTIC_EXT** to import column-level statistics.
- Before importing multiple columns, query the **staextname** column in **PG_STATISTIC_EXT** to obtain the aliases of multiple columns and transfer them as the input parameter **colname**.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Create a table and collect statistics.
gaussdb=# CREATE SCHEMA dbe_stats_import;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = dbe_stats_import;
SET
gaussdb=# CREATE TABLE IF NOT EXISTS t1 (a int, b int, c int);

```

- DBE_STATS.IMPORT_SCHEMA_STATS

  Retrieves statistics for the specified schema from the user statistics table of the stattab identifier and writes it back to the system catalog. This API does not return any value.

  The prototype of the DBE_STATS.IMPORT_SCHEMA_STATS function is as follows:

```
DBE_STATS.IMPORT_SCHEMA_STATS (
   ownname       VARCHAR2,
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN  DEFAULT NULL,
   force         BOOLEAN DEFAULT FALSE,
   stat_category VARCHAR2 DEFAULT NULL);
```

Table 10-391 DBE_STATS.IMPORT_SCHEMA_STATS parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Name of the schema. Null indicates that the current schema is used by default.
stattab	VARCHAR2	No	Name of the user table that stores statistics.
statid	VARCHAR2	Yes	(Optional) Identifier that points to statistics in stattab.
statown	VARCHAR2	Yes	Not supported currently.
no_invalidate	BOOLEAN	Yes	Not supported currently.
force	BOOLEAN	Yes	Specifies whether to forcibly import data. The lock status is ignored. The default value is **FALSE**.
stat_category	VARCHAR2	Yes	Not supported currently.

NOTE

- To call this procedure to import statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- To call this procedure to import statistics from a user statistics table to a system catalog, you must have the SELECT, INSERT, DELETE, and UPDATE permissions on the user statistics table.
- You need to import statistics about all tables on which the current user has permission in the specified schema. Tables on which the current user does not have permission are skipped and no error is reported.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The method of importing schema statistics is the same as that of importing table statistics. This section describes only the API calling method. For details, see the DBE_STATS.IMPORT_TABLE_STATS
```

```
example.
gaussdb=# CALL DBE_STATS.IMPORT_SCHEMA_STATS(ownname => 'dbe_stats_import', stattab =>
'export_table', statid => 's1',force => false);
 import_schema_stats
---------------------
(1 row)
```

- DBE_STATS.SET_COLUMN_STATS

  Sets column-related statistics, including single-column, multi-column, and expression statistics. This API does not return any value.

  The prototype of the DBE_STATS.SET_COLUMN_STATS function is as follows:

```
DBE_STATS.SET_COLUMN_STATS (
    ownname         VARCHAR2,
    tabname         VARCHAR2,
    colname         VARCHAR2,
    partname        VARCHAR2    DEFAULT NULL,
    stattab         VARCHAR2    DEFAULT NULL,
    statid          VARCHAR2    DEFAULT NULL,
    distcnt         NUMBER      DEFAULT NULL,
    density         NUMBER      DEFAULT NULL,
    nullcnt         NUMBER      DEFAULT NULL,
    srec            VARCHAR2    DEFAULT NULL,
    avgclen         NUMBER      DEFAULT NULL,
    flags           NUMBER      DEFAULT NULL,
    statown         VARCHAR2    DEFAULT NULL,
    no_invalidate   BOOLEAN     DEFAULT NULL,
    force           BOOLEAN     DEFAULT FALSE
);
```

Table 10-392 DBE_STATS.SET_COLUMN_STATS parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Schema where the table is located. Null indicates that the current schema is used by default.
tabname	VARCHAR2	No	Table name.
colname	VARCHAR2	No	Column name.
partname	VARCHAR2	Yes	Name of the table partition whose statistics are to be set. If the table has been partitioned and **partname** is null, global column–level statistics are set.

Parameter	Type	Whether NULL Is Allowed	Description
stattab	VARCHAR2	Yes	This parameter is not supported currently.
statid	VARCHAR2	Yes	This parameter is not supported currently.
distcnt	NUMBER	Yes	Number of NDVs in the column.
density	NUMBER	Yes	Not supported currently.
nullcnt	NUMBER	Yes	Number of null values in the column.
srec	VARCHAR2	Yes	This parameter is not supported currently.
avgclen	NUMBER	Yes	Average length (in bytes) of the fields in the column.
flags	NUMBER	Yes	This parameter is not supported currently.
statown	VARCHAR2	Yes	This parameter is not supported currently.
no_invalidate	BOOLEAN	Yes	This parameter is not supported currently.
force	NUMBER	Yes	Behavior when the statistics are locked. If the value is **true**, the procedure sets the value even if the column-level statistics are locked. The default value is **FALSE**.

NOTE

- To call this procedure to set column-level statistics for a table, you must have the same permissions as the ANALYZE statement on the tables involved in the column. For details, see **ANALYZE | ANALYSE**.
- This API can be used to set expression statistics. Expression creation depends on indexes. Therefore, when this API is called to set expression statistics, **tabname** must be set to the index name.
- Currently, only NDV (distcnt), nullfrac (nullcnt) and width (avgclen) statistics of columns can be set.
- After the statistics of a single column or expression are deleted, this API can still be called to set the statistics of the corresponding single column or expression. In this case, new data is inserted into the **PG_STATISTIC** system catalog. After the multi-column statistics are deleted, this API cannot be used to reset the statistics.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Prerequisites: Create a table and collect statistics.
gaussdb=# CREATE SCHEMA dbe_stats_set_schema;

- DBE_STATS.SET_INDEX_STATS

  Sets index-related statistics. This API does not return any value.

  The prototype of the DBE_STATS.SET_INDEX_STATS function is:

```
DBE_STATS.SET_INDEX_STATS (
   ownname       VARCHAR2,
   indname       VARCHAR2,
   partname      VARCHAR2  DEFAULT NULL,
   stattab       VARCHAR2  DEFAULT NULL,
```

```
  statid        VARCHAR2  DEFAULT NULL,
  numrows       NUMBER    DEFAULT NULL,
  numlblks      NUMBER    DEFAULT NULL,
  relallvisible NUMBER    DEFAULT NULL,
  numdist       NUMBER    DEFAULT NULL,
  avglblk       NUMBER    DEFAULT NULL,
  avgdblk       NUMBER    DEFAULT NULL,
  clstfct       NUMBER    DEFAULT NULL,
  indlevel      NUMBER    DEFAULT NULL,
  flags         NUMBER    DEFAULT NULL,
  statown       VARCHAR2  DEFAULT NULL,
  no_invalidate BOOLEAN   DEFAULT NULL,
  guessq        NUMBER    DEFAULT NULL,
  cachedblk     NUMBER    DEFAULT NULL,
  cachehit      NUMBER    DEFAULT NULL,
  force         BOOLEAN   DEFAULT FALSE
);
```

Table 10-393 DBE_STATS.SET_INDEX_STATS parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Schema to which the index belongs. Null indicates that the current schema is used by default.
indname	VARCHAR2	No	Index name.
partname	VARCHAR2	Yes	Name of the index partition whose statistics are to be set. If the index has been partitioned and **partname** is null, global index–level statistics are set.
stattab	VARCHAR2	Yes	This parameter is not supported currently.
statid	VARCHAR2	Yes	This parameter is not supported currently.
numrows	NUMBER	Yes	Number of rows in an index.
numlblks	NUMBER	Yes	Number of pages in an index.

Parameter	Type	Whether NULL Is Allowed	Description
relallvisible	NUMBER	Yes	Number of pages marked as all visible in the index.
numdist	NUMBER	Yes	This parameter is not supported currently.
avglblk	NUMBER	Yes	This parameter is not supported currently.
avgdblk	NUMBER	Yes	This parameter is not supported currently.
clstfct	NUMBER	Yes	This parameter is not supported currently.
indlevel	NUMBER	Yes	This parameter is not supported currently.
flags	NUMBER	Yes	This parameter is not supported currently.
statown	VARCHAR2	Yes	This parameter is not supported currently.
no_invalidate	BOOLEAN	Yes	This parameter is not supported currently.
guessq	NUMBER	Yes	This parameter is not supported currently.
cachedblk	NUMBER	Yes	This parameter is not supported currently.
cachehit	NUMBER	Yes	This parameter is not supported currently.

Parameter	Type	Whether NULL Is Allowed	Description
force	BOOLEAN	Yes	Behavior when the statistics are locked. If the value is **TRUE**, the procedure sets the value even if the index-level statistics are locked. The default value is **FALSE**.

NOTE

- To call this procedure to set index statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- Currently, only reltuples (numrows), relpages (numlblks) and relallvisible (relallvisible) statistics of indexes can be set.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Prerequisites: Create a table and collect statistics.
gaussdb=# CREATE SCHEMA dbe_stats_set_schema;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = dbe_stats_set_schema;
SET
gaussdb=# DROP TABLE IF EXISTS t1;
NOTICE:  table "t1" does not exist, skipping
DROP TABLE
gaussdb=# CREATE TABLE IF NOT EXISTS t1 (a int, b int, c int);

gaussdb=# INSERT INTO t1 VALUES (100, 300, 1);
INSERT 0 1
gaussdb=# INSERT INTO t1 VALUES (150, 550, 1);
INSERT 0 1
gaussdb=# INSERT INTO t1 VALUES (250, 150, 1);
INSERT 0 1
gaussdb=# ANALYZE t1;
ANALYZE
-- Set index statistics.
-- View the current index statistics.
gaussdb=# SELECT reltuples,relpages,relallvisible FROM PG_CLASS WHERE relname='idx_t1_a';
 reltuples | relpages | relallvisible
-----------+----------+---------------
         3 |        2 |             0
(1 row)
-- Set the statistics and query again.
gaussdb=# CALL DBE_STATS.SET_INDEX_STATS(indname => 'idx_t1_a', ownname =>
'dbe_stats_set_schema', numrows => 1, numlblks => 3, relallvisible => 6);
 set_index_stats
-----------------
(1 row)
```

```
gaussdb=# SELECT reltuples,relpages,relallvisible FROM PG_CLASS WHERE relname='idx_t1_a';
 reltuples | relpages | relallvisible
-----------+----------+---------------
         1 |        3 |             6
(1 row)
-- Delete a table or namespace.
gaussdb=# DROP INDEX idx_t1_a;
DROP INDEX
gaussdb=# DROP TABLE t1;
DROP TABLE
gaussdb=# DROP SCHEMA dbe_stats_set_schema CASCADE;
DROP SCHEMA
```

- DBE_STATS.SET_TABLE_STATS

  Sets table-level statistics. This API does not return any value.

  The prototype of the DBE_STATS.SET_TABLE_STATS function is as follows:

```
DBE_STATS.SET_TABLE_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2  DEFAULT NULL,
   statid           VARCHAR2  DEFAULT NULL,
   numrows          NUMBER    DEFAULT NULL,
   numblks          NUMBER    DEFAULT NULL,
   relallvisible    NUMBER    DEFAULT NULL,
   avgrlen          NUMBER    DEFAULT NULL,
   flags            NUMBER    DEFAULT NULL,
   statown          VARCHAR2  DEFAULT NULL,
   no_invalidate    BOOLEAN   DEFAULT NULL,
   cachedblk        NUMBER    DEFAULT NULL,
   cachehit         NUMBER    DEFAULT NULL,
   force            BOOLEAN   DEFAULT FALSE,
   im_imcu_count    NUMBER    DEFAULT NULL,
   im_block_count NUMBER    DEFAULT NULL,
   scanrate         NUMBER    DEFAULT NULL
);
```

Table 10-394 DBE_STATS.SET_TABLE_STATS parameters

Parameter	Parameter	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Schema where the table is located. Null indicates that the current schema is used by default.
tabname	VARCHAR2	No	Table name.

Parameter	Parameter	Whether NULL Is Allowed	Description
partname	VARCHAR2	Yes	Name of the table partition whose statistics are to be set. If the table has been partitioned and **partname** is null, global table–level statistics are set.
stattab	VARCHAR2	Yes	This parameter is not supported currently.
statid	VARCHAR2	Yes	This parameter is not supported currently.
numrows	NUMBER	Yes	Number of rows in a table.
numblks	NUMBER	Yes	Number of pages in a table.
relallvisible	NUMBER	Yes	Number of pages marked as all visible in a table.
avgrlen	NUMBER	Yes	This parameter is not supported currently.
flags	NUMBER	Yes	This parameter is not supported currently.
statown	VARCHAR2	Yes	This parameter is not supported currently.
no_invalidate	BOOLEAN	Yes	This parameter is not supported currently.
cachedblk	NUMBER	Yes	This parameter is not supported currently.
cachehit	NUMBER	Yes	This parameter is not supported currently.

Parameter	Parameter	Whether NULL Is Allowed	Description
force	BOOLEAN	Yes	Behavior when the statistics are locked. If the value is **TRUE**, the procedure sets the value even if the table statistics are locked. The default value is **FALSE**.
im_imcu_count	NUMBER	Yes	This parameter is not supported currently.
im_block_count	NUMBER	Yes	This parameter is not supported currently.
scanrate	NUMBER	Yes	This parameter is not supported currently.

NOTE

- To call this procedure to set table statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- Currently, only reltuples (numrows), relpages (numblks) and relallvisible (relallvisible) statistics of tables can be set.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The procedure for setting index statistics is similar to that for setting index statistics. The following describes only the API calling method. For details, see the DBE_STATS.SET_INDEX_STATS API example.
-- Set table-level statistics.
gaussdb=# CALL DBE_STATS.SET_TABLE_STATS(tabname => 't1', ownname => 'dbe_stats_set_schema', numrows => 1, numblks => 3, relallvisible => 6);
 set_table_stats
-----------------

(1 row)
```

- DBE_STATS.DELETE_COLUMN_STATS

  Deletes column-related statistics, including single-column, multi-column, and expression statistics. This API does not return any value.

  The prototype of the DBE_STATS.DELETE_COLUMN_STATS function is as follows:

```
DBE_STATS.DELETE_COLUMN_STATS (
    ownname         VARCHAR2,
    tabname         VARCHAR2,
```

```
  colname        VARCHAR2,
  partname       VARCHAR2 DEFAULT NULL,
  stattab        VARCHAR2 DEFAULT NULL,
  statid         VARCHAR2 DEFAULT NULL,
  cascade_parts  BOOLEAN  DEFAULT TRUE,
  statown        VARCHAR2 DEFAULT NULL,
  no_invalidate  BOOLEAN  DEFAULT NULL,
  force          BOOLEAN  DEFAULT FALSE,
  col_stat_type  VARCHAR2 DEFAULT NULL
);
```

Table 10-395 DBE_STATS.DELETE_COLUMN_STATS parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Schema where the table is located. Null indicates that the current schema is used by default.
tabname	VARCHAR2	No	Table name.
colname	VARCHAR2	No	Column name.
partname	VARCHAR2	Yes	Name of the table partition whose statistics are to be deleted. If the table has been partitioned and **partname** is **null**, global column–level statistics are deleted. If **cascade_parts** is **true**, column-level statistics of all partitions are deleted.
stattab	VARCHAR2	Yes	This parameter is not supported currently.
statid	VARCHAR2	Yes	This parameter is not supported currently.

Parameter	Type	Whether NULL Is Allowed	Description
cascade_parts	BOOLEAN	Yes	Specifies whether to delete the statistics of all partitions under a column when deleting the column-level statistics. The default value is **true**.
statown	VARCHAR2	Yes	This parameter is not supported currently.
no_invalidate	BOOLEAN	Yes	This parameter is not supported currently.
force	BOOLEAN	Yes	Behavior when the statistics are locked. If the value is **true**, the procedure deletes the column statistics even if they are locked. The default value is **false**.
col_stat_type	VARCHAR2	Yes	This parameter is not supported currently.

NOTE

- To call this procedure to delete column statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- This API can be used to delete expression statistics. Expression creation depends on indexes. Therefore, when this API is called to delete expression statistics, **tabname** must be set to the index name.
- If the table is a level-2 partitioned table and **partname** is set to the level-1 partition name, and **cascade_parts** is set to **true**, statistics on all level-2 partitions under the level-1 partition will be deleted.
- Before deleting the statistics of multiple columns, query the **staextname** column in **PG_STATISTIC_EXT** to obtain the aliases of multiple columns and transfer them as the input parameter **colname**.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Prerequisites: Create a table and collect statistics.
gaussdb=# CREATE SCHEMA dbe_stats_delete_schema;

- DBE_STATS.DELETE_INDEX_STATS

  Deletes index-related statistics. This API does not return any value.

  The prototype of the DBE_STATS.DELETE_INDEX_STATS function is:

```
DBE_STATS.DELETE_INDEX_STATS (
   ownname          VARCHAR2,
   indname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   cascade_parts    BOOLEAN  DEFAULT TRUE,
```

```
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN  DEFAULT NULL,
  stattype         VARCHAR2 DEFAULT NULL,
  force            BOOLEAN  DEFAULT FALSE,
  stat_category    VARCHAR2 DEFAULT NULL
)
```

Table 10-396 DBE_STATS.DELETE_INDEX_STATS parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Schema to which the index belongs. Null indicates that the current schema is used by default.
indname	VARCHAR2	No	Index name.
partname	VARCHAR2	Yes	Name of the index partition whose statistics are to be deleted. If the index has been partitioned and **partname** is **null**, global index–level statistics are deleted. If **cascade_parts** is **true**, index-level statistics of all partitions are deleted.
stattab	VARCHAR2	Yes	This parameter is not supported currently.
statid	VARCHAR2	Yes	This parameter is not supported currently.

Parameter	Type	Whether NULL Is Allowed	Description
cascade_parts	BOOLEAN	Yes	Specifies whether to delete the statistics of all partitions under an index when deleting the index-level statistics. The default value is **true**.
statown	VARCHAR2	Yes	This parameter is not supported currently.
no_invalidate	BOOLEAN	Yes	This parameter is not supported currently.
stattype	VARCHAR2	Yes	This parameter is not supported currently.
force	BOOLEAN	Yes	Behavior when the statistics are locked. If the value is **true**, the procedure deletes the index statistics even if they are locked. The default value is **false**.
stat_category	VARCHAR2	Yes	This parameter is not supported currently.

NOTE

- To call this procedure to delete index statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- Deleting index statistics is equivalent to set **reltuples**, **relpages**, and **relallvisible** to **0**.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Prerequisites: Create a table.

```

```
gaussdb=# DROP SCHEMA dbe_stats_delete_schema CASCADE;
DROP SCHEMA
```

- DBE_STATS.DELETE_TABLE_STATS

  Deletes table-level statistics. This API does not return any value.

  The prototype of the DBE_STATS.DELETE_TABLE_STATS function is:

```
DBE_STATS.DELETE_TABLE_STATS (
   ownname              VARCHAR2,
   tabname              VARCHAR2,
   partname             VARCHAR2 DEFAULT NULL,
   stattab              VARCHAR2 DEFAULT NULL,
   statid               VARCHAR2 DEFAULT NULL,
   cascade_parts        BOOLEAN  DEFAULT TRUE,
   cascade_columns      BOOLEAN  DEFAULT TRUE,
   cascade_indexes      BOOLEAN  DEFAULT TRUE,
   statown              VARCHAR2 DEFAULT NULL,
   no_invalidate        BOOLEAN  DEFAULT NULL,
   force                BOOLEAN  DEFAULT FALSE,
   stat_category        VARCHAR2 DEFAULT NULL
)
```

Table 10-397 DBE_STATS.DELETE_TABLE_STATS parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Schema where the table is located. Null indicates that the current schema is used by default.
tabname	VARCHAR2	No	Table name.
partname	VARCHAR2	Yes	Name of the table partition whose statistics are to be deleted. If the table has been partitioned and **partname** is **null**, global table–level statistics are deleted. If **cascade_parts** is **true**, table-level statistics of all partitions are deleted.
stattab	VARCHAR2	Yes	This parameter is not supported currently.

Parameter	Type	Whether NULL Is Allowed	Description
statid	VARCHAR2	Yes	This parameter is not supported currently.
cascade_parts	BOOLEAN	Yes	Specifies whether to delete the statistics of all table partitions when deleting the table-level statistics. The default value is **true**.
cascade_columns	BOOLEAN	Yes	Specifies whether to call delete_column_stats to delete all column-level statistics of the table. The default value is **true**.
cascade_indexes	BOOLEAN	Yes	Specifies whether to call delete_index_stats to delete all index-level statistics of the table. The default value is **true**.
statown	VARCHAR2	Yes	This parameter is not supported currently.
no_invalidate	BOOLEAN	Yes	This parameter is not supported currently.

Parameter	Type	Whether NULL Is Allowed	Description
force	BOOLEAN	Yes	Behavior when the statistics are locked. If the value is **true**, the procedure deletes the table statistics even if they are locked. The default value is **false**.
stat_category	VARCHAR2	Yes	This parameter is not supported currently.

NOTE

- To call this procedure to delete table statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- If **cascade_columns** or **cascade_indexes** is set to **true**, **cascade_parts** also determines whether to delete the statistics of the corresponding partition key or index in cascading mode. For example, if **cascade_parts** is set to **true**, not only table-level statistics of all partitions of a partitioned table are deleted, but also column-level and index-level statistics of all partitions are deleted.
- Deleting table statistics is equivalent to clearing the information of reltuples, relpages, and relallvisible.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- The procedure for deleting table-level index statistics is similar to that for deleting index statistics. The following describes only the API calling method. For details, see the DBE_STATS.DELETE_INDEX_STATS example.
-- Delete table-level statistics, including all column and index statistics of a table.
gaussdb=# CALL DBE_STATS.DELETE_TABLE_STATS(ownname => 'dbe_stats_delete_schema', tabname => 't2', cascade_columns => true, cascade_indexes => true);
 delete_table_stats
--------------------
(1 row)
```

- DBE_STATS.DELETE_SCHEMA_STATS

  Deletes all table-level, index-level, and column-level statistics in a schema. This API does not return any value.

  The prototype of the DBE_STATS.DELETE_SCHEMA_STATS function is:

```
DBE_STATS.DELETE_SCHEMA_STATS (
   ownname          VARCHAR2,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT NULL,
   force            BOOLEAN  DEFAULT FALSE,
   stat_category    VARCHAR2 DEFAULT NULL
);
```

Table 10-398 DBE_STATS.DELETE_SCHEMA_STATS parameters

Parameter	Type	Whether NULL Is Allowed	Description
ownname	VARCHAR2	No	Schema name. Null indicates that the current schema is used by default.
stattab	VARCHAR2	Yes	This parameter is not supported currently.
statid	VARCHAR2	Yes	This parameter is not supported currently.
statown	VARCHAR2	Yes	This parameter is not supported currently.
no_invalidate	BOOLEAN	Yes	This parameter is not supported currently.
force	BOOLEAN	Yes	Behavior when the statistics are locked. If the value is **true**, the procedure deletes the statistics even if they are locked. The default value is **false**.
stat_category	VARCHAR2	Yes	This parameter is not supported currently.

NOTE

- To call this procedure to delete statistics, you must have the same permission on the specified table as that of the ANALYZE statement. For details, see **ANALYZE | ANALYSE**.
- If you delete statistics in a schema, that is, delete all tables on which the current user has permission in the specified schema, tables on which the current user does not have permission are skipped and no error is reported.
- If **ownname** is set to **null**, the current schema is used. In this case, you need to set **behavior_compat_options** to **bind_procedure_searchpath**.

Example:

```
-- Only API calling is displayed here. For details about the implementation cases, see
DBE_STATS.DELETE_TABLE_STATS.
```

```
gaussdb=# CALL DBE_STATS.DELETE_SCHEMA_STATS(ownname => 'dbe_stats_delete_schema');
 delete_schema_stats
---------------------
(1 row)
```

10.12.2.17 DBE_TASK

API Description

Table 10-399 lists all APIs supported by the **DBE_TASK** package.

Table 10-399 DBE_TASK

API	Description
DBE_TASK.SUBMIT	Submits a scheduled task. The job ID is automatically generated by the system.
DBE_TASK.JOB_SUBMIT	Same as DBE_TASK.SUBMIT. However, It provides syntax compatibility parameters.
DBE_TASK.ID_SUBMIT	Submits a scheduled task. The job ID is specified by the user.
DBE_TASK.CANCEL	Removes a scheduled task by job ID.
DBE_TASK.RUN	Executes a scheduled task.
DBE_TASK.FINISH	Disables or enables scheduled task execution.
DBE_TASK.UPDATE	Modifies user-definable attributes of a scheduled task, including the task content, next-execution time, and execution interval.
DBE_TASK.CHANGE	Same as DBE_TASK.UPDATE. However, It provides syntax compatibility parameters.
DBE_TASK.CONTENT	Modifies the content attribute of a scheduled task.
DBE_TASK.NEXT_TIME	Modifies the next-execution time attribute of a scheduled task.
DBE_TASK.INTERVAL	Modifies the execution interval attribute of a scheduled task.

- DBE_TASK.SUBMIT

  The stored procedure SUBMIT submits a scheduled task provided by the system.

  The prototype of the DBE_TASK.SUBMIT function is as follows:

  ```
  DBE_TASK.SUBMIT(
  what          IN   TEXT,
  next_time     IN   TIMESTAMP DEFAULT sysdate,
  interval_time IN   TEXT  DEFAULT 'null',
  id            OUT  INTEGER
  )RETURN INTEGER;
  ```

NOTE

When a scheduled task is created (using **DBE_TASK**), the system binds the current database and the username to the task by default. The API function can be called using CALL or SELECT. If the API function is called using CALLA, you do not need to set the output parameter. If the API function is called using SELECT, you need to set the output parameter. To call this function within a stored procedure, use **perform**. If the committed SQL statement task uses a non-public schema, specify the schema to a table schema or a function schema, or add **set current_schema = xxx** before the SQL statement.

Table 10-400 DBE_TASK.SUBMIT parameters

Parameter	Type	Input/Output Parameter	Whether NULL Is Allowed	Description
what	text	IN	No	SQL statement to be executed. One or multiple DDLs (excluding database-related operations), DMLs, anonymous blocks, and statements for calling stored procedures, or all four combined are supported.
next_time	timestamp	IN	No	Specifies the next time the job will be executed. The default value is the current system time (**sysdate**). If the specified time has past, the job is executed at the time it is submitted.
interval_time	text	IN	Yes	Calculates the next time to execute the job. It can be an interval expression, or **sysdate** followed by a numeric value, for example, **sysdate+1.0/24**. If this parameter is left empty or set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward.
id	integer	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When SELECT is used for calling, this parameter cannot be added. When CALL is used for calling, this parameter must be added.

NOTICE

When you create a user using the **what** parameter, the plaintext password of the user is recorded in the log. Therefore, you are advised not to do so.

Example:

```
gaussdb=# SELECT DBE_TASK.SUBMIT('call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate+1');
 submit
--------
  31031
(1 row)

gaussdb=# SELECT DBE_TASK.SUBMIT('call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate
+1.0/24');
 submit
--------
    512
(1 row)

gaussdb=# DECLARE
gaussdb-#     jobid int;
gaussdb-# BEGIN
gaussdb$#     PERFORM DBE_TASK.SUBMIT('call pro_xxx();', sysdate, 'interval ''5 minute''', jobid);
gaussdb$# END;
gaussdb$# /
ANONYMOUS BLOCK EXECUTE
```

- DBE_TASK.JOB_SUBMIT

  The stored procedure SUBMIT submits a scheduled task provided by the system. In addition, it provides additional compatibility parameters.

  The prototype of the DBE_TASK.JOB_SUBMIT function is as follows:

```
DBE_TASK.JOB_SUBMIT(
job           OUT  INTEGER,
what           IN   TEXT,
next_date      IN   TIMESTAMP  DEFAULT sysdate,
job_interval  IN   TEXT       DEFAULT 'null',
no_parse       IN   BOOLEAN    DEFAULT false,
instance       IN   INTEGER    DEFAULT 0,
force          IN   BOOLEAN    DEFAULT false
)RETURN INTEGER;
```

Table 10-401 DBE_TASK.JOB_SUBMIT parameters

Parameter	Type	Input/Output Parameter	Whether NULL Is Allowed	Description
job	integer	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When dbe.job_submit is called by using the SELECT statement, this parameter can be omitted.
what	text	IN	No	SQL statement to be executed. One or multiple DDLs (excluding database-related operations), DMLs, anonymous blocks, and statements for calling stored procedures, or all four combined are supported.

Parameter	Type	Input/Output Parameter	Whether NULL Is Allowed	Description
next_date	timestamp	IN	Yes	Specifies the next time the job will be executed. The default value is the current system time (**sysdate**). If the specified time has past, the job is executed at the time it is submitted.
job_interval	text	IN	Yes	Calculates the next time to execute the job. It can be an interval expression, or **sysdate** followed by a numeric value, for example, **sysdate+1.0/24**. If this parameter is left empty or set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward.
no_parse	Boolean	IN	Yes	The default value is **FALSE**, which is used only for syntax compatibility.
instance	integer	IN	Yes	The default value is **0**, which is used only for syntax compatibility.
force	Boolean	IN	Yes	The default value is **FALSE**, which is used only for syntax compatibility.

Example:

```
gaussdb=# DECLARE
gaussdb-#     id integer;
gaussdb-# BEGIN
gaussdb$#     id = DBE_TASK.JOB_SUBMIT(
gaussdb$#         what => 'insert into t1 values (1, 2)',
gaussdb$#         job_interval => 'sysdate + 1' --daily
gaussdb$#     );
gaussdb$# END;
gaussdb$# /
ANONYMOUS BLOCK EXECUTE
```

- DBE_TASK.ID_SUBMIT

  ID_SUBMIT has the same syntax function as SUBMIT, but the first parameter of ID_SUBMIT is an input parameter, that is, a specified job ID. In contrast, that last parameter of ID_SUBMIT is an output parameter, indicating the job ID automatically generated by the system.

  ```
  DBE_TASK.ID_SUBMIT(
  id            IN   BIGINT,
  what          IN   TEXT,
  next_time     IN   TIMESTAMP DEFAULT sysdate,
  interval_time IN   TEXT  DEFAULT 'null');
  ```

  Example:

  ```
  gaussdb=# CALL dbe_task.id_submit(101, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
   id_submit
  ```

```
-----------

(1 row)
```

- DBE_TASK.CANCEL

  The stored procedure CANCEL deletes a specified task.

  The prototype of the DBE_TASK.CANCEL function is as follows:

  ```
  CANCEL(id  IN  INTEGER);
  ```

  Table 10-402 DBE_TASK.CANCEL parameters

Parameter	Type	Input/Output Parameter	Whether NULL Is Allowed	Description
id	integer	IN	No	Specifies the job ID.

  Example:

  ```
  gaussdb=# CALL dbe_task.cancel(101);
   cancel
  --------

  (1 row)
  ```

- DBE_TASK.RUN

  The stored procedure runs a scheduled task.

  The prototype of the DBE_TASK.RUN function is as follows:

  ```
  DBE_TASK.RUN(
  job          IN   BIGINT,
  force        IN   BOOLEAN DEFAULT FALSE);
  ```

  Table 10-403 DBE_TASK.RUN parameters

Parameter	Type	Input/Output Parameter	Whether NULL Is Allowed	Description
job	bigint	IN	No	Specifies the job ID.
force	Boolean	IN	Yes	Used only for syntax compatibility.

  Example:

  ```
  gaussdb=# BEGIN
  gaussdb$#     DBE_TASK.ID_SUBMIT(12345, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
  ```

```
gaussdb$#     DBE_TASK.RUN(12345);
gaussdb$# END;
gaussdb$# /
ANONYMOUS BLOCK EXECUTE
```

- DBE_TASK.FINISH

  The stored procedure FINISH disables or enables a scheduled task.

  The prototype of the DBE_TASK.FINISH function is as follows:

```
DBE_TASK.FINISH(
id          IN   INTEGER,
broken      IN   BOOLEAN,
next_time   IN   TIMESTAMP  DEFAULT  sysdate);
```

Table 10-404 DBE_TASK.FINISH parameters

Parameter	Type	Input/Output Parameter	Whether NULL Is Allowed	Description
id	integer	IN	No	Specifies the job ID.
broken	Boolean	IN	No	Specifies the status flag, **true** for broken and **false** for not broken. The current job is updated based on the parameter value **true** or **false**. If the parameter is left empty, the job status remains unchanged.
next_time	timestamp	IN	Yes	Specifies the next execution time. The default value is the current system time. If **broken** is set to **true**, **next_time** is updated to **'4000-1-1'**. If **broken** is set to **false** and **next_time** is not empty, **next_time** is updated for the job. If **next_time** is empty, it will not be updated. This parameter can be omitted, and its default value will be used in this case.

Example:

```
gaussdb=# CALL dbe_task.id_submit(101, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
 id_submit
-----------

(1 row)

gaussdb=# CALL dbe_task.finish(101, true);
 finish
--------
```

```
(1 row)
```

- DBE_TASK.UPDATE

  The stored procedure UPDATE modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

  The prototype of the DBE_TASK.UPDATE function is as follows:

```
DBE_TASK.UPDATE(
id              IN     INTEGER,
content         IN     TEXT,
next_time       IN     TIMESTAMP,
interval_time   IN  TEXT);
```

Table 10-405 DBE_TASK.UPDATE parameters

Parameter	Type	Input/ Output Parameter	Whether NULL Is Allowed	Description
id	integer	IN	No	Specifies the job ID.
content	text	IN	Yes	Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the **content** parameter for the specified job. Otherwise, the system updates the **content** parameter for the specified job.
next_time	timestamp	IN	Yes	Specifies the next execution time. If this parameter is left empty, the system does not update the **next_time** parameter for the specified job. Otherwise, the system updates the **next_time** parameter for the specified job.
interval_time	text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the **interval_time** parameter for the specified job. Otherwise, the system updates the **interval_time** parameter for the specified job after necessary validity check. If this parameter is set to **"null"**, the job will be executed only once, and the job state will change to **'d'** afterward.

Example:

```
gaussdb=# CALL dbe_task.update(101, 'call userproc();', sysdate, 'sysdate + 1.0/1440')
 update
--------

(1 row)

gaussdb=# CALL dbe_task.update(101, 'insert into tbl_a values(sysdate);', sysdate, 'sysdate +
1.0/1440');
 update
--------

(1 row)
```

- DBE_TASK.CHANGE

  The stored procedure UPDATE modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

  The prototype of the DBE_TASK.CHANGE function is as follows:

```
DBE_TASK.CHANGE(
job             IN    INTEGER,
what            IN    TEXT       DEFAULT NULL,
next_date       IN    TIMESTAMP  DEFAULT NULL,
job_interval    IN    TEXT       DEFAULT NULL,
instance        IN    INTEGER    DEFAULT NULL,
force           IN    BOOLEAN    DEFAULT false);
```

Table 10-406 DBE_TASK.CHANGE parameters

Parameter	Type	Input/ Output Parameter	Whether NULL Is Allowed	Description
job	integer	IN	No	Specifies the job ID.
what	text	IN	Yes	Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the **what** parameter for the specified job. Otherwise, the system updates the **what** parameter for the specified job.
next_date	timestamp	IN	Yes	Specifies the next execution time. If this parameter is left empty, the system does not update the **next_time** parameter for the specified job. Otherwise, the system updates the **next_date** parameter for the specified job.

Parameter	Type	Input/ Output Parameter	Whether NULL Is Allowed	Description
job_interval	text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the **job_interval** parameter for the specified job. Otherwise, the system updates the **job_interval** parameter for the specified job after necessary validity check. If this parameter is set to **"null"**, the job will be executed only once, and the job state will change to **'d'** afterward.
instance	integer	IN	Yes	Used only for syntax compatibility.
force	Boolean	IN	No	Used only for syntax compatibility.

Example:

```
gaussdb=# BEGIN
gaussdb$#     DBE_TASK.CHANGE(
gaussdb$#         job => 101,
gaussdb$#         what => 'insert into t2 values (2);'
gaussdb$#     );
gaussdb$# END;
gaussdb$# /
ANONYMOUS BLOCK EXECUTE
```

- DBE_TASK.CONTENT

  The stored procedure CONTENT modifies the procedures to be executed by a specified task.

  The prototype of the DBE_TASK.CONTENT function is as follows:

```
DBE_TASK.CONTENT(
id          IN     INTEGER,
content      IN TEXT);
```

Table 10-407 DBE_TASK.CONTENT parameters

Parameter	Type	Input/ Output Parameter	Whether NULL Is Allowed	Description
id	integer	IN	No	Specifies the job ID.

Parameter	Type	Input/ Output Parameter	Whether NULL Is Allowed	Description
content	text	IN	No	Specifies the name of the stored procedure or SQL statement block that is executed.

NOTE

- If the value specified by the **content** parameter is one or multiple executable SQL statements, program blocks, or stored procedures, this procedure can be executed successfully; otherwise, it will fail to be executed.
- If the value specified by the **content** parameter is a simple statement such as INSERT and UPDATE, a schema name must be added in front of the table name.

Example:

```
gaussdb=# CALL dbe_task.content(101, 'call userproc();');
 content
---------

(1 row)

gaussdb=# CALL dbe_task.content(101, 'insert into tbl_a values(sysdate);');
 content
---------

(1 row)
```

- DBE_TASK.NEXT_TIME

  The stored procedure NEXT_TIME modifies the next-execution time attribute of a task.

  The prototype of the DBE_TASK.NEXT_TIME function is as follows:

```
DBE_TASK.NEXT_TIME(
id         IN    BIGINT,
next_time  IN    TEXT);
```

Table 10-408 DBE_TASK.NEXT_TIME parameters

Parameter	Type	Input/ Output Parameter	Whether NULL Is Allowed	Description
id	bigint	IN	No	Specifies the job ID.
next_time	text	IN	No	Specifies the next execution time.

NOTE

If the specified **next_time** value is earlier than the current date, the job is executed once immediately.

Example:

```
gaussdb=# CALL dbe_task.next_time(101, sysdate);
 next_time
-----------

(1 row)
```

- DBE_TASK.INTERVAL

  The stored procedure INTERVAL modifies the execution interval attribute of a task.

  The prototype of the DBE_TASK.INTERVAL function is as follows:

```
DBE_TASK.INTERVAL(
id             IN      INTEGER,
interval_time      IN    TEXT);
```

Table 10-409 DBE_TASK.INTERVAL parameters

Parameter	Type	Input / Output Parameter	Whether NULL Is Allowed	Description
id	integer	IN	No	Specifies the job ID.
interval_time	text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty or set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward. The job interval must be of a valid time type or interval type.

Example:

```
gaussdb=# CALL dbe_task.interval(101, 'sysdate + 1.0/1440');
 interval
----------

(1 row)

gaussdb=# CALL dbe_task.cancel(101);
 cancel
--------

(1 row)
```

NOTE

For a job that is currently running (that is, **job_status** is **'r'**), it is not allowed to use the cancel, update, next_time, content, or interval API to delete or modify job parameters.

Constraints

1. You can create, update, and delete jobs only using the procedures provided by the **dbe_task** package. These procedures synchronize job information between different primary database nodes and associate primary keys between the **pg_job** and **pg_job_proc** catalogs. If you use DML statements to add, delete, or modify records in the **pg_job** catalog, job information will become inconsistent between primary database nodes and system catalogs may fail to be associated, compromising internal job management.
2. Each task created by a user is bound to a primary database node. If the primary database node fails while a task is being executed, the task status cannot be updated in real time and will stay at **'r'**. The task status will be updated to **'s'** only after the primary database node recovers. When a primary database node fails, all tasks on this primary database node cannot be scheduled or executed until the primary database node is restored manually, or deleted and then replaced.
3. For each job, the bound primary database node updates the real-time job information (including the job status, last execution start time, last execution end time, next execution start time, the number of execution failures [if any]) to the pg_job system catalog, and synchronizes the information to other primary database nodes, ensuring consistent job information between different primary database nodes. In the case of primary database node failures, job information synchronization is reattempted by the hosting primary database nodes, which increases job execution time. Although job information fails to be synchronized between primary database nodes, job information can still be properly updated in the pg_job table on the hosting primary database nodes, and jobs can be executed successfully. After a primary database node recovers, job information such as job execution time and status in its pg_job table may be incorrect and will be updated only after the jobs are executed again on related primary database nodes.
4. For each job, a thread is established to execute it. If multiple jobs are triggered concurrently as scheduled, the system will need some time to start the required threads, resulting in a latency of 0.1 ms in job execution.

10.12.2.18 DBE_UTILITY

API Description

Table 10-410 provides all APIs supported by the **DBE_UTILITY** package.

Table 10-410 DBE_UTILITY

API	Description
DBE_UTILITY.FORMAT_ERROR_BACKTRACE	Outputs the call stack of an abnormal stored procedure.
DBE_UTILITY.FORMAT_ERROR_STACK	Outputs detailed information about a stored procedure exception.
DBE_UTILITY.FORMAT_CALL_STACK	Outputs the call stack of a stored procedure.

API	Description
DBE_UTILITY.GET_TIME	Outputs the current time, which is used to obtain the execution duration.
DBE_UTILITY.CANONICALIZE	Canonicalizes the character string of a table name.
DBE_UTILITY.COMMA_TO_TABLE	Converts a comma-delimited string of names into a PL/SQL table of names.
DBE_UTILITY.DB_VERSION	Returns the version number and compatibility version number of the database.
DBE_UTILITY.EXEC_DDL_STATEMENT	Executes DDL statements entered by users.
DBE_UTILITY.EXPAND_SQL_TEXT_PROC	Expands the view of the SQL query.
DBE_UTILITY.GET_CPU_TIME	Returns the measured value of the current CPU processing time.
DBE_UTILITY.GET_ENDIANNESS	Obtains the big-endian and little-endian information of the byte order on the platform where the database is located.
DBE_UTILITY.GET_HASH_VALUE	Returns the hash value of a given string.
DBE_UTILITY.GET_SQL_HASH	Outputs the hash value of a given string. This stored procedure is used when **proc_outparam_override** is not enabled.
DBE_UTILITY.IS_BIT_SET	Checks whether parameter **n** exists in **r**.
DBE_UTILITY.IS_CLUSTER_DATABASE	Determines whether the current database is running in database cluster mode.
DBE_UTILITY.NAME_RESOLVE	Parses the given object name, including synonym translation and necessary authorization checks.
DBE_UTILITY.NAME_TOKENIZE	Parses the name in the **a [. b [. c]][@ dblink]** format.
DBE_UTILITY.OLD_CURRENT_SCHEMA	Returns the name of the database schema in the current user environment.
DBE_UTILITY.OLD_CURRENT_USER	Returns the name of the current user.

API	Description
DBE_UTILITY.TABLE_TO_COMMA	Converts a PL/SQL table of names into a comma-delimited string of names.
DBE_UTILITY.GET_SQL_HASH_FUNC	Equivalent to DBE_UTILITY.GET_SQL_HASH. This function is used when **proc_outparam_override** is enabled.
DBE_UTILITY.EXPAND_SQL_TEXT	This is an internal function and is not recommended.
DBE_UTILITY.CANONICALIZE_RET	This is an internal function and is not recommended.
DBE_UTILITY.COMMA_TO_TABLE_FUN	This is an internal function and is not recommended.
DBE_UTILITY.COMPILE_SCH....	This is an internal function and is not recommended. You are advised to use pkg_util.gs_compile_schema.
DBE_UTILITY.NAME_SEPARATE	This is an internal function and is not recommended.
DBE_UTILITY.NAME_TOKENIZE_FUNC	This is an internal function and is not recommended.
DBE_UTILITY.NAME_TOKENIZE_LOWER	This is an internal function and is not recommended.
DBE_UTILITY.NAME_TOKENIZE_LOWER_FUNC	This is an internal function and is not recommended.
DBE_UTILITY.PRIVILEGE_CHECK	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_CLASS_WITH_NSPOID_ONAME_TYPE	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_OBJECTS	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_OBJECTS_SYNONYM_FILL_SECHEMA	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_PROCEDURE_WITH_NSPOID_ONAME	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_SYNONM_WITH_NSPOID_ONAME	This is an internal function and is not recommended.
DBE_UTILITY.TABLE_TO_COMMA_FUNC	This is an internal function and is not recommended.
DBE_UTILITY.USER_NAME	This is an internal function and is not recommended.

- DBE_UTILITY.FORMAT_ERROR_BACKTRACE

  Returns the call stack where an error occurs during execution. The prototype of the DBE_UTILITY.FORMAT_ERROR_BACKTRACE function is as follows:

  ```
  DBE_UTILITY.FORMAT_ERROR_BACKTRACE()
  RETURN TEXT;
  ```

- DBE_UTILITY.FORMAT_ERROR_STACK

  Returns the detailed information about the error location when an error occurs during the execution. The prototype of the DBE_UTILITY.FORMAT_ERROR_STACK function is as follows:

  ```
  DBE_UTILITY.FORMAT_ERROR_STACK()
  RETURN TEXT;
  ```

- DBE_UTILITY.FORMAT_CALL_STACK

  Sets the call stack of the output function. The prototype of the DBE_UTILITY.FORMAT_CALL_STACK function is as follows:

  ```
  DBE_UTILITY.FORMAT_CALL_STACK()
  RETURN TEXT;
  ```

- DBE_UTILITY.COMPILE_SCHEMA

  Recompiles the PL/SQL packages and functions (except the packages and functions provided by the system) under a specified schema. The prototype of the DBE_UTILITY.COMPILE_SCHEMA function is as follows:

  ```
  DBE_UTILITY.COMPILE_SCHEMA (
  SCHEMA IN VARCHAR2,
  COMPILE_ALL IN BOOLEAN DEFAULT TRUE,
  REUSE_SETTINGS IN BOOLEAN DEFAULT FALSE
  )
  RETURNS VOID;
  For details about the example, see the usage of the pkg_util.utility_compile_schema function in 11.12.1.2. To call the schema, run the following command:
  call DBE_UTILITY.compile_schema('pkg_var_test');
  ```

- DBE_UTILITY.GET_TIME

  Sets the output time, which is usually used for difference. A separate return value is meaningless. The prototype of the DBE_UTILITY.GET_TIME function is as follows:

  ```
  DBE_UTILITY.GET_TIME()
  RETURN BIGINT;
  ```

- DBE_UTILITY.CANONICALIZE

  Canonicalizes the character string of a table name. The procedure handles a single reserved word or keyword, and removes white spaces for a single identifier so that "table" becomes TABLE. The prototype of the DBE_UTILITY.CANONICALIZE function is as follows:

  ```
  DBE_UTILITY.CANONICALIZE(
     name       IN   VARCHAR2,
     canon_name OUT  VARCHAR2,
     canon_len  IN   BINARY_INTEGER DEFAULT 1024
  );
  ```

Table 10-411 DBE_UTILITY.CANONICALIZE parameters

Parameter	Type	Input/Output Parameter	Whether NULL Is Allowed	Description
name	VARCHAR2	IN	No	Character string to be canonicalized.
canon_name	VARCHAR2	OUT	Yes	Canonicalized character string.
canon_len	BINARY_INTEGER	IN	Yes	Length of the string to be canonicalized. The default value is **1024** (in bytes). If the value of this parameter is less than the actual length (in bytes) of the character string to be standardized, the character string is truncated by byte.

- DBE_UTILITY.COMMA_TO_TABLE

  Converts a comma-delimited string of names into a PL/SQL table of names. The prototype of the DBE_UTILITY.COMMA_TO_TABLE function is as follows:

```
DBE_UTILITY.COMMA_TO_TABLE (
   list   IN  VARCHAR2,
   tablen OUT BINARY_INTEGER,
   tab    OUT VARCHAR2[]
);
```

Table 10-412 DBE_UTILITY.COMMA_TO_TABLE parameters

Parameter	Type	Input/Output Parameter	Whether NULL Is Allowed	Description
list	VARCHAR2	IN	No	A comma-delimited string of names.
tablen	BINARY_INTEGER	OUT	Yes	Number of names in the table.
tab	VARCHAR2	OUT	Yes	Table which contains the string of names.

- DBE_UTILITY.DB_VERSION

  Returns the version number and compatibility version number of the database. The prototype of the DBE_UTILITY.DB_VERSION function is as follows:

```
DBE_UTILITY.DB_VERSION (
   version OUT VARCHAR2
);
```

Table 10-413 DBE_UTILITY.DB_VERSION parameters

Parameter	Type	Input/Output Parameter	Whether NULL Is Allowed	Description
version	VARCHAR2	OUT	No	Output parameter, which indicates the internal database software version. The value is a character string.

- DBE_UTILITY.EXEC_DDL_STATEMENT

  Executes DDL statements entered by users. DBE_UTILITY. The prototype of the EXEC_DDL_STATEMENT function is as follows:

```
DBE_UTILITY. EXEC_DDL_STATEMENT (
   parse_string IN TEXT
);
```

Table 10-414 DBE_UTILITY.EXEC_DDL_STATEMENT parameters

Parameter	Type	Input/Output Parameter	Whether NULL Is Allowed	Description
parse_string	TEXT	IN	Yes	DDL statements to be executed.

- DBE_UTILITY.EXPAND_SQL_TEXT_PROC

  Expands the view of the SQL query. It recursively expands the view objects in the view until a table is displayed. The function prototype of DBE_UTILITY.EXPAND_SQL_TEXT_PROC is as follows:

```
DBE_UTILITY.EXPAND_SQL_TEXT_PROC (
   input_sql_text  IN  CLOB,
   output_sql_text OUT CLOB
);
```

Table 10-415 DBE_UTILITY.EXPAND_SQL_TEXT_PROC parameters

Parameter	Type	Input/Output Parameter	Whether NULL Is Allowed	Description
input_sql_text	CLOB	IN	No	Input SQL text.

Parameter	Type	Input/ Output Parameter	Whether NULL Is Allowed	Description
output_sql_text	CLOB	OUT	No	Output SQL text of the expanded view.

NOTE

In the **input_sql_text** parameter entered by a user, a schema prefix must be added to the object in the SQL statement. If **behavior_compat_options** is set to **bind_procedure_searchpath**, you do not need to forcibly specify the schema prefix.

- DBE_UTILITY.GET_CPU_TIME

  Returns the measured value of the current CPU processing time, in hundredths of a second. The prototype of the DBE_UTILITY.GET_CPU_TIME function is as follows:

```
DBE_UTILITY.GET_CPU_TIME()
RETURN BIGINT;
```

- DBE_UTILITY.GET_ENDIANNESS

  Obtains the big-endian and little-endian information of the byte order on the platform where the database is located. The prototype of the DBE_UTILITY.GET_ENDIANNESS function is as follows:

```
DBE_UTILITY.GET_ENDIANNESS
RETURN INTEGER;
```

- DBE_UTILITY.GET_HASH_VALUE

  Returns the hash value of a given string. The prototype of the DBE_UTILITY.GET_HASH_VALUE function is as follows:

```
DBE_UTILITY.GET_HASH_VALUE(
   name      IN VARCHAR2(n),
   base      IN INTEGER,
   hash_size IN INTEGER)
RETURN INTEGER;
```

Table 10-416 DBE_UTILITY.GET_HASH_VALUE parameters

Parameter	Type	Input/ Output Parameter	Whether NULL Is Allowed	Description
name	VARCHAR2	IN	No	Character string to be hashed.
base	INTEGER	IN	No	Start value of the returned hash value.
hash_size	INTEGER	IN	No	Size of the hash table to which the hash is mapped.

- DBE_UTILITY.GET_SQL_HASH

  Outputs the hash value of a given character string using the MD5 algorithm. The prototype of the DBE_UTILITY.GET_SQL_HASH function is as follows:

```
DBE_UTILITY.GET_SQL_HASH(
   name       IN  VARCHAR2,
   hash       OUT RAW,
   last4bytes OUT BIGINT
);
```

Table 10-417 DBE_UTILITY.GET_SQL_HASH parameters

Parameter	Type	Input/Output Parameter	Whether NULL Is Allowed	Description
name	VARCHAR2	IN	No	Character string to be hashed.
hash	RAW	OUT	No	Complete hexadecimal MD5 hash value.
last4bytes	BIGINT	OUT	No	Last four bytes of the MD5 hash value, which is displayed as an unsigned integer.

NOTE

After setting **set behavior_compat_options** to a value other than **proc_outparam_override** (Contact the administrator for parameter setting.), call the DBE_UTILITY.GET_SQL_HASH function. If DBE_UTILITY.GET_SQL_HASH_FUNC is called, the value assignment fails.

- DBE_UTILITY.IS_BIT_SET

  Checks whether parameter **n** exists in **r**. The prototype of the DBE_UTILITY.IS_BIT_SET function is as follows:

```
DBE_UTILITY.IS_BIT_SET (
   r IN RAW,
   n IN INTEGER)
RETURN INTEGER;
```

Table 10-418 DBE_UTILITY.IS_BIT_SET parameters

Parameter	Type	Input/Output Parameter	Whether NULL Is Allowed	Description
r	RAW	IN	No	4 bytes plus the actual hexadecimal string.
n	INTEGER	IN	No	Determines whether the value exists in the binary system.

- DBE_UTILITY.IS_CLUSTER_DATABASE

  Determines whether the current database is running in database cluster mode. The prototype of the DBE_UTILITY.IS_CLUSTER_DATABASE function is as follows:

```
DBE_UTILITY.IS_CLUSTER_DATABASE
RETURN BOOLEAN;
```

- DBE_UTILITY.NAME_RESOLVE

  Parses the given object name, including synonym translation and necessary authorization checks. The prototype of the DBE_UTILITY.NAME_RESOLVE function is as follows:

```
DBE_UTILITY.NAME_RESOLVE (
   name          IN   VARCHAR2,
   context       IN   INTEGER,
   schema        OUT VARCHAR2,
   part1         OUT VARCHAR2,
   part2         OUT VARCHAR2,
   dblink        OUT VARCHAR2,
   part1_type    OUT INTEGER,
   object_number OUT OID
);
```

Table 10-419 DBE_UTILITY.NAME_RESOLVE parameters

Parameter	Type	Input / Output Parameter	Whether NULL Is Allowed	Description
name	VARCHAR2	IN	No	Name of the object to be parsed. The structure is [[a.]b.]c[@d].
context	INTEGER	IN	No	Start value of the returned hash value.
schema	VARCHAR2	OUT	No	Schema of an object.
part1	VARCHAR2	OUT	No	First part of the name. The type of this column is specified by **part1_type**.
part2	VARCHAR2	OUT	Yes	If this column is not empty, the value is the subprogram name.
dblink	VARCHAR2	OUT	Yes	Database link.

Parameter	Type	Input / Output Parameter	Whether NULL Is Allowed	Description
part1_type	INTEGER	OUT	No	Part 1 types: • **5**: synonym • **7**: procedure (top level) • **8**: function (top level) • **9**: package
object_number	OID	OUT	No	Object ID. In database A, **object_number** is of the numeric type, indicating the object ID. In GaussDB, **object_number** is of the OID type and does not support implicit conversion from a number to an OID.

- DBE_UTILITY.NAME_TOKENIZE

  Parses names in the **a [. b [. c]][@ dblink]** format. If a name contains double quotation marks, the double quotation marks are deleted. Otherwise, the name becomes uppercase letters. The prototype of the DBE_UTILITY.NAME_TOKENIZE function is as follows:

```
DBE_UTILITY.NAME_TOKENIZE (
name    IN  VARCHAR2,
a       OUT VARCHAR2,
b       OUT VARCHAR2,
c       OUT VARCHAR2,
dblink  OUT VARCHAR2,
nextpos OUT INTEGER
);
```

Table 10-420 DBE_UTILITY.NAME_TOKENIZE parameters

Parameter	Type	Input/Output Parameter	Whether NULL Is Allowed	Description
name	VARCHAR2	IN	No	Name, consisting of SQL identifiers (for example, **scott.foo@dblink**).
a	VARCHAR2	OUT	No	First token of the name.
b	VARCHAR2	OUT	Yes	Second token of the name.

Parameter	Type	Input/Output Parameter	Whether NULL Is Allowed	Description
c	VARCHAR2	OUT	Yes	Third token of the name.
dblink	VARCHAR2	OUT	Yes	Database link.
nextpos	INTEGER	OUT	No	Next position of a parsed character string.

- DBE_UTILITY.OLD_CURRENT_SCHEMA

  Returns the name of the database schema in the current user environment. The prototype of the DBE_UTILITY.OLD_CURRENT_SCHEMA function is as follows:

  ```
  DBE_UTILITY.OLD_CURRENT_SCHEMA()
  RETURN VARCHAR;
  ```

- DBE_UTILITY.OLD_CURRENT_USER

  Returns the name of the current user. The prototype of the DBE_UTILITY.OLD_CURRENT_USER function is as follows:

  ```
  DBE_UTILITY.OLD_CURRENT_USER()
  RETURN TEXT;
  ```

- DBE_UTILITY.TABLE_TO_COMMA

  Converts a PL/SQL table of names into a comma-delimited string of names. The prototype of the DBE_UTILITY.TABLE_TO_COMMA function is as follows:

  ```
  DBE_UTILITY.TABLE_TO_COMMA (
     tab    IN  VARCHAR2[],
     tablen OUT BINARY_INTEGER,
     list   OUT VARCHAR2
  );
  ```

  Table 10-421 DBE_UTILITY.TABLE_TO_COMMA parameters

Parameter	Type	Input/Output Parameter	Whether NULL Is Allowed	Description
tab	VARCHAR2[]	IN	No	PL/SQL table which contains the string of names.
tablen	BINARY_INTEGER	OUT	No	Number of names in the PL/SQL table.
list	VARCHAR2	OUT	No	A comma-delimited string of names.

- DBE_UTILITY.GET_SQL_HASH_FUNC

Uses the MD5 algorithm to output the hash value of a given character string. The function prototype of DBE_UTILITY.GET_SQL_HASH_FUNC is:

```
DBE_UTILITY.GET_SQL_HASH_FUNC(
    name       IN  VARCHAR2,
    hash       OUT RAW,
    last4bytes OUT BIGINT
)RETURN BIGINT;
```

Table 10-422 DBE_UTILITY.GET_SQL_HASH_FUNC parameters

Parameter	Type	Input/Output Parameter	Whether NULL Is Allowed	Description
name	VARCHAR2	IN	No	Character string to be hashed.
hash	RAW	OUT	No	Complete hexadecimal MD5 hash value.
last4bytes	BIGINT	OUT	No	Last four bytes of the MD5 hash value, which is displayed as an unsigned integer.

NOTE

After setting **set behavior_compat_options** to **'proc_outparam_override'**, call the DBE_UTILITY.GET_SQL_HASH_FUNC function. If you call the DBE_UTILITY.GET_SQL_HASH function, a parameter mismatch error is reported.

Examples

```
-- Example 1
create or replace procedure print_err() as
DECLARE
    a bool;
BEGIN
    a := not_exist;
exception
    when others then
        dbe_output.print_line('err_stack: ' || DBE_UTILITY.FORMAT_ERROR_STACK());
END;
/
CREATE PROCEDURE

call print_err();
-- The expected result is as follows:
err_stack: 50360452: column "not_exist" does not exist
 print_err
-----------

(1 row)

-- Clean the environment.
drop procedure print_err;
DROP PROCEDURE
```

```
-- Example 2
create or replace procedure print_err() as
DECLARE
    a bool;
BEGIN
    a := not_exist;
exception
    when others then
        dbe_output.print_line('backtrace: ' || DBE_UTILITY.FORMAT_ERROR_BACKTRACE());
END;
/
CREATE PROCEDURE

call print_err();
-- The expected result is as follows:
backtrace: 50360452: PL/pgSQL function print_err() line 5 at assignment

10.12.2.19 DBE_XMLDOM

API Description

The advanced function package DBE_XMLDOM is used to access XMLType objects and implement Document Object Model (DOM), which is an API used to access HTML and XML documents. For details about all types supported by the advanced function package DBE_XMLDOM, see **Table 10-423**. For details about all APIs supported by DBE_XMLDOM, see **Table 10-424**.

NOTE

When the character set of the database is set to **SQL_ASCII** and the **DBE_XMLDOM** advanced package is used, an error message is displayed if the input characters exceed the ASCII range.

Table 10-423 DBE_XMLDOM data types

Type	Description
DOMATTR	Implements the DOMAttributes API.
DOMDOCUMENT	Implements the DOMDocument API.
DOMELEMENT	Implements the DOMElement API.
DOMNAMEDNODEMAP	Implements the DOMNamedNodeMap API.
DOMNODELIST	Implements the DOMNodeList API.
DOMNODE	Implements the DOMNode API.
DOMTEXT	Implements the DOMText API.

Table 10-424 DBE_XMLDOM parameters

API	Description
DBE_XMLDOM.APPENDCHILD	Adds the newchild node to the end of the parent(n) node and returns the newly added node.
DBE_XMLDOM.CREATEELEMENT	Creates a DOMElement object with the specified name.
DBE_XMLDOM.CREATETEXTNODE	Creates a DOMText node.
DBE_XMLDOM.FREEDOCUMENT	Frees resources related to DOMDocument nodes.
DBE_XMLDOM.FREEELEMENT	Frees resources related to DOMElement nodes.
DBE_XMLDOM.FREENODE	Frees resources related to DOMNode nodes.
DBE_XMLDOM.FREENODELIST	Frees resources related to DOMNodeList nodes.
DBE_XMLDOM.GETATTRIBUTE	Returns the attribute values of a DOMElement object by name.
DBE_XMLDOM.GETATTRIBUTES	Returns the attribute values of a DOMNode node as a map.
DBE_XMLDOM.GETCHILDNODES	Converts several subnodes under a node into a node list.
DBE_XMLDOM.GETCHILDRENBYTAGNAME	Returns the subnodes of a DOMElement node by name.

API	Description
DBE_XMLDOM.GETDOCUMENTELEMENT	Returns the first subnode of the specified document.
DBE_XMLDOM.GETFIRSTCHILD	Returns the first subnode.
DBE_XMLDOM.GETLASTCHILD	Returns the last subnode.
DBE_XMLDOM.GETLENGTH	Obtains the number of subnodes under a specified node.
DBE_XMLDOM.GETLOCALNAME	Returns the local name of a node.
DBE_XMLDOM.GETNAMEDITEM	Returns the node specified by name.
DBE_XMLDOM.GETNEXTSIBLING	Returns the next node of the specified node.
DBE_XMLDOM.GETNODENAME	Returns the name of a node.
DBE_XMLDOM.GETNODETYPE	Returns the type of a node.
DBE_XMLDOM.GETNODEVALUE	Obtains the value of a node, depending on its type.
DBE_XMLDOM.GETPARENTNODE	Returns the parent node of a node.
DBE_XMLDOM.GETTAGNAME	Returns the tag name of the specified DOMElement node.
DBE_XMLDOM.HASCHILDNODES	Checks whether the DOMNode object has any subnode.
DBE_XMLDOM.IMPORTNODE	Copies a node and specifies the document to which the node belongs.
DBE_XMLDOM.ISNULL	Checks whether a node is null.
DBE_XMLDOM.ITEM	Returns the item corresponding to the index parameter in the mapping.
DBE_XMLDOM.MAKEELEMENT	Converts a DOMNode object to the DOMElement type.
DBE_XMLDOM.MAKENODE	Forcibly converts a node to the DOMNode type.
DBE_XMLDOM.NEWDOMDOCUMENT	Returns a new DOMDocument object.
DBE_XMLDOM.SETATTRIBUTE	Sets the value of the DOMElement attribute by name.
DBE_XMLDOM.SETCHARSET	Sets the character set for a DOMDocument object.
DBE_XMLDOM.SETDOCTYPE	Sets the external DTD of a DOMDocument object.

API	Description
DBE_XMLDOM.SETNODEVALUE	Sets the value of a node in the DOMNode object.
DBE_XMLDOM.WRITETOBUFFER	Writes an XML node to a specified buffer.
DBE_XMLDOM.WRITETOCLOB	Writes an XML node to a specified CLOB.
DBE_XMLDOM.WRITETOFILE	Writes an XML node to a specified file.
DBE_XMLDOM.GETSESSIONTREENUM	Displays the number of DOM trees of all types in the current session.
DBE_XMLDOM.GETDOCTREESINFO	Displays statistics such as the memory usage and number of nodes of the DOM tree of the document type.
DBE_XMLDOM.GETDETAILDOCTREEINFO	Displays the number of nodes of each type for a specific document variable.
DBE_XMLDOM.GETELEMENTSBYTAGNAME	Returns the list of DOMNodeList nodes that matches TAGNAME.

- DBE_XMLDOM.APPENDCHILD

  Adds the newchild node to the end of the parent(n) node and returns the newly added node. The prototype of the DBE_XMLDOM.APPENDCHILD function is as follows:

```
DBE_XMLDOM.APPENDCHILD(
  n IN DOMNode,
  newchild IN DOMNode)
RETURN DOMNODE;
```

  Table 10-425 DBE_XMLDOM.APPENDCHILD parameters

Parameter	Description
n	Node to be added
newchild	New node added

  NOTE

  1. The error message "operation not support" is displayed for the APPEND ATTR node under the DOCUMENT node. Database A does not report an error in this scenario, but the mounting fails.
  2. The error message "operation not support" is displayed for the APPEND ATTR node under the ATTR node. Database A does not report an error in this scenario, but the mounting fails.
  3. When multiple child nodes of the ATTR type are added to a parent node, the child nodes with the same key value cannot exist under the same parent node.

  Example:

```
-- Add a DOMNode node to a specified DOC tree and use DBE_XMLDOM.HASCHILDNODES() to
check whether the subnode is successfully added.
DECLARE
    doc DBE_XMLDOM.DOMDocument;
    doc1 DBE_XMLDOM.DOMDocument;
    root DBE_XMLDOM.DOMElement;
    rootnode DBE_XMLDOM.DOMNode;
    child1 DBE_XMLDOM.DOMElement;
    child2 DBE_XMLDOM.DOMElement;
    attr DBE_XMLDOM.DOMAttr;
    text DBE_XMLDOM.DOMTEXT;
    node DBE_XMLDOM.DOMNode;
    child1_node DBE_XMLDOM.DOMNode;
    attr_node DBE_XMLDOM.DOMNode;
    parent DBE_XMLDOM.DOMNode;
    buf varchar2(1000);
BEGIN
    doc := DBE_XMLDOM.newDOMDocument();
    root := DBE_XMLDOM.createElement(doc, 'root');
    rootnode := DBE_xmldom.makeNode(root);
    node := DBE_XMLDOM.appendChild(DBE_xmldom.makeNode(doc), rootnode);
    child1 := DBE_XMLDOM.createElement(doc, 'child1');
    child1_node := DBE_XMLDOM.makeNode(child1);
    node := DBE_XMLDOM.appendChild(rootnode, child1_node);
    attr := DBE_XMLDOM.createAttribute(doc, 'abc');
    attr_node := DBE_XMLDOM.makeNode(attr);
    node := DBE_XMLDOM.appendChild(child1_node, attr_node);
    IF DBE_XMLDOM.HASCHILDNODES(child1_node) THEN
        DBE_OUTPUT.print_line('HAS CHILD NODES');
    ELSE
        DBE_OUTPUT.print_line('NOT HAS CHILD NODES ');
    END IF;
    parent := DBE_XMLDOM.GETPARENTNODE(attr_node);
    buf := DBE_XMLDOM.GETNODENAME(parent);
    DBE_OUTPUT.print_line(buf);
END;
/
-- Expected result:
NOT HAS CHILD NODES
ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.CREATEELEMENT

  Returns the DOMElement object with the specified name. The prototype of the DBE_XMLDOM.CREATEELEMENT function is as follows:

```
DBE_XMLDOM.CREATEELEMENT(
  doc        IN      DOMDOCUMENT,
  tagName    IN      VARCHAR2)
 RETURN DOMELEMENT;
```

  Returns the DOMElement object with the specified name and namespace. The prototype of the DBE_XMLDOM.CREATEELEMENT function is as follows:

```
DBE_XMLDOM.CREATEELEMENT(
  doc        IN     DOMDOCUMENT,
  tagName    IN     VARCHAR2,
  ns         IN     VARCHAR2)
 RETURN DOMELEMENT;
```

Table 10-426 DBE_XMLDOM.CREATEELEMENT parameters

Parameter	Description
doc	Specified DOMDocument object
tagName	Name of the new DOMElement object

Parameter	Description
ns	Namespace

NOTE

1. When the **tagName** parameter is set to null or an empty character string, the exception "NULL or invalid TagName argument specified" is thrown.
2. The default maximum length of **tagName** and **ns** is 32767. If the length exceeds 32767, an exception is thrown.

Example:

```
-- 1. Create a DOMElement object with the specified name.
DECLARE
  doc dbe_xmldom.domdocument;
  attr DBE_XMLDOM.DOMATTR;
  elem DBE_XMLDOM.DOMELEMENT;
  ans DBE_XMLDOM.DOMATTR;
  buf varchar2(1010);
BEGIN
   doc := dbe_xmldom.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>
      <computer size="ITX"><cpu>Ryzen 9 3950X</cpu>
      <ram>32GBx2 DDR4 3200MHz</ram>
      <motherboard>ROG X570i</motherboard>
      <gpu>RTX2070 Super</gpu>
      <ssd>1TB NVMe Toshiba + 2TB NVMe WD Black</ssd>
      <hdd>12TB WD Digital</hdd>
      <psu>CORSAIR SF750</psu>
      <case>LIANLI TU150</case>
      </computer>');
   elem := dbe_xmldom.createelement(doc,'elem');
   DBE_XMLDOM.WRITETOBUFFER(dbe_xmldom.makenode(elem), buf);
   DBE_OUTPUT.print_line(buf);
END;
/
-- Expected result:
ANONYMOUS BLOCK EXECUTE

-- 2. Create a DOMElement object with the specified name and namespace.
DECLARE
  doc dbe_xmldom.domdocument;
  attr DBE_XMLDOM.DOMATTR;
  elem DBE_XMLDOM.DOMELEMENT;
  ans DBE_XMLDOM.DOMNODE;
  buf varchar2(1010);
  list DBE_XMLDOM.DOMNODELIST;
  node DBE_XMLDOM.DOMNODE;
BEGIN
   doc := dbe_xmldom.newdomdocument('<h:data xmlns:h="http://www.w3.org/TR/html4/">
      <h:da1 len="10">test namespace</h:da1><h:da1>bbbbbbbbbb</h:da1></h:data>');
   elem := dbe_xmldom.createelement(doc,'elem','http://www.w3.org/TR/html5/');
   ans := DBE_XMLDOM.APPENDCHILD(dbe_xmldom.makenode(doc), dbe_xmldom.makenode(elem));
   DBE_XMLDOM.WRITETOBUFFER(doc, buf);
   DBE_OUTPUT.print_line(buf);
END;
/
-- Expected result:
<?xml version="1.0" encoding="UTF-8"?>
<h:data xmlns:h="http://www.w3.org/TR/html4/">
 <h:da1 len="10">test namespace</h:da1>
 <h:da1>bbbbbbbbbb</h:da1>
</h:data>
<elem xmlns="http://www.w3.org/TR/html5/"/>

ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.CREATETEXTNODE

  Creates and returns a DOMText object. The prototype of the DBE_XMLDOM.CREATETEXTNOD function is as follows:

```
DBE_XMLDOM.CREATETEXTNODE(
  doc IN DOMDocument,
  data IN VARCHAR2)
RETURN DOMTEXT;
```

Table 10-427 DBE_XMLDOM.CREATETEXTNODE parameters

Parameter	Description
doc	Specified DOMDocument object
data	Content of the DOMText node

NOTE

1. You can enter an empty string or null value for **data**.
2. The default maximum length of **data** is 32767. If the length exceeds 32767, an exception is thrown.

Example:

```
-- Add a DOMText node to the DOC tree and print the DOC tree to the buffer.
DECLARE
  doc DBE_XMLDOM.DOMDOCUMENT;
  doctext DBE_XMLDOM.DOMTEXT;
  node DBE_XMLDOM.DOMNODE;
  buffer varchar2(1010);
BEGIN
  doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
     <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)>
     <!ELEMENT to (#PCDATA)>
     <!ELEMENT from (#PCDATA)>
     <!ELEMENT heading (#PCDATA)>
     <!ELEMENT body (#PCDATA)>]>
     <note>
       <to>Chinese</to>
       <from>Jani</from>
       <heading>Reminder</heading>
       <body>Don''t forget me this weekend!</body>
     </note>');
  doctext := DBE_XMLDOM.CREATETEXTNODE(doc, 'there is nothing');
  node := DBE_XMLDOM.MAKENODE(doctext);
  dbe_xmldom.writetobuffer(node, buffer);
  dbe_output.print_line('buffer: ');
  dbe_output.print_line(buffer);
END;
/
-- Expected result:
buffer:
there is nothing
ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.FREEDOCUMENT

  Frees a DOMDocument node. The prototype of the DBE_XMLDOM.FREEDOCUMENT function is as follows:

```
DBE_XMLDOM.FREEDOCUMENT(
  doc    IN    DOMDOCUMENT);
```

Table 10-428 DBE_XMLDOM.FREEDOCUMENT parameters

Parameter	Description
doc	Specified DOMDocument node

Example:

```
-- Free the entire DOC tree after the DOMNode node is added to the DOC tree.
DECLARE
  doc dbe_xmldom.domdocument;
  elem dbe_xmldom.domelement;
  doc_node dbe_xmldom.DOMNODE;
  root_elmt dbe_xmldom.DOMELEMENT;
  root_node dbe_xmldom.DOMNODE;
  value  varchar(1000);
BEGIN
  doc := dbe_xmldom.newdomdocument();
  doc_node := dbe_xmldom.MAKENODE(doc);
  root_elmt := dbe_xmldom.CREATEELEMENT(doc,'staff');
  root_node:=dbe_xmldom.APPENDCHILD(doc_node, dbe_xmldom.MAKENODE(root_elmt));
  dbe_xmldom.freedocument(doc);
END;
/
-- Expected result:
ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.FREEELEMENT

  Frees a DOMElement node. The prototype of the DBE_XMLDOM.FREEELEMENT function is as follows:

```
DBE_XMLDOM.FREEELEMENT(
  elem     IN     DOMELEMENT);
```

Table 10-429 DBE_XMLDOM.FREEELEMENT parameters

Parameter	Description
elem	Specified DOMElement node

Example:

```
-- Obtain a DOMElement node from the DOC tree and free the node. Check whether the node is
empty before and after the node is freed.
DECLARE
  doc dbe_xmldom.domdocument;
  elem dbe_xmldom.domelement;
  node dbe_xmldom.domnode;
  node1 dbe_xmldom.domnode;
  nodelist DBE_XMLDOM.DOMNODELIST;
  len INTEGER;
  buffer varchar2(1010);
BEGIN
  doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
     <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)>
     <!ELEMENT to (#PCDATA)>
     <!ELEMENT from (#PCDATA)>
     <!ELEMENT heading (#PCDATA)>
     <!ELEMENT body (#PCDATA)>]>
     <note>
       <to>Chinese</to>
       <from>Jani</from>
```

```
        <heading>Reminder</heading>
        <body>Don''t forget me this weekend!</body>
      </note>');
  elem := dbe_xmldom.GETDOCUMENTELEMENT(doc);
  IF DBE_XMLDOM.ISNULL(elem) THEN
      dbe_output.print_line('IS NULL');
  ELSE
      dbe_output.print_line('NOT NULL');
  END IF;
  dbe_xmldom.FREEELEMENT(elem);
  IF DBE_XMLDOM.ISNULL(elem) THEN
       dbe_output.print_line('IS NULL');
  ELSE
       dbe_output.print_line('NOT NULL');
  END IF;
END;
/
-- Expected result:
NOT NULL
IS NULL
ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.FREENODE

  Frees a DOMNode node. The prototype of the DBE_XMLDOM.FREENODE function is as follows:

```
DBE_XMLDOM.FREENODE(
  n IN DOMNODE);
```

Table 10-430 DBE_XMLDOM.FREENODE parameters

Parameter	Description
n	Specified DOMNode node

NOTE

1. After GaussDB performs the FREENODE operation, the freed node is not available again. After the database A performs the FREENODE operation, the freed node is available again and becomes another node.
2. When other APIs call the freed DOMNode node, the calling is different from that in database A.

Example:

```
-- Obtain a DOMNode node from the DOC tree and free the node. Check whether the node is empty
before and after the node is freed.
DECLARE
  doc dbe_xmldom.domdocument;
  node dbe_xmldom.domnode;
  node1 dbe_xmldom.domnode;
  nodelist DBE_XMLDOM.DOMNODELIST;
  len INTEGER;
  buffer1 varchar2(1010);
BEGIN
  doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
     <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)>
     <!ELEMENT to (#PCDATA)>
     <!ELEMENT from (#PCDATA)>
     <!ELEMENT heading (#PCDATA)>
     <!ELEMENT body (#PCDATA)>]>
     <note>
       <to>Chinese</to>
       <from>Jani</from>
```

```
        <heading>Reminder</heading>
        <body>Don''t forget me this weekend!</body>
      </note>');
  node := dbe_xmldom.makenode(doc);
  node := dbe_xmldom.GETFIRSTCHILD(node);
  IF DBE_XMLDOM.ISNULL(node) THEN
        dbe_output.print_line('IS NULL');
  ELSE
        dbe_output.print_line('NOT NULL');
  END IF;
  DBE_XMLDOM.FREENODE(node);
  IF DBE_XMLDOM.ISNULL(node) THEN
        dbe_output.print_line('IS NULL');
  ELSE
        dbe_output.print_line('NOT NULL');
  END IF;
END;
/
-- Expected result:
NOT NULL
IS NULL
ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.FREENODELIST

  Frees a DOMNodeList node. The prototype of the DBE_XMLDOM.FREENODE function is as follows:

```
DBE_XMLDOM.GETLENGTH(
  nl     IN    DOMNODELIST);
```

Table 10-431 DBE_XMLDOM.FREENODELIST parameters

Parameter	Description
nl	Specified DOMNodeList node

NOTE

1. A DOMNodeList node will be completed freed by FREENODELIST.
2. When other APIs call the freed DOMNodelist node, the calling is different from that in database A.
3. The input parameter **freenodelist** cannot be empty.

Example:

```
-- Obtain a DOMNodeList node from the DOC tree and free the node. Check the node length before and after the node is freed.
DECLARE
  doc dbe_xmldom.domdocument;
  node dbe_xmldom.domnode;
  node1 dbe_xmldom.domnode;
  nodelist DBE_XMLDOM.DOMNODELIST;
  len INTEGER;
  buffer1 varchar2(1010);
BEGIN
  doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
     <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)>
     <!ELEMENT to (#PCDATA)>
     <!ELEMENT from (#PCDATA)>
     <!ELEMENT heading (#PCDATA)>
     <!ELEMENT body (#PCDATA)>]>
     <note>
       <to>Chinese</to>
       <from>Jani</from>
```

```
        <heading>Reminder</heading>
        <body>Don''t forget me this weekend!</body>
      </note>');
  node := dbe_xmldom.makenode(doc);
  node := dbe_xmldom.GETFIRSTCHILD(node);
  nodelist := DBE_XMLDOM.GETCHILDNODES(node);
  len := DBE_XMLDOM.GETLENGTH(nodelist);
  RAISE NOTICE 'len :  %', len;
  DBE_XMLDOM.FREENODELIST(nodelist);
  len := DBE_XMLDOM.GETLENGTH(nodelist);
  RAISE NOTICE 'len :  %', len;
END;
/
-- Expected result:
NOTICE:  len :  4
NOTICE:  len :  0
ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.GETATTRIBUTE

  Returns the attribute values of a DOMElement object by name. The prototype of the DBE_XMLDOM.GETATTRIBUTE function is as follows:

```
DBE_XMLDOM.GETATTRIBUTE(
  elem       IN      DOMELEMENT,
  name       IN      VARCHAR2)
RETURN VARCHAR2;
```

  Returns the attribute values of a DOMElement object by name and namespace URI. The prototype of the DBE_XMLDOM.GETATTRIBUTE function is as follows:

```
DBE_XMLDOM.GETATTRIBUTE(
  elem      IN     DOMELEMENT,
  name      IN     VARCHAR2,
  ns        IN     VARCHAR2)
RETURN VARCHAR2;
```

Table 10-432 DBE_XMLDOM.GETATTRIBUTE parameters

Parameter	Description
elem	Specified DOMElement node
name	Attribute name
ns	Namespace

NOTE

1. The **ns** parameter of the DBE_XMLDOM.GETATTRIBUTE API does not support the asterisk (*) parameter.
2. GaussDB does not support the namespace prefix as an attribute, and the value of the prefix cannot be queried through the DBE_XMLDOM.GETATTRIBUTE API.

Example:

```
-- 1. Return the attribute values of a DOMElement object by name.
DECLARE
  doc dbe_xmldom.domdocument;
  elem dbe_xmldom.domelement;
  docnode DBE_XMLDOM.DOMNode;
  buffer varchar2(1010);
  value  varchar2(1000);
BEGIN
```

```
  doc := dbe_xmldom.newDOMDocument();
  elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
  DBE_XMLDOM.setattribute(elem, 'len', '50cm');
  docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
DBE_XMLDOM.makeNode(elem));
  value := DBE_XMLDOM.getattribute(elem, 'len');
  dbe_output.print_line('value: ');
  dbe_output.print_line(value);
  dbe_xmldom.writetobuffer(doc, buffer);
  dbe_output.print_line('buffer: ');
  dbe_output.print_line(buffer);
END;
/
-- Expected result:
value:
50cm
buffer:
<?xml version="1.0" encoding="UTF-8"?>
<root len="50cm"/>

ANONYMOUS BLOCK EXECUTE

-- 2. Return the attribute values of a DOMElement object by name and namespace URI.
DECLARE
  doc dbe_xmldom.domdocument;
  elem dbe_xmldom.domelement;
  docnode DBE_XMLDOM.DOMNode;
  buffer varchar2(1010);
  value  varchar(1000);

BEGIN
  doc := dbe_xmldom.newDOMDocument();
  elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
  DBE_XMLDOM.setattribute(elem, 'len', '50cm', 'www.huawei.com');
  docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
DBE_XMLDOM.makeNode(elem));
  value := DBE_XMLDOM.getattribute(elem, 'len', 'www.huawei.com');
  dbe_output.print_line('value: ');
  dbe_output.print_line(value);
  dbe_xmldom.writetobuffer(doc, buffer);

```

- DBE_XMLDOM.GETATTRIBUTES

  Returns the attribute values of a DOMNode node as a map. The prototype of the DBE_XMLDOM.GETATTRIBUTES function is as follows:

```
DBE_XMLDOM.GETATTRIBUTES(
  n IN DOMNode)
RETURN DOMNAMEDNODEMAP;
```

Table 10-433 DBE_XMLDOM.GETATTRIBUTES parameters

Parameter	Description
n	Specified DOMNode node

Example:

```
-- Obtain the attribute values of a DOMNode node, return an object of the DOMNamedNodeMap
type, and output the length of the DOMNamedNodeMap object and the value of the first node.
DECLARE
  doc dbe_xmldom.domdocument;
  node dbe_xmldom.domnode;
  node1 dbe_xmldom.domnode;
  len INTEGER;
  map DBE_XMLDOM.DOMNAMEDNODEMAP;
  buffer1 varchar2(1010);
BEGIN
  doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>

ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.GETCHILDRENBYTAGNAME

  Returns the subnodes of a DOMElement node by name. The prototype of the DBE_XMLDOM.GETCHILDRENBYTAGNAME function is as follows:

```
DBE_XMLDOM.GETCHILDRENBYTAGNAME (
  elem       IN      DOMELEMENT,
  name       IN      VARCHAR2)
RETURN DOMNODELIST;
```

  Returns the subnodes of a DOMElement node by name and namespace. The prototype of the DBE_XMLDOM.GETCHILDRENBYTAGNAME function is as follows:

```
DBE_XMLDOM.GETCHILDRENBYTAGNAME (
  elem      IN     DOMELEMENT,
  name      IN     VARCHAR2,
  ns        IN     VARCHAR2)
 RETURN DOMNODELIST;
```

  Table 10-435 DBE_XMLDOM.GETCHILDRENBYTAGNAME parameters

Parameter	Description
elem	Specified DOMElement node
name	Attribute name
ns	Namespace

  NOTE

  The **ns** parameter of the DBE_XMLDOM.GETCHILDRENBYTAGNAME API does not support the asterisk (*) parameter. To obtain all attributes of a node, use the DBE_XMLDOM.GETCHILDNODES API.

  Example:

```
-- 1. Return the subnodes of a DOMElement node by name.
DECLARE
  doc dbe_xmldom.domdocument;
  elem dbe_xmldom.domelement;
  docnodelist dbe_xmldom.domnodelist;

  Returns the node specified by name. The prototype of the DBE_XMLDOM.GETNAMEDITEM function is as follows:

```
DBE_XMLDOM.GETNAMEDITEM(
  nnm IN DOMNAMEDNODEMAP,
  name IN VARCHAR2)
RETURN DOMNODE;
```

  Returns the node specified by name and namespace. The prototype of the DBE_XMLDOM.GETNAMEDITEM function is as follows:

```
DBE_XMLDOM.GETNAMEDITEM(
  nnm IN DOMNAMEDNODEMAP,
  name IN VARCHAR2,
  ns IN VARCHAR2)
RETURN DOMNODE;
```

  Table 10-441 DBE_XMLDOM.GETNAMEDITEM parameters

Parameter	Description
nnm	Specified DOMNamedNodeMap object
name	Name of the element to be retrieved
ns	Namespace

  NOTE

  1. The values of **name** and **nnm** can be null, but they are required arguments.
  2. The default maximum length of **name** and **ns** is 32767. If the length exceeds 32767, an error is reported.
  3. The values of **name** and **ns** can be of the int type and contain more than 127 bits.

  Example:

```
-- 1. Return the node specified by name.
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  elem DBE_XMLDOM.DOMElement;
  map DBE_XMLDOM.DOMNAMEDNODEMAP;

```

- DBE_XMLDOM.HASCHILDNODES

  Checks whether the DOMNode object has any subnode. The prototype of the DBE_XMLDOM.HASCHILDNODES function is as follows:

```
DBE_XMLDOM.HASCHILDNODES(
  n  IN  DOMNODE)
RETURN  BOOLEAN;
```

Table 10-448 DBE_XMLDOM.HASCHILDNODES parameters

Parameter	Description
n	Specified DOMNode object

Example:

```
-- Create a node named child1, mount it to the DOC tree, and add a node to child1. Then, check
whether the child1 node has any subnode.
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  doc1 DBE_XMLDOM.DOMDocument;
  root DBE_XMLDOM.DOMElement;
  child1 DBE_XMLDOM.DOMElement;
  child2 DBE_XMLDOM.DOMElement;
  attr DBE_XMLDOM.DOMAttr;
  text DBE_XMLDOM.DOMTEXT;
  node DBE_XMLDOM.DOMNode;
  buf varchar2(1000);
BEGIN
  doc := DBE_XMLDOM.newDOMDocument();
  root := DBE_XMLDOM.createElement(doc, 'root');
  node := DBE_XMLDOM.appendChild(DBE_xmldom.makeNode(doc),DBE_xmldom.makeNode(root));
  child1 := DBE_XMLDOM.createElement(doc, 'child1');
  node := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(root),
DBE_XMLDOM.makeNode(child1));
  child2 := DBE_XMLDOM.createElement(doc, 'child2');
  node := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(child1),
DBE_XMLDOM.makeNode(child2));
  IF DBE_XMLDOM.HASCHILDNODES(DBE_XMLDOM.makeNode(child1)) THEN
    DBE_OUTPUT.print_line('HAS CHILD NODES');
  ELSE
    DBE_OUTPUT.print_line('NOT HAS CHILD NODES ');
  END IF;
END;
/
-- Expected result:
HAS CHILD NODES
ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.IMPORTNODE

  Copies a node to another node and mounts the copied node to a specified document. If the type of the copied node does not belong to the 12 types specified by constants of XML DOM, an exception indicating that the type is not supported is thrown. The prototype of the DBE_XMLDOM.IMPORTNODE function is as follows:

```
DBE_XMLDOM.IMPORTNODE(
  doc IN DOMDOCUMENT,
  importedNode IN DOMNODE,
  deep IN BOOLEAN)
RETURN DOMNODE;
```

Table 10-449 DBE_XMLDOM.IMPORTNODE parameters

Parameter	Description
doc	Document to which the node is mounted
importedNode	Node to be imported
deep	Specifies whether to perform recursive import. ● If the value is **TRUE**, the node and all its subnodes are imported. ● If the value is **FALSE**, the node itself is imported.

Example:

```
-- Obtain the root2_node node in the DOC2 tree, copy it, and mount it to the DOC tree.
DECLARE
    doc dbe_xmldom.domdocument;
    doc2 dbe_xmldom.domdocument;
    doc_node dbe_xmldom.domnode;
    doc2_node dbe_xmldom.domnode;
     root_node dbe_xmldom.domnode;
    root2_node dbe_xmldom.domnode;
    import_node dbe_xmldom.domnode;
    result_node dbe_xmldom.domnode;
    buffer varchar2(1010);
BEGIN
    doc := dbe_xmldom.newdomdocument('<bookstore category="web" cover="paperback">
       <book category="cooking"><title lang="en">Everyday Italian</title>
       <author>Giada De Laurentiis</author><year>2005</year>
       <price>30.00</price></book></bookstore>');
    doc2 := dbe_xmldom.newdomdocument('<case>LIANLI TU150</case>');
    doc_node := DBE_XMLDOM.MAKENODE(doc);
    doc2_node := DBE_XMLDOM.MAKENODE(doc2);
    root_node := DBE_XMLDOM.GETFIRSTCHILD(doc_node);
    root2_node := DBE_XMLDOM.GETFIRSTCHILD(doc2_node);
    DBE_XMLDOM.WRITETOBUFFER(doc, buffer);
    dbe_output.print_line(buffer);
    import_node := DBE_XMLDOM.IMPORTNODE(doc, root2_node, TRUE);
    result_node := DBE_XMLDOM.APPENDCHILD(root_node, import_node);
    DBE_XMLDOM.WRITETOBUFFER(doc, buffer);
    dbe_output.print_line(buffer);
END;
/
-- Expected result:

ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.ISNULL

  Checks whether the given DOMAttr node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE_XMLDOM.ISNULL function is as follows:

  ```
  DBE_XMLDOM.ISNULL(
    a       IN     DOMATTR)
  RETURN BOOLEAN;
  ```

  Checks whether the given DOMDocument node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  doc      IN     DOMDOCUMENT)
RETURN BOOLEAN;
```

Checks whether the given DOMElement node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  elem     IN     DOMELEMENT)
RETURN BOOLEAN;
```

Checks whether the given DOMNamedNodeMap node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  nnm      IN     DOMNAMEDNODEMAP)
RETURN BOOLEAN;
```

Checks whether the given DOMNode node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  n      IN     DOMNODE)
RETURN BOOLEAN;
```

Checks whether the given DOMNodeList node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  nl       IN     DOMNODELIST)
RETURN BOOLEAN;
```

Checks whether the given DOMText node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  t      IN     DOMTEXT)
RETURN BOOLEAN;
```

Table 10-450 DBE_XMLDOM.ISNULL parameters

Parameter	Description
a	Specified DOMAttr node
doc	Specified DOMDocument node
elem	Specified DOMElement node
nnm	Specified DOMNamedNodeMap node
n	Specified DOMNode node
nl	Specified DOMNodeList node
t	Specified DOMText node

NOTE

Due to the implementation difference of DBE_XMLDOM.FREEDOCUMENT, an error is reported when the DBE_XMLDOM.ISNULL API calls the freed DOMDocument node.

Example:

```
-- 1. Use createAttribute to create a DOMAttr node and check whether the node is empty.
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  attr DBE_XMLDOM.DOMATTR;
  buf VARCHAR2(1000);
BEGIN
  doc := DBE_xmldom.newdomdocument('<?xml version="1.0"?>

```

- DBE_XMLDOM.ITEM

  Returns the element corresponding to the index in a list based on the index. The prototype of the DBE_XMLDOM.ITEM function is as follows:

```
DBE_XMLDOM.ITEM(
  nl IN DOMNODELIST,
  index IN NUMBER)
RETURN DOMNODE;
```

  Returns the element corresponding to the index in a map based on the index. The prototype of the DBE_XMLDOM.ITEM function is as follows:

```
DBE_XMLDOM.ITEM(
  nnm IN DOMNAMEDNODEMAP,
  index IN NUMBER)
RETURN DOMNODE;
```

Table 10-451 DBE_XMLDOM.ITEM parameters

Parameter	Description
nl	Specified DOMNodeList object
nnm	Specified DOMNamedNodeMap object
index	Index of the element to be retrieved

NOTE

For improper input parameters such as Boolean and CLOB, the item function of the map type points to the value of the first index by default.

Example:

```
-- 1. Return the element corresponding to the index in a map based on the index.
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  elem DBE_XMLDOM.DOMElement;
  map DBE_XMLDOM.DOMNAMEDNODEMAP;

  DBE_OUTPUT.print_line(buf);
END;
/
-- Expected result:
aaa
ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.MAKENODE

  Forcibly converts a specified DOMAttr node to a DOMNode node and returns the DOMNode node. The prototype of the DBE_XMLDOM.MAKENODE function is as follows:

  ```
  DBE_XMLDOM.MAKENODE(
    a        IN     DOMATTR)
  RETURN DOMNODE;
  ```

  Forcibly converts a specified DOMDocument node to a DOMNode node and returns the DOMNode node. The prototype of the DBE_XMLDOM.MAKENODE function is as follows:

  ```
  DBE_XMLDOM.MAKENODE(
    doc      IN     DOMDOCUMENT)
  RETURN DOMNODE;
  ```

  Forcibly converts a specified DOMElement node to a DOMNode node and returns the DOMNode node. The prototype of the DBE_XMLDOM.MAKENODE function is as follows:

  ```
  DBE_XMLDOM.MAKENODE(
    elem       IN     DOMELEMENT)
  RETURN DOMNODE;
  ```

  Forcibly converts a specified DOMText node to a DOMNode node and returns the DOMNode node. The prototype of the DBE_XMLDOM.MAKENODE function is as follows:

  ```
  DBE_XMLDOM.MAKENODE(
    t       IN     DOMTEXT)
  RETURN DOMNODE;
  ```

  Table 10-453 DBE_XMLDOM.MAKENODE parameters

Parameter	Description
a	Specified DOMAttr node
doc	Specified DOMDocument node
elem	Specified DOMElement node
t	Specified DOMText node

NOTE

Due to syntax restrictions, when DBE_XMLDOM.MAKENODE is used as the return value of a function, it cannot be directly implemented by running the following command:

```
return DBE_XMLDOM.MAKENODE(doc);
```

You are advised to run the following command:

```
tmp_node := DBE_XMLDOM.MAKENODE(doc );
return tmp_node;
```

Example:

```
-- 1. Use createattr to generate ATTR and convert it to a node.
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  attr DBE_XMLDOM.DOMATTR;
  dom_node DBE_XMLDOM.DOMNode;
  buf VARCHAR2(1000);
BEGIN
  doc := DBE_xmldom.newdomdocument('<?xml version="1.0"?>

- DBE_XMLDOM.NEWDOMDOCUMENT

  Returns a new DOMDocument object. The prototype of the DBE_XMLDOM.NEWDOMDOCUMENT function is as follows:

  ```
  DBE_XMLDOM.NEWDOMDOCUMENT
  RETURN DOMDOCUMENT;
  ```

  Returns a new DOMDocument instance object created from the specified XMLType type. The prototype of the DBE_XMLDOM.NEWDOMDOCUMENT function is as follows:

  ```
  DBE_XMLDOM.NEWDOMDOCUMENT(
    xmldoc    IN SYS.XMLTYPE)
  RETURN DOMDOCUMENT;
  ```

  Returns a new DOMDocument instance object created from the specified CLOB type. The prototype of the DBE_XMLDOM.NEWDOMDOCUMENT function is as follows:

```
DBE_XMLDOM.NEWDOMDOCUMENT(
  cl      IN    CLOB)
RETURN DOMDOCUMENT;
```

Table 10-454 DBE_XMLDOM.NEWDOMDOCUMENT parameters

Parameter	Description
xmldoc	Specified XMLType type
cl	Specified CLOB type

NOTE

- The size of the input parameter must be less than 2 GB.
- Currently, external DTD parsing is not supported.
- The document created by NEWDOMDOCUMENT uses the UTF-8 character set by default.
- Each document parsed from the same XMLType instance is independent, and the modification of the document does not affect the XMLType.
- For details about the differences between our database and database A, see **DBE_XMLPARSER.PARSECLOB**.

Example:

```
-- 1. Return a new DOMDocument object.
DECLARE
  doc dbe_xmldom.domdocument;
  buffer varchar2(1010);
BEGIN
  doc := dbe_xmldom.newdomdocument();
  dbe_xmldom.setdoctype(doc, 'note', 'sysid', 'pubid');

- DBE_XMLDOM.SETATTRIBUTE

  Sets the value of the DOMElement attribute by name. The prototype of the DBE_XMLDOM.SETATTRIBUTE function is as follows:

  ```
  DBE_XMLDOM.SETATTRIBUTE(
    elem    IN  DOMELEMENT,
    name    IN  VARCHAR2,
    value   IN  VARCHAR2);
  ```

  Sets the attribute values of a DOMElement object by name and namespace URI. The prototype of the DBE_XMLDOM.SETATTRIBUTE function is as follows:

  ```
  DBE_XMLDOM.SETATTRIBUTE(
    elem    IN  DOMELEMENT,
    name    IN  VARCHAR2,
    value   IN  VARCHAR2,
    ns      IN  VARCHAR2);
  ```

  Table 10-455 DBE_XMLDOM.SETATTRIBUTE parameters

Parameter	Description
elem	Specified DOMElement node
name	Attribute name
value	Attribute value
ns	Namespace

> **NOTE**
>
> Multiple attributes can be added through the DBE_XMLDOM.SETATTRIBUTE API. The attribute name cannot be null, and attributes with the same name cannot exist in the same DOMElement node. If you want to add attributes with the same name, you should explicitly set a namespace for each attribute with the same name, but you are advised not to perform such operations. If an attribute exists in a namespace, the specified namespace must be displayed when you modify the attribute. Otherwise, the attribute with the same name is added.

Example:

```
-- 1. Set the value of the DOMElement attribute by name.
DECLARE
  doc dbe_xmldom.domdocument;
  elem dbe_xmldom.domelement;
  docnode DBE_XMLDOM.DOMNode;
  buffer varchar2(1010);
  value  varchar(1000);
BEGIN
  doc := dbe_xmldom.newDOMDocument();
  elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
  DBE_XMLDOM.setattribute(elem, 'len', '50cm');
  docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
DBE_XMLDOM.makeNode(elem));
  dbe_xmldom.writetobuffer(doc, buffer);
  dbe_output.print_line('buffer: ');
  dbe_output.print_line(buffer);
END;
/
-- Expected result:
buffer:
<?xml version="1.0" encoding="UTF-8"?>
<root len="50cm"/>

ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.SETCHARSET

  Sets the character set for a DOMDocument object. The prototype of the DBE_XMLDOM.SETCHARSET function is as follows:

```
DBE_XMLDOM.SETCHARSET(
  doc       IN     DOMDocument,
  charset   IN     VARCHAR2);
```

Table 10-456 DBE_XMLDOM.SETCHARSET parameters

Parameter	Description
doc	Specified DOMDocument node
charset	Character set

NOTE

- The value of **charset** contains a maximum of 60 bytes.
- Currently, the following character sets are supported: UTF-8, UTF-16, UCS-4, UCS-2, ISO-8859-1, ISO-8859-2, ISO-8859-3, ISO-8859-4, ISO-8859-5, ISO-8859-6, ISO-8859-7, ISO-8859-8, ISO-8859-9, ISO-2022-JP, Shift_JIS, EUC-JP and ASCII. If you enter other character sets, an error is reported or garbled characters may be displayed.

Example:

```
-- Set the UTF-16 character set for the DOC tree and print the DOC tree to the buffer.
DECLARE
  doc dbe_xmldom.domdocument;
  buffer varchar2(1010);
BEGIN
  doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
     <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>
     <!ELEMENT from (#PCDATA)><!ELEMENT heading (#PCDATA)><!ELEMENT body (#PCDATA)>]>
     <note><to>test</to><from>Jani</from><heading>Reminder</heading>
     <body>Don''t forget me this weekend!</body></note>');
  dbe_xmldom.setcharset(doc, 'utf-16');
  dbe_xmldom.writetobuffer(doc, buffer);
  dbe_output.print_line('buffer: ');
  dbe_output.print_line(buffer);
  dbe_xmldom.freedocument(doc);
END;
/
-- Expected result:

  <to>test</to>
  <from>Jani</from>
  <heading>Reminder</heading>
  <body>Don't forget me this weekend!</body>
</note>

ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.SETDOCTYPE

  Sets the external DTD of a DOMDocument object. The prototype of the DBE_XMLDOM.SETDOCTYPE function is as follows:

```
DBE_XMLDOM.SETDOCTYPE(
  doc     IN   DOMDocument,
  name    IN   VARCHAR2,
  sysid   IN   VARCHAR2,
  pubid   IN   VARCHAR2);
```

Table 10-457 DBE_XMLDOM.SETDOCTYPE parameters

Parameter	Description
doc	Specified DOMDocument node
name	Name of the DOCType to be initialized

Parameter	Description
sysid	ID of the system whose DOCType needs to be initialized
pubid	Public ID of the DOCType to be initialized

NOTE

The total length of **name**, **sysid**, and **pubid** cannot exceed 32500 bytes.

Example:

```
-- After the initial system ID, public ID, and name are set for the external DTD of the DOMDocument, the DOC tree modified each time is output to the buffer.
DECLARE
  doc dbe_xmldom.domdocument;
  buffer varchar2(1010);
begin
  doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
     <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>
     <!ELEMENT from (#PCDATA)><!ELEMENT heading (#PCDATA)><!ELEMENT body (#PCDATA)>]>
     <note><to>test</to><from>Jani</from><heading>Reminder</heading>
     <body>Don''t forget me this weekend!</body></note>');
  dbe_xmldom.setdoctype(doc, 'note', 'sysid', 'pubid');
  dbe_xmldom.writetobuffer(doc, buffer);
  dbe_output.print_line('buffer: ');
  dbe_output.print_line(buffer);
  dbe_output.print_line('-------------------------------------------------');
  dbe_xmldom.setdoctype(doc, 'n0te', NULL, '');
  dbe_xmldom.setdoctype(doc, 'n0t1e', NULL, '');
  dbe_xmldom.writetobuffer(doc, buffer);
  dbe_output.print_line('buffer: ');
  dbe_output.print_line(buffer);
  dbe_xmldom.freedocument(doc);
END;
/
-- Expected result:
buffer:
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE note PUBLIC "pubid" "sysid" [

ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.SETNODEVALUE

  Sets the value of a node in the DOMNode object. The prototype of the DBE_XMLDOM.SETNODEVALUE function is as follows:

```
DBE_XMLDOM.SETNODEVALUE(
 n IN DOMNODE,
 nodeValue IN VARCHAR2);
```

Table 10-458 DBE_XMLDOM.SETNODEVALUE parameters

Parameter	Description
n	Specified DOMNode object
nodeValue	String to be set in the DOMNode object

NOTE

1. You can enter an empty string or null value for **nodeValue**, but the node value will not be changed.
2. Currently, **nodeValue** does not support the escape character '&'. If the character string contains the escape character, the node value will be cleared.
3. The default maximum length of **nodeValue** is restricted by the VARCHAR2 type and is 32767 bytes. If the length exceeds 32767 bytes, an exception is thrown.

Example:

```
-- After setting a node value different from the initial value for the DOMNode node that is converted from DOMText, obtain and output the node value.
DECLARE
  buf VARCHAR2(1000);
  doc DBE_XMLDOM.DOMDocument;
  text DBE_XMLDOM.DOMText;
  elem2 DBE_XMLDOM.DOMElement;
  node DBE_XMLDOM.DOMNode;
BEGIN
  doc := DBE_XMLDOM.NEWDOMDOCUMENT();
  text := DBE_XMLDOM.createTextNode(doc, 'aaa');
  DBE_XMLDOM.SETNODEVALUE(DBE_XMLDOM.makeNode(text), 'ccc');
  buf := DBE_XMLDOM.GETNODEVALUE(DBE_XMLDOM.makeNode(text));
  DBE_OUTPUT.print_line(buf);
END;
/
-- Expected result:
ccc
ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.WRITETOBUFFER

  Writes an XML node to a specified buffer using the database character set. The prototype of the DBE_XMLDOM.WRITETOBUFFER function is as follows:

```
DBE_XMLDOM.WRITETOBUFFER(
  doc      IN     DOMDOCUMENT,
  buffer   INOUT  VARCHAR2);
```

Writes an XML document to a specified buffer using the database character set. The prototype of the DBE_XMLDOM.WRITETOBUFFER function is as follows:

```
DBE_XMLDOM.WRITETOBUFFER(
  n        IN     DOMNODE,
  buffer   INOUT  VARCHAR2);
```

Table 10-459 DBE_XMLDOM.WRITETOBUFFER parameters

Parameter	Description
doc	Specified DOMDocument node
buffer	Buffer for the write operation
n	Specified DOMNode node

NOTE

- The buffer to which the writetobuffer function writes is less than 1 GB.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- By default, XML files are output in the UTF-8 character set.

Example:

```
-- 1. Enter a parameter of the DOMNode type.
DECLARE
   doc dbe_xmldom.domdocument;
   elem DBE_XMLDOM.DOMELEMENT;
   buf varchar2(1000);
BEGIN
    doc := dbe_xmldom.newdomdocument();
    elem := dbe_xmldom.createelement(doc,'elem');
    DBE_XMLDOM.WRITETOBUFFER(dbe_xmldom.makenode(elem), buf);
    DBE_OUTPUT.print_line(buf);
END;
/
-- Expected result:
<elem/>
ANONYMOUS BLOCK EXECUTE

-- 2. Enter a parameter of the DOMDocument type.

</note>

ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.WRITETOCLOB

  Writes an XML node to a specified CLOB using the database character set. The prototype of the DBE_XMLDOM.WRITETOCLOB function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
  doc     IN      DOMDOCUMENT,
  cl      INOUT  CLOB);
```

  Writes an XML node to a specified CLOB using the database character set. The prototype of the DBE_XMLDOM.WRITETOCLOB function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
  n       IN      DOMNODE,
  cl      INOUT  CLOB);
```

Table 10-460 DBE_XMLDOM.WRITETOCLOB parameters

Parameter	Description
doc	Specified DOMDocument node
cl	CLOB to be written
n	Specified DOMNode node

NOTE

- The **doc** parameter is an input parameter. The value of **writetoclob** is less than 2 GB.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- By default, XML files are output in the UTF-8 character set.

Example:

```
-- 1. Enter a parameter of the DOMNode type.
DECLARE
  CL  CLOB;
  N   DBE_XMLDOM.DOMNODE;
BEGIN
  DBE_XMLDOM.WRITETOCLOB(N, CL);

```

- DBE_XMLDOM.WRITETOFILE

  Writes an XML node to a specified file using the database character set. The prototype of the DBE_XMLDOM.WRITETOFILE function is as follows:

  ```
  DBE_XMLDOM.WRITETOCLOB(
    doc     IN      DOMDOCUMENT,
    fileName   IN      VARCHAR2);
  ```

  Writes an XML node to a specified file using the database character set. The prototype of the DBE_XMLDOM.WRITETOFILE function is as follows:

  ```
  DBE_XMLDOM.WRITETOCLOB(
    n       IN      DOMNODE,
    fileName   IN      VARCHAR2);
  ```

  Writes an XML document to a specified file using the specified character set. The prototype of the DBE_XMLDOM.WRITETOFILE function is as follows:

  ```
  DBE_XMLDOM.WRITETOCLOB(
    doc     IN      DOMDOCUMENT,
    fileName   IN      VARCHAR2,
    charset   IN   VARCHAR2);
  ```

  Writes an XML document to a specified file using the specified character set. The prototype of the DBE_XMLDOM.WRITETOFILE function is as follows:

  ```
  DBE_XMLDOM.WRITETOCLOB(
    n       IN      DOMNODE,
    fileName   IN      VARCHAR2,
    charset   IN   VARCHAR2);
  ```

Table 10-461 DBE_XMLDOM.WRITETOFILE parameters

Parameter	Description
doc	Specified DOMDocument node
fileName	File to be written
n	Specified DOMNode node
charset	Specified character set

NOTE

- The **doc** parameter is an input parameter. The value of **filename** can contain a maximum of 255 bytes, and the value of **charset** can contain a maximum of 60 bytes. For details about the character sets supported by **charset**, see the **DBE_XMLDOM.SETCHARSET** API.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- If newdomdocument() is used to create a document without parameters, no error is reported when **charset** is not specified. The UTF-8 character set is used by default.
- The **filename** must be in the path created in **pg_directory**. The backslash (\) in the filename will be converted to a slash (/). Only one slash (/) is allowed. The file name must be in the **pg_directory_name/file_name.xml** format. The output file must be in the XML format.
- When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to read and write files in the file path specified by **safe_data_path**.
- Before creating a directory, ensure that the directory exists in the operating system and the user has the read and write permissions on the directory. For details about how to create a directory, see **CREATE DIRECTORY**.

Example:

```
-- Before creating a directory, ensure that the directory exists in the OS and the user has the read and write permissions on the directory.
create directory dir as '/tmp';
-- 1. Write an XML node to a specified file using the database character set.
DECLARE
  FPATH VARCHAR2(1000);
  DOC   DBE_XMLDOM.DOMDOCUMENT;
BEGIN
  DOC := DBE_XMLDOM.NEWDOMDOCUMENT('<ROOT>
    <A ATTR1="A_VALUE">
        <ACHILD>ACHILD TXT</ACHILD>
    </A>
    <B>B TXT</B>
    <C/>
  </ROOT>');
  FPATH := 'dir/simplexml.xml';
  DBE_XMLDOM.WRITETOFILE(DOC, FPATH);
END;
/
-- Expected result:
ANONYMOUS BLOCK EXECUTE

-- 2. Write an XML document to a specified file using the specified character set.
DECLARE
  SRC   VARCHAR(1000);
  FPATH VARCHAR2(1000);
```

```
  DOC   DBE_XMLDOM.DOMDOCUMENT;
  ELE   DBE_XMLDOM.DOMELEMENT;
BEGIN
  FPATH := 'dir/simplexml.xml';
  SRC := '<ROOT>
    <A ATTR1="A_VALUE">
        <ACHILD>ACHILD TXT</ACHILD>
    </A>
    <B>B TXT</B>
    <C/>
  </ROOT>';
  DOC := DBE_XMLDOM.NEWDOMDOCUMENT(SRC);
  ELE := DBE_XMLDOM.GETDOCUMENTELEMENT(DOC);
  DBE_XMLDOM.WRITETOFILE(DBE_XMLDOM.MAKENODE(ELE), FPATH, 'ASCII');
  DBE_XMLDOM.FREEDOCUMENT(DOC);
END;
/
-- Expected result:
ANONYMOUS BLOCK EXECUTE

-- Clean the environment.
drop directory dir;
```

- DBE_XMLDOM.GETSESSIONTREENUM

  Queries the number of DOM trees of all types in the current session. The prototype of the DBE_XMLDOM.GETSESSIONTREENUM function is as follows:

  ```
  DBE_XMLDOM.GETSESSIONTREENUM()
  RETURN INTEGER;
  ```

  NOTE

  For DOM trees that have used FREEElement and FREENode, this function still counts them.

  Example:

  ```
  -- Create three documents and obtain the number of DOM trees in the current session.
  DECLARE
    doc DBE_XMLDOM.DOMDocument;
    doc2 DBE_XMLDOM.DOMDocument;
    doc3 DBE_XMLDOM.DOMDocument;

    buffer varchar2(1010);
  BEGIN
  -- Create three documents.
    doc := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
  <root>
     <elem1 attr="attrtest">
        <elem2>Im text</elem2>

- DBE_XMLDOM.GETELEMENTSBYTAGNAME

  Searches for the DOMNodelist node by name in the XML file and returns the node. The prototype of the DBE_XMLDOM.GETELEMENTSBYTAGNAME function is:

  ```
  DBE_XMLDOM.GETELEMENTSBYTAGNAME(
    doc        IN      DOMDOCUMENT,
    tagname    IN      VARCHAR2)
  RETURN DOMNODELIST;
  ```

  Searches for the DOMNodelist node by name in the XML file and returns the node. The prototype of the DBE_XMLDOM.GETELEMENTSBYTAGNAME function is:

  ```
  DBE_XMLDOM.GETELEMENTSBYTAGNAME(
    elem       IN      DOMELEMENT,
    tagname       IN      VARCHAR2)
  RETURN DOMNODELIST;
  ```

  Searches for the DOMNodelist node by name and namespace in the XML file and returns the node. The prototype of the DBE_XMLDOM.GETELEMENTSBYTAGNAME function is:

  ```
  DBE_XMLDOM.GETELEMENTSBYTAGNAME(
    elem       IN      DOMELEMENT,
    tagname       IN      VARCHAR2,
    ns         IN      VARCHAR2)
   RETURN DOMNODELIST;
  ```

Table 10-463 DBE_XMLDOM.GETELEMENTSBYTAGNAME parameters

Parameter	Description
doc	Specified DOMDocument node
elem	Specified DOMElement node
tagname	Tag name. Using the wildcard (*) will match any tag.
ns	Namespace. Using the wildcard (*) will match any namespace.

Example:

```
-- 1. Search the DOMDocument node by TAGNAME and return the matched DOMNodelist node list.
DECLARE

10.12.2.20 DBE_XMLPARSER

API Description

The DBE_XMLPARSER API is used to deserialize XML character strings and convert the character strings that store XML documents to document nodes. **Table 10-464** lists all APIs supported by the DBE_XMLPARSER advanced package.

The XMLParser data type can be used to store XMLParser data. The maximum number of XMLParser data records that can be stored is 16777215. The XMLPARSER data type can parse and create the DOMDocument node according to the input character string. The advanced package also provides the corresponding set and get APIs to perform operations on the constraint attributes of the parsing process.

NOTE

When the DBE_XMLPARSER advanced package is used in the database whose character set is set to **SQL_ASCII**, an error is reported if characters beyond the ASCII range are input.

The DBE_XMLPARSER advanced package supports only the A-compatible mode.

Table 10-464 DBE_XMLPARSER parameters

API	Description
DBE_XMLPARSER.FREEPARSER	Frees a parser.
DBE_XMLPARSER.GETDOCUMENT	Obtains the parsed document node.
DBE_XMLPARSER.GETVALIDATIONMODE	Obtains the validation attribute.
DBE_XMLPARSER.NEWPARSER	Creates a parser instance.
DBE_XMLPARSER.PARSEBUFFER	Parses the VARCHAR string.
DBE_XMLPARSER.PARSECLOB	Parses the CLOB string.
DBE_XMLPARSER.SETVALIDATIONMODE	Sets the validation attribute.

- DBE_XMLPARSER.FREEPARSER

  Frees a given parser object.

  The stored procedure prototype of DBE_XMLPARSER.FREEPARSER is as follows:

```
DBE_XMLPARSER.FREEPARSER (
  p     IN     parser);
```

  Table 10-465 DBE_XMLPARSER.FREEPARSER parameters

Parameter	Description
p	Parser object

  Example:

```
-- Create a parser and then release it.
DECLARE
  l_parser dbe_xmlparser.parser;
  BEGIN
  l_parser := dbe_xmlparser.newparser;
-- Directly release the l_parser instance.
  dbe_xmlparser.freeparser(l_parser);
END;
/
```

  Result: The operation is successful.

- DBE_XMLPARSER.GETDOCUMENT

  Returns the root node of the DOM tree document constructed by the parser. This function can be called only after the document is parsed.

The prototype of the DBE_XMLPARSER.GETDOCUMENT function is as follows:

```
DBE_XMLPARSER.GETDOCUMENT (
 p     IN     parser)
RETURN DOMDocument;
```

Table 10-466 DBE_XMLPARSER.GETDOCUMENT parameters

Parameter	Description
p	Parser object

NOTE

- If the GETDOCUMENT function has no input parameter, an error is reported.
- If the **parser** parameter of the GETDOCUMENT function is null, **NULL** is returned.
- If the parser input by the GETDOCUMENT function has not parsed any document, **NULL** is returned.

Example:

```
-- Create a parser to parse character strings and print the obtained document.
DECLARE
  l_parser dbe_xmlparser.parser;
  l_doc dbe_xmldom.domdocument;
  buffer varchar2 :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>';
  buffer2 varchar2;
  BEGIN
  l_parser := dbe_xmlparser.newparser;
-- The l_parser parses the character string and obtains the DOMDocument node through
GETDOCUMENT.
  dbe_xmlparser.PARSEBUFFER(l_parser, buffer);
  l_doc := dbe_xmlparser.getdocument(l_parser);
-- Print the content in l_doc.
  dbe_xmldom.writetobuffer(l_doc, buffer2);
  RAISE NOTICE '%', buffer2;

  dbe_xmlparser.freeparser(l_parser);
  dbe_xmldom.freedocument(l_doc);
END;
/
```

Execution result:

```
NOTICE:  <?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>
```

- DBE_XMLPARSER.GETVALIDATIONMODE

  Obtains the parsing validation mode of a specified parser. If DTD validation is enabled, **TRUE** is returned. Otherwise, **FALSE** is returned.

  The prototype of the DBE_XMLPARSER.GETVALIDATIONMODE function is as follows:

```
DBE_XMLPARSER.GETVALIDATIONMODE (
 p     IN     parser)
 RETURN BOOLEAN;
```

Table 10-467 DBE_XMLPARSER.GETVALIDATIONMODE parameters

Parameter	Description
p	Parser object

Example:

```
-- Create a parser and use GETVALIDATIONMODE to check whether the parser validation mode is
enabled.
DECLARE
  l_parser dbe_xmlparser.parser;
BEGIN
  l_parser := dbe_xmlparser.newparser();
    if (dbe_xmlparser.GETVALIDATIONMODE(l_parser) = true) then
 RAISE NOTICE 'validation';
    else
    RAISE NOTICE 'no validation';
  end if;
  dbe_xmlparser.freeparser(l_parser);
END;
/
```

Execution result:

```
NOTICE:  validation
```

- DBE_XMLPARSER.NEWPARSER

  Creates a parser object and returns a new parser instance.

  The prototype of the DBE_XMLPARSER.NEWPARSER function is as follows:

  ```
  DBE_XMLPARSER.NEWPARSER
   RETURN Parser;
  ```

  Example:

  ```
  -- Create a parser to parse character strings and then free the parser.
  DECLARE
    -- Create a parser.
    l_parser dbe_xmlparser.parser;
    l_doc dbe_xmldom.domdocument;
    buffer varchar2(1000) :=
      '<?xml version="1.0" encoding="UTF-8"?>
      <note>
      <to>Tove</to>
      <from>Jani</from>
      <heading>Reminder</heading>
      <body>Donot forget me this weekend!</body>
      </note>';
    buffer2 varchar2(1000);
    BEGIN
    l_parser := dbe_xmlparser.newparser;
    -- Parse the document and create a new DOM document.
    dbe_xmlparser.PARSEBUFFER(l_parser, buffer);

    dbe_xmlparser.freeparser(l_parser);
  END;
  /
  ```

  Result: The operation is successful.

- DBE_XMLPARSER.PARSEBUFFER

  Parses XML documents stored in strings.

The stored procedure prototype of DBE_XMLPARSER.PARSEBUFFER is as follows:

```
DBE_XMLPARSER.PARSEBUFFER (
  p     IN     parser,
  doc   IN VARCHAR2);
```

Table 10-468 DBE_XMLPARSER.PARSEBUFFER parameters

Parameter	Description
p	Parser object
doc	A string that stores XML documents

NOTE

- The maximum length of a character string that can be parsed by the PARSEBUFFER function is 32767. If the length exceeds the maximum, an error is reported.
- Different from the database A, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsing, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value **"Ch..."** is not an enumerated value in the brackets. However, the database A does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case sensitive. **Baidu** cannot correspond to **baidu**. However, the database A does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the database A reports an error.
- Difference in parsing XML predefined entities: **'** and **"** are parsed and translated into ' and ". However, predefined entities in database A are not translated into characters.

Example:

```
-- Create a parser to parse character strings and print the obtained document.
DECLARE
  l_parser dbe_xmlparser.parser;
  l_doc dbe_xmldom.domdocument;
  buffer varchar2 :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>';
  buffer2 varchar2;
  BEGIN
  l_parser := dbe_xmlparser.newparser;
  dbe_xmlparser.PARSEBUFFER(l_parser, buffer);
  l_doc := dbe_xmlparser.getdocument(l_parser);

  dbe_xmldom.writetobuffer(l_doc, buffer2);
  RAISE NOTICE '%', buffer2;

  dbe_xmlparser.freeparser(l_parser);
  dbe_xmldom.freedocument(l_doc);
```

```
END;
/
```

Execution result:

```
NOTICE:  <?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>
```

- DBE_XMLPARSER.PARSECLOB

  Parses XML documents stored in a CLOB.

  The stored procedure prototype of DBE_XMLPARSER.PARSECLOB is as follows:

```
DBE_XMLPARSER.PARSECLOB (
  p     IN     parser,
  doc   IN CLOB);
```

Table 10-469 DBE_XMLPARSER.PARSECLOB parameters

Parameter	Description
p	Parser object
doc	A CLOB that stores XML documents

NOTE

- PARSECLOB cannot parse CLOBs greater than or equal to 2 GB.
- Different from the database A, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsing, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value **"Ch..."** is not an enumerated value in the brackets. However, the database A does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case sensitive. **Baidu** cannot correspond to **baidu**. However, the database A does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the database A reports an error.
- Difference in parsing XML predefined entities: **'** and **"** are parsed and translated into ' and ". However, predefined entities in database A are not translated into characters.

Example:

```
-- Create a parser to parse character strings and print the obtained document.
DECLARE

 l_clob clob :=
'<?xml version="1.0" encoding="UTF-8"?>
 <note>
 <to>Tove</to>
 <from>Jani</from>
 <heading>Reminder</heading>
 <body>this weekend!</body>
 </note>';
```

```
-- Create a parser.
l_parser dbe_xmlparser.parser;
l_doc dbe_xmldom.domdocument;
buffer varchar2(1000);
BEGIN
l_parser := dbe_xmlparser.newparser;
-- Parse the document and create a new DOM document.
dbe_xmlparser.parseclob(l_parser, l_clob);
l_doc := dbe_xmlparser.getdocument(l_parser);
dbe_xmldom.writetobuffer(l_doc, buffer);
RAISE NOTICE '%',buffer;

dbe_xmlparser.freeparser(l_parser);
dbe_xmldom.freedocument(l_doc);

END;
/
```

Execution result:

```
NOTICE:  <?xml version="1.0" encoding="UTF-8"?>
<note>
 <to>Tove</to>
 <from>Jani</from>
 <heading>Reminder</heading>
 <body>this weekend!</body>
</note>
```

- DBE_XMLPARSER.SETVALIDATIONMODE

  Sets the parsing validation mode of a specified parser.

  The stored procedure prototype of DBE_XMLPARSER.SETVALIDATIONMODE is as follows:

```
DBE_XMLPARSER.SETVALIDATIONMODE(
 p     IN     parser)
 yes   IN BOOLEAN);
```

Table 10-470 DBE_XMLPARSER.SETVALIDATIONMODE parameters

Parameter	Description
p	Parser object
yes	Mode to be set: • **TRUE**: DTD validation is enabled. • **FALSE**: DTD validation is disabled.

NOTE

- If the input parameter **yes** of the SETVALIDATIONMODE function is null, the parsing validation mode of the parser is not changed.
- By default, the DTD validation is enabled during parser initialization.

Example 1:

```
-- Create a parser. The XML character string to be parsed does not match the DTD format.
-- If setValidationMode is set to false, the string can be parsed. If setValidationMode is set to true, an error is reported during parsing.
DECLARE
 l_clob clob :=
'<!DOCTYPE note [
<!ELEMENT note (to,from,heading,body)>
<!ELEMENT to (#PCDATA)>
```

```
<!ELEMENT from (#PCDATA)>
<!ELEMENT heading (#PCDATA)>
<!ELEMENT body (#PCDATA)>
]>
<table>
<name attr1="WEB" attr2="web2">African Coffee Table</name>
<width>80</width>
<length>120</length>
</table>';
 l_parser dbe_xmlparser.parser;
 l_doc dbe_xmldom.domdocument;
buffer varchar2(1000);
 BEGIN
 l_parser := dbe_xmlparser.newparser;
 -- Set it to false for parsing.
   dbe_xmlparser.setValidationMode(l_parser, false);
   dbe_xmlparser.parseclob(l_parser, l_clob);
   l_doc := dbe_xmlparser.getdocument(l_parser);
   dbe_xmldom.writetobuffer(l_doc, buffer);
   RAISE NOTICE '%', buffer;
   dbe_xmlparser.freeparser(l_parser);
   dbe_xmldom.freedocument(l_doc);
 END;
 /
```

Execution result:

```
NOTICE:  <?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE note [
<!ELEMENT note (to , from , heading , body)>
<!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)>
<!ELEMENT heading (#PCDATA)>
<!ELEMENT body (#PCDATA)>
]>
<table>
 <name attr1="WEB" attr2="web2">African Coffee Table</name>
 <width>80</width>
 <length>120</length>
 </table>
```

Example 2:

```
-- Create a parser. The XML character string to be parsed does not match the DTD format.
-- An error is reported during parsing after setValidationMode is set to true.
DECLARE
  l_clob clob :=
 '<!DOCTYPE note [
 <!ELEMENT note (to,from,heading,body)>
 <!ELEMENT to (#PCDATA)>
 <!ELEMENT from (#PCDATA)>
 <!ELEMENT heading (#PCDATA)>
 <!ELEMENT body (#PCDATA)>
 ]>
 <table>
 <name attr1="WEB" attr2="web2">African Coffee Table</name>
 <width>80</width>
 <length>120</length>
 </table>';
 l_parser dbe_xmlparser.parser;
 l_doc dbe_xmldom.domdocument;
buffer varchar2(1000);
 BEGIN
 l_parser := dbe_xmlparser.newparser;
 -- Set it to true for parsing.
--The XML character string does not match the DTD format. An error is expected.
   dbe_xmlparser.setValidationMode(l_parser, true);
   dbe_xmlparser.parseclob(l_parser, l_clob);
   l_doc := dbe_xmlparser.getdocument(l_parser);
   dbe_xmldom.writetobuffer(l_doc, buffer);
   dbe_xmlparser.freeparser(l_parser);
   dbe_xmldom.freedocument(l_doc);
```

```
END;
/
```

Execution result:

```
An error is reported during xmlparser parsing.
ERROR:  invalid XML document
```

10.12.2.21 DBE_DESCRIBE

Data Types

The advanced package **DBE_DESCRIBE** has two built-in data types. The two data types are created using user-defined types and are used for the return values of the DESCRIBE_PROCEDURE API.

- DBE_DESCRIBE.NUMBER_TABLE

  This type is the TABLE type of NUMBER and is implemented through the TABLE OF syntax.

  The prototype of the DBE_DESCRIBE.NUMBER_TABLE type is as follows:

  ```
  CREATE TYPE DBE_DESCRIBE.NUMBER_TABLE AS TABLE OF NUMBER INDEX BY INTEGER;
  ```

- DBE_DESCRIBE.VARCHAR2_TABLE

  This type is the TABLE type of VARCHAR2 and is implemented through the TABLE OF syntax.

  The prototype of the DBE_DESCRIBE.VARCHAR2_TABLE type is as follows:

  ```
  CREATE TYPE DBE_DESCRIBE.VARCHAR2_TABLE AS TABLE OF VARCHAR2(30) INDEX BY INTEGER;
  ```

API Description

The advanced package **DBE_DESCRIBE** provides the DESCRIBE_PROCEDURE API to return the parameter information (such as parameter names and parameter data types) of functions or stored procedures in a list.

Table 10-471 DBE_DESCRIBE overview

API	Description
DBE_DESCRIBE.DESCRIBE_PROCEDURE	Displays the parameters of a stored procedure or function.

- DBE_DESCRIBE.DESCRIBE_PROCEDURE

  The stored procedure DESCRIBE_PROCEDURE is used to display the parameter information of a stored procedure or function, such as the parameter name, parameter mode, and parameter location. The parameter information of a function or stored procedure is returned in a list.

  The prototype of the DBE_DESCRIBE.DESCRIBE_PROCEDURE function is as follows:

  ```
  DBE_DESCRIBE.DESCRIBE_PROCEDURE(
    object_name               IN  VARCHAR2,
    reserved1                 IN  VARCHAR2,
    reserved2                 IN  VARCHAR2,
    overload                  OUT DBE_DESCRIBE.NUMBER_TABLE,
  ```

```
 dataposition              OUT DBE_DESCRIBE.NUMBER_TABLE,
 datalevel                 OUT DBE_DESCRIBE.NUMBER_TABLE,
 argument_name             OUT DBE_DESCRIBE.VARCHAR2_TABLE,
 datatype                  OUT DBE_DESCRIBE.NUMBER_TABLE,
 default_value             OUT DBE_DESCRIBE.NUMBER_TABLE,
 in_out                    OUT DBE_DESCRIBE.NUMBER_TABLE,
 datalength                OUT DBE_DESCRIBE.NUMBER_TABLE,
 dataprecision             OUT DBE_DESCRIBE.NUMBER_TABLE,
 scale                     OUT DBE_DESCRIBE.NUMBER_TABLE,
 radix                     OUT DBE_DESCRIBE.NUMBER_TABLE,
 spare                     OUT DBE_DESCRIBE.NUMBER_TABLE,
 include_string_constraints OUT BOOLEAN
);
```

Table 10-472 DBE_DESCRIBE.DESCRIBE_PROCEDURE API

Parameter	Type	Whether NULL Is Allowed	Description
object_name	varchar2	No	Stored procedure name. The syntax format of this parameter is [[*schema*.]*package*.]*function*[@*dblink*], in which: • *schema* (optional): schema name. • *package* (optional): package name. • *function* (mandatory): name of a function or stored procedure. • *dblink* (optional): remote connection name.
reserved1	varchar2	Yes	Reserved parameter.
reserved2	varchar2	Yes	Reserved parameter.
overload	number_table	Yes	Unique ID assigned to a stored procedure or function. If a stored procedure or function is overloaded, overload is each overload of the stored procedure or function. Overload is numbered from 1 in ascending order based on the entire stored procedure or function. If a stored procedure or function is not overloaded, **overload** is set to **0**.
dataposition	number_table	Yes	Position of a specified parameter in the parameter list.
datalevel	number_table	Yes	It is set to **0**.

Parameter	Type	Whether NULL Is Allowed	Description
argument_name	varchar2_table	Yes	Name of the parameter associated with the specified stored procedure.
datatype	number_table	Yes	OID of the data type of the specified parameter.
default_value	number_table	Yes	If the specified parameter has a default value, the value is **1**. Otherwise, the value is **0**.
in_out	number_table	Yes	Parameter mode. The options are as follows: • **0**: IN • **1**: OUT • **2**: IN OUT
datalength	number_table	Yes	Not supported. Set it to **0** by default.
dataprecision	number_table	Yes	Not supported. Set it to **0** by default.
scale	number_table	Yes	Not supported. Set it to **0** by default.
radix	number_table	Yes	If the value is of the numeric type (such as **NUMBER** and **INTEGER**), **10** is returned. Otherwise, **0** is returned. For details about the numeric type, see **numeric types**.
spare	number_table	Yes	Reserved parameter. Set it to **0** by default.
include_string_constraints	Boolean	Yes	Reserved parameter, which does not need to be processed.

NOTE

- The data type of the **datatype** parameter is different from that of the A-compatible database. The GaussDB returns the OID of the data type, and the A-compatible database returns the number of the data type in the A-compatible database.
- The **include_string_constraints** parameter does not take effect on the stored procedure. The value of the **include_string_constraints** parameter does not change, and the return values of other parameters are not affected.
- The OIDs of the data types created by the create type operation are uncertain. Therefore, do not use these OIDs for fixed judgment.
- For the **dataposition** parameter, if a stored procedure is specified, the return value starts from **1**. If a function is specified, the return value starts from **0**. **0** indicates the position sequence number of the return value of the function.
- For the **argument_name** parameter, if a function is specified, the first position of the return value is empty. This position indicates the name of the return value of the described function (that is, the empty name).
- Do not directly specify a package. Otherwise, an error is reported.
- If you do not have the execute permission on a stored procedure, function, or package, the system considers that the stored procedure, function, or package does not exist and reports an error.
- The input parameters **reserved1** and **reserved2** are not involved in internal processing. Entering any character string does not affect the returned result.
- The advanced package cannot specify the stored procedures or functions obtained through DBLINK.
- You are advised to add the schema prefix before the specified stored procedure or function. If the schema prefix is omitted, the advanced package uses the schema of the current session to search for the entity to which the advanced package belongs. In this case, you need to change the value of **behavior_compat_options** to **bind_procedure_searchpath** for the advanced package to take effect.
- If the %type operation is used to obtain the data type from a table column, the constraint on the data type (such as NUMBER(3) and VARCHAR2(10)) is not retained.

Example:

```
-- Create a stored procedure to encapsulate the advanced package for printing return values.
CREATE PROCEDURE PRINT_DESCRIBE (obj_name IN VARCHAR2)
AS
  a_overload      DBE_DESCRIBE.NUMBER_TABLE;
  a_position      DBE_DESCRIBE.NUMBER_TABLE;
  a_level         DBE_DESCRIBE.NUMBER_TABLE;
  a_arg_name      DBE_DESCRIBE.VARCHAR2_TABLE;
  a_dty           DBE_DESCRIBE.NUMBER_TABLE;

10.12.2.22 prvt_ilm

The prvt_ilm API is an internal API of the ILM feature and cannot be directly called by users. Only the API names are listed and the API prototypes are not described.

API	Description
be_active_ado_window	The maintenance window updates the ilmadowindow triggering time and action.
be_create_ado_window_for_each_db	The maintenance window creates ilmadowindow in each database of the instance.
be_execute_ilm	The ilmadowind performs automatic evaluation.
flush_task_executestate	The automatic scheduling task updates the task status.
evaluate_obj_policy	Data objects are evaluated after scheduling is triggered.
change_be_ilm	dbe_ilm_admin.enable_ilm() and disable_ilm() help functions. This operation affects the overall ILM background scheduling of the cluster.
get_compression_ratio	dbe_compression.get_compression_ratio() help function.
get_compression_type	dbe_compression.get_compression_type() help function.
get_lastmodified_time	dbe_heat_map.row_heat_map() help function.
gs_ilm_ticker	The maintenance window performs an action, performs a dotting operation, and records the mapping between the LSN and time.
compress_blocks	prvt_ilm.ilm_job_action() help function.

API	Description
get_job_status	dbe_ilm.stop_ilm help function.
ilm_job_action	Executor of a compression task.
query_unfinishedjob_num	Queries whether there are jobs that are not complete, including jobs in the initial and running states.
ilm_seq_nextval	Obtains the next sequence value of the ILM.
ilm_seq_setval	Sets the current sequence value of the ILM.

10.12.2.23 DBE_XMLGEN

API Description

The **DBE_XMLGEN** system package converts the result of an SQL query into a standard XML format and returns the result. For details about all supported APIs, see **Table 2 DBE_XMLGEN**.

Table 10-473 DBE_XMLGEN data type

Type	Description
DBE_XMLGEN.CTXHANDLE	Data type used to store the XML output status.

NOTE

1. A maximum of 65,535 context handles can exist in a session. Closing the context handle does not reclaim the number.
2. The case of the table column and type in the output XML file is the same as that of the table field and type created by the user. If you need to write a large field and type name, use double quotation marks ("") to enclose the field and type name.
3. During NEWCONTEXTFROMHIERARCHY initialization, the SETNULLHANDLING, USENULLATTRIBUTEINDICATOR, and SETCONVERTSPECIALCHARS methods are used to set this parameter, but the setting does not take effect.

Table 10-474 DBE_XMLGEN

API	Description
DBE_XMLGEN.CONVERT	Encodes or decodes the input character string in XML format.
DBE_XMLGEN.NEWCONTEXT	Initializes the common context handle.

API	Description
DBE_XMLGEN.NEWCONTEXTFROMHIERARCHY	Initializes the context handle with recursive elements.
DBE_XMLGEN.SETCONVERTSPECIALCHARS	Specifies whether the output XML file needs to be encoded.
DBE_XMLGEN.SETNULLHANDLING	Sets how to display the null value in the XML file.
DBE_XMLGEN.SETROWSETTAG	Sets the name of the XML root node.
DBE_XMLGEN.SETROWTAG	Sets the tag name of each row of data in the XML file.
DBE_XMLGEN.USENULLATTRIBUTEINDICATOR	Adds the **xsi:nil="true"** attribute to the element where the **null** value is located in the XML file.
DBE_XMLGEN.USEITEMTAGSFORCOLL	Adds the suffix **'_item'** to the element where the variable of the array type is located.
DBE_XMLGEN.GETNUMROWSPROCESSED	Views the number of data rows returned by getxml or getxmltype last time.
DBE_XMLGEN.SETMAXROWS	Sets the maximum number of rows returned by getxml.
DBE_XMLGEN.SETSKIPROWS	Sets the number of SQL rows to be skipped.
DBE_XMLGEN.RESTARTQUERY	Restarts the SQL.
DBE_XMLGEN.GETXMLTYPE	Returns the XML text of the XMLTYPE type.
DBE_XMLGEN.GETXML	Returns the XML text of the CLOB type.
DBE_XMLGEN.CLOSECONTEXT	Disables the context handle.

- DBE_XMLGEN.CONVERT

  Encodes or decodes the input character string in XML format.

  The conversion is performed according to the following rules.

  Table 10-475 XML encoding rules

Original Value	Code Value
&	&

Original Value	Code Value
<	<
>	>
"	"
'	'

Function prototype:

```
DBE_XMLGEN.CONVERT(XMLSTR IN VARCHAR2, FLAG IN NUMBER := 0) RETURNS VARCHAR2;
DBE_XMLGEN.CONVERT(XMLCLOB IN CLOB, FLAG IN NUMBER := 0) RETURNS CLOB;
```

Parameter description

Table 10-476 DBE_XMLGEN.CONVERT parameters

Parameter	Description
XMLSTR	XML character string to be converted. The value is of the VARCHAR2 type.
XMLCLOB	XML character string to be converted. The value is of the CLOB type.
FLAG	Transcodes or decodes character strings. **0**: encoding. **1**: decoding.

Example:

```
-- XML decoding
SELECT DBE_XMLGEN.CONVERT('<foo/>', 1);
 convert
---------
 <foo/>
(1 row)
-- XML encoding
SELECT DBE_XMLGEN.CONVERT('<foo><qwe</foo>', 0);
            convert
--------------------------------
 &lt;foo&gt;&lt;qwe&lt;/foo&gt;
(1 row)
```

- DBE_XMLGEN.NEWCONTEXT

  Initializes the common context handle.

  Function prototype:

  ```
  DBE_XMLGEN.NEWCONTEXT(QUERYSTRING IN VARCHAR2) RETURNS DBE_XMLGEN.CTXHANDLE;
  DBE_XMLGEN.NEWCONTEXT(QUERYSTRING IN SYS_REFCURSOR) RETURNS
  DBE_XMLGEN.CTXHANDLE;
  ```

  Parameter description

Table 10-477 DBE_XMLGEN.NEWCONTEXT parameters

Parameter	Description
QUERYSTRING	Queries SQL statement or SYS_REFCURSOR used to generate XML files.

Example:

```
-- Preset data.
CREATE TABLE IF NOT EXISTS department(department_id NUMBER, department_name
VARCHAR2(30), manager NUMBER, location NUMBER);
INSERT INTO department VALUES(10, 'administrator', 200, 1700);
INSERT INTO department VALUES(11, 'aaa', 200, 1700);
INSERT INTO department VALUES(12, 'bbb', 300, 1600);
INSERT INTO department VALUES(13, 'ccc', 400, 1600);
INSERT INTO department VALUES(14, 'aaa</row><a>asd</a><row>', 400, 1600);
INSERT INTO department VALUES(15, NULL, 500,1600);
INSERT INTO department VALUES(16, '!@#$ %^&*()+-=<>/\"a3_a', 400, 1600);
-- Initialize the common context handle.

</row>
</rowset>
```

- DBE_XMLGEN.NEWCONTEXTFROMHIERARCHY

  Initializes the context handle with recursive elements.

  The data format must contain two columns. The first column is of the numeric type, and the second column is of the XML or XMLTYPE type. Generally, the value is generated by the connect by statement. The first column specifies the generation level.

  NOTE

  The number of nested layers in the generated XML file cannot exceed 50 million.

  Function prototype:

```
DBE_XMLGEN.NEWCONTEXTFROMHIERARCHY(QUERYSTRING IN VARCHAR2);
```

Parameter description

Table 10-478 DBE_XMLGEN.NEWCONTEXTFROMHIERARCHY parameters

Parameter	Description
QUERYSTRING	XML character string to be converted. The value is of the VARCHAR2 type.

Example:

```
-- Preset data.
CREATE TABLE tree_list(id NUMBER, name VARCHAR2(30), fid NUMBER);
INSERT INTO tree_list VALUES(1, 'a', NULL);
INSERT INTO tree_list VALUES(6, 'a-1-2', 2);
INSERT INTO tree_list VALUES(2, 'a-1', 1);
INSERT INTO tree_list VALUES(3, 'a-2', 1);
INSERT INTO tree_list VALUES(4, 'a-3', 1);
INSERT INTO tree_list VALUES(5, 'a-1-1', 2);
INSERT INTO tree_list VALUES(7, 'a-2-1', 3);
INSERT INTO tree_list VALUES(8, 'a-2-2', 3);
INSERT INTO tree_list VALUES(9, 'a-3-1', 4);
INSERT INTO tree_list VALUES(10, 'a-3-2', 4);
INSERT INTO tree_list VALUES(11, 'a-3-2-1', 10);
INSERT INTO tree_list VALUES(12, 'a-3-2-1-1', 11);
INSERT INTO tree_list VALUES(13, 'a-3-2-1-1-1', 12);
INSERT INTO tree_list VALUES(14, 'a-3-2-1-1-1-1', 13);
INSERT INTO tree_list VALUES(15, 'a-3-2-1-1-1-1-1', 14);

  </children>
 </children>
</children>
```

- DBE_XMLGEN.SETCONVERTSPECIALCHARS

  Specifies whether the output XML file needs to be encoded. If XML encoding is canceled, XML injection may occur. If the XML is secured and the performance is considered, XML encoding is not required.

  Function prototype:

  ```
  DBE_XMLGEN.SETCONVERTSPECIALCHARS(CTX IN DBE_XMLGEN.CTXHANDLE, CONV IN BOOLEAN);
  ```

  Parameter description

  Table 10-479 DBE_XMLGEN.SETCONVERTSPECIALCHARS parameters

Parameter	Description
CTX	Context handle.
CONV	Specifies whether to encode the output XML file. • **true**: yes • **false**: no

  Example:

  ```
  -- Preset data.
  CREATE TABLE IF NOT EXISTS department(department_id NUMBER, department_name
  VARCHAR2(30), manager NUMBER, location NUMBER);
  INSERT INTO department VALUES(10, 'administrator', 200, 1700);
  INSERT INTO department VALUES(11, 'aaa', 200, 1700);
  INSERT INTO department VALUES(12, 'bbb', 300, 1600);
  INSERT INTO department VALUES(13, 'ccc', 400, 1600);
  ```

```
INSERT INTO department VALUES(14, 'aaa</row><a>asd</a><row>', 400, 1600);
INSERT INTO department VALUES(15, NULL, 500,1600);
INSERT INTO department VALUES(16, '!@#$ %^&*()+-=<>/\"a3_a', 400, 1600);
-- XML encoding.

```

- DBE_XMLGEN.USENULLATTRIBUTEINDICATOR

  Adds the **xsi:nil="true"** attribute to the element where the **null** value is located in the XML file.

  Function prototype:

  ```
  DBE_XMLGEN.USENULLATTRIBUTEINDICATOR(CTX IN DBE_XMLGEN.CTXHANDLE, ATTRIND IN
  BOOLEAN);
  ```

  Parameter description

  Table 10-483 DBE_XMLGEN.USENULLATTRIBUTEINDICATOR parameters

Parameter	Description
CTX	Context handle.
ATTRIND	None.

  Example:

  ```
  -- Preset data.
  CREATE TABLE IF NOT EXISTS department(department_id NUMBER, department_name
  VARCHAR2(30), manager NUMBER, location NUMBER);
  INSERT INTO department VALUES(10, 'administrator', 200, 1700);
  INSERT INTO department VALUES(11, 'aaa', 200, 1700);
  INSERT INTO department VALUES(12, 'bbb', 300, 1600);
  INSERT INTO department VALUES(13, 'ccc', 400, 1600);
  INSERT INTO department VALUES(14, 'aaa</row><a>asd</a><row>', 400, 1600);
  INSERT INTO department VALUES(15, NULL, 500,1600);
  INSERT INTO department VALUES(16, '!@#$ %^&*()+-=<>/\"a3_a', 400, 1600);
  -- Add the xsi:nil="true" attribute to the null value.
  DECLARE
      result CLOB;
      qryctx DBE_XMLGEN.CTXHANDLE;
  BEGIN
      qryctx:=DBE_XMLGEN.NEWCONTEXT('SELECT * from department where department_id=15');
      DBE_XMLGEN.USENULLATTRIBUTEINDICATOR(qryctx, true);
      result:=DBE_XMLGEN.GETXML(qryctx);
      DBE_OUTPUT.PUT_LINE(result);
      DBE_XMLGEN.CLOSECONTEXT(qryctx);
  END;
  /
  <?xml version="1.0"?>
  ```

```
<rowset xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
<row>
  <department_id>15</department_id>
  <department_name xsi:nil="true"/>
  <manager>500</manager>
  <location>1600</location>
</row>
</rowset>
```

- DBE_XMLGEN.USEITEMTAGSFORCOLL

  Adds the suffix **'_item'** to the element where the variable of the array type is located.

  Function prototype:

  ```
  DBE_XMLGEN.USEITEMTAGSFORCOLL(CTX IN DBE_XMLGEN.CTXHANDLE);
  ```

  Parameter description

  Table 10-484 DBE_XMLGEN.USEITEMTAGSFORCOLL parameters

Parameter	Description
CTX	Context handle.

  Example:

  ```
  -- Preset data.
  CREATE TABLE test_for_array(id INT[]);
  INSERT INTO test_for_array VALUES(ARRAY[1,2,3]);
  SELECT DBE_XMLGEN.GETXML('SELECT * from test_for_array');
  -- The suffix '_item' is added to the array type.
  DECLARE
  qryctx DBE_XMLGEN.CTXHANDLE;
  result CLOB;
  BEGIN
      qryctx := DBE_XMLGEN.NEWCONTEXT('SELECT * from test_for_array');
      DBE_XMLGEN.useItemTagsForColl(qryctx);
      result:=DBE_XMLGEN.GETXML(qryctx);
      DBE_XMLGEN.CLOSECONTEXT(qryctx);
      DBE_OUTPUT.PUT_LINE(result);
  END;
  /
  <?xml version="1.0"?>
  <rowset>
  <row>
    <id>
      <int4_ITEM>1</int4_ITEM>
      <int4_ITEM>2</int4_ITEM>
      <int4_ITEM>3</int4_ITEM>
    </id>
  </row>
  </rowset>
  ```

- DBE_XMLGEN.GETNUMROWSPROCESSED

  Views the number of data rows returned by getxml or getxmltype last time.

  Function prototype:

  ```
  DBE_XMLGEN.GETNUMROWSPROCESSED(CTX IN DBE_XMLGEN.CTXHANDLE);
  ```

  Parameter description

Table 10-485 DBE_XMLGEN.GETNUMROWSPROCESSED parameters

Parameter	Description
CTX	Context handle.

Example:

```
-- Preset data.
CREATE TABLE IF NOT EXISTS department(department_id NUMBER, department_name
VARCHAR2(30), manager NUMBER, location NUMBER);
INSERT INTO department VALUES(10, 'administrator', 200, 1700);

```

- DBE_XMLGEN.CLOSECONTEXT

  Disables the context handle.

  Function prototype:

  ```
  DBE_XMLGEN.CLOSECONTEXT(CTX IN DBE_XMLGEN.CTXHANDLE);
  ```

  Parameter description

  Table 10-491 DBE_XMLGEN.CLOSECONTEXT parameters

Parameter	Description
CTX	Context handle.

  Example:

```
CREATE TABLE IF NOT EXISTS department(department_id NUMBER, department_name
VARCHAR2(30), manager NUMBER, location NUMBER);
INSERT INTO department VALUES(10, 'administrator', 200, 1700);
INSERT INTO department VALUES(11, 'aaa', 200, 1700);
INSERT INTO department VALUES(12, 'bbb', 300, 1600);
INSERT INTO department VALUES(13, 'ccc', 400, 1600);
INSERT INTO department VALUES(14, 'aaa</row><a>asd</a><row>', 400, 1600);
INSERT INTO department VALUES(15, NULL, 500,1600);
INSERT INTO department VALUES(16, '!@#$ %^&*()+-=<>/\"a3_a', 400, 1600);
-- Disable the context.
DECLARE
    qryctx DBE_XMLGEN.CTXHANDLE;
    result CLOB;
BEGIN
 qryctx := DBE_XMLGEN.NEWCONTEXT('SELECT * from department where department_id=14');
 DBE_XMLGEN.SETCONVERTSPECIALCHARS(qryctx, false);
 result:=DBE_XMLGEN.GETXML(qryctx);
 DBE_XMLGEN.CLOSECONTEXT(qryctx);
 DBE_OUTPUT.PUT_LINE(result);
END;
/
<?xml version="1.0"?>
<rowset>
<row>
 <department_id>14</department_id>
 <department_name>aaa</row><a>asd</a><row></department_name>
 <manager>400</manager>
 <location>1600</location>
</row>
</rowset>
```

10.13 Retry Management

Retry is a process in which the database executes an SQL statement or stored procedure (including anonymous block) again in the case of execution failure, improving the execution success rate and user experience. The database checks the error code and retry configuration to determine whether to retry.

- If the execution fails, the system rolls back the executed statements and executes the stored procedure again.

  Example:

```
gaussdb=# CREATE OR REPLACE PROCEDURE retry_basic ( IN  x INT)
AS
BEGIN
     INSERT INTO t1 (a) VALUES (x);
     INSERT INTO t1 (a) VALUES (x+1);
END;
/
CREATE PROCEDURE
gaussdb=# CALL retry_basic(1);
ERROR:  relation "t1" does not exist on datanode
LINE 1: INSERT INTO t1 (a) VALUES (x)
                    ^
QUERY:  INSERT INTO t1 (a) VALUES (x)
CONTEXT:  PL/pgSQL function retry_basic(integer) line 3 at SQL statement
```

10.14 Debugging

Syntax

RAISE

The syntax of RAISE is as follows:

Figure 10-36 raise_format::=

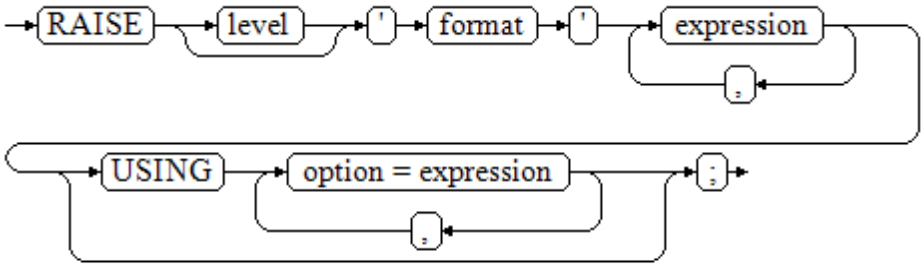

Figure 10-37 raise_condition::=

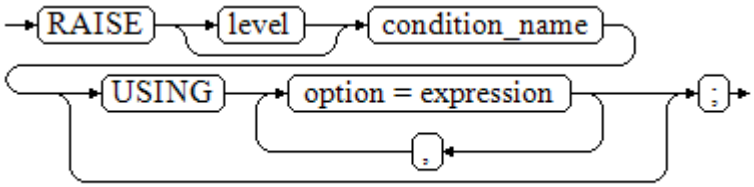

Figure 10-38 raise_sqlstate::=

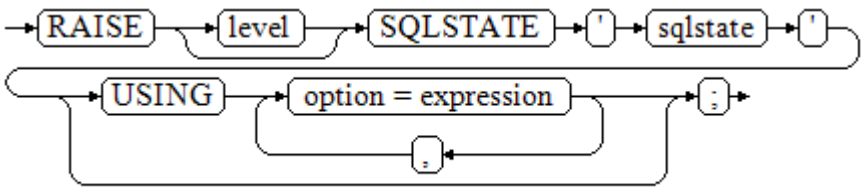

Figure 10-39 raise_option::=

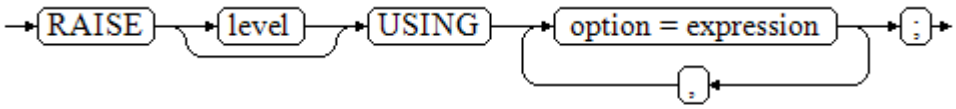

Figure 10-40 raise::=

Parameter description:

- The **level** option is used to specify the error level, that is, **DEBUG**, **LOG**, **INFO**, **NOTICE**, **WARNING**, or **EXCEPTION** (default). **EXCEPTION** throws an error that normally terminates the current transaction and the others only generate information at their levels. The GUC parameters **log_min_messages** and **client_min_messages** determine whether the error messages of specific levels are reported to the client and are written to the server log.
- **format**: specifies the error message text to be reported, a format string. The format string can be appended with an expression for insertion to the message text. In a format string, **%** is replaced by the parameter value attached to format and **%%** is used to print **%**. For example:

```
--v_job_id replaces % in the string.
RAISE NOTICE 'Calling cs_create_job(%)',v_job_id;
```

- **option = expression**: inserts additional information to an error report. The keyword option can be **MESSAGE**, **DETAIL**, **HINT**, or **ERRCODE**, and each expression can be any string.
  - **MESSAGE**: specifies the error message text. This option cannot be used in a **RAISE** statement that contains a format character string in front of **USING**.
  - **DETAIL**: specifies detailed information of an error.
  - **HINT**: prints hint information.
  - **ERRCODE**: designates an error code (SQLSTATE) to a report. A condition name or a five-character SQLSTATE error code can be used.
- **condition_name**: specifies the condition name corresponding to the error code.
- **sqlstate**: specifies the error code.

If neither a condition name nor an **SQLSTATE** is designated in a **RAISE EXCEPTION** command, the **RAISE EXCEPTION (P0001)** is used by default. If no message text is designated, the condition name or SQLSTATE is used as the message text by default.

NOTICE

- If the **SQLSTATE** designates an error code, the error code is not limited to a defined error code. It can be any error code containing five digits or ASCII uppercase rather than **00000**. Do not use an error code ended with three zeros because such error codes are category codes and can be captured by the whole category.
- In O-compatible mode, SQLCODE is equivalent to SQLSTATE.

NOTE

The syntax described in **Figure 10-40** does not append any parameter. This form is used only for the **EXCEPTION** statement in a **BEGIN** block so that the error can be re-processed.

EXCEPTION_INIT

In O-compatible mode, EXCEPTION_INIT can be used to define the SQLCODE error code. The syntax is as follows:

Figure 10-41 exception_init::=

Parameter description:

- **exception_name** indicates the name of the exception declared by the user. The EXCEPTION_INIT syntax must follow the declared exception.
- **sqlcode** is a customized SQL code, which must be a negative integer ranging from –2147483647 to –1.

Precautions:

- This function can be used in A-compatible mode but cannot be bound to system error codes.
- Only exception_init can be used to assign a value to sqlcode joined with exception. Other value assignment modes are invalid.
- Cross-database.schema.package.exception calling is not supported.

NOTICE

When **EXCEPTION_INIT** is used to customize an SQL code, SQLSTATE is equivalent to SQLCODE, and SQLERRM is in the format of *xxx*: **non-GaussDB Exception**. For example, if the customized SQL code is **–1**, SQLSTATE is **–1** and SQLERRM is **1: non-GaussDB Exception**.

Examples

Display error and hint information when a transaction terminates:

```
CREATE OR REPLACE PROCEDURE proc_raise1(user_id in integer)
AS
```

```
BEGIN
RAISE EXCEPTION 'Noexistence ID --> %',user_id USING HINT = 'Please check your user ID';
END;
/

call proc_raise1(300011);

-- Execution result:
ERROR:  Noexistence ID --> 300011
HINT:  Please check your user ID
```

Two methods are available for setting **SQLSTATE**:

```
CREATE OR REPLACE PROCEDURE proc_raise2(user_id in integer)
AS
BEGIN
RAISE 'Duplicate user ID: %',user_id USING ERRCODE = 'unique_violation';
END;
/

\set VERBOSITY verbose
call proc_raise2(300011);

-- Execution result:
ERROR:  Duplicate user ID: 300011
SQLSTATE: 23505
LOCATION:  exec_stmt_raise, pl_exec.cpp:3482
```

If the main parameter is a condition name or **SQLSTATE**, the following applies:

RAISE division_by_zero;

RAISE SQLSTATE '22012';

For example:

```
CREATE OR REPLACE PROCEDURE division(div in integer, dividend in integer)
AS
DECLARE
res int;
    BEGIN
    IF dividend=0 THEN
        RAISE division_by_zero;
        RETURN;
    ELSE
        res := div/dividend;
        RAISE INFO 'division result: %', res;
        RETURN;
    END IF;
    END;
/
call division(3,0);

-- Execution result:
ERROR:  division_by_zero
```

Alternatively:

```
RAISE unique_violation USING MESSAGE = 'Duplicate user ID: ' || user_id;
```

In O-compatible mode, EXCEPTION_INIT can be used to customize error codes SQLCODE.

```
declare
    deadlock_detected exception;
    pragma exception_init(deadlock_detected, -1);
begin
    if 1 > 0 then
        raise deadlock_detected;
    end if;
exception
```

```
    when deadlock_detected then
        raise notice 'sqlcode:%,sqlstate:%,sqlerrm:%',sqlcode,sqlstate,sqlerrm;
end;
/
-- Execution result:
NOTICE:  sqlcode:-1,sqlstate:-1,sqlerrm: 1: non-GaussDB Exception
```

10.15 Package

A package is a combination of PL/SQL programs, such as stored procedures, functions, variables, constants, and cursors. It is object-oriented and can encapsulate PL/SQL program design elements. Functions in a package are created, deleted, and modified in a unified manner.

A package contains two parts: package specifications and package body. The declaration contained in the package specifications can be accessed by external functions and anonymous blocks. The declaration contained in the package body cannot be accessed by external functions or anonymous blocks, but can be accessed only by functions and stored procedures in the package body.

For details about how to create a package, see **CREATE PACKAGE**.

NOTICE

- Cross-package variables cannot be used as control variables in the for loops.
- Types defined in a package cannot be deleted or modified, and cannot be used to define tables.
- Cursor variables cannot be referenced in SCHEMA.PACKAGE.CURSOR mode.
- A cursor with parameters can be opened only in the current package.
- A package variable cannot be used as the default value of a function or stored procedure parameter.

11 Autonomous Transaction

An autonomous transaction is an independent transaction that is started during the execution of a primary transaction. Committing and rolling back an autonomous transaction does not affect the data that has been committed by the primary transaction. In addition, an autonomous transaction is not affected by the primary transaction.

Autonomous transactions are defined in stored procedures, functions, anonymous blocks, and packages, and are declared using the **PRAGMA AUTONOMOUS_TRANSACTION** keyword.

11.1 Restrictions

CAUTION

- When an autonomous transaction is executed, an autonomous transaction session is started in the background. You can use **max_concurrent_autonomous_transactions** to set the maximum number of concurrent autonomous transactions. The value range is 0 to 10000, and the default value is **10**.
- When **max_concurrent_autonomous_transactions** is set to **0**, autonomous transactions cannot be executed.
- After a new session is started for an autonomous transaction, the default session parameters are used and objects (including session-level variables, local temporary variables, and global temporary table data) of the primary session are not shared.
- Theoretically, the upper limit of autonomous transactions is 10000. Actually, the upper limit is a dynamic value. For details, see the description of the GUC parameter **max_concurrent_autonomous_transactions**.
- Autonomous transactions are affected by the communication buffer. The size of the information returned to the client is limited by the length of the communication buffer. If the size exceeds the length of the communication buffer, an error is reported.

- A trigger function does not support autonomous transactions.

```
gaussdb=# CREATE TABLE test_trigger_des_tbl(id1 int, id2 int, id3 int);
CREATE TABLE

gaussdb=# CREATE OR REPLACE FUNCTION tri_insert_func() RETURNS TRIGGER AS
$$
DECLARE
PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
INSERT INTO test_trigger_des_tbl VALUES(new.id1, new.id2, new.id3);
RETURN new;
END$$ LANGUAGE plpgsql;
ERROR:  Triggers do not support autonomous transactions
DETAIL:  N/A

gaussdb=# DROP TABLE test_trigger_des_tbl;
DROP TABLE
```

- Autonomous transactions cannot be called by non-top-layer anonymous blocks (but can only be called by top-layer autonomous transactions, including stored procedures, functions, and anonymous blocks).

```
gaussdb=# CREATE TABLE t1(a INT ,b TEXT);
CREATE TABLE

gaussdb=# DECLARE
--PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
DECLARE
PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
DBE_OUTPUT.PRINT_LINE('JUST USE CALL.');
INSERT INTO t1 VALUES(1,'CAN YOU ROLLBACK!');
END;
INSERT INTO t1 VALUES(2,'I WILL ROLLBACK!');
ROLLBACK;
END;
/
JUST USE CALL.
ANONYMOUS BLOCK EXECUTE
gaussdb=# SELECT * FROM t1;
 a | b
---+---
(0 rows)

gaussdb=# DROP TABLE t1;
DROP TABLE
```

- In an autonomous transaction, the **ref cursor** parameter can be passed only through the **PROCEDURE OUT** parameter. The **ref cursor** parameter cannot be passed through **IN**, **INOUT**, or **FUNCTION**. In a stored procedure, the **ref cursor** parameter can be passed only through the **OUT** parameter of an autonomous transaction. The **ref cursor** parameter cannot be directly called on the client (such as gsql and JDBC).

```
-- Create a table.
gaussdb=# CREATE TABLE sections(section_id INT);
CREATE TABLE
gaussdb=# INSERT INTO sections VALUES(1);
INSERT 0 1
gaussdb=# INSERT INTO sections VALUES(1);
INSERT 0 1
gaussdb=# INSERT INTO sections VALUES(1);
INSERT 0 1
gaussdb=# INSERT INTO sections VALUES(1);
INSERT 0 1
```

  a. The **PROCEDURE OUT** output parameter passes the **ref cursor** parameter (supported).

```
gaussdb=# CREATE OR REPLACE PROCEDURE proc_sys_ref(OUT c1 REFCURSOR)
IS
DECLARE
  PRAGMA AUTONOMOUS_TRANSACTION;

gaussdb=# DROP TABLE test_in;
DROP TABLE
```

11.2 Stored Procedure Supporting Autonomous Transaction

An autonomous transaction can be defined in a stored procedure. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a stored procedure. For details, see **CREATE PROCEDURE**. The following is an example.

```
-- Create a table.
gaussdb=# CREATE TABLE t2(a INT, b INT);
CREATE TABLE
gaussdb=# INSERT INTO t2 VALUES(1,2);
INSERT 0 1
gaussdb=# SELECT * FROM t2;
 a | b
```

```
---+---
 1 | 2
(1 row)

-- Create a stored procedure that contains an autonomous transaction.
gaussdb=# CREATE OR REPLACE PROCEDURE autonomous_4(a INT, b INT)  AS
DECLARE
    num3 INT := a;
    num4 INT := b;
    PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
    INSERT INTO t2 VALUES(num3, num4);
    DBE_OUTPUT.PRINT_LINE('JUST USE CALL.');
END;
/
CREATE PROCEDURE
-- Create a common stored procedure that calls an autonomous transaction stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE autonomous_5(a INT, b INT)  AS
DECLARE
BEGIN
    DBE_OUTPUT.PRINT_LINE('JUST NO USE CALL.');
    INSERT INTO t2 VALUES(666, 666);
    autonomous_4(a,b);
    ROLLBACK;
END;
/
CREATE PROCEDURE
-- Call a common stored procedure.
gaussdb=# SELECT autonomous_5(11,22);
JUST NO USE CALL.
JUST USE CALL.
 autonomous_5
--------------

(1 row)

-- View the table result.
gaussdb=# SELECT * FROM t2 ORDER BY a;
 a  | b
----+----
  1 |  2
 11 | 22
(2 rows)

gaussdb=# DROP TABLE t2;
DROP TABLE
gaussdb=# DROP PROCEDURE autonomous_4;
DROP PROCEDURE
gaussdb=# DROP PROCEDURE autonomous_5;
DROP PROCEDURE
```

In the preceding example, a stored procedure containing an autonomous transaction is finally executed in a transaction block to be rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by the autonomous transaction.

11.3 Anonymous Block Supporting Autonomous Transaction

An autonomous transaction can be defined in an anonymous block. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating an

anonymous block. For details, see **Anonymous Blocks**. The following is an example.

```
gaussdb=# CREATE TABLE t1(a INT ,B TEXT);
CREATE TABLE

gaussdb=# START TRANSACTION;
START TRANSACTION

gaussdb=# DECLARE
    PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
    DBE_OUTPUT.PRINT_LINE('JUST USE CALL.');
    INSERT INTO t1 VALUES(1,'YOU ARE SO CUTE,WILL COMMIT!');
END;
/
JUST USE CALL.
ANONYMOUS BLOCK EXECUTE

gaussdb=# INSERT INTO t1 VALUES(1,'YOU WILL ROLLBACK!');
INSERT 0 1
gaussdb=# ROLLBACK;
ROLLBACK

gaussdb=# SELECT * FROM t1;
 a |             b
---+-----------------------------
 1 | YOU ARE SO CUTE,WILL COMMIT!
(1 row)

gaussdb=# DROP TABLE t1;
DROP TABLE
```

In the preceding example, an anonymous block containing an autonomous transaction is finally executed before a transaction block to be rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by the autonomous transaction.

11.4 Function Supporting Autonomous Transaction

An autonomous transaction can be defined in a function. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a function. For details, see **CREATE FUNCTION**. The following is an example.

```
gaussdb=# CREATE TABLE t4(a INT, b INT, c TEXT);
CREATE TABLE

gaussdb=# CREATE OR REPLACE FUNCTION autonomous_32(a INT ,b INT ,c TEXT) RETURN INT AS
DECLARE
    PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
    INSERT INTO t4 VALUES(a, b, c);
    RETURN 1;
END;
/
CREATE FUNCTION

gaussdb=# CREATE OR REPLACE FUNCTION autonomous_33(num1 INT) RETURN INT AS
DECLARE
    num3 INT := 220;
    tmp INT;
    PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
```

```
    num3 := num3/num1;
    RETURN num3;
EXCEPTION
    WHEN DIVISION_BY_ZERO THEN
        SELECT autonomous_32(num3, num1, SQLERRM) INTO tmp;
        ROLLBACK;
        RETURN 0;
END;
/
CREATE FUNCTION

gaussdb=# SELECT autonomous_33(0);
 autonomous_33
---------------
             0
(1 row)

gaussdb=# SELECT * FROM t4;
  a  | b |        c
-----+---+------------------
 220 | 0 | division by zero
(1 row)

gaussdb=# DROP TABLE t4;
DROP TABLE
gaussdb=# DROP FUNCTION autonomous_32;
DROP FUNCTION
gaussdb=# DROP FUNCTION autonomous_33;
DROP FUNCTION
```

In the preceding example, a function containing an autonomous transaction is finally executed in a transaction block to be rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by the autonomous transaction.

11.5 Package Supporting Autonomous Transaction

An autonomous transaction can be defined in a stored procedure or function in a package. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a stored procedure or function in a package. For details, see **CREATE PACKAGE**. The following is an example.

```
-- Create a table.
gaussdb=# CREATE TABLE t2(a INT, b INT);
CREATE TABLE
gaussdb=# INSERT INTO t2 VALUES(1,2);
INSERT 0 1
gaussdb=# SELECT * FROM t2;
 a | b
---+---
 1 | 2
(1 row)

-- Create a stored procedure or function in a package that contains autonomous transactions.
gaussdb=# CREATE OR REPLACE PACKAGE autonomous_pkg AS
  PROCEDURE autonomous_4(a INT, b INT);
  FUNCTION autonomous_32(a INT ,b INT) RETURN INT;
END autonomous_pkg;
/
CREATE PACKAGE
gaussdb=# CREATE OR REPLACE PACKAGE BODY autonomous_pkg AS
PROCEDURE autonomous_4(a INT, b INT)  AS
DECLARE
```

```
 num3 INT := a;
 num4 INT := b;
 PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
    INSERT INTO t2 VALUES(num3, num4);
END;
FUNCTION autonomous_32(a INT ,b INT) RETURN INT AS
DECLARE
    PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
    INSERT INTO t2 VALUES(a, b);
    RETURN 1;
END;
END autonomous_pkg;
/
CREATE PACKAGE BODY

-- Create a common stored procedure that calls a stored procedure or function from a package that
contains autonomous transactions.
gaussdb=# CREATE OR REPLACE PROCEDURE autonomous_5(a INT, b INT)  AS
DECLARE
va INT;
BEGIN
    INSERT INTO t2 VALUES(666, 666);
    autonomous_pkg.autonomous_4(a,b);
        va := autonomous_pkg.autonomous_32(a + 1, b + 1);
    ROLLBACK;
END;
/
CREATE PROCEDURE
-- Call a common stored procedure.
gaussdb=# SELECT autonomous_5(11,22);
 autonomous_5
--------------

(1 row)

-- View the table result.
gaussdb=# SELECT * FROM t2 ORDER BY a;
 a  | b
----+----
  1 |  2
 11 | 22
 12 | 23
(3 rows)

gaussdb=# DROP TABLE t2;
DROP TABLE
```

In the preceding example, a stored procedure or function in a package containing autonomous transactions is finally executed in a transaction block that is rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by an autonomous transaction.

12 System Catalogs and System Views

12.1 Overview of System Catalogs and System Views

System catalogs store the structured metadata of GaussDB. They are the source of information used by GaussDB to control system running and are a core component of the database system.

System views provide ways to query system catalogs and internal database status.

System catalogs and system views are visible to either system administrators or all users. Some of the following system catalogs and views have marked the need of administrator permissions. They are accessible only to administrators.

You can delete and rebuild the catalogs, add columns to them, and insert and update values in them, but doing so may make system information inconsistent and cause system faults. Generally, users should not modify system catalogs or system views, or rename their schemas. They are automatically maintained by the system.

NOTICE

- You are advised not to modify the permissions on system catalogs or system views.
- Do not add, delete, or modify system catalogs because doing so will result in exceptions or even database unavailability.
- For details about column types in system catalogs and system views, see **Data Types**.
- For ADM views, the accessed objects are all objects of this type in the database. Therefore, unified permission management is required for ADM views. By default, only the system administrator has the permission to access ADM views. Some ADM view data comes from public and non-sensitive columns in base tables. For DB views, the objects that the current user has the permission to access in the database can be queried. Common users can access these views. For MY views, objects to which the current user belongs can be queried. Common users can access these views.

12.2 System Catalogs

12.2.1 Partitioned Table

12.2.1.1 PG_PARTITION

PG_PARTITION records all partitioned tables, table partitions, and index partitions in the database. Partitioned index information is not stored in the system catalog PG_PARTITION. The partitioned table does not have actual physical files. Therefore, pg_partition does not record information such as **relfilenode**, **relpages**, **reltuples**, **reltoastrelid**, and **reltoastidxid**.

Table 12-1 PG_PARTITION columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
relname	name	Names of the partitioned tables, table partitions, TOAST tables on table partitions, and index partitions.
parttype	"char"	Object type. ● **'r'**: partitioned table. ● **'p'**: table partition. ● **'s'**: table subpartition. ● **'x'**: index partition.
parentid	oid	● OID of the partitioned table in PG_CLASS when the object is a partitioned table or a partition. ● OID of the level-1 partition in PG_PARTITION when the object is a level-2 partition. ● OID of the partitioned index when the object is an index partition.
rangenum	integer	Reserved column.
intervalnum	integer	Reserved column.

Name	Type	Description
partstrategy	"char"	Partitioning policy of the partitioned table. ● **'r'**: range partition. ● **'i'**: interval partition. ● **'l'**: list partition. ● **'a'**: automatically extended list partition. ● **'h'**: hash partition. ● **'n'**: no partition policy. The object is not a table partition.
relfilenode	oid	Physical storage locations of the table partition, index partition, and TOAST table on the table partition.
reltablespace	oid	OID of the tablespace containing the table partition, index partition, and TOAST table on the table partition.
relpages	double precision	Statistics: numbers of data pages of the table partition and index partition.
reltuples	double precision	Statistics: numbers of tuples of the table partition and index partition.
relallvisible	integer	Statistics: number of visible data pages of the table partition and index partition.
reltoastrelid	oid	OID of the TOAST table corresponding to the table partition.
reltoastidxid	oid	OID of the TOAST table index corresponding to the table partition.
indextblid	oid	OID of the table partition corresponding to the index partition.
indisusable	Boolean	Specifies whether the index partition is available.
relfrozenxid	xid32	Frozen transaction ID. To ensure forward compatibility, this column is reserved. The **relfrozenxid64** column is added to record the information.
intspnum	integer	Number of tablespaces that the interval partition belongs to.
partkey	int2vector	Column number of the partition key.
intervaltablespace	oidvector	Tablespace that the interval partition belongs to. Interval partitions fall in the tablespaces in the round-robin manner.

Name	Type	Description
interval	text[]	Interval value of the interval partition.
boundaries	text[]	Upper boundary of the range partition and interval partition.
transit	text[]	Transit of the interval partition.
reloptions	text[]	Storage attribute of a partition used for collecting online scale-out information. Same as **pg_class.reloptions**, it is expressed in a string in the format of *keyword*=*value*.
relfrozenxid64	xid	Frozen transaction ID.
relminmxid	xid	Frozen multi-transaction ID.
partitionno	integer	Used for maintaining the partition map of a partitioned table. ● If the object is a partition, this field indicates the partition ID, which starts from 1 in ascending order. ● If the object is a partitioned table, this field indicates the maximum partition ID and a negative value is used for special meaning. The value increases with the DDL syntax of some partitions. ● If the object is of other types, this field is null and has no meaning. **partitionno** is a permanent auto-increment column, which can be reset or reclaimed by using the syntax ALTER TABLE t_name RESET PARTITION.
subpartitionno	integer	Used for maintaining the map of level-2 partitions in a partitioned table. ● If the object is a level-2 partition, this field indicates the level-2 partition ID, which starts from 1 in ascending order. ● If the object is a level-1 partition in a level-2 partitioned table, this field indicates the maximum level-2 partition ID and a negative value is used for special meaning. This value increases with the DDL syntax of some partitions. ● If the object is of other types, this field is null and has no meaning. **subpartitionno** is a permanent auto-increment column, which can be reset or reclaimed by using the syntax ALTER TABLE t_name RESET PARTITION.

12.2.2 OLTP Table Compression

12.2.2.1 GS_ILM

The GS_ILM system catalog provides the main information about the ILM policy, including the policy name, policy owner, policy type, policy ID, and policy status.

Table 12-2 GS_ILM columns

Name	Type	Description
pidx	integer	Policy sequence number, which is globally unique and starts with 1.
creator	oid	Policy owner.
name	name	Policy name. Currently, the policy name cannot be customized. The default name is p+pidx.
ptype	"char"	Policy type: • **m**: data movement.
flag	smallint	Value range: • **0**: The policy is enabled. • **1**: The policy is disabled.

12.2.2.2 GS_ILM_JOBDETAIL

The GS_ILM_JOBDETAIL system catalog records policy action types and judgment conditions.

Table 12-3 GS_ILM_JOBDETAIL columns

Name	Type	Description
taskoid	bigint	OID of an ADO task.
jobtype	"char"	Current job type: compression ('c').
jobstatus	smallint	Current job status: • **1**: JOB CREATED • **2**: COMPLETED SUCCESSFULLY • **3**: FAILED • **4**: STOPPED • **5**: JOB CREATION FAILED

Name	Type	Description
jobname	text	The ADO job name is unique in the table and is joined with **job_name** in the PG_JOB system catalog.
starttime	timestamp with time zone	Start time.
completetime	timestamp with time zone	Completion time.
payload	text	PL/SQL code of the current job.
statistics	text	Statistics of the current job.
comments	text	Description of the current job execution, such as the failure cause.

12.2.2.3 GS_ILM_OBJECT

GS_ILM_OBJECT records the relationships between data objects and policies as well as the scheduling information of policies on the data objects. When a policy is set for a partitioned table, this catalog generates an independent record for each partition or subpartition.

Table 12-4 GS_ILM_OBJECT columns

Name	Type	Description
pidx	integer	Policy ID.
objoid	oid	OID of a logical data object which has a partitioned table and partitions with level-2 partitions.
dataobjoid	oid	OID of a physical data object, which is the entity that needs to execute the policy and the leaf of the tree-level partition relationship.
objtype	"char"	Current data object type. The options are as follows: • Table ('r') • Partition ('p') • Level-2 partition ('s')
origobjoid	oid	OID of the original object that defines the policy.

Name	Type	Description
origobjtype	"char"	Type of the original data object that defines the policy. The options are as follows: • Table ('r') • Partition ('p') • Level-2 partition ('s')
lastchktime	timestamp with time zone	Time of the last ADO task.
lastexetime	timestamp with time zone	Time of the last ADO job.
roundcnt	smallint	Number of successful rounds.
failcnt	smallint	Number of failures.
lastjobstatus	"char"	Execution status of the last job.
lastroundstarttime	timestamp with time zone	Start time of the full table scan.
lastjobblkid	bigint	ID of the block that has been processed by the job last time.
flag	smallint	Value range: • **0**: enabled. • **1**: disabled.

12.2.2.4 GS_ILM_PARAM

GS_ILM_PARAM is a feature parameter table, which records the parameters related to the ILM feature, such as the control parameters of background scheduling.

Table 12-5 GS_ILM_PARAM columns

Name	Type	Description
idx	smallint	Parameter ID.
name	name	Parameter name.
value	double precision	Parameter value.

Table 12-6 GS_ILM_PARAM feature parameter range

Parameter ID	Parameter Value	Description
1	EXECUTION_INTERVAL	Specifies the frequency of executing an ADO task, in minutes. The default value is **15**. The value is an integer or floating-point number greater than or equal to 1 and less than or equal to 2147483647. The value is rounded down.
2	RETENTION_TIME	Specifies the retention period of ADO-related history records, in days. The default value is **30**. The value is an integer or floating-point number greater than or equal to 1 and less than or equal to 2147483647. The value is rounded down.
7	ENABLE	Specifies the background scheduling status which cannot be modified in this interface. Otherwise, the message "Invalid argument value, ENABLED should be change by calling DBE_ILM_ADMIN.ENABLE_ILM and DBE_ILM_ADMIN.DISABLE_ILM" is displayed. Instead, use disable_ilm() and enable_ilm() to modify it.
11	POLICY_TIME	Specifies whether the time unit of ADO is day or second. The time unit second is used only for testing. The value can be **ILM_POLICY_IN_SECONDS** or **ILM_POLICY_IN_DAYS** (default value).
12	ABS_JOBLIMIT	Specifies the maximum number of ADO jobs generated by an ADO task. The value is an integer or floating-point number greater than or equal to 0 and less than or equal to 2147483647. The value is rounded down.
13	JOB_SIZELIMIT	Specifies the maximum number of bytes that can be processed by a single ADO job. The unit is MB. The value is an integer or floating-point number greater than or equal to 0 and less than or equal to 2147483647. The value is rounded down.
14	WIND_DURATION	Specifies the maintenance window duration, in minutes. The default value is 240 minutes (4 hours). The value is an integer greater than or equal to 0 and less than 1440 (24 hours).

Parameter ID	Parameter Value	Description
15	BLOCK_LIMITS	Specifies the upper limit of the instance-level row-store compression rate. The default value is **40**. The value ranges from 0 to 10000, in block/ms, indicating the maximum number of blocks that can be compressed per millisecond. **0** indicates that the rate is not limited.

12.2.2.5 GS_ILM_POLICY

The GS_ILM_POLICY system catalog records policy action types and judgment conditions.

Table 12-7 GS_ILM_POLICY columns

Name	Type	Description
pidx	integer	Policy ID.
action	"char"	Policy action. Only compression ('c') is supported.
ctype	"char"	Compression type. Only advanced row compression ('a') is supported.
condition	"char"	Condition type. Only LAST MODIFICATION('m') is supported.
days	smallint	Number of judgment days.
scope	"char"	Policy scope. Only row ('r') is supported.
predicate	pg_node_tree	Policy row-level expression.

12.2.2.6 GS_ILM_TASK

The GS_ILM_TASK system catalog records ADO task information, such as the creation time, start time, end time, and execution status.

Table 12-8 GS_ILM_TASK columns

Name	Type	Description
taskoid	bigint	OID of an ADO task.
creator	oid	Creator of an ADO task.

Name	Type	Description
createtime	timestamp with time zone	Creation time.
starttime	timestamp with time zone	Start time.
completetime	timestamp with time zone	Completion time.
executestate	smallint	Value range: • **1**: 'INACTIVE' • **2**: 'ACTIVE' • **3**: 'COMPLETED'
flag	smallint	Reserved column.

12.2.2.7 GS_ILM_TASKDETAIL

The GS_ILM_TASKDETAIL system catalog records the evaluation result of a specified data object and policy.

Table 12-9 GS_ILM_TASKDETAIL columns

Name	Type	Description
pidx	integer	Policy ID.
objoid	oid	Data OID.
objtype	"char"	Data object type.
taskoid	bigint	OID of an ADO task.
evalresult	smallint	Evaluation result: • **0**: SELECTED FOR EXECUTION. The evaluation is passed. • **1**: PRECONDITION NOT SATISFIED. The condition is not met. • **2**: JOB ALREADY EXISTS. The job already exists.
jobname	text	ADO job name generated after the evaluation is passed is joined with the **jobname** column in the **GS_ILM_JOBDETAIL** system catalog.

12.2.2.8 GS_ILM_TICKER

The GS_ILM_TICKER system catalog records the mapping between LSNs and time. A maximum of 3650 lines of records can be retained.

Table 12-10 GS_ILM_TICKER columns

Name	Type	Description
ilm_ticker_lsn	bigint	LSN when the dotting operation is triggered.
ilm_ticker_time	timestamp with time zone	Time when the dotting operation is triggered.

12.2.3 Encrypted Equality Query

12.2.3.1 GS_CLIENT_GLOBAL_KEYS

GS_CLIENT_GLOBAL_KEYS records information about the CMK in the encrypted equality feature. Each record corresponds to a CMK.

Table 12-11 GS_CLIENT_GLOBAL_KEYS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
global_key_name	name	CMK name
key_namespace	oid	Namespace OID that contains the CMK
key_owner	oid	CMK owner
key_acl	aclitem[]	Access permissions that the key should have on creation
create_date	timestamp without time zone	Time when the key is created

12.2.3.2 GS_CLIENT_GLOBAL_KEYS_ARGS

GS_CLIENT_GLOBAL_KEYS_ARGS records the metadata about the CMK in the encrypted equality feature. Each record corresponds to a key-value pair of the CMK.

Table 12-12 GS_CLIENT_GLOBAL_KEYS_ARGS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
global_key_id	oid	CMK OID
function_name	name	The value is **encryption**.
key	name	CMK metadata name
value	bytea	Value of the CMK metadata name

12.2.3.3 GS_COLUMN_KEYS

GS_COLUMN_KEYS records information about the CEK in the encrypted equality feature. Each record corresponds to a CEK.

Table 12-13 GS_COLUMN_KEYS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
column_key_name	name	CEK name
column_key_distributed_id	oid	ID obtained based on the hash value of the fully qualified domain name (FQDN) of the CEK
global_key_id	oid	Foreign key, which is the CMK OID
key_namespace	oid	Namespace OID that contains the CEK
key_owner	oid	CEK owner
create_date	timestamp without time zone	Time when the CEK is created
key_acl	aclitem[]	Access permissions that the CEK should have on creation

12.2.3.4 GS_COLUMN_KEYS_ARGS

GS_COLUMN_KEYS_ARGS records the metadata about the CMK in the encrypted equality feature. Each record corresponds to a key-value pair of the CMK.

Table 12-14 GS_COLUMN_KEYS_ARGS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
column_key_id	oid	CEK OID
function_name	name	The value is **encryption**.
key	name	CEK metadata name
value	bytea	Value of the CEK metadata name

12.2.3.5 GS_ENCRYPTED_COLUMNS

GS_ENCRYPTED_COLUMNS records information about encrypted columns in the encrypted equality feature. Each record corresponds to an encrypted column.

Table 12-15 GS_ENCRYPTED_COLUMNS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
rel_id	oid	Table OID
column_name	name	Name of an encrypted column.
column_key_id	oid	Foreign key, which is the CEK OID
encryption_type	tinyint	Encryption type. The value can be **2 (DETERMINISTIC)** or **1 (RANDOMIZED)**.
data_type_original_oid	oid	ID of the original data type of the encrypted column. For details about the value, see **oid** in the **PG_TYPE** system catalog.
data_type_original_mod	integer	Original data type modifier of the encrypted column. For details about the value, see **atttypmod** in the **PG_ATTRIBUTE** system catalog. The value of **data_type_original_mod** is generally **–1** when data types are not specific.
create_date	timestamp without time zone	Time when an encrypted column is created

12.2.3.6 GS_ENCRYPTED_PROC

GS_ENCRYPTED_PROC provides information such as the parameters of encrypted functions and stored procedure functions, original data type of return values, and encrypted columns.

Table 12-16 GS_ENCRYPTED_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
func_id	oid	OID of the function, corresponding to the OID row identifier in the **PG_PROC** system catalog.
prorettype_orig	integer	Original data type of the return value
last_change	timestamp without time zone	Last modification time of the encrypted function information
proargcachedcol	oidvector	OID of the encrypted column corresponding to the **INPUT** parameter of the function, corresponding to the OID row identifier in the **GS_ENCRYPTED_COLUMNS** system catalog.
proallargtypes_orig	oid[]	Original data type of all function parameters

12.2.4 Communications

12.2.4.1 PGXC_NODE

The **PGXC_NODE** system catalog stores information about database instance nodes. In the centralized system, only the definition of this table can be queried.

Table 12-17 PGXC_NODE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
node_name	name	Node name.

Name	Type	Description
node_type	"char"	Node type. • **C**: CN • **D**: DN • **S**: standby node
node_port	integer	Port number of the node.
node_host	name	Host name or IP address of a node. (If a virtual IP address is configured, its value is a virtual IP address.)
node_port1	integer	Port number of a replication node.
node_host1	name	Host name or IP address of a replication node. (If a virtual IP address is configured, its value is a virtual IP address.)
hostis_primary	Boolean	Specifies whether a primary/standby switchover occurs on the current node. • **t** (true): yes • **f** (false): no
nodeis_primary	Boolean	Specifies whether the current node is preferred to execute non-query operations in the **replication** table. • **t** (true): yes • **f** (false): no
nodeis_preferred	Boolean	Specifies whether the current node is preferred to execute queries in the **replication** table. • **t** (true): yes • **f** (false): no
node_id	integer	Node identifier. The value is obtain by calculating the value of **node_name** using the hash function.
sctp_port	integer	Port used by the TCP proxy communications library of the primary node to listen to the data channel. (The SCTP communications library is no longer supported in the current version.)
control_port	integer	Port used by the TCP proxy communications library of the primary node to listen to the control channel.
sctp_port1	integer	Port used by the TCP proxy communications library of the standby node to listen to the data channel. (The SCTP communications library is no longer supported in the current version.)

Name	Type	Description
control_port1	integer	Port used by the TCP proxy communications library of the standby node to listen to the control channel.
nodeis_central	Boolean	Specifies whether the current node is a CN. It is invalid for DNs. • **t** (true): yes • **f** (false): no
nodeis_active	Boolean	Specifies whether the current node is normal. It is invalid for DNs. • **t** (true): yes • **f** (false): no

12.2.5 Ledger Database

12.2.5.1 GS_GLOBAL_CHAIN

GS_GLOBAL_CHAIN records information about modification operations performed by users on the tamper-proof user table. Each record corresponds to a table-level modification operation. Users with the audit administrator permission can query this system catalog, but no user is allowed to modify this system catalog.

Table 12-18 GS_GLOBAL_CHAIN columns

Name	Type	Description
blocknum	bigint	Block number, which is the sequence number of the current user operation recorded in the ledger
dbname	name	Name of the database, to which the modified tamper-proof user table belongs
username	name	Username, which is the name of the user who performs the operation of modifying the user table
starttime	timestamp with time zone	Time when a user performs an operation.
relid	oid	OID of the modified tamper-proof user table
relnsp	name	Schema name, which is the name of the schema to which the modified tamper-proof user table belongs.
relname	name	User table name, which is the name of the modified tamper-proof user table

Name	Type	Description
relhash	hash16	Table-level hash change amount generated by the current operation
globalhash	hash32	Global digest, which is calculated based on the information of the current row and the **globalhash** of the previous row. It connects the entire table to verify the integrity of GS_GLOBAL_CHAIN data.
txcommand	text	SQL statement whose operations are recorded

12.2.6 SPM

12.2.6.1 GS_SPM_SQL

GS_SPM_SQL is a system catalog used to store SPM information. Users with sysadmin permissions can read the system catalog, but only initial users can write the system catalog.

Table 12-19 GS_SPM_SQL columns

Name	Type	Description
sql_namespace	oid	Schema OID.
sql_hash	bigint	Unique ID of the SQL statement in the SPM.
sql_text	text	SQL text string.
param_num	integer	Number of parameters required for SQL execution.
user	oid	OID of the login user.
creation_time	timestamp with time zone	Time when a record is created.

12.2.6.2 GS_SPM_BASELINE

GS_PLAN_BASELINE is a system catalog used to store baseline information. Users with sysadmin permissions can read the system catalog, but only initial users can write the system catalog.

Table 12-20 GS_SPM_BASELINE columns

Name	Type	Description
sql_namespace	oid	Schema OID.
sql_hash	bigint	Unique ID of the SQL statement in the SPM.
plan_hash	bigint	Unique ID of a plan in the current SQL statement.
outline	text	Outline text, which can be used to fix a group of hints of the current plan.
cost	double precision	Total plan cost.
user	oid	User who creates the baseline.
status	integer	Baseline status. The options are as follows: • **0** (UNACC): indicates that the plan is not accepted. • **1** (ACC): indicates that the plan has been accepted. • **2** (FIXED): indicates a special ACC plan. The matching priority of this plan is higher than that of other ACC plan.
source	text	Baseline source.
gplan	Boolean	Determines whether the plan is a gplan.
creation_time	timestamp with time zone	Time when the baseline is created.
last_used_time	timestamp with time zone	Last time when a plan was used.
modification_time	timestamp with time zone	Time when the baseline is modified.
jump_intercept_cnt	bigint	Number of baseline interception plan jumps.
invalid	Boolean	Specifies whether the current baseline is invalid.

12.2.6.3 GS_SPM_ID_HASH_JOIN

The GS_SPM_ID_HASH_JOIN system catalog stores the relationship between unique_sql_id and sql_hash. Users with sysadmin permissions can read the system catalog, but only initial users can write data to the system catalog.

Table 12-21 GS_SPM_ID_HASH_JOIN columns

Name	Type	Description
unique_sql_id	bigint	Unique ID of an SQL statement in the database.
sql_hash	bigint	Unique ID of the SQL statement in the SPM.

12.2.6.4 GS_SPM_PARAM

GS_SPM_PARAM is a system catalog used to store SQL parameters. Each SQL statement stores only one group of parameters. Users with the sysadmin permission can read the system catalog, but only initial users can write the system catalog.

Table 12-22 GS_SPM_PARAM columns

Name	Type	Description
sql_namespace	oid	Schema OID
sql_hash	bigint	Unique ID of the SQL statement in the SPM.
position	integer	Position index of a parameter in the SQL statement, starting from 0.
datatype	integer	OID of the parameter type.
datatype_string	text	Character string of a parameter type.
value_string	text	Character string of a parameter value.
is_null	Boolean	Determines whether a parameter value is **NULL**.
hash_value	bigint	Hash value of a parameter value.
user	oid	User who creates the record.
creation_time	timestamp with time zone	Time when a record is created.

12.2.6.5 GS_SPM_EVOLUTION

GS_SPM_EVOLUTION is a system catalog used to store plan evolution result. Users with sysadmin permissions can read the system catalog, but only initial users can write the system catalog.

Table 12-23 GS_SPM_EVOLTOIN columns

Name	Type	Description
sql_namespace	oid	Schema OID.
sql_hash	bigint	Unique ID of the SQL statement in the SPM.
plan_hash	bigint	Plan ID.
better	Boolean	Determines whether it is a positive evolution. ● **t** indicates positive evolution. ● **f** indicates negative evolution.
refer_plan	bigint	Plan hash used as a reference for report generation.
status	integer	Determines whether exceptions occur during the evolution. ● The value **0** indicates that no exception occurs. ● The value **1** indicates that an exception occurs.
reason	text	Content of the evolution report.
user	oid	User who generates the evolution result.
creation_time	timestamp with time zone	Time when the evolution result is created.

12.2.7 AI

12.2.7.1 GS_MODEL_WAREHOUSE

GS_MODEL_WAREHOUSE stores AI engine training models, including the models and detailed description of the training process.

Table 12-24 GS_MODEL_WAREHOUSE columns

Name	Data Type	Description
oid	oid	Hidden column
modelname	name	Unique constraint
modelowner	oid	OID of a model owner

Name	Data Type	Description
createtime	timestamp without time zone	Time when a model is created
processedtuples	integer	Number of tuples involved in training
discardedtuples	integer	Number of unqualified tuples not involved in training
preprocesstime	real	Data preprocessing time
exectime	real	Training duration
iterations	integer	Iteration round
outputtype	oid	OID of the output data type
modeltype	text	AI operator type
query	text	Query statement executed to create a model
modeldata	bytea	Stored binary model information
weight	real[]	Currently, this column applies only to GD operator models.
hyperparametersnames	text[]	Involved hyperparameter name
hyperparametersvalues	text[]	Hyperparameter value
hyperparametersoids	oid[]	OID of the data type corresponding to a hyperparameter
coefnames	text[]	Model parameter
coefvalues	text[]	Value of a model parameter
coefoids	oid[]	OID of the data type corresponding to a model parameter
trainingscoresname	text[]	Method used to measure model performance
trainingscoresvalue	real[]	Value used to measure model performance

Name	Data Type	Description
modeldescribe	text[]	Model description

12.2.7.2 GS_OPT_MODEL

GS_OPT_MODEL is a data table used when the AI engine is enabled to predict the planned time. It records the configurations, training results, features, corresponding system functions, and training history of machine learning models.

Table 12-25 GS_OPT_MODEL columns

Name	Type	Description
template_name	name	Template name of the machine learning model, which determines the interfaces called for training and prediction. Currently, only rlstm is implemented.
model_name	name	Model name. Each model corresponds to a set of parameters, training logs, and model coefficients in the AI engine online learning process. The name must be unique.
datname	name	Name of the database served by the model. Each model is specific to a single database. This parameter determines data used for training.
ip	name	IP address of the host where the AI engine is deployed
port	integer	Listening port number of the AI engine
max_epoch	integer	Maximum number of iterations in an epoch
learning_rate	real	Learning rate of model training. The default value **1** is recommended.

Name	Type	Description
dim_red	real	Number of model feature dimensions whose retention is reduced
hidden_units	integer	Number of neurons in the model's hidden layer. If the model cannot be converged for a long time, increase the value of this parameter.
batch_size	integer	Size of a batch in each iteration. It is recommended that the size be greater than or equal to the total training data volume to accelerate model convergence.
feature_size	integer	Length of the model feature, which is used to trigger retraining. This parameter is automatically updated after model training and does not need to be specified.
available	Boolean	Specifies whether the model is converged. This parameter does not need to be specified.
Is_training	Boolean	Specifies whether the model is being trained. This parameter does not need to be specified.
label	"char"[]	Target task of the model. ● S: startup time ● T: total time ● R: rows ● M: peak memory Currently, {S, T} or {R} is recommended due to model performance restrictions.

Name	Type	Description
max	bigint[]	Maximum value of each task label of the model, which is used to trigger retraining. This parameter does not need to be specified.
acc	real[]	Accuracy of each model task. This parameter does not need to be specified.
description	text	Model comment

12.2.7.3 GS_ABO_MODEL_STATISTIC

GS_ABO_MODEL_STATISTIC records the metadata, model name, and operator information of the ABO-based model estimation based on the feedback cardinality.

Table 12-26 GS_ABO_MODEL_STATISTIC columns

Name	Data Type	Description
oid	oid	Hidden column.
modelname	name	Model name, which is unique.
createtime	timestamp	Time when a model is created or updated.
groupkey	oid	Hash of the operator corresponding to the model.
joinkey	oid	Hash of the operator connection shape corresponding to the model.
fixed_selectivity	real	Fixed selectivity for operators that do not contain numeric conditions.
avg_qerror	real	Average errors of qerror in the model.
max_qerror	real	Maximum errors of qerror in the model.

Name	Data Type	Description
feedback_num	integer	Model training data volume.
status	integer	Model status. The value **0** indicates that the model is invalid. The value **1** indicates that the model is valid. The value **2** indicates that the model is to be updated. The value **3** indicates that the model is in the blocklist.
train_count	integer	Total number of model training times.
train_failure_count	integer	Number of model training failures.
prediction_count	integer	Total number of prediction times of a model.
predfiction_failure_count	integer	Number of model prediction failures.
rtable_ids	oid[]	Sequence of entering model conditions in the base table.
attnums	int2[]	Model condition input condition involves the column sequence.

12.2.8 Auditing

12.2.8.1 GS_AUDITING_POLICY

GS_AUDITING_POLICY records the main information about the unified audit. Each record corresponds to a design policy. Only the system administrator or security policy administrator can access this system catalog.

Table 12-27 GS_AUDITING_POLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)

Name	Type	Description
polname	name	Policy name, which must be unique
polcomments	name	Policy description field, which records policy-related description information and is represented by the COMMENTS keyword
modifydate	timestamp without time zone	Latest timestamp when a policy is created or modified
polenabled	boolean	Specifies whether to enable a policy. • **t** (true): enabled. • **f** (false): disabled

12.2.8.2 GS_AUDITING_POLICY_ACCESS

GS_AUDITING_POLICY_ACCESS records the unified audit information about DML database operations. Only the system administrator or security policy administrator can access this system catalog.

Table 12-28 GS_AUDITING_POLICY_ACCESS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
accesstype	name	DML database operation type. For example, SELECT, INSERT, and DELETE.
labelname	name	Resource label name. This column corresponds to the **polname** column in the GS_AUDITING_POLICY system catalog.
policyoid	oid	OID of the audit policy, corresponding to the OID in the GS_AUDITING_POLICY system catalog
modifydate	timestamp without time zone	Latest creation or modification timestamp

12.2.8.3 GS_AUDITING_POLICY_FILTERS

GS_AUDITING_POLICY_FILTERS records the filtering policies about the unified audit. Each record corresponds to a design policy. Only the system administrator or security policy administrator can access this system catalog.

Table 12-29 GS_AUDITING_POLICY_FILTERS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
filtertype	name	Filter type. Currently, the value is **logical_expr**.
labelname	name	Name. Currently, the value is **logical_expr**.
policyoid	oid	OID of the audit policy, corresponding to the OID in the GS_AUDITING_POLICY system catalog
modifydate	timestamp without time zone	Latest creation or modification timestamp
logicaloperator	text	Logical character string of a filter criterion

12.2.8.4 GS_AUDITING_POLICY_PRIVILEGES

GS_AUDITING_POLICY_PRIVILEGES records the DDL database operations about the unified audit. Each record corresponds to a design policy. Only the system administrator or security policy administrator can access this system catalog.

Table 12-30 GS_AUDITING_POLICY_PRIVI columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
privilegetype	name	DDL database operation type. For example, CREATE, ALTER, and DROP.
labelname	name	Resource label name. This column corresponds to the **polname** column in the GS_AUDITING_POLICY system catalog.
policyoid	oid	This column corresponds to the OID in the GS_AUDITING_POLICY system catalog.
modifydate	timestamp without time zone	Latest creation or modification timestamp

12.2.9 User and Permission Management

12.2.9.1 GS_DB_PRIVILEGE

GS_DB_PRIVILEGE records the granting of ANY permissions. Each record corresponds to a piece of authorization information.

Table 12-31 GS_DB_PRIVILEGE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
roleid	oid	User ID.
privilege_type	text	ANY permission of a user. For details about the value, see **Table 7-223**.
admin_option	boolean	Whether the ANY permission recorded in the **privilege_type** column can be re-granted. • **t**: yes. • **f**: no.

12.2.9.2 PG_DB_ROLE_SETTING

PG_DB_ROLE_SETTING records the default values of configuration items bound to each role and database when the database is running.

Table 12-32 PG_DB_ROLE_SETTING columns

Name	Type	Description
setdatabase	oid	Database corresponding to the configuration items (**0** if no database is specified)
setrole	oid	Role corresponding to the configuration items (**0** if no role is specified)
setconfig	text[]	Default value of runtime configuration items. Contact the administrator to configure it.

12.2.9.3 PG_DEFAULT_ACL

PG_DEFAULT_ACL records initial permissions assigned to newly created objects.

Table 12-33 PG_DEFAULT_ACL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
defaclrole	oid	ID of the role associated with the permission
defaclnamespace	oid	Namespace associated with the permission (**0** if no ID)
defaclobjtype	"char"	Object type of the permission • **r** indicates a table or view. • **S** indicates a sequence. • **f** indicates a function. • **T** indicates a type. • **K** indicates the client master key. • **k** indicates the column encryption key.
defaclacl	aclitem[]	Access permissions that this type of object should have on creation

12.2.9.4 PG_RLSPOLICY

PG_RLSPOLICY records row-level security policies.

Table 12-34 PG_RLSPOLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
polname	name	Name of an access control policy.
polrelid	oid	OID of the table object on which the row-level security policy takes effect.
polcmd	"char"	SQL operations affected by the row-level security policy.
polpermissive	Boolean	Attribute of the row-level security policy. • **t**: OR condition concatenation of expressions. • **f**: AND condition concatenation of expressions.
polroles	oid[]	OID list of users affected by the row-level security policy. If this parameter is not specified, all users are affected.

Name	Type	Description
polqual	pg_node_tree	Expression of the row-level security policy.

12.2.9.5 PG_SECLABEL

PG_SECLABEL records security labels on database objects.

See also **PG_SHSECLABEL**, which provides a similar function for security labels of database objects that are shared within one database.

Table 12-35 PG_SECLABEL columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this security label pertains to
classoid	oid	**PG_CLASS**.oid	OID of the system catalog where the object appears
objsubid	integer	-	Column number for a security label on a table column
provider	text	-	Label provider associated with the label
label	text	-	Security label applied to the object

12.2.9.6 PG_SHSECLABEL

PG_SHSECLABEL records security labels on shared database objects. Security labels can be manipulated with the **SECURITY LABEL** command.

For an easier way to view security labels, see **PG_SECLABELS**.

See also **PG_SECLABEL**, which provides a similar function for security labels involving objects within a single database.

Unlike most system catalogs, **PG_SHSECLABEL** is shared across all databases in the system. There is only one copy of **PG_SHSECLABEL** in the GaussDB system, not one per database.

Table 12-36 PG_SHSECLABEL columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this security label pertains to

Name	Type	Reference	Description
classoid	oid	PG_CLASS.oid	OID of the system catalog where the object appears
provider	text	-	Label provider associated with the label
label	text	-	Security label applied to the object

12.2.9.7 PG_USER_MAPPING

PG_USER_MAPPING records mappings from local users to remote.

This system catalog is accessible only to system administrators. Common users can query the **PG_USER_MAPPINGS** view.

Table 12-37 PG_USER_MAPPING columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
umuser	oid	PG_AUTHID.oid	OID of the local role being mapped (**0** if the user mapping is public)
umserver	oid	PG_FOREIGN_SERVER.oid	OID of the foreign server that contains the mapping
umoptions	text[]	-	User mapping specific options, expressed in a string in the format of keyword=value

12.2.9.8 PG_USER_STATUS

PG_USER_STATUS records the states of users who access the database. This system catalog is accessible only to system administrators.

Table 12-38 PG_USER_STATUS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
roloid	oid	ID of the role.
failcount	integer	Number of failed attempts.

Name	Type	Description
locktime	timestamp with time zone	By default, the creation date of the role is displayed. If the role is locked by the administrator or the role is locked because the number of login failures exceeds the threshold, the date when the role is locked is displayed.
rolstatus	smallint	Role state. • **0**: normal. • **1**: The role is locked for a specific period of time because the failed login attempts exceed the threshold. • **2**: The role is locked by the administrator.
permspace	bigint	Size of the permanent table storage space used by the role.
tempspace	bigint	Size of the temporary table storage space used by the role.
password expired	smallint	Specifies whether a password is valid. • **0**: The password is valid. • **1**: The password is invalid.

12.2.10 Connection and Authentication

12.2.10.1 PG_AUTHID

PG_AUTHID records information about database authentication identifiers (roles). The concept of users is contained in that of roles. A user is actually a role whose **rolcanlogin** has been set. Any role, whether its **rolcanlogin** is set or not, can use other roles as members.

For GaussDB, only one PG_AUTHID exists, which is not available for every database. This system catalog is accessible only to system administrators.

Table 12-39 PG_AUTHID columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
rolname	name	Role name.

Name	Type	Description
rolsuper	Boolean	Specifies whether a role is the initial system administrator with the highest permission. ● **t** (true): yes ● **f** (false): no
rolinherit	Boolean	Specifies whether a role automatically inherits permissions of roles of which it is a member. ● **t** (true): automatically inherited ● **f** (false): not automatically inherited
rolcreaterole	Boolean	Specifies whether a role can create more roles. ● **t** (true): yes ● **f** (false): no
rolcreatedb	Boolean	Specifies whether a role can create databases. ● **t** (true): yes ● **f** (false): no
rolcatupdate	Boolean	Specifies whether the role can directly update system catalogs. Only the initial system administrator whose **usesysid** is set to **10** has this permission. It is unavailable for other users. ● **t** (true): yes ● **f** (false): no
rolcanlogin	Boolean	Specifies whether the role can log in, that is, whether the role can be given as the initial session authorization identifier. ● **t** (true): yes ● **f** (false): no
rolreplication	Boolean	Specifies whether the role has the replication permission. ● **t** (true): yes ● **f** (false): no
rolauditadmin	Boolean	Specifies whether the role has the audit administrator permission. ● **t** (true): yes ● **f** (false): no

Name	Type	Description
rolsystemadmin	Boolean	Specifies whether the role has the system administrator permission. ● **t** (true): yes ● **f** (false): no
rolconnlimit	integer	Maximum number of concurrent connections that this role can make (valid for roles that can log in). The value **–1** indicates there is no limit.
rolpassword	text	Password ciphertext. If there is no password, the value is **NULL**.
rolvalidbegin	timestamp with time zone	Account validity start time (**NULL** if no start time).
rolvaliduntil	timestamp with time zone	Password expiry time (**NULL** if no expiration).
rolrespool	name	Resource pool that a user can use.
roluseft	Boolean	Specifies whether the role can perform operations on foreign tables. ● **t** (true): yes ● **f** (false): no
rolparentid	oid	OID of a group user to which the user belongs.
roltabspace	text	Maximum size of a user data table.
rolkind	"char"	Type of a user. ● **n**: common user ● **p**: permanent user
rolnodegroup	oid	Unsupported currently.
roltempspace	text	Maximum size of a user's temporary table, in KB.
rolspillspace	text	Maximum size of data that can be written to disks when a user executes a job, in KB.
rolexcpdata	text	Query rules that can be set by users (reserved).
rolmonitoradmin	Boolean	Specifies whether the role has the monitor administrator permission. ● **t** (true): yes ● **f** (false): no

Name	Type	Description
roloperatoradmin	Boolean	Specifies whether the role has the O&M administrator permission. • **t** (true): yes • **f** (false): no
rolpolicyadmin	Boolean	Specifies whether the role has the security policy administrator permission. • **t** (true): yes • **f** (false): no

12.2.10.2 PG_AUTH_HISTORY

PG_AUTH_HISTORY records the authentication history of a role. This system catalog is accessible only to system administrators.

Table 12-40 PG_AUTH_HISTORY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
roloid	oid	ID of a role
passwordtime	timestamp with time zone	Time of password creation and change
rolpassword	text	Ciphertext of the role password. The encryption mode is determined by the GUC parameter **password_encryption_type**.

12.2.10.3 PG_AUTH_MEMBERS

PG_AUTH_MEMBERS records the membership between roles.

Table 12-41 PG_AUTH_MEMBERS columns

Name	Type	Description
roleid	oid	ID of a role that has a member
member	oid	ID of a role that is a member of ROLEID
grantor	oid	ID of a role that grants this membership
admin_option	Boolean	Whether a member can grant membership in ROLEID to others. The value can be **true** (yes) and **false** (no).

12.2.11 Dynamic Data Masking

12.2.11.1 GS_MASKING_POLICY

GS_MASKING_POLICY records the main information about dynamic data masking policies. Each record corresponds to a masking policy. Only the system administrator or security policy administrator can access this system catalog.

Table 12-42 GS_MASKING_POLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
polname	name	Policy name, which must be unique
polcomments	name	Policy description field, which records policy-related description information and is represented by the COMMENTS keyword
modifydate	timestamp without time zone	Latest timestamp when a policy is created or modified
polenabled	boolean	Specifies whether to enable a policy. • **t** (true): enabled. • **f** (false): disabled

12.2.11.2 GS_MASKING_POLICY_ACTIONS

GS_MASKING_POLICY_ACTIONS records the masking actions of a masking policy in the dynamic data masking policies. One masking policy corresponds to one or more rows of records in the catalog. Only the system administrator or security policy administrator can access this system catalog.

Table 12-43 GS_MASKING_POLICY_ACTIONS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
actiontype	name	Name of a masking function used by a masking policy

Name	Type	Description
actparams	name	Parameter information transferred to a masking function
actlabelname	name	Name of a masked label
policyoid	oid	OID of a masking policy to which a record belongs, corresponding to the OID in GS_MASKING_POLICY
actmodifydate	timestamp without time zone	Latest timestamp when a record is created or modified

12.2.11.3 GS_MASKING_POLICY_FILTERS

GS_MASKING_POLICY_FILTERS records the user filter criteria corresponding to the dynamic data masking policies. The corresponding masking policy takes effect only when the user information meets the filter criteria. Only the system administrator or security policy administrator can access this system catalog.

Table 12-44 GS_MASKING_POLICY_FILTERS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
filtertype	name	Filter type. Currently, the value is **logical_expr**.
filterlabelname	name	Filter range. Currently, the value is **logical_expr**.
policyoid	oid	OID of the masking policy to which a user filter criterion belongs, which corresponds to the OID in GS_MASKING_POLICY
modifydate	timestamp without time zone	Latest timestamp when a user filter criterion is created or modified
logicaloperator	text	Polish notation of a filter criterion

12.2.12 DATABASE LINK

12.2.12.1 GS_DATABASE_LINK

GS_DATABASE_LINK stores database link information, mainly recording detailed information about database links. Only sysadmin can read this system catalog. Currently, the database link function is not supported.

Table 12-45 GS_DATABASE_LINK columns

Name	Type	Description
oid	oid	Unique ID of the current database link object (hidden attribute, which must be specified).
dlname	name	Name of the current database link.
dlowner	oid	ID of the owner of the current DATABASE LINK. If the owner is **public**, the value is **0**.
dlfdw	oid	OID of the foreign-data wrapper of the current DATABASE LINK.
dlcreater	oid	ID of the creator of the current database link.
options	text[]	Current DATABASE LINK connection information in the format of "keyword=value".
useroptions	text[]	User information used by the current DATABASE LINK to connect to the remote end, in the format of "keyword=value".
dlacl	aclitem[]	Current database link access permission.

12.2.13 Materialized Views

12.2.13.1 GS_MATVIEW

GS_MATVIEW provides information about each materialized view in the database.

Table 12-46 GS_MATVIEW columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
matviewid	oid	OID of a materialized view
mapid	oid	OID of a map table associated with a materialized view. Each map table corresponds to one materialized view. If a complete-refresh materialized view does not correspond to a map table, the value of this column is **0**.

Name	Type	Description
ivm	boolean	Type of a materialized view. The value **t** indicates a fast-refresh materialized view, and the value **f** indicates a complete-refresh materialized view.
needrefresh	boolean	Reserved column
refreshtime	timestamp without time zone	Last time when a materialized view was refreshed. If the materialized view is not refreshed, the value is null. This column is maintained only for fast-refresh materialized views. For complete-refresh materialized views, the value is null.

12.2.13.2 GS_MATVIEW_DEPENDENCY

GS_MATVIEW_DEPENDENCY provides association information about each fast-refresh materialized view, base table, and Mlog table in the database. The Mlog table corresponding to the base table does not exist in the complete-refresh materialized view. Therefore, no record is written into the Mlog table.

Table 12-47 GS_MATVIEW_DEPENDENCY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
matviewid	oid	OID of a materialized view
relid	oid	OID of a base table of a materialized view
mlogid	oid	OID of a Mlog table which is the log table of a materialized view. Each Mlog table corresponds to one base table.
mxmin	integer	Reserved column

12.2.14 Other System Catalogs

12.2.14.1 GS_ASP

GS_ASP displays the persistent ACTIVE SESSION PROFILE samples. This catalog can be queried only in the system database but cannot be queried in the user database.

Table 12-48 GS_ASP columns

Name	Type	Description
sampleid	bigint	Sample ID.
sample_time	timestamp with time zone	Sampling time.
need_flush_sample	Boolean	Specifies whether the sample needs to be flushed to disks. • **t** (true): yes • **f** (false): no
databaseid	oid	Database ID.
thread_id	bigint	Thread ID.
sessionid	bigint	Session ID.
start_time	timestamp with time zone	Start time of a session.
event	text	Event name. For key events in the kernel, see **Table 12-412**, **15.3.67-Table 3 List of wait events corresponding to lightweight locks**, **Table 12-414**, and **Table 12-415**. For details about the impact of each transaction lock on services, see **LOCK**.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread. The value corresponds to the level (ID) of the execution plan.
smpid	integer	Concurrent thread ID in SMP execution mode.
userid	oid	ID of a session user.
application_name	text	Name of an application.
client_addr	inet	IP address of a client.
client_hostname	text	Name of a client.
client_port	integer	TCP port number used by a client to communicate with the backend.
query_id	bigint	Debug query ID.

Name	Type	Description
unique_query_id	bigint	Unique query ID.
user_id	oid	User ID in the key of the unique query.
cn_id	integer	ID of the node that delivers the unique SQL statement. **cn_id** is in the key of the unique query.
unique_query	text	Standardized unique SQL text string.
locktag	text	Information of a lock that the session waits for, which can be parsed using **locktag_decode**.
lockmode	text	Mode of a lock that the session waits for. • **LW_EXCLUSIVE**: exclusive lock • **LW_SHARED**: shared lock • **LW_WAIT_UNTIL_FREE**: waits for the **LW_EXCLUSIVE** to be available
block_sessionid	bigint	Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.
wait_status	text	Provides more details about an event column.
global_sessionid	text	Global session ID.
xact_start_time	timestamp with time zone	Start time of the transaction.
query_start_time	timestamp with time zone	Time when the statement starts to be executed.

Name	Type	Description
state	text	Current transaction state. The options are as follows: • **active**: The backend is executing a query. • **idle in transaction**: The backend is in a transaction, but there is no statement being executed in the transaction. • **idle in transaction (aborted)**: The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend.
event_start_time	timestamp with time zone	Start time of a wait event.
current_xid	xid	ID of the current transaction.
top_xid	xid	ID of the top-level transaction that is being executed.

12.2.14.2 GS_DEPENDENCIES

The GS_DEPENDENCIES system catalog records object dependency information and has a one-to-many relationship with the **GS_DEPENDENCIES_OBJ** table.

Table 12-49 GS_DEPENDENCIES columns

Name	Type	Description
schemaname	name	Name of a namespace
packagename	name	Name of a package

Name	Type	Description
refobjpos	integer	Position of the referenced object • **1**: type • **2**: package header • **4**: function header • **8**: function body • **16**: package body • **32**: view
refobjoid	oid	OID of the referenced object
objectname	text	Name of the dependent object

12.2.14.3 GS_DEPENDENCIES_OBJ

The GS_DEPENDENCIES_OBJ system catalog records the detailed information about the referenced object.

Table 12-50 GS_DEPENDENCIES_OBJ columns

Name	Type	Description
schemaname	name	Name of a namespace
packagename	name	Name of a package
type	integer	Type of the referenced object • **1**: unknown type • **2**: variable • **3**: type • **4**: function • **5**: view • **6**: function header
name	text	Name of the referenced object
objnode	pg_node_tree	Detailed information about the referenced object

12.2.14.4 GS_GLOBAL_CONFIG

GS_GLOBAL_CONFIG records the parameter values specified by users during database instance initialization. In addition, it also stores weak passwords set by users. Initial database users can write, modify, and delete parameters in system catalogs by using ALTER and DROP. Only the initial user, system administrator, and security administrator can access this system catalog. Other users do not have such permission.

Table 12-51 GS_GLOBAL_CONFIG columns

Name	Type	Description
name	name	Specifies the preset parameter name, weak password name, or parameter required by users during database instance initialization.
value	text	Specifies the preset parameter value, weak password value, or parameter value required by users during database instance initialization.

12.2.14.5 GS_JOB_ARGUMENT

GS_JOB_ARGUMENT provides the parameter attributes of DBE_SCHEDULER scheduled tasks and programs.

Table 12-52 GS_JOB_ARGUMENT columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
argument_position	integer	Location of a parameter of a scheduled task or program.
argument_type	name	Parameter type of a scheduled task or program.
job_name	text	Name of a scheduled task or program.
argument_name	text	Parameter name of a scheduled task or program. The scheduled task inherits the parameter name of the program. Therefore, this parameter is null.
argument_value	text	Parameter value of a scheduled task. (The program cannot bind a value.)
default_value	text	Default parameter value of a program.

12.2.14.6 GS_JOB_ATTRIBUTE

GS_JOB_ATTRIBUTE records attributes of DBE_SCHEDULER scheduled tasks, including basic attributes of scheduled tasks, scheduled task classes, certificates, authorization, programs, and schedules. Common users do not have the permission to access the newly installed database instance.

Table 12-53 GS_JOB_ATTRIBUTE columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
job_name	text	Names of scheduled tasks, scheduled task classes, certificates, programs, and schedules, and authorized usernames.
attribute_name	text	Attribute names of scheduled tasks, scheduled task classes, certificates, programs, and schedules, and authorized content.
attribute_value	text	Attribute values of scheduled tasks, scheduled task classes, certificates, programs, and schedules.

12.2.14.7 GS_PACKAGE

GS_PACKAGE records package information.

Table 12-54 GS_PACKAGE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
pkgnamespace	oid	Schema to which a package belongs
pkgowner	oid	Owner of a package
pkgname	name	Name of a package
pkgspecsrc	text	Package specification
pkgbodydeclsrc	text	Package body
pkgbodyinitsrc	text	Package initialization source
pkgacl	aclitem[]	Access permission
pkgsecdef	boolean	Whether a user has the definer permission on the package.

12.2.14.8 GS_PLAN_TRACE

The GS_PLAN_TRACE system catalog stores plan traces. It records details about the plan generation process of DML statements. Only initial users have the write permission on this system catalog. Users with the sysadmin permission can read this system catalog.

Table 12-55 GS_PLAN_TRACE columns

Name	Type	Description
query_id	text	Unique ID of the current request
query	text	SQL statement of the current request. The value of this field cannot exceed the value of **track_activity_query_size**.
unique_sql_id	bigint	Unique ID of the SQL statement of the current request
plan	text	Query plan text corresponding to the current request SQL statement. The value of this field cannot exceed 10 KB.
plan_trace	text	Details about the query plan generation process corresponding to the SQL statement of the current request. The value of this field cannot exceed 300 MB.
owner	oid	OID of the user who initiates the current SQL request
modifydate	timestamp with time zone	Time when the current plan trace is updated (that is, time when the plan trace is created)

12.2.14.9 GS_POLICY_LABEL

GS_POLICY_LABEL records the resource label configuration information. One resource label corresponds to one or more records, and each record identifies the resource label to which a database resource belongs. Only the system administrator or security policy administrator can access this system catalog.

Fully Qualified Domain Name (FQDN) identifies an absolute path of a database resource.

Table 12-56 GS_POLICY_LABEL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
labelname	name	Resource label name
labeltype	name	Resource tag type. Currently, the value is **RESOURCE**.
fqdnnamespace	oid	OID of a namespace to which an identified database resource belongs

Name	Type	Description
fqdnid	oid	OID of an identified database resource. If the database resource is a column, this column is the OID of the catalog.
relcolumn	name	Column name. If the identified database resource is a column, this column indicates the column name. Otherwise, this column is empty.
fqdntype	name	Type of the identified database resource, for example, schema, table, column, or view

12.2.14.10 GS_RECYCLEBIN

GS_RECYCLEBIN describes details about objects in the recycle bin.

Table 12-57 GS_RECYCLEBIN columns

Name	Type	Description
oid	oid	System column.
rcybaseid	oid	Base table object ID, which references **gs_recyclebin.oid**.
rcydbid	oid	OID of the database to which the current object belongs.
rcyrelid	oid	OID of the current object.
rcyname	name	Name of the object in the recycle bin. The format is BIN*$unique_id$oid$*0. *unique_id* indicates the unique identifier with a maximum of 16 characters, and *oid* indicates the OID.
rcyoriginname	name	Original object name.
rcyoperation	char	Operation type. ● **d**: drop ● **t**: truncate

Name	Type	Description
rcytype	integer	Object type. ● **0**: table ● **1**: index. ● **2**: TOAST table. ● **3**: TOAST index. ● **4**: sequence, indicating the sequence object that is automatically associated with the serial, bigserial, smallserial, and largeserial types. ● **5**: partition. ● **6**: global index. ● **7**: materialized view
rcyrecyclecsn	bigint	CSN when an object is dropped or truncated.
rcyrecycletime	timestamp with time zone	Time when an object is dropped or truncated.
rcycreatecsn	bigint	CSN when an object is created.
rcychangecsn	bigint	CSN when an object definition is modified.
rcynamespace	oid	OID of the namespace that contains this relationship.
rcyowner	oid	Owner of the relationship.
rcytablespace	oid	Tablespace in which this relationship is stored. If the value is **0**, the default tablespace of the database is used. This column is meaningless if the relationship has no on-disk file.
rcyrelfilenode	oid	File name of the recycle bin object on a disk, or **0** if none, which is used to restore the physical file when the TRUNCATE object is restored.
rcycanrestore	Boolean	Specifies whether flashback can be performed separately.
rcycanpurge	Boolean	Specifies whether the purge operation can be performed independently.
rcyfrozenxid	xid32	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table.
rcyfrozenxid64	xid	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table.

Name	Type	Description
rcybucket	oid	Bucket information in 13.2.15.41 PG_HASHBUCKET.

12.2.14.11 GS_SECURITY_LABEL

The GS_SECURITY_LABEL is a shared system catalog that records information about security labels. Each record corresponds to a security label.

Table 12-58 GS_SECURITY_LABEL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
label_name	name	Security label name.
label_content	text	Content of the security label.

12.2.14.12 GS_SQL_PATCH

GS_SQL_PATCH records the status information about all SQL patches.

Table 12-59 GS_SQL_PATCH columns

Name	Type	Description
patch_name	name	Patch name.
unique_sql_id	bigint	Global unique ID.
owner	oid	ID of the user who creates the patch.
enable	boolean	Specifies whether the patch takes effect.
status	"char"	Patch status (reserved column).
abort	boolean	Specifies whether the patch is an abort hint.
hint_string	text	Hint text.
hint_node	pg_node_tree	Hint parsing and serialization result.
original_query	text	Original statement (reserved column).
patched_query	text	Patched statement (reserved column).

Name	Type	Description
original_query_tree	pg_node_tree	Original statement parsing result (reserved column).
patched_query_tree	pg_node_tree	Patched statement parsing result (reserved column).
description	text	Patch description.
parent_unique_sql_id	bigint	Globally unique ID of the outer statement of the SQL statement for which the patch takes effect. The value of this parameter is **0** for statements outside a stored procedure. For statements inside the stored procedure, and the value of this parameter is the globally unique ID of the statement that invokes the stored procedure.

12.2.14.13 GS_STATISTIC_EXT_HISTORY

GS_STATISTIC_EXT_HISTORY is a multi-column historical statistics management table. It stores historical extended statistics about tables in the database, including multi-column statistics and expression statistics (supported later). You can specify the extended statistics to collect. This system catalog is accessible only to system administrators.

Table 12-60 GS_STATISTIC_EXT_HISTORY columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.
starelkind	"char"	Type of the object to which a table belongs. **'c'** indicates an ordinary table, and **'p'** indicates a partitioned table.
stainherit	Boolean	Determines whether to collect statistics for objects that have inheritance relationship.
statimestamp	timestamp with time zone	Time when the statistics are collected.
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.

Name	Type	Description
stadistinct	real	Number of distinct, non-null data values in the column for database nodes. ● A value greater than 0 indicates the actual number of distinct values. ● A value less than 0 indicates the ratio of the **distinct** value to the total number of rows. For example, if **stadistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. ● The value **0** indicates that the number of distinct values is unknown.
standistinct	real	Number of unique non-null data values in the **DN1** column. ● A value greater than 0 indicates the actual number of distinct values. ● A value less than 0 is the ratio of the **distinct** value to the total number of rows. For example, if **standistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. ● The value **0** indicates that the number of distinct values is unknown.
standvfunc	"char"	Algorithm used to calculate the NDV based on the statistics. ● **d**: The original DUJ1 algorithm is used for estimation. ● **c**: The C19 algorithm is used for estimation.
staorigin	"char"	Source of the statistics collection mode. ● **a**: The collection is triggered by AUTOANALYZE. ● **m**: The collection is triggered by manual ANALYZE. ● **g**: The gsstat thread is triggered to perform ANALYZE collection when a large amount of data is inserted.
stakindN	smallint	Code number stating that the type of statistics is stored in slot *N* of the *pg_statistic* row. The value of *N* ranges from 1 to 5.
staopN	oid	Operator used to generate the statistics stored in slot *N*. For example, a histogram slot shows the < operator that defines the sort order of the data. The value of *N* ranges from 1 to 5.
stakey	int2vector	Array of a column ID.

Name	Type	Description
stanumbersN	real[]	Numerical statistics of the appropriate type for slot *N*. The value is **NULL** if the slot does not involve numerical values. The value of *N* ranges from 1 to 5.
stavaluesN	anyarray	Column data values of the appropriate type for slot *N*. The value is **NULL** if the slot type does not store any data values. Each array's element values are actually of the specific column's data type so there is no way to define these columns' type more specifically than anyarray. The value of *N* ranges from 1 to 5.
staexprs	pg_node_tree	Expression corresponding to the extended statistics information.
stasource	"char"	Source of extended statistics: ● **'a'**: indicates that the statistics data is automatically created, which is controlled by the GUC parameter **auto_statistic_ext_columns**. ● **'m'**: indicates that a user manually creates the statistics data using analyze tablename ((column list)) or alter table tablename add statistics ((column list)).
stastatus	"char"	Status of extended statistics: ● **'a'**: active and available. ● **'d'**: disabled. Related information is not collected, and the optimizer does not use the data when generating a plan. You can use the alter table tablename disable/enable statistics((column list)) syntax to modify the status of extended statistics.
staextname	name	Alias of the multi-column group of multi-column statistics.

12.2.14.14 GS_STATISTIC_HISTORY

GS_STATISTIC_HISTORY is a single-column historical statistics management table that stores historical statistics about tables and index columns in a database. By default, only the system administrator can access the system catalog. Common users can access the system catalog only after being authorized.

Table 12-61 GS_STATISTIC_HISTORY columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.

Name	Type	Description
starelkind	"char"	Type of an object.
staattnum	smallint	Number of the described column in the table, starting from 1.
stainherit	Boolean	Determines whether to collect statistics for objects that have inheritance relationship.
statimestamp	timestamp with time zone	Time when the statistics are collected.
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.
stadistinct	real	Number of distinct, non-null data values in the column for database nodes. ● A value greater than 0 indicates the actual number of distinct values. ● A value less than 0 indicates the ratio of the **distinct** value to the total number of rows. For example, if **stadistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. ● The value **0** indicates that the number of distinct values is unknown.
standvfunc	"char"	Algorithm used to calculate the NDV based on the statistics. ● **d**: The original DUJ1 algorithm is used for estimation. ● **c**: The C19 algorithm is used for estimation.
staorigin	"char"	Source of the statistics collection mode. ● **a**: The collection is triggered by AUTOANALYZE. ● **m**: The collection is triggered by manual ANALYZE. ● **g**: The gsstat thread is triggered to perform ANALYZE collection when a large amount of data is inserted.
stakindN	smallint	Code number stating that the type of statistics is stored in slot *N* of the *pg_statistic* row. The value of *N* ranges from 1 to 5.
staopN	oid	Operator used to generate the statistics stored in slot *N*. For example, a histogram slot shows the < operator that defines the sort order of the data. The value of *N* ranges from 1 to 5.

Name	Type	Description
stanumbersN	real[]	Numerical statistics of the appropriate type for slot *N*. The value is **NULL** if the slot does not involve numerical values. The value of *N* ranges from 1 to 5.
stavaluesN	anyarray	Column data values of the appropriate type for slot *N*. The value is **NULL** if the slot type does not store any data values. Each array's element values are actually of the specific column's data type so there is no way to define these columns' type more specifically than anyarray. The value of *N* ranges from 1 to 5.
stadndistinct	real	Number of unique non-null data values in the **DN1** column. ● A value greater than 0 indicates the actual number of distinct values. ● A value less than 0 is the ratio of the **distinct** value to the total number of rows. For example, if **stadndistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. ● The value **0** indicates that the number of distinct values is unknown.
staextinfo	text	Information about extension statistics. Reserved column.

12.2.14.15 GS_TABLESTATS_HISTORY

GS_TABLESTATS_HISTORY is a table for managing historical statistics at the table, index, and partition levels. It stores historical statistics about tables, indexes, and partitions in a database.

Table 12-62 GS_TABLESTATS_HISTORY columns

Name	Type	Description
relid	oid	Unique identifier of a table, index, or partition in pg_class/pg_partition.
relname	name	Name of a table, index, or partition.
relnamespace	oid	OID of the namespace that contains this object.

Name	Type	Description
relkind	"char"	Object type. • **r**: ordinary table. • **I**: table-level index. • **i**: partitioned index. • **p**: level-1 partition. • **s**: level-2 partition.
reltimestamp	timestamp with time zone	Time when the statistics are collected.
relpages	double precision	Size of the table on disk in pages. This is only an estimate used by the optimizer.
reltuples	double precision	Number of rows in the table. This is only an estimate used by the optimizer.
relallvisible	integer	Number of pages marked as all visible in the table.

12.2.14.16 GS_TXN_SNAPSHOT

GS_TXN_SNAPSHOT is a timestamp-CSN mapping table. It periodically samples and maintains an appropriate time range to estimate the CSN value corresponding to the timestamp in the range.

Table 12-63 GS_TXN_SNAPSHOT columns

Name	Data Type	Description
snptime	timestamp with time zone	Snapshot time
snpxmin	bigint	Minimum snapshot ID
snpcsn	bigint	Snapshot CSN
snpsnapshot	text	Serialized snapshot text

12.2.14.17 GS_UID

GS_UID records the unique identification meta information of the hasuids attribute table in the database.

Table 12-64 GS_UID columns

Name	Type	Description
relid	oid	OID of a table.
uid_backup	bigint	Largest unique identifier that can be assigned to a table.

12.2.14.18 GS_WORKLOAD_RULE

The GS_WORKLOAD_RULE system catalog records information about SQL concurrency control rules. There is no permission restriction on this system catalog. All users can query this system catalog.

Table 12-65 GS_WORKLOAD_RULE columns

Name	Type	Description
rule_id	bigint	Concurrency control rule ID, which is automatically generated by the system.
rule_name	name	Name of the concurrency control rule, which is used for search. The name may not be unique and can be **NULL**.
databases	name[]	List of databases on which the concurrency control rules take effect. If the value is **NULL**, the concurrency control rules take effect for all databases.
max_workload	bigint	Maximum number of concurrent rule settings.
is_valid	boolean	Determines whether the concurrency control rules take effect. If the concurrency control rules time out, the value is set to **false**.
start_time	timestamp with time zone	Start time of the concurrency control rules. The value **NULL** indicates that the rules take effect from now on.
end_time	timestamp with time zone	End time of the concurrency control rules. The value **NULL** indicates that the rules are always effective.
rule_type	text	Concurrency control rule type. Currently, only **"sqlid"**, **"select"**, **"insert"**, **"update"**, **"delete"**, **"merge"**, and **"resource"** are supported. Other values are invalid.

Name	Type	Description
option_val	text[]	Parameter values of concurrency control rules, including SQL ID, keyword list, and resource restriction. For details, see the description of the **gs_add_workload_rule** API.
node_names	text[]	List of nodes on which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.
user_names	text[]	List of users for which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.

12.2.14.19 PG_AGGREGATE

PG_AGGREGATE records information about aggregate functions. Each entry in PG_AGGREGATE is an extension of an entry in PG_PROC. The PG_PROC entry carries the aggregate's name, input and output data types, and other information that is similar to ordinary functions.

Table 12-66 PG_AGGREGATE columns

Name	Type	Reference	Description
aggfnoid	regproc	**PG_PROC**.proname	**PG_PROC** proname of the aggregate function
aggtransfn	regproc	**PG_PROC**.proname	Transition function
aggcollectfn	regproc	**PG_PROC**.proname	Collect function
aggfinalfn	regproc	**PG_PROC**.proname	Final function (**0** if none)
aggsortop	oid	**PG_OPERATOR**.oid	Associated sort operator (**0** if none)
aggtranstype	oid	**PG_TYPE**.oid	Data type of the aggregate function's internal transition (state) data The possible values and their meanings are defined by the types in **pg_type.h**. The main two types are polymorphic (isPolymorphicType) and non-polymorphic.

Name	Type	Reference	Description
agginitval	text	-	Initial value of the transition state. This is a text column containing the initial value in its external string representation. If this column is null, the transition state value starts from null.
agginitcollect	text	-	Initial value of the collection state. This is a text column containing the initial value in its external string representation. If this column is null, the collection state value starts from null.
aggkind	"char"	-	Type of the aggregate function: • **n**: normal aggregate • **o**: ordered set aggregate
aggnumdirectargs	smallint	-	Number of direct parameters (non-aggregation-related parameters) of the aggregate function of the ordered set aggregate type. For an aggregate function of the normal aggregate type, the value is **0**.
agginitfn	regproc	PG_PROC.proname	Initialization function.

12.2.14.20 PG_AM

PG_AM records information about index access methods. There is one row for each index access method supported by the system.

Table 12-67 PG_AM columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
amname	name	-	Name of the access method
amstrategies	smallint	-	Number of operator strategies for the access method (**0** if the access method does not have a fixed set of operator strategies)

Name	Type	Reference	Description
amsupport	smallint	-	Number of support routines for the access method
amcanorder	Boolean	-	Whether the access method supports ordered scans sorted by the indexed column's value ● **t** (true): supported. ● **f** (false): not supported.
amcanorderbyop	Boolean	-	Whether the access method supports ordered scans sorted by the result of an operator on the indexed column ● **t** (true): supported. ● **f** (false): not supported.
amcanbackward	Boolean	-	Whether the access method supports backward scanning ● **t** (true): supported. ● **f** (false): not supported.
amcanunique	Boolean	-	Whether the access method supports unique indexes ● **t** (true): supported. ● **f** (false): not supported.
amcanmulticol	Boolean	-	Whether the access method supports composite indexes ● **t** (true): supported. ● **f** (false): not supported.
amoptionalkey	Boolean	-	Whether the access method supports scanning without any constraint for the first index column ● **t** (true): supported. ● **f** (false): not supported.
amsearcharray	Boolean	-	Whether the access method supports **ScalarArrayOpExpr** searches ● **t** (true): supported. ● **f** (false): not supported.
amsearchnulls	Boolean	-	Whether the access method supports **IS NULL/NOT NULL** searches ● **t** (true): supported. ● **f** (false): not supported.

Name	Type	Reference	Description
amstorage	Boolean	-	Whether the index storage data type can differ from the column data type • **t** (true): allowed. • **f** (false): not allowed.
amclusterable	Boolean	-	Whether an index of this type can be clustered on • **t** (true): allowed. • **f** (false): not allowed.
ampredlocks	Boolean	-	Whether an index of this type manages fine-grained predicate locks • **t** (true): allowed. • **f** (false): not allowed.
amkeytype	oid	OID in **PG_TYPE**	Type of data stored in index (**0** if it is not a fixed type)
aminsert	regproc	**PG_PROC**.proname	"Insert this tuple" function
ambeginscan	regproc	**PG_PROC**.proname	"Prepare for index scan" function
amgettuple	regproc	**PG_PROC**.proname	"Next valid tuple" function (**0** if none)
amgetbitmap	regproc	**PG_PROC**.proname	"Fetch all valid tuples" function (**0** if none)
amrescan	regproc	**PG_PROC**.proname	"(Re)start index scan" function
amendscan	regproc	**PG_PROC**.proname	"Clean up after index scan" function
ammarkpos	regproc	**PG_PROC**.proname	"Mark current scan position" function
amrestrpos	regproc	**PG_PROC**.proname	"Restore marked scan position" function
ammerge	regproc	**PG_PROC**.proname	"Merge multiple indexes" function
ambuild	regproc	**PG_PROC**.proname	"Build new index" function
ambuildempty	regproc	**PG_PROC**.proname	"Build empty index" function

Name	Type	Reference	Description
ambulkdelete	regproc	PG_PROC.proname	Bulk-delete function
amvacuumcleanup	regproc	PG_PROC.proname	Post-**VACUUM** cleanup function
amcanreturn	regproc	PG_PROC.proname	Function to check whether the index supports index-only scans (**0** if none)
amcostestimate	regproc	PG_PROC.proname	Function to estimate cost of an index scan
amoptions	regproc	PG_PROC.proname	Function to parse and validate **reloptions** for an index

12.2.14.21 PG_AMOP

PG_AMOP records information about operators associated with access method operator families. There is one row for each operator that is a member of an operator family. A family member can be either a search operator or an ordering operator. An operator can appear in more than one family, but cannot appear in more than one search position nor more than one ordering position within a family.

Table 12-68 PG_AMOP columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
amopfamily	oid	PG_OPFAMILY.oid	Operator family of this entry.
amoplefttype	oid	**oid** in PG_TYPE	Left-hand input data type of the operator. For details about the possible values and their descriptions, see 7.3 Data Types.
amoprighttype	oid	**oid** in PG_TYPE	Right-hand input data type of the operator For details about the possible values and their descriptions, see 7.3 Data Types.

Name	Type	Reference	Description
amopstrategy	smallint	-	Number of operator strategies.
amoppurpose	"char"	-	Purpose of the operator. • **s**: search. • **o**: order.
amopopr	oid	PG_OPERATOR.oid	OID of the operator.
amopmethod	oid	PG_AM.oid	Operator family of the index access method.
amopsortfamily	oid	PG_OPFAMILY.oid	The B-tree operator family according to which this entry sorts for an ordering operator (**0** for a search operator)

A search operator entry indicates that an index of this operator family can be searched to find all rows satisfying **WHERE indexed_column operator constant**. Obviously, such an operator must return a Boolean value, and its left-hand input type must match the index's column data type.

An ordering operator entry indicates that an index of this operator family can be scanned to return rows in the order represented by **ORDER BY indexed_column operator constant**. Such an operator could return any sortable data type, though again its left-hand input type must match the index's column data type. The exact semantics of **ORDER BY** are specified by the **amopsortfamily** column, which must reference the B-tree operator family for the operator's result type.

12.2.14.22 PG_AMPROC

PG_AMPROC records information about the support procedures associated with the access method operator families. There is one row for each support procedure that belongs to an operator family.

Table 12-69 PG_AMPROC columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
amprocfamily	oid	PG_OPFAMILY.oid	Operator family of this entry

Name	Type	Reference	Description
amproclefttype	oid	PG_TYPE.oid	Left-hand input data type of the associated operator For details about the possible values and their descriptions, see 8.3 Data Type.
amprocrighttype	oid	PG_TYPE.oid	Right-hand input data type of the associated operator For details about the possible values and their descriptions, see 8.3 Data Type.
amprocnum	smallint	-	Support procedure number
amproc	regproc	PG_PROC.proname	OID of the procedure

The usual interpretation of the **amproclefttype** and **amprocrighttype** columns is that they identify the left and right input types of the operator(s) that a particular support procedure supports. For some access methods, these match the input data type(s) of the support procedure itself; for others not. There is a notion of "default" support procedures for an index, which are those with **amproclefttype** and **amprocrighttype** both equal to the index opclass's **opcintype**.

12.2.14.23 PG_ATTRDEF

PG_ATTRDEF records default values of columns.

Table 12-70 PG_ATTRDEF columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
adrelid	oid	Table to which a column belongs.
adnum	smallint	Number of columns.
adbin	pg_node_tree	Internal representation of the default value of a column or of a generated expression.
adsrc	text	Readable representation of the default value of a column or of a generated expression.
adgencol	"char"	Specifies whether a column is a generated column. The value **s** indicates that the column is a generated column, and the value **'\0** indicates that the column is a common column. The default value is **'\0**.

Name	Type	Description
adbin_on_update	pg_node_tree	Internal representation of the attribute expression **on update current_timestamp** of the column.
adsrc_on_update	text	Internal representation of the readable attribute expression **on update current_timestamp**.

12.2.14.24 PG_ATTRIBUTE

PG_ATTRIBUTE records information about table columns.

Table 12-71 PG_ATTRIBUTE columns

Name	Type	Description
attrelid	oid	Table to which a column belongs.
attname	name	Column name.
atttypid	oid	Column type.
attstattarget	integer	Level of details of statistics collected for this column by ANALYZE. • The value **0** indicates that no statistics should be collected. • A negative value indicates that the system default statistic object is used. • The exact meaning of positive values is data type-dependent. For scalar data types, **attstattarget** is both the target number of "most common values" to collect, and the target number of histogram bins to create.
attlen	smallint	Copy of typlen in **13.2.15.77 PG_TYPE** of the field type.
attnum	smallint	Number of the column.
attndims	integer	Number of dimensions if the column is an array (**0** in other cases).
attcacheoff	integer	This column is always set to **–1** on disks. When it is loaded into a row descriptor in the memory, it may be updated to cache the offset of the columns in the row.

Name	Type	Description
atttypmod	integer	Type-specific data supplied at the table creation time (for example, the maximum length of a **varchar** column). This column is used as the third parameter when passing to type-specific input functions and length coercion functions. The value will generally be **–1** for types that do not need ATTTYPMOD.
attbyval	Boolean	Copy of typbyval in **13.2.15.77 PG_TYPE** of the column type.
attstorage	"char"	Copy of typstorage in **13.2.15.77 PG_TYPE** of the column type.
attalign	"char"	Copy of typalign in **13.2.15.77 PG_TYPE** of the column type.
attnotnull	Boolean	A non-null constraint. It is possible to change this column to enable or disable the constraint.
atthasdef	Boolean	This column has a default value, in which case there will be a corresponding entry in **13.2.15.24 PG_ATTRDEF** that actually defines the value.
attisdropped	Boolean	Indicates that this column has been deleted and is no longer valid. A deleted column is still physically present in the table but is ignored by the analyzer, so it cannot be accessed through SQL.
attislocal	Boolean	Indicates that this column is locally defined in the relationship. Note that a column can be locally defined and inherited simultaneously.
attcmprmode	tinyint	Compressed modes for a specific column. The compressed mode includes: • **0**: not compressed (**ATT_CMPR_NOCOMPRESS**) • **1**: DELTA compression algorithm (**ATT_CMPR_DELTA**) • **2**: dictionary compression algorithm (**ATT_CMPR_DICTIONARY**) • **3**: prefix compression algorithm (**ATT_CMPR_PREFIX**) • **4**: digital string compression algorithm (**ATT_CMPR_NUMSTR**)
attinhcount	integer	Number of direct ancestors that this column has. A column with an ancestor cannot be dropped nor renamed.
attcollation	oid	Defined collation of a column.
attacl	aclitem[]	Permissions for column-level access.

Name	Type	Description
attoptions	text[]	Column attribute. Currently, the following attributes are supported: **n_distinct**: number of **distinct** values of a column (excluding subtables). **n_distinct_inherited**: number of **distinct** values of a column (including subtables).
attfdwoptions	text[]	Column attribute of a foreign table. Currently, **dist_fdw**, **file_fdw**, and **log_fdw** do not use foreign table column attributes.
attinitdefval	bytea	Stores the default value expression. ADD COLUMN in the row-store table must use this column.
attkvtype	tinyint	Key value type for a column. Value: **0**: default value (**ATT_KV_UNDEFINED**) **1**: dimension (**ATT_KV_TAG**) **2**: indicator (**ATT_KV_FIELD**) **3**: time column (**ATT_KV_TIMETAG**)
attidentity	"char"	Identity type of a column. Value: **'0'** or **'\0'**: The column is a non-IDENTITY column. **'a'**: The **IDENTITY** column attribute is of the **ALWAYS** type. **'d'**: The **IDENTITY** column attribute is of the **BY DEFAULT** type. **'n'**: The **IDENTITY** column attribute is of the **BY DEFAULT ON NULL** type.

12.2.14.25 PG_CAST

PG_CAST records the conversion relationship between data types.

Table 12-72 PG_CAST columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
castsource	oid	OID of the source data type.
casttarget	oid	OID of the target data type.
castfunc	oid	OID of the conversion function. The value **0** indicates that no conversion function is required.

Name	Type	Description
castcontext	"char"	Conversion mode between the source and target data types. ● **'e'**: Only explicit conversion can be performed (using the CAST or :: syntax). ● **'i'**: Implicit conversion can be performed. ● **'a'**: Both explicit and implicit conversion can be performed between data types.
castmethod	"char"	Conversion method. ● **'f'**: Conversion is performed using the specified function in the **castfunc** column. ● **'b'**: Binary forcible conversion rather than the specified function in the **castfunc** column is performed between data types.

12.2.14.26 PG_CLASS

PG_CLASS records database objects and their relationship.

Table 12-73 PG_CLASS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
relname	name	Name of an object, such as a table, index, or view.
relnamespace	oid	OID of the namespace that contains the relationship.
reltype	oid	Data type that corresponds to the table's row type. The index is 0 because the index does not have PG_TYPE records.
reloftype	oid	OID of the composite type (**0** for other types).
relowner	oid	Owner of the relationship.
relam	oid	Access method used, such as B-tree, if the row is an index.
relfilenode	oid	Name of the on-disk file of this relationship (**0** if such file does not exist).
reltablespace	oid	Tablespace in which this relationship is stored. If the value is **0**, the default tablespace in this database is used. This column is meaningless if the relationship has no on-disk file.

Name	Type	Description
relpages	double precision	Size of the on-disk representation of the table in pages (of size **BLCKSZ**). This is only an estimate used by the optimizer.
reltuples	double precision	Number of rows in the table. This is only an estimate used by the optimizer.
relallvisible	integer	Number of pages marked as all visible in the table. This column is used by the optimizer for optimizing SQL execution. It is updated by VACUUM, ANALYZE, and a few DDL statements such as CREATE INDEX.
reltoastrelid	oid	OID of the TOAST table associated with the table (**0** if no TOAST table exists). The TOAST table stores large columns "offline" in a secondary table.
reltoastidxid	oid	OID of the index for a TOAST table (**0** for a table other than a TOAST table)
relhasindex	Boolean	Its value is **true** if this column is a table and has (or recently had) at least one index. It is set by CREATE INDEX but is not immediately cleared by DROP INDEX. If the VACUUM thread detects that a table has no index, it clears the **relhasindex** column and sets the value to **false**.
relisshared	Boolean	Its value is **true** if the table is shared across all database nodes in the database. Otherwise, the value is **false**. Only certain system catalogs (such as PG_DATABASE) are shared.
relpersistence	"char"	• **p**: permanent table • **u**: non-log table • **t**: temporary table • **g**: global temporary table.
relkind	"char"	• **r**: ordinary table • **i**: index • **I**: global index of a partitioned table • **s**: sequence • **L**: long sequence • **v**: view • **c**: composite type • **t**: TOAST table • **f**: foreign table • **m**: materialized view

Name	Type	Description
relnatts	smallint	Number of user columns in the relationship (excluding system columns). **PG_ATTRIBUTE** has the same number of rows as the user columns.
relchecks	smallint	Number of check constraints in the table. For details, see the system catalog **PG_CONSTRAINT**.
relhasoids	Boolean	Its value is **true** if an OID is generated for each row of the relationship. Otherwise, the value is **false**.
relhaspkey	Boolean	Its value is **true** if the table has (or once had) a primary key. Otherwise, the value is **false**.
relhasrules	Boolean	Its value is **true** if the table has rules. For details, see the system catalog **PG_REWRITE**.
relhastriggers	Boolean	The value is **true** if the table has (or once had) triggers. Triggers of the table and view are recorded in the system catalog **PG_TRIGGER**.
relhassubclass	Boolean	Its value is **true** if the table has (or once had) any inheritance child table. Otherwise, the value is **false**.
relcmprs	tinyint	Specifies whether the compression feature is enabled for the table. Note that only batch insertion triggers compression, so ordinary CRUD does not trigger compression. • **0**: Tables that do not support compression (primarily system catalogs, on which the compression attribute cannot be modified). • **1**: The compression feature of the table data is NOCOMPRESS or has no specified keyword. • **2**: The compression feature of the table data is COMPRESS.
relrowmovement	Boolean	Specifies whether row migration is allowed when the partitioned table is updated. • **true**: Row migration is allowed. • **false**: Row migration is not allowed.
parttype	"char"	Specifies whether the table or index has the property of a partitioned table. • **p**: The table or index has the property of a partitioned table. • **n**: The table or index does not have the property of a partitioned table. • **s**: The table is a level-2 partitioned table.

Name	Type	Description
relfrozenxid	xid32	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table. This column is used to track whether the table needs to be vacuumed to prevent transaction ID wraparound (or to allow PG_CLOG to be shrunk). The value is **0** (**InvalidTransactionId**) if the relationship is not a table. To ensure forward compatibility, this column is reserved. The **relfrozenxid64** column is added to record the information.
relacl	aclitem[]	Access permissions. For details about the ACLItem type, see **ACLItem Type**. The command output of the query is as follows: *user1*=*privs*/*user2* indicates that the permission granted by user 2 to user 1 is **privs**. =*privs*/*user3* indicates that the permission granted to the **public** role by user 3 is **privs**. In the preceding command, user 1, user 2, and user 3 are the existing users or roles in the database, and **privs** indicates the permissions supported by the database. For details on permission descriptions, see **Table 12-74**.
reloptions	text[]	Table or index access method, using character strings in the format of "keyword=value"
relreplident	"char"	Identifier of a decoding column in logical decoding. • **d**: default (primary key, if any) • **n**: none • **f**: all columns • **i**: The indisreplident of the index is specified or the default index is used.
relfrozenxid64	xid	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table. This column is used to track whether the table needs to be vacuumed to prevent transaction ID wraparound (or to allow PG_CLOG to be shrunk). The value is **0** (**InvalidTransactionId**) if the relationship is not a table. For a global temporary table, this field is meaningless. You can view **relfrozenxid64** of the global temporary table of each session in the **pg_catalog.pg_gtt_relstats** view.

Name	Type	Description
relbucket	oid	Specifies whether the current catalog contains hash bucket shards. A valid OID points to the specific shard information recorded in the PG_HASHBUCKET catalog. **NULL** indicates that hash bucket shards are not included.
relbucketkey	int2vector	Hash partition column information. **NULL** indicates that the column information is not included.
relminmxid	xid	All multi-transaction IDs before this one have been replaced with a transaction ID in the table. This is used to track whether the table needs to be vacuumed in order to prevent multi-transaction IDs wraparound or to allow PG_CLOG to be shrunk. The value is **0** (**InvalidTransactionId**) if the relationship is not a table.

Table 12-74 Description of permissions

Parameter	Description
r	SELECT (read)
w	UPDATE (write)
a	INSERT (insert)
d	DELETE
D	TRUNCATE
x	REFERENCES
t	TRIGGER
X	EXECUTE
U	USAGE
C	CREATE
c	CONNECT
T	TEMPORARY
A	ALTER
P	DROP
m	COMMENT
i	INDEX
v	VACUUM

Parameter	Description
*	Authorization options for preceding permissions

12.2.14.27 PG_COLLATION

PG_COLLATION describes available collations, which are essentially mappings from an SQL name to operating system locale categories.

Table 12-75 PG_COLLATION columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
collname	name	-	Collation name (unique per namespace and encoding)
collnamespace	oid	OID in **PG_NAMESPACE**	OID of the namespace that contains this collation
collowner	oid	OID in **PG_AUTHID**	Owner of the collation
collencoding	integer	-	Encoding in which the collation is applicable, or **–1** if it works for any encoding. It is compatible with PostgreSQL.
collcollate	name	-	**LC_COLLATE** for this collation object
collctype	name	-	**LC_CTYPE** for this collation object
collpadattr	text	-	Collation padding attribute. • **NULL**: not applicable. • **NO PAD**: no padding. • **PAD SPACE**: blank spaces padded at the end.
collisdef	Boolean	-	Determines whether the collation is the default collation of the character set.

12.2.14.28 PG_CONSTRAINT

PG_CONSTRAINT records check, primary key, and unique constraints on tables.

Table 12-76 PG_CONSTRAINT columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
conname	name	Constraint name (not necessarily unique).
connamespace	oid	OID of the namespace that contains the constraint.
contype	"char"	• **c**: check constraint. • **p**: primary key constraint. • **u**: unique constraint. • **t**: trigger constraint. • **x**: mutual exclusion constraint. • **f**: foreign key constraint. • **s**: clustering constraint. • **i**: invalid constraint.
condeferrable	Boolean	Specifies whether the constraint is deferrable. • **true**: yes. • **false**: no.
condeferred	Boolean	Specifies whether the constraint can be deferrable by default. • **true**: yes. • **false**: no.
convalidated	Boolean	Specifies whether the constraint is valid. Currently, it can be set to **false** only for foreign key and check constraints. • **true**: valid. • **false**: invalid.
conrelid	oid	Table containing this constraint (**0** if it is not a table constraint).
contypid	oid	Domain containing this constraint (**0** if it is not a domain constraint).
conindid	oid	ID of the index associated with the constraint.
confrelid	oid	Referenced table if this constraint is a foreign key. Otherwise, the value is **0**.

Name	Type	Description
confupdtype	"char"	Foreign key update action code. ● **a**: no action. ● **r**: restriction. ● **c**: cascading. ● **n**: The parameter is set to **null**. ● **d**: The default value is used.
confdeltype	"char"	Foreign key deletion action code. ● **a**: no action. ● **r**: restriction. ● **c**: cascading. ● **n**: The parameter is set to **null**. ● **d**: The default value is used.
confmatchtype	"char"	Foreign key match type. ● **f**: full match. ● **p**: partial match. ● **u**: unspecified. (The NULL value can be matched if **f** is specified.)
conislocal	Boolean	Specifies whether the constraint is defined locally for the relationship. ● **true**: yes. ● **false**: no.
coninhcount	integer	Number of direct inheritance parent tables that this constraint has. When the value is not **0**, the constraint cannot be deleted or renamed.
connoinherit	Boolean	Specifies whether the constraint can be inherited. ● **true**: yes. ● **false**: no.
consoft	Boolean	Specifies whether the column indicates an informational constraint. ● **true**: yes. ● **false**: no.
conopt	Boolean	Specifies whether you can use the informational constraint to optimize the execution plan. ● **true**: yes. ● **false**: no.

Name	Type	Description
conkey	smallint[]	Column list of the constrained control if this column is a table constraint.
confkey	smallint[]	List of referenced columns if this column is a foreign key.
conpfeqop	oid[]	ID list of the equality operators for PK = FK comparisons if this column is a foreign key.
conppeqop	oid[]	ID list of the equality operators for PK = PK comparisons if this column is a foreign key.
conffeqop	oid[]	ID list of the equality operators for FK = FK comparisons if this column is a foreign key. The value is empty because foreign keys are not supported currently.
conexclop	oid[]	ID list of the per-column exclusion operators if this column is an exclusion constraint.
conbin	pg_node_tree	Internal representation of the expression if this column is a check constraint.
consrc	text	Readable representation of the expression if this column is a check constraint.
conincluding	smallint[]	Not for constraint, but will be included in the attribute column of **INDEX**.

NOTICE

- **consrc** is not updated when referenced objects change and does not track new column names. Instead of relying on this column to update, you are advised to use pg_get_constraintdef() to extract the definition of a check constraint.
- **relchecks** of **PG_CLASS** must agree with the number of check-constraint entries found in the table for each relationship.

12.2.14.29 PG_CONVERSION

PG_CONVERSION describes encoding conversion information.

Table 12-77 PG_CONVERSION columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)

Name	Type	Reference	Description
conname	name	-	Conversion name (unique within a namespace)
connamespace	oid	PG_NAMESPACE.oid	OID of the namespace that contains this conversion
conowner	oid	PG_AUTHID.oid	Owner of the conversion
conforencoding	integer	-	Source encoding ID
contoencoding	integer	-	Destination encoding ID
conproc	regproc	PG_PROC.proname	Conversion procedure
condefault	Boolean	-	If this is the default conversion, the value is **true**. Otherwise, the value is **false**.

12.2.14.30 PG_DATABASE

PG_DATABASE records information about available databases.

Table 12-78 PG_DATABASE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
datname	name	Database name
datdba	oid	Owner of the database, usually the user who created it
encoding	integer	Character encoding for the database
datcollate	name	Sequence used by the database
datctype	name	Character type used by the database
datistemplate	Boolean	Whether the database can be used as a template database
datallowconn	Boolean	If the value is **true**, users can connect to the database. If the value is **false**, no one can connect to this database. This column is used to protect the **template0** database from being altered.
datconnlimit	integer	Maximum number of concurrent connections allowed on this database. The value **-1** indicates no limit.

Name	Type	Description
datlastsysoid	oid	Last system OID in the database
datfrozenxid	xid32	Tracks whether the database needs to be vacuumed to prevent transaction ID wraparound. This column is discarded in the current version. To ensure forward compatibility, this column is reserved. The **datfrozenxid64** column is added to record the information.
dattablespace	oid	Default tablespace of the database
datcompatibility	name	Database compatibility mode. Currently, four compatibility modes are supported: A, B, C, and PG, indicating that the Oracle, MySQL, Teradata, and Postgres databases are compatible.
datacl	aclitem[]	Access permission
datfrozenxid64	xid	Tracks whether the database needs to be vacuumed to prevent transaction ID wraparound.
datminmxid	xid	All multi-transaction IDs before this one have been replaced with a transaction ID in the database. This is used to track whether the database needs to be vacuumed in order to prevent transaction IDs wraparound or to allow PG_CLOG to be shrunk. It is the minimum value of **relminmxid** in **PG_CLASS** of all tables in the database.
dattimezone	name	Database time zone. The default is PRC.

12.2.14.31 PG_DEPEND

PG_DEPEND records the dependency between database objects. This information allows **DROP** commands to find which other objects must be dropped by **DROP CASCADE** or prevent dropping in the **DROP RESTRICT** case.

See also **PG_SHDEPEND**, which performs a similar function for dependencies involving objects that are shared across databases.

Table 12-79 PG_DEPEND columns

Name	Type	Reference	Description
classid	oid	OID in **PG_CLASS**	OID of the system catalog where a dependent object resides

Name	Type	Reference	Description
objid	oid	Any OID column	OID of the dependent object
objsubid	integer	-	For a table column, this is the column number (**objid** and **classid** refer to the table itself). The value is **0** for all other object types.
refclassid	oid	OID in **PG_CLASS**	OID of the system catalog where a referenced object resides
refobjid	oid	Any OID column	OID of the referenced object
refobjsubid	integer	-	For a table column, this is the column number (**refobjid** and **refclassid** refer to the table itself). The value is **0** for all other object types.
deptype	"char"	-	A code defining the specific semantics of this dependency

In all cases, a PG_DEPEND entry indicates that the referenced object cannot be dropped without also dropping the dependent object. However, there are several subflavors identified by **deptype**:

- DEPENDENCY_NORMAL (n): A normal relationship between separately created objects. The dependent object can be dropped without affecting the referenced object. The referenced object can only be dropped by specifying CASCADE, in which case the dependent object is dropped too. Example: a table column has a normal dependency on its data type.
- DEPENDENCY_AUTO (a): The dependent object can be dropped separately from the referenced object, and should be automatically dropped (regardless of RESTRICT or CASCADE mode) if the referenced object is dropped. Example: a named constraint on a table is made autodependent on the table, so that it will go away if the table is dropped.
- DEPENDENCY_INTERNAL (i): The dependent object was created as part of creation of the referenced object, and is only a part of its internal implementation. A DROP of the dependent object will be disallowed outright (We'll tell the user to issue a DROP against the referenced object, instead). A DROP of the referenced object will be propagated through to drop the dependent object whether CASCADE is specified or not.
- DEPENDENCY_EXTENSION (e): The dependent object is a member of the extension of the referenced object (see **PG_EXTENSION**). The dependent object can be dropped only via DROP EXTENSION on the referenced object. Functionally this dependency type acts the same as an internal dependency, but it is kept separate for clarity and to simplify GS_DUMP.

NOTICE

The extended function is for internal use only. You are advised not to use it.

- DEPENDENCY_PIN (p): There is no dependent object; this type of entry is a signal that the system itself depends on the referenced object, and so that object must never be deleted. Entries of this type are created only by **initdb**. The columns for the dependent object contain zeroes.

12.2.14.32 PG_DESCRIPTION

PG_DESCRIPTION records optional descriptions (comments) for each database object. Descriptions of many built-in system objects are provided in the initial contents of PG_DESCRIPTION.

See also **PG_SHDESCRIPTION**, which provides a similar function for descriptions involving objects that are shared within the entire database.

Table 12-80 PG_DESCRIPTION columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this description pertains to
classoid	oid	PG_CLASS.oid	OID of the system catalog where the object appears
objsubid	integer	-	Column number for a comment on a table column (**objoid** and **classoid** refer to the table itself); **0** for all other object types
description	text	-	Arbitrary text that serves as the description of the object

12.2.14.33 PG_DIRECTORY

PG_DIRECTORY stores directory objects added by users. You can execute the **CREATE DIRECTORY** statement to add records to this system catalog. When **enable_access_server_directory** is set to **off**, only the initial user can create directory objects. When **enable_access_server_directory** is set to **on**, users with the SYSADMIN permission and users inheriting the built-in role permission gs_role_directory_create can create directory objects. Common users can access this system catalog only after being authorized.

Table 12-81 PG_DIRECTORY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)

Name	Type	Description
dirname	name	Name of a directory object
owner	oid	Owner of a directory object
dirpath	text	Directory path.
diracl	aclitem[]	Access permissions.

12.2.14.34 PG_ENUM

PG_ENUM contains entries showing the values and labels for each enumerated type. The internal representation of a given enumerated value is actually the OID of its associated row in PG_ENUM.

Table 12-82 PG_ENUM columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
enumtypid	oid	PG_TYPE.oid	OID of the PG_TYPE entry owning this enumerated value
enumsortorder	real	-	Sort position of this enumerated value within its enumerated type
enumlabel	name	-	Textual label for this enumerated value

The OIDs for PG_ENUM rows follow a special rule: even-numbered OIDs are guaranteed to be ordered in the same way as the sort ordering of their enumerated type. If two even OIDs belong to the same enumerated type, the smaller OID must have the smaller **enumsortorder** value. Odd-numbered OID values need bear no relationship to the sort order. This rule allows the enumerated comparison routines to avoid catalog lookups in many common cases. The routines that create and alter enumerated types attempt to assign even OIDs to enumerated values whenever possible.

When an enumerated type is created, its members are assigned sort-order positions from 1 to *n*. However, members added later might be given negative or fractional values of **enumsortorder**. The only requirement on these values is that they be correctly ordered and unique within each enumerated type.

12.2.14.35 PG_EXTENSION

PG_EXTENSION records information about the installed extensions. The default GaussDB extensions are PLPGSQL, DIST_FDW, FILE_FDW, LOG_FDW, DBLINK_FDW, PACKAGES, SECURITY_PLUGIN, GSSTAT_PLUGIN, NUMERIC_ENHANCE, PKG_DBE_RAW, PKG_DBE_OUTPUT, PKG_DBE_UTILITY, PKG_ILM,

PKG_DBE_XMLGEN, PKG_DBE_STATS, PKG_DBE_XML, PKG_DBE_DESCRIBE, and PKG_PL_PROFILER. This system catalog is for internal use only. You are advised not to use it.

Table 12-83 PG_EXTENSION

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
extname	name	Extension name.
extowner	oid	Owner of the extension.
extnamespace	oid	Namespace containing the extension's exported objects.
extrelocatable	Boolean	Specifies whether the extension can be relocated to another namespace. The value **true** indicates that relocation is allowed.
extversion	text	Version number of the extension.
extconfig	oid[]	Configuration information about the extension.
extcondition	text[]	Filter conditions for the extension's configuration information.

12.2.14.36 PG_FOREIGN_DATA_WRAPPER

PG_FOREIGN_DATA_WRAPPER records foreign-data wrapper definitions. A foreign-data wrapper is the mechanism by which external data, residing on foreign servers, is accessed.

Table 12-84 PG_FOREIGN_DATA_WRAPPER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
fdwname	name	-	Name of a foreign-data wrapper
fdwowner	oid	OID in **PG_AUTHID**	Owner of a foreign-data wrapper
fdwhandler	oid	OID in **PG_PROC**	References a handler function that is responsible for supplying execution routines for a foreign-data wrapper The value is **0** if no handler is provided.

Name	Type	Reference	Description
fdwvalidator	oid	OID in PG_PROC	References a validator function that is responsible for checking the validity of the options given to a foreign-data wrapper, as well as options for foreign servers and user mappings using the foreign-data wrapper. The value is **0** if no validator is provided.
fdwacl	aclitem[]	-	Access permissions
fdwoptions	text[]	-	Foreign-data wrapper specific option, expressed in a string in the format of keyword=value

12.2.14.37 PG_FOREIGN_SERVER

PG_FOREIGN_SERVER records foreign server definitions. A foreign server describes a source of external data, such as a remote server. Foreign servers are accessed via foreign-data wrappers.

Table 12-85 PG_FOREIGN_SERVER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
srvname	name	-	Name of a foreign server
srvowner	oid	OID in PG_AUTHID	Owner of the foreign server
srvfdw	oid	OID in PG_FOREIGN_DATA_WRAPPER	OID of the foreign-data wrapper on a foreign server
srvtype	text	-	Type of the server (optional)
srvversion	text	-	Version of the server (optional)
srvacl	aclitem[]	-	Access permissions
srvoptions	text[]	-	Option used for foreign servers, expressed in a string in the format of keyword=value

12.2.14.38 PG_HASHBUCKET

PG_HASHBUCKET records hash bucket information. It is an empty table and is not supported in the current version.

Table 12-86 PG_HASHBUCKET columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
bucketid	oid	This parameter is not supported in the current version. The value is **NULL**.
bucketcnt	integer	This parameter is not supported in the current version. The value is **NULL**.
bucketmapsize	integer	This parameter is not supported in the current version. The value is **NULL**.
bucketref	integer	This parameter is not supported in the current version. The value is **NULL**.
bucketvector	oidvector_extend	This parameter is not supported in the current version. The value is **NULL**.
bucketmap	text	This parameter is not supported in the current version. The value is **NULL**.
bucketversion	oidvector_extend	This parameter is not supported in the current version. The value is **NULL**.
bucketcsn	text	This parameter is not supported in the current version. The value is **NULL**.
bucketxid	text	This parameter is not supported in the current version. The value is **NULL**.

12.2.14.39 PG_INDEX

PG_INDEX records part of index information. The rest is mostly recorded in PG_CLASS.

Table 12-87 PG_INDEX columns

Name	Type	Description
indexrelid	oid	OID of the **PG_CLASS** entry for the index.
indrelid	oid	OID of the **PG_CLASS** entry for the table that uses the index.
indnatts	smallint	Number of columns in the index.

Name	Type	Description
indisunique	Boolean	Specifies whether the index is unique. ● **true**: The index is unique. ● **false**: The index is not unique.
indisprimary	Boolean	Specifies whether the index is the primary key of the table. ● **true**: The index is the primary key of the table. **indisunique** should always be **true** when the value of this column is **true**. ● **false**: The index is not the primary key of the table.
indisexclusion	Boolean	Specifies whether the index supports exclusive constraints. ● **true**: The index supports exclusive constraints. ● **false**: The index does not support exclusive constraints.
indimmediate	Boolean	Specifies whether to check the uniqueness of data to be inserted. ● **true**: The uniqueness check is performed immediately when data is inserted. ● **false**: The uniqueness check is not performed when data is inserted.
indisclustered	Boolean	Specifies whether the table is clustered on the index. ● **true**: The table is clustered on the index. ● **false**: The table is not clustered on the index.
indisusable	Boolean	Specifies whether the index is available for insert and select operations. ● **true**: The index is available for insert and select operations. ● **false**: The index is unavailable for insert and select operations.
indisvalid	Boolean	● **true**: The index can be used for query. ● **false**: The index is possibly incomplete and must still be modified by INSERT or UPDATE operations, but it cannot be securely used for queries. If it is a unique index, the uniqueness property is also not **true**.

Name	Type	Description
indcheckxmin	Boolean	• **true**: Queries must not use the index until the xmin of this row in PG_INDEX is lower than their **TransactionXmin**, because the table may contain broken HOT chains with incompatible rows that they can see. • **false**: Indexes can be used for query.
indisready	Boolean	• **true**: The index is available for inserting data. • **false**: The index is ignored when data is inserted or modified.
indkey	int2vector	This is an array of **indnatts** values indicating that this index creates table columns. For example, a value of **1 3** indicates that the first and the third columns make up the index key. The value **0** in this array indicates that the corresponding index attribute is an expression over the table columns, rather than a simple column reference.
indcollation	oidvector	OID of the collation corresponding to each index column. For details, see **PG_COLLATION**.
indclass	oidvector	For each column in the index key, this contains the OID of the operator class to use. For details, see section **12.2.15.53 PG_OPCLASS**.
indoption	int2vector	Array of values that store per-column flag bits. The meaning of the bits is defined by the index's access method.
indexprs	pg_node_tree	Expression trees (in **nodeToString()** representation) for index attributes that are not simple column references. It is a list with one element for each zero entry in indkey. The value is null if all index attributes are simple references.
indpred	pg_node_tree	Expression tree (in **nodeToString()** representation) for partial index predicate. If the index is not a partial index, this column is an empty string.
indisreplident	Boolean	Specifies whether the column of this index is a decoded column of logical decoding. • **true**: The column of this index is a decoded column of logical decoding. • **false**: The column of this index is not a decoded column of logical decoding.
indnkeyatts	smallint	Total number of columns in the index. The columns that exceed the value of **indnatts** are not involved in the index query.

Name	Type	Description
indcctmpid	oid	OID of the temporary table when the Ustore builds indexes online.
indisvisible	Boolean	• **true**: The index status is visible, that is, the optimizer can use the index. • **false**: The index is invisible. If the value of **enable_invisible_indexes** is **off**, the optimizer cannot use the index. If the value of **enable_invisible_indexes** is **on**, the optimizer can use the index.

12.2.14.40 PG_INHERITS

PG_INHERITS records information about table inheritance hierarchies. There is one entry for each direct child table in the database. Indirect inheritance can be determined by following chains of entries.

Table 12-88 PG_INHERITS columns

Name	Type	Reference	Description
inhrelid	oid	PG_CLASS.oid	OID of a child table
inhparent	oid	PG_CLASS.oid	OID of a parent table
inhseqno	integer	-	If there is more than one direct parent for a child table (multiple inheritances), this number tells the order in which the inherited columns are to be arranged. The count starts at 1.

12.2.14.41 PG_JOB

PG_JOB records detailed information about jobs created by users. Dedicated threads poll the system catalog PG_JOB and trigger jobs based on scheduled job execution time, and update job status in PG_JOB. This system catalog belongs to the Shared Relation category. All job records are visible to all databases. Common users can access this system catalog only after being authorized.

Table 12-89 PG_JOB columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).

Name	Type	Description
job_id	bigint	Job ID, which is the primary key and is unique (with a unique index).
current_postgres_pid	bigint	If the current job has been executed, the thread ID of this job is recorded. The default value is **–1**, indicating that the job has not yet been executed.
log_user	name	Username of the creator.
priv_user	name	Username of the job executor.
dbname	name	Name of the database in which the job will be executed.
node_name	name	Primary database node on which the job will be executed.
job_status	"char"	Execution status of the current task. The default value is **'s'**. The options are as follows: ● **'r'**: running ● **'s'**: successfully finished ● **'f'**: job failed ● **'d'**: disable If a job fails to be executed for 16 consecutive times, **job_status** is automatically set to **'d'**, and no more attempt will be made on this job. Note: When you disable a scheduled job (by setting **job_queue_processes** to **0**), the thread that monitors the job execution is not started, and the job status will not be updated. You can ignore this status. Only when the scheduled job function is enabled (**job_queue_processes** is not set to **0**), the system updates the value of this column based on the real-time job status.
start_date	timestamp without time zone	Start time of the first job execution, accurate to millisecond.
next_run_date	timestamp without time zone	Time when a scheduled job is executed next time. The time is accurate to milliseconds.
failure_count	smallint	Number of times the job has started and failed. If a job fails to be executed for 16 consecutive times, no more attempt will be made on it.
interval	text	Job execution interval.
last_start_date	timestamp without time zone	Start time of the last job execution, accurate to millisecond.

Name	Type	Description
last_end_date	timestamp without time zone	End time of the last job execution, accurate to millisecond.
last_suc_date	timestamp without time zone	Start time of the last successful job execution, accurate to millisecond.
this_run_date	timestamp without time zone	Start time of the ongoing job execution, accurate to millisecond.
nspname	name	Name of the schema used for job execution.
job_name	text	Name of the DBE_SCHEDULER scheduled job.
end_date	timestamp without time zone	Expiration time of the DBE_SCHEDULER scheduled job, accurate to millisecond.
enable	Boolean	Enabling status of the DBE_SCHEDULER scheduled job. The options are as follows: • **true**: enabled • **false**: disabled
failure_msg	text	Error information about the latest task execution.

12.2.14.42 PG_JOB_PROC

PG_JOB_PROC records the content of each job in the **PG_JOB** system catalog, including the PL/SQL code blocks and anonymous blocks. Storing such information in the system catalog PG_JOB and loading it to the shared memory will result in excessive memory usage. Therefore, such information is stored in a separate table and is retrieved when needed. Common users can access this system catalog only after being authorized.

Table 12-90 PG_JOB_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
job_id	integer	Foreign key, which is associated with **job_id** in **PG_JOB**.
what	text	Job content, which is the program content in the DBE_SCHEDULER scheduled job.

Name	Type	Description
job_name	text	Name of the DBE_SCHEDULER scheduled job or program.

12.2.14.43 PG_LANGUAGE

PG_LANGUAGE registers programming languages. You can use them and interfaces to write functions or stored procedures.

Table 12-91 PG_LANGUAGE columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
lanname	name	-	Language name
lanowner	oid	OID in PG_AUTHID	Owner of the language
lanispl	Boolean	-	• **true**: user-defined language. • **false**: internal language, for example, SQL. Currently, **gs_dump** still uses this column to determine which languages need to be dumped, but this might be replaced by a different mechanism in the future.
lanpltrusted	Boolean	-	• **true**: The language is trusted, which means that it is believed not to grant access to anything outside the normal SQL execution environment. • **false**: The language is untrusted. Only the initial user can create functions in untrusted languages.
lanplcallfoid	oid	OID in PG_PROC	For non-internal languages, this column references the language handler, which is a special function responsible for executing all functions that are written in the particular language.
laninline	oid	PG_PROC.oid	This column references a function responsible for executing "inline" anonymous code blocks (DO blocks). The value is **0** if inline blocks are not supported.

Name	Type	Reference	Description
lanvalidator	oid	PG_PROC.oid	This column references a language validator function responsible for checking the syntax and validity of new functions when they are created. The value is **0** if no validator is provided.
lanacl	aclitem[]	-	Access permissions

12.2.14.44 PG_LARGEOBJECT

PG_LARGEOBJECT records data making up large objects. A large object is identified by an OID assigned when it is created. Each large object is broken into segments or "pages" small enough to be conveniently stored as rows in PG_LARGEOBJECT. The amount of data per page is defined as **LOBLKSIZE**.

This system catalog is accessible only to system administrators.

Table 12-92 PG_LARGEOBJECT columns

Name	Type	Reference	Description
loid	oid	OID in PG_LARGEOBJECT_METADATA	Identifier of the large object that includes this page.
pageno	integer	-	Page number of this page within its large object (counting from zero).
data	bytea	-	Data stored in the large object. This will never be more than **LOBLKSIZE** bytes and might be less.

Each row of **PG_LARGEOBJECT** holds data for one page of a large object, beginning at byte offset (**pageno * LOBLKSIZE**) within the object. The implementation allows sparse storage: pages might be missing, and might be shorter than **LOBLKSIZE** bytes even if they are not the last page of the object. Missing regions within a large object read as zeroes.

12.2.14.45 PG_LARGEOBJECT_METADATA

PG_LARGEOBJECT_METADATA records metadata associated with large objects. The actual large object data is stored in **PG_LARGEOBJECT**.

Table 12-93 PG_LARGEOBJECT_METADATA columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
lomowner	oid	PG_AUTHID.oid	Owner of the large object
lomacl	aclitem[]	-	Access permissions

12.2.14.46 PG_NAMESPACE

PG_NAMESPACE records namespaces, that is, schema-related information. If the database object isolation attribute is enabled, users can view only the schema information that they have the permission to access.

Table 12-94 PG_NAMESPACE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
nspname	name	Name of a namespace
nspowner	oid	Owner of a namespace
nsptimeline	bigint	Timeline when a namespace is created on the database node. This column is for internal use and valid only on the database node.
nspacl	aclitem[]	Access permission For details, see 7.13.12.1 GRANT and 7.13.17.9 REVOKE.
in_redistribution	"char"	Specifies whether the content is in the redistribution state.
nspblockchain	Boolean	Specifies whether the mode is the tamper-proof mode. • **true**: The mode is the tamper-proof mode. • **false**: The mode is not the tamper-proof mode.
nspcollation	oid	Default collation of the namespace (a value may exist only when **sql_compatibility** is set to **'b'**).

12.2.14.47 PG_OBJECT

PG_OBJECT records the creator, creation time, and last modification time of objects of specified types (ordinary tables, indexes, sequences, views, stored procedures, and functions).

Table 12-95 PG_OBJECT columns

Name	Type	Description
object_oid	oid	Object identifier.
object_type	"char"	Object type. ● **r**: ordinary table ● **i**: index ● **s**: sequence ● **v**: view ● **P**: stored procedure and function ● **S**: package header ● **B**: package body
creator	oid	ID of a creator.
ctime	timestamp with time zone	Creation time of an object.
mtime	timestamp with time zone	Last modification time of an object. The modification operations include **ALTER**, **GRANT**, and **REVOKE**.
createcsn	bigint	CSN when an object is created.
changecsn	bigint	CSN when DDL operations are performed on a table or an index.
valid	Boolean	Validity of an object. **t** indicates valid, and **f** indicates invalid.

NOTICE

- Objects created or modified during database initialization (initdb) cannot be recorded. **PG_OBJECT** does not contain these object records.
- When an object created before the upgrade is modified again, the modification time (specified by **mtime**) is recorded. When DDL operations are performed on a table or an index, the transaction commit sequence number (specified by **changecsn**) of the transaction to which the table or index belongs is recorded. Because the creation time of the object cannot be obtained, **ctime** and **createcsn** are empty.
- The time recorded by **ctime** and **mtime** is the start time of the transaction to which the current operation belongs.
- The time of object modification due to capacity expansion is also recorded.
- **createcsn** and **changecsn** record the transaction commit sequence number of the transaction to which the current operation belongs.
- When **enable_gtt_concurrent_truncate** is set to **on**, the **mtime** column is not updated when the global temporary table is truncated.
- If the statement for creating an object has an undefined object, or the referenced object is modified or deleted, the object to be created will be invalid.

12.2.14.48 PG_OPCLASS

PG_OPCLASS defines index access method operator classes.

Each operator class defines semantics for index columns of a particular data type and a particular index access method. An operator class essentially specifies that a particular operator family is applicable to a particular indexable column data type. The set of operators from the family that are actually usable with the indexed column are data types that accept the left-hand column.

Table 12-96 PG_OPCLASS columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
opcmethod	oid	OID in **PG_AM**	Index access method operator class served by an operator class
opcname	name	-	Name of the operator class
opcnamespace	oid	OID in **PG_NAMESPACE**	Namespace of the operator class
opcowner	oid	OID in **PG_AUTHID**	Owner of the operator class
opcfamily	oid	OID in **PG_OPFAMILY**	Operator family containing the operator class
opcintype	oid	OID in **PG_TYPE**	Data type that the operator class indexes

Name	Type	Reference	Description
opcdefault	boolean	-	The value is **t** (true) if the operator class is the default for **opcintype**. Otherwise, the value is **f** (false).
opckeytype	oid	OID in **PG_TYPE**	Type of data stored in an index, or zero if same as **opcintype**

An operator class's **opcmethod** must match the **opfmethod** of its containing operator family.

12.2.14.49 PG_OPERATOR

PG_OPERATOR records information about operators.

Table 12-97 PG_OPERATOR columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
oprname	name	-	Name of an operator.
oprnamespace	oid	**oid** in **PG_NAMESPACE**	OID of the namespace that contains the operator.
oprowner	oid	OID in **PG_AUTHID**	Owner of the operator.
oprkind	"char"	-	• **b**: infix (both sides) • **l**: prefix (left side) • **r**: suffix (right side)
oprcanmerge	Boolean	-	Specifies whether the operator supports merge joins. • **t (true)**: yes • **f (false)**: no
oprcanhash	Boolean	-	Specifies whether the operator supports hash joins. • **t (true)**: yes • **f (false)**: no
oprleft	oid	OID in **PG_TYPE**	Type of the left operand.
oprright	oid	OID in **PG_TYPE**	Type of the right operand.

Name	Type	Reference	Description
oprresult	oid	OID in **PG_TYPE**	Type of the result.
oprcom	oid	OID in **PG_OPERATOR**	Exchange character of this operator if any; otherwise, **0**.
oprnegate	oid	OID in **PG_OPERATOR**	Negator of this operator if any; otherwise, **0**.
oprcode	regproc	**proname** in **PG_PROC**	Function that implements the operator
oprrest	regproc	**proname** in **PG_PROC**	Restriction selectivity estimation function for the operator.
oprjoin	regproc	**proname** in **PG_PROC**	Join selectivity estimation function for the operator.

12.2.14.50 PG_OPFAMILY

PG_OPFAMILY defines operator families.

Each operator family is a collection of operators and associated support routines that implement semantics specified for a particular index access method. Furthermore, the operators in a family are all compatible, in a way that is specified by the access method. The operator family allows cross-data-type operators to be used with indexes and to be reasoned about using knowledge of access method semantics.

Table 12-98 PG_OPFAMILY columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
opfmethod	oid	**PG_AM**.oid	Index access method used by an operator family
opfname	name	-	Name of the operator family
opfnamespace	oid	**PG_NAMESPACE**.oid	Namespace of the operator family
opfowner	oid	**PG_AUTHID**.oid	Owner of the operator family

The majority of the information defining an operator family is not in its **PG_OPFAMILY** row, but in the associated rows in **PG_AMOP**, **PG_AMPROC**, and **PG_OPCLASS**.

12.2.14.51 PG_PLTEMPLATE

PG_PLTEMPLATE records template information for procedural languages.

Table 12-99 PG_PLTEMPLATE columns

Name	Type	Description
tmplname	name	Name of the language for which this template is used.
tmpltrusted	Boolean	The value is **true** if the language is considered trusted. Otherwise, the value is **false**.
tmpldbacreate	Boolean	The value is **true** if the language is created by the owner of the database. Otherwise, the value is **false**.
tmplhandler	text	Name of the call handler function.
tmplinline	text	Name of the anonymous block handler (**NULL** if no name of the block handler exists).
tmplvalidator	text	Name of the verification function (**NULL** if no verification function is available).
tmpllibrary	text	Path of the shared library that implements languages.
tmplacl	aclitem[]	Access permissions for template (not yet used).

12.2.14.52 PG_PROC

PG_PROC stores information about functions or stored procedures.

Table 12-100 PG_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
proname	name	Function name.
pronamespace	oid	OID of the namespace that contains the function.

Name	Type	Description
proowner	oid	Owner of the function.
prolang	oid	Implementation language or call interface of the function.
procost	real	Estimated execution cost.
prorows	real	Estimated number of rows that are influenced.
provariadic	oid	Data type of parameter element.
protransform	regproc	Simplified call method for the function.
proisagg	Boolean	Specifies whether the function is an aggregate function. ● **t** (true): yes ● **f** (false): no
proiswindow	Boolean	Specifies whether the function is a window function. ● **t** (true): yes ● **f** (false): no
prosecdef	Boolean	Specifies whether the function is a security definer (or a setuid function). ● **t** (true): yes ● **f** (false): no
proleakproof	Boolean	Specifies whether the function has side effects. If no leakproof treatment is provided for parameters, the function throws errors. ● **t** (true): There is no side effect. ● **f** (false): There are side effects.
proisstrict	Boolean	● **t** (true): When this function is used, the function does not invoke the function and returns null if the input parameter is null. ● **f** (false): When this function is used, it is invoked even if the input parameter is null. Therefore, this function must process null input.
proretset	Boolean	Specifies whether the return value of the function is a set (that is, multiple values of the specified data type). ● **true**: The return value of the function is a set. ● **false**: The return value of the function is not a set.

Name	Type	Description
provolatile	"char"	Specifies whether the function's result depends only on its input parameters, or is affected by outside factors. ● **i**: immutable functions, which always deliver the same result for the same inputs. ● **s**: stable functions, whose results (for fixed inputs) do not change within a scan. ● **v**: volatile functions, whose results may change at any time. Use **v** also for functions with side-effects, so that the engine cannot get optimized if volatile functions are called.
pronargs	smallint	Number of parameters.
pronargdefaults	smallint	Number of parameters that have default values.
prorettype	oid	Data type of return values.
proargtypes	oidvector	Array that stores the data types of function parameters. This array includes only input parameters (including **INOUT** parameters), and indicates the call signature (interface) of the function.
proallargtypes	oid[]	Array that contains the data types of function parameters. This array includes all parameter types (including **OUT** and **INOUT** parameters); however, if all the parameters are **IN** parameters, this column is null. Note that array subscripting is 1-based, whereas for historical reasons, **proargtypes** is subscripted from 0.
proargmodes	"char"[]	Array with the modes of the function parameters, encoded as follows: ● **i** indicates the **IN** parameter. ● **o** indicates the **OUT** parameter. ● **b** indicates the **INOUT** parameter. ● **v** indicates the **VARIADIC** parameter. If all the parameters are **IN** parameters, this column is null. Note that subscripts correspond to positions of **proallargtypes**, not **proargtypes**.
proargnames	text[]	Array that stores the names of the function parameters. Parameters without a name are set to empty strings in the array. If none of the parameters have a name, this column is null. Note that subscripts correspond to positions of **proallargtypes**, not **proargtypes**.

Name	Type	Description
proargdefaults	pg_node_tree	Expression tree of the default value. This is the list of **pronargdefaults** elements.
prosrc	text	A definition that describes a function or stored procedure. In an interpreting language, it is the function source code, a connection symbol, a file name, or any body content specified when a function or stored procedure is created, depending on how a language or call is used.
probin	text	Additional information about how to call the function. Again, the interpretation is language-specific.
proconfig	text[]	Function's local settings for run-time configuration variables.
proacl	aclitem[]	Access permissions. For details, see **GRANT** and **REVOKE**.
prodefaultargpos	int2vector	Position of the input parameter of a function with a default value.
fencedmode	Boolean	Execution mode of a function, indicating whether the function is executed in fence or not fence mode. ● **true**: fence mode. In this mode, the function is executed in the fork process. ● **false**: not fence mode. For built-in functions in the system, **fencedmode** is set to **false**, indicating the not fence mode.
proshippable	Boolean	Specifies whether the function can be pushed down to database nodes. The default value is **false**. ● Functions of the IMMUTABLE type can always be pushed down to the database nodes. ● A STABLE or VOLATILE function can be pushed down to the database nodes only if SHIPPABLE is specified for it.
propackage	Boolean	Specifies whether the function supports overloading. The default value is **false**. ● **t** (true): supported. ● **f** (false): not supported.

Name	Type	Description
prokind	"char"	Specifies whether the object is a function or a stored procedure. ● **'f'**: The object is a function. ● **'p'**: The object is a stored procedure.
proargsrc	text	Describes the parameter input strings of functions or stored procedures that are A-compatible syntax, including parameter comments. The default value is **NULL**.
proisprivate	Boolean	Specifies whether a function is a private function in the package. The default value is **false**.
propackageid	oid	OID of the package to which the function belongs. If the function is not in the package, the value is **0**.
proargtypesext	oidvector_extend	Data type array used to store function parameters when there are a large number of function parameters. This array includes only input parameters (including **INOUT** parameters), and indicates the call signature (interface) of the function.
prodefaultargposext	int2vector_extend	Position of the input parameter with a default value when the function has a large number of parameters.
allargtypes	oidvector	Array for storing the data types of stored procedure parameters, including all parameters (input parameters, output parameters, and **INOUT** parameters) of the stored procedure.
allargtypesext	oidvector_extend	Array for storing the data types of stored procedure parameters when the number of function parameters is greater than 666. The array contains all parameters (including input parameters, output parameters, and **INOUT** parameters).

NOTE

When a function is created, data is inserted into the PG_PROC catalog to update the index. When there are a large number of input and output parameters, the index length may exceed one third of the page length. As a result, the error "Index row size xxx exceeds maximum xxx for index 'pg_proc_proname_all_args_nsp_index'" may be reported as expected. You can reduce the number of parameters to avoid this error.

12.2.14.53 PG_RANGE

PG_RANGE records information about range types, except for records of types in **PG_TYPE**.

Table 12-101 PG_RANGE columns

Name	Type	Reference	Description
rngtypid	oid	OID in **PG_TYPE**	OID of the range type.
rngsubtype	oid	OID in **PG_TYPE**	OID of the element type (subtype) of this range type.
rngcollation	oid	OID in **PG_COLLATION**	OID of the collation used for range comparisons (**0** if none).
rngsubopc	oid	OID in **PG_OPCLASS**	OID of the subtype's operator class used for range comparisons.
rngcanonical	regproc	**proname** in **PG_PROC**	Name of the function to convert a range value into canonical form (**0** if none).
rngsubdiff	regproc	**proname** in **PG_PROC**	Name of the function used to calculate the difference between two elements in a range. The return value of the function is of the double-precision type. If the function does not exist, the value of **rngsubdiff** is **0**.

If the element type is discrete, **rngcanonical** determines the collation used for the range type. If the element type is not collatable, **rngsubopc** determines the collation used for the range type. If the element type is collatable, **rngsubopc** and **rngcollation** determine the collation used for the range type.

12.2.14.54 PG_REPLICATION_ORIGIN

PG_REPLICATION_ORIGIN contains all created replication sources. This catalog is shared among all databases of a database instance. That is, there is only one copy for each instance, not for each database.

Table 12-102 PG_REPLICATION_ORIGIN columns

Name	Type	Description
roident	oid	Unique replication source identifier within a cluster.

Name	Type	Description
roname	text	External user-defined replication source name.

12.2.14.55 PG_RESOURCE_POOL

PG_RESOURCE_POOL provides information about database resource pools.

Table 12-103 PG_RESOURCE_POOL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
respool_name	name	Name of the resource pool.
mem_percent	integer	Percentage of the memory configuration
cpu_affinity	bigint	Value of cores bound to the CPU
control_group	name	Name of the Cgroup where the resource pool is located
active_statements	integer	Maximum number of concurrent statements in the resource pool
max_dop	integer	Maximum scanning concurrency during data redistribution. This column is used only for scaling.
memory_limit	name	Maximum memory of the resource pool
parentid	oid	OID of the parent resource pool
io_limits	integer	Upper limit of IOPS. It is counted by ones and by 10 thousands.
io_priority	name	Specifies the I/O priority set for jobs that consume many I/O resources. It takes effect when the I/O usage reaches 90%.
nodegroup	name	Name of the logical database to which the resource pool belongs This column is not supported in the centralized system.

Name	Type	Description
is_foreign	Boolean	Specifies whether the resource pool can be used for users outside the logical database. This column is not supported in the centralized system. • **true**: The resource pool controls the resources of common users who do not belong to the current resource pool. • **false**: The resources of common users who do not belong to the current resource pool are not controlled.
max_worker	integer	Concurrency in a table during data redistribution. This column is used only for scaling.
max_connections	integer	Maximum number of connections that can be used by a resource pool.
max_dynamic_memory	name	Maximum dynamic memory that can be used by a resource pool.
max_shared_memory	name	Maximum shared memory that can be used by a resource pool.
max_concurrency	integer	Maximum number of concurrent requests that can be used by a resource pool.

Note: **max_dop** and **max_worker** are used for scaling and are not applicable to the centralized deployment.

12.2.14.56 PG_REWRITE

PG_REWRITE records rewrite rules defined for tables and views.

Table 12-104 PG_REWRITE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
rulename	name	Rule name.
ev_class	oid	Name of the table that uses the rule.
ev_attr	smallint	Column to which this rule applies (always **0** to indicate the entire table).

Name	Type	Description
ev_type	"char"	Event type for the rule. • **1**: SELECT • **2**: UPDATE • **3**: INSERT • **4**: DELETE
ev_enabled	"char"	Controls the mode in which the rule is triggered. • **O**: The rule is triggered in origin and local modes. • **D**: The rule is disabled. • **R**: The rule is triggered in replica mode. • **A**: The rule is always triggered.
is_instead	Boolean	The value is **true** if the rule is of the **INSTEAD** type. Otherwise, the value is **false**.
ev_qual	pg_node_tree	Expression tree (in the form of a nodeToString() representation) for the rule's qualifying condition.
ev_action	pg_node_tree	Query tree (in the form of a nodeToString() representation) for the rule's action.

12.2.14.57 PG_SHDEPEND

PG_SHDEPEND records the dependency between database objects and shared objects, such as roles. Based on this information, GaussDB can ensure that those objects are unreferenced before attempting to delete them.

See also **PG_DEPEND**, which provides a similar function for dependencies involving objects within a single database.

PG_SHDEPEND is shared among all databases of a database instance. That is, there is only one PG_SHDEPEND for each instance, not for each database.

Table 12-105 PG_SHDEPEND columns

Name	Type	Reference	Description
dbid	oid	OID in **PG_DATABASE**	OID of the database where a dependent object is (**0** for a shared object)
classid	oid	OID in **PG_CLASS**	OID of the system catalog where a dependent object resides
objid	oid	Any OID column	OID of the dependent object

Name	Type	Reference	Description
objsubid	integer	-	Column number of a table column (the table to which the column points can be determined based on **objid** and **classid**). The value is **0** for all other object types.
refclassid	oid	OID in PG_CLASS	OID of the system catalog (must be a shared catalog) where a referenced object is located.
refobjid	oid	Any OID column	OID of the referenced object.
deptype	"char"	-	Code segment defining the specific semantics of this dependency relationship. The value can be **o**, **a**, **p**, **d**, or **l**. For details, see the following text.
objfile	text	-	Path of a user-defined function library file

In all cases, a PG_SHDEPEND entry indicates that the referenced object cannot be dropped without also dropping the dependent object. However, there are several subflavors identified by **deptype**:

- SHARED_DEPENDENCY_OWNER (o)

  The referenced object (which must be a role) is the owner of the dependent object.

- SHARED_DEPENDENCY_ACL (a)

  The referenced object (which must be a role) is mentioned in the access control list (ACL) of the dependent object. SHARED_DEPENDENCY_ACL does not add a record to the owner of the object because the owner will have a SHARED_DEPENDENCY_OWNER record.

- SHARED_DEPENDENCY_PIN (p)

  This type of record indicates that the system itself depends on the depended object. Therefore, such an object cannot be deleted. Entries of this type are created only by **initdb**. The columns for the dependent object contain zeroes.

- SHARED_DEPENDENCY_ DBPRIV(d)

  The referenced object (must be a role) has the ANY permission on the dependent object (the specified OID of the dependent object corresponds to a row in the 12.2.10.1 GS_DB_PRIVILEGE system catalog).

- SHARED_DEPENDENCY_ SECLABEL(l)

  The referenced object (must be a security label) is applied to the dependent object.

12.2.14.58 PG_SHDESCRIPTION

PG_SHDESCRIPTION records optional comments for shared database objects. Descriptions can be manipulated with the **COMMENT** command and viewed with the **\d** command.

See also PG_DESCRIPTION, which provides a similar function for descriptions involving objects within a single database.

PG_SHDESCRIPTION is shared among all databases of a database instance. That is, there is only one PG_SHDESCRIPTION for each instance, not for each database.

Table 12-106 PG_SHDESCRIPTION columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the described object.
classoid	oid	OID in PG_CLASS	OID of the system catalog where the object appears.
description	text	-	Description of the object.

12.2.14.59 PG_SET

PG_SET records metadata defined by the SET data type.

Table 12-107 PG_SET columns

Name	Type	Description
settypid	oid	OID of the SET data type
setnum	tinyint	Number of members of the SET data type. A maximum of 64 members are supported.
setsortorder	tinyint	Sorting order of members when the SET data type is defined. The value starts from 0.
setlabel	text	Member name of the SET data type

12.2.14.60 PG_STATISTIC

PG_STATISTIC stores statistics about tables and index columns in a database. By default, only the system administrator can access the system catalog. Common users can access the system catalog only after being authorized.

Table 12-108 PG_STATISTIC columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.

Name	Type	Description
starelkind	"char"	Type of an object.
staattnum	smallint	Number of the described column in the table, starting from 1.
stainherit	Boolean	Specifies whether to collect statistics for objects that have inheritance relationship.
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.
stadistinct	real	Number of distinct, non-null data values in the column for database nodes. ● A value greater than 0 is the actual number of distinct values. ● A value less than 0 is the ratio of the **distinct** value to the total number of rows. For example, if **stadistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. ● The value **0** indicates that the number of distinct values is unknown.
stakindN	smallint	Code number stating that the type of statistics is stored in slot *N* of the *pg_statistic* row. The value of *N* ranges from 1 to 5.
staopN	oid	Operator used to generate the statistics stored in slot *N*. For example, a histogram slot shows the < operator that defines the sort order of the data. The value of *N* ranges from 1 to 5.
stanumbersN	real[]	Numerical statistics of the appropriate type for slot *N*. The value is **NULL** if the slot does not involve numerical values. The value of *N* ranges from 1 to 5.
stavaluesN	anyarray	Column data values of the appropriate type for slot *N*. The value is **NULL** if the slot type does not store any data values. Each array's element values are actually of the specific column's data type, so there is no way to define these columns' type more specifically than anyarray. The value of *N* ranges from 1 to 5.

Name	Type	Description
stadndistinct	real	Number of unique non-null data values in the **DN1** column. • A value greater than 0 is the actual number of distinct values. • A value less than 0 is the ratio of the **distinct** value to the total number of rows. For example, if **stadistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. • The value **0** indicates that the number of distinct values is unknown.
staextinfo	text	Information about extension statistics. This is reserved.
stastate	"char"	Specifies whether the statistics are locked. If the statistics are locked, they cannot be updated. • **l**: locked • **u**: unlocked

NOTICE

PG_STATISTIC stores sensitive information about statistical objects, such as MCVs. The system administrator and authorized users can access the PG_STATISTIC system catalog to query the sensitive information about the statistical objects.

12.2.14.61 PG_STATISTIC_EXT

PG_STATISTIC_EXT displays extended statistics of tables in a database, such as statistics of multiple columns. Statistics of expressions will be supported later. You can specify the extended statistics to be collected. This system catalog is accessible only to the system administrator.

Table 12-109 PG_STATISTIC_EXT columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.
starelkind	char	Type of the object to which a table belongs. **'c'** indicates an ordinary table, and **'p'** indicates a partitioned table.
stainherit	Boolean	Specifies whether to collect statistics for objects that have inheritance relationship.
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.

Name	Type	Description
stadistinct	real	Number of distinct, non-null data values in the column for database nodes. • A value greater than 0 is the actual number of distinct values. • A value less than 0 is the ratio of the **distinct** value to the total number of rows. For example, if **stadistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. • The value **0** indicates that the number of distinct values is unknown.
stadndistinct	real	Number of unique non-null data values in the **DN1** column. • A value greater than 0 is the actual number of distinct values. • A value less than 0 is the ratio of the **distinct** value to the total number of rows. For example, if **stadistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. • The value **0** indicates that the number of distinct values is unknown.
stakindN	smallint	Code number stating that the type of statistics is stored in slot *N* of the *pg_statistic* row. The value of *N* ranges from 1 to 5.
staopN	oid	Operator used to generate the statistics stored in slot *N*. For example, a histogram slot shows the < operator that defines the sort order of the data. The value of *N* ranges from 1 to 5.
stakey	int2vector	Array of a column ID.
stanumbersN	real[]	Numerical statistics of the appropriate type for slot *N*. The value is **NULL** if the slot does not involve numerical values. The value of *N* ranges from 1 to 5.
stavaluesN	anyarray	Column data values of the appropriate type for slot *N*. The value is **NULL** if the slot type does not store any data values. Each array's element values are actually of the specific column's data type so there is no way to define these columns' type more specifically than anyarray. The value of *N* ranges from 1 to 5.
staexprs	pg_node_tree	Expression corresponding to the extended statistics information.

Name	Type	Description
stasource	char	Source of extended statistics: • **'a'**: indicates that the statistics data is automatically created, which is controlled by the GUC parameter **auto_statistic_ext_columns**. • **'m'**: indicates that a user manually creates the statistics data using analyze tablename ((column list)) or alter table tablename add statistics ((column list)).
stastatus	char	Status of extended statistics: • **'a'**: active and available. • **'d'**: disabled. Related information is not collected, and the optimizer does not use the data when generating a plan. You can use the alter table tablename disable/enable statistics((column list)) syntax to modify the status of extended statistics.
staextname	name	Alias of the multi-column group of multi-column statistics.
stastate	"char"	Specifies whether the statistics are locked. If the statistics are locked, they cannot be updated. • **l**: locked • **u**: unlocked

NOTICE

PG_STATISTIC_EXT stores sensitive information about statistical objects, such as MCVs. The system administrator and authorized users can access the PG_STATISTIC_EXT system catalog to query the sensitive information about the statistical objects.

12.2.14.62 PG_SYNONYM

PG_SYNONYM records the mapping between synonym object names and other database object names.

Table 12-110 PG_SYNONYM columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
synname	name	Synonym name.

Name	Type	Description
synnamespace	oid	OID of the namespace that contains a synonym. The OID of the PUBLIC synonym namespace is 0.
synowner	oid	Owner of a synonym, usually the OID of the user who created it The owner of the PUBLIC synonym is 0.
synobjschema	name	Schema name specified by an associated object.
synobjname	name	Name of an associated object.
syndblinkname	name	Name of the associated DATABASE LINK object.

12.2.14.63 PG_TABLESPACE

PG_TABLESPACE records tablespace information.

Table 12-111 PG_TABLESPACE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
spcname	name	Tablespace name.
spcowner	oid	Owner of the tablespace, usually the user who created it.
spcacl	aclitem[]	Access permissions. For details, see **GRANT** and **REVOKE**.
spcoptions	text[]	Options of the tablespace.
spcmaxsize	text	Maximum size of the available disk space, in bytes.
relative	Boolean	Specifies whether the storage path specified by the tablespace is a relative path. • **t** (true): yes • **f** (false): no

12.2.14.64 PG_TRIGGER

PG_TRIGGER records trigger information.

Table 12-112 PG_TRIGGER columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
tgrelid	oid	OID of the table where the trigger is located.
tgname	name	Trigger name.
tgfoid	oid	Function to be invoked by the trigger.
tgtype	smallint	Trigger type.
tgenabled	"char"	• **O**: The trigger is triggered in origin and local modes. • **D**: The trigger is disabled. • **R**: The trigger is triggered in replica mode. • **A**: The trigger is always triggered.
tgisinternal	Boolean	Internal trigger ID. If the value is **true**, it indicates an internal trigger.
tgconstrrelid	oid	Table referenced by the integrity constraint.
tgconstrindid	oid	Index of the integrity constraint.
tgconstraint	oid	OID of the constraint trigger in PG_CONSTRAINT.
tgdeferrable	Boolean	Specifies whether the constraint trigger is of the DEFERRABLE type. • **t** (true): yes • **f** (false): no
tginitdeferred	Boolean	Specifies whether the trigger is of the INITIALLY DEFERRED type. • **t** (true): yes • **f** (false): no
tgnargs	smallint	Number of input parameters of the trigger function.
tgattr	int2vector	Column ID specified by the trigger. If no column is specified, an empty array is used.
tgargs	bytea	Parameter transferred to the trigger.
tgqual	pg_node_tree	WHEN condition of the trigger (**NULL** if the WHEN condition does not exist).
tgowner	oid	Trigger owner.

12.2.14.65 PG_TS_CONFIG

PG_TS_CONFIG contains entries representing text search configurations. Each of these configurations contains a list of specific text search parsers and dictionary mappings.

The parser is shown in the PG_TS_CONFIG entry, but the token-to-dictionary mapping is defined by subsidiary entries in **PG_TS_CONFIG_MAP**.

Table 12-113 PG_TS_CONFIG columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
cfgname	name	-	Text search configuration name.
cfgnamespace	oid	**oid** in **PG_NAMESPACE**	OID of the namespace that contains the configuration.
cfgowner	oid	**PG_AUTHID**.oid	Owner of the configuration.
cfgparser	oid	**PG_TS_PARSER**.oid	OID of the text search parser for this configuration.
cfoptions	text[]	-	Configuration options.

12.2.14.66 PG_TS_CONFIG_MAP

PG_TS_CONFIG_MAP contains parser symbol mappings for each text search configuration.

Table 12-114 PG_TS_CONFIG_MAP columns

Name	Type	Reference	Description
mapcfg	oid	OID in **PG_TS_CONFIG**	OID of the **PG_TS_CONFIG** entry owning this map entry.
maptokentype	integer	-	Token type generated by the configuration's parser.
mapseqno	integer	-	Sequence number of a token type when the values of **mapcfg** or **maptokentype** are the same.
mapdict	oid	OID in **PG_TS_DICT**	OID of the text search dictionary to consult.

12.2.14.67 PG_TS_DICT

PG_TS_DICT contains entries that define text search dictionaries. A dictionary depends on a text search template, which specifies all the implementation functions needed; the dictionary itself provides values for the user-settable parameters supported by the template.

This division of labor allows dictionaries to be created by unprivileged users. The parameters are specified by a text string **dictinitoption**, whose format and meaning vary depending on the template.

Table 12-115 PG_TS_DICT columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
dictname	name	-	Text search dictionary name
dictnamespace	oid	PG_NAMESPACE.oid	OID of the namespace that contains the dictionary
dictowner	oid	PG_AUTHID.oid	Owner of the dictionary
dicttemplate	oid	PG_TS_TEMPLATE.oid	OID of the text search template for the dictionary
dictinitoption	text	-	Initialization option string for the template

12.2.14.68 PG_TS_PARSER

PG_TS_PARSER contains definition of text search parsers. A parser is responsible for splitting input text into lexemes and assigning a token type to each lexeme. Because the parser must be implemented through functions at the C language level, the new parser must be created by the database system administrator.

Table 12-116 PG_TS_PARSER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
prsname	name	-	Text search parser name.
prsnamespace	oid	**oid** in PG_NAMESPACE	OID of the namespace that contains the parser.

Name	Type	Reference	Description
prsstart	regproc	**proname** in PG_PROC	Name of the parser's startup function.
prstoken	regproc	**proname** in PG_PROC	Name of the parser's next-token function.
prsend	regproc	**proname** in PG_PROC	Name of the parser's shutdown function.
prsheadline	regproc	**proname** in PG_PROC	Name of the parser's headline function.
prslextype	regproc	**proname** in PG_PROC	Name of the parser's lextype function.

12.2.14.69 PG_TS_TEMPLATE

PG_TS_TEMPLATE contains entries defining text search templates. A template provides a framework for text search dictionaries. Since a template must be implemented by C-language-level functions, templates can be created only by database administrators.

Table 12-117 PG_TS_TEMPLATE columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
tmplname	name	-	Text search template name
tmplnamespace	oid	**oid** in PG_NAMESPACE	OID of the namespace that contains the template
tmplinit	regproc	**proname** in PG_PROC	Name of the template's initialization function
tmpllexize	regproc	**proname** in PG_PROC	Name of the template's lexize function

12.2.14.70 PG_TYPE

PG_TYPE stores information about data types.

Table 12-118 PG_TYPE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
typname	name	Data type name.
typnamespace	oid	OID of the namespace that contains the type.
typowner	oid	Owner of the type.
typlen	smallint	Number of bytes in the internal representation of the type for a fixed-size type. It is a negative number for a variable-length type. • The value **–1** indicates a "varlena" type (one that has a length word). • The value **–2** indicates a null-terminated C string.
typbyval	Boolean	• **true**: A value of this type is transferred by value internally. • **false**: A value of this type is transferred by reference internally. If **typlen** of this type is not **1**, **2**, **4**, or **8**, you are advised to transfer a reference value for **typbyval**. You can also transfer a value for **typbyval**. Variable-length types are usually passed by reference or by value.
typtype	"char"	• **b**: basic type. • **c**: composite type (for example, the row type of a table). • **d**: domain type. • **p**: pseudo type. • **u**: undefined type. • **o**: set type. For details, see **typrelid** and **typbasetype**.
typcategory	"char"	Fuzzy classification of data types, which can be used by parsers as the basis for data conversion.
typispreferred	Boolean	• **true**: Data is converted when it complies with the conversion rule specified by **typcategory**. • **false**: Data is not converted.
typisdefined	Boolean	• **true**: The type has been defined. • **false**: The placeholder of an undefined type is used. In this case, there is no reliable information except the name, namespace, and OID of the type.

Name	Type	Description
typdelim	"char"	Character that separates two values of this type when parsing an array input. Note that the delimiter is associated with the array element data type, not the array data type.
typrelid	oid	If this is a composite type (see **typtype**), then this column points to the **PG_CLASS** entry that defines the corresponding table. For a free-standing composite type, the PG_CLASS entry does not represent a table, but it is required for the type's **PG_ATTRIBUTE** entries to link to. It is **0** for non-composite type.
typelem	oid	If **typelem** is not **0**, it identifies another row in PG_TYPE. The current type can be described as an array yielding values of type **typelem**. A "true" array type has a variable length (**typlen** = **–1**), but some fixed-length types (**typlen** > **0**) also have non-zero **typelem**, for example **name** and **point**. If a fixed-length type has a **typelem**, its internal representation must be a number of values of the **typelem** data type with no other data. Variable-length array types have a header defined by the array subroutines.
typarray	oid	If the value is not **0**, the corresponding type record is available in PG_TYPE.
typinput	regproc	Input conversion function (text format)
typoutput	regproc	Output conversion function (text format)
typreceive	regproc	Input conversion function (binary format); **0** for non-input conversion function
typsend	regproc	output conversion function (binary format); **0** for non-output conversion function
typmodin	regproc	Input type modifier function; **0** if none.
typmodout	regproc	Output type modifier function; **0** if none.
typanalyze	regproc	Custom ANALYZE function; **0** if the standard function is used.

Name	Type	Description
typalign	"char"	Alignment required when storing a value of this type. It applies to storage on disks as well as most representations of the value. When multiple values are stored consecutively, such as in the representation of a complete row on disk, padding is inserted before a data of this type so that it begins on the specified boundary. The alignment reference is the beginning of the first datum in the sequence. Possible values are: • **c**: char alignment, that is, no alignment required • **s**: short alignment (2 bytes on most machines) • **i**: integer alignment (4 bytes on most machines) • **d**: double alignment (8 bytes on many machines, but by no means all) **NOTICE** For types used in system tables, the size and alignment defined in PG_TYPE must agree with the way that the compiler lays out the column in a structure representing a table row.
typstorage	"char"	**typstorage** tells for varlena types (those with **typlen = –1**) if the type is prepared for toasting and what the default strategy for attributes of this type should be. Possible values are: • **p**: Values are always stored plain. • **e**: Values can be stored in a secondary relationship (if the relation has one, see **reltoastrelid** in 12.2.15.28 PG_CLASS). • **m**: Values can be stored compressed inline. • **x**: Values can be stored compressed inline or stored in secondary storage. **NOTICE** **m** domains can also be moved out to secondary storage, but only as a last resort (**e** and **x** domains are moved first).
typnotnull	Boolean	Specifies whether the type has a NOTNULL constraint. Currently, it is used for domains only.
typbasetype	oid	If this is a domain (see **typtype**), then **typbasetype** identifies the type that this one is based on. The value is **0** if this type is not a derived type.

Name	Type	Description
typtypmod	integer	Records the **typtypmod** to be applied to domains' base types by domains (the value is **–1** if the base type does not use **typmod**). This is **–1** if this type is not a domain. If the type is array, **typtypmod** indicates the maximum capacity of the array type. If the type is index-by table collection, **typtypmod** indicates the maximum index length of the collection type.
typndims	integer	If a field is an array, **typndims** is the number of array dimensions. This is **0** for types other than domains over array types.
typcollation	oid	Sequence rule for specified types. For details about the value, see the system catalog in PG_COLLATION. (**0** if sequencing is not supported)
typdefaultbin	pg_node_tree	**nodeToString()** representation of a default expression for the type if the value is non-null. Currently, this column is only used for domains.
typdefault	text	The value is **NULL** if a type has no associated default value. • If **typdefaultbin** is not **NULL**, **typdefault** must contain a default expression represented by **typdefaultbin**. • If **typdefaultbin** is **NULL** and **typdefault** is not, then **typdefault** is the external representation of the type's default value, which can be fed to the type's input converter to produce a constant.
typacl	aclitem[]	Access permission
typelemmod	integer	• **-1**: **typmod** is not required for the element type corresponding to the set and array types. • Value greater than or equal to 0: **typmod** of the element type corresponding to the set and array types is used. • **NULL**: **typmod** of the element type corresponding to the set and array types is unknown. **typmod** usually refers to the maximum length of a type.

12.2.14.71 PGXC_CLASS

PGXC_CLASS records replicated or distributed information for each table. PGXC_CLASS can only be used to query table definitions in centralized mode.

Table 12-119 PGXC_CLASS columns

Name	Type	Description
pcrelid	oid	Table OID
pclocatortype	"char"	Locator type • **H**: Hash • **G**: Range • **L**: List • **M**: Modulo • **N**: Round Robin • **R**: Replication
pchashalgorithm	smallint	Distributed tuple using the hash algorithm • **1**: default hash algorithm. • **2**: MURMURHASH algorithm.
pchashbuckets	smallint	Value of a hash container
pgroup	name	Name of the node
redistributed	"char"	Indicates that a table has been redistributed.
redis_order	integer	Redistribution sequence. Tables whose values are **0** will not be redistributed in this round of redistribution.
pcattnum	int2vector	Column number used as a distributed key
nodeoids	oidvector_extend	List of distributed table node OIDs
options	text	Extension status information. This is a reserved column in the system.
diskey	text	Not supported. Its value is **NULL**.
diskeyexprs	pg_node_tree	Not supported. Its value is **NULL**.

12.2.14.72 PGXC_GROUP

PGXC_GROUP records information about node groups. PGXC_GROUP can only be used to query table definitions in the centralized system.

Table 12-120 PGXC_GROUP columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).

Name	Type	Description
group_name	name	Node group name.
in_redistribution	"char"	Specifies whether redistribution is required. Valid value: • **n**: The node group is not redistributed. • **y**: The source node group is in redistribution. • **t**: The destination node group is in redistribution.
group_members	oidvector_extend	Node OID list of the node group.
group_buckets	text	Distributed data bucket group.
is_installation	Boolean	Specifies whether to install a sub-database instance. • **t** (true): yes • **f** (false): no
group_acl	aclitem[]	Access permission
group_kind	"char"	Node group type. The options are as follows: • **i**: installation node group • **n**: node group in a common non-logical database instance • **v**: node group in a logical database instance • **e**: elastic database instance
group_parent	oid	For a child node group, this field indicates the OID of the parent node group. For a parent node group, this field is left blank.
bucket_map	text	Not supported. The value is **NULL**.

12.2.14.73 PGXC_SLICE

PGXC_SLICE is a system catalog created for recording range distribution and list distribution details. Currently, range interval cannot be used to automatically scale out shards. It is reserved in the system catalog. In the centralized system, only the definition of this table can be queried.

Table 12-121 PGXC_SLICE columns

Name	Type	Description
relname	name	Table name or shard name, which is distinguished by **type**.

Name	Type	Description
type	"char"	• **'t'**: **relname** is the table name. • **'s'**: **relname** is the shard name.
strategy	"char"	• **'r'**: range distribution table. • **'l'**: list distribution table. This value will be extended for subsequent interval shards.
relid	oid	OID of the distribution table to which the tuple belongs.
referenceoid	oid	OID of the referenced distribution table, which is used for slice reference table creation syntax.
sindex	integer	Position of the current boundary in a shard when the table is a list distribution table.
interval	text[]	Reserved column.
transitboundary	text[]	Reserved column.
transitno	integer	Reserved column.
nodeoid	oid	When **relname** is set to a shard name, **nodeoid** indicates the OID of the DN where the shard data is stored.
boundaries	text[]	When **relname** is set to a shard name, this parameter indicates the boundary value of the shard.
specified	Boolean	Specifies whether the DN corresponding to the current shard is explicitly specified in the DDL.
sliceorder	integer	User-defined shard sequence.

12.2.14.74 PLAN_TABLE_DATA

PLAN_TABLE_DATA stores plan information collected by EXPLAIN PLAN. Different from the PLAN_TABLE view, the system catalog PLAN_TABLE_DATA stores EXPLAIN PLAN information collected by all sessions and users.

Table 12-122 PLAN_TABLE_DATA columns

Name	Type	Description
session_id	text	Session that inserts the data. Its value consists of a service thread start timestamp and a service thread ID. Values are constrained by **NOT NULL**.

Name	Type	Description
user_id	oid	User who inserts the data. Values are constrained by **NOT NULL**.
statement_id	character varying(30)	Query tag specified by a user.
plan_id	bigint	Query ID The ID is automatically generated in the plan generation phase and is used by kernel engineers for debugging.
id	integer	Node ID in a plan.
operation	character varying(30)	Operation description.
options	character varying(255)	Operation action.
object_name	name	Name of an operated object. It is defined by users.
object_type	character varying(30)	Object type.
object_owner	name	Schema to which the object belongs. It is defined by users.
projection	character varying(4000)	Returned column information.
cost	double precision	Execution cost estimated by the optimizer for an operator.
cardinality	double precision	Number of rows estimated by the optimizer for an operator.

NOTE

- PLAN_TABLE_DATA records data of all users and sessions on the current node. Only administrators can access all the data. Common users can view their own data in the **PLAN_TABLE** view.
- Data is automatically inserted into PLAN_TABLE_DATA after **EXPLAIN PLAN** is executed. Therefore, do not manually insert data into or update data in PLAN_TABLE_DATA. Otherwise, data in PLAN_TABLE_DATA may be disordered. To delete data from PLAN_TABLE_DATA, you are advised to use the **PLAN_TABLE** view.
- Information in the **statement_id**, **object_name**, **object_owner**, and **projection** columns is stored in letter cases specified by users and information in other columns is stored in uppercase.

12.2.14.75 STATEMENT_HISTORY

Displays information about statements executed on the current node. To query this system catalog, you must have the sysadmin permission. The result can be queried only in the system database but cannot be queried in the user database.

The constraints on the query of this system catalog are as follows:

- Data must be queried in the Postgres database. No data exists in other databases.
- This system catalog is controlled by **track_stmt_stat_level**. The default value is **OFF,L0**, where the first part controls full SQL statements, and the second part controls slow SQL statements. For details about the record level of each column, see the following table. To ensure system performance, you are advised to use the SET statement to change the value of this parameter so that the parameter takes effect only for the current session.
- For slow SQL statements, if the value of **track_stmt_stat_level** is not **OFF** and the SQL execution time exceeds the value of **log_min_duration_statement**, the SQL statement is recorded as a slow SQL statement.

Table 12-123 STATEMENT_HISTORY columns

Name	Type	Description	Record Level
db_name	name	Database name.	L0
schema_name	name	Schema name.	L0
origin_node	integer	Node name.	L0
user_name	name	Username.	L0
application_name	text	Name of the application that sends a request.	L0
client_addr	text	IP address of the client that sends a request.	L0
client_port	integer	Port number of the client that sends a request.	L0
unique_query_id	bigint	ID of the normalized SQL statement.	L0
debug_query_id	bigint	ID of the unique SQL statement. Some statements are not unique. For example, the value of **debug_query_id** in the Parse packet, DCL statements, and TCL statements is **0**.	L0

Name	Type	Description	Record Level
query	text	Normalized SQL statement. When the **track_stmt_parameter** parameter is enabled, the complete SQL statement is displayed.	L0
start_time	timestamp with time zone	Time when a statement starts.	L0
finish_time	timestamp with time zone	Time when a statement ends.	L0
slow_sql_threshold	bigint	Standard for slow SQL statement execution.	L0
transaction_id	bigint	Transaction ID.	L0
thread_id	bigint	ID of an execution thread.	L0
session_id	bigint	Session ID of a user.	L0
n_soft_parse	bigint	Number of soft parsing times. The value of **n_soft_parse** plus the value of **n_hard_parse** may be greater than the value of **n_calls** because the number of subqueries is not counted in the value of **n_calls**.	L0
n_hard_parse	bigint	Number of hard parsing times. The value of **n_soft_parse** plus the value of **n_hard_parse** may be greater than the value of **n_calls** because the number of subqueries is not counted in the value of **n_calls**.	L0
query_plan	text	Statement execution plan.	L1(Full SQL) L0(Slow SQL)
n_returned_rows	bigint	Number of rows in the result set returned by the **SELECT** statement.	L0
n_tuples_fetched	bigint	Number of rows randomly scanned.	L0
n_tuples_returned	bigint	Number of rows sequentially scanned.	L0

Name	Type	Description	Record Level
n_tuples_inserted	bigint	Number of rows inserted.	L0
n_tuples_updated	bigint	Number of rows updated.	L0
n_tuples_deleted	bigint	Number of rows deleted.	L0
n_blocks_fetched	bigint	Number of buffer block access times.	L0
n_blocks_hit	bigint	Number of buffer block hits.	L0
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: μs).	L0
cpu_time	bigint	CPU time (unit: μs).	L0
execution_time	bigint	Execution time in the executor (unit: μs).	L0
parse_time	bigint	SQL parsing time (unit: μs).	L0
plan_time	bigint	SQL plan generation time (unit: μs).	L0
rewrite_time	bigint	SQL rewriting time (unit: μs).	L0
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: μs).	L0
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: μs).	L0
data_io_time	bigint	I/O time (unit: μs).	L0
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). This column is not supported in the centralized system.	L0
net_recv_info	text	Network status of messages received through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). This column is not supported in the centralized system.	L0

Name	Type	Description	Record Level
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). This column is not supported in the centralized system.	L0
net_stream_recv_info	text	Network status of messages received through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). This column is not supported in the centralized system.	L0
lock_count	bigint	Number of locks.	L0
lock_time	bigint	Time required for locking.	L1
lock_wait_count	bigint	Number of lock waits.	L0
lock_wait_time	bigint	Time required for lock waiting.	L1
lock_max_count	bigint	Maximum number of locks.	L0
lwlock_count	bigint	Number of lightweight locks (reserved).	L0
lwlock_wait_count	bigint	Number of lightweight lock waits.	L0
lwlock_time	bigint	Time required for lightweight locking (reserved).	L1
lwlock_wait_time	bigint	Time required for lightweight lock waiting.	L1

Name	Type	Description	Record Level
details	bytea	List of wait events and statement lock events. When the value of the record level is greater than or equal to L0, the list of wait events starts to be recorded. Statistics about the wait events of the current statement are displayed. For details about events, see **Table 12-412**, **Table 12-413**, **Table 12-414**, and **Table 12-415**. For details about the impact of each transaction lock on services, see **LOCK**. When the value of **track_stmt_stat_level** is **L2**, the list of statement lock events starts to be recorded. The list records events in chronological order. The number of records is determined by the **track_stmt_details_size** parameter. This column is in binary format and needs to be read by using the parsing function **pg_catalog.statement_detail_decode**. For details, see **Table 7-102**. Events include: • Start locking. • Complete locking. • Start lock waiting. • Complete lock waiting. • Start unlocking. • Complete unlocking. • Start lightweight lock waiting. • Complete lightweight lock waiting.	L0/L2
is_slow_sql	Boolean	Specifies whether the SQL statement is a slow SQL statement. • **t** (true): yes • **f** (false): no	L0
trace_id	text	Driver-specific trace ID, which is associated with an application request.	L0

Name	Type	Description	Record Level
advise	text	Risk information that may cause the SQL statement to be a slow SQL statement.	L0
parent_unique_sql_id	bigint	Normalized SQL ID of the outer SQL statement. For statements executed in a stored procedure, the value is the normalized SQL ID of the statement that invokes the stored procedure. For statements outside the stored procedure, the value is **0**.	L0
finish_status	text	Statement completion status. • **normal** (default) • **cancelled**: cancellation or termination.	L0

NOTICE

- The record level of the **query_plan** column is L1 for full SQL statements and L0 for slow SQL statements.
- For the **db_time** time model, the time statistics of each dimension in **statement_history** meet the requirement that **db_time** is greater than or equal to **max(cpu_time, parse_time, plan_time, rewrite_time, data_io_time, net_send_info.time, net_recv_info.time, net_stream_send_info.time, net_stream_recv_info.time)**.
- For the **db_time** time model formula, the following dimensions are not included in the statistical accuracy scope:
  1. **execution_time**
  2. **pl_execution_time**
  3. **pl_compilation_time**
- The maximum nesting depth of wait events is **20**. If the nesting depth exceeds 20, a new wait event overwrites the last wait event.

12.2.14.76 STREAMING_STREAM

STREAMING_STREAM records the metadata of all STREAM objects.

Table 12-124 STREAMING_STREAM columns

Name	Type	Description
relid	oid	STREAM object ID.

Name	Type	Description
queries	bytea	Bitmap mapping of the CONTVIEW corresponding to the STREAM.

12.2.14.77 STREAMING_CONT_QUERY

STREAMING_CONT_QUERY records the metadata of all CONTVIEW objects.

Table 12-125 STREAMING_CONT_QUERY columns

Name	Type	Description
id	integer	Unique identifier of the CONTVIEW object.
type	"char"	CONTVIEW type. ● **'r'**: CONTVIEW is based on the row-store model.
relid	oid	CONTVIEW object ID.
defrelid	oid	ID of the continuous computing rule view corresponding to CONTVIEW.
active	Boolean	Determines whether the CONTVIEW is in the continuous computing state. ● **t** (true): yes ● **f** (false): no
streamrelid	oid	ID of STREAM corresponding to CONTVIEW.
matrelid	oid	ID of the materialized table corresponding to CONTVIEW.
lookupidxid	oid	ID of GROUP LOOK UP INDEX corresponding to CONTVIEW. This column is for internal use and is available only in row-store tables.
step_factor	smallint	CONTVIEW step mode. The main values are **0** (no overlapping window) and **1** (sliding window, with one step).
ttl	integer	Value of **ttl_interval** set by CONTVIEW.
ttl_attno	smallint	Number of a time column corresponding to the TTL function set by CONTVIEW.
dictrelid	oid	ID of the dictionary table corresponding to CONTVIEW.
grpnum	smallint	Number of dimension columns in the CONTVIEW continuous computing rule. This column is for internal use.

Name	Type	Description
grpidx	int2vector	Index of the dimension column in TARGET LIST in the CONTVIEW continuous computing rule. This column is for internal use.

12.3 System Views

12.3.1 Partitioned Table

12.3.1.1 ADM_IND_PARTITIONS

ADM_IND_PARTITIONS displays the partition information about local indexes of level-1 partitioned table in the database (excluding global indexes on partitioned tables). Each local index partition of level-1 index partitioned table in the database, if present, has a row of records in ADM_IND_PARTITIONS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-126 ADM_IND_PARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Owner name of the partitioned table index to which an index partition belongs
index_name	character varying(64)	Index name of the partitioned table index to which an index partition belongs
partition_name	character varying(64)	Name of an index partition
def_tablespace_name	name	Tablespace name of an index partition

Name	Type	Description
high_value	text	Upper limit of the partition corresponding to the index partition **NOTE** • For range partitioning and interval partitioning, the upper limit of each partition is displayed. • For list partitioning, the value list of each partition is displayed. • For hash partitioning, the number of each partition is displayed.
index_partition_usable	Boolean	Specifies whether an index partition is available: • **t** (true): yes • **f** (false): no
schema	character varying(64)	Schema of the partitioned table index to which an index partition belongs
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition
composite	character varying(3)	Specifies whether the index is a local index on the level-2 partitioned table. This table does not store level-2 partition information. Therefore, the value is **NO**.
subpartition_count	numeric	Number of level-2 partitions in a partition. The value is **0** because this table does not store level-2 partition information.
partition_position	numeric	Position of an index partition in the index

Name	Type	Description
status	character varying(8)	Specifies whether the index partition is available.
tablespace_name	name	Name of the tablespace that contains the partition
pct_free	numeric	Minimum percentage of available space in a block
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-USTORE partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-USTORE partitioned tables.
initial_extent	numeric	Not supported. Set it to **NULL**.
next_extent	numeric	Not supported. Set it to **NULL**.
min_extent	numeric	Not supported. Set it to **NULL**.
max_extent	numeric	Not supported. Set it to **NULL**.
max_size	numeric	Not supported. Set it to **NULL**.
pct_increase	numeric	Not supported. Set it to **NULL**.
freelists	numeric	Not supported. Set it to **NULL**.
freelist_groups	numeric	Not supported. Set it to **NULL**.
logging	character varying(7)	Specifies whether changes to an index are recorded.

Name	Type	Description
compression	character varying(13)	Specifies whether an index compression is enabled for a partitioned index.
blevel	numeric	Not supported. Set it to **NULL**.
leaf_blocks	numeric	Not supported. Set it to **NULL**.
distinct_keys	numeric	Not supported. Set it to **NULL**.
avg_leaf_blocks_per_key	numeric	Not supported. Set it to **NULL**.
avg_data_blocks_per_key	numeric	Not supported. Set it to **NULL**.
clustering_factor	numeric	Sequence of a row in the table based on the index value You need to run the analyze command to collect statistics.
num_rows	numeric	Number of rows in a partition You need to run the vacuum command to collect statistics.
sample_size	numeric	Not supported. Set it to **NULL**.
last_analyzed	timestamp with time zone	Last date when the partition was analyzed
buffer_pool	character varying(7)	Actual buffer pool of a partition
flash_cache	character varying(7)	Not supported. Set it to **NULL**.
cell_flash_cache	character varying(7)	Not supported. Set it to **NULL**.
user_stats	character varying(3)	Not supported. Set it to **NULL**.
pct_direct_access	numeric	Not supported. Set it to **NULL**.
global_stats	character varying(3)	Not supported. Set it to **NULL**.

Name	Type	Description
domidx_opstatus	character varying(6)	Not supported. Set it to **NULL**.
parameters	character varying(1000)	Not supported. Set it to **NULL**.
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table.
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
orphaned_entries	character varying(3)	Not supported. Set it to **NULL**.

12.3.1.2 ADM_IND_SUBPARTITIONS

ADM_IND_SUBPARTITIONS displays the partition information about local indexes of level-2 partitioned table in the database (excluding global indexes on partitioned tables). Each local index partition of level-2 index partitioned table in the database, if present, has a row of records in ADM_IND_SUBPARTITIONS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 12-127 ADM_IND_SUBPARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Name of the owner of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Name of the partitioned table index to which the index partition belongs.
partition_name	character varying(64)	Name of the level-1 partition where an index is located.
subpartition_name	character varying(64)	Name of the level-2 partition where an index is located.
def_tablespace_name	name	Tablespace name of the index partition.

Name	Type	Description
high_value	text	Limit of the partition corresponding to an index partition. • For range partitioning and interval partitioning, the upper limit of each partition is displayed. • For list partitioning, the value list of each partition is displayed. • For hash partitioning, the number of each partition is displayed.
index_partition_usable	Boolean	Specifies whether an index partition is available. • **t** (true): yes. • **f** (false): no.
schema	character varying(64)	Schema of the partitioned table index to which an index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
partition_position	numeric	Position of an index partition in the index.
subpartition_position	numeric	Position of the level-2 partition in the partition.
status	character varying(8)	Specifies whether an index partition is available.
tablespace_name	name	Tablespace name of the index partition.
pct_free	numeric	Percentage of minimum available space in a block.

Name	Type	Description
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is **NULL**.
next_extent	numeric	Not supported. Its value is **NULL**.
min_extent	numeric	Not supported. Its value is **NULL**.
max_extent	numeric	Not supported. Its value is **NULL**.
max_size	numeric	Not supported. Its value is **NULL**.
pct_increase	numeric	Not supported. Its value is **NULL**.
freelists	numeric	Not supported. Its value is **NULL**.
freelist_groups	numeric	Not supported. Its value is **NULL**.
logging	character varying(7)	Specifies whether changes to an index are logged.
compression	character varying(13)	Compression type used for level-2 partitions.
blevel	numeric	Not supported. Its value is **NULL**.
leaf_blocks	numeric	Not supported. Its value is **NULL**.
distinct_keys	numeric	Not supported. Its value is **NULL**.
avg_leaf_blocks_per_key	numeric	Not supported. Its value is **NULL**.

Name	Type	Description
avg_data_blocks_per_key	numeric	Not supported. Its value is **NULL**.
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the **analyze** command to collect statistics.
num_rows	numeric	Number of rows in a level-2 partition. You need to run the vacuum command to collect statistics.
sample_size	numeric	Not supported. Its value is **NULL**.
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Buffer pool of a level-2 partition.
flash_cache	character varying(7)	Not supported. Its value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table.
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
domidx_opstatus	character varying(6)	Not supported. Its value is **NULL**.
parameters	character varying(1000)	Not supported. Its value is **NULL**.

12.3.1.3 ADM_PART_COL_STATISTICS

ADM_PART_COL_STATISTICS displays the column statistics and histogram information about all table partitions in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-128 ADM_PART_COL_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Owner of the partitioned table
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Table partition name
column_name	character varying(4000)	Column name.
num_distinct	numeric	Not supported. Set it to **NULL**.
low_value	raw	Not supported. Set it to **NULL**.
high_value	raw	Not supported. Set it to **NULL**.
density	numeric	Not supported. Set it to **NULL**.
num_nulls	numeric	Not supported. Set it to **NULL**.
num_buckets	numeric	Not supported. Set it to **NULL**.
sample_size	numeric	Not supported. Set it to **NULL**.
last_analyzed	timestamp(0) without time zone	Not supported. Set it to **NULL**.
global_stats	character varying(3)	Not supported. Set it to **NULL**.
user_stats	character varying(3)	Not supported. Set it to **NULL**.
notes	character varying(63)	Not supported. Set it to **NULL**.
avg_col_len	numeric	Not supported. Set it to **NULL**.
histogram	character varying(15)	Not supported. Set it to **NULL**.

Name	Type	Description
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.1.4 ADM_PART_INDEXES

ADM_PART_INDEXES displays information about all partitioned table indexes (excluding global indexes of partitioned tables) in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 12-129 ADM_PART_INDEXES columns

Name	Type	Description
def_tablespace_name	name	Tablespace name of a partitioned table index.
index_owner	character varying(64)	Owner name of a partitioned table index.
index_name	character varying(64)	Name of a partitioned table index.
partition_count	bigint	Number of index partitions of a partitioned table index.
partitioning_key_count	integer	Number of partition keys of a partitioned table.
partitioning_type	text	Partitioning policy of a partitioned table. **NOTE** For details about the supported partitioning policies of the current partitioned table, see **CREATE TABLE PARTITION**.
schema	character varying(64)	Name of the schema to which a partitioned table index belongs.
table_name	character varying(64)	Name of the partitioned table to which a partitioned table index belongs.

Name	Type	Description
subpartitioning_type	text	Partitioning policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, **NONE** is displayed. **NOTE** For details about the supported partitioning policies of the current level-2 partitioned table, see **CREATE TABLE SUBPARTITION**.
def_subpartition_count	integer	Default number of level-2 partitions to be created. The value is **1** for level-2 partitioned tables and **0** for level-1 partitioned tables.
subpartitioning_key_count	integer	Number of level-2 partition keys of the partitioned table.

12.3.1.5 ADM_PART_TABLES

ADM_PART_TABLES displays information about all partitioned tables in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 12-130 ADM_PART_TABLES columns

Name	Type	Description
table_owner	character varying(64)	Owner name of a partitioned table.
table_name	character varying(64)	Name of a partitioned table.
partitioning_type	text	Partitioning policy of a partitioned table. **NOTE** For details about the supported partitioning policies of the current partitioned table, see **CREATE TABLE PARTITION**.
partition_count	bigint	Number of partitions of a partitioned table.
partitioning_key_count	integer	Number of partition keys of a partitioned table.

Name	Type	Description
def_tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Schema of a partitioned table.
subpartitioning_type	text	Partitioning policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, **NONE** is displayed. **NOTE** For details about the supported partitioning policies of the current level-2 partitioned table, see **CREATE TABLE SUBPARTITION**.
def_subpartition_count	integer	Default number of level-2 partitions to be created. The value is **1** for a level-2 partitioned table and **0** for a level-1 partitioned table.
subpartitioning_key_count	integer	Number of level-2 partition keys of the partitioned table.
status	character varying(8)	Not supported. The value is **valid**.
def_pct_free	numeric	Default value of **PCTFREE** used when a partition is added.
def_pct_used	numeric	Not supported. Its value is **NULL**.
def_ini_trans	numeric	Default value of **INITRANS** used when a partition is added.
def_max_trans	numeric	Default value of **MAXTRANS** used when a partition is added.
def_initial_extent	character varying(40)	Not supported. Its value is **NULL**.
def_next_extent	character varying(40)	Not supported. Its value is **NULL**.
def_min_extents	character varying(40)	Not supported. Its value is **NULL**.

Name	Type	Description
def_max_extents	character varying(40)	Not supported. Its value is **NULL**.
def_max_size	character varying(40)	Not supported. Its value is **NULL**.
def_pct_increase	character varying(40)	Not supported. Its value is **NULL**.
def_freelists	numeric	Not supported. Its value is **NULL**.
def_freelist_groups	numeric	Not supported. Its value is **NULL**.
def_logging	character varying(7)	Not supported. Its value is **NULL**.
def_compression	character varying(8)	Default compression mode used when a partition is added. The options are as follows: • **NONE** • **ENABLED** • **DISABLED**
def_compress_for	character varying(30)	Default compression mode used when a partition is added. **NOTE** For available compression modes and compression levels, see **WITH ({ storage_parameter = value } [, ...])**.
def_buffer_pool	character varying(7)	Not supported. The value is **DEFAULT**.
def_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
def_cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
ref_ptn_constraint_name	character varying(128)	Not supported. Its value is **NULL**.
interval	character varying(1000)	Interval.

Name	Type	Description
autolist	text	Specifies whether to enable the automatic extension function for the level-1 list partition. • **YES**: Enable the automatic extension function. • **NO**: Disable the automatic extension function.
interval_subpartition	character varying(1000)	Not supported. Its value is **NULL**.
autolist_subpartition	text	Specifies whether to enable the automatic extension function for the level-2 list partition. • **YES**: Enable the automatic extension function. • **NO**: Disable the automatic extension function.
is_nested	character varying(3)	Not supported. The value is **NO**.
def_segment_creation	character varying(4)	Currently, the segment-page mode is not supported. When the segment-page mode is enabled, the value is **YES**.
def_indexing	character varying(3)	Not supported. The value is **ON**.
def_inmemory	character varying(8)	Not supported. The value is **NONE**.
def_inmemory_priority	character varying(8)	Not supported. Its value is **NULL**.
def_inmemory_distribute	character varying(15)	Not supported. Its value is **NULL**.
def_inmemory_compression	character varying(17)	Not supported. Its value is **NULL**.
def_inmemory_duplicate	character varying(13)	Not supported. Its value is **NULL**.
def_read_only	character varying(3)	Not supported. The value is **NO**.
def_cellmemory	character varying(24)	Not supported. Its value is **NULL**.

Name	Type	Description
def_inmemory_service	character varying(12)	Not supported. Its value is **NULL**.
def_inmemory_service_name	character varying(1000)	Not supported. Its value is **NULL**.

12.3.1.6 ADM_SUBPART_COL_STATISTICS

ADM_SUBPART_COL_STATISTICS displays the column statistics and histogram information about all level-2 partitions in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-131 ADM_SUBPART_COL_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
subpartition_name	character varying(128)	Name of a level-2 partition.
column_name	character varying(4000)	Column name.
num_distinct	numeric	Not supported. Set it to **NULL**.
low_value	raw	Not supported. Set it to **NULL**.
high_value	raw	Not supported. Set it to **NULL**.
density	numeric	Not supported. Set it to **NULL**.
num_nulls	numeric	Not supported. Set it to **NULL**.
num_buckets	numeric	Not supported. Set it to **NULL**.
sample_size	numeric	Not supported. Set it to **NULL**.
last_analyzed	timestamp(0) without time zone	Not supported. Set it to **NULL**.
global_stats	character varying(3)	Not supported. Set it to **NULL**.

Name	Type	Description
user_stats	character varying(3)	Not supported. Set it to **NULL**.
notes	character varying(41)	Not supported. Set it to **NULL**.
avg_col_len	numeric	Not supported. Set it to **NULL**.
histogram	character varying(15)	Not supported. Set it to **NULL**.
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.1.7 ADM_SUBPART_KEY_COLUMNS

ADM_SUBPART_KEY_COLUMNS displays information about the partition key columns of level-2 partitioned tables or partitioned indexes in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 12-132 ADM_SUBPART_KEY_COLUMNS columns

Name	Type	Description
owner	character varying(128)	Owner of a level-2 partitioned table or index.
name	character varying(128)	Name of a level-2 partitioned table or index.
object_type	character(5)	Object type. • Its value is **table** for a level-2 partitioned table. • Its value is **index** for a level-2 partitioned index.
column_name	character varying(4000)	Partition key column name of a level-2 partitioned table or index.
column_position	numeric	Position of a column in a partition.
collated_column_id	numeric	Not supported. Its value is **NULL**.

12.3.1.8 ADM_TAB_SUBPARTITIONS

ADM_TAB_SUBPARTITIONS displays information about all level-2 partitions in the database. By default, only the system administrator can access this view. Common

users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 12-133 ADM_TAB_SUBPARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Relational table name.
partition_name	character varying(64)	Partition name.
subpartition_name	character varying(64)	Name of a level-2 partition.
high_value	text	Limit of a level-2 partition. • For range partitioning and interval partitioning, the upper limit of each partition is displayed. • For list partitioning, the value list of each partition is displayed. • For hash partitioning, the number of each partition is displayed.
tablespace_name	name	Tablespace name of a level-2 partitioned table.
schema	character varying(64)	Name of a namespace.
high_value_length	integer	Character length of the limit of a level-2 partition.

12.3.1.9 ADM_TAB_PARTITIONS

ADM_TAB_PARTITIONS displays information about level-1 partitions (including level-2 partitioned tables) in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 12-134 ADM_TAB_PARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Relational table name.
partition_name	character varying(64)	Partition name.

Name	Type	Description
high_value	text	Limit of a partition. • For range partitioning and interval partitioning, the upper limit of each partition is displayed. • For list partitioning, the value list of each partition is displayed. • For hash partitioning, the number of each partition is displayed.
tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Name of a namespace.
subpartition_count	bigint	Number of level-2 partitions.
high_value_length	integer	Length of the partition boundary value expression.
composite	character varying(3)	Specifies whether the table is a level-2 partitioned table.
partition_position	numeric	Position of the partition in the table.
pct_free	numeric	Minimum percentage of available space in a block.
pct_used	numeric	Not supported. Its value is **NULL**.
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is **NULL**.
next_extent	numeric	Not supported. Its value is **NULL**.
min_extent	numeric	Not supported. Its value is **NULL**.
max_extent	numeric	Not supported. Its value is **NULL**.
max_size	numeric	Not supported. Its value is **NULL**.

Name	Type	Description
pct_increase	numeric	Not supported. Its value is **NULL**.
freelists	numeric	Not supported. Its value is **NULL**.
freelist_groups	numeric	Not supported. Its value is **NULL**.
logging	character varying(7)	Specifies whether changes to a table are logged.
compression	character varying(8)	Actual compression attribute of a partitioned table.
compress_for	character varying(30)	Not supported. Its value is **NULL**.
num_rows	numeric	Number of rows in a partition.
blocks	numeric	Not supported. Its value is **NULL**.
empty_blocks	numeric	Not supported. Its value is **NULL**.
avg_space	numeric	Not supported. Its value is **NULL**.
chain_cnt	numeric	Not supported. Its value is **NULL**.
avg_row_len	numeric	Not supported. Its value is **NULL**.
sample_size	numeric	Not supported. Its value is **NULL**.
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Buffer pool allocated to a partitioned block.
flash_cache	character varying(7)	Not supported. Its value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
is_nested	character varying(3)	Specifies whether this partitioned table is a nested partitioned table.
parent_table_partition	character varying(128)	Not supported. Its value is **NULL**.
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table.
segment_created	character varying(4)	Specifies whether a table partition has segments created.
indexing	character varying(4)	Not supported. Its value is **NULL**.

Name	Type	Description
read_only	character varying(4)	Not supported. Its value is **NULL**.
inmemory	character varying(8)	Not supported. Its value is **NULL**.
inmemory_priority	character varying(8)	Not supported. Its value is **NULL**.
inmemory_distribute	character varying(15)	Not supported. Its value is **NULL**.
inmemory_compression	character varying(17)	Not supported. Its value is **NULL**.
inmemory_duplicate	character varying(13)	Not supported. Its value is **NULL**.
cellmemory	character varying(24)	Not supported. Its value is **NULL**.
inmemory_service	character varying(12)	Not supported. Its value is **NULL**.
inmemory_service_name	character varying(100)	Not supported. Its value is **NULL**.
memoptimize_read	character varying(8)	Not supported. Its value is **NULL**.
memoptimize_write	character varying(8)	Not supported. Its value is **NULL**.

12.3.1.10 DB_IND_PARTITIONS

DB_IND_PARTITIONS displays partition information about local indexes of level-1 partitioned table accessible to the current user (excluding global indexes of partitioned tables). It is accessible to all users. This view exists in both PG_CATALOG and SYS schema.

Table 12-135 DB_IND_PARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Name of the owner of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Name of the partitioned table index to which the index partition belongs.
partition_name	character varying(64)	Name of an index partition.

Name	Type	Description
def_tablespace_name	name	Tablespace name of the index partition.
high_value	text	Upper limit of the partition corresponding to the index partition.
index_partition_usable	Boolean	Specifies whether an index partition is available. • **t** (true): yes. • **f** (false): no.
schema	character varying(64)	Schema of the partitioned table index to which an index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
composite	character varying(3)	Specifies whether the index is a local index on the level-2 partitioned table. This table does not store level-2 partition information. Therefore, the value is **NO**.
subpartition_count	numeric	Number of level-2 partitions in a partition. This table does not store level-2 partition information. Therefore, the value is **0**.
partition_position	numeric	Position of an index partition in the index.
status	character varying(8)	Specifies whether an index partition is available.
tablespace_name	name	Name of the tablespace that contains the partition.
pct_free	numeric	Percentage of minimum available space in a block.

Name	Type	Description
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is **NULL**.
next_extent	numeric	Not supported. Its value is **NULL**.
min_extent	numeric	Not supported. Its value is **NULL**.
max_extent	numeric	Not supported. Its value is **NULL**.
max_size	numeric	Not supported. Its value is **NULL**.
pct_increase	numeric	Not supported. Its value is **NULL**.
freelists	numeric	Not supported. Its value is **NULL**.
freelist_groups	numeric	Not supported. Its value is **NULL**.
logging	character varying(7)	Specifies whether changes to an index are logged.
compression	character varying(13)	Specifies whether an index compression is enabled for a partitioned index.
blevel	numeric	Not supported. Its value is **NULL**.
leaf_blocks	numeric	Not supported. Its value is **NULL**.
distinct_keys	numeric	Not supported. Its value is **NULL**.

Name	Type	Description
avg_leaf_blocks_per_key	numeric	Not supported. Its value is **NULL**.
avg_data_blocks_per_key	numeric	Not supported. Its value is **NULL**.
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the **analyze** command to collect statistics.
num_rows	numeric	Number of rows in a partition. You need to run the vacuum command to collect statistics.
sample_size	numeric	Not supported. Its value is **NULL**.
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Actual buffer pool of a partition.
flash_cache	character varying(7)	Not supported. Its value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
pct_direct_access	numeric	Not supported. Its value is **NULL**.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
domidx_opstatus	character varying(6)	Not supported. Its value is **NULL**.
parameters	character varying(1000)	Not supported. Its value is **NULL**.
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table.

Name	Type	Description
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
orphaned_entries	character varying(3)	Not supported. Its value is **NULL**.

12.3.1.11 DB_IND_SUBPARTITIONS

DB_IND_SUBPARTITIONS displays partition information about local indexes of level-2 partitioned table accessible to the current user (excluding global indexes of partitioned tables). It is accessible to all users. This view exists in both PG_CATALOG and SYS schema.

Table 12-136 DB_IND_SUBPARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Name of the owner of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Name of the partitioned table index to which the index partition belongs.
partition_name	character varying(64)	Name of the level-1 partition where an index is located.
subpartition_name	character varying(64)	Name of the level-2 partition where an index is located.
def_tablespace_name	name	Tablespace name of the index partition.
high_value	text	Limit of the partition corresponding to an index partition.
index_partition_usable	Boolean	Specifies whether an index partition is available. • **t** (true): yes. • **f** (false): no.

Name	Type	Description
schema	character varying(64)	Schema of the partitioned table index to which an index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
partition_position	numeric	Position of an index partition in the index.
subpartition_position	numeric	Position of the level-2 partition in the partition.
status	character varying(8)	Specifies whether an index partition is available.
tablespace_name	name	Tablespace name of the index partition.
pct_free	numeric	Percentage of minimum available space in a block.
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is **NULL**.
next_extent	numeric	Not supported. Its value is **NULL**.
min_extent	numeric	Not supported. Its value is **NULL**.
max_extent	numeric	Not supported. Its value is **NULL**.
max_size	numeric	Not supported. Its value is **NULL**.

Name	Type	Description
pct_increase	numeric	Not supported. Its value is **NULL**.
freelists	numeric	Not supported. Its value is **NULL**.
freelist_groups	numeric	Not supported. Its value is **NULL**.
logging	character varying(7)	Specifies whether changes to an index are logged.
compression	character varying(13)	Compression type used for level-2 partitions.
blevel	numeric	Not supported. Its value is **NULL**.
leaf_blocks	numeric	Not supported. Its value is **NULL**.
distinct_keys	numeric	Not supported. Its value is **NULL**.
avg_leaf_blocks_per_key	numeric	Not supported. Its value is **NULL**.
avg_data_blocks_per_key	numeric	Not supported. Its value is **NULL**.
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the **analyze** command to collect statistics.
num_rows	numeric	Number of rows in a level-2 partition. You need to run the vacuum command to collect statistics.
sample_size	numeric	Not supported. Its value is **NULL**.
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Buffer pool of a level-2 partition.
flash_cache	character varying(7)	Not supported. Its value is **NULL**.

Name	Type	Description
cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table.
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
domidx_opstatus	character varying(6)	Not supported. Its value is **NULL**.
parameters	character varying(1000)	Not supported. Its value is **NULL**.

12.3.1.12 DB_PART_COL_STATISTICS

DB_PART_COL_STATISTICS displays column statistics and histogram information about table partitions accessible to the current user. All users can access this view. This view exists in the PG_CATALOG and SYS schemas.

Table 12-137 DB_PART_COL_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Owner of the partitioned table
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Table partition name
column_name	character varying(4000)	Column name.
num_distinct	numeric	Not supported. Set it to **NULL**.
low_value	raw	Not supported. Set it to **NULL**.
high_value	raw	Not supported. Set it to **NULL**.

Name	Type	Description
density	numeric	Not supported. Set it to **NULL**.
num_nulls	numeric	Not supported. Set it to **NULL**.
num_buckets	numeric	Not supported. Set it to **NULL**.
sample_size	numeric	Not supported. Set it to **NULL**.
last_analyzed	timestamp(0) without time zone	Not supported. Set it to **NULL**.
global_stats	character varying(3)	Not supported. Set it to **NULL**.
user_stats	character varying(3)	Not supported. Set it to **NULL**.
notes	character varying(63)	Not supported. Set it to **NULL**.
avg_col_len	numeric	Not supported. Set it to **NULL**.
histogram	character varying(15)	Not supported. Set it to **NULL**.
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.1.13 DB_PART_INDEXES

DB_PART_INDEXES displays information about partitioned table indexes (excluding global indexes of partitioned tables) accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-138 DB_PART_INDEXES columns

Name	Type	Description
def_tablespace_name	name	Tablespace name of a partitioned table index
index_owner	character varying(64)	Owner name of a partitioned table index
index_name	character varying(64)	Name of a partitioned table index

Name	Type	Description
partition_count	bigint	Number of index partitions of a partitioned table index
partitioning_key_count	integer	Number of partition keys of a partitioned table
partitioning_type	text	Partitioning policy of a partitioned table **NOTE** For details about the supported partitioning policies of the current partitioned table, see **CREATE TABLE PARTITION**.
schema	character varying(64)	Name of the schema to which a partitioned table index belongs
table_name	character varying(64)	Name of the partitioned table to which a partitioned table index belongs
subpartitioning_type	text	Partitioning policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, **NONE** is displayed. **NOTE** For details about the supported partitioning policies of the current level-2 partitioned table, see **CREATE TABLE SUBPARTITION**.
def_subpartition_count	integer	Default number of level-2 partitions to be created. The value is **1** for a level-2 partitioned table and **0** for a level-1 partitioned table.
subpartitioning_key_count	integer	Number of level-2 partition keys of a partitioned table

12.3.1.14 DB_PART_KEY_COLUMNS

DB_PART_KEY_COLUMNS displays information about the partition key columns of partitioned tables or partitioned indexes accessible to the current user. This view is accessible to all users and displays all information accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 12-139 DB_PART_KEY_COLUMNS columns

Name	Type	Description
owner	character varying(128)	Owner of a partitioned table or index.
name	character varying(128)	Name of a partitioned table or index.
object_type	character(5)	Object type. • Its value is **table** for a partitioned table. • Its value is **index** for a partitioned index.
column_name	character varying(4000)	Partition key column name of a partitioned table or index.
column_position	numeric	Position of a column in a partition.
collated_column_id	numeric	Not supported. Its value is **NULL**.

12.3.1.15 DB_PART_TABLES

DB_PART_TABLES displays information about partitioned tables accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 12-140 DB_PART_TABLES columns

Name	Type	Description
table_owner	character varying(64)	Owner name of a partitioned table.
table_name	character varying(64)	Name of a partitioned table.
partitioning_type	text	Partitioning policy of a partitioned table. **NOTE** For details about the supported partitioning policies of the current partitioned table, see **CREATE TABLE PARTITION**.
partition_count	bigint	Number of partitions of a partitioned table.
partitioning_key_count	integer	Number of partition keys of a partitioned table.

Name	Type	Description
def_tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Schema of a partitioned table.
subpartitioning_type	text	Partitioning policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, **NONE** is displayed. **NOTE** For details about the supported partitioning policies of the current level-2 partitioned table, see **CREATE TABLE SUBPARTITION**.
def_subpartition_count	integer	Default number of level-2 partitions to be created. The value is **1** for a level-2 partitioned table and **0** for a level-1 partitioned table.
subpartitioning_key_count	integer	Number of level-2 partition keys of the partitioned table.
status	character varying(8)	Not supported. The value is **valid**.
def_pct_free	numeric	Default value of **PCTFREE** used when a partition is added.
def_pct_used	numeric	Not supported. Its value is **NULL**.
def_ini_trans	numeric	Default value of **INITRANS** used when a partition is added.
def_max_trans	numeric	Default value of **MAXTRANS** used when a partition is added.
def_initial_extent	character varying(40)	Not supported. Its value is **NULL**.
def_next_extent	character varying(40)	Not supported. Its value is **NULL**.
def_min_extents	character varying(40)	Not supported. Its value is **NULL**.

Name	Type	Description
def_max_extents	character varying(40)	Not supported. Its value is **NULL**.
def_max_size	character varying(40)	Not supported. Its value is **NULL**.
def_pct_increase	character varying(40)	Not supported. Its value is **NULL**.
def_freelists	numeric	Not supported. Its value is **NULL**.
def_freelist_groups	numeric	Not supported. Its value is **NULL**.
def_logging	character varying(7)	Not supported. Its value is **NULL**.
def_compression	character varying(8)	Default compression mode used when a partition is added. The options are as follows: • **NONE** • **ENABLED** • **DISABLED**
def_compress_for	character varying(30)	Default compression mode used when a partition is added. **NOTE** For available compression modes and compression levels, see **WITH ({ storage_parameter = value } [, ...])**.
def_buffer_pool	character varying(7)	Not supported. The value is **DEFAULT**.
def_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
def_cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
ref_ptn_constraint_name	character varying(128)	Not supported. Its value is **NULL**.
interval	character varying(1000)	Interval.

Name	Type	Description
autolist	text	Specifies whether to enable the automatic extension function for the level-1 list partition. • **YES**: Enable the automatic extension function. • **NO**: Disable the automatic extension function.
interval_subpartition	character varying(1000)	Not supported. Its value is **NULL**.
autolist_subpartition	text	Specifies whether to enable the automatic extension function for the level-2 list partition. • **YES**: Enable the automatic extension function. • **NO**: Disable the automatic extension function.
is_nested	character varying(3)	Not supported. The value is **NO**.
def_segment_creation	character varying(4)	Currently, the segment-page mode is not supported. When the segment-page mode is enabled, the value is **YES**.
def_indexing	character varying(3)	Not supported. The value is **ON**.
def_inmemory	character varying(8)	Not supported. The value is **NONE**.
def_inmemory_priority	character varying(8)	Not supported. Its value is **NULL**.
def_inmemory_distribute	character varying(15)	Not supported. Its value is **NULL**.
def_inmemory_compression	character varying(17)	Not supported. Its value is **NULL**.
def_inmemory_duplicate	character varying(13)	Not supported. Its value is **NULL**.
def_read_only	character varying(3)	Not supported. The value is **NO**.
def_cellmemory	character varying(24)	Not supported. Its value is **NULL**.

Name	Type	Description
def_inmemory_service	character varying(12)	Not supported. Its value is **NULL**.
def_inmemory_service_name	character varying(1000)	Not supported. Its value is **NULL**.

12.3.1.16 DB_SUBPART_COL_STATISTICS

DB_SUBPART_COL_STATISTICS displays column statistics and histogram information about level-2 partitions of partitioned objects accessible to the current user. All users can access this view. This view exists in the PG_CATALOG and SYS schemas.

Table 12-141 DB_SUBPART_COL_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
subpartition_name	character varying(128)	Name of a level-2 partition.
column_name	character varying(4000)	Column name.
num_distinct	numeric	Not supported. Set it to **NULL**.
low_value	raw	Not supported. Set it to **NULL**.
high_value	raw	Not supported. Set it to **NULL**.
density	numeric	Not supported. Set it to **NULL**.
num_nulls	numeric	Not supported. Set it to **NULL**.
num_buckets	numeric	Not supported. Set it to **NULL**.
sample_size	numeric	Not supported. Set it to **NULL**.
last_analyzed	timestamp(0) without time zone	Not supported. Set it to **NULL**.
global_stats	character varying(3)	Not supported. Set it to **NULL**.

Name	Type	Description
user_stats	character varying(3)	Not supported. Set it to **NULL**.
notes	character varying(41)	Not supported. Set it to **NULL**.
avg_col_len	numeric	Not supported. Set it to **NULL**.
histogram	character varying(15)	Not supported. Set it to **NULL**.
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.1.17 DB_SUBPART_KEY_COLUMNS

DB_SUBPART_KEY_COLUMNS displays information about the partition key columns of level-2 partitioned tables or partitioned indexes accessible to the current user. This view is accessible to all users and displays all information accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 12-142 DB_SUBPART_KEY_COLUMNS columns

Name	Type	Description
owner	character varying(128)	Owner of a level-2 partitioned table or index.
name	character varying(128)	Name of a level-2 partitioned table or index.
object_type	character(5)	Object type. • Its value is **table** for a partitioned table. • Its value is **index** for a partitioned index.
column_name	character varying(4000)	Partition key column name of a level-2 partitioned table or index.
column_position	numeric	Position of a column in a partition.
collated_column_id	numeric	Not supported. Its value is **NULL**.

12.3.1.18 DB_TAB_PARTITIONS

DB_TAB_PARTITIONS displays information about level-1 partitions (including level-2 partitioned tables) accessible to the current user. It is accessible to all users. This view exists in both PG_CATALOG and SYS schema.

Table 12-143 DB_TAB_PARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Relational table name.
partition_name	character varying(64)	Partition name.
high_value	text	Limit of a partition. • For range partitioning and interval partitioning, the upper limit of each partition is displayed. • For list partitioning, the value list of each partition is displayed. • For hash partitioning, the number of each partition is displayed.
tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Name of a namespace.
subpartition_count	bigint	Number of level-2 partitions.
high_value_length	integer	Length of the partition boundary value expression.
composite	character varying(3)	Specifies whether the table is a level-2 partitioned table.
partition_position	numeric	Position of the partition in the table.
pct_free	numeric	Minimum percentage of available space in a block.
pct_used	numeric	Not supported. Its value is **NULL**.
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.

Name	Type	Description
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is **NULL**.
next_extent	numeric	Not supported. Its value is **NULL**.
min_extent	numeric	Not supported. Its value is **NULL**.
max_extent	numeric	Not supported. Its value is **NULL**.
max_size	numeric	Not supported. Its value is **NULL**.
pct_increase	numeric	Not supported. Its value is **NULL**.
freelists	numeric	Not supported. Its value is **NULL**.
freelist_groups	numeric	Not supported. Its value is **NULL**.
logging	character varying(7)	Specifies whether changes to a table are logged.
compression	character varying(8)	Actual compression attribute of a partitioned table.
compress_for	character varying(30)	Not supported. Its value is **NULL**.
num_rows	numeric	Number of rows in a partition.
blocks	numeric	Not supported. Its value is **NULL**.
empty_blocks	numeric	Not supported. Its value is **NULL**.
avg_space	numeric	Not supported. Its value is **NULL**.
chain_cnt	numeric	Not supported. Its value is **NULL**.
avg_row_len	numeric	Not supported. Its value is **NULL**.
sample_size	numeric	Not supported. Its value is **NULL**.
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Buffer pool allocated to a partitioned block.
flash_cache	character varying(7)	Not supported. Its value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.

Name	Type	Description
is_nested	character varying(3)	Specifies whether this partitioned table is a nested partitioned table.
parent_table_partition	character varying(128)	Not supported. Its value is **NULL**.
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table.
segment_created	character varying(4)	Specifies whether a table partition has segments created.
indexing	character varying(4)	Not supported. Its value is **NULL**.
read_only	character varying(4)	Not supported. Its value is **NULL**.
inmemory	character varying(8)	Not supported. Its value is **NULL**.
inmemory_priority	character varying(8)	Not supported. Its value is **NULL**.
inmemory_distribute	character varying(15)	Not supported. Its value is **NULL**.
inmemory_compression	character varying(17)	Not supported. Its value is **NULL**.
inmemory_duplicate	character varying(13)	Not supported. Its value is **NULL**.
cellmemory	character varying(24)	Not supported. Its value is **NULL**.
inmemory_service	character varying(12)	Not supported. Its value is **NULL**.
inmemory_service_name	character varying(100)	Not supported. Its value is **NULL**.
memoptimize_read	character varying(8)	Not supported. Its value is **NULL**.
memoptimize_write	character varying(8)	Not supported. Its value is **NULL**.

12.3.1.19 DB_TAB_SUBPARTITIONS

DB_TAB_SUBPARTITIONS displays information about level-2 partitioned tables accessible to the current user. It is accessible to all users. This view exists in both PG_CATALOG and SYS schema.

Table 12-144 DB_TAB_SUBPARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Relational table name.
partition_name	character varying(64)	Partition name.
subpartition_name	character varying(64)	Name of a level-2 partition.
high_value	text	Limit of a level-2 partition. • For range partitioning and interval partitioning, the upper limit of each partition is displayed. • For list partitioning, the value list of each partition is displayed. • For hash partitioning, the number of each partition is displayed.
tablespace_name	name	Tablespace name of a level-2 partitioned table.
schema	character varying(64)	Name of a namespace.
high_value_length	integer	Character length of the limit of a level-2 partition.
partition_position	numeric	Position of the partition in the table.
subpartition_position	numeric	Position of the level-2 partition in the partition.
pct_free	numeric	Minimum percentage of available space in a block.
pct_used	numeric	Not supported. Its value is **NULL**.
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is **NULL**.
next_extent	numeric	Not supported. Its value is **NULL**.

Name	Type	Description
min_extent	numeric	Not supported. Its value is **NULL**.
max_extent	numeric	Not supported. Its value is **NULL**.
max_size	numeric	Not supported. Its value is **NULL**.
pct_increase	numeric	Not supported. Its value is **NULL**.
freelists	numeric	Not supported. Its value is **NULL**.
freelist_groups	numeric	Not supported. Its value is **NULL**.
logging	character varying(3)	Specifies whether changes to a table are logged.
compression	character varying(8)	Actual compression attribute of a partitioned table.
compress_for	character varying(30)	Not supported. Its value is **NULL**.
num_rows	numeric	Number of rows in a level-2 partition.
blocks	numeric	Not supported. Its value is **NULL**.
empty_blocks	numeric	Not supported. Its value is **NULL**.
avg_space	numeric	Not supported. Its value is **NULL**.
chain_cnt	numeric	Not supported. Its value is **NULL**.
avg_row_len	numeric	Not supported. Its value is **NULL**.
sample_size	numeric	Not supported. Its value is **NULL**.
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Buffer pool of a level-2 partition.
flash_cache	character varying(7)	Not supported. Its value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table.
segment_created	character varying(3)	Specifies whether a segment is created in a level-2 partitioned table.
indexing	character varying(3)	Not supported. Its value is **NULL**.

Name	Type	Description
read_only	character varying(3)	Not supported. Its value is **NULL**.
inmemory	character varying(8)	Not supported. Its value is **NULL**.
inmemory_priority	character varying(8)	Not supported. Its value is **NULL**.
inmemory_distribute	character varying(15)	Not supported. Its value is **NULL**.
inmemory_compression	character varying(17)	Not supported. Its value is **NULL**.
inmemory_duplicate	character varying(13)	Not supported. Its value is **NULL**.
inmemory_service	character varying(12)	Not supported. Its value is **NULL**.
inmemory_service_name	character varying(1000)	Not supported. Its value is **NULL**.
cellmemory	character varying(24)	Not supported. Its value is **NULL**.
memoptimize_read	character varying(8)	Not supported. Its value is **NULL**.
memoptimize_write	character varying(8)	Not supported. Its value is **NULL**.

12.3.1.20 MY_IND_PARTITIONS

MY_IND_PARTITIONS displays the partition information about local indexes of level-1 partitioned table accessible to the current user (excluding global indexes of partitioned tables). It is accessible to all users. This view exists in both PG_CATALOG and SYS schema.

Table 12-145 MY_IND_PARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Name of the owner of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Name of the partitioned table index to which the index partition belongs.
partition_name	character varying(64)	Name of an index partition.

Name	Type	Description
def_tablespace_name	name	Tablespace name of the index partition.
high_value	text	Upper limit of the partition corresponding to the index partition.
index_partition_usable	Boolean	Specifies whether an index partition is available: • **t** (true): yes. • **f** (false): no.
schema	character varying(64)	Schema of the partitioned table index to which an index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
composite	character varying(3)	Specifies whether the index is a local index on the level-2 partitioned table. This table does not store level-2 partition information. Therefore, the value is **NO**.
subpartition_count	numeric	Number of level-2 partitions in a partition. This table does not store level-2 partition information. Therefore, the value is **0**.
partition_position	numeric	Position of an index partition in the index.
status	character varying(8)	Specifies whether an index partition is available.
tablespace_name	name	Name of the tablespace that contains the partition.
pct_free	numeric	Percentage of minimum available space in a block.

Name	Type	Description
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is **NULL**.
next_extent	numeric	Not supported. Its value is **NULL**.
min_extent	numeric	Not supported. Its value is **NULL**.
max_extent	numeric	Not supported. Its value is **NULL**.
max_size	numeric	Not supported. Its value is **NULL**.
pct_increase	numeric	Not supported. Its value is **NULL**.
freelists	numeric	Not supported. Its value is **NULL**.
freelist_groups	numeric	Not supported. Its value is **NULL**.
logging	character varying(7)	Specifies whether changes to an index are logged.
compression	character varying(13)	Specifies whether an index compression is enabled for a partitioned index.
blevel	numeric	Not supported. Its value is **NULL**.
leaf_blocks	numeric	Not supported. Its value is **NULL**.
distinct_keys	numeric	Not supported. Its value is **NULL**.

Name	Type	Description
avg_leaf_blocks_per_key	numeric	Not supported. Its value is **NULL**.
avg_data_blocks_per_key	numeric	Not supported. Its value is **NULL**.
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the **analyze** command to collect statistics.
num_rows	numeric	Number of rows in a partition. You need to run the vacuum command to collect statistics.
sample_size	numeric	Not supported. Its value is **NULL**.
last_analyzed	timestamp with time zone	Last date when the partition was analyzed. Database restart is not supported. Otherwise, data loss will occur.
buffer_pool	character varying(7)	Actual buffer pool of a partition.
flash_cache	character varying(7)	Not supported. Its value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
pct_direct_access	numeric	Not supported. Its value is **NULL**.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
domidx_opstatus	character varying(6)	Not supported. Its value is **NULL**.
parameters	character varying(1000)	Not supported. Its value is **NULL**.

Name	Type	Description
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table.
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
orphaned_entries	character varying(3)	Not supported. Its value is **NULL**.

12.3.1.21 MY_IND_SUBPARTITIONS

MY_IND_SUBPARTITIONS displays the partition information about local indexes of level-2 partitioned table owned by the current user (excluding global indexes of partitioned tables). It is accessible to all users. This view exists in the PG_CATALOG and SYS schemas.

Table 12-146 MY_IND_SUBPARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Owner name of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Index name of the partitioned table index to which an index partition belongs.
partition_name	character varying(64)	Name of the level-1 partition where an index is located.
subpartition_name	character varying(64)	Name of the level-2 partition where an index is located.
def_tablespace_name	name	Tablespace name of an index partition.
high_value	text	Limit of the partition corresponding to an index partition.

Name	Type	Description
index_partition_usable	Boolean	Specifies whether an index partition is available: • **t** (true): yes • **f** (false): no
schema	character varying(64)	Schema of the partitioned table index to which an index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
partition_position	numeric	Position of an index partition in the index.
subpartition_position	numeric	Location of the level-2 partition in the partition.
status	character varying(8)	Specifies whether the index partition is available.
tablespace_name	name	Tablespace name of an index partition.
pct_free	numeric	Minimum percentage of available space in a block.
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. The value is **NULL**.
next_extent	numeric	Not supported. The value is **NULL**.
min_extent	numeric	Not supported. The value is **NULL**.

Name	Type	Description
max_extent	numeric	Not supported. The value is **NULL**.
max_size	numeric	Not supported. The value is **NULL**.
pct_increase	numeric	Not supported. The value is **NULL**.
freelists	numeric	Not supported. The value is **NULL**.
freelist_groups	numeric	Not supported. The value is **NULL**.
logging	character varying(7)	Specifies whether changes to an index are recorded.
compression	character varying(13)	Compression type used for level-2 partitions.
blevel	numeric	Not supported. The value is **NULL**.
leaf_blocks	numeric	Not supported. The value is **NULL**.
distinct_keys	numeric	Not supported. The value is **NULL**.
avg_leaf_blocks_per_key	numeric	Not supported. The value is **NULL**.
avg_data_blocks_per_key	numeric	Not supported. The value is **NULL**.
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the analyze command to collect statistics.
num_rows	numeric	Number of rows in a level-2 partition. You need to run the vacuum command to collect statistics.
sample_size	numeric	Not supported. The value is **NULL**.

Name	Type	Description
last_analyzed	timestamp with time zone	Last date when the partition was analyzed. Database restart is not supported. Otherwise, data loss will occur.
buffer_pool	character varying(7)	Buffer pool of a level-2 partition.
flash_cache	character varying(7)	Not supported. The value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. The value is **NULL**.
user_stats	character varying(3)	Not supported. The value is **NULL**.
global_stats	character varying(3)	Not supported. The value is **NULL**.
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table.
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
domidx_opstatus	character varying(6)	Not supported. The value is **NULL**.
parameters	character varying(1000)	Not supported. The value is **NULL**.

12.3.1.22 MY_PART_COL_STATISTICS

MY_PART_COL_STATISTICS displays column statistics and histogram information about table partitions owned by the current user. It is accessible to all users. This view exists in the PG_CATALOG and SYS schemas.

Table 12-147 MY_PART_COL_STATISTICS columns

Name	Type	Description
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Table partition name
column_name	character varying(4000)	Column name.

Name	Type	Description
num_distinct	numeric	Not supported. Set it to **NULL**.
low_value	raw	Not supported. Set it to **NULL**.
high_value	raw	Not supported. Set it to **NULL**.
density	numeric	Not supported. Set it to **NULL**.
num_nulls	numeric	Not supported. Set it to **NULL**.
num_buckets	numeric	Not supported. Set it to **NULL**.
sample_size	numeric	Not supported. Set it to **NULL**.
last_analyzed	timestamp(0) without time zone	Not supported. Set it to **NULL**.
global_stats	character varying(3)	Not supported. Set it to **NULL**.
user_stats	character varying(3)	Not supported. Set it to **NULL**.
notes	character varying(63)	Not supported. Set it to **NULL**.
avg_col_len	numeric	Not supported. Set it to **NULL**.
histogram	character varying(15)	Not supported. Set it to **NULL**.
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.1.23 MY_PART_INDEXES

MY_PART_INDEXES displays information about partitioned table indexes accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-148 MY_PART_INDEXES columns

Name	Type	Description
def_tablespace_name	name	Tablespace name of a partitioned table index

Name	Type	Description
index_owner	character varying(64)	Owner name of a partitioned table index
index_name	character varying(64)	Name of a partitioned table index
partition_count	bigint	Number of index partitions of a partitioned table index
partitioning_key_count	integer	Number of partition keys of a partitioned table
partitioning_type	text	Partitioning policy of a partitioned table **NOTE** For details about the supported partitioning policies of the current partitioned table, see **CREATE TABLE PARTITION**.
schema	character varying(64)	Schema of a partitioned table index
table_name	character varying(64)	Name of the partitioned table to which a partitioned table index belongs
subpartitioning_type	text	Partitioning policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, **NONE** is displayed. **NOTE** For details about the supported partitioning policies of the current level-2 partitioned table, see **CREATE TABLE SUBPARTITION**.
def_subpartition_count	integer	Default number of level-2 partitions to be created. The value is **1** for a level-2 partitioned table and **0** for a level-1 partitioned table.
subpartitioning_key_count	integer	Number of level-2 partition keys of the partitioned table.

12.3.1.24 MY_PART_KEY_COLUMNS

MY_PART_KEY_COLUMNS displays information about the partition key columns of partitioned tables or partitioned indexes owned by the current user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in both PG_CATALOG and SYS schema.

Table 12-149 MY_PART_KEY_COLUMNS columns

Name	Type	Description
name	character varying(128)	Name of a partitioned table or index.
object_type	character(5)	Object type. • Its value is **table** for a partitioned table. • Its value is **index** for a partitioned index.
column_name	character varying(4000)	Partition key column name of a partitioned table or index.
column_position	numeric	Position of a column in a partition.
collated_column_id	numeric	Not supported. Its value is **NULL**.

12.3.1.25 MY_PART_TABLES

MY_PART_TABLES displays information about partitioned tables accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 12-150 MY_PART_TABLES columns

Name	Type	Description
table_owner	character varying(64)	Owner name of a partitioned table.
table_name	character varying(64)	Name of a partitioned table.
partitioning_type	text	Partitioning policy of a partitioned table. **NOTE** For details about the supported partitioning policies of the current partitioned table, see **CREATE TABLE PARTITION**.
partition_count	bigint	Number of partitions of a partitioned table.
partitioning_key_count	integer	Number of partition keys of a partitioned table.
def_tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Schema of a partitioned table.

Name	Type	Description
subpartitioning_type	text	Partitioning policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, **NONE** is displayed. **NOTE** For details about the supported partitioning policies of the current level-2 partitioned table, see **CREATE TABLE SUBPARTITION**.
def_subpartition_count	integer	Default number of level-2 partitions to be created. The value is **1** for a level-2 partitioned table and **0** for a level-1 partitioned table.
subpartitioning_key_count	integer	Number of level-2 partition keys of the partitioned table.
status	character varying(8)	Not supported. The value is **valid**.
def_pct_free	numeric	Default value of **PCTFREE** used when a partition is added.
def_pct_used	numeric	Not supported. Its value is **NULL**.
def_ini_trans	numeric	Default value of **INITRANS** used when a partition is added.
def_max_trans	numeric	Default value of **MAXTRANS** used when a partition is added.
def_initial_extent	character varying(40)	Not supported. Its value is **NULL**.
def_next_extent	character varying(40)	Not supported. Its value is **NULL**.
def_min_extents	character varying(40)	Not supported. Its value is **NULL**.
def_max_extents	character varying(40)	Not supported. Its value is **NULL**.
def_max_size	character varying(40)	Not supported. Its value is **NULL**.

Name	Type	Description
def_pct_increase	character varying(40)	Not supported. Its value is **NULL**.
def_freelists	numeric	Not supported. Its value is **NULL**.
def_freelist_groups	numeric	Not supported. Its value is **NULL**.
def_logging	character varying(7)	Not supported. Its value is **NULL**.
def_compression	character varying(8)	Default compression mode used when a partition is added. The options are as follows: • **NONE** • **ENABLED** • **DISABLED**
def_compress_for	character varying(30)	Default compression mode used when a partition is added. **NOTE** For available compression modes and compression levels, see **WITH ({ storage_parameter = value } [, ...])**.
def_buffer_pool	character varying(7)	Not supported. The value is **DEFAULT**.
def_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
def_cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
ref_ptn_constraint_name	character varying(128)	Not supported. Its value is **NULL**.
interval	character varying(1000)	Interval.
autolist	text	Specifies whether to enable the automatic extension function for the level-1 list partition. • **YES**: Enable the automatic extension function. • **NO**: Disable the automatic extension function.

Name	Type	Description
interval_subpartition	character varying(1000)	Not supported. Its value is **NULL**.
autolist_subpartition	text	Specifies whether to enable the automatic extension function for the level-2 list partition. • **YES**: Enable the automatic extension function. • **NO**: Disable the automatic extension function.
is_nested	character varying(3)	Not supported. The value is **NO**.
def_segment_creation	character varying(4)	Currently, the segment-page mode is not supported. When the segment-page mode is enabled, the value is **YES**.
def_indexing	character varying(3)	Not supported. The value is **ON**.
def_inmemory	character varying(8)	Not supported. The value is **NONE**.
def_inmemory_priority	character varying(8)	Not supported. Its value is **NULL**.
def_inmemory_distribute	character varying(15)	Not supported. Its value is **NULL**.
def_inmemory_compression	character varying(17)	Not supported. Its value is **NULL**.
def_inmemory_duplicate	character varying(13)	Not supported. Its value is **NULL**.
def_read_only	character varying(3)	Not supported. The value is **NO**.
def_cellmemory	character varying(24)	Not supported. Its value is **NULL**.
def_inmemory_service	character varying(12)	Not supported. Its value is **NULL**.
def_inmemory_service_name	character varying(1000)	Not supported. Its value is **NULL**.

12.3.1.26 MY_SUBPART_COL_STATISTICS

MY_SUBPART_COL_STATISTICS displays column statistics and histogram information about level-2 partitions of partitioned objects owned by the current

user. All users can access this view. This view exists in the PG_CATALOG and SYS schemas.

Table 12-151 MY_SUBPART_COL_STATISTICS columns

Name	Type	Description
table_name	character varying(128)	Table name.
subpartition_name	character varying(128)	Name of a level-2 partition.
column_name	character varying(4000)	Column name.
num_distinct	numeric	Not supported. Set it to **NULL**.
low_value	raw	Not supported. Set it to **NULL**.
high_value	raw	Not supported. Set it to **NULL**.
density	numeric	Not supported. Set it to **NULL**.
num_nulls	numeric	Not supported. Set it to **NULL**.
num_buckets	numeric	Not supported. Set it to **NULL**.
sample_size	numeric	Not supported. Set it to **NULL**.
last_analyzed	timestamp(0) without time zone	Not supported. Set it to **NULL**.
global_stats	character varying(3)	Not supported. Set it to **NULL**.
user_stats	character varying(3)	Not supported. Set it to **NULL**.
notes	character varying(41)	Not supported. Set it to **NULL**.
avg_col_len	numeric	Not supported. Set it to **NULL**.
histogram	character varying(15)	Not supported. Set it to **NULL**.
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.1.27 MY_SUBPART_KEY_COLUMNS

MY_SUBPART_KEY_COLUMNS displays information about the partition key columns of level-2 partitioned tables or partitioned indexes owned by the current user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in both PG_CATALOG and SYS schema.

Table 12-152 MY_SUBPART_KEY_COLUMNS columns

Name	Type	Description
name	character varying(128)	Name of a level-2 partitioned table or index.
object_type	character(5)	Object type. • Its value is **table** for a partitioned table. • Its value is **index** for a partitioned index.
column_name	character varying(4000)	Partition key column name of a level-2 partitioned table or index.
column_position	numeric	Position of a column in a partition.
collated_column_id	numeric	Not supported. Its value is **NULL**.

12.3.1.28 MY_TAB_PARTITIONS

MY_TAB_PARTITIONS displays all level-1 partitions accessible to the current user. Each level-1 table partition of a partitioned table accessible to the current user has one record in MY_TAB_PARTITIONS. It is accessible to all users. This view exists in both PG_CATALOG and SYS schema.

Table 12-153 MY_TAB_PARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Relational table name.
partition_name	character varying(64)	Partition name.

Name	Type	Description
high_value	text	Limit of a partition. • For range partitioning and interval partitioning, the upper limit of each partition is displayed. • For list partitioning, the value list of each partition is displayed. • For hash partitioning, the number of each partition is displayed.
tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Name of a namespace.
subpartition_count	bigint	Number of level-2 partitions.
high_value_length	integer	Length of the partition boundary value expression.
composite	character varying(3)	Specifies whether the table is a level-2 partitioned table.
partition_position	numeric	Position of the partition in the table.
pct_free	numeric	Minimum percentage of available space in a block.
pct_used	numeric	Not supported. Its value is **NULL**.
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is **NULL**.
next_extent	numeric	Not supported. Its value is **NULL**.
min_extent	numeric	Not supported. Its value is **NULL**.
max_extent	numeric	Not supported. Its value is **NULL**.
max_size	numeric	Not supported. Its value is **NULL**.

Name	Type	Description
pct_increase	numeric	Not supported. Its value is **NULL**.
freelists	numeric	Not supported. Its value is **NULL**.
freelist_groups	numeric	Not supported. Its value is **NULL**.
logging	character varying(7)	Specifies whether changes to a table are logged.
compression	character varying(8)	Actual compression attribute of a partitioned table.
compress_for	character varying(30)	Not supported. Its value is **NULL**.
num_rows	numeric	Number of rows in a partition.
blocks	numeric	Not supported. Its value is **NULL**.
empty_blocks	numeric	Not supported. Its value is **NULL**.
avg_space	numeric	Not supported. Its value is **NULL**.
chain_cnt	numeric	Not supported. Its value is **NULL**.
avg_row_len	numeric	Not supported. Its value is **NULL**.
sample_size	numeric	Not supported. Its value is **NULL**.
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Buffer pool allocated to a partitioned block.
flash_cache	character varying(7)	Not supported. Its value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
is_nested	character varying(3)	Specifies whether this partitioned table is a nested partitioned table.
parent_table_partition	character varying(128)	Not supported. Its value is **NULL**.
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table.
segment_created	character varying(4)	Specifies whether a table partition has segments created.
indexing	character varying(4)	Not supported. Its value is **NULL**.

Name	Type	Description
read_only	character varying(4)	Not supported. Its value is **NULL**.
inmemory	character varying(8)	Not supported. Its value is **NULL**.
inmemory_priority	character varying(8)	Not supported. Its value is **NULL**.
inmemory_distribute	character varying(15)	Not supported. Its value is **NULL**.
inmemory_compression	character varying(17)	Not supported. Its value is **NULL**.
inmemory_duplicate	character varying(13)	Not supported. Its value is **NULL**.
cellmemory	character varying(24)	Not supported. Its value is **NULL**.
inmemory_service	character varying(12)	Not supported. Its value is **NULL**.
inmemory_service_name	character varying(100)	Not supported. Its value is **NULL**.
memoptimize_read	character varying(8)	Not supported. Its value is **NULL**.
memoptimize_write	character varying(8)	Not supported. Its value is **NULL**.

12.3.1.29 MY_TAB_SUBPARTITIONS

MY_TAB_SUBPARTITIONS displays information about all level-2 partitioned tables accessible to the current user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in both PG_CATALOG and SYS schema.

Table 12-154 MY_TAB_SUBPARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
schema	character varying(64)	Schema name.
table_name	character varying(64)	Table name.
partition_name	character varying(64)	Partition name.

Name	Type	Description
subpartition_name	character varying(64)	Name of a level-2 partition.
high_value	text	Boundary value expression in a level-2 partition.
high_value_length	integer	Length of the boundary value expression in level-2 partition.
partition_position	numeric	Position of the partition in the table.
subpartition_position	numeric	Position of the level-2 partition in the partition.
tablespace_name	name	Name of the tablespace where the level-2 partition is located.
pct_free	numeric	Percentage of minimum available space in a block.
pct_used	numeric	Not supported. Its value is **NULL**.
ini_trans	numeric	Initial number of transactions.
max_trans	numeric	Maximum number of transactions.
initial_extent	numeric	Not supported. Its value is **NULL**.
next_extent	numeric	Not supported. Its value is **NULL**.
min_extent	numeric	Not supported. Its value is **NULL**.
max_extent	numeric	Not supported. Its value is **NULL**.
max_size	numeric	Not supported. Its value is **NULL**.
pct_increase	numeric	Not supported. Its value is **NULL**.
freelists	numeric	Not supported. Its value is **NULL**.
freelist_groups	numeric	Not supported. Its value is **NULL**.
logging	character varying(7)	Specifies whether changes to a table are logged. • **YES** • **NO**
compression	character varying(8)	Specifies whether a subpartition is compressed. Value range: **ENABLED** and **DISABLED**.
compress_for	character varying(30)	Not supported. Its value is **NULL**.
num_rows	numeric	Not supported. Its value is **NULL**.
blocks	numeric	Not supported. Its value is **NULL**.

Name	Type	Description
empty_blocks	numeric	Not supported. Its value is **NULL**.
avg_space	numeric	Not supported. Its value is **NULL**.
chain_cnt	numeric	Not supported. Its value is **NULL**.
avg_row_len	numeric	Not supported. Its value is **NULL**.
sample_size	numeric	Not supported. Its value is **NULL**.
last_analyzed	timestamp with time zone	Date when the table was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
buffer_pool	character varying(7)	Buffer pool of a level-2 partition. • **DEFAULT** • **KEEP** • **RECYCLE** • **NULL**
flash_cache	character varying(7)	Not supported. Its value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
interval	character varying(3)	Specifies whether the partition is in the interval section of an interval partitioned table (**YES**) or whether the partition is in the range section (**NO**).
segment_created	character varying(3)	Specifies whether the level-2 partition segment of the table has been created. • **YES**: created. • **NO**: not created. • **N/A**: The table does not have level-2 partitions.
indexing	character varying(3)	Not supported. Its value is **NULL**.
read_only	character varying(5)	Not supported. Its value is **NULL**.
inmemory	character varying(8)	Not supported. Its value is **NULL**.

Name	Type	Description
inmemory_priority	character varying(8)	Not supported. Its value is **NULL**.
inmemory_distribute	character varying(15)	Not supported. Its value is **NULL**.
inmemory_compression	character varying(17)	Not supported. Its value is **NULL**.
inmemory_duplicate	character varying(13)	Not supported. Its value is **NULL**.
inmemory_service	character varying(12)	Not supported. Its value is **NULL**.
inmemory_service_name	character varying(1000)	Not supported. Its value is **NULL**.
cellmemory	character varying(24)	Not supported. Its value is **NULL**.
memoptimize_read	character varying(8)	Not supported. Its value is **NULL**.
memoptimize_write	character varying(8)	Not supported. Its value is **NULL**.

12.3.1.30 GS_STATIO_ALL_PARTITIONS

GS_STATIO_ALL_PARTITIONS contains I/O statistics about each partition in a partitioned table of the current database. The information can be queried by using the gs_statio_get_all_partitions_stats() function.

Table 12-155 GS_STATIO_ALL_PARTITIONS columns

Name	Type	Description
partition_oid	oid	Specifies a partition OID.
schemaname	name	Specifies the name of a partition mode.
relname	name	Specifies the name of a table to which a partition belongs.
partition_name	name	Specifies the name of a level-1 partition to which a partition belongs.
sub_partition_name	name	Specifies the name of a level-2 partition to which a partition belongs.
heap_blks_read	bigint	Specifies the number of disk blocks read from a partition.

Name	Type	Description
heap_blks_hit	bigint	Specifies the number of cache hits in a partition.
idx_blks_read	bigint	Specifies the number of disk blocks read from all indexes in a partition.
idx_blks_hit	bigint	Specifies the number of cache hits of all indexes in a partition.
toast_blks_read	bigint	Specifies the number of disk blocks read from TOAST table partitions (if any) in a partition.
toast_blks_hit	bigint	Specifies the number of buffer hits in TOAST tables (if any) in a partition.
tidx_blks_read	bigint	Specifies the number of disk blocks read from TOAST table partitioned indexes (if any) in a partition.
tidx_blks_hit	bigint	Specifies the number of buffer hits in TOAST table indexes (if any) in a partition.

12.3.1.31 GS_STAT_XACT_ALL_PARTITIONS

GS_STAT_XACT_ALL_PARTITIONS displays the transaction status about all partitions of partitioned tables in a namespace. The information can be queried by using the gs_stat_get_xact_all_partitions_stats() function.

Table 12-156 GS_STAT_XACT_ALL_PARTITIONS columns

Name	Type	Description
partition_oid	oid	Partition OID.
schemaname	name	Name of a partition schema.
relname	name	Name of a table where the partition is located.
partition_name	name	Name of a level-1 partition to which the partition belongs.
sub_partition_name	name	Name of the level-2 partition to which the partition belongs.
seq_scan	bigint	Number of sequential scans initiated by a partition.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated by a partition.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.

Name	Type	Description
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

12.3.1.32 GS_STAT_ALL_PARTITIONS

GS_STAT_ALL_PARTITIONS displays information about each partition in all partitioned tables in the current database. Each partition occupies one row (only its level-2 partitions are displayed for level-2 partitioned tables). The view information is queried by the gs_stat_get_all_partitions_stats() function.

Table 12-157 GS_STAT_ALL_PARTITIONS columns

Name	Type	Description
partition_oid	oid	Partition OID.
schemaname	name	Schema name of a table to which the partition belongs.
relname	name	Name of a table where the partition is located.
partition_name	name	Name of a level-1 partition to which the partition belongs.
sub_partition_name	name	Name of the level-2 partition to which the partition belongs.
seq_scan	bigint	Number of sequential scans initiated by a partition.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated by a partition.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.

Name	Type	Description
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Time when the partition was last cleared.
last_autovacuum	timestamp with time zone	Time when the partition was last cleared by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Time when the partition was last analyzed.
last_autoanalyze	timestamp with time zone	Time when the partition was last analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times that a partition is cleared.
autovacuum_count	bigint	Number of times that a partition is cleared by the autovacuum daemon thread.
analyze_count	bigint	Number of times that a partition is analyzed.
autoanalyze_count	bigint	Number of times that a partition is analyzed by the autovacuum daemon thread.

12.3.2 OLTP Table Compression

12.3.2.1 GS_ADM_ILMDATAMOVEMENTPOLICIES

GS_ADM_ILMDATAMOVEMENTPOLICIES displays the data movement summary of ILM policies, including the policy name, action type, and conditions. Only the system administrator can access this system view.

Table 12-158 GS_ADM_ILMDATAMOVEMENTPOLICIES columns

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is P + Policy ID.

Name	Type	Description
action_type	character varying(11)	Action type. The current version supports only compression.
scope	character varying(7)	Scope. In the current version, only rows are supported.
compression_level	character varying(30)	Compression level. This parameter is available when the action type is compression.
tier_tablespace	character varying(128)	Target space. This parameter is available only when the action type is migration. The value is **null** in the current version.
tier_status	character varying(9)	Specifies whether the target space is read-only. The value is **null** in the current version.
condition_type	character varying(22)	Condition type. The current version supports only the last modification time.
condition_days	numeric	Number of days as a condition.
custom_function	character varying(128)	Name of a user-defined function. The value is **null** in the current version.
policy_subtype	character varying(10)	Policy subtype. The value is **null** in the current version.
action_clause	clob	Text that can be automatically executed during policy execution. The value is **null** in the current version.
tier_to	character varying(10)	Type of the target database to which data is migrated. The value is **null** in the current version.

12.3.2.2 GS_ADM_ILMOBJECTS

GS_ADM_ILMOBJECTS displays the brief information about all data objects to which ILM policies are applied and the corresponding policies, including the policy name, data object name, policy source, and policy enabling/disabling status. Only the system administrator can access this system view.

Table 12-159 GS_ADM_ILMOBJECTS columns

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is P + Policy ID.

Name	Type	Description
object_owner	character varying(128)	Name of the schema where the data object is located.
object_name	character varying(128)	Data object name.
subobject_name	character varying(128)	Data object partition name or level-2 partition name.
object_type	character varying(18)	Data object type. • **r**: table • **p**: partition • **s**: level-2 partition
inherited_from	character varying(20)	Object whose policy is inherited by the current policy. The options are as follows: • **TABLE**: table • **TABLE PARTITION**: partition • **POLICY NOT INHERITED**: not inherited
tbs_inherited_from	character varying(30)	TS whose policy is inherited by the current policy. The value is **null** in the current version.
enabled	character varying(7)	Specifies whether the policy is enabled for the current object.
deleted	character varying(7)	Specifies that the ILM policy on the object is deleted. If the partition or the policy on the partition is deleted, the record (ILMOBJ) is deleted.

12.3.2.3 GS_ADM_ILMPOLICIES

GS_ADM_ILMPOLICIES displays the brief information about an ILM policy, including the policy name, type, enabling status, disabling status, and deletion status. Only the system administrator can access this system view.

Table 12-160 GS_ADM_ILMPOLICIES columns

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is p+*Policy ID*.
policy_type	character varying(13)	Policy type.

tablespace	character varying(30)	Tablespace name. It has a value when the policy is created on a tablespace. The value is **null** in the current version.
enabled	character varying(6)	Specifies whether the policy is enabled.
deleted	character varying(7)	Specifies whether the policy is deleted.

12.3.2.4 GS_ADM_ILMEVALUATIONDETAILS

GS_ADM_ILMEVALUATIONDETAILS displays the evaluation details of an ADO task, including the task ID, policy information, object information, evaluation result, and ADO job name. By default, only the system administrator can access the system view.

Table 12-161 GS_ADM_ILMEVALUATIONDETAILS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is p+*Policy ID*.
object_owner	character varying(128)	Name of the schema where the data object is located.
object_name	character varying(128)	Data object name.
subobject_name	character varying(128)	Data object partition name or level-2 partition name.
object_type	character varying(18)	Data object type. • **r**: table • **p**: partition • **s**: level-2 partition
selected_for_execution	character varying(42)	Evaluation result: • **SELECTED FOR EXECUTION**: The evaluation is passed. • **PRECONDITION NOT SATISFIED**: The evaluation fails. • **JOB ALREADY EXISTS**: The task already exists.
job_name	character varying(128)	Name of the task that executes a specific ADO job. If the evaluation result is "passed", this parameter has a value.

Name	Type	Description
comments	character varying(4000)	Reserved column.

12.3.2.5 GS_ADM_ILMPARAMETERS

GS_ADM_ILMPARAMETERS displays the environment parameters related to ILM scheduling and execution. The parameters can be modified through the DBE_ILM_ADMIN.CUSTOMIZE_ILM interface. By default, only the system administrator can access the system view.

Table 12-162 GS_ADM_ILMPARAMETERS columns

Name	Type	Description
name	character varying(128)	ADO-related environment parameters, which can be modified through the DBE_ILM_ADMIN.CUSTOMIZE_ILM interface.
value	numeric	Parameter value.

12.3.2.6 GS_ADM_ILMRESULTS

GS_ADM_ILMRESULTS displays the execution details of an ADO job, including the task ID, job name, job status, and job time. By default, only the system administrator can access this system view. Common users can access the system view only after being authorized.

Table 12-163 GS_ADM_ILMRESULTS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.
job_name	character varying(128)	ADO job name.
job_state	character varying(35)	ADO job status.
start_time	timestamp with time zone	Time when a job starts to be scheduled.
completion_time	timestamp with time zone	Completion time.

Name	Type	Description
comments	character varying(4000)	If a job fails, the failure cause is recorded here.
statistics	clob	Statistics.

12.3.2.7 GS_ADM_ILMTASKS

GS_ADM_ILMTASKS displays the brief information about an ADO task, including the task ID, task owner, status, and time. By default, only the system administrator can access this view. Common users can access the view only after being authorized.

Table 12-164 GS_ADM_ILMTASKS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.
task_owner	character varying(128)	User who initiates an ADO task. This column exists only in the ADM view.
state	character varying(9)	Status. • **INACTIVE** • **ACTIVE** • **COMPLETED** • **UNKNOWN**: being evaluated
creation_time	timestamp with time zone	Creation time.
start_time	timestamp with time zone	Time when the status changes to active.
completion_time	timestamp with time zone	Completion time.

12.3.2.8 GS_MY_ILMEVALUATIONDETAILS

GS_MY_ILMEVALUATIONDETAILS displays the evaluation details of an ADO task, including the task ID, policy information, object information, evaluation result, and ADO job name.

Table 12-165 GS_MY_ILMEVALUATIONDETAILS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is P + Policy ID.
object_owner	character varying(128)	Name of the schema where the data object is located.
object_name	character varying(128)	Data object name.
subobject_name	character varying(128)	Data object partition name or level-2 partition name.
object_type	character varying(18)	Data object type. • **r**: table • **p**: partition • **s**: level-2 partition
selected_for_execution	character varying(42)	Evaluation result: • **SELECTED FOR EXECUTION**: The evaluation is passed. • **PRECONDITION NOT SATISFIED**: The evaluation fails. • **JOB ALREADY EXISTS**: The task already exists.
job_name	character varying(128)	Name of the task that executes a specific ADO job. If the evaluation result is "passed", this parameter has a value.
comments	character varying(4000)	Reserved column.

12.3.2.9 GS_MY_ILMRESULTS

GS_MY_ILMRESULTS displays the execution details of an ADO job, including the task ID, job name, job status, and job time.

Table 12-166 GS_MY_ILMRESULTS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.
job_name	character varying(128)	ADO job name.

Name	Type	Description
job_state	character varying(35)	ADO job status.
start_time	timestamp with time zone	Time when a job starts to be scheduled.
completion_time	timestamp with time zone	Completion time.
comments	character varying(4000)	If a job fails, the failure cause is recorded here.
statistics	clob	Statistics.

12.3.2.10 GS_MY_ILMTASKS

GS_MY_ILMTASKS displays the brief information about an ADO task, including the task ID, task owner, status, and time.

Table 12-167 GS_MY_ILMTASKS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.
task_owner	character varying(128)	User who initiates an ADO task. This column exists only in the ADM view.
state	character varying(9)	Status. • **INACTIVE** • **ACTIVE** • **COMPLETED** • **UNKNOWN**: being evaluated
creation_time	timestamp with time zone	Creation time.
start_time	timestamp with time zone	Time when the status changes to active.
completion_time	timestamp with time zone	Completion time.

12.3.2.11 GS_MY_ILMDATAMOVEMENTPOLICIES

GS_MY_ILMDATAMOVEMENTPOLICIES displays the data movement summary of ILM policies, including the policy name, action type, and conditions.

Table 12-168 GS_MY_ILMDATAMOVEMENTPOLICIES columns

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is p + Policy ID.
action_type	character varying(11)	Action type. The current version supports only compression.
scope	character varying(7)	Scope. In the current version, only rows are supported.
compression_level	character varying(30)	Compression level. This parameter is available when the action type is compression.
tier_tablespace	character varying(128)	Target space. This parameter is available only when the action type is migration. The value is **null** in the current version.
tier_status	character varying(9)	Specifies whether the target space is read-only. The value is **null** in the current version.
condition_type	character varying(22)	Condition type. The current version supports only the last modification time.
condition_days	numeric	Number of days as a condition.
custom_function	character varying(128)	Name of a user-defined function. The value is **null** in the current version.
policy_subtype	character varying(10)	Policy subtype. The value is **null** in the current version.
action_clause	clob	Text that can be automatically executed during policy execution. The value is **null** in the current version.
tier_to	character varying(10)	Type of the target database to which data is migrated. The value is **null** in the current version.

12.3.2.12 GS_MY_ILMOBJECTS

GS_MY_ILMOBJECTS displays the brief information about all data objects to which ILM policies are applied and the corresponding policies, including the policy name, data object name, policy source, and policy enabling/disabling status.

Table 12-169 GS_MY_ILMOBJECTS columns

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is p + Policy ID.
object_owner	character varying(128)	Name of the schema where the data object is located.
object_name	character varying(128)	Data object name.
subobject_name	character varying(128)	Data object partition name or level-2 partition name.
object_type	character varying(18)	Data object type. • **r**: table • **p**: partition • **s**: level-2 partition
inherited_from	character varying(20)	Object whose policy is inherited by the current policy. The options are as follows: • **TABLE**: table • **TABLE PARTITION**: partition • **POLICY NOT INHERITED**: not inherited
tbs_inherited_from	character varying(30)	TS whose policy is inherited by the current policy. The value is **null** in the current version.
enabled	character varying(7)	Specifies whether the policy is enabled for the current object.
deleted	character varying(7)	Specifies that the ILM policy on the object is deleted. If the partition or the policy on the partition is deleted, the record (ILMOBJ) is deleted.

12.3.2.13 GS_MY_ILMPOLICIES

GS_MY_ILMPOLICIES displays the brief information about an ILM policy, including the policy name, type, enabling status, disabling status, and deletion status.

Table 12-170 GS_MY_ILMPOLICIES columns

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is p + Policy ID.

Name	Type	Description
policy_type	character varying(13)	Policy type.
tablespace	character varying(30)	Tablespace name. This parameter has a value when the policy is created on a tablespace. The value is **null** in the current version.
enabled	character varying(6)	Specifies whether the policy is enabled.
deleted	character varying(7)	Specifies whether the policy is deleted.

12.3.3 Communications

12.3.3.1 GS_COMM_LISTEN_ADDRESS_EXT_INFO

GS_COMM_LISTEN_ADDRESS_EXT_INFO queries DFX information, such as threads, sessions, and sockets, for connecting the extended IP addresses. Currently, this view cannot be queried.

Table 12-171 GS_COMM_LISTEN_ADDRESS_EXT_INFO columns

Name	Type	Description
node_name	text	Name of the current instance.
app	text	Client connected to the DN.
tid	bigint	Thread ID of the current thread.
lwtid	integer	Lightweight thread ID of the current thread.
query_id	bigint	Query ID of the current thread.
socket	integer	Socket FD of the current physical connection.
remote_ip	text	Peer IP address of the current connection.
remote_port	text	Peer port of the current connection.
local_ip	text	Local IP address of the current connection.
local_port	text	Local port of the current connection.

12.3.3.2 GS_GET_LISTEN_ADDRESS_EXT_INFO

GS_GET_LISTEN_ADDRESS_EXT_INFO queries the extended IP address configured for the current instance. Currently, this view cannot be queried.

Table 12-172 GS_GET_LISTEN_ADDRESS_EXT_INFO columns

Name	Type	Description
node_name	text	Name of the current instance.
host	text	Listening IP address of the current instance.
port	bigint	Listening port of the current instance.
ext_listen_ip	text	Extended IP address configured for the current instance.

12.3.3.3 PG_COMM_DELAY

PG_COMM_DELAY displays the communication library delay status for a single DN.

Table 12-173 PG_COMM_DELAY columns

Name	Type	Description
node_name	text	Node name
remote_name	text	Name of the peer node
remote_host	text	IP address of the peer node
stream_num	integer	Number of logical stream connections used by the current physical connection
min_delay	integer	Minimum delay of the current physical connection within 1 minute, in microsecond **NOTE** A negative result is invalid. Wait until the delay status is updated and query again.
average	integer	Average delay of the current physical connection within 1 minute, in microsecond
max_delay	integer	Maximum delay of the current physical connection within 1 minute, in microsecond

12.3.3.4 PG_COMM_RECV_STREAM

PG_COMM_RECV_STREAM displays the receiving stream status of all the communication libraries for a single DN.

Table 12-174 PG_COMM_RECV_STREAM columns

Name	Type	Description
node_name	text	Node name
local_tid	bigint	ID of the thread using this stream
remote_name	text	Name of the peer node
remote_tid	bigint	Peer thread ID
idx	integer	Peer DN ID in the local DN
sid	integer	Stream ID in the physical connection
tcp_sock	integer	TCP socket used in the stream
state	text	Status of the stream • **UNKNOWN**: The logical connection status is unknown. • **READY**: The logical connection is ready. • **RUN**: The logical connection sends packets normally. • **HOLD**: The logical connection is waiting to send packets. • **CLOSED**: The logical connection is closed. • **TO_CLOSED**: The logical connection will be closed.
query_id	bigint	**debug_query_id** corresponding to the stream
pn_id	integer	**plan_node_id** of the query executed by the stream
send_smp	integer	**smpid** of the sender of the query executed by the stream
recv_smp	integer	**smpid** of the receiver of the query executed by the stream
recv_bytes	bigint	Total data volume received from the stream, in byte
time	bigint	Current lifecycle service duration of the stream, in ms
speed	bigint	Average receiving rate of the stream, in byte/s
quota	bigint	Current communication quota value of the stream, in byte
buff_usize	bigint	Current size of the data cache of the stream, in byte

12.3.3.5 PG_COMM_SEND_STREAM

PG_COMM_SEND_STREAM displays the sending stream status of all the communication libraries for a single DN.

Table 12-175 PG_COMM_SEND_STREAM columns

Name	Type	Description
node_name	text	Node name
local_tid	bigint	ID of the thread using this stream
remote_name	text	Name of the peer node
remote_tid	bigint	Peer thread ID
idx	integer	Peer DN ID in the local DN
sid	integer	Stream ID in the physical connection
tcp_sock	integer	TCP socket used in the stream
state	text	Status of the stream • **UNKNOWN**: The logical connection status is unknown. • **READY**: The logical connection is ready. • **RUN**: The logical connection sends packets normally. • **HOLD**: The logical connection is waiting to send packets. • **CLOSED**: The logical connection is closed. • **TO_CLOSED**: The logical connection will be closed.
query_id	bigint	**debug_query_id** corresponding to the stream
pn_id	integer	**plan_node_id** of the query executed by the stream
send_smp	integer	**smpid** of the sender of the query executed by the stream
recv_smp	integer	**smpid** of the receiver of the query executed by the stream
send_bytes	bigint	Total data volume sent by the stream, in byte
time	bigint	Current lifecycle service duration of the stream, in ms

Name	Type	Description
speed	bigint	Average sending rate of the stream, in byte/s
quota	bigint	Current communication quota value of the stream, in byte
wait_quota	bigint	Extra time generated when the stream waits the quota value, in ms

12.3.3.6 PG_COMM_STATUS

PG_COMM_STATUS displays the communications library status for a single DN.

Table 12-176 PG_COMM_STATUS columns

Name	Type	Description
node_name	text	Node name.
rxpck_rate	integer	Receiving rate of the communications library on the node, in byte/s.
txpck_rate	integer	Sending rate of the communications library on the node, in byte/s.
rxkbyte_rate	bigint	Receiving rate of the communications library on the node, in kbyte/s.
txkbyte_rate	bigint	Sending rate of the communications library on the node, in kbyte/s.
buffer	bigint	Size of the buffer of the Cmailbox.
memkbyte_libcomm	bigint	Communication memory size of the **libcomm** thread, in bytes.
memkbyte_libpq	bigint	Communication memory size of the **libpq** thread, in bytes.
used_pm	integer	Real-time usage of the **postmaster** thread.
used_sflow	integer	Real-time usage of the **gs_sender_flow_controller** thread.
used_rflow	integer	Real-time usage of the **gs_receiver_flow_controller** thread.
used_rloop	integer	Highest real-time usage among multiple **gs_receivers_loop** threads.
stream	integer	Total number of used logical connections.

12.3.3.7 PG_GET_INVALID_BACKENDS

The view cannot be queried, and the error message "Un-support feature" is displayed.

12.3.4 Segment-Page Storage

12.3.4.1 GS_SEG_DATAFILES

GS_SEG_DATAFILES displays information about data files in all tablespaces. Only an administrator can query the information.

Table 12-177 GS_SEG_DATAFILES columns

Name	Type	Description
node_name	text	Node name.
file_name	text	Data file name, for example, **base/17467/2_fsm**.
file_id	integer	Data file ID.
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
forknum	integer	Segment fork type. Value range: • **0**: main fork. • **1**: fsm fork • **2**: vm fork
tablespace_name	name	Name of the tablespace to which a data file belongs.
contents	text	Storage content of a data file. Value range: • **permanent**: permanent • **unlogged**: no log • **temporary**: global temporary • **temporary2**: local temporary

Name	Type	Description
extent_size	integer	Extent size of a data file.
meta_blocks	bigint	Number of allocated metadata pages of a data file.
data_blocks	bigint	Number of allocated data pages of a data file.
total_blocks	bigint	Total number of physical pages in a data file.
high_water_mark	bigint	High watermark of the number of pages used by a data file.
utilization	real	Percentage of used blocks to the total number of blocks, that is, (**data_blocks** + **meta_blocks**)/ **total_blocks**.

12.3.4.2 GS_SEG_DATAFILE_LAYOUT

GS_SEG_DATAFILE_LAYOUT displays the static layout of data files 1 to 5 in segment-page mode. Only an administrator can query the information.

Table 12-178 GS_SEG_DATAFILE_LAYOUT columns

Name	Type	Description
version	text	Segment-page version. Default value: **1.0**.
seg_storage_type	text	Type of the data to be stored. Value range: • **segment** indicates common segment-page data. • **hashbucket** indicates hash bucket data.
file_id	integer	Data file ID.
section_id	integer	Data section ID of a data file.

Name	Type	Description
section_type	text	Type of the data file section. Value range: • **file_header** indicates the file header. • **spc_header** indicates the space header. • **map_header** indicates the mapping header. • **map_pages** indicates the mapping page. • **ip_pages(inverse pointer pages)** indicates the reverse pointer page. • **data_pages** indicates the data page.
page_start	bigint	Start page number of the data section.
page_end	bigint	End page number of the data section.
page_count	bigint	Number of pages in the data section.
total_size	bigint	Size of the data section. The unit is byte.

12.3.4.3 GS_SEG_EXTENTS

GS_SEG_EXTENTS displays extent information about all tablespaces. This view displays all extents of user segments, including segment heads, fork heads, and level-1 pages in file 1 and data extents in files 2 to 5. Only an administrator can query the information.

Table 12-179 GS_SEG_EXTENTS columns

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace to which a segment belongs.

Name	Type	Description
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
head_block_id	bigint	Page number of the segment header.
extent_id	integer	Logical extent number.
file_id	integer	ID of the data file where the extent is located.
forknum	integer	Fork type of a segment object. Value range: • **0**: main fork. • **1**: fsm fork. • **2**: vm fork.
block_id	bigint	Start page number in the data file where the extent is located.
blocks	integer	Extent size. The value can be **1**, **8**, **128**, **1024**, or **4096**.
usage_type	text	Usage type of the extension. Value range: • **segment head** indicates the segment header. • **fork head** indicates the fork header. • **level1 page** indicates the level-1 page. • **data extent** indicates data extents.

12.3.4.4 GS_SEG_SEGMENTS

GS_SEG_SEGMENTS displays information about segments in all tablespaces, including tables, indexes, TOAST, TOAST INDEX segments, and fsm fork and vm fork segments. Only an administrator can query the information.

Table 12-180 GS_SEG_SEGMENTS columns

Name	Type	Description
node_name	text	Node name.
schema_name	name	Namespace to which a segment belongs.
segment_name	name	Segment name. Source: pg_class and pg_partition.relname.
partition_name	name	Partition name of the segment object; **NULL** if the segment object is not partitioned. Source: pg_partition.relname.
forknum	integer	Fork type of a segment object. Value range: ● **0**: main fork. ● **1**: fsm fork. ● **2**: vm fork.
segment_type	text	Segment object type. Value range: ● **table**: segment-page ordinary table. ● **table partition**: segment-page partitioned table (main table and child table) and segment-page level-2 partitioned table (level-1 partitioned table). ● **table subpartition**: segment-page level-2 partitioned table (top node table and level-2 partitioned table). ● **index**: index of a segment-page ordinary table. ● **index partition**: index of a segment-page partitioned table or level-2 partitioned table. ● **global partition index**: global index for segment-page partitioned tables and level-2 partitioned tables. ● **toast**: segment-page TOAST table. ● **toast index**: index of a segment-page TOAST table.
tablespace_name	name	Tablespace to which a segment belongs.

Name	Type	Description
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
head_block_id	bigint	Page number of the segment header.
contents	text	Storage content of a data file. Value range: • **permanent**: permanent. • **unlogged**: no log. • **temporary**: global temporary. • **temporary2**: local temporary.
table_name	name	Name of the base table to which a segment belongs.
blocks	bigint	Number of logical pages of a segment.
total_blocks	bigint	Number of physical pages of a segment.
extents	integer	Number of logical extents of a segment.
total_extents	integer	Number of physical extents of a segment.
head_lsn	text	Segment header LSN.
level0_slots	bigint[]	Level-0 slot array of segment extent mapping.
level1_slots	bigint[]	Level-1 slot array of segment extent mapping.
fork_head	bigint[]	Fork head array of a segment.

12.3.4.5 GS_SEG_SEGMENT_LAYOUT

GS_SEG_SEGMENT_LAYOUT displays the static layout of segment-page files. Only the administrator can query the information.

Table 12-181 GS_SEG_SEGMENT_LAYOUT columns

Name	Type	Description
version	text	Segment-page version. Default value: **1.0**.
section_id	integer	ID of the data section divided by a segment.
section_type	text	Extent type of the segment data section. Value range: • **meta**: segment header. • **data**: data.
extent_size	integer	Extent size. The unit is byte.
extent_page_count	integer	Number of extent pages.
extent_count_start	bigint	Start extent number.
extent_count_end	bigint	End extent number.
total_size	bigint	Size of the segment data section. The unit is byte.

12.3.4.6 GS_SEG_SPC_EXTENTS

GS_SEG_SPC_EXTENTS displays information about the used extents of all tablespaces. The output contains segment heads, fork heads, level-1 pages, data extents. Only the administrator can query the information.

Table 12-182 GS_SEG_SPC_EXTENTS

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace name.
file_id	integer	Data file ID.
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.

Name	Type	Description
forknum	integer	Fork type of a segment object. The options are as follows: • **0**: main fork • **1**: fsm fork • **2**: vm fork
block_id	bigint	Start page number of a data extent.
blocks	integer	Data extension size. The value can be **1**, **8**, **128**, **1024**, or **4096**.
contents	text	Storage content of a data file. The options are as follows: • **permanent**: permanent • **unlogged**: no log • **temporary**: global temporary • **temporary2**: local temporary
in_used	text	Specifies whether a resource has been allocated. The value can be **Y** or **N**.
mapblock_location	text	Position of the extension in the map block. The format is (*page_id*, *offset*).
head_file_id	integer	Segment header file ID.
head_block_id	bigint	Page number of the segment header.
usage_type	text	Extended usage type. The options are as follows: • **segment head** indicates the segment header. • **fork head** indicates the fork header. • **level1 page** indicates the level-1 page. • **data extent** indicates data extents.
remain_flag	text	Specifies whether it is a shrink residual extension. The value can be **Y** or **N**.
special_data	integer	Special data section of the reverse pointer corresponding to an extent.
ipblock_location	text	Position of the extended reverse pointer. The format is (*block_id*, *offset*).

12.3.4.7 GS_SEG_SPC_SEGMENTS

GS_SEG_SPC_SEGMENTS displays information about used segments in all tablespaces. Only the administrator can query the information.

Table 12-183 GS_SEG_SPC_SEGMENTS columns

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace name.
file_id	integer	Data file ID.
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
forknum	integer	Fork type of a segment object. The options are as follows: • **0**: main fork • **1**: fsm fork • **2**: vm fork
block_id	bigint	Start page number of a data extent.
blocks	integer	Data extension size. The value can be **1**, **8**, **128**, **1024**, or **4096**.
contents	text	Storage content of a data file. The options are as follows: • **permanent**: permanent • **unlogged**: no log • **temporary**: global temporary • **temporary2**: local temporary
in_used	text	Specifies whether a resource has been allocated. The value can be **Y** or **N**.
mapblock_location	text	Position of the extension in the map block. The format is (*page_id*, *offset*).
head_file_id	integer	Segment header file ID.
head_block_id	bigint	Page number of the segment header.

Name	Type	Description
usage_type	text	Extended usage type. The options are as follows: • **segment head** indicates the segment header. • **fork head** indicates the fork header. • **level1 page** indicates the level-1 page. • **data extent** indicates data extents.
remain_flag	text	Specifies whether it is a shrink residual extension. The value can be **Y** or **N**.
special_data	integer	Special data area of the reverse pointer corresponding to an extent.
ipblock_location	text	Position of the extended reverse pointer. The format is (*block_id*, *offset*).

12.3.4.8 GS_SEG_SPC_REMAIN_EXTENTS

GS_SEG_REMAIN_EXTENTS displays the residual isolated extent information of the index tablespace. The extent information is not included in the residual segment and can be used as an independent clearing unit. Only the administrator can query the information.

Table 12-184 GS_SEG_SPC_REMAIN_EXTENTS columns

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace name.
file_id	integer	Data file ID.
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.

Name	Type	Description
forknum	integer	Fork type of a segment object. The options are as follows: • **0**: main fork • **1**: fsm fork • **2**: vm fork
block_id	bigint	Start page number of a data extent.
blocks	integer	Data extension size. The value can be **1**, **8**, **128**, **1024**, or **4096**.
contents	text	Storage content of a data file. The options are as follows: • **permanent**: permanent • **unlogged**: no log • **temporary**: global temporary • **temporary2**: local temporary
in_used	text	Specifies whether a resource has been allocated. The value can be **Y** or **N**.
mapblock_location	text	Position of the extension in the map block. The format is (*page_id*, *offset*).
head_file_id	integer	Segment header file ID.
head_block_id	bigint	Page number of the segment header.
usage_type	text	Extended usage type. The options are as follows: • **segment head** indicates the segment header. • **fork head** indicates the fork header. • **level1 page** indicates the level-1 page. • **data extent** indicates data extents.
remain_flag	text	Specifies whether it is a shrink residual extension. The value can be **Y** or **N**.
special_data	integer	Special data area of the reverse pointer corresponding to an extent.
ipblock_location	text	Position of the extended reverse pointer. The format is (*block_id*, *offset*).

12.3.4.9 GS_SEG_SPC_REMAIN_SEGMENTS

GS_SEG_SPC_REMAIN_SEGMENTS displays the residual segment information of the index tablespace, including the main fork, fsm fork, and vm fork segments. Only the administrator can query the information.

Table 12-185 GS_SEG_SPC_REMAIN_SEGMENTS columns

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace name.
file_id	integer	Data file ID.
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table.
forknum	integer	Fork type of a segment object. The options are as follows: • **0**: main fork • **1**: fsm fork • **2**: vm fork
block_id	bigint	Start page number of a data extent.
blocks	integer	Data extension size. The value can be **1**, **8**, **128**, **1024**, or **4096**.
contents	text	Storage content of a data file. The options are as follows: • **permanent**: permanent • **unlogged**: no log • **temporary**: global temporary • **temporary2**: local temporary
in_used	text	Specifies whether a resource has been allocated. The value can be **Y** or **N**.
mapblock_location	text	Position of the extension in the map block. The format is (*page_id*, *offset*).
head_file_id	integer	Segment header file ID.
head_block_id	bigint	Page number of the segment header.

Name	Type	Description
usage_type	text	Extended usage type. The options are as follows: • **segment head** indicates the segment header. • **fork head** indicates the fork header. • **level1 page** indicates the level-1 page. • **data extent** indicates data extents.
remain_flag	text	Specifies whether it is a shrink residual extension. The value can be **Y** or **N**.
special_data	integer	Special data area of the reverse pointer corresponding to an extent.
ipblock_location	text	Position of the extended reverse pointer. The format is (*block_id*, *offset*).

12.3.5 SPM

12.3.5.1 GS_SPM_SQL_BASELINE

GS_SPM_SQL_BASELINE is used to view the baseline information of the current user. Users with permissions higher than common users can access this view.

Table 12-186 GS_SPM_SQL_BASELINE columns

Name	Type	Description
sql_namespace	oid	OID of a schema.
sql_hash	bigint	Unique ID of an SQL statement in the current schema.
plan_hash	bigint	Unique ID of a plan in the current SQL statement.
outline	text	Outline text, which can be used to fix a group of hints of the current plan.
status	text	Status of a plan. Value range: • **UNACC**: The plan is not accepted. • **ACC**: The plan has been accepted. • **FIXED**: indicates a special ACC plan. The matching priority of this plan is higher than that of other ACC plans.
gplan	Boolean	Specifies whether the plan corresponding to the current outline is a gplan.

Name	Type	Description
cost	double precision	Total plan cost.
sql_text	text	SQL text string.
param_num	integer	Number of SQL parameters.
source	text	Baseline source.
creation_time	timestamp with time zone	Time when the baseline is created.
modification_time	timestamp with time zone	Time when the baseline is modified.
jump_intercept_cnt	bigint	Number of baseline interception plan jumps.
invalid	Boolean	Specifies whether the current baseline is invalid.

12.3.5.2 GS_SPM_SQL_PARAM

GS_SPM_SQL_PARAM is used to view the SQL parameter information of the current user. Users with permissions higher than common users can access this view.

Table 12-187 GS_SPM_SQL_PARAM columns

Name	Type	Description
sql_namespace	oid	OID of a schema.
sql_hash	bigint	Unique ID of an SQL statement in the current schema.
sql_text	text	SQL text string.
position	integer	Position index of a parameter in the SQL statement, starting from 0.
datatype	integer	OID of the parameter type.
datatype_string	text	Character string of a parameter type.
value_string	text	Character string of a parameter value.
is_null	Boolean	Specifies whether a parameter value is **NULL**.
hash_value	bigint	Hash value of a parameter value.

Name	Type	Description
creation_time	timestamp with time zone	Time when a record is created.

12.3.5.3 GS_SPM_SQL_EVOLUTION

GS_SPM_SQL_EVOLUTION is used to view the planned evolution result of the current user. Common users and users with higher permissions can access this view.

Table 12-188 GS_SPM_SQL_EVOLUTION columns

Name	Type	Description
sql_namespace	oid	OID of a schema.
sql_hash	bigint	Unique ID of an SQL statement in the current schema.
plan_hash	bigint	Unique ID of a plan in the current SQL statement.
better	Boolean	Determines whether it is a positive evolution.
status	text	Specifies whether exceptions occur during the evolution. Value range: • **SUCCESS**: The evolution is successful. • **FAILED**: The evolution fails.
refer_plan	bigint	Plan hash used as a reference for report generation.
sql_text	text	SQL text string.
outline	text	Hint string list of the current plan.
reason	text	Content of the evolution report.
gplan	Boolean	Determines whether the plan is a gplan.
creation_time	timestamp with time zone	Time when the evolution result is created.

12.3.5.4 GS_SPM_SYS_BASELINE

GS_SPM_SYS_BASELINE is used to view baseline information in the database. The user with the SYSADMIN permission and initial users can access this view.

Table 12-189 GS_SPM_SYS_BASELINE columns

Name	Type	Description
sql_hash	bigint	Unique ID of the SQL statement in the SPM.
plan_hash	bigint	Unique ID of a plan in the current SQL statement.
unique_sql_id	bigint	Unique ID of an SQL statement in the database.
outline	text	Outline text, which can be used to fix a group of hints of the current plan.
status	integer	Plan status. The options are as follows: • **0** (UNACC): The plan is not accepted. • **1** (ACC): The plan is accepted. • **2** (FIXED): a special ACC plan. The matching priority of this plan is higher than that of other ACC plan.
gplan	Boolean	Specifies whether the plan corresponding to the current outline is a gplan.
cost	double precision	Total plan cost.
sql_text	text	SQL text string.
param_num	integer	Number of SQL parameters.
source	text	Baseline source.
creation_time	timestamp with time zone	Time when the baseline is created.
modification_time	timestamp with time zone	Time when the baseline is modified.
jump_intercept_cnt	bigint	Number of baseline interception plan jumps.
invalid	Boolean	Specifies whether the current baseline is invalid.

12.3.6 Auditing

12.3.6.1 ADM_AUDIT_OBJECT

ADM_AUDIT_OBJECT displays the audit trail records of all objects in the database. This view exists in both PG_CATALOG and SYS schema. By default, only the system

administrator can access this view. Common users can access the view only after being authorized.

Table 12-190 ADM_AUDIT_OBJECT columns

Name	Type	Description
os_username	character varying(255)	Not supported. Its value is **NULL**.
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. Its value is **NULL**.
terminal	character varying(255)	Not supported. Its value is **NULL**.
timestamp	timestamp(0) without time zone	Date and time when an audit trail entry is created in the local database session time zone (user login date and time of the entry created by the audit session)
owner	character varying(128)	Creator of the object affected by the operation.
obj_name	character varying(128)	Name of the object affected by the operation.
action_name	character varying(28)	Action name corresponding to the numeric code in the **ACTION** column in DBA_AUDIT_TRAIL **NOTE** The **action_name** column in GaussDB is inconsistent with the audit action of database A.
new_owner	character varying(128)	Not supported. Its value is **NULL**.
new_name	character varying(128)	Not supported. Its value is **NULL**.
ses_actions	character varying(19)	Not supported. Its value is **NULL**.

Name	Type	Description
comment_text	character varying(4000)	Not supported. Its value is **NULL**.
sessionid	numeric	Not supported. Its value is **NULL**.
entryid	numeric	Not supported. Its value is **NULL**.
statementid	numeric	Not supported. Its value is **NULL**.
returncode	numeric	Not supported. Its value is **NULL**.
priv_used	character varying(40)	Not supported. Its value is **NULL**.
client_id	character varying(128)	Not supported. Its value is **NULL**.
econtext_id	character varying(64)	Not supported. Its value is **NULL**.
session_cpu	numeric	Not supported. Its value is **NULL**.
extended_timestamp	timestamp(6) with time zone	Timestamp when an audit trail entry is created (user login timestamp of the entry created by the audit session in UTC).
proxy_sessionid	numeric	Not supported. Its value is **NULL**.
global_uid	character varying(32)	Not supported. Its value is **NULL**.
instance_number	numeric	Not supported. Its value is **NULL**.
os_process	character varying(16)	Not supported. Its value is **NULL**.
transactionid	text	Identifier of the transaction that accesses or modifies an object. **NOTE** The type of the **transactionid** column in GaussDB must be the same as that in database A.
scn	numeric	Not supported. Its value is **NULL**.
sql_bind	nvarchar2(2000)	Not supported. Its value is **NULL**.

Name	Type	Description
sql_text	character varying	SQL text of the query. **NOTE** The **sql_text** column in GaussDB is the parsed SQL description statement, which is not completely the same as the executed SQL statement.
obj_edition_name	character varying(128)	Not supported. Its value is **NULL**.

12.3.6.2 ADM_AUDIT_SESSION

ADM_AUDIT_SESSION displays all audit trail records concerning CONNECT and DISCONNECT. The audit information of GaussDB is mainly queried through the pg_query_audit function. This view exists in both PG_CATALOG and SYS schema. Only users with the AUDITADMIN attribute can view audit information.

Table 12-191 ADM_AUDIT_SESSION columns

Name	Type	Description
os_username	character varying(255)	Not supported. Its value is **NULL**.
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. Its value is **NULL**.
terminal	character varying(255)	Not supported. Its value is **NULL**.
timestamp	timestamp(0) without time zone	Date and time when an audit trail entry is created (user login date and time of the entry created by the audit session)
action_name	character varying(28)	Action name corresponding to the numeric code in the **ACTION** column in DBA_AUDIT_TRAIL. **NOTE** The **action_name** column in GaussDB is inconsistent with the audit action of database A.

Name	Type	Description
logoff_time	timestamp(0) without time zone	Not supported. Its value is **NULL**.
logoff_lread	numeric	Not supported. Its value is **NULL**.
logoff_pread	numeric	Not supported. Its value is **NULL**.
logoff_lwrite	numeric	Not supported. Its value is **NULL**.
logoff_dlock	character varying(40)	Not supported. Its value is **NULL**.
sessionid	numeric	Not supported. Its value is **NULL**.
returncode	numeric	Not supported. Its value is **NULL**.
client_id	character varying(128)	Not supported. Its value is **NULL**.
session_cpu	numeric	Not supported. Its value is **NULL**.
extended_timestamp	timestamp(6) with time zone	Time zone of the timestamp when an audit trail entry is created (user login date and time of the entry created by the audit session in UTC)
proxy_sessionid	numeric	Not supported. Its value is **NULL**.
global_uid	character varying(32)	Not supported. Its value is **NULL**.
instance_number	numeric	Not supported. Its value is **NULL**.
os_process	character varying(16)	Not supported. Its value is **NULL**.

12.3.6.3 ADM_AUDIT_STATEMENT

ADM_AUDIT_STATEMENT displays all grant and revoke audit trail entries. The audit information of GaussDB is mainly queried through the pg_query_audit function. This view exists in both PG_CATALOG and SYS schema. Only users with the AUDITADMIN attribute can view audit information.

Table 12-192 ADM_AUDIT_STATEMENT columns

Name	Type	Description
os_username	character varying(255)	Not supported. Its value is **NULL**.
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. Its value is **NULL**.
terminal	character varying(255)	Not supported. Its value is **NULL**.
timestamp	timestamp(0) without time zone	Date and time when an audit trail entry is created (user login date and time of the entry created by AUDIT SESSION).
owner	character varying(128)	Not supported. Its value is **NULL**.
obj_name	character varying(128)	Name of the object affected by the operation.
action_name	character varying(28)	Action name corresponding to the numeric code in the **ACTION** column in **DBA_AUDIT_TRAIL**. **NOTE** The **action_name** column of GaussDB is inconsistent with the audit action of database A, and the **transactionid** column is consistent with the type of **transactionid** data in database A.
new_name	character varying(128)	Not supported. Its value is **NULL**.
obj_privilege	character varying(32)	Not supported. Its value is **NULL**.
sys_privilege	character varying(40)	Not supported. Its value is **NULL**.
admin_option	character varying(1)	Not supported. Its value is **NULL**.

Name	Type	Description
grantee	character varying(128)	Not supported. Its value is **NULL**.
audit_option	character varying(40)	Not supported. Its value is **NULL**.
ses_actions	character varying(19)	Not supported. Its value is **NULL**.
comment_text	character varying(4000)	Not supported. Its value is **NULL**.
sessionid	numeric	Not supported. Its value is **NULL**.
entryid	numeric	Not supported. Its value is **NULL**.
statementid	numeric	Not supported. Its value is **NULL**.
returncode	numeric	Not supported. Its value is **NULL**.
priv_used	character varying(40)	Not supported. Its value is **NULL**.
client_id	character varying(128)	Not supported. Its value is **NULL**.
econtext_id	character varying(64)	Not supported. Its value is **NULL**.
session_cpu	numeric	Not supported. Its value is **NULL**.
extended_timestamp	timestamp(6) with time zone	Timestamp when an audit trail entry is created (user login timestamp of the entry created by AUDIT SESSION in UTC).
proxy_sessionid	numeric	Not supported. Its value is **NULL**.
global_uid	character varying(32)	Not supported. Its value is **NULL**.
instance_number	numeric	Not supported. Its value is **NULL**.
os_process	character varying(16)	Not supported. Its value is **NULL**.

Name	Type	Description
transactionid	text	Identifier of the transaction that accesses or modifies an object. **NOTE** The type of the **transactionid** column in GaussDB must be the same as that in database A.
scn	numeric	Not supported. Its value is **NULL**.
sql_bind	nvarchar2(2000)	Not supported. Its value is **NULL**.
sql_text	character varying(2000)	SQL text of the query. **NOTE** The **sql_text** column in GaussDB is the parsed SQL description statement, which is not completely the same as the executed SQL statement.
obj_edition_name	character varying(128)	Not supported. Its value is **NULL**.

12.3.6.4 ADM_AUDIT_TRAIL

ADM_AUDIT_TRAIL displays all standard audit trail entries. The audit information of GaussDB is mainly queried through the pg_query_audit function. This view exists in both PG_CATALOG and SYS schema. Only users with the AUDITADMIN attribute and the SELECT permission on ADM_AUDIT_TRAIL can view audit information. If separation of duties is disabled, users with the SYSADMIN attribute can also view audit information.

Table 12-193 ADM_AUDIT_TRAIL columns

Name	Type	Description
os_username	character varying(255)	Not supported. Its value is **NULL**.
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. Its value is **NULL**.
terminal	character varying(255)	Not supported. Its value is **NULL**.
timestamp	timestamp(0) without time zone	Date and time when an audit trail entry is created in the local database session time zone (user login date and time of the entry created by the audit session)

Name	Type	Description
owner	character varying(128)	Creator of the object affected by the operation.
obj_name	character varying(128)	Name of the object affected by the operation.
action	numeric	Not supported. Its value is **NULL**.
action_name	character varying(28)	Action type corresponding to the code in the action column. **NOTE** The **action_name** column in GaussDB is inconsistent with the audit action of database A.
new_owner	character varying(128)	Not supported. Its value is **NULL**.
new_name	character varying(128)	Not supported. Its value is **NULL**.
obj_privilege	character varying(32)	Not supported. Its value is **NULL**.
sys_privilege	character varying(40)	Not supported. Its value is **NULL**.
admin_option	character varying(1)	Not supported. Its value is **NULL**.
grantee	character varying(128)	Not supported. Its value is **NULL**.
audit_option	character varying(40)	Not supported. Its value is **NULL**.
ses_actions	character varying(19)	Not supported. Its value is **NULL**.
logoff_time	timestamp(0) without time zone	Not supported. Its value is **NULL**.
logoff_lread	numeric	Not supported. Its value is **NULL**.
logoff_pread	numeric	Not supported. Its value is **NULL**.
logoff_lwrite	numeric	Not supported. Its value is **NULL**.
logoff_dlock	character varying(40)	Not supported. Its value is **NULL**.
comment_text	character varying(4000)	Not supported. Its value is **NULL**.
sessionid	numeric	Not supported. Its value is **NULL**.

Name	Type	Description
entryid	numeric	Not supported. Its value is **NULL**.
statementid	numeric	Not supported. Its value is **NULL**.
returncode	numeric	Not supported. Its value is **NULL**.
priv_used	character varying(40)	Not supported. Its value is **NULL**.
client_id	character varying(128)	Not supported. Its value is **NULL**.
econtext_id	character varying(64)	Not supported. Its value is **NULL**.
session_cpu	numeric	Not supported. Its value is **NULL**.
extended_timestamp	timestamp(6) with time zone	Time zone of the timestamp when an audit trail entry is created (user login date and time of the entry created by the audit session in UTC).
proxy_sessionid	numeric	Not supported. Its value is **NULL**.
global_uid	character varying(32)	Not supported. Its value is **NULL**.
instance_number	numeric	Not supported. Its value is **NULL**.
os_process	character varying(16)	Not supported. Its value is **NULL**.
transactionid	text	Identifier of the transaction that accesses or modifies an object. **NOTE** The type of the **transactionid** column in GaussDB must be the same as that in database A.
scn	numeric	Not supported. Its value is **NULL**.
sql_bind	nvarchar2(2000)	Not supported. Its value is **NULL**.
sql_text	nvarchar2	SQL text of the query. **NOTE** The **sql_text** column in GaussDB is the parsed SQL description statement, which is not completely the same as the executed SQL statement.
obj_edition_name	character varying(128)	Not supported. Its value is **NULL**.
dbid	numeric	Not supported. Its value is **NULL**.
rls_info	clob	Not supported. Its value is **NULL**.

Name	Type	Description
current_user	character varying(128)	Not supported. Its value is **NULL**.

12.3.6.5 GS_AUDITING

GS_AUDITING displays all audit information about database-related operations. Only the users with system administrator or security policy administrator permission can access this view.

Table 12-194 GS_AUDITING columns

Name	Type	Description
polname	name	Policy name, which must be unique.
pol_type	text	Audit policy type. Value range: • **access**: DML operations are audited. • **privilege**: DDL operations are audited.
polenabled	Boolean	Specifies whether to enable a policy. • **t** (true): enabled. • **f** (false): disabled.
access_type	name	DML database operation types, such as SELECT, INSERT, and DELETE, or DDL database operation types, such as CREATE, ALTER, and DROP.
label_name	name	Resource label name. This column corresponds to the **polname** column in the GS_AUDITING_POLICY system catalog.
priv_object	text	Path of the database asset.
filter_name	text	Logical character string of a filter criterion

12.3.6.6 GS_AUDITING_ACCESS

GS_AUDITING_ACCESS displays all audit information about database DML-related operations. Only the users with system administrator or security policy administrator permission can access this view.

Table 12-195 GS_AUDITING_ACCESS columns

Name	Type	Description
polname	name	Policy name, which must be unique.

Name	Type	Description
pol_type	text	Audit policy type. The value **access** indicates that DML operations are audited.
polenabled	Boolean	Specifies whether the policy is enabled. • **t** (true): enabled. • **f** (false): disabled.
access_type	name	DML database operation type. For example, SELECT, INSERT, and DELETE.
label_name	name	Resource label name. This column corresponds to the **polname** column in the **GS_AUDITING_POLICY** system catalog.
access_object	text	Path of the database asset.
filter_name	text	Logical character string of a filter criterion

12.3.6.7 GS_AUDITING_PRIVILEGE

GS_AUDITING_PRIVILEGE displays all audit information about database DDL-related operations. Only the users with system administrator or security policy administrator permission can access this view.

Table 12-196 GS_AUDITING_PRIVILEGE columns

Name	Type	Description
polname	name	Policy name, which must be unique.
pol_type	text	Audit policy type. The value **privilege** indicates that DDL operations are audited.
polenabled	Boolean	Specifies whether the policy is enabled. • **t** (true): enabled. • **f** (false): disabled.
access_type	name	DDL database operation type. For example, CREATE, ALTER, and DROP.
label_name	name	Resource label name. This column corresponds to the **polname** column in the **GS_AUDITING_POLICY** system catalog.
priv_object	text	Full domain name of a database object.
filter_name	text	Logical character string of a filter criterion

12.3.7 User and Permission Management

12.3.7.1 ADM_COL_PRIVS

ADM_COL_PRIVS displays permission granting information about all columns. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 12-197 ADM_COL_PRIVS columns

Name	Type	Description
grantor	character varying(128)	Name of the user who grants the permission.
owner	character varying(128)	Object owner.
grantee	character varying(128)	Name of the user or role to which the permission is granted.
table_schema	character varying(128)	Schema of an object
table_name	character varying(128)	Object name.
column_name	character varying(128)	Column name.
privilege	character varying(40)	Permission on a column.
grantable	character varying(3)	Specifies whether to grant privileges. • **YES**: The privileges are granted. • **NO**: The privileges are not granted.
common	character varying(3)	Not supported. Its value is **NULL**.
inherited	character varying(3)	Not supported. Its value is **NULL**.

12.3.7.2 ADM_ROLE_PRIVS

ADM_ROLE_PRIVS displays information about roles granted to all users and roles. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 12-198 ADM_ROLE_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
granted_role	character varying(128)	Name of the role to be granted.
admin_option	character varying(3)	Specifies whether the grant contains the **ADMIN** option. • **YES** • **NO**
delegate_option	character varying(3)	Not supported. Its value is **NULL**.
default_role	character varying(3)	Not supported. Its value is **NULL**.
os_granted	character varying(3)	Not supported. Its value is **NULL**.
common	character varying(3)	Not supported. Its value is **NULL**.
inherited	character varying(3)	Not supported. Its value is **NULL**.

12.3.7.3 ADM_ROLES

ADM_ROLES displays information about database roles. This view exists in both the PG_CATALOG and SYS schema. By default, only the system administrator can access this view.

Table 12-199 ADM_ROLES columns

Name	Type	Description
role	character varying(128)	Role name.
role_id	oid	Role ID.
authentication_type	text	Role authentication mechanism. • **password**: Password authentication is required. • **NULL**: Authentication is not required.

Name	Type	Description
common	character varying(3)	Not supported. Its value is **NULL**.
oracle_maintained	character varying(1)	Not supported. Its value is **NULL**.
inherited	character varying(3)	Not supported. Its value is **NULL**.
implicit	character varying(3)	Not supported. Its value is **NULL**.
external_name	character varying(4000)	Not supported. Its value is **NULL**.

12.3.7.4 ADM_SYS_PRIVS

ADM_SYS_PRIVS displays information about system permissions granted to users and roles. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 12-200 ADM_SYS_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
privilege	character varying(40)	System permissions or ANY permissions of the user. • System permissions include rolsuper, rolinherit, rolcreaterole, rolcreatedb, rolcatupdate, rolcanlogin, rolreplication, rolauditadmin, rolsystemadmin, roluseft, rolmonitoradmin, roloperatoradmin, and rolpolicyadmin. • For details about the value of the ANY permissions, see **Table 7-223**.
admin_option	character varying(3)	Specifies whether the grant contains the **ADMIN** option. • **YES** • **NO**
common	character varying(3)	Not supported. Its value is **NULL**.

Name	Type	Description
inherited	character varying(3)	Not supported. Its value is **NULL**.

12.3.7.5 ADM_TAB_PRIVS

ADM_TAB_PRIVS displays authorization information about all objects in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 12-201 ADM_TAB_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
owner	character varying(128)	Object owner.
table_name	character varying(128)	Object name.
grantor	character varying(128)	Name of the user who grants the permission.
privilege	character varying(40)	Permissions on an object, including USAGE, UPDATE, DELETE, INSERT, CONNECT, SELECT, and EXECUTE.
grantable	character varying(3)	Specifies whether the grant contains the **GRANT** option. • **YES** • **NO**

Name	Type	Description
type	character varying(24)	Object types, including NODE GROUP, COLUMN_ENCRYPTION_KEY, PACKAGE, COLUMN, TABLE, VIEW, SEQUENCE, TYPE, INDEX, DATABASE, DIRECTORY, FOREIGN DATA WRAPPER, FOREIGN SERVER, LANGUAGE, LARGE OBJECT, SCHEMA, TEMPLATE, FUNCTION, PROCEDURE, and TABLESPACE.
hierarchy	character varying(3)	Not supported. Its value is **NULL**.
common	character varying(3)	Not supported. Its value is **NULL**.
inherited	character varying(3)	Not supported. Its value is **NULL**.

12.3.7.6 ADM_USERS

ADM_USERS displays information about all database users. This view is accessible only to system administrators. This view exists in both PG_CATALOG and SYS schema.

Table 12-202 ADM_USERS columns

Name	Type	Description
username	character varying(128)	Username.
user_id	oid	User ID.

Name	Type	Description
account_status	character varying(32)	Account status. • **NULL**: The account is the initial system administrator with the highest permission. • **0**: normal. • **1**: The account is locked for a specific period of time because the number of failed login attempts exceeds the threshold. • **2**: The account is locked by the administrator.
lock_date	timestamp with time zone	By default, the creation date of the account is displayed. If the account is locked by the administrator or the account is locked because the number of login failures exceeds the threshold, the date when the account is locked is displayed. The value is **NULL** for the initial system administrator.
expiry_date	timestamp with time zone	Account expiration date.
default_tablespace	character varying(4000)	Default tablespace for storing data.
temporary_tablespace	character varying(4000)	Name of the default tablespace or tablespace group of a temporary table.
local_temp_tablespace	character varying(30)	Not supported. The default value is **NULL**.
created	timestamp with time zone	Date when a user is created.
profile	character varying(128)	Not supported. The default value is **NULL**.
initial_rsrc_consumer_group	character varying(128)	Not supported. The default value is **NULL**.
external_name	character varying(4000)	Not supported. The default value is **NULL**.
password_versions	character varying(12)	Encryption type of account passwords. Value range: **MD5**, **SHA256**, or **SM3**.
editions_enabled	character varying(1)	Not supported. The default value is **NULL**.

Name	Type	Description
authentication_type	text	Authentication mechanism of the user.
proxy_only_connect	character varying(1)	Not supported. The default value is **NULL**.
common	character varying(3)	Not supported. The default value is **NULL**.
last_login	timestamp with time zone	Last login.
oracle_maintained	character varying(1)	Not supported. The default value is **NULL**.
inherited	character varying(3)	Not supported. The default value is **NULL**.
default_collation	character varying(100)	Default collation of the user schema.
implicit	character varying(3)	Not supported. The default value is **NULL**.
all_shard	character varying(3)	Not supported. The default value is **NULL**.
password_change_date	timestamp with time zone	Date when the user password was set last time.

12.3.7.7 DB_COL_PRIVS

DB_COL_PRIVS displays the following granting information:

- Column permission granting information when the current user is the object owner, grantor, or grantee.
- Column permission granting information when the enabled role or PUBLIC role is the grantee.

By default, it is accessible to all users. This view exists in both PG_CATALOG and SYS schema.

Table 12-203 DB_COL_PRIVS columns

Name	Type	Description
grantor	character varying(128)	Name of the user who grants the permission.
owner	character varying(128)	Object owner.

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
table_schema	character varying(128)	Schema of an object.
table_name	character varying(128)	Object name.
column_name	character varying(128)	Column name.
privilege	character varying(40)	Permission on a column.
grantable	character varying(3)	Specifies whether to grant privileges. • **YES** • **NO**
common	character varying(3)	Not supported. Its value is **NULL**.
inherited	character varying(3)	Not supported. Its value is **NULL**.

12.3.7.8 DB_DIRECTORIES

DB_DIRECTORIES is used to view all directories on which the current user has the operation permission. Administrators can query all directories, and common users can query only directories on which the current user has the operation permission. This view exists in both PG_CATALOG and SYS schema.

Table 12-204 DB_DIRECTORIES columns

Name	Type	Description
owner	oid	OID of the owner of a directory object.
directory_name	name	Name of a directory object.
directory_path	text	Directory path represented by a directory object.
origin_con_id	character varying(256)	ID of the container where a directory object is created. Not supported. Its value is **NULL**.

12.3.7.9 DB_TAB_PRIVS

DB_TAB_PRIVS displays authorization information about all objects accessible to the current user. All users can access this view. This view exists in both PG_CATALOG and SYS schema.

Table 12-205 DB_TAB_PRIVS columns

Name	Type	Description
grantor	character varying(128)	Name of the user who grants the permission.
grantee	character varying(128)	Name of the user or role to which the permission is granted.
table_schema	character varying(128)	Schema to which an object belongs.
table_name	character varying(128)	Object name.
privilege	character varying(40)	Permissions on an object, including USAGE, UPDATE, DELETE, INSERT, CONNECT, SELECT, and EXECUTE.
grantable	character varying(3)	Specifies whether the grant contains the **GRANT** option. • **YES** • **NO**
type	character varying(24)	Object types, including NODE GROUP, COLUMN_ENCRYPTION_KEY, PACKAGE, COLUMN, TABLE, VIEW, SEQUENCE, TYPE, INDEX, DATABASE, DIRECTORY, FOREIGN DATA WRAPPER, FOREIGN SERVER, LANGUAGE, LARGE OBJECT, SCHEMA, TEMPLATE, FUNCTION, PROCEDURE, and TABLESPACE.
hierarchy	character varying(3)	Not supported. Its value is **NULL**.
common	character varying(3)	Not supported. Its value is **NULL**.
inherited	character varying(3)	Not supported. Its value is **NULL**.

12.3.7.10 DB_USERS

DB_USERS displays all users of the database visible to the current user. However, it does not describe the users. By default, only the system administrator can access this view. This view exists in the PG_CATALOG and SYS schemas.

Table 12-206 DB_USERS columns

Name	Type	Description
user_id	oid	OID of a user
username	name	Username

12.3.7.11 GS_DB_PRIVILEGES

GS_DB_PRIVILEGES displays the granting of ANY permissions. Each record corresponds to a piece of authorization information.

Table 12-207 GS_DB_PRIVILEGES columns

Name	Type	Description
rolename	name	Username.
privilege_type	text	ANY permission of a user. For details about the value, see **Table 7-223**.
admin_option	text	Specifies whether the ANY permission recorded in the **privilege_type** column can be re-granted. • **yes** • **no**

12.3.7.12 GS_LABELS

GS_LABELS displays all configured resource labels. Only the users with system administrator or security policy administrator permission can access this view.

Table 12-208 GS_LABELS columns

Name	Type	Description
labelname	name	Resource label name
labeltype	name	Resource label type This parameter corresponds to the **labeltype** column in the **GS_POLICY_LABEL** system catalog.
fqdntype	name	Database resource type Such as table, schema, and index.
schemaname	name	Name of the schema to which the database resource belongs
fqdnname	name	Database resource name

Name	Type	Description
columnname	name	Name of the database resource column. If the marked database resource is not a column, this parameter is left blank.

12.3.7.13 MY_COL_PRIVS

MY_COL_PRIVS displays the column permission granting information of the current user as the object owner, grantor, or grantee. By default, it is accessible to all users. This view exists in both PG_CATALOG and SYS schema.

Table 12-209 MY_COL_PRIVS columns

Name	Type	Description
grantor	character varying(128)	Name of the user who grants the permission.
owner	character varying(128)	Object owner.
grantee	character varying(128)	Name of the user or role to which the permission is granted.
table_schema	character varying(128)	Schema of an object.
table_name	character varying(128)	Object name.
column_name	character varying(128)	Column name.
privilege	character varying(40)	Permission on a column.
grantable	character varying(3)	Specifies whether to grant privileges. • **YES** • **NO**
common	character varying(3)	Not supported. Its value is **NULL**.
inherited	character varying(3)	Not supported. Its value is **NULL**.

12.3.7.14 MY_ROLE_PRIVS

MY_ROLE_PRIVS displays permission information about roles (including the public role) granted to the current user. By default, it is accessible to all users. This view exists in both PG_CATALOG and SYS schema.

Table 12-210 MY_ROLE_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
granted_role	character varying(128)	Role to be granted.
admin_option	character varying(3)	Specifies whether the grant contains the **ADMIN** option. • **YES** • **NO**
delegate_option	character varying(3)	Not supported. Its value is **NULL**.
default_role	character varying(3)	Not supported. Its value is **NULL**.
os_granted	character varying(3)	Not supported. Its value is **NULL**.
common	character varying(3)	Not supported. Its value is **NULL**.
inherited	character varying(3)	Not supported. Its value is **NULL**.

12.3.7.15 MY_SYS_PRIVS

MY_SYS_PRIVS displays information about system permissions granted to the current user. By default, it is accessible to all users. This view exists in both PG_CATALOG and SYS schema.

Table 12-211 MY_SYS_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.

Name	Type	Description
privilege	character varying(40)	System permissions or ANY permissions of the user. • System permissions include rolsuper, rolinherit, rolcreaterole, rolcreatedb, rolcatupdate, rolcanlogin, rolreplication, rolauditadmin, rolsystemadmin, roluseft, rolmonitoradmin, roloperatoradmin, and rolpolicyadmin. • For details about the value of the ANY permissions, see Table 7-223.
admin_option	character varying(3)	Specifies whether the grant contains the **ADMIN** option. • **YES** • **NO**
common	character varying(3)	Not supported. Its value is **NULL**.
inherited	character varying(3)	Not supported. Its value is **NULL**.

12.3.7.16 PG_RLSPOLICIES

PG_RLSPOLICIES displays information about row-level security policies. The initial user and users with the sysadmin attribute can view all policy information. Other users can view only the policy information in their own tables.

Table 12-212 PG_RLSPOLICIES columns

Name	Type	Description
schemaname	name	Name of the schema of the table object to which a row-level security policy is applied.
tablename	name	Name of the table object to which a row-level security policy is applied.

Name	Type	Description
policyname	name	Name of a row-level security policy.
policypermissive	text	Expression combination mode of a row-level security policy. The options are as follows: • **PERMISSIVE**: permissive policy, which is concatenated using the OR expression. • **RESTRICTIVE**: restrictive policy, which is concatenated using an AND expression.
policyroles	name[]	List of users affected by the row-level security policy. If this parameter is not specified, all users are affected.
policycmd	text	SQL operations affected by a row-level security policy.
policyqual	text	Expression of a row-level security policy.

12.3.7.17 PG_ROLES

PG_ROLES displays information about database roles. Initial users and users with the **sysadmin** or **createrole** attribute can view information about all roles. Other users can view only their own information.

Table 12-213 PG_ROLES columns

Name	Type	Reference	Description
rolname	name	N/A	Role name.
rolsuper	Boolean	N/A	Specifies whether a role is the initial system administrator with the highest permissions. • **t** (true): yes. • **f** (false): no.
rolinherit	Boolean	N/A	Specifies whether the role inherits the permissions for this type of roles. • **t** (true): yes. • **f** (false): no.
rolcreaterole	Boolean	N/A	Specifies whether the role can create other roles. • **t** (true): yes. • **f** (false): no.

Name	Type	Reference	Description
rolcreatedb	Boolean	N/A	Specifies whether the role can create databases. ● **t** (true): yes. ● **f** (false): no.
rolcatupdate	Boolean	N/A	Specifies whether the role can update system catalogs directly. Only the initial system administrator whose **usesysid** is **10** has this permission. This permission is unavailable for other users. ● **t** (true): yes. ● **f** (false): no.
rolcanlogin	Boolean	N/A	Specifies whether the role can log in to the database. ● **t** (true): yes. ● **f** (false): no.
rolreplication	Boolean	N/A	Specifies whether the role can be replicated. ● **t** (true): yes. ● **f** (false): no.
rolauditadmin	Boolean	N/A	Specifies whether the role is an audit administrator. ● **t** (true): yes. ● **f** (false): no.
rolsystemadmin	Boolean	N/A	Specifies whether the role is a system administrator. ● **t** (true): yes. ● **f** (false): no.
rolconnlimit	integer	N/A	Maximum number of concurrent connections that this role can initiate if this role can log in. The value **–1** indicates no limit.
rolpassword	text	N/A	Encrypted user password. The value is displayed as ********.
rolvalidbegin	timestamp with time zone	N/A	Start time for account validity (**NULL** if the start time is not specified).
rolvaliduntil	timestamp with time zone	N/A	End time for account validity (**NULL** if the end time is not specified).

Name	Type	Reference	Description
rolrespool	name	N/A	Resource pool that can be used by a user.
rolparentid	oid	**rolparentid** in **PG_AUTHID**	OID of a group user to which the user belongs
roltabspace	text	N/A	Storage space of the user permanent table, in KB.
rolconfig	text[]	**setconfig** in **PG_DB_ROLE_SETTING**	Default value of runtime configuration items.
oid	oid	**oid** in **PG_AUTHID**	Role ID
roluseft	Boolean	**roluseft** in **PG_AUTHID**	Specifies whether the role can perform operations on foreign tables • **t** (true): yes. • **f** (false): no.
rolkind	"char"	N/A	Role type • **n**: common user, that is, non-permanent user. • **p**: permanent user.
nodegroup	name	N/A	Unsupported currently.
roltempspace	text	N/A	Storage space of the user temporary table, in KB.
rolspillspace	text	N/A	Operator disk spill space of the user, in KB.
rolmonitoradmin	Boolean	N/A	Specifies whether the role is a monitor administrator. • **t** (true): yes. • **f** (false): no.
roloperatoradmin	Boolean	N/A	Specifies whether the role is an O&M administrator. • **t** (true): yes. • **f** (false): no.

Name	Type	Reference	Description
rolpolicyadmin	Boolean	N/A	Specifies whether the role is a security policy administrator. • **t** (true): yes. • **f** (false): no.

12.3.7.18 PG_SECLABELS

PG_SECLABELS provides information about storage security labels.

Table 12-214 PG_SECLABELS columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this security label pertains to.
classoid	oid	**oid** in PG_CLASS	OID of the system catalog where the object to which the security label belongs is located.
objsubid	integer	-	Column number for the security label on a table column (**objoid** and **classoid** refer to the table itself). The value is **0** for all other object types.
objtype	text	-	Type of the object to which the label belongs, in text format. Example: • **table**: table type • **column**: column type
objnamespace	oid	**oid** in PG_NAMESPACE	OID of the namespace for the object, if applicable; otherwise, **NULL**.
objname	text	-	Name of the object to which the label belongs, in text format.
provider	text	**provider** in PG_SECLABEL	Provider of the label.
label	text	**label** in PG_SECLABEL	Security label name.

12.3.7.19 PG_SHADOW

PG_SHADOW displays the attributes of all roles marked with rolcanlogin in **PG_AUTHID**. Only the system administrator can access this system view.

The information in this view is basically the same as that in **PG_USER**. The difference is that in **PG_USER**, passwords are sensitive and displayed as ********.

Table 12-215 PG_SHADOW columns

Name	Type	Reference	Description
usename	name	**rolname** in **PG_AUTHID**	Username.
usesysid	oid	**oid** in **PG_AUTHID**	ID of this user.
usecreatedb	Boolean	-	Specifies whether a user has the permissions to create databases. • **t** (true): yes. • **f** (false): no.
usesuper	Boolean	-	Specifies whether the user is a system administrator. • **t** (true): yes. • **f** (false): no.
usecatupd	Boolean	-	Specifies whether the user can update a view. Even the system administrator cannot do this unless this column is **true**.
userepl	Boolean	-	Specifies whether the user has the permissions to duplicate data streams. • **t** (true): yes. • **f** (false): no.
passwd	text	**rolpassword** in **PG_AUTHID**	Password ciphertext. If there is no password, the value is **NULL**.
valbegin	timestamp with time zone	-	Start time for account validity (**NULL** if the start time is not specified).
valuntil	timestamp with time zone	-	End time for account validity (**NULL** if the end time is not specified).
respool	name	-	Resource pool where the user is in.
parent	oid	-	Parent user OID.

Name	Type	Reference	Description
spacelimit	text	-	Storage space of the permanent table, in KB.
useconfig	text[]	**setconfig** in PG_DB_ROLE_SETTING	Default value of runtime configuration items.
tempspacelimit	text	-	Storage space of the temporary table, in KB.
spillspacelimit	text	-	Operator disk spill space, in KB.
usemonitoradmin	Boolean	-	Specifies whether the user is a monitor administrator. • **t** (true): yes. • **f** (false): no.
useoperatoradmin	Boolean	-	Specifies whether the user is an O&M administrator. • **t** (true): yes. • **f** (false): no.
usepolicyadmin	Boolean	-	Specifies whether the user is a security policy administrator. • **t** (true): yes. • **f** (false): no.

12.3.7.20 PG_USER

PG_USER displays information about database users. By default, only the initial user and users with the sysadmin attribute can view the information. Other users can view the information only after being granted with permissions.

Table 12-216 PG_USER columns

Name	Type	Description
usename	name	Username.
usesysid	oid	ID of this user.
usecreatedb	Boolean	Specifies whether a user has the permissions to create databases. • **t** (true): yes. • **f** (false): no.

Name	Type	Description
usesuper	Boolean	Specifies whether the user is the initial system administrator with the highest permissions. • **t** (true): yes. • **f** (false): no.
usecatupd	Boolean	Specifies whether the user can directly update system catalogs. Only the initial system administrator whose **usesysid** is **10** has this permission. This permission is unavailable for other users. • **t** (true): yes. • **f** (false): no.
userepl	Boolean	Specifies whether the user has the permissions to duplicate data streams. • **t** (true): yes. • **f** (false): no.
passwd	text	Encrypted user password. The value is displayed as ********.
valbegin	timestamp with time zone	Start time for account validity (**NULL** if the start time is not specified).
valuntil	timestamp with time zone	End time for account validity (**NULL** if the end time is not specified).
respool	name	Resource pool where the user is in.
parent	oid	Parent user OID.
spacelimit	text	Storage space of the permanent table, in KB.
useconfig	text[]	Default value of runtime configuration items. For details, see **setconfig** in **PG_DB_ROLE_SETTING**.
nodegroup	name	Name of the logical database associated with the user. If the user does not manage the logical database, this column is left blank.
tempspacelimit	text	Storage space of the temporary table, in KB.
spillspacelimit	text	Operator disk spill space, in KB.

Name	Type	Description
usemonitoradmin	Boolean	Specifies whether the user is a monitor administrator. • **t** (true): yes. • **f** (false): no.
useoperatoradmin	Boolean	Specifies whether the user is an O&M administrator. • **t** (true): yes. • **f** (false): no.
usepolicyadmin	Boolean	Specifies whether the user is a security policy administrator. • **t** (true): yes. • **f** (false): no.

12.3.7.21 PG_USER_MAPPINGS

PG_USER_MAPPINGS displays user mapping information.

This is essentially a publicly readable view of **PG_USER_MAPPING** that leaves out the options column if the user has no rights to use the system catalog and query the view. Common users must be authorized to access this view.

Table 12-217 PG_USER_MAPPINGS columns

Name	Type	Reference	Description
umid	oid	**oid** in **PG_USER_MAPPING**	OID of the user mapping.
srvid	oid	**oid** in **PG_FOREIGN_SERVER**	OID of the foreign server that contains the mapping.
srvname	name	**srvname** in **PG_FOREIGN_SERVER**	Name of the foreign server.
umuser	oid	**oid** in **PG_AUTHID**	OID of the local role being mapped (**0** if the user mapping is public).
usename	name	-	Name of the local user to be mapped.
umoptions	text[]	-	User mapping specific options. If the current user is the owner of the foreign server, the value is **keyword=value strings**. Otherwise, the value is **NULL**.

12.3.7.22 ROLE_ROLE_PRIVS

ROLE_ROLE_PRIVS displays roles granted to other roles and provides only information about the roles that the user has access to. By default, it is accessible to all users. This view exists in both PG_CATALOG and SYS schema.

Table 12-218 ROLE_ROLE_PRIVS columns

Name	Type	Description
role	character varying(128)	Role name.
granted_role	character varying(128)	Role to be granted.
admin_option	character varying(3)	Specifies whether the grant contains the **ADMIN** option. • **YES** • **NO**
common	character varying(3)	Not supported. Its value is **NULL**.
inherited	character varying(3)	Not supported. Its value is **NULL**.

12.3.7.23 ROLE_SYS_PRIVS

ROLE_SYS_PRIVS displays information about system privileges granted to roles (only roles accessible to the user are displayed). By default, it is accessible to all users. This view exists in both PG_CATALOG and SYS schema.

Table 12-219 ROLE_SYS_PRIVS columns

Name	Type	Description
role	character varying(128)	Role name.

Name	Type	Description
privilege	character varying(40)	System permissions or ANY permissions of the user. • System permissions include rolsuper, rolinherit, rolcreaterole, rolcreatedb, rolcatupdate, rolcanlogin, rolreplication, rolauditadmin, rolsystemadmin, roluseft, rolmonitoradmin, roloperatoradmin, and rolpolicyadmin. • For details about the value of the ANY permissions, see Table 7-223.
admin_option	character varying(3)	Specifies whether the grant contains the **ADMIN** option. • **YES** • **NO**
common	character varying(3)	Not supported. Its value is **NULL**.
inherited	character varying(3)	Not supported. Its value is **NULL**.

12.3.7.24 ROLE_TAB_PRIVS

ROLE_TAB_PRIVS displays information about object permissions granted to roles (only roles accessible to the user are displayed). It is accessible to all users. This view exists in the PG_CATALOG and SYS schemas.

Table 12-220 ROLE_TAB_PRIVS columns

Name	Type	Description
role	character varying(128)	Role name.
owner	character varying(128)	Object owner.
table_name	character varying(128)	Object name. Object types include tables, packages, indexes, and sequences.
column_name	character varying(128)	Not supported. Set it to **NULL**.

Name	Type	Description
privilege	character varying(40)	Permissions on an object, including USAGE, UPDATE, DELETE, INSERT, CONNECT, SELECT, and EXECUTE.
grantable	character varying(3)	Specifies whether the grant contains the **GRANT** option. • **YES** • **NO**
common	character varying(3)	Not supported. Set it to **NULL**.
inherited	character varying(3)	Not supported. Set it to **NULL**.

12.3.8 Dynamic Data Masking

12.3.8.1 GS_MASKING

GS_MASKING displays all configured dynamic masking policies. Only the users with system administrator or security policy administrator permission can access this view.

Table 12-221 GS_MASKING columns

Name	Type	Description
polname	name	Name of the masking policy
polenabled	Boolean	Specifies whether to enable the masking policy.
maskaction	name	Masking function
labelname	name	Name of the label to which the masking function applies.
masking_object	text	Masking database resource object
filter_name	text	Logical expression of a filter criterion

12.3.9 Transparent Encryption

12.3.9.1 PG_TDE_INFO

PG_TDE_INFO displays encryption information of the entire database.

Table 12-222 PG_TDE_INFO columns

Name	Type	Description
is_encrypt	Boolean	Specifies whether to encrypt the database. • **f**: The database is not encrypted. • **t**: The database is encrypted.
g_tde_algo	text	Encryption algorithm. • **SM4-CTR-128** • **AES-CTR-128**
remain	text	Reserved column.

12.3.10 DATABASE LINK

12.3.10.1 GS_DB_LINKS

GS_DB_LINKS displays information about DATABASE LINK objects. You can view information about your own DATABASE LINK objects and DATABASE LINK objects at the PUBLIC level.

Table 12-223 GS_DB_LINKS columns

Name	Type	Description
dblinkid	oid	OID of the current DATABASE LINK object.
dlname	name	Name of the current DATABASE LINK object.
dlowner	oid	Owner ID of the current DATABASE LINK object. If the object owner is **public**, the value is **0**.
dlownername	name	Name of the owner of the current DATABASE LINK object.
options	text[]	Connection information of the current DATABASE LINK object. The value is a character string in the "keyword=value" format.
useroptions	text	Information of the remote end user to which the current DATABASE LINK object connects.
heterogeneous	text	Not supported. Its value is **NULL**.

Name	Type	Description
protocol	text	Not supported. Its value is **NULL**.
opencursors	text	Not supported. Its value is **NULL**.
intransaction	Boolean	Specifies whether the current DATABASE LINK object exists in a transaction.
updatasent	Boolean	Specifies whether the current DATABASE LINK object uses statements for updating data.

12.3.10.2 V$DBLINK

V$DBLINK displays information about database links. You can view information about your own database links and database links at the PUBLIC level. By default, only administrators can view this view.

NOTE

The data in this view is obtained from **GS_DB_LINKS**. This view records only the information about the links that have been used or are being used in the current session. For details about database links, see **DATABASE LINK**.

Table 12-224 V$DBLINK columns

Name	Type	Description
db_link	character varying(128)	Name of the current database link.
owner_id	numeric	Owner ID of the current database link. If the owner of the database link is **PUBLIC**, the value of **owner_id** is **0**.
logged_on	character varying(3)	Not supported. Set it to **NULL**.
heterogeneous	character varying(3)	Not supported. Set it to **NULL**.
protocol	character varying(6)	Not supported. Set it to **NULL**.

Name	Type	Description
open_cursors	numeric	Not supported. Set it to **NULL**.
in_transaction	character varying(3)	Determines whether the current database link exists in a transaction. • **YES** • **NO**
update_sent	character varying(3)	Determines whether the current database link uses statements for updating data. • **YES** • **NO**
commit_point_strength	numeric	Not supported. Set it to **NULL**.
con_id	numeric	Not supported. Set it to **NULL**.

12.3.11 Materialized Views

12.3.11.1 GS_MATVIEWS

GS_MATVIEWS displays information about each materialized view in the database.

Table 12-225 GS_MATVIEWS columns

Name	Type	Reference	Description
schemaname	name	PG_NAMESPACE.nspname	Name of the schema of a materialized view.
matviewname	name	PG_CLASS.relname	Name of a materialized view.
matviewowner	name	PG_AUTHID.rolname	Owner of a materialized view.
tablespace	name	PG_TABLESPACE.spcname	Tablespace name of a materialized view. If the default tablespace of the database is used, the value is null.
hasindexes	Boolean	-	This column is true if a materialized view has (or has recently had) any indexes.

Name	Type	Reference	Description
definition	text	-	Definition of a materialized view (a reconstructed SELECT query)

12.3.12 Other System Views

12.3.12.1 ADM_ARGUMENTS

ADM_ARGUMENTS displays parameter information of all stored procedures or functions. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 12-226 ADM_ARGUMENTS columns

Name	Type	Description
owner	character varying(128)	Owner of a function or stored procedure.
object_name	character varying(128)	Name of a function or stored procedure.
package_name	character varying(128)	Package name.
object_id	oid	OID of a function or stored procedure.
overload	character varying(40)	*n*th overloaded function of the name.
subprogram_id	numeric	Location of a function or stored procedure in a package.
argument_name	character varying(128)	Parameter name.
position	numeric	Position of the parameter in the parameter list. The value is **0** for the return value of the function by default.
sequence	numeric	Sequence of a parameter, which starts from 1, with the return type before all parameters.

Name	Type	Description
data_level	numeric	Nesting depth of parameters of the composite type. The value is fixed at **0** because only one line is displayed for each parameter.
data_type	character varying(30)	Data type of a parameter.
defaulted	character varying(1)	Specifies whether a parameter has a default value: ● **Y**: yes. ● **N**: no.
default_value	text	Not supported. Its value is **NULL**.
default_length	numeric	Not supported. Its value is **NULL**.
in_out	character varying(9)	Input and output attributes of a parameter: ● **IN**: input parameter. ● **OUT**: output parameter. ● **IN_OUT**: input and output parameters. ● **VARIADIC**: VARIADIC parameter.
data_length	numeric	Not supported. Its value is **NULL**.
data_precision	numeric	Not supported. Its value is **NULL**.
data_scale	numeric	Not supported. Its value is **NULL**.
radix	numeric	Radix of a number, which is **10** when the data type is smallint, integer, bigint, numeric, or float. For other data types, set this column to **NULL**.
character_set_name	character varying(44)	Not supported. Its value is **NULL**.

Name	Type	Description
type_owner	character varying(128)	Owner of the data type.
type_name	character varying(128)	Parameter type name. Only the customized type is displayed.
type_subname	character varying(128)	Not supported. Its value is **NULL**.
type_link	character varying(128)	Not supported. Its value is **NULL**.
type_object_type	character varying(7)	Types of types of the **type_owner**, **type_name**, and **type_subname** columns: • **TABLE**: The parameter is of the table type. • **VIEW**: The parameter is of the view type. • For other data types, the value is **NULL**.
pls_type	character varying(128)	Name of the PL/SQL type for parameters of the number type. Otherwise, this column is empty.
char_length	numeric	Not supported. Its value is **NULL**.
char_used	character varying(1)	Not supported. Set it to **B** if the data type is varchar, nvarchar2, bpchar, or char. For other data types, set it to **NULL**.
origin_con_id	character varying(256)	Not supported. Its value is **0**.

12.3.12.2 ADM_COL_COMMENTS

ADM_COL_COMMENTS displays information about table column comments in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-227 ADM_COL_COMMENTS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
comments	text	Comments.
origin_con_id	numeric	Not supported. Set it to **0**.
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.12.3 ADM_COLL_TYPES

ADM_COLL_TYPES displays information about all collection types. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-228 ADM_COLL_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of a collection.
type_name	character varying(128)	Name of a collection.
coll_type	character varying(128)	Description of a collection.
upper_bound	numeric	Not supported. Set it to **NULL**.
elem_type_mod	character varying(7)	Type modifier of an element.
elem_type_owner	character varying(128)	Owner of the element type on which the collection is based. This parameter is mainly used for user-defined types.
elem_type_name	character varying(128)	Name of the data type or user-defined type on which the collection is based.
length	numeric	Not supported. Set it to **NULL**.
precision	numeric	Not supported. Set it to **NULL**.
scale	numeric	Not supported. Set it to **NULL**.

Name	Type	Description
character_set_name	character varying(44)	Not supported. Set it to **NULL**.
elem_storage	character varying(7)	Not supported. Set it to **NULL**.
nulls_stored	character varying(3)	Not supported. Set it to **NULL**.
char_used	character varying(1)	Not supported. Set it to **NULL**.

12.3.12.4 ADM_CONS_COLUMNS

ADM_CONS_COLUMNS displays information about constraint columns in database tables. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-229 ADM_CONS_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Constraint creator.
constraint_name	character varying(64)	Constraint name.
table_name	character varying(64)	Name of a constraint-related table.
column_name	character varying(64)	Name of a constraint-related column.
position	smallint	Position of a column in a table.

12.3.12.5 ADM_CONSTRAINTS

ADM_CONSTRAINTS displays information about table constraints in database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-230 ADM_CONSTRAINTS columns

Name	Type	Description
owner	character varying(64)	Constraint creator.

Name	Type	Description
constraint_name	character varying(64)	Constraint name.
constraint_type	text	Constraint type. • **c**: check constraint • **f**: foreign key constraint • **p**: primary key constraint • **u**: unique constraint
table_name	character varying(64)	Name of a constraint-related table.
index_owner	character varying(64)	Owner of a constraint-related index (only for the unique constraint and primary key constraint).
index_name	character varying(64)	Name of a constraint-related index (only for the unique constraint and primary key constraint).
status	character varying(8)	Constraint status
generated	character varying(14)	Not supported. Set it to **NULL**.
search_condition	text	Not supported. Set it to **NULL**.
search_condition_vc	character varying(4000)	Not supported. Set it to **NULL**.
r_owner	character varying(128)	Not supported. Set it to **NULL**.
r_constraint_name	character varying(128)	Not supported. Set it to **NULL**.
delete_rule	character varying(9)	Not supported. Set it to **NULL**.
con_deferrable	character varying(14)	Not supported. Set it to **NULL**.
deferred	character varying(9)	Not supported. Set it to **NULL**.
validated	character varying(13)	Not supported. Set it to **NULL**.
bad	character varying(3)	Not supported. Set it to **NULL**.
rely	character varying(4)	Not supported. Set it to **NULL**.
last_change	timestamp(0) without time zone	Not supported. Set it to **NULL**.
invalid	character varying(7)	Not supported. Set it to **NULL**.
view_related	character varying(14)	Not supported. Set it to **NULL**.
origin_con_id	character varying(256)	Not supported. Set it to **NULL**.

12.3.12.6 ADM_DATA_FILES

ADM_DATA_FILES displays the description of database files. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-231 ADM_DATA_FILES columns

Name	Type	Description
tablespace_name	name	Name of the tablespace to which a file belongs
bytes	double precision	Length of a file, in bytes

12.3.12.7 ADM_DEPENDENCIES

ADM_DEPENDENCIES displays the dependency relationships between types, tables, views, stored procedures, functions, and triggers in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-232 ADM_DEPENDENCIES columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	character varying(18)	Object class.
referenced_owner	name	Owner of the referenced object.
referenced_name	name	Name of the referenced object.
referenced_type	character varying(18)	Type of the referenced object.
referenced_link_name	character varying(128)	Not supported. Set it to **NULL**.
dependency_type	character varying(4)	Not supported. Set it to **NULL**.

12.3.12.8 ADM_DIRECTORIES

ADM_DIRECTORIES stores information about all directory objects in the database. By default, only the system administrator can access this view. Common users can

access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-233 ADM_DIRECTORIES columns

Name	Type	Description
owner	oid	Directory owner
directory_name	name	Directory name
directory_path	text	Operating system path name of a directory
origin_con_id	character varying(256)	Not supported. Set it to **NULL**.

12.3.12.9 ADM_HIST_SNAPSHOT

ADM_HIST_SNAPSHOT records the WDR snapshot data stored in the current system. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema. This view can be accessed only when the GUC parameter **enable_wdr_snapshot** is set to **on**. To access the PG_CATALOG.ADM_HIST_SNAPSHOT and SYS.ADM_HIST_SNAPSHOT views, you must have the permission to access the **snapshot schema**, **snapshot**, and **tables_snap_timestamp** tables.

Table 12-234 ADM_HIST_SNAPSHOT columns

Name	Type	Description
snap_id	bigint	Unique snapshot ID.
dbid	oid	Database ID of the snapshot.
instance_number	oid	Not supported. Its value is the same as that of **dbid**.
startup_time	timestamp(3) without time zone	Instance start time.
begin_interval_time	timestamp without time zone	Start time of the snapshot interval (the end time of the last snapshot).
end_interval_time	timestamp without time zone	End time of the snapshot interval. Actual time when the snapshot is taken (that is, the end time of the snapshot).
flush_elapsed	interval	Amount of time to perform the snapshot.

Name	Type	Description
snap_level	numeric	Not supported. Its value is **NULL**.
error_count	numeric	Not supported. Its value is **NULL**.
snap_flag	numeric	Not supported. Its value is **NULL**.
snap_timezone	interval day to second(0)	Time offset between the snapshot time zone and the coordinated universal time (UTC).
begin_interval_time_tz	timestamp with time zone	Start time of the snapshot interval with the time zone (end time of the last snapshot).
end_interval_time_tz	timestamp with time zone	End time of the snapshot interval. Actual time when the snapshot is taken (that is, the end time of the snapshot), with the time zone.
con_id	numeric	Not supported. Its value is **0**.

12.3.12.10 ADM_HIST_SQL_PLAN

ADM_HIST_SQL_PLAN displays plan information collected by the current user by running the **EXPLAIN PLAN** statement. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-235 ADM_HIST_SQL_PLAN columns

Name	Type	Description
dbid	text	Database ID
sql_id	character varying(30)	Session that inserts the data. Its value consists of a service thread start timestamp and a service thread ID. Values are constrained by **NOT NULL**.
plan_hash_value	bigint	Query ID
id	integer	Number assigned to each step in the execution plan
operation	character varying(30)	Operation description
options	character varying(255)	Operation option
object_node	character varying(128)	Not supported. Set it to **NULL**.
object#	numeric	Not supported. Set it to **NULL**.

Name	Type	Description
object_owner	name	Object number of a table or an index
object_name	name	Name of the operated object. It is defined by users.
object_alias	character varying(261)	Not supported. Set it to **NULL**.
object_type	character varying(30)	Object type.
optimizer	character varying(20)	Not supported. Set it to **NULL**.
parent_id	numeric	Not supported. Set it to **NULL**.
depth	numeric	Not supported. Set it to **NULL**.
position	numeric	Not supported. Set it to **NULL**.
search_columns	numeric	Not supported. Set it to **NULL**.
cost	double precision	Execution cost estimated by the optimizer for an operator
cardinality	double precision	Cardinality estimated by the optimizer for an operator to access table records.
bytes	numeric	Not supported. Set it to **NULL**.
other_tag	character varying(35)	Not supported. Set it to **NULL**.
partition_start	character varying(64)	Not supported. Set it to **NULL**.
partition_stop	character varying(64)	Not supported. Set it to **NULL**.
partition_id	numeric	Not supported. Set it to **NULL**.
other	character varying(4000)	Not supported. Set it to **NULL**.
distribution	character varying(20)	Not supported. Set it to **NULL**.
cpu_cost	numeric	Not supported. Set it to **NULL**.
io_cost	numeric	Not supported. Set it to **NULL**.
temp_space	numeric	Not supported. Set it to **NULL**.

Name	Type	Description
access_predicates	character varying(4000)	Not supported. Set it to **NULL**.
filter_predicates	character varying(4000)	Not supported. Set it to **NULL**.
projection	character varying(4000)	Returned column information
time	numeric	Not supported. Set it to **NULL**.
qblock_name	character varying(128)	Not supported. Set it to **NULL**.
remarks	character varying(4000)	Not supported. Set it to **NULL**.
timestamp	timestamp(0) without time zone	Not supported. Set it to **NULL**.
other_xml	clob	Not supported. Set it to **NULL**.
con_dbid	text	Database ID of a container, which is currently set to a value the same as that of **dbid**.
con_id	numeric	Container ID. Containers are not supported and this field is set to **0**.

12.3.12.11 ADM_HIST_SQLSTAT

ADM_HIST_SQLSTAT displays information about statements executed on the current node. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

After the WDR snapshot function is enabled (that is, the GUC parameter **enable_wdr_snapshot** is set to **on**), users can view the data in this view.

Table 12-236 ADM_HIST_SQLSTAT columns

Name	Type	Description
instance_number	integer	Instance ID of a snapshot.
plan_hash_value	integer	ID of the normalized SQL statement.

Name	Type	Description
module	integer	Name of the module that is executing when the SQL statement is first parsed.
apwait_delta	integer	Delta value of the application wait time.
sql_id	bigint	Query ID.
snap_id	bigint	Unique snapshot ID.
elapsed_time_delta	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: μs).
cpu_time_delta	bigint	CPU time (unit: μs).
executions_delta	bigint	Increment in the number of executions that have occurred on this object since it was brought into the cache.
iowait_delta	bigint	I/O time (unit: μs).
rows_processed_delta	bigint	Number of rows in the result set returned by the SELECT statement.
parsing_schema_name	character varying	Not supported. Its value is **NULL**.
disk_reads_delta	bigint	Not supported. Its value is **NULL**.
buffer_reads_delta	bigint	Not supported. Its value is **NULL**.
clwait_delta	bigint	Not supported. Its value is **NULL**.

12.3.12.12 ADM_HIST_SQLTEXT

ADM_HIST_SQLTEXT displays information about statements executed on the current node. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

After the WDR snapshot function is enabled (that is, the GUC parameter **enable_wdr_snapshot** is set to **on**), users can view the data in this view.

Table 12-237 ADM_HIST_SQLTEXT columns

Name	Type	Description
dbid	integer	Database ID
sql_id	bigint	Query ID

Name	Type	Description
sql_text	clob	Text corresponding to the query
command_type	integer	Not supported. Set it to **0**.
con_dbid	integer	Database ID of a container, which is currently set to a value the same as that of **dbid**.
con_id	integer	Container ID. Containers are not supported and this field is set to **0**.

12.3.12.13 ADM_IND_COLUMNS

ADM_IND_COLUMNS displays information about index columns in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 12-238 ADM_IND_COLUMNS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	name	Column name.
column_position	smallint	Position of a column in an index.
column_length	numeric	Length of the column. For the variable-length type, its value is **NULL**.
char_length	numeric	Maximum length of a column, in bytes.
descend	character varying(4)	Columns sorted in descending (**DESC**) or ascending (**ASC**) order.
collated_column_id	numeric	Not supported. Its value is **NULL**.

12.3.12.14 ADM_IND_EXPRESSIONS

ADM_IND_EXPRESSIONS displays information about expression indexes in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-239 ADM_IND_EXPRESSIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
column_expression	text	Function-based index expression of a specified column.
column_position	smallint	Position of a column in an index.

12.3.12.15 ADM_INDEXES

ADM_INDEXES displays all indexes in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 12-240 ADM_INDEXES columns

Name	Type	Description
owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_name	character varying(64)	Name of a table corresponding to an index.
uniqueness	text	Specifies whether the index is unique. • **UNIQUE**: unique index. • **NONUNIQUE**: non-unique index.

Name	Type	Description
partitioned	character(3)	Specifies whether the index has the property of partitioned tables. • **Yes**: The index has the property of a partitioned table. • **No**: The index does not have the property of a partitioned table.
generated	character varying(1)	Specifies whether the name of the index is generated by the system. • **y**: The index name is generated by the system. • **n**: The index name is not generated by the system.
index_type	character varying(27)	Index type. • **NORMAL**: Index attributes are simple references, and the expression tree is empty. • **FUNCTION-BASED NORMAL**: Expression trees are used for index attributes that are not simple column references.
table_owner	character varying(128)	Owner of an index object.
table_type	character(11)	Type of an index object. • **TABLE**: The index object is of the table type.
tablespace_name	character varying(30)	Name of a tablespace that contains the index.

Name	Type	Description
status	character varying(8)	Status of a non-partitioned index. • **VALID**: Non-partitioned indexes can be used for query. • **UNUSABLE**: The non-partitioned index is unavailable. • **N/A**: The index has the property of a partitioned table.
compression	character varying(13)	Not supported. Its value is **NULL**.
prefix_length	numeric	Not supported. Its value is **NULL**.
ini_trans	numeric	Not supported. Its value is **NULL**.
max_trans	numeric	Not supported. Its value is **NULL**.
initial_extent	numeric	Not supported. Its value is **NULL**.
next_extent	numeric	Not supported. Its value is **NULL**.
min_extents	numeric	Not supported. Its value is **NULL**.
max_extents	numeric	Not supported. Its value is **NULL**.
pct_increase	numeric	Not supported. Its value is **NULL**.
pct_threshold	numeric	Not supported. Its value is **NULL**.
include_column	numeric	Not supported. Its value is **NULL**.
freelists	numeric	Not supported. Its value is **NULL**.
freelist_groups	numeric	Not supported. Its value is **NULL**.
pct_free	numeric	Not supported. Its value is **NULL**.

Name	Type	Description
logging	character varying(3)	Not supported. Its value is **NULL**.
blevel	numeric	Not supported. Its value is **NULL**.
leaf_blocks	numeric	Not supported. Its value is **NULL**.
distinct_keys	numeric	Not supported. Its value is **NULL**.
avg_leaf_blocks_per_key	numeric	Not supported. Its value is **NULL**.
avg_data_blocks_per_key	numeric	Not supported. Its value is **NULL**.
clustering_factor	numeric	Not supported. Its value is **NULL**.
num_rows	numeric	Not supported. Its value is **NULL**.
sample_size	numeric	Not supported. Its value is **NULL**.
last_analyzed	timestamp(0) without time zone	Not supported. Its value is **NULL**.
degree	character varying(40)	Not supported. Its value is **NULL**.
instances	character varying(40)	Not supported. Its value is **NULL**.
temporary	character varying(1)	Not supported. Its value is **NULL**.
secondary	character varying(1)	Not supported. Its value is **NULL**.
buffer_pool	character varying(7)	Not supported. Its value is **NULL**.
flash_cache	character varying(7)	Not supported. Its value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
duration	character varying(15)	Not supported. Its value is **NULL**.

Name	Type	Description
pct_direct_access	numeric	Not supported. Its value is **NULL**.
ityp_owner	character varying(128)	Not supported. Its value is **NULL**.
ityp_name	character varying(128)	Not supported. Its value is **NULL**.
parameters	character varying(1000)	Not supported. Its value is **NULL**.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
domidx_status	character varying(12)	Not supported. Its value is **NULL**.
domidx_opstatus	character varying(6)	Not supported. Its value is **NULL**.
funcidx_status	character varying(8)	Not supported. Its value is **NULL**.
join_index	character varying(3)	Not supported. Its value is **NULL**.
iot_redundant_pkey_elim	character varying(3)	Not supported. Its value is **NULL**.
dropped	character varying(3)	Not supported. Its value is **NULL**.
visibility	character varying(9)	Specifies whether the index is visible to the optimizer. • **VISIBLE**: The index is visible to the optimizer. • **INVISIBLE**: The index is invisible to the optimizer.
domidx_management	character varying(14)	Not supported. Its value is **NULL**.
segment_created	character varying(3)	Not supported. Its value is **NULL**.
orphaned_entries	character varying(3)	Not supported. Its value is **NULL**.
indexing	character varying(7)	Not supported. Its value is **NULL**.

Name	Type	Description
auto	character varying(3)	Not supported. Its value is **NULL**.

12.3.12.16 ADM_OBJECTS

ADM_OBJECTS displays all database objects in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-241 ADM_OBJECTS columns

Name	Type	Description
owner	name	Object owner.
object_name	name	Object name.
object_id	oid	Object OID.
object_type	name	Object class. For example, table, schema, and index.
namespace	oid	Namespace containing an object
temporary	character(1)	Specifies whether an object is a temporary object.
status	character varying(7)	Object status.
subobject_name	name	Subobject name of an object.
generated	character(1)	Specifies whether an object name is generated by the system.
created	timestamp with time zone	Creation time of an object.
last_ddl_time	timestamp with time zone	Last modification time of an object.
default_collation	character varying(100)	Default collation of objects.
data_object_id	numeric	Not supported. Set it to **NULL**.
timestamp	character varying(19)	Not supported. Set it to **NULL**.

Name	Type	Description
secondary	character varying(1)	Not supported. Set it to **NULL**.
edition_name	character varying(128)	Not supported. Set it to **NULL**.
sharing	character varying(18)	Not supported. Set it to **NULL**.
editionable	character varying(1)	Not supported. Set it to **NULL**.
oracle_maintained	character varying(1)	Not supported. Set it to **NULL**.
application	character varying(1)	Not supported. Set it to **NULL**.
duplicated	character varying(1)	Not supported. Set it to **NULL**.
sharded	character varying(1)	Not supported. Set it to **NULL**.
created_appid	numeric	Not supported. Set it to **NULL**.
modified_appid	numeric	Not supported. Set it to **NULL**.
created_vsnid	numeric	Not supported. Set it to **NULL**.
modified_vsnid	numeric	Not supported. Set it to **NULL**.

NOTICE

For details about the value ranges of **created** and **last_ddl_time**, see **PG_OBJECT**.

12.3.12.17 ADM_PROCEDURES

ADM_PROCEDURES displays information about all stored procedures, functions, and triggers in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-242 ADM_PROCEDURES columns

Name	Type	Description
owner	character varying(64)	Owner of a stored procedure, function, trigger, or package

Name	Type	Description
object_name	character varying(64)	Name of a stored procedure, function, or trigger. This column will be a package name if the object is a function in a package or a stored procedure.
procedure_name	character varying(128)	This column will be the name of a function or stored procedure in a package if **object_name** is a package name. Otherwise, the column is empty.
object_id	oid	OID of a stored procedure, function, trigger, or package
subprogram_id	numeric	Location of a function or stored procedure in a package.
overload	character varying(40)	Mth overloaded function.
object_type	character varying(13)	Object class.
aggregate	character varying(3)	Specifies whether the function is an aggregate function: • **YES** • **NO**
pipelined	character varying(3)	Not supported. Set it to **NO**.
impltypeowner	character varying(128)	Owner of an implementation type
impltypename	character varying(128)	Name of an implementation type
parallel	character varying(3)	Not supported. Set it to **NO**.
interface	character varying(3)	Not supported. Set it to **NO**.
deterministic	character varying(3)	Not supported. Set it to **NO**.

Name	Type	Description
authid	character varying(12)	Whether to use the creator permission or caller permission: • **DEFINER**: The creator permission is used. • **CURRENT_USER**: The caller permission is used. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
result_cache	character varying(3)	Not supported. Set it to **NULL**.
origin_con_id	character varying(256)	Not supported. Set it to **0**.
polymorphic	character varying(5)	Not supported. Set it to **NULL**.
argument_number	smallint	Number of input parameters in a stored procedure

12.3.12.18 ADM_RECYCLEBIN

ADM_RECYCLEBIN displays information about all recycle bins. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 12-243 ADM_RECYCLEBIN columns

Name	Type	Description
owner	character varying(128)	Original owner name of the object.
object_name	character varying(128)	New name of an object.
original_name	character varying(128)	Original name of an object.

Name	Type	Description
operation	character varying(18)	Operation performed on an object. The options are as follows: ● **DROP**: The object is deleted (the object is no longer required). ● **TRUNCATE**: The object is truncated.
type	character varying(25)	Object type.
ts_name	character varying(30)	Name of the tablespace to which the object belongs.
createtime	character varying(19)	Timestamp when an object is created.
droptime	character varying(19)	Timestamp when an object is deleted.
dropscn	numeric	System change number (SCN) of the transaction that moves an object to the recycle bin.
partition_name	character varying(128)	Name of a deleted partition.
can_undrop	character varying(3)	Specifies whether to flash back an object.
can_purge	character varying(3)	Specifies whether to purge an object.
related	numeric	ID of the parent object.
base_object	oid	ID of a base object.
purge_object	oid	ID of the purged object.
space	numeric	Number of blocks used by an object.

12.3.12.19 ADM_SCHEDULER_JOB_ARGS

ADM_SCHEDULER_JOB_ARG displays parameters related to all jobs in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-244 ADM_SCHEDULER_JOB_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the job to which the parameter belongs.
job_name	character varying(128)	Name of the job to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter.
value	character varying(4000)	Parameter value.
anydata_value	character varying(4000)	Not supported. Set it to **NULL**.
out_argument	character varying(5)	Reserved column. Set it to **NULL**.

12.3.12.20 ADM_SCHEDULER_JOBS

ADM_SCHEDULER_JOBS displays information about all DBE_SCHEDULER scheduled jobs in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 12-245 ADM_SCHEDULER_JOBS columns

Name	Type	Description
owner	name	Owner of a scheduled job.
job_name	text	Name of a scheduled job.
job_subname	character varying(128)	Not supported. Its value is **NULL**.
job_style	text	Action mode of a scheduled job. It is specified during creation. Its value can only be **"REGULAR"**. If this parameter is not specified, the value is **NULL**.
job_creator	name	Creator of a scheduled job.

Name	Type	Description
client_id	character varying(65)	Not supported. Its value is **NULL**.
global_uid	character varying(33)	Not supported. Its value is **NULL**.
program_owner	character varying(4000)	Owner of a program referenced by a scheduled job.
program_name	text	Name of the program referenced by a scheduled job.
job_type	character varying(16)	Inline program type of a scheduled job. The options are as follows: • **PLSQL_BLOCK**: anonymous block of a stored procedure. • **STORED_PROCEDURE**: stored procedure that is saved. • **EXTERNAL_SCRIPT**: external script.
job_action	text	Program content of a scheduled job.
number_of_arguments	text	Number of parameters of a scheduled job.
schedule_owner	character varying(4000)	Not supported. Its value is **NULL**.
schedule_name	text	Name of the schedule referenced by a scheduled job.
schedule_type	character varying(12)	Not supported. Its value is **NULL**.
start_date	timestamp without time zone	Start time of a scheduled job.
repeat_interval	text	Period of a scheduled job.
event_queue_owner	character varying(128)	Not supported. Its value is **NULL**.
event_queue_name	character varying(128)	Not supported. Its value is **NULL**.

Name	Type	Description
event_queue_agent	character varying(523)	Not supported. Its value is **NULL**.
event_condition	character varying(4000)	Not supported. Its value is **NULL**.
event_rule	character varying(261)	Not supported. Its value is **NULL**.
file_watcher_owner	character varying(261)	Not supported. Its value is **NULL**.
file_watcher_name	character varying(261)	Not supported. Its value is **NULL**.
end_date	timestamp without time zone	End time of a scheduled job.
job_class	text	Name of the scheduled job class to which a scheduled job belongs.
enabled	boolean	Status of a scheduled job.
auto_drop	text	Status of the automatic deletion function of a scheduled job.
restart_on_recovery	character varying(5)	Not supported. Its value is **NULL**.
restart_on_failure	character varying(5)	Not supported. Its value is **NULL**.
state	"char"	Status of a scheduled job.
job_priority	numeric	Not supported. Its value is **NULL**.
run_count	numeric	Not supported. Its value is **NULL**.
uptime_run_count	numeric	Not supported. Its value is **NULL**.
max_runs	numeric	Not supported. Its value is **NULL**.
failure_count	smallint	Number of scheduled job failures.
uptime_failure_count	numeric	Not supported. Its value is **NULL**.

Name	Type	Description
max_failures	numeric	Maximum number of failures allowed before the status of a scheduled job is marked as broken.
retry_count	numeric	Not supported. Its value is **NULL**.
last_start_date	timestamp without time zone	Last time when a scheduled job was started.
last_run_duration	interval day to second(6)	Last execution duration of a scheduled job.
next_run_date	timestamp without time zone	Next execution time of a scheduled job.
schedule_limit	interval day to second(0)	Not supported. Its value is **NULL**.
max_run_duration	interval day to second(0)	Not supported. Its value is **NULL**.
logging_level	character varying(11)	Not supported. Its value is **NULL**.
store_output	character varying(5)	Specifies whether to store the output information of all scheduled jobs.
stop_on_window_close	character varying(5)	Not supported. Its value is **NULL**.
instance_stickiness	character varying(5)	Not supported. Its value is **NULL**.
raise_events	character varying(4000)	Not supported. Its value is **NULL**.
system	character varying(5)	Not supported. Its value is **NULL**.
job_weight	numeric	Not supported. Its value is **NULL**.
nls_env	character varying(4000)	Not supported. Its value is **NULL**.
source	character varying(128)	Not supported. Its value is **NULL**.
number_of_destinations	numeric	Not supported. Its value is **NULL**.
destination_owner	character varying(261)	Not supported. Its value is **NULL**.

Name	Type	Description
destination	text	Target name of a scheduled job.
credential_owner	character varying(128)	Not supported. Its value is **NULL**.
credential_name	text	Certificate name of a scheduled job
instance_id	oid	OID of the current database.
deferred_drop	character varying(5)	Not supported. Its value is **NULL**.
allow_runs_in_restricted_mode	character varying(5)	Not supported. Its value is **NULL**.
comments	text	Comments of a scheduled job.
flags	numeric	Not supported. Its value is **NULL**.
restartable	character varying(5)	Not supported. Its value is **NULL**.
has_constraints	character varying(5)	Not supported. Its value is **NULL**.
connect_credential_owner	character varying(128)	Not supported. Its value is **NULL**.
connect_credential_name	character varying(128)	Not supported. Its value is **NULL**.
fail_on_script_error	character varying(5)	Not supported. Its value is **NULL**.

12.3.12.21 ADM_SCHEDULER_PROGRAM_ARGS

ADM_SCHEDULER_PROGRAM_ARG displays parameters related to all programs in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-246 ADM_SCHEDULER_PROGRAM_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the program to which the parameter belongs.

Name	Type	Description
program_name	character varying(128)	Name of the program to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter.
metadata_attribute	character varying(19)	Not supported. Set it to **NULL**.
default_value	character varying(4000)	Default parameter value.
default_anydata_value	character varying(4000)	Not supported. Set it to **NULL**.
out_argument	character varying(5)	Reserved column. Set it to **NULL**.

12.3.12.22 ADM_SCHEDULER_PROGRAMS

ADM_SCHEDULER_PROGRAMS displays information about all programs that can be scheduled in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 12-247 ADM_SCHEDULER_PROGRAMS columns

Name	Type	Description
owner	name	Owner of a scheduler program
program_name	text	Name of a scheduler program

Name	Type	Description
program_type	character varying(16)	Type of the scheduler. The options are as follows: • **PLSQL_BLOCK**: anonymous block of a stored procedure. • **STORED_PROCEDURE**: stored procedure that is saved. • **EXTERNAL_SCRIPT**: external script.
program_action	text	Action performed by a scheduler program
number_of_arguments	numeric	Number of scheduler program parameters
enabled	character varying(5)	Specifies whether a scheduler program is enabled.
comments	text	Comments of a scheduler program
detached	character varying(5)	Not supported. Its value is **NULL**.
schedule_limit	interval day to second(0)	Not supported. Its value is **NULL**.
priority	numeric	Not supported. Its value is **NULL**.
weight	numeric	Not supported. Its value is **NULL**.
max_runs	numeric	Not supported. Its value is **NULL**.
max_failures	numeric	Not supported. Its value is **NULL**.
max_run_duration	interval day to second(0)	Not supported. Its value is **NULL**.
has_constraints	character varying(5)	Not supported. Its value is **NULL**.
nls_env	character varying(4000)	Not supported. Its value is **NULL**.

12.3.12.23 ADM_SCHEDULER_RUNNING_JOBS

ADM_SCHEDULER_RUNNING_JOBS displays information about all **DBE_SCHEDULER** jobs that are being executed in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-248 ADM_SCHEDULER_RUNNING_JOBS columns

Name	Type	Description
owner	character varying(128)	Owner of a scheduler job
job_name	character varying(128)	Name of a scheduler job
job_subname	character varying(128)	Not supported. Set it to **NULL**.
job_style	character varying(17)	Action style of a scheduler job
detached	character varying(5)	Not supported. Set it to **NULL**.
session_id	numeric	ID of the session that executes a scheduler job
slave_process_id	numeric	Not supported. Set it to **NULL**.
slave_os_process_id	character varying(12)	ID of the process that executes a scheduler job
running_instance	numeric	Not supported. Set it to **NULL**.
resource_consumer_group	character varying(32)	Not supported. Set it to **NULL**.
elapsed_time	interval day to second(2)	Execution duration of a scheduler job
cpu_used	interval day to second(2)	Not supported. Set it to **NULL**.
destination_owner	character varying(261)	Not supported. Set it to **NULL**.
destination	character varying(261)	Target name of a scheduler job
credential_owner	character varying(128)	Not supported. Set it to **NULL**.
credential_name	character varying(128)	Certificate name of a scheduler job.

Name	Type	Description
log_id	numeric	Not supported. Set it to **NULL**.

12.3.12.24 ADM_SEGMENTS

ADM_SEGMENTS displays the storage space allocated to all segments in the database. It exists in the PG_CATALOG and SYS schemas. Only the system administrator can access this view. The Astore engine supports the segment-page storage, but information cannot be obtained from the system catalog.

Table 12-249 ADM_SEGMENTS columns

Name	Type	Description
owner	character varying(128)	Not supported. The value is **NULL**.
segment_name	character varying(128)	Not supported. The value is **NULL**.
partition_name	character varying(128)	Not supported. The value is **NULL**.
segment_type	character varying(18)	Not supported. The value is **NULL**.
segment_subtype	character varying(10)	Not supported. The value is **NULL**.
tablespace_name	character varying(30)	Not supported. The value is **NULL**.
header_file	numeric	Not supported. The value is **NULL**.
header_block	numeric	Not supported. The value is **NULL**.
bytes	numeric	Not supported. The value is **NULL**.
blocks	numeric	Not supported. The value is **NULL**.
extents	numeric	Not supported. The value is **NULL**.
initial_extent	numeric	Not supported. The value is **NULL**.
next_extent	numeric	Not supported. The value is **NULL**.

Name	Type	Description
min_extents	numeric	Not supported. The value is **NULL**.
max_extents	numeric	Not supported. The value is **NULL**.
max_size	numeric	Not supported. The value is **NULL**.
retention	character varying(7)	Not supported. The value is **NULL**.
minretention	numeric	Not supported. The value is **NULL**.
pct_increase	numeric	Not supported. The value is **NULL**.
freelists	numeric	Not supported. The value is **NULL**.
freelist_groups	numeric	Not supported. The value is **NULL**.
relative_fno	numeric	Not supported. The value is **NULL**.
buffer_pool	character varying(7)	Not supported. The value is **NULL**.
flash_cache	character varying(7)	Not supported. The value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. The value is **NULL**.
inmemory	character varying(8)	Not supported. The value is **NULL**.
inmemory_priority	character varying(8)	Not supported. The value is **NULL**.
inmemory_distribute	character varying(15)	Not supported. The value is **NULL**.
inmemory_duplicate	character varying(13)	Not supported. The value is **NULL**.
inmemory_compression	character varying(17)	Not supported. The value is **NULL**.
cellmemory	character varying(24)	Not supported. The value is **NULL**.

12.3.12.25 ADM_SEQUENCES

ADM_SEQUENCES displays information about all sequences in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 12-250 ADM_SEQUENCES columns

Name	Type	Description
sequence_owner	character varying(64)	Owner of a sequence.
sequence_name	character varying(64)	Name of the sequence.
min_value	int16	Minimum value of the sequence.
max_value	int16	Maximum value of the sequence.
increment_by	int16	Increment of the sequence.
last_number	int16	Value of the previous sequence.
cache_size	int16	Size of the sequence disk cache.
cycle_flag	character(1)	Specifies whether a sequence is a cyclic sequence. Value range: • **Y**: It is a cyclic sequence. • **N**: It is not a cyclic sequence.

12.3.12.26 ADM_SOURCE

ADM_SOURCE displays the definition information about all stored procedures, functions, triggers, and packages in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 12-251 ADM_SOURCE columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.

Name	Type	Description
type	name	Object type. Its values can be **function**, **package**, **package body**, **procedure**, and **trigger**.
line	numeric	Number of the line in the definition information.
text	text	Text source of the storage object.
origin_con_id	character varying(256)	Not supported. Its value is **0**.

12.3.12.27 ADM_SYNONYMS

ADM_SYNONYMS displays all synonyms in the database. This view is accessible only to system administrators. This view exists in both PG_CATALOG and SYS schema.

Table 12-252 ADM_SYNONYMS columns

Name	Type	Description
owner	text	Owner of a synonym. The owner of the PUBLIC synonym is PUBLIC.
schema_name	text	Name of the schema to which the synonym belongs. The name of the schema to which the PUBLIC synonym belongs is NULL.
synonym_name	text	Synonym name.
table_owner	text	Owner of the associated object. Although the column is called **table_owner**, its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_name	text	Name of the associated object. Although the column is called **table_name**, its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_schema_name	text	Schema name of the associated object. Although the column is called **table_schema_name**, its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.

12.3.12.28 ADM_TAB_COL_STATISTICS

ADM_TAB_COL_STATISTICS displays column statistics and histogram information extracted from ADM_TAB_COLUMNS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema. The values of the **LOW_VALUE** and **HIGH_VALUE** columns in this view are different from those in database A due to different underlying table structures. When the value of **LOW_VALUE** is a high-frequency value, the value of **LOW_VALUE** in GaussDB is the second smallest value. When **HIGH_VALUE** is a high-frequency value, **HIGH_VALUE** of GaussDB is the second highest value. The value of the **HISTOGRAM** column is different from that of database A due to different statistical methods. GaussDB supports only two types of histograms: frequency and equi-width. The value of the **SCOPE** column in GaussDB is different from that in database A because GaussDB does not support global temporary table statistics. GaussDB database supports only local temporary table statistics, and the default value is **SHARED**.

Table 12-253 ADM_TAB_COL_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Low value in a column.
high_value	raw	High value in a column.
density	numeric	• If there is a histogram on **COLUMN_NAME**, this column displays the selectivity of values in the histogram that span less than two endpoints. It does not represent the selectivity of values that span two or more endpoints. • If no histogram is available on **COLUMN_NAME**, the value of this column is **1/NUM_DISTINCT**.
num_nulls	numeric	Number of empty values in a column.

Name	Type	Description
num_buckets	numeric	Number of buckets in the histogram of a column.
sample_size	numeric	Sample size used to analyze a column.
last_analyzed	timestamp(0) without time zone	Date when a column was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
notes	character varying(99)	Not supported. Its value is **NULL**.
avg_col_len	numeric	Average length of a column, in bytes.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. ● **NONE**: no histogram. ● **FREQUENCY**: frequency histogram. ● **EQUI-WIDTH**: equal-width histogram.
scope	character varying(7)	For statistics collected on any table other than global temporary tables, the value is **SHARED** (indicating that the statistics are shared among all sessions).
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.12.29 ADM_TAB_COLS

ADM_TAB_COLS displays information about table and view columns. Each column of each table and view in the database has a row of data in ADM_TAB_COLS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG

and SYS schema. The number of rows displayed in this view is the same as that in the ADM_TAB_COLUMNS view. Only columns are different.

Table 12-254 ADM_TAB_COLS columns

Name	Type	Description
owner	character varying(64)	Owner of a table or view.
table_name	character varying(128)	Name of the table or view.
column_name	character varying(128)	Column name.
data_type	character varying(128)	Data type of a column, which can be a user-defined data type.
data_type_mod	character varying(3)	Not supported. Its value is **NULL**.
data_type_owner	character varying(128)	Owner of the data type of a column.
data_length	numeric	Length of a column, in bytes.
data_precision	numeric	Precision of a data type. This column is valid for the numeric data type and **NULL** for other data types.
data_scale	numeric	Number of decimal places. This column is valid for the numeric data type and is set to **0** for other data types.
nullable	character varying(1)	Specifies whether a column can be empty (**n** for the primary key constraint and non-null constraint).
column_id	numeric	Sequence number of a column when a table is created.
default_length	numeric	Length of the default value of a column, in bytes.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.
density	numeric	Column density.

Name	Type	Description
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	timestamp(0) without time zone	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported. Its value is **NULL**.
char_col_decl_length	numeric	Declaration length of a column of the character type.
global_stats	character varying(3)	Not supported. Its value is **NO**.
user_stats	character varying(3)	Not supported. Its value is **NO**.
avg_col_len	numeric	Average length of a column, in bytes.
char_length	numeric	Column length (in bytes) which is valid only for the varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported. Set it to **B** if the data type is varchar, nvarchar2, bpchar, or char, and to **NULL** for other data types.
v80_fmt_image	character varying(3)	Not supported. Its value is **NULL**.
data_upgraded	character varying(3)	Not supported. Its value is **YES**.
hidden_column	character varying(3)	Not supported. Its value is **NULL**.
virtual_column	character varying	Specifies whether a column is a virtual column (a generated column). • **YES** • **NO**

Name	Type	Description
segment_column_id	numeric	Not supported. Its value is **NULL**.
internal_column_id	numeric	Internal sequence number of a column. The value is the same as that of **COLUMN_ID**.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. • **NONE**: no histogram. • **FREQUENCY**: frequency histogram. • **EQUI_WIDTH**: equal-width histogram.
qualified_col_name	character varying(64)	Qualified column name, which is the same as **COLUMN_NAME**.
user_generated	character varying(3)	Not supported. Its value is **YES**.
default_on_null	character varying(3)	Not supported. Its value is **NULL**.
identity_column	character varying(3)	Not supported. Its value is **NULL**.
sensitive_column	character varying(3)	Not supported. Its value is **NULL**.
evaluation_edition	character varying(128)	Not supported. Its value is **NULL**.
unusable_before	character varying(128)	Not supported. Its value is **NULL**.
unusable_beginning	character varying(128)	Not supported. Its value is **NULL**.
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
collated_column_id	numeric	Not supported. Its value is **NULL**.
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.12.30 ADM_TAB_COLUMNS

ADM_TAB_COLUMNS displays information about the columns of tables and views. Each column of each table and view in the database has a row of data in ADM_TAB_COLUMNS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 12-255 ADM_TAB_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
data_type	character varying(128)	Data type of a column.
data_type_mod	character varying(3)	Not supported. Its value is **NULL**.
data_type_owner	character varying(128)	Owner of the data type of a column.
data_length	integer	Length of a column, in bytes.
data_precision	integer	Precision of a data type. This column is valid for the numeric data type and **NULL** for other data types.
data_scale	integer	Number of decimal places. This column is valid for the numeric data type and is set to **0** for other data types.
nullable	bpchar	Specifies whether the column can be null. Value range: • **y**: yes. • **n**: no. For primary key constraints and non-null constraints, the value is **n**.
column_id	integer	Sequence number of a column when a table is created.
default_length	numeric	Length of the default value of a column, in bytes. This column is left blank if no default value left.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.

Name	Type	Description
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.
density	numeric	Column density.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	timestamp(0) without time zone	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported. Its value is **NULL**.
char_col_decl_length	numeric	Declaration length of a column of the character type.
global_stats	character varying(3)	Not supported. Its value is **NO**.
user_stats	character varying(3)	Not supported. Its value is **NO**.
avg_col_len	numeric	Average length of a column, in bytes.
char_length	numeric	Column length (in bytes) which is valid only for the varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported. Set it to **B** if the data type is varchar, nvarchar2, bpchar, or char. For other data types, set it to **NULL**.
v80_fmt_image	character varying(3)	Not supported. Its value is **NULL**.
data_upgraded	character varying(3)	Not supported. Its value is **YES**.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. • **NONE**: no histogram. • **FREQUENCY**: frequency histogram. • **EQUI_WIDTH**: equal-width histogram.
default_on_null	character varying(3)	Not supported. Its value is **NULL**.
identity_column	character varying(3)	Not supported. Its value is **NULL**.

Name	Type	Description
sensitive_column	character varying(3)	Not supported. Its value is **NULL**.
evaluation_edition	character varying(128)	Not supported. Its value is **NULL**.
unusable_before	character varying(128)	Not supported. Its value is **NULL**.
unusable_beginning	character varying(128)	Not supported. Its value is **NULL**.
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
comments	text	Comment of a column.
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.12.31 ADM_TAB_COMMENTS

ADM_TAB_COMMENTS displays comments about all tables and views in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-256 ADM_TAB_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Owner of a table or view.
table_name	character varying(64)	Name of a table or view.
comments	text	Comments.
schema	character varying(64)	Name of the namespace to which the table belongs.

12.3.12.32 ADM_TAB_HISTOGRAMS

ADM_TAB_HISTOGRAMS displays the histogram information about all tables and views in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-257 ADM_TAB_HISTOGRAMS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(4000)	Column name or attribute of an object column.
endpoint_number	numeric	Bucket ID of the histogram.
endpoint_value	numeric	Not supported. Set it to **NULL**.
endpoint_actual_value	character varying(4000)	Actual value of the bucket endpoint.
endpoint_actual_value_raw	raw	Not supported. Set it to **NULL**.
endpoint_repeat_count	numeric	Not supported. Set it to **NULL**.
scope	character varying(7)	Not supported. Set it to **SHARED**.

12.3.12.33 ADM_TAB_STATISTICS

ADM_TAB_STATISTICS displays optimizer statistics for all tables in the database. This view exists in the PG_CATALOG and SYS schemas. By default, only the system administrator can access this view. Common users can access the view only after being authorized.

Table 12-258 ADM_TAB_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Object owner.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported. Set it to **NULL**.
partition_position	numeric	Not supported. Set it to **NULL**.
subpartition_name	character varying(128)	Not supported. Set it to **NULL**.

Name	Type	Description
subpartition_position	numeric	Not supported. Set it to **NULL**.
object_type	character varying(12)	Object type. • **TABLE** • **PARTITION** • **SUBPARTITION**
num_rows	numeric	Number of rows in an object.
blocks	numeric	Not supported. Set it to **NULL**.
empty_blocks	numeric	Not supported. Set it to **NULL**.
avg_space	numeric	Not supported. Set it to **NULL**.
chain_cnt	numeric	Not supported. Set it to **NULL**.
avg_row_len	integer	Average row length, including the row overhead.
avg_space_freelist_blocks	numeric	Not supported. Set it to **NULL**.
num_freelist_blocks	numeric	Not supported. Set it to **NULL**.
avg_cached_blocks	numeric	Not supported. Set it to **NULL**.
avg_cache_hit_ratio	numeric	Not supported. Set it to **NULL**.
im_imcu_count	numeric	Not supported. Set it to **NULL**.
im_block_count	numeric	Not supported. Set it to **NULL**.
im_stat_update_time	timestamp(6) without time zone	Not supported. Set it to **NULL**.
scan_rate	numeric	Not supported. Set it to **NULL**.
sample_size	numeric	Number of samples used for analyzing a table.
last_analyzed	timestamp with time zone	Date when a table was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported. Set it to **NULL**.
user_stats	character varying(3)	Not supported. Set it to **NULL**.

Name	Type	Description
stattype_locked	character varying(5)	Not supported. Set it to **NULL**.
stale_stats	character varying(7)	Not supported. Set it to **NULL**.
notes	character varying(25)	Not supported. Set it to **NULL**.
scope	character varying(7)	Not supported. Set it to **SHARED**.

12.3.12.34 ADM_TAB_STATS_HISTORY

ADM_TAB_STATS_HISTORY provides historical statistics about all tables in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-259 ADM_TAB_STATS_HISTORY columns

Name	Type	Description
owner	character varying(128)	Object owner.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported. Set it to **NULL**.
subpartition_name	character varying(128)	Not supported. Set it to **NULL**.
stats_update_time	timestamp(6) with time zone	Time when statistics are updated. Database restart is not supported. Otherwise, data loss will occur.

12.3.12.35 ADM_TABLES

ADM_TABLES displays all tables in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-260 ADM_TABLES columns

Name	Type	Description
owner	character varying(64)	Table owner
table_name	character varying(64)	Table name
tablespace_name	character varying(64)	Tablespace name of the table
dropped	character varying	Specifies whether the current table is deleted. ● **YES**: The record is deleted. ● **NO**: The record is not deleted.
num_rows	numeric	Estimated number of rows in the table
status	character varying(8)	Specifies whether the current table is valid. ● **VALID**: The current table is valid. ● **UNUSABLE**: The current table is unavailable.
sample_size	numeric	Number of samples used for analyzing the table
temporary	character(1)	Specifies whether a table is a temporary table. ● **Y**: The table is a temporary table. ● **N**: The table is not a temporary table.
pct_free	numeric	Minimum percentage of free space in a block
ini_trans	numeric	Initial number of transactions
max_trans	numeric	Maximum number of transactions
avg_row_len	integer	Average number of bytes in each row

Name	Type	Description
partitioned	character varying(3)	Specifies whether a table is a partitioned table. ● **YES**: The table is a partitioned table. ● **NO**: The table is not a partitioned table.
last_analyzed	timestamp with time zone	Last time when the table was analyzed. Database restart is not supported. Otherwise, data loss will occur.
row_movement	character varying(8)	Specifies whether to allow partition row movement. ● **ENABLED**: The partition row movement is allowed. ● **DISABLED**: The partition row movement is not allowed.
compression	character varying(8)	Specifies whether to enable a table compression. ● **ENABLED**: A table compression is enabled. ● **DISABLED**: A table compression is disabled.
duration	character varying(15)	Time elapsed when a temporary table is processed ● **NULL**: The table is not a temporary table. ● **sys$session**: The table is a temporary session table. ● **sys$transaction**: The table is a temporary transaction table.

Name	Type	Description
logical_replication	character varying(8)	Specifies whether logical replication is enabled for a table. • **ENABLED**: Logical replication is enabled. • **DISABLED**: Logical replication is disabled.
external	character varying(3)	Specifies whether the table is an external table. • **YES**: The table is an external table. • **NO**: The table is not an external table.
logging	character varying(3)	Specifies whether changes to a table are logged. • **YES**: Logs are recorded for table changes. • **NO**: Logs are not recorded for table changes.
default_collation	character varying(100)	Default collation of a table
degree	character varying(10)	Number of instances in a scanned table
table_lock	character varying(8)	Specifies whether to enable a table lock. • **ENABLED**: The table lock is enabled. • **DISABLED**: The table lock is disabled.
nested	character varying(3)	Specifies whether a table is a nested table. • **YES**: The table is a nested table. • **NO**: The table is not a nested table.
buffer_pool	character varying(7)	Default buffer pool of a table
flash_cache	character varying(7)	Not supported. The value is **NULL**.

Name	Type	Description
cell_flash_cache	character varying(7)	Not supported. The value is **NULL**.
skip_corrupt	character varying(8)	Specifies whether to skip corrupted blocks during table scanning. ● **ENABLED**: The corrupted block is skipped. ● **DISABLED**: The corrupted block is not skipped.
has_identity	character varying(3)	Specifies whether a table has an identifier column. ● **YES**: There is an identifier column. ● **NO**: There is no identifier column.
segment_created	character varying(3)	Specifies whether a table segment has been created. ● **YES**: The table segment has been created. ● **NO**: The table segment is not created.
monitoring	character varying(3)	Specifies whether to monitor the modification of a table. ● **YES**: The modification of the table is monitored. ● **NO**: The modification of the table is not monitored.
cluster_name	character varying(128)	Not supported. The value is **NULL**.
iot_name	character varying(128)	Not supported. The value is **NULL**.
pct_used	numeric	Not supported. The value is **NULL**.

Name	Type	Description
initial_extent	numeric	Not supported. The value is **NULL**.
next_extent	numeric	Not supported. The value is **NULL**.
min_extents	numeric	Not supported. The value is **NULL**.
max_extents	numeric	Not supported. The value is **NULL**.
pct_increase	numeric	Not supported. The value is **NULL**.
freelists	numeric	Not supported. The value is **NULL**.
freelist_groups	numeric	Not supported. The value is **NULL**.
backed_up	character varying(1)	Not supported. The value is **NULL**.
blocks	numeric	Not supported. The value is **NULL**.
empty_blocks	numeric	Not supported. The value is **NULL**.
avg_space	numeric	Not supported. The value is **NULL**.
chain_cnt	numeric	Not supported. The value is **NULL**.
avg_space_freelist_blocks	numeric	Not supported. The value is **NULL**.
num_freelist_blocks	numeric	Not supported. The value is **NULL**.
instances	character varying(10)	Not supported. The value is **NULL**.
cache	character varying(5)	Not supported. The value is **NULL**.
iot_type	character varying(12)	Not supported. The value is **NULL**.
secondary	character varying(1)	Not supported. The value is **NULL**.
global_stats	character varying(3)	Not supported. The value is **NULL**.

Name	Type	Description
user_stats	character varying(3)	Not supported. The value is **NULL**.
cluster_owner	character varying(30)	Not supported. The value is **NULL**.
dependencies	character varying(8)	Not supported. The value is **NULL**.
compression_for	character varying(30)	Not supported. The value is **NULL**.
read_only	character varying(3)	Not supported. The value is **NULL**.
result_cache	character varying(7)	Not supported. The value is **NULL**.
clustering	character varying(3)	Not supported. The value is **NULL**.
activity_tracking	character varying(23)	Not supported. The value is **NULL**.
dml_timestamp	character varying(25)	Not supported. The value is **NULL**.
container_data	character varying(3)	Not supported. The value is **NULL**.
inmemory_priority	character varying(8)	Not supported. The value is **NULL**.
inmemory_distribute	character varying(15)	Not supported. The value is **NULL**.
inmemory_compression	character varying(17)	Not supported. The value is **NULL**.
inmemory_duplicate	character varying(13)	Not supported. The value is **NULL**.
duplicated	character varying(1)	Not supported. The value is **NULL**.
sharded	character varying(1)	Not supported. The value is **NULL**.
hybrid	character varying(3)	Not supported. The value is **NULL**.
cellmemory	character varying(24)	Not supported. The value is **NULL**.
containers_default	character varying(3)	Not supported. The value is **NULL**.

Name	Type	Description
container_map	character varying(3)	Not supported. The value is **NULL**.
extended_data_link	character varying(3)	Not supported. The value is **NULL**.
extended_data_link_map	character varying(3)	Not supported. The value is **NULL**.
inmemory_service	character varying(12)	Not supported. The value is **NULL**.
inmemory_service_name	character varying(1000)	Not supported. The value is **NULL**.
container_map_object	character varying(3)	Not supported. The value is **NULL**.
memoptimize_read	character varying(8)	Not supported. The value is **NULL**.
memoptimize_write	character varying(8)	Not supported. The value is **NULL**.
has_sensitive_column	character varying(3)	Not supported. The value is **NULL**.
admit_null	character varying(3)	Not supported. The value is **NULL**.
data_link_dml_enabled	character varying(3)	Not supported. The value is **NULL**.
object_id_type	character varying(16)	Not supported. The value is **NULL**.
table_type_owner	character varying(128)	Not supported. The value is **NULL**.
table_type	character varying(128)	Not supported. The value is **NULL**.
compress_for	character varying(30)	Not supported. The value is **NULL**.

12.3.12.36 ADM_TABLESPACES

ADM_TABLESPACES displays information about all tablespaces. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas. The logical structure features of GaussDB are different from those of the A database.

Table 12-261 ADM_TABLESPACES columns

Name	Type	Description
tablespace_name	character varying(64)	Tablespace name.
block_size	numeric	Not supported. The value is **NULL**.
initial_extent	numeric	Not supported. The value is **NULL**.
next_extent	numeric	Not supported. The value is **NULL**.
min_extents	numeric	Not supported. The value is **NULL**.
max_extents	numeric	Not supported. The value is **NULL**.
max_size	numeric	Not supported. The value is **NULL**.
pct_increase	numeric	Not supported. The value is **NULL**.
min_extlen	numeric	Not supported. The value is **NULL**.
contents	character varying(9)	Not supported. The value is **NULL**.
status	character varying(9)	Not supported. The value is **ONLINE**.
logging	character varying(9)	Not supported. The value is **NULL**.
force_logging	character varying(3)	Not supported. The value is **NULL**.
extent_management	character varying(10)	Not supported. The value is **NULL**.
allocation_type	character varying(9)	Not supported. The value is **NULL**.
plugged_in	character varying(3)	Not supported. The value is **NULL**.
segment_space_management	character varying(6)	Not supported. The value is **NULL**.
def_tab_compression	character varying(8)	Not supported. The value is **NULL**.
retention	character varying(11)	Not supported. The value is **NULL**.

Name	Type	Description
bigfile	character varying(3)	Not supported. The value is **NULL**.
predicate_evaluation	character varying(7)	Not supported. The value is **NULL**.
encrypted	character varying(3)	Not supported. The value is **NULL**.
compress_for	character varying(30)	Not supported. The value is **NULL**.
def_inmemory	character varying(8)	Not supported. The value is **NULL**.
def_inmemory_priority	character varying(8)	Not supported. The value is **NULL**.
def_inmemory_distribute	character varying(15)	Not supported. The value is **NULL**.
def_inmemory_compression	character varying(17)	Not supported. The value is **NULL**.
def_inmemory_duplicate	character varying(13)	Not supported. The value is **NULL**.
shared	character varying(12)	Not supported. The value is **NULL**.
def_index_compression	character varying(8)	Not supported. The value is **NULL**.
index_compress_for	character varying(13)	Not supported. The value is **NULL**.
def_cellmemory	character varying(14)	Not supported. The value is **NULL**.
def_inmemory_service	character varying(12)	Not supported. The value is **NULL**.
def_inmemory_service_name	character varying(1000)	Not supported. The value is **NULL**.
lost_write_protect	character varying(7)	Not supported. The value is **NULL**.
chunk_tablespace	character varying(1)	Not supported. The value is **NULL**.

12.3.12.37 ADM_TRIGGERS

ADM_TRIGGERS displays information about triggers in the database. By default, only the system administrator can access this view. Common users can access the

view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 12-262 ADM_TRIGGERS columns

Name	Type	Description
owner	character varying(128)	Trigger owner.
trigger_name	character varying(64)	Trigger name.
trigger_type	character varying	Time when a trigger is triggered. Value range: **before statement**, **before each row**, **after statement**, **after each row**, and **instead of**.
triggering_event	character varying	Event that triggers a trigger. Value range: **update**, **insert**, **delete**, and **truncate**.
table_owner	character varying(64)	Owner of the table that defines a trigger.
base_object_type	character varying(18)	Defines the basic object of a trigger. Value range: **table** and **view**.
table_name	character varying(64)	Name of the table or view that defines a trigger.
column_name	character varying(4000)	Not supported. Its value is **NULL**.
referencing_name	character varying(422)	Not supported. Its value is **referencing new as new old as old**.
when_clause	character varying(4000)	Content of the WHEN clause. **trigger_body** can be executed only when the value is **true**.
status	character varying(64)	Trigger status: • **O**: The trigger is enabled in origin or local mode. • **D**: The trigger is disabled. • **R**: The trigger is enabled in replica mode. • **A**: The trigger is always enabled.
description	character varying(4000)	Trigger description, which is used to rebuild a trigger creation statement.
action_type	character varying(11)	Action type of a trigger, which only supports **call**.
trigger_body	text	Statement executed when a trigger is triggered.

Name	Type	Description
crossedition	character varying(7)	Not supported. Its value is **NULL**.
before_statement	character varying(3)	Not supported. Its value is **NULL**.
before_row	character varying(3)	Not supported. Its value is **NULL**.
after_row	character varying(3)	Not supported. Its value is **NULL**.
after_statement	character varying(3)	Not supported. Its value is **NULL**.
instead_of_row	character varying(3)	Not supported. Its value is **NULL**.
fire_once	character varying(3)	Not supported. Its value is **NULL**.
apply_server_only	character varying(3)	Not supported. Its value is **NULL**.

12.3.12.38 ADM_TYPE_ATTRS

ADM_TYPE_ATTRS displays the attributes of the current database object type. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 12-263 ADM_TYPE_ATTRS columns

Name	Type	Description
owner	oid	Owner of the type.
type_name	name	Data type name.
attr_name	name	Column name.
attr_type_mod	integer	Type-specific data supplied at the table creation time (for example, the maximum length of a **varchar** column). This column is used as the third parameter when passing to type-specific input functions and length coercion functions. The value will generally be **–1** for types that do not need ATTTYPMOD.
attr_type_owner	oid	Owner of an attribute of this type.

Name	Type	Description
attr_type_name	name	Data type attribute name, which records the type name after conversion.
length	smallint	Number of bytes in the internal representation of the type for a fixed-size type. It is a negative number for a variable-length type. • The value **-1** indicates a "varlena" type (one that has a length word). • The value **-2** indicates a NULL-terminated C string.
precision	integer	Precision of the numeric type.
scale	integer	Range of the numeric type
character_set_name	character(1)	Character set name of an attribute (**c** or **n**). • **c**: CHAR_CS. • **n**: NCHAR_CS.
attr_no	smallint	Attribute number
inherited	character(1)	Specifies whether the attribute is inherited from the super type (**Y** or **N**).
attr_length	integer	Type-specific data supplied at the table creation time (for example, the maximum length of a **varchar** column). The raw type is not recorded due to kernel implementation.

12.3.12.39 ADM_TYPES

ADM_TYPES describes all object types in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-264 ADM_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of the type.
type_name	character varying(128)	Type name.
type_oid	raw	Type OID.
typecode	character varying(128)	Type code.
attributes	numeric	Number of attributes in a type.
methods	numeric	Not supported. Set it to **0**.

Name	Type	Description
predefined	character varying(3)	Specifies whether the type is a predefined type.
incomplete	character varying(3)	Specifies whether the type is an incomplete type.
final	character varying(3)	Not supported. Set it to **NULL**.
instantiable	character varying(3)	Not supported. Set it to **NULL**.
persistable	character varying(3)	Not supported. Set it to **NULL**.
supertype_owner	character varying(128)	Not supported. Set it to **NULL**.
supertype_name	character varying(128)	Not supported. Set it to **NULL**.
local_attributes	numeric	Not supported. Set it to **NULL**.
local_methods	numeric	Not supported. Set it to **NULL**.
typeid	raw	Not supported. Set it to **NULL**.

12.3.12.40 ADM_VIEWS

ADM_VIEWS displays views in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-265 ADM_VIEWS columns

Name	Type	Description
owner	character varying(64)	Owner of a view.
view_name	character varying(64)	Name of the view.
text	text	Text of a view.
text_length	integer	Text length of a view.

Name	Type	Description
text_vc	character varying(4000)	View creation statement. This column may truncate the view text. The BEQUEATH clause will not appear as part of the **TEXT_VC** column in this view.
type_text_length	numeric	Not supported. Set it to **NULL**.
type_text	character varying(4000)	Not supported. Set it to **NULL**.
oid_text_length	numeric	Not supported. Set it to **NULL**.
oid_text	character varying(4000)	Not supported. Set it to **NULL**.
view_type_owner	character varying(128)	Not supported. Set it to **NULL**.
view_type	character varying(128)	Not supported. Set it to **NULL**.
superview_name	character varying(128)	Not supported. Set it to **NULL**.
editioning_view	character varying(1)	Not supported. Set it to **NULL**.
read_only	character varying(1)	Not supported. Set it to **NULL**.
container_data	character varying(1)	Not supported. Set it to **NULL**.
bequeath	character varying(12)	Not supported. Set it to **NULL**.
origin_con_id	character varying(256)	Not supported. Set it to **NULL**.
default_collation	character varying(100)	Not supported. Set it to **NULL**.
containers_default	character varying(3)	Not supported. Set it to **NULL**.
container_map	character varying(3)	Not supported. Set it to **NULL**.
extended_data_link	character varying(3)	Not supported. Set it to **NULL**.

Name	Type	Description
extended_data_link_map	character varying(3)	Not supported. Set it to **NULL**.
has_sensitive_column	character varying(3)	Not supported. Set it to **NULL**.
admit_null	character varying(3)	Not supported. Set it to **NULL**.
pdb_local_only	character varying(3)	Not supported. Set it to **NULL**.

12.3.12.41 DB_ARGUMENTS

DB_ARGUMENTS displays parameter information about stored procedures and functions accessible to the current user. This view exists in both PG_CATALOG and SYS schema. This view is accessible to all users and displays all information accessible to the current user.

Table 12-266 DB_ARGUMENTS columns

Name	Type	Description
owner	character varying(128)	Owner of a function or stored procedure.
object_name	character varying(128)	Name of a function or stored procedure.
package_name	character varying(128)	Package name.
object_id	oid	OID of a function or stored procedure.
overload	character varying(40)	*n*th overloaded function of the name.
subprogram_id	numeric	Location of a function or stored procedure in a package.
argument_name	character varying(128)	Parameter name.
position	numeric	Position of the parameter in the parameter list. The value is **0** for the return value of the function by default.

Name	Type	Description
sequence	numeric	Sequence of a parameter, which starts from 1, with the return type before all parameters.
data_level	numeric	Nesting depth of parameters of the composite type. The value is fixed at **0** because only one line is displayed for each parameter.
data_type	character varying(30)	Data type of a parameter.
defaulted	character varying(1)	Specifies whether a parameter has a default value: • **Y**: yes. • **N**: no.
default_value	text	Not supported. Its value is **NULL**.
default_length	numeric	Not supported. Its value is **NULL**.
in_out	character varying(9)	Input and output attributes of a parameter: • **IN**: input parameter. • **OUT**: output parameter. • **IN_OUT**: input and output parameters. • **VARIADIC**: VARIADIC parameter.
data_length	numeric	Not supported. Its value is **NULL**.
data_precision	numeric	Not supported. Its value is **NULL**.
data_scale	numeric	Not supported. Its value is **NULL**.

Name	Type	Description
radix	numeric	Radix of a number, which is **10** when the data type is smallint, integer, bigint, numeric, or float. For other data types, set this column to **NULL**.
character_set_name	character varying(44)	Not supported. Its value is **NULL**.
type_owner	character varying(128)	Owner of the data type.
type_name	character varying(128)	Parameter type name. Only the customized type is displayed.
type_subname	character varying(128)	Not supported. Its value is **NULL**.
type_link	character varying(128)	Not supported. Its value is **NULL**.
type_object_type	character varying(7)	Type of **type_name**: • **TABLE**: The parameter is of the table type. • **VIEW**: The parameter is of the view type. • For other data types, the value is **NULL**.
pls_type	character varying(128)	Name of the PL/SQL type for parameters of the number type. Otherwise, this column is empty.
char_length	numeric	Not supported. Its value is **NULL**.
char_used	character varying(1)	Not supported. Set it to **B** if the data type is varchar, nvarchar2, bpchar, or char, and to **NULL** for other data types.
origin_con_id	character varying(256)	Not supported. Its value is **0**.

12.3.12.42 DB_ALL_TABLES

DB_ALL_TABLES displays tables or views accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-267 DB_ALL_TABLES columns

Name	Type	Description
owner	name	Owner of a table or view.
table_name	name	Name of a table or view.
tablespace_name	name	Tablespace where a table or view is located.

12.3.12.43 DB_COL_COMMENTS

DB_COL_COMMENTS displays comment information about table columns accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-268 DB_COL_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
comments	text	Comments.
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.12.44 DB_COLL_TYPES

DB_COLL_TYPES displays information about collection types that can be accessed by the current user. By default, they are accessible to all users. This view exists in the PG_CATALOG and SYS schemas.

Table 12-269 DB_COLL_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of a collection.
type_name	character varying(128)	Name of a collection.
coll_type	character varying(128)	Description of a collection.

Name	Type	Description
upper_bound	numeric	Not supported. Set it to **NULL**.
elem_type_mod	character varying(7)	Type modifier of an element.
elem_type_owner	character varying(128)	Owner of the element type on which the collection is based. This parameter is mainly used for user-defined types.
elem_type_name	character varying(128)	Name of the data type or user-defined type on which the collection is based.
length	numeric	Not supported. Set it to **NULL**.
precision	numeric	Not supported. Set it to **NULL**.
scale	numeric	Not supported. Set it to **NULL**.
character_set_name	character varying(44)	Not supported. Set it to **NULL**.
elem_storage	character varying(7)	Not supported. Set it to **NULL**.
nulls_stored	character varying(3)	Not supported. Set it to **NULL**.
char_used	character varying(1)	Not supported. Set it to **NULL**.

12.3.12.45 DB_CONS_COLUMNS

DB_CONS_COLUMNS displays information about constraint columns accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-270 DB_CONS_COLUMNS columns

Name	Type	Description
constraint_name	character varying(64)	Constraint name.
table_name	character varying(64)	Name of a constraint-related table.

Name	Type	Description
column_name	character varying(64)	Name of a constraint-related column.
owner	character varying(64)	Constraint creator.
position	smallint	Position of a column in a table.

12.3.12.46 DB_CONSTRAINTS

DB_CONSTRAINTS displays information about constraints accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-271 DB_CONSTRAINTS columns

Name	Type	Description
constraint_name	character varying(64)	Constraint name.
constraint_type	text	Constraint type. • **c**: check constraint • **f**: foreign key constraint • **p**: primary key constraint • **u**: unique constraint
table_name	character varying(64)	Name of a constraint-related table.
index_owner	character varying(64)	Owner of a constraint-related index (only for the unique constraint and primary key constraint).
index_name	character varying(64)	Name of a constraint-related index (only for the unique constraint and primary key constraint).
owner	character varying(64)	Constraint creator.

12.3.12.47 DB_DEPENDENCIES

DB_DEPENDENCIES displays the dependency relationship between types, tables, views, stored procedures, functions, and triggers accessible to the current user. It is accessible to all users. This view exists in the PG_CATALOG and SYS schemas.

Table 12-272 DB_DEPENDENCIES columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	character varying(18)	Object class.
referenced_owner	name	Owner of the referenced object.
referenced_name	name	Name of the referenced object.
referenced_type	character varying(18)	Type of the referenced object.
referenced_link_name	character varying(128)	Not supported. Set it to **NULL**.
dependency_type	character varying(4)	Not supported. Set it to **NULL**.

12.3.12.48 DB_ERRORS

DB_ERRORS displays the latest compilation error information about storage objects accessible to users. By default, it is accessible to all users. This view exists in both PG_CATALOG and SYS schema.

Table 12-273 DB_ERRORS columns

Name	Type	Description
owner	character varying(128)	Object owner.
name	character varying(128)	Object name.
type	character varying(12)	Object type. • **PROCEDURE** • **FUNCTION** • **PACKAGE** • **PACKAGE BODY**
sequence	numeric	Serial number.
line	numeric	Row where an error occurs.
position	numeric	Not supported. Its value is **NULL**.
text	character varying(4000)	Error text.
attribute	character varying(9)	Attribute tag: ERROR.

Name	Type	Description
message_number	numeric	Not supported. Its value is **NULL**.

12.3.12.49 DB_IND_COLUMNS

DB_IND_COLUMNS displays all index columns accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 12-274 DB_IND_COLUMNS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	name	Column name.
column_position	smallint	Position of a column in an index.
column_length	numeric	Column length
char_length	numeric	Length of a column (character type).
descend	character varying(4)	Sorting mode of a column. The value can be **DESC** or **ASC**.
collated_column_id	numeric	Provides the internal serial number of the language sorting columns.

12.3.12.50 DB_IND_EXPRESSIONS

DB_IND_EXPRESSIONS displays information about expression indexes accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-275 DB_IND_EXPRESSIONS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.

Name	Type	Description
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_expression	text	Function-based index expression of a specified column.
column_position	smallint	Position of a column in an index.

12.3.12.51 DB_INDEXES

DB_INDEXES displays information about indexes accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 12-276 DB_INDEXES columns

Name	Type	Description
owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_name	character varying(64)	Name of a table corresponding to an index.
uniqueness	text	Specifies whether the index is a unique index. • **UNIQUE**: unique index. • **NONUNIQUE**: non-unique index.
partitioned	character(3)	Specifies whether the index has the property of partitioned tables. • **Yes**: The index has the property of a partitioned table. • **No**: The index does not have the property of a partitioned table.

Name	Type	Description
generated	character varying(1)	Specifies whether the index name is generated by the system. • **y**: The index name is generated by the system. • **n**: The index name is not generated by the system.
index_type	character varying(27)	Index type. • **NORMAL**: Index attributes are simple references, and the expression tree is empty. • **FUNCTION-BASED NORMAL**: Expression trees are used for index attributes that are not simple column references.
table_owner	character varying(128)	Owner of an index object.
table_type	character(11)	Type of an index object • **TABLE**: The index object is of the table type.
tablespace_name	character varying(30)	Name of the tablespace that contains the index.
status	character varying(8)	Status of a non-partitioned index. • **VALID**: Non-partitioned indexes can be used for query. • **UNUSABLE**: The non-partitioned index is unavailable. • **N/A**: The index has the property of a partitioned table.
compression	character varying(13)	Not supported. Its value is **NULL**.

Name	Type	Description
prefix_length	numeric	Not supported. Its value is **NULL**.
ini_trans	numeric	Not supported. Its value is **NULL**.
max_trans	numeric	Not supported. Its value is **NULL**.
initial_extent	numeric	Not supported. Its value is **NULL**.
next_extent	numeric	Not supported. Its value is **NULL**.
min_extents	numeric	Not supported. Its value is **NULL**.
max_extents	numeric	Not supported. Its value is **NULL**.
pct_increase	numeric	Not supported. Its value is **NULL**.
pct_threshold	numeric	Not supported. Its value is **NULL**.
include_column	numeric	Not supported. Its value is **NULL**.
freelists	numeric	Not supported. Its value is **NULL**.
freelist_groups	numeric	Not supported. Its value is **NULL**.
pct_free	numeric	Not supported. Its value is **NULL**.
logging	character varying(3)	Not supported. Its value is **NULL**.
blevel	numeric	Not supported. Its value is **NULL**.
leaf_blocks	numeric	Not supported. Its value is **NULL**.
distinct_keys	numeric	Not supported. Its value is **NULL**.
avg_leaf_blocks_per_key	numeric	Not supported. Its value is **NULL**.
avg_data_blocks_per_key	numeric	Not supported. Its value is **NULL**.

Name	Type	Description
clustering_factor	numeric	Not supported. Its value is **NULL**.
num_rows	numeric	Not supported. Its value is **NULL**.
sample_size	numeric	Not supported. Its value is **NULL**.
last_analyzed	timestamp(0) without time zone	Not supported. Its value is **NULL**.
degree	character varying(40)	Not supported. Its value is **NULL**.
instances	character varying(40)	Not supported. Its value is **NULL**.
temporary	character varying(1)	Not supported. Its value is **NULL**.
secondary	character varying(1)	Not supported. Its value is **NULL**.
buffer_pool	character varying(7)	Not supported. Its value is **NULL**.
flash_cache	character varying(7)	Not supported. Its value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
duration	character varying(15)	Not supported. Its value is **NULL**.
pct_direct_access	numeric	Not supported. Its value is **NULL**.
ityp_owner	character varying(128)	Not supported. Its value is **NULL**.
ityp_name	character varying(128)	Not supported. Its value is **NULL**.
parameters	character varying(1000)	Not supported. Its value is **NULL**.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
domidx_status	character varying(12)	Not supported. Its value is **NULL**.

Name	Type	Description
domidx_opstatus	character varying(6)	Not supported. Its value is **NULL**.
funcidx_status	character varying(8)	Not supported. Its value is **NULL**.
join_index	character varying(3)	Not supported. Its value is **NULL**.
iot_redundant_pkey_elim	character varying(3)	Not supported. Its value is **NULL**.
dropped	character varying(3)	Not supported. Its value is **NULL**.
visibility	character varying(9)	Specifies whether the index is visible to the optimizer. • **VISIBLE**: The index is visible to the optimizer. • **INVISIBLE**: The index is invisible to the optimizer.
domidx_management	character varying(14)	Not supported. Its value is **NULL**.
segment_created	character varying(3)	Not supported. Its value is **NULL**.
orphaned_entries	character varying(3)	Not supported. Its value is **NULL**.
indexing	character varying(7)	Not supported. Its value is **NULL**.
auto	character varying(3)	Not supported. Its value is **NULL**.

12.3.12.52 DB_OBJECTS

DB_OBJECTS displays all database objects accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-277 DB_OBJECTS columns

Name	Type	Description
owner	name	Object owner.

Name	Type	Description
object_name	name	Object name.
object_id	oid	Object OID.
object_type	name	Object class.
namespace	oid	ID of the namespace where an object resides.
temporary	character(1)	Specifies whether an object is a temporary object.
status	character varying(7)	Object status.
subobject_name	name	Subobject name of an object.
generated	character(1)	Specifies whether an object name is generated by the system.
created	timestamp with time zone	Creation time of an object.
last_ddl_time	timestamp with time zone	Last modification time of an object.
default_collation	character varying(100)	Default collation of objects.
data_object_id	numeric	Not supported. Set it to **NULL**.
timestamp	character varying(19)	Not supported. Set it to **NULL**.
secondary	character varying(1)	Not supported. Set it to **NULL**.
edition_name	character varying(128)	Not supported. Set it to **NULL**.
sharing	character varying(18)	Not supported. Set it to **NULL**.
editionable	character varying(1)	Not supported. Set it to **NULL**.
oracle_maintained	character varying(1)	Not supported. Set it to **NULL**.
application	character varying(1)	Not supported. Set it to **NULL**.
duplicated	character varying(1)	Not supported. Set it to **NULL**.
sharded	character varying(1)	Not supported. Set it to **NULL**.

Name	Type	Description
created_appid	numeric	Not supported. Set it to **NULL**.
modified_appid	numeric	Not supported. Set it to **NULL**.
created_vsnid	numeric	Not supported. Set it to **NULL**.
modified_vsnid	numeric	Not supported. Set it to **NULL**.

NOTICE

For details about the value ranges of **created** and **last_ddl_time**, see **PG_OBJECT**.

12.3.12.53 DB_PROCEDURES

DB_PROCEDURES displays information about all stored procedures or functions accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-278 DB_PROCEDURES columns

Name	Type	Description
owner	name	Object owner.
object_name	name	Object name.

12.3.12.54 DB_SCHEDULER_JOB_ARGS

DB_SCHEDULER_JOB_ARG displays the parameters related to the tasks accessible to the current user. This view is accessible to all users and displays all information accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-279 DB_SCHEDULER_JOB_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the job to which the parameter belongs.
job_name	character varying(128)	Name of the job to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.

Name	Type	Description
argument_type	character varying(257)	Data type of a parameter.
value	character varying(4000)	Parameter value.
anydata_value	character varying(4000)	Not supported. Set it to **NULL**.
out_argument	character varying(5)	Reserved column. Set it to **NULL**.

12.3.12.55 DB_SCHEDULER_PROGRAM_ARGS

DB_SCHEDULER_PROGRAM_ARG displays the parameters related to the programs accessible to the current user. This view is accessible to all users and displays all information accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-280 DB_SCHEDULER_PROGRAM_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the program to which the parameter belongs.
program_name	character varying(128)	Name of the program to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter.
metadata_attribute	character varying(19)	Not supported. Set it to **NULL**.
default_value	character varying(4000)	Default parameter value.
anydata_default_value	character varying(4000)	Not supported. Set it to **NULL**.
out_argument	character varying(5)	Reserved column. Set it to **NULL**.

12.3.12.56 DB_SEQUENCES

DB_SEQUENCES displays all sequences accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 12-281 DB_SEQUENCES columns

Name	Type	Description
sequence_owner	name	Owner of a sequence.
sequence_name	name	Name of the sequence.
min_value	int16	Minimum value of the sequence.
max_value	int16	Maximum value of the sequence.
increment_by	int16	Value by which the sequence is incremented.
cycle_flag	character(1)	Specifies whether a sequence is a cyclic sequence. Value range: • **Y**: It is a cyclic sequence. • **N**: It is not a cyclic sequence.
order_flag	character varying(1)	Specifies whether a sequence occurs in a request sequence. This parameter is not supported. Set it to **NULL**.
cache_size	int16	Size of the sequence disk cache.
last_number	int16	Value of the previous sequence.
scale_flag	character varying(1)	Specifies whether a sequence is a scalable sequence. Not supported. Its value is **NULL**.
extend_flag	character varying(1)	Specifies whether the value generated by a scalable sequence exceeds the maximum or minimum value of the sequence. Not supported. Its value is **NULL**.
sharded_flag	character varying(1)	Specifies whether a sequence is a shard sequence. Not supported. Its value is **NULL**.
session_flag	character varying(1)	Specifies whether a sequence has a private session. Not supported. Its value is **NULL**.
keep_value	character varying(1)	Specifies whether to retain the sequence value during replay after a failure. This parameter is not supported. Set it to **NULL**.

12.3.12.57 DB_SOURCE

DB_SOURCE displays the definition information about stored procedures, functions, triggers, and packages accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 12-282 DB_SOURCE columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	name	Object type. Its values can be **function**, **package**, **package body**, **procedure**, and **trigger**.
line	numeric	Number of the line in the definition information.
text	text	Text source of the storage object.
origin_con_id	character varying(256)	Not supported. Its value is **0**.

12.3.12.58 DB_SYNONYMS

DB_SYNONYMS displays all synonyms accessible to the current user.

Table 12-283 DB_SYNONYMS columns

Name	Type	Description
owner	text	Owner of a synonym. The owner of the PUBLIC synonym is PUBLIC.
schema_name	text	Name of the schema to which the synonym belongs. The name of the schema to which the PUBLIC synonym belongs is NULL.
synonym_name	text	Synonym name.
table_owner	text	Owner of the associated object. Although the column is called **table_owner**, its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.

Name	Type	Description
table_name	text	Name of the associated object. Although the column is called **table_name**, its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_schema_name	text	Schema name of the associated object. Although the column is called **table_schema_name**, its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
db_link	character varying(128)	Reserved column. Its value is **NULL**.
origin_con_id	character varying(256)	Not supported. Its value is **0**.

12.3.12.59 DB_TAB_COL_STATISTICS

DB_TAB_COL_STATISTICS displays column statistics and histogram information extracted from DB_TAB_COLUMNS. All users can access this view. This view exists in both PG_CATALOG and SYS schema. The values of the **LOW_VALUE** and **HIGH_VALUE** columns in this view are different from those in database A due to different underlying table structures. When the value of **LOW_VALUE** is a high-frequency value, the value of **LOW_VALUE** in GaussDB is the second smallest value. When **HIGH_VALUE** is a high-frequency value, **HIGH_VALUE** of GaussDB is the second highest value. The value of the **HISTOGRAM** column is different from that of database A due to different statistical methods. GaussDB supports only two types of histograms: frequency and equi-width. The value of the **SCOPE** column in GaussDB is different from that in database A because GaussDB does not support global temporary table statistics. GaussDB database supports only local temporary table statistics, and the default value is **SHARED**.

Table 12-284 DB_TAB_COL_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Low value in a column.

Name	Type	Description
high_value	raw	High value in a column.
density	numeric	• If there is a histogram on **COLUMN_NAME**, this column displays the selectivity of values in the histogram that span less than two endpoints. It does not represent the selectivity of values that span two or more endpoints. • If no histogram is available on **COLUMN_NAME**, the value of this column is **1/NUM_DISTINCT**.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
sample_size	numeric	Sample size used to analyze a column.
last_analyzed	timestamp(0) without time zone	Date when a column was last analyzed. After the database is restarted, data loss will occur.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
notes	character varying(99)	Not supported. Its value is **NULL**.
avg_col_len	numeric	Average length of a column, in bytes.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. • **NONE**: no histogram. • **FREQUENCY**: frequency histogram. • **EQUI-WIDTH**: equal-width histogram.
scope	character varying(7)	For statistics collected on any table other than global temporary tables, the value is SHARED (indicating that the statistics are shared among all sessions).
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.12.60 DB_TAB_COLUMNS

DB_TAB_COLUMNS displays description information about columns of tables and views accessible to the current user. This view exists in both PG_CATALOG and SYS schema. This view is accessible to all users and displays all information accessible to the current user.

Table 12-285 DB_TAB_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
data_type	character varying(128)	Data type of a column.
data_type_mod	character varying(3)	Not supported. Its value is **NULL**.
data_type_owner	character varying(128)	Owner of the data type of a column.
data_length	integer	Length of a column, in bytes.
data_precision	integer	Precision of a data type. This column is valid for the numeric data type and **NULL** for other data types.
data_scale	integer	Number of decimal places. This column is valid for the numeric data type and is set to **0** for other data types.
nullable	bpchar	Specifies whether a column can be empty (**n** for the primary key constraint and non-null constraint). Value range: • **y**: yes. • **n**: no.
column_id	integer	Sequence number of a column when a table is created.
default_length	numeric	Length of the default value of a column, in bytes.
data_default	text	Default value of a column.

Name	Type	Description
num_distinct	numeric	Number of different values in a column.
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.
density	numeric	Column density.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	timestamp(0) without time zone	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported. Its value is **NULL**.
char_col_decl_length	numeric	Declaration length of a column of the character type.
global_stats	character varying(3)	Not supported. Its value is **NO**.
user_stats	character varying(3)	Not supported. Its value is **NO**.
avg_col_len	numeric	Average length of a column, in bytes.
char_length	numeric	Column length (in bytes) which is valid only for the varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported. Set it to **B** if the data type is varchar, nvarchar2, bpchar, or char. For other data types, set it to **NULL**.
v80_fmt_image	character varying(3)	Not supported. Its value is **NULL**.
data_upgraded	character varying(3)	Not supported. Its value is **YES**.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. • **NONE**: no histogram. • **FREQUENCY**: frequency histogram. • **EQUI_WIDTH**: equal-width histogram.

Name	Type	Description
default_on_null	character varying(3)	Not supported. Its value is **NULL**.
identity_column	character varying(3)	Not supported. Its value is **NULL**.
evaluation_edition	character varying(128)	Not supported. Its value is **NULL**.
unusable_before	character varying(128)	Not supported. Its value is **NULL**.
unusable_beginning	character varying(128)	Not supported. Its value is **NULL**.
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
comments	text	Comments.
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.12.61 DB_TAB_COMMENTS

DB_TAB_COMMENTS displays comments about all tables and views accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-286 DB_TAB_COMMENTS columns

Name	Type	Description
owner	character varying(128)	Owner of a table or view.
table_name	character varying(128)	Name of a table or view.
table_type	character varying(11)	Object type.
comments	text	Comments.
origin_con_id	numeric	Not supported. Set it to **0**.
schema	character varying(64)	Name of the namespace to which the table belongs.

12.3.12.62 DB_TAB_HISTOGRAMS

DB_TAB_HISTOGRAMS displays histogram statistics about the tables and views accessible to the current user, that is, the distribution of data in each column of

the table. All users can access this view. This view exists in the PG_CATALOG and SYS schemas.

Table 12-287 DB_TAB_HISTOGRAMS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(4000)	Column name or attribute of an object column.
endpoint_number	numeric	Bucket ID of the histogram.
endpoint_value	numeric	Not supported. Set it to **NULL**.
endpoint_actual_value	character varying(4000)	Actual value of the bucket endpoint.
endpoint_actual_value_raw	raw	Not supported. Set it to **NULL**.
endpoint_repeat_count	numeric	Not supported. Set it to **NULL**.
scope	character varying(7)	Not supported. Set it to **SHARED**.

12.3.12.63 DB_TAB_MODIFICATIONS

DB_TAB_MODIFICATIONS displays statistics about modifications to tables accessible to the current user since the last statistics collection on the tables. Currently, this view displays only the statistics data of tables on which INSERT, DELETE, and UPDATE operations have been performed. All users can access this view. This view exists in both PG_CATALOG and SYS schema.

Table 12-288 DB_TAB_MODIFICATIONS columns

Name	Type	Description
table_owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Partition name.

Name	Type	Description
subpartition_name	character varying(128)	Subpartition name.
inserts	numeric	Approximate number of insertions since the last statistics collection.
updates	numeric	Approximate number of updates since the last statistics collection.
deletes	numeric	Approximate number of deletions since the last statistics collection.
timestamp	timestamp(0) without time zone	Last modification time. Currently, the modification time of a partitioned table is not supported. The value is **NULL**.
truncated	character varying(3)	Not supported. Its value is **NULL**.
drop_segments	numeric	Not supported. Its value is **NULL**.
schema_name	character varying(128)	Name of the schema to which the table belongs.

12.3.12.64 DB_TAB_STATS_HISTORY

DB_TAB_STATS_HISTORY displays the tables, partitions, and subpartitions involved in table statistics and the time when table statistics are collected. All users can access this view. This view exists in both PG_CATALOG and SYS schema.

Table 12-289 DB_TAB_STATS_HISTORY columns

Name	Type	Description
owner	character varying(128)	Object owner.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported. Its value is **NULL**.
subpartition_name	character varying(128)	Not supported. Its value is **NULL**.
stats_update_time	timestamp(6) with time zone	Time when statistics are updated. Database restart is not supported. Otherwise, data loss will occur.

12.3.12.65 DB_TABLES

DB_TABLES displays all tables accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-290 DB_TABLES columns

Name	Type	Description
owner	character varying(64)	Table owner
table_name	character varying(64)	Table name.
tablespace_name	character varying(64)	Tablespace name of the table.
dropped	character varying	Specifies whether the current table is deleted. • **YES**: It is deleted. • **NO**: It is not deleted.
num_rows	numeric	Estimated number of rows in the table.
status	character varying(8)	Specifies whether the current table is valid. • **VALID**: The current table is valid. • **UNUSABLE**: The current table is unavailable.
sample_size	numeric	Number of samples used for analyzing the table.
temporary	character(1)	Specifies whether the table is a temporary table. • **Y**: The table is a temporary table. • **N**: The table is not a temporary table.
pct_free	numeric	Minimum percentage of free space in a block.
ini_trans	numeric	Initial number of transactions.
max_trans	numeric	Maximum number of transactions.
avg_row_len	integer	Average number of bytes in each row.

Name	Type	Description
partitioned	character varying(3)	Specifies whether a table is a partitioned table. • **YES**: The table is a partitioned table. • **NO**: The table is not a partitioned table.
last_analyzed	timestamp with time zone	Last time when the table was analyzed. Database restart is not supported. Otherwise, data loss will occur.
row_movement	character varying(8)	Specifies whether to allow partition row movement. • **ENABLED**: The partition row movement is allowed. • **DISABLED**: The partition row movement is not allowed.
compression	character varying(8)	Specifies whether to enable a table compression. • **ENABLED**: A table compression is enabled. • **DISABLED**: A table compression is disabled.
duration	character varying(15)	Time elapsed when a temporary table is processed. • **NULL**: The table is not a temporary table. • **sys$session**: The table is a temporary session table. • **sys$transaction**: The table is a temporary transaction table.
logical_replication	character varying(8)	Specifies whether logical replication is enabled for a table. • **ENABLED**: Logical replication is enabled. • **DISABLED**: Logical replication is disabled.

Name	Type	Description
external	character varying(3)	Specifies whether the table is an external table. • **YES**: The table is an external table. • **NO**: The table is not an external table.
logging	character varying(3)	Specifies whether to record logs for table changes. • **YES**: Logs are recorded for table changes. • **NO**: Logs are not recorded for table changes.
default_collation	character varying(100)	Default collation of a table.
degree	character varying(10)	Number of instances in a scanned table.
table_lock	character varying(8)	Specifies whether to enable a table lock. • **ENABLED**: The table lock is enabled. • **DISABLED**: The table lock is disabled.
nested	character varying(3)	Specifies whether a table is a nested table. • **YES**: The table is a nested table. • **NO**: The table is not a nested table.
buffer_pool	character varying(7)	Default buffer pool of a table.
flash_cache	character varying(7)	Not supported. The value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. The value is **NULL**.
skip_corrupt	character varying(8)	Specifies whether to skip corrupted blocks during table scanning. • **ENABLED**: The corrupted block is skipped. • **DISABLED**: The corrupted block is not skipped.

Name	Type	Description
has_identity	character varying(3)	Specifies whether a table has an identifier column. • **YES**: There is an identifier column. • **NO**: There is no identifier column.
segment_created	character varying(3)	Specifies whether a table segment has been created. • **YES**: The table segment has been created. • **NO**: The table segment is not created.
monitoring	character varying(3)	Specifies whether to monitor the modification of a table. • **YES**: The modification of the table is monitored. • **NO**: The modification of the table is not monitored.
cluster_name	character varying(128)	Not supported. The value is **NULL**.
iot_name	character varying(128)	Not supported. The value is **NULL**.
pct_used	numeric	Not supported. The value is **NULL**.
initial_extent	numeric	Not supported. The value is **NULL**.
next_extent	numeric	Not supported. The value is **NULL**.
min_extents	numeric	Not supported. The value is **NULL**.
max_extents	numeric	Not supported. The value is **NULL**.
pct_increase	numeric	Not supported. The value is **NULL**.
freelists	numeric	Not supported. The value is **NULL**.
freelist_groups	numeric	Not supported. The value is **NULL**.

Name	Type	Description
backed_up	character varying(1)	Not supported. The value is **NULL**.
blocks	numeric	Not supported. The value is **NULL**.
empty_blocks	numeric	Not supported. The value is **NULL**.
avg_space	numeric	Not supported. The value is **NULL**.
chain_cnt	numeric	Not supported. The value is **NULL**.
avg_space_freelist_blocks	numeric	Not supported. The value is **NULL**.
num_freelist_blocks	numeric	Not supported. The value is **NULL**.
instances	character varying(10)	Not supported. The value is **NULL**.
cache	character varying(5)	Not supported. The value is **NULL**.
iot_type	character varying(12)	Not supported. The value is **NULL**.
secondary	character varying(1)	Not supported. The value is **NULL**.
global_stats	character varying(3)	Not supported. The value is **NULL**.
user_stats	character varying(3)	Not supported. The value is **NULL**.
cluster_owner	character varying(30)	Not supported. The value is **NULL**.
dependencies	character varying(8)	Not supported. The value is **NULL**.
compression_for	character varying(30)	Not supported. The value is **NULL**.
read_only	character varying(3)	Not supported. The value is **NULL**.
result_cache	character varying(7)	Not supported. The value is **NULL**.
clustering	character varying(3)	Not supported. The value is **NULL**.

Name	Type	Description
activity_tracking	character varying(23)	Not supported. The value is **NULL**.
dml_timestamp	character varying(25)	Not supported. The value is **NULL**.
container_data	character varying(3)	Not supported. The value is **NULL**.
inmemory_priority	character varying(8)	Not supported. The value is **NULL**.
inmemory_distribute	character varying(15)	Not supported. The value is **NULL**.
inmemory_compression	character varying(17)	Not supported. The value is **NULL**.
inmemory_duplicate	character varying(13)	Not supported. The value is **NULL**.
duplicated	character varying(1)	Not supported. The value is **NULL**.
sharded	character varying(1)	Not supported. The value is **NULL**.
hybrid	character varying(3)	Not supported. The value is **NULL**.
cellmemory	character varying(24)	Not supported. The value is **NULL**.
containers_default	character varying(3)	Not supported. The value is **NULL**.
container_map	character varying(3)	Not supported. The value is **NULL**.
extended_data_link	character varying(3)	Not supported. The value is **NULL**.
extended_data_link_map	character varying(3)	Not supported. The value is **NULL**.
inmemory_service	character varying(12)	Not supported. The value is **NULL**.
inmemory_service_name	character varying(1000)	Not supported. The value is **NULL**.
container_map_object	character varying(3)	Not supported. The value is **NULL**.
memoptimize_read	character varying(8)	Not supported. The value is **NULL**.

Name	Type	Description
memoptimize_write	character varying(8)	Not supported. The value is **NULL**.
has_sensitive_column	character varying(3)	Not supported. The value is **NULL**.
admit_null	character varying(3)	Not supported. The value is **NULL**.
data_link_dml_enabled	character varying(3)	Not supported. The value is **NULL**.
object_id_type	character varying(16)	Not supported. The value is **NULL**.
table_type_owner	character varying(128)	Not supported. The value is **NULL**.
table_type	character varying(128)	Not supported. The value is **NULL**.
compress_for	character varying(30)	Not supported. The value is **NULL**.

12.3.12.66 DB_TRIGGERS

DB_TRIGGERS displays information about triggers accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 12-291 DB_TRIGGERS columns

Name	Type	Description
trigger_name	character varying(64)	Trigger name.
table_name	character varying(64)	Relational table name.
table_owner	character varying(64)	Role name.
status	character varying(64)	Trigger status: • **O**: The trigger is enabled in origin or local mode. • **D**: The trigger is disabled. • **R**: The trigger is enabled in replica mode. • **A**: The trigger is always enabled.

12.3.12.67 DB_TYPES

DB_TYPES displays all object types accessible to the current user. All users can access this view. This view exists in the PG_CATALOG and SYS schemas.

Table 12-292 DB_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of the type.
type_name	character varying(128)	Type name.
type_oid	raw	Type OID.
typecode	character varying(128)	Type code.
attributes	numeric	Number of attributes in a type.
methods	numeric	Not supported. Set it to **0**.
predefined	character varying(3)	Specifies whether the type is a predefined type.
incomplete	character varying(3)	Specifies whether the type is an incomplete type.
final	character varying(3)	Not supported. Set it to **NULL**.
instantiable	character varying(3)	Not supported. Set it to **NULL**.
persistable	character varying(3)	Not supported. Set it to **NULL**.
supertype_owner	character varying(128)	Not supported. Set it to **NULL**.
supertype_name	character varying(128)	Not supported. Set it to **NULL**.
local_attributes	numeric	Not supported. Set it to **NULL**.
local_methods	numeric	Not supported. Set it to **NULL**.
typeid	raw	Not supported. Set it to **NULL**.

12.3.12.68 DB_VIEWS

DB_VIEWS displays the description about all views accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-293 DB_VIEWS columns

Name	Type	Description
owner	name	Owner of a view.
view_name	name	Name of a view.
text	text	Text of a view.
text_length	integer	Text length of a view.
text_vc	character varying(4000)	View creation statement. This column may truncate the view text. The BEQUEATH clause will not appear as part of the **text_vc** column in this view.
type_text_length	numeric	Not supported. Set it to **NULL**.
type_text	character varying(4000)	Not supported. Set it to **NULL**.
oid_text_length	numeric	Not supported. Set it to **NULL**.
oid_text	character varying(4000)	Not supported. Set it to **NULL**.
view_type_owner	character varying(128)	Not supported. Set it to **NULL**.
view_type	character varying(128)	Not supported. Set it to **NULL**.
superview_name	character varying(128)	Not supported. Set it to **NULL**.
editioning_view	character varying(1)	Not supported. Set it to **NULL**.
read_only	character varying(1)	Not supported. Set it to **NULL**.
container_data	character varying(1)	Not supported. Set it to **NULL**.
bequeath	character varying(12)	Not supported. Set it to **NULL**.
origin_con_id	character varying(256)	Not supported. Set it to **NULL**.
default_collation	character varying(100)	Not supported. Set it to **NULL**.
containers_default	character varying(3)	Not supported. Set it to **NULL**.

Name	Type	Description
container_map	character varying(3)	Not supported. Set it to **NULL**.
extended_data_link	character varying(3)	Not supported. Set it to **NULL**.
extended_data_link_map	character varying(3)	Not supported. Set it to **NULL**.
has_sensitive_column	character varying(3)	Not supported. Set it to **NULL**.
admit_null	character varying(3)	Not supported. Set it to **NULL**.
pdb_local_only	character varying(3)	Not supported. Set it to **NULL**.

12.3.12.69 DICT

DICT displays the description of data dictionary tables and system views in the database. This view exists in the PG_CATALOG and SYS schemas and all users can access this view.

Table 12-294 DICT columns

Name	Type	Description
table_name	character varying(64)	Object name.
comments	character varying(4000)	Comment on an object.

12.3.12.70 DICTIONARY

DICTIONARY displays the description of data dictionary tables and system views in the database. This view exists in the PG_CATALOG and SYS schemas and all users can access this view.

Table 12-295 DICTIONARY columns

Name	Type	Description
table_name	character varying(64)	Object name.

Name	Type	Description
comments	character varying(4000)	Comment on an object.

12.3.12.71 DUAL

DUAL is automatically created by the database based on the data dictionary and is used to save expression calculation results. It is accessible to all users. This view exists in the PG_CATALOG and SYS schemas.

Table 12-296 DUAL columns

Name	Type	Description
DUMMY	text	Expression calculation result.

12.3.12.72 DV_SESSIONS

DV_SESSIONS displays information about all active backend threads. By default, only the system administrator can access this view. Common users can access the view only after being authorized.

Table 12-297 DV_SESSIONS columns

Name	Type	Description
sid	bigint	OID of the active backend thread of the current session.
serial#	integer	Sequence number of the backend thread of the current activity, which is **0** in GaussDB.
user#	oid	OID of the user that has logged in to the backend thread. The OID is **0** if the backend thread is a global auxiliary thread.
username	name	Name of the user logged in to the backend process. **username** is null if the backend thread is a global auxiliary thread. **application_name** can be identified by associating with **pg_stat_get_activity()**. Example: `SELECT s.*,a.application_name FROM DV_SESSIONS AS s LEFT JOIN pg_stat_get_activity(NULL) AS a ON s.sid=a.sessionid;`

12.3.12.73 DV_SESSION_LONGOPS

DV_SESSION_LONGOPS displays the progress of ongoing operations. Users can access this view only after being authorized.

Table 12-298 DV_SESSION_LONGOPS columns

Name	Type	Description
sid	bigint	OID of the running backend thread.
serial#	integer	Sequence number of the running backend thread, which is **0** in GaussDB.
sofar	integer	Completed workload, which is null in GaussDB.
totalwork	integer	Total workload, which is null in GaussDB.

12.3.12.74 GS_ALL_CONTROL_GROUP_INFO

GS_ALL_CONTROL_GROUP_INFO displays all Cgroup information in a database.

Table 12-299 GS_ALL_CONTROL_GROUP_INFO columns

Name	Type	Description
name	text	Cgroup name.
type	text	Cgroup type. • **GROUP_NONE**: no group. • **GROUP_TOP**: top group. • **GROUP_CLASS**: Class Cgroup, which does not control any thread. • **GROUP_BAKWD**: backend thread Cgroup. • **GROUP_DEFWD**: default Cgroup, which controls only the query threads at this level. • **GROUP_TSWD**: time-sharing Cgroup of each user, which controls the query threads at the bottom layer.
gid	bigint	Cgroup ID.
classgid	bigint	ID of the class Cgroup where a workload Cgroup belongs.
class	text	Class Cgroup.
workload	text	Workload Cgroup.
shares	bigint	CPU quota allocated to the Cgroup.
limits	bigint	Limit of CPU resources allocated to a Cgroup.
wdlevel	bigint	Workload Cgroup level.

Name	Type	Description
cpucores	text	Information about the CPU cores used by a Cgroup.

12.3.12.75 GS_ALL_PREPARED_STATEMENTS

GS_ALL_PREPARED_STATEMENTS displays information about prepared statements that are available in all sessions. This view is accessible only to system administrators.

Table 12-300 GS_ALL_PREPARED_STATEMENTS columns

Name	Type	Description
pid	bigint	Backend thread ID. **NOTE** In thread pool mode, **pid** indicates the ID of the thread bound to the current session. When a session is executed on different threads, **pid** changes accordingly. In thread pool mode, statements are associated with **sessionid** but not **pid**. You are advised to use **sessionid** for associated query.
sessionid	bigint	Current session ID.
global_sessionid	text	Global session ID.
name	text	Prepared statement identifier.
statement	text	Query string for creating this prepared statement. ● The column is the PREPARE statements submitted by the client for prepared statements created from SQL. ● The column is the text of the prepared statements for prepared statements created through a front-end/back-end protocol.
prepare_time	timestamp with time zone	Timestamp when the prepared statement is created.
parameter_types	regtype[]	Expected parameter type of the prepared statement in the form of a regtype array. The OID corresponding to this array can be obtained by converting the regtype value.
from_sql	boolean	● **True** if the prepared statement was created through the PREPARE statement. ● **False** if the statement was prepared through the frontend/backend protocol.

12.3.12.76 GS_COMM_PROXY_THREAD_STATUS

GS_COMM_PROXY_THREAD_STATUS displays statistics on packets sent and received by the proxy communication library comm_proxy. This view displays statistics about data sent and received by comm_proxy only when the user-mode network deployment mode is enabled during the installation of the centralized database and **enable_dfx** of **comm_proxy_attr** is set to **true**. In other scenarios, this view cannot be queried.

Table 12-301 GS_COMM_PROXY_THREAD_STATUS columns

Name	Type	Description
ProxyThreadId	bigint	ID of the current network proxy thread comm_proxy.
ProxyCpuAffinity	text	NUMA-CPU affinity of the current network proxy thread comm_proxy, indicating the NUMA and CPU ID.
ThreadStartTime	text	Start time of the current network proxy thread comm_proxy.
RxPckNums	bigint	Number of packets received by the current network proxy thread comm_proxy.
TxPckNums	bigint	Number of packets sent by the current network proxy thread comm_proxy.
RxPcks	double precision	Number of packets received by the network proxy thread comm_proxy per second.
TxPcks	double precision	Number of packets sent by the network proxy thread comm_proxy per second.

12.3.12.77 GS_FILE_STAT

GS_FILE_STAT records statistics about data file I/Os to indicate I/O performance and detect performance problems such as abnormal I/O operations.

Table 12-302 GS_FILE_STAT columns

Name	Type	Description
filenum	oid	File identifier
dbid	oid	Database ID
spcid	oid	Tablespace ID

Name	Type	Description
phyrds	bigint	Number of times of reading physical files
phywrts	bigint	Number of times of writing into physical files
phyblkrd	bigint	Number of times of reading physical file blocks
phyblkwrt	bigint	Number of times of writing into physical file blocks
readtim	bigint	Total duration of reading, in microseconds
writetim	bigint	Total duration of writing, in microseconds
avgiotim	bigint	Average duration of reading and writing, in microseconds
lstiotim	bigint	Duration of the last file reading, in microseconds
miniotim	bigint	Minimum duration of reading and writing, in microseconds
maxiowtm	bigint	Maximum duration of reading and writing, in microseconds

12.3.12.78 GS_GET_CONTROL_GROUP_INFO

This view is not supported in the centralized system.

12.3.12.79 GS_GLC_MEMORY_DETAIL

GS_GLC_MEMORY_DETAIL displays the memory usage of the global PL/pgSQL cache in all databases. This view is available only when **enable_global_plsqlcache** is set to **on**.

Table 12-303 GS_GLC_MEMORY_DETAIL columns

Name	Type	Description
contextname	text	Name of a memory object.
database	text	Database to which the memory object belongs. **"pkg_bucket"** and **"func_bucket"** are displayed as **"NULL"**.
schema	text	Database to which the memory object belongs. **"pkg_bucket"** and **"func_bucket"** are displayed as **"NULL"**.

Name	Type	Description
type	text	Object type. • **"pkg_bucket"**: indicates that the object is the parent node of a package object. • **"func_bucket"**: indicates that the object is the parent node of a function or stored procedure. • **"pkg"**: indicates that the object is a package object. • **"func"**: indicates that the object is a function or stored procedure.
status	text	Current status of the cache object. **"valid"** indicates that the cache object is available, and **'invalid'** indicates that the cache object is unavailable. The **"pkg_bucket"** and **"func_bucket"** objects have no status and are displayed as **"NULL"**.
location	text	Current location of a cached object. It is displayed as **"in_global_hash_table"** in the cache hash table and **"in_global_expired_list"** in the invalid linked list. The **"pkg_bucket"** and **"func_bucket"** objects are displayed as **"NULL"**.
env	bigint	Environment parameter when an object is created, that is, the value of **behavior_compat_flags**. The **"pkg_bucket"** and **"func_bucket"** objects are displayed as **0**.
usedsize	bigint	Size of a cached object.
usecount	bigint	Number of objects that are referencing the global cache. When no object references the global compilation product, the number is 0.

12.3.12.80 GS_GLOBAL_ARCHIVE_STATUS

GS_GLOBAL_ARCHIVE_STATUS describes the archiving progress of DNs and all shards, including the shard name (**node_name**), archiving location (**restart_lsn**), name of the primary or standby node (**archive_node**), and current log location (**current_xlog_location**). To query this view, you need to enable the archiving function of the database and query the view from the primary DN.

Table 12-304 GS_GLOBAL_ARCHIVE_STATUS columns

Name	Type	Description
node_name	text	Shard name.
restart_lsn	text	Archiving location.

Name	Type	Description
archive_node	text	Name of the primary or standby node where archiving is performed.
current_xlog_location	text	Current log position.

12.3.12.81 GS_GSC_MEMORY_DETAIL

GS_GSC_MEMORY_DETAIL displays the memory usage of the global system cache of the current process on the current node. The data is displayed only when GSC is enabled.

The query is separated by the database memory context. Therefore, some memory statistics are missing. The memory context corresponding to the missing memory statistics is **GlobalSysDBCache**.

Table 12-305 GS_GSC_MEMORY_DETAIL columns

Name	Type	Description
db_id	text	Database ID.
totalsize	numeric	Total size of the shared memory, in bytes.
freesize	numeric	Remaining size of the shared memory, in bytes.
usedsize	numeric	Used size of the shared memory, in bytes.

12.3.12.82 GS_INSTANCE_TIME

Records time consumption information of the current node. The time consumption information is classified into the following types:

- DB_TIME: effective time spent by jobs in multi-core scenarios.
- CPU_TIME: CPU time cost.
- EXECUTION_TIME: time spent in the executor.
- PARSE_TIME: time spent on parsing SQL statements.
- PLAN_TIME: time spent on generating plans.
- REWRITE_TIME: time spent on rewriting SQL statements.
- PL_EXECUTION_TIME: execution time of the PL/SQL stored procedure.
- PL_COMPILATION_TIME: compilation time of the PL/SQL stored procedure.
- NET_SEND_TIME: time spent on the network.
- DATA_IO_TIME: time spent on I/Os.

Table 12-306 GS_INSTANCE_TIME columns

Name	Type	Description
stat_id	integer	Statistics ID
stat_name	text	Type name
value	bigint	Time value, in μs

12.3.12.83 GS_LSC_MEMORY_DETAIL

GS_LSC_MEMORY_DETAIL displays statistics about the local SysCache memory usage of all threads based on the MemoryContext node. The statistics are available only when GSC is enabled.

Table 12-307 GS_LSC_MEMORY_DETAIL columns

Name	Type	Description
threadid	text	Thread start time + thread ID (string: *timestamp.sessionid*).
tid	bigint	Thread ID.
thrdtype	text	Thread type. It can be any thread type in the system, such as postgresql and wlmmonitor.
contextname	text	Name of the memory context.
level	smallint	Hierarchy of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the memory context, in bytes.
freesize	bigint	Total size of released memory in the current memory context, in bytes.
usedsize	bigint	Total size of used memory in the current memory context, in bytes.

12.3.12.84 GS_MY_PLAN_TRACE

GS_MY_PLAN_TRACE is a view of the GS_PLAN_TRACE system catalog. This view displays the plan traces of the current user.

Table 12-308 GS_MY_PLAN_TRACE columns

Name	Type	Description
query_id	text	Unique ID of the current request.

Name	Type	Description
query	text	SQL statement of the current request. The value of this field cannot exceed the value of **track_activity_query_size**.
unique_sql_id	bigint	Unique ID of the SQL statement of the current request.
plan	text	Query plan text corresponding to the SQL statement of the current request. The size of this field cannot exceed 10 KB.
plan_trace	text	Details about the query plan generation process corresponding to the SQL statement of the current request. The value of this field cannot exceed 300 MB.
modifydate	timestamp with time zone	Time when the current plan trace is updated (that is, time when the plan trace is created).

12.3.12.85 GS_OS_RUN_INFO

GS_OS_RUN_INFO displays the running status of the OS.

Table 12-309 GS_OS_RUN_INFO columns

Name	Type	Description
id	integer	ID.
name	text	Name of the OS running status.
value	numeric	Value of the OS running status
comments	text	Remarks of the OS running status.
cumulative	boolean	Specifies whether the value of the OS running status is cumulative.

12.3.12.86 GS_REDO_STAT

GS_REDO_STAT displays the log replay of session threads.

Table 12-310 GS_REDO_STAT columns

Name	Type	Description
phywrts	bigint	Number of times that data is written during log replay.

Name	Type	Description
phyblkwrt	bigint	Number of data blocks written during log replay.
writetim	bigint	Total time required for writing data during log replay.
avgiotim	bigint	Average time required for writing data during log replay.
lstiotim	bigint	Time consumed by the last data write operation during log replay.
miniotim	bigint	Minimum time consumed by a single data write operation during log replay.
maxiowtm	bigint	Maximum time consumed by a single data write operation during log replay.

12.3.12.87 GS_SESSION_ALL_SETTINGS

GS_SESSION_ALL_SETTINGS displays the full GUC parameter settings of all sessions on the local node. Only the **sysadmin** and **monadmin** users have the permission to view this view.

Table 12-311 GS_SESSION_ALL_SETTINGS columns

Name	Type	Description
sessionid	bigint	Session ID.
pid	bigint	Backend thread ID.
name	text	Parameter name.
setting	text	Current parameter value.
unit	text	Implicit unit of a parameter.

12.3.12.88 GS_SESSION_MEMORY

GS_SESSION_MEMORY displays the memory usage at the session level, including all the memory allocated to GaussDB and Stream threads on DNs for jobs currently executed by users. If the GUC parameter **enable_memory_limit** is set to **off**, this view is unavailable.

Table 12-312 GS_SESSION_MEMORY columns

Name	Type	Description
sessid	text	Thread start time and ID.

Name	Type	Description
init_mem	integer	Memory allocated to the currently executed jobs before they enter the executor, in MB.
used_mem	integer	Memory allocated to the currently executed jobs, in MB.
peak_mem	integer	Peak memory allocated to the currently executed jobs, in MB.

12.3.12.89 GS_SESSION_MEMORY_CONTEXT

GS_SESSION_MEMORY_CONTEXT displays the memory usage of all sessions based on the MemoryContext node. If the GUC parameter **enable_memory_limit** or **enable_thread_pool** is set to **off**, this view is unavailable.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

Table 12-313 GS_SESSION_MEMORY_CONTEXT columns

Name	Type	Description
sessid	text	Session start time + session ID (character string: *timestamp.sessionid*).
threadid	bigint	ID of the thread bound to a session (**-1** if no thread is bound).
contextname	text	Name of the memory context.
level	smallint	Hierarchy of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the memory context, in bytes.
freesize	bigint	Total size of released memory in the current memory context, in bytes.
usedsize	bigint	Size of used memory in the memory context, in bytes. For **TempSmallContextGroup**, this parameter specifies the number of collected memory contexts.

> **CAUTION**
>
> This view is an O&M view and is used to locate memory problems. Do not query this view concurrently. If you query this view concurrently, the waiting time for new connections increases as the number of concurrent connections increases. As a result, new connections cannot be connected for a long time.

12.3.12.90 GS_SESSION_MEMORY_DETAIL

GS_SESSION_MEMORY_DETAIL displays the thread memory usage based on the MemoryContext node. When **enable_thread_pool** is set to **on**, this view contains memory usage of all threads and sessions. If the GUC parameter **enable_memory_limit** is set to **off**, this view is unavailable.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

You can run the **SELECT * FROM gs_session_memctx_detail(***threadid***, '');** statement to record information about all memory contexts of a thread into the *threadid_timestamp***.log** file in the *$GAUSSLOG*/**gs_log/***${node_name}*/**dumpmem** directory. *threadid* can be obtained from **sessid** in the following table.

Table 12-314 GS_SESSION_MEMORY_DETAIL columns

Name	Type	Description
sessid	text	1. When the thread pool is disabled (**enable_thread_pool = off**), this column indicates the thread start time + session ID (string: **timestamp.sessionid**). 2. When the thread pool is enabled (**enable_thread_pool = on**): If the memory context is at the thread level, this column indicates the thread start time + thread ID (string: **timestamp.threadid**). If the memory context is at the session level, the column indicates the thread start time + session ID (string: **timestamp.sessionid**).
sesstype	text	Thread name
contextname	text	Name of the memory context
level	smallint	Hierarchy of the memory context
parent	text	Name of the parent memory context
totalsize	bigint	Total size of the memory context, in bytes

Name	Type	Description
freesize	bigint	Total size of released memory in the memory context, in bytes
usedsize	bigint	Size of used memory in the memory context, in bytes. For **TempSmallContextGroup**, this parameter specifies the number of collected memory contexts.

CAUTION

This view is an O&M view and is used to locate memory problems. Do not query this view concurrently. If you query this view concurrently, the waiting time for new connections increases as the number of concurrent connections increases. As a result, new connections cannot be connected for a long time.

12.3.12.91 GS_SESSION_STAT

GS_SESSION_STAT displays the session states based on session threads or the **AutoVacuum** thread.

Table 12-315 GS_SESSION_STAT columns

Name	Type	Description
sessid	text	Thread ID and start time.
statid	integer	ID of the statistics session.
statname	text	Name of the statistics session.
statunit	text	Unit of the statistics session.
value	bigint	Value of the statistics session.

12.3.12.92 GS_SESSION_TIME

GS_SESSION_TIME displays the running time of session threads and time consumed in each execution phase.

Table 12-316 GS_SESSION_TIME columns

Name	Type	Description
sessid	text	Thread ID and start time.
stat_id	integer	ID of the statistics session.
stat_name	text	Type name of the statistics session.

Name	Type	Description
value	bigint	Value of the statistics session.

12.3.12.93 GS_SHARED_MEMORY_DETAIL

SHARED_MEMORY_DETAIL queries the usage information about shared memory contexts on the current node.

Table 12-317 GS_SHARED_MEMORY_DETAIL columns

Name	Type	Description
contextname	text	Name of the memory context
level	smallint	Level of the memory context
parent	text	Name of the parent memory context
totalsize	bigint	Total size of the shared memory (unit: byte)
freesize	bigint	Remaining size of the shared memory (unit: byte)
usedsize	bigint	Used size of the shared memory (unit: byte)

12.3.12.94 GS_SQL_COUNT

GS_SQL_COUNT displays statistics about five types of running statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) on the current node of the database.

- When a common user queries the GS_SQL_COUNT view, statistics about the current node of the user are displayed. When an administrator queries the GS_SQL_COUNT view, statistics about the current node of all users are displayed.
- When the database or the node is restarted, the statistics are cleared and the counting restarts.
- The system counts when a node receives a query, including a query inside the database.

Table 12-318 GS_SQL_COUNT columns

Name	Type	Description
node_name	name	Node name.
user_name	name	Username.

Name	Type	Description
select_count	bigint	Statistical result of the SELECT statement.
update_count	bigint	Statistical result of the UPDATE statement.
insert_count	bigint	Statistical result of the INSERT statement.
delete_count	bigint	Statistical result of the DELETE statement.
mergeinto_count	bigint	Statistical result of the MERGE INTO statement.
ddl_count	bigint	Number of DDL statements.
dml_count	bigint	Number of DML statements.
dcl_count	bigint	Number of DML statements.
total_select_elapse	bigint	Total response time of SELECT statements (unit: μs).
avg_select_elapse	bigint	Average response time of SELECT statements (unit: μs).
max_select_elapse	bigint	Maximum response time of SELECT statements (unit: μs).
min_select_elapse	bigint	Minimum response time of SELECT statements (unit: μs).
total_update_elapse	bigint	Total response time of UPDATE statements (unit: μs).
avg_update_elapse	bigint	Average response time of UPDATE statements (unit: μs).
max_update_elapse	bigint	Maximum response time of UPDATE statements (unit: μs).
min_update_elapse	bigint	Minimum response time of UPDATE statements (unit: μs).
total_insert_elapse	bigint	Total response time of INSERT statements (unit: μs).
avg_insert_elapse	bigint	Average response time of INSERT statements (unit: μs).
max_insert_elapse	bigint	Maximum response time of INSERT statements (unit: μs).
min_insert_elapse	bigint	Minimum response time of INSERT statements (unit: μs).

Name	Type	Description
total_delete_elapse	bigint	Total response time of DELETE statements (unit: μs).
avg_delete_elapse	bigint	Average response time of DELETE statements (unit: μs).
max_delete_elapse	bigint	Maximum response time of DELETE statements (unit: μs).
min_delete_elapse	bigint	Minimum response time of DELETE statements (unit: μs).

12.3.12.95 GS_THREAD_MEMORY_CONTEXT

GS_THREAD_MEMORY_CONTEXT displays statistics about memory usage of all threads based on MemoryContext nodes. This view is equivalent to the GS_SESSION_MEMORY_DETAIL view when **enable_thread_pool** is set to **off**. If the GUC parameter **enable_memory_limit** is set to **off**, this view is unavailable.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

Table 12-319 GS_THREAD_MEMORY_CONTEXT columns

Name	Type	Description
threadid	text	Thread start time + thread ID (string: *timestamp.sessionid*).
tid	bigint	Thread ID.
thrdtype	text	Thread type.
contextname	text	Name of the memory context.
level	smallint	Hierarchy of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the memory context, in bytes.
freesize	bigint	Total size of released memory in the current memory context, in bytes.

Name	Type	Description
usedsize	bigint	Size of used memory in the memory context, in bytes. For **TempSmallContextGroup**, this parameter specifies the number of collected memory contexts.

12.3.12.96 GS_TOTAL_MEMORY_DETAIL

GS_TOTAL_MEMORY_DETAIL displays the memory usage of the current database node, in MB. If the GUC parameter **enable_memory_limit** is set to **off**, this view is unavailable.

Table 12-320 GS_TOTAL_MEMORY_DETAIL columns

Name	Type	Description
nodename	text	Node name.

Name	Type	Description
memorytype	text	Memory type. The value must be one of the following: • **max_process_memory**: memory occupied by the GaussDB instance • **process_used_memory**: memory occupied by the GaussDB process • **max_dynamic_memory**: maximum dynamic memory • **dynamic_used_memory**: used dynamic memory • **dynamic_peak_memory**: dynamic peak memory • **dynamic_used_shrctx**: maximum dynamic shared memory context • **dynamic_peak_shrctx**: dynamic peak value of the shared memory context • **max_backend_memory**: maximum memory that can be used when the HA port is used to execute services. • **backend_used_memory**: memory that has been used when the HA port is used to execute services. • **max_shared_memory**: maximum shared memory • **shared_used_memory**: used shared memory • **max_sctpcomm_memory**: maximum memory allowed for the communications library. • **sctpcomm_used_memory**: memory used by the communications library • **sctpcomm_peak_memory**: memory peak of the communications library • **other_used_memory**: other used memory • **llvm_used_memory**: memory occupied by the expression IR that is generated by Codegen and is not released
memorymbytes	integer	Size of allocated memory-typed memory.

12.3.12.97 GS_TOTAL_NODEGROUP_MEMORY_DETAIL

GS_TOTAL_NODEGROUP_MEMORY_DETAIL returns the memory usage (in MB) of the current logical instance of the database. If the GUC parameter **enable_memory_limit** is set to **off**, this view is unavailable.

Table 12-321 GS_TOTAL_NODEGROUP_MEMORY_DETAIL columns

Name	Type	Description
ngname	text	Logical instance name.
memorytype	text	Memory type. The value must be one of the following: • **ng_total_memory**: total memory of the logical instance • **ng_used_memory**: memory usage of the logical instance • **ng_estimate_memory**: estimated memory usage of the logical instance • **ng_foreignrp_memsize**: total memory of the external resource pool of the logical instance • **ng_foreignrp_usedsize**: memory usage of the external resource pool of the logical instance • **ng_foreignrp_peaksize**: peak memory usage of the external resource pool of the logical instance • **ng_foreignrp_mempct**: percentage of the external resource pool of the logical instance to the total memory of the logical instance • **ng_foreignrp_estmsize**: estimated memory usage of the external resource pool of the logical instance
memorymbytes	integer	Size of allocated memory-typed memory.

12.3.12.98 GS_WORKLOAD_RULE_STAT

GS_WORKLOAD_RULE_STAT displays information about SQL concurrency control rules. Only the sysadmin user can access the system view.

Table 12-322 GS_WORKLOAD_RULE_STAT columns

Name	Type	Description
rule_id	bigint	Concurrency control rule ID.
rule_name	name	Name of a concurrency control rule, which is used to search for the concurrency control rule.
databases	name[]	List of databases on which the concurrency control rules take effect. If the value is **NULL**, the concurrency control rules take effect for all databases.

Name	Type	Description
rule_type	text	Concurrency control rule type. Currently, only **"sqlid"**, **"select"**, **"insert"**, **"update"**, **"delete"**, **"merge"**, and **"resource"** are supported. Other values are invalid.
start_time	timestamp with time zone	Start time of the concurrency control rules. The value **NULL** indicates that the rules take effect from now on.
end_time	timestamp with time zone	End time of the concurrency control rules. The value **NULL** indicates that the rules are always effective.
max_workload	bigint	Maximum number of concurrent rule settings.
option_val	text[]	Parameter values of a concurrency control rule, including SQL ID, keyword list, and resource restriction. For details, see **gs_add_workload_rule(rule_type, rule_name, databases, start_time, end_time, max_workload, option_val)**.
is_valid	Boolean	Determines whether the concurrency control rules take effect. If the concurrency control rules time out, the value is set to **false**.
validate_count	bigint	Number of SQL statements intercepted by the concurrency control rule.
node_names	text[]	List of nodes on which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.
user_names	text[]	List of users for which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.

12.3.12.99 GV_INSTANCE

GV_INSTANCE displays information about the current database instance. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-323 GV_INSTANCE columns

Name	Type	Description
inst_id	oid	OID of the current database.
instance_number	oid	OID of the current database.
instance_name	character varying(16)	Name of the current database.
host_name	character varying(64)	Not supported. The value is **NULL**.
version	character varying(17)	Not supported. The value is **NULL**.
version_legacy	character varying(17)	Not supported. The value is **NULL**.
version_full	character varying(17)	Not supported. The value is **NULL**.
startup_time	timestamp(0) without time zone	Not supported. The value is **NULL**.
status	character varying(12)	Not supported. The value is **NULL**.
parallel	character varying(3)	Not supported. The value is **NULL**.
thread#	numeric	Not supported. The value is **NULL**.
archiver	character varying(7)	Not supported. The value is **NULL**.
log_switch_wait	character varying(15)	Not supported. The value is **NULL**.
logins	character varying(10)	Not supported. The value is **NULL**.
shutdown_pending	character varying(3)	Not supported. The value is **NULL**.
database_status	character varying(17)	Not supported. The value is **NULL**.
instance_role	character varying(18)	Not supported. The value is **NULL**.
active_state	character varying(9)	Not supported. The value is **NULL**.
blocked	character varying(3)	Not supported. The value is **NULL**.

Name	Type	Description
con_id	numeric	Not supported. The value is **NULL**.
instance_mode	character varying(11)	Not supported. The value is **NULL**.
edition	character varying(7)	Not supported. The value is **NULL**.
family	character varying(80)	Not supported. The value is **NULL**.
database_type	character varying(15)	Not supported. The value is **NULL**.

12.3.12.100 GV_SESSION

GV_SESSION displays information about all current sessions. Only administrators can access this view. Common users can access the view only after being authorized. This view exists in both the PG_CATALOG and SYS schemas. When the thread pool is enabled (**enable_thread_pool** is set to **on**), all session information is displayed. When the thread pool is disabled (**enable_thread_pool** is set to **off**), the sessions connected by users are not displayed.

Table 12-324 GV_SESSION columns

Name	Type	Description
inst_id	numeric	Not supported. The value is **NULL**.
saddr	raw	Not supported. The value is **NULL**.
sid	bigint	Session ID.
serial#	integer	Sequence number of the active background thread.
audsid	numeric	Not supported. The value is **NULL**.
paddr	raw	Not supported. The value is **NULL**.
schema#	numeric	Not supported. The value is **NULL**.
schemaname	name	Name of the user logged in to the backend.
user#	oid	OID of the user who has logged in to the backend thread. The OID is **0** if the backend thread is a global auxiliary thread.
username	name	Name of the user logged in to the backend process. **username** is null if the backend thread is a global auxiliary thread.

Name	Type	Description
command	numeric	Not supported. The value is **NULL**.
ownerid	numeric	Not supported. The value is **NULL**.
taddr	character varying(16)	Not supported. The value is **NULL**.
lockwait	character varying(16)	Not supported. The value is **NULL**.
machine	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
sql_id	bigint	SQL OID.
client_info	text	Client information
event	text	Queuing status of a statement. The value can be: • **waiting in queue**: The statement is in the queue. • **Empty**: The statement is running.
sql_exec_start	timestamp with time zone	Start time of SQL statement execution.
program	text	Name of the application connected to the backend.
status	text	Overall status of this backend. The value can be: • **active**: The backend is executing a query. • **idle**: The backend is waiting for a new client command. • **idle in transaction**: The backend is in a transaction, but there is no statement being executed in the transaction. • **idle in transaction (aborted)**: The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend.
server	character varying(9)	Not supported. The value is **NULL**.
pdml_status	character varying(8)	Specifies whether to enable a DML parallel execution in the current session.

Name	Type	Description
port	numeric	Port number of the current session
process	character varying(24)	Process ID of the current session
logon_time	timestamp(0) without time zone	Login time of the current session
last_call_et	integer	Duration when the status of the current session changes last time
osuser	text	OS username of the server.
terminal	character varying(30)	Not supported. The value is **NULL**.
type	character varying(10)	Not supported. The value is **NULL**.
sql_address	raw	Not supported. The value is **NULL**.
sql_hash_value	numeric	Not supported. The value is **NULL**.
sql_child_number	numeric	Not supported. The value is **NULL**.
sql_exec_id	numeric	Not supported. The value is **NULL**.
prev_sql_addr	raw	Not supported. The value is **NULL**.
prev_hash_value	numeric	Not supported. The value is **NULL**.
prev_sql_id	character varying(13)	Not supported. The value is **NULL**.
prev_child_number	numeric	Not supported. The value is **NULL**.
prev_exec_start	timestamp(0) without time zone	Not supported. The value is **NULL**.
prev_exec_id	numeric	Not supported. The value is **NULL**.
plsql_entry_object_id	numeric	Not supported. The value is **NULL**.
plsql_entry_subprogram_id	numeric	Not supported. The value is **NULL**.

Name	Type	Description
plsql_object_id	numeric	Not supported. The value is **NULL**.
plsql_subprogram_id	numeric	Not supported. The value is **NULL**.
module	text	Name of the running module, which is set by calling DBE_APPLICATION_INFO.SET_MODULE.
module_hash	numeric	Not supported. The value is **NULL**.
action	text	Name of the current operation in the current module, which is set by calling DBE_APPLICATION_INFO.SET_MODULE or DBE_APPLICATION_INFO.SET_ACTION.
action_hash	numeric	Not supported. The value is **NULL**.
fixed_table_sequence	numeric	Not supported. The value is **NULL**.
row_wait_obj#	numeric	Not supported. The value is **NULL**.
row_wait_file#	numeric	Not supported. The value is **NULL**.
row_wait_block#	numeric	Not supported. The value is **NULL**.
row_wait_row#	numeric	Not supported. The value is **NULL**.
top_level_call#	numeric	Not supported. The value is **NULL**.
pdml_enabled	character varying(3)	Not supported. The value is **NULL**.
failover_type	character varying(13)	Not supported. The value is **NULL**.
failover_method	character varying(10)	Not supported. The value is **NULL**.
failed_over	character varying(3)	Not supported. The value is **NULL**.
resource_consumer_group	character varying(32)	Not supported. The value is **NULL**.
pddl_status	character varying(8)	Not supported. The value is **NULL**.

Name	Type	Description
pq_status	character varying(8)	Not supported. The value is **NULL**.
current_queue_duration	numeric	Not supported. The value is **NULL**.
client_identifier	character varying(64)	Not supported. The value is **NULL**.
blocking_session_status	character varying(11)	Not supported. The value is **NULL**.
blocking_instance	numeric	Not supported. The value is **NULL**.
blocking_session	numeric	Not supported. The value is **NULL**.
final_blocking_session_status	character varying(11)	Not supported. The value is **NULL**.
final_blocking_instance	numeric	Not supported. The value is **NULL**.
final_blocking_session	numeric	Not supported. The value is **NULL**.
seq#	numeric	Not supported. The value is **NULL**.
event#	numeric	Not supported. The value is **NULL**.
p1text	character varying(64)	Not supported. The value is **NULL**.
p1	numeric	Not supported. The value is **NULL**.
p1raw	raw	Not supported. The value is **NULL**.
p2text	character varying(64)	Not supported. The value is **NULL**.
p2	numeric	Not supported. The value is **NULL**.
p2raw	raw	Not supported. The value is **NULL**.
p3text	character varying(64)	Not supported. The value is **NULL**.
p3	numeric	Not supported. The value is **NULL**.
p3raw	raw	Not supported. The value is **NULL**.
wait_class_id	numeric	Not supported. The value is **NULL**.
wait_class#	numeric	Not supported. The value is **NULL**.

Name	Type	Description
wait_class	character varying(64)	Not supported. The value is **NULL**.
wait_time	numeric	Not supported. The value is **NULL**.
seconds_in_wait	numeric	Not supported. The value is **NULL**.
state	character varying(19)	Not supported. The value is **NULL**.
wait_time_micro	numeric	Not supported. The value is **NULL**.
time_remaining_micro	numeric	Not supported. The value is **NULL**.
time_since_last_wait_micro	numeric	Not supported. The value is **NULL**.
service_name	character varying(64)	Not supported. The value is **NULL**.
sql_trace	character varying(8)	Not supported. The value is **NULL**.
sql_trace_waits	character varying(5)	Not supported. The value is **NULL**.
sql_trace_binds	character varying(5)	Not supported. The value is **NULL**.
sql_trace_plan_stats	character varying(10)	Not supported. The value is **NULL**.
session_edition_id	numeric	Not supported. The value is **NULL**.
creator_addr	raw	Not supported. The value is **NULL**.
creator_serial#	numeric	Not supported. The value is **NULL**.
ecid	character varying(64)	Not supported. The value is **NULL**.
sql_translation_profile_id	numeric	Not supported. The value is **NULL**.
pga_tunable_mem	numeric	Not supported. The value is **NULL**.
shard_ddl_status	character varying(8)	Not supported. The value is **NULL**.

Name	Type	Description
con_id	numeric	Not supported. The value is **NULL**.
external_name	character varying(1024)	Not supported. The value is **NULL**.
plsql_debugger_connected	character varying(5)	Not supported. The value is **NULL**.

12.3.12.101 MPP_TABLES

The following information is displayed in the MPP_TABLES view.

Table 12-325 MPP_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that contains a table.
tablename	name	Table name.
tableowner	name	Table owner.
tablespace	name	Tablespace that contains the table.
pgroup	name	Name of a node cluster.
nodeoids	oidvector_extend	List of distributed table node OIDs.

12.3.12.102 MY_AUDIT_TRAIL

MY_AUDIT_TRAIL displays the standard audit trail entries related to the current user. The GaussDB audit information is mainly obtained through the pg_query_audit() function. This view exists in both the PG_CATALOG and SYS schemas. Only users with the AUDITADMIN attribute and the SELECT permission on MY_AUDIT_TRAIL can view audit information. If separation-of-duty is disabled, users with the SYSADMIN attribute can also view audit information. The **action_name** field of GaussDB is different from that of the A database in terms of the audit actions. The type of the **transactionid** field is the same as that in the A database. In GaussDB, the **sql_text** field is the parsed SQL statement, which is not completely the same as the executed SQL statement.

Table 12-326 MY_AUDIT_TRAIL columns

Name	Type	Description
os_username	character varying(255)	Not supported. The value is **NULL**.
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. The value is **NULL**.
terminal	character varying(255)	Not supported. The value is **NULL**.
timestamp	timestamp(0) without time zone	Date and time when an audit trail entry is created in the local database session time zone (user login date and time of the entry created by the audit session).
owner	character varying(128)	Creator of the object affected by the operation.
obj_name	character varying(128)	Name of the object affected by the operation.
action	numeric	Not supported. The value is **NULL**.
action_name	character varying(28)	Action type corresponding to the code in the **action** column.
new_owner	character varying(128)	Not supported. The value is **NULL**.
new_name	character varying(128)	Not supported. The value is **NULL**.
obj_privilege	character varying(32)	Not supported. The value is **NULL**.
sys_privilege	character varying(40)	Not supported. The value is **NULL**.
admin_option	character varying(1)	Not supported. The value is **NULL**.
grantee	character varying(128)	Not supported. The value is **NULL**.
audit_option	character varying(40)	Not supported. The value is **NULL**.
ses_actions	character varying(19)	Not supported. The value is **NULL**.

Name	Type	Description
logoff_time	timestamp(0) without time zone	Not supported. The value is **NULL**.
logoff_lread	numeric	Not supported. The value is **NULL**.
logoff_pread	numeric	Not supported. The value is **NULL**.
logoff_lwrite	numeric	Not supported. The value is **NULL**.
logoff_dlock	character varying(40)	Not supported. The value is **NULL**.
comment_text	character varying(4000)	Not supported. The value is **NULL**.
sessionid	numeric	Not supported. The value is **NULL**.
entryid	numeric	Not supported. The value is **NULL**.
statementid	numeric	Not supported. The value is **NULL**.
returncode	numeric	Not supported. The value is **NULL**.
priv_used	character varying(40)	Not supported. The value is **NULL**.
client_id	character varying(128)	Not supported. The value is **NULL**.
econtext_id	character varying(64)	Not supported. The value is **NULL**.
session_cpu	numeric	Not supported. The value is **NULL**.
extended_timestamp	timestamp(6) with time zone	Time zone of the timestamp when an audit trail entry is created (user login date and time of the entry created by the audit session in UTC).
proxy_sessionid	numeric	Not supported. The value is **NULL**.
global_uid	character varying(32)	Not supported. The value is **NULL**.
instance_number	numeric	Not supported. The value is **NULL**.
os_process	character varying(16)	Not supported. The value is **NULL**.
transactionid	text	Identifier of the transaction that accesses or modifies an object.
scn	numeric	Not supported. The value is **NULL**.
sql_bind	nvarchar2(2000)	Not supported. The value is **NULL**.

Name	Type	Description
sql_text	nvarchar2	SQL text of the query.
obj_edition_name	character varying(128)	Not supported. The value is **NULL**.
dbid	numeric	Not supported. The value is **NULL**.
rls_info	clob	Not supported. The value is **NULL**.
current_user	character varying(128)	Not supported. The value is **NULL**.

12.3.12.103 MY_COL_COMMENTS

MY_COL_COMMENTS displays column comments of the table accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-327 MY_COL_COMMENTS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
comments	text	Comments.
origin_con_id	numeric	Not supported. The value is **0**.
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.12.104 MY_COLL_TYPES

MY_COLL_TYPES displays information about types of collections created by the current user. By default, it is accessible to all users. This view exists in the PG_CATALOG and SYS schemas.

Table 12-328 MY_COLL_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of a collection.
type_name	character varying(128)	Name of a collection.

Name	Type	Description
coll_type	character varying(128)	Description of a collection.
upper_bound	numeric	Not supported. The value is **NULL**.
elem_type_mod	character varying(7)	Type modifier of an element.
elem_type_owner	character varying(128)	Owner of the element type on which the collection is based. This parameter is mainly used for user-defined types.
elem_type_name	character varying(128)	Name of the data type or user-defined type on which the collection is based.
length	numeric	Not supported. The value is **NULL**.
precision	numeric	Not supported. The value is **NULL**.
scale	numeric	Not supported. The value is **NULL**.
character_set_name	character varying(44)	Not supported. The value is **NULL**.
elem_storage	character varying(7)	Not supported. The value is **NULL**.
nulls_stored	character varying(3)	Not supported. The value is **NULL**.
char_used	character varying(1)	Not supported. The value is **NULL**.

12.3.12.105 MY_CONS_COLUMNS

MY_CONS_COLUMNS displays information about primary key constraint columns in tables accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-329 MY_CONS_COLUMNS columns

Name	Type	Description
table_name	character varying(64)	Name of a constraint-related table.
column_name	character varying(64)	Name of a constraint-related column.
constraint_name	character varying(64)	Constraint name.
owner	character varying(64)	Constraint creator.
position	smallint	Position of a column in a table.

12.3.12.106 MY_CONSTRAINTS

MY_CONSTRAINTS displays table constraint information accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-330 MY_CONSTRAINTS columns

Name	Type	Description
constraint_name	character varying(64)	Constraint name.
constraint_type	text	Constraint type. • **c**: check constraint • **f**: foreign key constraint • **p**: primary key constraint • **u**: unique constraint
table_name	character varying(64)	Name of a constraint-related table.
index_owner	character varying(64)	Owner of a constraint-related index (only for the unique constraint and primary key constraint).
index_name	character varying(64)	Name of a constraint-related index (only for the unique constraint and primary key constraint).
owner	character varying(64)	Constraint creator.

12.3.12.107 MY_DEPENDENCIES

MY_DEPENDENCIES displays the dependencies between objects that are accessible to the current user. This view exists in the PG_CATALOG and SYS schemas and all users can access this view.

Table 12-331 MY_DEPENDENCIES columns

Name	Type	Description
name	name	Object name.
type	character varying(18)	Object type.
referenced_owner	name	Owner of the referenced object.
referenced_name	name	Name of the referenced object.
referenced_type	character varying(18)	Type of the referenced object.
referenced_link_name	character varying(128)	Name of the link to the parent object (if remote).
dependency_type	character varying(4)	Specifies whether the dependency is an REF dependency.

12.3.12.108 MY_ERRORS

MY_ERRORS displays the latest compilation error information about user-owned storage objects. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in the PG_CATALOG and SYS schemas.

Table 12-332 MY_ERRORS columns

Name	Type	Description
name	character varying(128)	Object name.
type	character varying(12)	Object type. • **PROCEDURE** • **FUNCTION** • **PACKAGE** • **PACKAGE BODY**

Name	Type	Description
sequence	numeric	Serial number.
line	numeric	Row where an error occurs.
position	numeric	Position in the row where an error occurs.
text	character varying(4000)	Error text.
attribute	character varying(9)	Attribute tag: ERROR.
message_number	numeric	Not supported. The value is **NULL**.

12.3.12.109 MY_IND_COLUMNS

MY_IND_COLUMNS displays column information about all indexes accessible to the current user. It is accessible to all users. This view exists in the PG_CATALOG and SYS schemas.

Table 12-333 MY_IND_COLUMNS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	name	Column name.
column_position	smallint	Position of a column in an index.
column_length	numeric	Length of the column. For the variable-length type, the value of this field is **NULL**.
char_length	numeric	Maximum length of a column, in bytes.
descend	character varying(4)	Specifies whether columns are sorted in descending (**DESC**) or ascending (**ASC**) order.
collated_column_id	numeric	Not supported. The value is **NULL**.

12.3.12.110 MY_IND_EXPRESSIONS

MY_IND_EXPRESSIONS displays information about function-based expression indexes accessible to the current user. It is accessible to all users. This view exists in the PG_CATALOG and SYS schemas.

Table 12-334 MY_IND_EXPRESSIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
column_expression	text	Function-based index expression of a specified column.
column_position	smallint	Position of a column in an index.

12.3.12.111 MY_INDEXES

MY_INDEXES displays index information about the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-335 MY_INDEXES columns

Name	Type	Description
owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_name	character varying(64)	Name of a table corresponding to an index.
uniqueness	text	Specifies whether an index is unique.
partitioned	character(3)	Specifies whether an index has the property of partitioned tables.
generated	character varying(1)	Specifies whether the name of an index is generated by the system.
index_type	character varying(27)	Index type.
table_owner	character varying(128)	Owner of an index object.

Name	Type	Description
table_type	character(11)	Type of an index object.
tablespace_name	character varying(30)	Name of the tablespace that contains the index.
status	character varying(8)	Status of a non-partitioned index.
compression	character varying(13)	Not supported. The value is **NULL**.
prefix_length	numeric	Not supported. The value is **NULL**.
ini_trans	numeric	Not supported. The value is **NULL**.
max_trans	numeric	Not supported. The value is **NULL**.
initial_extent	numeric	Not supported. The value is **NULL**.
next_extent	numeric	Not supported. The value is **NULL**.
min_extents	numeric	Not supported. The value is **NULL**.
max_extents	numeric	Not supported. The value is **NULL**.
pct_increase	numeric	Not supported. The value is **NULL**.
pct_threshold	numeric	Not supported. The value is **NULL**.
include_column	numeric	Not supported. The value is **NULL**.
freelists	numeric	Not supported. The value is **NULL**.
freelist_groups	numeric	Not supported. The value is **NULL**.
pct_free	numeric	Not supported. The value is **NULL**.
logging	character varying(3)	Not supported. The value is **NULL**.
blevel	numeric	Not supported. The value is **NULL**.

Name	Type	Description
leaf_blocks	numeric	Not supported. The value is **NULL**.
distinct_keys	numeric	Not supported. The value is **NULL**.
avg_leaf_blocks_per_key	numeric	Not supported. The value is **NULL**.
avg_data_blocks_per_key	numeric	Not supported. The value is **NULL**.
clustering_factor	numeric	Not supported. The value is **NULL**.
num_rows	numeric	Not supported. The value is **NULL**.
sample_size	numeric	Not supported. The value is **NULL**.
last_analyzed	timestamp(0) without time zone	Not supported. The value is **NULL**.
degree	character varying(40)	Not supported. The value is **NULL**.
instances	character varying(40)	Not supported. The value is **NULL**.
temporary	character varying(1)	Not supported. The value is **NULL**.
secondary	character varying(1)	Not supported. The value is **NULL**.
buffer_pool	character varying(7)	Not supported. The value is **NULL**.
flash_cache	character varying(7)	Not supported. The value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. The value is **NULL**.
user_stats	character varying(3)	Not supported. The value is **NULL**.
duration	character varying(15)	Not supported. The value is **NULL**.
pct_direct_access	numeric	Not supported. The value is **NULL**.
ityp_owner	character varying(128)	Not supported. The value is **NULL**.

Name	Type	Description
ityp_name	character varying(128)	Not supported. The value is **NULL**.
parameters	character varying(1000)	Not supported. The value is **NULL**.
global_stats	character varying(3)	Not supported. The value is **NULL**.
domidx_status	character varying(12)	Not supported. The value is **NULL**.
domidx_opstatus	character varying(6)	Not supported. The value is **NULL**.
funcidx_status	character varying(8)	Not supported. The value is **NULL**.
join_index	character varying(3)	Not supported. The value is **NULL**.
iot_redundant_pkey_elim	character varying(3)	Not supported. The value is **NULL**.
dropped	character varying(3)	Not supported. The value is **NULL**.
visibility	character varying(9)	Specifies whether the index is visible to the optimizer.
domidx_management	character varying(14)	Not supported. The value is **NULL**.
segment_created	character varying(3)	Not supported. The value is **NULL**.
orphaned_entries	character varying(3)	Not supported. The value is **NULL**.
indexing	character varying(7)	Not supported. The value is **NULL**.
auto	character varying(3)	Not supported. The value is **NULL**.

12.3.12.112 MY_JOBS

MY_JOBS displays details about the scheduled tasks owned by the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-336 MY_JOBS columns

Name	Type	Description
job	bigint	Job ID.
log_user	name	Username of a job creator.
priv_user	name	Username of a job executor.
dbname	name	Name of the database where the job is created.
schema_user	name	Default schema name of a scheduler job.
start_date	timestamp without time zone	Job start time.
start_suc	text	Start time of a successful job execution.
last_date	timestamp without time zone	Start time of the last job execution.
last_suc	text	Start time of the last successful job execution.
last_sec	text	Start time of the last successful job execution. Compatibility is supported.
this_date	timestamp without time zone	Start time of an ongoing job execution.
this_suc	text	Start time of an ongoing successful job execution.
this_sec	text	Start time of an ongoing successful job execution. Compatibility is supported.
next_date	timestamp without time zone	Schedule time of the next job execution.
next_suc	text	Schedule time of the next successful job execution.
next_sec	text	Schedule time of the next successful job execution. Compatibility is supported.
total_time	numeric	Latest execution duration of a task.
broken	text	The value is **y** if the job state is broken and **n** if otherwise.

Name	Type	Description
status	"char"	Status of the current job. The value can be **r**, **s**, **f**, or **d**. The default value is **r**. • **r**: running • **s**: successful execution • **f**: failed execution • **d**: canceling an execution
interval	text	Time expression used to calculate the next time the job will be executed. If this parameter is set to **null**, the job will be executed once only.
failures	smallint	Number of times the job has started and failed. If a job fails to be executed for 16 consecutive times, no more attempt will be made on it.
what	text	Executable job.
nls_env	character varying(4000)	Not supported. The value is **NULL**.
misc_env	raw	Not supported. The value is **NULL**.
instance	numeric	Not supported. The value is **NULL**.

12.3.12.113 MY_OBJECTS

MY_OBJECTS displays database objects accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-337 MY_OBJECTS columns

Name	Type	Description
object_name	name	Object name.
object_id	oid	Object OID.
object_type	name	Object type (**TABLE**, **INDEX**, **SEQUENCE**, or **VIEW**).
namespace	oid	Namespace that an object belongs to.
temporary	character(1)	Specifies whether an object is a temporary object.

Name	Type	Description
status	character varying(7)	Object status.
subobject_name	name	Subobject name of an object.
generated	character(1)	Specifies whether an object name is generated by the system.
created	timestamp with time zone	Creation time of an object.
last_ddl_time	timestamp with time zone	Last modification time of an object.
default_collation	character varying(100)	Default collation of objects.
data_object_id	numeric	Not supported. The value is **NULL**.
timestamp	character varying(19)	Not supported. The value is **NULL**.
secondary	character varying(1)	Not supported. The value is **NULL**.
edition_name	character varying(128)	Not supported. The value is **NULL**.
sharing	character varying(18)	Not supported. The value is **NULL**.
editionable	character varying(1)	Not supported. The value is **NULL**.
oracle_maintained	character varying(1)	Not supported. The value is **NULL**.
application	character varying(1)	Not supported. The value is **NULL**.
duplicated	character varying(1)	Not supported. The value is **NULL**.
sharded	character varying(1)	Not supported. The value is **NULL**.
created_appid	numeric	Not supported. The value is **NULL**.
modified_appid	numeric	Not supported. The value is **NULL**.

Name	Type	Description
created_vsnid	numeric	Not supported. The value is **NULL**.
modified_vsnid	numeric	Not supported. The value is **NULL**.

NOTICE

For details about the value ranges of **created** and **last_ddl_time**, see **PG_OBJECT**.

12.3.12.114 MY_PROCEDURES

MY_PROCEDURES displays information about stored procedures, functions, or triggers owned by the current user. This view exists in the PG_CATALOG and SYS schemas. This view can be accessed by all users. Only the information about the current user can be viewed.

Table 12-338 MY_PROCEDURES columns

Name	Type	Description
owner	character varying(64)	Owner of a stored procedure, function, trigger, or package.
object_name	character varying(64)	Name of a stored procedure, function, or trigger. This column will be a package name if the object is a function in a package or a stored procedure.
procedure_name	character varying(128)	This column will be the name of a function or stored procedure in a package if **object_name** is a package name. Otherwise, this column is empty.
object_id	oid	OID of a stored procedure, function, trigger, or package.
subprogram_id	numeric	Location of a function or stored procedure in a package.
overload	character varying(40)	*M*th overloaded function.
object_type	character varying(13)	Object class.

Name	Type	Description
aggregate	character varying(3)	Specifies whether the function is an aggregate function: • **YES** • **NO**
pipelined	character varying(3)	Not supported. The value is **NO**.
impltypeowner	character varying(128)	Owner of an implementation type.
impltypename	character varying(128)	Name of an implementation type.
parallel	character varying(3)	Not supported. The value is **NO**.
interface	character varying(3)	Not supported. The value is **NO**.
deterministic	character varying(3)	Not supported. The value is **NO**.
authid	character varying(12)	Specifies whether to use the creator permission or caller permission: • **DEFINER**: The creator permission is used. • **CURRENT_USER**: The caller permission is used. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
result_cache	character varying(3)	Not supported. The value is **NULL**.
origin_con_id	character varying(256)	Not supported. The value is **0**.
polymorphic	character varying(5)	Not supported. The value is **NULL**.
argument_number	smallint	Number of input parameters in a stored procedure.

12.3.12.115 MY_RECYCLEBIN

MY_RECYCLEBIN displays information about the recycle bin owned by the current user. This view exists in the PG_CATALOG and SYS schemas and all users can access this view.

Table 12-339 MY_RECYCLEBIN columns

Name	Type	Description
object_name	character varying(128)	New name of an object.
original_name	character varying(128)	Original name of an object.
operation	character varying(18)	Operation performed on an object. The options are as follows: ● **DROP**: The object is deleted (the object is no longer required). ● **TRUNCATE**: The object is truncated.
type	character varying(25)	Object class.
ts_name	character varying(30)	Name of the tablespace to which the object belongs.
createtime	character varying(19)	Timestamp when an object is created.
droptime	character varying(19)	Timestamp when an object is deleted.
dropscn	numeric	System change number (SCN) of the transaction that moves an object to the recycle bin.
partition_name	character varying(128)	Name of a deleted partition.
can_undrop	character varying(3)	Determines whether to flash back an object.
can_purge	character varying(3)	Determines whether to purge the object.
related	numeric	ID of the parent object.
base_object	oid	ID of a base object.
purge_object	oid	ID of the purged object.
space	numeric	Number of blocks used by an object.

12.3.12.116 MY_SCHEDULER_JOB_ARGS

MY_SCHEDULER_JOB_ARG displays the parameters related to the jobs owned by the current user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in the PG_CATALOG and SYS schemas.

Table 12-340 MY_SCHEDULER_JOB_ARGS columns

Name	Type	Description
job_name	character varying(128)	Name of the job to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter.
value	character varying(4000)	Parameter value.
anydata_value	character varying(4000)	Not supported. The value is **NULL**.
out_argument	character varying(5)	This column is reserved. The value is **NULL**.

12.3.12.117 MY_SCHEDULER_JOBS

MY_SCHEDULER_JOBS displays information about all DBE_SCHEDULER scheduled tasks owned by the current user in the database. By default, it is accessible to all users. This view exists in the PG_CATALOG and SYS schemas.

Table 12-341 MY_SCHEDULER_JOBS columns

Name	Type	Description
job_name	text	Name of a scheduler job.
job_subname	character varying(128)	Not supported. The value is **NULL**.
job_style	text	Action mode of a scheduler job.
job_creator	name	Creator of a scheduler job.
client_id	character varying(65)	Not supported. The value is **NULL**.

Name	Type	Description
global_uid	character varying(33)	Not supported. The value is **NULL**.
program_owner	character varying(4000)	Owner of a program referenced by a scheduler job.
program_name	text	Name of the program referenced by a scheduler job.
job_type	character varying(16)	Type of the inline program of a scheduler job.
job_action	text	Program content of a scheduler job.
number_of_arguments	text	Number of parameters of a scheduler job.
schedule_owner	character varying(4000)	Not supported. The value is **NULL**.
schedule_name	text	Name of the scheduler referenced by a scheduler job.
schedule_type	character varying(12)	Not supported. The value is **NULL**.
start_date	timestamp without time zone	Start time of a scheduler job.
repeat_interval	text	Period of a scheduler job.
event_queue_owner	character varying(128)	Not supported. The value is **NULL**.
event_queue_name	character varying(128)	Not supported. The value is **NULL**.
event_queue_agent	character varying(523)	Not supported. The value is **NULL**.
event_condition	character varying(4000)	Not supported. The value is **NULL**.
event_rule	character varying(261)	Not supported. The value is **NULL**.
file_watcher_owner	character varying(261)	Not supported. The value is **NULL**.
file_watcher_name	character varying(261)	Not supported. The value is **NULL**.

Name	Type	Description
end_date	timestamp without time zone	End time of a scheduler job.
job_class	text	Name of the scheduler job class to which a scheduler job belongs.
enabled	boolean	Status of a scheduler job.
auto_drop	text	Status of the automatic deletion function of a scheduler job.
restart_on_recovery	character varying(5)	Not supported. The value is **NULL**.
restart_on_failure	character varying(5)	Not supported. The value is **NULL**.
state	"char"	Status of a scheduler job.
job_priority	numeric	Not supported. The value is **NULL**.
run_count	numeric	Not supported. The value is **NULL**.
uptime_run_count	numeric	Not supported. The value is **NULL**.
max_runs	numeric	Not supported. The value is **NULL**.
failure_count	smallint	Number of scheduler job failures.
uptime_failure_count	numeric	Not supported. The value is **NULL**.
max_failures	numeric	Maximum number of failures allowed before the status of a scheduler job is marked as broken.
retry_count	numeric	Not supported. The value is **NULL**.
last_start_date	timestamp without time zone	Last time when a scheduler job was started.
last_run_duration	interval day to second(6)	Last execution duration of a scheduler job.
next_run_date	timestamp without time zone	Next execution time of a scheduler job.

Name	Type	Description
schedule_limit	interval day to second(0)	Not supported. The value is **NULL**.
max_run_duration	interval day to second(0)	Not supported. The value is **NULL**.
logging_level	character varying(11)	Not supported. The value is **NULL**.
store_output	character varying(5)	Specifies whether to store the output information of all scheduler jobs.
stop_on_window_close	character varying(5)	Not supported. The value is **NULL**.
instance_stickiness	character varying(5)	Not supported. The value is **NULL**.
raise_events	character varying(4000)	Not supported. The value is **NULL**.
system	character varying(5)	Not supported. The value is **NULL**.
job_weight	numeric	Not supported. The value is **NULL**.
nls_env	character varying(4000)	Not supported. The value is **NULL**.
source	character varying(128)	Not supported. The value is **NULL**.
number_of_destinations	numeric	Not supported. The value is **NULL**.
destination_owner	character varying(261)	Not supported. The value is **NULL**.
destination	text	Target name of a scheduler job.
credential_owner	character varying(128)	Not supported. The value is **NULL**.
credential_name	text	Certificate name of a scheduler job.
instance_id	oid	OID of the current database.
deferred_drop	character varying(5)	Not supported. The value is **NULL**.
allow_runs_in_restricted_mode	character varying(5)	Not supported. The value is **NULL**.

Name	Type	Description
comments	text	Comments of a scheduler job.
flags	numeric	Not supported. The value is **NULL**.
restartable	character varying(5)	Not supported. The value is **NULL**.
has_constraints	character varying(5)	Not supported. The value is **NULL**.
connect_credential_owner	character varying(128)	Not supported. The value is **NULL**.
connect_credential_name	character varying(128)	Not supported. The value is **NULL**.
fail_on_script_error	character varying(5)	Not supported. The value is **NULL**.

12.3.12.118 MY_SCHEDULER_PROGRAM_ARGS

MY_SCHEDULER_PROGRAM_ARG displays the parameters related to the programs owned by the current user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in the PG_CATALOG and SYS schemas.

Table 12-342 MY_SCHEDULER_PROGRAM_ARGS columns

Name	Type	Description
program_name	character varying(128)	Name of the program to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter.
metadata_attribute	character varying(19)	Not supported. Set it to **NULL**.
default_value	character varying(4000)	Default parameter value.
default_anydata_value	character varying(4000)	Not supported. Set it to **NULL**.

Name	Type	Description
out_argument	character varying(5)	Reserved column. Set it to **NULL**.

12.3.12.119 MY_SEQUENCES

MY_SEQUENCES displays the sequence information about the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-343 MY_SEQUENCES columns

Name	Type	Description
sequence_owner	name	Owner of a sequence.
sequence_name	name	Name of a sequence.
min_value	int16	Minimum value of a sequence.
max_value	int16	Maximum value of a sequence.
increment_by	int16	Value by which a sequence is incremented.
cycle_flag	character(1)	Whether a sequence is a cycle sequence. The value can be **Y** or **N**. • **Y**: It is a cycle sequence. • **N**: It is not a cycle sequence.
order_flag	character varying(1)	Specifies whether a sequence occurs in a request sequence. This parameter is not supported. Set it to **NULL**.
cache_size	int16	Size of the sequence disk cache.
last_number	int16	Value of the previous sequence.
scale_flag	character varying(1)	Specifies whether a sequence is a scalable sequence. This parameter is not supported. Set it to **NULL**.

Name	Type	Description
extend_flag	character varying(1)	Specifies whether the value generated by a scalable sequence exceeds the maximum or minimum value of the sequence. This parameter is not supported. Set it to **NULL**.
sharded_flag	character varying(1)	Specifies whether a sequence is a shard sequence. This parameter is not supported. Set it to **NULL**.
session_flag	character varying(1)	Specifies whether a sequence has a private session. This parameter is not supported. Set it to **NULL**.
keep_value	character varying(1)	Specifies whether to retain the sequence value during replay after a failure. This parameter is not supported. Set it to **NULL**.

12.3.12.120 MY_SOURCE

MY_SOURCE displays the definition information about stored procedures, functions, triggers, and packages accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-344 MY_SOURCE columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	name	Object types: **function**, **package**, **package body**, **procedure**, and **trigger**
line	numeric	Number of the source line.
text	text	Text source of the storage object.
origin_con_id	character varying(256)	Not supported. The value is **0**.

12.3.12.121 MY_SYNONYMS

MY_SYNONYMS displays synonyms in the current schema. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in the PG_CATALOG and SYS schemas.

Table 12-345 MY_SYNONYMS columns

Name	Type	Description
schema_name	text	Name of the schema to which the synonym belongs.
synonym_name	text	Synonym name.
table_owner	text	Owner of the associated object. Although the column is called **table_owner**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_name	text	Name of the associated object. Although the column is called **table_name**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_schema_name	text	Schema name of the associated object. Although the column is called **table_schema_name**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
db_link	character varying(128)	This column is reserved. The value is **NULL**.
origin_con_id	character varying(256)	Not supported. The value is **0**.

12.3.12.122 MY_TAB_COL_STATISTICS

MY_TAB_COL_STATISTICS displays column statistics and histogram information extracted from MY_TAB_COLUMNS. All users can access this view. This view exists in the PG_CATALOG and SYS schemas. The values of the **LOW_VALUE** and **HIGH_VALUE** columns in this view are different from those in database A due to different underlying table structures. When the value of **LOW_VALUE** is a high-

frequency value, the value of **LOW_VALUE** in GaussDB is the second minimum value. When **HIGH_VALUE** is a high-frequency value, **HIGH_VALUE** of GaussDB is the second maximum value. The value of the **HISTOGRAM** column is different from that of database A due to different statistical methods. GaussDB supports only two types of histograms: **frequency** and **equi-width**. The value of the **SCOPE** column in GaussDB is different from that in database A because GaussDB does not support global temporary table statistics. GaussDB supports only local temporary table statistics. The default value is **SHARED**.

Table 12-346 MY_TAB_COL_STATISTICS columns

Name	Type	Description
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Low value in a column.
high_value	raw	High value in a column.
density	numeric	• If **COLUMN_NAME** is available on the histogram, this column indicates the selectivity of values that span less than two endpoints in the histogram. It does not represent the selectivity of values that span two or more endpoints. • If **COLUMN_NAME** is not available on the histogram, the value of this column is 1/**NUM_DISTINCT**.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	timestamp(0) without time zone	Date when a column was last analyzed.
sample_size	numeric	Sample size used to analyze a column.
global_stats	character varying(3)	Not supported. The value is **NULL**.
user_stats	character varying(3)	Not supported. The value is **NULL**.

Name	Type	Description
notes	character varying(99)	Not supported. The value is **NULL**.
avg_col_len	numeric	Average length of a column, in bytes.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram if it exists. • **NONE**: no histogram • **FREQUENCY**: frequency histogram • **EQUI-WIDTH**: equal-width histogram
scope	character varying(7)	The value **SHARED** is used to collect statistics on any table other than global temporary tables.
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.12.123 MY_TAB_COLUMNS

MY_TAB_COLUMNS displays the columns of the tables and views owned by the current user. This view exists in the PG_CATALOG and SYS schemas. All users can access this view. Only the information about the user is displayed.

Table 12-347 MY_TAB_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
data_type	character varying(128)	Data type of a column.
data_type_mod	character varying(3)	Not supported. The value is **NULL**.
data_type_owner	character varying(128)	Owner of the data type of a column.
data_length	integer	Length of a column, in bytes.

Name	Type	Description
data_precision	integer	Precision of a data type. This column is valid for the numeric data type and **NULL** for other data types.
data_scale	integer	Number of decimal places. This column is valid for the numeric data type and is set to **0** for other data types.
nullable	bpchar	Specifies whether the column can be empty (**n** for the primary key constraint and non-null constraint).
column_id	integer	Sequence number of a column when a table is created.
default_length	numeric	Length of the default value of a column, in bytes.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.
density	numeric	Column density.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	timestamp(0) without time zone	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported. The value is **NULL**.
char_col_decl_length	numeric	Declaration length of a column of the character type.
global_stats	character varying(3)	Not supported. Set it to **NO**.
user_stats	character varying(3)	Not supported. Set it to **NO**.
avg_col_len	numeric	Average length of a column, in bytes.

Name	Type	Description
char_length	numeric	Length of the column, in characters. This parameter is valid only for the varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported. Set it to **B** if the data type is varchar, nvarchar2, bpchar, or char. For other data types, set it to **NULL**.
v80_fmt_image	character varying(3)	Not supported. The value is **NULL**.
data_upgraded	character varying(3)	Not supported. Set it to **YES**.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram if it exists. • **NONE**: no histogram • **FREQUENCY**: frequency histogram • **EQUI_WIDTH**: equal-width histogram
default_on_null	character varying(3)	Not supported. The value is **NULL**.
identity_column	character varying(3)	Not supported. The value is **NULL**.
sensitive_column	character varying(3)	Not supported. The value is **NULL**.
evaluation_edition	character varying(128)	Not supported. The value is **NULL**.
unusable_before	character varying(128)	Not supported. The value is **NULL**.
unusable_beginning	character varying(128)	Not supported. The value is **NULL**.
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
comments	text	Comment of a column.

Name	Type	Description
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.12.124 MY_TAB_COMMENTS

MY_TAB_COMMENTS displays comments on all tables and views owned by the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-348 MY_TAB_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Owner of a table or view.
table_name	character varying(64)	Name of a table or view.
comments	text	Comments.
schema	character varying(64)	Name of the namespace to which the table belongs.

12.3.12.125 MY_TAB_HISTOGRAMS

MY_TAB_HISTOGRAMS displays histogram information about the tables and views owned by the current user. All users can access this view. This view exists in the PG_CATALOG and SYS schemas.

Table 12-349 MY_TAB_HISTOGRAMS columns

Name	Type	Description
table_name	character varying(128)	Table name.
column_name	character varying(4000)	Column name or attribute of an object column.
endpoint_number	numeric	Bucket ID of the histogram.
endpoint_value	numeric	Not supported. The value is **NULL**.
endpoint_actual_value	character varying(4000)	Actual value of the bucket endpoint.
endpoint_actual_value_raw	raw	Not supported. The value is **NULL**.

Name	Type	Description
endpoint_repeat_count	numeric	Not supported. The value is **NULL**.
scope	character varying(7)	Not supported. The value is **SHARED**.

12.3.12.126 MY_TAB_MODIFICATIONS

MY_TAB_MODIFICATIONS displays statistics about modifications to tables owned by the current user since the last statistics collection on the tables. Currently, this view displays only tables on which INSERT, DELETE, and UPDATE operations have been performed. All users can access this view. This view exists in the PG_CATALOG and SYS schemas.

Table 12-350 MY_TAB_MODIFICATIONS columns

Name	Type	Description
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Partition name.
subpartition_name	character varying(128)	Subpartition name.
inserts	numeric	Approximate number of insertions since the last statistics collection.
updates	numeric	Approximate number of updates since the last statistics collection.
deletes	numeric	Approximate number of deletions since the last statistics collection.
timestamp	timestamp(0) without time zone	Last modification time. Currently, the modification time of a partitioned table is not supported. The value is **NULL**.
truncated	character varying(3)	Not supported. The value is **NULL**.
drop_segments	numeric	Not supported. The value is **NULL**.
schema_name	character varying(128)	Name of the schema to which the table belongs.

12.3.12.127 MY_TAB_STATS_HISTORY

MY_TAB_STATS_HISTORY provides the table statistics history of the tables owned by the current user. All users can access this view. This view exists in the PG_CATALOG and SYS schemas.

Table 12-351 MY_TAB_STATS_HISTORY columns

Name	Type	Description
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported. The value is **NULL**.
subpartition_name	character varying(128)	Not supported. The value is **NULL**.
stats_update_time	timestamp(6) with time zone	Time when statistics are updated. Database restart is not supported. Otherwise, data loss will occur.

12.3.12.128 MY_TAB_STATISTICS

MY_TAB_STATISTICS displays statistics about tables owned by the current user in the database. This view exists in the PG_CATALOG and SYS schemas and all users can access this view.

Table 12-352 MY_TAB_STATISTICS columns

Name	Type	Description
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported. The value is **NULL**.
partition_position	numeric	Not supported. The value is **NULL**.
subpartition_name	character varying(128)	Not supported. The value is **NULL**.
subpartition_position	numeric	Not supported. The value is **NULL**.
object_type	character varying(12)	Object type. • **TABLE** • **PARTITION** • **SUBPARTITION**

Name	Type	Description
num_rows	numeric	Number of rows in an object.
blocks	numeric	Not supported. The value is **NULL**.
empty_blocks	numeric	Not supported. The value is **NULL**.
avg_space	numeric	Not supported. The value is **NULL**.
chain_cnt	numeric	Not supported. The value is **NULL**.
avg_row_len	integer	Average row length, including the row overhead.
avg_space_freelist_blocks	numeric	Not supported. The value is **NULL**.
num_freelist_blocks	numeric	Not supported. The value is **NULL**.
avg_cached_blocks	numeric	Not supported. The value is **NULL**.
avg_cache_hit_ratio	numeric	Not supported. The value is **NULL**.
im_imcu_count	numeric	Not supported. The value is **NULL**.
im_block_count	numeric	Not supported. The value is **NULL**.
im_stat_update_time	timestamp(6) without time zone	Not supported. The value is **NULL**.
scan_rate	numeric	Not supported. The value is **NULL**.
sample_size	numeric	Number of samples used for analyzing a table.
last_analyzed	timestamp with time zone	Date when a table was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported. The value is **NULL**.
user_stats	character varying(3)	Not supported. The value is **NULL**.
stattype_locked	character varying(5)	Not supported. The value is **NULL**.
stale_stats	character varying(7)	Not supported. The value is **NULL**.
notes	character varying(25)	Not supported. The value is **NULL**.
scope	character varying(7)	Not supported. The default value is **SHARED**.

12.3.12.129 MY_TABLES

MY_TABLES displays information about the tables owned by the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-353 MY_TABLES columns

Name	Type	Description
owner	character varying(64)	Table owner
table_name	character varying(64)	Table name
tablespace_name	character varying(64)	Tablespace name of the table
dropped	character varying	Specifies whether the current table is deleted. ● **YES**: It is deleted. ● **NO**: It is not deleted.
num_rows	numeric	Estimated number of rows in the table
status	character varying(8)	Specifies whether the current table is valid. ● **VALID**: The current table is valid. ● **UNUSABLE**: The current table is unavailable.
sample_size	numeric	Number of samples used for analyzing the table
temporary	character(1)	Specifies whether the table is a temporary table. ● **Y**: The table is a temporary table. ● **N**: The table is not a temporary table.
pct_free	numeric	Minimum percentage of free space in a block
ini_trans	numeric	Initial number of transactions
max_trans	numeric	Maximum number of transactions
avg_row_len	integer	Average number of bytes in each row

Name	Type	Description
partitioned	character varying(3)	Specifies whether a table is a partitioned table. ● **YES**: The table is a partitioned table. ● **NO**: The table is not a partitioned table.
last_analyzed	timestamp with time zone	Last time when the table was analyzed Database restart is not supported. Otherwise, data loss will occur.
row_movement	character varying(8)	Specifies whether to allow partition row movement. ● **ENABLED**: The partition row movement is allowed. ● **DISABLED**: The partition row movement is not allowed.
compression	character varying(8)	Specifies whether to enable a table compression. ● **ENABLED**: A table compression is enabled. ● **DISABLED**: A table compression is disabled.
duration	character varying(15)	Time elapsed when a temporary table is processed. ● **NULL**: The table is not a temporary table. ● **sys$session**: The table is a temporary session table. ● **sys$transaction**: The table is a temporary transaction table.
logical_replication	character varying(8)	Specifies whether logical replication is enabled for a table. ● **ENABLED**: Logical replication is enabled. ● **DISABLED**: Logical replication is disabled.
external	character varying(3)	Specifies whether the table is an external table. ● **YES**: The table is an external table. ● **NO**: The table is not an external table.

Name	Type	Description
logging	character varying(3)	Specifies whether to record logs for table changes. • **YES**: Logs are recorded for table changes. • **NO**: Logs are not recorded for table changes.
default_collation	character varying(100)	Default collation of a table
degree	character varying(10)	Number of instances in a scanned table
table_lock	character varying(8)	Specifies whether to enable a table lock. • **ENABLED**: The table lock is enabled. • **DISABLED**: The table lock is disabled.
nested	character varying(3)	Specifies whether a table is a nested table. • **YES**: The table is a nested table. • **NO**: The table is not a nested table.
buffer_pool	character varying(7)	Default buffer pool of a table
flash_cache	character varying(7)	Not supported. The value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. The value is **NULL**.
skip_corrupt	character varying(8)	Specifies whether to skip corrupted blocks during table scanning. • **ENABLED**: The corrupted block is skipped. • **DISABLED**: The corrupted block is not skipped.
has_identity	character varying(3)	Specifies whether a table has an identifier column. • **YES**: There is an identifier column. • **NO**: There is no identifier column.

Name	Type	Description
segment_created	character varying(3)	Specifies whether a table segment has been created. • **YES**: The table segment has been created. • **NO**: The table segment is not created.
monitoring	character varying(3)	Specifies whether to monitor the modification of a table. • **YES**: The modification of the table is monitored. • **NO**: The modification of the table is not monitored.
cluster_name	character varying(128)	Not supported. The value is **NULL**.
iot_name	character varying(128)	Not supported. The value is **NULL**.
pct_used	numeric	Not supported. The value is **NULL**.
initial_extent	numeric	Not supported. The value is **NULL**.
next_extent	numeric	Not supported. The value is **NULL**.
min_extents	numeric	Not supported. The value is **NULL**.
max_extents	numeric	Not supported. The value is **NULL**.
pct_increase	numeric	Not supported. The value is **NULL**.
freelists	numeric	Not supported. The value is **NULL**.
freelist_groups	numeric	Not supported. The value is **NULL**.
backed_up	character varying(1)	Not supported. The value is **NULL**.
blocks	numeric	Not supported. The value is **NULL**.
empty_blocks	numeric	Not supported. The value is **NULL**.

Name	Type	Description
avg_space	numeric	Not supported. The value is **NULL**.
chain_cnt	numeric	Not supported. The value is **NULL**.
avg_space_freelist_blocks	numeric	Not supported. The value is **NULL**.
num_freelist_blocks	numeric	Not supported. The value is **NULL**.
instances	character varying(10)	Not supported. The value is **NULL**.
cache	character varying(5)	Not supported. The value is **NULL**.
iot_type	character varying(12)	Not supported. The value is **NULL**.
secondary	character varying(1)	Not supported. The value is **NULL**.
global_stats	character varying(3)	Not supported. The value is **NULL**.
user_stats	character varying(3)	Not supported. The value is **NULL**.
cluster_owner	character varying(30)	Not supported. The value is **NULL**.
dependencies	character varying(8)	Not supported. The value is **NULL**.
compression_for	character varying(30)	Not supported. The value is **NULL**.
read_only	character varying(3)	Not supported. The value is **NULL**.
result_cache	character varying(7)	Not supported. The value is **NULL**.
clustering	character varying(3)	Not supported. The value is **NULL**.
activity_tracking	character varying(23)	Not supported. The value is **NULL**.
dml_timestamp	character varying(25)	Not supported. The value is **NULL**.
container_data	character varying(3)	Not supported. The value is **NULL**.

Name	Type	Description
inmemory_priority	character varying(8)	Not supported. The value is **NULL**.
inmemory_distribute	character varying(15)	Not supported. The value is **NULL**.
inmemory_compression	character varying(17)	Not supported. The value is **NULL**.
inmemory_duplicate	character varying(13)	Not supported. The value is **NULL**.
duplicated	character varying(1)	Not supported. The value is **NULL**.
sharded	character varying(1)	Not supported. The value is **NULL**.
hybrid	character varying(3)	Not supported. The value is **NULL**.
cellmemory	character varying(24)	Not supported. The value is **NULL**.
containers_default	character varying(3)	Not supported. The value is **NULL**.
container_map	character varying(3)	Not supported. The value is **NULL**.
extended_data_link	character varying(3)	Not supported. The value is **NULL**.
extended_data_link_map	character varying(3)	Not supported. The value is **NULL**.
inmemory_service	character varying(12)	Not supported. The value is **NULL**.
inmemory_service_name	character varying(1000)	Not supported. The value is **NULL**.
container_map_object	character varying(3)	Not supported. The value is **NULL**.
memoptimize_read	character varying(8)	Not supported. The value is **NULL**.
memoptimize_write	character varying(8)	Not supported. The value is **NULL**.
has_sensitive_column	character varying(3)	Not supported. The value is **NULL**.
admit_null	character varying(3)	Not supported. The value is **NULL**.

Name	Type	Description
data_link_dml_enabled	character varying(3)	Not supported. Set it to null.
object_id_type	character varying(16)	Not supported. The value is **NULL**.
table_type_owner	character varying(128)	Not supported. The value is **NULL**.
table_type	character varying(128)	Not supported. The value is **NULL**.
compress_for	character varying(30)	Not supported. The value is **NULL**.

12.3.12.130 MY_TABLESPACES

MY_TABLESPACES displays the description of tablespaces that store objects owned by users. By default, it is accessible to all users. This view exists in the PG_CATALOG and SYS schemas. The logical structure features of the GaussDB are different from those of the A database.

Table 12-354 MY_TABLESPACES columns

Name	Type	Description
tablespace_name	character varying(64)	Tablespace name.
block_size	numeric	Not supported. The value is **NULL**.
initial_extent	numeric	Not supported. The value is **NULL**.
next_extent	numeric	Not supported. The value is **NULL**.
min_extents	numeric	Not supported. The value is **NULL**.
max_extents	numeric	Not supported. The value is **NULL**.
max_size	numeric	Not supported. The value is **NULL**.
pct_increase	numeric	Not supported. The value is **NULL**.
min_extlen	numeric	Not supported. The value is **NULL**.

Name	Type	Description
contents	character varying(9)	Not supported. The value is **NULL**.
status	character varying(9)	Tablespace status. The default value is **ONLINE**.
logging	character varying(9)	Not supported. The value is **NULL**.
force_logging	character varying(3)	Not supported. The value is **NULL**.
extent_management	character varying(10)	Not supported. The value is **NULL**.
allocation_type	character varying(9)	Not supported. The value is **NULL**.
segment_space_management	character varying(6)	Not supported. The value is **NULL**.
def_tab_compression	character varying(8)	Not supported. The value is **NULL**.
retention	character varying(11)	Not supported. The value is **NULL**.
bigfile	character varying(3)	Not supported. The value is **NULL**.
predicate_evaluation	character varying(7)	Not supported. The value is **NULL**.
encrypted	character varying(3)	Not supported. The value is **NULL**.
compress_for	character varying(30)	Not supported. The value is **NULL**.
def_inmemory	character varying(8)	Not supported. The value is **NULL**.
def_inmemory_priority	character varying(8)	Not supported. The value is **NULL**.
def_inmemory_distribute	character varying(15)	Not supported. The value is **NULL**.
def_inmemory_compression	character varying(17)	Not supported. The value is **NULL**.
def_inmemory_duplicate	character varying(13)	Not supported. The value is **NULL**.
shared	character varying(12)	Not supported. The value is **NULL**.

Name	Type	Description
def_index_compression	character varying(8)	Not supported. The value is **NULL**.
index_compress_for	character varying(13)	Not supported. The value is **NULL**.
def_cellmemory	character varying(14)	Not supported. The value is **NULL**.
def_inmemory_service	character varying(12)	Not supported. The value is **NULL**.
def_inmemory_service_name	character varying(1000)	Not supported. The value is **NULL**.
lost_write_protect	character varying(7)	Not supported. The value is **NULL**.
chunk_tablespace	character varying(1)	Not supported. The value is **NULL**.

12.3.12.131 MY_TRIGGERS

MY_TRIGGERS displays information about the triggers owned by the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-355 MY_TRIGGERS columns

Name	Type	Description
owner	character varying(128)	Trigger owner.
trigger_name	character varying(64)	Trigger name.
trigger_type	character varying	Trigger type, which can be **before statement**, **before each row**, **after statement**, **after each row**, or **instead of**.
triggering_event	character varying	Event that triggers a trigger. The value can be **update**, **insert**, **delete**, or **truncate**.
table_owner	character varying(64)	Owner of the table that defines a trigger.
base_object_type	character varying(18)	Basic object type of a trigger, which can be **table** or **view**.
table_name	character varying(64)	Name of the table or view that defines a trigger.

Name	Type	Description
column_name	character varying(4000)	Not supported. The value is **NULL**.
referencing_name	character varying(422)	Not supported. Set it to **referencing new as new old as old**.
when_clause	character varying(4000)	Content of **when**. **TRUE** must be evaluated as **TRIGGER_BODY** to execute.
status	character varying(64)	• **O**: The trigger is enabled in origin or local mode. • **D**: The trigger is disabled. • **R**: The trigger is enabled in replica mode. • **A**: The trigger is always enabled.
description	character varying(4000)	Trigger description, which is used to rebuild a trigger creation statement.
action_type	character varying(11)	Action type of a trigger, which only supports **call**.
trigger_body	text	Statement executed when a trigger is triggered.
crossedition	character varying(7)	Not supported. The value is **NULL**.
before_statement	character varying(3)	Not supported. The value is **NULL**.
before_row	character varying(3)	Not supported. The value is **NULL**.
after_row	character varying(3)	Not supported. The value is **NULL**.
after_statement	character varying(3)	Not supported. The value is **NULL**.
instead_of_row	character varying(3)	Not supported. The value is **NULL**.
fire_once	character varying(3)	Not supported. The value is **NULL**.
apply_server_only	character varying(3)	Not supported. The value is **NULL**.

12.3.12.132 MY_TYPE_ATTRS

MY_TYPE_ATTRS displays all types of attributes owned by the current user in the database. This view exists in the PG_CATALOG and SYS schemas and all users can access this view.

Table 12-356 MY_TYPE_ATTRS columns

Name	Type	Description
type_name	character varying(128)	Data type name.
attr_name	character varying(128)	Attribute name.
attr_type_mod	character varying(7)	Type modifier of an attribute: • **REF** • **POINT**
attr_type_owner	character varying(128)	Owner of an attribute type.
attr_type_name	character varying(128)	Name of an attribute type.
length	numeric	Length of the CHAR attribute, or the maximum length of the VARCHAR and character varying attribute.
precision	numeric	Decimal precision of a number or DECIMAL attribute, or binary precision of a FLOAT attribute.
scale	numeric	Decimal places for a numeric or DECIMAL attribute.
character_set_name	character varying(44)	Character set name (**Char_CS** or **NCHAR_CS**) of an attribute.
attr_no	numeric	Syntax order number or location (not used as an ID number) of an attribute specified in the type specification or CREATE TYPE statement.
inherited	character varying(3)	Specifies whether an attribute is inherited from a supertype. • **YES**: It is inherited from a supertype. • **NO**: It is not inherited from a supertype.

12.3.12.133 MY_TYPES

MY_TYPES describes all object types owned by the current user. All users can access this view. This view exists in the PG_CATALOG and SYS schemas.

Table 12-357 MY_TYPES columns

Name	Type	Description
type_name	character varying(128)	Type name.
type_oid	raw	Type OID.
typecode	character varying(128)	Type code.
attributes	numeric	Number of attributes in a type.
methods	numeric	Not supported. The value is **0**.
predefined	character varying(3)	Specifies whether the type is a predefined type.
incomplete	character varying(3)	Specifies whether the type is incomplete.
final	character varying(3)	Not supported. The value is **NULL**.
instantiable	character varying(3)	Not supported. The value is **NULL**.
persistable	character varying(3)	Not supported. The value is **NULL**.
supertype_owner	character varying(128)	Not supported. The value is **NULL**.
supertype_name	character varying(128)	Not supported. The value is **NULL**.
local_attributes	numeric	Not supported. The value is **NULL**.
local_methods	numeric	Not supported. The value is **NULL**.
typeid	raw	Not supported. The value is **NULL**.

12.3.12.134 MY_VIEWS

MY_VIEWS displays information about all views of the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-358 MY_VIEWS columns

Name	Type	Description
owner	character varying(64)	Owner of a view.

Name	Type	Description
view_name	character varying(64)	Name of the view.
text	text	Text of a view.
text_length	integer	Text length of a view.
text_vc	character varying(4000)	View creation statement. This column may truncate the view text. The BEQUEATH clause will not appear as part of the **TEXT_VC** column in this view.
type_text_length	numeric	Not supported. The value is **NULL**.
type_text	character varying(4000)	Not supported. The value is **NULL**.
oid_text_length	numeric	Not supported. The value is **NULL**.
oid_text	character varying(4000)	Not supported. The value is **NULL**.
view_type_owner	character varying(128)	Not supported. The value is **NULL**.
view_type	character varying(128)	Not supported. The value is **NULL**.
superview_name	character varying(128)	Not supported. The value is **NULL**.
editioning_view	character varying(1)	Not supported. The value is **NULL**.
read_only	character varying(1)	Not supported. The value is **NULL**.
container_data	character varying(1)	Not supported. The value is **NULL**.
bequeath	character varying(12)	Not supported. The value is **NULL**.
origin_con_id	character varying(256)	Not supported. The value is **NULL**.
default_collation	character varying(100)	Not supported. The value is **NULL**.
containers_default	character varying(3)	Not supported. The value is **NULL**.

Name	Type	Description
container_map	character varying(3)	Not supported. The value is **NULL**.
extended_data_link	character varying(3)	Not supported. The value is **NULL**.
extended_data_link_map	character varying(3)	Not supported. The value is **NULL**.
has_sensitive_column	character varying(3)	Not supported. The value is **NULL**.
admit_null	character varying(3)	Not supported. The value is **NULL**.
pdb_local_only	character varying(3)	Not supported. The value is **NULL**.

12.3.12.135 NLS_DATABASE_PARAMETERS

NLS_DATABASE_PARAMETERS lists the permanent NLS parameters of the database server. This view exists in the PG_CATALOG and SYS schemas. It is accessible to all users. Due to different database kernels and parameter setting formats, the query results of the same parameters in the database may be obviously different from those in the database A.

Table 12-359 NLS_DATABASE_PARAMETERS columns

Name	Type	Description
parameter	character varying(128)	Parameter name
value	character varying(64)	Parameter value

12.3.12.136 NLS_INSTANCE_PARAMETERS

NLS_INSTANCE_PARAMETERS lists the permanent NLS parameters of the database client. This view exists in the PG_CATALOG and SYS schemas. It is accessible to all users. Due to different database kernels and parameter setting formats, the query results of the same parameters in the database may be obviously different from those in the database A.

Table 12-360 NLS_INSTANCE_PARAMETERS columns

Name	Type	Description
parameter	character varying(128)	Parameter name

Name	Type	Description
value	character varying(64)	Parameter value

12.3.12.137 PG_AVAILABLE_EXTENSION_VERSIONS

PG_AVAILABLE_EXTENSION_VERSIONS displays extension versions of certain database features. This view is for internal use only. You are advised not to use it.

Table 12-361 PG_AVAILABLE_EXTENSION_VERSIONS columns

Name	Type	Description
name	name	Extension name
version	text	Version name
installed	boolean	Specifies whether this extension version is installed.
superuser	boolean	Specifies whether only system administrators are allowed to install the extension.
relocatable	boolean	Specifies whether the extension can be relocated to another schema.
schema	name	Name of the schema that the extension must be installed into (**NULL** if the extension is partially or fully relocatable)
requires	name[]	Names of prerequisite extensions (**NULL** if none)
comment	text	Comment from the extension's control file.

12.3.12.138 PG_AVAILABLE_EXTENSIONS

PG_AVAILABLE_EXTENSIONS displays the extension information about certain database features. This view is for internal use only. You are advised not to use it.

Table 12-362 PG_AVAILABLE_EXTENSIONS columns

Name	Type	Description
name	name	Extension name
default_version	text	Name of the default version (**NULL** if none is specified)
installed_version	text	Currently installed version of the extension (**NULL** if no version is installed)

Name	Type	Description
comment	text	Comment from the extension's control file.

12.3.12.139 PG_CONTROL_GROUP_CONFIG

PG_CONTROL_GROUP_CONFIG stores Cgroup configuration information in the system. Only the user with sysadmin permission can query this view.

Table 12-363 PG_CONTROL_GROUP_CONFIG columns

Name	Type	Description
pg_control_group_config	text	Configuration information of the Cgroup

12.3.12.140 PG_CURSORS

PG_CURSORS displays cursors that are currently available.

Table 12-364 PG_CURSORS columns

Name	Type	Description
name	text	Cursor name
statement	text	Query statement when the cursor is declared to change
is_holdable	boolean	**True** if the cursor is holdable (it can be accessed after the transaction that declared the cursor has committed); **false** otherwise
is_binary	boolean	Whether the cursor was declared BINARY. If it was, the value is **TRUE**.
is_scrollable	boolean	Whether the cursor is scrollable (it allows rows to be retrieved in a nonsequential manner). If it is, the value is **TRUE**.
creation_time	timestamp with time zone	Timestamp at which the cursor is declared

12.3.12.141 PG_EXT_STATS

PG_EXT_STATS displays extended statistics stored in **PG_STATISTIC_EXT**. The extension statistics means multiple columns of statistics.

Table 12-365 PG_EXT_STATS columns

Name	Type	Reference	Description
schemaname	name	PG_NAMESPACE.nspname	Name of the schema that contains a table.
tablename	name	PG_CLASS.relname	Table name.
attname	int2vector	PG_STATISTIC_EXT.stakey	Columns to be combined for collecting statistics
inherited	Boolean	-	Inherited tables are not supported currently. The value of this column is **false**.
null_frac	real	-	Percentage of column combinations that are null to all records
avg_width	integer	-	Average width of column combinations, in byte
n_distinct	real	-	• Estimated number of distinct values in a column combination if the value is greater than 0 • Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by **–1** if the value is less than **0**. For example, **–1** indicates that the number of distinct values is the same as the number of rows for a column combination. 1. The negated form is used when ANALYZE believes that the number of distinct values is likely to increase as the table grows. 2. The positive form is used when the column seems to have a fixed number of possible values. • The number of distinct values is unknown if the value is **0**.

Name	Type	Reference	Description
n_dndistinct	real	-	Number of not-null distinct values in the **dn1** column combination. ● Exact number of distinct values if the value is greater than 0. ● Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by –1 if the value is less than 0. For example, if a value in a column combination appears twice in average, **n_dndistinct** equals **–0.5**. ● The number of distinct values is unknown if the value is **0**.
most_common_vals	anyarray	-	List of the most common values in a column combination. If this combination does not have the most common values, the column will be **NULL**. None of the most common values in the column is **NULL**.
most_common_freqs	real[]	-	List of the frequencies of the most common values in a column combination. The frequencies are obtained by dividing the number of occurrences of each value by the number of rows. If the value of **most_common_vals** is **NULL**, the value of this column is **NULL**.
most_common_vals_null	anyarray	-	List of the most common values in a column combination. If this combination does not have the most common values, the column will be **NULL**. At least one of the common values in the column is **NULL**.

Name	Type	Reference	Description
most_common_freqs_null	real[]	-	List of the frequencies of the most common values in a column combination. The frequencies are obtained by dividing the number of occurrences of each value by the number of rows. If the value of **most_common_vals_null** is **NULL**, the value of this column is **NULL**.
histogram_bounds	anyarray	-	Boundary value list of the histogram
partitionname	name	PG_PARTITION.relname	Name of the level-1 partition in the partitioned table. For a non-partitioned table, this field is left blank.
subpartitionname	name	PG_PARTITION.relname	Name of the level-2 partition in the partitioned table. For a non-partitioned table or level-1 partitioned table, this field is left blank.

12.3.12.142 PG_GET_SENDERS_CATCHUP_TIME

PG_GET_SENDERS_CATCHUP_TIME provides catchup information of the currently active primary/standby instance sender thread on the database node.

Table 12-366 PG_GET_SENDERS_CATCHUP_TIME columns

Name	Type	Description
pid	bigint	Current sender thread ID
lwpid	integer	Current sender lwpid
local_role	text	Local role
peer_role	text	Peer role

Name	Type	Description
state	text	Current sender's replication status • **Startup**: startup state. • **Backup**: backup state. • **Catchup**: catch-up state, which indicates that the standby node is catching up with the primary node. • **Streaming**: streaming replication state. When the standby node catches up with the primary node, the replication remains in this state.
type	text	Current sender type. • **Wal**: type that logs are written in advance. • **Data**: data type.
catchup_start	timestamp with time zone	Startup time of a catchup task
catchup_end	timestamp with time zone	End time of a catchup task

12.3.12.143 PG_GROUP

PG_GROUP displays the database role authentication and the relationship between roles.

Table 12-367 PG_GROUP columns

Name	Type	Description
groname	name	Group name
grosysid	oid	Group ID
grolist	oid[]	An array, including all the role IDs in this group

12.3.12.144 PG_GTT_RELSTATS

PG_GTT_RELSTATS displays basic information about all global temporary tables of the current session by invoking **pg_get_gtt_relstats**.

Table 12-368 PG_GTT_RELSTATS columns

Name	Type	Description
schemaname	name	Schema name
tablename	name	Name of a global temporary table
relfilenode	oid	ID of a file object
relpages	integer	Number of disk pages of a global temporary table
reltuples	real	Number of records in a global temporary table
relallvisible	integer	Number of pages that are marked as all visible
relfrozenxid	xid	All transaction IDs before this one have been replaced with a permanent (frozen) transaction ID in the table.
relminmxid	xid	Reserved

12.3.12.145 PG_GTT_STATS

PG_GTT_STATS displays statistics about a single column in all global temporary tables of the current session by calling **pg_get_gtt_relstats**.

Table 12-369 PG_GTT_STATS columns

Name	Type	Description
schemaname	name	Schema name.
tablename	name	Name of a global temporary table.
attname	name	Attribute name.
inherited	boolean	Specifies whether to collect statistics for objects that have inheritance relationship.
null_frac	real	Percentage of column entries that are null.
avg_width	integer	Average stored width, in bytes, of non-null entries.
n_distinct	real	Number of distinct, non-null data values in the column.
most_common_vals	text[]	List of the most common values, which is sorted by occurrence frequency.
most_common_freqs	real[]	Frequencies of the most common values.

Name	Type	Description
histogram_bounds	text[]	Data distribution (excluding the most common values) in a frequency histogram description column.
correlation	real	Correlation coefficient.
most_common_elems	text[]	List of the most common element values, which is used for the array type or some other type.
most_common_elem_freqs	real[]	Frequencies of the most common element values.
elem_count_histogram	real[]	Array type histogram.

12.3.12.146 PG_GTT_ATTACHED_PIDS

PG_GTT_ATTACHED_PIDS checks which sessions are using global temporary tables by calling the **pg_get_attached_pid** function.

Table 12-370 PG_GTT_ATTACHED_PIDS columns

Name	Type	Description
schemaname	name	Schema name
tablename	name	Name of a global temporary table
relid	oid	OID of a global temporary table
pids	bigint[]	Thread PID list
sessionids	bigint[]	Session ID list

12.3.12.147 PG_INDEXES

PG_INDEXES provides access to useful information about each index in the database.

Table 12-371 PG_INDEXES columns

Name	Type	Reference	Description
schemaname	name	PG_NAMESPACE.nspname	Name of the schema that contains tables and indexes
tablename	name	PG_CLASS.relname	Name of the table for which the index serves

Name	Type	Reference	Description
indexname	name	PG_CLASS.relname	Index name
tablespace	name	PG_TABLESPACE.nspname	Name of the tablespace that contains the index
indexdef	text	-	Index definition (a reconstructed **CREATE INDEX** command)

12.3.12.148 PG_LOCKS

PG_LOCKS displays information about locks held by open transactions.

Table 12-372 PG_LOCKS columns

Name	Type	Reference	Description
locktype	text	-	Type of the locked object: relation, extend, page, tuple, transactionid, virtualxid, object, userlock, and advisory
database	oid	OID in PG_DATABASE	OID of the database in which the locked target exists • The OID is **0** if the target is a shared object. • The OID is **NULL** if the locked target is a transaction.
relation	oid	OID in PG_CLASS	OID of the relationship targeted by the lock (**NULL** if the object is not a relation or part of a relation)
page	integer	-	Page number targeted by the lock within the relation (**NULL** if the object is not a relation page or row page)
tuple	smallint	-	Row number targeted by the lock within the page (**NULL** if the object is not a row)
bucket	integer	-	Bucket number corresponding to the child table. The value is **NULL** if the target is not a table.
virtualxid	text	-	Virtual ID of the transaction targeted by the lock (**NULL** if the object is not a virtual transaction)

Name	Type	Reference	Description
transactionid	xid	-	ID of the transaction targeted by the lock (**NULL** if the object is not a transaction)
classid	oid	OID in **PG_CLASS**	OID of the system catalog that contains the object (**NULL** if the object is not a general database object)
objid	oid	-	OID of the lock target within its system table (**NULL** if the target is not a general database object)
objsubid	smallint	-	Column number for a column in the table (**0** if the object is of other object type and **NULL** if the object is not a general database object)
virtualtransaction	text	-	Virtual ID of the transaction holding or awaiting this lock
pid	bigint	-	Logical ID of the server thread holding or awaiting this lock (**NULL** if the lock is held by a prepared transaction)
sessionid	bigint	-	ID of the session that holds or waits for the lock
mode	text	-	Lock mode held or desired by this thread The value can be **AccessShareLock**, **RowShareLock**, **RowExclusiveLock**, **ShareLock**, **ShareRowExclusive-Lock**, **ExclusiveLock**, or **AccessExclusiveLock**.
granted	Boolean	-	• The value is **TRUE** if the lock is a held lock. • The value is **FALSE** if the lock is an awaited lock.
fastpath	Boolean	-	The value is **TRUE** if the lock is obtained through **fast-path**, and is **FALSE** if the lock is obtained through the main lock table.
locktag	text	-	Lock information that the session waits for. It can be parsed using the **locktag_decode()** function.
global_sessionid	text	-	Global session ID

12.3.12.149 PG_NODE_ENV

PG_NODE_ENV obtains environmental variable information about the current node.

Table 12-373 PG_NODE_ENV columns

Name	Type	Description
node_name	text	Current node name
host	text	Host name of the node
process	integer	Number of the node process
port	integer	Port ID of the node
installpath	text	Installation directory of the node
datapath	text	Data directory of the node
log_directory	text	Log directory of the node

12.3.12.150 PG_OS_THREADS

PG_OS_THREADS provides status information about all the threads under the current node.

Table 12-374 PG_OS_THREADS columns

Name	Type	Description
node_name	text	Current node name
pid	bigint	PID of the thread running under the current node process
lwpid	integer	Lightweight thread ID corresponding to the PID
thread_name	text	Thread name corresponding to the PID
creation_time	timestamp with time zone	Thread creation time corresponding to the PID

12.3.12.151 PG_PREPARED_STATEMENTS

PG_PREPARED_STATEMENTS displays all prepared statements that are available in the current session.

Table 12-375 PG_PREPARED_STATEMENTS columns

Name	Type	Description
name	text	Identifier of the prepared statement
statement	text	Query string for creating this prepared statement. For prepared statements created through SQL, this is the PREPARE statement submitted by the client. For prepared statements created through the frontend/backend protocol, this is the text of the prepared statement itself.
prepare_time	timestamp with time zone	Timestamp when the prepared statement is created
parameter_types	regtype[]	Expected parameter types for the prepared statement in the form of an array of **regtype**. The OID corresponding to an element of this array can be obtained by converting the **regtype** value to **oid**.
from_sql	boolean	• **True** if the prepared statement was created through the PREPARE statement • **False** if the statement was prepared through the frontend/backend protocol

12.3.12.152 PG_PREPARED_XACTS

PG_PREPARED_XACTS displays information about transactions that are currently prepared for two-phase commit.

Table 12-376 PG_PREPARED_XACTS columns

Name	Type	Reference	Description
transaction	xid	-	Numeric transaction identifier of the prepared transaction
gid	text	-	Global transaction identifier that was assigned to the transaction
prepared	timestamp with time zone	-	Time at which the transaction is prepared for commit
owner	name	PG_AUTHID.rolname	Name of the user that executes the transaction

Name	Type	Reference	Description
database	name	PG_DATABASE.datname	Name of the database in which the transaction is executed

12.3.12.153 PG_REPLICATION_ORIGIN_STATUS

PG_REPLICATION_ORIGIN_STATUS displays the replication status of the replication source.

Table 12-377 PG_REPLICATION_ORIGIN_STATUS columns

Name	Type	Description
local_id	oid	Replication source ID.
external_id	text	Name of the replication source.
remote_lsn	text	Remote LSN of the replication source.
local_lsn	text	Local LSN of the replication source.

12.3.12.154 PG_REPLICATION_SLOTS

PG_REPLICATION_SLOTS displays replication slot information.

Table 12-378 PG_REPLICATION_SLOTS columns

Name	Type	Description
slot_name	text	Replication slot name.
plugin	text	Name of the output plug-in corresponding to the logical replication slot.
slot_type	text	Replication slot type. • **physical**: physical replication slot. • **logical**: logical replication slot.
datoid	oid	OID of the database where the replication slot resides.
database	name	Name of the database where the replication slot resides.

Name	Type	Description
active	Boolean	Determines whether the replication slot is activated. • **t** (true): yes • **f** (false): no
xmin	xid	XID of the earliest transaction that the database must reserve for the replication slot.
catalog_xmin	xid	XID of the earliest system catalog-involved transaction that the database must reserve for the logical replication slot.
restart_lsn	text	Physical location of the earliest Xlog required by the replication slot.
dummy_standby	Boolean	Reserved parameter.
confirmed_flush	text	Dedicated logical replication slot. The client confirms the location of the received log.
confirmed_csn	xid	Dedicated logical replication slot. The client confirms the CSN corresponding to the last transaction in the received log.

Example:

```
gaussdb=# SELECT * FROM pg_replication_slots;
 slot_name |      plugin      | slot_type | datoid | database | active | xmin | catalog_xmin | restart_lsn |
dummy_standby | confirmed_flush | confirmed_csn
-----------+------------------+-----------+--------+----------+--------+------+--------------+-------------+---------------
+-----------------+---------------
 dn_6002   |                  | physical  |      0 |          | t      |      |              | 0/3622B528  | f             |               |
 dn_6003   |                  | physical  |      0 |          | t      |      |              | 0/3622B528  | f             |               |
 slot_lsn  | mppdb_decoding | logical   | 131072 | db_test  | f      |      |        66658 | 0/36252350  | f             |
0/362523D0       |
 slot_test | mppdb_decoding | logical   | 131072 | db_test  | f      |      |        66658 | 0/36251718  | f
|               |      10025527
(4 rows)
```

NOTICE

When a query is performed on a DN, the confirmed_csn query result of the LSN-based logical replication slot is empty, and the confirmed_flush query result of the CSN-based logical replication slot is empty.

12.3.12.155 PG_RULES

PG_RULES provides access to query useful information about rewrite rules.

Table 12-379 PG_RULES columns

Name	Type	Description
schemaname	name	Name of the schema that contains a table
tablename	name	Name of the table to which the rule applies
rulename	name	Name of a rule
definition	text	Rule definition (a reconstructed creation command)

12.3.12.156 PG_RUNNING_XACTS

PG_RUNNING_XACTS displays the running transaction information on the current node.

Table 12-380 PG_RUNNING_XACTS columns

Name	Type	Description
handle	integer	Slot handle in the transaction manager corresponding to a transaction. The value is fixed at **–1**.
gxid	xid	Transaction ID
state	tinyint	Transaction status (**3**: prepared or **0**: starting)
node	text	Node name
xmin	xid	Minimum transaction ID on the node
vacuum	boolean	Whether the current transaction is lazy vacuum • **t** (true): yes • **f** (false): no
timeline	bigint	Number of database restarts
prepare_xid	xid	Transaction ID in the **prepared** state. If the status is not **prepared**, the value is **0**.
pid	bigint	Thread ID corresponding to the transaction
next_xid	xid	Transaction ID sent by other nodes to the current node. The value is fixed at **0**.

12.3.12.157 PG_SETTINGS

PG_SETTINGS displays information about parameters of the running database.

Table 12-381 PG_SETTINGS columns

Name	Type	Description
name	text	Parameter name
setting	text	Current parameter value
unit	text	Implicit unit of the parameter
category	text	Logical group of the parameter
short_desc	text	Brief description of the parameter
extra_desc	text	Detailed description of the parameter
context	text	Context required to set the parameter value, including **internal**, **postmaster**, **sighup**, **backend**, **superuser**, and **user**
vartype	text	Parameter type, including **bool**, **enum**, **integer**, **real**, or **string**
source	text	Method of assigning the parameter value
min_val	text	Minimum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.
max_val	text	Maximum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.
enumvals	text[]	Valid values of an enum-type parameter. If the parameter type is not enum, the value of this column is **null**.
boot_val	text	Default parameter value used upon the database startup
reset_val	text	Default parameter value used upon the database reset
sourcefile	text	Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.
sourceline	integer	Row number of the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.

12.3.12.158 PG_STATS

PG_STATS displays single-column statistics stored in the **pg_statistic** table. The **autovacuum_naptime** parameter specifies the interval for updating statistics recorded in the view.

Table 12-382 PG_STATS columns

Name	Type	Reference	Description
schemaname	name	PG_NAMESPACE.nspname	Name of the schema that contains a table.
tablename	name	PG_CLASS.relname	Table name.
attname	name	PG_ATTRIBUTE.attname	Column name
inherited	Boolean	-	Inherited tables are not supported currently. The value of this column is **false**.
null_frac	real	-	Percentage of column entries that are null
avg_width	integer	-	Average width in bytes of column's entries
n_distinct	real	-	• Estimated number of distinct values in the column if the value is greater than 0 • Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by –1 if the value is less than 0. For example, value **–1** indicates that the number of distinct values is the same as the number of rows for a unique column. 1. The negated form is used when ANALYZE believes that the number of distinct values is likely to increase as the table grows. 2. The positive form is used when the column seems to have a fixed number of possible values. • The number of distinct values is unknown if the value is **0**.

Name	Type	Reference	Description
n_dndistinct	real	-	Number of not-null distinct values in the **dn1** column. ● Exact number of distinct values if the value is greater than **0**. ● Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by –1 if the value is less than 0. For example, if the value of a column appears twice in average, set **n_dndistinct=-0.5**. ● The number of distinct values is unknown if the value is **0**.
most_common_vals	anyarray	-	List of the most common values in a column. If this column does not have the most common value, the value is **NULL**.
most_common_freqs	real[]	-	List of the frequencies of the most common values in a column. The frequencies are obtained by dividing the number of occurrences of each value by the number of rows. The value is **NULL** if the value of **most_common_vals** is **NULL**.
histogram_bounds	anyarray	-	Frequency histogram consisting of values excluding null values and MVC values. If a value appears in the value of **most_common_vals**, it does not appear in the histogram. If the column data type does not have the < operator or the list specified by **most_common_vals** contains all values of the column, the histogram information of the column is **NULL**.

Name	Type	Reference	Description
correlation	real	-	Correlation between the physical row sequence and logical row sequence of a column value. The value ranges from –1 to +1. When the value is close to –1 or +1, the index scan overhead is less than that when the value is close to 0 because random access to the disk is reduced. This column is **NULL** if the column data type does not have a < operator.
most_common_elems	anyarray	-	A list of non-null element values most often appearing
most_common_elem_freqs	real[]	-	List that records the frequency of the most commonly used non-null elements.
elem_count_histogram	real[]	-	A histogram of the counts of distinct non-null element values
partitionname	name	PG_PARTITION.relname	Name of the level-1 partition in the partitioned table. For a non-partitioned table, this field is left blank.
subpartitionname	name	PG_PARTITION.relname	Name of the level-2 partition in the partitioned table. For a non-partitioned table or level-1 partitioned table, this field is left blank.

12.3.12.159 PG_STAT_ACTIVITY

PG_STAT_ACTIVITY displays information about the current user's queries. The columns save information about the last query.

Table 12-383 PG_STAT_ACTIVITY columns

Name	Type	Description
datid	oid	OID of the database that the user session connects to in the backend.
datname	name	Name of the database that the user session connects to in the backend.
pid	bigint	ID of the backend thread.

Name	Type	Description
sessionid	bigint	Session ID.
usesysid	oid	OID of the user logged in to the backend.
usename	name	Name of the user logged in to the backend.
application_name	text	Name of the application connected to the backend.
client_addr	inet	IP address of the client connected to the backend. If this column is **NULL**, it indicates either the client is connected through a Unix socket on the server or this is an internal process, such as autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (**–1** if a Unix socket is used)
backend_start	timestamp with time zone	Time when this session was started, that is, when the client connected to the server.
xact_start	timestamp with time zone	Time when the current active transaction was started (**NULL** if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the **query_start** column.
query_start	timestamp with time zone	Time when the current active query was started, or time when the last query was started if the value of **state** is not **active**. For a stored procedure, function, or package, the first query time is displayed and does not change with the running of statements in the stored procedure.
state_change	timestamp with time zone	Time when **state** was last modified.

Name	Type	Description
waiting	Boolean	Whether the backend is currently waiting for a lock. If yes, the value is **true**.
enqueue	text	Unsupported currently.
state	text	Overall status of the backend. The value must be one of the following: • **active**: The backend is executing a query. • **idle**: The backend is waiting for a new client command. • **idle in transaction**: The backend is in a transaction, but there is no statement being executed in the transaction. • **idle in transaction** (aborted): The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend. **NOTE** Common users can view their own session status only. The state information of other accounts is empty. For example, after user **judy** is connected to the database, the state information of user **joe** and the initial user omm in **pg_stat_activity** is empty. `SELECT datname, usename, usesysid, state,pid FROM pg_stat_activity;` ` datname  | usename | usesysid | state  | pid` `----------+---------+----------+--------+-----------------` ` testdb | omm     |       10 |        | 139968752121616` ` testdb | omm     |       10 |        | 139968903116560` ` db_tpcc | judy    |    16398 | active | 139968391403280` ` testdb | omm     |       10 |        | 139968643069712` ` testdb | omm     |       10 |        | 139968680818448` ` testdb | joe     |    16390 |        | 139968563377936` `(6 rows)`
resource_pool	name	Resource pool used by the user.

Name	Type	Description
query_id	bigint	ID of a query.
query	text	Latest query at the backend. If the value of **state** is **active**, this column shows the ongoing query. In all other states, it shows the last query that was executed.
connection_info	text	A string in JSON format recording the driver type, driver version, driver deployment path, and process owner of the connected database. For details, see the GUC parameter **connection_info**.
unique_sql_id	bigint	Unique SQL statement ID.
trace_id	text	Driver-specific trace ID, which is associated with an application request.
top_xid	xid	Top-level transaction ID of a transaction.
current_xid	xid	Current transaction ID of a transaction.
xlog_quantity	bigint	Amount of Xlogs currently used by a transaction, in bytes.

12.3.12.160 PG_STAT_ACTIVITY_NG

PG_STAT_ACTIVITY_NG displays information about all queries in the logical database instance of the current user.

Table 12-384 PG_STAT_ACTIVITY_NG columns

Name	Type	Description
datid	oid	OID of the database that the user session connects to in the backend.
datname	name	Name of the database that the user session connects to in the backend.
pid	bigint	ID of the backend thread.
sessionid	bigint	Session ID.
usesysid	oid	OID of the user logged in to the backend.

Name	Type	Description
usename	name	Name of the user logged in to the backend.
application_name	text	Name of the application connected to the backend.
client_addr	inet	IP address of the client connected to the backend. If this column is **NULL**, it indicates either the client is connected via a Unix socket on the server or this is an internal thread, such as **AUTOVACUUM**.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (**–1** if a Unix socket is used).
backend_start	timestamp with time zone	Time when this session was started, that is, when the client connected to the server.
xact_start	timestamp with time zone	Time when the current active transaction was started (**NULL** if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the **query_start** column.
query_start	timestamp with time zone	Time when the current active query was started, or time when the last query was started if the value of **state** is not **active**. For a stored procedure, function, or package, the first query time is displayed and does not change with the running of statements in the stored procedure.
state_change	timestamp with time zone	Time when **state** was last modified.
waiting	Boolean	Specifies whether the backend is currently waiting for a lock. If yes, the value is **true**. Otherwise, the value is **false**.

Name	Type	Description
enqueue	text	Queuing status of a statement. The value can be: • **waiting in queue**: The statement is in the queue. • **Empty**: The statement is running.
state	text	Overall status of the backend. The value can be: • **active**: The backend is executing a query. • **idle**: The backend is waiting for a new client command. • **idle in transaction**: The backend is in a transaction, but there is no statement being executed in the transaction. • **idle in transaction** (aborted): The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend. **NOTE** Common users can view their own session status only. The state information of other accounts is empty. For example, after user **judy** is connected to the database, the state information of user **joe** and the initial user **omm** in **pg_stat_activity** is empty. SELECT datname, usename, usesysid, state,pid FROM pg_stat_activity_ng; datname | usename | usesysid | state | pid ----------+---------+----------+--------+----------------- testdb | omm | 10 | | 139968752121616 testdb | omm | 10 | | 139968903116560 db_tpcds | judy | 16398 | active | 139968391403280 testdb | omm | 10 | | 139968643069712 testdb | omm | 10 | | 139968680818448 testdb | joe | 16390 | | 139968563377936 (6 rows)

Name	Type	Description
resource_pool	name	Resource pool used by the user.
query_id	bigint	ID of a query.
query	text	Latest query at the backend. If the value of **state** is **active**, this column shows the ongoing query. In all other states, it shows the last query that was executed.
node_group	text	Logical database instance of the user to which the statement belongs.

12.3.12.161 PG_STAT_ALL_INDEXES

PG_STAT_ALL_INDEXES displays statistics about accesses to a specific index by querying each index row in the current database.

Indexes can be used via either simple index scans or bitmap index scans. In a bitmap scan the output of several indexes can be combined via AND or OR rules, so it is difficult to associate individual heap row fetches with specific indexes when a bitmap scan is used. Therefore, each bitmap scan increments the **pg_stat_all_indexes.idx_tup_read** count(s) for the index(es) it uses, and it increments the **pg_stat_all_tables.idx_tup_fetch** count for the table, but it does not affect **pg_stat_all_indexes.idx_tup_fetch**.

Table 12-385 PG_STAT_ALL_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	bigint	Number of index scans initiated on the index
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

12.3.12.162 PG_STAT_ALL_TABLES

PG_STAT_ALL_TABLES queries one row for each table in the current database (including TOAST tables), showing statistics about a specific table.

Table 12-386 PG_STAT_ALL_TABLES columns

Name	Type	Description
relid	oid	OID of the table.
schemaname	name	Name of the schema that the table is in.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (that is, with no separate index update required).
n_live_tup	bigint	Estimated number of active rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time when the table was cleared.
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time when the table was analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.

Name	Type	Description
vacuum_count	bigint	Number of times the table is cleared.
autovacuum_count	bigint	Number of times that the table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times the table is analyzed.
autoanalyze_count	bigint	Number of times that the table has been analyzed by the autovacuum daemon thread.
last_data_changed	timestamp with time zone	Last time when the data in the table changes (modifications that cause data changes on tables (insert/update/delete/truncate) and partitioned or subpartitioned tables (exchange/truncate/drop)). Data in this column is recorded only in the local database primary node.

12.3.12.163 PG_STAT_BAD_BLOCK

PG_STAT_BAD_BLOCK displays statistics about page verification failures after a node is started.

Table 12-387 PG_STAT_BAD_BLOCK columns

Name	Type	Description
nodename	text	Node name
databaseid	integer	OID of a database
tablespaceid	integer	Tablespace OID
relfilenode	integer	File object ID
bucketid	smallint	ID of the bucket for consistent hashing
forknum	integer	File type The values are as follows: **0**: main data file. **1**: FSM file. **2**: VM file. **3**: BCM file.
error_count	integer	Number of verification failures

Name	Type	Description
first_time	timestamp with time zone	Time of the first verification failure
last_time	timestamp with time zone	Time of the latest verification failure.

12.3.12.164 PG_STAT_BGWRITER

PG_STAT_BGWRITER displays statistics about the activity of the background writer process.

Table 12-388 PG_STAT_BGWRITER columns

Name	Type	Description
checkpoints_timed	bigint	Number of scheduled checkpoints that have been performed.
checkpoints_req	bigint	Number of checkpoints that have been performed actively.
checkpoint_write_time	double precision	Total time spent in the checkpoint processing portion when writing files to disk, in milliseconds.
checkpoint_sync_time	double precision	Total time spent in the checkpoint processing portion when synchronizing files to disk, in milliseconds.
buffers_checkpoint	bigint	Number of buffers written by checkpoints.
buffers_clean	bigint	Number of buffers written by the background writer process.
maxwritten_clean	bigint	Number of times that cleanup scanning stops because the background writer process writes too many buffers.
buffers_backend	bigint	Number of buffers written directly by the backend.

Name	Type	Description
buffers_backend_fsync	bigint	Number of times that the backend calls fsync (usually, even if the backend executes these write actions, the background writer process processes them again).
buffers_alloc	bigint	Number of buffers allocated.
stats_reset	timestamp with time zone	Time at which these statistics were last reset.

12.3.12.165 PG_STAT_DATABASE

PG_STAT_DATABASE contains database statistics for each database in GaussDB.

Table 12-389 PG_STAT_DATABASE columns

Name	Type	Description
datid	oid	OID of a database
datname	name	Name of the database
numbackends	integer	Number of backends currently connected to this database. This is the only column in this view that returns a value reflecting the current state; all other columns return the accumulated values since the last reset.
xact_commit	bigint	Number of transactions in this database that have been committed
xact_rollback	bigint	Number of transactions in this database that have been rolled back
blks_read	bigint	Number of disk blocks read in this database
blks_hit	bigint	Number of times disk blocks were found in the buffer cache (unnecessary as the number includes only hits in the database buffer cache)
tup_returned	bigint	Number of rows returned by queries in this database
tup_fetched	bigint	Number of rows fetched by queries in this database

Name	Type	Description
tup_inserted	bigint	Number of rows inserted by queries in this database
tup_updated	bigint	Number of rows updated by queries in this database
tup_deleted	bigint	Number of rows deleted by queries in this database
conflicts	bigint	Number of queries canceled due to database recovery conflicts (conflicts occurring only on the standby server). For details, see PG_STAT_DATABASE_CONFLICTS.
temp_files	bigint	Number of temporary files created by queries in this database. All temporary files are counted, regardless of why the temporary file was created (for example, sorting or hashing), and regardless of the **log_temp_files** setting.
temp_bytes	bigint	Total amount of data written to temporary files by queries in this database. All temporary files are counted, regardless of why the temporary file was created, and regardless of the **log_temp_files** setting.
deadlocks	bigint	Number of deadlocks detected in this database
blk_read_time	double precision	Time spent reading data file blocks by backends in this database (unit: ms)
blk_write_time	double precision	Time spent writing into data file blocks by backends in this database (unit: ms)
stats_reset	timestamp with time zone	Time at which the current statistics were reset

12.3.12.166 PG_STAT_DATABASE_CONFLICTS

PG_STAT_DATABASE_CONFLICTS displays statistics about database conflicts.

Table 12-390 PG_STAT_DATABASE_CONFLICTS columns

Name	Type	Description
datid	oid	Database ID
datname	name	Database name

Name	Type	Description
confl_tablespace	bigint	Number of conflicting tablespaces
confl_lock	bigint	Number of conflicting locks
confl_snapshot	bigint	Number conflicting snapshots
confl_bufferpin	bigint	Number of conflicting buffers
confl_deadlock	bigint	Number of conflicting deadlocks

12.3.12.167 PG_STAT_REPLICATION

PG_STAT_REPLICATION displays information about the log synchronization thread, such as the locations where the sender sends logs and where the receiver receives logs.

Table 12-391 PG_STAT_REPLICATION columns

Name	Type	Description
pid	bigint	Process ID of the thread
usesysid	oid	User system ID
usename	name	Username
application_name	text	Program name
client_addr	inet	Client address
client_hostname	text	Client name
client_port	integer	Port of the client
backend_start	timestamp with time zone	Start time of the program

Name	Type	Description
state	text	State of the log synchronization thread: • **startup**: The thread is being started. • **catchup**: The thread is establishing a connection between the standby server and the primary server. • **streaming**: The thread has established a connection between the standby server and the primary server and is replicating data streams. • **backup**: The thread is sending a backup. • **stopping**: The thread is being stopped.
sender_sent_location	text	Location where the sender sends logs
receiver_write_location	text	Location where the receiver writes logs
receiver_flush_location	text	Location where the receive end flushes logs
receiver_replay_location	text	Location where the receive end replays logs
sync_priority	integer	Priority of synchronous duplication (**0** indicates asynchronization.)

Name	Type	Description
sync_state	text	Synchronization state • **async**: asynchronous replication. • **sync**: synchronous replication. • **potential**: The standby server is asynchronous currently, but if a current synchronization server fails, the standby server becomes synchronous. • Qurom: switches between the synchronous and asynchronous states to ensure that there are more than a certain number of synchronous standby servers. Generally, the number of synchronous standby servers is (n+1)/2-1, where *n* indicates the total number of copies. Whether the standby server is synchronous depends on whether logs are received first. For details, see the description of the **synchronous_standby_names** parameter.

12.3.12.168 PG_STAT_SYS_INDEXES

PG_STAT_SYS_INDEXES displays index status information about all the system catalogs in the pg_catalog and information_schema schemas.

Table 12-392 PG_STAT_SYS_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	bigint	Number of index scans initiated on the index
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

12.3.12.169 PG_STAT_SYS_TABLES

PG_STAT_SYS_TABLES displays statistics about the system catalogs of all the namespaces in pg_catalog and information_schema schemas.

Table 12-393 PG_STAT_SYS_TABLES columns

Name	Type	Description
relid	oid	OID of the table.
schemaname	name	Name of the schema that the table is in.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.

Name	Type	Description
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time when this table was manually vacuumed (excluding **VACUUM FULL**)
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time when the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times that the table has been manually vacuumed (not counting **VACUUM FULL**).
autovacuum_count	bigint	Number of times the table has been vacuumed by the autovacuum daemon thread.
analyze_count	bigint	Number of times that the table has been manually analyzed.
autoanalyze_count	bigint	Number of times that the table has been analyzed by the autovacuum daemon thread.
last_data_changed	timestamp with time zone	Last modification time of the table data.

12.3.12.170 PG_STAT_USER_FUNCTIONS

PG_STAT_USER_FUNCTIONS shows user-defined function status information in the namespace. (The language of the function is non-internal language.)

Table 12-394 PG_STAT_USER_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of a function

Name	Type	Description
schemaname	name	Schema name
funcname	name	Function name
calls	bigint	Number of times the function has been called
total_time	double precision	Total time spent in the function and all other functions called by it
self_time	double precision	Total time spent in the function itself, excluding other functions called by it

12.3.12.171 PG_STAT_USER_INDEXES

PG_STAT_USER_INDEXES displays information about the index status of user-defined ordinary tables and TOAST tables.

Table 12-395 PG_STAT_USER_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	bigint	Number of index scans initiated on the index
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

12.3.12.172 PG_STAT_USER_TABLES

PG_STAT_USER_TABLES displays information about user-defined ordinary tables and TOAST tables in the namespaces.

Table 12-396 PG_STAT_USER_TABLES columns

Name	Type	Description
relid	oid	OID of the table.
schemaname	name	Name of the schema that the table is in.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time when this table was manually vacuumed (excluding **VACUUM FULL**)
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time when the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times that the table has been manually vacuumed (not counting **VACUUM FULL**).

Name	Type	Description
autovacuum_count	bigint	Number of times the table has been vacuumed by the autovacuum daemon thread.
analyze_count	bigint	Number of times that the table has been manually analyzed.
autoanalyze_count	bigint	Number of times that the table has been analyzed by the autovacuum daemon thread.
last_data_changed	timestamp with time zone	Last modification time of the table data.

12.3.12.173 PG_STAT_XACT_ALL_TABLES

PG_STAT_XACT_ALL_TABLES displays transaction status information about all ordinary tables and TOAST tables in the namespaces.

Table 12-397 PG_STAT_XACT_ALL_TABLES columns

Name	Type	Description
relid	oid	OID of the table
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

12.3.12.174 PG_STAT_XACT_SYS_TABLES

PG_STAT_XACT_SYS_TABLES displays transaction status information of the system catalog in the namespace.

Table 12-398 PG_STAT_XACT_SYS_TABLES columns

Name	Type	Description
relid	oid	OID of the table
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

12.3.12.175 PG_STAT_XACT_USER_FUNCTIONS

PG_STAT_XACT_USER_FUNCTIONS contains statistics on the execution of each function.

Table 12-399 PG_STAT_XACT_USER_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of a function
schemaname	name	Schema name
funcname	name	Function name
calls	bigint	Number of times the function has been called
total_time	double precision	Total time spent in the function and all other functions called by it
self_time	double precision	Total time spent in the function itself, excluding other functions called by it

12.3.12.176 PG_STAT_XACT_USER_TABLES

PG_STAT_XACT_USER_TABLES displays transaction status information of the user table in the namespace.

Table 12-400 PG_STAT_XACT_USER_TABLES columns

Name	Type	Description
relid	oid	OID of the table
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

12.3.12.177 PG_STATIO_ALL_INDEXES

PG_STATIO_ALL_INDEXES contains one row for each index in the current database, showing I/O statistics about accesses to that specific index.

Table 12-401 PG_STATIO_ALL_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	bigint	Number of disk blocks read from the index

Name	Type	Description
idx_blks_hit	bigint	Number of cache hits in the index

12.3.12.178 PG_STATIO_ALL_SEQUENCES

PG_STATIO_ALL_SEQUENCES contains the I/O statistics of each sequence in the current database.

Table 12-402 PG_STATIO_ALL_SEQUENCES columns

Name	Type	Description
relid	oid	OID of this sequence
schemaname	name	Name of the schema where the sequence is in
relname	name	Name of the sequence
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Cache hits in the sequence

12.3.12.179 PG_STATIO_ALL_TABLES

PG_STATIO_ALL_TABLES contains I/O statistics for each table (including the TOAST table) in the current database.

Table 12-403 PG_STATIO_ALL_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from all indexes in the table
idx_blks_hit	bigint	Number of cache hits in indexes in the table
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table

Name	Type	Description
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table

12.3.12.180 PG_STATIO_SYS_INDEXES

PG_STATIO_SYS_INDEXES displays I/O status information for all system catalog indexes in a namespace.

Table 12-404 PG_STATIO_SYS_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	bigint	Number of disk blocks read from the index
idx_blks_hit	bigint	Number of cache hits in the index

12.3.12.181 PG_STATIO_SYS_SEQUENCES

PG_STATIO_SYS_SEQUENCES displays I/O status information about all the sequences in the namespace.

Table 12-405 PG_STATIO_SYS_SEQUENCES columns

Name	Type	Description
relid	oid	OID of this sequence
schemaname	name	Name of the schema where the sequence is in
relname	name	Name of the sequence

Name	Type	Description
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Cache hits in the sequence

12.3.12.182 PG_STATIO_SYS_TABLES

PG_STATIO_SYS_TABLES shows I/O status information about all the system catalogs in the namespace.

Table 12-406 PG_STATIO_SYS_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from all indexes in the table
idx_blks_hit	bigint	Number of cache hits in indexes in the table
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table

12.3.12.183 PG_STATIO_USER_INDEXES

PG_STATIO_USER_INDEXES displays I/O status information about all the user relationship table indexes in the namespace.

Table 12-407 PG_STATIO_USER_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_blks_read	bigint	Number of disk blocks read from the index
idx_blks_hit	bigint	Number of cache hits in the index

12.3.12.184 PG_STATIO_USER_SEQUENCES

PG_STATIO_USER_SEQUENCES shows I/O status information about all the user relationship table sequences in the namespace.

Table 12-408 PG_STATIO_USER_SEQUENCES columns

Name	Type	Description
relid	oid	OID of this sequence
schemaname	name	Name of the schema where the sequence is in
relname	name	Name of the sequence
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Cache hits in the sequence

12.3.12.185 PG_STATIO_USER_TABLES

PG_STATIO_USER_TABLES displays I/O status information about all the user relationship tables in the namespace.

Table 12-409 PG_STATIO_USER_TABLES columns

Name	Type	Description
relid	oid	Table OID

Name	Type	Description
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from all indexes in the table
idx_blks_hit	bigint	Number of cache hits in indexes in the table
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table

12.3.12.186 PG_TABLES

PG_TABLES provides access to each table in the database.

Table 12-410 PG_TABLES columns

Name	Type	Reference	Description
schemaname	name	PG_NAMESPACE.nspname	Name of the schema that contains a table
tablename	name	PG_CLASS.relname	Table name
tableowner	name	pg_get_userbyid(PG_CLASS.relowner)	Table owner
tablespace	name	PG_TABLESPACE.spcname	Tablespace that contains the table. The default value is null.
hasindexes	boolean	PG_CLASS.relhasindex	The value is **TRUE** if the table has (or recently had) an index; otherwise, the value is **FALSE**.
hasrules	boolean	PG_CLASS.relhasruls	The value is **TRUE** if the table has rules; otherwise, the value is **FALSE**.

Name	Type	Reference	Description
hastriggers	boolean	PG_CLASS.RELHASTRIGGERS	The value is **TRUE** if the table has triggers; otherwise, the value is **FALSE**.
tablecreator	name	pg_get_userbyid(po.creator)	Table creator.
created	timestamp with time zone	pg_object.ctime	Creation time of the object
last_ddl_time	timestamp with time zone	pg_object.mtime	Last modification time of the object

12.3.12.187 PG_THREAD_WAIT_STATUS

PG_THREAD_WAIT_STATUS allows you to test the block waiting status about the backend thread and auxiliary thread of the current instance.

Table 12-411 PG_THREAD_WAIT_STATUS columns

Name	Type	Description
node_name	text	Current node name.
db_name	text	Database name.
thread_name	text	Thread name.
query_id	bigint	Query ID. It is equivalent to **debug_query_id**.
tid	bigint	Thread ID of the current thread.
sessionid	bigint	Current session ID.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent session ID.
tlevel	integer	Level of the streaming thread.
smpid	integer	Concurrent thread ID.
wait_status	text	Waiting status of the current thread. For details about the waiting status, see **Table 12-412**.

Name	Type	Description
wait_event	text	If **wait_status** is set to **acquire lock**, **acquire lwlock**, or **wait io**, this column describes the lock, lightweight lock, and I/O information, respectively. Otherwise, this column is empty.
locktag	text	Information about the lock that the current thread is waiting to obtain.
lockmode	text	Lock mode that the current thread is waiting to obtain. The values include table-level lock, row-level lock, and page-level lock modes.
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock.
global_sessionid	text	Global session ID.

The waiting states in the **wait_status** column are as follows.

Table 12-412 Waiting states

Value	Description
none	Waiting for no event.
acquire lock	Waiting for locking until the locking succeeds or times out.
acquire lwlock	Waiting for a lightweight lock.
wait io	Waiting for I/O completion.
wait cmd	Waiting for reading network communication packets to complete.
wait pooler get conn	Waiting for pooler to obtain connections.
wait pooler abort conn	Waiting for pooler to terminate connections.
wait pooler clean conn	Waiting for pooler to clear connections.
pooler create conn: [nodename], total N	Waiting for the pooler to set up a connection. The connection is being established with the node specified by *nodename*, and there are *N* connections waiting to be set up.
get conn	Obtaining the connection to other nodes.

Value	Description
set cmd: [nodename]	Waiting for running the **SET**, **RESET**, **TRANSACTION BLOCK LEVEL PARA SET**, or **SESSION LEVEL PARA SET** statement on the connection. The statement is being executed on the node specified by *nodename*.
cancel query	Canceling the SQL statement that is being executed through the connection.
stop query	Stopping the query that is being executed through the connection.
wait node: [nodename](plevel), total N, [phase]	Waiting for receiving data from a connected node. The thread is waiting for data from the plevel thread of the node specified by *nodename*. The data of *N* connections is waiting to be returned. If *phase* is included, the possible phases are as follows: • **begin**: The transaction is being started. • **commit**: The transaction is being committed. • **rollback**: The transaction is being rolled back.
wait transaction sync: xid	Waiting for synchronizing the transaction specified by *xid*.
wait wal sync	Waiting for the completion of WAL of synchronization from the specified LSN to the standby instance.
wait data sync	Waiting for the completion of data page synchronization to the standby instance.
wait data sync queue	Waiting for putting the data pages that are in the row-store into the synchronization queue.
flush data: [nodename](plevel), [phase]	Waiting for sending data to the plevel thread of the node specified by *nodename*. If *phase* is included, the possible phase is **wait quota**, indicating that the current communication flow is waiting for the quota value.
stream get conn: [nodename], total N	Waiting for connecting to the consumer object of the node specified by *nodename* when the stream flow is initialized. There are *N* consumers waiting to be connected.

Value	Description
wait producer ready: [nodename] (plevel), total N	Waiting for each producer to be ready when the stream flow is initialized. The thread is waiting for the procedure of the plevel thread on the *nodename* node to be ready. There are *N* producers waiting to be ready.
synchronize quit	Waiting for the threads in the stream thread group to quit when the stream plan ends.
wait stream nodegroup destroy	Waiting for destroying the stream node group when the stream plan ends.
wait active statement	Waiting for job execution under resource and load control.
analyze: [relname], [phase]	Executing ANALYZE for the *relname* table. If *phase* is included, the possible phase is **autovacuum**, indicating that the database automatically enables the AutoVacuum thread to execute **ANALYZE**.
vacuum: [relname], [phase]	Executing VACUUM for the *relname* table. If *phase* is included, the possible phase is **autovacuum**, indicating that the database automatically enables the AutoVacuum thread to execute **VACUUM**.
vacuum full: [relname]	Executing VACUUM FULL for the *relname* table.
create index	Creating an index.
HashJoin - [build hash | write file]	The **HashJoin** operator is being executed. In this phase, you need to pay attention to the execution time-consuming. • **build hash**: The **HashJoin** operator is creating a hash table. • **write file**: The **HashJoin** operator is writing data to disks.
HashAgg - [build hash | write file]	The **HashAgg** operator is being executed. In this phase, you need to pay attention to the execution time-consuming. • **build hash**: The **HashAgg** operator is creating a hash table. • **write file**: The **HashAgg** operator is writing data to disks.

Value	Description
HashSetop - [build hash | write file]	The **HashSetop** operator is being executed. In this phase, you need to pay attention to the execution time-consuming. • **build hash**: The **HashSetop** operator is creating a hash table. • **write file**: The **HashSetop** operator is writing data to disks.
Sort | Sort - [fetch tuple | write file]	The **Sort** operator is used for sorting. **fetch tuple** indicates that the **Sort** operator is obtaining tuples, and **write file** indicates that the **Sort** operator is writing data to disks.
Material | Material - write file	The **Material** operator is being executed. **write file** indicates that the **Material** operator is writing data to disks.
NestLoop	The **NestLoop** operator is being executed.
wait memory	Waiting for obtaining the memory.
wait sync consumer next step	Waiting for the consumer to execute the stream operator.
wait sync producer next step	Waiting for the producer to execute the stream operator.
vacuum gpi	Clearing the global partitioned index in the vacuum or autovacuum process.
standby read recovery conflict	The read-only mode of the standby node conflicts with the log replay mode.
standby get snapshot	The standby node obtains the snapshot in read-only mode.
prune table	Waiting for a heap table to clear historical deleted data.
prune index	Waiting for an index to clear historical deleted data.
wait reserve td	Waiting for the Ustore transaction slot allocation.
wait td rollback	Waiting for the Ustore transaction slot to roll back transactions.
wait available td	Waiting for an available transaction slot for Ustore.
wait transaction rollback	Waiting for a transaction to roll back.

Value	Description
wait sync bgworkers	Waiting for an index subthread created in parallel to complete local scanning and sorting.
wait io control	Waiting for job execution under I/O control.
wait gs_sleep	Waiting for the server thread delay.
wait vacuum delay	Waiting for VACUUM delay.
wait seq scan	Execution time of seq scan.
wait index scan	Execution time of index scan.
wait checkpoint start	Start time of the checkpoint phase.
wait checkpoint done	End time of the checkpoint phase.
wait xact start command	Start time of xact.
wait xact commit command	Commit time of xact.
wait for autoextend partition	Waiting for the partitioned table to automatically expand and create partitions.
Accept client conn - Total Time	Total duration from the time when a connection is established to the time when the connection is successful (after the GaussDB receives a connection request from a client).
Accept client conn - ThrdPool - add epoll	Duration from the time when a connection is established to the time when the thread pool adds the session handle to the epoll in thread pool mode (after the GaussDB receives a connection request from a client).
Accept client conn - ThrdPool - wait worker	Duration from the time when the thread pool adds the session handle to the epoll to the time when the working thread pool starts to work in thread pool mode (after the GaussDB receives a connection request from a client).
Accept client conn - ThrdPool - init session	Duration from the time when the working thread pool starts to work to the time the session initialization ends in thread pool mode (after the GaussDB receives a connection request from a client).
Accept client conn - Worker - init proc	(After the GaussDB receives a connection request from a client) Duration from the time when a connection is established to the time when the thread initialization ends in non-thread pool mode.

Value	Description
Accept client conn - Worker - init session	(After the GaussDB receives a connection request from a client) Duration from the time when the thread initialization ends to the time when the session initialization ends in non-thread pool mode.
security audit write pipe	Waiting for an audit log to be written to the pipe.

If **wait_status** is **acquire lwlock**, **acquire lock**, or **wait io**, there is an event performing I/O operations or waiting for obtaining the corresponding lightweight lock or transaction lock.

The following table describes the corresponding wait events when **wait_status** is **acquire lwlock**. If **wait_event** is **extension**, the lightweight lock is dynamically allocated and is not monitored.

Table 12-413 List of wait events corresponding to lightweight locks

wait_event	Description
ShmemIndexLock	Used to protect the primary index table, a hash table, in shared memory.
OidGenLock	Used to prevent different threads from generating the same OID.
XidGenLock	Used to prevent two transactions from obtaining the same XID.
ProcArrayLock	Used to prevent concurrent access to or concurrent modification on the ProcArray shared array.
SInvalReadLock	Used to prevent concurrent execution with invalid message deletion.
SInvalWriteLock	Used to prevent concurrent execution with invalid message write and deletion.
WALInsertLock	Used to prevent concurrent execution with WAL insertion.
WALWriteLock	Used to prevent concurrent write from a WAL buffer to a disk
ControlFileLock	Used to prevent concurrent read/write or concurrent write/write on the **pg_control** file.
CheckpointLock	Used to prevent multi-checkpoint concurrent execution.

wait_event	Description
CLogControlLock	Used to prevent concurrent access to or concurrent modification on the Clog control data structure.
SubtransControlLock	Used to prevent concurrent access to or concurrent modification on the subtransaction control data structure.
MultiXactGenLock	Used to allocate a unique MultiXact ID in serial mode.
MultiXactOffsetControlLock	Used to prevent concurrent read/write or concurrent write/write on **pg_multixact/offset**.
MultiXactMemberControlLock	Used to prevent concurrent read/write or concurrent write/write on **pg_multixact/members**.
RelCacheInitLock	Used to add a lock before any operations are performed on the **init** file when messages are invalid.
CheckpointerCommLock	Used to send file flush requests to a checkpointer. The request structure needs to be inserted to a request queue in serial mode.
TwoPhaseStateLock	Used to prevent concurrent access to or modification on two-phase information sharing arrays.
TablespaceCreateLock	Used to check whether a tablespace exists.
BtreeVacuumLock	Used to prevent VACUUM from clearing pages that are being used by B-tree indexes.
AutovacuumLock	Used to access the autovacuum worker array in serial mode.
AutovacuumScheduleLock	Used to distribute tables requiring VACUUM in serial mode.
AutoanalyzeLock	Used to obtain and release resources related to a task that allows for autoanalyze execution.
SyncScanLock	Used to determine the start position of a relfilenode during heap scanning.
NodeTableLock	Used to protect a shared structure that stores database node information.
PoolerLock	Used to prevent two threads from simultaneously obtaining the same connection from a connection pool.

wait_event	Description
RelationMappingLock	Used to wait for the mapping file between system catalogs and storage locations to be updated.
Async Ctl	Used to protect asynchronization buffers.
AsyncCtlLock	Used to prevent concurrent access to or concurrent modification on the sharing notification status.
AsyncQueueLock	Used to prevent concurrent access to or concurrent modification on the sharing notification queue.
SerializableXactHashLock	Used to prevent concurrent read/write or concurrent write/write on a sharing structure for serializable transactions.
SerializableFinishedListLock	Used to prevent concurrent read/write or concurrent write/write on a shared linked list for completed serial transactions.
SerializablePredicateLockList-Lock	Used to protect a linked list of serializable transactions that have locks.
OldSerXidLock	Used to protect a structure that records serializable transactions that have conflicts.
FileStatLock	Used to protect a data structure that stores statistics file information.
SyncRepLock	Used to protect Xlog synchronization information during primary-standby replication.
DataSyncRepLock	Used to protect data page synchronization information during primary-standby replication.
MetaCacheSweepLock	Used to add a lock when metadata is cyclically washed out.
ExtensionConnectorLibLock	Used to add a lock when a specific dynamic library is loaded or uninstalled in ODBC connection initialization scenarios.
SearchServerLibLock	Used to add a lock on the file read operation when a specific dynamic library is initially loaded in GPU-accelerated scenarios.
LsnXlogChkFileLock	Used to serially update the Xlog flush points for primary and standby servers recorded in a specific structure.

wait_event	Description
ReplicationSlotAllocationLock	Used to add a lock when a primary server allocates streaming replication slots during primary-standby replication.
ReplicationSlotControlLock	Used to prevent concurrent update of replication slot status during primary-standby replication.
ResourcePoolHashLock	Used to prevent concurrent access to or concurrent modification on a resource pool table, a hash table.
WorkloadStatHashLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains SQL requests from the primary node of the database.
WorkloadIoStatHashLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains I/O information of the current database node.
WorkloadCGroupHashLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains Cgroup information.
OBSGetPathLock	Used to prevent concurrent read/write or concurrent write/write on an OBS path.
WorkloadUserInfoLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains user information about load management.
WorkloadRecordLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains requests received by the primary node of the databases during adaptive memory management.
WorkloadIOUtilLock	Used to protect a structure that records **iostat** and CPU load information.
WorkloadNodeGroupLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains node group information in memory.
JobShmemLock	Used to protect global variables in the shared memory that is periodically read during a scheduled job.
OBSRuntimeLock	Used to obtain environment variables, for example, **GASSHOME**.

wait_event	Description
LLVMDumpIRLock	Used to export the assembly language for dynamically generating functions.
LLVMParseIRLock	Used to compile and parse a finished IR function from the IR file at the start position of a query.
CriticalCacheBuildLock	Used to load caches from a shared or local cache initialization file.
WaitCountHashLock	Used to protect a shared structure in user statement counting scenarios.
BufMappingLock	Used to protect operations on a table mapped to shared buffer.
LockMgrLock	Used to protect a common lock structure.
PredicateLockMgrLock	Used to protect a lock structure that has serializable transactions.
OperatorRealTLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains real-time data at the operator level.
OperatorHistLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains historical data at the operator level.
SessionRealTLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains real-time data at the query level.
SessionHistLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains historical data at the query level.
BarrierLock	Used to ensure that only one thread is creating a barrier at a time
dummyServerInfoCacheLock	Used to protect a global hash table where the information about database connections is cached.
RPNumberLock	Used by a database node on a computing GaussDB to count the number of threads for a task where plans are being executed.
CBMParseXlogLock	Used to protect the lock used when CBM parses Xlogs.
RelfilenodeReuseLock	Used to prevent the link to a reused column attribute file from being canceled by mistake.

wait_event	Description
RcvWriteLock	Used to prevent concurrent call of **WalDataRcvWrite**.
PercentileLock	Used to protect global percentile buffers.
CSNBufMappingLock	Used to protect CSN pages.
UniqueSQLMappingLock	Used to protect a unique SQL hash table.
DelayDDLLock	Used to prevent concurrent DDL operations.
CLOG Ctl	Used to prevent concurrent access to or concurrent modification on the Clog control data structure.
Async Ctl	Used to protect asynchronization buffers.
MultiXactOffset Ctl	Used to protect SLRU buffers of a MultiXact offset.
MultiXactMember Ctl	Used to protect SLRU buffers of a MultiXact member.
OldSerXid SLRU Ctl	Used to protect SLRU buffers of old transaction IDs.
ReplicationSlotLock	Used to protect a replication slot.
PGPROCLock	Used to protect the PGPROC structure.
MetaCacheLock	Used to protect meta caches.
DataCacheLock	Used to protect data caches.
InstrUserLock	Used to protect InstrUserHTAB.
BadBlockStatHashLock	Used to protect the hash table **global_bad_block_stat**.
BufFreelistLock	Used to ensure the atomicity of free list operations in the shared buffer.
AddinShmemInitLock	Used to protect the initialization of the shared memory object.
AlterPortLock	Used to protect the coordinator node from changing the registration port number.
FdwPartitionCaheLock	Management lock of the buffer of the HDFS partitioned table.
DfsConnectorCacheLock	Management lock of the DFSConnector buffer.
DfsSpaceCacheLock	Management lock of the HDFS tablespace management buffer.

wait_event	Description
FullBuildXlogCopyStartPtrLock	Used to protect Xlog copy operations in the full build.
DfsUserLoginLock	Used for HDFS user login and authentication.
LogicalReplicationSlotPersis-tentDataLock	Used to protect data in the replication slot during logical replication.
PgfdwLock	Used by the management instance to establish a connection to the foreign server.
InstanceTimeLock	Used to obtain time information of sessions in an instance.
XlogRemoveSegLock	Used to protect Xlog segment file recycling.
DnUsedSpaceHashLock	Used to update space usage information corresponding to a session.
CsnMinLock	Used to calculate CSNmin.
GPCCommitLock	Used to protect the addition of the global Plan Cache hash table.
GPCClearLock	Used to protect the clearing of the global plan cache hash table.
GPCTimelineLock	Used to protect the timeline check of the global plan cache hash table.
InstanceRealTLock	Used to protect the update of the hash table that stores shared instance statistics.
CLogBufMappingLock	Used to manage the cache of commit logs.
GPCMappingLock	Used to manage the global plan cache.
GPCPrepareMappingLock	Used to manage the global plan cache.
BufferIOLock	Used to protect I/O operations on pages in the shared buffer.
BufferContentLock	Used to protect the read and modification of the page content in the shared buffer.
CSNLOG Ctl	Used for CSN log management.
DoubleWriteLock	Used to manage doublewrite operations.
RowPageReplicationLock	Used to manage data page replication of row-store.
MatviewSeqnoLock	Used to manage the cache of materialized views.

wait_event	Description
GPRCMappingLock	Used to manage the access and modification operations of the global cache hash table of autonomous transactions.
extension	Other lightweight locks.
wait active statement	Waiting for job execution under resource and load control.
wait memory	Waiting for obtaining the memory.
IOStatLock	Used to concurrently maintain the hash table of resource management I/O statistics.
StartBlockMappingLock	Used by globalstat to obtain information such as startblockarray from pgstat.
PldebugLock	Used to debug stored procedures and perform concurrent maintenance operations.
DataFileIdCacheLock	Used to manage the concurrent access and storage of hash table that stores data file descriptor in the shared memory.
GTMHostInfoLock	Used to protect the concurrent access and storage of shared GTM host information.
TwoPhaseStatePartLock	Used to protect the status information of two-phase transactions (in each partition).
WALBufMappingLock	Used to protect the mapping between WAL buffer page and LSN offset.
UndoZoneLock	Used to protect the concurrent access and storage of undo zone.
RollbackReqHashLock	Used to protect the concurrent access and storage of hash table that stores the rollback request in the shared memory.
UHeapStatLock	Used to protect the concurrent access and storage of Ustore statistics.
WALWritePaxosLock	Used to protect the concurrent sequence of WAL log written to the paxos replication component.
SyncPaxosLock	Used to protect the concurrent access and storage of paxos synchronization queue.
BackgroundWorkerLock	Used to protect the concurrent sequence of background workers.
HadrSwitchoverLock	Used to protect the concurrent sequence of DR switchover.

wait_event	Description
HashUidLock	Used to protect the concurrent sequence of UID allocation.
ParallelDecodeLock	Used to protect the concurrent sequence of parallel decoding.
XLogMaxCSNLock	Used to protect the maximum volume of CSNs that can be restored locally in DR mode.
DisasterCacheLock	Used to protect the concurrent access and storage of DR cache information in the shared memory.
MaxCSNArrayLock	Used to protect the restoration progress of standby node CSNs in each shard in the shared memory.
RepairBadBlockStatHashLock	Used to protect the concurrent access and storage of the hash table that stores damaged pages in the shared memory.
HypoIndexLock	Used to create, delete and reset the virtual index by the lightweight lock.
XGBoostLibLock	Used by DB4AI to call the XGBoost library.
DropArchiveSlotLock	Used to protect the concurrent sequence of deleting the archive slot.
ProcXactMappingLock	Used to protect the concurrent access and storage of the hash table that stores the mapping information between transaction IDs and threads.
UndoPerZoneLock	Used to protect the concurrent access and storage of each information in undo zone.
UndoSpaceLock	Used to protect the concurrent access and storage of undo space.
SnapshotBlockLock	Used to control the concurrent sequence of snapshot-based backup and disk flushing.
DWSingleFlushFirstLock	Used to control the concurrent sequence of non-segment-pages and single-page doublewrite files.
DWSingleFlushSecondLock	Used to control the concurrent sequence of segment-pages and single-page doublewrite files.
DWSingleFlushSecondBufTag-Lock	Used to control the concurrent access and storage of metadata of segment-pages and single-page doublewrite files.

wait_event	Description
RestartPointQueueLock	Used to control the concurrent access and storage of restart point arrays on the standby node.
UnlinkRelHashTblLock	Used to protect the concurrent access and storage of the hash table that restores files to be deleted.
UnlinkRelForkHashTblLock	Used to protect the concurrent access and storage of the hash table that restores the fork files to be deleted.
WALFlushWait	Used to protect the concurrent sequence of log flushing.
WALConsensusWait	Used to protect the transaction commit or log replay which is performed only when the logs are consistent.
WALBufferInitWait	Used to protect the initialization and disk flushing sequence of WAL pages in the shared memory.
WALInitSegment	Used to protect the initialization sequence of WAL segment files.
SegmentHeadPartitionLock	Used to protect the partition lock of metadata in the segment-page header.
PgwrSyncQueueLock	Used to protect the concurrent access and storage of file queues to be flushed to disks.
BarrierHashTblLock	Used to protect the concurrent access and storage of barrier tables in the shared memory.
PageRepairHashTblLock	Used to protect the concurrent access and storage of hash table that stores repaired pages.
FileRepairHashTblLock	Used to protect the concurrent access and storage of the hash table that stores repaired files.
InstrUserLockId	Used to protect the concurrent modification of the hash table that stores user login and logout records.
GsStackLock	Used to ensure that the gs_tack function is not concurrently invoked.
InstrStmtTrackCtlLock	Used to protect the concurrent access and storage of the hash table when full SQL statements are dynamically enabled.

wait_event	Description
CaptureViewFileHashLock	Used to protect the concurrent access and storage of the hash table when capturing the performance view.
UniqueSqlEvictLock	Used to protect the concurrent access and storage of the hash table when the unique SQL reclamation is enabled.
gtt_shared_ctl	Used to protect concurrent read and write of the hash table that stores the global temporary tables.
AuditIndexFileLock	Used to protect concurrent read and write of index files in the audit log.
TDEKeyCacheLock	Used to control the concurrent read and write of cached data keys encrypted transparently.
BlockchainVersionLock	Used to control the concurrent read and write of global block numbers in the ledger database.
GlobalPrevHashLock	Used to control the concurrent read and write of global verification hash tables in the ledger database.
LWTRANCHE_ACCOUNT_TABLE	Used to control the concurrent read and write of the hash table that stores the account locking status.

The following table describes the corresponding wait events when **wait_status** is **wait io**.

Table 12-414 List of wait events corresponding to I/Os

wait_event	Description
BufFileRead	Reads data from a temporary file to a specified buffer.
BufFileWrite	Writes the content of a specified buffer to a temporary file.
ControlFileRead	Reads the **pg_control** file, mainly during database startup, checkpoint execution, and primary/standby verification.
ControlFileSync	Flushes the **pg_control** file to a disk, mainly during database initialization.

wait_event	Description
ControlFileSyncUpdate	Flushes the **pg_control** file to a disk, mainly during database startup, checkpoint execution, and primary/standby verification.
ControlFileWrite	Writes the **pg_control** file, during database initialization.
ControlFileWriteUpdate	Updates the **pg_control** file, mainly during database startup, checkpoint execution, and primary/standby verification.
CopyFileRead	Reads a file during file copying.
CopyFileWrite	Writes a file during file copying.
DataFileExtend	Writes a file during file name extension.
DataFileFlush	Flushes a table data file to a disk.
DataFileImmediateSync	Flushes a table data file to a disk immediately.
DataFilePrefetch	Reads a table data file asynchronously.
DataFileRead	Reads a table data file synchronously.
DataFileSync	Flushes table data file modifications to a disk.
DataFileTruncate	Truncates a table data file.
DataFileWrite	Writes a table data file.
LockFileAddToDataDirRead	Reads the **postmaster.pid** file.
LockFileAddToDataDirSync	Flushes the **postmaster.pid** file to a disk.
LockFileAddToDataDirWrite	Writes PID information into the **postmaster.pid** file.
LockFileCreateRead	Reads the LockFile file **%s.lock**.
LockFileCreateSync	Flushes the LockFile file **%s.lock** to a disk.
LockFileCreateWRITE	Writes PID information into the LockFile file **%s.lock**.
RelationMapRead	Reads the mapping file between system catalogs and storage locations.
RelationMapSync	Flushes the mapping file between system catalogs and storage locations to a disk.
RelationMapWrite	Writes the mapping file between system catalogs and storage locations.
ReplicationSlotRead	Reads a streaming replication slot file during a restart.

wait_event	Description
ReplicationSlotRestoreSync	Flushes a streaming replication slot file to a disk during a restart.
ReplicationSlotSync	Flushes a temporary streaming replication slot file to a disk during checkpoint execution.
ReplicationSlotWrite	Writes a temporary streaming replication slot file during checkpoint execution.
SLRUFlushSync	Flushes the **pg_clog**, **pg_subtrans**, and **pg_multixact** files to a disk, mainly during checkpoint execution and database shutdown.
SLRURead	Reads the **pg_clog**, **pg_subtrans**, and **pg_multixact** files.
SLRUSync	Writes dirty pages into the **pg_clog**, **pg_subtrans**, and **pg_multixact** files, and flushes the files to a disk, mainly during checkpoint execution and database shutdown.
SLRUWrite	Writes the **pg_clog**, **pg_subtrans**, and **pg_multixact** files.
TimelineHistoryRead	Reads the timeline history file during database startup.
TimelineHistorySync	Flushes the timeline history file to a disk during database startup.
TimelineHistoryWrite	Writes to the timeline history file during database startup.
TwophaseFileRead	Reads the **pg_twophase** file, mainly during two-phase transaction commit and restoration.
TwophaseFileSync	Flushes the **pg_twophase** file to a disk, mainly during two-phase transaction commit and restoration.
TwophaseFileWrite	Writes the **pg_twophase** file, mainly during two-phase transaction commit and restoration.
WALBootstrapSync	Flushes an initialized WAL file to a disk during database initialization.
WALBootstrapWrite	Writes an initialized WAL file during database initialization.
WALCopyRead	Reads operation generated when an existing WAL file is read for replication after archiving and restoration.
WALCopySync	Flushes a replicated WAL file to a disk after archiving and restoration.

wait_event	Description
WALCopyWrite	Writes operation generated when an existing WAL file is read for replication after archiving and restoration.
WALInitSync	Flushes a newly initialized WAL file to a disk during log reclaiming or writing.
WALInitWrite	Initializes a newly created WAL file to **0** during log reclaiming or writing.
WALRead	Reads data from Xlogs during redo operations on two-phase files.
WALSyncMethodAssign	Flushes all open WAL files to a disk.
WALWrite	Writes a WAL file.
WALBufferAccess	Used to access WAL buffer. (To ensure performance, only the number of access times is counted in the kernel code, and the access duration is not counted.)
WALBufferFull	Used to write WAL files when the WAL buffer is full.
DoubleWriteFileRead	Doublewrites and reads a file.
DoubleWriteFileSync	Doublewrites a file and forcibly flushes files to disks.
DoubleWriteFileWrite	Doublewrites a file and writes a file.
PredoProcessPending	Waits for the replay of other records to complete during parallel log replay.
PredoApply	Waits for the replay of other threads to the LSN of the current thread during parallel log replay.
DisableConnectFileRead	Reads the HA lock fragment logic file.
DisableConnectFileSync	Forcibly flushes the HA lock fragment logic file to disks.
DisableConnectFileWrite	Writes the HA lock fragment logic file.
BufHashTableSearch	Searches the hash table in the shared buffer (page eviction may be triggered).
StrategyGetBuffer	Obtains pages from strategy buffer (page eviction may be triggered).
UndoFileExtend	Extends an undo file.
UndoFilePrefetch	Prefetches an undo file.
UndoFileRead	Reads an undo file.

wait_event	Description
UndoFileWrite	Writes an undo file.
UndoFileSync	Flushes an undo file to a disk.
UndoFileUnlink	Deletes an undo file.
UndoMetaSync	Flushes an undo metadata file to a disk.
DWSingleFlushGetPos	Searches for an available location for a single-page doublewrite file.
DWSingleFlushWrite	Flushes a single-page doublewrite file to a disk.
CkptWaitPageWriterFlush	Waits for page refreshing during full checkpoint execution.
CkptWaitPageWriterSync	Waits for the modified file to be synchronized to the disk before checkpointing.
CkptWaitCommitTransac-tionFinish	Waits until all transactions are committed before checkpointing.
MPFL_INIT	Initiates max_page_flush_lsn.
MPFL_READ	Reads max_page_flush_lsn.
MPFL_WRITE	Writes max_page_flush_lsn.
OBSList	Traverses an OBS directory.
OBSRead	Reads an OBS object.
OBSWrite	Writes an OBS object.
LOGCTRL_SLEEP	Waits for the standby node to catch up with logs.
ShareStorageWalRead	Reads log files from the shared disk.
ShareStorageWalWrite	Writes log files to the shared disk.
ShareStorageCtlInfoRead	Reads control information from the shared disk.
ShareStorageCtlInfoWrite	Writes control information to the shared disk.
SegFileExtend	Extends segment-page files.
SegReadDisk	Reads segment-page files.
SegWriteDisk	Writes segment-page files.
SegSync	Flushes segment-page files.
SegFileShrink	Collapses segment-page files.

The following table describes the corresponding wait events when **wait_status** is **acquire lock**.

Table 12-415 List of wait events corresponding to transaction locks

wait_event	Description
relation	Adds a lock to a table.
extend	Adds a lock to a table being scaled out.
partition	Adds a lock to a partitioned table.
partition_seq	Adds a lock to a partition of a partitioned table.
page	Adds a lock to a table page.
tuple	Adds a lock to a tuple on a page.
transactionid	Adds a lock to a transaction ID.
virtualxid	Adds a lock to a virtual transaction ID.
object	Adds a lock to an object.
userlock	Adds a lock to a user.
advisory	Adds an advisory lock.
filenode	Adds a lock to a file name and controls the concurrent sequence of file-level operations.
subtransactionid	Adds a lock to a sub-transaction ID.
tuple_uid	Adds a lock to the hidden column of a tuple UID.

12.3.12.188 PG_TIMEZONE_ABBREVS

PG_TIMEZONE_ABBREVS displays information about all available time zones.

Table 12-416 PG_TIMEZONE_ABBREVS columns

Name	Type	Description
abbrev	text	Time zone name abbreviation
utc_offset	interval	Offset from UTC
is_dst	boolean	Whether DST is used. If DST is used, the value is **TRUE**. Otherwise, the value is **FALSE**.

12.3.12.189 PG_TIMEZONE_NAMES

PG_TIMEZONE_NAMES displays all time zone names that can be recognized by **SET TIMEZONE**, along with their abbreviations, UTC offsets, and daylight saving time (DST) statuses.

Table 12-417 PG_TIMEZONE_NAMES columns

Name	Type	Description
name	text	Name of the time zone
abbrev	text	Abbreviation of the ime zone name
utc_offset	interval	Offset from UTC
is_dst	boolean	Whether DST is used. If DST is used, the value is **TRUE**. Otherwise, the value is **FALSE**.

12.3.12.190 PG_TOTAL_MEMORY_DETAIL

PG_TOTAL_MEMORY_DETAIL displays memory usage of a node in the database.

Table 12-418 PG_TOTAL_MEMORY_DETAIL columns

Name	Type	Description
nodename	text	Specifies the node name.
memorytype	text	Memory name
memorymbytes	integer	Size of the used memory in the unit of MB.

12.3.12.191 PG_TOTAL_USER_RESOURCE_INFO

PG_TOTAL_USER_RESOURCE_INFO displays resource usage of all users. Only administrators can query this view. This view is valid only when the GUC parameter **use_workload_manager** is set to **on**. I/O monitoring items are valid only when **enable_logical_io_statistics** is set to **on**.

Table 12-419 PG_TOTAL_USER_RESOURCE_INFO columns

Name	Type	Description
username	name	Username
used_memory	integer	Used memory, in MB
total_memory	integer	Available memory, in MB. The value **0** indicates that the available memory is not limited and depends on the maximum memory available in the database.
used_cpu	double precision	Number of CPU cores in use. CPU usage data is collected only in complex jobs, and the value is the CPU usage of the related Cgroup.

Name	Type	Description
total_cpu	integer	Total number of CPU cores of the Cgroup associated with the user on the node
used_space	bigint	Used permanent table storage space, in KB
total_space	bigint	Available permanent table storage space, in KB (**-1** if the storage space is not limited)
used_temp_space	bigint	Used temporary space, in KB
total_temp_space	bigint	Total available temporary space, in KB (**-1** if the temporary space is not limited)
used_spill_space	bigint	Size of the used operator flushing space, in KB
total_spill_space	bigint	Total size of the available operator flushing space, in KB (**-1** if the space is not limited)
read_kbytes	bigint	Primary database node: total bytes read by the user's complex jobs on all database nodes in the last 5 seconds, in KB Database node: total bytes read by the user's complex jobs from the instance startup time to the current time, in KB
write_kbytes	bigint	Primary database node: total bytes written by the user's complex jobs on all database nodes in the last 5 seconds, in KB Database node: total bytes written by the user's complex jobs from the instance startup time to the current time, in KB
read_counts	bigint	Primary database node: total number of read times of the user's complex jobs on all database nodes in the last 5 seconds Database node: total number of read times of the user's complex jobs from the instance startup time to the current time
write_counts	bigint	Primary database node: total number of write times of the user's complex jobs on all database nodes in the last 5 seconds Database node: total number of write times of the user's complex jobs from the instance startup time to the current time

Name	Type	Description
read_speed	double precision	Primary database node: average read rate of the user's complex jobs on a single database node in the last 5 seconds, in KB/s Database node: average read rate of the user's complex jobs on the database node in the last 5 seconds, in KB/s
write_speed	double precision	Primary database node: average write rate of the user's complex jobs on a single database node in the last 5 seconds, in KB/s Database node: average write rate of the user's complex jobs on the database node in the last 5 seconds, in KB/s

12.3.12.192 PG_TOTAL_USER_RESOURCE_INFO_OID

PG_TOTAL_USER_RESOURCE_INFO_OID displays resource usage of all users. Only administrators can query this view. This view is valid only when the GUC parameter **use_workload_manager** is set to **on**.

Table 12-420 PG_TOTAL_USER_RESOURCE_INFO_OID columns

Name	Type	Description
userid	oid	User ID.
used_memory	integer	Size of the memory being used, in MB.
total_memory	integer	Available memory (unit: MB) The value **0** indicates that the available memory is not limited and depends on the maximum memory available in the database.
used_cpu	double precision	Number of CPU cores in use.
total_cpu	integer	Total number of CPU cores of the Cgroup associated with the user on the node.
used_space	bigint	Used storage space, in KB.
total_space	bigint	Available storage space (unit: KB). The value **-1** indicates that the space is not limited.
used_temp_space	bigint	Used temporary storage space, in KB.
total_temp_space	bigint	Total available temporary space, in KB (**-1** if the temporary space is not limited).

Name	Type	Description
used_spill_space	bigint	Used disk space for spilling, in KB.
total_spill_space	bigint	Total available disk space for spilling, in KB. The value **-1** indicates that the space is not limited.
read_kbytes	bigint	Amount of data read from the disk, in KB.
write_kbytes	bigint	Amount of data written to the disk, in KB.
read_counts	bigint	Number of disk read times.
write_counts	bigint	Number of disk write times.
read_speed	double precision	Disk read rate, in B/ms.
write_speed	double precision	Disk write rate, in B/ms.

12.3.12.193 PG_VARIABLE_INFO

PG_VARIABLE_INFO records information about transaction IDs and OIDs of the current node in the database.

Table 12-421 PG_VARIABLE_INFO columns

Name	Type	Description
node_name	text	Node name
next_oid	oid	OID generated next time for the node
next_xid	xid	Transaction ID generated next time for the node
oldest_xid	xid	Oldest transaction ID on the node.
xid_vac_limit	xid	Critical point (transaction ID) that triggers forcible autovacuum
oldest_xid_db	oid	OID of the database that has the minimum datafrozenxid on the node
last_extend_csn_logpage	xid	Number of the last extended csnlog page
start_extend_csn_logpage	xid	Number of the page from which csnlog extending starts
next_commit_seqno	xid	CSN generated next time for the node
latest_completed_xid	xid	Latest transaction ID on the node after the transaction commission or rollback

Name	Type	Description
startup_max_xid	xid	Last transaction ID before the node is powered off

12.3.12.194 PG_VIEWS

PG_VIEWS provides access to basic information about each view in the database.

Table 12-422 PG_VIEWS columns

Name	Type	Reference	Description
schemaname	name	**PG_NAMESPACE**.nspname	Name of the schema that contains the view
viewname	name	**PG_CLASS**.relname	View name
viewowner	name	**PG_AUTHID**.Erolname	Owner of the view
definition	text	-	Definition of the view

12.3.12.195 PGXC_PREPARED_XACTS

PGXC_PREPARED_XACTS displays two-phase transactions in the **prepared** phase. Only users with the **system admin** or **monitor admin** permission can view the information.

Table 12-423 PGXC_PREPARED_XACTS columns

Name	Type	Description
pgxc_prepared_xact	text	Displays the two-phase transaction currently in the **prepared** phase.

12.3.12.196 PGXC_THREAD_WAIT_STATUS

This view is not supported in centralized scenarios.

12.3.12.197 PLAN_TABLE

PLAN_TABLE displays plan information collected by **EXPLAIN PLAN**. Plan information is in a session-level lifecycle. After a session exits, the data will be deleted. Data is isolated between sessions and between users. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 12-424 PLAN_TABLE columns

Name	Type	Description
statement_id	character varying(30)	Query tag specified by a user
plan_id	bigint	Query ID
id	integer	ID of each operator in a generated plan
operation	character varying(30)	Operation description of an operator in a plan
options	character varying(255)	Operation option
object_name	name	Object name corresponding to the operation, which is not the object alias used in the query. The object name is defined by users.
object_type	character varying(30)	Object type
object_owner	name	Schema to which the object belongs. It is defined by users.
projection	character varying(4000)	Returned column information
cost	double precision	Execution cost estimated by the optimizer for an operator
cardinality	double precision	Number of rows estimated by the optimizer for an operator
remarks	character varying(4000)	Not supported. Set it to **NULL**.
timestamp	timestamp(0) without time zone	Not supported. Set it to **NULL**.
object_node	character varying(128)	Not supported. Set it to **NULL**.
object_alias	character varying(261)	Not supported. Set it to **NULL**.
object_instance	numeric	Not supported. Set it to **NULL**.
optimizer	character varying(255)	Not supported. Set it to **NULL**.
search_columns	numeric	Not supported. Set it to **NULL**.
parent_id	numeric	Not supported. Set it to **NULL**.

Name	Type	Description
depth	numeric	Not supported. Set it to **NULL**.
position	numeric	Not supported. Set it to **NULL**.
bytes	numeric	Not supported. Set it to **NULL**.
other_tag	character varying(255)	Not supported. Set it to **NULL**.
partition_start	character varying(255)	Not supported. Set it to **NULL**.
partition_stop	character varying(255)	Not supported. Set it to **NULL**.
partition_id	numeric	Not supported. Set it to **NULL**.
other	character varying	Not supported. Set it to **NULL**.
other_xml	clob	Not supported. Set it to **NULL**.
distribution	character varying(20)	Not supported. Set it to **NULL**.
cpu_cost	numeric	Not supported. Set it to **NULL**.
io_cost	numeric	Not supported. Set it to **NULL**.
temp_space	numeric	Not supported. Set it to **NULL**.
access_predicates	character varying(4000)	Not supported. Set it to **NULL**.
filter_predicates	character varying(4000)	Not supported. Set it to **NULL**.
time	numeric	Not supported. Set it to **NULL**.
qblock_name	character varying(128)	Not supported. Set it to **NULL**.

NOTE

- A valid **object_type** value consists of a relkind type defined in **PG_CLASS** (**TABLE**, **INDEX**, **SEQUENCE**, **VIEW**, **COMPOSITE TYPE**, or **TOASTVALUE TOAST**) and the rtekind type used in the plan (**SUBQUERY**, **JOIN**, **FUNCTION**, **VALUES**, **CTE**, or **REMOTE_QUERY**).
- For RangeTableEntry (RTE), **object_owner** is the object description used in the plan. Non-user-defined objects do not have **object_owner**.
- Information in the **statement_id**, **object_name**, **object_owner**, and **projection** columns is stored in letter cases specified by users and information in other columns is stored in uppercase.
- **PLAN_TABLE** supports only **SELECT** and **DELETE** and does not support other DML operations.

12.3.12.198 SYS_DUMMY

SYS_DUMMY is automatically created by the database based on the data dictionary. It has only one text column in only one row for storing expression calculation results. This view is accessible to all users. This view exists in the PG_CATALOG and SYS schemas.

Table 12-425 SYS_DUMMY columns

Name	Type	Description
DUMMY	text	Expression calculation result

12.3.12.199 V_INSTANCE

V_INSTANCE displays instance information in current database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 12-426 V_INSTANCE columns

Name	Type	Description
instance_number	oid	OID of the current database
instance_name	character varying(16)	Name of the current database
host_name	character varying(64)	Host name
version	character varying(17)	Not supported. Set it to **NULL**.
version_legacy	character varying(17)	Not supported. Set it to **NULL**.
version_full	character varying(17)	Not supported. Set it to **NULL**.
startup_time	timestamp(0) without time zone	Not supported. Set it to **NULL**.
status	character varying(12)	Not supported. Set it to **NULL**.
parallel	character varying(3)	Not supported. Set it to **NULL**.
thread#	numeric	Not supported. Set it to **NULL**.
archiver	character varying(7)	Not supported. Set it to **NULL**.

Name	Type	Description
log_switch_wait	character varying(15)	Not supported. Set it to **NULL**.
logins	character varying(10)	Not supported. Set it to **NULL**.
shutdown_pending	character varying(3)	Not supported. Set it to **NULL**.
database_status	character varying(17)	Not supported. Set it to **NULL**.
instance_role	character varying(18)	Not supported. Set it to **NULL**.
active_state	character varying(9)	Not supported. Set it to **NULL**.
blocked	character varying(3)	Not supported. Set it to **NULL**.
con_id	numeric	Not supported. Set it to **NULL**.
instance_mode	character varying(11)	Not supported. Set it to **NULL**.
edition	character varying(7)	Not supported. Set it to **NULL**.
family	character varying(80)	Not supported. Set it to **NULL**.
database_type	character varying(15)	Not supported. Set it to **NULL**.

12.3.12.200 V_MYSTAT

V_MYSTAT displays statistics information about all sessions in the database. Only system administrators can access this view. Common users can access this view only after being authorized. This view exists in both the **PG_CATALOG** and **SYS** schemas.

Table 12-427 V_MYSTAT columns

Name	Type	Description
sid	numeric	Current session ID
statistic#	numeric	Not supported. Set it to **NULL**.
value	numeric	Not supported. Set it to **NULL**.

Name	Type	Description
con_id	numeric	Not supported. Set it to **NULL**.

12.3.12.201 V_SESSION

V_SESSION describes information about all current sessions. Only system administrators can access this view. Common users can access this view only after being authorized. This view exists in both the PG_CATALOG and SYS schemas.

Table 12-428 V_SESSION columns

Name	Type	Description
saddr	raw	Not supported. Set it to **NULL**.
sid	bigint	Session ID
serial#	integer	Sequence number of the active background thread, which is **0** in GaussDB
audsid	numeric	Not supported. Set it to **NULL**.
paddr	raw	Not supported. Set it to **NULL**.
schema#	numeric	Not supported. Set it to **NULL**.
schemaname	name	Name of the user logged in to the backend
user#	oid	OID of the user that has logged in to the backend thread. The OID is **0** if the backend thread is a global auxiliary thread.
username	name	Name of the user logged in to the backend process. **username** is null if the backend thread is a global auxiliary thread.
command	numeric	Not supported. Set it to **NULL**.
ownerid	numeric	Not supported. Set it to **NULL**.
taddr	character varying(16)	Not supported. Set it to **NULL**.
lockwait	character varying(16)	Not supported. Set it to **NULL**.
machine	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
sql_id	bigint	Query ID

Name	Type	Description
client_info	text	Client information
event	text	Queuing status of a statement. Possible values are: • **waiting in queue**: The statement is in the queue. • **Empty**: The statement is running.
sql_exec_start	timestamp with time zone	Time when the currently active query was started, or time when the last query was started if the value of **state** is not **active**
program	text	Name of the application connected to the backend
status	text	Overall status of this backend Possible values are: • **active**: The backend is executing a query. • **idle**: The backend is waiting for a new client command. • **idle in transaction**: The backend is in a transaction, but there is no statement being executed in the transaction. • **idle in transaction** (aborted): The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend.
server	character varying(9)	Not supported. Set it to **NULL**.
pdml_status	character varying(8)	Specifies whether to enable a DML parallel execution in the current session.
port	numeric	Port number of the current session
process	character varying(24)	Process ID of the current session
logon_time	timestamp(0) without time zone	Login time of the current session
last_call_et	integer	Duration when the status of the current session changes last time
osuser	character varying(128)	Not supported. Set it to **NULL**.

Name	Type	Description
terminal	character varying (30)	Not supported. Set it to **NULL**.
type	character varying(10)	Not supported. Set it to **NULL**.
sql_address	raw	Not supported. Set it to **NULL**.
sql_hash_value	numeric	Not supported. Set it to **NULL**.
sql_child_number	numeric	Not supported. Set it to **NULL**.
sql_exec_id	numeric	Not supported. Set it to **NULL**.
prev_sql_addr	raw	Not supported. Set it to **NULL**.
prev_hash_value	numeric	Not supported. Set it to **NULL**.
prev_sql_id	character varying(13)	Not supported. Set it to **NULL**.
prev_child_number	numeric	Not supported. Set it to **NULL**.
prev_exec_start	timestamp(0) without time zone	Not supported. Set it to **NULL**.
prev_exec_id	numeric	Not supported. Set it to **NULL**.
plsql_entry_object_id	numeric	Not supported. Set it to **NULL**.
plsql_entry_subprogram_id	numeric	Not supported. Set it to **NULL**.
plsql_object_id	numeric	Not supported. Set it to **NULL**.
plsql_subprogram_id	numeric	Not supported. Set it to **NULL**.
module	character varying(64)	Not supported. Set it to **NULL**.
module_hash	numeric	Not supported. Set it to **NULL**.
action	character varying(64)	Not supported. Set it to **NULL**.

Name	Type	Description
action_hash	numeric	Not supported. Set it to **NULL**.
fixed_table_sequence	numeric	Not supported. Set it to **NULL**.
row_wait_obj#	numeric	Not supported. Set it to **NULL**.
row_wait_file#	numeric	Not supported. Set it to **NULL**.
row_wait_block#	numeric	Not supported. Set it to **NULL**.
row_wait_row#	numeric	Not supported. Set it to **NULL**.
top_level_call#	numeric	Not supported. Set it to **NULL**.
pdml_enabled	character varying(3)	Not supported. Set it to **NULL**.
failover_type	character varying(13)	Not supported. Set it to **NULL**.
failover_method	character varying(10)	Not supported. Set it to **NULL**.
failed_over	character varying(3)	Not supported. Set it to **NULL**.
resource_consumer_group	character varying(32)	Not supported. Set it to **NULL**.
pddl_status	character varying(8)	Not supported. Set it to **NULL**.
pq_status	character varying(8)	Not supported. Set it to **NULL**.
current_queue_duration	numeric	Not supported. Set it to **NULL**.
client_identifier	character varying(64)	Not supported. Set it to **NULL**.
blocking_session_status	character varying(11)	Not supported. Set it to **NULL**.
blocking_instance	numeric	Not supported. Set it to **NULL**.
blocking_session	numeric	Not supported. Set it to **NULL**.

Name	Type	Description
final_blocking_session_status	character varying(11)	Not supported. Set it to **NULL**.
final_blocking_instance	numeric	Not supported. Set it to **NULL**.
final_blocking_session	numeric	Not supported. Set it to **NULL**.
seq#	numeric	Not supported. Set it to **NULL**.
event#	numeric	Not supported. Set it to **NULL**.
p1text	character varying(64)	Not supported. Set it to **NULL**.
p1	numeric	Not supported. Set it to **NULL**.
p1raw	raw	Not supported. Set it to **NULL**.
p2text	character varying(64)	Not supported. Set it to **NULL**.
p2	numeric	Not supported. Set it to **NULL**.
p2raw	raw	Not supported. Set it to **NULL**.
p3text	character varying(64)	Not supported. Set it to **NULL**.
p3	numeric	Not supported. Set it to **NULL**.
p3raw	raw	Not supported. Set it to **NULL**.
wait_class_id	numeric	Not supported. Set it to **NULL**.
wait_class#	numeric	Not supported. Set it to **NULL**.
wait_class	character varying(64)	Not supported. Set it to **NULL**.
wait_time	numeric	Not supported. Set it to **NULL**.
seconds_in_wait	numeric	Not supported. Set it to **NULL**.
state	character varying(19)	Not supported. Set it to **NULL**.
wait_time_micro	numeric	Not supported. Set it to **NULL**.
time_remaining_micro	numeric	Not supported. Set it to **NULL**.

Name	Type	Description
time_since_last_wait_micro	numeric	Not supported. Set it to **NULL**.
service_name	character varying(64)	Not supported. Set it to **NULL**.
sql_trace	character varying(8)	Not supported. Set it to **NULL**.
sql_trace_waits	character varying(5)	Not supported. Set it to **NULL**.
sql_trace_binds	character varying(5)	Not supported. Set it to **NULL**.
sql_trace_plan_stats	character varying(10)	Not supported. Set it to **NULL**.
session_edition_id	numeric	Not supported. Set it to **NULL**.
creator_addr	raw	Not supported. Set it to **NULL**.
creator_serial#	numeric	Not supported. Set it to **NULL**.
ecid	character varying(64)	Not supported. Set it to **NULL**.
sql_translation_profile_id	numeric	Not supported. Set it to **NULL**.
pga_tunable_mem	numeric	Not supported. Set it to **NULL**.
shard_ddl_status	character varying(8)	Not supported. Set it to **NULL**.
con_id	numeric	Not supported. Set it to **NULL**.
external_name	character varying(1024)	Not supported. Set it to **NULL**.
plsql_debugger_connected	character varying(5)	Not supported. Set it to **NULL**.

12.3.12.202 V$GLOBAL_TRANSACTION

V$GLOBAL_TRANSACTION displays information about currently active global transactions. By default, only the system administrator can access this view.

Common users can access the view only after being authorized. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 12-429 V$GLOBAL_TRANSACTION columns

Name	Type	Description
formatid	numeric	Global transaction format identifier. Not supported. Set it to **NULL**.
globalid	raw	Global transaction identifier.
branchid	raw	Global transaction branch identifier. Not supported. Set it to **NULL**. Each individual transaction of a global transaction is called a branch.
branches	numeric	Total number of global transaction branches.
refcount	numeric	Number of siblings for the global transaction (must be the same as branches).
preparecount	numeric	Number of prepared global transaction branches. If the value of **system_view_version** is greater than **0** and no prepared global transaction branch exists, the value is **0**. Otherwise, the value is **NULL**.
state	character varying(38)	Status of the global transaction branch.
flags	numeric	Numeric representation of the status.
coupling	character varying(15)	Indicates whether the branch is free (`FREE`), loosely coupled (`LOOSELY COUPLED`), or tightly coupled (TIGHTLY COUPLED). Not supported. Set it to **NULL**.
con_id	numeric	ID of the container related to data. Not supported. Set it to **0**.

12.3.12.203 V$LOCK

V$LOCK displays information about locks held by open transactions. By default, only the system administrator can access the system view. Common users must be authorized to access the system view. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 12-430 V$LOCK columns

Name	Type	Description
addr	raw	Not supported. Set it to **NULL**.

Name	Type	Description
kaddr	raw	Not supported. Set it to **NULL**.
sid	number	ID of the session that owns the lock.
type	varchar(2)	TM or TX. • TM: corresponding relation lock in pg_locks. • TX: other locks.
id1	number	• TM lock: **relationId** corresponding to the object ID. • TX lock: not supported. Set to **0**.
id2	number	• TM lock: The default value is **0**. • TX lock: not supported. Set to **0**.
lmode	number	For details, see **Table 12-431**.
request	number	For details, see **Table 12-431**.
ctime	number	Not supported. Set it to **NULL**.
block	number	Specifies whether it is blocked by other sessions. The value **1** indicates yes, and the value **0** indicates no.
con_id	number	Not supported. Set it to **NULL**.
blocksid	bigint	ID of another thread blocked by the current thread.

Table 12-431 Lock mode

Level	GaussDB
-	NULL
0	INVALID
1	AccessShare
2	RowShare
3	RowExclusive
4	ShareUpdateExclusive
5	Share
6	ShareRowExclusive
7	Exclusive
8	AccessExclusive

12.3.12.204 V$NLS_PARAMETERS

V$NLS_PARAMETERS displays the National Language Support (NLS) parameters and parameter values configured for the database. This view exists in the **PG_CATALOG** and **SYS** schemas and all users can access this view.

Table 12-432 V$NLS_PARAMETERS columns

Name	Type	Description
parameter	character varying(64)	NLS parameter name.
value	character varying(64)	NLS parameter value.
con_id	numeric	Not supported. Set it to **0**.

12.3.12.205 V$OPEN_CURSOR

V$OPEN_CURSOR displays information about cursors opened by all current sessions. By default, only the system administrator can access the system view. Common users must be authorized to access the system view. This view exists in both PG_CATALOG and SYS schema.

Table 12-433 V$OPEN_CURSOR columns

Name	Type	Description
saddr	raw	Not supported. Its value is **NULL**.
sid	numeric	Session ID.
user_name	character varying(128)	Username.
address	raw	Not supported. Its value is **NULL**.
hash_value	numeric	Not supported. Its value is **NULL**.
sql_id	character varying(13)	Query statement ID.
sql_text	character varying(60)	First 60 bytes of the SQL text of a cursor.
last_sql_active_time	timestamp(0) without time zone	Not supported. Its value is **NULL**.

Name	Type	Description
sql_exec_id	numeric	Not supported. Its value is **NULL**.
cursor_type	character varying(64)	Cursor type. • **OPEN-PL/SQL**: opened PL/SQL cursor. • **OPEN**: other open cursors.
child_address	raw	Not supported. Its value is **NULL**.
con_id	numeric	Not supported. Its value is **NULL**.

12.3.12.206 V$SESSION_WAIT

V$SESSION_WAIT stores the current wait event or the last wait event of each session of each user. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 12-434 V$SESSION_WAIT columns

Name	Type	Description
sid	numeric	Session ID, which is mapped to the **V$SESSION.SID** column.
seq#	numeric	Not supported. Set it to **NULL**.
event	character varying(64)	If the session is waiting, the resource or event that is waiting for is displayed. If the session is not waiting, the resource or event that is waiting for the last time is displayed.
p1text	character varying(64)	Not supported. Set it to **NULL**.
p1	numeric	Not supported. Set it to **NULL**.
p1raw	raw	Not supported. Set it to **NULL**.
p2text	character varying(64)	Not supported. Set it to **NULL**.
p2	numeric	Not supported. Set it to **NULL**.
p2raw	raw	Not supported. Set it to **NULL**.
p3text	character varying(64)	Not supported. Set it to **NULL**.
p3	numeric	Not supported. Set it to **NULL**.

Name	Type	Description
p3raw	raw	Not supported. Set it to **NULL**.
wait_class_id	numeric	Not supported. Set it to **NULL**.
wait_class#	numeric	Not supported. Set it to **NULL**.
wait_class	character varying(64)	Name of a wait event type
wait_time	numeric	If the session is waiting, the value is **0**. If the session is not waiting, the options are as follows: ● >0: duration of the last wait (unit: centisecond). ● **-1**: The duration of the last wait is less than a centisecond. ● **-2**: The **TIMED_STATISTICS** parameter is set to **false**. This column has been deprecated and replaced by **WAIT_TIME_MICRO** and **STATE**.
seconds_in_wait	numeric	If the session is waiting, the value is the amount of time to wait. If the session is not waiting, the value is the amount of time since the last wait started. This column has been deprecated and replaced by the **WAIT_TIME_MICRO** and **TIME_SINCE_LAST_WAIT_MICRO** columns.
state	character varying(19)	Waiting state. The options are as follows: ● **WAITING**: The session is waiting. ● **WAITED UNKNOWN TIME**: The duration of the last wait is unknown. This value is used when **TIMED_STATISTICS** is set to **false**. ● **WAITED SHORT TIME**: The duration of the last wait is less than a centisecond. ● **WAITED KNOWN TIME**: duration of the last wait specified in the **WAIT_TIME** column.
wait_time_micro	numeric	Wait time, in microseconds. If the session is waiting, the value is the time spent in the current wait. If the session is not waiting, the value is the time spent for the last wait.
time_remaining_micro	numeric	Not supported. Set it to **NULL**.

Name	Type	Description
time_since_last_wait_micro	numeric	Time elapsed since the last wait ended, in microseconds. If the session is waiting, the value is **0**.
con_id	numeric	Not supported. Set it to **0**.

12.3.12.207 V$SYSSTAT

V$SYSSTAT displays the resource usage of the entire database instance since the database instance starts to run. By default, only the initial user or monitoring administrator can access the database. Other users can access the database only after being granted the MONADMIN permission. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 12-435 V$SYSSTAT columns

Name	Type	Description
statistic#	numeric	Statistics ID.
name	character varying(64)	Statistical item name.
class	numeric	Not supported. Set it to **NULL**.
value	numeric	Statistical item value.
stat_id	numeric	Not supported. Set it to **NULL**.
con_id	numeric	Not supported. Set it to **0**.

12.3.12.208 V$SYSTEM_EVENT

V$SYSTEM_EVENT displays information about all the wait events (summary of each wait event since the instance is started). By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 12-436 V$SYSTEM_EVENT columns

Name	Type	Description
event	character varying(64)	Wait event name
total_waits	numeric	Total number of wait events
total_timeouts	numeric	Total number of timeout events

Name	Type	Description
time_waited	numeric	Total time (in centiseconds) of wait events
average_wait	numeric	Average time (in centiseconds) of wait events
time_waited_micro	numeric	Total time (in microseconds) of wait events
total_waits_fg	numeric	Not supported. Set it to **NULL**.
total_timeouts_fg	numeric	Not supported. Set it to **NULL**.
time_waited_fg	numeric	Not supported. Set it to **NULL**.
average_wait_fg	numeric	Not supported. Set it to **NULL**.
time_waited_micro_fg	numeric	Not supported. Set it to **NULL**.
event_id	numeric	Not supported. Set it to **NULL**.
wait_class_id	numeric	Not supported. Set it to **NULL**.
wait_class#	numeric	Not supported. Set it to **NULL**.
wait_class	character varying(64)	Class name of a wait event
con_id	numeric	Not supported. Set it to **0**.

12.3.12.209 V$VERSION

V$VERSION displays the version number of the database. This view exists in the **PG_CATALOG** and **SYS** schemas and all users can access this view.

Table 12-437 V$VERSION columns

Name	Type	Description
banner	character varying(80)	Component name and version number
banner_full	character varying(160)	Database version and specific version number
banner_legacy	character varying(80)	Database version
con_id	numeric	Not supported. Set it to **0**.

12.4 Discarded

The following centralized system catalogs and views have been discarded in the latest version.

12.4.1 System Views

12.4.1.1 GET_GLOBAL_PREPARED_XACTS

This view is not supported in the centralized system.

12.4.1.2 GS_CLUSTER_RESOURCE_INFO

This view is not supported in the centralized system.

12.4.1.3 GS_WLM_WORKLOAD_RECORDS

This view is not supported in the centralized system.

13 Schemas

Table 13-1 describes the schemas of GaussDB.

NOTE

Do not create service data of users in a schema that provides functional interfaces, including but not limited to tables and functions (such as dbe_* and pkg_*).

Table 13-1 Schemas supported by GaussDB

Schema	Description
blockchain	Stores the user history table that is automatically created when a tamper-proof table is created in the ledger database.
db4ai	Manages data of different versions in AI training.
dbe_perf	Diagnoses performance issues and is also the data source of WDR snapshots. After a database is installed, only the initial user and monitoring administrator have permission to view views and functions in this schema by default.
dbe_pldebugger	Debugs PL/SQL functions and stored procedures.
snapshot	Manages data related to WDR snapshots. By default, the initial user or monitoring administrator can access the data.
sqladvisor	Is used for distribution key recommendation and is unavailable in centralized deployment.
sys	Provides the system information view APIs.
pg_catalog	Maintains system catalog information, including system catalogs and all built-in data types, functions, and operators.
pg_toast	Stores large objects (for internal use).

Schema	Description
public	Public schema, which is used to store public objects. If **search_path** is not specified and a schema with the same name exists, new tables (and other objects) are created in the schema by default. If no schema with the same name exists, new tables (and other objects) are automatically placed in this public schema.
pkg_service	Manages information about the package service.
pkg_util	Manages information about the package tool.
dbe_raw	Advanced function package dbe_raw, which is used to convert raw data, obtain substrings, and calculate the length.
dbe_session	Advanced function package dbe_session, which is used to set the value of a specified attribute and support user query and verification.
dbe_lob	Advanced function package dbe_lob, which is used to read, write, and copy large files (CLOB/BLOB).
dbe_match	Advanced function package dbe_match, which is used to compare character string similarity.
dbe_task	Advanced function package dbe_task, which is used to schedule job tasks, including submitting tasks, canceling tasks, synchronizing task status, and updating task information, so that the database can periodically execute specific tasks.
dbe_sql	Advanced function package dbe_sql, which is used to execute dynamic SQL statements and construct query and other commands during application running.
dbe_file	Advanced function package **dbe_file**, which is used to read, copy, write, delete, and rename external database files.
dbe_output	Advanced function package dbe_output, which is used to print output information.
dbe_random	Advanced function package dbe_random, which is used to generate random seeds and random numbers.
dbe_application_info	Advanced function package dbe_application_info, which is used for recording client information.
dbe_utility	Advanced function package **dbe_utility**, which is used to invoke the debugging tool in a stored procedure, for example, to print error stacks.

Schema	Description
dbe_scheduler	Advanced function package **dbe_scheduler**, which is used to create scheduled jobs and enable the database to periodically execute specified tasks through programs and schedules. You can also perform external database tasks by authorizing and providing certificates.
information_schema	Stores information about objects defined in the current database.
dbe_pldeveloper	Compiles and debugs user stored procedures.
dbe_xmlgen	Advanced function package **dbe_xmlgen**, which is used to convert query results into XML character strings.
dbe_stats	Advanced function package **dbe_stats**, which is used to manage statistics.
dbe_describe	Advanced function package **dbe_describe**, which is used to query parameter information about stored procedures or functions.
dbe_sql_util	SQL O&M function, including the O&M interface of SQL patches and plan management.

13.1 Information Schema

An information schema named INFORMATION_SCHEMA automatically exists in all databases. An information schema consists of a group of views that contain information about objects defined in the current database. The owner of this schema is the initial database user. However, all users have only the permission to use this schema and do not have the permission to create objects such as tables and functions.

Information schemas are compatible with PG, including constraint_table_usage, domain_constraints, domain_udt_usage, domains, enabled_roles, key_column_usage, parameters, referential_constraints, applicable_roles, administrable_role_authorizations, attributes, character_sets, check_constraint_routine_usage, check_constraints, collations, collation_character_set_applicability, column_domain_usage, column_privileges, column_udt_usage, columns, constraint_column_usage, role_column_grants, routine_privileges, role_routine_grants, routines, schemata, sequences, table_constraints, table_privileges, role_table_grants, tables, triggered_update_columns, triggers, udt_privileges, role_udt_grants, usage_privileges, role_usage_grants, user_defined_types, view_column_usage, view_routine_usage, view_table_usage, views, data_type_privileges, element_types, column_options, foreign_data_wrapper_options, foreign_data_wrappers, foreign_server_options, foreign_servers, foreign_table_options, foreign_tables, user_mapping_options, user_mappings, sql_features, sql_implementation_info, sql_languages, sql_packages, sql_parts, sql_sizing, and sql_sizing_profiles.

The following sections display only the views that are not listed in the preceding description.

13.1.1 _PG_FOREIGN_DATA_WRAPPERS

Displays information about a foreign-data wrapper, as shown in **Table 13-2**. Only the sysadmin user has the permission to view this view.

Table 13-2 _PG_FOREIGN_DATA_WRAPPERS columns

Name	Type	Description
oid	oid	OID of the foreign-data wrapper
fdwowner	oid	OID of the owner of the foreign-data wrapper
fdwoptions	text[]	Foreign-data wrapper specific option, expressed in a string in the format of *keyword*=*value*
foreign_data_wrapper_catalog	information_schema.sql_identifier	Name of the database where the foreign-data wrapper is located (always the current database)
foreign_data_wrapper_name	information_schema.sql_identifier	Name of the foreign-data wrapper
authorization_identifier	information_schema.sql_identifier	Role of the owner of the foreign-data wrapper
foreign_data_wrapper_language	information_schema.character_data	Programming language of the foreign-data wrapper

13.1.2 _PG_FOREIGN_SERVERS

Displays information about a foreign server, as described in **Table 13-3**. Only the sysadmin user has the permission to view this view.

Table 13-3 _PG_FOREIGN_SERVERS columns

Name	Type	Description
oid	oid	OID of the foreign server
srvoptions	text[]	Foreign server specific options, expressed in a string in the format of *keyword*=*value*

Name	Type	Description
foreign_server_catalog	information_schema.sql_identifier	Name of the database where the foreign server is located (always the current database)
foreign_server_name	information_schema.sql_identifier	Name of the foreign server
foreign_data_wrapper_catalog	information_schema.sql_identifier	Name of the database where the foreign-data wrapper is located (always the current database)
foreign_data_wrapper_name	information_schema.sql_identifier	Name of the foreign-data wrapper
foreign_server_type	information_schema.character_data	Type of the foreign server
foreign_server_version	information_schema.character_data	Version of the foreign server
authorization_identifier	information_schema.sql_identifier	Role of the owner of the foreign server

13.1.3 _PG_FOREIGN_TABLE_COLUMNS

Displays column information about a foreign table, as described in **Table 13-4**. Only the sysadmin user has the permission to view this view.

Table 13-4 _PG_FOREIGN_TABLE_COLUMNS columns

Name	Type	Description
nspname	name	Schema name
relname	name	Table name
attname	name	Column name
attfdwoptions	text[]	Attribute-level foreign data wrapper options, expressed in a string in the format of *keyword=value*

13.1.4 _PG_FOREIGN_TABLES

Stores information about all foreign tables defined in the current database, as described in **Table 13-5**, whereas displays information about foreign tables

accessible to the current user. Only the sysadmin user has the permission to view this view.

Table 13-5 _PG_FOREIGN_TABLES columns

Name	Type	Description
foreign_table_catalog	information_schema.sql_identifier	Name of the database where the foreign table is located (always the current database)
foreign_table_schema	name	Name of the schema that the foreign table is in
foreign_table_name	name	Name of the foreign table
ftoptions	text[]	Foreign table options
foreign_server_catalog	information_schema.sql_identifier	Name of the database where the foreign server is located (always the current database)
foreign_server_name	information_schema.sql_identifier	Name of the foreign server
authorization_identifier	information_schema.sql_identifier	Role of the owner

13.1.5 _PG_USER_MAPPINGS

Stores mappings from local users to remote users, as described in **Table 13-6**. Only the **sysadmin** user has the permission to view this view.

Table 13-6 _PG_USER_MAPPINGS columns

Name	Type	Description
oid	oid	OID of the mapping from the local user to a remote user
umoptions	text[]	User mapping specific options, expressed in a string in the format of *keyword*=*value*.
umuser	oid	OID of the local user being mapped (**0** if the user mapping is public).
authorization_identifier	information_schema.sql_identifier	Role of the local user.

Name	Type	Description
foreign_server_catalog	information_schema.sql_identifier	Name of the database where the foreign server is located (always the current database)
foreign_server_name	information_schema.sql_identifier	Name of the foreign server.
srvowner	information_schema.sql_identifier	Owner of the foreign server.

13.1.6 INFORMATION_SCHEMA_CATALOG_NAME

Displays the name of the current database, as described in **Table 13-7**.

Table 13-7 INFORMATION_SCHEMA_CATALOG_NAME columns

Name	Type	Description
catalog_name	information_schema.sql_identifier	Current database name.

13.2 DBE_PERF Schema

In the DBE_PERF schema, views are used to diagnose performance issues and are also the data source of WDR snapshots. After the database is installed, only the initial user and monitoring administrator have the permission for the DBE_PERF schema by default. To ensure forward compatibility, the permission on the DBE_PERF schema has no change before and after an upgrade. In the current version, all users are not allowed to create operators in this schema. Existing operators are not affected. Organization views are divided based on multiple dimensions, such as OS, instance, and memory. These views comply with the following naming rules:

- Views starting with **GLOBAL_**: Request data from database nodes and return the data without processing them.
- Views starting with **SUMMARY_**: Summarize data in the database. In most cases, data from database nodes (sometimes only the primary database node) is processed and collected.
- Views that do not start with **GLOBAL_** or **SUMMARY_**: Local views that do not request data from other database nodes.

13.2.1 OS

13.2.1.1 OS_RUNTIME

Displays the running status of the current OS, as shown in **Table 13-8**.

Table 13-8 OS_RUNTIME columns

Name	Type	Description
id	integer	ID.
name	text	Name of the OS running status.
value	numeric	Value of the OS running status.
comments	text	Remarks of the OS running status.
cumulative	boolean	Specifies whether the value of the OS running status is cumulative.

13.2.1.2 GLOBAL_OS_RUNTIME

Provides OS running status information about all normal nodes in the database, as shown in **Table 13-9**.

Table 13-9 GLOBAL_OS_RUNTIME columns

Name	Type	Description
node_name	name	Node name
id	integer	ID
name	text	Name of the OS running status
value	numeric	Value of the OS running status
comments	text	Remarks of the OS running status
cumulative	boolean	Whether the value of the OS running status is cumulative

13.2.1.3 OS_THREADS

Provides status information about all threads on the current node, as shown in **Table 13-10**.

Table 13-10 OS_THREADS columns

Name	Type	Description
node_name	text	Name of the current node.
pid	bigint	ID of the thread running under the current node process.

Name	Type	Description
lwpid	integer	Lightweight thread ID corresponding to **pid**.
thread_name	text	Name of the thread corresponding to **pid**.
creation_time	timestamp with time zone	Creation time of the thread corresponding to **pid**.

13.2.1.4 GLOBAL_OS_THREADS

Provides status information about threads on all normal nodes in the database, as shown in **Table 13-11**.

Table 13-11 GLOBAL_OS_THREADS columns

Name	Type	Description
node_name	text	Node name
pid	bigint	ID of the thread running under the current node process
lwpid	integer	Lightweight thread ID corresponding to **pid**
thread_name	text	Name of the thread corresponding to **pid**
creation_time	timestamp with time zone	Creation time of the thread corresponding to **pid**

13.2.1.5 NODE_NAME

Provides the names of all normal nodes in the database, as shown in **Table 13-12**.

Table 13-12 NODE_NAME columns

Name	Type	Description
node_name	name	Node name

13.2.1.6 PERF_QUERY

Provides the name, tree structure, and percentage of the stack information collected on the current node, as shown in **Table 13-13**. The sysadmin or monadmin permission is required.

Table 13-13 PERF_QUERY columns

Name	Type	Description
backtrace	text	Text of the stack information tree structure.
overhead	double precision	Percentage of the time occupied by the current stack information in the entire stack collection process.

13.2.2 Instance

13.2.2.1 INSTANCE_TIME

Provides various time consumption information under the current database node, as shown in **Table 13-14**.

Table 13-14 INSTANCE_TIME columns

Name	Type	Description
stat_id	integer	Statistics ID
stat_name	text	Type name • DB_TIME: effective time spent by jobs in multi-core scenarios • CPU_TIME: CPU time cost. • EXECUTION_TIME: time spent in the executor. • PARSE_TIME: time spent on parsing SQL statements • PLAN_TIME: time spent on generating plans • REWRITE_TIME: time spent on rewriting SQL statements • PL_EXECUTION_TIME: execution time of the PL/SQL stored procedure • PL_COMPILATION_TIME: compilation time of the PL/SQL stored procedure • NET_SEND_TIME: time spent on the network • DATA_IO_TIME: time spent on I/Os.
value	bigint	Time value (unit: μs)

13.2.2.2 GLOBAL_INSTANCE_TIME

Provides various time consumption information under all normal nodes in the database, as shown in **Table 13-15**.

Table 13-15 GLOBAL_INSTANCE_TIME columns

Name	Type	Description
node_name	name	Node name
stat_id	integer	Statistics ID
stat_name	text	Type name. See the INSTANCE_TIME view.
value	bigint	Duration (unit: μs)

13.2.3 Memory

13.2.3.1 GLOBAL_MEMORY_NODE_DETAIL

Displays the memory usage of all normal nodes in the database, as shown in **Table 13-16**.

Table 13-16 GLOBAL_MEMORY_NODE_DETAIL columns

Name	Type	Description
nodename	text	Node name

Name	Type	Description
memorytype	text	Memory name. • **max_process_memory**: maximum available memory of the database node. • **process_used_memory**: memory occupied by a process • **max_dynamic_memory**: maximum dynamic memory • **dynamic_used_memory**: used dynamic memory • **dynamic_peak_memory**: dynamic peak value of the memory • **dynamic_used_shrctx**: context of the used dynamic shared memory. • **dynamic_peak_shrctx**: dynamic peak value of the shared memory context • **max_shared_memory**: maximum shared memory • **shared_used_memory**: used shared memory • **max_sctpcomm_memory**: maximum memory allowed for TCP proxy communication • **sctpcomm_used_memory**: used memory for TCP proxy communication • **sctpcomm_peak_memory**: peak memory of TCP proxy communication • **other_used_memory**: other used memory • **gpu_max_dynamic_memory**: maximum dynamic GPU memory • **gpu_dynamic_used_memory**: used dynamic GPU memory • **gpu_dynamic_peak_memory**: dynamic peak GPU memory • **pooler_conn_memory**: applied memory in the connection pool • **pooler_freeconn_memory**: memory occupied by idle connections in the connection pool • **storage_compress_memory**: memory used by the storage module for compression • **udf_reserved_memory**: reserved memory for the UDF
memorymbytes	integer	Size of the used memory in the unit of MB.

13.2.3.2 GLOBAL_SHARED_MEMORY_DETAIL

Displays the usage of shared memory contexts on all normal nodes in the database, as shown in **Table 13-17**.

Table 13-17 GLOBAL_SHARED_MEMORY_DETAIL columns

Name	Type	Description
node_name	name	Node name
contextname	text	Name of the memory context
level	smallint	Level of the memory context
parent	text	Name of the parent memory context
totalsize	bigint	Total size of the shared memory (unit: byte)
freesize	bigint	Remaining size of the shared memory (unit: byte)
usedsize	bigint	Used size of the shared memory (unit: byte)

13.2.3.3 MEMORY_NODE_DETAIL

Displays memory usage of a node in the database, as shown in **Table 13-18**.

Table 13-18 MEMORY_NODE_DETAIL columns

Name	Type	Description
nodename	text	Node name

Name	Type	Description
memorytype	text	Memory name • **max_process_memory**: maximum available memory of the database node. • **process_used_memory**: memory occupied by a process • **max_dynamic_memory**: maximum dynamic memory • **dynamic_used_memory**: used dynamic memory • **dynamic_peak_memory**: dynamic peak value of the memory • **dynamic_used_shrctx**: context of the used dynamic shared memory. • **dynamic_peak_shrctx**: dynamic peak value of the shared memory context • **max_shared_memory**: maximum shared memory • **shared_used_memory**: used shared memory • **max_sctpcomm_memory**: maximum memory allowed for TCP proxy communication • **sctpcomm_used_memory**: used memory for TCP proxy communication • **sctpcomm_peak_memory**: memory peak of TCP proxy communication • **other_used_memory**: other used memory • **gpu_max_dynamic_memory**: maximum dynamic GPU memory • **gpu_dynamic_used_memory**: used dynamic memory of GPU • **gpu_dynamic_peak_memory**: dynamic peak value of the GPU memory • **pooler_conn_memory**: applied memory in the connection pool • **pooler_freeconn_memory**: memory occupied by idle connections in the connection pool • **storage_compress_memory**: memory used by the storage module for compression • **udf_reserved_memory**: reserved memory for the UDF
memorymbytes	integer	Size of the used memory in the unit of MB.

13.2.3.4 SHARED_MEMORY_DETAIL

Displays the usage information about shared memory contexts on the current node, as shown in **Table 13-19**.

Table 13-19 Table 1 SHARED_MEMORY_DETAIL columns

Name	Type	Description
contextname	text	Name of the memory context
level	smallint	Level of the memory context
parent	text	Name of the parent memory context
totalsize	bigint	Total size of the shared memory (unit: byte)
freesize	bigint	Remaining size of the shared memory (unit: byte)
usedsize	bigint	Used size of the shared memory (unit: byte)

13.2.4 File

13.2.4.1 FILE_IOSTAT

Records statistics about data file I/Os to indicate I/O performance and detect performance problems such as abnormal I/O operations, as shown in **Table 13-20**.

Table 13-20 FILE_IOSTAT columns

Name	Type	Description
filenum	oid	File identifier
dbid	oid	Database ID
spcid	oid	Tablespace ID
phyrds	bigint	Number of times of reading physical files
phywrts	bigint	Number of times of writing into physical files
phyblkrd	bigint	Number of times of reading physical file blocks
phyblkwrt	bigint	Number of times of writing into physical file blocks

Name	Type	Description
readtim	bigint	Total duration of reading (unit: μs)
writetim	bigint	Total duration of writing (unit: μs)
avgiotim	bigint	Average duration of reading and writing (unit: μs)
lstiotim	bigint	Duration of the last file reading (unit: μs)
miniotim	bigint	Minimum duration of reading and writing (unit: μs)
maxiowtm	bigint	Maximum duration of reading and writing (unit: μs)

13.2.4.2 SUMMARY_FILE_IOSTAT

Records statistics about data file I/Os in the database to indicate I/O performance and detect performance problems such as abnormal I/O operations, as shown in **Table 13-21**.

The values of **phyrds**, **phywrts**, **phyblkrd**, **phyblkwrt**, **readtim** and **writetim** are summed up based on the data of each node. **avgiotim** is the average value (total duration/total times) of each node. **lstiotim** and **maxiowtm** are the maximum values of each node. **miniotim** is the minimum value of each node.

Table 13-21 SUMMARY_FILE_IOSTAT columns

Name	Type	Description
filenum	oid	File ID
dbid	oid	Database ID
spcid	oid	Tablespace ID
phyrds	numeric	Number of times of reading physical files
phywrts	numeric	Number of times of writing into physical files
phyblkrd	numeric	Number of times of reading physical file blocks
phyblkwrt	numeric	Number of times of writing into physical file blocks
readtim	numeric	Total duration of reading (unit: μs)
writetim	numeric	Total duration of writing (unit: μs)

Name	Type	Description
avgiotim	bigint	Average duration of reading and writing (unit: μs)
lstiotim	bigint	Duration of the last file reading (unit: μs)
miniotim	bigint	Minimum duration of reading and writing (unit: μs)
maxiowtm	bigint	Maximum duration of reading and writing (unit: μs)

13.2.4.3 GLOBAL_FILE_IOSTAT

Displays the data file I/O statistics of all nodes in the database, as described in Table 13-22.

Table 13-22 GLOBAL_FILE_IOSTAT columns

Name	Type	Description
node_name	name	Node name.
filenum	oid	File ID.
dbid	oid	Database ID.
spcid	oid	Tablespace ID.
phyrds	bigint	Number of times of reading physical files.
phywrts	bigint	Number of times of writing into physical files.
phyblkrd	bigint	Number of times of reading physical file blocks.
phyblkwrt	bigint	Number of times of writing into physical file blocks.
readtim	bigint	Total duration of reading (unit: μs).
writetim	bigint	Total duration of writing (unit: μs).
avgiotim	bigint	Average duration of reading and writing (unit: μs).
lstiotim	bigint	Duration of the last file reading (unit: μs).
miniotim	bigint	Minimum duration of reading and writing (unit: μs).

Name	Type	Description
maxiowtm	bigint	Maximum duration of reading and writing (unit: μs).

13.2.4.4 FILE_REDO_IOSTAT

Records statistics about redo logs (WALs) on the current node, as shown in **Table 13-23**.

Table 13-23 FILE_REDO_IOSTAT columns

Name	Type	Description
phywrts	bigint	Number of times writing into the WAL buffer
phyblkwrt	bigint	Number of blocks written into the WAL buffer
writetim	bigint	Duration of writing into Xlog files (unit: μs)
avgiotim	bigint	Average duration of writing into Xlog files (unit: μs). **avgiotim** = **writetim**/ **phywrts**
lstiotim	bigint	Duration of the last writing into Xlog files (unit: μs)
miniotim	bigint	Minimum duration of writing into Xlog files (unit: μs)
maxiowtm	bigint	Maximum duration of writing into Xlog files (unit: μs)

13.2.4.5 SUMMARY_FILE_REDO_IOSTAT

Records redo log (WAL) statistics of all nodes in the database, as shown in **Table 13-24**. The values of **phywrts**, **phyblkwrt**, and **writetim** are summed up based on the data of each node. **avgiotim** is the average value (summed up **writetim** or **phywrts**) of each node. **lstiotim** and **maxiowtm** are the maximum values of each node. **miniotim** is the minimum value of each node.

Table 13-24 SUMMARY_FILE_REDO_IOSTAT columns

Name	Type	Description
phywrts	numeric	Number of times writing into the WAL buffer

Name	Type	Description
phyblkwrt	numeric	Number of blocks written into the WAL buffer
writetim	numeric	Duration of writing into Xlog files (unit: μs)
avgiotim	bigint	Average duration of writing into Xlog files (unit: μs). **avgiotim** = **writetim**/**phywrts**
lstiotim	bigint	Duration of the last writing into Xlog files (unit: μs)
miniotim	bigint	Minimum duration of writing into Xlog files (unit: μs)
maxiowtm	bigint	Maximum duration of writing into Xlog files (unit: μs)

13.2.4.6 GLOBAL_FILE_REDO_IOSTAT

Displays statistics about redo logs (WALs) on nodes in the database, as shown in **Table 13-25**.

Table 13-25 GLOBAL_FILE_REDO_IOSTAT columns

Name	Type	Description
node_name	name	Node name
phywrts	bigint	Number of times writing into the WAL buffer
phyblkwrt	bigint	Number of blocks written into the WAL buffer
writetim	bigint	Duration of writing into Xlog files (unit: μs)
avgiotim	bigint	Average duration of writing into Xlog files (unit: μs). **avgiotim** = **writetim**/**phywrts**
lstiotim	bigint	Duration of the last writing into Xlog files (unit: μs)
miniotim	bigint	Minimum duration of writing into Xlog files (unit: μs)
maxiowtm	bigint	Maximum duration of writing into Xlog files (unit: μs)

13.2.4.7 LOCAL_REL_IOSTAT

Displays the accumulated I/O status of all data files on the current node, as shown in **Table 13-26**.

Table 13-26 LOCAL_REL_IOSTAT columns

Name	Type	Description
phyrds	bigint	Number of times of reading physical files
phywrts	bigint	Number of times of writing into physical files
phyblkrd	bigint	Number of times of reading physical file blocks
phyblkwrt	bigint	Number of times of writing into physical file blocks

13.2.4.8 GLOBAL_REL_IOSTAT

Displays statistics about data file I/Os on all nodes, as shown in **Table 13-27**.

Table 13-27 GLOBAL_REL_IOSTAT columns

Name	Type	Description
node_name	name	Node name
phyrds	bigint	Number of times of reading physical files
phywrts	bigint	Number of times of writing into physical files
phyblkrd	bigint	Number of times of reading physical file blocks
phyblkwrt	bigint	Number of times of writing into physical file blocks

13.2.4.9 SUMMARY_REL_IOSTAT

Obtains statistics about data file I/Os on all nodes, as shown in **Table 13-28**.

Table 13-28 SUMMARY_REL_IOSTAT columns

Name	Type	Description
phyrds	numeric	Number of times of reading physical files
phywrts	numeric	Number of times of writing into physical files
phyblkrd	numeric	Number of times of reading physical file blocks
phyblkwrt	numeric	Number of times of writing into physical file blocks

13.2.5 Object

13.2.5.1 STAT_USER_TABLES

Displays the status information about user-defined ordinary tables in all schemas on the current node, as described in **Table 13-29**.

Table 13-29 STAT_USER_TABLES columns

Name	Type	Description
relid	oid	OID of the table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.

Name	Type	Description
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting **VACUUM FULL**).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times that the table has been manually vacuumed (not counting **VACUUM FULL**).
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times the table has been manually analyzed.
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.5.2 SUMMARY_STAT_USER_TABLES

Displays the sum of the status information about user-defined ordinary tables in all schemas on each database node, as described in **Table 13-30**. The timestamp column is not summed up and only the latest value of this column on all nodes is used.

Table 13-30 SUMMARY_STAT_USER_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on this table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	numeric	Estimated number of live rows.
n_dead_tup	numeric	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting **VACUUM FULL**).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time when the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	numeric	Number of times that the table has been manually vacuumed (not counting **VACUUM FULL**).
autovacuum_count	numeric	Number of times that the table has been vacuumed by the autovacuum daemon.

Name	Type	Description
analyze_count	numeric	Number of times that the table has been manually analyzed.
autoanalyze_count	numeric	Number of times that the table has been analyzed by the autovacuum daemon thread.

13.2.5.3 GLOBAL_STAT_USER_TABLES

Displays the status information (not summed up) about user-defined common tables in all schemas on each database node, as described in **Table 13-31**.

Table 13-31 GLOBAL_STAT_USER_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on this table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.

Name	Type	Description
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting **VACUUM FULL**).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times that the table has been manually vacuumed (not counting **VACUUM FULL**).
autovacuum_count	bigint	Number of times that the table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times that the table has been manually analyzed.
autoanalyze_count	bigint	Number of times that the table has been analyzed by the autovacuum daemon thread.

13.2.5.4 STAT_USER_INDEXES

Displays the index status information about the user-defined ordinary tables on the current node, as shown in **Table 13-32**.

Table 13-32 STAT_USER_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.

Name	Type	Description
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.5.5 SUMMARY_STAT_USER_INDEXES

Displays the sum of the index status information about user-defined ordinary tables in all schemas on each database node, as described in **Table 13-33**.

Table 13-33 SUMMARY_STAT_USER_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	numeric	Number of index scans performed on the index.
idx_tup_read	numeric	Number of index entries returned by scans on the index.
idx_tup_fetch	numeric	Number of active rows fetched in the original table by a simple index scan that uses the index.

13.2.5.6 GLOBAL_STAT_USER_INDEXES

Displays the index status information about user-defined common tables in all schemas on each database node, as described in **Table 13-34**. Data on different nodes is not summed up.

Table 13-34 GLOBAL_STAT_USER_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.

Name	Type	Description
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of active rows fetched in the original table by a simple index scan that uses the index.

13.2.5.7 STAT_SYS_TABLES

Displays status information about all the system catalogs in the pg_catalog, information_schema, and pg_toast schemas on the current node, as described in **Table 13-35**.

Table 13-35 STAT_SYS_TABLES columns

Name	Type	Description
relid	oid	OID of the table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.

Name	Type	Description
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting **VACUUM FULL**).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times that the table has been manually vacuumed (not counting **VACUUM FULL**).
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times the table has been manually analyzed.
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.5.8 SUMMARY_STAT_SYS_TABLES

Displays the sum of the status information in all system catalogs on each node in pg_catalog, information_schema, and pg_toast schemas. The status information in the system catalogs on each node is summed up, as described in **Table 13-36**. Columns of the timestamp type are not summed up, and only the latest values of these columns on all nodes are used.

Table 13-36 SUMMARY_STAT_SYS_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on this table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	numeric	Estimated number of live rows.
n_dead_tup	numeric	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting **VACUUM FULL**).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time when the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	numeric	Number of times that the table has been manually vacuumed (not counting **VACUUM FULL**).
autovacuum_count	numeric	Number of times that the table has been vacuumed by the autovacuum daemon.

Name	Type	Description
analyze_count	numeric	Number of times that the table has been manually analyzed.
autoanalyze_count	numeric	Number of times that the table has been analyzed by the autovacuum daemon thread.

13.2.5.9 GLOBAL_STAT_SYS_TABLES

Displays the status information about all system catalogs in pg_catalog, information_schema, and pg_toast schemas on each database node, as described in **Table 13-37**. Data on different nodes is not summed up.

Table 13-37 GLOBAL_STAT_SYS_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on this table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.

Name	Type	Description
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting **VACUUM FULL**).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time when the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times that the table has been manually vacuumed (not counting **VACUUM FULL**).
autovacuum_count	bigint	Number of times that the table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times that the table has been manually analyzed.
autoanalyze_count	bigint	Number of times that the table has been analyzed by the autovacuum daemon thread.

13.2.5.10 STAT_SYS_INDEXES

Displays index status information about all the system catalogs in the pg_catalog, information_schema, and pg_toast schemas, as shown in **Table 13-38**.

Table 13-38 STAT_SYS_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.

Name	Type	Description
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.5.11 SUMMARY_STAT_SYS_INDEXES

Displays the summary of the index status information of all system catalogs in the pg_catalog, information_schema, and pg_toast schemas on each database node, as shown in **Table 13-39**.

Table 13-39 SUMMARY_STAT_SYS_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	numeric	Number of index scans performed on the index.
idx_tup_read	numeric	Number of index entries returned by scans on the index.
idx_tup_fetch	numeric	Number of live rows fetched in the original table by a simple index scan that uses the index.

13.2.5.12 GLOBAL_STAT_SYS_INDEXES

Displays the index status information about all system catalogs in the pg_catalog, information_schema, and pg_toast schemas on each database node, as shown in **Table 13-40**. Data on different nodes is not summed up.

Table 13-40 GLOBAL_STAT_SYS_INDEXES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the table for this index
indexrelid	oid	OID of the index.

Name	Type	Description
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

13.2.5.13 STAT_ALL_TABLES

Displays the status of each table (including the TOAST table) on the current node of the database, as described in **Table 13-41**.

Table 13-41 STAT_ALL_TABLES columns

Name	Type	Description
relid	oid	OID of the table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).

Name	Type	Description
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting **VACUUM FULL**).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times that the table has been manually vacuumed (not counting **VACUUM FULL**).
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times the table has been manually analyzed.
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.5.14 SUMMARY_STAT_ALL_TABLES

Displays the sum of the status information of each table (including the TOAST table) on each node of the database, as described in **Table 13-42**. The timestamp column is not summed up and only the latest value of this column on all nodes is used.

Table 13-42 SUMMARY_STAT_ALL_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.

Name	Type	Description
seq_scan	numeric	Number of sequential scans initiated on this table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	numeric	Estimated number of live rows.
n_dead_tup	numeric	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting **VACUUM FULL**).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time when the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	numeric	Number of times that the table has been manually vacuumed (not counting **VACUUM FULL**).
autovacuum_count	numeric	Number of times that the table has been vacuumed by the autovacuum daemon.
analyze_count	numeric	Number of times that the table has been manually analyzed.
autoanalyze_count	numeric	Number of times that the table has been analyzed by the autovacuum daemon thread.

Name	Type	Description
last_updated	timestamp with time zone	Time when the monitoring data of the table in the view is updated for the last time.

13.2.5.15 GLOBAL_STAT_ALL_TABLES

Displays the status of each table (including the TOAST table) on each node of the database, as described in **Table 13-43**. Data on different nodes is not summed up.

Table 13-43 GLOBAL_STAT_ALL_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on this table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting **VACUUM FULL**).

Name	Type	Description
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time when the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times that the table has been manually vacuumed (not counting **VACUUM FULL**).
autovacuum_count	bigint	Number of times that the table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times that the table has been manually analyzed.
autoanalyze_count	bigint	Number of times that the table has been analyzed by the autovacuum daemon thread.
last_updated	timestamp with time zone	Time when the monitoring data of the table in the view is updated for the last time.

13.2.5.16 STAT_ALL_INDEXES

Displays the access information about each index on the current node of the database, as shown in **Table 13-44**.

Table 13-44 STAT_ALL_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.

Name	Type	Description
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.5.17 SUMMARY_STAT_ALL_INDEXES

Displays the sum of the access information of each index on each database node, as described in **Table 13-45**. The timestamp column is not summed up and only the latest value of this column on all nodes is used.

Table 13-45 SUMMARY_STAT_ALL_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	numeric	Number of index scans performed on the index.
idx_tup_read	numeric	Number of index entries returned by scans on the index.
idx_tup_fetch	numeric	Number of active rows fetched in the original table by a simple index scan that uses the index.
last_updated	timestamp with time zone	Time when the monitoring data of the index in the view is updated for the last time.

13.2.5.18 GLOBAL_STAT_ALL_INDEXES

Displays the access information about each index on each node of the database, as described in **Table 13-46**. The status information of each index on each node is not summed up.

Table 13-46 GLOBAL_STAT_ALL_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table for this index.

Name	Type	Description
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of active rows fetched in the original table by a simple index scan that uses the index.
last_updated	timestamp with time zone	Time when the monitoring data of the index in the view is updated for the last time.

13.2.5.19 STAT_DATABASE

Displays the statistics of the current node in the database, as shown in **Table 13-47**.

Table 13-47 STAT_DATABASE columns

Name	Type	Description
datid	oid	OID of a database
datname	name	Database name
numbackends	integer	Number of backends currently connected to this database.
xact_commit	bigint	Number of transactions in this database that have been committed
xact_rollback	bigint	Number of transactions in this database that have been rolled back
blks_read	bigint	Number of disk blocks read in this database
blks_hit	bigint	Number of disk blocks that have been hit in the cache. In this case, data does not need to be read from disks. (The cache includes only the database buffer cache and does not include the file system cache of the OS.)

Name	Type	Description
tup_returned	bigint	Number of live rows fetched by sequential scans and number of index rows returned by index scans in the database.
tup_fetched	bigint	Number of rows returned by the current database through indexes.
tup_inserted	bigint	Number of rows inserted.
tup_updated	bigint	Number of rows updated.
tup_deleted	bigint	Number of rows deleted.
conflicts	bigint	Number of queries canceled due to conflicts with database replay (conflicts occur only on the standby node). For details, see **STAT_DATABASE_CONFLICTS**.
temp_files	bigint	Number of temporary files created by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter **log_temp_files**.
temp_bytes	bigint	Total amount of data written to temporary files by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter **log_temp_files**.
deadlocks	bigint	Number of deadlocks detected in this database
blk_read_time	double precision	Time spent reading data file blocks by backends in this database (unit: ms)
blk_write_time	double precision	Time spent reading data file blocks by backends in this database (unit: ms)
stats_reset	timestamp with time zone	Time at which the current statistics were reset

13.2.5.20 SUMMARY_STAT_DATABASE

Displays the summary of the status statistics of each database node, as described in **Table 13-48**. The timestamp column is not summed up and only the latest value of this column on all nodes is used.

Table 13-48 SUMMARY_STAT_DATABASE

Name	Type	Description
datname	name	Database name.
numbackends	bigint	Number of backends currently connected to this database.
xact_commit	numeric	Number of transactions in this database that have been committed.
xact_rollback	numeric	Number of transactions in this database that have been rolled back.
blks_read	numeric	Number of disk blocks read in this database.
blks_hit	numeric	Number of disk blocks that have been hit in the cache. In this case, data does not need to be read from disks. (The cache includes only the database buffer cache and does not include the file system cache of the OS.)
tup_returned	numeric	Number of live rows fetched by sequential scans and number of index rows returned by index scans in the database.
tup_fetched	numeric	Number of rows returned by the current database through indexes.
tup_inserted	bigint	Number of rows inserted.
tup_updated	bigint	Number of rows updated.
tup_deleted	bigint	Number of rows deleted.
conflicts	bigint	Number of queries canceled due to conflicts with database replay (conflicts occur only on the standby node). For details, see **STAT_DATABASE_CONFLICTS**.
temp_files	numeric	Number of temporary files created by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter **log_temp_files**.
temp_bytes	numeric	Total amount of data written to temporary files by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter **log_temp_files**.

Name	Type	Description
deadlocks	bigint	Number of deadlocks detected in this database.
blk_read_time	double precision	Time spent reading data file blocks by backends in this database (unit: ms).
blk_write_time	double precision	Time spent writing into data file blocks by backends in this database (unit: ms).
stats_reset	timestamp with time zone	Time at which the current statistics were reset.

13.2.5.21 GLOBAL_STAT_DATABASE

Displays the statistics of each database node, as shown in **Table 13-49**. The database status information on different nodes is not summed up.

Table 13-49 GLOBAL_STAT_DATABASE columns

Name	Type	Description
node_name	name	Node name.
datid	oid	OID of the database
datname	name	Name of the database
numbackends	integer	Number of backends currently connected to this database.
xact_commit	bigint	Number of transactions in this database that have been committed.
xact_rollback	bigint	Number of transactions in this database that have been rolled back.
blks_read	bigint	Number of disk blocks read in this database.
blks_hit	bigint	Number of disk blocks that have been hit in the cache. In this case, data does not need to be read from disks. (The cache includes only the database buffer cache and does not include the file system cache of the OS.)
tup_returned	bigint	Number of live rows fetched by sequential scans and number of index rows returned by index scans in the database.
tup_fetched	bigint	Number of rows returned by the current database through indexes.

Name	Type	Description
tup_inserted	bigint	Number of rows inserted.
tup_updated	bigint	Number of rows updated.
tup_deleted	bigint	Number of rows deleted.
conflicts	bigint	Number of queries canceled due to conflicts with database replay (conflicts occur only on the standby node). For details, see **STAT_DATABASE_CONFLICTS**.
temp_files	bigint	Number of temporary files created by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter **log_temp_files**.
temp_bytes	bigint	Total amount of data written to temporary files by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter **log_temp_files**.
deadlocks	bigint	Number of deadlocks detected in this database
blk_read_time	double precision	Time spent reading data file blocks by backends in this database (unit: ms)
blk_write_time	double precision	Time spent writing into data file blocks by backends in this database (unit: ms)
stats_reset	timestamp with time zone	Time at which the current statistics were reset

13.2.5.22 STAT_DATABASE_CONFLICTS

Displays statistics about the conflict status of the current database node, as shown in **Table 13-50**.

Table 13-50 STAT_DATABASE_CONFLICTS columns

Name	Type	Description
datid	oid	Database ID
datname	name	Database name
confl_tablespace	bigint	Number of conflicting tablespaces

Name	Type	Description
confl_lock	bigint	Number of conflicting locks
confl_snapshot	bigint	Number of conflicting snapshots
confl_bufferpin	bigint	Number of conflicting buffers
confl_deadlock	bigint	Number of conflicting deadlocks

13.2.5.23 SUMMARY_STAT_DATABASE_CONFLICTS

Displays the summay of the conflict status statistics of each node in the database, as shown in **Table 13-51**.

Table 13-51 SUMMARY_STAT_DATABASE_CONFLICTS columns

Name	Type	Description
datname	name	Database name
confl_tablespace	bigint	Number of conflicting tablespaces
confl_lock	bigint	Number of conflicting locks
confl_snapshot	bigint	Number of conflicting snapshots
confl_bufferpin	bigint	Number of conflicting buffers
confl_deadlock	bigint	Number of conflicting deadlocks

13.2.5.24 GLOBAL_STAT_DATABASE_CONFLICTS

Displays the conflict status statistics of each database node, as shown in **Table 13-52**. The status information of each database node is not summed up.

Table 13-52 GLOBAL_STAT_DATABASE_CONFLICTS columns

Name	Type	Description
node_name	name	Node name.
datid	oid	Database ID
datname	name	Database name
confl_tablespace	bigint	Number of conflicting tablespaces
confl_lock	bigint	Number of conflicting locks

Name	Type	Description
confl_snapshot	bigint	Number of conflicting snapshots
confl_bufferpin	bigint	Number of conflicting buffers
confl_deadlock	bigint	Number of conflicting deadlocks

13.2.5.25 STAT_XACT_ALL_TABLES

Displays transaction status information about all ordinary tables and TOAST tables in all schemas on the current node, as shown in **Table 13-53**.

Table 13-53 STAT_XACT_ALL_TABLES columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

13.2.5.26 SUMMARY_STAT_XACT_ALL_TABLES

Displays the summary of transaction status information about all ordinary tables and TOAST tables in all schemas of each database node, as shown in **Table 13-54**.

Table 13-54 SUMMARY_STAT_XACT_ALL_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on this table
seq_tup_read	numeric	Number of live rows fetched by sequential scans
idx_scan	numeric	Number of index scans initiated on the table
idx_tup_fetch	numeric	Number of live rows fetched by index scans
n_tup_ins	numeric	Number of rows inserted
n_tup_upd	numeric	Number of rows updated
n_tup_del	numeric	Number of rows deleted
n_tup_hot_upd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

13.2.5.27 GLOBAL_STAT_XACT_ALL_TABLES

Displays the transaction status information about all ordinary tables and TOAST tables in all schemas of each database node, as shown in **Table 13-55**. The transaction status information about tables on different nodes is not summed up.

Table 13-55 GLOBAL_STAT_XACT_ALL_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on this table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted

Name	Type	Description
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

13.2.5.28 STAT_XACT_SYS_TABLES

Displays transaction status information about the system catalogs in the schemas of the current node, as shown in **Table 13-56**.

Table 13-56 STAT_XACT_SYS_TABLES columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

13.2.5.29 SUMMARY_STAT_XACT_SYS_TABLES

Displays the summary of the transaction status information about system catalogs in all the schemas of each database node, as shown in **Table 13-57**.

Table 13-57 SUMMARY_STAT_XACT_SYS_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on this table
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

13.2.5.30 GLOBAL_STAT_XACT_SYS_TABLES

Displays the transaction status information about the system catalogs in all the schemas of each database node, as shown in **Table 13-58**. The transaction status information of the tables on different nodes is not summed up.

Table 13-58 GLOBAL_STAT_XACT_SYS_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	Table OID.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on this table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.

Name	Type	Description
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

13.2.5.31 STAT_XACT_USER_TABLES

Displays transaction status information about the user tables in schemas on the current node, as shown in **Table 13-59**.

Table 13-59 STAT_XACT_USER_TABLES columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

13.2.5.32 SUMMARY_STAT_XACT_USER_TABLES

Displays the summary of the transaction status information about user tables in all the schemas of each database node, as shown in **Table 13-60**.

Table 13-60 SUMMARY_STAT_XACT_USER_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on this table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

13.2.5.33 GLOBAL_STAT_XACT_USER_TABLES

Displays the transaction status information about the user tables in all the schemas of each database node, as shown in **Table 13-61**. The transaction status information of the tables on different nodes is not summed up.

Table 13-61 GLOBAL_STAT_XACT_USER_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	Table OID.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on this table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.

Name	Type	Description
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

13.2.5.34 STAT_XACT_USER_FUNCTIONS

Displays statistics about function executions in the current transaction on the current database node, as shown in **Table 13-62**.

Table 13-62 STAT_XACT_USER_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of a function.
schemaname	name	Name of the schema where the function is located.
funcname	name	Function name.
calls	bigint	Number of times the function has been called.
total_time	double precision	Total time spent in this function and all other functions called by it.
self_time	double precision	Time spent in this function, excluding other functions called by it.

13.2.5.35 SUMMARY_STAT_XACT_USER_FUNCTIONS

Displays the summary of function execution statistics in a transaction on each database node, as shown in **Table 13-63**.

Table 13-63 SUMMARY_STAT_XACT_USER_FUNCTIONS columns

Name	Type	Description
schemaname	name	Name of the schema where the function is located.
funcname	name	Function name
calls	numeric	Number of times that the function has been called

Name	Type	Description
total_time	double precision	Total time spent in this function and all other functions called by it.
self_time	double precision	Time spent in this function, excluding other functions called by it.

13.2.5.36 GLOBAL_STAT_XACT_USER_FUNCTIONS

Displays statistics about function execution in a transaction on each database node, as shown in **Table 13-64**. Data on different nodes is not summed up.

Table 13-64 GLOBAL_STAT_XACT_USER_FUNCTIONS columns

Name	Type	Description
node_name	name	Node name.
funcid	oid	OID of a function.
schemaname	name	Name of the schema where the function is located.
funcname	name	Function name.
calls	bigint	Number of times that the function has been called.
total_time	double precision	Total time spent in this function and all other functions called by it.
self_time	double precision	Time spent in this function, excluding other functions called by it.

13.2.5.37 STAT_BAD_BLOCK

Obtains the information about table and index read failures on the current node, as shown in **Table 13-65**.

Table 13-65 STAT_BAD_BLOCK columns

Name	Type	Description
nodename	text	Node name.
databaseid	integer	Database OID.
tablespaceid	integer	Tablespace OID.
relfilenode	integer	Relationship file node.

Name	Type	Description
bucketid	smallint	ID of the bucket for consistent hashing.
forknum	integer	Fork number.
error_count	integer	Number of errors.
first_time	timestamp with time zone	Time when the page damage occurs for the first time.
last_time	timestamp with time zone	Time when the page damage occurs for the last time.

13.2.5.38 SUMMARY_STAT_BAD_BLOCK

Obtains the summary of the table and index read failure information of each database node in a period specified by **first_time** and **last_time**, as shown in **Table 13-66**. The value of **first_time** is the start time and the value of **last_time** is the end time.

Table 13-66 SUMMARY_STAT_BAD_BLOCK columns

Name	Type	Description
databaseid	integer	Database OID.
tablespaceid	integer	Tablespace OID.
relfilenode	integer	Relationship file node.
forknum	bigint	Fork number.
error_count	bigint	Number of errors.
first_time	timestamp with time zone	Time when the page damage occurs for the first time.
last_time	timestamp with time zone	Time when the page damage occurs for the last time.

13.2.5.39 GLOBAL_STAT_BAD_BLOCK

Obtains the table and index read failure information of each database node, as shown in **Table 13-67**. The read failure information of different nodes is not summed up.

Table 13-67 GLOBAL_STAT_BAD_BLOCK columns

Name	Type	Description
node_name	text	Node name.

Name	Type	Description
databaseid	integer	Database OID.
tablespaceid	integer	Tablespace OID.
relfilenode	integer	Relationship file node.
forknum	integer	Fork number.
error_count	integer	Number of errors.
first_time	timestamp with time zone	Time when the page damage occurs for the first time.
last_time	timestamp with time zone	Time when the page damage occurs for the last time.

13.2.5.40 STAT_USER_FUNCTIONS

Displays statistics about user-defined functions (the function language is not an internal language) in all the schemas of the current node, as shown in **Table 13-68**.

Table 13-68 STAT_USER_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of a function.
schemaname	name	Schema name.
funcname	name	Rename the customized function.
calls	bigint	Number of times that the function has been called.
total_time	double precision	Total time spent in this function, including other functions called by it (unit: ms).
self_time	double precision	Time spent in this function, excluding other functions called by it (unit: ms).

13.2.5.41 SUMMARY_STAT_USER_FUNCTIONS

Displays the summary of statistics about user-defined functions on each database node, as shown in **Table 13-69**.

Table 13-69 SUMMARY_STAT_USER_FUNCTIONS columns

Name	Type	Description
schemaname	name	Schema name.
funcname	name	UDF name.
calls	numeric	Number of times the function has been called.
total_time	double precision	Total time spent in this function, including other functions called by it (unit: ms).
self_time	double precision	Time spent in this function, excluding other functions called by it (unit: ms).

13.2.5.42 GLOBAL_STAT_USER_FUNCTIONS

Displays the statistics of UDFs on each database node, as shown in **Table 13-70**. The statistics on different nodes are not summed up.

Table 13-70 GLOBAL_STAT_USER_FUNCTIONS columns

Name	Type	Description
node_name	name	Node name.
funcid	oid	ID of the function.
schemaname	name	Name of the schema where the function is located.
funcname	name	UDF name.
calls	bigint	Number of times the function has been called.
total_time	double precision	Total time spent in this function, including other functions called by it (unit: ms).
self_time	double precision	Time spent in this function, excluding other functions called by it (unit: ms).

13.2.6 Workload

13.2.6.1 WORKLOAD_SQL_COUNT

Displays the distribution of SQL statements in workloads on the current node, as shown in **Table 13-71**.

Table 13-71 WORKLOAD_SQL_COUNT columns

Name	Type	Description
workload	name	Workload name
select_count	bigint	Number of **SELECT** statements
update_count	bigint	Number of **UPDATE** statements
insert_count	bigint	Number of **INSERT** statements
delete_count	bigint	Number of **DELETE** statements
ddl_count	bigint	Number of **DDL** statements
dml_count	bigint	Number of **DML** statements
dcl_count	bigint	Number of **DCL** statements

13.2.6.2 SUMMARY_WORKLOAD_SQL_COUNT

Displays the distribution of SQL statements in workloads on each primary database node in the database, as shown in **Table 13-72**.

Table 13-72 SUMMARY_WORKLOAD_SQL_COUNT columns

Name	Type	Description
node_name	name	Node name.
workload	name	Workload name.
select_count	bigint	Number of SELECT statements.
update_count	bigint	Number of UPDATE statements.
insert_count	bigint	Number of INSERT statements.
delete_count	bigint	Number of DELETE statements.
ddl_count	bigint	Number of DDL statements.
dml_count	bigint	Number of DML statements.
dcl_count	bigint	Number of DCL statements.

13.2.6.3 WORKLOAD_TRANSACTION

Displays information about transactions loaded on the current node, as shown in **Table 13-73**.

Table 13-73 WORKLOAD_TRANSACTION columns

Name	Type	Description
workload	name	Workload name.
commit_counter	bigint	Number of user transactions committed.
rollback_counter	bigint	Number of user transactions rolled back.
resp_min	bigint	Minimum response time of user transactions (unit: μs).
resp_max	bigint	Maximum response time of user transactions (unit: μs).
resp_avg	bigint	Average response time of user transactions (unit: μs).
resp_total	bigint	Total response time of user transactions (unit: μs).
bg_commit_counter	bigint	Number of background transactions committed.
bg_rollback_counter	bigint	Number of background transactions rolled back.
bg_resp_min	bigint	Minimum response time of background transactions (unit: μs).
bg_resp_max	bigint	Maximum response time of background transactions (unit: μs).
bg_resp_avg	bigint	Average response time of background transactions (unit: μs).
bg_resp_total	bigint	Total response time of background transactions (unit: μs).

13.2.6.4 SUMMARY_WORKLOAD_TRANSACTION

Displays information about transactions loaded in the database, as shown in **Table 13-74**.

Table 13-74 SUMMARY_WORKLOAD_TRANSACTION columns

Name	Type	Description
workload	name	Workload name.

Name	Type	Description
commit_counter	numeric	Number of user transactions committed.
rollback_counter	numeric	Number of user transactions rolled back.
resp_min	bigint	Minimum response time of user transactions (unit: μs).
resp_max	bigint	Maximum response time of user transactions (unit: μs).
resp_avg	bigint	Average response time of user transactions (unit: μs).
resp_total	numeric	Total response time of user transactions (unit: μs).
bg_commit_counter	numeric	Number of background transactions committed.
bg_rollback_counter	numeric	Number of background transactions rolled back.
bg_resp_min	bigint	Minimum response time of background transactions (unit: μs).
bg_resp_max	bigint	Maximum response time of background transactions (unit: μs).
bg_resp_avg	bigint	Average response time of background transactions (unit: μs).
bg_resp_total	numeric	Total response time of background transactions (unit: μs).

13.2.6.5 GLOBAL_WORKLOAD_TRANSACTION

Displays load information about workloads on each node, as shown in **Table 13-75**.

Table 13-75 GLOBAL_WORKLOAD_TRANSACTION columns

Name	Type	Description
node_name	name	Node name.
workload	name	Workload name.
commit_counter	bigint	Number of user transactions committed.
rollback_counter	bigint	Number of user transactions rolled back.
resp_min	bigint	Minimum response time of user transactions (unit: μs).

Name	Type	Description
resp_max	bigint	Maximum response time of user transactions (unit: μs).
resp_avg	bigint	Average response time of user transactions (unit: μs).
resp_total	bigint	Total response time of user transactions (unit: μs).
bg_commit_counter	bigint	Number of background transactions committed.
bg_rollback_counter	bigint	Number of background transactions rolled back.
bg_resp_min	bigint	Minimum response time of background transactions (unit: μs).
bg_resp_max	bigint	Maximum response time of background transactions (unit: μs).
bg_resp_avg	bigint	Average response time of background transactions (unit: μs).
bg_resp_total	bigint	Total response time of background transactions (unit: μs).

13.2.6.6 WORKLOAD_SQL_ELAPSE_TIME

WORKLOAD_SQL_ELAPSE_TIME collects SELECT, UPDATE, INSERT, and DELETE (SUID) statistics, as described in **Table 13-76**.

Table 13-76 WORKLOAD_SQL_ELAPSE_TIME columns

Name	Type	Description
workload	name	Workload name.
total_select_elapse	bigint	Total response time of SELECT statements (unit: μs).
max_select_elapse	bigint	Maximum response time of SELECT statements (unit: μs).
min_select_elapse	bigint	Minimum response time of SELECT statements (unit: μs).
avg_select_elapse	bigint	Average response time of SELECT statements (unit: μs).
total_update_elapse	bigint	Total response time of UPDATE statements (unit: μs).

Name	Type	Description
max_update_elapse	bigint	Maximum response time of UPDATE statements (unit: μs).
min_update_elapse	bigint	Minimum response time of UPDATE statements (unit: μs).
avg_update_elapse	bigint	Average response time of UPDATE statements (unit: μs).
total_insert_elapse	bigint	Total response time of INSERT statements (unit: μs).
max_insert_elapse	bigint	Maximum response time of INSERT statements (unit: μs).
min_insert_elapse	bigint	Minimum response time of INSERT statements (unit: μs).
avg_insert_elapse	bigint	Average response time of INSERT statements (unit: μs).
total_delete_elapse	bigint	Total response time of DELETE statements (unit: μs).
max_delete_elapse	bigint	Maximum response time of DELETE statements (unit: μs).
min_delete_elapse	bigint	Minimum response time of DELETE statements (unit: μs).
avg_delete_elapse	bigint	Average response time of DELETE statements (unit: μs).

13.2.6.7 SUMMARY_WORKLOAD_SQL_ELAPSE_TIME

SUMMARY_WORKLOAD_SQL_ELAPSE_TIME collects SELECT, UPDATE, INSERT, and DELETE (SUID) statistics on workloads (services) of the primary database node, as shown in **Table 13-77**.

Table 13-77 SUMMARY_WORKLOAD_SQL_ELAPSE_TIME columns

Name	Type	Description
node_name	name	Node name.
workload	name	Workload name.
total_select_elapse	bigint	Total response time of SELECT statements (unit: μs).
max_select_elapse	bigint	Maximum response time of SELECT statements (unit: μs).

Name	Type	Description
min_select_elapse	bigint	Minimum response time of SELECT statements (unit: μs).
avg_select_elapse	bigint	Average response time of SELECT statements (unit: μs).
total_update_elapse	bigint	Total response time of UPDATE statements (unit: μs).
max_update_elapse	bigint	Maximum response time of UPDATE statements (unit: μs).
min_update_elapse	bigint	Minimum response time of UPDATE statements (unit: μs).
avg_update_elapse	bigint	Average response time of UPDATE statements (unit: μs).
total_insert_elapse	bigint	Total response time of INSERT statements (unit: μs).
max_insert_elapse	bigint	Maximum response time of INSERT statements (unit: μs).
min_insert_elapse	bigint	Minimum response time of INSERT statements (unit: μs).
avg_insert_elapse	bigint	Average response time of INSERT statements (unit: μs).
total_delete_elapse	bigint	Total response time of DELETE statements (unit: μs).
max_delete_elapse	bigint	Maximum response time of DELETE statements (unit: μs).
min_delete_elapse	bigint	Minimum response time of DELETE statements (unit: μs).
avg_delete_elapse	bigint	Average response time of DELETE statements (unit: μs).

13.2.6.8 USER_TRANSACTION

USER_TRANSACTION collects statistics about transactions executed by users. Users with the monadmin permission can view information about transactions executed by all users, as shown in **Table 13-78**.

Table 13-78 USER_TRANSACTION columns

Name	Type	Description
username	name	Username.

Name	Type	Description
commit_counter	bigint	Number of user transactions committed.
rollback_counter	bigint	Number of user transactions rolled back.
resp_min	bigint	Minimum response time of user transactions (unit: μs).
resp_max	bigint	Maximum response time of user transactions (unit: μs).
resp_avg	bigint	Average response time of user transactions (unit: μs).
resp_total	bigint	Total response time of user transactions (unit: μs).
bg_commit_counter	bigint	Number of background transactions committed.
bg_rollback_counter	bigint	Number of background transactions rolled back.
bg_resp_min	bigint	Minimum response time of background transactions (unit: μs).
bg_resp_max	bigint	Maximum response time of background transactions (unit: μs).
bg_resp_avg	bigint	Average response time of background transactions (unit: μs).
bg_resp_total	bigint	Total response time of background transactions (unit: μs).

13.2.6.9 GLOBAL_USER_TRANSACTION

GLOBAL_USER_TRANSACTION collects statistics about transactions executed by all users, as shown in **Table 13-79**.

Table 13-79 GLOBAL_USER_TRANSACTION columns

Name	Type	Description
node_name	name	Node name.
username	name	Username.
commit_counter	bigint	Number of user transactions committed.
rollback_counter	bigint	Number of user transactions rolled back.

Name	Type	Description
resp_min	bigint	Minimum response time of user transactions (unit: μs).
resp_max	bigint	Maximum response time of user transactions (unit: μs).
resp_avg	bigint	Average response time of user transactions (unit: μs).
resp_total	bigint	Total response time of user transactions (unit: μs).
bg_commit_counter	bigint	Number of background transactions committed.
bg_rollback_counter	bigint	Number of background transactions rolled back.
bg_resp_min	bigint	Minimum response time of background transactions (unit: μs).
bg_resp_max	bigint	Maximum response time of background transactions (unit: μs).
bg_resp_avg	bigint	Average response time of background transactions (unit: μs).
bg_resp_total	bigint	Total response time of background transactions (unit: μs).

13.2.7 Session/Thread

13.2.7.1 SESSION_STAT

Collects statistics about session status on the current node based on session threads or the **AutoVacuum** thread, as shown in **Table 13-80**.

Table 13-80 SESSION_STAT columns

Name	Type	Description
sessid	text	Thread start time and ID
statid	integer	Statistics ID
statname	text	Name of the statistics session
statunit	text	Unit of the statistics session
value	bigint	Value of the statistics session

13.2.7.2 GLOBAL_SESSION_STAT

Collects statistics about session status on each node based on session threads or the AutoVacuum thread, as shown in **Table 13-81**.

Table 13-81 GLOBAL_SESSION_STAT columns

Name	Type	Description
node_name	name	Node name.
sessid	text	Thread start time and ID.
statid	integer	Statistics ID.
statname	text	Name of the statistics session.
statunit	text	Unit of the statistics session.
value	bigint	Value of the statistics session.

13.2.7.3 SESSION_TIME

Collects statistics about the running time of session threads and time consumed in each execution phase on the current node, as shown in **Table 13-82**.

Table 13-82 SESSION_TIME columns

Name	Type	Description
sessid	text	Thread start time and ID.
stat_id	integer	Statistics ID.
stat_name	text	Session type.
value	bigint	Session value.

13.2.7.4 GLOBAL_SESSION_TIME

Collects statistics about the running time of session threads and time consumed in each execution phase on each node, as shown in **Table 13-83**.

Table 13-83 GLOBAL_SESSION_TIME columns

Name	Type	Description
node_name	name	Node name.
sessid	text	Thread start time and ID.
stat_id	integer	Statistics ID.

Name	Type	Description
stat_name	text	Session type.
value	bigint	Session value.

13.2.7.5 SESSION_MEMORY

Collects statistics about memory usage at the session level in the unit of MB, including all the memory allocated to GaussDB and stream threads on DNs for jobs currently executed by users, as shown in **Table 13-84**.

Table 13-84 SESSION_MEMORY columns

Name	Type	Description
sessid	text	Thread start time and ID.
init_mem	integer	Memory allocated to the currently executed job before the job enters the executor.
used_mem	integer	Memory allocated to the currently executed job.
peak_mem	integer	Peak memory allocated to the currently executed job.

13.2.7.6 GLOBAL_SESSION_MEMORY

Collects statistics about memory usage at the session level on each node in the unit of MB, including all the memory allocated to GaussDB and stream threads on DNs for jobs currently executed by users, as shown in **Table 13-85**.

Table 13-85 GLOBAL_SESSION_MEMORY columns

Name	Type	Description
node_name	name	Node name.
sessid	text	Thread start time and ID.
init_mem	integer	Memory allocated to the currently executed job before the job enters the executor.
used_mem	integer	Memory allocated to the currently executed job.
peak_mem	integer	Peak memory allocated to the currently executed job.

13.2.7.7 SESSION_MEMORY_DETAIL

Collects statistics on the memory usage of threads on the current node, in the unit specified by **MemoryContext**, as shown in **Table 13-86**.

Table 13-86 SESSION_MEMORY_DETAIL columns

Name	Type	Description
sessid	text	Thread start time and ID.
sesstype	text	Thread name.
contextname	text	Name of the memory context.
level	smallint	Level of memory context importance.
parent	text	Name of the parent memory context.
totalsize	bigint	Size of the allocated memory (unit: byte).
freesize	bigint	Size of the idle memory (unit: byte).
usedsize	bigint	Size of the used memory (unit: byte).

13.2.7.8 GLOBAL_SESSION_MEMORY_DETAIL

Collects statistics about thread memory usage on each node by **MemoryContext**, as shown in **Table 13-87**.

Table 13-87 GLOBAL_SESSION_MEMORY_DETAIL columns

Name	Type	Description
node_name	name	Node name.
sessid	text	Thread start time and ID.
sesstype	text	Thread name.
contextname	text	Name of the memory context.
level	smallint	Level of memory context importance.
parent	text	Name of the parent memory context.
totalsize	bigint	Size of the allocated memory (unit: byte).
freesize	bigint	Size of the idle memory (unit: byte).
usedsize	bigint	Size of the used memory (unit: byte).

13.2.7.9 SESSION_STAT_ACTIVITY

Displays information about threads that are running on the current node, as described in **Table 13-88**.

Table 13-88 SESSION_STAT_ACTIVITY columns

Name	Type	Description
datid	oid	OID of the database that the user session connects to in the backend.
datname	name	Name of the database that the user session connects to in the backend.
pid	bigint	ID of the backend thread.
usesysid	oid	OID of the user logged in to the backend.
usename	name	Name of the user logged in to the backend.
application_name	text	Name of the application connected to the backend.
client_addr	inet	IP address of the client connected to the backend. If this column is **NULL**, it indicates either the client is connected via a Unix socket on the server or this is an internal thread, for example, **autovacuum** is displayed for the thread autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (**–1** if a Unix socket is used).
backend_start	timestamp with time zone	Time when this process was started, that is, when the client connected to the server.
xact_start	timestamp with time zone	Time when current transaction was started (null if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the **query_start** column.

Name	Type	Description
query_start	timestamp with time zone	Time when the currently active query was started, or time when the last query was started if **state** is not **active**. For a stored procedure, function, or package, the first query time is queried and does not change with the running of statements in the stored procedure.
state_change	timestamp with time zone	Time when **state** was last modified.
waiting	Boolean	Specifies whether the backend is currently waiting for a lock. If yes, the value is **true**.
enqueue	text	Unsupported currently.

Name	Type	Description
state	text	Overall status of this backend. The value can be: • **active**: The backend is executing a query. • **idle**: The backend is waiting for a new client command. • **idle in transaction**: The backend is in a transaction, but is not currently executing a query. • **idle in transaction (aborted)**: The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend. **NOTE** Common users can view their own session status only. The state information of other accounts is empty. For example, after the **judy** user is connected to the database, the state information of the **joe** user and the initial user **omm** in **pg_stat_activity** is empty. gaussdb=# SELECT datname, usename, usesysid,state,pid FROM pg_stat_activity; datname | usename | usesysid | state | pid ----------+---------+----------+-------- +-----------------testdb | omm | 10 | | 139968752121616 testdb | omm | 10 | | 139968903116560 db_tpcds | judy | 16398 | active | 139968391403280 testdb | omm | 10 | | 139968643069712 testdb | omm | 10 | | 139968680818448 testdb | joe | 16390 | | 139968563377936 (6 rows)
resource_pool	name	Resource pool used by the user.
query_id	bigint	ID of a query.
query	text	Text of this backend's latest query. If the value of **state** is **active**, this column shows the ongoing query. In all other states, it shows the last query that was executed.
unique_sql_id	bigint	Unique SQL statement ID.

Name	Type	Description
trace_id	text	Trace ID passed by the driver, which is used to identify a request of an application.

13.2.7.10 GLOBAL_SESSION_STAT_ACTIVITY

Displays information about threads that are running on each node in the database, as described in **Table 13-89**.

Table 13-89 GLOBAL_SESSION_STAT_ACTIVITY columns

Name	Type	Description
coorname	text	Database process name.
datid	oid	OID of the database that the user session connects to in the backend.
datname	text	Name of the database that the user session connects to in the backend.
pid	bigint	ID of the backend thread.
usesysid	oid	OID of the user logged in to the backend.
usename	text	Name of the user logged in to the backend.
application_name	text	Name of the application connected to the backend.
client_addr	inet	IP address of the client connected to the backend. If this column is **NULL**, it indicates either the client is connected via a Unix socket on the server or this is an internal thread, for example, **autovacuum** is displayed for the thread autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (**–1** if a Unix socket is used).
backend_start	timestamp with time zone	Time when this process was started, that is, when the client connected to the server.

Name	Type	Description
xact_start	timestamp with time zone	Time when current transaction was started (null if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the **query_start** column.
query_start	timestamp with time zone	Time when the currently active query was started, or time when the last query was started if **state** is not **active**. For a stored procedure, function, or package, the first query time is queried and does not change with the running of statements in the stored procedure.
state_change	timestamp with time zone	Time when **state** was last modified.
waiting	Boolean	Specifies whether the backend is currently waiting for a lock. If yes, the value is **true**.
enqueue	text	Unsupported currently.

Name	Type	Description
state	text	Overall status of this backend. The value can be: • **active**: The backend is executing a query. • **idle**: The backend is waiting for a new client command. • **idle in transaction**: The backend is in a transaction, but is not currently executing a query. • **idle in transaction (aborted)**: The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend. **NOTE** Common users can view their own session status only. The state information of other accounts is empty. For example, after the **judy** user is connected to the database, the state information of the **joe** user and the initial user **omm** in **pg_stat_activity** is empty. gaussdb=# SELECT datname, username, usesysid,state,pid FROM pg_stat_activity; datname | username | usesysid | state | pid ----------+----------+----------+-------- +-----------------testdb | omm | 10 | | 139968752121616 testdb | omm | 10 | | 139968903116560 db_tpcds | judy | 16398 | active | 139968391403280 testdb | omm | 10 | | 139968643069712 testdb | omm | 10 | | 139968680818448 testdb | joe | 16390 | | 139968563377936 (6 rows)
resource_pool	name	Resource pool used by the user.
query_id	bigint	ID of a query.
query	text	Text of this backend's latest query. If the value of **state** is **active**, this column shows the ongoing query. In all other states, it shows the last query that was executed.
unique_sql_id	bigint	Unique SQL statement ID.

Name	Type	Description
trace_id	text	Trace ID passed by the driver, which is used to identify a request of an application.

13.2.7.11 THREAD_WAIT_STATUS

In this view, you can check the blocking and waiting status of the backend threads and auxiliary threads on the current node, as shown in **Table 13-90**. For details about events, see **Table 12-412**, **Table 12-413**, **Table 12-414**, and **Table 12-415**.

Table 13-90 THREAD_WAIT_STATUS columns

Name	Type	Description
node_name	text	Node name.
db_name	text	Database name.
thread_name	text	Thread name.
query_id	bigint	Query ID. The value of this column is the same as that of **debug_query_id**.
tid	bigint	Thread ID of the current thread.
sessionid	bigint	Session ID.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread.
smpid	integer	Concurrent thread ID.
wait_status	text	Waiting status of the current thread. For details about the waiting status, see **Table 12-412**.
wait_event	text	If **wait_status** is **acquire lock**, **acquire lwlock**, or **wait io**, this column describes the lock, lightweight lock, or I/O information. Otherwise, this column is empty.
locktag	text	Information about the lock that the current thread is waiting for.
lockmode	text	Lock mode that the current thread is waiting to obtain. The values include modes in the table-level lock, row-level lock, and page-level lock.
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock.

Name	Type	Description
global_sessionid	text	Global session ID.

13.2.7.12 GLOBAL_THREAD_WAIT_STATUS

In this view, you can check the blocking and waiting status of the backend threads and auxiliary threads on all nodes, as shown in **Table 13-91**. For details about events, see **Table 12-412**, **Table 12-413**, **Table 12-414**, and **Table 12-415**.

In GLOBAL_THREAD_WAIT_STATUS, you can see all the call hierarchy relationships between threads of the SQL statements on all nodes in the database, and the block waiting status for each thread. With this view, you can easily locate the causes of process hang and similar issues.

The definitions of GLOBAL_THREAD_WAIT_STATUS and THREAD_WAIT_STATUS are the same, because the GLOBAL_THREAD_WAIT_STATUS view is essentially the query summary of the THREAD_WAIT_STATUS view on each node in the database.

Table 13-91 GLOBAL_THREAD_WAIT_STATUS columns

Name	Type	Description
node_name	text	Node name.
db_name	text	Database name.
thread_name	text	Thread name.
query_id	bigint	Query ID. The value of this column is the same as that of **debug_query_id**.
tid	bigint	Thread ID of the current thread.
sessionid	bigint	Session ID.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread.
smpid	integer	Concurrent thread ID.
wait_status	text	Waiting status of the current thread. For details about the waiting status, see **Table 12-412**.
wait_event	text	If **wait_status** is **acquire lock**, **acquire lwlock**, or **wait io**, this column describes the lock, lightweight lock, or I/O information. Otherwise, this column is empty.

Name	Type	Description
locktag	text	Information about the lock that the current thread is waiting for.
lockmode	text	Lock mode that the current thread is waiting to obtain. The values include modes in the table-level lock, row-level lock, and page-level lock.
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock.
global_sessionid	text	Global session ID.

13.2.7.13 LOCAL_THREADPOOL_STATUS

LOCAL_THREADPOOL_STATUS displays the status of worker threads and sessions in a thread pool, as shown in **Table 13-92**. This view is valid only when **enable_thread_pool** is set to **on**.

Table 13-92 LOCAL_THREADPOOL_STATUS columns

Name	Type	Description
node_name	text	Database process name.
group_id	integer	ID of the thread pool group.
bind_numa_id	integer	NUMA ID to which the thread pool group is bound.
bind_cpu_number	integer	Information about the CPU to which the thread pool group is bound. If no CPUs are bound, the value is **NULL**.
listener	integer	Number of listener threads in the thread pool group.

Name	Type	Description
worker_info	text	Information about threads in the thread pool, including: • **default**: Number of initial threads in the thread pool group • **new**: Number of new threads in the thread pool group • **expect**: Expected number of threads in the thread pool group • **actual**: Actual number of threads in the thread pool group • **idle**: Number of idle threads in the thread pool group • **pending**: Number of pending threads in the thread pool group
session_info	text	Information about sessions in the thread pool, including: • **total**: Total number of sessions in the thread pool group • **waiting**: Number of sessions pending scheduling in the thread pool group • **running**: Number of running sessions in the thread pool group • **idle**: Number of idle sessions in the thread pool group
stream_info	text	Stream pool information, including: • **total**: total number of threads in the stream pool group. • **running**: number of threads that are being executed in the stream pool. • **idle**: number of idle threads in the stream pool.

13.2.7.14 GLOBAL_THREADPOOL_STATUS

GLOBAL_THREADPOOL_STATUS displays the status of worker threads and sessions in thread pools on all nodes. For details, see **Table 13-92**.

13.2.7.15 LOCAL_ACTIVE_SESSION

LOCAL_ACTIVE_SESSION displays samples in the ACTIVE SESSION PROFILE memory on the current node, as shown in **Table 13-93**.

Table 13-93 LOCAL_ACTIVE_SESSION columns

Name	Type	Description
sampleid	bigint	Sample ID
sample_time	timestamp with time zone	Sampling time
need_flush_sample	Boolean	Specifies whether the sample needs to be flushed to disks.
databaseid	oid	Database ID
thread_id	bigint	Thread ID
sessionid	bigint	Session ID
start_time	timestamp with time zone	Start time of a session
event	text	Event name
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread, which corresponds to the level (**id**) of the execution plan
smpid	integer	Concurrent thread ID in SMP execution mode
userid	oid	ID of a session user
application_name	text	Name of an application
client_addr	inet	IP address of a client
client_hostname	text	Name of a client
client_port	integer	TCP port number used by a client to communicate with the backend
query_id	bigint	Debug query ID.
unique_query_id	bigint	Unique query ID.
user_id	oid	User ID in the key of the unique query

Name	Type	Description
cn_id	integer	CN ID. On a DN, this parameter indicates the ID of the node that delivers the unique SQL statement, that is, the value of **cn_id** in the key of the unique query.
unique_query	text	Standardized text string of the unique SQL statement
locktag	text	Information of a lock that the session waits for, which can be parsed using **locktag_decode**
lockmode	text	Mode of a lock that the session waits for
block_sessionid	bigint	Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.
final_block_sessionid	bigint	ID of the blocked session at the source end
wait_status	text	Provides more details about an event column.
global_sessionid	text	Global session ID
xact_start_time	timestamp with time zone	Start time of the transaction
query_start_time	timestamp with time zone	Time when the statement starts to be executed
state	text	Current statement state The value can be **active**, **idle in transaction**, **fastpath function call**, **idle in transaction (aborted)**, **disabled**, or **retrying**.
event_start_time	timestamp with time zone	Start time of a wait event.
current_xid	xid	Current transaction ID.
top_xid	xid	Top-level transaction ID.

13.2.8 Transaction

13.2.8.1 TRANSACTIONS_PREPARED_XACTS

Displays information about transactions that are currently prepared for two-phase commit on the current node, as described in **Table 13-94**.

Table 13-94 TRANSACTIONS_PREPARED_XACTS columns

Name	Type	Description
transaction	xid	Numeric transaction identifier of the prepared transaction
gid	text	Global transaction identifier that was assigned to the transaction
prepared	timestamp with time zone	Time at which the transaction is prepared for commit
owner	name	Name of the user who executes the transaction
database	name	Name of the database in which the transaction is executed

13.2.8.2 SUMMARY_TRANSACTIONS_PREPARED_XACTS

Displays information about transactions that are currently prepared for two-phase commit on the primary database node, as described in **Table 13-95**.

Table 13-95 SUMMARY_TRANSACTIONS_PREPARED_XACTS columns

Name	Type	Description
transaction	xid	Numeric transaction identifier of the prepared transaction
gid	text	Global transaction identifier that was assigned to the transaction
prepared	timestamp with time zone	Time at which the transaction is prepared for commit
owner	name	Name of the user who executes the transaction
database	name	Name of the database in which the transaction is executed

13.2.8.3 GLOBAL_TRANSACTIONS_PREPARED_XACTS

Displays information about transactions that are currently prepared for two-phase commit on the primary database node, as described in **Table 13-96**.

Table 13-96 GLOBAL_TRANSACTIONS_PREPARED_XACTS columns

Name	Type	Description
transaction	xid	Numeric transaction identifier of the prepared transaction
gid	text	Global transaction identifier that was assigned to the transaction
prepared	timestamp with time zone	Time at which the transaction is prepared for commit
owner	name	Name of the user who executes the transaction
database	name	Name of the database in which the transaction is executed

13.2.8.4 TRANSACTIONS_RUNNING_XACTS

Displays information about running transactions on the current node, as described in **Table 13-97**.

Table 13-97 TRANSACTIONS_RUNNING_XACTS columns

Name	Type	Description
handle	integer	Slot handle in the transaction manager corresponding to a transaction. The value is fixed at **–1**.
gxid	xid	Transaction ID
state	tinyint	Transaction status (**3**: prepared or **0**: starting)
node	text	Node name.
xmin	xid	Minimum transaction ID on the node
vacuum	boolean	Specifies whether the current transaction is a lazy vacuum (VACUUM only if necessary) transaction. • **true**: yes • **false**: no
timeline	bigint	Number of database restarts
prepare_xid	xid	Transaction ID in the **prepared** state. If the state is not **prepared**, the value is **0**.
pid	bigint	Thread ID corresponding to the transaction
next_xid	xid	Transaction ID sent by other nodes to the current node. The value is fixed at **0**.

13.2.8.5 SUMMARY_TRANSACTIONS_RUNNING_XACTS

Displays the summary of running transactions on the primary database node, as described in **Table 13-98**.

Table 13-98 SUMMARY_TRANSACTIONS_RUNNING_XACTS columns

Name	Type	Description
handle	integer	Slot handle in the transaction manager corresponding to a transaction. The value is fixed at **–1**.
gxid	xid	Transaction ID.
state	tinyint	Transaction status (**3**: prepared; or **0**: starting).
node	text	Node name.
xmin	xid	Minimum transaction ID on the node.
vacuum	boolean	Specifies whether the current transaction is a lazy vacuum (VACUUM only if necessary) transaction. • **true**: yes • **false**: no
timeline	bigint	Number of database restarts.
prepare_xid	xid	Transaction ID in the **prepared** state. If the status is not **prepared**, the value is **0**.
pid	bigint	Thread ID corresponding to the transaction.
next_xid	xid	Transaction ID sent by other nodes to the current node. The value is fixed at **0**.

13.2.8.6 GLOBAL_TRANSACTIONS_RUNNING_XACTS

Displays the summary of running transactions on the primary database node, as described in **Table 13-99**.

Table 13-99 GLOBAL_TRANSACTIONS_RUNNING_XACTS columns

Name	Type	Description
handle	integer	Slot handle in the transaction manager corresponding to a transaction. The value is fixed at **–1**.
gxid	xid	Transaction ID.
state	tinyint	Transaction status (**3**: prepared; or **0**: starting).
node	text	Node name.

Name	Type	Description
xmin	xid	Minimum transaction ID on the node.
vacuum	boolean	Specifies whether the current transaction is a lazy vacuum (VACUUM only if necessary) transaction. • **true**: yes • **false**: no
timeline	bigint	Number of database restarts.
prepare_xid	xid	Transaction ID in the **prepared** state. If the status is not **prepared**, the value is **0**.
pid	bigint	Thread ID corresponding to the transaction.
next_xid	xid	Transaction ID sent by other nodes to the current node. The value is fixed at **0**.

13.2.9 Query

13.2.9.1 STATEMENT

Obtains information about executed statements (normalized SQL statements) on the current node, as described in **Table 13-100**. You can view all statistics about normalized SQL statements received by the primary database node and other database nodes, whereas you can view only the statistics about normalized SQL statements executed on other database nodes.

NOTE

The **unique_sql_id** generated by different **savepoint_name** values is different. When a large number of **savepoint_name** is used, the number of **unique_sql_id** values generated in the system increases rapidly. If the number of **unique_sql_id** values is greater than the number of **instr_unique_sql_count** values, the newly generated **unique_sql_id** information is not counted.

Table 13-100 STATEMENT columns

Name	Type	Description
node_name	name	Database process name.
node_id	integer	Node ID.
user_name	name	Username.
user_id	oid	OID of the user.
unique_sql_id	bigint	ID of the normalized SQL statement.

Name	Type	Description
query	text	Normalized SQL statement. Note: The length is controlled by **track_activity_query_size**.
n_calls	bigint	Number of calls.
min_elapse_time	bigint	Minimum execution time of the SQL statement in the kernel (unit: μs).
max_elapse_time	bigint	Maximum execution time of the SQL statement in the kernel (unit: μs).
total_elapse_time	bigint	Total execution time of the SQL statement in the kernel (unit: μs).
n_returned_rows	bigint	Number of rows in the result set returned by the **SELECT** statement.
n_tuples_fetched	bigint	Number of rows randomly scanned.
n_tuples_returned	bigint	Number of rows sequentially scanned.
n_tuples_inserted	bigint	Number of rows inserted.
n_tuples_updated	bigint	Number of rows updated.
n_tuples_deleted	bigint	Number of rows deleted.
n_blocks_fetched	bigint	Number of buffer block access times.
n_blocks_hit	bigint	Number of buffer block hits.
n_soft_parse	bigint	Number of soft parsing times. The value of **n_soft_parse** plus the value of **n_hard_parse** may be greater than the value of **n_calls** because the number of subqueries is not counted in the value of **n_calls**.
n_hard_parse	bigint	Number of hard parsing times. The value of **n_soft_parse** plus the value of **n_hard_parse** may be greater than the value of **n_calls** because the number of subqueries is not counted in the value of **n_calls**.
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: μs).
cpu_time	bigint	CPU time (unit: μs).
execution_time	bigint	Execution time in the executor (unit: μs).
parse_time	bigint	SQL parsing time (unit: μs).
plan_time	bigint	SQL plan generation time (unit: μs).

Name	Type	Description
rewrite_time	bigint	SQL rewriting time (unit: μs).
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: μs).
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: μs).
data_io_time	bigint	I/O time (unit: μs).
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.
net_recv_info	text	Network status of messages received through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.
net_stream_recv_info	text	Network status of messages received through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.
last_updated	timestamp with time zone	Last time when the statement was updated.
sort_count	bigint	Sorting count
sort_time	bigint	Sorting duration (unit: μs).
sort_mem_used	bigint	Size of work memory used during sorting (unit: KB).
sort_spill_count	bigint	Count of file writing when data is flushed to disks during sorting.
sort_spill_size	bigint	File size used when data is flushed to disks during sorting (unit: KB).
hash_count	bigint	Hashing count.
hash_time	bigint	Hashing duration (unit: μs).

Name	Type	Description
hash_mem_used	bigint	Size of work memory used during hashing (unit: KB).
hash_spill_count	bigint	Count of file writing when data is flushed to disks during hashing.
hash_spill_size	bigint	File size used when data is flushed to disks during hashing (unit: KB).
parent_unique_sql_id	bigint	Unique ID of the parent SQL statement. The value is **0** for a non-stored procedure substatement.
lock_wait_time	bigint	SQL lock waiting time (unit: μs).

NOTE

n_calls indicates the actual number of calling times. For the FETCH statement in the stored procedure, the actual number of triggering times of the FETCH statement is the increase times of **n_calls** of the statement actually executed by the cursor.

13.2.9.2 SUMMARY_STATEMENT

Obtains all information about executed statements (normalized SQL statements) on the primary database node and other database nodes, as described in **Table 13-101**.

Table 13-101 SUMMARY_STATEMENT columns

Name	Type	Description
node_name	name	Database process name.
node_id	integer	Node ID.
user_name	name	Username.
user_id	oid	OID of the user.
unique_sql_id	bigint	ID of the normalized SQL statement.
query	text	Normalized SQL statement. Note: The length is controlled by **track_activity_query_size**.
n_calls	bigint	Number of calls.
min_elapse_time	bigint	Minimum execution time of the SQL statement in the kernel (unit: μs).
max_elapse_time	bigint	Maximum execution time of the SQL statement in the kernel (unit: μs).

Name	Type	Description
total_elapse_time	bigint	Total execution time of the SQL statement in the kernel (unit: μs).
n_returned_rows	bigint	Number of rows in the result set returned by the **SELECT** statement.
n_tuples_fetched	bigint	Number of rows randomly scanned.
n_tuples_returned	bigint	Number of rows sequentially scanned.
n_tuples_inserted	bigint	Number of rows inserted.
n_tuples_updated	bigint	Number of rows updated.
n_tuples_deleted	bigint	Number of rows deleted.
n_blocks_fetched	bigint	Number of buffer block access times.
n_blocks_hit	bigint	Number of buffer block hits.
n_soft_parse	bigint	Number of soft parsing times.
n_hard_parse	bigint	Number of hard parsing times.
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: μs).
cpu_time	bigint	CPU time (unit: μs).
execution_time	bigint	Execution time in the executor (unit: μs).
parse_time	bigint	SQL parsing time (unit: μs).
plan_time	bigint	SQL plan generation time (unit: μs).
rewrite_time	bigint	SQL rewriting time (unit: μs).
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: μs).
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: μs).
data_io_time	bigint	I/O time (unit: μs).
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.
net_recv_info	text	Network status of messages received through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.

Name	Type	Description
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: µs), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.
net_stream_recv_info	text	Network status of messages received through a logical connection, including the time (unit: µs), number of calls, and throughput (unit: byte). This column is not supported in standalone mode.
last_updated	timestamp with time zone	Last time when the statement was updated.
sort_count	bigint	Sorting count.
sort_time	bigint	Sorting duration (unit: µs).
sort_mem_used	bigint	Size of work memory used during sorting (unit: KB).
sort_spill_count	bigint	Count of file writing when data is flushed to disks during sorting.
sort_spill_size	bigint	File size used when data is flushed to disks during sorting (unit: KB).
hash_count	bigint	Hashing count.
hash_time	bigint	Hashing duration (unit: µs).
hash_mem_used	bigint	Size of work memory used during hashing (unit: KB).
hash_spill_count	bigint	Count of file writing when data is flushed to disks during hashing.
hash_spill_size	bigint	File size used when data is flushed to disks during hashing (unit: KB).
parent_unique_sql_id	bigint	Unique ID of the parent SQL statement. The value is **0** for a non-stored procedure substatement.
lock_wait_time	bigint	SQL lock waiting time (unit: µs).

13.2.9.3 STATEMENT_COUNT

Displays statistics about five types of running statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) as well as DDL, DML, and DCL statements on the current node of the database, as described in **Table 13-102**.

NOTE

An administrator can query the STATEMENT_COUNT view to view the statistics of all users on the current node. When the database or the node is restarted, the statistics are cleared and the counting restarts. The system counts when a node receives a query, including queries inside the database. For example, when the primary database node receives a query, it is counted on the database node though multiple queries are delivered the database node.

Table 13-102 STATEMENT_COUNT columns

Name	Type	Description
node_name	text	Database process name.
user_name	text	Username.
select_count	bigint	Statistical result of the SELECT statements.
update_count	bigint	Statistical result of the UPDATE statements.
insert_count	bigint	Statistical result of the INSERT statements.
delete_count	bigint	Statistical result of the DELETE statements.
mergeinto_count	bigint	Statistical result of the MERGE INTO statements.
ddl_count	bigint	Number of DDL statements.
dml_count	bigint	Number of DML statements.
dcl_count	bigint	Number of DCL statements.
total_select_elapse	bigint	Total response time of SELECT statements (unit: μs).
avg_select_elapse	bigint	Average response time of SELECT statements (unit: μs).
max_select_elapse	bigint	Maximum response time of SELECT statements (unit: μs).
min_select_elapse	bigint	Minimum response time of SELECT statements (unit: μs).
total_update_elapse	bigint	Total response time of UPDATE statements (unit: μs).
avg_update_elapse	bigint	Average response time of UPDATE statements (unit: μs).
max_update_elapse	bigint	Maximum response time of UPDATE statements (unit: μs).
min_update_elapse	bigint	Minimum response time of UPDATE statements (unit: μs).

Name	Type	Description
total_insert_elapse	bigint	Total response time of INSERT statements (unit: μs).
avg_insert_elapse	bigint	Average response time of INSERT statements (unit: μs).
max_insert_elapse	bigint	Maximum response time of INSERT statements (unit: μs).
min_insert_elapse	bigint	Minimum response time of INSERT statements (unit: μs).
total_delete_elapse	bigint	Total response time of DELETE statements (unit: μs).
avg_delete_elapse	bigint	Average response time of DELETE statements (unit: μs).
max_delete_elapse	bigint	Maximum response time of DELETE statements (unit: μs).
min_delete_elapse	bigint	Minimum response time of DELETE statements (unit: μs).

13.2.9.4 GLOBAL_STATEMENT_COUNT

Displays statistics about five types of running statements (**SELECT**, **INSERT**, **UPDATE**, **DELETE**, and **MERGE INTO**) as well as DDL, DML, and DCL statements on each node of the database, as described in **Table 13-103**.

Table 13-103 GLOBAL_STATEMENT_COUNT columns

Name	Type	Description
node_name	text	Node name
user_name	text	Username
select_count	bigint	Statistical result of the **SELECT** statement
update_count	bigint	Statistical result of the **UPDATE** statement
insert_count	bigint	Statistical result of the **INSERT** statement
delete_count	bigint	Statistical result of the **DELETE** statement
mergeinto_count	bigint	Statistical result of the **MERGE INTO** statement
ddl_count	bigint	Number of DDL statements
dml_count	bigint	Number of DML statements

Name	Type	Description
dcl_count	bigint	Number of DCL statements
total_select_elapse	bigint	Total response time of **SELECT** statements (unit: μs)
avg_select_elapse	bigint	Average response time of **SELECT** statements (unit: μs)
max_select_elapse	bigint	Maximum response time of **SELECT** statements (unit: μs)
min_select_elapse	bigint	Minimum response time of **SELECT** statements (unit: μs)
total_update_elapse	bigint	Total response time of **UPDATE** statements (unit: μs)
avg_update_elapse	bigint	Average response time of **UPDATE** statements (unit: μs)
max_update_elapse	bigint	Maximum response time of **UPDATE** statements (unit: μs)
min_update_elapse	bigint	Minimum response time of **UPDATE** statements (unit: μs)
total_insert_elapse	bigint	Total response time of **INSERT** statements (unit: μs)
avg_insert_elapse	bigint	Average response time of **INSERT** statements (unit: μs)
max_insert_elapse	bigint	Maximum response time of **INSERT** statements (unit: μs)
min_insert_elapse	bigint	Minimum response time of **INSERT** statements (unit: μs)
total_delete_elapse	bigint	Total response time of **DELETE** statements (unit: μs)
avg_delete_elapse	bigint	Average response time of **DELETE** statements (unit: μs)
max_delete_elapse	bigint	Maximum response time of **DELETE** statements (unit: μs)
min_delete_elapse	bigint	Minimum response time of **DELETE** statements (unit: μs)

13.2.9.5 SUMMARY_STATEMENT_COUNT

Displays statistics about five types of running statements (**SELECT**, **INSERT**, **UPDATE**, **DELETE**, and **MERGE INTO**) as well as DDL, DML, and DCL statements on all nodes (database nodes) of the database, as described in **Table 13-104**.

Table 13-104 SUMMARY_STATEMENT_COUNT columns

Name	Type	Description
user_name	text	Username
select_count	numeric	Statistical result of the **SELECT** statement
update_count	numeric	Statistical result of the **UPDATE** statement
insert_count	numeric	Statistical result of the **INSERT** statement
delete_count	numeric	Statistical result of the **DELETE** statement
mergeinto_count	numeric	Statistical result of the **MERGE INTO** statement
ddl_count	numeric	Number of DDL statements
dml_count	numeric	Number of DML statements
dcl_count	numeric	Number of DCL statements
total_select_elapse	numeric	Total response time of **SELECT** statements (unit: μs)
avg_select_elapse	bigint	Average response time of **SELECT** statements (unit: μs)
max_select_elapse	bigint	Maximum response time of **SELECT** statements (unit: μs)
min_select_elapse	bigint	Minimum response time of **SELECT** statements (unit: μs)
total_update_elapse	numeric	Total response time of **UPDATE** statements (unit: μs)
avg_update_elapse	bigint	Average response time of **UPDATE** statements (unit: μs)
max_update_elapse	bigint	Maximum response time of **UPDATE** statements (unit: μs)
min_update_elapse	bigint	Minimum response time of **UPDATE** statements (unit: μs)
total_insert_elapse	numeric	Total response time of **INSERT** statements (unit: μs)
avg_insert_elapse	bigint	Average response time of **INSERT** statements (unit: μs)
max_insert_elapse	bigint	Maximum response time of **INSERT** statements (unit: μs)

Name	Type	Description
min_insert_elapse	bigint	Minimum response time of **INSERT** statements (unit: μs)
total_delete_elapse	numeric	Total response time of **DELETE** statements (unit: μs)
avg_delete_elapse	bigint	Average response time of **DELETE** statements (unit: μs)
max_delete_elapse	bigint	Maximum response time of **DELETE** statements (unit: μs)
min_delete_elapse	bigint	Minimum response time of **DELETE** statements (unit: μs)

13.2.9.6 STATEMENT_RESPONSETIME_PERCENTILE

Obtains the response times of 80% and 95% SQL statements in the database, as described in **Table 13-105**.

Table 13-105 STATEMENT_RESPONSETIME_PERCENTILE columns

Name	Type	Description
p80	bigint	Response time of 80% SQL statements in the database (unit: μs).
p95	bigint	Response time of 95% SQL statements in the database (unit: μs).

13.2.9.7 STATEMENT_HISTORY

Displays information about statements executed on the current node. The result can be queried only in the system database but cannot be queried in the user database, as described in **Table 13-106**.

Table 13-106 STATEMENT_HISTORY columns

Name	Type	Description
db_name	name	Database name.
schema_name	name	Schema name.
origin_node	integer	Node name.
user_name	name	Username.
application_name	text	Name of the application that sends a request.

Name	Type	Description
client_addr	text	IP address of the client that sends a request.
client_port	integer	Port number of the client that sends a request.
unique_query_id	bigint	ID of the normalized SQL statement.
debug_query_id	bigint	ID of the unique SQL statement.
query	text	Normalized SQL statement.
start_time	timestamp with time zone	Time when a statement starts.
finish_time	timestamp with time zone	Time when a statement ends.
slow_sql_threshold	bigint	Standard for slow SQL statement execution.
transaction_id	bigint	Transaction ID.
thread_id	bigint	ID of an execution thread.
session_id	bigint	Session ID of a user.
n_soft_parse	bigint	Number of soft parsing times. The value of **n_soft_parse** plus the value of **n_hard_parse** may be greater than the value of **n_calls** because the number of subqueries is not counted in the value of **n_calls**.
n_hard_parse	bigint	Number of hard parsing times. The value of **n_soft_parse** plus the value of **n_hard_parse** may be greater than the value of **n_calls** because the number of subqueries is not counted in the value of **n_calls**.
query_plan	text	Statement execution plan.
n_returned_rows	bigint	Number of rows in the result set returned by the **SELECT** statement.
n_tuples_fetched	bigint	Number of rows randomly scanned.
n_tuples_returned	bigint	Number of rows sequentially scanned.
n_tuples_inserted	bigint	Number of rows inserted.

Name	Type	Description
n_tuples_updated	bigint	Number of rows updated.
n_tuples_deleted	bigint	Number of rows deleted.
n_blocks_fetched	bigint	Number of buffer block access times.
n_blocks_hit	bigint	Number of buffer block hits.
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: μs).
cpu_time	bigint	CPU time (unit: μs).
execution_time	bigint	Execution time in the executor (unit: μs).
parse_time	bigint	SQL parsing time (unit: μs).
plan_time	bigint	SQL plan generation time (unit: μs).
rewrite_time	bigint	SQL rewriting time (unit: μs).
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: μs).
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: μs).
data_io_time	bigint	I/O time (unit: μs).
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). This can be used to analyze the network overhead of SQL statements in a distributed system and is not supported in standalone system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
net_recv_info	text	Network status of messages received through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). This can be used to analyze the network overhead of SQL statements in a distributed system and is not supported in standalone system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.

Name	Type	Description
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). This can be used to analyze the network overhead of SQL statements in a distributed system and is not supported in standalone system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
net_stream_recv_info	text	Network status of messages received through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). This can be used to analyze the network overhead of SQL statements in a distributed system and is not supported in standalone system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
lock_count	bigint	Number of locks.
lock_time	bigint	Time required for locking.
lock_wait_count	bigint	Number of lock waits.
lock_wait_time	bigint	Time required for lock waiting.
lock_max_count	bigint	Maximum number of locks.
lwlock_count	bigint	Number of lightweight locks (reserved).
lwlock_wait_count	bigint	Number of lightweight lock waits.
lwlock_time	bigint	Time required for lightweight locking (reserved).
lwlock_wait_time	bigint	Time required for lightweight locking.

Name	Type	Description
details	bytea	List of wait events and statement lock events. When the value of **track_stmt_stat_level** is greater than or equal to **L0**, the list of wait events starts to be recorded. Statistics about the wait events of the current statement are displayed. For details about the events, see **Table 12-412**, **Table 12-413**, **Table 12-414**, and **Table 12-415**. For details about the impact of each transaction lock on services, see **LOCK**. When the value of **track_stmt_stat_level** is **L2**, the list of statement lock events starts to be recorded. The list records events in chronological order. The number of records is determined by the **track_stmt_details_size** parameter. Events include: • Start locking. • Complete locking. • Start lock waiting. • Complete lock waiting. • Start unlocking. • Complete unlocking. • Start lightweight lock waiting. • Complete lightweight lock waiting.
is_slow_sql	boolean	Whether the SQL statement is a slow SQL statement.
trace_id	text	Driver-specific trace ID, which is associated with an application request.
advise	text	Risk information that may cause the SQL statement to be a slow SQL statement. **NOTE** If the statement is executed in SQLBypass mode (you can run the explain command to view the plan. For details, see the description of the enable_opfusion parameter), there is no slow SQL risk and the information in this field may be missing.

Name	Type	Description
parent_unique_sql_id	bigint	Normalized SQL ID of the outer SQL statement. For statements executed in a stored procedure, the value is the normalized SQL ID of the statement that invokes the stored procedure. For statements outside the stored procedure, the value is **0**.
finish_status	text	Statement completion status. The default value is **normal**. **cancelled** indicates cancellation or termination.

13.2.9.8 GS_SLOW_QUERY_INFO

GS_SLOW_QUERY_INFO displays the slow query information that has been dumped on the current node, as described in **Table 13-107**. Data is dumped from the kernel to this system catalog. If the GUC parameter **enable_resource_record** is set to **on**, the system imports the query information from the kernel to GS_WLM_SESSION_QUERY_INFO_ALL every 3 minutes. This operation occupies storage space and affects performance. You can check GS_SLOW_QUERY_INFO to view the slow query information that has been dumped. This view has been discarded in this version.

Table 13-107 GS_SLOW_QUERY_INFO columns

Name	Type	Description
dbname	text	Database name
schemaname	text	Schema name
nodename	text	Node name
username	text	Username
queryid	bigint	Normalization ID
query	text	Query statement
start_time	timestamp with time zone	Execution start time
finish_time	timestamp with time zone	Execution end time
duration	bigint	Execution duration (unit: ms)
query_plan	text	Plan information

Name	Type	Description
n_returned_rows	bigint	Number of rows in the result set returned by the SELECT statement
n_tuples_fetched	bigint	Number of rows randomly scanned
n_tuples_returned	bigint	Number of rows sequentially scanned
n_tuples_inserted	bigint	Number of rows inserted
n_tuples_updated	bigint	Number of rows updated
n_tuples_deleted	bigint	Number of rows deleted
n_blocks_fetched	bigint	Number of cache loading times
n_blocks_hit	bigint	Cache hits
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: μs)
cpu_time	bigint	CPU time (unit: μs)
execution_time	bigint	Execution time in the executor (unit: μs)
parse_time	bigint	SQL parsing time (unit: μs)
plan_time	bigint	SQL plan generation time (unit: μs)
rewrite_time	bigint	SQL rewriting time (unit: μs)
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: μs)
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: μs)
net_send_time	bigint	Network time (unit: μs)
data_io_time	bigint	I/O time (unit: μs)

13.2.9.9 GS_SLOW_QUERY_HISTORY

GS_SLOW_QUERY_HISTORY displays the slow query information that is not dumped on the current node. For details, see **GS_SLOW_QUERY_INFO**. This is discarded in the current version.

13.2.9.10 GLOBAL_SLOW_QUERY_HISTORY

GS_SLOW_QUERY_HISTORY displays the slow query information that is not dumped on all nodes. This view is discarded in this version. For details, see GS_SLOW_QUERY_INFO.

13.2.9.11 GLOBAL_SLOW_QUERY_INFO

GS_SLOW_QUERY_HISTORY displays the slow query information that has been dumped on all nodes. This view is discarded in this version. For details, see GS_SLOW_QUERY_INFO.

13.2.10 Cache/IO

13.2.10.1 STATIO_USER_TABLES

STATIO_USER_TABLES displays I/O status information about all user relationship tables in the namespace, as described in **Table 13-108**.

Table 13-108 STATIO_USER_TABLES columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.
heap_blks_hit	bigint	Number of cache hits in the table.
idx_blks_read	bigint	Number of disk blocks read from indexes in the table.
idx_blks_hit	bigint	Number of cache hits in indexes in the table.
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table.
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table.
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table.
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table.

Name	Type	Description
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.10.2 SUMMARY_STATIO_USER_TABLES

SUMMARY_STATIO_USER_TABLES displays I/O status information about all user relationship tables in namespaces in the database, as described in **Table 13-109**.

Table 13-109 SUMMARY_STATIO_USER_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	numeric	Number of disk blocks read from the table.
heap_blks_hit	numeric	Number of cache hits in the table
idx_blks_read	numeric	Number of disk blocks read from indexes in the table.
idx_blks_hit	numeric	Number of cache hits in indexes in the table.
toast_blks_read	numeric	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	numeric	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	numeric	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	numeric	Number of buffer-hits in the TOAST table index (if any) in the table

13.2.10.3 GLOBAL_STATIO_USER_TABLES

GLOBAL_STATIO_USER_TABLES displays I/O status information about all user relationship tables in namespaces on each node, as described in **Table 13-110**.

Table 13-110 GLOBAL_STATIO_USER_TABLES columns

Name	Type	Description
node_name	name	Node name

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema that contains the table
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from all indexes in the table
idx_blks_hit	bigint	Number of cache hits in the table
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table

13.2.10.4 STATIO_USER_INDEXES

STATIO_USER_INDEXES displays I/O status information about all user relationship table indexes in namespaces on the current node, as described in **Table 13-111**.

Table 13-111 STATIO_USER_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	bigint	Number of disk blocks read from the index

Name	Type	Description
idx_blks_hit	bigint	Number of cache hits in the index
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.10.5 SUMMARY_STATIO_USER_INDEXES

SUMMARY_STATIO_USER_INDEXES displays I/O status information about all user relationship table indexes in namespaces in the database, as described in **Table 13-112**.

Table 13-112 SUMMARY_STATIO_USER_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	numeric	Number of disk blocks read from the index
idx_blks_hit	numeric	Number of cache hits in the index

13.2.10.6 GLOBAL_STATIO_USER_INDEXES

GLOBAL_STATIO_USER_INDEXES displays I/O status information about all user relationship table indexes in namespaces on each node, as described in **Table 13-113**.

Table 13-113 GLOBAL_STATIO_USER_INDEXES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name

Name	Type	Description
idx_blks_read	numeric	Number of disk blocks read from the index
idx_blks_hit	numeric	Number of cache hits in the index

13.2.10.7 STATIO_USER_SEQUENCES

STATIO_USER_SEQUENCE displays I/O status information about all user relationship table sequences in namespaces on the current node, as described in **Table 13-114**.

Table 13-114 STATIO_USER_SEQUENCE columns

Name	Type	Description
relid	oid	OID of the sequence
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Number of cache hits in the sequence

13.2.10.8 SUMMARY_STATIO_USER_SEQUENCES

SUMMARY_STATIO_USER_SEQUENCES displays I/O status information about all user relationship table sequences in namespaces in the database, as described in **Table 13-115**.

Table 13-115 SUMMARY_STATIO_USER_SEQUENCES columns

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	numeric	Number of disk blocks read from the sequence
blks_hit	numeric	Number of cache hits in the sequence

13.2.10.9 GLOBAL_STATIO_USER_SEQUENCES

GLOBAL_STATIO_USER_SEQUENCES displays I/O status information about all user relationship table sequences in namespaces on each node, as described in **Table 13-116**.

Table 13-116 GLOBAL_STATIO_USER_SEQUENCES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the sequence
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Number of cache hits in the sequence

13.2.10.10 STATIO_SYS_TABLES

STATIO_SYS_TABLES displays I/O status information about all system catalogs in the current namespace, as described in **Table 13-117**.

Table 13-117 STATIO_SYS_TABLES columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.
heap_blks_hit	bigint	Number of cache hits in the table.
idx_blks_read	bigint	Number of disk blocks read from indexes in the table.
idx_blks_hit	bigint	Number of cache hits in indexes in the table.
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table.
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table.

Name	Type	Description
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table.
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.10.11 SUMMARY_STATIO_SYS_TABLES

SUMMARY_STATIO_SYS_TABLES displays I/O status information about all system catalogs in namespaces in the database, as described in **Table 13-118**.

Table 13-118 SUMMARY_STATIO_SYS_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	numeric	Number of disk blocks read from the table.
heap_blks_hit	numeric	Number of cache hits in the table
idx_blks_read	numeric	Number of disk blocks read from indexes in the table.
idx_blks_hit	numeric	Number of cache hits in indexes in the table.
toast_blks_read	numeric	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	numeric	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	numeric	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	numeric	Number of buffer-hits in the TOAST table index (if any) in the table

13.2.10.12 GLOBAL_STATIO_SYS_TABLES

GLOBAL_STATIO_SYS_TABLES displays I/O status information about all system catalogs in namespaces on each node, as described in **Table 13-119**.

Table 13-119 GLOBAL_STATIO_SYS_TABLES columns

Name	Type	Description
node_name	name	Node name
relid	oid	Table OID
schemaname	name	Name of the schema that contains the table
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from all indexes in the table
idx_blks_hit	bigint	Number of cache hits in the table
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table

13.2.10.13 STATIO_SYS_INDEXES

STATIO_SYS_INDEXES displays the I/O status information about all system catalog indexes in the current namespace, as described in **Table 13-120**.

Table 13-120 STATIO_SYS_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name

Name	Type	Description
idx_blks_read	bigint	Number of disk blocks read from the index
idx_blks_hit	bigint	Number of cache hits in the index
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.10.14 SUMMARY_STATIO_SYS_INDEXES

SUMMARY_STATIO_SYS_INDEXES displays I/O status information about all system catalog indexes in namespaces in the database, as described in **Table 13-121**.

Table 13-121 SUMMARY_STATIO_SYS_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	numeric	Number of disk blocks read from the index
idx_blks_hit	numeric	Number of cache hits in the index

13.2.10.15 GLOBAL_STATIO_SYS_INDEXES

GLOBAL_STATIO_SYS_INDEXES displays I/O status information about all system catalog indexes in namespaces on each node, as described in **Table 13-122**.

Table 13-122 GLOBAL_STATIO_SYS_INDEXES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for

Name	Type	Description
indexrelname	name	Index name
idx_blks_read	numeric	Number of disk blocks read from the index
idx_blks_hit	numeric	Number of cache hits in the index

13.2.10.16 STATIO_SYS_SEQUENCES

STATIO_SYS_SEQUENCES shows the I/O status information about all the system sequences in the current namespace, as described in **Table 13-123**.

Table 13-123 STATIO_SYS_SEQUENCES columns

Name	Type	Description
relid	oid	OID of the sequence
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Number of cache hits in the sequence

13.2.10.17 SUMMARY_STATIO_SYS_SEQUENCES

SUMMARY_STATIO_SYS_SEQUENCES displays I/O status information about all system sequences in namespaces in the database, as described in **Table 13-124**.

Table 13-124 SUMMARY_STATIO_SYS_SEQUENCES columns

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	numeric	Number of disk blocks read from the sequence
blks_hit	numeric	Number of cache hits in the sequence

13.2.10.18 GLOBAL_STATIO_SYS_SEQUENCES

GLOBAL_STATIO_SYS_SEQUENCES displays I/O status information about all system sequences in namespaces on each node, as described in **Table 13-125**.

Table 13-125 GLOBAL_STATIO_SYS_SEQUENCES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the sequence
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Number of cache hits in the sequence

13.2.10.19 STATIO_ALL_TABLES

STATIO_ALL_TABLES contains one row for each table (including TOAST tables) in the current database, showing I/O statistics about specific tables, as described in **Table 13-126**.

Table 13-126 STATIO_ALL_TABLES columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.
heap_blks_hit	bigint	Number of cache hits in the table.
idx_blks_read	bigint	Number of disk blocks read from indexes in the table.
idx_blks_hit	bigint	Number of cache hits in indexes in the table.
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table.
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table.

Name	Type	Description
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table.
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.10.20 SUMMARY_STATIO_ALL_TABLES

SUMMARY_STATIO_ALL_TABLES contains I/O statistics about each table (including TOAST tables) in databases in the database, as described in **Table 13-127**.

Table 13-127 SUMMARY_STATIO_ALL_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	numeric	Number of disk blocks read from the table.
heap_blks_hit	numeric	Number of cache hits in the table.
idx_blks_read	numeric	Number of disk blocks read from all indexes in the table.
idx_blks_hit	numeric	Number of cache hits in indexes in the table.
toast_blks_read	numeric	Number of disk blocks read from the TOAST table (if any) in the table.
toast_blks_hit	numeric	Number of buffer hits in the TOAST table (if any) in the table.
tidx_blks_read	numeric	Number of disk blocks read from the TOAST table index (if any) in the table.
tidx_blks_hit	numeric	Number of buffer-hits in the TOAST table index (if any) in the table.
last_updated	timestamp with time zone	Time when the monitoring data of the table in the view is updated for the last time.

13.2.10.21 GLOBAL_STATIO_ALL_TABLES

GLOBAL_STATIO_ALL_TABLES contains I/O statistics about each table (including TOAST tables) in databases on each node, as described in **Table 13-128**.

Table 13-128 GLOBAL_STATIO_ALL_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	Table OID.
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.
heap_blks_hit	bigint	Number of cache hits in the table.
idx_blks_read	bigint	Number of disk blocks read from all indexes in the table.
idx_blks_hit	bigint	Number of cache hits in indexes in the table.
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table.
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table.
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table.
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table.
last_updated	timestamp with time zone	Time when the monitoring data of the table in the view is updated for the last time.

13.2.10.22 STATIO_ALL_INDEXES

STATIO_ALL_INDEXES contains one row for each index in the current database, showing I/O statistics about specific indexes, as described in **Table 13-129**.

Table 13-129 STATIO_ALL_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for

Name	Type	Description
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	bigint	Number of disk blocks read from the index
idx_blks_hit	bigint	Number of cache hits in the index
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.10.23 SUMMARY_STATIO_ALL_INDEXES

SUMMARY_STATIO_ALL_INDEXES contains every row of each index in a database, showing I/O statistics about specific indexes, as described in **Table 13-130**.

Table 13-130 SUMMARY_STATIO_ALL_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that the index is in.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	numeric	Number of disk blocks read from the index.
idx_blks_hit	numeric	Number of cache hits in the index.
last_updated	timestamp with time zone	Time when the monitoring data of the index in the view is updated for the last time.

13.2.10.24 GLOBAL_STATIO_ALL_INDEXES

GLOBAL_STATIO_ALL_INDEXES contains one row for each index in databases on each node, showing I/O statistics about specific indexes, as described in **Table 13-131**.

Table 13-131 GLOBAL_STATIO_ALL_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that the index is in.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	numeric	Number of disk blocks read from the index.
idx_blks_hit	numeric	Number of cache hits in the index.
last_updated	timestamp with time zone	Time when the monitoring data of the index in the view is updated for the last time.

13.2.10.25 STATIO_ALL_SEQUENCES

STATIO_ALL_SEQUENCES contains one row for each sequence in the current database, showing I/O statistics about specific sequences, as described in **Table 13-132**.

Table 13-132 STATIO_ALL_SEQUENCES columns

Name	Type	Description
relid	oid	OID of this sequence
schemaname	name	Name of the schema where the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Cache hits in the sequence

13.2.10.26 SUMMARY_STATIO_ALL_SEQUENCES

SUMMARY_STATIO_ALL_SEQUENCES contains each row for all sequences in the entire database, showing I/O statistics about specific sequences, as described in **Table 13-133**.

Table 13-133 SUMMARY_STATIO_ALL_SEQUENCES columns

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	numeric	Number of disk blocks read from the sequence
blks_hit	numeric	Number of cache hits in the sequence

13.2.10.27 GLOBAL_STATIO_ALL_SEQUENCES

GLOBAL_STATIO_ALL_SEQUENCES contains every row of each sequence in databases on each node, showing I/O statistics about specific sequences, as described in **Table 13-134**.

Table 13-134 GLOBAL_STATIO_ALL_SEQUENCES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the sequence
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Number of cache hits in the sequence

13.2.11 Utility

13.2.11.1 REPLICATION_STAT

REPLICATION_STAT describes information about log synchronization status, such as the locations where the sender sends logs and where the receiver receives logs, as described in **Table 13-135**.

Table 13-135 REPLICATION_STAT columns

Name	Type	Description
pid	bigint	Process ID of the thread
usesysid	oid	User system ID

Name	Type	Description
usename	name	Username
application_name	text	Program name
client_addr	inet	Client address
client_hostname	text	Client name
client_port	integer	Port of the client
backend_start	timestamp with time zone	Start time of the program
state	text	Log replication state: • Catch-up state • Consistent streaming state
sender_sent_location	text	Location where the sender sends logs
receiver_write_location	text	Location where the receiver writes logs
receiver_flush_location	text	Location where the receiver flushes logs
receiver_replay_location	text	Location where the receiver replays logs
sync_priority	integer	Priority of synchronous duplication (**0** indicates asynchronization.)
sync_state	text	Synchronization state: • Asynchronous replication • Synchronous replication • Potential synchronization

13.2.11.2 GLOBAL_REPLICATION_STAT

GLOBAL_REPLICATION_STAT displays information about log synchronization status on each node, such as the locations where the sender sends logs and where the receiver receives logs, as described in **Table 13-136**.

Table 13-136 GLOBAL_REPLICATION_STAT columns

Name	Type	Description
node_name	name	Node name.
pid	bigint	PID of the thread
usesysid	oid	User system ID

Name	Type	Description
usename	name	Username
application_name	text	Program name
client_addr	inet	Client address
client_hostname	text	Client name
client_port	integer	Port of the client
backend_start	timestamp with time zone	Start time of the program
state	text	Log replication state: • Catch-up state • Consistent streaming state
sender_sent_location	text	Location where the transmit sends logs
receiver_write_location	text	Location where the receive end writes logs
receiver_flush_location	text	Location where the receive end flushes logs
receiver_replay_location	text	Location where the receive end replays logs
sync_priority	integer	Priority of synchronous duplication (**0** indicates asynchronization.)
sync_state	text	Synchronization state: • Asynchronous replication • Synchronous replication • Potential synchronization

13.2.11.3 REPLICATION_SLOTS

REPLICATION_SLOTS displays replication slot information, as described in **Table 13-137**.

Table 13-137 REPLICATION_SLOTS columns

Name	Type	Description
slot_name	text	Replication slot name.
plugin	text	Name of the output plug-in corresponding to the logical replication slot.

Name	Type	Description
slot_type	text	Replication slot type. • **physical**: physical replication slot. • **logical**: logical replication slot.
datoid	oid	OID of the database where the replication slot resides.
database	name	Name of the database where the replication slot resides.
active	boolean	Specifies whether the replication slot is activated. • **t** (true): yes • **f** (false): no
xmin	xid	XID of the earliest transaction that the database must reserve for the replication slot.
catalog_xmin	xid	XID of the earliest system catalog-involved transaction that the database must reserve for the logical replication slot.
restart_lsn	text	Physical location of the earliest Xlog required by the replication slot.
dummy_standby	boolean	Reserved parameter.

13.2.11.4 GLOBAL_REPLICATION_SLOTS

GLOBAL_REPLICATION_SLOTS displays replication slot information of each node in the database, as described in **Table 13-138**.

Table 13-138 GLOBAL_REPLICATION_SLOTS columns

Name	Type	Description
node_name	name	Node name.
slot_name	text	Replication slot name.
plugin	text	Name of the output plug-in corresponding to the logical replication slot.
slot_type	text	Replication slot type. • **physical**: physical replication slot. • **logical**: logical replication slot.
datoid	oid	OID of the database where the replication slot resides.

Name	Type	Description
database	name	Name of the database where the replication slot resides.
active	boolean	Determines whether the replication slot is activated. • **t** (true): yes • **f** (false): no
x_min	xid	XID of the earliest transaction that the database must reserve for the replication slot.
catalog_xmin	xid	XID of the earliest system catalog-involved transaction that the database must reserve for the logical replication slot.
restart_lsn	text	Physical location of the earliest Xlog required by the replication slot.
dummy_standby	boolean	Reserved parameter.

13.2.11.5 BGWRITER_STAT

BGWRITER_STAT displays statistics about the background writer thread's activities, as described in **Table 13-139**.

Table 13-139 BGWRITER_STAT columns

Name	Type	Description
checkpoints_timed	bigint	Number of scheduled checkpoints that have been performed.
checkpoints_req	bigint	Number of requested checkpoints that have been performed.
checkpoint_write_time	double precision	Total time that has been spent in the portion of checkpoint processing where files are written to disk (unit: ms).
checkpoint_sync_time	double precision	Total time that has been spent in the portion of checkpoint processing where files are synchronized to disk (unit: ms).
buffers_checkpoint	bigint	Number of buffers written during checkpoints.
buffers_clean	bigint	Number of buffers written by the background writer thread.

Name	Type	Description
maxwritten_clean	bigint	Number of times the background writer thread stopped a cleaning scan because it had written too many buffers.
buffers_backend	bigint	Number of buffers written directly by a backend.
buffers_backend_fsync	bigint	Number of times a backend had to execute its own fsync call (normally the background writer thread handles those even when the backend does its own write).
buffers_alloc	bigint	Number of buffers allocated.
stats_reset	timestamp with time zone	Time at which these statistics were last reset.

13.2.11.6 GLOBAL_BGWRITER_STAT

GLOBAL_BGWRITER_STAT displays statistics about the background writer thread's activities on each node, as described in **Table 13-140**.

Table 13-140 GLOBAL_BGWRITER_STAT columns

Name	Type	Description
node_name	name	Node name.
checkpoints_timed	bigint	Number of scheduled checkpoints that have been performed.
checkpoints_req	bigint	Number of requested checkpoints that have been performed.
checkpoint_write_time	double precision	Total time that has been spent in the portion of checkpoint processing where files are written to disk (unit: ms).
checkpoint_sync_time	double precision	Total time that has been spent in the portion of checkpoint processing where files are synchronized to disk (unit: ms).
buffers_checkpoint	bigint	Number of buffers written during checkpoints.
buffers_clean	bigint	Number of buffers written by the background writer thread.

Name	Type	Description
maxwritten_clean	bigint	Number of times the background writer thread stopped a cleaning scan because it had written too many buffers.
buffers_backend	bigint	Number of buffers written directly by a backend.
buffers_backend_fsync	bigint	Number of times a backend had to execute its own fsync call (normally the background writer thread handles those even when the backend does its own write).
buffers_alloc	bigint	Number of buffers allocated.
stats_reset	timestamp with time zone	Time at which these statistics were last reset.

13.2.11.7 GLOBAL_CKPT_STATUS

GLOBAL_CKPT_STATUS displays the checkpoint information and log flushing information about all instances in the database, as described in **Table 13-141**.

Table 13-141 GLOBAL_CKPT_STATUS columns

Name	Type	Description
node_name	text	Node name.
ckpt_redo_point	text	Checkpoint of the current instance
ckpt_clog_flush_num	bigint	Number of Clog flushing pages from the startup time to the current time
ckpt_csnlog_flush_num	bigint	Number of CSN log flushing pages from the startup time to the current time
ckpt_multixact_flush_num	bigint	Number of MultiXact flushing pages from the startup time to the current time
ckpt_predicate_flush_num	bigint	Number of predicate flushing pages from the startup time to the current time
ckpt_twophase_flush_num	bigint	Number of two-phase flushing pages from the startup time to the current time

13.2.11.8 GLOBAL_DOUBLE_WRITE_STATUS

GLOBAL_DOUBLE_WRITE_STATUS displays doublewrite file status of all instances in the database, as described in **Table 13-142**. It consists of the local_double_write_stat view of each node. Columns in the view on each node are the same.

Table 13-142 GLOBAL_DOUBLE_WRITE_STATUS columns

Name	Type	Description
node_name	text	Node name.
curr_dwn	bigint	Sequence number of the doublewrite file
curr_start_page	bigint	Start page for restoring the doublewrite file
file_trunc_num	bigint	Number of times that the doublewrite file is reused
file_reset_num	bigint	Number of reset times after the doublewrite file is full
total_writes	bigint	Total number of I/Os of the doublewrite file
low_threshold_writes	bigint	Number of I/Os for writing doublewrite files with low efficiency (the number of I/O flushing pages at a time is less than 16)
high_threshold_writes	bigint	Number of I/Os for writing doublewrite files with high efficiency (the number of I/O flushing pages at a time is more than 421)
total_pages	bigint	Total number of pages that are flushed to the doublewrite file area
low_threshold_pages	bigint	Number of pages that are flushed with low efficiency
high_threshold_pages	bigint	Number of pages that are flushed with high efficiency
file_id	bigint	ID of the current doublewrite file

13.2.11.9 GLOBAL_PAGEWRITER_STATUS

GLOBAL_PAGEWRITER_STATUS displays the page flushing information and checkpoint information about all instances in the database, as described in **Table 13-143**.

Table 13-143 GLOBAL_PAGEWRITER_STATUS columns

Name	Type	Description
node_name	text	Node name.

Name	Type	Description
pgwr_actual_flush_total_num	bigint	Total number of dirty pages flushed from the startup to the current time.
pgwr_last_flush_num	integer	Number of dirty pages flushed in the previous batch
remain_dirty_page_num	bigint	Estimated number of remaining dirty pages.
queue_head_page_rec_lsn	text	**recovery_lsn** of the first dirty page in the dirty page queue of the current instance
queue_rec_lsn	text	**recovery_lsn** of the dirty page queue of the current instance
current_xlog_insert_lsn	text	The write position of Xlogs in the current instance
ckpt_redo_point	text	Checkpoint of the current instance

13.2.11.10 GLOBAL_RECORD_RESET_TIME

GLOBAL_RECORD_RESET_TIME displays statistics about reset time in the database. Restart, primary/standby switchover, and database deletion will cause the time to be reset, as described in **Table 13-144**.

Table 13-144 GLOBAL_RECORD_RESET_TIME columns

Name	Type	Description
node_name	text	Node name.
reset_time	timestamp with time zone	Time to be reset

13.2.11.11 GLOBAL_REDO_STATUS

GLOBAL_REDO_STATUS displays the log replay status of all instances in the database, as described in **Table 13-145**.

Table 13-145 GLOBAL_REDO_STATUS columns

Name	Type	Description
node_name	text	Node name.
redo_start_ptr	bigint	Start point for replaying the instance logs
redo_start_time	bigint	Start time (UTC) when the instance logs are replayed

Name	Type	Description
redo_done_time	bigint	End time (UTC) when the instance logs are replayed
curr_time	bigint	Current time (UTC) of the instance
min_recovery_point	bigint	Position of the minimum consistency point for the instance logs
read_ptr	bigint	Position for reading the instance logs
last_replayed_read_ptr	bigint	Position for replaying the instance logs
recovery_done_ptr	bigint	Replay position after the instance is started
read_xlog_io_counter	bigint	Number of I/Os when the current instance reads and replays logs
read_xlog_io_total_dur	bigint	Total I/O latency when the current instance reads and replays logs
read_data_io_counter	bigint	Number of data page I/O reads during replay in the current instance
read_data_io_total_dur	bigint	Total I/O latency of data page reads during replay in the current instance
write_data_io_counter	bigint	Number of data page I/O writes during replay in the current instance
write_data_io_total_dur	bigint	Total I/O latency of data page writes during replay in the current instance
process_pending_counter	bigint	Number of synchronization times of log distribution threads during replay in the instance
process_pending_total_dur	bigint	Total synchronization latency of log distribution threads during replay in the instance
apply_counter	bigint	Number of synchronization times of replay threads during replay in the instance
apply_total_dur	bigint	Total synchronization latency of replay threads during replay in the instance
speed	bigint	Log replay rate of the current instance
local_max_ptr	bigint	Maximum number of replay logs received by the local host after the instance is started
primary_flush_ptr	bigint	Log point where the host flushes logs to a disk

Name	Type	Description
worker_info	text	Replay thread information of the instance. If concurrent replay is not enabled, the value is **NULL**.

13.2.11.12 GLOBAL_RECOVERY_STATUS

GLOBAL_RECOVERY_STATUS displays log flow control information about the primary and standby nodes, as described in **Table 13-146**.

Table 13-146 GLOBAL_RECOVERY_STATUS columns

Name	Type	Description
node_name	text	Node name (including the primary and standby nodes)
standby_node_name	text	Name of the standby node
source_ip	text	IP address of the primary node
source_port	integer	Port number of the primary node
dest_ip	text	IP address of the standby node
dest_port	integer	Port number of the standby node
current_rto	bigint	Current log flow control time of the standby node (unit: s)
target_rto	bigint	Expected flow control time of the standby node specified by the corresponding GUC parameter (unit: s)
current_sleep_time	bigint	Sleep time required to achieve the expected flow control time (unit: μs)

13.2.11.13 CLASS_VITAL_INFO

CLASS_VITAL_INFO is used to check whether the OIDs of the same table or index are consistent for WDR snapshots, as described in **Table 13-147**.

Table 13-147 CLASS_VITAL_INFO columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Schema name.

Name	Type	Description
relname	name	Table name.
relkind	"char"	Object type. Its value can be: • **r**: ordinary table • **t**: TOAST table • **i**: index
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.11.14 USER_LOGIN

USER_LOGIN records the number of user logins and logouts, as described in **Table 13-148**.

Table 13-148 USER_LOGIN columns

Name	Type	Description
node_name	text	Database process name
user_name	text	Username
user_id	integer	User OID (Its value is the same as that of **oid** in **pg_authid**.)
login_counter	bigint	Number of logins
logout_counter	bigint	Number of logouts

13.2.11.15 SUMMARY_USER_LOGIN

SUMMARY_USER_LOGIN records information about user logins and logouts on the primary database node, as described in **Table 13-149**.

Table 13-149 SUMMARY_USER_LOGIN columns

Name	Type	Description
node_name	text	Database process name
user_name	text	Username

Name	Type	Description
user_id	integer	User OID (Its value is the same as that of **oid** in **pg_authid**.)
login_counter	bigint	Number of logins
logout_counter	bigint	Number of logouts

13.2.11.16 GLOBAL_SINGLE_FLUSH_DW_STATUS

GLOBAL_SINGLE_FLUSH_DW_STATUS displays information about doublewrite files eliminated on a single page of all instances in the database, as described in **Table 13-150**. In the displayed information, the information before the slash (/) indicates the page flushing status of the first version, and the information after the slash (/) indicates the page flushing status of the second version.

Table 13-150 GLOBAL_SINGLE_FLUSH_DW_STATUS columns

Name	Type	Description
node_name	text	Instance name
curr_dwn	text	Sequence number of the doublewrite file
curr_start_page	text	Start position of the current doublewrite file
total_writes	text	Total number of data write pages in the current doublewrite file
file_trunc_num	text	Number of times that the doublewrite file is reused
file_reset_num	text	Number of reset times after the doublewrite file is full

13.2.11.17 GLOBAL_CANDIDATE_STATUS

GLOBAL_CANDIDATE_STATUS displays the number of candidate buffers and buffer eviction information of all instances in the database, as described in **Table 13-151**.

Table 13-151 GLOBAL_GET_BGWRITER_STATUS columns

Name	Type	Description
node_name	text	Node name
candidate_slots	integer	Number of pages in the candidate buffer chain of the current normal buffer pool

Name	Type	Description
get_buf_from_list	bigint	Number of times that pages are obtained from the candidate buffer chain during buffer eviction in the current normal buffer pool
get_buf_clock_sweep	bigint	Number of times that pages are obtained from the original eviction solution during buffer eviction in the current normal buffer pool
seg_candidate_slots	integer	Number of pages in the candidate buffer chain of the current segment buffer pool
seg_get_buf_from_list	bigint	Number of times that pages are obtained from the candidate buffer chain during buffer eviction in the current segment buffer pool
seg_get_buf_clock_sweep	bigint	Number of times that pages are obtained from the original eviction solution during buffer eviction in the current segment buffer pool

13.2.11.18 PARALLEL_DECODE_STATUS

PARALLEL_DECODE_STATUS displays parallel decoding information about replication slots on the current node, as described in **Table 13-152**.

Table 13-152 PARALLEL_DECODE_STATUS columns

Name	Type	Description
slot_name	text	Specifies the replication slot name.
parallel_decode_num	integer	Specifies the number of parallel decoder threads of the replication slot.
read_change_queue_length	text	Concatenates the current length of the log queue read by each decoder thread and then outputs the result.
decode_change_queue_length	text	Concatenates the current length of the decoding result queue of each decoder thread and then outputs the result.
reader_lsn	text	Specifies the location of the log read by the current reader thread.

Name	Type	Description
working_txn_cnt	bigint	Specifies the number of transactions that are being concatenated in the current sender thread.
working_txn_memory	bigint	Specifies the total memory occupied by concatenation transactions in the sender thread, in bytes.
decoded_time	timestamptz	Specifies the time of the latest WAL decoded by the replication slot.

13.2.11.19 GLOBAL_PARALLEL_DECODE_STATUS

GLOBAL_PARALLEL_DECODE_STATUS displays parallel decoding information about replication slots on the current node, as described in **Table 13-153**.

Table 13-153 GLOBAL_PARALLEL_DECODE_STATUS columns

Name	Type	Description
node_name	name	Specifies the node name.
slot_name	text	Specifies the replication slot name.
parallel_decode_num	integer	Specifies the number of parallel decoder threads of the replication slot.
read_change_queue_length	text	Concatenates the current length of the log queue read by each decoder thread and then outputs the result.
decode_change_queue_length	text	Concatenates the current length of the decoding result queue of each decoder thread and then outputs the result.
reader_lsn	text	Specifies the location of the log read by the current reader thread.
working_txn_cnt	bigint	Specifies the number of transactions that are being concatenated in the current sender thread.
working_txn_memory	bigint	Total memory occupied by concatenation transactions in the sender thread, in bytes.
decoded_time	timestamptz	Specifies the time of the latest WAL decoded by the replication slot.

13.2.11.20 PARALLEL_DECODE_THREAD_INFO

PARALLEL_DECODE_THREAD_INFO displays information about threads that perform parallel decoding on the current node, as described in **Table 13-154**.

Table 13-154 PARALLEL_DECODE_THREAD_INFO columns

Name	Type	Description
thread_id	bigint	Thread ID.
slot_name	text	Replication slot name.
thread_type	text	Thread type (sender, reader, or decoder).
seq_number	integer	Sequence number (starting from 1) of threads of the same type in the current replication slot.

13.2.11.21 GLOBAL_PARALLEL_DECODE_THREAD_INFO

GLOBAL_PARALLEL_DECODE_THREAD_INFO displays information about parallel decoder threads of replication slots on the current node, as described in **Table 13-155**.

Table 13-155 GLOBAL_PARALLEL_DECODE_THREAD_INFO columns

Name	Type	Description
node_name	name	Node name.
thread_id	bigint	Thread ID.
slot_name	text	Replication slot name.
thread_type	text	Thread type (sender, reader, or decoder).
seq_number	integer	Sequence number (starting from 1) of threads of the same type in the current replication slot.

13.2.11.22 GLOBAL_ADIO_COMPLETER_STATUS

GLOBAL_ADIO_COMPLETER_STATUS displays statistics about the AIO Completer thread in all database instances, as described in **Table 13-156**.

Table 13-156 GLOBAL_ADIO_COMPLETER_STATUS columns

Name	Type	Description
node_name	text	Instance name.
tid	int8	ID of the AIO Completer thread.
thread_type	text	AIO Completer thread type (read or write).
aio_submitted_num	int8	Number of committed asynchronous I/O requests of the AIO Completer thread.
aio_completed_num	int8	Number of completed asynchronous I/O requests of the AIO Completer thread.
aio_incompleted_num	int8	Number of asynchronous I/O requests that are not completed of the AIO Completer thread.
slot_count_left	int8	Indicates the number of idle slots.

13.2.11.23 GLOBAL_AIO_SLOT_USAGE_STATUS

GLOBAL_AIO_SLOT_USAGE_STATUS displays statistics about asynchronous I/O commit slots in all database instances, as described in **Table 13-157**.

Table 13-157 GLOBAL_AIO_SLOT_USAGE_STATUS columns

Name	Type	Description
node_name	text	Instance name.
slot_id	int4	Slot ID.
slot_type	char	Slot type. The value can be **r** (read) or **w** (write).
status	bool	Slot usage status.
buffer_id	int8	Buffer ID corresponding to the slot.
relfilenode_blocknum	text	Position of the physical page where the buffer corresponding to the slot is located.
lsn	int8	LSN corresponding to the page.
submitted_time	int8	Time when a page is committed asynchronously.
elapsed_time	int8	Waiting time of the page.

13.2.12 Lock

13.2.12.1 LOCKS

LOCKS displays information about locks held by each open transaction, as described in **Table 13-158**.

Table 13-158 LOCKS columns

Name	Type	Description
locktype	text	Type of the locked object: **relation**, **extend**, **page**, **tuple**, **transactionid**, **virtualxid**, **object**, **userlock**, or **advisory**
database	oid	OID of the database in which the locked object exists. • The OID is **0** if the object is a shared object. • The OID is **NULL** if the object is a transaction ID.
relation	oid	OID of the relationship targeted by the lock. The value is **NULL** if the object is not a relationship or part of a relationship.
page	integer	Page number targeted by the lock within the relationship. The value is **NULL** if the object is not a relationship page or row page.
tuple	smallint	Row number targeted by the lock within the page. The value is **NULL** if the object is not a row.
bucket	integer	Hash bucket ID.
virtualxid	text	Virtual ID of the transaction targeted by the lock. The value is **NULL** if the object is not a virtual transaction ID.
transactionid	xid	ID of the transaction targeted by the lock. The value is **NULL** if the object is not a transaction ID.
classid	oid	OID of the system catalog that contains the object. The value is **NULL** if the object is not a general database object.
objid	oid	OID of the locked object within its system catalog. The value is **NULL** if the object is not a general database object.
objsubid	smallint	Column number for a column in the table (**0** if the object is of other object type and **NULL** if the object is not a general database object)
virtualtransaction	text	Virtual ID of the transaction holding or awaiting this lock

Name	Type	Description
pid	bigint	Logical ID of the server thread holding or awaiting this lock. The value is **NULL** if the lock is held by a prepared transaction.
sessionid	bigint	ID of the session holding or awaiting this lock The value is **NULL** if the lock is held by a prepared transaction.
mode	text	Lock mode held or desired by this thread
granted	Boolean	• The value is **TRUE** if the lock is a held lock. • The value is **FALSE** if the lock is an awaited lock.
fastpath	Boolean	The value is **TRUE** if the lock is obtained through **fast-path**, and is **FALSE** if the lock is obtained through the main lock table.
locktag	text	Lock information that the session waits for. It can be parsed using the **locktag_decode()** function.
global_sessionid	text	Global session ID

13.2.12.2 GLOBAL_LOCKS

GLOBAL_LOCKS displays information about locks held by open transactions on each node, as described in **Table 13-159**.

Table 13-159 GLOBAL_LOCKS columns

Name	Type	Description
node_name	name	Node name.
locktype	text	Type of the locked object: **relation**, **extend**, **page**, **tuple**, **transactionid**, **virtualxid**, **object**, **userlock**, or **advisory**
database	oid	OID of the database in which the locked object exists. • The OID is **0** if the object is a shared object. • The OID is **NULL** if the object is a transaction ID.
relation	oid	OID of the relationship targeted by the lock. The value is **NULL** if the object is not a relationship or part of a relationship.

Name	Type	Description
page	integer	Page number targeted by the lock within the relationship. The value is **NULL** if the object is not a relationship page or row page.
tuple	smallint	Row number targeted by the lock within the page. The value is **NULL** if the object is not a row.
virtualxid	text	Virtual ID of the transaction targeted by the lock. The value is **NULL** if the object is not a virtual transaction ID.
transactionid	xid	ID of the transaction targeted by the lock. The value is **NULL** if the object is not a transaction ID.
classid	oid	OID of the system catalog that contains the object. The value is **NULL** if the object is not a general database object.
objid	oid	OID of the locked object within its system catalog. The value is **NULL** if the object is not a general database object.
objsubid	smallint	Column number for a column in the table (**0** if the target is of other object type and **NULL** if the object is not a general database object).
virtualtransaction	text	Virtual ID of the transaction holding or awaiting this lock.
pid	bigint	Logical ID of the server thread holding or awaiting this lock. The value is **NULL** if the lock is held by a prepared transaction.
mode	text	Lock mode held or desired by this thread.
granted	Boolean	• The value is **TRUE** if the lock is a held lock. • The value is **FALSE** if the lock is an awaited lock.
fastpath	Boolean	The value is **TRUE** if the lock is obtained through **fast-path**, and is **FALSE** if the lock is obtained through the main lock table.

13.2.13 Wait Events

13.2.13.1 WAIT_EVENTS

WAIT_EVENTS displays statistics about wait events on the current node, as described in **Table 13-160**. For details about the events, see **Table 12-412**, **Table**

12-413, Table 12-414, and Table 12-415. For details about the impact of each transaction lock on services, see LOCK.

Table 13-160 WAIT_EVENTS columns

Name	Type	Description
nodename	text	Database process name.
type	text	Event type.
event	text	Event name.
wait	bigint	Number of waiting times.
failed_wait	bigint	Number of waiting failures.
total_wait_time	bigint	Total waiting time (unit: μs).
avg_wait_time	bigint	Average waiting time (unit: μs).
max_wait_time	bigint	Maximum waiting time (unit: μs).
min_wait_time	bigint	Minimum waiting time (unit: μs).
last_updated	timestamp with time zone	Last time when the event was updated.

13.2.13.2 GLOBAL_WAIT_EVENTS

GLOBAL_WAIT_EVENTS displays statistics about wait events on each node, as described in Table 13-161.

Table 13-161 GLOBAL_WAIT_EVENTS columns

Name	Type	Description
nodename	text	Database process name
type	text	Event type
event	text	Event name
wait	bigint	Number of waiting times
failed_wait	bigint	Number of waiting failures
total_wait_time	bigint	Total waiting time (unit: μs)
avg_wait_time	bigint	Average waiting time (unit: μs)
max_wait_time	bigint	Maximum waiting time (unit: μs)

Name	Type	Description
min_wait_time	bigint	Minimum waiting time (unit: μs)
last_updated	timestamp with time zone	Last time when the event was updated

13.2.14 Configuration

13.2.14.1 CONFIG_SETTINGS

CONFIG_SETTINGS displays information about parameters of the running database, as described in **Table 13-162**.

Table 13-162 CONFIG_SETTINGS columns

Name	Type	Description
name	text	Parameter name
setting	text	Current parameter value
unit	text	Implicit unit of the parameter
category	text	Logical group of the parameter
short_desc	text	Brief description of the parameter
extra_desc	text	Detailed description of the parameter
context	text	Context required to set the parameter value, including **internal**, **postmaster**, **sighup**, **backend**, **superuser**, and **user**.
vartype	text	Parameter type, including **bool**, **enum**, **integer**, **real**, or **string**.
source	text	Method of assigning the parameter value
min_val	text	Maximum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.
max_val	text	Minimum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.
enumvals	text[]	Valid values of an enum-type parameter. If the parameter type is not enum, the value of this column is **null**.

Name	Type	Description
boot_val	text	Default parameter value used upon the database startup
reset_val	text	Default parameter value used upon the database reset
sourcefile	text	Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.
sourceline	integer	Row number in the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.

13.2.14.2 GLOBAL_CONFIG_SETTINGS

GLOBAL_CONFIG_SETTINGS displays information about parameters of running databases on each node, as described in **Table 13-163**.

Table 13-163 GLOBAL_CONFIG_SETTINGS columns

Name	Type	Description
node_name	text	Node name
name	text	Parameter name
setting	text	Current parameter value
unit	text	Implicit unit of the parameter
category	text	Logical group of the parameter
short_desc	text	Brief description of the parameter
extra_desc	text	Detailed description of the parameter
context	text	Context required to set the parameter value, including **internal**, **postmaster**, **sighup**, **backend**, **superuser**, and **user**.
vartype	text	Parameter type, including **bool**, **enum**, **integer**, **real**, or **string**.
source	text	Method of assigning the parameter value
min_val	text	Minimum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.

Name	Type	Description
max_val	text	Maximum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.
enumvals	text[]	Valid values of an enum-type parameter. If the parameter type is not enum, the value of this column is **null**.
boot_val	text	Default parameter value used upon the database startup
reset_val	text	Default parameter value used upon the database reset
sourcefile	text	Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.
sourceline	integer	Row number in the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.

13.2.15 Operator

13.2.15.1 OPERATOR_HISTORY_TABLE

OPERATOR_HISTORY_TABLE displays records about operators of completed jobs, as described in **Table 13-164**. Data is dumped from the kernel to this system catalog.

Table 13-164 OPERATOR_HISTORY_TABLE columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution.
pid	bigint	Thread ID of the backend.
plan_node_id	integer	Plan node ID of the execution plan.
plan_node_name	text	Name of the operator corresponding to the plan node ID.
start_time	timestamp with time zone	Time when the operator starts to process the first data record.

Name	Type	Description
duration	bigint	Total execution time of the operator (unit: ms).
query_dop	integer	DOP of the operator.
estimated_rows	bigint	Number of rows estimated by the optimizer.
tuple_processed	bigint	Number of elements returned by the operator.
min_peak_memory	integer	Minimum peak memory used by the operator on database nodes (unit: MB).
max_peak_memory	integer	Maximum peak memory used by the operator on database nodes (unit: MB).
average_peak_memory	integer	Average peak memory used by the operator on database nodes (unit: MB).
memory_skew_percent	integer	Memory usage skew of the operator among database nodes.
min_spill_size	integer	Minimum spilled data among database nodes when a spill occurs (unit: MB) (default value: **0**).
max_spill_size	integer	Maximum spilled data among database nodes when a spill occurs (unit: MB) (default value: **0**).
average_spill_size	integer	Average spilled data among database nodes when a spill occurs (unit: MB) (default value: **0**).
spill_skew_percent	integer	Database node spill skew when a spill occurs.
min_cpu_time	bigint	Minimum execution time of the operator on database nodes (unit: ms).
max_cpu_time	bigint	Maximum execution time of the operator on database nodes (unit: ms).
total_cpu_time	bigint	Total execution time of the operator on database nodes (unit: ms).
cpu_skew_percent	integer	Execution time skew among database nodes.

Name	Type	Description
warning	text	Warning. The following warnings are displayed: • Sort/SetOp/HashAgg/HashJoin spill • Spill file size large than 256MB • Broadcast size large than 100MB • Early spill • Spill times is greater than 3 • Spill on memory adaptive • Hash table conflict

13.2.15.2 OPERATOR_HISTORY

OPERATOR_HISTORY displays records of operators in jobs that have been executed by the current user on the current primary database node.

13.2.15.3 OPERATOR_RUNTIME

OPERATOR_RUNTIME displays information about operators of the jobs that are being executed by the current user, as described in **Table 13-165**.

Table 13-165 OPERATOR_RUNTIME columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution
pid	bigint	Thread ID of the backend
plan_node_id	integer	Plan node ID of the execution plan of a query
plan_node_name	text	Name of the operator corresponding to the plan node ID
start_time	timestamp with time zone	Time when the operator starts to process the first data record
duration	bigint	Total execution time of the operator, in ms
status	text	Execution status of the current operator, which can be **finished** or **running**.
query_dop	integer	DOP of the operator
estimated_rows	bigint	Number of rows estimated by the optimizer
tuple_processed	bigint	Number of elements returned by the operator

Name	Type	Description
min_peak_memory	integer	Minimum peak memory used by the operator on database nodes (unit: MB)
max_peak_memory	integer	Maximum peak memory used by the operator on database nodes (unit: MB)
average_peak_memory	integer	Average peak memory used by the operator on database nodes (unit: MB)
memory_skew_percent	integer	Memory usage skew of the operator among database nodes
min_spill_size	integer	Minimum spilled data among database nodes when a spill occurs (unit: MB) (default value: **0**)
max_spill_size	integer	Maximum spilled data among database nodes when a spill occurs (unit: MB) (default value: **0**)
average_spill_size	integer	Average spilled data among database nodes when a spill occurs (unit: MB) (default value: **0**)
spill_skew_percent	integer	Database node spill skew when a spill occurs
min_cpu_time	bigint	Minimum execution time of the operator on database nodes (unit: ms).
max_cpu_time	bigint	Maximum execution time of the operator on database nodes (unit: ms).
total_cpu_time	bigint	Total execution time of the operator on database nodes (unit: ms).
cpu_skew_percent	integer	Execution time skew among database nodes
warning	text	Warning. The following warnings are displayed: ● Sort/SetOp/HashAgg/HashJoin spill ● Spill file size large than 256MB ● Broadcast size large than 100MB ● Early spill ● Spill times is greater than 3 ● Spill on memory adaptive ● Hash table conflict

13.2.15.4 GLOBAL_OPERATOR_HISTORY

GLOBAL_OPERATOR_HISTORY displays records of operators in jobs that have been executed by the current user on the primary database node, as described in **Table 13-166**.

Table 13-166 GLOBAL_OPERATOR_HISTORY columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution
pid	bigint	Thread ID of the backend
plan_node_id	integer	Plan node ID of the execution plan
plan_node_name	text	Name of the operator corresponding to the plan node ID
start_time	timestamp with time zone	Time when the operator starts to process the first data record
duration	bigint	Total execution time of the operator, in ms
query_dop	integer	DOP of the operator
estimated_rows	bigint	Number of rows estimated by the optimizer
tuple_processed	bigint	Number of elements returned by the operator
min_peak_memory	integer	Minimum peak memory used by the operator on database nodes (unit: MB)
max_peak_memory	integer	Maximum peak memory used by the operator on database nodes (unit: MB)
average_peak_memory	integer	Average peak memory used by the operator on database nodes (unit: MB)
memory_skew_percent	integer	Memory usage skew of the operator among database nodes
min_spill_size	integer	Minimum spilled data among database nodes when a spill occurs (unit: MB) (default value: **0**)
max_spill_size	integer	Maximum spilled data among database nodes when a spill occurs (unit: MB) (default value: **0**)
average_spill_size	integer	Average spilled data among database nodes when a spill occurs (unit: MB) (default value: **0**)
spill_skew_percent	integer	Database node spill skew when a spill occurs

Name	Type	Description
min_cpu_time	bigint	Minimum execution time of the operator on database nodes (unit: ms)
max_cpu_time	bigint	Maximum execution time of the operator on database nodes (unit: ms)
total_cpu_time	bigint	Total execution time of the operator on database nodes (unit: ms)
cpu_skew_percent	integer	Execution time skew among database nodes
warning	text	Warning. The following warnings are displayed: 1. Sort/SetOp/HashAgg/HashJoin spill 2. Spill file size large than 256MB 3. Broadcast size large than 100MB 4. Early spill 5. Spill times is greater than 3 6. Spill on memory adaptive 7. Hash table conflict

13.2.15.5 GLOBAL_OPERATOR_HISTORY_TABLE

GLOBAL_OPERATOR_HISTORY_TABLE displays the records about operators of completed jobs on the primary database node. Data is dumped from the kernel to the system catalog **GS_WLM_OPERATOR_INFO**.
GLOBAL_OPERATOR_HISTORY_TABLE is a collection view for querying the system catalog **GS_WLM_OPERATOR_INFO** on the primary database node. Columns in this view are the same as those in **Table 13-166**.

13.2.15.6 GLOBAL_OPERATOR_RUNTIME

GLOBAL_OPERATOR_RUNTIME displays information about operators of the jobs that are being executed by the current user on the primary database node, as described in **Table 13-167**.

Table 13-167 GLOBAL_OPERATOR_RUNTIME columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution
pid	bigint	Thread ID of the backend
plan_node_id	integer	Plan node ID of the execution plan
plan_node_name	text	Name of the operator corresponding to the plan node ID

Name	Type	Description
start_time	timestamp with time zone	Time when the operator starts to process the first data record
duration	bigint	Total execution time of the operator, in ms
status	text	Execution status of the current operator, which can be **finished** or **running**.
query_dop	integer	DOP of the operator
estimated_rows	bigint	Number of rows estimated by the optimizer
tuple_processed	bigint	Number of elements returned by the operator
min_peak_memory	integer	Minimum peak memory used by the operator on database nodes (unit: MB)
max_peak_memory	integer	Maximum peak memory used by the operator on database nodes (unit: MB)
average_peak_memory	integer	Average peak memory used by the operator on database nodes (unit: MB)
memory_skew_percent	integer	Memory usage skew of the operator among database nodes
min_spill_size	integer	Minimum spilled data among database nodes when a spill occurs (unit: MB) (default value: **0**)
max_spill_size	integer	Maximum spilled data among database nodes when a spill occurs (unit: MB) (default value: **0**)
average_spill_size	integer	Average spilled data among database nodes when a spill occurs (unit: MB) (default value: **0**)
spill_skew_percent	integer	Database node spill skew when a spill occurs
min_cpu_time	bigint	Minimum execution time of the operator on database nodes (unit: ms)
max_cpu_time	bigint	Maximum execution time of the operator on database nodes (unit: ms)
total_cpu_time	bigint	Total execution time of the operator on database nodes (unit: ms)
cpu_skew_percent	integer	Execution time skew among database nodes

Name	Type	Description
warning	text	Warning. The following warnings are displayed: • Sort/SetOp/HashAgg/HashJoin spill • Spill file size large than 256MB • Broadcast size large than 100MB • Early spill • Spill times is greater than 3 • Spill on memory adaptive • Hash table conflict

13.2.16 Workload Manager

13.2.16.1 WLM_USER_RESOURCE_CONFIG

WLM_USER_RESOURCE_CONFIG displays the resource configuration information of a user, as described in **Table 13-168**.

Table 13-168 WLM_USER_RESOURCE_CONFIG columns

Name	Type	Description
userid	oid	OID of the user
username	name	Username
sysadmin	boolean	Whether the user has the **sysadmin** permission
rpoid	oid	OID of the resource pool
respool	name	Name of a resource pool
parentid	oid	OID of the parent user
totalspace	bigint	Size of the occupied space
spacelimit	bigint	Upper limit of the space size
childcount	integer	Number of child users
childlist	text	Child user list

13.2.16.2 WLM_USER_RESOURCE_RUNTIME

WLM_USER_RESOURCE_RUNTIME displays resource usage of all users. Only administrators can query this view, as described in **Table 13-169**. This view is valid only when the GUC parameter **use_workload_manager** is set to **on**.

Table 13-169 WLM_USER_RESOURCE_RUNTIME columns

Name	Type	Description
username	name	Username
used_memory	integer	Used memory (unit: MB)
total_memory	integer	Available memory (unit: MB) The value **0** indicates that the available memory is not limited and depends on the maximum memory available in the database.
used_cpu	integer	Number of CPU cores in use
total_cpu	integer	Total number of CPU cores of the Cgroup associated with the user on the node
used_space	bigint	Used storage space (unit: KB)
total_space	bigint	Available storage space (unit: KB) The value **-1** indicates that the maximum storage space is not limited.
used_temp_space	bigint	Used temporary space (reserved column; unit: KB)
total_temp_space	bigint	Available temporary storage space (reserved column; unit: KB) The value **-1** indicates that the maximum temporary storage space is not limited.
used_spill_space	bigint	Used space for storing spilled data (reserved column; unit: KB)
total_spill_space	bigint	Available storage space for spilled data (reserved column; unit: KB) The value **-1** indicates that the maximum space for spilled data is not limited.

13.2.17 Global Plancache

Global plan cache (GPC) views are valid only when **enable_global_plancache** is set to **on**.

13.2.17.1 GLOBAL_PLANCACHE_STATUS

GLOBAL_PLANCACHE_STATUS displays the GPC status information, as described in **Table 13-170**.

Table 13-170 GLOBAL_PLANCACHE_STATUS columns

Name	Type	Description
nodename	text	Name of the node that the plan cache belongs to
query	text	Text of query statements
refcount	integer	Number of times that the plan cache is referenced
valid	bool	Whether the plan cache is valid
databaseid	oid	ID of the database that the plan cache belongs to
schema_name	text	Schema that the plan cache belongs to
params_num	integer	Number of parameters
func_id	oid	OID of the stored procedure where the plan cache is located. If the plancache does not belong to the stored procedure, the value is **0**.
pkg_id	oid	Package to which the stored procedure where the plancache is located belongs. If the stored procedure does not belong to a package, the value is **0**.
stmt_id	integer	Sequence number of the statement plan in the stored procedure.

13.2.17.2 GLOBAL_PLANCACHE_CLEAN

GLOBAL_PLANCACHE_CLEAN clears the global plan cache that is not used on all nodes. The return value is of the Boolean type.

13.2.18 RTO & RPO

13.2.18.1 global_rto_status

global_rto_status displays log flow control information about the primary and standby nodes (except the current node and standby DNs), as described in **Table 13-171**.

Table 13-171 global_rto_status columns

Parameter	Type	Description
node_name	text	Node name (including the primary and standby nodes)

Parameter	Type	Description
rto_info	text	Flow control information, including the current log flow control time (unit: second) of the standby node, the expected flow control time (unit: second) specified by the GUC parameter, and the primary node sleep time (unit: μs) required to reach the expectation

13.2.18.2 global_streaming_hadr_rto_and_rpo_stat

global_streaming_hadr_rto_and_rpo_stat displays the log flow control information about the primary and standby database instances in the streaming DR scenario, as described in **Table 13-172**. (This schema can be used only on the primary DN of the primary database instance. Statistics cannot be obtained from the standby DN or the standby database instance.)

Table 13-172 Parameters

Parameter	Type	Description
hadr_sender_node_name	text	Node name, including the primary database instance and the first standby node of the standby database instance.
hadr_receiver_node_name	text	Name of the first standby node of the standby database instance.
current_rto	int	Flow control information, that is, log RTO time of the current primary and standby database instances (unit: second). **-1** indicates that the majority of the DR cluster is abnormal.
target_rto	int	Flow control information, that is, the RTO time between the target primary and standby database instances (unit: second).
current_rpo	int	Flow control information, that is, log RPO time of the current primary and standby database instances (unit: second). **-1** indicates that the majority of the DR cluster is abnormal.
target_rpo	int	Flow control information, that is, the RPO time between the target primary and standby database instances (unit: second).
rto_sleep_time	int	RTO flow control information, that is, the expected sleep time (unit: μs) required by walsender on the host to reach the specified RTO.
rpo_sleep_time	int	RPO flow control information, that is, the expected sleep time (unit: μs) required by xlogInsert on the host to reach the specified RPO.

13.2.19 AI Watchdog

13.2.19.1 ai_watchdog_monitor_status

Table 13-173 ai_watchdog_monitor_status parameters

Parameter	Type	Description
metric_name	text	Metric names: • **tps**: TPS. • **tps_hourly**: average TPS per hour. • **shared_used_mem**: the used shared memory (MB). • **dynamic_used_shrctx**: the used shared memory context (MB). • **other_used_mem**: other used memory (MB). • **process_used_mem**: the used resident memory (MB). • **dynamic_used_mem**: the used dynamic memory (MB). • **malloc_failures**: the number of memory allocation failures in each collection interval. • **D_state_rate**: percentage of threads in the D state. • **R_state_rate**: percentage of threads in the R state. • **S_state_rate**: ratio of threads in the S state. • **db_state**: database state (**68** indicates D, **82** indicates R, and **83** indicates S). • **cpu_usage**: CPU usage. The upper limit is 100. • **disk_io**: disk I/O delay between two collection intervals. • **network_io**: network I/O delay between two collection intervals. • **threadpool_usage**: thread pool usage. • **threadpool_hang_rate**: percentage of the thread pool group in the hang state.
max_length	int	Collection queue length.
current_length	int	The number of currently collected samples.

Parameter	Type	Description
collection_interval	int	Collection interval, in seconds.
latest_value	int	Value collected last time. If no value is collected, the value is **null**.
last_report	timestamp	The last collection time.

13.2.19.2 ai_watchdog_detection_warnings

Table 13-174 ai_watchdog_detection_warnings parameters

Parameter	Type	Description
event	text	Event name.
cause	text	Event cause.
details	text	Event details.
time	timestamp	Reporting time.
need_to_handle	bool	Determines whether automatic processing is required.

13.2.19.3 ai_watchdog_parameters

Table 13-175 ai_watchdog_parameters parameters

Parameter	Type	Description
name	text	Parameter name. The options are as follows: • **enable_ai_watchdog**: determines whether to enable this function. • **ai_watchdog_max_consuming_time_ms**: specifies the maximum duration. • **ai_watchdog_used_memory_kb**: specifies the memory used by this function. • **ai_watchdog_detection_times**: specifies the number of detection times. • **enable_self_healing**: determines whether self-healing can be performed after a problem is detected. • **oom_detected_times**: specifies the number of detected OOMs. • **hang_detected_times**: specifies the number of detected hang times. • **enable_oom_detection**: determines whether the OOM detection function is automatically enabled. • **in_wait_time**: determines whether the system is waiting. • **other_used_memory_has_risk**: determines whether other memory usage is risky. • **shared_used_mem_has_risk**: determines whether risks exist when the shared memory context is used. • **dynamic_used_shrctx_has_risk**: determines whether the dynamic memory usage is risky.
value	text	Parameter value

13.2.19.4 ai_watchdog_ftask_status

Table 13-176 ai_watchdog_ftask_status parameters

Parameter	Type	Description
name	text	Name of the watchdog feeding task.
timeout_threshold	int	Timeout threshold of the watchdog feeding task.
register_time	timestamp	Registration time of the watchdog feeding task.
thread_id	bigint	ID of the thread on which the watchdog feeding task is used.
thread_name	text	Name of the thread on which the watchdog feeding task is used.
last_feed	timestamp	Latest time when the watchdog is fed. The default initial value is **register_time**.
restart_count	int	Number of times that the same name of watchdog feeding task is repeatedly registered due to the same backend thread exception. This parameter is cleared after the task invokes the interface for canceling watchdog resetting task registration.
timeout_action	text	Timeout processing action specified during task registration. Currently, the following actions are provided: • **WATCHDOG_REPORT_WARNING**: Prompt the timeout locating and demarcation. • **WATCHDOG_SEND_SIGTERM**: Send SIGTERM signals to threads. • **WATCHDOG_SEND_SIGUSR2**: Send SIGUSR2 signals to threads. • **WATCHDOG_SEND_SIGQUIT**: Send SIGQUIT signals to threads. • **WATCHDOG_EXIT_PROCESS**: Exit the process.

13.3 WDR Snapshot Schema

After the WDR snapshot function is enabled (the GUC parameter **enable_wdr_snapshot** is set to **on**), objects are created in the snapshot schema of user tablespace **pg_default** and database postgres to flush WDR snapshot data. By default, the initial user or the **monadmin** user can access and operate the object of the snapshot schema.

You can set the GUC parameter **wdr_snapshot_retention_days** to automatically manage the snapshot lifecycle.

NOTICE

Do not add, delete, or modify tables in the snapshot schema. Manual modification or damage to these tables may cause WDR exceptions or even WDR unavailability.

13.3.1 Original Information of WDR Snapshots

13.3.1.1 SNAPSHOT.SNAPSHOT

SNAPSHOT records the index information, start time, and end time of WDR snapshots stored in the current system. The result can be queried only in the system database but cannot be queried in the user database, as described in **Table 13-177**. After the WDR snapshot function is enabled (the GUC parameter **enable_wdr_snapshot** is set to **on**), the table is created.

Table 13-177 SNAPSHOT attributes

Name	Type	Description	Example
snapshot_id	bigint	WDR snapshot ID.	1
start_ts	timestamp	Start time of a WDR snapshot.	2019-12-28 17:11:27.423742+08
end_ts	timestamp	End time of a WDR snapshot.	2019-12-28 17:11:43.67726+08
version	int	Version of a WDR snapshot.	1
snap_flag	bigint	Attribute of the WDR snapshot. • **NULL**: The snapshot is of an earlier version. • **0**: The snapshot is a full snapshot. • **1**: The snapshot is an incremental snapshot.	0
base_snapshot_id	bigint	ID of the full snapshot corresponding to the WDR snapshot.	1

13.3.1.2 SNAPSHOT.TABLES_SNAP_TIMESTAMP

TABLES_SNAP_TIMESTAMP records the databases, table objects, and start and end time of all WDR snapshots, as described in **Table 13-178**. After the WDR snapshot function is enabled (the GUC parameter **enable_wdr_snapshot** is set to **on**), the table is created.

Table 13-178 TABLES_SNAP_TIMESTAMP attributes

Name	Type	Description	Example
snapshot_id	bigint	WDR snapshot ID.	1
node_name	name	Name of the node to which the table information of the WDR snapshot belongs.	dn_6001
db_name	text	Database corresponding to a WDR snapshot.	tpcc1000
tablename	text	Table corresponding to a WDR snapshot.	snap_xc_statio_all_indexes
start_ts	timestamp	Start time of a WDR snapshot.	2019-12-28 17:11:27.425849+08
end_ts	timestamp	End time of a WDR snapshot.	2019-12-28 17:11:27.707398+08

13.3.1.3 SNAP_SEQ

SNAP_SEQ is an incremental sequence that provides the snapshot IDs for the WDR snapshot. After the WDR snapshot function is enabled (the GUC parameter **enable_wdr_snapshot** is set to **on**), the sequence is created.

13.3.2 WDR Snapshot Data Table

The naming rule of a WDR Snapshot data table is **snap**_*{Source data table}*.

The source of WDR snapshot data tables is the view under **DBE_PERF Schema**. After the WDR snapshot function is enabled (the GUC parameter **enable_wdr_snapshot** is set to **on**), the WDR snapshot data table is created.

13.4 DBE_PLDEBUGGER Schema

DBE_PLDEBUGGER Schema system functions are used to debug stored procedures. This chapter describes the interfaces supported by DBE_PLDEBUGGER Schema.

Only an administrator has the permission to execute these debugging interfaces, but does not have the permission to modify or create functions in the schema. Common users can debug only non-system functions in the public schema or user-created schema. Common users are not allowed to debug system functions.

NOTICE

- When a user is created in the function body, the plaintext password is returned when attach, next, continue, info_code, step, info_breakpoint, backtrace or finish is called. You are advised not to create a user in the function body.
- During the debugging of a stored procedure, if the stored procedure to be debugged involves lock operations, do not perform operations that may cause deadlocks on the debugging end.
- The debugging end and the debugged end must be connected to the same database. Otherwise, the API that uses the function OID to obtain function information is unavailable.

The administrator can run the following command to grant the **gs_role_pldebugger** role and debugger permissions to a user:

```
GRANT gs_role_pldebugger to user;
```

Two clients are required to connect to the database. One client is responsible for executing the debugging API as the debug end, and the other client is responsible for executing the debugging function to control the execution of stored procedures on the server. The following is an example:

- Prepare for debugging.

  Use PG_PROC to find the OID of the stored procedure to be debugged and execute DBE_PLDEBUGGER.turn_on(oid). In this case, the client functions as the server.

  ```
  gaussdb=# CREATE OR REPLACE PROCEDURE test_debug ( IN  x INT)
  AS
  BEGIN
      INSERT INTO t1 (a) VALUES (x);
      DELETE FROM t1 WHERE a = x;
  END;
  /
  CREATE PROCEDURE
  gaussdb=# SELECT OID FROM PG_PROC WHERE PRONAME='test_debug';
    oid
  -------
   16389
  (1 row)
  gaussdb=# SELECT * FROM DBE_PLDEBUGGER.turn_on(16389);
   nodename | port
  ----------+------
   datanode |    0
  (1 row)
  ```

- Start debugging.

  When the server executes the stored procedure, the server hangs before the first SQL statement in the stored procedure and waits for the debugging message sent by the debug end. Debugging is supported only by directly executing a stored procedure and cannot be achieved by invoking an executed stored procedure through a trigger.

  ```
  gaussdb=# call test_debug(1);
  ```

  Start another client as the debug end and invoke **DBE_PLDEBUGGER.attach** to attach with the stored procedure for debugging based on the data returned by **turn_on**.

  ```
  gaussdb=# SELECT * FROM DBE_PLDEBUGGER.attach('datanode',0);
   funcoid |  funcname  | lineno |              query
  ```

```
---------+------------+--------+---------------------------------
  16389 | test_debug |      3 |   INSERT INTO t1 (a) VALUES (x);
(1 row)
```

Execute the next statement on the client where the attach operation is performed.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.next();
 funcoid |  funcname  | lineno |        query
---------+------------+--------+----------------------
  16389 | test_debug |      0 | [EXECUTION FINISHED]
(1 row)
```

Execute the following variable operations on the client where the attach command is performed.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.info_locals(); -- Print all variables.
 varname | vartype | value | package_name | isconst
---------+---------+-------+--------------+---------
 x       | int4    | 1     |              | f
(1 row)
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.set_var('x', 2); -- Assign a value to a variable.
 set_var
---------
 t
(1 row)
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.print_var('x'); -- Print a single variable.
 varname | vartype | value | package_name | isconst
---------+---------+-------+--------------+---------
 x       | int4    | 2     |              | f
(1 row)
```

Directly execute the stored procedure that is being debugged.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.continue();
 funcoid |  funcname  | lineno |        query
---------+------------+--------+----------------------
  16389 | test_debug |      0 | [EXECUTION FINISHED]
(1 row)
```

When the stored procedure reports an error, the following information is displayed. In this case, the suspended process logic is triggered.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.continue();
 funcoid |  funcname  | lineno |            query
---------+------------+--------+-------------------------------
  16389 | test_debug |      0 | [EXECUTION HAS ERROR OCCURRED!]
(1 row)
```

If the suspended process logic is triggered, you can call the error_info_locals,error_backtrace, error_end, and print_var APIs to view information. Other APIs cannot be used anymore. You need to use error_end to end the suspended process logic.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.error_end();
 funcoid |  funcname  | lineno |      query
---------+------------+--------+------------------
  16389 | test_debug |      0 | [END HANG ERROR!]
(1 row)
```

Exit the stored procedure that is being debugged (the suspended process logic is unavailable), and do not execute statements that have not been executed before.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.abort();
 abort
-------
 t
(1 row)
```

View the code information on the client and identify the line number of the breakpoint that can be set.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.info_code(16389);
 lineno |                          query                          | canbreak
--------+---------------------------------------------------------+----------
        | CREATE OR REPLACE PROCEDURE public.test_debug( IN  x INT) | f
      1 | AS  DECLARE                                               | f
      2 | BEGIN                                                     | f
      3 |     INSERT INTO t1 (a) VALUES (x);                        | t
      4 |     DELETE FROM t1 WHERE a = x;                           | t
      5 | END;                                                      | f
      6 | /                                                         | f
(7 rows)
```

Sets a breakpoint.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.add_breakpoint(16389,4);
breakpointno
--------------
           0
(1 row)
```

View the breakpoint information.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.info_breakpoints();
 breakpointno | funcoid | lineno |              query              | enable
--------------+---------+--------+---------------------------------+--------
            0 |   16389 |      4 |     DELETE FROM t1 WHERE a = x; | t
(1 row)
```

Execute to the breakpoint.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.continue();
 funcoid |  funcname  | lineno |              query
---------+------------+--------+---------------------------------
   16389 | test_debug |      4 |     DELETE FROM t1 WHERE a = x;
(1 row)
```

After the stored procedure is executed, the debugging automatically exits. To debug the stored procedure again, you need to attach again. If the server does not need to be debugged, run the **turn_off** command to disable the debugging or exit the session. **Table 13-179** describes the debugging interfaces.

Table 13-179 DBE_PLDEBUGGER

Interface	Description
DBE_PLDEBUGGER.turn_on	Invoked by the server, indicating that the stored procedure can be debugged. After the interface is invoked, the stored procedure is hung to wait for debugging information.
DBE_PLDEBUGGER.turn_off	Invoked by the server, indicating that debugging the stored procedure is disabled.
DBE_PLDEBUGGER.local_debug_server_info	Invoked by the server to print all stored procedures that have been turned on in the current session.
DBE_PLDEBUGGER.attach	Invoked by the debug end to attach with the stored procedure that is being debugged.
DBE_PLDEBUGGER.info_locals	Invoked by the debug end to print the current values of variables in the stored procedure that is being debugged.

Interface	Description
DBE_PLDEBUGGER.next	Invoked by the debug end to execute the next step.
DBE_PLDEBUGGER.continue	Invoked by the debug end to continue the execution until the breakpoint or stored procedure ends.
DBE_PLDEBUGGER.abort	Invoked by the debug end to stop debugging. The server reports a long jump error.
DBE_PLDEBUGGER.print_var	Invoked by the debug end to print the current values of specified variables in the stored procedure that is being debugged.
DBE_PLDEBUGGER.info_code	Invoked by the debug end or server to print the source statement of a specified stored procedure and the line number corresponding to each line.
DBE_PLDEBUGGER.step	Invoked by the debug end to execute step by step.
DBE_PLDEBUGGER.add_breakpoint	Invoked by the debug end to add a breakpoint.
DBE_PLDEBUGGER.delete_breakpoint	Invoked by the debug end to delete a breakpoint.
DBE_PLDEBUGGER.info_breakpoints	Invoked by the debug end to view all breakpoints.
DBE_PLDEBUGGER.backtrace	Invoked by the debug end to check the current call stack.
DBE_PLDEBUGGER.enable_breakpoint	Invoked by the debug end to enable breakpoints.
DBE_PLDEBUGGER.disable_breakpoint	Invoked by the debug end to disable breakpoints.
DBE_PLDEBUGGER.finish	Invoked by the debug end to continue the debugging until the breakpoint is reached or the upper-layer call stack is returned.
DBE_PLDEBUGGER.set_var	Invoked by the debug end to assign a value to a variable.

13.4.1 DBE_PLDEBUGGER.turn_on

This function is used to mark a stored procedure as debuggable, as described in Table 13-180. After **turn_on** is executed, the server can execute the stored procedure for debugging. You need to manually obtain the OID of the stored procedure based on the PG_PROC system catalog and transfer it to the function. After **turn_on** is executed, the execution of the stored procedure in the current session is hung before the first SQL statement to wait for the debugging

instruction from the debug end. This setting is cleared by default after the session is disconnected. Currently, stored procedures and functions with autonomous transactions enabled cannot be debugged. After **turn_on** is executed, the number of stored procedures cannot exceed 100.

The function prototype is as follows:

```
DBE_PLDEBUGGER.turn_on(Oid)
RETURN Record;
```

Table 13-180 turn_on input parameters and return values

Name	Type	Description
func_oid	IN oid	Function OID.
nodename	OUT text	Node name.
port	OUT integer	Connection port number.

13.4.2 DBE_PLDEBUGGER.turn_off

This function is used only to remove the debugging flag added by **turn_on** to the current session. The return value indicates success or failure, as described in **Table 13-181**. You can run the **DBE_PLDEBUGGER.local_debug_server_info** command to query the OID of the stored procedure that has been turned on.

The function prototype is as follows:

```
DBE_PLDEBUGGER.turn_off(Oid)
RETURN boolean;
```

Table 13-181 turn_off input parameters and return values

Name	Type	Description
func_oid	IN oid	Function OID.
turn_off	OUT boolean	Whether turn-off is successful.

13.4.3 DBE_PLDEBUGGER.local_debug_server_info

This function is used to query the OID of the stored procedure that has been turned on in the current connection. You can use **funcoid** and **pg_proc** together to determine which stored procedures are to be debugged, as described in **Table 13-182**.

Table 13-182 local_debug_server_info returned input parameters and return values

Name	Type	Description
nodename	OUT text	Node name.
port	OUT bigint	Port number.
funcoid	OUT oid	Stored procedure OID.

13.4.4 DBE_PLDEBUGGER.attach

When the server executes a stored procedure, the server hangs the execution before the first statement and waits for attaching with the debug end. The debug end invokes the attach function and transfers node name and port number to attach with the specified stored procedure, as described in **Table 13-183**.

If an error is reported during debugging, the attach operation automatically becomes invalid. If the debug end is attached to another stored procedure during debugging, the debugging of the attached stored procedure becomes invalid. If the attach operation is performed repeatedly, the current stored procedure is disconnected.

Table 13-183 attach input parameters and return values

Name	Type	Description
nodename	IN text	Node name.
port	IN integer	Connection port number.
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.
lineno	OUT integer	Number of the next line in the current debugging process.
query	OUT text	Source code of the next line of the function that is being debugged.

13.4.5 DBE_PLDEBUGGER.info_locals

During debugging on the debug end, **info_locals** is invoked to print the variables in the current stored procedure. The input parameter **frameno** of this function indicates the stack layer to be traversed. This function can be called without **frameno**. By default, the top-layer stack variable is queried, as described in **Table 13-184**.

Table 13-184 info_locals input parameters and return values

Name	Type	Description
frameno	IN integer (optional)	Specified stack layer. The default value is the top layer.
varname	OUT text	Variable name.
vartype	OUT text	Variable type.
value	OUT text	Variable value.
package_name	OUT text	Name of the package corresponding to the variable. If the variable is not a package, the value is null.
isconst	OUT boolean	Whether the value is a constant.

13.4.6 DBE_PLDEBUGGER.next

This function is used to execute the current SQL statement in a stored procedure and return the number of the next SQL statement and the corresponding query, as described in **Table 13-185**.

Table 13-185 next input parameters and return values

Name	Type	Description
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.
lineno	OUT integer	Number of the next line in the current debugging process.
query	OUT text	Source code of the next line of the function that is being debugged.

13.4.7 DBE_PLDEBUGGER.continue

Executes the current stored procedure until reaching the next breakpoint or end, and returns the line number of the next execution and the corresponding query, as described in **Table 13-186**.

The function prototype is as follows:

```
DBE_PLDEBUGGER.continue()
RETURN Record;
```

Table 13-186 continue input parameters and return values

Name	Type	Description
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.
lineno	OUT integer	Number of the next line in the current debugging process.
query	OUT text	Source code of the next line of the function that is being debugged.

13.4.8 DBE_PLDEBUGGER.abort

This function is used to abort the stored procedure executed on the server and report an error. The return value indicates whether the abort message is successfully sent, as described in **Table 13-187**.

The function prototype is as follows:

```
DBE_PLDEBUGGER.abort()
RETURN boolean;
```

Table 13-187 abort input parameters and return values

Name	Type	Description
abort	OUT boolean	Success or failure.

13.4.9 DBE_PLDEBUGGER.print_var

During debugging on the debug end, print_var is called to print the name and value of the specified variable in the current stored procedure. You can also use this function to print variables when an error is reported, as described in **Table 13-188**. The input parameter **frameno** of this function indicates the stack layer to be traversed. This function can be invoked without **frameno**. By default, the top-layer stack variable is queried.

Table 13-188 print_var input parameters and return values

Name	Type	Description
var_name	IN text	Variable.

Name	Type	Description
frameno	IN integer (optional)	Specified stack layer. The default value is the top layer.
varname	OUT text	Variable name.
vartype	OUT text	Variable type.
value	OUT text	Variable value.
package_name	OUT text	Package name corresponding to the variable. This parameter is reserved and is left empty currently.
isconst	OUT boolean	Whether the value is a constant.

13.4.10 DBE_PLDEBUGGER.info_code

During debugging on the debug end, **info_code** is invoked to view the source statement of the specified stored procedure and the line number corresponding to each line. The line number starts from the function body, and the line number in the function header is empty, as described in **Table 13-189**.

Table 13-189 info_code input parameters and return values

Name	Type	Description
funcoid	IN oid	Function ID.
lineno	OUT integer	Line number.
query	OUT text	Source statement.
canbreak	OUT bool	Whether the current line supports breakpoints.

13.4.11 DBE_PLDEBUGGER.step

During debugging on the debug end, if a stored procedure is being executed, the stored procedure continues to be executed and information such as the line number in the first line of the stored procedure is returned. If the executed object is not a stored procedure, the return is the same as that for **next**. After the SQL statement is executed, information such as the line number in the next line is returned, as described in **Table 13-190**.

Table 13-190 step input parameters and return values

Name	Type	Description
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.
lineno	OUT integer	Number of the next line in the current debugging process.
query	OUT text	Source code of the next line of the function that is being debugged.

13.4.12 DBE_PLDEBUGGER.add_breakpoint

During debugging on the debug end, call **add_breakpoint** to add a breakpoint, as described in **Table 13-191**. If **–1** is returned, the specified breakpoint is invalid. Determine a proper breakpoint position by referring to the **canbreak** column in **DBE_PLDEBUGGER.info_code**. If the outer function does not have a breakpoint before entering the inner function, a breakpoint cannot be added to the outer function when the inner function is executed.

Table 13-191 add_breakpoint input parameters and return values

Name	Type	Description
funcoid	IN text	Function ID.
lineno	IN integer	Line number.
breakpointno	OUT integer	Breakpoint number.

13.4.13 DBE_PLDEBUGGER.delete_breakpoint

During debugging on the debug end, call **delete_breakpoint** to delete the existing breakpoint, as described in **Table 13-192**.

Table 13-192 delete_breakpoint input parameters and return values

Name	Type	Description
breakpointno	IN integer	Breakpoint number.
result	OUT bool	Whether the request is successful.

13.4.14 DBE_PLDEBUGGER.info_breakpoints

During debugging on the debug end, call **info_breakpoints** to view the current function breakpoint, as described in **Table 13-193**.

Table 13-193 info_breakpoints input parameters and return values

Name	Type	Description
breakpointno	OUT integer	Breakpoint number.
funcoid	OUT oid	Function ID.
lineno	OUT integer	Line number.
query	OUT text	Breakpoint content.
enable	OUT boolean	Whether the value is valid.

13.4.15 DBE_PLDEBUGGER.backtrace

During debugging on the debug end, call **backtrace** to view the current call stack, as described in **Table 13-194**.

Table 13-194 backtrace input parameters and return values

Name	Type	Description
frameno	OUT integer	Call stack ID.
funcname	OUT text	Function name.
lineno	OUT integer	Line number.
query	OUT text	Breakpoint content.
funcoid	OUT oid	Function OID.

13.4.16 DBE_PLDEBUGGER.enable_breakpoint

During debugging on the debug end, calls enable_breakpoint to enable breakpoints, as described in **Table 13-195**.

Table 13-195 enable_breakpoint input parameters and return values

Name	Type	Description
breakpointno	IN integer	Breakpoint number.

Name	Type	Description
result	OUT bool	Whether the request is successful.

13.4.17 DBE_PLDEBUGGER.disable_breakpoint

During debugging on the debug end, call disable_breakpoint to disable breakpoints, as described in **Table 13-196**.

Table 13-196 disable_breakpoint input parameters and return values

Name	Type	Description
breakpointno	IN integer	Breakpoint number.
result	OUT bool	Whether the request is successful.

13.4.18 DBE_PLDEBUGGER.finish

Executes the current SQL statement in the stored procedure until the next breakpoint is triggered or the next line of the upper-layer stack is executed, as described in **Table 13-197**.

Table 13-197 finish input parameters and return values

Name	Type	Description
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.
lineno	OUT integer	Number of the next line in the current debugging process.
query	OUT text	Source code of the next line of the function that is being debugged.

13.4.19 DBE_PLDEBUGGER.set_var

Changes the variable on the top-layer stack in the specified debugging stored procedure to the value of the input parameter, as described in **Table 13-198**. If a stored procedure contains variables with the same name, set_var supports only the setting of the first variable value.

Table 13-198 set_var input parameters and return values

Name	Type	Description
var_name	IN text	Variable name.
value	IN text	New value.
result	OUT boolean	Whether the request is successful.

13.4.20 DBE_PLDEBUGGER.error_backtrace

If the server is suspended due to an error reported by the stored procedure, you can call error_backtrace on the debug end to view the current function call stack, as described in **Table 13-199**. (This function is used only for suspension after an error is reported.)

Table 13-199 error_backtrace return values

Name	Type	Description
frameno	OUT integer	Call stack ID.
funcname	OUT text	Function name.
lineno	OUT integer	Line number.
query	OUT text	Breakpoint content.
funcoid	OUT oid	Function OID.

13.4.21 DBE_PLDEBUGGER.error_end

If the server is suspended due to an error reported by the stored procedure, you can call error_end on the debug end to end the suspended process, end the debugging process, return the ended suspended process, and stop debugging, as described in **Table 13-200**. (This function is used only for suspension after an error is reported.)

Table 13-200 error_end return values

Name	Type	Description
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.
lineno	OUT integer	The next debugging line number (fixed value: 0).

Name	Type	Description
query	OUT text	Ends the suspended process and stops debugging.

13.4.22 DBE_PLDEBUGGER.error_info_locals

If the server is suspended due to an error reported by the stored procedure, you can call error_info_locals on the debug end to print the variables in the current stored procedure. The input parameter **frameno** of this function indicates the stack layer to be traversed. This function can be called without input parameters. By default, the top-layer stack variable is queried, as described in **Table 13-201**. (This function is used only for suspension after an error is reported.)

Table 13-201 error_info_locals return values

Name	Type	Description
frameno	IN integer (optional)	Specified stack layer. The default value is the top layer.
varname	OUT text	Variable name.
vartype	OUT text	Variable type.
value	OUT text	Variable value.
package_name	OUT text	Name of the package corresponding to the variable. If the variable is not a package, the value is null.
isconst	OUT boolean	Whether the value is a constant.

13.5 DB4AI Schema

The DB4AI schema is used to store and manage dataset versions in the AI feature. The schema holds a snapshot of the original view of the data tables, a change record for each data version, and management information for the version snapshot. This schema is intended for common users. In this schema, users can query the snapshot version information created by DB4AI.SNAPSHOT.

13.5.1 DB4AI.SNAPSHOT

DB4AI.SNAPSHOT records the snapshots stored by the current user through the DB4AI.SNAPSHOT feature, as described in **Table 13-202**.

Table 13-202 Attributes of the DB4AI.SNAPSHOT table

Name	Type	Description	Instance
id	bigint	ID of the current snapshot	1
parent_id	bigint	ID of the parent snapshot	0
matrix_id	bigint	Matrix ID of the snapshot in CSS mode. Otherwise, the value is **NULL**.	0
root_id	bigint	ID of the initial snapshot, which is constructed from the operated data using db4ai.create_snapshot().	0
schema	name	Schema for exporting the snapshot view	public
name	name	Snapshot name, including the version suffix	example0@1.1.0
owner	name	Name of the user who creates the snapshot	nw
commands	text[]	A complete list of SQL statements that record how to generate this snapshot from its root snapshot	{DELETE,"WHERE id > 7"}
comment	text	Snapshot description	inherits from @1.0.0
published	boolean	**TRUE**, only when the snapshot has been published	f
archived	boolean	**TRUE**, only when the snapshot has been archived	f
created	timestamp without time zone	Timestamp marking the snapshot creation date	2021-08-25 10:59:52.955604
row_count	bigint	Number of data rows in the snapshot	8

13.5.2 DB4AI.CREATE_SNAPSHOT

CREATE_SNAPSHOT creates snapshots for the DB4AI feature, as described in **Table 13-203**. You can invoke **CREATE SNAPSHOT** to implement this function.

Table 13-203 DB4AI.CREATE_SNAPSHOT input parameters and return values

Parameter	Type	Description
i_schema	IN NAME	Name of the schema storing snapshots. The default value is the current user or **PUBLIC**.
i_name	IN NAME	Snapshot name.
i_commands	IN TEXT[]	SQL commands for obtaining data.
i_vers	IN NAME	Version suffix.
i_comment	IN TEXT	Snapshot description.
res	OUT db4ai.snapshot_name	Result.

13.5.3 DB4AI.CREATE_SNAPSHOT_INTERNAL

CREATE_SNAPSHOT_INTERNAL is a built-in execution function of the DB4AI.CREATE_SNAPSHOT function, as described in **Table 13-204**. The function involves information verification and cannot be directly invoked.

Table 13-204 DB4AI.CREATE_SNAPSHOT_INTERNAL input parameters and return values

Parameter	Type	Description
s_id	IN BIGINT	Snapshot ID.
i_schema	IN NAME	Namespace storing the snapshot.
i_name	IN NAME	Snapshot name.
i_commands	IN TEXT[]	SQL commands for obtaining data.
i_comment	IN TEXT	Snapshot description.
i_owner	IN NAME	Snapshot owner.

13.5.4 DB4AI.PREPARE_SNAPSHOT

PREPARE_SNAPSHOT prepares data for model training and interprets snapshots for the DB4AI feature, as described in **Table 13-205**. A snapshot provides a complete sequence of data and documents that are changed by all applications. You can invoke **PREPARE SNAPSHOT** to implement this function.

Table 13-205 DB4AI.PREPARE_SNAPSHOT input parameters and return values

Parameter	Type	Description
i_schema	IN NAME	Name of the schema storing snapshots. The default value is the current user or **PUBLIC**.
i_parent	IN NAME	Parent snapshot name.
i_commands	IN TEXT[]	DDL and DML commands for modifying snapshots.
i_vers	IN NAME	Version suffix.
i_comment	IN TEXT	Data comment.
res	OUT db4ai.snapshot_name	Result.

13.5.5 DB4AI.PREPARE_SNAPSHOT_INTERNAL

PREPARE_SNAPSHOT_INTERNAL is a built-in execution function of the DB4AI.PREPARE_SNAPSHOT function, as described in **Table 13-206**. The function involves information verification and cannot be directly invoked.

Table 13-206 Input parameters of DB4AI.PREPARE_SNAPSHOT_INTERNAL

Parameter	Type	Description
s_id	IN BIGINT	Snapshot ID.
p_id	IN BIGINT	Parent snapshot ID.
m_id	IN BIGINT	Matrix ID.
r_id	IN BIGINT	Root snapshot ID.
i_schema	IN NAME	Snapshot schema.
i_name	IN NAME	Snapshot name.
i_commands	IN TEXT[]	DDL and DML commands for modifying snapshots.
i_comment	IN TEXT	Snapshot description.
i_owner	IN NAME	Snapshot owner.
i_idx	INOUT INT	Index of exec_cmds.
i_exec_cmds	INOUT TEXT[]	DDL and DML commands for execution.

Parameter	Type	Description
i_mapping	IN NAME[]	Maps user columns to backup columns. A rule is generated if the value is not **NULL**.

13.5.6 DB4AI.ARCHIVE_SNAPSHOT

ARCHIVE_SNAPSHOT archives snapshots for the DB4AI feature, as described in **Table 13-207**. You can invoke **ARCHIVE SNAPSHOT** to implement this function. After taking effect, the snapshot cannot be used for training.

Table 13-207 DB4AI.ARCHIVE_SNAPSHOT input parameters and return values

Parameter	Type	Description
i_schema	IN NAME	Name of the schema storing snapshots. The default value is the current user.
i_name	IN NAME	Snapshot name.
res	OUT db4ai.snapshot_name	Result.

13.5.7 DB4AI.PUBLISH_SNAPSHOT

PUBLISH_SNAPSHOT publishes snapshots for the DB4AI feature, as described in **Table 13-208**. You can invoke **PUBLISH SNAPSHOT** to implement this function.

Table 13-208 DB4AI.PUBLISH_SNAPSHOT input parameters and return values

Parameter	Type	Description
i_schema	IN NAME	Name of the schema storing snapshots. The default value is the current user or **PUBLIC**.
i_name	IN NAME	Snapshot name.
res	OUT db4ai.snapshot_name	Result.

13.5.8 DB4AI.MANAGE_SNAPSHOT_INTERNAL

MANAGE_SNAPSHOT_INTERNAL is a built-in execution function of the **DB4AI.PUBLISH_SNAPSHOT** and **DB4AI.ARCHIVE_SNAPSHOT** functions, as described in **Table 13-209**. The function involves information verification and cannot be directly invoked.

Table 13-209 DB4AI.MANAGE_SNAPSHOT_INTERNAL input parameters and return values

Parameter	Type	Description
i_schema	IN NAME	Name of the schema storing snapshots.
i_name	IN NAME	Snapshot name.
publish	IN BOOLEAN	Whether the snapshot is published.
res	OUT db4ai.snapshot_name	Result.

13.5.9 DB4AI.SAMPLE_SNAPSHOT

SAMPLE_SNAPSHOT samples basic data to generate snapshots for the DB4AI feature, as described in **Table 13-210**. You can invoke **SAMPLE SNAPSHOT** to implement this function.

Table 13-210 DB4AI.SAMPLE_SNAPSHOT input parameters and return values

Parameter	Type	Description
i_schema	IN NAME	Name of the schema storing snapshots.
i_parent	IN NAME	Parent snapshot name.
i_sample_infixes	IN NAME[]	Sample snapshot name infix.
i_sample_ratios	IN NUMBER[]	Size of each sample, which is used as the sample set ratio.
i_stratify	IN NAME[]	Layering strategy.
i_sample_comments	IN TEXT[]	Sample snapshot description.
res	OUT db4ai.snapshot_name	Result.

13.5.10 DB4AI.PURGE_SNAPSHOT

PURGE_SNAPSHOT deletes snapshots for the DB4AI feature, as described in **Table 13-211**. You can invoke **PURGE SNAPSHOT** to implement this function.

Table 13-211 DB4AI.PURGE_SNAPSHOT input parameters and return values

Parameter	Type	Description
i_schema	IN NAME	Name of the schema storing snapshots.
i_name	IN NAME	Snapshot name.
res	OUT db4ai.snapshot_name	Result.

13.5.11 DB4AI.PURGE_SNAPSHOT_INTERNAL

PURGE_SNAPSHOT_INTERNAL is a built-in execution function of the DB4AI.PURGE_SNAPSHOT function, as described in **Table 13-212**. The function involves information verification and cannot be directly invoked.

Table 13-212 DB4AI.PURGE_SNAPSHOT_INTERNAL input parameters and return values

Parameter	Type	Description
i_schema	IN NAME	Name of the schema storing snapshots.
i_name	IN NAME	Snapshot name.

13.6 DBE_PLDEVELOPER

The DBE_PLDEVELOPER system catalog records information required for compiling PL/SQL packages, functions, and stored procedures.

13.6.1 DBE_PLDEVELOPER.gs_source

Records compilation information about PL/SQL objects (stored procedures, functions, packages, and package bodies), as described in **Table 13-213**.

When the **plsql_show_all_error** parameter is enabled, information about PL/SQL object compilation success or failure is recorded in this table. When the **plsql_show_all_error** parameter is disabled, only information about correct compilation is inserted into this table.

CAUTION

1. The gs_source table records only user-defined original object statements. Even if a user uses ALTER to change the created schema or name, the information in the gs_source table does not change. If the user changes the schema or name of an object, the deleted object still exists in the gs_source table.
2. The owner in the gs_source table is the user who creates the table, not the user specified when the user creates the stored procedure or package.
3. By default, row-level security is not configured for the gs_source table in the database. If you want to use the database isolation feature, run the following statement to add row-level security:

```
ALTER TABLE dbe_pldeveloper.gs_source ENABLE ROW LEVEL SECURITY;
CREATE ROW LEVEL SECURITY POLICY all_data_rls ON dbe_pldeveloper.gs_source USING(owner =
(select oid from pg_roles where rolname=current_user));
```

Table 13-213 DBE_PLDEVELOPER.gs_source columns

Name	Type	Description
id	oid	Object ID.
owner	bigint	ID of the user who creates the object.
nspid	oid	Schema ID of an object.
name	name	Object name.
type	text	Object type (**procedure**/**function**/**package**/**package body**).
status	Boolean	Determines whether the creation is successful.
src	text	Original statement for creating an object.

13.6.2 DBE_PLDEVELOPER.gs_errors

Records errors that occur during PL/SQL object (stored procedure, function, package, and package body) compilation, as described in **Table 13-214**.

After the **plsql_show_all_error** parameter is enabled, if an error occurs during compilation, the error is skipped and the compilation continues, and the error information is recorded in **gs_errors**. If the **plsql_show_all_error** parameter is disabled, and the value of **behavior_compat_options** is not **skip_insert_gs_source**, then an error is reported and related information is inserted into this table.

The owner of the table is the user who creates the table. Modifying the owner of the stored procedure or package does not modify the table information.

CAUTION

1. If errors occur before AS/IS and after END when a packet header is created, the errors are not recorded in the **gs_errors** table. Instead, the error row numbers and content are directly returned on the client. The returned row numbers may be inaccurate. Some IS and END errors are not recorded in the **gs_errors** table.

2. If errors occur before AS/IS and after END when a packet body is created, the errors are not recorded in the **gs_errors** table. Instead, the error row numbers and content are directly returned on the client. The returned row numbers may be inaccurate. Some IS and END errors are not recorded in the **gs_errors** table.

3. If errors occur at the end of functions or stored procedures (after END) when a packet body is created, the errors are not recorded in the **gs_errors** table. Instead, the error row numbers and content are directly returned on the client. The row numbers may be inaccurate.

4. If errors occur at the beginning of functions or stored procedures (before AS/IS) when a packet body is created, the error row numbers are incorrect.

5. If a semicolon (;) is missing in the variable declaration when a packet header is created, the error is recorded in the **gs_errors** table but the row number is incorrect. If the parameter is enabled, the error is not recorded.

6. In a stored procedure or function in the package body, the error declared by the autonomous transaction identifier PRAGMA AUTONOMOUS_TRANSACTION may not be recorded in the **gs_errors** table.

7. The client directly reports an error, but the **gs_errors** table does not record the error. If the row number reported by the client is incorrect, this requirement does not correct the reported row number.

8. For an error in the middle of statements such as IF....THEN, FOR....LOOP, and WHEN.... THEN, or an EXCEPTION error, the error row number is in the current row instead of the row where the next semicolon is located.

9. When the BEGIN in the stored procedure or function in the package is incorrect, the error row number is incorrect.

Table 13-214 DBE_PLDEVELOPER.gs_errors columns

Name	Type	Description
id	oid	Object ID.
owner	bigint	ID of the user who creates the object.
nspid	oid	Schema ID of an object.
name	name	Object name.
type	text	Object type (**procedure**/**function**/**package**/**package body**).
line	integer	Line number.
src	text	Error message.

13.7 DBE_SQL_UTIL Schema

The DBE_SQL_UTIL schema stores tools for managing SQL patches, including creating, deleting, enabling, and disabling SQL patches. Common users have only the USAGE permission and do not have the CREATE, ALTER, DROP, and COMMENT permissions.

13.7.1 DBE_SQL_UTIL.create_hint_sql_patch

create_hint_sql_patch creates hint SQL patches and returns whether the execution is successful, as described in **Table 13-215**.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

Table 13-215 DBE_SQL_UTIL.create_hint_sql_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique ID.
hint_string	IN text	Hint text.
description	IN text	Patch description. The default value is **NULL**.
enabled	IN bool	Specifies whether the patch takes effect. The default value is **true**.
result	OUT bool	Specifies whether this operation is successful.

13.7.2 DBE_SQL_UTIL.create_abort_sql_patch

create_abort_sql_patch is an interface function used to create abort SQL patches. It returns whether the execution is successful, as described in **Table 13-216**.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

Table 13-216 DBE_SQL_UTIL.create_abort_sql_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.

Parameter	Type	Description
unique_sql_id	IN bigint	Global unique ID.
description	IN text	Patch description. The default value is **NULL**.
enabled	IN bool	Specifies whether the patch takes effect. The default value is **true**.
result	OUT bool	Specifies whether this operation is successful.

13.7.3 DBE_SQL_UTIL.drop_sql_patch

drop_sql_patch is an interface function used to delete SQL patches. It returns whether the execution is successful, as described in **Table 13-217**.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

Table 13-217 DBE_SQL_UTIL.drop_sql_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
result	OUT bool	Specifies whether this operation is successful.

13.7.4 DBE_SQL_UTIL.enable_sql_patch

enable_sql_patch is an interface function used to enable SQL patches. It returns whether the execution is successful, as described in **Table 13-218**.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

Table 13-218 DBE_SQL_UTIL.enable_sql_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
result	OUT bool	Specifies whether this operation is successful.

13.7.5 DBE_SQL_UTIL.disable_sql_patch

disable_sql_patch is an interface function used to disable SQL patches. It returns whether the execution is successful, as described in **Table 13-219**.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

Table 13-219 DBE_SQL_UTIL.disable_sql_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
result	OUT bool	Specifies whether this operation is successful.

13.7.6 DBE_SQL_UTIL.show_sql_patch

show_sql_patch is an interface function used to display the SQL patch corresponding to a specified patch name and return the running result, as described in **Table 13-220**.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

Table 13-220 DBE_SQL_UTIL.show_sql_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	OUT bigint	Global unique ID.
enabled	OUT bool	Specifies whether the patch takes effect.
abort	OUT bool	Specifies whether the patch is an abort hint.
hint_str	OUT text	Hint text.

13.7.7 DBE_SQL_UTIL.create_hint_sql_patch

create_hint_sql_patch is an interface function used to create SQL patches for hints. It returns whether the execution is successful, as described in **Table 13-221**. This function is an overloaded function of the original function. The value of **parent_unique_sql_id** can be used to limit the effective range of the hint patch.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

Table 13-221 DBE_SQL_UTIL.create_hint_sql_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique ID.
parent_unique_sql_id	IN bigint	Global unique ID of the outer SQL statement. The value **0** indicates that the SQL patch statement outside the stored procedure is restricted to take effect. A non-zero value indicates that the specific stored procedure is restricted to take effect.
hint_string	IN text	Hint text.
description	IN text	Patch description. The default value is **NULL**.
enabled	IN bool	Specifies whether the patch takes effect. The default value is **true**.
result	OUT bool	Specifies whether this operation is successful.

13.7.8 DBE_SQL_UTIL.create_abort_sql_patch

create_abort_sql_patch is an interface function used to create abort SQL patches. It returns whether the execution is successful, as described in **Table 13-222**. This function is an overloaded function of the original function. The value of **parent_unique_sql_id** can be used to limit the effective range of the abort patch.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

Table 13-222 DBE_SQL_UTIL.create_abort_sql_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique ID.
parent_unique_sql_id	IN bigint	Global unique ID of the outer SQL statement. The value **0** indicates that the SQL patch statement outside the stored procedure is restricted to take effect. A non-zero value indicates that the specific stored procedure is restricted to take effect.
description	IN text	Patch description. The default value is **NULL**.

Parameter	Type	Description
enabled	IN bool	Specifies whether the patch takes effect. The default value is **true**.
result	OUT bool	Specifies whether this operation is successful.

14 Configuring Running Parameters

14.1 Viewing Parameters

GaussDB uses a set of default GUC parameters after it is installed. You can modify the GUC parameters to enable GaussDB to better fit your service scenarios and data volume.

Procedure

Step 1 Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

Step 2 View the GUC parameter values in the database.

- Method 1: Run the **SHOW** command.
  - View the value of a certain parameter.
    ```
    gaussdb=# SHOW server_version;
    ```
    server_version indicates the database version.
  - View values of all parameters.
    ```
    gaussdb=#  SHOW ALL;
    ```
- Method 2: Query the pg_settings view.
  - View the value of a certain parameter.
    ```
    gaussdb=# SELECT * FROM pg_settings WHERE NAME='server_version';
    ```
  - View values of all parameters.
    ```
    gaussdb=# SELECT * FROM pg_settings;
    ```

----End

Example

Check the character encoding type of the client.

```
gaussdb=# SHOW client_encoding;
 client_encoding
-----------------
 UTF8
(1 row)
```

14.2 Setting Parameters

Context

GaussDB provides multiple methods to set GUC parameters for databases, users, or sessions.

- Parameter names are case-insensitive.
- The parameter values can be integers, floating points, strings, Boolean values, or enumerated values.
  - The Boolean values can be **on**/**off**, **true**/**false**, **yes**/**no**, or **1**/**0**, and are case-insensitive.
  - The enumerated value range is specified in the **enumvals** column of the system catalog pg_settings.
- For parameters using units, specify their units during the setting. Otherwise, default units are used.
  - The default units are specified in the **unit** column of pg_settings.
  - The unit of memory can be KB, MB, or GB.
  - The unit of time can be ms, s, min, h, or d.

For details about parameters, see **GUC Parameters**.

Setting GUC Parameters

GaussDB provides six types of GUC parameters. For details about parameter types and their setting methods, see **Table 14-1**.

Table 14-1 GUC parameter types

Parameter Type	Description	Setting Method
INTERNAL	Fixed parameters. They are set during database creation and cannot be modified. Users can only view the parameters by running the **SHOW** command or in the pg_settings view.	None.
POSTMASTER	Database server parameters. They can be set when the database is started or in the configuration file.	Method 1 in **Table 14-2**.
SIGHUP	Global database parameters. They can be set when the database is started or be modified later.	Method 1 or 2 in **Table 14-2**.

Parameter Type	Description	Setting Method
BACKEND	Session connection parameters. They are specified during session connection creation and cannot be modified after that. The parameter setting becomes invalid when the session is disconnected. The parameters of this type are internal parameters and not recommended for users to set it.	Method 1 or 2 in **Table 14-2**. **NOTE** The parameter setting takes effect when the next session is created.
SUSET	Database administrator parameters. They can be set by common users during database startup or after the database is started. They can also be set by database administrators using SQL statements.	Method 1 or 2 by a common user, or method 3 by a database administrator in **Table 14-2**.
USERSET	Common user parameters. They can be set by any user at any time.	Method 1, 2, or 3 in **Table 14-2**.

You can set GUC parameters in GaussDB using the three methods listed in **Table 14-2**.

Table 14-2 Methods for setting GUC parameters

No.	Setting Method
Method 1	1. Modify a parameter. **gs_guc set -D** *datadir* **-c** "*paraname=value*" **NOTE** • If any parameter is a string variable, use **-c** *parameter*="'*value*'" or **-c** "*parameter* = '*value*'". • If any parameter is a string variable, gs_guc does not check the validity of the parameter. If the database runs abnormally due to invalid parameter settings, view gs_log to locate the fault. • Set a parameter for database nodes at the same time. **gs_guc set -Z datanode -N *all* -I *all* -c "*paraname=value*"** • Set a CM Agent parameter for database nodes. **gs_guc set -Z cmagent -c "paraname=value"** **gs_guc set -Z cmagent -N *all* -I *all* -c "paraname=value"** • Set a CM Server parameter for database nodes. **gs_guc set -Z cmserver -c "paraname=value"** **gs_guc set -Z cmserver -N *all* -I *all* -c "paraname=value"** 2. Restart the database to make the setting take effect. **NOTE** Restarting the database results in operation interruption. Properly plan the restart to avoid affecting users. **gs_om -t stop && gs_om -t start**

No.	Setting Method
Method 2	**gs_guc reload -D** *datadir* **-c** *"paraname=value"* **NOTE** Set a parameter for database nodes at the same time. **gs_guc reload -Z datanode -N *all* -I *all* -c "*paraname=value*"**
Method 3	Set parameters at the database, user, or session level. • Set a database-level parameter. gaussdb=# **ALTER DATABASE** *dbname* **SET** *paraname* **TO** *value;* The setting takes effect in the next session. • Set a user-level parameter. gaussdb=# **ALTER USER** *username* **SET** *paraname* **TO** *value;* The setting takes effect in the next session. • Set a session-level parameter. gaussdb=# **SET** *paraname* **TO** *value;* The parameter value in the current session is changed. After you exit the session, the setting becomes invalid. **NOTE** Session-level parameters set by SET have the highest priority, prior to those set by ALTER. Parameter values set by ALTER DATABASE have a higher priority than those set using ALTER USER. Priorities of the three methods are all higher than using gs_guc. The parameters set by ALTER DATABASE and ALTER USER do not take effect in the current session. You need to restart the session for the parameters to take effect.

CAUTION

- If you use method 1 or 2 to set a parameter that does not belong to the current node, the database displays a message indicating that the parameter is not supported.
- When you use method 3 to set a parameter, if the parameter value is an integer, leading zeros will be filtered out. For example, **SET** *paraname* **TO** *008192* and **SET** *paraname* **TO** *8192* have the same effect.

Procedure

The following example shows how to set **hot_standby** on the primary node of the database using method 1.

Step 1 Log in as the OS user **omm** to the primary node of the database.

Step 2 View the value of **hot_standby**.

```
cat /gaussdb/data/dbnode/gaussdb.conf | grep "hot_standby ="
hot_standby = on
```

The value **on** indicates that the query operation in the restoration phase is allowed.

Step 3 Set **hot_standby** to **off** to disable query operations in the restoration phase.

```
gs_guc set -Z datanode -D /gaussdb/data/dbnode -c "hot_standby=off"
```

NOTE

You can set **hot_standby** to **off** for the database nodes.

```
gs_guc set -Z datanode -N all -I all -c "hot_standby=off"
```

Step 4 Restart the database to make the setting take effect.

```
gs_om -t stop && gs_om -t start
```

Step 5 Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

Step 6 Check whether the parameter is correctly set.

```
gaussdb=# SHOW hot_standby;
 hot_standby
-------------
 off
(1 row)
```

----End

The following example shows how to set **authentication_timeout** on a the primary node of the database using method 2:

Step 1 Log in as the OS user **omm** to the primary node of the database.

Step 2 View the value of **authentication_timeout**.

```
cat /gaussdb/data/dbnode/gaussdb.conf | grep authentication_timeout
authentication_timeout = 1min
```

Step 3 Set **authentication_timeout** to **59s**.

```
gs_guc reload -Z datanode -N all -I all -c "authentication_timeout = 59s"

Total instances: 2. Failed instances: 0.
Success to perform gs_guc!
```

NOTE

You can set **authentication_timeout** to **59s** for the database nodes.

```
gs_guc reload -Z datanode -N all -I all -c "authentication_timeout = 59s"
```

Step 4 Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

Step 5 Check whether the parameter is correctly set.

```
gaussdb=# SHOW authentication_timeout;
 authentication_timeout
------------------------
 59s
(1 row)
```

----End

The following example shows how to set **explain_perf_mode** using method 3:

Step 1 Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

Step 2 View the value of **explain_perf_mode**.

```
gaussdb=# SHOW explain_perf_mode;
 explain_perf_mode
-------------------
 normal
(1 row)
```

Step 3 Set **explain_perf_mode**.

Perform one of the following operations:

- Set a database-level parameter.
  ```
  gaussdb=# ALTER DATABASE postgres SET explain_perf_mode TO pretty;
  ```
  If the following information is displayed, the setting is successful:
  ```
  ALTER DATABASE
  ```
  The setting takes effect in the next session.
- Set a user-level parameter.
  ```
  gaussdb=# ALTER USER omm SET explain_perf_mode TO pretty;
  ```
  If the following information is displayed, the setting is successful:
  ```
  ALTER ROLE
  ```
  The setting takes effect in the next session.
- Set a session-level parameter.
  ```
  gaussdb=# SET explain_perf_mode TO pretty;
  ```
  If the following information is displayed, the setting is successful:
  ```
  SET
  ```

Step 4 Check whether the parameter is correctly set.

```
gaussdb=# SHOW explain_perf_mode;
 explain_perf_mode
---------------
 pretty
(1 row)
```

----End

Examples

- Example 1: Modify the maximum number of connections for the primary database node in GaussDB using method 1.
  a. Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.
  b. View the maximum number of connections.
     ```
     gaussdb=# SHOW max_connections;
      max_connections
     -----------------
      200
     (1 row)
     ```
  c. Exit the database.
     ```
     gaussdb=# \q
     ```
  d. Change the maximum number of connections for the primary database node in GaussDB.
     ```
     gs_guc set -Z datanode -N all -I all -c "max_connections = 800"
     ```
  e. Restart the database.
     ```
     gs_om -t stop && gs_om -t start
     ```
  f. Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.
  g. View the maximum number of connections.
     ```
     gaussdb=# SHOW max_connections;
      max_connections
     ```

```
-----------------
 800
(1 row)
```

- Example 2: Set **authentication_timeout** (timeout period for client authentication) for the primary node using method 2.

  a. Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

  b. View the timeout period for client authentication.

  ```
  gaussdb=# SHOW authentication_timeout;
   authentication_timeout
  ------------------------
   1min
  (1 row)
  ```

  c. Exit the database.

  ```
  gaussdb=# \q
  ```

  d. Change the timeout period for client authentication of the primary node.

  ```
  gs_guc reload -Z datanode -N all -I all -c "authentication_timeout = 59s"
  ```

  e. Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

  f. View the timeout period for client authentication.

  ```
  gaussdb=# SHOW authentication_timeout;
   authentication_timeout
  ------------------------
   59s
  (1 row)
  ```

- Example 3: Change the maximum number of connections between GaussDB database nodes.

  a. Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

  b. View the maximum number of connections.

  ```
  gaussdb=# SHOW max_connections;
   max_connections
  -----------------
   200
  (1 row)
  ```

  c. Exit the database.

  ```
  gaussdb=# \q
  ```

  d. Change the maximum number of connections between GaussDB database nodes.

  ```
  gs_guc set -Z datanode -N all -I all -c "max_connections = 500"
  ```

  e. Restart the database.

  ```
  gs_om -t stop
  gs_om -t start
  ```

  f. Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

  g. View the maximum number of connections.

  ```
  gaussdb=# SHOW max_connections;
   max_connections
  -----------------
   500
  (1 row)
  ```

- Example 4: Set **authentication_timeout** (timeout period for client authentication) for database nodes.
  a. Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.
  b. View the timeout period for client authentication.
  ```
  gaussdb=# SHOW authentication_timeout;
   authentication_timeout
  ------------------------
   1min
  (1 row)
  ```
  c. Exit the database.
  ```
  gaussdb=# \q
  ```
  d. Change the timeout period for client authentication of GaussDB database nodes.
  ```
  gs_guc reload -Z datanode -N all -I all -c "authentication_timeout = 30s"
  ```
  e. Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.
  f. View the timeout period for client authentication.
  ```
  gaussdb=# SHOW authentication_timeout;
   authentication_timeout
  ------------------------
   30s
  (1 row)
  ```

14.3 GUC Parameters

14.3.1 GUC Parameter Usage

A database provides many GUC parameters. Changing these parameters will affect the behavior of the database system. Before modifying these parameters, learn the impact of these parameters on the database. Otherwise, unexpected results may occur.

Precautions

- If the value range of a parameter is a string, the string should comply with the path and file naming conventions of the OS running the target database.
- If the maximum value of a parameter is *INT_MAX*, the maximum parameter value varies by OS.
- If the maximum value of a parameter is *DBL_MAX*, the maximum parameter value varies by OS.
- Some GUC parameters affect the selection of functions and operators, compilation of stored procedures, and generation of execution plans. As a result, views, default values of function parameters, compilation products of stored procedures, and plan cache are affected. Due to these mechanisms, subsequent GUC parameter changes may not affect these behaviors.
  – View: When defining a view, the database generates rewriting rules based on the GUC parameter status. Subsequent operations on the view directly follow the corresponding rules without being affected by GUC parameters (which affect the generation of rewriting rules).

- Default value of a function parameter: For a function parameter, a function is selected as the default parameter value based on the GUC parameter status when the function parameter is created and the OID of the function that is used as the default value is recorded in the corresponding system catalog (pg_proc). When this function parameter is executed later, the function OID recorded in the system catalog will be used as the default value, and the value is not affected by GUC parameters.
- Compilation product of a stored procedure: When compiling a stored procedure, the database generates a compilation product based on the GUC parameter status. When executing the stored procedure, the database directly uses the compilation product without being affected by GUC parameters (which affect the generation of compilation products).
- Plan cache: When executing an SQL statement, the database generates an execution plan based on the GUC parameter status. If the plan is cached, the SQL statement will be executed according to the plan without being affected by GUC parameters (which affect the generation of execution plans).

The following table lists the GUC parameters that exert influence. You can view the function of each GUC parameter.

GUC Parameter	Enabled	Disabled	Impact	Example
convert_string_to_digit	Strings are preferentially converted to numbers.	Character strings cannot be preferentially converted to numbers.	Views, default values of function parameters, stored procedure compilation products, and plan cache.	CREATE or REPLACE FUNCTION test(c numeric) RETURN text package AS BEGIN RETURN 'test(c numeric)'; END; / CREATE or REPLACE FUNCTION test(c varchar2) RETURN text package AS BEGIN RETURN 'test(c varchar2)'; END; / SET convert_string_to_digit=on; CREATE or REPLACE VIEW test_view AS SELECT test('123'::text); SELECT test('123'::text); test ----------------- test(c numeric) (1 row) SELECT * FROM test_view; test ----------------- test(c numeric) (1 row) -- Disable the parameter. SET convert_string_to_digit=off; SELECT test('123'::text); test ------------------ test(c varchar2) (1 row) -- The view behavior is inconsistent with the direct function calling behavior. SELECT * FROM test_view; test ----------------- test(c numeric) (1 row))

GUC Parameter	Enabled	Disabled	Impact	Example
set behavior_compat_options = 'current_sysdate';	The SYSDATE function obtains the current OS time. (The current_sysdate function is used at the bottom layer.)	The SYSDATE function obtains the current database time. (The sysdate function is used at the bottom layer.)	Views, default values of function parameters, stored procedure compilation products, and plan cache.	SET behavior_compat_options = 'current_sysdate'; CREATE or REPLACE VIEW test_view_SYSDATE AS SELECT SYSDATE AS test; SELECT * FROM test_view_SYSDATE;--Returns the current OS time. SELECT SYSDATE;--Returns the current OS time. -- Disable the parameter. SET behavior_compat_options = ''; -- The view behavior is inconsistent with the direct function calling behavior. SELECT * FROM test_view_SYSDATE;--Returns the current OS time. SELECT SYSDATE;--Returns the current database time.

GUC Parameter	Enabled	Disabled	Impact	Example
set a_format_version='10c'; set a_format_dev_version='s1';	• NVL2 is supported. • Some system functions are added. For details, see the disabled system functions supported by the **a_format_disable_func** parameter. • The CASE WHEN return type is changed. • Constructors of the set type are prior to functions. • Implicit conversion from timestamp to timestamptz is supported.	The functions supported when the parameter is enabled are not supported.	Views, default values of function parameters, stored procedure compilation products, and plan cache.	SET a_format_version='10c'; SET a_format_dev_version='s1'; CREATE OR REPLACE VIEW test_view_nvl2 AS SELECT nvl2(1,2,3) AS test; SELECT * FROM test_view_nvl2; test ------ 2 (1 row) RESET a_format_dev_version; SELECT * FROM test_view_nvl2; test ------ 2 (1 row)

GUC Parameter	Enabled	Disabled	Impact	Example
set a_format_version='10c'; set a_format_dev_version='s2';	• CURRENT_TIMESTAMP '(' FCONST ')' is supported. • DBTIMEZONE is supported. • LNNVL is supported. • CURRENT_DATE (when **a_format_date_timestamp** is set to **off**): returns the date and time (timestamp). • Some system functions are added. For details, see the disabled system functions supported by the **a_format_disabl**	The functions supported when the parameter is enabled are not supported.	Views, default values of function parameters, stored procedure compilation products, and plan cache.	SET a_format_version='10c'; SET a_format_dev_version='s2'; CREATE or REPLACE VIEW test_view_LNNVL AS SELECT LNNVL(123=123) AS test; SELECT * FROM test_view_LNNVL; RESET a_format_dev_version; SELECT * FROM test_view_LNNVL;

GUC Parameter	Enabled	Disabled	Impact	Example
	e_func parameter.			
set a_format_version='10c'; set a_format_dev_version='s4';	Some system functions are added. For details, see the disabled system functions supported by the **a_format_disable_func** parameter.	The functions supported when the parameter is enabled are not supported.	Views, default values of function parameters, stored procedure compilation products, and plan cache.	-

GUC Parameter	Enabled	Disabled	Impact	Example
set a_format_version='10c'; set a_format_dev_version='s5';	• Some system functions are added. For details, see the disabled system functions supported by the **a_format_disable_func** parameter. • Composite constructors are prior to functions.	The functions supported when the parameter is enabled are not supported.	Views, default values of function parameters, stored procedure compilation products, and plan cache.	--The composite type constructor is prior to functions. CREATE TYPE tt AS (val1 int, val2 int); CREATE OR REPLACE FUNCTION tt(va int, vb int) RETURN int IS ret int; BEGIN ret := va; RETURN ret; END; / SET a_format_version='10c'; SET a_format_dev_version='s5'; -- Assign a value to the *tt* variable. CREATE OR REPLACE FUNCTION test0 RETURN int IS va tt; ret int; BEGIN va := tt(1,2); RAISE INFO 'tt: %' ,va; ret := 9; RETURN ret; END; / SELECT test0(); INFO: tt: (1,2) test0 ------- 9 (1 row) SET a_format_version=''; SET a_format_dev_version=''; SELECT test0(); INFO: tt: (1,2) test0 ------- 9 (1 row) -- Assign a value to the *tt* variable. CREATE OR REPLACE FUNCTION test0 RETURN int IS va tt; ret int; BEGIN va := tt(1,2); RAISE INFO 'tt: %' ,va; ret := 9; RETURN ret; END; / select test0();

GUC Parameter	Enabled	Disabled	Impact	Example
				ERROR: cannot assign non-composite value to a row variable

GUC Parameter	Enabled	Disabled	Impact	Example
set behavior_compat_options = 'enable_bpcharlikebpchar_compare';	The bpcharlikebpchar and bpcharnlikebpchar operators are enabled.	The bpcharlikebpchar and bpcharnlikebpchar operators are disabled.	Views, stored procedure compilation products, and plan cache.	CREATE TABLE op_test (col BPCHAR(2) DEFAULT NULL); CREATE INDEX op_index ON op_test(col); INSERT INTO op_test VALUES ('a'); INSERT INTO op_test VALUES ('1'); INSERT INTO op_test VALUES ('11'); INSERT INTO op_test VALUES ('12'); INSERT INTO op_test VALUES ('sd'); INSERT INTO op_test VALUES ('aa'); SET behavior_compat_options = 'enable_bpcharlikebpchar_compare'; EXPLAIN (COSTS OFF) SELECT * FROM op_test WHERE col LIKE col::BPCHAR ORDER BY col; QUERY PLAN ------------------------------ Sort Sort Key: col -> Seq Scan on op_test Filter: (col ~~ col) (4 rows) CREATE OR REPLACE VIEW test_view_bpchar AS SELECT * FROM op_test WHERE col LIKE col::BPCHAR ORDER BY col; EXPLAIN SELECT * FROM test_view_bpchar; QUERY PLAN -- Sort (cost=34.48..34.50 rows=10 width=12) Sort Key: op_test.col -> Seq Scan on op_test (cost=0.00..34.31 rows=10 width=12) Filter: (col ~~ col) (4 rows) SET behavior_compat_options = ''; EXPLAIN (COSTS OFF) SELECT * FROM op_test WHERE col LIKE col::BPCHAR ORDER BY col; QUERY PLAN -------------------------------------- Sort Sort Key: col -> Seq Scan on op_test Filter: (col ~~ (col)::text) (4 rows) EXPLAIN SELECT * FROM test_view_bpchar; QUERY PLAN --

GUC Parameter	Enabled	Disabled	Impact	Example
				Sort (cost=34.48..34.50 rows=10 width=12) Sort Key: op_test.col -> Seq Scan on op_test (cost=0.00..34.31 rows=10 width=12) Filter: (col OPERATOR(pg_catalog.~~) col) (4 rows) -- Rebuild a view when the parameter is disabled. CREATE OR REPLACE VIEW test_view_bpchar AS SELECT * FROM op_test WHERE col LIKE col::BPCHAR ORDER BY col; explain select * from test_view_bpchar; QUERY PLAN ---------- Sort (cost=39.34..39.37 rows=10 width=12) Sort Key: op_test.col -> Seq Scan on op_test (cost=0.00..39.17 rows=10 width=12) Filter: (col ~~ (col)::text) (4 rows)
set b_format_version='5.7'; set b_format_dev_version='s1';	• CURDATE, CURRENT_TIME, CURRENT_TIMESTAMP, LOCALTIME, and LOCALTIMESTAMP NOW return the statement execution time. • SYSDATE returns the function execution time.	The functions return the transaction start time.	Views, default values of function parameters, stored procedure compilation products, and plan cache.	-

GUC Parameter	Enabled	Disabled	Impact	Example
set b_format_version='5.7'; set b_format_dev_version='s1';	The behaviors of the DB_JSOBJ, LAST_DAY_FUNC, EXTRACT, TIMESTAMPDIFF, and SUBSTRING functions are changed to be the same as that of a B-compatible database.	Restores the default behavior.	Views, default values of function parameters, stored procedure compilation products, and plan cache.	-

GUC Parameter	Enabled	Disabled	Impact	Example
set behavior_compat_options = 'bind_procedure_searchpath';	• Specifies the search path of the database objects in a stored procedure for which no schema name is specified. • If no schema name is specified for a stored procedure, the schema to which the stored procedure belongs is searched preferentially.	Restores the default behavior.	Stored procedure compilation products.	-

GUC Parameter	Enabled	Disabled	Impact	Example
set behavior_compat_options = 'enable_out_param_override';	Determines the overloading of output parameters of a stored procedure.	Restores the default behavior.	Stored procedure compilation products.	-
enable_bitmapscan	The bitmapscan operator is selected.	The bitmapscan operator is not selected.	Plan cache.	SET enable_auto_explain=true; SET auto_explain_level=notice; CREATE TABLE t1(a int, b int, c int,d varchar)WITH(storage_type=ustore); CREATE TABLE t2(a int, b int, c int,d varchar)WITH(storage_type=ustore); INSERT INTO t1 SELECT i,10*random()*i,i%20,'atr'||i from generate_series(1,1000) i; CREATE INDEX index1 ON t1(a); SET enable_bitmapscan=on; SET enable_seqscan=off; SET enable_indexscan=off; CREATE OR REPLACE PROCEDURE proc_while_loop() AS DECLARE i int :=1; BEGIN WHILE i < 5 LOOP INSERT INTO t2 SELECT * FROM t1 WHERE a = i ; i:=i+1; END LOOP; END; / CALL proc_while_loop(); SET enable_bitmapscan=off; CALL proc_while_loop(); SET enable_bitmapscan=on; CALL proc_while_loop();

GUC Parameter	Enabled	Disabled	Impact	Example
enable_indexscan	The indexscan operator is selected.	The indexscan operator is not selected.	Plan cache.	SET enable_auto_explain=true; SET auto_explain_level=notice; CREATE TABLE t1(a int, b int, c int,d varchar)WITH(storage_type=ustore); CREATE TABLE t2(a int, b int, c int,d varchar)WITH(storage_type=ustore); INSERT INTO t1 SELECT i,10*random()*i,i%20,'atr'||i from generate_series(1,1000) i; CREATE INDEX index1 on t1(a); SET enable_bitmapscan=off; SET enable_seqscan=off; CREATE OR REPLACE PROCEDURE proc_while_loop() AS DECLARE i int :=1; BEGIN WHILE i < 5 LOOP insert into t2 select * from t1 where a = i ; i:=i+1; END LOOP; END; / CALL proc_while_loop(); SET enable_indexscan=off; CALL proc_while_loop();

GUC Parameter	Enabled	Disabled	Impact	Example
query_Dop	Users can specify the degree of query parallelism. If the SMP function is enabled, the system uses the specified degree of parallelism.	The default value is **1**, which indicates that parallel query is disabled.	Plan cache.	SET enable_auto_explain=true; SET auto_explain_level=notice; CREATE TABLE t1(a int, b int, c int,d varchar)WITH(storage_type=ustore); CREATE TABLE t2(a int, b int, c int,d varchar)WITH(storage_type=ustore); INSERT INTO t1 SELECT i,10*random()*i,i%20,'atr'||i from generate_series(1,1000) i; CREATE INDEX index1 ON t1(a); SET enable_bitmapscan=f; CREATE OR REPLACE PROCEDURE proc_while_loop() AS DECLARE i int :=1; BEGIN WHILE i < 5 LOOP INSERT INTO t2 SELECT /*+ indexscan(t1 index1) */* FROM t1 WHERE a = i ; i:=i+1; END LOOP; END; / SET enable_auto_explain=true; SET auto_explain_level=notice; SET client_min_messages=log; SET query_dop=4; SET sql_beta_feature='enable_plsql_smp'; CALL proc_while_loop(); SET enable_force_Smp=on; CALL proc_while_loop(); SET query_Dop=6; CALL proc_while_loop();

GUC Parameter	Enabled	Disabled	Impact	Example
set plan_cache_mode = force_generic_plan	In PBE mode, the gplan is forcibly executed.	In PBE mode, the gplan is not forcibly executed.	Plan cache.	SET enable_auto_explain=true; SET auto_explain_level=notice; CREATE TABLE t1(a int, b int, c int,d varchar)WITH(storage_type=ustore); CREATE TABLE t2(a int, b int, c int,d varchar)WITH(storage_type=ustore); INSERT INTO t1 SELECT i,10*random()*i,i%20,'atr'||i from generate_series(1,1000) i; CREATE INDEX index1 ON t1(a); SET enable_bitmapscan=on; SET enable_seqscan=off; SET enable_indexscan=off; CREATE OR REPLACE PROCEDURE proc_while_loop() AS DECLARE i int :=1; BEGIN WHILE i < 5 LOOP insert into t2 select * from t1 where a = i ; i:=i+1; END LOOP; END; / CALL proc_while_loop(); SET plan_cache_mode = force_generic_plan; PREPARE aa AS SELECT proc_while_loop(); EXECUTE aa; SET enable_bitmapscan=off; EXECUTE aa;
a_format_date_timestamp	CURRENT_DATE returns the timestamp when the current SQL statement is started.	CURRENT_DATE returns the date or date and time when the transaction is started.	Views, default values of function parameters, stored procedure compilation products, and plan cache.	SET a_format_date_timestamp=on; CREATE OR REPLACE PROCEDURE proc_while_loop() AS DECLARE i date; BEGIN i:=current_date; raise info 'step2:%',TO_CHAR(current_date, 'MM-DD-YYYY HH24:MI:SS'); END; / CALL proc_while_loop(); SET a_format_date_timestamp=off; CALL proc_while_loop();

GUC Parameter	Enabled	Disabled	Impact	Example
proc_implicit_for_loop_variable	Determines the behavior of the FOR_LOOP query statement in a stored procedure. When this parameter is set, if *rec* has been defined in the FOR rec IN query LOOP statement, the defined *rec* variable is not reused but a new variable is created. Otherwise, the defined *rec* variable is reused and no variable is created.	Restores the default behavior.	Stored procedure compilation products.	-
adjust_systemview_priority	Views with the same name preferentially access user-defined views.	Views with the same name preferentially access system views.	Default value of parameters in the views.	CREATE DATABASE database_test DBCOMPATIBILITY = 'A'; SELECT datname,datcompatibility,dattimezone FROM pg_database; \c database_test CREATE TABLE t1(c int); CREATE VIEW dual AS SELECT * FROM t1; SHOW adjust_systemview_priority; SELECT * FROM dual; SET adjust_systemview_priority = on; SELECT * FROM dual;

14.3.2 File Location

After a database has been installed, three configuration files (**gaussdb.conf**, **gs_hba.conf**, and **gs_ident.conf**) are automatically generated and saved in the data directory. You can use the methods described in this section to change the names and save paths of these configuration files.

When changing the storage directory of a configuration file, set **data_directory** in **gaussdb.conf** to the actual data directory.

NOTICE

If a configuration file is incorrectly modified, the database will be seriously affected. Do not modify the configuration files mentioned in this section after installation.

data_directory

Parameter description: Specifies the GaussDB **data** directory. Only the sysadmin user can access this parameter. You can set this parameter using one of the following methods:

- Set it when you install the GaussDB.
- This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Value range: a string, consisting of one or more characters.

Default value: Specify this parameter during installation. If this parameter is not specified during installation, the database is not initialized by default.

config_file

Parameter description: Specifies the configuration file (**gaussdb.conf**) of the primary node.

This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Value range: a string, consisting of one or more characters.

Default value: **gaussdb.conf** (The absolute directory of this file may be displayed in the actual situation.)

hba_file

Parameter description: Specifies the configuration file (**gs_hba.conf**) for host-based authentication (HBA). This parameter can be specified only in the **gaussdb.conf** file and can be accessed only by the sysadmin user.

This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Value range: a string.

Default value: **gs_hba.conf** (The absolute directory of this file may be displayed in the actual situation.)

ident_file

Parameter description: Specifies the name of the configuration file (**gs_ident.conf)** for client authentication. Only the sysadmin user can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Value range: a string.

Default value: **gs_ident.conf** (The absolute directory of this file may be displayed in the actual situation.)

external_pid_file

Parameter description: Specifies the extra PID file that can be used by the server management program. Only the sysadmin user can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

NOTICE

This parameter takes effect only after the database restarts.

Value range: a string.

Default value: empty

14.3.3 Connection and Authentication

14.3.3.1 Connection Settings

This section describes parameters related to client-server connection modes.

light_comm

Parameter description: Specifies whether the server uses the lightweight communications mode.

This parameter specifies whether the server uses the communication mode based on lightweight locks and non-blocking sockets.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The lightweight communications mode is used.
- **off**: The lightweight communications mode is not used.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Setting suggestion: none

Risks and impacts of improper settings: none

listen_addresses

Parameter description: Specifies the TCP/IP address of the client for a server to listen on.

This parameter specifies the IP address used by the GaussDB server for listening, for example, an IPv4 address. Multiple NICs may exist on the host and each NIC can be bound to multiple IP addresses. This parameter specifies the IP addresses to which GaussDB is bound. The client can use the IP addresses specified by this parameter to connect to GaussDB or send requests to GaussDB.

Parameter type: string.

Unit: none

Value range:

- Host name or IP address. Multiple values are separated with commas (,).
- Asterisk (*) or **0.0.0.0**, indicating that all IP addresses will be listened on, which is not recommended due to potential security risks. This parameter must be used together with valid addresses (for example, the local IP address). Otherwise, the build may fail. In primary/standby mode, if the value is set to ***** or **0.0.0.0**, the value of **localport** in the **gaussdb.conf** file of the database on the primary node cannot be the value of **dataPortBase** plus 1. Otherwise, the database cannot be started.
- If the parameter value is invalid (for example, the parameter value contains invalid IP addresses or characters, is empty, or is listened repeatedly), the process fails to be started.

Default value: After the database instance is installed, the default value is set based on the IP addresses of different instances in the **public_cloud.conf** configuration file. The default value of DN is "*IP address of the data.net NIC*".

Setting method: This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

Setting suggestion: Retain the default value.

NOTE

- The **public_cloud.conf** file contains the following NIC information: **mgr.net** (management NIC), **data.net** (data NIC), and **virtual.net** (virtual NIC).
- If an IPv6 address is used and the IP address is a fe80 address block, add '%zone index' during the configuration.
- This parameter can be set in **gs_guc reload** mode. The GaussDB kernel dynamically listens on the IP addresses specified by this parameter based on the policy of listening on new IP addresses, keeping listening on duplicate IP addresses, and disabling listening on invalid IP addresses. If an invalid IP address exists (for example, the IP address is not configured on the local host, the IP address is invalid, or the IP address has been listened on), the kernel fails to listen on the IP address. In this case, the value of **listen_addresses** does not match the actual listening IP address.
- If this parameter is set in **gs_guc reload** mode and all IP addresses in the parameter value are invalid, listening on new IP addresses fails and listening on all old IP addresses is canceled. If this parameter is left empty, new IP addresses are intercepted and old IP addresses are listened on.
- If **listen_addresses** is configured in the process startup parameter, this parameter is forcibly set to the configured value and will not be modified by reload.
- If the new parameter value is the same as the old parameter value, the listening action is not performed. Therefore, when the **listen_addresses** parameter is set and an invalid IP address exists in the list, the kernel fails to listen on the IP address. After the IP address becomes valid and the same parameter is set again, the kernel does not listen on the IP address because the two parameter values are the same. In this case, you need to run the **gs_guc reload** command to remove the IP address from the parameter value and add the IP address again.
- After this parameter is updated by using **gs_guc reload**, if an IP address is no longer listened on, you need to execute the gs_validate_ext_listen_ip() function to clear the connection. For details about the input parameters and execution, see "SQL Reference > Functions and Operators > Other System Functions" in *Developer Guide*.
- Do not use gs_guc to reload the value of **listen_addresses** on all DNs in **"-N all"** mode. This parameter can be set only on a single DN.
- Dynamically modifying **listen_addresses** is a high-risk operation. If the configuration is incorrect, the database may fail to accept new connections, affecting services. Exercise caution when performing this operation.

Risks and impacts of improper settings: none

local_bind_address

Parameter description: Specifies the local IP address bound to the current node for connecting to other nodes in the database.

Parameter type: string.

Unit: none

Value range: an IPv4 address. Multiple IP addresses are not supported.

Default value: After the database instance is installed, the default value is set based on the IP addresses of different instances in the **public_cloud.conf** configuration file. The default value of DN is "*IP address of the data.net NIC*".

NOTE

The **public_cloud.conf** file contains the following NIC information: **mgr.net** (management NIC), **data.net** (data NIC), and **virtual.net** (virtual NIC).

Setting method: This is a POSTMASTER parameter. Set it based on instructions in Table 14-1.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: none

port

Parameter description: Specifies the TCP port listened on by the GaussDB.

Parameter type: integer.

Unit: none

Value range: 1 to 65535

NOTE

- When setting the port number, ensure that the port number is not in use. When setting the port numbers of multiple instances, ensure that the port numbers do not conflict.
- Ports 1 to 1023 are reserved for the OS. Do not use them.
- When the database instance is installed using the configuration file, pay attention to the ports reserved in the communication matrix in the configuration file. For example, the port specified by the value of **dataPortBase** plus 1 needs to be reserved for internal tools Therefore, during database instance installation, the maximum port number is **65529** for DNs. Ensure that the port number does not conflict with each other.

Default value: **5432** (The actual value is specified in the configuration file during installation.)

Setting method: This is a POSTMASTER parameter. Set it based on instructions in Table 14-1.

Setting suggestion: Retain the default value.

Risks and impact of improper settings: This parameter is specified in the configuration file during installation. Do not modify this parameter unless necessary. Otherwise, database communications will be affected after the modification.

max_connections

Parameter description: Specifies the maximum number of concurrent connections to the database. This parameter influences the concurrent processing capability of the database.

Parameter type: integer.

Unit: none

Value range: an integer. The minimum value is **10** (greater than the value of **max_wal_senders**). The theoretical maximum value is **262143**. The actual maximum value is a dynamic value, which is calculated using the formula: 262143 – **job_queue_processes** – **autovacuum_max_workers** – **AUXILIARY_BACKENDS** – **AV_LAUNCHER_PROCS** – **max_inner_tool_connections** – **max_concurrent_autonomous_transactions** – *min(max(newValue/4,64),1024)*. The values of **job_queue_processes**, **autovacuum_max_workers**,

max_inner_tool_connections, and **max_concurrent_autonomous_transactions** depend on the settings of the corresponding GUC parameters. **AUXILIARY_BACKENDS** indicates the number of reserved auxiliary threads, which is fixed to **20**. **AV_LAUNCHER_PROCS** indicates the number of reserved autovacuum launcher threads, which is fixed to **2**. In *min(max(newValue/4,64),1024)*, **newValue** indicates the new value.

The value range of this parameter varies depending on different instance memory specifications.

Table 14-3 Value ranges of memory specifications for different instances

Memory Specifications	Value Range for DNs
< 32 GB	[10, 300]
[32GB,64GB)	[10, 600]
[64GB,128GB)	[10,2048]
[128GB,256GB)	[10,5000]
[256GB,480GB)	[10,11000]
[480GB,512GB)	[10,24000]
[512GB,640GB)	[10,25000]
[640GB,768GB)	[10,34000]
[768GB,1024GB)	[10,40000]
[1024GB,1536GB)	[10,55000]
[1536GB,2048GB)	[10,85000]
≥ 2048 GB	[10,110000]

Default value:

85000 (196-core CPU/1536 GB memory); **55000** (128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory); **40000** (96-core CPU/768 GB memory); **34000** (80-core CPU/640 GB memory); **25000** (64-core CPU/512 GB memory); **24000** (60-core CPU/480 GB memory); **11000** (32-core CPU/256 GB memory); **5000** (16-core CPU/128 GB memory); **2048** (8-core CPU/64 GB memory); **600** (4-core CPU/32 GB memory); **300** (4-core CPU/16 GB memory)

Setting method: This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Setting suggestion: Retain the default value of this parameter in the primary node of the databases. If this parameter is set to a smaller value, the number of available connections decreases. Before changing the value of this parameter, understand the parameter description and exercise caution to avoid risks caused by misoperations.

Risks and impacts of improper settings:

- If the value of **max_connections** exceeds the maximum dynamic value, the node fails to be started and the following error message is displayed: "invalid value for parameter "max_connections"." Alternatively, the memory fails to be allocated during the node startup and the following error message is displayed: "Cannot allocate memory."
- If the value of **max_connections** is not increased based on the external export specifications, the memory parameter is not adjusted in the same proportion. When the service load is heavy, the memory may be insufficient and the error message "memory is temporarily unavailable" is displayed.

NOTE

- If the number of connections of the administrator exceeds the value of **max_connections**, the administrator can still connect to the database after the connections are used up by common users. If the number of connections exceeds the value of **sysadmin_reserved_connections**, an error is reported. That is, the maximum number of connections of the administrator is equal to the value of **max_connections** + **sysadmin_reserved_connections**.
- For common users, internal jobs use some connections. Therefore, the value of this parameter is slightly less than that of **max_connections**. The value depends on the number of internal connections.

max_inner_tool_connections

Parameter description: Specifies the maximum number of concurrent connections of a tool which is allowed to connect to the database. This parameter influences the concurrent connection capability of the GaussDB tool.

Parameter type: integer.

Unit: none

Value range: The minimum value is **1**. The formula for calculating the maximum value: 262143 – **job_queue_processes** – **autovacuum_max_workers** – **max_connections** – **max_concurrent_autonomous_transactions** – **AUXILIARY_BACKENDS** – **AV_LAUNCHER_PROCS** – *min(max(max_connections/4,64),1024)*. The values of **job_queue_processes**, **autovacuum_max_workers**, **max_connections**, and **max_concurrent_autonomous_transactions** are related to the settings of the corresponding GUC parameters. **AUXILIARY_BACKENDS** indicates the number of reserved auxiliary threads and its value is fixed to **20**. **AV_LAUNCHER_PROCS** indicates the number of launcher threads reserved for autovacuum and its value is fixed to **2**.

Default value: **50** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory); **10** (4-core CPU/16 GB memory)

If the default value is greater than the maximum value supported by the kernel (determined when the **gs_initdb** command is executed), an error message is displayed.

Setting method: This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Setting suggestion: Retain the default value of this parameter in the primary database node file. If this parameter is set to a large value, GaussDB requires more System V shared memories or semaphores, which may exceed the default maximum configuration of the OS. In this case, modify the value as needed.

Risks and impacts of improper settings: none

sysadmin_reserved_connections

Parameter description: Specifies the minimum number of connections reserved for administrators. You are advised not to set this parameter to a large value. This parameter is used together with the **max_connections** parameter. The maximum number of connections of the administrator is equal to the value of **max_connections** + **sysadmin_reserved_connections**.

NOTE

- When the thread pool function is enabled, if the thread pool is fully occupied, a processing bottleneck occurs. As a result, connections reserved by the administrator cannot be established. In this case, you can use gsql to establish connections through the port specified by the primary port number plus 1 and clear useless sessions.
- When the reserved connections are used up, new connections will fail. In this case, you can only restart the database to restore the connections. Therefore, exercise caution when using the reserved connections.

Parameter type: integer.

Unit: none

Value range: an integer ranging from 0 to *MIN(262143, max_connections)* (the smaller value between **262143** and **max_connections**). For details about how to calculate the value of **max_connections**, see the preceding description.

Default value: **3**

Setting method: This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Setting suggestion: none

Risks and impacts of improper settings: none

service_reserved_connections

Parameter description: Specifies the minimum number of connections reserved for background O&M users (with the persistence attribute). A large value is not recommended. This parameter is used together with **max_connections**. The maximum number of connections of an O&M user can be calculated as follows: **max_connections** + **service_reserved_connections**.

Parameter type: integer.

Unit: none

Value range: 0 to 262143.

Default value: **10**

Setting method: This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Setting suggestion: Retain the default value. If this parameter is set to a small value, the O&M user (with the persistence attribute) cannot connect to the database and jobs cannot be executed if **max_connections** is set to the maximum value.

Risks and impacts of improper settings: none

unix_socket_directory

Parameter description: Specifies the UDS directory for the GaussDB server to listen to connections from the client.

Parameter type: string.

Unit: none

Value range: valid path of a directory.

NOTE

The value of this parameter depends on the maximum path length of a directory in the OS. If the value exceeds the limit, "Unix-domain socket path "xxx" is too long" is reported.

Default value: empty. The actual value is specified by the configuration file during installation.

Setting method: This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Setting suggestion: none

Risks and impact of improper configuration: If the configuration is incorrect (for example, the length exceeds the limit or the directory is invalid), the process cannot be started properly. You can locate the fault based on the startup logs.

unix_socket_group

Parameter description: Specifies the group of the UDS (the user of a socket is the user who starts the server). This parameter can work with **unix_socket_permissions** to control socket access.

This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Value range: a string. If this parameter is set to an empty string, the default group of the current user is used.

Default value: an empty string.

unix_socket_permissions

Parameter description: Specifies access permissions on the UDS.

The UDS uses the usual permission set of the Unix file system. The value of this parameter should be a number (acceptable for the **chmod** and **umask** commands). If a user-defined octal format is used, the number must start with 0.

You are advised to set it to **0770** (only allowing access from users connecting to the database and users in the same group as them) or **0700** (only allowing access from users connecting to the database).

This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Value range: 0000 to 0777

Default value: **0700**

NOTE

In the Linux OS, a document has one document attribute and nine permission attributes, which are the read (r), write (w), and execute (x) permissions of the **owner**, **group**, and **others** groups.

The r, w, and x permissions are represented by the following numbers:

r: 4

w: 2

x: 1

-: 0

The three attributes in a group are accumulative.

For example, **-rwxrwx---** indicates the following permissions:

owner=rwx=4+2+1=7

group=rwx=4+2+1=7

others =---=0+0+0=0

The permission of the file is 0770.

application_name

Parameter description: Specifies the client name used in the current connection request.

This is a USERSET parameter. Set it based on instructions in **Table 14-1**. Note that after the client is connected, this parameter is set to the client name and the client level. Therefore, only the session-level parameters take effect. Other methods do not take effect because they are lower than the client level.

When a standby node requests to replicate logs on the primary node, if this parameter is not an empty string, it is used as the name of the streaming replication slot of the standby node on the primary node. In this case, if the length of this parameter exceeds 61 bytes, only the first 61 bytes are used as the streaming replication slot name.

Value range: a string.

Default value: empty (The actual value is the name of the application connected to the backend.)

connection_info

Parameter description: Specifies the database connection information, including the driver type, driver version, driver deployment path, and process owner.

This is a USERSET parameter used for O&M. You are advised not to set the parameter.

Value range: a string.

Default value: an empty string.

NOTE

- An empty string indicates that the driver connected to the database does not support automatic setting of the **connection_info** parameter or the parameter is not set by users in applications.
- The following is an example of the concatenated value of **connection_info**:
  ```
  {"driver_name":"ODBC","driver_version": "(GaussDB Kernel XXX.X.XXX build 290d125f) compiled at 2020-05-08 02:59:43 commit 2143 last mr 131 release","driver_path":"/usr/local/lib/gsqlodbcw.so","os_user":"omm"}
  ```
  By default, **driver_name** and **driver_version** are displayed. The display of **driver_path** and **os_user** is controlled by users. For details, see "Application Development Guide > Development Based on JDBC > Connecting to the Database" in *Developer Guide* and "Application Development Guide > Development Based on ODBC > Configuring a Data Source in the Linux OS" in *Developer Guide*.

check_disconnect_query

Parameter description: Specifies whether to terminate the execution of statements on the GaussDB server after the client is disconnected abnormally (for example, socketTimeout is triggered by JDBC, rwtimeout is triggered by libpq and the connection is closed, or the client process is terminated during service running).

Parameter type: Boolean.

Unit: none

Value range:

- **on**: indicates that the GaussDB server stops running the corresponding statements after the client is disconnected unexpectedly.
- **off**: indicates that the GaussDB server does not stop running the corresponding statements after the client is disconnected unexpectedly.

Default value: **on**

Setting method: This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Setting suggestion: Retain the default value.

plat_compat_server_port

Parameter description: Specifies the database configuration item in M-compatible mode. This parameter specifies the TCP port number for protocol listening.

Parameter type: integer.

Unit: none

Value range: 1024 to 65536

Default value: **65536**, indicating that the listening port is not enabled.

Setting method: This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Setting suggestion: The default value is **65536**, indicating that the listening port is disabled. Ports 1024 to 65535 are valid listening ports. Set the parameter to a value of unused port.

14.3.3.2 Security and Authentication (gaussdb.conf)

This section describes parameters about client-to-server authentication.

authentication_timeout

Parameter description: Specifies the timeout period for client authentication. If a client is not authenticated by the server within the period, the server automatically disconnects from the client so that the client does not occupy connection resources.

This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

Value range: an integer ranging from 1 to 600. The unit is s.

Default value: **1min**

auth_iteration_count

Parameter description: Specifies the number of iterations during the generation of encryption information for authentication.

This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

Value range: an integer ranging from 2048 to 134217728.

Default value: **10000**

NOTICE

If the number of iterations is too small, the password storage security is reduced. If the number of iterations is too large, the performance deteriorates in scenarios involving password encryption, such as authentication and user creation. Set the number of iterations based on actual hardware conditions. You are advised to retain the default value.

session_authorization

Parameter description: Specifies the user ID of the current session.

This is a USERSET parameter and can be set only by following the instructions in "SQL Reference > SQL Syntax > SET SESSION AUTHORIZATION" in *Developer Guide*.

Value range: a string.

Default value: **NULL**

session_timeout

Parameter description: Specifies the longest duration allowed when no operations are performed on a client after it is connected to the server.

Parameter type: integer.

Unit: second

Value range: 0 to 86400 (1d).

- The value **0** indicates that the timeout setting is disabled.
- A positive number indicates the maximum duration in which no operation is performed after the connection to the server is set up. When the value of this parameter is exceeded, the client is disconnected from the server.

Default value: 600s

Setting method: This is a USERSET parameter. Set it based on instructions in **Table 14-1**.

Setting suggestion: Retain the default value.

NOTICE

The gsql client of GaussDB has an automatic reconnection mechanism. For local connection of initialized users, the client reconnects to the server if the connection breaks after the timeout.

ssl

Parameter description: Specifies whether to enable the SSL connection on the server. Before using this option, read "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Value range: Boolean.

- **on** indicates that the SSL connection is enabled on the server. Whether SSL encrypted transmission is used during actual communication depends on the client configuration.
- **off** indicates that the SSL connection is disabled on the server.

NOTICE

To enable this parameter, configure parameters **ssl_cert_file**, **ssl_key_file**, and **ssl_ca_file** as well as the corresponding files. If Chinese cryptographic algorithms are used, ensure that **ssl_enc_cert_file** and **ssl_enc_key_file** are correctly configured. Incorrect configurations may cause database startup failures.

Default value: **on**

require_ssl

Parameter description: Specifies whether SSL is used to connect to the server. This parameter is valid only when **ssl** is set to **on**. Before using this option, read "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

Value range: Boolean.

- **on** indicates that the server requires SSL connections.
- **off** indicates that the server does not require SSL connections.

NOTICE

GaussDB supports SSL when a client connects to the primary node of the database. It is recommended that the SSL connection be enabled only on the primary node of the database.

Default value: **off**

ssl_ciphers

Parameter description: Specifies the list of encryption algorithms supported by SSL. Only the sysadmin user can access the list.

This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Value range: a string. Separate multiple encryption algorithms by semicolons (;).

Default value: **ALL**

NOTICE

If **ssl_ciphers** is set incorrectly, the database cannot be started properly.

ssl_renegotiation_limit

Parameter description: Specifies the allowed traffic volume over an SSL-encrypted channel before the session key is renegotiated. The renegotiation mechanism reduces the probability that attackers use the password analysis method to crack the key based on a huge amount of data but causes big performance losses. The traffic indicates the sum of transmitted and received traffic. The SSL renegotiation mechanism has been disabled because of potential risks. This parameter is reserved for version compatibility and does not take effect.

This is a USERSET parameter. Set it based on instructions in **Table 14-1**.

Value range: an integer ranging from 0 to 2147483647. The unit is KB. **0** indicates that the renegotiation mechanism is disabled.

Default value: **0**

ssl_cert_file

Parameter description: Specifies the name of the file that contains the SSL server certificate. The path is relative to the data directory.

This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Value range: a string.

Default value: **server.crt**

ssl_key_file

Parameter description: Specifies the name of the file that contains the SSL private key. The path is relative to the data directory.

This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Value range: a string.

Default value: **server.key**

ssl_enc_cert_file

Parameter description: Specifies the name of the SSL server certificate file that is encrypted using Chinese cryptographic algorithms. The path is relative to the data directory.

This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Value range: a string.

Default value: an empty string.

ssl_enc_key_file

Parameter description: Specifies the name of the file that contains the SSL private key. The path is relative to the data directory.

This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Value range: a string.

Default value: an empty string.

ssl_ca_file

Parameter description: Specifies the name of a file that contains CA information. The path is relative to the data directory.

This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Value range: a string. If it is an empty string, no CA file is loaded and client certificate verification is not performed.

Default value: **cacert.pem**

ssl_crl_file

Parameter description: Specifies the certificate revocation list (CRL). If the certificate of a client is in the list, the certificate is invalid. A relative path must be used. The path depends on the data directory.

This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Value range: a string. An empty string indicates that there is no CRL.

Default value: empty

krb_server_keyfile

Parameter description: Specifies the location of the main configuration file of the Kerberos service.

This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

Value range: a string.

Default value: empty

krb_srvname

Parameter description: Specifies the Kerberos service name.

This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

Value range: a string.

Default value: **postgres**

krb_caseins_users

Parameter description: Specifies whether the Kerberos username is case-sensitive.

This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

Value range: Boolean.

- **on** indicates that the Kerberos username is case-insensitive.
- **off** indicates that the Kerberos username is case-sensitive.

Default value: **off**

modify_initial_password

Parameter description: After GaussDB is installed, there is only one initial user account (whose UID is 10) in the database. When a user logs in to the database using this initial account for the first time, this parameter determines whether the password of the initial account needs to be modified.

This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

NOTICE

If the initial user password is not specified during the installation, the initial user password is empty by default after the installation. Before performing other operations, you need to set the initial user password using the gsql client. This parameter no longer takes effect and is reserved only for compatibility with upgrade scenarios.

Value range: Boolean.

- **on** indicates that the password of the initial user needs to be modified upon the first login after the database is successfully installed.
- **off** indicates that the password of the initial user does not need to be modified upon the first login after the database is successfully installed.

Default value: **off**

password_policy

Parameter description: Specifies whether to check the password complexity when you run the **CREATE ROLE/USER** or **ALTER ROLE/USER** command to create or modify the GaussDB account.

This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

NOTICE

For security purposes, do not disable the password complexity policy.

Value range: **0** or **1**

- **0** indicates that no password complexity policy is enabled.
- **1** indicates that the default password complexity policy is enabled.

Default value: **1**

password_reuse_time

Parameter description: Specifies whether to check the reuse interval of the new password when you run the **ALTER USER** or **ALTER ROLE** command to change a user password.

This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

NOTICE

When you change the password, the system checks the values of **password_reuse_time** and **password_reuse_max**.

- If the values of **password_reuse_time** and **password_reuse_max** are both positive numbers, an old password can be reused when it meets either of the reuse restrictions.
- If the value of **password_reuse_time** is **0**, password reuse is restricted based on the number of reuse times, and not on the reuse interval.
- If the value of **password_reuse_max** is **0**, password reuse is restricted based on the reuse interval, and not on the number of reuse times.
- If the values of both **password_reuse_time** and **password_reuse_max** are **0**, password reuse is not restricted.

Value range: a floating-point number ranging from 0 to 3650. The unit is day.

- **0** indicates that the password reuse interval is not checked.
- A positive number indicates that a new password cannot be chosen from passwords in history that are newer than the specified number of days.

Default value: **0**

password_reuse_max

Parameter description: Specifies whether to check the reuse times of the new password when you run the **ALTER USER** or **ALTER ROLE** command to change a user password. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

NOTICE

When you change the password, the system checks the values of **password_reuse_time** and **password_reuse_max**.

- If the values of **password_reuse_time** and **password_reuse_max** are both positive numbers, an old password can be reused when it meets either of the reuse restrictions.
- If the value of **password_reuse_time** is **0**, password reuse is restricted based on the number of reuse times, and not on the reuse interval.
- If the value of **password_reuse_max** is **0**, password reuse is restricted based on the reuse interval, and not on the number of reuse times.
- If the values of both **password_reuse_time** and **password_reuse_max** are **0**, password reuse is not restricted.

Value range: an integer ranging from 0 to 1000.

- **0** indicates that the password reuse times are not checked.
- A positive number indicates that the new password cannot be the one whose reuse times exceed the specified number.

Default value: **0**

password_lock_time

Parameter description: Specifies the duration before a locked account is automatically unlocked.

Parameter type: floating-point.

Unit: day

NOTICE

The locking and unlocking functions take effect only when the values of **password_lock_time** and **failed_login_attempts** are positive numbers.

Value range: 0 to 365. The integer part indicates the number of days, and the decimal part can be converted into hours, minutes, and seconds. For example, **password_lock_time=1.5** indicates one day and 12 hours.

- **0** indicates that an account is not automatically locked if the password verification fails.
- A positive number indicates the duration after which a locked account is automatically unlocked.

Default value: **1**

Setting method: This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

Setting suggestion: Retain the default value. Do not set the automatic unlock time to a large value. Set it to a proper value based on the value of **failed_login_attempts**. If the value of **failed_login_attempts** is too small but the automatic unlock time is too long, the account cannot be used for a long time after the input fails, affecting user experience.

failed_login_attempts

Parameter description: If the number of incorrect password attempts reaches the value of **failed_login_attempts**, the current account is locked. The account is automatically unlocked after the number of seconds specified by **password_lock_time**. During this period, only the sysadmin user can access the account. The automatic account locking policy applies in scenarios such as login and password modification using the **ALTER USER** command.

Parameter type: integer.

Unit: none

NOTICE

The locking and unlocking functions take effect only when the values of **failed_login_attempts** and **password_lock_time** are positive numbers.

Value range: 0 to 1000.

- **0** indicates that the automatic locking function does not take effect.
- A positive number indicates that an account is locked when the number of incorrect password attempts reaches the specified number.

Default value: **10**

Setting method: This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

Setting suggestion: You are advised to set it to a value ranging from 5 to 10. If this parameter is set to a large value that allows too many incorrect password attempts (less than the maximum value of 1000), but no security measure is taken, security risk occurs. If this parameter is set to a small value (greater than 0 and less than 5), the account may be locked due to failed password attempts, affecting normal use.

password_encryption_type

Parameter description: Specifies the encryption type of a user password. Changing the value of this parameter does not automatically trigger the change of the password encryption type of an existing user. Only the password of a new user or the password changed by an existing user is encrypted using the new encryption type.

Parameter type: enumerated type

Unit: none

Value range: **0**, **1**, **2**, or **3**

- **0** indicates that passwords are encrypted with MD5.
- **1** indicates that passwords are encrypted with SHA-256 and MD5.
- **2** indicates that passwords are encrypted with SHA-256.
- **3** indicates that the passwords are encrypted with SM3.

NOTICE

The MD5 encryption algorithm is not recommended because it has lower security and poses security risks.

Default value: 2

Setting method: This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

Setting suggestion: Retain the default value.

password_min_length

Parameter description: Specifies the minimum length of an account password. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

Value range: an integer ranging from 6 to 999.

Default value: **8**

password_max_length

Parameter description: Specifies the maximum length of an account password. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

Value range: an integer ranging from 6 to 999.

Default value: **32**

password_min_uppercase

Parameter description: Specifies the minimum number of uppercase letters that an account password must contain. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

Value range: an integer ranging from 0 to 999

- **0** means no limit.
- An integer ranging from 1 to 999 indicates the minimum number of uppercase letters required in a password when you create an account.

Default value: **0**

password_min_lowercase

Parameter description: Specifies the minimum number of lowercase letters that an account password must contain. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

Value range: an integer ranging from 0 to 999

- **0** means no limit.
- An integer ranging from 1 to 999 indicates the minimum number of lowercase letters required in a password when you create an account.

Default value: **0**

password_min_digital

Parameter description: Specifies the minimum number of digits that an account password must contain. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

Value range: an integer ranging from 0 to 999

- **0** means no limit.

- An integer ranging from 1 to 999 indicates the minimum number of digits required in a password when you create an account.

Default value: **0**

password_min_special

Parameter description: Specifies the minimum number of special characters that an account password must contain. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

Value range: an integer ranging from 0 to 999

- **0** means no limit.
- An integer ranging from 1 to 999 indicates the minimum number of special characters required in a password when you create an account.

Default value: **0**

password_effect_time

Parameter description: Specifies the validity period of an account password.

Parameter type: floating-point.

Unit: day

Value range: 0 to 999. The integer part indicates the number of days, and the decimal part can be converted into hours, minutes, and seconds. For example, **password_lock_time=0.5** indicates 0 days and 12 hours.

- **0** indicates that the validity period restriction is disabled.
- A floating-point number from 1 to 999 indicates the number of days for which an account password is valid. When the password is about to expire or has expired, the system prompts the user to change the password.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

Setting suggestion: For security purposes, you are advised to retain the default value.

password_notify_time

Parameter description: Specifies how many days in advance a user is notified before a password expires.

This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

Value range: an integer ranging from 0 to 999. The unit is day.

- **0** indicates that the reminder is disabled.
- An integer ranging from 1 to 999 indicates the number of days prior to password expiration that a user will receive a reminder.

Default value: **7**

enable_innertool_cert

Parameter description: Specifies whether internal tools use certificate-based authentication.

This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

Value range: Boolean.

- **on**: indicates that internal tools use certificate-based authentication.
- **off**: indicates that internal tools do not use certificate-based authentication.

Default value: **off**

NOTICE

- This parameter takes effect only when both this parameter and **ssl** are enabled.
- By default, the certificate in the *$GAUSSHOME*/**share/sslcert/gsql** directory is used. The **Common Name** of the certificate must be the same as the initial user. Otherwise, the authentication fails.
- After this parameter takes effect, the initial user uses certificate-based authentication, and other users use password-based authentication.
- If this parameter is enabled, the initial user can remotely connect to the database using certificate-based authentication.

ssl_cert_notify_time

Parameter description: Specifies the number of days prior to SSL server certificate expiration that a user will receive a reminder. When the SSL certificate is initialized during connection establishment, if the duration from the current time to the certificate expiration time is shorter than the specified value, an expiration notification is recorded in the log.

This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

Value range: an integer ranging from 7 to 180. The unit is day.

Default value: **90**

plat_compat_allow_public_key_retrieval

Parameter description: Specifies the database configuration item in M-compatible mode. This parameter specifies whether to enable the RSA public key function on the client. By default, this function is disabled.

Parameter type: Boolean.

- **on**: The kernel allows the client to request the RSA public key for password transmission encryption.
- **off**: The client is not allowed to request the RSA public key.

Unit: none

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Setting suggestions: If the RSA connection is used, set this parameter to **on** and SSL to **off**.

14.3.3.3 Communications Library Parameters

This section describes parameter settings and value ranges for communications libraries.

tcp_keepalives_idle

Parameter description: Specifies the interval for transmitting keepalive signals on an OS that supports the **TCP_KEEPIDLE** socket option. If no keepalive signal is transmitted, the connection is in idle mode.

This is a USERSET parameter. Set it based on instructions in **Table 14-1**.

NOTICE

- If the OS does not support **TCP_KEEPIDLE**, set this parameter to **0**.
- The parameter is ignored on an OS where connections are established using the UDS.
- If this parameter is set to **0**, the system value is used.
- This parameter is not shared among different sessions. That is, different session connections may have different values.
- The parameter value in the current session connection, not the value of the GUC copy, is displayed.

Value range: 0 to 3600. The unit is s.

Default value: **60**

tcp_keepalives_interval

Parameter description: Specifies the response time before retransmission on an OS that supports the **TCP_KEEPINTVL** socket option.

This is a USERSET parameter. Set it based on instructions in **Table 14-1**.

Value range: 0 to 180. The unit is s.

Default value: **30**

NOTICE

- If the OS does not support **TCP_KEEPINTVL**, set this parameter to **0**.
- The parameter is ignored on an OS where connections are established using the UDS.
- If this parameter is set to **0**, the system value is used.
- This parameter is not shared among different sessions. That is, different session connections may have different values.
- The parameter value in the current session connection, not the value of the GUC copy, is displayed.

tcp_keepalives_count

Parameter description: Specifies the number of keepalive signals that can be waited before the GaussDB server is disconnected from the client on an OS that supports the **TCP_KEEPCNT** socket option.

This is a USERSET parameter. Set it based on instructions in **Table 14-1**.

NOTICE

- If the OS does not support **TCP_KEEPCNT**, set this parameter to **0**.
- The parameter is ignored on an OS where connections are established using the UDS.
- If this parameter is set to **0**, the system value is used.
- This parameter is not shared among different sessions. That is, different session connections may have different values.
- The parameter value in the current session connection, not the value of the GUC copy, is displayed.

Value range: 0 to 100. **0** indicates that the connection is immediately broken if GaussDB does not receive a keepalive signal from the client.

Default value: 20

tcp_user_timeout

Parameter description: Specifies the maximum duration for which the transmitted data can remain in the unacknowledged state before the TCP connection is forcibly closed when the GaussDB sends data on the OS that supports the **TCP_USER_TIMEOUT** socket option.

This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

NOTICE

- If the OS does not support the **TCP_USER_TIMEOUT** option, the value of this parameter does not take effect. The default value is **0**.
- The parameter is ignored on an OS where connections are established using the UDS.

Value Range: 0 to 3600000. The unit is ms. The value **0** indicates that the value is set based on the OS.

Default value: **0**

Note that the effective result of this parameter varies according to the OS kernel.

- For AArch64 EulerOS (Linux kernel version: 4.19), the timeout interval is the value of this parameter.
- For x86 Euler 2.5 (Linux kernel version: 3.10), the timeout interval is not the value of this parameter but the maximum value in different ranges. That is, the timeout interval is the maximum upper limit of the total Linux TCP retransmission duration to which the value of **tcp_user_timeout** belongs. For example, if **tcp_user_timeout** is set to **40000**, the total retransmission duration is 51 seconds.

  Table 14-4 Value of tcp_user_timeout for x86 Euler 2.5 (Linux kernel version: 3.10)

Number of Linux TCP Retransmission Times	Total Linux TCP Retransmission Duration Range (s)	Example of tcp_user_timeout (ms)	Actual Linux TCP Retransmission Duration (s)
1	(0.2,0.6]	400	0.6
2	(0.6,1.4]	1000	1.4
3	(1.4,3]	2000	3
4	(3,6.2]	4000	6.2
5	(6.2,12.6]	10000	12.6
6	(12.6,25.4]	20000	25.4
7	(25.4,51]	40000	51
8	(51,102.2]	80000	102.2
9	(102.2,204.6]	150000	204.6
10	(204.6,324.6]	260000	324.6
11	(324.6,444.6]	400000	444.6

Note: The duration of each TCP retransmission increases exponentially with the number of retransmission times. When the duration of a TCP retransmission reaches 120 seconds, the duration of each subsequent retransmission does not change.

comm_proxy_attr

Parameter description: Specifies the parameters related to the communications proxy library.

NOTE

- This parameter applies only to the centralized Arm standalone system running EulerOS 2.9.
- This function takes effect when the thread pool is enabled, that is, **enable_thread_pool** is set to **on**.
- When setting this parameter, you need to set the GUC parameter **local_bind_address** to the IP address of the NIC of the **libos_kni**.
- **Parameter template**: comm_proxy_attr = '{enable_libnet:true, enable_dfx:false, numa_num:4, numa_bind:[[30,31],[62,63],[94,95],[126,127]]}'
- Parameters that need to be configured include:
  - **enable_libnet**: specifies whether to enable the user-mode protocol. The value can be **true** or **false**.
  - **enable_dfx**: specifies whether to enable the communications proxy library view. The value can be **true** or **false**.
  - **numa_num**: number of NUMA nodes in the system. 2P and 4P servers are supported. The value can be **4** or **8**.
  - **numa_bind**: core binding parameter of the agent thread. Each numa has two CPUs. There are a total of **numa_num** groups. The value range is [0,*Number of CPUs* – 1].

This is a POSTMASTER parameter. Set it based on instructions in **Table 14-1**.

Value range: a string, consisting of one or more characters.

Default value: **'none'**

umdk_enabled

Parameter description: Specifies whether UMDK is enabled for the current primary and standby DNs in the database. If the UMDK protocol is used for communication between the primary and standby DNs, the related log keyword on DNs is umdk. If the TCP protocol is used for communication between the primary and standby DNs, logs are recorded. Currently, this function is supported only in some scenarios.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: UMDK is enabled. If the current database instance does not support the UMDK network communication protocol, TCP is used for communication between the primary and standby DNs. Otherwise, UMDK is used for communication between the primary and standby DNs.

- **off**: The UMDK function is disabled. TCP is used for communication between the primary and standby DNs.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions in Table 14-1.

Setting suggestion: Set this parameter based on the actual application scenarios.

NOTE

- GaussDB adapts to the UMDK communication protocol stack. The UMDK capability is provided and maintained by the OS.
- By default, the **umdk_enabled** parameter is disabled in GaussDB. After this parameter is enabled, whether GaussDB supports this capability depends on whether the OS provides and supports the UMDK function.
- The UMDK capability depends on the hardware NIC and software OS configuration. For example, the hardware NIC should be 1823V200 and the OS should be HCE2.0.
- To check whether the environment has the UMDK capability, run the **lsmod | grep ums** statement as the **root** user to check whether the UMS module is loaded to the operating systemOS.

  If the result of the preceding operation shows that the current environment does not support the UMDK (UMS module) or the UMS module is faulty, enabling **umdk_enabled** will cause the connection between the primary and standby nodes to fail. Before enabling **umdk_enabled**, ensure that the environment has the UMDK capability.

umdk_port

Parameter description: Specifies the listening port of the network communication link between the primary and standby DNs when the UMDK protocol is used for communication between the primary and standby DNs.

Parameter type: integer.

Unit: none

Value range: 1 to 65535

Default value: ***dataPortBase* + 15**. The value of *dataPortBase* is the same as the value of GUC parameter **port** set when the database is installed for the first time.

Setting method: This is a POSTMASTER parameter. Set it based on instructions in Table 14-1.

Setting suggestion: Retain the default value.

NOTE

- GaussDB adapts to the UMDK communication protocol stack. The UMDK capability is provided and maintained by the OS.
- By default, GaussDB does not listen on the port specified by **umdk_port**. The UMDK protocol function of the database is enabled and related ports are listened on only when the GUC parameter **umdk_enabled** is enabled and the hardware and software in the current environment support the UMDK protocol. Then, the primary and standby DNs start to execute the UMS network protocol (a type of UMDK network protocols).

14.3.4 Resource Consumption

14.3.4.1 Memory

This section describes memory parameters.

NOTICE

These parameters, except **local_syscache_threshold**, take effect only after the database restarts.

memorypool_enable

Parameter description: Specifies whether to enable a memory pool.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the memory pool is enabled.
- **off** indicates that the memory pool is disabled.

Default value: **off**

memorypool_size

Parameter description: Specifies the memory pool size.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 128 x 1024 to *INT_MAX*/2. The unit is KB.

Default value: **512MB**

enable_memory_limit

Parameter description: Specifies whether to enable the logical memory management module.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the logical memory management module is enabled.
- **off** indicates that the logical memory management module is disabled.

Default value: **on**

CAUTION

- Fixed overhead exists, that is, **shared_buffers** and metadata (about 200 MB). If **max_process_memory** minus the fixed overhead is less than 2 GB, GaussDB forcibly sets **enable_memory_limit** to **off**. Metadata is the memory used in GaussDB and is related to some concurrent parameters, such as **max_connections**, **thread_pool_attr**, and **max_prepared_transactions**.
- If this parameter is set to **off**, the memory used by the database is not limited. When a large number of concurrent or complex queries are performed, too much memory is used, which may cause OS OOM problems.

max_process_memory

Parameter description: Specifies the maximum physical memory of a database node.

Parameter type: integer.

Unit: KB

Value range: 2097152 to 2147483647

Default value:

1400GB (196-core CPU/1536 GB memory); **900GB** (128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory); **680GB** (96-core CPU/768 GB memory); **560GB** (80-core CPU/640 GB memory); **450GB** (64-core CPU/512 GB memory); **420GB** (60-core CPU/480 GB memory); **200GB** (32-core CPU/256 GB memory); **90GB** (16-core CPU/128 GB memory); **40GB** (8-core CPU/64 GB memory); **20GB** (4-core CPU/32 GB memory); **10GB** (4-core CPU/16 GB memory)

CAUTION

If this parameter is set to a value greater than the physical memory of the server, the OS OOM problem may occur.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is used to prevent node OOM caused by memory bloat, ensuring system reliability. The value of this parameter on the database node depends on the physical memory of the system and the number of primary database nodes deployed on a single node. The recommended formula is as follows: (Physical memory size – **vm.min_free_kbytes**) x 0.7/Number of primary nodes. **vm.min_free_kbytes** in this formula indicates that the OS memory reserved for the kernel to receive and send data. Its value is at least 5% of the total memory. That is, **max_process_memory** = Physical memory size x 0.665/Number of primary nodes.

enable_memory_context_control

Parameter description: Enables the function of checking whether the number of memory contexts exceeds the specified limit. This parameter applies only to the DEBUG version.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the function of checking the number of memory contexts is enabled.
- **off** indicates that the function of checking the number of memory contexts is disabled.

Default value: **off**

uncontrolled_memory_context

Parameter description: Specifies which memory context will not be checked when the function of checking whether the number of memory contexts exceeds the specified limit is enabled. This parameter applies only to the DEBUG version.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

During the query, the title meaning string "MmgrMemoryController white list:" is added to the beginning of the parameter value.

Value range: a string.

Default value: empty

shared_buffers

Parameter description: Specifies the size of shared memory used by GaussDB. Increasing the value of this parameter causes GaussDB to request more System V shared memory than the default configuration allows.

Parameter type: integer.

Unit: page (8 KB)

Value range: 16 to 1073741823. The value of this parameter must be an integer multiple of **BLCKSZ**. Currently, **BLCKSZ** is set to **8KB**. That is, the value of this parameter must be an integer multiple of 8 KB.

Default value:

560GB (196-core CPU/1536 GB memory); **360GB** (128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory); **270GB** (96-core CPU/768 GB memory); **220GB** (80-core CPU/640 GB memory); **180GB** (64-core CPU/512 GB memory); **160GB** (60-core CPU/480 GB memory); **80GB** (32-core CPU/256 GB memory); **36GB** (16-core CPU/128 GB memory); **16GB** (8-core CPU/64 GB memory); **8GB** (4-core CPU/32 GB memory); **2GB** (4-core CPU/16 GB memory)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion:

1. Set **shared_buffers** to a value less than 40% of the memory.
2. If **shared_buffers** is set to a larger value, increase the value of **checkpoint_segments** because a longer period of time is required to write a large amount of new or changed data.
3. If the process fails to be restarted after the value of **shared_buffers** is changed, perform either of the following operations based on the error information:
   a. Adjust the **kernel.shmall**, **kernel.shmmax**, and **kernel.shmmin** OS parameters. For details, see "Configuring Other OS Parameters" in *Installation Guide*.
   b. Run the **free -g** command to check whether the available memory and swap space of the OS are sufficient. If the memory is insufficient, manually stop other user programs that occupy much memory.
   c. Set this parameter to the recommended default value for different specifications. You are advised not to change the value of **shared_buffers**. Otherwise, it may be too large or too small. The following condition must be met: **data_replicate_buffer_size** + **segment_buffers** + **shared_buffers** + **wal_buffers** + **temp_buffers** + **maintenance_work_mem** + **work_mem** + **query_mem** + (Standby node) **wal_receiver_buffer_size** < **max_process_memory** < Memory size of the physical machine. If the value of the memory parameter is too large and exceeds the upper limit of the physical memory, the database cannot be started because it cannot allocate sufficient memory.

page_version_check

Parameter description: Specifies whether to perform verification for underlying storage faults and pages not marked as dirty based on page version information. **page_version_check** is a level-3 switch. The verification for underlying storage faults is to check whether a page read from the underlying storage is of a correct version, which prevents loss of page version information caused by a fault such as a disk power failure. The verification for pages not marked as dirty is to check whether modified pages are not marked as dirty, and is controlled by an independent switch **page_missing_dirty_check**.

Value type: enumerated type

Unit: none

Value range:

- **off**: The verification for underlying storage faults and pages not marked as dirty is disabled.
- **memory**: The page version verification function (that is, verification for underlying storage faults and pages not marked as dirty) in pure memory mode is enabled. The page version information is cached only in the memory and will be lost after a restart.
- **persistence**: The persistent page version verification function (that is, verification for underlying storage faults and pages not marked as dirty) is enabled. The page version information is persisted to files and will not be lost after a restart.

Default value: **memory**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestions: Set the value of this parameter based on different specifications, that is, **off** (four-core CPU/16 GB memory, four-core CPU/32 GB memory, and eight-core CPU/64 GB memory) or **memory** (16-core CPU/128 GB memory, 32-core CPU/256 GB memory, 60-core CPU/480 GB memory, 64-core CPU/512 GB memory, 72-core CPU/576 GB memory, 80-core CPU/640 GB memory, and 96-core CPU/768 GB memory, 96-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 128-core CPU/1024 GB memory, and 196-core CPU/1536 GB memory). Setting this parameter to **memory** affects the performance of a device, and the one with smaller specifications suffers more. (For example, the performance of a 16-core CPU/128 GB memory device using TPC-C model is about 7%.) If the system needs to restart frequently, you are advised to set this parameter to **persistence** to ensure that the version information on the page is not lost. However, the performance will be affected.

page_missing_dirty_check

Parameter description: Checks whether the modified pages are not marked as dirty. **page_missing_dirty_check** is controlled by **page_version_check**. If **page_version_check** is set to **off**, setting **page_missing_dirty_check** to **on** does not take effect.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The verification for pages not marked as dirty is performed.
- **off**: The verification for pages not marked as dirty is not performed.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised to enable this function in test scenarios to detect as many pages not marked as dirty that lead to code bugs in non-production environments as possible. On the live network, this function is disabled by default to avoid extra overhead and performance deterioration.

page_version_max_num

Parameter description: Specifies the maximum number of page versions that can be cached in the memory. This parameter is valid only when **page_version_check** is not set to **off**. The proper number must be twice to four times the value of **shared_buffers**. Each **page_version** occupies 36 bytes of memory. Pay attention to the memory usage.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647.

- **0**: When **page_version_check** is not set to **OFF**, the value of **page_version_max_num** is automatically calculated based on the value of **shared_buffers** using the following formula: **shared_buffers** x 2. For example, 32 MB of **shared_buffers** corresponds to 4096 buffers. Therefore, the value of this parameter is set to **8192**.
- Non-zero values: The manually configured value is forcibly used.
- If **page_version_check** is not set to **OFF**, the value cannot be less than 16 times of **page_version_partitions**. Otherwise, it is forcibly set to a value equal to **page_version_partitions** x 16.

Default value: **0**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: If high performance is required and the memory is sufficient, you are advised to manually set this parameter to four times the value of **shared_buffers** and the ratio of this parameter to **page_version_partitions** is [256, 1024].

page_version_partitions

Parameter description: Specifies the number of hash table partitions in cached page version information in the memory. This parameter directly affects the hash query efficiency and hash conflict probability.

Parameter type: integer.

Unit: none

Value range: 0–2097152

- **0**: **When page_version_check** is not set to **OFF**, the value is automatically calculated based on **page_version_max_num**, that is, **page_version_partitions** = **page_version_max_num**/512. If the automatically calculated value is smaller than 4, the parameter is forcibly set to **4**.
- Non-zero values: The manually configured value is forcibly used. If **page_version_check** is not set to **OFF,** the minimum value is **4**. If the value is less than 4, the parameter is forcibly set to **4**.

Default value: **0**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: If you have high performance requirements, you are advised to manually set this parameter to a value 1/256 to 1/1024 of the value of **page_version_max_num**.

page_version_recycler_thread_num

Parameter description: Specifies the number of threads for recycling and verifying page version information. This parameter is valid only when **page_version_check** is not set to **off**.

Parameter type: integer.

Unit: none

Value range: 0–16

- If **page_version_check** is set to **memory**:
  - **0**: The value is automatically calculated based on the value of **page_version_partitions** using the following formula: **page_version_recycler_thread_num** = **page_version_partitions**/16384. If the automatically calculated value is greater than 4, the parameter is forcibly set to **4**.
  - Non-zero values: The manually configured value is forcibly used.
  - The parameter cannot be set to a value greater than that of **page_version_partitions**. Otherwise, **page_version_partitions** is forcibly set to a value equal to that of **page_version_partitions**.
- If **page_version_check** is set to **persistence**:

  If the value is less than 2, set this parameter to **2**. If the value is greater than or equal to 2, the manually configured parameter value is forcibly used.

Default value: **0**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value **0**.

verify_log_buffers

Parameter description: Specifies the size of the verifyLog buffer. This parameter is valid only when **page_version_check** is set to **persistence**. The verifyLog buffer memory is managed by page, and each page is 8 KB.

Parameter type: integer.

Unit: page (8 KB)

Value range: 4-262144

Default value: **4** (32KB)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. For example, the value **131072** of **verify_log_buffers** indicates that the size is 131072 x 8 KB = 1GB, and the value **131072kB** indicates that **verify_log_buffers** is 131072 KB. If the value contains a unit, the value must be KB, MB, or GB and must be an integer multiple of 8 KB.

Setting suggestion: Set this parameter based on the system hardware specifications.

1GB (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory); **512MB** (16-core CPU/128 GB memory); **256MB** (8-core CPU/64 GB memory); **128MB** (4-core CPU/32 GB memory); **16MB** (4-core CPU/16 GB memory)

segment_buffers

Parameter description: Specifies the memory size of a GaussDB segment-page metadata page.

Parameter type: integer.

Unit: KB

Value range: 16 to 1073741823. The value of this parameter must be an integer multiple of **BLCKSZ**. Currently, **BLCKSZ** is set to **8KB**. That is, the value of this parameter must be an integer multiple of 8 KB.

Default value:

8MB (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory); **128KB** (4-core CPU/16 GB memory)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestions: **segment_buffers** is used to cache the content of segment-page headers, which is key metadata information. To improve performance, it is recommended that the segment headers of ordinary tables be cached in the buffer and not be replaced. You are advised to set this parameter based on the following formula: Number of tables (including indexes and TOAST tables) x Number of partitions x 3 + 128. Multiplying by 3 is because each table (partition) has some extra metadata segments. Generally, a table has three segments. Adding 128 at last is because segment-page tablespace management requires a certain number of buffers. If this parameter is set to a small value, it takes a long time to create a segment-page table for the first time. Therefore, you are advised to retain the default value to avoid setting **segment_buffers** to an excessively large or small value. The following condition must be met: **data_replicate_buffer_size** + **segment_buffers** + **shared_buffers** + **wal_buffers** + **temp_buffers** + **maintenance_work_mem** + **work_mem** + **query_mem** + (Standby node) **wal_receiver_buffer_size** < **max_process_memory** < Memory size of the physical machine. If the value of the memory parameter is too large and exceeds the upper limit of the physical memory, the database cannot be started because it cannot allocate sufficient memory.

bulk_write_ring_size

Parameter description: Specifies the size of the ring buffer used by the operation when a large amount of data is written (for example, the copy operation).

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 16384 to 2147483647. The unit is KB.

Default value: **2GB**

Setting suggestion: Increase the value of this parameter on database nodes if a huge amount of data will be imported.

standby_shared_buffers_fraction

Parameter description: Specifies the **shared_buffers** proportion used on the server where a standby instance is deployed.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a double-precision floating-point number ranging from 0.1 to 1.0

Default value: **1**

temp_buffers

Parameter description: Specifies the maximum size of local temporary buffers used by a database session.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

temp_buffers can be modified only before the first use of temporary tables within each session. Subsequent attempts to change the value of this parameter will not take effect on that session.

A session allocates temporary buffers based on the value of **temp_buffers**. If a large value is set in a session that does not require many temporary buffers, only the overhead of one buffer descriptor is added. If a buffer is used, additional 8192 bytes will be consumed for it.

Value range: an integer ranging from 100 to 1073741823. The unit is 8 KB.

Default value: **1MB**

max_prepared_transactions

Parameter description: Sets the maximum number of transactions that can be in the "prepared" state simultaneously. Increasing the value of this parameter causes GaussDB to request more System V shared memory than the default configuration allows.

When GaussDB is deployed as an HA system, set this parameter on standby nodes to a value greater than or equal to that on primary nodes. Otherwise, queries will fail on the standby nodes.

Parameter type: integer.

Unit: none

Value range: 0 to 262143

Default value:

200 (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory); **0** (4-core CPU/16 GB memory)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestions: Generally, explicit PREPARE operations are not required for transactions. If explicit PREPARE operations are performed for transactions, set this parameter to a value greater than the number of concurrent services that require PREPARE to prevent preparation failures.

work_mem

Parameter description: Specifies the amount of memory to be used by internal sort operations and hash tables before they write data into temporary disk files. Sort operations are required for **ORDER BY**, **DISTINCT**, and merge joins. Hash tables are used in hash joins, hash-based aggregation, and hash-based processing of IN subqueries.

In a complex query, several sort or hash operations may run in parallel; each operation will be allowed to use as much memory as this parameter specifies. If the memory is insufficient, data will be written into temporary files. In addition, several running sessions could be performing such operations concurrently. Therefore, the total memory used may be many times the value of **work_mem**.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 64 to 2147483647. The unit is KB.

Default value:

280MB (196-core CPU/1536 GB memory); **256MB** (128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory); **128MB** (80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory); **64MB** (8-core CPU/64 GB memory) ; **32MB** (4-core CPU/32 GB memory); **16MB** (4-core CPU/16 GB memory)

NOTICE

Setting suggestion:

If the physical memory specified by **work_mem** is insufficient, additional operator calculation data will be written into temporary tables based on query characteristics and the degree of parallelism. This reduces performance by five to ten times, and prolongs the query response time from seconds to minutes.

- For complex serial queries, each query requires five to ten associated operations. Set **work_mem** using the following formula: **work_mem** = 50% of the memory/10.
- For simple serial queries, each query requires two to five associated operations. Set **work_mem** using the following formula: **work_mem** = 50% of the memory/5.
- For concurrent queries, set **work_mem** using the following formula: **work_mem** = **work_mem** for serial queries/Number of concurrent SQL statements.
- BitmapScan hash tables are also restricted by **work_mem**, but will not be forcibly flushed to disks. In the case of complete lossify, every 1 MB memory occupied by the hash table corresponds to a 16 GB page of BitmapHeapScan (32 GB for Ustore). After the upper limit of **work_mem** is reached, the memory increases linearly with the data access traffic based on this ratio.

query_mem

Parameter description: Specifies the memory used by a query.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: 0 or an integer greater than 32 MB. The default unit is KB.

Default value: **0**

NOTICE

- If the value of **query_mem** is greater than 0, the optimizer adjusts the memory cost estimate to this value when generating an execution plan.
- If the value is set to a negative value or a positive integer less than 32 MB, the default value **0** is used. In this case, the optimizer does not adjust the estimated query memory.

query_max_mem

Parameter description: Specifies the maximum memory that can be used by a query.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: 0 or an integer greater than 32 MB. The default unit is KB.

Default value: **0**

NOTICE

- If the value of **query_max_mem** is greater than 0, an error is reported when the query memory usage exceeds the value.
- If the value is set to a negative value or a positive integer less than 32 MB, the default value **0** is used. In this case, the optimizer does not limit the query memory.

maintenance_work_mem

Parameter description: Specifies the maximum amount of memory to be used by maintenance operations, such as VACUUM, CREATE INDEX, and ALTER TABLE ADD FOREIGN KEY. This parameter may affect the execution efficiency of **VACUUM**, **VACUUM FULL**, **CLUSTER**, and **CREATE INDEX**.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1024 to *INT_MAX*. The unit is KB.

Default value:

2GB (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core

CPU/480 GB memory); **1GB** (32-core CPU/256 GB memory); **512MB** (16-core CPU/128 GB memory); **256MB** (8-core CPU/64 GB memory); **128MB** (4-core CPU/32 GB memory); **64MB** (4-core CPU/16 GB memory)

NOTICE

Setting suggestion:

- The value of this parameter must be greater than that of **work_mem** so that database dumps can be more quickly cleared or restored. In a database session, only one maintenance operation can be performed at a time. Maintenance is usually performed when there are not many running sessions.
- When the **Autovacuum** process is running, up to ***autovacuum_max_workers*** times this memory may be allocated. In this case, set **maintenance_work_mem** to a value greater than or equal to that of **work_mem**.
- If a large amount of data is to be clustered, increase the value of this parameter in the session.

max_stack_depth

Parameter description: Specifies the maximum safe depth of the GaussDB execution stack. The safety margin is required because the stack depth is not checked in every routine in the server, but only in key potentially-recursive routines, such as expression evaluation.

Parameter type: integer.

Unit: KB

Value range: [100,*INT_MAX*]

Default value:

- If the value of **ulimit -s** minus 640 KB is greater than or equal to 2 MB, the default value of this parameter is **2 MB**.
- If the value of **ulimit -s** minus 640 KB is less than 2 MB, the default value of this parameter is the value of **ulimit -s** minus 640 KB.

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

When setting this parameter, comply with the following principles:

- The database needs to reserve 640 KB stack depth. Therefore, the ideal value of this parameter is the actual stack size limit enforced by the OS kernel (as set by **ulimit -s**) minus 640 KB.
- If the value of this parameter is greater than the value of **ulimit -s** minus 640 KB before the database is started, the database fails to be started. During database running, if the value of this parameter is greater than the value of **ulimit -s** minus 640 KB, this parameter does not take effect.
- If the value of **ulimit -s** minus 640 KB is less than the minimum value of this parameter, the database fails to be started.
- Setting this parameter to a value greater than the actual kernel limit means that a running recursive function may crash an individual backend process.
- Since not all OSs provide this function, you are advised to set a specific value for this parameter.
- The default value is **2 MB**, which is relatively small and does not easily cause system breakdown.

bulk_read_ring_size

Parameter description: Specifies the size of the ring buffer used by the operation when a large amount of data is queried (for example, during large table scanning).

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 256 to 2147483647. The unit is KB.

Default value: **16MB**

enable_early_free

Parameter description: Specifies whether the operator memory can be released in advance.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the operator memory can be released in advance.
- **off** indicates that the operator memory cannot be released in advance.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

local_syscache_threshold

Parameter description: Specifies the size of system catalog cache in a session. If **enable_global_plancache** is enabled, **local_syscache_threshold** does not take effect when it is set to a value less than 16 MB to ensure that GPC takes effect. The minimum value is 16 MB. If **enable_global_syscache** and **enable_thread_pool** are enabled, this parameter indicates the total cache size of the current thread and sessions bound to the current thread.

Parameter type: integer.

Unit: kB

Value range:

Method 1: Set this parameter to an integer without a unit. The integer ranges from 1 x 1024 to 512 x 1024. You are advised to set this parameter to an integer multiple of 1024. For example, the value **2048** indicates 2048 KB.

Method 2: Set this parameter to a value with a unit. The value ranges from 1 x 1024 KB to 512 x 1024 KB. For example, the value **32MB** indicates 32 MB. The unit can only be kB, MB, or GB.

Default value:

32MB (196-core CPU/1536 GB memory); **16MB** (128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory, 4-core CPU/16 GB memory)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

memory_trace_level

Parameter description: Specifies the control level for recording memory allocation information after the dynamic memory usage exceeds 90% of the maximum dynamic memory. This parameter takes effect only when **use_workload_manager** and **enable_memory_limit** are enabled. This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: enumerated values

- **none**: indicates that memory application information is not recorded.
- **level1**: After the dynamic memory usage exceeds 90% of the maximum dynamic memory, the following memory information is recorded and saved in the *$GAUSSLOG*/**mem_log** directory:
  - Global memory overview.
  - Memory usage of the top 20 memory contexts of the instance, session, and thread types.
  - The **totalsize** and **freesize** columns for each memory context.

- **level2**: After the dynamic memory usage exceeds 90% of the maximum dynamic memory, the following memory information is recorded and saved in the *$GAUSSLOG*/**mem_log** directory:
  - Global memory overview.
  - Memory usage of the top 20 memory contexts of the instance, session, and thread types.
  - The **totalsize** and **freesize** columns for each memory context.
  - Detailed information about all memory applications in each memory context, including the file where the allocated memory is located, line number, and size.

Default value: **level1**

NOTICE

- If this parameter is set to **level2**, the memory allocation details (file, line, and size) of each memory context are recorded, which greatly affects the performance. Therefore, exercise caution when setting this parameter.
- You can use the system function gs_get_history_memory_detail(cstring) to query the recorded memory snapshot information. For details about the function, see "SQL Reference > Functions and Operators > Statistics Functions" in *Developer Guide*.
- The recorded memory context is obtained after all memory contexts of the same type with the same name are summarized.

resilience_memory_reject_percent

Parameter description: Specifies the dynamic memory usage percentage for escape from memory overload. This parameter takes effect only when the GUC parameters **use_workload_manager** and **enable_memory_limit** are enabled. This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string, consisting of one or more characters.

This parameter consists of **recover_memory_percent** and **overload_memory_percent**. The meanings of the two parts are as follows:

- **recover_memory_percent**: Percentage of the dynamic memory usage when the memory recovers from overload to the maximum dynamic memory. When the dynamic memory usage is less than the maximum dynamic memory multiplied by the value of this parameter, the overload escape function is disabled and new connections are allowed. The value ranges from 0 to 100. The value indicates a percentage.
- **overload_memory_percent**: Percentage of the dynamic memory usage to the maximum dynamic memory when the memory is overloaded. When the dynamic memory usage is greater than the maximum dynamic memory multiplied by the value of this parameter, the current memory is overloaded. In this case, the overload escape function is triggered to kill sessions and new connections are prohibited. The value ranges from 0 to 100. The value indicates a percentage.

Default value: **'0,0'**, indicating that the escape from memory overload function is disabled.

Example:

```
resilience_memory_reject_percent = '70,90'
```

When the memory usage exceeds 90% of the upper limit, new connections are forbidden and stacked sessions are killed. When the memory usage is less than 70% of the upper limit, session killing is stopped and new connections are allowed.

NOTICE

- You can query the maximum dynamic memory and used dynamic memory in the gs_total_memory_detail view. **max_dynamic_memory** indicates the maximum dynamic memory, and **dynamic_used_memory** indicates the used dynamic memory.
- If this parameter is set to a small value, the escape from memory overload process is frequently triggered. As a result, ongoing sessions are forcibly logged out, and new connections fail to be connected for a short period of time. Therefore, exercise caution when setting this parameter based on the actual memory usage.
- The values of **recover_memory_percent** and **overload_memory_percent** can be **0** at the same time. In addition, the value of **recover_memory_percent** must be smaller than that of **overload_memory_percent**. Otherwise, the setting does not take effect.

resilience_escape_user_permissions

Parameter description: Specifies the escape permission of users. You can set it for multiple users and separate users by commas (,). The value **sysadmin** indicates that jobs of the sysadmin user can be canceled by the escape function. The value **monadmin** indicates that jobs of the monadmin user can be canceled by the escape function. By default, this parameter is left blank, indicating that the escape function of the sysadmin and monadmin users is disabled. The value can only be **sysadmin**, **monadmin**, or an empty string. This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string, consisting of one or more characters.

Currently, this parameter supports only three values: **sysadmin**, **monadmin**, and **''**. The meanings of these values are as follows:

- **sysadmin**: Jobs of the sysadmin user can be canceled by the escape function.
- **monadmin**: Jobs of the monadmin user can be canceled by the escape function.
- **''**: The escape function of the sysadmin and monadmin users is disabled.

Default value: **''**, indicating that the escape function of the sysadmin and monadmin users is disabled.

Example:

```
resilience_escape_user_permissions = 'sysadmin,monadmin'
```

The escape function is enabled for both the sysadmin and monadmin users.

NOTICE

- You can set this parameter to multiple values separated by commas (,), for example, **resilience_escape_user_permissions = 'sysadmin,monadmin'**. You can also set this parameter to only one value, for example, **resilience_escape_user_permissions = 'monadmin'**.
- If this parameter is set for multiple times, the latest setting takes effect.
- If this parameter is set to any value in the value range, common users support the escape function.
- If a user has both the sysadmin and monadmin role permissions, the escape function of the user can be triggered only when **resilience_escape_user_permissions** is set to **'sysadmin,monadmin'**.

14.3.4.2 Disk Space

This section describes the disk space parameters, which are used to set limits on the disk space for storing temporary files.

sql_use_spacelimit

Parameter description: Specifies the space size for files to be flushed to disks when a single SQL statement is executed on a single database node. The managed space includes the space occupied by ordinary tables, temporary tables, and intermediate result sets to be flushed to disks.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from –1 to 2147483647. The unit is KB. **–1** indicates no limit.

Default value: –1

temp_file_limit

Parameter description: Specifies the limit on the size of a temporary file spilled to disk in a session. The temporary file can be a sort or hash temporary file, or the storage file for a held cursor. This is a session-level setting.

Parameter type: integer.

Unit: KB

NOTICE

This parameter does not apply to disk space used for temporary tables during the SQL query process.

Value range: –1 to 2147483647. The value **–1** indicates that there is no limit.

Default value: **–1**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none

14.3.4.3 Kernel Resource Usage

This section describes kernel resource parameters. Whether these parameters take effect depends on OS settings.

max_files_per_process

Parameter description: Specifies the maximum number of simultaneously open files allowed by each server process. If the kernel is enforcing a proper limit, setting this parameter is not required.

However, on some platforms, such as most Berkeley Software Distribution (BSD) systems, the kernel allows individual processes to open many more files than the system can support. If the message "Too many open files" is displayed, set this parameter to a smaller value. Generally, the system must meet this requirement: Number of file descriptors ≥ Maximum number of concurrent statements x Number of database nodes x **max_files_per_process** x 3.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 25 to 2147483647.

Default value: 1024

shared_preload_libraries

Parameter description: Specifies one or more shared libraries to be preloaded at server start. If multiple libraries are to be loaded, separate their names using commas (,). Only the sysadmin user can access this parameter. For example, *$libdir*/**mylib** will cause **mylib.so** (or on some platforms, **mylib.sl**) to be preloaded before the loading of the standard library directory.

You can preinstall the GaussDB's stored procedure library using the '*$libdir*/pl*XXX*' syntax as described in the preceding text. *XXX* can only be **pgsql**, **perl**, **tcl**, or **python**.

By preloading a shared library and initializing it as required, the library startup time is avoided when the library is first used. However, the time to start each new server process may increase, even if that process never uses the library. Therefore, set this parameter only for libraries that will be used in most sessions.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

- If a specified library is not found, the GaussDB service will fail to start.
- Each GaussDB-supported library has a special mark that is checked to guarantee compatibility. Therefore, libraries that do not support GaussDB cannot be loaded in this way.

Value range: a string.

Default value: **security_plugin**

14.3.4.4 Cost-based Vacuum Delay

This feature allows administrators to reduce the I/O impact of the VACUUM and ANALYZE statements on concurrent database activities. It is often more important to prevent maintenance statements, such as VACUUM and ANALYZE, from affecting other database operations than to run them quickly. Cost-based vacuum delay provides a way for administrators to achieve this purpose.

NOTICE

Certain VACUUM operations hold critical locks and should be complete as quickly as possible. In GaussDB, cost-based vacuum delays do not take effect during such operations. To avoid uselessly long delays in such cases, the actual delay is the larger of the two calculated values:

- **vacuum_cost_delay** x **accumulated_balance**/**vacuum_cost_limit**
- **vacuum_cost_delay** x 4

Context

During the execution of the ANALYZE | ANALYSE and VACUUM statements, the system maintains an internal counter that keeps tracking the estimated cost of various I/O operations that are performed. For details about ANALYZE | ANALYSE and VACUUM, see "SQL Reference > SQL Syntax" in *Developer Guide*. When the accumulated cost reaches a limit (specified by **vacuum_cost_limit**), the thread performing the operation will sleep for a short period of time (specified by **vacuum_cost_delay**). Then, the counter resets and the operation continues.

By default, this feature is disabled. To enable this feature, set **vacuum_cost_delay** to a non-zero value.

vacuum_cost_delay

Parameter description: Specifies the length of time that the thread will sleep when **vacuum_cost_limit** has been exceeded.

Parameter type: integer.

Unit: ms

Value range: 0 to 100. The value **0** indicates that the cost-based vacuum delay is disabled, and a positive value indicates that the cost-based vacuum delay is

enabled. In many systems, the effective resolution of the sleep time is 10 milliseconds. Therefore, setting **vacuum_cost_delay** to a value that is not an integer multiple of 10 has the same effect as setting it to the next higher multiple of 10.

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is usually set to a small value, such as **10ms** or **20ms**. Adjusting vacuum's resource consumption is best done by changing other vacuum cost parameters.

vacuum_cost_page_hit

Parameter description: Specifies the estimated cost for vacuuming a buffer found in the shared buffer. It represents the cost to lock the buffer pool, look up the shared hash table, and scan the content of the page.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 10000.

Default value: **1**

vacuum_cost_page_miss

Parameter description: Specifies the estimated cost for vacuuming a buffer read from the disk. It represents the cost to lock the buffer pool, look up the shared hash table, read the desired block from the disk, and scan the block.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 10000.

Default value: **10**

vacuum_cost_page_dirty

Parameter description: Specifies the estimated cost charged when vacuum modifies a block that was previously clean. It represents the extra cost required to update the dirty block out to the disk again.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 10000

Default value: 20

vacuum_cost_limit

Parameter description: Specifies the cost limit. The vacuum thread will hibernate if this limit is exceeded.

Parameter type: integer.

Unit: none

Value range: 1 to 10000

Default value: **1000**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. A larger value indicates a smaller I/O frequency limit of the VACUUM, a lower probability of falling into hibernation, more efficient VACUUM, and a greater impact on service I/Os.

14.3.4.5 Background Writer

This section describes background writer parameters. The background writer thread is used to write dirty data (new or modified data) in shared buffers to disks. This mechanism ensures that database processes seldom or never need to wait for a write action to occur when handling user queries.

It also mitigates performance deterioration caused by checkpoints because the background writer continues to write dirty pages to disks and only several pages need to be written to disks at each checkpoint. This mechanism, however, increases the overall net I/O load because while a repeatedly-dirtied page may otherwise be written only once per checkpoint interval, the background writer may write it several times as it is dirtied in the same interval. In most cases, continuous light loads are preferred, instead of periodic load peaks. The parameters discussed in this section can be set based on actual requirements.

bgwriter_delay

Parameter description: Specifies the interval at which the background writer writes dirty shared buffers. Each time, the background writer initiates write operations for some dirty buffers. In full checkpoint mode, the **bgwriter_lru_maxpages** parameter is used to control the amount of data to be written each time, and the process is restarted after the period of hibernation specified by **bgwriter_delay** (in ms). In incremental checkpoint mode, the number of target idle buffer pages is calculated based on the value of **candidate_buf_percent_target**. If the number of idle buffer pages is insufficient, a batch of pages are flushed to disks at the interval specified by **bgwriter_delay** (in ms). The number of flushed pages is calculated based on the target difference percentage. The maximum number of flushed pages is limited by **max_io_capacity**.

In many systems, the effective resolution of the sleep time is 10 milliseconds. Therefore, setting this parameter to a value that is not a multiple of 10 has the same effect as setting it to a value multiple of 10.

Parameter type: integer.

Unit: millisecond

Value range: 10 to 10000

Default value: **2s** (that is, 2000 ms)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion:

Incremental checkpoint mode: If the data volume is multiple times the value of **shared_buffers**, the value of **bgwriter_delay** cannot be greater than 2s. If the data volume is smaller than the value of **shared_buffers**, the value of **bgwriter_delay** can be increased to save I/O resources.

Full checkpoint mode: Retain the default value. If the disk capability is poor, increase the value.

candidate_buf_percent_target

Parameter description: Specifies the expected percentage of available buffers in the candidate buffer chain to **shared_buffer** when incremental checkpoints are enabled. If the actual percentage is less than the value of this parameter, the background writer thread starts to flush dirty pages that meet the conditions to disks.

Parameter type: double-precision floating point

Unit: none

Value range: 0.1 to 0.85

Default value: **0.3**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter directly affects the number of pages flushed by the background writer thread. If the data volume is greater than the value of **shared_buffers** and the parameter is set to an excessively small value, the performance is affected. If the data volume is twice or more of the value of **shared_buffers**, the value of this parameter cannot be smaller than the default value. In other scenarios, to reduce I/Os, set this parameter to a smaller value.

bgwriter_lru_maxpages

Parameter description: Specifies the number of dirty buffers the background writer can write in each round.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 1000

NOTE

When this parameter is set to **0**, the background writer is disabled. This setting does not affect checkpoints.

Default value: **100**

bgwriter_lru_multiplier

Parameter description: Specifies the coefficient used to estimate the number of dirty buffers the background writer can write in the next round.

The number of dirty buffers written in each round depends on the number of buffers used by server processes during recent rounds. The estimated number of buffers required in the next round is calculated using the following formula:

Average number of recently used buffers x **bgwriter_lru_multiplier**. The background writer writes dirty buffers until sufficient, clean, and reusable buffers are available. The number of buffers the background writer writes in each round is always equal to or less than the value of **bgwriter_lru_maxpages**.

Therefore, the value **1.0** of **bgwriter_lru_multiplier** represents a just-in-time policy of writing exactly the number of dirty buffers predicted to be required. Larger values provide some cushion against spikes in demand, whereas smaller values intentionally leave more writes to be done by server processes.

Smaller values of **bgwriter_lru_maxpages** and **bgwriter_lru_multiplier** reduce the extra I/O load caused by the background writer, but make it more likely that server processes will have to issue writes for themselves, delaying response to queries.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a floating-point number ranging from 0 to 10.

Default value: **2**

pagewriter_thread_num

Parameter description: Specifies the number of threads for background page flushing after the incremental checkpoint is enabled. Dirty pages are flushed in sequence to disks, updating recovery points.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to 16

Default value: **4**

dirty_page_percent_max

Parameter description: Specifies the percentage of dirty pages to **shared_buffers** after the incremental checkpoint is enabled. When the value of this parameter is reached, the background page flush thread flushes dirty pages based on the maximum value of **max_io_capacity**.

Parameter type: floating point

Unit: none

Value range: 0.1 to 1

Default value: **0.9**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

pagewriter_sleep

Parameter description: Specifies the interval for the page writer thread to flush dirty pages to disks after the incremental checkpoint is enabled. When the ratio of dirty pages to **shared_buffers** reaches **dirty_page_percent_max**, the number of

pages in each batch is calculated based on the value of **max_io_capacity**. In other cases, the number of pages in each batch decreases proportionally.

Parameter type: integer.

Unit: millisecond

Value range: 0 to 3600000

Default value: **2000ms** (2s)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Do not set this parameter to a value greater than 2s. If dirty pages are generated quickly, you are advised to set this parameter to a value ranging from 100 ms to 500 ms. If this parameter is set to a large value, redo points are updated slowly, affecting Xlog recycling.

max_io_capacity

Parameter description: Specifies the maximum I/O per second for the background writer to flush pages in batches.

Parameter type: integer.

Unit: kB

Value range: 30720 to 10485760

Default value: **512000kB** (that is, 500 MB)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. If the value of the parameter does not contain a unit, the default unit is kB. The unit can also be MB or GB.

Setting suggestion: Set this parameter based on the service scenario and disk I/O capability of the host. If the RTO is short or the data volume is many times larger than the shared memory, and the service access data volume is random, the value of this parameter cannot be too small. A small parameter value reduces the number of pages flushed by the background writer. If a large number of pages are eliminated due to service triggering, the services are affected.

enable_consider_usecount

Parameter description: Specifies whether the backend thread considers the page popularity during page replacement. You are advised to enable this parameter in large-capacity scenarios.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**/**true**: The page popularity is considered.
- **off**/**false**: The page popularity is not considered.

Default value: **off**

dw_file_num

Parameter description: Specifies the number of doublewrite files to be written in batches. The value is related to **pagewriter_thread_num** and cannot be greater than that of **pagewriter_thread_num**. If the value is too large, it will be corrected to the value of **pagewriter_thread_num**.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to 16

Default value: **1**

dw_file_size

Parameter description: Specifies the size of each doublewrite file.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 32 to 256.

Default value: **256**

14.3.4.6 Asynchronous I/O

checkpoint_flush_after

Parameter description: Specifies the threshold for the number of pages flushed by the checkpointer thread. If the threshold is exceeded, the OS is instructed to flush the pages cached in the OS asynchronously. In GaussDB, the disk page size is 8 KB.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 256. **0** indicates that the asynchronous flush function is disabled. The size of a single page is 8 KB. You can set the number of pages or the size in bytes, for example, **32** or **256KB**. After the checkpointer thread continuously writes 32 disk pages, that is, 32 x 8 = 256 KB disk space, the asynchronous flush is performed.

Default value: **256KB**

bgwriter_flush_after

Parameter description: Specifies the threshold for the number of pages flushed by the background writer thread. If the threshold is exceeded, the background writer thread instructs the OS to asynchronously flush the pages cached in the OS to disks. In GaussDB, the disk page size is 8 KB.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 256. **0** indicates that the asynchronous flush function is disabled. The size of a single page is 8 KB. You can set the number of pages or the size in bytes, for example, **64** or **512KB**. After the

background writer thread continuously writes 64 disk pages, that is, 64 x 8 = 512 KB disk space, the asynchronous flush is performed.

Default value: **512KB** (that is, 64 pages)

backend_flush_after

Parameter description: Specifies the threshold for the number of pages flushed by the backend thread. If the number of pages exceeds the threshold, the backend thread instructs the OS to asynchronously flush the pages cached in the OS to disks. In GaussDB, the disk page size is 8 KB.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 256. **0** indicates that the asynchronous flush function is disabled. The size of a single page is 8 KB. You can set the number of pages or the size in bytes, for example, **64** or **512KB**. After the backend thread continuously writes 64 disk pages, that is, 64 x 8 = 512 KB disk space, the asynchronous flush is performed.

Default value: **0**

enable_adio_function

Parameter description: Specifies whether to enable the ADIO mode. For details about the ADIO mode, see "High Performance > ADIO and Doublewrite Removal" in *Feature Description*.

Parameter type: Boolean

Unit: none

Value range:

- **on** indicates that the ADIO mode is enabled.
- **off** indicates that the ADIO mode is disabled.

Default value: **off**

Setting method: This is a SIGHUP parameter. You can change the value of this parameter from **off** to **on** by referring to "Method 2" in **Table 14-2**. After the setting is complete, you can use the system function gs_get_io_type() to check whether the ADIO mode is enabled. For details, see "SQL Reference > Functions and Operators > System Management Functions > Other Functions" in *Developer Guide*. If you want to change the value of this parameter from **on** to **off**, restart the instance. For details, see "Method 1" in **Table 14-2**.

Setting suggestion: If the **candidate_slots** column in the DBE_PERF.global_candidate_status system view is less than 15% of the buffer page for multiple times in a short period of time, you are advised to set this parameter to **on**.

14.3.5 Data Import and Export

This section describes the parameters for importing and exporting data.

raise_errors_if_no_files

Parameter description: Specifies whether to distinguish between the problems "the number of imported file records is empty" and "the imported file does not exist." If this parameter is set to **TRUE** and the problem "the imported file does not exist" occurs, GaussDB will report the error message "file does not exist."

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **TRUE** indicates that the messages of "the number of imported file records is empty" and "the imported file does not exist" are distinguished when files are imported.
- **FALSE** indicates that the messages of "the number of imported file records is empty" and "the imported file does not exist" are not distinguished when files are imported.

Default value: **FALSE**

safe_data_path

Parameter description: Specifies the path prefix restriction except for the initial user. Currently, the path prefix restriction applies to the COPY operation and advanced packages.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string of less than 4096 characters

Default value: **NULL**

CAUTION

- If a soft link file exists in the **safe_data_path** directory, the system processes the file based on the actual file path to which the soft link points. If the actual path is not in the **safe_data_path** directory, an error is reported.
- If a hard link file exists in the **safe_data_path** directory, it can be used properly. For security purposes, exercise caution when using hard link files. Do not create hard link files that point to other directories in the **safe_data_path** directory. Ensure that the permission on the **safe_data_path** directory is minimized.

enable_copy_server_files

Parameter description: Specifies whether to enable the permission to copy server files.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the permission to copy server files is enabled.
- **off** indicates that the permission to copy server files is disabled.

Default value: **off**

NOTICE

When the **enable_copy_server_files** parameter is disabled, only the initial user is allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME** statement. When the **enable_copy_server_files** parameter is enabled, users with the SYSADMIN permission or users who inherit the gs_role_copy_files permission of the built-in role are allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME** statement.

a_format_load_with_constraints_violation

Parameter description: Specifies whether to enable **gs_loader** to support no rollback in the case of constraint conflicts.

Parameter type: string

Unit: none

Value range:

- **s1** indicates that **gs_loader** is enabled to support no rollback in the case of constraint conflicts.
- **''** indicates that **gs_loader** is not enabled to support no rollback in the case of constraint conflicts.

Default value: ''

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none.

support_binary_copy_version

Parameter description: Specifies whether the encoding information of the current database server is included when data is exported in BINARY mode using COPY FROM.

Parameter type: string

Unit: none

Value range: **''** and **header_encoding**.

Default value: **header_encoding**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If forward compatibility is required, leave this parameter empty.

Table 14-5 Compatibility configuration items

Configuration Item	Behavior
header_encoding	When the binary mode of COPY FROM is used for export, the binary file header contains the encoding information of the current database server.
Empty	Forward compatibility configuration is performed and data is exported in the original binary format.

copy_special_character_version

Parameter description: Determines the processing of invalid characters during data import and export using COPY.

Parameter type: string

Unit: none

Value range: **''**, **no_error**, and **per_byte**.

Default value: ''

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Use gsql to connect to the database. If you use the set method, the value is case-insensitive. If you use gs_guc, the value can only be lowercase.

Setting suggestion: none

Table 14-6 Compatibility configuration items

Configuration Item	Behavior
no_error	When COPY is used to import a data file with the same encoding as that on the server, fault tolerance is performed on the data that does not meet the encoding requirements in the data file. No error is reported and the data with the original codes is inserted into the table.
per_byte	Determines how to process files encoded in GBK or ZHS16GBK when COPY is used to export text files. After the parameter is set to **per_byte**, one byte of data is exported at a time. Otherwise, two bytes of data are exported at a time. (One character occupies two bytes if data is encoded in GBK.)
Empty	The default value, which does not affect any function. Forward compatibility is supported. That is, an error is reported when invalid characters are found during COPY.

NOTICE

- To ensure that the data to be imported is valid, its encoding must be validated when it is being copied. If this parameter is enabled, verification against invalid encoding will be masked, which causes invalid characters in the field. Therefore, exercise caution before enabling this parameter.
- Currently, encoding verification is masked only when the server encoding is the same as the data encoding. Client encoding is used by default if not specified.
- To record fields where invalid encoding exists, you are advised to use the **log errors** or **log errors data** parameter in the COPY syntax.
- In binary mode, **copy_special_character_version** is set to **'no_error'**, and it takes effect only for fields of the TEXT, CHAR, VARCHAR, NVARCHAR2, or CLOB type.
- This parameter is valid only in the database with character sets encoded in UTF-8, GB18030, GB18030_2022, ZHS16GBK, or LATIN1.
- When the encoding of both the client and server is GBK or ZHS16GBK and the database contains data encoded in an invalid format, if **copy_special_character_version** is not set to **per_byte**, the exported data file may contain unexpected data.
- If **copy_special_character_version** is set to **no_error**, this parameter cannot be used together with the **COMPATIABLE_ILLEGAL_CHARS** parameter in COPY.

14.3.6 Write Ahead Log

14.3.6.1 Settings

wal_level

Parameter description: Specifies the level of information to be written to the WAL. The value cannot be empty or commented out.

NOTICE

- To enable WAL archiving and data streaming replication between the primary and standby nodes, set this parameter to **archive**, **hot_standby**, or **logical**.
- If this parameter is set to **minimal**, **hot_standby** must be set to **off**, and **max_wal_senders** must be set to **0**. In addition, the database must be deployed in a standalone system. Otherwise, the database cannot be started.
- If this parameter is set to **archive**, **hot_standby** must be set to **off**. Otherwise, the database startup fails. However, **hot_standby** cannot be set to **off** in an HA cluster. For details, see the description of the **hot_standby** parameter.

Value type: enumerated type

Value range:

- **minimal**

Advantages: Certain bulk operations (including creating tables and indexes, executing cluster operations, and copying tables) are safely skipped in logging, which can make those operations much faster.

Disadvantages: WALs contain only basic information required for recovery from a database server crash or an emergency shutdown. Data cannot be restored from archived WALs.

- **archive**

  Adds logging required for WAL archiving, supporting the database restoration from archives.

- **hot_standby**
  - Further adds information required to run SQL queries on a standby node and takes effect after the database restarts.
  - To enable read-only queries on a standby node, the **wal_level** parameter must be set to **hot_standby** on the primary node and the same value must be set on the standby node. There are few measurable differences in performance between using **hot_standby** and **archive** levels. However, feedback is welcome if any differences in their impacts on product performance are noticeable.

- **logical**

  This parameter indicates that WALs support logical replication.

Default value: **hot_standby**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter to **logical** when the logical replication function is enabled. In other scenarios, set this parameter to **hot_standby**.

fsync

Parameter description: Specifies whether the GaussDB server uses the fsync() function (see **wal_sync_method**) to ensure that updates can be written to disks in a timely manner.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

- Using the fsync() function ensures that the data can be recovered to a known state when the OS or hardware crashes.
- Setting this parameter to **off** may result in unrecoverable data corruption in a system crash.

Value range: Boolean

- **on** indicates that the fsync() function is used.
- **off** indicates that the fsync() function is not used.

Default value: **on**

synchronous_commit

Parameter description: Specifies the synchronization mode of the current transaction.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Generally, logs generated by a transaction are synchronized in the following sequence:

1. The primary node writes the logs to the local memory.
2. The primary node writes the logs in the local memory to the local file system.
3. The primary node flushes the logs in the local file system to disks.
4. The primary node sends the logs to the standby node.
5. The standby node receives the logs and saves them to the local memory.
6. The standby node writes the logs in the local memory to the local file system.
7. The standby node flushes the logs in the local file system to disks.
8. The standby node replays the logs to complete the incremental update of data files.

Value range: enumerated values

- **on**: The primary node waits for the standby node to flush logs to disks before committing a transaction.
- **off**: The primary node commits transactions without waiting for the primary node to flush logs to disks. This mode is also called asynchronous commit.
- **local**: The primary node waits for the primary node to flush logs to disks before committing a transaction. This mode is also called local commit.
- **remote_write**: The primary node waits for the standby node to write logs to the file system before committing a transaction. (The logs do not need to be flushed to disks.)
- **remote_receive**: The primary node waits for the standby node to receive logs before committing a transaction. (The logs do not need to be written to the file system.)
- **remote_apply**: The primary node waits for the standby node to complete log replay before committing a transaction.
- **true**: same as **on**.
- **false**: same as **off**.
- **yes**: same as **on**.
- **no**: same as **off**.
- **1**: same as **on**.
- **0**: same as **off**.
- **2**: same as **remote_apply**.

Default value: **on**

NOTICE

This parameter is maintained by the CM. If it is manually modified, data may be lost. For details, see "Unified Cluster Management Tool > Features > Automatic Copy Addition and Reduction by Shard > Remarks" in *Tool Reference*.

wal_sync_method

Parameter description: Specifies the method used for forcing WAL updates out to disk.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

If **fsync** is set to **off**, the setting of this parameter does not take effect because WAL updates will not be forcibly written to disks.

Value range: enumerated values

- **open_datasync** indicates that WAL files are opened with the **O_DSYNC** option.
- **fdatasync** indicates that fdatasync() is called at each commit (SUSE 10 and SUSE 11 are supported).
- **fsync_writethrough** indicates that fsync() is called at each commit to force data in the buffer to be written to disks.

  NOTE

  wal_sync_method can be set to **fsync_writethrough** on a Windows platform, but this setting has the same effect as setting the parameter to **fsync** on the Windows platform.
- **fsync** indicates that fsync() is called at each commit. (SUSE 10 and SUSE 11 are supported.)
- **open_sync** indicates that open() with the **O_SYNC** option is used to write WAL files (SUSE 10 and SUSE 11 are supported).

  NOTE

  Not all platforms support the preceding parameters.

Default value: fdatasync

full_page_writes

Parameter description: Specifies whether the GaussDB server writes the entire content of each disk page to WALs during the first modification of that page after a checkpoint. When both **enable_incremental_checkpoint** and **enable_double_write** are enabled, **full_page_writes** is not used.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

- This parameter is needed because a page write that is in process during an OS crash might be only partially completed, leading to an on-disk page that contains a mix of old and new data. The row-level change data normally stored in WALs will not be enough to completely restore such a page during post-crash recovery. Storing the full page image guarantees that the page can be correctly restored, but at the price of increasing the amount of data that must be written to WALs.
- Setting this parameter to **off** might lead to unrecoverable data corruption after a system failure. It might be safe to set this parameter to **off** if you have hardware (such as a battery-backed disk controller) or file-system software (such as ReiserFS 4) that reduces the risk of partial page writes to an acceptably low level.

Value range: Boolean

- **on** indicates that this feature is enabled.
- **off** indicates that this feature is disabled.

Default value: **on**

wal_log_hints

Parameter description: Specifies whether to write an entire page to WALs during the first modification of that page after a checkpoint, even for non-critical modifications of so-called hint bits. You are advised not to modify the setting.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the entire page is written to WALs.
- **off** indicates that the entire page is not written to WALs.

Default value: **on**

wal_buffers

Parameter description: Specifies the size of shared memory for storing WALs, in multiples of **XLOG_BLCKSZ** or the actual size. **XLOG_BLCKSZ** indicates the size of an Xlog block, typically 8 KB.

Parameter type: integer.

Unit: 8 kB (**XLOG_BLCKSZ** size)

Value range: **–1**, or 4 to 2^{18}. The minimum value is **–1** and the maximum value is **262144** (number of **XLOG_BLCKSZ**).

- If this parameter is set to **–1**, the value of **wal_buffers** is automatically adjusted based on the value of **shared_buffers**. The default value of **wal_buffers** is 1/32 of **shared_buffers**. The minimum value is **XLOG_BLCKSZ** multiplied by 8 and the maximum value is **XLOG_BLCKSZ** multiplied by 2048.

If the automatically adjusted value is less than the minimum value, the value is forcibly set to the minimum value. If the value is greater than the maximum value, the value is forcibly set to the maximum value.

- If this parameter is set to a value smaller than 4 (that is, **0**, **1**, **2**, or **3**), the value **4** is forcibly used.

Default value:

1GB (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory); **512MB** (16-core CPU/128 GB memory); **256MB** (8-core CPU/64 GB memory); **128MB** (4-core CPU/32 GB memory); **16MB** (4-core CPU/16 GB memory)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. For example, the value **2048** indicates that **wal_buffers** is 2048 x 8 KB, and the value **20480kB** indicates that **wal_buffers** is **20480KB**. If the value contains a unit, the value must be KB, MB, or GB and must be an integer multiple of 8 KB.

Setting suggestion: The content of the WAL buffer is written to disks at every transaction commit. Therefore, setting an extremely large value is unlikely to bring a significant increase in system performance. However, setting this parameter to a few megabytes can improve the disk write performance on a server where a large number of transactions are committed at the same time. The default value meets user requirements in most cases. You are advised to retain it. Do not set **wal_buffers** to an excessively large or small value, and the following condition must be true: **data_replicate_buffer_size** + **segment_buffers** + **shared_buffers** + **wal_buffers** + **temp_buffers** + **maintenance_work_mem** + **work_mem** + **query_mem** + (Standby node) **wal_receiver_buffer_size** < **max_process_memory** < Memory size of the physical machine. If the value of the memory parameter is too large and exceeds the upper limit of the physical memory, the database fails to be started because no sufficient memory can be allocated.

wal_writer_delay

Parameter description: Specifies the delay between activity rounds for the WAL writer.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

A longer delay might lead to insufficient WAL buffer and a shorter delay leads to continuously writing of the WALs, thereby increasing the load of disk I/O.

Value range: an integer ranging from 1 to 10000. The unit is millisecond.

Default value: **200ms**

commit_delay

Parameter description: Specifies the duration for committed data to be stored in the WAL buffer.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

- When this parameter is set to a non-zero value, the committed transaction is stored in the WAL buffer instead of being written to the WAL immediately. Then the WAL writer flushes the buffer to disks periodically.
- If system load is high, other transactions are probably ready to be committed within the delay. If no other transactions are ready to be committed, the delay is a waste of time.

Value range: an integer ranging from 0 to 100000. The unit is μs. **0** indicates no delay.

Default value: **0**

commit_siblings

Parameter description: Specifies a threshold on the number of concurrent transactions when a transaction initiates a commit request. If the number of concurrent transactions is greater than the value of this parameter, the transaction will wait for a period of time specified by **commit_delay**. Otherwise, this transaction is written into WALs immediately.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 1000

Default value: **5**

wal_block_size

Parameter description: Specifies the size of a WAL disk block.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Value range: an integer. The unit is byte.

Default value: **8192**

wal_segment_size

Parameter description: Specifies the size of a WAL segment file.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Value range: an integer. The unit is 8 KB.

Default value: **16MB** (2048 x 8 KB)

walwriter_cpu_bind

Parameter description: Binds the WAL writer thread to a specified CPU core.

Parameter type: integer.

Unit: none

Value range: –1 to the number of cores minus 1. CPU cores are numbered starting from 0.

- **–1**: indicates that CPU core binding is not performed.
- *N*: indicates that the WAL writer thread is bound to CPU core *N*.

Default value: **–1**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

wal_sender_bind_cpu_attr

Parameter description: Specifies the core binding operation of the log sender thread. Only the sysadmin user can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

- **'nobind'**: The thread is not bound to a core.
- **'cpuorderbind: 8-12'**: One thread is bound to one core starting from core 8. If the number of cores in the range is insufficient, the remaining threads are not bound. You are advised to set the interval to a value greater than or equal to the value of **max_wal_senders**.

Value range: a string of more than 0 characters. The value is case-insensitive.

Default value: **'nobind'**

walwriteraux_bind_cpu

Parameter description: Specifies the CPU core bound to the auxiliary log writer thread.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from –1 to the number of cores minus 1.

Default value: **–1**

walwriter_sleep_threshold

Parameter description: Specifies the number of times that idle Xlogs are refreshed before the Xlog flusher enters the sleep state. If the number of times reaches the threshold, the Xlog flusher enters the sleep state.

Parameter type: integer.

Unit: none

Value range: 1 to 50000

Default value: **500** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, and 60-core CPU/480 GB memory); **50** (32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory, and 4-core CPU/16 GB memory)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

wal_file_init_num

Parameter description: Specifies the number of Xlog segment files created at a time when the WAL writer thread is started.

Parameter type: integer.

Unit: none

Value range: 0 to 1000000

Default value: **10** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, and 60-core CPU/480 GB memory); **0** (32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory, and 4-core CPU/16 GB memory)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

wal_file_preinit_bounds

Parameter description: Specifies the maximum number of WAL segment files that can be pre-expanded by the WAL writer auxiliary thread per second during service running. The WAL segment file size is 16 MB. If this parameter is set to **0**, there is no restriction.

Parameter type: integer

Unit: none

Value range: [0,1024]

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. Set this parameter to a valid value based on the disk I/O capability. For details, see the value of **max_io_capacity**.

- If **max_io_capacity** is set to **500MB**, set this parameter to **25**.
- If **max_io_capacity** is set to **1GB**, set this parameter to **50**.

xlog_file_path

Parameter description: Specifies the path of the Xlog shared disk in dual-database instance shared storage scenarios. This parameter is configured by the OM during database system initialization. You are advised not to modify the configuration.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string.

Default value: **NULL**

xlog_file_size

Parameter description: Specifies the size of the Xlog shared disk in dual-database instance shared storage scenarios. This parameter is configured by the OM during database system initialization. You are advised not to modify the configuration.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a long integer ranging from 5053733504 to 576460752303423487. The unit is byte.

Default value: **549755813888**

xlog_lock_file_path

Parameter description: Specifies the path of the lock file preempted by the Xlog shared disk in dual-database instance shared storage scenarios. This parameter is configured by the OM during database system initialization. You are advised not to modify the configuration.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string.

Default value: **NULL**

max_size_for_shared_storage_xlog_write

Parameter description: Specifies the maximum amount of data that can be written to a shared disk at a time.

Parameter type: integer.

Unit: KB

Value range: 8–131072

Default value: 1024

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none

force_promote

Parameter description: Specifies whether to enable the forcible switchover function on the standby node.

When a database instance is faulty, the forcible switchover enables the database instance to recover services as soon as possible at the cost of losing some data. This is an escape method used when the database instance is unavailable. You are advised not to trigger this method frequently. You are advised not to use this function if you are not clear about the impact of data loss on services.

To use this function, you need to enable it on the DN and CM Server and restart the database instance for the setting to take effect. For details about how to enable the forcible switchover function on the standby node, see "Emergency Handling > Performing a Forcible Primary/Standby Switchover" in *Troubleshooting*.

Value range: **0** or **1**

The value **0** indicates that the function is disabled, and the value **1** indicates that the function is enabled.

Default value: **0**

wal_debug

Parameter description: Specifies whether to output WAL-related debugging information. This parameter is available only when **WAL_DEBUG** is enabled during compilation.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

Default value: **false**

wal_flush_timeout

Parameter description: Specifies the timeout interval for traversing **WalInsertStatusEntryTbl**. It is the maximum wait time for the adaptive Xlog disk flushing I/O to traverse **WalInsertStatusEntryTbl**.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

If the timeout interval is too long, the Xlog flushing frequency may decrease, reducing the Xlog processing performance.

Value range: an integer ranging from 0 to 90000000 (μs)

Default value:

2us (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory); **800us** (4-core CPU/16 GB memory)

wal_flush_delay

Parameter description: Specifies the wait interval when an entry in the **WAL_NOT_COPIED** state is encountered during **WalInsertStatusEntryTbl** traversal.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 90000000 (μs)

Default value:

1us (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory); **100us** (4-core CPU/16 GB memory)

wal_receiver_bind_cpu

Parameter description: Specifies the CPU core ID bound to the WAL receiver thread.

The default value is **–1**, which is an invalid value, indicating that cores are not bound.

Although the value range is *INT_MAX*, the actual value is related to the number of used device cores. If the specified CPU core ID does not exist, an error is reported and core binding is interrupted.

Multiple threads can be bound to one core, but the performance deteriorates. Therefore, you are advised not to bind multiple threads to one core.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a value ranging from –1 to *INT_MAX*.

Default value: **–1**

wal_rec_writer_bind_cpu

Parameter description: Specifies the CPU core ID bound to the WAL rec writer thread.

The default value is **–1**, which is an invalid value, indicating that cores are not bound.

Although the value range is *INT_MAX*, the actual value is related to the number of used device cores. If the specified CPU core ID does not exist, an error is reported and core binding is interrupted.

Multiple threads can be bound to one core, but the performance deteriorates. Therefore, you are advised not to bind multiple threads to one core.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a value ranging from –1 to *INT_MAX*.

Default value: **–1**

14.3.6.2 Checkpoints

checkpoint_segments

Parameter description: Specifies the minimum number of WAL segment files in the period specified by **checkpoint_timeout**. The size of each log file is 16 MB.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer. The minimum value is **1**.

Increasing the value of this parameter speeds up the import of a large amount of data. Set this parameter based on **checkpoint_timeout** and **shared_buffers**. This parameter affects the number of WAL segment files that can be reused. Generally, the maximum number of reused files in the **pg_xlog** folder is twice the number of **checkpoint_segments**. The reused files are not deleted and are renamed to the WAL segment files which will be later used.

Default value: 1024

checkpoint_timeout

Parameter description: Specifies the maximum time between automatic WAL checkpoints.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 30 to 3600. The unit is s.

If the value of **checkpoint_segments** is increased, you need to increase the value of this parameter. The increase of these two parameters further requires the increase of **shared_buffers**. Consider all these parameters during setting.

Default value: **15min**

checkpoint_completion_target

Parameter description: Specifies the target of checkpoint completion.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a double-precision floating-point number ranging from 0.0 to 1.0

Default value: **0.5**

NOTE

The default value **0.5** indicates that each checkpoint should be complete within 50% of the interval between checkpoints.

checkpoint_warning

Parameter description: Specifies a time in seconds. If the checkpoint interval is close to this time due to filling of checkpoint segment files, a message is sent to the server log to suggest an increase in the **checkpoint_segments** value.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to *INT_MAX*. The unit is s. **0** indicates that the warning is disabled.

Default value: **5min**

Recommended value: **5min**

checkpoint_wait_timeout

Parameter description: Sets the longest time that the checkpoint waits for the checkpointer thread to start.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 2 to 3600. The unit is s.

Default value: **1min**

enable_incremental_checkpoint

Parameter description: Specifies whether to enable incremental checkpoint.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

Default value: **on**

enable_double_write

Parameter description: Specifies whether to enable double writing. When the incremental checkpoint function is enabled and **enable_double_write** is enabled, the **enable_double_write** dual-write feature is used for protection and **full_page_writes** is not used to prevent half-page write.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

Default value: **on**

incremental_checkpoint_timeout

Parameter description: Specifies the maximum interval between automatic WAL checkpoints when the incremental checkpoint is enabled.

Parameter type: integer

Unit: second

Value range: 1 to 3600

Default value: **60**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

enable_xlog_prune

Parameter description: Specifies whether the primary node recycles logs if the size of Xlogs exceeds the value of **max_size_for_xlog_prune** when any standby node is disconnected.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- If this parameter is set to **on**, the primary node recycles logs when any standby node is disconnected.
- If this parameter is set to **off**, the primary node does not recycle logs when any standby node is disconnected.

Default value: **on**

max_size_for_xlog_prune

Parameter description: Specifies the maximum number of Xlogs retained on the primary node when the standby node is faulty. This parameter takes effect when **enable_xlog_prune** is enabled. The mechanism is as follows:

1. If all standby nodes specified by the replconninfo series GUC parameters are connected to the primary node, this parameter does not take effect.
2. This parameter takes effect when one or more standby nodes specified by the replconninfo series GUC parameters are disconnected to the primary node. If the number of Xlogs on the host is greater than the value of this parameter, the Xlogs will be forcibly recycled. Exception: In synchronous commit mode (that is, the **synchronous_commit** parameter is not set to **local** or **off**), if there are standby nodes connecting to the primary node, the primary node retains the logs after the minimum log receiving location in the majority of standby nodes. In this case, the number of retained logs may be greater than the value of **max_size_for_xlog_prune**.
3. If a standby node is being built, this parameter does not take effect. All logs on the primary node are retained to prevent failures caused by log recycling during the build operation.

Parameter type: integer

Unit: KB

Value range: 0 to 2147483647

Default value: **256GB**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. If the value of the parameter does not contain a unit, the default unit is KB. The unit can also be MB or GB.

Setting suggestion: If the disk space is small, you are advised to set this parameter to a small value. The maximum value is **256GB**.

14.3.6.3 Log Replay

recovery_time_target

Parameter description: Specifies the time for a standby node to write and replay logs.

Parameter type: integer

Unit: second

Value range: 0 to 3600

0 indicates that log flow control is disabled. A value from **1** to **3600** indicates that a standby node can write and replay logs within the period specified by the value, so that the standby node can quickly assume the primary role. If this parameter is set to a small value, the performance of the primary node is affected. If it is set to a large value, the log flow is not effectively controlled.

Default value: **60**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

recovery_max_workers

Parameter description: Specifies the maximum number of concurrent replayer threads.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 20

Default value: **4** (For better performance, the default value in tool installation is **4**.)

queue_item_size

Parameter description: Specifies the maximum length of the task queue of each redo replayer thread.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a value ranging from 1 to 65535.

Default value: **560**

recovery_parse_workers

Parameter description: Specifies the number of **ParseRedoRecord** threads for the ultimate RTO feature.

1. In addition, it must be used together with **recovery_redo_workers**. If both **recovery_parse_workers** and **recovery_redo_workers** are greater than 1, ultimate RTO is enabled. If you do not want to enable ultimate RTO, retain the default value **1** of **recovery_parse_workers**.
2. Ensure that the value of this parameter **replication_type** is set to **1** when ultimate RTO is enabled.
3. If both the ultimate RTO and parallel replay are enabled at the same time, the ultimate RTO feature takes effect but the parallel replay feature does not take effect.
4. Ultimate RTO does not support flow control. Flow control is determined by the parameter **recovery_time_target**.

Parameter type: integer

Unit: none

Value range: 1 to 16

Default value: **1**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: For details about the values of **recovery_parse_workers** and **recovery_redo_workers** for different CPUs, memories, and deployment modes, see **Table 1 Parameter settings for different CPUs, memory sizes, and deployment modes**.

NOTE

After ultimate RTO is enabled, the total number of extra replayer threads started by the standby node = **recovery_parse_workers** x (**recovery_redo_workers** + 2) + 5. More replayer threads occupy more CPU, memory, and I/O resources. Set parameters based on the actual hardware configuration. If the parameter value is too large, the CPU and memory usage may be too high, causing system startup exceptions.

recovery_redo_workers

Parameter description: Specifies the number of **PageRedoWorker** threads corresponding to each **ParseRedoRecord** thread when the ultimate RTO feature is enabled. **recovery_redo_workers** must be used together with **recovery_parse_workers**. The value of **recovery_redo_workers** takes effect only when **recovery_parse_workers** is greater than 1.

Parameter type: integer

Unit: none

Value range: 1 to 8

Default value: **1**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: For details about the values of **recovery_parse_workers** and **recovery_redo_workers** for different CPUs, memories, and deployment modes, see **Table 1 Parameter settings for different CPUs, memory sizes, and deployment modes**.

Table 14-7 Parameter settings for different CPUs, memory sizes, and deployment modes

No.	Number of CPUs	Memory (GB)	Hybrid Deployment or Not	recovery_parse_workers	recovery_redo_workers	Number of Replayer Threads	Remarks
1	4	-	-	1	1	-	Ultimate RTO is not recommended.
2	8	-	Yes	1	1	-	Ultimate RTO is not recommended.
3	8	64	No	1	1	-	Ultimate RTO is not recommended.
4	16	128	Yes	1	1	-	Ultimate RTO is not recommended.
5	16	128	No	2	3	15	-
6	32	256	Yes	2	2	13	-
7	32	256	No	2	8	25	-
8	64	512	Yes	2	4	17	-

No.	Number of CPUs	Memory (GB)	Hybrid Deployment or Not	recovery_parse_workers	recovery_redo_workers	Number of Replayer Threads	Remarks
9	64	512	No	2	8	25	Set the parameter to the recommended value for larger hardware specifications.
10	96	768	-	2	8	25	Set the parameter to the recommended value for larger hardware specifications.

recovery_parallelism

Parameter description: Specifies the actual number of replayer threads. This parameter is read-only.

This is a POSTMASTER parameter and is affected by **recovery_max_workers** and **recovery_parse_workers**. If any value is greater than 0, **recover_parallelism** will be recalculated.

Value range: an integer ranging from 1 to 2147483647

Default value: **1**

enable_page_lsn_check

Parameter description: Specifies whether to enable the data page LSN check. During replay, the current LSN of the data page is checked to see if it is the expected one.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

Default value: **on**

recovery_min_apply_delay

Parameter description: Specifies the replay delay of the standby node.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

- This parameter does not take effect on the primary node. It must be set on the standby node that requires a delay. You are advised to set this parameter on the asynchronous standby node. If the delay is set on the asynchronous standby node, the RTO will take a long time after the node is promoted to primary.
- The delay time is calculated based on the transaction commit timestamp on the primary node and the current time on the standby node. Therefore, ensure that the clocks of the primary and standby nodes are synchronized.
- If the delay time is too long, the disk where the Xlog file is located on the standby node may be full. Therefore, you need to set the delay time based on the disk size.
- Operations without transactions are not delayed.
- After the primary/standby switchover, if the original primary node needs to be delayed, you need to manually set this parameter.
- When **synchronous_commit** is set to **remote_apply**, synchronous replication is affected by the delay. Each commit message is returned only after the replay on the standby node is complete.
- Using this feature also delays **hot_standby_feedback**, which may cause the primary node to bloat, so be careful when using both.
- If a DDL operation (such as DROP or TRUNCATE) that holds an AccessExclusive lock is performed on the primary node, the query operation on the operation object on the standby node will be returned only after the lock is released during the delayed replay of the record on the standby node.

Value range: an integer ranging from 0 to INT_MAX. The unit is ms.

Default value: **0** (no delay added)

dcf_truncate_dump_info_level

Parameter description: Specifies whether to print the LSN truncated by the DCF and the subsequent LSNs.

Parameter type: integer

Unit: none

Value range: 0 to 2

- **0**: disabled.
- **1**: prints all LSNs truncated by the DCF (Xlogs whose LSN is greater than or equal to the truncated LSN).
- **2**: prints all LSNs truncated by the DCF and prints warning-level logs when the LSNs flushed to disks are greater than the truncated LSNs.

Default value: **0** (disabled)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

redo_bind_cpu_attr

Parameter description: Specifies the core binding operation of the replayer thread. Only the sysadmin user can access this parameter. This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string of more than 0 characters. The value is case-insensitive.

- **'nobind'**: The thread is not bound to a core.
- **'nodebind: 1, 2'**: Use the CPU cores in NUMA groups 1 and 2 to bind threads.
- **'cpubind: 0-30'**: Use the CPU cores 0 to 30 to bind threads.
- **'cpuorderbind: 16-32'**: One thread is bound to one CPU core starting from core 16. If the number of cores in the range is insufficient, the remaining threads are not bound. You are advised to set the interval to a value greater than or equal to the value of **recovery_parallelism** plus 1.

Default value: **'nobind'**

14.3.6.4 Archiving

archive_timeout

Parameter description: Specifies the archiving period.

This is a **SIGHUP** parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

- The server is forced to switch to a new WAL segment file when the period specified by this parameter has elapsed since the last file switch.
- Archived files that are closed early due to a forced switch are still of the same length as full files. Therefore, a very short **archive_timeout** will bloat the archive storage. You are advised to set **archive_timeout** to **60s**.

Value range: an integer ranging from 0 to 1073741823. The unit is s. **0** indicates that archiving timeout is disabled.

Default value: **0**

archive_interval

Parameter description: Specifies the archiving interval.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

- Log files are forcibly archived when the period specified by this parameter has elapsed.
- Archiving involves I/O operations. Therefore, frequent archiving is not allowed. In addition, the RPO cannot be set to a large value; otherwise, the PITR will be affected. You are advised to use the default value.

Value range: an integer ranging from 1 to 1000. The unit is second.

Default value: **1**

14.3.7 HA Replication

14.3.7.1 Sending Server

max_wal_senders

Parameter description: Specifies the maximum number of concurrent connections of the transaction log sender. The value must be smaller than that of **max_connections**.

NOTICE

wal_level must be set to **archive**, **hot_standby**, or **logical** to allow the connection from standby nodes.

Parameter type: integer.

Value range: 0 to 1024. The recommended value range is 8 to 100.

Default value: 20

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestions: 1. It can be set to **0** only when a single DN is used and there is no primary/standby instance. 2. When HA replication, backup and restoration, and logical decoding are used, you are advised to set this parameter to a value by referring to the following formula: Number of current standby nodes + Number of backup connections + Number of required logical replication connections. If the actual value is smaller than the recommended value, these functions may be unavailable or abnormal.

wal_keep_segments

Parameter description: Specifies the number of Xlog file segments. Specifies the minimum number of transaction log files stored in the **pg_xlog** directory. The standby node obtains log files from the primary node for streaming replication.

Parameter type: integer.

Value range: 2 to *INT_MAX*.

Default value: **128**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion:

- During WAL archiving or recovery from a checkpoint on the server, the system may retain more log files than the number specified by **wal_keep_segments**.
- If this parameter is set to an excessively small value, a transaction log may have been overwritten by a new transaction before requested by the standby node. As a result, the request fails and the connection between the primary and standby nodes is terminated.
- If the HA system uses asynchronous transmission, increase the value of **wal_keep_segments** when data greater than 4 GB is continuously imported in COPY mode. Take T6000 board as an example. If the data to be imported reaches 50 GB, you are advised to set this parameter to **1000**. You can dynamically restore the setting of this parameter after data import is complete and the log synchronization is normal.
- If the synchronous_commit level is lower than LOCAL_FLUSH, you are advised to set this parameter to **1000** when rebuilding the standby node to prevent rebuilding failures caused by primary node log recycling during the rebuilding.

wal_sender_timeout

Parameter description: Specifies the maximum duration that the sender waits for the receiver to receive transaction logs.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

- If the data volume on the primary node is huge, the value of this parameter must be increased for the database rebuilding on a standby node. For example, if the data volume on the primary node reaches 500 GB, you are advised to set this parameter to 600 seconds.
- This parameter cannot be set to a value larger than the value of **wal_receiver_timeout** or the timeout parameter for database rebuilding.

Value range: an integer ranging from 0 to *INT_MAX*. The unit is ms.

Default value: **6s**

max_replication_slots

Parameter description: Specifies the number of log replication slots on the primary node.

Parameter type: integer.

Value range: 0 to 1024. The recommended value range is 8 to 100.

Default value: 20

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion:

When HA replication, backup and restoration, and logical decoding are used, you are advised to set this parameter to a value by referring to the following formula: Number of current physical streaming replication slots + Number of backup slots + Number of required logical replication slots. If the actual value is smaller than the recommended value, these functions may be unavailable or abnormal.

- Physical streaming replication slots provide an automatic method to ensure that Xlogs are not removed from a primary node before they are received by all the standby nodes. That is, physical streaming replication slots are used to support primary/standby HA. The number of physical streaming replication slots required by a database is equal to the ratio of standby nodes to the primary node. For example, if an HA database has one primary node and one standby node, the number of required physical streaming replication slots will be one. If an HA database has one primary node and three standby nodes, the number of required physical streaming replication slots will be three.
- Backup slot records replication information during backup execution. Full backup and incremental backup correspond to two independent backup slots.
- Plan the number of logical replication slots as follows:
  - A logical replication slot can carry changes of only one database for decoding. If multiple databases are involved, create multiple logical replication slots.
  - If logical replication is needed by multiple target databases, create multiple logical replication slots in the source database. Each logical replication slot corresponds to one logical replication link.
  - A maximum of 20 logical replication slots can be enabled for decoding on the same instance.

enable_slot_log

Parameter description: Specifies whether to enable primary/standby synchronization for replication slots. Currently, only archive slots and backup slots are involved.

Parameter type: Boolean.

Value range:

- **on** indicates that primary/standby synchronization is enabled for replication slots.
- **off** indicates that primary/standby synchronization is disabled for replication slots.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter to **on** only in cloud scenarios where logical replication is enabled. In other scenarios, set this parameter to **off**.

max_changes_in_memory

Parameter description: Specifies the maximum number of DML statements cached in memory for a single transaction during logical decoding.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to 2147483647.

Default value: **4096**

max_cached_tuplebufs

Parameter description: Specifies the upper limit of the total tuple information cached in the memory during logical decoding. You are advised to set this parameter to a value greater than or equal to twice of **max_changes_in_memory**.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to 2147483647.

Default value: **8192**

logical_decode_options_default

Parameter description: Specifies the global default value for unspecified decoding options when logical decoding starts.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Currently, the following logical decoding options are supported: **parallel-decode-num**, **parallel-queue-size**, **max-txn-in-memory**, **max-reorderbuffer-in-memory**, **exclude-users**, and **skip-generated-columns**. For details about the options, see "Logical Replication > Logical Decoding > Logical Decoding Options" in *Feature Guide*.

Value range: a string of key=value characters separated by commas (,), for example, **'parallel-decode-num=4,parallel-queue-size=128,exclude-users=userA,skip-generated-columns=on'**. An empty string indicates that the default value of the program is used.

Default value: **""**

NOTICE

- The SIGHUP parameter does not affect the started logical decoding process. The options specified by this parameter are used as the default settings for subsequent logical decoding startup, and the settings specified in the startup command are preferentially used.
- The **exclude-users** option is different from the logical decoding startup option. You are not allowed to specify multiple blacklisted users.

logical_sender_timeout

Parameter description: Specifies the maximum waiting time for the sender to wait for the receiver to receive logical logs.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 2147483647. The unit is ms.

Default value: **30s**

enable_logicalrepl_xlog_prune

Parameter description: Specifies whether to enable the function of forcibly invalidating a logical replication slot. When the current GUC parameters **enable_logicalrepl_xlog_prune** is set to **on**, **enable_xlog_prune** is set to **on**, and **max_size_for_xlog_retention** is set to a non-zero value, the number of reserved log segments caused by the backup slot or logical replication slot exceeds the value of **wal_keep_segments**, and other replication slots do not cause more reserved log segments, if the value of **max_size_for_xlog_retention** is greater than 0 and the number of retained log segments (the size of each log segment is 16 MB) caused by the current logical replication slot exceeds the value of **max_size_for_xlog_retention**, or if the value of **max_size_for_xlog_retention** is less than 0 and the disk usage reaches the value of **–max_size_for_xlog_retention**/**100**, the logical replication slot is forcibly invalidated and **restart_lsn** is set to **7FFFFFFF/FFFFFFFF**.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **true** indicates that the function of forcibly invalidating a logical replication slot is enabled.
- **false** indicates that the function of forcibly invalidating a logical replication slot is disabled.

Default value: **false**

enable_logical_replication_ddl

Parameter description: Specifies whether the logical decoding supports DDL statements, reverse parsing, and log generation.

Parameter type: Boolean.

Value range:

- **on**: Logical replication supports DDL statements, reversely parses DDL execution results, and generates DDL WALs.
- **off**: DDL statements are not supported, reverse parsing is not performed, and WALs are not generated.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

enable_wal_shipping_compression

Parameter description: Specifies whether to enable cross-database instance log compression in streaming DR mode.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

This parameter applies only to a pair of WAL sender and WAL receiver for cross-database instance transmission in streaming DR and is configured on the primary database instance.

Value range: Boolean

- **true** indicates that cross-database instance log compression is enabled for streaming DR.
- **false** indicates that cross-database instance log compression is disabled for streaming DR.

Default value: **false**

repl_auth_mode

Parameter description: Specifies the validation mode for primary/standby replication and standby node rebuilding.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

- If UUID validation is enabled on the primary node and a non-null repl_uuid validation code is configured, UUID validation must also be enabled on the standby node and the same repl_uuid validation code must be configured on the standby node. Otherwise, requests for log replication between the primary and standby nodes and standby node rebuilding will be rejected by the primary node.
- The SIGHUP parameter can dynamically load new values. The modification does not affect the established primary/standby connection and takes effect for subsequent primary/standby replication requests and primary/standby rebuilding requests.
- It supports the standby node rebuild validation under the Quorum and DCF protocols and the primary/standby replication validation under the Quorum protocol. It does not support primary/standby replication validation under the DCF protocol.
- Authentication between the primary and standby database instances is not supported, including primary and standby Dorado instances and DR instances.
- The UUID validation function is used to prevent data crosstalk and pollution caused by incorrect connection between the primary and standby nodes. It is not used for security purposes.
- This parameter cannot be automatically synchronized between the primary and standby nodes.

Value range: enumerated values

- **off**: indicates that UUID validation is disabled.
- **default**: indicates that UUID validation is disabled.
- **uuid**: indicates that UUID validation is enabled.

Default value: **default**

repl_uuid

Parameter description: Specifies the UUID used for primary/standby UUID validation.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

- If UUID validation is enabled on the primary node and a non-null repl_uuid validation code is configured, UUID validation must also be enabled on the standby node and the same repl_uuid validation code must be configured on the standby node. Otherwise, requests for log replication between the primary and standby nodes and standby node rebuilding will be rejected by the primary node.
- The SIGHUP parameter can dynamically load new values. The modification does not affect the established primary/standby connection and takes effect for subsequent primary/standby replication requests and primary/standby rebuilding requests.
- It supports the standby node rebuild validation under the Quorum and DCF protocols and the primary/standby replication validation under the Quorum protocol. It does not support primary/standby replication validation under the DCF protocol.
- Authentication between the primary and standby database instances is not supported, including primary and standby Dorado instances and DR instances.
- The UUID validation function is used to prevent data crosstalk and pollution caused by incorrect connection between the primary and standby nodes. It is not used for security purposes.
- This parameter cannot be automatically synchronized between the primary and standby nodes.

Value range: a string. The value is a string of 0 to 63 case-insensitive letters and digits. It is converted to lowercase letters for storage. An empty string indicates that UUID validation is disabled.

Default value: an empty string

replconninfo1

Parameter description: Specifies the information about the first node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the first node is configured.

Default value: an empty string

replconninfo2

Parameter description: Specifies the information about the second node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the second node is configured.

Default value: an empty string

replconninfo3

Parameter description: Specifies the information about the third node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the third node is configured.

Default value: an empty string

replconninfo4

Parameter description: Specifies the information about the fourth node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the fourth node is configured.

Default value: an empty string

replconninfo5

Parameter description: Specifies the information about the fifth node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the fifth node is configured.

Default value: an empty string

replconninfo6

Parameter description: Specifies the information about the sixth node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the sixth node is configured.

Default value: an empty string

replconninfo7

Parameter description: Specifies the information about the seventh node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the seventh node is configured.

Default value: an empty string

replconninfo8

Parameter description: Specifies the information about the eighth node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the eighth node is configured.

Default value: an empty string

replconninfo9

Parameter description: Specifies the information about the ninth node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the ninth node is configured.

Default value: an empty string

replconninfo10

Parameter description: Specifies the information about the tenth node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the tenth node is configured.

Default value: an empty string

replconninfo11

Parameter description: Specifies the information about the eleventh node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the eleventh node is configured.

Default value: an empty string

replconninfo12

Parameter description: Specifies the information about the twelfth node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the twelfth node is configured.

Default value: an empty string

replconninfo13

Parameter description: Specifies the information about the thirteenth node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the thirteenth node is configured.

Default value: an empty string

replconninfo14

Parameter description: Specifies the information about the fourteenth node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the fourteenth node is configured.

Default value: an empty string

replconninfo15

Parameter description: Specifies the information about the fifteenth node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the fifteenth node is configured.

Default value: an empty string

replconninfo16

Parameter description: Specifies the information about the sixteenth node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the sixteenth node is configured.

Default value: an empty string

replconninfo17

Parameter description: Specifies the information about the seventeenth node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the seventeenth node is configured.

Default value: an empty string

replconninfo18

Parameter description: Specifies the information about the eighteenth node to be listened on and authenticated by the current server.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the eighteenth node is configured.

Default value: an empty string

cross_cluster_replconninfo1

Parameter description: Specifies the information about the local first node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the first node is configured.

Default value: an empty string

cross_cluster_replconninfo2

Parameter description: Specifies the information about the local second node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the second node is configured.

Default value: an empty string

cross_cluster_replconninfo3

Parameter description: Specifies the information about the local third node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the third node is configured.

Default value: an empty string

cross_cluster_replconninfo4

Parameter description: Specifies the information about the local fourth node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the fourth node is configured.

Default value: an empty string

cross_cluster_replconninfo5

Parameter description: Specifies the information about the local fifth node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the fifth node is configured.

Default value: an empty string

cross_cluster_replconninfo6

Parameter description: Specifies the information about the local sixth node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the sixth node is configured.

Default value: an empty string

cross_cluster_replconninfo7

Parameter description: Specifies the information about the local seventh node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the seventh node is configured.

Default value: an empty string

cross_cluster_replconninfo8

Parameter description: Specifies the information about the local eighth node to be listened on and authenticated across database instances.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the eighth node is configured.

Default value: an empty string

available_zone

Parameter description: Specifies the region where the local node is located.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that no information about the node is configured.

Default value: an empty string

enable_availablezone

Parameter description: Specifies whether the local cascaded standby node can connect to standby nodes across AZs.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **true** indicates that the cascaded standby node can only connect to standby nodes in the same AZ.
- **false** indicates that the cascaded standby node can connect to standby nodes across AZs.

Default value: **false**

max_keep_log_seg

Parameter description: Stream control parameter. In logical replication, physical logs are parsed and converted into logical logs locally on the DN. When the number of physical log files that are not parsed is greater than the value of this parameter, stream control is triggered. The value **0** indicates that the stream control function is disabled.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 2147483647.

Default value: **0**

enable_time_report

Parameter description: Specifies whether to record the time consumed by each redo log.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the time when a redo record is generated is recorded.
- **off** indicates that no record is generated.

Default value: **off**

thread_top_level

Parameter description: Increases the priority of the WALWRITERAUXILIARY || WALWRITER || STARTUP ||WALRECEIVER || WAL_NORMAL_SENDER || PGSTAT threads to the highest.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the priority of the preceding threads is increased to the highest.

- **off** indicates that the priority of the preceding threads is not increased.

Default value: **off**

page_work_queue_size

Parameter description: Specifies the length of the blocking queue of each redo worker.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a value ranging from 1 to 100000.

Default value: **4096**

14.3.7.2 Primary Server

synchronous_standby_names

Parameter description: Specifies a comma-separated list of names of potential standby nodes that support synchronous replication.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

- The current synchronous standby node is on the top of the list. If the current synchronous standby node is disconnected, it will be replaced immediately with the next-highest-priority standby node. Name of the next-highest-priority standby node is added to the list.
- The standby node name can be specified by setting the environment variable **PGAPPNAME**.

Value range: a string. If this parameter is set to *****, the name of any standby node that provides synchronous replication is matched. The value can be configured in the following format:

- ANY *num_sync* (*standby_name* [, ...]) [, ANY *num_sync* (*standby_name* [, ...])]
- [FIRST] *num_sync* (*standby_name* [, ...])
- *standby_name* [, ...]

NOTE

- In the preceding command, *num_sync* indicates the number of standby nodes that need to wait for responses from the transaction, *standby_name* indicates the name of the standby node, and FIRST and ANY specify the policies for selecting standby nodes for synchronous replication from the listed servers.
- **ANY N (dn_instanceId1, dn_instanceId2,...)** indicates that any *N* host names in the brackets are selected as the name list of standby nodes for synchronous replication. For example, **ANY 1(dn_instanceId1, dn_instanceId2)** indicates that either of **dn_instanceId1** or **dn_instanceId2** is used as the standby node for synchronous replication.
- **FIRST N (dn_instanceId1, dn_instanceId2, ...)** indicates that the first N primary node names in the brackets are selected as the standby node name list for synchronous replication based on the priority. For example, **FIRST 1 (dn_instanceId1, dn_instanceId2)** indicates that **dn_instanceId1** is selected as the standby node for synchronous replication.
- The meanings of **dn_instanceId1, dn_instanceId2, ...** are the same as those of **FIRST 1 (dn_instanceId1, dn_instanceId2, ...)**.

NOTICE

This parameter is maintained by the CM. If it is manually modified, data may be lost. For details, see "Unified Cluster Management Tool > Features > Automatic Copy Addition and Reduction by Shard > Remarks" in *Tool Reference*.

If you use the gs_guc tool to set this parameter, perform the following operations:

```
gs_guc reload -Z datanode -N @NODE_NAME@ -D @DN_PATH@ -c "synchronous_standby_names='ANY
NODE 1(dn_instanceId1, dn_instanceId2)'";
```

or

```
gs_guc reload -Z datanode -N @NODE_NAME@ -D @DN_PATH@ -c "synchronous_standby_names='ANY
1(AZ1, AZ2)'";
```

Default value: *****

most_available_sync

Parameter description: Specifies whether transactions on the primary node are not blocked due to faults on synchronous standby nodes. For example, if one of the two synchronous standby nodes is faulty and the other is normal, the primary node waits for the normal synchronous standby node instead of being blocked by the faulty synchronous standby node.

For another example, the quorum protocol is executed and one primary node and three synchronous standby nodes are configured by using ANY 2(node1,node2,node3). When node 1 and node 3 are faulty and node 2 is normal, services on the primary node are not blocked.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the primary node is not blocked when all synchronous standby nodes are faulty.

- **off** indicates that the primary node is blocked when all synchronous standby nodes are faulty.

Default value: **off**

keep_sync_window

Parameter description: Specifies the delay for entering the maximum availability mode.

- If **most_available_sync** is set to **on**, when synchronous standby nodes are faulty in primary/standby scenarios and the number of configured synchronous standby nodes is insufficient (for details, see the meaning of **synchonous_standby_name**), setting **keep_sync_window** will retain the maximum protection mode within the time window specified by **keep_sync_window**. That is, committing transactions on the primary node is blocked, delay the primary node to enter the maximum availability mode.
- If synchronous standby nodes recover from faults and the number of synchronous standby nodes meets the configuration requirements, transactions are not blocked.
- You are advised to set **keep_sync_window** to 5s. This prevents the monitoring system from incorrectly reporting network instability.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to *INT_MAX*. The unit is second.

- The value **0** indicates that the **keep_sync_window** is not set, that is, the maximum availability mode is entered directly.
- Other values indicate the size of the timeout window.

Default value: **0**

NOTE

Setting this parameter may affect the RPO. If the primary node is faulty within the configured timeout window, the data generated from the time when the primary node is blocked to the time when the primary node is faulty may be lost.

enable_stream_replication

Parameter description: Specifies whether data and logs are synchronized between the primary and standby nodes.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

- This parameter is used for performance testing in scenarios where data synchronization to standby nodes is enabled and where it is disabled. If this parameter is set to **off**, tests on abnormal scenarios, such as switchover and faults, cannot be performed to prevent inconsistency between the primary and standby nodes.
- This is a restricted parameter, and you are advised not to set it to **off** in normal service scenarios.

Value range: Boolean

- **on** indicates that data and log synchronization between the primary and standby nodes is enabled.
- **off** indicates that data and log synchronization between the primary and standby nodes is disabled.

Default value: **on**

enable_mix_replication

Parameter description: Specifies how WAL files and data are replicated between the primary and standby nodes.

This parameter is an INTERNAL parameter. Its default value is **off** and cannot be modified.

NOTICE

- This parameter cannot be modified in normal service scenarios. That is, mixed replication of the WAL files and data pages is disabled.

Value range: Boolean

- **on** indicates that the WAL file and data page mixed replication mode is enabled.
- **off** indicates that the WAL file and data page mixed replication mode is disabled.

Default value: **off**

vacuum_defer_cleanup_age

Parameter description: Specifies the number of transactions by which **VACUUM** will defer the cleanup of invalid row-store table records. That is, **VACUUM** and **VACUUM FULL** do not clean up deleted tuples immediately.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 1000000. **0** means no delay.

Default value: **0**

data_replicate_buffer_size

Parameter description: Specifies the amount of memory used by queues when the sender sends data pages to the receiver. The value of this parameter affects the buffer size used during the replication from the primary node to the standby node.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 4096 to 1072693248. The unit is KB.

Default value:

128MB (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory); **4MB** (4-core CPU/16 GB memory)

Setting suggestion: Retain the default value. Do not set **data_replicate_buffer_size** to an excessively large or small value. The following condition must be met: **data_replicate_buffer_size** + **segment_buffers** + **shared_buffers** + **wal_buffers** + **temp_buffers** + **maintenance_work_mem** + **work_mem** + **query_mem** + (Standby node) **wal_receiver_buffer_size** < **max_process_memory** < Memory size of the physical machine. If the value of the memory parameter is too large and exceeds the upper limit of the physical memory, the database cannot be started because it cannot allocate sufficient memory.

walsender_max_send_size

Parameter description: Specifies the size of the log or data sending buffer on the primary node.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 8 to *INT_MAX*. The unit is KB.

Default value: **8MB** (that is, 8192 KB)

enable_data_replicate

Parameter description: Specifies how data is synchronized between the primary and standby nodes when the data is imported to a row-store table.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the primary and standby nodes synchronize data using data pages when the data is imported to a row-store table. When **replication_type** is set to **1**, this parameter cannot be set to **on**. If this parameter is set to **on** using the GUC tool, its value will be forcibly changed to **off**.
- **off** indicates that the primary and standby nodes synchronize data using Xlogs when the data is imported to a row-store table.

Default value: **off**

ha_module_debug

Parameter description: Specifies the replication status log of a specific data block during data replication.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the status of each data block is recorded in logs during data replication.
- **off** indicates that the status of each data block is not recorded in logs during data replication.

Default value: **off**

catchup2normal_wait_time

Parameter description: Specifies the maximum duration for the standby node to catch up with the primary node when **most_available_sync** is enabled in primary/standby scenarios. The value of this parameter is an estimate and may be different from the actual value.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from –1 to 10000. The unit is ms.

- The value **–1** indicates that the primary node is blocked until the data catchup on the standby node is complete.
- The value **0** indicates that the primary node is not blocked during the data catchup on the standby node.
- Other values indicate the maximum duration that the primary node is blocked during the data catchup on the standby node. For example, if this parameter is set to **5000**, the primary node is blocked until the data catchup on the standby node is complete in 5s.

Default value: **–1**

check_sync_standby

Parameter description: Specifies whether to enable the standby node check function. After the **synchronous_standby_names** parameter is correctly configured in the primary/standby scenario, if the synchronous standby node is faulty, the write service on the primary node reports a write failure. This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: on or **off**

- **on** indicates that the standby node check is enabled.
- **off** indicates that the standby node check is disabled.

Default value: **off**

NOTE

- This parameter cannot be synchronized in job work and autonomous transactions. Otherwise, the check may not take effect.
- If the standby node check is not configured for a specified user or session and the standby node is faulty when the forcible synchronization commit mode is enabled, the write operation on a table causes the query on the same table by another user or in another session to hang. In this case, you need to recover the standby node or manually terminate the hung client.
- The standby node check function cannot be enabled in scenarios (such as VACUUM ANALYZE) where non-write operations trigger log writing. If the standby node does not meet the requirements for synchronizing configurations to the standby node, services will be hung in this scenario. In this case, you need to manually terminate the services.

sync_config_strategy

Parameter description: Specifies the policy for synchronizing configuration files between the primary node and standby node, and between the standby node and cascaded standby node.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: enumerated values

- **all_node**: If this parameter is set to **all_node** for the primary node, the primary node is allowed to proactively synchronize configuration files to all standby nodes. If this parameter is set to **all_node** for a standby node, the standby node is allowed to send synchronization requests to its primary node, and the standby node is allowed to proactively synchronize configuration files to all cascaded standby nodes. If this parameter is set to **all_node** for a cascaded standby node, the current cascaded standby node is allowed to send synchronization requests to its standby node.
- **only_sync_node**: If this parameter is set to **only_sync_node** for the primary node, the primary node is only allowed to proactively synchronize configuration files to all standby nodes. If this parameter is set to **only_sync_node** for a standby node, the standby node is allowed to send synchronization requests to its primary node, and the standby node is not allowed to proactively synchronize configuration files to all cascaded standby nodes. If this parameter is set to **only_sync_node** for a cascaded standby node, the current cascaded standby node is allowed to send synchronization requests to its standby node.
- **none_node**: If this parameter is set to **none_node** for the primary node, the primary node is not allowed to proactively synchronize configuration files to all standby nodes. If this parameter is set to **none_node** for a standby node, the standby node is not allowed to send synchronization requests to its primary node, and the standby node is allowed to proactively synchronize configuration files to all cascaded standby nodes. If this parameter is set to **none_node** for a cascaded standby node, the current cascaded standby node is not allowed to send synchronization requests to its standby node.

Default value: all_node

hadr_recovery_time_target

Parameter description: Specifies whether the standby database instance completes log writing and replay in streaming DR mode.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 3600. The unit is second.

0 indicates that log flow control is disabled. A value from 1 to 3600 indicates that a standby node can write and replay logs within the period specified by **hadr_recovery_time_target**. This ensures that the logs can be written and replayed within the period specified by **hadr_recovery_time_target** and the standby database instance can be promoted to primary quickly. If this parameter is set to a small value, the performance of the primary node is affected. If it is set to a large value, the log flow is not effectively controlled.

Default value: **0**

hadr_recovery_point_target

Parameter description: Specifies the RPO time allowed for the standby database instance to flush logs to disks in streaming DR mode.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 3600. The unit is second.

0 indicates that log flow control is disabled. A value from 1 to 3600 indicates that the standby node can flush logs to disks within the period specified by **hadr_recovery_point_target**. This ensures that the log difference between the primary and standby database instances is controlled within the period specified by **hadr_recovery_point_target** during the switchover and the standby database instance can be promoted to primary. If this parameter is set to a small value, the performance of the primary node is affected. If it is set to a large value, the log flow is not effectively controlled.

Default value: **0**

hadr_super_user_record_path

Parameter description: Specifies the path for storing encrypted files of the **hadr_disaster** user in the standby database instance in streaming DR mode. This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Modification suggestion: The value is automatically set by the streaming DR password transfer tool and does not need to be manually added.

Value range: a string.

Default value: **NULL**

NOTICE

- In a database instance that contains a primary node, and a standby node, the primary node is a sender relative to the standby node and the standby node is a receiver relative to the primary node.
- The sender actively synchronizes the configuration file to the receiver, and the receiver requests the sender to synchronize the configuration file, which are two independent events, so that the configuration files are synchronized. If you do not want to synchronize configuration files, set this parameter to **none_node** on the receiver. If the sender is a standby node, set this parameter to **none_node** only. If the sender is a primary node, set this parameter to **none_node** when the primary node does not synchronize with any standby node; or set this parameter to **only_sync_node** when the primary node synchronizes with synchronous standby nodes only and does not synchronize with asynchronous standby nodes.
- To be specific, the sender sends a configuration file which directly overwrites the corresponding parameter in the configuration file of the receiver. After the policy for synchronizing configuration files is set, even if you modify configuration parameters of the receiver, the modification does not take effect because the sender immediately overwrites these parameters.
- The following configuration parameters are not synchronized even if the policy for synchronizing configuration files is set: application_name, audit_directory, available_zone, comm_control_port, comm_sctp_port, listen_addresses, log_directory, port, replconninfo1, replconninfo2, replconninfo3, replconninfo4, replconninfo5, replconninfo6, replconninfo7, replconninfo8, replconninfo9, replconninfo10, replconninfo11, replconninfo12, replconninfo13, replconninfo14, replconninfo15, replconninfo16, replconninfo17, replconninfo18, ssl, ssl_ca_file, ssl_cert_file, ssl_ciphers, ssl_crl_file, ssl_key_file, ssl_renegotiation_limit, ssl_cert_notify_time, synchronous_standby_names, local_bind_address, perf_directory, query_log_directory, asp_log_directory, streaming_router_port, enable_upsert_to_merge, recovery_min_apply_delay, and sync_config_strategy.

enable_wal_sender_crc_check

Parameter description: Specifies whether to enable CRC for the WAL sender thread. CRC is performed before the primary node sends logs. If this parameter is enabled, the performance may deteriorate by less than 5%.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the check function is enabled.
- **off** indicates that the check function is disabled.

Default value: **on**

14.3.7.3 Standby Server

hot_standby

Parameter description: Specifies whether to allow connections and queries on a standby node during its recovery.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

- If this parameter is set to **on**, **wal_level** must be set to **hot_standby** or a higher level. Otherwise, the database startup fails.
- In an HA system, **hot_standby** cannot be set to **off**, because this setting can affect other features of the HA system.
- If the **hot_standby** parameter was disabled and the **wal_level** parameter was set to a value smaller than that of **hot_standby**, perform the following operations to ensure that the logs to be replayed on the standby node can be queried on the standby node before enabling the **hot_standby** parameter again:
  1. Change the value of **wal_level** of the primary and standby nodes to the value of **hot_standby** or a higher value, and restart the instances for the change to take effect.
  2. Perform the checkpoint operation on the primary node and query the **pg_stat_get_wal_senders()** function to ensure that the value of **receiver_replay_location** of each standby node is the same as that of **sender_flush_location** of the primary node. Ensure that the value adjustment of **wal_level** is synchronized to the standby nodes and takes effect, and the standby nodes do not need to replay low-level logs.
  3. Set the **hot_standby** parameter of the primary and standby nodes to **on**, and restart the instances for the setting to take effect.
- If the read on standby function is enabled, conflicts between replay and query on the standby node may cause the query to cancel. The error information is as follows:
  - ERROR: canceling statement due to conflict with recovery
  - ERROR: terminating connection due to conflict with recovery
- During the standby node read in serial and parallel replay modes, when the primary node rebuilds indexes online, an error may be reported when the standby node is read. Try again later. The error information is as follows:
  - could not open relation with OID xxx during recovery delete object, please try again later
  - Catalog is missing xxx attribute(s) for relid xxx
  - cache lookup failed for index xxx, refilenode:xxx, name:"xxx"
  - could not find pg_class entry for xxx
- During the standby node read in the case of ultimate RTO, the VM with small memory configuration may report an error indicating insufficient memory. You can enable the GUC parameter **exrto_standby_read_opt** (enabled by default) to effectively reduce the memory and I/O overhead.
- Use sysbench to test the read performance of the standby node in typical scenarios: The primary node executes 100 concurrent update services. The primary and standby nodes both execute 200 concurrent read services at the same time. When the I/O and CPU are not limited, the read performance of the standby node in serial replay mode is not lower than 80% of that of the primary node, and the read performance of the standby node in ultimate RTO deteriorates by no more than 10% compared with that of the standby node in serial replay mode.

Value range: Boolean

- **on** indicates that connections and queries are allowed on the standby node during the recovery.
- **off** indicates that connections and queries are not allowed on the standby node during the recovery.

Default value: **on**

max_standby_archive_delay

Parameter description: Specifies the wait period before queries on a standby node are canceled when the queries conflict with WAL processing and archiving in hot standby mode. In the current version, the setting does not take effect and is controlled by the **max_standby_streaming_delay** parameter.

Parameter type: integer

Unit: millisecond

Value range: 1 to 2147483647

NOTE

–1 indicates that the standby node waits until the conflicting queries are complete.

Default value: **3000ms** (that is, 3s)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

max_standby_streaming_delay

Parameter description: Specifies the wait period before queries on the standby node are canceled when the queries conflict with WAL data receiving through streaming replication in hot standby mode. If this parameter is set to a large value or the service load is heavy, an error may be reported for waiting for transaction replay and flushing to disks.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

–1 indicates that the standby node waits until the conflicting queries are complete. In the scenario where serial or parallel replay is enabled, if the system detects that the query thread and replayer thread are in the deadlock state, the system still cancels the query to prevent replay blocking.

Value range: an integer ranging from –1 to *INT_MAX*. The unit is ms.

Default value: **3000ms** (that is, 3s)

wal_receiver_status_interval

Parameter description: Specifies the maximum interval for notifying the primary node of the WAL receiver status.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to *INT_MAX*/1000. The unit is s.

Default value: **5s**

NOTICE

If this parameter is set to **0**, the standby node does not send information, such as the log receiving location, to the primary node. As a result, the transaction commit on the primary node may be blocked, and the switchover may fail. In normal service scenarios, you are advised not to set this parameter to **0**.

hot_standby_feedback

Parameter description: Specifies whether the ID of the oldest transaction active on standby nodes will be sent to the primary node, preventing a query conflict.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the ID of the oldest transaction active on standby nodes will be sent to the primary node.
- **off** indicates that the ID of the oldest transaction active on standby nodes will not be sent to the primary node.

Default value: **off**

NOTICE

If this parameter is set to **on**, VACUUM on the primary node will not clean up tuples modified in transactions later than the oldest transaction active on standby nodes.

Therefore, the performance of the primary node will be affected. If replay conflicts with query on the standby node and a query error is reported, you are advised to increase the value of **max_standby_streaming_delay**.

wal_receiver_timeout

Parameter description: Specifies the maximum wait period for a standby node to receive data from the primary node.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to *INT_MAX*. The unit is ms.

Default value: **6s** (that is, 6000 ms)

wal_receiver_connect_timeout

Parameter description: Specifies the timeout interval for a standby node to connect to the primary node.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to *INT_MAX*/1000. The unit is s.

Default value: **2s**

wal_receiver_connect_retries

Parameter description: Specifies the maximum attempts that a standby node connects to the primary node.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to *INT_MAX*

Default value: **1**

wal_receiver_buffer_size

Parameter description: Specifies the memory buffer size for the standby nodes to store the received Xlog files.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 4096 to 1047552. The unit is KB.

Default value: **64MB** (that is, 65536 KB)

primary_slotname

Parameter description: Specifies the slot name of the primary node corresponding to a standby node. This parameter is used for the mechanisms to verify the primary-standby relationship and delete WALs.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string

Default value: an empty string

max_standby_base_page_size

Parameter description: Specifies the maximum storage space of base page files on the standby node after the ultimate RTO function is enabled.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a long integer ranging from 1048576 to 562949953421311. The unit is KB.

Default value: **268435456** (256 GB)

max_standby_lsn_info_size

Parameter description: Specifies the maximum size of LSN info files on the standby node after the ultimate RTO function is enabled.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a long integer ranging from 1048576 to 562949953421311. The unit is KB.

Default value: **268435456** (256 GB)

max_keep_csn_info_size

Parameter description: Specifies the maximum size of CSN info linked lists allowed by each DN on the standby node after the ultimate RTO function is enabled.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a long integer ranging from 16384 to 131072. The unit is KB.

Default value: **16384** (16 MB)

base_page_saved_interval

Parameter description: Specifies the interval for generating base pages on the standby node after the ultimate RTO function is enabled. For the same page, a base page is generated each time the value of this parameter is replayed.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 5 to 2000.

Default value: **400**

standby_force_recycle_ratio

Parameter description: Specifies the percentage of files read by the standby node to trigger forcible recycling after the ultimate RTO function is enabled. When the total size of base page files exceeds the value of **max_standby_base_page_size** x **standby_force_recycle_ratio** or the total size of LSN info files exceeds the value of **max_standby_lsn_info_size** x **standby_force_recycle_ratio**, forcible recycling is triggered and some queries are canceled. When the value of **standby_force_recycle_ratio** is **0**, forcible recycling is not started, and the setting of **max_standby_base_page_size** and **max_standby_lsn_info_size** does not take effect.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a double-precision floating-point number ranging from 0.0 to 1.0

Default value: **0.8**

standby_recycle_interval

Parameter description: Specifies the interval for the standby node to recycle read files after the ultimate RTO function is enabled. The thread for recycling read

resources on the standby node attempts to clear read files on the standby node at the interval specified by this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 86400. The unit is s.

Default value: **10**

standby_max_query_time

Parameter description: Specifies the maximum query time supported on the standby node after the ultimate RTO function is enabled. If the query time exceeds the value of this parameter, the query will be canceled. Note: The time when the query is canceled is affected by the interval parameter **standby_recycle_interval** of the recycling thread and the time when the snapshot is obtained. Therefore, the actual execution time of the query on the standby node must be greater than the value of this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 86400. The unit is s.

Default value: **600**

exrto_standby_read_opt

Parameter description: Specifies whether to support read optimization of the standby node with ultimate RTO. This parameter is enabled by default. This parameter is not synchronized between the primary and standby nodes.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean. **on** indicates that the optimization is enabled, and **off** indicates that the optimization is disabled.

Default value: **on**

walrcv_writer_crc_check_level

Parameter description: Specifies whether to enable Xlog verification on the standby node in the primary/standby databases in the streaming DR scenario. By default, the parameter is enabled only in the DR database.

Parameter type: integer

Unit: none

Value range: 0 to 3

- **0**: The verification is disabled.
- **1**: The verification in the DR database takes effect.
- **2**: The verification on the standby node of the primary database takes effect.
- **3**: Standby nodes in the primary database and nodes in the DR database take effect.

Default value: **1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

14.3.8 Query Planning

This section describes the method configuration, cost constants, planning algorithm, and some configuration parameters for the optimizer.

NOTE

- Two parameters are involved in the optimizer:
  - *INT_MAX* indicates the maximum value of the INT data type. The value is **2147483647**.
  - *DBL_MAX* indicates the maximum value of the FLOAT data type.
- In addition to customer services, global query planning parameters also affect database O&M and monitoring services, such as WDR generation, scale-out, redistribution, and data import and export.

14.3.8.1 Optimizer Method Configuration

These configuration parameters provide a crude method of influencing the query plans chosen by the query optimizer. If the default plan chosen by the optimizer for a particular query is not optimal, a temporary solution is to use one of these configuration parameters to force the optimizer to choose a different plan. Better ways include adjusting the optimizer cost constants, manually running **ANALYZE**, increasing the value of the **default_statistics_target** parameter, and increasing the amount of the statistics collected in specific columns using **ALTER TABLE SET STATISTICS**.

enable_broadcast

Parameter description: Controls the query optimizer's use of broadcast distribution method when it evaluates the cost of stream.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: used.
- **off**: not used.

Default value: **on**

NOTE

This parameter does not take effect in the current version.

enable_bitmapscan

Parameter description: Controls the query optimizer's use of bitmap-scan plan types.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: After this function is disabled, the bitmap scan operator is disabled globally, which may cause performance deterioration in some scenarios. Exercise caution when modifying the parameter to avoid risks caused by misoperations.

force_bitmapand

Parameter description: Specifies whether the optimizer forcibly uses BitmapAnd plan types.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: used.
- **off**: not used.

Default value: **off**

enable_hashagg

Parameter description: Controls the query optimizer's use of Hash aggregation plan types.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: used.
- **off**: not used.

Default value: **on**

enable_hashjoin

Parameter description: Controls the query optimizer's use of Hash-join plan types.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: used.
- **off**: not used.

Default value: **on**

enable_indexscan

Parameter description: Controls the query optimizer's use of index-scan plan types.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: used.
- **off**: not used.

Default value: **on**

enable_indexonlyscan

Parameter description: Controls the query optimizer's use of index-only-scan plan types.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: used.
- **off**: not used.

Default value: **on**

enable_material

Parameter description: Controls the query optimizer's use of materialization. It is impossible to suppress materialization entirely, but setting this variable to **off** prevents the optimizer from inserting materialized nodes.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: used.
- **off**: not used.

Default value: **on**

enable_mergejoin

Parameter description: Controls the query optimizer's use of merge-join plan types.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

enable_nestloop

Parameter description: Controls the query optimizer's use of nested-loop join plan types to fully scan internal tables. It is impossible to suppress nested-loop joins entirely, but setting this variable to **off** encourages the optimizer to choose other methods if available.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

enable_index_nestloop

Parameter description: Controls the query optimizer's use of the index nested-loop join plan types to scan the parameterized indexes of internal tables.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: used.
- **off**: not used.

Default value: **on**

enable_seqscan

Parameter description: Controls the query optimizer's use of sequential scan plan types. It is impossible to suppress sequential scans entirely, but setting this variable to **off** encourages the optimizer to choose other methods if available.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

enable_sort

Parameter description: Controls the query optimizer's use of sort methods. It is impossible to suppress explicit sorts entirely, but setting this variable to **off** encourages the optimizer to choose other methods if available.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: used.
- **off**: not used.

Default value: **on**

enable_tidscan

Parameter description: Controls the query optimizer's use of Tuple ID (TID) scan plan types.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: used.
- **off**: not used.

Default value: **on**

enable_kill_query

Parameter description: In CASCADE mode, when a user is deleted, all the objects belonging to the user are deleted. This parameter specifies whether the queries of the objects belonging to the user can be unlocked when the user is deleted.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the unlocking is allowed.
- **off** indicates that the unlocking is not allowed.

Default value: **off**

enforce_a_behavior

Parameter description: Controls the rule matching modes of regular expressions.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the A matching rule is used.
- **off** indicates that the POSIX matching rule is used.

Default value: **on**

max_recursive_times

Parameter description: Specifies the maximum number of **WITH RECURSIVE** iterations.

Parameter type: integer.

Unit: none

Value range: 0 to *INT_MAX*

Default value: **200**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

enable_change_hjcost

Parameter description: Specifies whether the optimizer excludes inner table running costs when selecting the hash join cost path. If it is set to **on**, tables with a few records and high running costs are more possible to be selected.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: used.
- **off**: not used.

Default value: **off**

enable_absolute_tablespace

Parameter description: Controls whether the tablespace can use an absolute path.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that an absolute path can be used.
- **off** indicates that an absolute path cannot be used.

Default value: **on**

enable_valuepartition_pruning

Parameter description: Specifies whether the DFS partitioned table is dynamically or statically optimized.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the DFS partitioned table is dynamically or statically optimized.
- **off** indicates that the DFS partitioned table is not dynamically or statically optimized.

Default value: **on**

qrw_inlist2join_optmode

Parameter description: Specifies whether to enable inlist-to-join (inlist2join) query rewriting.

Parameter type: string.

Unit: none

Value range:

- **disable** indicates that the inlist2join query rewriting is disabled.
- **cost_base** indicates that the cost-based inlist2join query rewriting is enabled.
- **rule_base** indicates that the rule-based inlist2join query rewriting is forcibly enabled.
- A positive integer (1 to 2147483647) indicates the threshold of inlist2join query rewriting. If the number of elements in the list is greater than the threshold, the rewriting is performed.

Default value: **cost_base**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

skew_option

Parameter description: Specifies whether an optimization policy is used.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string.

- **off** indicates that the policy is disabled.
- **normal** indicates that a radical policy is used. All possible skews are optimized.
- **lazy** indicates that a conservative policy is used. Uncertain skews are ignored.

Default value: **normal**

default_limit_rows

Parameter description: Specifies the default estimated number of limit rows for generating genericplan. If this parameter is set to a non-negative value, the value is used as the estimated number of limit rows. If this parameter is set to a negative value, the value is converted to a percentage and used as default estimated value; for example, **-5** indicates 5%.

Parameter type: floating point

Unit: none

Value range: -100 to *DBL_MAX*

Default value: **–10**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none

check_implicit_conversions

Parameter description: Specifies whether to check candidate index paths generated for index columns that have implicit type conversions in a query.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that a check will be performed for candidate index paths generated for index columns that have implicit type conversion in a query.
- **off** indicates that a check will not be performed.

Default value: **off**

cost_weight_index

Parameter description: Specifies the cost weight of index_scan.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a floating-point number ranging from 1e-10 to 1e+10.

Default value: **1**

enable_default_index_deduplication

Parameter description: Specifies whether to deduplicate and compress tuples with duplicate key values for a B-tree index by default. The deduplication and compression functions do not take effect for primary key indexes and unique indexes. When there are a large number of indexes with duplicate key values, the deduplication and compression function can effectively reduce the space occupied by indexes. In scenarios where non-unique indexes are used and index key values are seldom repeated or unique, the deduplication and compression function slightly deteriorates the index insertion performance. If the WITH (**deduplication** set to **on**/**off**) syntax is used during index creation, the deduplication parameter is preferentially used to determine whether to use deduplication and compression for the index.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **off**: indicates that the deduplication and compression function is disabled for B-tree indexes. This is the default value.

- **on**: indicates that the deduplication and compression function is enabled for B-tree indexes.

Default value: **off**

enable_expr_fusion

Parameter description: Specifies whether to enable the SRF, expression flattening, centralized Seq Scan projection cancellation, transition status of shared aggregate functions, and step number optimization features.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **off**: indicates that this function is disabled. This is the default value.
- **on**: indicates that the SRF, expression flattening, centralized Seq Scan projection cancellation, transition status of shared aggregate functions, and step number optimization features are enabled.

Default value: **off**

NOTE

The SRF supports only the scenario where **query_dop** is set to **1**.

enable_opfusion_reuse

Parameter description: Specifies whether to reuse the opfusion obj memory.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the opfusion obj memory is reused when conditions are met.
- **off** indicates that this function is disabled.

Default value: **on**

enable_iud_fusion

Parameter description: Specifies whether to optimize the IUD statements.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the input is optimized during type conversion.
- **off** indicates that this function is disabled.

Default value: **off**

14.3.8.2 Optimizer Cost Constants

This section describes the optimizer cost constants. The cost variables described here are measured on an arbitrary scale. Only their relative values matter, therefore scaling them all up or down by the same factor will result in no change

in the optimizer's choices. By default, they use the cost of fetching sequential pages as the basic unit. That is, **seq_page_cost** is set to **1.0** and the other cost variables are set with reference to the parameter. However, you can use a different scale, such as actual execution time in milliseconds.

seq_page_cost

Parameter description: Specifies the optimizer's estimated cost of a disk page fetch that is part of a series of sequential fetches.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a floating-point number ranging from 0 to *DBL_MAX*.

Default value: **1**

random_page_cost

Parameter description: Specifies the optimizer's estimated cost of an out-of-sequence disk page fetch.

Parameter type: floating point

Unit: none

Value range: 0 to *DBL_MAX*

Default value: **4**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none

NOTICE

Although the server allows you to set **random_page_cost** to a value less than that of **seq_page_cost**, it is not physically sensitive to do so. However, setting them equal makes sense if the database is entirely cached in RAM, because in that case there is no penalty for fetching pages out of sequence. Also, in a heavily-cached database you should lower both values relative to the CPU parameters, since the cost of fetching a page already in RAM is much smaller than it would normally be.

NOTE

- This value can be overwritten for tables and indexes in a particular tablespace by setting the tablespace parameter of the same name.
- Reducing this value relative to **seq_page_cost** will cause the system to prefer index scans and raising it will make index scans relatively more expensive. You can increase or decrease both values together to change the disk I/O costs relative to CPU costs.

cpu_tuple_cost

Parameter description: Specifies the optimizer's estimated cost of processing each row during a query.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a floating-point number ranging from 0 to *DBL_MAX*.

Default value: **0.01**

cpu_index_tuple_cost

Parameter description: Specifies the optimizer's estimated cost of processing each index entry during an index scan.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a floating-point number ranging from 0 to *DBL_MAX*.

Default value: 0.005

cpu_operator_cost

Parameter description: Specifies the optimizer's estimated cost of processing each operator or function executed during a query.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a floating-point number ranging from 0 to *DBL_MAX*.

Default value: **0.0025**

effective_cache_size

Parameter description: Specifies the optimizer's assumption about the effective size of the disk cache that is available to a single query.

When setting this parameter you should consider both GaussDB's shared buffers and the kernel's disk cache. Also, take into account the expected number of concurrent queries on different tables, since they will have to share the available space.

This parameter has no effect on the size of shared memory allocated by GaussDB. It is used only for estimation purposes and does not reserve kernel disk cache. The value is in the unit of disk page. Usually the size of each page is 8192 bytes.

Parameter type: integer.

Unit: page (8 KB)

Value range:

- Method 1: Set this parameter to an integer without a unit. The integer ranges from 1 to 2147483647. For example, **200** indicates that there are 200 pages, that is, the size of 200 x 8 KB.
- Method 2: Set this parameter to a value with a unit. The value ranges from 1 x 8 KB to 2147483647 x 8 KB. For example, the value **200MB** indicates 200 MB. The unit can only be KB, MB, or GB.

Default value:

280GB (196-core CPU/1536 GB memory); **180GB** (128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory); **135GB**

(96-core CPU/768 GB memory); **100GB** (80-core CPU/640 GB memory); **90GB** (64-core CPU/512 GB memory); **80GB** (60-core CPU/480 GB memory); **40GB** (32-core CPU/256 GB memory); **18GB** (16-core CPU/128 GB memory); **8GB** (8-core CPU/64 GB memory); **4GB** (4-core CPU/32 GB memory); **2GB** (4-core CPU/16 GB memory)

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: A value greater than the default one may enable index scan, and a value less than the default one may enable sequential scan.

allocate_mem_cost

Parameter description: Specifies the query optimizer's estimated cost of creating a hash table for memory space using hash join. This parameter is used for optimization when the hash join estimation is inaccurate.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a floating-point number ranging from 0 to *DBL_MAX*.

Default value: **0**

14.3.8.3 Genetic Query Optimizer

This section describes parameters related to genetic query optimizer. The genetic query optimizer (GEQO) is an algorithm that plans queries by using heuristic searching. This algorithm reduces planning time for complex queries and the costs of producing plans are sometimes inferior to those found by the normal exhaustive-search algorithm.

geqo

Parameter description: Specifies whether to enable the genetic query optimization.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

It is best not to turn it off in execution. **geqo_threshold** provides more subtle control of GEQO.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **on**

geqo_threshold

Parameter description: Specifies the number of **FROM** items. Genetic query optimization is used to plan queries when the number of statements executed is greater than this value.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

- For simpler queries, it is best to use the regular, exhaustive-search planner; but for queries with many tables, it is better to use GEQO to manage the queries.
- A **FULL OUTER JOIN** construct counts as only one **FROM** item.

Value range: an integer ranging from 2 to *INT_MAX*.

Default value: **12**

geqo_effort

Parameter description: Controls the trade-off between planning time and query plan quality in GEQO.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

- **geqo_effort** does not perform operations directly. This parameter is only used to compute the default values for the other variables that influence GEQO behavior. If you prefer, you can manually set the other parameters instead.
- Larger values increase the time spent in query planning, but also increase the probability that an efficient query plan is chosen.

Value range: an integer ranging from 1 to 10.

Default value: **5**

geqo_pool_size

Parameter description: Controls the pool size used by GEQO, that is, the number of individuals in the genetic population.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to *INT_MAX*.

NOTICE

The value of this parameter must be at least **2**, and useful values are typically from **100** to **1000**. If this parameter is set to **0**, GaussDB selects a proper value based on **geqo_effort** and the number of tables.

Default value: **0**

geqo_generations

Parameter description: Specifies the number of iterations of the GEQO.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to *INT_MAX*.

NOTICE

The value of this parameter must be at least **1**, and useful values are typically from **100** to **1000**. If it is set to **0**, a suitable value is chosen based on **geqo_pool_size**.

Default value: **0**

geqo_selection_bias

Parameter description: Specifies the selection bias used by GEQO. The selection bias is the selective pressure within the population.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a floating-point number ranging from 1.5 to 2.0.

Default value: **2**

geqo_seed

Parameter description: Specifies the initial value of the random number generator used by GEQO to select random paths through the join order search space.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a floating-point number ranging from 0.0 to 1.0.

NOTICE

Varying the value changes the set of join paths explored, and may result in a better or worse best path being found.

Default value: **0**

14.3.8.4 Other Optimizer Options

cost_model_version

Parameter description: Specifies the version of the optimizer cost model. It can be regarded as a protection parameter to disable the latest optimizer cost model and keep consistent with the plan of the earlier version. If the value of this parameter is changed, many SQL plans may be changed. Therefore, exercise caution when performing this operation.

Parameter type: integer.

Unit: none

Value range: **0**, **1**, **2**, **3**, or **4**

- **0** indicates that the latest cost estimation model is used. The current version is equivalent to **4**.
- **1** indicates that the original cost estimation model is used.
- **2**: indicates that the enhanced COALESCE expression, hash join cost, and semi/anti join cost are used for estimation on the basis of **1**.
- **3**: indicates that the boundary correction estimator is used to estimate the NDV on the basis of **2**. The hint of indexscan can be applied to indexonlyscan.
- **4**: indicates that partition-level statistics are used for cost estimation on the basis of **3**.

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: When upgrading the database, you are advised to set this parameter the same as that of the source version. When installing a new environment, you are advised to set this parameter to the default value.

explain_dna_file

Parameter description: Sets **explain_perf_mode** to **run** to export object files in CSV format.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

The value of this parameter must be an absolute path plus a file name with the extension **.csv**.

Value range: a string.

Default value: empty

explain_perf_mode

Parameter description: Specifies the display format of the **explain** command.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: normal, **pretty**, **summary**, and **run**

- **normal** indicates that the default printing format is used.
- **pretty** indicates a new format improved by using GaussDB. The new format contains a plan node ID, directly and effectively analyzing performance.
- **summary** indicates that the analysis result on this information is printed in addition to the printed information specified by **pretty**.
- **run** indicates that the system exports the printed information specified by **summary** as a CSV file for further analysis.

NOTICE

The display sequence may vary greatly according to the display format of **explain**. The examples of the **normal** and **pretty** formats are described as follows:

Example of the **normal** format:

```
                                                  QUERY PLAN
------------------------------------------------------------------------------------------------------------------------------------------------------------
 Sort  (cost=21.23..21.23 rows=1 width=306)
   Sort Key: supplier.s_suppkey
   CTE revenue
     ->  HashAggregate  (cost=12.88..12.88 rows=1 width=76)
           Group By Key: lineitem.l_suppkey
           ->  Partition Iterator  (cost=0.00..12.87 rows=1 width=44)
                 Iterations: 7
                 ->  Partitioned Seq Scan on lineitem  (cost=0.00..12.87 rows=1 width=44)
                       Filter: ((l_shipdate >= '1996-01-01 00:00:00'::timestamp(0) without time zone) AND
(l_shipdate < '1996-04-01 00:00:00'::timestamp without time zone))
                       Selected Partitions:  1..7
   InitPlan 2 (returns $3)
     ->  Aggregate  (cost=0.02..0.03 rows=1 width=64)
           ->  CTE Scan on revenue  (cost=0.00..0.02 rows=1 width=32)
   ->  Nested Loop  (cost=0.00..8.30 rows=1 width=306)
         ->  CTE Scan on revenue  (cost=0.00..0.02 rows=1 width=40)
               Filter: (total_revenue = $3)
         ->  Partition Iterator  (cost=0.00..8.27 rows=1 width=274)
               Iterations: 7
               ->  Partitioned Index Scan using supplier_s_suppkey_idx on supplier  (cost=0.00..8.27 rows=1
width=274)
                     Index Cond: (s_suppkey = revenue.supplier_no)
                     Selected Partitions:  1..7
(21 rows)
```

Example of the **pretty** format:

```
 id |                      operation                                    | E-rows | E-width |    E-costs
----+-------------------------------------------------------------------+--------+---------+----------------
  1 | ->  Sort                                                          |      1 |     306 | 21.230..21.235
  2 |    ->  Nested Loop (3,9)                                          |      1 |     306 | 0.000..8.303
  3 |       ->  CTE Scan on revenue                                     |      1 |      40 | 0.000..0.022
  4 |    ->  HashAggregate  [3, CTE revenue]                            |      1 |      76 | 12.875..12.885
  5 |       ->  Partition Iterator                                      |      1 |      44 | 0.000..12.865
  6 |          ->  Partitioned Seq Scan on lineitem                     |      1 |      44 | 0.000..12.865
  7 |    ->  Aggregate  [4, InitPlan 2 (returns $3)]                    |      1 |      64 | 0.022..0.033
  8 |       ->  CTE Scan on revenue                                     |      1 |      32 | 0.000..0.020
  9 |       ->  Partition Iterator                                      |      1 |     274 | 0.000..8.270
 10 |          ->  Partitioned Index Scan using supplier_s_suppkey_idx on supplier |      1 |     274 | 0.000..8.270
(10 rows)

                                      Predicate Information (identified by plan id)
------------------------------------------------------------------------------------------------------------------------------------------------------------
   5 --Partition Iterator
         Iterations: 7
   6 --Partitioned Seq Scan on lineitem
         Filter: ((l_shipdate >= '1996-01-01 00:00:00'::timestamp(0) without time zone) AND (l_shipdate <
'1996-04-01 00:00:00'::timestamp without time zone))
         Selected Partitions:  1..7
   3 --CTE Scan on revenue
         Filter: (total_revenue = $3)
   9 --Partition Iterator
         Iterations: 7
  10 --Partitioned Index Scan using supplier_s_suppkey_idx on supplier
         Index Cond: (s_suppkey = revenue.supplier_no)
         Selected Partitions:  1..7
(12 rows)
```

Note: The plan blocks in the preceding two formats are different display formats of the same plan. In the **pretty** format, the parts in bold are the CET and InitPlan plan blocks, which may be inserted in the middle of the join block. When the join block is being read, skip the CTE and InitPlan blocks to find the inner table of the corresponding join block.

Default value: pretty

analysis_options

Parameter description: Specifies whether to enable function options in the corresponding options to use the corresponding location functions, including data verification and performance statistics. For details, see the options in the value range.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string.

- **LLVM_COMPILE** indicates that the codegen compilation time of each thread is displayed on the explain performance page.
- **HASH_CONFLICT** indicates that the log in the **gs_log** directory of the database node process displays the statistics of the hash table, including the hash table size, hash link length, and hash conflict.
- **STREAM_DATA_CHECK** indicates that a CRC check is performed on data before and after network data transmission.

Default value:
ALL,on(),off(LLVM_COMPILE,HASH_CONFLICT,STREAM_DATA_CHECK), which indicates that no location function is enabled.

cost_param

Parameter description: Specifies use of different estimation methods in specific customer scenarios, allowing estimated values approximating to onsite values. This parameter can control various methods simultaneously by performing AND (&) on the bit of each method. A method is selected if the result value is not **0**.

When **cost_param & 1** is set to a value other than **0**, an improved mechanism is used for connecting the selectivity of non-equi-joins. This method is more accurate for estimating the selectivity of joins between two identical tables. At present, **cost_param & 1=0** is not used. That is, a better formula is selected for calculation.

When **cost_param & 2** is set to a value other than **0**, the selectivity is estimated based on multiple filter criteria. The lowest selectivity among all filter criteria, but not the product of the selectivities for two tables under a specific filter criterion, is used as the total selectivity. This method is more accurate when a close correlation exists between the columns to be filtered.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to *INT_MAX*.

Default value: **0**

var_eq_const_selectivity

Parameter description: Determines whether to use the new selectivity model to estimate the integer const selectivity.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the new selectivity model is used to calculate the selectivity of the integer const.
  - If an integer does not fall into the MCV, is not NULL, but falls into the histogram, the left and right boundaries of the histogram are used for estimation. If the integer does not fall into the histogram, the number of rows in the table is used for estimation.
  - If the integer is NULL or falls into the MCV, the original logic is used to calculate the selectivity.
- **off** indicates that the original selectivity calculation model is used.

Default value: **off**

enable_partitionwise

Parameter description: Specifies whether to select an intelligent algorithm for joining partitioned tables.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that an intelligent algorithm is selected.
- **off** indicates that an intelligent algorithm is not selected.

Default value: **off**

partition_page_estimation

Parameter description: Determines whether to optimize the estimation of partitioned table pages based on the pruning result.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the pruning result is used to optimize the page estimation.
- **off** indicates that the pruning result is not used to optimize the page estimation.

Default value: **off**

partition_iterator_elimination

Parameter description: Determines whether to eliminate the partition iteration operator to improve execution efficiency when the partition pruning result of a partitioned table is a partition.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the partition iteration operator is eliminated.
- **off** indicates that the partition iteration operator is not eliminated.

Default value: **off**

enable_partition_pseudo_predicate

Parameter description: Specifies whether to rewrite pseudo-predicates to calculate the selectivity of query in a specified partition.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that pseudo-predicate rewriting is used.
- **off** indicates that pseudo-predicate rewriting is not used.

Default value: **off**

enable_functional_dependency

Parameter description: Determines whether the statistics about multiple columns generated by ANALYZE contain function dependency statistics and whether the function dependency statistics are used to calculate the selectivity.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates the following functions: 1. The statistics about multiple columns generated by ANALYZE contain function dependency statistics. 2. Function dependency statistics are used to calculate the selectivity.
- **off** indicates the following functions: 1. The statistics about multiple columns generated by ANALYZE do not contain function dependency statistics. 2. Function dependency statistics are not used to calculate the selectivity.

Default value: **off**

rewrite_rule

Parameter description: Specifies the optional query rewriting rules that are enabled. Some query rewriting rules are optional. Enabling them cannot always improve the query efficiency. In a specific customer scenario, you can set the query rewriting rules through this GUC parameter to achieve optimal query efficiency.

This parameter can control the combination of query rewriting rules, for example, there are multiple rewriting rules: **rule1**, **rule2**, **rule3**, and **rule4**. You can perform the following settings:

```
set rewrite_rule=rule1;          -- Enable query rewriting rule rule1
set rewrite_rule=rule2, rule3;     -- Enable query rewriting rules rule2 and rule3
set rewrite_rule=none;         -- Disable all optional query rewriting rules
```

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string

- **none**: No optional query rewriting rules are used.
- **lazyagg**: The Lazy Agg query rewriting rules are used to eliminate aggregation operations in subqueries.
- **magicset**: The Magic Set query rewriting rules are used to associate subqueries which have aggregation operators with the main query in advance to reduce repeated scanning of sublinks.
- **uniquecheck**: The Unique Check query rewriting rules are used to optimize the subquery statements in target columns without agg and check whether the number of returned rows is 1.
- **intargetlist**: The In Target List query rewriting rules are used to improve subqueries in the target column.
- **predpushnormal**: The Predicate Push query rewriting rules are used to push the predicate condition to the subquery.
- **predpushforce**: The Predicate Push query rewriting rules are used to push down predicate conditions to subqueries and use indexes as much as possible for acceleration.
- **predpush**: The optimal plan is selected based on the cost in **predpushnormal** and **predpushforce**.
- **disable_pullup_expr_sublink**: The optimizer is not allowed to pull up sublinks of the expr_sublink type. For details about sublink classification and pull-up principles, see "SQL Tuning Guide > Typical SQL Tuning Methods > Subquery Tuning" in *Developer Guide*.
- **enable_sublink_pullup_enhanced**: Enhanced sublink query rewriting rules are used, including unrelated sublink pull-up of the WHERE and HAVING clauses and WinMagic rewriting optimization.
- **disable_pullup_not_in_sublink**: The optimizer is not allowed to pull up sublinks related to NOT IN. For details about sublink classification and pull-up principles, see "SQL Tuning Guide > Typical SQL Tuning Methods > Subquery Tuning" in *Developer Guide*.
- **disable_rownum_pushdown**: The filter criterion ROWNUM in the parent query cannot be pushed down to the subquery.
- **disable_windowagg_pushdown**: The filter criterion of the window function in the parent query cannot be pushed down to the subquery.

Default value: **magicset**

NOTE

The **partialpush** and **disablerep** parameters can be set but do not take effect.

enable_pbe_optimization

Parameter description: Specifies whether the optimizer optimizes the query plan for statements executed in Parse Bind Execute (PBE) mode.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the optimizer optimizes the query plan for statements executed in PBE mode.
- **off** indicates that the optimization is not performed.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

enable_global_plancache

Parameter description: Specifies whether to share the cache for the execution plans of statements in PBE queries and stored procedures. Enabling this function can reduce the memory usage of database nodes in high concurrency scenarios.

When **enable_global_plancache** is enabled, the value of **local_syscache_threshold** cannot be less than 16 MB to ensure that GPC takes effect. If the value of **local_syscache_threshold** is less than 16 MB, set it to 16 MB. If the value is greater than 16 MB, the actual value is used.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that cache sharing is enabled for the execution plans of statements in PBE queries and stored procedures.
- **off** indicates no sharing.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

gpc_clean_timeout

Parameter description: When **enable_global_plancache** is set to **on**, if a plan in the shared plan list is not used within the period specified by **gpc_clean_timeout**, the plan will be deleted. This parameter is used to control the retention period of a shared plan that is not used.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 300 to 86400

- The unit is second.

Default value: **1800**, that is, 30 minutes

enable_global_stats

This parameter has been discarded in the current version. Do not set it.

enable_opfusion

Parameter description: Specifies whether to optimize simple addition, deletion, modification, and query operations.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

The restrictions on simple queries are as follows:

- Only index scan and index-only scan are supported, and the filter criteria of all WHERE statements are on indexes.
- Only single tables can be added, deleted, modified, and queried. JOIN and USING operations are not supported.
- Only row-store tables are supported. Partitioned tables and tables with triggers are not supported.
- Information statistics features of active SQL statements and queries per second (QPS) are not supported.
- Tables that are being scaled out or in are not supported.
- System columns cannot be queried or modified.
- Only simple SELECT statements are supported. For example:
  ```
  SELECT c3 FROM t1 WHERE c1 = ? and c2 =10;
  ```
  Only columns in the target table can be queried. Columns **c1** and **c2** are index columns, which can be followed by constants or parameters. You can use **for update**.
- Only simple INSERT statements are supported. For example:
  ```
  INSERT INTO t1 VALUES (?,10,?);
  ```
  Only one VALUES is supported. The type in VALUES can be a constant or a parameter. RETURNING is not supported.
- Only simple DELETE statements are supported. For example:
  ```
  DELETE FROM t1 WHERE c1 = ? and c2 = 10;
  ```
  Columns **c1** and **c2** are index columns, which can be followed by constants or parameters.
- Only simple UPDATE statements are supported. For example:
  ```
  UPDATE t1 SET c3 = c3+? WHERE c1 = ? and c2 = 10;
  ```
  The values modified in column **c3** can be constants, parameters, or a simple expression. Columns **c1** and **c2** are index columns, which can be followed by constants or parameters.

Value range: Boolean

- **on**: used.
- **off**: not used.

Default value: **on**

enable_plsql_opfusion

Parameter description: Optimizes simple ADD, DELETE, MODIFY, and QUERY statements in stored procedures to improve SQL execution performance.

For details about restrictions on simple ADD, DELETE, MODIFY, and QUERY statements, see **enable_opfusion**.

> NOTE
>
> This parameter takes effect only when **enable_opfusion** is enabled.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

sql_beta_feature

Parameter description: Specifies the SQL engine's optional beta features to be enabled, including optimization of row count estimation and query equivalence estimation.

These optional features provide optimization for specific scenarios, but performance deterioration may occur in some scenarios for which testing is not performed. In a specific customer scenario, you can set the query rewriting rules through this GUC parameter to achieve optimal query efficiency.

This parameter determines the combination of the SQL engine's beta features, for example, **feature1**, **feature2**, **feature3**, and **feature4**. You can perform the following settings:

```
-- Enable beta feature feature1 of the SQL engine.
set sql_beta_feature=feature1;
-- Enable beta features feature2 and feature3 of the SQL engine.
set sql_beta_feature=feature2,feature3;
-- Disable all optional beta features of the SQL engine.
set sql_beta_feature=none;
```

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string

- **none**: uses none of the beta optimizer features.
- **sel_semi_poisson**: uses Poisson distribution to calibrate the equivalent semi-join and anti-join selectivity.
- **sel_expr_instr**: uses the matching row count estimation method to provide more accurate estimation for **instr(col, 'const') > 0, = 0, = 1**.
- **param_path_gen**: generates more possible parameterized paths.
- **rand_cost_opt**: optimizes the random read cost of tables that have a small amount of data.
- **param_path_opt**: uses the bloating ratio of the table to optimize the analysis information of indexes.
- **page_est_opt**: optimizes the **relpages** estimation for the analysis information of table indexes.

- **no_unique_index_first**: disables optimization of the primary key index scan path first.
- **join_sel_with_cast_func**: supports type conversion functions when the number of join rows is estimated.
- **canonical_pathkey**: The regular path key is generated in advance. (**pathkey**: a set of ordered key values of data.)

  WARNING

  After this parameter is enabled, the semantics of the output data of statements such as ORDER BY may be different from that of the standard ones in the case of outer join. Contact Huawei engineers to determine whether to enable this parameter.

- **index_cost_with_leaf_pages_only**: specifies whether index leaf nodes are included when the index cost is estimated.
- **a_style_coerce**: enables the Decode type conversion rule to be compatible with O. For details, see the part related to case processing in ORA compatibility mode in "SQL Reference > Type Conversion > UNION, CASE, and Related Constructs" in *Developer Guide*.
- **predpush_same_level**: enables the **predpush** hint to control parameterized paths at the same layer.
- **enable_plsql_smp**: enables parallel execution of queries in stored procedures. Currently, only one query can be executed in parallel at a time, and no parallel execution plan is generated for autonomous transactions and queries in exceptions.
- **disable_bitmap_cost_with_lossy_pages**: disables the computation of the cost of lossy pages in the bitmap path cost.
- **enable_upsert_execute_gplan**: allows execution through **gplan** in the PBE scenario, if the UPDATE clause in the ON DUPLICATE KEY UPDATE statement contains parameters.
- **disable_merge_append_partition**: disables the generation of the Merge Append path for partitioned tables.
- **disable_text_expr_flatten**: disables the function of automatically inlining expressions during comparison between text and numeric types (numeric, bigint).

Default value:
"sel_semi_poisson,sel_expr_instr,rand_cost_opt,param_path_opt,page_est_opt"

default_statistics_target

Parameter description: Specifies the default statistics target for table columns without a column-specific target set by running **ALTER TABLE SET STATISTICS**. The number of rows sampled during statistics collection is affected.

If this parameter is set to a positive number, the number of rows sampled in the statistics histogram is **default_statistics_target** x 300. If the parameter is set to a negative number, it indicates the percentage of statistics collected. The negative number corresponds to a percentage, for example, **–5** means 5%. That is, the

number of sampled rows is the total number of rows multiplied by 5%. This parameter affects only the target number of sampled rows in the statistics. The actual number of sampled rows is also affected by the memory parameter **maintenance_work_mem**.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from –100 to 10000.

NOTICE

- A larger positive number than the default value increases the time required to do **ANALYZE**, but might improve the quality of the optimizer's estimates.
- Changing settings of this parameter may result in performance deterioration. If query performance deteriorates, you can:
  1. Restore to the default statistics.
  2. Use hints to force the optimizer to use the optimal query plan. For details, see "SQL Tuning Guide > Tuning Using Plan Hints" in *Developer Guide*.

Default value: **100**

auto_statistic_ext_columns

Parameter description: Collects statistics about multiple columns based on the first *K* columns of the composite index in the data table. This GUC parameter indicates *K*. For example, if a composite index is (a,b,c,d,e) and the GUC parameter is set to **3**, statistics about multiple columns are generated on columns (a,b) and (a,b,c). Multi-column statistics can make the optimizer estimate the cardinality more accurate when querying with combined conditions.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

- The system catalog does not take effect.
- The statistics take effect only when the types of all columns support the comparison functions '=' and '<'.
- System pseudocolumns in indexes, such as **tableoid** and **ctid**, are not collected.
- By default, distinct values, MCVs without NULL, and MCVs with NULL are collected. If the AI-based cardinality estimation parameter **enable_ai_stats** is enabled, MCVs are not collected. Instead, models for AI-based cardinality estimation are collected.
- If the index for creating multi-column statistics is deleted and no other index contains the multi-column combination, the multi-column statistics will be deleted in the next ANALYZE operation.
- If the value of this parameter decreases, the new index generates multi-column statistics based on the value of this parameter. The generated multi-column statistics that exceed the value of this parameter will not be deleted.
- If you want to disable the multi-column statistics on a specific combination only, you can retain the value of this parameter and run the DDL command **ALTER TABLE** *tablename* **disable statistics** *((column list))* to disable the statistics on multiple columns in a specific combination.

Value range: an integer ranging from 1 to 4. The value **1** indicates that statistics about multiple columns are not automatically collected.

Default value: **1**

constraint_exclusion

Parameter description: Specifies the query optimizer's use of table constraints to optimize queries.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: enumerated values

- **on** indicates that constraints for all tables are examined.
- **off** indicates that constraints for any table are not examined.
- **partition** indicates that only constraints for inheritance child tables and **UNION ALL** subqueries are examined.

NOTICE

When **constraint_exclusion** is set to **on**, the optimizer compares query conditions with the table's **CHECK** constraints, and omits scanning tables for which the conditions contradict the constraints.

Default value: **partition**

NOTE

Currently, **constraint_exclusion** is enabled by default only for cases that are often used to implement table partitioning. Turning this feature on for all tables imposes extra planning on simple queries, and provides no benefit for simple queries. If you have no partitioned tables, set it to **off**.

cursor_tuple_fraction

Parameter description: Specifies the optimizer's estimated fraction of a cursor's rows that are retrieved.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a floating-point number ranging from 0.0 to 1.0.

NOTICE

Smaller values of this setting bias the optimizer towards using **fast start** plans for cursors, which will retrieve the first few rows quickly while perhaps taking a long time to fetch all rows. Larger values put more emphasis on the total estimated time. At the maximum setting of **1.0**, cursors are planned exactly like regular queries, considering only the total estimated time and how soon the first rows might be delivered.

Default value: **0.1**

from_collapse_limit

Parameter description: Specifies whether the optimizer merges sub-queries into upper queries based on the resulting FROM list. The optimizer merges sub-queries into upper queries if the resulting FROM list would have no more than this many items.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to *INT_MAX*.

NOTICE

Smaller values reduce planning time but may lead to inferior execution plans.

Default value: **8**

join_collapse_limit

Parameter description: Specifies whether the optimizer rewrites JOIN constructs (except FULL JOINS) into lists of FROM items based on the number of the items in the result list.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to *INT_MAX*.

NOTICE

- Setting this parameter to **1** prevents join reordering. As a result, the join order specified in the query will be the actual order in which the relations are joined. The query optimizer does not always choose the optimal join order. Therefore, advanced users can temporarily set this variable to **1**, and then specify the join order they desire explicitly.
- Smaller values reduce planning time but lead to inferior execution plans.

Default value: **8**

plan_mode_seed

Parameter description: This is a debugging parameter. Currently, it supports only **OPTIMIZE_PLAN** and **RANDOM_PLAN**. The value **0** (for **OPTIMIZE_PLAN**) indicates the optimized plan using the dynamic planning algorithm. Other values are for **RANDOM_PLAN**, which indicates that the plan is randomly generated. **–1** indicates that users do not specify the value of the seed identifier. In this case, the optimizer generates a random integer from 1 to 2147483647 and a random execution plan based on the generated integer. A GUC parameter value from 1 to 2147483647 is regarded as the seed identifier, based on which the optimizer generates a random execution plan.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from –1 to 2147483647.

Default value: **0**

NOTICE

- If this parameter is set to a random execution plan, the optimizer generates a random execution plan that may not be the optimal one. Therefore, to guarantee the query performance, the default value **0** is recommended during upgrade, scale-out, scale-in, and O&M.
- If this parameter is not set to **0**, the specified plan hint will not be used.

hashagg_table_size

Parameter description: Specifies the hash table size during the execution of the HASH JOIN operation.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to *INT_MAX*/2.

Default value: **0**

enable_codegen

Parameter description: Specifies whether code optimization can be enabled. Currently, the code optimization uses the LLVM optimization.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that code optimization is enabled.
- **off** indicates that code optimization is disabled.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

codegen_compile_thread_num

Parameter description: Specifies the number of Codegen compilation threads.

Parameter type: integer.

Unit: none

Value range: 1 to 8

Default value: **1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If the number of threads is too large, the system performance may deteriorate. However, when there are a large number of concurrent services, you can increase the number of threads to improve the throughput performance.

llvm_max_memory

Parameter description: Specifies the maximum memory occupied by IRs (including cached and in-use IRs) generated during Codegen compilation. The memory used by Codegen is not applied for by preoccupation. It is a part of **max_dynamic_memory** and is restricted by the **llvm_max_memory** parameter.

Parameter type: integer.

Unit: KB

Value range: 0 to 2147483647. If the value exceeds the specified value, the original recursive execution logic, instead of the Codegen execution logic, is used. When the upper limit is reached and a downgrade is triggered, decreasing the value of **llvm_max_memory** cannot immediately release the memory occupied by extra IRs. The memory occupied by IRs is released after the corresponding SQL statements are executed.

Default value: **131072kB** (128 MB)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

- If the parameter is set to an excessively small value, the system does not use the Codegen execution logic, affecting the use of functions.
- If the parameter is set to an excessively small value, LLVM compilation may occupy too many resources of other threads. As a result, the overall system performance deteriorates.

enable_codegen_print

Parameter description: Specifies whether the LLVM IR function can be printed in logs.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the IR function can be printed in logs.
- **off** indicates that the IR function cannot be printed in logs.

Default value: **off**

codegen_cost_threshold

Parameter description: The LLVM compilation takes some time to generate executable machine code. Therefore, LLVM compilation is beneficial only when the actual execution cost is more than the sum of the code required for generating machine code and the optimized execution cost. Parameter **codegen_cost_threshold** specifies a threshold. If the estimated execution cost exceeds the threshold, LLVM optimization is performed. codegen uses **plan_rows** of the execution operator as the cost to compare with the value of **codegen_cost_threshold**. You can run the **explain** command to view the value of **plan_rows**.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 2147483647.

Default value: **100000**

enable_bloom_filter

Parameter description: Specifies whether the BloomFilter optimization can be used. This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the BloomFilter optimization can be used.
- **off** indicates that the BloomFilter optimization cannot be used.

Default value: **on**

enable_extrapolation_stats

Parameter description: Specifies whether the extrapolation logic is used for data of DATE type based on historical statistics. The logic can increase the accuracy of estimation for tables whose statistics are not collected in time, but will possibly

provide an overlarge estimation due to incorrect extrapolation. Enable the logic only in scenarios where the data of DATE type is periodically inserted. This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the extrapolation logic is used.
- **off** indicates that the extrapolation logic is not used.

Default value: **off**

autoanalyze

Parameter description: Specifies whether to automatically collect statistics on tables that have no statistics when a plan is generated. **autoanalyze** cannot be used for foreign or temporary tables. To collect statistics, manually perform the ANALYZE operation. If an exception occurs in the database during the execution of autoanalyze on a table, after the database is recovered, the system may still prompt you to collect the statistics of the table when you run the statement again. In this case, manually perform the ANALYZE operation on the table to synchronize statistics.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the table statistics are automatically collected.
- **off** indicates that the table statistics are not automatically collected.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

NOTE

This parameter does not take effect in centralized mode.

enable_analyze_check

Parameter description: Specifies whether it is allowed to check whether statistics were collected about tables whose **reltuples** and **relpages** are displayed as **0** in **pg_class** during plan generation.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the tables will be checked.
- **off** indicates that the tables will not be checked.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

enable_sonic_hashagg

Parameter description: Specifies whether to use the hash aggregation operator designed for column-oriented hash tables when certain constraints are met.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the hash aggregation operator designed for column-oriented hash tables is used when certain constraints are met.
- **off** indicates that the hash aggregation operator designed for column-oriented hash tables is not used.

NOTE

- If **enable_sonic_hashagg** is enabled and the hash aggregation operator designed based on the column-oriented hash table is used when the query meets the constraint condition, the memory usage of the hash aggregation operator can be reduced. However, in scenarios where **enable_codegen** is enabled and the performance is significantly improved, the performance of the operator may deteriorate.
- If **enable_sonic_hashagg** is enabled and the hash aggregation operator designed based on the column-oriented hash table is used when the query meets the constraint condition, the operator is displayed as Sonic Hash Aggregation in the execution plan and execution information of Explain Analyze/Performance; when the query does not meet the constraint condition, the operator is displayed as Hash Aggregation. For details, see "SQL Tuning Guide > Introduction to the SQL Execution Plan > Description" in *Developer Guide*.

Default value: **on**

enable_sonic_hashjoin

Parameter description: Specifies whether to use the hash join operator designed for column-oriented hash tables when certain constraints are met.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the hash join operator designed for column-oriented hash tables is used when certain constraints are met.
- **off** indicates that the hash join operator designed for column-oriented hash tables is not used.

NOTE

- Currently, the parameter can be used only for Inner Join.
- If **enable_sonic_hashjoin** is enabled, the memory usage of query using the Hash Inner operator can be reduced. However, in scenarios where the code generation technology can significantly improve performance, the performance of the operator may deteriorate.
- If **enable_sonic_hashjoin** is enabled and the hash join operator designed based on the column-oriented hash table is used when the query meets the constraint condition, the operator is displayed as Sonic Hash Join in the execution plan and execution information of Explain Analyze/Performance; when the query does not meet the constraint condition, the operator is displayed as Hash Join. For details, see "SQL Tuning Guide > Introduction to the SQL Execution Plan > Description" in *Developer Guide*.

Default value: **on**

enable_sonic_optspill

Parameter description: Specifies whether to optimize the number of files to be written to disks for the hash join operator designed for column-oriented hash tables. If this parameter is enabled, the number of files written to disks does not increase significantly when the hash join operator writes a large number of files to disks.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the number of files to be written to disks for the hash join operator designed for column-oriented hash tables is optimized.
- **off** indicates that the number of files to be written to disks for the hash join operator designed for column-oriented hash tables is not optimized.

Default value: **on**

plan_cache_mode

Parameter description: Specifies the policy for generating an execution plan in the prepared statement.

Parameter type: enumerated type

Unit: none

Value range:

- **auto** indicates that the **custom plan** or **generic plan** is selected by default.
- **force_generic_plan** indicates that the generic plan is forcibly used (soft parsing). The generic plan is a plan generated after you run a prepared statement. The plan policy binds parameters to the plan when you run the **EXECUTE** statement to execute the plan. The advantage of this scheme is that repeated optimizer overheads can be avoided in each execution. The disadvantage is that the plan may not be optimal when data skew occurs for the bound parameters and may result in poor plan execution performance. The bound parameters bind the types of parameters transferred for the first time. If the type of a parameter transferred into the same placeholder is different from the previous time, an error is reported.

- **force_custom_plan** indicates that the custom plan is forcibly used (hard parsing). The custom plan is a plan generated after you run a prepared statement where parameters in the EXECUTE statement are embedded. The custom plan generates a plan based on specific parameters in the EXECUTE statement. This scheme generates a preferred plan based on specific parameters each time and has good execution performance. The disadvantage is that the plan needs to be regenerated before each execution, resulting in a large amount of repeated optimizer overhead.

NOTE

This parameter is valid only for prepared statements. It is used when the parameterized field in a prepared statement has severe data skew.

Default value: **auto**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on the actual service scenario.

enable_hypo_index

Parameter description: Determines whether the optimizer creates virtual indexes when executing the **EXPLAIN** command.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: A virtual index is created when the **EXPLAIN** command is executed.
- **off**: No virtual index is created when the **EXPLAIN** command is executed.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

enable_auto_explain

Parameter description: Specifies whether to enable the function of automatically printing execution plans. This parameter is used to locate slow stored procedures or slow queries. It is valid for the currently connected database primary node and directly connected standby node.

Parameter type: Boolean.

Unit: none

Value range:

- **true**: enabled.
- **false**: disabled.

Default value: **false**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If you want to view the execution plan, enable this parameter. However, this causes the current system performance to deteriorate.

auto_explain_level

Parameter description: Specifies the log level for automatically printing execution plans.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: enumerated type. The value can be **LOG** or **NOTICE**.

- **LOG**: Execution plans are printed as logs.
- **NOTICE**: Execution plans are printed as notices.

Default value: **LOG**

auto_explain_log_min_duration

Parameter description: Specifies the minimum duration of execution plans that are automatically printed. Only execution plans whose duration is greater than the value of **auto_explain_log_min_duration** will be printed. For example, if this parameter is set to **0**, all executed plans are printed. If this parameter is set to **3000**, all executed plans are printed if the execution of a statement takes more than 3000 ms.

Parameter type: integer.

Unit: millisecond

Value range: 0 to 2147483647

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

query_dop

Parameter description: Specifies the user-defined degree of parallelism (DOP). If the SMP function is enabled, the system uses the specified degree of parallelism.

Parameter type: integer.

Unit: none

Value range: 1 to 64. **1** indicates that parallel query is disabled.

Default value: **1**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

NOTE

After enabling concurrent queries, ensure you have sufficient CPU, memory, and network to achieve the optimal performance.

enable_startwith_debug

Parameter description: Specifies whether to enable the **start with** or **connect by** parameter for debugging. If this parameter is enabled, information about all tail columns related to the **start with** feature is displayed.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean. The value **true** indicates that the function is enabled, and the value **false** indicates that the function is disabled.

Default value: **false**

enable_inner_unique_opt

Parameter description: Specifies that Inner Unique is optimized for nested loop join, hash join, and sort merge join. That is, the number of matching times is reduced when the attribute corresponding to the inner table in the join condition meets the uniqueness constraint.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: used.
- **off**: not used.

Default value: **on**

enable_indexscan_optimization

Parameter description: Specifies whether to optimize B-tree index scan (IndexScan and IndexOnlyScan) in the Astore engine.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: used.
- **off**: not used.

Default value: **on**

immediate_analyze_threshold

Parameter description: Specifies the threshold for automatically analyzing inserted data. When the amount of data inserted at a time reaches the original data amount multiplied by the value of **immediate_analyze_threshold** and the total number of rows exceeds 100, ANALYZE is automatically triggered.

Parameter type: integer.

Unit: none

Value range: 0 to 1000. If this parameter is set to **0**, this function is disabled.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter to a small value for tables whose data changes rapidly and whose statistics need to be updated continuously. Set this parameter to a large value for tables whose statistics fluctuate greatly only after a certain amount of data is reached.

NOTE

1. This function supports only permanent and unlogged tables. Temporary tables are not supported.
2. ANALYZE is not automatically triggered twice within 10 seconds for the same table.

enable_invisible_indexes

Parameter description: Specifies whether the optimizer can use invisible indexes.

NOTE

After an index is set to invisible, the performance of query statements may be affected. If you do not want to change the index visibility status and want to use invisible indexes, set **enable_invisible_indexes** to **on**.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The optimizer can use invisible indexes.
- **off**: The optimizer cannot use invisible indexes.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

enable_dynamic_samplesize

Parameter description: Specifies whether to dynamically adjust the number of sampled rows. For a large table with more than one million rows, the number of sampled rows is dynamically adjusted during statistics collection to improve statistics accuracy.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: indicates that the function is enabled.
- **off**: indicates that the function is disabled.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

NOTE

The function of dynamically adjusting the number of sampled rows supports only absolute sampling.

STATS_HISTORY_RECORD_LIMIT

Parameter description: Specifies the maximum number of historical statistics that can be retained for each object (including tables, columns, partitions, and indexes). When collecting statistics about an object, the system saves the statistics to the historical statistics table. When the number of statistics about the object in the historical statistics table reaches the threshold and new statistics are collected, the earlier statistics are deleted.

Parameter type: integer.

Unit: none

Value range: 0 to 100

Default value: **10**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: The default value is recommended. If you need to record statistics of more historical versions, increase the value of this parameter. However, the performance of ANALYZE may be affected.

STATS_HISTORY_RETENTION_TIME

Parameter description: Specifies the retention period of historical statistics about each object (including tables, columns, partitions, and indexes). When collecting statistics about an object, the system saves the statistics to the historical statistics table. If the retention period of the statistics about the object in the historical statistics table exceeds the threshold, the system deletes the statistics that exceed the retention period when collecting new statistics.

Parameter type: floating point

Unit: day

Value range: **–1** or a value ranging from 0 to 365000. **–1** indicates that the history statistics are not cleared over time.

Default value: **31**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: The default value is recommended. If you need to record statistics of earlier versions, increase the value of this parameter. However, the performance of ANALYZE may be affected.

default_statistic_granularity

Parameter description: Specifies which partition-level statistics of a partitioned table are collected by default when **PARTITION MODE** is not specified. This parameter does not take effect for non-partitioned tables.

Parameter type: enumerated type

Unit: none

Value range: enumerated values

- **ALL**: collects statistics about the entire table, level-1 partitions, and level-2 partitions.
- **GLOBAL**: indicates that the statistics of the entire table are collected.
- **PARTITION**: indicates that statistics of the level-1 partition are collected.
- **GLOBAL_AND_PARTITION**: indicates that statistics about the entire table and level-1 partitions are collected.
- **SUBPARTITION**: collects statistics about level-2 partitions.
- **ALL_COMPLETE**: collects statistics about the entire table, level-1 partitions, and level-2 partitions.

Default value: **ALL**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If partition-level statistics need to be collected, you can set this parameter as required. However, the **ANALYZE** performance may be affected.

14.3.9 SPM

SPM_ENABLE_PLAN_CAPTURE

Parameter description: Specifies the SPM plan capture mode.

Parameter type: enumerated type

Unit: none

Value range: **off**, **auto**, **manual**, and **store**

- **off**: indicates that the plan capture function is disabled.
- **auto**: indicates that the automatic plan capture function is enabled. In this mode, the prerequisite for capturing an SQL plan is that the SQL plan is executed twice or more.
- **manual**: indicates that the manual plan capture function is enabled. In this mode, the prerequisite for capturing an SQL plan does not need to meet the requirement that the SQL plan is executed twice or more.

- **store**: The status of all plans is captured as UNACC based on the behavior of the **auto** option.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none

NOTICE

During the upgrade, the outline of the new plan is not captured regardless of whether this parameter is enabled. During the upgrade, the upgrade may be rolled back. If a new outline is stored, the outline version compatibility issue may occur after the upgrade rollback.

SPM_ENABLE_PLAN_SELECTION

Parameter description: Specifies whether to enable the SPM plan selection function.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: indicates that the plan selection function is enabled.
- **off**: indicates that the plan selection function is disabled.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none

SPM_PLAN_CAPTURE_FILTER

Parameter description: Specifies the database and schema to be captured.

Parameter type: string

Unit: none

Value range: A maximum of 10,000 schemas can be captured, including duplicate schemas.

NOTE

The parameter format is "$db1_oid:$schema1_oid, $db2_oid:$schema2_oid..", for example, "33245:56432,44321:12332,55432:65432", in which:

- **33245:56432** indicates that the SQL plan whose DB OID is **33245** and schema OID is **56432** is to be captured.
- **44321:12332** indicates that the SQL plan whose DB OID is **44321** and schema OID is **12332** is to be captured.
- **55432:65432** indicates that the SQL plan whose DB OID is **55432** and schema OID is **65432** is to be captured.

Default value: an empty string, indicating that all schemas are captured during SPM plan capture and plan selection.

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none

SPM_PLAN_GLOBAL_CACHED_SIZE

Parameter description: Specifies the size of the SPM global plan cache.

Parameter type: integer

Unit: KB

Value range: 10240 to 20971520

Default value: **1048576**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised to set this parameter for database nodes in heavy-load scenarios.

SPM_PLAN_SESSION_CACHED_SIZE

Parameter description: Specifies the size of the SPM session plan cache.

Parameter type: integer

Unit: KB

Value range: 1 to 1048576

Default value: 1024

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised to set this parameter for database nodes in heavy-load scenarios.

SPM_PLAN_CAPTURE_MAX_PLANNUM

Parameter description: Specifies the maximum number of flush plans for a single database.

Parameter type: integer

Unit: none

Value range: 1 to 1000000

Default value: **10000**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none

SPM_PLAN_RETENTION_DAYS

Parameter description: Specifies the retention period of unused plans on disks.

Parameter type: integer.

Unit: day

Value range: 1 to 1095

Default value: **365**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none

SPM_ENABLE_LOG_DETAIL

Parameter description: Specifies whether to enable the notice SPM key execution process when the SPM is used. This parameter is usually used together with the following two parameters to view the SPM execution process in gsql: **client_min_messages=notice;logging_module='on(SPM_KEY_FLOW)'**.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: enabled.
- **off**: disabled.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none

SPM_ENABLE_BASELINE_CLEANUP

Parameter description: Specifies whether to clear baseline data periodically.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The periodic baseline clearance function is enabled.
- **off**: The periodic baseline clearance function is disabled.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none

14.3.10 Error Reporting and Logging

14.3.10.1 Logging Destination

log_destination

Parameter description: GaussDB supports several methods of logging server messages. Set this parameter to a list of desired log destinations separated by commas. (For example, **log_destination** can be set to **"stderr,csvlog"**.)

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string.

The valid values are **stderr**, **csvlog**, and **syslog**.

- **stderr** indicates that logs are printed to the screen.
- **csvlog** indicates that logs are output in comma separated value (CSV) format. The prerequisite for generating logs in CSV format is that **logging_collector** must be set to **on**. For details, see **Using CSV Log Output**.
- **syslog** indicates that logs are recorded using the syslog of the OS. GaussDB can record logs using syslog from **LOCAL0** to **LOCAL7**. For details, see **syslog_facility**. To record logs using syslog, add the following information to syslog daemon's configuration file:
  ```
  local0.* /var/log/omm
  ```

Default value: stderr

logging_collector

Parameter description: Specifies whether to enable the logger thread to collect logs. This thread captures log messages sent to **stderr** or **csvlog** and redirects them into log files.

This method is more effective than recording logs to syslog because some types of messages cannot be displayed in syslog output, such as messages indicating the loading failures of dynamic link libraries and error messages generated by scripts.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

It is possible to log to **stderr** without using the parameter **logging_collector** and the log messages will go to where the server's **stderr** is directed. However, this method is only suitable for low log volumes due to difficulties in rotating log files.

Value range: Boolean

- **on** indicates that the log collection is enabled.
- **off** indicates that the log collection is disabled.

Default value: **on**

log_directory

Parameter description: Specifies the directory for storing log files when **logging_collector** is set to **on**. The value can be an absolute path, or relative to the data directory. The **log_directory** parameter can be dynamically modified using the **gs_guc reload** command. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

- If **log_directory** in the configuration file is set to an invalid path, the database cannot be started.
- If you modify the **log_directory** parameter using the **gs_guc reload** command, and the specified path is valid, the log files are output to this new path. If the specified path is invalid, the log files are output to the valid path set last time and the database operation is not affected. The invalid value of **log_directory** is still written into the configuration file.
- In the sandbox environment, the path cannot contain **/var/chroot**. For example, if the absolute path of log is **/var/chroot/var/lib/log/Ruby/gs_log/cn_log**, you only need to set the path to **/var/lib/log/Ruby/gs_log/cn_log**.

NOTE

- Valid path: Users have read and write permissions on the path.
- Invalid path: Users do not have read or write permission on the path.

Value range: a string.

Default value: specified during installation.

log_filename

Parameter description: Specifies the names of generated log files when **logging_collector** is set to **on**. The value is treated as a strftime pattern, so %-escapes can be used to specify time-varying file names. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

- You are advised to use %-escapes to specify the log file names for efficient management of log files.
- If **log_destination** is set to **csvlog**, log files are output in CSV format with timestamped names, for example, **server_log.1093827753.csv**.

Value range: a string.

Default value: **gaussdb-***%Y-%m-%d_%H%M%S*.**log**

log_file_mode

Parameter description: Specifies the permissions of log files when **logging_collector** is set to **on**. The value of **log_file_mode** is usually a number in the format acceptable to the **chmod** and **umask** system calls.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

- Before setting this parameter, set **log_directory** to store the logs to a directory other than the data directory.
- Do not make the log files world-readable because they might contain sensitive data.

Value range: an octal integer ranging from 0000 to 0777 (that is, 0 to 511 in the decimal format).

NOTE

- **0600** indicates that log files are readable and writable only to the server administrator.
- **0640** indicates that log files are readable and writable to members of the administrator's group.

Default value: 0600

log_truncate_on_rotation

Parameter description: Specifies the writing mode of the log files when **logging_collector** is set to **on**.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Example:

To keep 7 days of logs, one log file per day named **server_log.Mon**, **server_log.Tue**, etc., and automatically overwrite last week's log with this week's log, set **log_filename** to **server_log.%a**, **log_truncate_on_rotation** to **on**, and **log_rotation_age** to **1440**, indicating that the valid duration of the log file is one day.

Value range: Boolean

- **on** indicates that GaussDB overwrites the existing log files of the same name on the server.
- **off** indicates that GaussDB appends the logging messages to the existing log files of the same name on the server.

Default value: **off**

log_rotation_age

Parameter description: Specifies the interval for creating a log file when **logging_collector** is set to **on**. If the duration from the time when the last log file was created to the current time is greater than the value of **log_rotation_age**, a new log file will be generated.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 35791394. The unit is min. **0** indicates that the time-based creation of new log files is disabled.

Default value: **1440**

log_rotation_size

Parameter description: Specifies the maximum size of a server log file when **logging_collector** is set to **on**. If the total size of messages in a log file exceeds the specified value, a log file will be generated.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to *INT_MAX*/1024. The unit is KB.

0 indicates that the capacity-based creation of new log files is disabled.

It is recommended that the unit of the value be MB or bigger, so that log files can be of proper size.

Default value: 20 MB

syslog_facility

Parameter description: Specifies the syslog facility to be used when **log_destination** is set to **syslog**.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: enumerated values. Valid values are **local0**, **local1**, **local2**, **local3**, **local4**, **local5**, **local6**, and **local7**.

Default value: local0

syslog_ident

Parameter description: Specifies the identifier of GaussDB messages in syslog logs when **log_destination** is set to **syslog**.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string.

Default value: **postgres**

event_source

Parameter description: This parameter takes effect only in a Windows environment and is not supported in GaussDB. It specifies the identifier of GaussDB messages in logs when **log_destination** is set to **eventlog**.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string.

Default value: **PostgreSQL**

14.3.10.2 Logging Time

client_min_messages

Parameter description: Specifies which level of messages will be sent to the client. Each level covers all the levels following it. The lower the level is, the fewer messages are sent.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

A same value for **client_min_messages** and **log_min_messages** does not indicate the same level.

Value range: enumerated values. Valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal**, and **panic**. For details about the parameters, see **Table 14-8**. If the configured level is higher than **error**, for example, **fatal** or **panic**, the system changes the level to **error** by default.

Default value: **notice**

log_min_messages

Parameter description: Specifies which level of messages will be written into the server log. Each level covers all the levels following it. The lower the level is, the fewer messages will be written into the log.

NOTICE

A same value for **client_min_messages** and **log_min_messages** does not indicate the same level. For some log information, after this parameter is enabled, you also need to set **logging_module** to enable log printing for the corresponding module.

Value type: enumerated type

Unit: none

Value range: **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal**, and **panic**. For details about the parameters, see **Table 14-8**.

Default value: **warning**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

log_min_error_statement

Parameter description: Controls which SQL statements that cause an error condition are recorded in the server log.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: enumerated values. Valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal**, and **panic**. For details about the parameters, see **Table 14-8**.

NOTE

- The default is **error**, indicating that statements causing errors, log messages, fatal errors, or panics will be logged.
- **panic** indicates that this feature is disabled.

Default value: **error**

log_min_duration_statement

Parameter description: Specifies the threshold for logging the duration of a completed statement. The duration of each completed statement is logged if the statement ran for at least the specified number of milliseconds.

Setting **log_min_duration_statement** makes it easy to trace query statements that need to be optimized. For clients using extended query protocols, the time required for parsing, binding, and executing steps are logged independently.

Parameter type: integer

Unit: ms

NOTICE

When you use this option together with **log_statement**, the text of statements that have been logged by **log_statement** will not be repeatedly logged. If you are not using **syslog**, it is recommended that you log the process ID (PID) or session ID using **log_line_prefix** so that you can link the statement message to the latest duration message.

Value range: –1 to 2147483647.

- If this parameter is set to **250**, all SQL statements that run for 250 ms or longer will be logged.
- **0** indicates that the execution durations of all the statements are logged.
- **–1** indicates that the duration logging is disabled.

Default value: **3000ms** (that is, 3s)

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

backtrace_min_messages

Parameter description: Prints the function's stack information to the server's log file if the information generated is greater than or equal to the level specified by this parameter.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

This parameter is used to locate problems on-site. Frequent stack printing will affect the system's overhead and stability. Therefore, you are advised not to set **backtrace_min_messages** to a level other than fatal and panic when locating problems.

Value range: enumerated values

Valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal**, and **panic**. For details about the parameters, see **Table 14-8**.

Default value: **panic**

Table 14-8 explains message severities used by GaussDB. If logging output is sent to **syslog** or **eventlog**, the severities are translated as shown in the table. (Note that the translation takes effect only in a Windows environment where GaussDB does not involve this parameter.)

Table 14-8 Message severity levels

Severity	Description	System Log	Event Log
debug[1-5]	Provides detailed debug information.	DEBUG	INFORMATION
log	Reports information of interest to administrators, for example, checkpoint activity.	INFO	INFORMATION

Severity	Description	System Log	Event Log
info	Provides information implicitly requested by users, for example, output from **VACUUM VERBOSE**.	INFO	INFORMATION
notice	Provides information that might be helpful to users, for example, truncation of long identifiers and index created as part of the primary key.	NOTICE	INFORMATION
warning	Provides warnings of likely problems, for example, **COMMIT** outside a transaction block.	NOTICE	WARNING
error	Reports an error that causes a command to terminate.	WARNING	ERROR
fatal	Reports the reason that causes a session to terminate.	ERR	ERROR
panic	Reports an error that caused all database sessions to terminate.	CRIT	ERROR

14.3.10.3 Logging Content

debug_print_parse

Parameter description: Specifies whether to print parsing tree results.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the printing is enabled.
- **off** indicates that the printing is disabled.

Default value: **off**

debug_print_rewritten

Parameter description: Specifies whether to print query rewriting results.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the printing is enabled.
- **off** indicates that the printing is disabled.

Default value: **off**

debug_print_plan

Parameter description: Specifies whether to print the query execution plan to logs.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the printing is enabled.
- **off** indicates that the printing is disabled.

Default value: **off**

NOTICE

- Debugging information about **debug_print_parse**, **debug_print_rewritten**, and **debug_print_plan** is printed only when the log level is set to **log** or higher. When these parameters are set to **on**, their debugging information will be recorded in server logs and will not be sent to client logs. You can change the log level by setting **client_min_messages** and **log_min_messages**.
- Do not call the gs_encrypt_aes128 and gs_decrypt_aes128 functions when **debug_print_plan** is set to **on**, preventing the risk of sensitive information disclosure. You are advised to filter parameter information of the gs_encrypt_aes128 and gs_decrypt_aes128 functions in the log files generated when **debug_print_plan** is set to **on** before providing the log files to external maintenance engineers for fault locating. After you finish using the logs, delete them as soon as possible.

debug_pretty_print

Parameter description: Indents the logs produced by **debug_print_parse**, **debug_print_rewritten**, and **debug_print_plan**. The output format is more readable but much longer than that generated when this parameter is set to **off**.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the indentation is enabled.
- **off** indicates that the indentation is disabled.

Default value: **on**

log_checkpoints

Parameter description: Specifies whether the statistics on checkpoints and restart points are recorded in the server logs. When this parameter is set to **on**, statistics on checkpoints and restart points are recorded in the log messages, including the number of buffers written and the time spent in writing them.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the statistics on checkpoints and restart points are recorded in the server logs.
- **off** indicates that the statistics on checkpoints and restart points are not recorded in the server logs

Default value: **off**

log_connections

Parameter description: Specifies whether to record logs of connection requests from the client. The log information includes the IP address, port number, username, database name, and duration of key steps in the GaussDB database connection setup process.

Parameter type: Boolean.

Unit: none

NOTE

Some client programs (such as gsql) attempt to connect to the database twice when determining whether a password is required. Therefore, the log message may contain duplicate "connection receive" (indicating that a connection request is received).

Value range:

- **on** indicates that the logs are recorded.
- **off** indicates that the logs are not recorded.

Default value: **off**

Setting method: This is a BACKEND parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

log_disconnections

Parameter description: Specifies whether to record disconnection request information of the client.

This is a BACKEND parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the request information is recorded.
- **off** indicates that the request information is not recorded.

Default value: **off**

log_duration

Parameter description: Specifies whether to record the duration of every completed SQL statement. For clients using extended query protocols, the time required for parsing, binding, and executing steps are logged independently.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **off**: Compared with this option, **log_min_duration_statement** forcibly records the query text.
- If this parameter is set to **on** and **log_min_duration_statement** is set to a positive value, the duration of each completed statement is logged but the query text is included only for statements exceeding the threshold. This behavior can be used for gathering statistics in high-load situation.

Default value: **off**

log_error_verbosity

Parameter description: Specifies the content output to the server log for each message that is logged.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: enumerated values

- **terse** indicates that the output excludes the DETAIL, HINT, QUERY, and CONTEXT error information.
- **verbose** indicates that the output includes the SQLSTATE error code, the source code file name, function name, and number of the line in which the error occurs.
- **default** indicates that the output includes the DETAIL, HINT, QUERY, and CONTEXT error information, and excludes the SQLSTATE error code, the source code file name, function name, and number of the line in which the error occurs.

Default value: **default**

log_hostname

Parameter description: By default, connection log messages only show the IP address of the connecting host. The host name can be recorded when this parameter is set to **on**. It may take some time to parse the host name. Therefore, the database performance may be affected.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the host name is simultaneously recorded.
- **off** indicates that the host name is not simultaneously recorded.

Default value: **off**

log_line_prefix

Parameter description: Specifies the prefix format of each log information. A prefix is a printf-style string that is output at the beginning of each line of the log. The "escape sequences" which begin with % are replaced with status information as listed in **Table 14-9**.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Table 14-9 Escape characters

Escape Character	Effect
%a	Application name
%u	Username
%d	Database name
%r	Remote host name or IP address and remote port. If **log_hostname** is set to **off**, only the IP address and remote port are displayed.
%h	Remote host name or IP address. If **log_hostname** is set to **off**, only the IP address is displayed.
%p	Thread ID.
%t	Timestamp without milliseconds.
%m	Timestamp with milliseconds.
%n	Node from which an error is reported.
%i	Command tag: type of command executed in the current session.
%e	SQLSTATE error code.
%c	Session ID. For details, see the note below the table.
%l	Number of the log line for each session or thread, starting at 1
%s	Thread startup time.
%v	Virtual transaction ID (backend ID/local XID).
%x	Transaction ID (**0** indicates that no transaction ID is assigned).
%q	Produces no output. If the current thread is a backend thread, this escape sequence is ignored and subsequent escape sequences are processed. Otherwise, this escape sequence and subsequent escape sequences are all ignored.
%S	Session ID.
%T	Trace ID
%%	The character %.

NOTE

The %c escape character prints a session ID consisting of two 4-byte hexadecimal numbers separated by a period (.). The numbers are the thread startup time and the thread ID. Therefore, %c can also be used as a space saving way of printing those items. For example, execute the following query to generate the session ID from pg_stat_activity:

```
SELECT to_hex(EXTRACT(EPOCH FROM backend_start)::integer) || '.' ||
       to_hex(pid)
FROM pg_stat_activity;
```

- If you set a nonempty value for **log_line_prefix**, you should usually make its last character be a space, to provide visual separation from the rest of the log line. A punctuation character can be used, too.
- Syslog generates its own timestamp and thread ID information. Therefore, you do not need to include those escape characters when you are logging in to syslog.

Value range: a string.

Default value: **%m %n %u %d %h %p %S %x %a**

NOTE

%m %n %u %d %h %p %S %x %a indicates the session start timestamp, error reporting node, username, database name, remote host name or IP address, thread ID, session ID, transaction ID, and application name.

log_lock_waits

Parameter description: If the time for which a session waits to acquire a lock is longer than the value of **deadlock_timeout**, this parameter specifies whether to record this message in the database. This is useful in determining if lock waits are causing poor performance.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the information is recorded.
- **off** indicates that the information is not recorded.

Default value: **off**

log_statement

Parameter description: Specifies which SQL statements are recorded. For clients using extended query protocols, logging occurs when an execute message and values (enclosed by a pair of single quotation marks) of bound parameters are received.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

- Statements that contain simple syntax errors are not logged even if **log_statement** is set to **all**, because logging occurs only after basic parsing has been completed and the statement type is determined. If an extended query protocol is used, statements that fail before the execution phase (during parsing or planning) are not logged, either. Set **log_min_error_statement** to **ERROR** or lower to log such statements.
- If this parameter is set to a value other than **none**, the statement audit function is enabled. The database administrator can access server logs to view SQL execution records.

Value range: enumerated values

- **none** indicates that no statement is recorded.
- **ddl** indicates that all data definition statements, such as CREATE, ALTER, and DROP, are recorded.
- **mod** indicates that all DDL statements and data modification statements, such as INSERT, UPDATE, DELETE, TRUNCATE, and COPY FROM, are recorded.
- **all** indicates that all statements, including the PREPARE, EXECUTE, and EXPLAIN ANALYZE statements, are recorded.

Default value: **none**

log_temp_files

Parameter description: Specifies the deletion information about temporary files that meet recording requirements. Temporary files can be created for sorting, hashing, and storing temporary querying results. If the recording is enabled, a log entry is generated for each temporary file when it is deleted.

Parameter type: integer.

Unit: KB

Value range: –1 to 2147483647.

- A positive value indicates that the deletion information of temporary files whose size is larger than the value specified by **log_temp_files** is recorded.
- **0** indicates that the delete information of all temporary files is recorded.
- **–1** indicates that the delete information of any temporary files is not recorded.

Default value: **–1**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value **–1** which indicates that no temporary file deletion information is recorded. If this parameter is set, the more temporary files that meet the recording requirements, the more logs are recorded, which affects the system performance.

log_timezone

Parameter description: Specifies the time zone used for timestamps written in the server log. Different from **TimeZone**, this parameter takes effect for all sessions in the database.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. You can query the PG_TIMEZONE_NAMES view to obtain the value. For details, see "System Catalogs and System Views > System Views > PG_TIMEZONE_NAMES" in *Developer Guide*.

Default value: Set this parameter based on the OS time zone.

NOTE

The default value will be changed when **gs_initdb** is used to set system environments.

logging_module

Parameter description: Specifies whether module logs are output on the server. This is a session-level parameter, and you are advised not to use the gs_guc tool to set it.

Parameter type: string.

Unit: none

Default value: empty

Value range: Logs of this module are generated on the server. Logs of other modules are not generated on the server, but can be viewed by running **SHOW logging_module**.

```
ALL,on(),off(COMMAND,DFS,GUC,GSCLEAN,HDFS,ORC,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,SSL,GDS,TBLSPC,WLM,OBS,INDEX,EXECUTOR,OPFUSION,GPC,GSC,VEC_EXECUTOR,STREAM,LLVM,OPT,OPT_REWRITE,OPT_JOIN,OPT_AGG,OPT_CHOICE,OPT_SUBPLAN,OPT_SETOP,OPT_SKEW,OPT_PLANNER,OPT_STAT_EXT,SPM,SPM_KEY_FLOW,UDF,COOP_ANALYZE,WLMCP,ACCELERATE,PLANHINT,PARQUET,PGSTAT,CARBONDATA,SNAPSHOT,XACT,HANDLE,CLOG,EC,REMOTE,CN_RETRY,PLSQL,TEXTSEARCH,SEQ,REDO,FUNCTION,PARSER,INSTR,WDR_SNAPSHOT,WDR_REPORT,ASP_REPORT,INCRE_CKPT,INCRE_BG_WRITER,DBL_WRT,RTO_RPO,HEARTBEAT,COMM_IPC,COMM_PARAM,TIMESERIES,SCHEMA,GTT,SEGMENT_PAGE,LIGHTPROXY,HOTKEY,THREAD_POOL,OPT_AI,WALRECEIVER,USTORE,UPAGE,UBTREE,UNDO,TIMECAPSULE,GEN_COL,DCF,AI4DB,DB4AI,ABO,MOD_ABOFEEDBACK,PLDEBUGGER,ADVISOR,SEC,SEC_FE,SEC_LEGER,SEC_POLICY,SEC_SDD,SEC_TDE,COMM_FRAMEWORK,COMM_PROXY,COMM_POOLER,COMM_STATUS,VACUUM,JOB,SPI,NEST_COMPILE,RESOWNER,GSSTACK,LOGICAL_DECODE,GPRC,DISASTER_READ,STANDBY_READ,REPSYNC,SQLPATCH,PARTITION,UBT_NEWPAGE,GPI,GS_DEPENDENCY,LWLOCK,LOCK,UNIQUE_SQL,GLC,SRF,DBLINK,BARRIER_CREATOR,EXRTO_PAGE_P,SEQ_TUP_P,BT_TUP_P,DISPATCH_VERIFY,HBKT,DBE_STATS,DBE_XMLGEN,GS_ILM,GSPERF,EXEC_REMOTE,UBTREE_PARA,BTREE_PARA,ANTI_CACHE,ANTI_RECYCLER,VERIFYLOG,GS_REPAIR,AUTHID,CCINDEX)
```

CAUTION

CN_RETRY does not take effect in the current version.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting method: Run **SHOW logging_module** to view which modules are controllable. For example, the query output result is as follows:

```
gaussdb=# show logging_module;
logging_module
-----------------------------------------------------------------------------------------------------------------------------
-----------------------------------------------------------------------------------------------------------------------------
-------------------------------------------------
ALL,on(),off(COMMAND,DFS,GUC,GSCLEAN,HDFS,ORC,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,SSL,GDS,TBL
SPC,WLM,OBS,INDEX,EXECUTOR,OPFUSION,GPC,GSC,VEC_EXECUTOR,STREAM,LLVM,OPT,OPT_REWRITE,OPT
_JOIN,OPT_AGG,OPT_CHOICE,OPT_SUBPLAN,OPT_SETOP,OPT_SKEW,OPT_PLANNER,OPT_STAT_EXT,SPM,SP
M_KEY_FLOW,UDF,COOP_ANALYZE,WLMCP,ACCELERATE,PLANHINT,PARQUET,PGSTAT,CARBONDATA,SNAPS
HOT,XACT,HANDLE,CLOG,EC,REMOTE,CN_RETRY,PLSQL,TEXTSEARCH,SEQ,REDO,FUNCTION,PARSER,INSTR,W

(1 row)
```

Controllable modules are identified by uppercase letters, and the special ID **ALL** is used for setting all module logs. You can control the output of module logs by setting the parameter to **on** or **off**. Enable log output for SSL:

```
gaussdb=# set logging_module='on(SSL)';
SET
gaussdb=# show
logging_module;
        logging_module
-----------------------------------------------------------------------------------------------------------------------------
-----------------------------------------------------------------------------------------------------------------------------
------------------------------------------------
ALL,on(SSL),off(COMMAND,DFS,GUC,GSCLEAN,HDFS,ORC,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,SSL,GDS,

(1 row)
```

Dependency: The value of this parameter depends on the settings of **log_min_messages**.

opfusion_debug_mode

Parameter description: Checks whether simple queries are optimized for debugging. If this parameter is set to **log**, you can view the specific reasons why queries are not optimized in the database node execution plans.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: enumerated values

- **off** indicates that reasons why queries are not optimized are not included.
- **log** indicates that reasons why queries are not optimized are included in the database node execution plan.

NOTICE

To view the reasons why queries are not optimized in the log, set the parameter to **log**, **log_min_messages** to **debug4**, and **logging_module** to **on(OPFUSION)**. Note that a large number of log messages may be generated. Therefore, execute only a small number of jobs during debugging.

Default value: **off**

enable_debug_vacuum

Parameter description: Specifies whether to allow output of some VACUUM-related logs for problem locating. This parameter is used only by developers. Common users are advised not to use it.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**/**true**: enabled.
- **off**/**false**: disabled.

Default value: **off**

14.3.10.4 Using CSV Log Output

Prerequisites

- The **log_destination** parameter is set to **csvlog**.
- The **logging_collector** parameter is set to **on**.

Definition of csvlog

Log lines are emitted in comma separated values (CSV) format.

An example table definition for storing CSV-format log output is shown as follows:

```
CREATE TABLE gaussdb_log
(
log_time timestamp(3) with time zone,
node_name text,
user_name text,
database_name text,
process_id bigint,
connection_from text,
"session_id" text,
session_line_num bigint,
command_tag text,
session_start_time timestamp with time zone,
virtual_transaction_id text,
transaction_id bigint,
query_id bigint,
module text,
error_severity text,
sql_state_code text,
message text,
detail text,
hint text,
internal_query text,
internal_query_pos integer,
context text,
query text,
query_pos integer,
location text,
application_name text
);
```

For details, see **Table 14-10**.

Table 14-10 Meaning of each csvlog field

Column	Description	Column	Description
log_time	Timestamp in milliseconds	module	Module to which the log belongs
node_name	Node name	error_severity	ERRORSTATE code
user_name	Username	sql_state_code	SQLSTATE code
database_name	Database name	message	Error message
process_id	Thread ID	detail	Detailed error message
connection_from	Port number of the client host	hint	Prompt message
session_id	Session ID	internal_query	Internal query (This field is used to query the information leading to errors if any.)
session_line_num	Number of lines in each session	internal_query_pos	Pointer for an internal query
command_tag	Command tag	context	Environment
session_start_time	Start time of a session	query	Character count at the position where errors occur
virtual_transaction_id	Regular transaction	query_pos	Pointer at the position where errors occur
transaction_id	Transaction ID	location	Position where errors occur in the GaussDB source code if **log_error_verbosity** is set to **verbose**
query_id	Query ID	application_name	Application name

Run the **COPY FROM** command to import a log file to this table.

```
COPY gaussdb_log FROM '/opt/data/gs_log/logfile.csv' WITH csv;
```

NOTE

The log name (**logfile.csv**) here needs to be replaced with the name of a log generated.

Simplifying Input

Simplify importing CSV log files by performing the following operations:

- Set **log_filename** and **log_rotation_age** to provide a consistent, predictable naming solution for log files. By doing this, you can predict when an individual log file is complete and ready to be imported.
- Set **log_rotation_size** to **0** to disable size-based log rollback, as it makes the log file name difficult to predict.
- Set **log_truncate_on_rotation** to **on** so that old log data cannot be mixed with the new one in the same file.

14.3.11 Alarm Detection

During the running of a database, error scenarios can be detected so that users are informed of the errors in time. You can view system_alarm logs in *$GAUSSLOG*/**cm**, *$GAUSSLOG*/**gs_log**, or *$GAUSSLOG*/**roach/agent**.

enable_alarm

Parameter description: Specifies whether to enable the alarm detector thread to detect fault scenarios that may occur in the database.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the alarm detector thread is enabled.
- **off** indicates that the alarm detector thread is disabled.

Default value: **on**

NOTE

This parameter takes effect only on DNs.

connection_alarm_rate

Parameter description: Specifies the ratio restriction on the maximum number of allowed parallel connections to the database. The maximum number of concurrent connections to the database is **max_connections** x **connection_alarm_rate**.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a floating-point number ranging from 0.0 to 1.0

Default value: **0.9**

alarm_report_interval

Parameter description: Specifies the interval at which an alarm is reported.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer. The unit is s.

Default value: **10**

alarm_component

Parameter description: Certain alarms are suppressed during alarm reporting. That is, the same alarm will not be repeatedly reported by an instance within the period specified by **alarm_report_interval**. Its default value is **10s**. In this case, the parameter specifies the location of the alarm component that is used to process alarm information. Only the sysadmin user can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string.

- If **--alarm-type** in the gs_preinstall script is set to **5**, no third-party component is connected and alarms are written into system_alarm logs. In this case, the value of **alarm_component** is **/opt/huawei/snas/bin/snas_cm_cmd**.
- If **--alarm-type** in the gs_preinstall script is set to **1**, a third-party component is connected. In this case, the value of **alarm_component** is the absolute path of the executable program of the third-party component.

Default value: **/opt/huawei/snas/bin/snas_cm_cmd**

table_skewness_warning_threshold

Parameter description: Specifies the threshold for triggering a table skew alarm.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a floating-point number ranging from 0 to 1

Default value: **1**

table_skewness_warning_rows

Parameter description: Specifies the minimum number of rows for triggering a table skew alarm.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to *INT_MAX*

Default value: **100000**

14.3.12 Statistics During the Database Running

14.3.12.1 Query and Index Statistics Collector

The query and index statistics collector is used to collect statistics during database running. The statistics include the times of inserting and updating a table and index, the number of disk blocks and tuples, and the time required for the last cleanup and analysis on each table. The statistics can be viewed by querying system views pg_stats and pg_statistic. The following parameters are used to set the statistics collection feature in the server scope:

track_activities

Parameter description: Collects statistics about the commands that are being executed in each session. For a stored procedure, if this parameter is enabled, you can view the PERFORM statement, stored procedure calling statement, SQL statement, and OPEN CURSOR statement that are being executed in the stored procedure in the pg_stat_activity view.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the statistics collection function is disabled.

Default value: **on**

⚠ CAUTION

If this parameter is set to **off**, the memory recycling capability of the storage engine is affected, causing space expansion.

---

track_counts

Parameter description: Collects statistics about database activities.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the statistics collection function is disabled.

NOTE

Database statistics are required when the autovacuum process checks for databases that need to be vacuumed. Therefore, the default value is set to **on**.

Default value: **on**

⚠ CAUTION

If this parameter is set to **off**, the memory recycling capability of the storage engine is affected, causing space expansion.

---

track_procedure_sql

Parameter description: Specifies whether the SQL statements that are being executed in the stored procedure are printed in the query column in the pg_stat_activity system catalog.

Parameter type: Boolean

Unit: none

Value range: on or **off**

- **on**: indicates that when a stored procedure is called, the statements that are being executed by the stored procedure are printed in the query column of **pg_stat_activity**.
- **off**: indicates that when a stored procedure is called, only statements for invoking the stored procedure are printed in the query column of **pg_stat_activity**.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none

track_io_timing

Parameter description: Collects statistics about I/O timing in the database. The I/O timing statistics can be queried by using the **pg_stat_database** parameter.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- If this parameter is set to **on**, the collection function is enabled. In this case, the collector repeatedly queries the OS at the current time. As a result, large number of costs may occur on some platforms. Therefore, the default value is set to **off**.
- **off** indicates that the statistics collection function is disabled.

Default value: **off**

track_functions

Parameter description: Collects statistics of the number and duration of function invocations.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

When the SQL functions are set to inline functions queried by the invoking, these SQL functions cannot be traced no matter these functions are set or not.

Value range: enumerated values

- **pl** indicates that only procedural language functions are traced.
- **all** indicates that SQL language functions area traced.
- **none** indicates that the function tracing function is disabled.

Default value: **none**

track_activity_query_size

Parameter description: Specifies byte counts of the current running commands used to trace each active session. If the actual number of bytes in a command is greater than the value of this parameter, the command is truncated.

Parameter type: integer

Unit: byte

Value range: 100 to 102400

Default value: 1024

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on the actual service scenario.

update_process_title

Parameter description: Collects statistics updated with a process name each time the server receives a new SQL statement.

The process name can be viewed by running the **ps** command.

This is an INTERNAL parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the statistics collection function is disabled.

Default value: **off**

stats_temp_directory

Parameter description: Specifies the directory for storing temporary statistics. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

If a RAM-based file system directory is used, the actual I/O cost can be lowered and the performance can be improved.

Value range: a string

Default value: **pg_stat_tmp**

track_thread_wait_status_interval

Parameter description: Specifies the interval of collecting the thread status information.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: 0 to 1 day. The unit is min.

Default value: **30min**

enable_save_datachanged_timestamp

Parameter description: Specifies whether to record the time when **INSERT**, **UPDATE**, **DELETE**, or **EXCHANGE**/**TRUNCATE**/**DROP PARTITION** is performed on table data.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the time when an operation is performed on table data will be recorded.
- **off** indicates that the time when an operation is performed on table data will not be recorded.

Default value: **on**

enable_plan_trace

Parameter description: Specifies whether to enable the PLAN TRACE feature for the database. This parameter cannot be set globally by running the **gs_guc** command. It can be set only by running the **set** command in a connected session.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the PLAN TRACE feature is enabled.
- **off** indicates that the PLAN TRACE feature is disabled.

Default value: **off**

plan_collect_thresh

Parameter description: Collects statistics about the plans that are being executed in each session.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from –1 to 2147483647

- **–1**: Plans that are being executed are not collected.
- **0**: Plans that are being executed are collected before plan execution.

- A value greater than **0** indicates that when the total number of tuples incrementally returned by all operators in a plan is greater than or equal to the value of this parameter, plans that are being executed are collected once.

Default value: **0**

track_sql_count

Parameter description: Collects statistics about the statements (SELECT, INSERT, UPDATE, MERGE INTO, and DELETE) that are being executed in a session.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU and 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 0.8% by enabling or disabling this parameter.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the statistics collection function is disabled.

Default value: **on**

NOTE

- The **track_sql_count** parameter is restricted by the **track_activities** parameter.
  - If **track_activities** is set to **on** and **track_sql_count** is set to **off**, a warning message indicating that **track_sql_count** is disabled will be displayed in logs when the **gs_sql_count** view is queried.
  - If both **track_activities** and **track_sql_count** are set to **off**, two warning messages indicating that **track_activities** is disabled and **track_sql_count** is disabled will be displayed in logs when the views are queried.
  - If **track_activities** is set to **off** and **track_sql_count** is set to **on**, a warning message indicating that **track_activities** is disabled will be displayed in logs when the views are queried.
- If this parameter is disabled, the query result is 0.

14.3.13 Autovacuum

The autovacuum thread automatically runs the **VACUUM** and **ANALYZE** statements to recycle the record space marked as deleted and update statistics about the table.

The autovacuum thread contains the VACUUM and ANALYZE processes. The **autovacuum_naptime** parameter specifies the interval between them. The default interval is 10 minutes. You can set the interval based on the actual service scenario. The interval cannot be completely accurate. It depends on the hardware conditions and load of the environment. If a large amount of data needs to be vacuumed, the heavy load may delay the ANALYZE process. It also depends on the values of **autovacuum_naptime** and **autovacuum_max_workers**. **autovacuum_naptime** specifies the execution interval. A smaller value indicates a shorter execution interval. However, data vacuuming and statistics calculation involved increase the CPU usage, memory usage, and I/O overhead. **autovacuum_max_workers** specifies the maximum number of concurrent

automatic cleanup threads. A larger value makes the parameter more compatible with **autovacuum_naptime**, but the CPU usage, memory usage, and I/O overhead also increase.

In addition, you can set the **immediate_analyze_threshold** parameter to trigger ANALYZE when the amount of new data exceeds the threshold. For details about how to calculate the threshold, see the description of **immediate_analyze_threshold**.

autovacuum

Parameter description: Specifies whether to start the autovacuum thread in the database. Ensure that the **track_counts** parameter is set to **on** before starting the autovacuum thread.

NOTE

- Set the **autovacuum** parameter to **on** to automatically vacuum two-phase transactions after the system recovers from faults.
- If **autovacuum** is set to **on** and **autovacuum_max_workers** to **0**, the autovacuum process is started only when the system recovers from faults to clean up abnormal two-phase transactions.
- If **autovacuum** is set to **on** and the value of **autovacuum_max_workers** is greater than **0**, the system will automatically vacuum the two-phase transactions and processes after recovering from faults.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the autovacuum thread is started.
- **off** indicates that the autovacuum thread is not started.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

autovacuum_mode

Parameter description: Specifies whether the autoanalyze and autovacuum function are enabled. This parameter is valid only when **autovacuum** is set to **on**.

Value type: enumerated type

Unit: none

Value range: **analyze**, **vacuum**, **mix**, and **none**

- **analyze** indicates that only autoanalyze is performed.
- **vacuum** indicates that only autovacuum is performed.
- **mix** indicates that both autoanalyze and autovacuum are performed.
- **none** indicates that neither autoanalyze nor autovacuum is performed.

Default value: **mix**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

autoanalyze_timeout

Parameter description: Specifies the timeout interval of autoanalyze. If the duration of autoanalyze on a table exceeds the value of **autoanalyze_timeout**, the autoanalyze operation is automatically canceled.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483. The value **0** indicates that no timeout occurs.

Default value: **300**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none.

autovacuum_io_limits

Parameter description: Specifies the upper limit of I/Os triggered by the autovacuum thread per second.

Parameter type: integer.

Unit: none

Value range: –1 to 1073741823. **–1** indicates that the default Cgroup is used.

Default value: **–1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

log_autovacuum_min_duration

Parameter description: Records each step performed by the autovacuum process to the server log when the execution time of the autovacuum process is greater than or equal to a certain value. This parameter helps track the autovacuum behavior.

A setting example is as follows:

Set the **log_autovacuum_min_duration** parameter to 250 ms to record the actions of autovacuum if it runs for 250 ms or longer.

Value range: an integer ranging from –1 to 2147483647. The unit is ms.

- **0** indicates that all autovacuum actions are recorded in the log.
- **–1** indicates that all autovacuum actions are not recorded in the log.
- A value other than **–1** indicates that a message is recorded when an autovacuum action is skipped due to a lock conflict. (The reason for skipping autovacuum is recorded for audit.)

Default value: **–1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: The default value is **–1**. If the autovacuum operation needs to be recorded in logs, set this parameter to a value other than **–1**.

autovacuum_max_workers

Parameter description: Specifies the maximum number of autovacuum worker threads that can run at the same time. The upper limit of this parameter is related to the values of **max_connections** and **job_queue_processes**.

Parameter type: integer.

Unit: none

Value range: an integer. The minimum value is **0**, indicating that autovacuum is not enabled. The theoretical maximum value is **262143**, but the actual maximum value is a dynamic value calculated by the following formula: 262143 – **max_inner_tool_connections** – **max_connections job_queue_processes** – **max_concurrent_autonomous_transactions** – Number of auxiliary threads – Number of autovacuum launcher threads – 1. The number of auxiliary threads and the number of autovacuum launcher threads are specified by two macros. Their default values are **20** and **2** respectively.

Default value: **3**

Adjustment suggestion: If this parameter is set to a larger value, more autovacuum processes are created and more CPU and memory resources are occupied. Therefore, you are advised not to set this parameter to a large value. Otherwise, memory cannot be allocated or too many CPU resources are occupied, causing database startup errors or affecting services.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

autovacuum_naptime

Parameter description: Specifies the interval between activity rounds for the autovacuum process.

Parameter type: integer.

Unit: second

Value range: 1 to 2147483.

Default value: **10min** (that is, 600s)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **600** without a unit, **autovacuum_naptime** indicates 600s. If the value is **10min**, **autovacuum_naptime** indicates 10 minutes. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

Setting suggestion: Retain the default value.

autovacuum_vacuum_threshold

Parameter description: Used to calculate the threshold for triggering VACUUM. The formula is as follows: **autovacuum_vacuum_threshold** + **reltuples** (number of tuples in a table) x **autovacuum_vacuum_scale_factor**. When the number of deleted or updated records in a table exceeds the threshold, the VACUUM operation is executed on this table.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647

Default value: **50**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

autovacuum_analyze_threshold

Parameter description: Used to calculate the threshold for triggering the ANALYZE operation. The formula is as follows: **autovacuum_analyze_threshold** + **reltuples** (number of tuples in a table) x **autovacuum_analyze_scale_factor**. When the number of deleted, inserted, or updated records in a table exceeds the threshold, the ANALYZE operation is executed on this table.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647

Default value: **50**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

autovacuum_vacuum_scale_factor

Parameter description: The scale factor for vacuuming a table, which is used to calculate the threshold for triggering VACUUM. The formula is as follows: **autovacuum_vacuum_threshold** + **reltuples** (number of tuples in a table) x **autovacuum_vacuum_scale_factor**. When the number of deleted or updated records in a table exceeds the threshold, the VACUUM operation is executed on this table.

Parameter type: floating-point.

Unit: none

Value range: 0.0 to 100.0

Default value: **0.2**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: A larger value makes it harder to trigger VACUUM, which has less impact on performance.

autovacuum_analyze_scale_factor

Parameter description: Specifies the scale factor for analyzing a table, which is used to calculate the threshold for executing ANALYZE. The formula is as follows: **autovacuum_analyze_threshold** + **reltuples** (number of tuples in the table) x **autovacuum_analyze_scale_factor**. When the number of deleted, inserted, or updated records in a table exceeds the threshold, the ANALYZE operation is executed on this table.

Parameter type: floating-point.

Unit: none

Value range: 0.0 to 100.0

Default value: **0.1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: A larger value makes it harder to trigger ANALYZE, which has less impact on performance.

autovacuum_freeze_max_age

Parameter description: Specifies the maximum age (in transactions) that an Astore table's **pg_class.relfrozenxid** field can retain before a VACUUM operation is forcibly performed.

- The old files under the subdirectory of **pg_clog/** can also be deleted by the VACUUM operation.
- Even if the autovacuum thread is not started, the system will call the thread.

Parameter type: long integer

Unit: none

Value range: 100000 to 576460752303423487

Default value: **4000000000**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

autovacuum_vacuum_cost_delay

Parameter description: Specifies the value of the cost delay used in the autovacuum operation.

Parameter type: integer.

Unit: ms

Value range: –1 to 100. **–1** indicates that the regular vacuum cost delay is used.

Default value: 20

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

autovacuum_vacuum_cost_limit

Parameter description: Sets the value of the cost limit used in the autovacuum operation.

Parameter type: integer.

Unit: none

Value range: –1 to 10000. **–1** indicates that the regular vacuum cost limit is used.

Default value: **–1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

defer_csn_cleanup_time

Parameter description: Specifies the local recycling interval.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 2147483647. The unit is ms.

Default value: **5s** (5000 ms)

14.3.14 Default Settings of Client Connection

14.3.14.1 Statement Behavior

This section describes related default parameters involved in the execution of SQL statements.

search_path

Parameter description: Specifies the order in which schemas are searched when an object is referenced with no schema specified. The value of this parameter consists of one or more schema names. Different schema names are separated by commas (,).

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

- If schemas of temporary tables exist in the current session, the schemas can be listed in the search path by using the alias **pg_temp**, for example, **'pg_temp,public'**. The schema of temporary tables has the highest search priority and is always searched before all the other schemas specified in **pg_catalog** and **search_path**. Therefore, do not explicitly specify **pg_temp** to be searched after other schemas in **search_path**. This setting will not take effect and an error message will be displayed. If the alias **pg_temp** is used,

the temporary schema will be searched only for tables, views, and data types, and not for functions or operators.

- The system catalog schema, pg_catalog, has the second highest search priority and is the first to be searched among all the schemas, excluding **pg_temp**, specified in **search_path**. Therefore, do not explicitly specify **pg_catalog** to be searched after other schemas in **search_path**. This setting will not take effect and an error message will be displayed.
- When an object is created without a specific target schema, the object will be placed in the first valid schema listed in **search_path**. An error is reported if the search path is empty.
- The current effective value of the search path can be examined through the SQL function current_schema. This is different from examining the value of **search_path**, because the current_schema function displays the first valid schema name in **search_path**.

Value range: a string

NOTE

- When this parameter is set to **"$user", public**, shared use of a database (where no users have private schemas, and all share use of public), private per-user schemas and combinations of them are supported. Other effects can be obtained by modifying the default search path setting, either globally or per-user.
- When this parameter is set to a null string (''), the system automatically converts it into a pair of double quotation marks ("").
- If the content contains double quotation marks, the system considers them as insecure characters and converts each double quotation mark into a pair of double quotation marks.

Default value: **"$user",public**

NOTE

$user indicates the name of the schema with the same name as the current session user. If the schema does not exist, **$user** will be ignored.

current_schema

Parameter description: Specifies the current schema.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string

Default value: **"$user",public**

NOTE

$user indicates the name of the schema with the same name as the current session user. If the schema does not exist, **$user** will be ignored.

If you need to obtain a schema during kernel development, use the value of **search_path** because the schema is determined by **search_path**. For compatibility, **current_schema** is used only to modify the value of **search_path**.

default_tablespace

Parameter description: Specifies the default tablespace of the created objects (tables and indexes) when a **CREATE** command does not explicitly specify a tablespace.

- The value of this parameter is either the name of a tablespace, or an empty string that indicates the use of the default tablespace of the current database. If a non-default tablespace is specified, users must have CREATE privilege for it. Otherwise, creation attempts will fail.
- This parameter is not used for temporary tables. For them, the **temp_tablespaces** is used instead.
- This parameter is not used when users create databases. By default, a new database inherits its tablespace setting from the template database.

  This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that the default tablespace is used.

Default value: empty

temp_tablespaces

Parameter description: Specifies one or more tablespaces to which temporary objects (temporary tables and their indexes) will be created when a CREATE command does not explicitly specify a tablespace. Temporary files for sorting large data sets are created in these tablespaces.

The value of this parameter can be a list of names of tablespaces. When there is more than one name in the list, GaussDB chooses a random tablespace from the list upon the creation of a temporary object each time. However, within a transaction, successively created temporary objects are placed in successive tablespaces in the list. If the element selected from the list is an empty string, GaussDB will automatically use the default tablespace of the current database instead.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. An empty string indicates that all temporary objects are created only in the default tablespace of the current database. For details, see **default_tablespace**.

Default value: empty

check_function_bodies

Parameter description: Specifies whether to enable validation of the function body string during the execution of **CREATE FUNCTION**. Verification is occasionally disabled to avoid problems, such as forward references when you restore function definitions from a dump. After the function is enabled, the word syntax of the PL/SQL in the stored procedure is verified, including the data type, statement, and expression. The SQL statements in the stored procedure are not checked in the CREATE phase. Instead, they are checked during running.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that validation of the function body string is enabled during the execution of **CREATE FUNCTION**.
- **off** indicates that validation of the function body string is disabled during the execution of **CREATE FUNCTION**.

Default value: **on**

default_transaction_isolation

Parameter description: Specifies the default isolation level of each transaction.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

NOTE

The current version does not support the setting of the default transaction isolation level. The default value is **read committed**. Do not change the value.

Value range: enumerated values

- **read committed** indicates that the data read by a transaction is committed at the moment it is read.
- **repeatable read** indicates that the data that has been read by the current transaction cannot be modified by other transactions until the current transaction completes, thereby preventing unrepeatable reads.
- **serializable**: Currently, this isolation level is not supported in GaussDB. It is equivalent to **repeatable read**.

Default value: read committed

default_transaction_read_only

Parameter description: Specifies whether each new transaction is in read-only state.

CAUTION

If this parameter is set to **on**, the DML and write transactions cannot be executed.

Parameter type: Boolean

Unit: none

Value range:

- **on** indicates that the transaction is in read-only state.
- **off** indicates that the transaction is not in read-only state.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

default_transaction_deferrable

Parameter description: Specifies the default deferrable status of each new transaction. It currently has no effect on read-only transactions or those running at isolation levels lower than serializable.

GaussDB does not support the serializable isolation level. Therefore, the parameter takes no effect.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that a transaction is delayed by default.
- **off** indicates that a transaction is not delayed by default.

Default value: **off**

session_replication_role

Parameter description: Specifies the behavior of replication-related triggers and rules for the current session.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

Setting this parameter will discard all the cached execution plans.

Value range: enumerated values

- **origin** indicates that the system copies operations such as insert, delete, and update from the current session.
- **replica** indicates that the system copies operations such as insert, delete, and update from other places to the current session.
- **local** indicates that the system will detect the role that has logged in to the database when using the function to copy operations and will perform related operations.

Default value: **origin**

statement_timeout

Parameter description: If the statement execution time (starting from the time the server receives the command) is longer than the duration specified by the parameter, error information is displayed and the statement exits.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. The default value is **0**, indicating that the parameter does not take effect.

Value range: an integer ranging from 0 to 2147483647. The unit is ms.

Default value: **0**

vacuum_freeze_min_age

Parameter description: Specifies whether VACUUM replaces the **xmin** column of a record with **FrozenXID** when scanning a table (in the same transaction).

Parameter type: integer

Unit: none

Value range: 0 to 576460752303423487

NOTE

Although you can set this parameter to any value, VACUUM will limit the effective value to 50% of **autovacuum_freeze_max_age** by default.

Default value: **2000000000**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

vacuum_freeze_table_age

Parameter description: Specifies when VACUUM scans the whole table and freezes old tuples. VACUUM performs a full table scan if the difference between the current transaction ID and the value of **pg_class.relfrozenxid64** is greater than the specified time.

Parameter type: integer

Unit: none

Value range: 0 to 576460752303423487

NOTE

Although you can set this parameter to any value, **VACUUM** will limit the effective value to 95% of **autovacuum_freeze_max_age** by default. Therefore, a periodic manual **VACUUM** has a chance to run before an anti-wraparound autovacuum is launched for the table.

Default value: **4000000000**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

bytea_output

Parameter description: Specifies the output format for values of the bytea type.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: enumerated values

- **hex** indicates the binary data is converted to the two hexadecimal digits per byte.
- **escape** uses ASCII character sequences to represent binary strings, and converts those binary strings that cannot be represented as ASCII characters into special escape sequences.

Default value: **hex**

xmlbinary

Parameter description: Specifies how binary values are to be encoded in XML.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: enumerated values

- base64
- hex

Default value: **base64**

xmloption

Parameter description: Specifies whether DOCUMENT or CONTENT is implicit when converting between XML and string values.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: enumerated values

- **document** indicates an HTML document.
- **content** indicates a common string.

Default value: **content**

max_compile_functions

Parameter description: Specifies the maximum number of function compilation results stored in the server.

Parameter type: integer

Unit: none

Value range: 1 to 2147483647.

Default value: **1000** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory); **10** (4-core CPU/16 GB memory)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Excessive functions and compilation results of stored procedures may occupy large memory space. Setting this parameter to a proper value can reduce the memory usage and improve system performance.

14.3.14.2 Locale and Formatting

This section describes parameters related to the time format setting.

DateStyle

Parameter description: Specifies the display format for date and time values, as well as the rules for interpreting ambiguous date input values.

This variable contains two independent components: the output format declaration (ISO, Postgres, SQL, or German) and the input/output order of year/month/day (DMY, MDY, YMD, Euro, European, US, NonEuro, NonEuropean, or Default). The two components can be set separately or together. The keywords Euro and European are synonyms for DMY. The keywords US, NonEuro, and NonEuropean are synonyms for MDY.

Parameter type: string

Unit: none

Value range: combination of the output format declaration and the input/output order of year/month/day. (The two components can be set separately.)

- Output format declaration: ISO, Postgres, SQL, or German
- Input/Output order of year/month/day: DMY (Euro, European), MDY (US, NonEuro, NonEuropean), or YMD

Default value: **"ISO, MDY"**

NOTE

gs_initdb will initialize this parameter so that its value is the same as that of **lc_time**.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: The ISO format is recommended.

IntervalStyle

Parameter description: Specifies the display format for interval values.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: enumerated values

- **sql_standard** indicates that output matching SQL standards will be generated.
- **postgres** indicates that output matching PostgreSQL 8.4 will be generated when the **DateStyle** parameter is set to **ISO**.
- **postgres_verbose** indicates that output matching PostgreSQL 8.4 will be generated when the **DateStyle** parameter is set to **non_ISO**.
- **iso_8601** indicates that output matching the time interval "format with designators" defined in ISO 8601 will be generated.
- **a** indicates the output that matches the numtodsinterval function. For details, see "SQL Reference > Functions and Operators > Date and Time Processing Functions and Operators > numtodsinterval" in *Developer Guide*.

NOTICE

The **IntervalStyle** parameter also affects the interpretation of ambiguous interval input.

Default value: **postgres**

TimeZone

Parameter description: Specifies the time zone for displaying and interpreting timestamps.

Parameter type: string

Unit: none

Value range: You can query the PG_TIMEZONE_NAMES view to obtain the value. For details, see "System Catalogs and System Views > System Views > PG_TIMEZONE_NAMES" in *Developer Guide*.

Default value: **"PRC"**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

NOTE

gs_initdb will set a time zone value that is consistent with the system environment.

timezone_abbreviations

Parameter description: Specifies the time zone abbreviations that will be accepted by the server.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. **India**, **Australia**, or **Default**.

Default value: **Default**

NOTE

Default indicates an abbreviation that works in most of the world, which is applicable to most cases. There are also other abbreviations, such as **'Australia'** and **'India'** that can be defined for a particular installation. For other time zone abbreviations, you need to set them in the corresponding configuration files before creating the database.

extra_float_digits

Parameter description: Adjusts the number of digits displayed for floating-point values, including float4, float8, and geometric data types. The parameter value is added to the standard number of digits (FLT_DIG or DBL_DIG as appropriate).

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from –15 to 3.

NOTE

- This parameter can be set to **3** to include partially-significant digits. It is especially useful for dumping float data that needs to be restored exactly.
- This parameter can also be set to a negative value to suppress unwanted digits.

Default value: **0**

client_encoding

Parameter description: Specifies the client-side encoding (character set).

Set this parameter based on the situation of the front-end services. Try to keep the encoding consistent on the client and server to improve efficiency.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: encoding compatible with PostgreSQL. **UTF8** indicates that the database encoding is used.

NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required. The sorting rules may vary according to OSs or versions of the same OS. When application services are logically migrated between these OSs, differences and changes in OS sorting rules may cause differences in database functions such as indexes, partitions, and sorting operators. For example, data result sets returned by a same range query statement are different, or query results returned by a same sorting query statement are different. The application service needs to check whether the service data contains related characters based on the locale differences released by the OS.
- By default, **gs_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.
- To use consistent encoding for communication within the database, you are advised to retain the default value of **client_encoding**. Modification to this parameter in the **gaussdb.conf** file (by using the gs_guc tool, for example) does not take effect.
- **client_encoding** can be set to **GB18030_2022**. When **client_encoding** is set to **gb18030_2022**, ensure that the GB18030 character set supported by the client OS has been upgraded to version 2022.
- If the encoding format of the database character set is UTF8, the encoding format of the region supported by the current system is GB18030, the GB18030 character set supported by the client OS has been upgraded to version 2022, and the database contains historical data stored before the GB18030 character set is upgraded, the following situations may occur:
  1. When **client_encoding** is set to **gb18030**, the character encoding of historical data in the UTF8 database returned to the client is the same as that before the client character set is upgraded. However, the font of 38 characters whose mapping changes during the character set upgrade is the same as that in version 2022.
  2. When **client_encoding** is set to **gb18030_2022**, the character encoding of historical data in the UTF8 database returned to the client are the same as that after the upgrade of the client character set and the font of characters are the same as that before the upgrade. This is because the versions of the GB18030 character set are not completely compatible, which may cause data inconsistency. Therefore, if the GB18030 character set needs to be upgraded on the client and historical data exists, you need to convert the historical data before the upgrade.
- **client_encoding** can be set to **ZHS16GBK**. The following table lists the setting methods of **server_encoding** and **client_encoding** corresponding to all ways that ZHS16GBK, GB18030, and GB18030_2022 character sets can be transformed.

server_encoding	client_encoding	locale	Setting Method
zhs16gbk	utf8	utf8	The database automatically obtains the value of **locale**.
utf8	zhs16gbk	gbk	• Users use gsql to manually set **client_encoding** to **zhs16gbk**. • When JDBC is used for connection, the URL parameter is used to set **characterEncoding** to **zhs16gbk**.
zhs16gbk	zhs16gbk	gbk	• When gsql is used for connection, the database automatically obtains the value of **locale**. After internal processing, **client_encoding** is automatically set to **zhs16gbk**. • When JDBC is used for connection, the URL parameter is used to set **characterEncoding** to **zhs16gbk**.

zhs16gbk	gb18030	gb18030	• When gsql is used for connection, the database automatically obtains the value of **locale**. • When JDBC is used for connection, the URL parameter is used to set **characterEncoding** to **gb18030**.
gb18030	zhs16gbk	gbk	• gsql does not support this setting. • When JDBC is used for connection, the URL parameter is used to set **characterEncoding** to **zhs16gbk**.
zhs16gbk	gb18030-2022	gb18030	• When gsql is used for connection, users can manually set **client_encoding** to **gb18030_2022**. • When JDBC is used for connection, the URL parameter is used to set **characterEncoding** to **gb18030_2022**.

gb18030-2022	zhs16gbk	gbk	• gsql does not support this setting. • When JDBC is used for connection, the URL parameter is used to set **characterEncoding** to **zhs16gbk**.
gb18030	utf8	utf8	The database automatically obtains the value of **locale**.
utf8	gb18030	gb18030	• The database automatically obtains the value of **locale**. • When JDBC is used for connection, the URL parameter is used to set **characterEncoding** to **gb18030**.
gb18030_2022	utf8	utf8	The database automatically obtains the value of **locale**.
utf8	gb18030_2022	gb18030	• When gsql is used for connection, users can manually set **client_encoding** to **gb18030_2022**. • When JDBC is used for connection, the URL parameter is used to set **characterEncoding** to **gb18030_2022**.

gb18030	gb18030	gb18030	• The database automatically obtains the value of **locale**. • When JDBC is used for connection, the URL parameter is used to set **characterEncoding** to **gb18030**.
gb18030_2022	gb18030_2022	gb18030	• When gsql is used for connection, the database automatically obtains the value of **locale**. After internal processing, **client_encoding** is automatically set to **gb18030_2022**. • When JDBC is used for connection, the URL parameter is used to set **characterEncoding** to **gb18030_2022**.

Default value: **UTF8**

Recommended value: **SQL_ASCII** or **UTF8**

lc_messages

Parameter description: Specifies the language in which messages are displayed.

- Acceptable values are system-related.
- On some systems, this locale category does not exist. Setting this variable will still work, but there will be no effect. In addition, translated messages for the desired language may not exist. In this case, you can still see the English messages.

  This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string

NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.

Default value: **C**

lc_monetary

Parameter description: Specifies the display format of monetary values. It affects the output of functions such as **to_char**. Acceptable values are system-related.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string

NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.

Default value: **C**

lc_numeric

Parameter description: Specifies the display format of numbers. It affects the output of functions such as **to_char**. Acceptable values are system-related.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string

NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.

Default value: **C**

lc_time

Parameter description: Specifies the display format of time and locale. It affects the output of functions such as **to_char**. Acceptable values are system-related.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string

NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.

Default value: **C**

lc_time_names

Parameter description: Specifies the language used to display names and abbreviations of dates and months. The output of the DATE_FORMAT(), DAYNAME(), and MONTHNAME() functions is affected. The performance of STR_TO_DATE() and GET_FORMAT() is not affected.

Parameter type: string

Unit: none

Value range: IETF language tags in simple format, such as **en_US** or **zh_CN**.

Default value: **en_US**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Setting GUC Parameters**.

Setting suggestion: Switch the language based on service requirements.

default_week_format

Parameter description: Specifies the default **mode** value of the week() function. The following table lists the value range and description.

default_week_format	First Day of a Week	Range	First Week Definition
0	Sunday	0 to 53	The first week that contains a Sunday in this year.
1	Monday	0 to 53	The first week that contains four or more days in this year.
2	Sunday	1 to 53	The first week that contains a Sunday in this year.
3	Monday	1 to 53	The first week that contains four or more days in this year.
4	Sunday	0 to 53	The first week that contains four or more days in this year.

default_week_format	First Day of a Week	Range	First Week Definition
5	Monday	0 to 53	The first week that contains a Monday in this year.
6	Sunday	1 to 53	The first week that contains four or more days in this year.
7	Monday	1 to 53	The first week that contains a Monday in this year.

NOTE

For week 1 of a year, the number 1 indicates a week number. The week number of the first week of a year may be 0, depending on the value of **week_format**, as shown in the third column.

Parameter type: integer

Unit: none

Value range: [0,7]

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Setting GUC Parameters**.

Setting suggestion: Select a mode based on service requirements.

14.3.14.3 Other Default Parameters

This section describes the default database loading parameters.

dynamic_library_path

Parameter description: Specifies the path that the system will search for a shared database file that is dynamically loadable. When a dynamically loadable module needs to be opened and the file name specified in the **CREATE FUNCTION** or **LOAD** command does not contain a directory, the system will search this path for the required file. Only the sysadmin user can access this parameter.

The value of **dynamic_library_path** must be a list of absolute paths separated by colons (:). When the name of a path starts with the special variable *$libdir*, the variable will be replaced with the directory in which the module provided by the GaussDB is installed. For example:

```
dynamic_library_path = '/usr/local/lib/gaussdb:/opt/testgs/lib:$libdir'
```

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: string

NOTE

If the value of this parameter is set to an empty character string, the automatic path search is turned off. The dynamic library search paths specified by **local_preload_libraries** and **shared_preload_libraries** also depend on this parameter. If this parameter is left blank or set to an invalid path, the dynamic libraries fail to be loaded, which will result in abnormal database services.

Default value: $libdir

local_preload_libraries

Parameter description: Specifies one or more shared libraries that are to be preloaded at connection start. If multiple libraries are to be loaded, separate their names with commas (,). All library names are converted to lower case unless double-quoted.

- Any user can change this option. Therefore, library files that can be loaded are restricted to those saved in the **plugins** subdirectory of the standard library installation directory. It is the database administrator's responsibility to ensure that libraries in this directory are all safe. Entries in **local_preload_libraries** can specify the library directory explicitly, for example, *$libdir*/**plugins/mylib**, or just specify the library name, for example, **mylib**. (**mylib** is equivalent to *$libdir*/**plugins/mylib**.)
- Unlike **shared_preload_libraries**, there are no differences in performance between loading a module at session start or doing this during the session. The intent of this feature is to allow debugging or performance-measurement libraries to be loaded into specific sessions without an explicit LOAD command. For example, debugging can be enabled under a given username by setting this parameter to **ALTER USER SET**.
- If a specified library is not found, the connection attempt will fail. If the configuration is incorrect (for example, the length exceeds the limit or the directory is invalid), the process cannot be started properly.
- Every GaussDB-supported library has a "magic block" that is checked to guarantee compatibility. For this reason, non-GaussDB-supported libraries cannot be loaded in this way.

This is a BACKEND parameter. Set it based on instructions provided in **Table 14-1**.

Value range: string

Default value: empty

14.3.15 Lock Management

In GaussDB, a deadlock may occur when concurrently executed transactions compete for resources. This section describes parameters used for managing transaction locks.

deadlock_timeout

Parameter description: Specifies the deadlock timeout interval. When the applied lock exceeds the preset value, the system will check whether a deadlock occurs. This parameter takes effect only for common locks.

Parameter type: integer.

Unit: ms

Value range: 1 to 2147483647.

Default value: **1s**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion:

- The check for deadlock is relatively expensive. Therefore, the server does not check it when waiting for a lock every time. Deadlocks seldom occur when the system is running. Therefore, the system just needs to wait on the lock for a while before checking for deadlocks. Increasing the value of **deadlock_timeout** reduces the time wasted in deadlock check, but slows down reporting of real deadlock errors. On a heavily loaded server, you may need to set **deadlock_timeout** to a larger value. It is recommended that this value exceed the transaction time to avoid deadlock check before locks are released.
- When **log_lock_waits** is set to **on**, **deadlock_timeout** determines a waiting time to write the lock waiting time information during query execution to logs. To study the lock delay, you can set **deadlock_timeout** to a value smaller than the normal value.

lockwait_timeout

Parameter description: Specifies the timeout for attempts to acquire a lock. If the time spent in waiting for a lock exceeds the specified time, an error is reported. This parameter takes effect only for common locks.

Parameter type: integer.

Unit: ms

Value range: 0 to *INT_MAX*

Default value: **20min**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **900** without a unit, **lockwait_timeout** indicates 900 ms. If the value is **20min**, **lockwait_timeout** indicates 20 minutes. If the unit is required, the value must be **ms**, **s**, **min**, **h**, or **d**.

Setting suggestion: Retain the default value. Alternatively, set this parameter based on the service requirements.

update_lockwait_timeout

Parameter description: Specifies the maximum duration that a lock waits for concurrent updates on a row to complete when the concurrent update feature is enabled. If the time spent in waiting for a lock exceeds the specified time, an error is reported. This parameter takes effect only for common locks.

Parameter type: integer.

Unit: ms

Value range: 0 to 2147483647

Default value: **2min** (120000 ms)

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **900** without a unit, **update_lockwait_timeout** indicates 900 ms. If the value is **2min**, **update_lockwait_timeout** indicates 2 minutes. If the unit is required, the value must be **ms**, **s**, **min**, **h**, or **d**.

Setting suggestion: Observe the workload of transactions that concurrently update the same row. For common TP services, the execution time is less than two minutes. In this case, the probability of false positives is low. If a large number of transactions concurrently update the same row and the execution time exceeds two minutes, you can increase the value of this parameter to prevent false positives due to lock timeout.

max_locks_per_transaction

Parameter description: Determines the average number of object locks allocated to each transaction.

Parameter type: integer.

Unit: none

Value range: 10 to 2147483647

Default value:

256 (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory); **64** (4-core CPU/16 GB memory)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion:

- The maximum number of hash tables that can be locked by a shared lock at any time is calculated based on an assumption: **max_locks_per_transaction** x (**max_connections** + **max_prepared_transactions**) and **max_locks_per_transaction** ≥ Number of concurrent service transactions x Number of object locks added by each service transaction/(**max_connections** + **max_prepared_transactions**). In this case, an upper limit is determined for this parameter.
- Within the specified range, objects can be locked simultaneously at any time. You may need to increase the value of this parameter if many different tables are modified in a single transaction.
- Increasing the value of this parameter may cause GaussDB to request more System V-shared memory than the OS's default configuration allows, leading to database startup failure.

- When running a standby node, you must set this parameter to a value that is no less than that on the primary node. Otherwise, queries will not be allowed on the standby node.

max_pred_locks_per_transaction

Parameter description: Specifies the average number of predicate locks allocated for each transaction.

- The size of the shared predicate lock table is calculated under the condition that a maximum of *N* independent objects need to be locked at any time. *N* = **max_pred_locks_per_transaction** x (**max_connections** + **max_prepared_transactions**). Objects whose amount does not exceed the preset number can be locked simultaneously at any time. You may need to increase this value if many different tables are modified in a single transaction. This parameter can only be set at server start.
- Increasing the value of this parameter may cause GaussDB to request more System V-shared memory than the OS's default configuration allows.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 10 to *INT_MAX*.

Default value: **64**

gs_clean_timeout

Parameter description: Specifies the average interval for clearing temporary tables on the primary node.

- When the database connection is terminated abnormally, temporary tables may exist. In this case, you need to call the gs_clean tool to clear the temporary tables in the database.
- If this parameter is set to a larger value, the time for clearing GaussDB temporary tables may be prolonged.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 2147483. The unit is s.

Default value: **1min**

partition_lock_upgrade_timeout

Parameter description: Specifies the timeout for attempts to upgrade an exclusive lock (read allowed) to an access exclusive lock (read/write blocked) on a partitioned table during the execution of some query statements. If there are concurrent read transactions running, the lock upgrade will need to wait. **partition_lock_upgrade_timeout** sets the waiting timeout for lock upgrade attempts.

- When you do **MERGE PARTITION** and **CLUSTER PARTITION** on a partitioned table, temporary tables are used for data rearrangement and file exchange. To concurrently perform as many operations as possible on the partitions,

exclusive locks are acquired for the partitions during data rearrangement and access exclusive locks are acquired during file exchange.

- Generally, a partition waits until it acquires a lock, or a timeout occurs if the partition waits for a period longer than the value specified by the **lockwait_timeout** parameter.
- When doing **MERGE PARTITION** or **CLUSTER PARTITION** on a partitioned table, an access exclusive lock needs to be acquired during file exchange. If the lock fails to be acquired, the acquisition is retried at an interval of 50 ms until timeout occurs. The **partition_lock_upgrade_timeout** parameter specifies the time to wait before the lock acquisition attempt times out.
- If **partition_lock_upgrade_timeout** is set to **–1**, the lock upgrade never times out. The lock upgrade is continuously retried until it succeeds.

  This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from –1 to 3000. The unit is s.

Default value: **1800**

fault_mon_timeout

Parameter description: Specifies the period for detecting lightweight deadlocks. This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 1440. The unit is minute.

Default value: **5min**

enable_online_ddl_waitlock

Parameter description: Specifies whether to block DDL operations to wait for the release of database locks, such as **pg_advisory_lock**. This parameter is mainly used in online OM operations and you are advised not to modify the settings.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **off**

xloginsert_locks

Parameter description: Specifies the number of locks on concurrent write-ahead logging. This parameter is used to improve the efficiency of writing write-ahead logs.

Parameter type: integer.

Unit: none

Value range: 1 to 1000. If the CPU uses the NUMA architecture, the value must be an integer multiple of the number of NUMA nodes.

Default value: 16

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: When the concurrency pressure of the Arm CPU architecture is high, performance jitter may occur due to atomic operation competition. You can decrease the value of this parameter for stable running performance.

num_internal_lock_partitions

Parameter description: Specifies the number of internal lightweight lock partitions. It is mainly used for performance optimization in various scenarios. The content is organized in the KV format of keywords and numbers. Different types of locks are separated by commas (,). The sequence does not affect the setting result. For example, **CLOG_PART=256,CSNLOG_PART=512** is equivalent to **CSNLOG_PART=512,CLOG_PART=256**. If you set the same keyword multiple times, only the latest setting takes effect. For example, if you set **CLOG_PART** to **256** and **CLOG_PART** to **2**, the value of **CLOG_PART** is **2**. If no keyword is set, the default value is used. The usage description, maximum value, minimum value, and default value of each lock type are as follows:

- **CLOG_PART**: number of Clog file controllers. Increasing the value of this parameter improves the Clog writing efficiency and transaction commit performance, but increases the memory usage. Decreasing the value of this parameter reduces the memory usage, but may increase the conflict of writing Clogs and affect the performance. The value ranges from 1 to 256.
- **CSNLOG_PART**: number of CSNLOG file controllers. Increasing the value of this parameter improves the CSNLOG writing efficiency and transaction commit performance, but increases the memory usage. Decreasing the value of this parameter reduces the memory usage, but may increase the conflict of writing CSNLOGs and affect the performance. The value ranges from 1 to 512.
- **LOG2_LOCKTABLE_PART**: two logarithms of the number of ordinary table lock partitions. Increasing the value can improve the concurrency of obtaining locks in the normal process, but may increase the time required for transferring and clearing locks. When wait events occur in **LockMgrLock**, you can increase the value to improve the performance. The minimum value is 4, that is, the number of lock partitions is 16. The maximum value is 16, that is, the number of lock partitions is 65536.
- **TWOPHASE_PART**: number of partitions of the two-phase transaction lock. Increasing the value can increase the number of concurrent two-phase transaction commits. The value ranges from 1 to 64.
- **FASTPATH_PART**: maximum number of locks that each thread can obtain without using the main lock table. When a partitioned table is read, updated, inserted, or deleted and the wait event is LockMgrLock, you can increase the value of this parameter to prevent LockMgrLock from being obtained and improve performance. It is recommended that the value be greater than or equal to that calculated using the following formula: Number of partitions x (1 + Number of local indexes) + Number of global indexes + 10. Increasing the value will increase the memory usage. The value ranges from 20 to 10000.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string.

Default value:

'CLOG_PART=256,CSNLOG_PART=512,LOG2_LOCKTABLE_PART=4,TWOPHASE_PART=1,FASTPATH_PART=20' (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, or 4-core CPU/32 GB memory); **'CLOG_PART=8,CSNLOG_PART=16,LOG2_LOCKTABLE_PART=4,TWOPHASE_PART=1,FASTPATH_PART=20'** (4-core CPU/16 GB memory)

enable_wait_exclusive_lock

Parameter description: Specifies whether to enable the hang detection and cure function for the exclusive lock of ProcArrayLock.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **on**

barrier_lock_timeout

Parameter description: Specifies the timeout interval for holding a barrier lock.

Parameter type: integer.

Unit: second

Value range: 0 to 3600

Default value: **30s**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

enable_xid_abort_check

Parameter description: Specifies whether to verify transaction ID rollback is enabled when a transaction is committed.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: enabled.
- **off**: disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

14.3.16 Version and Platform Compatibility

14.3.16.1 Compatibility with Earlier Versions

This section describes the parameters that control the backward compatibility and external compatibility of GaussDB. A backward compatible database supports applications of earlier versions. This section describes parameters used for controlling backward compatibility of a database.

array_nulls

Parameter description: Determines whether the array input parser recognizes unquoted NULL as a null array element.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that null values can be entered in arrays.
- **off** indicates backward compatibility with the old behavior. Arrays containing the value **NULL** can still be created when this parameter is set to **off**.

Default value: **on**

backslash_quote

Parameter description: Determines whether a single quotation mark can be represented by \' in a string text.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

When the string text meets the SQL standards, \ has no other meanings. This parameter only affects the handling of non-standard-conforming string texts, including escape string syntax (E'...').

Value range: enumerated values

- **on** indicates that the use of \' is always allowed.
- **off** indicates that the use of \' is rejected.
- **safe_encoding** indicates that the use of \' is allowed only when client encoding does not allow ASCII \ within a multibyte character.

Default value: **safe_encoding**

escape_string_warning

Parameter description: Specifies whether to issue a warning when a backslash (\) is used as an escape in an ordinary character string.

- Applications that wish to use a backslash (\) as an escape need to be modified to use escape string syntax (E'...'). This is because the default behavior of ordinary character strings treats the backslash as an ordinary character in each SQL standard.
- This variable can be enabled to help locate codes that need to be changed.
- If E'...' is used as an escape, logs may be incomplete in some scenarios.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

Default value: **on**

lo_compat_privileges

Parameter description: Specifies whether to enable backward compatibility for the privilege check of large objects.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

on indicates that the privilege check is disabled when large objects are read or modified.

Default value: **off**

quote_all_identifiers

Parameter description: Specifies whether to forcibly quote all identifiers even if they are not keywords when the database generates SQL. This will affect the output of **EXPLAIN** and the results of functions, such as pg_get_viewdef. For details, see the **--quote-all-identifiers** parameter of **gs_dump**.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the forcible quoting is enabled.
- **off** indicates that the forcible quoting is disabled.

Default value: **off**

sql_inheritance

Parameter description: Controls the inheritance semantics. This parameter specifies the access policy of descendant tables. **off** indicates that subtables cannot be accessed by commands. That is, the ONLY keyword is used by default. This setting is compatible with earlier versions.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that subtables can be accessed.
- **off** indicates that subtables cannot be accessed.

Default value: **on**

standard_conforming_strings

Parameter description: Controls whether ordinary string texts ('...') treat backslashes as ordinary texts as specified in the SQL standard.

- Applications can check this parameter to determine how string texts will be processed.
- It is recommended that characters be escaped by using the escape string syntax (E'...').

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

Default value: **on**

synchronize_seqscans

Parameter description: Determines sequential scans of tables to synchronize with each other, so that concurrent scans read the same data block at about the same time and share the I/O load.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that a scan may start in the middle of the table and then "wrap around" the end to cover all rows to synchronize with the activity of scans already in progress. This may result in unpredictable changes in the row ordering returned by queries that have no ORDER BY clause.
- **off** indicates that the scan always starts from the table heading.

Default value: **on**

enable_beta_features

Parameter description: Specifies whether to enable some features that are not officially released and are used only for POC verification. Exercise caution when enabling these extended features because they may cause errors in some scenarios.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the features are enabled for forward compatibility. Note that enabling them may cause errors in certain scenarios.
- **off** indicates that the features are disabled.

Default value: **off**

default_with_oids

Parameter description: Specifies whether **CREATE TABLE** and **CREATE TABLE AS** include an **OID** field in newly-created tables if neither **WITH OIDS** nor **WITHOUT OIDS** is specified. It also determines whether OIDs will be included in tables created by **SELECT INTO**.

It is not recommended that OIDs be used in user tables. Therefore, this parameter is set to **off** by default. When OIDs are required for a particular table, **WITH OIDS** needs to be specified during the table creation.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that **CREATE TABLE** and **CREATE TABLE AS** can include an **OID** field in newly-created tables.
- **off** indicates that **CREATE TABLE** and **CREATE TABLE AS** cannot include any OID field in newly-created tables.

Default value: **off**

enable_recordtype_check_strict

Parameter description: Specifies whether to perform strict check on the record type in PL/SQL. For details, see the notice below.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: indicates that the record type created during compilation of stored procedures, functions, and packages is checked for unsupported functions, and the record type created by provided stored procedures and functions is checked for the NOT NULL function.
- **off**: indicates backward compatibility and the record type is not checked.

Default value: **on**

NOTICE

After an upgrade from an earlier version, this parameter is set to **off** by default.

After this parameter is set to **on**, the following three changes occur:

1. For the record type created in a stored procedure or function, the **NOT NULL** column constraint takes effect.

2. If **NOT NULL** or **DEFAULT** is specified for a column of the record type created in a package, a compilation error is reported. Variables created by accessing the package.rec type do not support **NOT NULL** and **DEFAULT**.

3. If **NOT NULL** or **DEFAULT** is specified for a column of another type with a nested record type, a compilation error is reported. For a variable nested with the record type, the record element of the variable does not support **NOT NULL** and **DEFAULT**.

system_view_version

Parameter description: Determines the version of the system view. For details, see **Table 1 System view version parameters**. All versions are backward compatible. For example, when **system_view_version** is set to **3**, all features of version 2 and version 1 are also supported.

Parameter type: integer.

Unit: none

Value range: 0 to 9999

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: In the upgrade scenario, do not change the value. In the installation scenario, set this parameter to the latest version listed in **Table 1 System view version parameters**.

Table 14-11 System view version parameters

Value	Description
0	Default behavior
1	The value of **PREPARECOUNT** in the V$GLOBAL_TRANSACTION view changes from **NULL** to **0** when no prepared transaction exists in GaussDB.

14.3.16.2 Platform and Client Compatibility

Many platforms use the database system. External compatibility of the database system provides great convenience for platforms.

a_format_date_timestamp

Parameter description: Specifies whether to return the date and time.

In A-compatible mode, when a transaction is started, the functions current_date, current_timestamp, and localtimestamp return the timestamp when the current SQL statement is started.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Returns the timestamp when the current SQL statement is started.
- **off**: Returns the date or date and time when the transaction is started.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. This parameter can be enabled when the system time needs to be returned when a transaction is started.

convert_string_to_digit

Parameter description: Specifies the implicit conversion priority, which determines whether to preferentially convert strings into numbers.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that strings are preferentially converted into numbers.
- **off** indicates that strings are not preferentially converted into numbers.

Default value: **on**

NOTICE

Adjusting this parameter will change the internal data type casting rule and cause unexpected behaviors. Exercise caution when performing this operation.

nls_timestamp_format

Parameter description: Specifies the default timestamp format.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string.

Default value: **DD-Mon-YYYY HH:MI:SS.FF AM**

nls_timestamp_tz_format

Parameter description: Specifies the default timestamp with time zone format.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. The supported formats are the same as those of **nls_timestamp_format**.

Default value: **DD-Mon-YYYY HH:MI:SS.FF AM**

NOTE

This parameter is valid only when **a_format_version** is set to **10c** and **a_format_dev_version** is set to **s1**.

nls_nchar_characterset

Parameter description: Sets the national character set, which is used together with the nchr(cvalue int|bigint) system function. The value of this parameter is an enumerated string.

Parameter type: string.

Unit: none

Value range: **'AL16UTF16'** and **'UTF8'** (case insensitive)

Default value: **'AL16UTF16'**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

NOTE

- The database does not support the national character set. This parameter is used only to be compatible with the A database and obtain the national character set for users.
- This GUC parameter applies only to the nchr(cvalue int|bigint) function.

group_concat_max_len

Parameter description: This parameter is used together with the GROUP_CONCAT function to limit the length of the return value. If the length exceeds the limit, the exceeded part of the return value is truncated.

Parameter type: integer.

Unit: none

Value range: 0 to 9223372036854775807. Currently, the maximum length that takes effect is 1073741823. If the length exceeds this limit, the out of memory error is reported.

Default value: 1024

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

max_function_args

Parameter description: Specifies the maximum number of parameters allowed for a function.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Value range: an integer.

Default value: **8192**

max_subpro_nested_layers

Parameter description: Specifies the maximum nesting depth of nested subprograms.

Parameter type: integer.

Unit: none

Value range: 0 to 100

NOTE

When this parameter is set to **0**, nested subprograms are not allowed.

Default value: **3**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on the maximum nesting depth.

transform_null_equals

Parameter description: Specifies whether expressions of the form expr = NULL (or NULL = expr) are treated as expr IS NULL. They return true if expr evaluates to the **NULL** value, and false otherwise.

- The correct SQL-standard-compliant behavior of **expr = NULL** is to always return **NULL** (unknown).
- Filtered forms in Microsoft Access generate queries that appear to use **expr = NULL** to test for null values. If you enable this option, you can use this API to access the database.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that expressions of the form **expr = NULL** (or **NULL = expr**) are treated as expr **IS NULL**.
- **off** indicates that **expr = NULL** always returns **NULL** (unknown).

Default value: **off**

NOTE

New users are always confused about the semantics of expressions involving **NULL** values. Therefore, **off** is used as the default value.

support_extended_features

Parameter description: Specifies whether extended database features are supported.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that extended database features are supported.
- **off** indicates that extended database features are not supported.

Default value: **off**

enable_extension

Parameter description: Specifies whether to support the creation of database extensions.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the creation of database extensions is supported.
- **off** indicates that the creation of database extensions is not supported.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

NOTICE

The extended function is for internal use only. You are advised not to use it.

sql_compatibility

Parameter description: Specifies the type of mainstream database with which the SQL syntax and statement behavior of the database is compatible. This is an INTERNAL parameter. It can be viewed but cannot be modified.

Value range: enumerated values

- **A** indicates that the database is compatible with the Oracle database.
- **B** indicates that the database is compatible with the MySQL database.
- **C** indicates that the database is compatible with the Teradata database.
- **PG** indicates that the database is compatible with the PostgreSQL database.

Default value: **A**

NOTICE

- This parameter can be set only when you run the **CREATE DATABASE** command to create a database. For details, see "SQL Reference > SQL Syntax > CREATE DATABASE" in *Developer Guide*.
- In the database, this parameter must be set to a specific value. It can be set to **A** or **B** and cannot be changed. Otherwise, the setting is not consistent with the database behavior.

b_format_behavior_compat_options

Parameter description: Specifies a B-compatible database configuration item.

Parameter type: string.

Unit: none

Value range: Currently, only B-compatible configuration items listed in **Table 1** are supported. Use commas (,) to separate multiple compatibility configuration items, for example, **set b_format_behavior_compat_options="enable_set_variables,set_session_transaction"**.

Default value: ""

NOTE

If **b_format_version** is not set to '', **b_format_behavior_compat_options** will be set to **all** and cannot be modified.

Table 14-12 B-compatible configuration items

Configuration Item	Behavior
enable_set_variables	Specifies whether to enable the enhancement of the SET syntax. • If this parameter is not set, user-defined variables and the SET [GLOBAL | SESSION] syntax are not supported. • If this parameter is set, the preceding syntax is supported in the B-compatible mode, for example, *set @v1 = 1;*.
set_session_transaction	Specifies whether to enable the SET SESSION TRANSACTION syntax. • If this parameter is not set, SET SESSION TRANSACTION is equivalent to SET LOCAL TRANSACTION. • If this parameter is set, the preceding syntax can be used in the B-compatible mode to modify the transaction features in the current session.

Configuration Item	Behavior
enable_modify_column	Specifies whether to enable the ALTER TABLE MODIFY syntax. • If this parameter is not set, running **ALTER TABLE table_name MODIFY column_name data_type;** can change only the data type of the column. • If this parameter is set, running **ALTER TABLE table_name MODIFY column_name data_type;** can change the entire column definition.
default_collation	Specifies whether to enable forward compatibility of the default collation. • If this item is not specified, the character set or collation of a column of the character type is not explicitly specified, and the collation of a table is empty, the column uses the default collation. • If this item is specified, the collation of a column of the character type inherits the collation of a table (if it is not empty). If the collation of a table is empty, the default collation corresponding to the database is used.
all	Determines whether to enable all syntax. **all** cannot be specified together with other configuration items. In the table, specifying all configuration items except **all** that are separated by commas is equivalent to specifying **all**.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Determines whether some B-compatible features are available. If you want to modify this parameter, make sure you understand its meaning and modify it with caution to avoid risks caused by misoperations.

m_format_behavior_compat_options

Parameter description: Specifies the configuration items of an M-compatible database.

Parameter type: string.

Unit: none

Value range: Currently, only **Table 14-13** are supported. Compatibility configuration items are separated by commas (,).

Default value: **""**

Table 14-13 M-compatible configuration items

Configuration Item	Behavior
enable_escape_string	Specifies whether escape character control is enabled. • If this item is not set, escape character behaviors are controlled by the GUC parameters **standard_conforming_strings**, **escape_string_warning**, and **backslash_quote** related to the GaussDB escape character. • If this item is set, all MySQL escape characters except '\0' are supported by default. In addition, the output behavior of '\b', '\r', and '\Z' on the gsql client changes to be the same as that on the MySQL client.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-2**.

Setting suggestion: none.

behavior_compat_options

Parameter description: Specifies the database compatibility configuration item.

Parameter type: string.

Unit: none

Value range: Currently, only compatibility configuration items listed in **Table 14-14** are supported. Use commas (,) to separate multiple compatibility configuration items, for example, **set behavior_compat_options='end_month_calculate,display_leading_zero'**.

Default value: **"forbid_package_function_with_prefix, enable_bpcharlikebpchar_compare,enable_crosstype_integer_operator"**

Table 14-14 Compatibility configuration items

Configuration Item	Behavior
display_leading_zero	Specifies how floating-point numbers are displayed. It determines the display of zeros before the decimal point of all character string types (such as char, character, nchar, varchar, character varying, varchar2, nvarchar2, text, and clob) and any precision types (such as float4, float8, and numeric) in the numeric type. In addition, the length of the calculated number is displayed synchronously. ● If this item is not specified, for a non-zero decimal number between –1 and +1, the 0 before the decimal point is not displayed. For example: `gaussdb=# select 0.1231243 as a, 0.1231243::numeric as b,0.1231243::integer(10,3) as c, length(0.1242343) as d;` ` a	b	c	d` `----------+----------+------+---` `.1231243	.1231243	.123	8` `(1 row)` ● If this item is specified, for a non-zero decimal number between –1 and +1, the 0 before the decimal point is displayed. For example: `gaussdb=# select 0.1231243 as a, 0.1231243::numeric as b,0.1231243::integer(10,3) as c, length(0.1242343) as d;` ` a	b	c	d` `----------+----------+-------+---` `0.1231243	0.1231243	0.123	9` `(1 row)`
end_month_calculate	Specifies the calculation logic of the add_months function. Assume that the two parameters of the add_months function are **param1** and **param2**, and that the month of **param1** and **param2** is **result**. ● If this item is not specified, and the **Day** of **param1** indicates the last day of a month shorter than **result**, the **Day** in the calculation result will equal that in **param1**. For example: `gaussdb=# select add_months('2018-02-28',3) from sys_dummy;` `add_months` `---------------------` `2018-05-28 00:00:00` `(1 row)` ● If this item is specified, and the **Day** of **param1** indicates the last day of a month shorter than **result**, the **Day** in the calculation result will equal that in **result**. For example: `gaussdb=# select add_months('2018-02-28',3) from sys_dummy;` `add_months` `---------------------` `2018-05-31 00:00:00` `(1 row)`

Configuration Item	Behavior
compat_analyze_sample	Specifies the sampling behavior of the **ANALYZE** operation. If this item is specified, the sample collected by the ANALYZE operation will be limited to around 30,000 records, controlling database node memory consumption and maintaining the stability of ANALYZE.
bind_schema_tablespace	Binds a schema with the tablespace with the same name. If a tablespace name is the same as *sche_name*, **default_tablespace** will also be set to *sche_name* if **search_path** is set to *sche_name*.
bind_procedure_searchpath	Specifies the search path of the database objects in a stored procedure for which no schema name is specified. If no schema name is specified for a stored procedure, the schema to which the stored procedure belongs is searched preferentially. If the stored procedure is not found, the following operations are performed: ● If this item is not specified, the system reports an error and exits. ● If this item is specified, the search continues based on the settings of **search_path**. If the issue persists, the system reports an error and exits.
correct_to_number	Specifies the compatibility of the to_number() result. ● If this item is not specified, the result of the to_number() function is the same as that in the A database by default. `gaussdb=# select '' AS to_number_14, to_number('34,50','999,99');` `ERROR:  invalid data.` `CONTEXT:  referenced column: to_number` ● If this item is specified, the result of the to_number() function is the same as that of pg11. `gaussdb=# select '' AS to_number_14, to_number('34,50','999,99');` ` to_number_14 | to_number` `--------------+-----------` `              |      3450` `(1 row)`

Configuration Item	Behavior
unbind_divide_bound	Specifies the range check on the result of integer division. ● If this item is not specified, the range of the division result is verified. For example, an out-of-bounds error is reported because the output result of *INT_MIN*/**(–1)** is greater than *INT_MAX*. `gaussdb=# select (-2147483648)::int4 / (-1)::int4;` `ERROR:  integer out of range` ● If this item is specified, the range of the division result does not need to be verified. For example, the output result of *INT_MIN*/**(–1)** is *INT_MAX*+**1**. `gaussdb=# select (-2147483648)::int4 / (-1)::int4;` `  ?column?` `------------` ` 2147483648` `(1 row)`
convert_string_digit_to_numeric	Determines whether to convert numeric constants of the character string type to those of the numeric type before these two types are compared. ● If this item is not specified, the numeric constants of the character string type are not converted to those of the numeric type. ● If this item is specified, the numeric constants of the character string type are converted to those of the numeric type. `gaussdb=# create table test1 (c1 int, c2 varchar);` `gaussdb=# insert into test1 values (2, '1.1');` `gaussdb=# set behavior_compat_options='';` `gaussdb=# select * from test1 where c2 > 1;` `ERROR:  invalid input syntax for type bigint: "1.1"` `gaussdb=# set behavior_compat_options='convert_string_digit_to_numeric';` `gaussdb=# select * from test1 where c2 > 1;` ` c1 | c2` `----+-----` `  2 | 1.1` `(1 row)`
return_null_string	Specifies how to display the empty result (empty string '') of the lpad() and rpad() functions. ● If this item is not specified, the empty string is displayed as **NULL**. `gaussdb=# select length(lpad('123',0,'*')) from sys_dummy;` `length` `--------` `(1 row)` ● If this item is specified, the empty string is displayed as single quotation marks (''). `gaussdb=# select length(lpad('123',0,'*')) from sys_dummy;` `length` `--------` `0` `(1 row)`

Configuration Item	Behavior
compat_concat_variadic	Specifies the compatibility of variadic results of the concat() and concat_ws() functions. The B database does not have the variadic type. Therefore, this option has no impact on the B database. ● If this item is not specified and the concat function parameter is of the variadic type, the results of the A and C databases in compatibility mode are the same by default. `gaussdb=# select concat(variadic NULL::int[]) is NULL;` ` ?column?` `----------` ` t` `(1 row)` ● If this item is specified and the concat function parameter is of the variadic type, different result formats of the A and C databases in compatibility mode are retained. `--In the A database:` `gaussdb=# select concat(variadic NULL::int[]) is NULL;` ` ?column?` `----------` ` t` `(1 row)` `--In the C database:` `gaussdb=# select concat(variadic NULL::int[]) is NULL;` ` ?column?` `----------` ` f` `(1 row)`
merge_update_multi	When MERGE INTO ... WHEN MATCHED THEN UPDATE (see "SQL Reference > SQL Syntax > MERGE INTO" in *Developer Guide*) and INSERT ... ON DUPLICATE KEY UPDATE (see "SQL Reference > SQL Syntax > INSERT" in *Developer Guide*) are used, it controls the UPDATE behavior if a piece of target data in the target table conflicts with multiple pieces of source data. ● If this item is specified and the preceding scenario exists, the system performs multiple UPDATE operations on the conflicting row. ● If this item is not specified (the default value is retained), an error is reported, indicating that the MERGE or INSERT operation fails.

Configuration Item	Behavior
plstmt_implicit_savepoint	Determines whether the execution of an UPDATE statement in a stored procedure has an independent subtransaction. If this parameter is set, the implicit savepoint is enabled before executing each UPDATE statement in the stored procedure, and the subtransaction is rolled backed to the latest savepoint in the EXCEPTION block by default, ensuring that only the modification of failed statements is rolled back. This option is used to be compatible with the EXCEPTION behavior of the ORA database.
hide_tailing_zero	Configuration item for numeric display. ● If this item is specified, the trailing zeros after the decimal point are hidden in all scenarios where numeric values are output, even if the precision format is specified. ● If this item is not specified, numeric data is displayed in the specified precision. `gaussdb=# set behavior_compat_options='hide_tailing_zero';` `gaussdb=# select cast(123.123 as numeric(15,10)) as a, to_char(cast(123.123 as numeric(15,10)), '999D999999');` ` a	to_char` `---------+----------` ` 123.123	123.123` `(1 row)` `gaussdb=# set behavior_compat_options='';` `gaussdb=# select cast(123.123 as numeric(15,10)) as a, to_char(cast(123.123 as numeric(15,10)), '999D999999');` ` a	to_char` `----------------+-------------` ` 123.1230000000	123.123000` `(1 row)`

Configuration Item	Behavior
rownum_type_compat	Specifies the ROWNUM type. The default value is **BIGINT**. After this parameter is specified, the value is changed to **NUMERIC**. gaussdb=# set behavior_compat_options=''; gaussdb=# create table tb_test(c1 int,c2 varchar2,c3 varchar2); gaussdb=# insert into tb_test values(1,'a','b'); gaussdb=# create or replace view v_test as select rownum from tb_test; gaussdb=# \d+ v_test View "public.v_test" Column | Type | Modifiers | Storage | Description --------+--------+-----------+---------+------------- rownum | bigint | | plain | View definition: SELECT ROWNUM AS "rownum" FROM tb_test; gaussdb=# set behavior_compat_options = 'rownum_type_compat'; gaussdb=# create or replace view v_test1 as select rownum from tb_test; gaussdb=# \d+ v_test1 View "public.v_test1" Column | Type | Modifiers | Storage | Description --------+---------+-----------+---------+------------- rownum | numeric | | main | View definition: SELECT ROWNUM AS "rownum" FROM tb_test;
aformat_null_test	Specifies the logic for checking whether **rowtype** is not null. When this parameter is set, if one column in a row is not empty, **true** is returned for checking whether **rowtype** is not null. When this parameter is not set, if all columns in a row are not empty, true is returned for checking whether **rowtype** is not null. This parameter has no influence on checking whether **rowtype** is not null. gaussdb=# set behavior_compat_options='aformat_null_test'; gaussdb=# select r, r is null as isnull, r is not null as isnotnull from (values (1,row(1,2)), (1,row(null,null)), (1,null), (null,row(1,2)), (null,row(null,null)), (null,null)) r(a,b); r | isnull | isnotnull -------------+--------+----------- (1,"(1,2)") | f | t (1,"(,)") | f | t (1,) | f | t (,"(1,2)") | f | t (,"(,)") | f | t (,) | t | f (6 rows) gaussdb=# set behavior_compat_options=''; gaussdb=# select r, r is null as isnull, r is not null as isnotnull from (values (1,row(1,2)), (1,row(null,null)), (1,null), (null,row(1,2)), (null,row(null,null)), (null,null)) r(a,b); r | isnull | isnotnull -------------+--------+----------- (1,"(1,2)") | f | t (1,"(,)") | f | t (1,) | f | f (,"(1,2)") | f | f (,"(,)") | f | f (,) | t | f (6 rows)

Configuration Item	Behavior
aformat_regexp_match	Determines the matching behavior of regular expression functions. When this parameter is set and **sql_compatibility** is set to **A** or **B** or in an M-compatible database, the options supported by the **flags** parameter of the regular expression are changed as follows: 1. By default, the character '\n' cannot be matched. 2. If **flags** contains the **n** option, the period (.) can match the character '\n'. 3. The regexp_replace(source, pattern replacement) function replaces all matching substrings. 4. regexp_replace(source, pattern, replacement, flags) returns **null** when the value of **flags** is **''** or **null**. Otherwise, the meanings of the options supported by the **flags** parameter of the regular expression are as follows: 1. By default, the character '\n' can be matched. 2. The **n** option in **flags** indicates that the multi-line matching mode is used. 3. The regexp_replace(source, pattern replacement) function replaces only the first matched substring. 4. If the value of **flags** is **''** or **null**, the return value of regexp_replace(source, pattern, replacement, flags) is the character string after replacement.
compat_cursor	Determines the compatibility behavior of implicit cursor states. If this parameter is set and the A-compatible mode is used, the effective scope of implicit cursor states (SQL %FOUND, SQL%NOTFOUND, SQL%ISOPNE, and SQL %ROWCOUNT) is extended from only the currently executed function to all subfunctions called by this function.
proc_outparam_override	Determines the overloading of output parameters of a stored procedure. After this parameter is enabled, the stored procedure can be properly created and called even if only the output parameters of the stored procedure are different. Currently, this parameter can be used only when gsql and JDBC are used to connect to the database. If this parameter is enabled for other tools to connect to the database, stored procedures with the **out** parameter cannot be called. It supports the functions that contain the **out** output parameter and returns data of the record type. Besides, a value is assigned to the **out** parameter.

Configuration Item	Behavior
proc_implicit_for_loop_variable	Determines the behavior of the FOR_LOOP query statement in a stored procedure. When this parameter is set, if *rec* has been defined in the FOR rec IN query LOOP statement, the defined *rec* variable is not reused but a new variable is created. Otherwise, the defined *rec* variable is reused and no variable is created.
allow_procedure_compile_check	Controls the compilation check of the SELECT and OPEN CURSOR statements in a stored procedure. If this parameter is set, when the SELECT, OPEN CURSOR FOR, CURSOR%rowtype, or FOR rec IN statement is executed in a stored procedure, the stored procedure cannot be created if the queried table does not exist, and the compilation check of the trigger function is not supported. If the queried table exists, the stored procedure is successfully created. Note: When creating an encrypted function, you need to disable **allow_procedure_compile_check**.

Configuration Item	Behavior
char_coerce_compat	Controls the behavior when char(n) types are converted to other variable-length string types. This parameter is valid only when the **sql_compatibility** parameter is set to **A**. After this parameter is enabled, spaces at the end are not omitted in implicit conversion, explicit conversion, or conversion by calling the text(bpchar) function. ● If this item is specified, spaces at the end are not omitted in conversion. In addition, if the length of the char(n) type exceeds that of other variable-length string types, an error is reported. ● If this item is not specified, spaces at the end are omitted when the char(n) type is converted to another variable-length string type. gaussdb=# set behavior_compat_options=''; gaussdb=# create table tab_1(col1 varchar(3)); gaussdb=# create table tab_2(col2 char(3)); gaussdb=# insert into tab_2 values(' '); gaussdb=# insert into tab_1 select col2 from tab_2; gaussdb=# select * from tab_1 where col1 is null; col1 ------ (1 row) gaussdb=# select * from tab_1 where col1=' '; col1 ------ (0 rows) gaussdb=# delete from tab_1; gaussdb=# set behavior_compat_options = 'char_coerce_compat'; gaussdb=# insert into tab_1 select col2 from tab_2; gaussdb=# select * from tab_1 where col1 is null; col1 ------ (0 rows) gaussdb=# select * from tab_1 where col1=' '; col1 ------ (1 row)

Configuration Item	Behavior
truncate_numeric_tail_zero	Configuration item for numeric display. ● If this item is specified, the trailing zeros after the decimal point are hidden in all numeric output scenarios except to_char(numeric, format). ● If this item is not specified, numeric data is displayed in the default precision. For example: gaussdb=# set behavior_compat_options='truncate_numeric_tail_zero'; gaussdb=# select cast(123.123 as numeric(15,10)) as a, to_char(cast(123.123 as numeric(15,10)), '999D999999'); a | to_char ---------+------------- 123.123 | 123.123000 (1 row) gaussdb=# set behavior_compat_options=''; gaussdb=# select cast(123.123 as numeric(15,10)) as a, to_char(cast(123.123 as numeric(15,10)), '999D999999'); a | to_char ----------------+------------- 123.1230000000 | 123.123000 (1 row)
plsql_security_definer	After this parameter is enabled, the definer permission is used by default when a stored procedure is created.

Configuration Item	Behavior
plpgsql_dependency	If this parameter is set, a function, stored procedure, or package containing undefined objects can be created. You can query the dependency in GS_DEPENDENCIES and GS_DEPENDENCIES_OBJ. If this parameter is enabled, when creating a PL/SQL object, the OID that depends on the PL/SQL object is automatically updated. Dependency can be established in the following scenarios: 1. A function appears at the position of the dependency type and parameter default value in a function header. 2. Package, type in the function, and variable dependency type. 3. Variable declaration and variable value assignment depend on variables in other packages. 4. In the function body, function A is called in the right value expression of the function call or assignment statement. If the input and output parameters of function A contain function B, no dependency is established for function B. For example, **functionA(functionB())**. Only the dependency for function A is established. 5. Dependency function in a view. Dependency cannot be established in the following scenarios: 1. A type in a schema depends on other types. 2. Dependency on functions, variables, tables, and views in SQL statements. For example, dependency is not recorded for **select id into var1 from table1 join view1 on table1.id = pkg1.var1; table1,view1,pkg1**. 3. Dependency on functions, variables, tables, and views in a view. Notes: 1. When PL/SQL objects are concurrently created, deadlocks may occur if contention occurs among the objects. 2. If the objects to be modified exist in **gs_dependencies** and **gs_dependencies_obj**, you cannot rename the objects. 3. When a function, stored procedure, or package depends on a synonym, the synonym must be created in advance. OIDs cannot be maintained manually. 4. This parameter is used together with the **plsql_expression_check** parameter of **plsql_compile_check_options** to provide complete

Configuration Item	Behavior
	verification and dependency creation functions. For details, see the description of the **plsql_expression_check** parameter. 5. Dependency types, tables, and functions do not exist at the beginning. They exist later through renaming. OIDs cannot be proactively maintained. 6. The package function is overloaded, the number of input and output parameters is the same, but the types are different. In addition, the input and output parameters depend on external types, and the sequence numbers of external types in the input and output parameters are the same. In this case, an error may be reported when a type is deleted. 7. The input and output parameters of the function and stored procedure depend on the external type **a.b**. The external type must be created in advance. After deleting a type, you need to rebuild the corresponding function and stored procedure. Example: **proc1(var1 a.b, var2 a.b %type, var3 a.b %rowtype)**. 8. For a specific dependency, for example, when you create function, stored procedure, or view A, the default values of the input and output parameters of A depend on the defined function B: ● When the **plpgsql_dependency** parameter is enabled, even if the pg_depend table records the dependency data of A and B, A is not deleted when B is deleted. ● When the **plpgsql_dependency** parameter is disabled, A is deleted when B is deleted because the pg_depend table records the dependency data of A and B. ● If the gs_dependencies and gs_dependencies_obj tables contain dependent data, the dependent data will be deleted regardless of whether **plpgsql_dependency** is enabled or not. The dependencies are as follows: ● The default values of input and output parameters of the function or stored procedure A depend on function B. ● The input and output parameters or return value of the function or stored procedure A depends on type B. ● The public variables of package A depend on the public variables of package B. ● View A depends on function B.

Configuration Item	Behavior
	9. Leave this parameter unchanged throughout the operation. If this parameter is disabled, OIDs that depend on the PL/SQL object are not proactively maintained, and data in gs_dependencies and gs_dependencies_obj is not updated. As a result, residual data exists in the gs_dependencies and gs_dependencies_obj tables. 10. If this parameter is enabled or disabled during the operation, data in the gs_dependencies catalog will be inconsistent. Therefore, you are advised not to do so. If this parameter is disabled, the following alarm information is displayed: WARNING: Disable parameter plpgsql_dependency. Check whether the data in the system table is normal. Please see Centralized-Administrator Guide->Configuring Running Parameters->GUC Parameters->Version and Platform Compatibility->Platform and Client Compatibility->plpgsql_dependency. DETAIL: Disable parameter plpgsql_dependency. see the description of the plpgsql_dependency parameter For example: Enable the parameter. set behavior_compat_options='plpgsql_dependency'; create type type1 as (c1 int, c2 int); CREATE OR REPLACE function fun1(var int) return int is var type1; begin return 1; end; / The data in the system catalog is as follows: gaussdb=# select * from gs_dependencies; schemaname | packagename | refobjpos | refobjoid | objectname ------------+-------------+-----------+----------- +---------------------- public | null | 8 | 115940 | fun1(pg_catalog.int4) (1 row) gaussdb=# select oid,* from gs_dependencies_obj order by oid;

Configuration Item	Behavior
	oid | schemaname | packagename | type | name | objnode --------+------------+-------------+------+------- +---------- ---------- ---------- 115940 | public | null | 3 | type1 | {DependenciesType :typType c :typCategory C :isRel false :attrInfo c1:pg_catalog.int4,c2:pg_catalog.int4, :elemTypName <> :idxByTypName <>} (1 row) Disable the parameter. set behavior_compat_options=''; create type type2 as (c1 int, c2 int); CREATE OR REPLACE function fun2(var int) return int is var type2; begin return 1; end; / The data in the system catalog is as follows: gaussdb=# select * from gs_dependencies; schemaname | packagename | refobjpos | refobjoid | objectname ------------+-------------+-----------+-----------+------------ (0 rows) gaussdb=# select oid,* from gs_dependencies_obj order by oid; oid | schemaname | packagename | type | name | objnode -----+------------+-------------+------+------+--------- (0 rows) If the parameter is disabled during the operation, you are advised to enable the parameter to rebuild the updated functions, stored procedures, and packages. Expected data is displayed in gs_dependencies. Rebuild **fun2**. Enable the parameter. set behavior_compat_options='plpgsql_dependency';

Configuration Item	Behavior
	CREATE OR REPLACE function fun2(var int) return int is var type2; begin return 1; end; / gaussdb=# select * from gs_dependencies; schemaname | packagename | refobjpos | refobjoid | objectname ------------+-------------+-----------+----------- +---------------------- public | null | 8 | 140563 | fun2(pg_catalog.int4) (1 row) gaussdb=# select oid,* from gs_dependencies_obj order by oid; oid | schemaname | packagename | type | name | objnode --------+------------+-------------+------+------- +-- -- ---------- 140563 | public | null | 3 | type2 | {DependenciesType :typType c :typCategory C :isRel false :attrInfo c1:pg_catalog.int4,c2:pg_catalog.int4, :elemTypName <> :idxByTypName <>} (1 row)
disable_rewrite_nesttable	If this parameter is enabled, rewriting columns of the tableof type in the pg_type table will be disabled. That is, when you read the pg_type table, the actual stored value of the tableof type is displayed.
skip_insert_gs_source	If this parameter is enabled, no data is inserted into the dbe_pldeveloper.gs_source table when the PL/SQL objects are created.

Configuration Item	Behavior
disable_emptystr2null	In the A-compatible parameter binding scenario, if this parameter is enabled, the function of converting the values of parameters of the character type from an empty string to **null** by default, if any, is disabled. text, clob, blob, raw, bytea, varchar, nvarchar2, bpchar, char, name, byteawithoutorderwithqualcol, and byteawithoutordercol. This parameter is reserved for emergency. Do not set it unless necessary.
select_into_return_null	This parameter takes effect only in PG-compatible mode. If it is enabled, **NULL** values can be assigned to the variables in the stored procedure statement **SELECT** *select_expressions* **INTO [STRICT]** *target* **FROM...** without specifying **STRICT** when the query result is empty.

Configuration Item	Behavior
proc_uncheck_default_param	When a function is called, the system does not check whether the default parameter is omitted. ● If this item is not specified and a function with default parameters is called, input parameters are added to the function from left to right. If inputs of non-default parameters are missing, an error is reported. For example: gaussdb=# create or replace function test(f1 int, f2 int default 20, f3 int, f4 int default 40, f5 int default 50) return int gaussdb-# as gaussdb$# begin gaussdb$# raise info 'f1:%',f1; gaussdb$# raise info 'f2:%',f2; gaussdb$# raise info 'f3:%',f3; gaussdb$# raise info 'f4:%',f4; gaussdb$# raise info 'f5:%',f5; gaussdb$# return 1; gaussdb$# end; gaussdb$# / CREATE FUNCTION gaussdb=# select test(1,2); ERROR: function test(integer, integer) does not exist LINE 1: select test(1,2); ^ HINT: No function matches the given name and argument types. You might need to add explicit type casts. CONTEXT: referenced column: test ● If this item is specified and a function with default parameters is called, input parameters are added to the function from left to right. The number of defaulted inputs depends on the number of default parameters. If an input of a non-default parameter is missing, the previous default value is used to fill this parameter. For example: gaussdb=# create or replace function test(f1 int, f2 int default 20, f3 int, f4 int default 40, f5 int default 50) return int gaussdb-# as gaussdb$# begin gaussdb$# raise info 'f1:%',f1; gaussdb$# raise info 'f2:%',f2; gaussdb$# raise info 'f3:%',f3; gaussdb$# raise info 'f4:%',f4; gaussdb$# raise info 'f5:%',f5; gaussdb$# return 1; gaussdb$# end; gaussdb$# / CREATE FUNCTION gaussdb=# select test(1,2); INFO: f1:1 CONTEXT: referenced column: test INFO: f2:2 CONTEXT: referenced column: test INFO: f3:20 CONTEXT: referenced column: test INFO: f4:40 CONTEXT: referenced column: test INFO: f5:50 CONTEXT: referenced column: test test

Configuration Item	Behavior
	------ 1 (1 row) As shown above, f3 is filled with an incorrect default value. **WARNING** In this scenario, a non-default parameter is filled with the previous default value.
dynamic_sql_compat	After this parameter is enabled: 1. Duplicate parameters in the SQL statement template are not regarded as the same parameter, but match variables in the USING clause in sequence. 2. If a stored procedure is called during dynamic statement execution, the IN and OUT attributes in a stored procedure and the USING clause are not checked. **CAUTION** If a stored procedure is called when a dynamic statement executes an anonymous block statement, only the **IN** parameters are corrected. If **OUT** parameters need to be checked, set the **proc_outparam_override** parameter.
dynamic_sql_check	After this parameter is enabled, an error is reported during dynamic statement execution if the number of different template parameters in the dynamic statement template SQL is different from that of variables in the USING clause. **CAUTION** ● If the **dynamic_sql_compat** option is enabled, the **dynamic_sql_check** option does not take effect. ● If a stored procedure is called when a dynamic statement executes an anonymous block statement, only the **IN** parameters are checked. If **OUT** parameters need to be checked, set the **proc_outparam_override** parameter. ● If a stored procedure is called when a dynamic statement executes an anonymous block statement and the parameter is enabled, the **IN** and **OUT** attributes in a stored procedure and the USING clause are not checked.

Configuration Item	Behavior
enable_funcname_with_argsname	If the parameter is enabled, the projection alias displays the complete function when SELECT is used to call a function. • If this item is not specified, the projection alias displays only the function name when SELECT is used to call a function. For example: `gaussdb=# select power(2,3);` ` power` `-------` `     8` `(1 row)` `gaussdb=# select count(*) from db_ind_columns;` ` count` `-------` `   611` `(1 row)` `gaussdb=# select count(index_name) from db_ind_columns;` ` count` `-------` `   611` `(1 row)` `gaussdb=# SELECT left('abcde', 2);` ` left` `------` ` ab` `(1 row)` `gaussdb=# SELECT pg_client_encoding();` ` pg_client_encoding` `--------------------` ` UTF8` `(1 row)` • If this item is specified, the projection alias displays the complete function when SELECT is used to call a function. For example: `gaussdb=# set behavior_compat_options =` `'enable_funcname_with_argsname';` `SET` `gaussdb=# select power(2,3);` ` power(2,3)` `------------` `          8` `(1 row)` `gaussdb=# select count(*) from db_ind_columns;` ` count(*)` `----------` `      611` `(1 row)` `gaussdb=# select count(index_name) from db_ind_columns;` ` count(index_name)` `-------------------` `              611` `(1 row)` `gaussdb=# SELECT left('abcde', 2);` ` left('abcde',2)` `-----------------`

Configuration Item	Behavior
	ab (1 row) gaussdb=# SELECT pg_client_encoding(); pg_client_encoding() ---------- UTF8 (1 row) **CAUTION** ● Currently, only func_name(args_list), func_name(), and func_name(*) can be used to display complete functions and the arguments can only be character strings, numeric values, column names, and functions. A function name can contain a schema or package name. The parameter cannot contain other clauses (such as the ORDER BY clause) or be an expression. The parameter can contain only the DISTINCT keyword. If the parameter contains other keywords, complete functions cannot be displayed. ● Some special functions do not support displaying projection alias, including COLLATION FOR, CURRENT_DATE, CURRENT_TIME, CURRENT_TIMESTAMP, DBTIMEZONE, LOCALTIME, LOCALTIMESTAMP, SYSDATE, SESSIONTIMEZONE, ROWNUM, CURRENT_ROLE, CURRENT_USER, SESSION_USER, USER, CURRENT_CATALOG, CURRENT_SCHEMA, CAST, EXTRACT, TIMESTAMPDIFF, OVERLAY, POSITION, SUBSTRING, TREAT, TRIM, NULLIF, NVL, NVL2, COALESCE, GREATEST, LEAST, LNNVL, REGEXP_LIKE, and XML functions. ● If some secure encryption and decryption functions and masking functions are displayed completely by projection aliases, it may bring security problems. Therefore, only function names are displayed here, including: gs_encrypt_aes128, gs_decrypt_aes128, gs_encrypt, gs_decrypt, gs_encrypt_bytea, gs_decrypt_bytea, aes_encrypt, aes_decrypt, pg_create_physical_replication_slot_extern, dblink_connect, creditcardmasking, basicemailmasking, fullemailmasking, alldigitsmasking, shufflemasking, randommasking, regexpmasking, and gs_digest. ● Parameter transfer using => is not supported for the projection alias to display the complete function. The projection alias cannot contain double quotation marks (""), for example, **select "power"(2,3)**. ● To enable the projection alias to display the complete function, this function is not affected by parameters such as removing 0 at the end.

Configuration Item	Behavior
proc_outparam_transfer_length	After this parameter is enabled, the length of the **out** output parameter can be transferred in the stored procedure and function, and an error is reported in the inner stored procedure or function. For example: gaussdb=# SET behavior_compat_options='proc_outparam_override,proc_outparam_transfer_length'; SET gaussdb=# CREATE OR REPLACE PROCEDURE out_param_test1(m in int, v inout varchar2,v1 inout varchar2) is gaussdb$# begin gaussdb$# v := 'aaaddd'; gaussdb$# v1 := 'aaaddd'; gaussdb$# end; gaussdb$# / CREATE PROCEDURE gaussdb=# CREATE OR REPLACE PROCEDURE call_out_param_test1 is gaussdb$# v varchar2(5) := 'aabbb'; gaussdb$# v1 varchar2(6) := 'aabb'; gaussdb$# begin gaussdb$# out_param_test1(5,v,v1); gaussdb$# end; gaussdb$# / CREATE PROCEDURE gaussdb=# CALL call_out_param_test1(); ERROR: value too long for type character varying(5) CONTEXT: PL/SQL function out_param_test1(integer,character varying,character varying) line 3 at assignment PL/SQL function call_out_param_test1() line 4 at SQL statement
varray_compat	After this parameter is enabled: 1. The behaviors of assigning values to elements of the array type and reading elements change. 2. The behavior of calling related array functions changes. 3. After this parameter is enabled, the maximum capacity behavior difference of the varray type is verified. For details and examples, see "Stored Procedure > Arrays, Collections, and Records > Arrays" in *Developer Guide*. **CAUTION** • Do not switch and use this parameter in the same session. • After a database is upgraded: • For array types that have been defined in stored procedures or packages, enabling the **varray_compat** parameter does not take effect. You need to rebuild the array type. That is, you need to rebuild the stored procedure or package by performing the CREATE OR REPLACE or DROP+CREATE operation. The parameter takes effect only after the array type is rebuilt. • After the **plpgsql_dependency** parameter is enabled, if the content of the CREATE OR REPLACE PACKAGE/CREATE OR REPLACE PACKAGE BODY operation is the same as that of the original package or package body, the original array type will not be rebuilt. Enabling the **varray_compat** parameter does not take effect.

Configuration Item	Behavior
tableof_elem_constraints	After this parameter is enabled: 1. For the collection type, the validity of elements will be verified. 2. If the index is of the varchar collection type, the validity of the index length is also verified. For details, see "Stored Procedure > Arrays, Collections, and Records > Collections" in *Developer Guide*. **CAUTION** • Do not switch and use this parameter in the same session. • After a database is upgraded: • For collection types that have been defined in stored procedures or packages, enabling the **tableof_elem_constraints** parameter does not take effect. You need to rebuild the collection type. That is, you need to rebuild the stored procedure or package by performing the CREATE OR REPLACE or DROP+CREATE operation. The parameter takes effect only after the collection type is rebuilt. • After the **plpgsql_dependency** parameter is enabled, if the content of the CREATE OR REPLACE PACKAGE/CREATE OR REPLACE PACKAGE BODY operation is the same as that of the original package or package body, the original collection type will not be rebuilt. Enabling the **tableof_elem_constraints** parameter does not take effect. • If a collection type is created using the syntax: CREATE TYPE type_name IS TABLE OF data_type, you need to drop the type and rebuild it for the function to take effect. The following is an example of verifying the validity of elements: If this parameter is not enabled, the elements are not verified when the following stored procedure is called: `gaussdb=# CREATE OR REPLACE procedure p1 is` `gaussdb$#  type t1 is table of varchar(5);` `gaussdb$#  v t1 := t1();` `gaussdb$# begin` `gaussdb$#  v.extend();` `gaussdb$#  v(1) := '123456';` `gaussdb$#  raise info '%', v;` `gaussdb$# end;` `gaussdb$# /` `CREATE PROCEDURE` `gaussdb=# CALL p1();` `INFO:  {123456}` ` p1` `----` `(1 row)` If this parameter is enabled, the elements are verified and an error may be reported when the following stored procedure is called: `gaussdb=# SET behavior_compat_options = 'tableof_elem_constraints';` `SET` `gaussdb=# CREATE OR REPLACE procedure p1 is`

Configuration Item	Behavior
	gaussdb$# type t1 is table of varchar(5); gaussdb$# v t1 := t1(); gaussdb$# begin gaussdb$# v.extend(); gaussdb$# v(1) := '123456'; gaussdb$# raise info '%', v; gaussdb$# end; gaussdb$# / CREATE PROCEDURE gaussdb=# CALL p1(); ERROR: value too long for type character varying(5) CONTEXT: PL/SQL function p1() line 5 at assignment The following is an example of verifying the index value: If this parameter is not enabled, no error is reported when the index value exceeds the defined length. gaussdb=# CREATE OR REPLACE procedure p1 is gaussdb$# type t1 is table of int index by varchar(5); gaussdb$# v t1; gaussdb$# begin gaussdb$# v('123456') := 1; gaussdb$# raise info '%', v; gaussdb$# end; gaussdb$# / CREATE PROCEDURE gaussdb=# CALL p1(); INFO: {indexbyType:varchar,"123456"=>1} p1 ---- (1 row) If this parameter is enabled, an error is reported when the index value exceeds the defined length. gaussdb=# SET behavior_compat_options = 'tableof_elem_constraints'; SET gaussdb=# CREATE OR REPLACE procedure p1 is gaussdb$# type t1 is table of int index by varchar(5); gaussdb$# v t1; gaussdb$# begin gaussdb$# v('123456') := 1; gaussdb$# raise info '%', v; gaussdb$# end; gaussdb$# / CREATE PROCEDURE gaussdb=# CALL p1(); ERROR: value too long for type character varying(5) CONTEXT: PL/SQL function p1() line 4 at assignment

Configuration Item	Behavior
allow_rownum_alias	After this parameter is enabled, ROWNUM can be used as a column alias in SQL statements using the AS syntax. ROWNUM is used as a common identifier and cannot be used as a pseudocolumn. **WARNING** You are advised not to change the status of this parameter during service execution. When the parameter is enabled, database objects (such as table names, column names, and database names) are created using ROWNUM as the name in the database. If the parameter is disabled, ambiguity occurs and the behavior is unpredictable. When the parameter is disabled, the behavior of using ROWNUM as a pseudocolumn in the database becomes invalid after the parameter is enabled and the behavior is unpredictable.
current_sysdate	If this parameter is enabled, the current OS time is obtained when the **sysdate** command is executed. gaussdb=# set behavior_compat_options='current_sysdate'; SET gaussdb=# select sysdate; current_sysdate --------------------- 2023-06-20 20:15:27 (1 row)

<table>
<tr><th>Configuration Item</th><th>Behavior</th></tr>
<tr><td>allow_function_procedure_replace</td><td>In the default scenario, for A and PG compatibility modes, when there is a stored procedure (or function) outside the package, you cannot create a function (or stored procedure) with the same name because they are of different object types, and an error is reported. After this parameter is enabled, you can use the CREATE OR REPLACE method to replace stored procedures and functions with the same names outside the package.

Configuration Item	Behavior
collection_exception_backcompat	Exception value thrown when an error related to the collection type is reported in the PL/SQL. Currently, three exception values are controlled. The mapping is as follows: Parameter not enabled Parameter enabled collection_is_null program_limit_exceeded subscript_beyond_count program_limit_exceeded subscript_outside_limit program_limit_exceeded Example: gaussdb=# create or replace procedure p1 is gaussdb$# type t1 is table of int; gaussdb$# v t1; gaussdb$# v_int int; gaussdb$# begin gaussdb$# v_int := v.count(); gaussdb$# exception when collection_is_null then gaussdb$# raise info '%', sqlerrm; gaussdb$# end; gaussdb$# / CREATE PROCEDURE gaussdb=# call p1(); INFO: Reference to uninitialized collection p1 ---- (1 row) gaussdb=# create or replace procedure p1 is gaussdb$# type t1 is table of int; gaussdb$# v t1 := t1(1, 2, 3); gaussdb$# v_int int; gaussdb$# begin gaussdb$# v_int := v(4); gaussdb$# exception when subscript_beyond_count then gaussdb$# raise info '%', sqlerrm; gaussdb$# end; gaussdb$# / CREATE PROCEDURE gaussdb=# call p1(); INFO: Subscript beyond count p1 ---- (1 row) gaussdb=# create or replace procedure p1 is gaussdb$# type t1 is table of int; gaussdb$# v t1 := t1(1, 2, 3); gaussdb$# v_int int; gaussdb$# begin gaussdb$# v_int := v(-1); gaussdb$# exception when subscript_outside_limit then gaussdb$# raise info '%', sqlerrm; gaussdb$# end; gaussdb$# / CREATE PROCEDURE gaussdb=# call p1(); INFO: Subscript outside of limit p1

Configuration Item	Behavior
	---- (1 row) gaussdb=# set behavior_compat_options = 'collection_exception_backcompat'; SET gaussdb=# create or replace procedure p1 is gaussdb$# type t1 is table of int; gaussdb$# v t1; gaussdb$# v_int int; gaussdb$# begin gaussdb$# v_int := v.count(); gaussdb$# exception when program_limit_exceeded then gaussdb$# raise info '%', sqlerrm; gaussdb$# end; gaussdb$# / CREATE PROCEDURE gaussdb=# call p1(); INFO: Reference to uninitialized collection p1 ---- (1 row) gaussdb=# create or replace procedure p1 is gaussdb$# type t1 is table of int; gaussdb$# v t1 := t1(1, 2, 3); gaussdb$# v_int int; gaussdb$# begin gaussdb$# v_int := v(4); gaussdb$# exception when program_limit_exceeded then gaussdb$# raise info '%', sqlerrm; gaussdb$# end; gaussdb$# / CREATE PROCEDURE gaussdb=# call p1(); INFO: Subscript beyond count p1 ---- (1 row) gaussdb=# create or replace procedure p1 is gaussdb$# type t1 is table of int; gaussdb$# v t1 := t1(1, 2, 3); gaussdb$# v_int int; gaussdb$# begin gaussdb$# v_int := v(-1); gaussdb$# exception when program_limit_exceeded then gaussdb$# raise info '%', sqlerrm; gaussdb$# end; gaussdb$# / CREATE PROCEDURE gaussdb=# call p1(); INFO: Subscript outside of limit p1 ---- (1 row)

Configuration Item	Behavior
enable_case_when_alias	If this parameter is enabled, the aliases of the CASE WHEN and DECODE syntaxes are character strings starting with __unnamed_. Example: gaussdb=# set behavior_compat_options='enable_case_when_alias'; SET gaussdb=# create table test(c1 varchar2); CREATE TABLE gaussdb=# insert into test values('x'); INSERT 0 1 gaussdb=# select decode(c1,'x','0','default') from test; __unnamed_decode__ -------------------- 0 (1 row) gaussdb=# select (case c1 when 'x' then '0' else 'default' end) from test; __unnamed_case_when__ ---------------------- 0 (1 row)

Configuration Item	Behavior
plsql_rollback_keep_user	Determines whether ROLLBACK and ROLLBACK TO SAVEPOINT in PL/SQL changes the current user. If this parameter is enabled, ROLLBACK in the PL/SQL does not change the current user. Example: gaussdb=# create user plsql_rollback1 PASSWORD '********'; gaussdb=# create user plsql_rollback2 PASSWORD '********'; gaussdb=# grant plsql_rollback1 to plsql_rollback2; gaussdb=# create or replace procedure plsql_rollback1.p1 () authid definer gaussdb-# as gaussdb$# va int; gaussdb$# begin gaussdb$# raise info 'current usr:%', current_user; gaussdb$# rollback; gaussdb$# raise info 'current usr:%', current_user; gaussdb$# end; gaussdb$# / CREATE PROCEDURE gaussdb=# set session AUTHORIZATION plsql_rollback2 PASSWORD '********'; SET gaussdb=> set behavior_compat_options = 'plsql_rollback_keep_user'; SET gaussdb=> call plsql_rollback1.p1 (); INFO: current usr:plsql_rollback1 INFO: current usr:plsql_rollback1 p1 ---- (1 row) **CAUTION** • This parameter is valid only in an A-compatible database.

Configuration Item	Behavior
forbid_package_function_with_prefix	After this parameter is enabled, an error is reported if a function with a prefix is created in a package. For example: -- Create a schema **sch1**. gaussdb=# CREATE SCHEMA sch1; -- An error is reported after a package is created. gaussdb=# CREATE PACKAGE pck1 IS PROCEDURE sch1.pck1(); END pck1; / ERROR: not support procedure name use *.* format in package at or near ";" CONTEXT: compilation of PL/pgSQL package near line 1

Configuration Item	Behavior
enable_bpcharlikebpchar_compare	Enables or disables the bpcharlikebpchar and bpcharnlikebpchar operators. ● This parameter is enabled by default for a newly installed database. ● After the database of a version earlier than 505.1.0 is upgraded, this parameter is disabled by default. gaussdb=# SELECT bpcharlikebpchar('455'::BPCHAR(10), '455 '::BPCHAR); bpcharlikebpchar ------------------ f (1 row) gaussdb=# SELECT bpcharlikebpchar('455 '::BPCHAR(10), '455 '::BPCHAR(10)); bpcharlikebpchar ------------------ t (1 row) gaussdb=# SELECT bpcharlikebpchar('455 '::BPCHAR(10), '455'::BPCHAR(10)); bpcharlikebpchar ------------------ t (1 row) gaussdb=# SELECT bpcharlikebpchar('455 '::BPCHAR(10), '455'::BPCHAR(11)); bpcharlikebpchar ------------------ f (1 row) gaussdb=# CREATE TABLE op_test (col BPCHAR(2) DEFAULT NULL); CREATE TABLE gaussdb=# CREATE INDEX op_index ON op_test(col); CREATE INDEX gaussdb=# INSERT INTO op_test VALUES ('a'); INSERT 0 1 gaussdb=# INSERT INTO op_test VALUES ('1'); INSERT 0 1 gaussdb=# INSERT INTO op_test VALUES ('11'); INSERT 0 1 gaussdb=# INSERT INTO op_test VALUES ('12'); INSERT 0 1 gaussdb=# INSERT INTO op_test VALUES ('sd'); INSERT 0 1 gaussdb=# INSERT INTO op_test VALUES ('aa'); INSERT 0 1 gaussdb=# SHOW behavior_compat_options; behavior_compat_options ------------------------- (1 row) -- If **behavior_compat_options** does not contain **enable_bpcharlikebpchar_compare**, the latest bpcharlikebpchar operator is not enabled and the result set returned by the matching between bpchars is not the same as expected (all data should be returned in normal cases). gaussdb=# EXPLAIN (COSTS OFF) SELECT * FROM op_test WHERE col LIKE col::BPCHAR ORDER BY col; QUERY PLAN -------------------------------------- Sort Sort Key: col -> Seq Scan on op_test Filter: (col ~~ (col)::text) (4 rows) gaussdb=# SELECT * FROM op_test WHERE col LIKE col::BPCHAR ORDER BY

Configuration Item	Behavior
	col; col ----- 11 12 aa sd (4 rows) gaussdb=# SET behavior_compat_options = 'enable_bpcharlikebpchar_compare'; SET gaussdb=# SHOW behavior_compat_options; behavior_compat_options --------------------------------- enable_bpcharlikebpchar_compare (1 row) -- After this parameter is enabled, the latest bpcharlikebpchar operator is enabled, and the returned behavior meets the expected behavior during matching. gaussdb=# EXPLAIN (COSTS OFF) SELECT * FROM op_test WHERE col LIKE col::BPCHAR ORDER BY col; QUERY PLAN ------------------------------ Sort Sort Key: col -> Seq Scan on op_test Filter: (col ~~ col) (4 rows) gaussdb=# SELECT * FROM op_test WHERE col LIKE col::BPCHAR ORDER BY col; col ----- 1 11 12 a aa sd (6 rows) gaussdb=# DROP TABLE op_test; DROP TABLE **NOTE** • This parameter takes effect only when **sql_compatibility** is set to **A**. • If this parameter is enabled, the result set and execution plan for LIKE or NOT LIKE pattern matching between BPCHAR types are affected.
cursor_asensitive	Used for forward compatibility of cursor data-sensitive behavior. This item is not supported in the centralized mode.

Configuration Item	Behavior
show_full_error_lineno	Displays the number of the line that contains the header information of a stored procedure. When compilation error information is printed during the creation of a stored procedure, the number of the line where the CREATE statement starts is displayed. When a statement with compilation problems is called, there are two cases: if the recompilation is non-invalid, the number of the line where the CREATE statement starts is displayed; if an error is reported indicating invalid recompilation, the line number is displayed based on the original logic. To display the error information, you must have permission to view gs_source which contains the original definition of the stored procedure; otherwise, the number of the line where the error is reported is displayed based on the original logic. If an error is reported when the stored procedure is executed, after this parameter is set, the number of the line where the CREATE statement starts is displayed. This parameter takes effect only in centralized mode. set behavior_compat_options='plpgsql_dependency, show_full_error_lineno'; set plsql_compile_check_options='plsql_expression_check'; CREATE OR REPLACE function proclex1(type1 int) return int is var1 int; var2 int; begin var3 := 30; --- **var3** is not defined. return type1; end; / WARNING: "var3" is not a known variable DETAIL: N/A CONTEXT: compilation of PL/pgSQL function "proclex1" near line 6 WARNING: Function created with compilation errors.

Configuration Item	Behavior
enable_crosstype_integer_operator	Enables or disables the cross-type integer operator. ● This parameter is enabled by default for a newly installed database. ● After the database of a version earlier than 505.1.0 is upgraded, this parameter is disabled by default. ● Involved operators: =, <>, <, >, <=, and >= ● After this parameter is enabled, the involved cross-type integers can be compared directly without implicit conversion. Here is an example that uses (int1 op int2): gaussdb=# CREATE TABLE implicit_index(c1 int1); CREATE TABLE gaussdb=# CREATE INDEX idx1 ON implicit_index(c1); CREATE INDEX gaussdb=# SET behavior_compat_options='enable_crosstype_integer_operator'; SET gaussdb=# EXPLAIN SELECT * FROM implicit_index WHERE c1 = 1::int2; QUERY PLAN -- [Bypass] Index Only Scan using idx1 on implicit_index (cost=0.00..4.48 rows=13 width=1) Index Cond: (c1 = 1::smallint) (3 rows) gaussdb=# SET behavior_compat_options=''; SET gaussdb=# EXPLAIN SELECT * FROM implicit_index WHERE c1 = 1::int2; QUERY PLAN -- Seq Scan on implicit_index (cost=0.00..49.52 rows=13 width=1) Filter: ((c1)::bigint = 1::smallint) (2 rows) gaussdb=# DROP TABLE implicit_index; DROP TABLE

Configuration Item	Behavior
	NOTE • This parameter takes effect only when **sql_compatibility** is set to **A**. • If this parameter is enabled, the execution plan of operators involved in the following scenarios will be affected: • (int1 op int2) • (int1 op int4) • (int1 op int8) • (int1 op int16) • (int1 op numeric) • (int2 op int1) • (int2 op int16) • (int2 op numeric) • (int4 op int1) • (in4 op int16) • (int4 op numeric) • (int8 op int1) • (int8 op int16) • (int8 op numeric) • (int16 op int1) • (int16 op int2) • (int16 op int4) • (int16 op int8) • (numeric op int1) • (numeric op int2) • (numeric op int4) • (numeric op int8)
time_constexpr_compact	If this parameter is enabled, in a scenario where the time expression is executed, the type automatically returned is with timezone or without timezone depending on whether the constant carries the time zone. Currently, the timestamp and time types are supported. `-- Execute a timestamp expression without a time zone.` `gaussdb=# SELECT timestamp '1999-03-15 8:00:00';` `     timestamp` `---------------------` ` 1999-03-15 08:00:00` `(1 row)` `-- The type timestamp with time zone is returned after a timestamp expression with a time zone is executed.` `gaussdb=# SELECT timestamp '1999-03-15 8:00:00 -8:00:00';` `     timestamptz` `------------------------` ` 1999-03-16 00:00:00+08` `(1 row)`

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Adjust the parameter value based on the database-compatible objects.

plsql_compile_check_options

Parameter description: Specifies the database compatibility configuration item.

Parameter type: string.

Unit: none

Value range: Currently, only compatibility configuration items listed in **Table 14-15** are supported. Use commas (,) to separate multiple compatibility configuration items, for example, **set plsql_compile_check_options='for_loop,outparam'**.

Default value: **''**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none.

Table 14-15 Compatibility configuration items

Configuration Item	Behavior
for_loop	Controls the behavior of the FOR_LOOP query statement in a stored procedure. When this parameter is set, if *rec* has been defined in the FOR rec IN query LOOP statement, the defined *rec* variable is not reused. Instead, a new variable is created. Otherwise, the defined *rec* variable is reused and no variable is created. (It is the same as **proc_implicit_for_loop_variable** and will be incorporated later.)
outparam	When the output parameter overloading condition is met, the output parameters are checked. If the output parameters are constant, an error is reported.

Configuration Item	Behavior
plsql_expression_check	If the **plsql_expression_check** parameter is enabled, the **plpgsql_dependency** parameter must also be enabled. It verifies full statements in functions, stored procedures, and packages. If an undefined object exists (for example, a table, variable, or function does not exist), an alarm is generated. **CAUTION** • The verification function supports only the following SQL statements: SELECT, INSERT, UPDATE, DELETE, and MERGE. DDL and DML statements are not supported. • Dynamic SQL statements are not verified. • False positives exist. As a result, alarms are generated when functions, stored procedures, and packages are created, invalid recompilation occurs, or the **valid** column of pg_object is **false**. Therefore, you are advised to use it in the test environment to debug functions, stored procedures, and packages and modify the definitions of functions, stored procedures, and packages to improve fault locating efficiency. It is not recommended in the production environment. The following is an example of the verification function: `CREATE OR REPLACE procedure proc1()` `AS` `var1 int;` `begin` `SELECT id into var1 from table1_not_exist limit 1;-- The table does not exist, and an alarm is generated.` `SELECT id into var1 from view1_not_exist limit 1;-- The view does not exist, and an alarm is generated.` `var1 := func_input1(func1_not_exist());-- The function does not exist, and an alarm is generated.` `var1 := pkg.var1_not_exist;-- The package variable does not exist, and an alarm is generated.` `end;` `/` The following command output indicates that the creation is successful and the alarm information is printed: `WARNING: compile failed when parse the query: select id from table1_not_exist limit 1, error info is relation "table1_not_exist" does not exist on datanode` `DETAIL: N/A` `CONTEXT: compilation of PL/SQL function "proc1" near line 3` `WARNING: compile failed when parse the query: select id from view1_not_exist limit 1, error info is relation "view1_not_exist" does not exist on datanode` `DETAIL: N/A` `CONTEXT: compilation of PL/SQL function "proc1" near line 4` `WARNING: compile failed when parse the query: SELECT func_input1(func1_not_exist()), error info is function func1_not_exist() does not exist` `DETAIL: N/A` `CONTEXT: compilation of PL/SQL function "proc1" near line 5` `WARNING: compile failed when parse the query: SELECT pkg.var1_not_exist, error info is missing FROM-clause entry for table "pkg"` `DETAIL: N/A` `CONTEXT: compilation of PL/SQL function "proc1" near line 6` `WARNING: Procedure created with compilation errors.` `CREATE PROCEDURE` False alarms:

Configuration Item	Behavior
	Example 1: CREATE TABLE emp(deptno smallint, ename char(100), salary int); CREATE TABLE emp_back(deptno smallint, ename char(100), salary int); CREATE OR REPLACE PROCEDURE proc_200() As BEGIN for data in delete from emp returning * loop INSERT INTO emp_back values(data.deptno,data.ename,data.salary);-- This alarm is falsely reported. END LOOP; END; / WARNING: compile failed when parse the query: INSERT INTO emp_back values(data.deptno,data.ename,data.salary), error info is record "data" is not assigned yet when get datum type info DETAIL: N/A CONTEXT: compilation of PL/pgSQL function "proc_200" near line 4 WARNING: Procedure created with compilation errors. CREATE PROCEDURE Example 2: CREATE OR REPLACE procedure proc1() is BEGIN DROP TABLE if exists table1; CREATE TABLE table1(id int); INSERT INTO table1 values(1);-- The system incorrectly reports that **table1** does not exist. END; / WARNING: compile failed when parse the query: insert into table1 values(1), error info is relation "table1" does not exist on datanode DETAIL: N/A CONTEXT: compilation of PL/SQL function "proc1" near line 2 WARNING: Procedure created with compilation errors. CREATE PROCEDURE The status of pg_object is invalid. SELECT object_type,valid from pg_object obj join pg_proc proc on obj.object_oid = proc.oid and proc.proname = 'proc1'; object_type | valid -------------+------- P | f (1 row) ALTER procedure proc1 compile; WARNING: compile failed when parse the query: insert into table1 values(1), error info is relation "table1" does not exist on datanode DETAIL: N/A CONTEXT: compilation of PL/SQL function "proc1" near line 5 WARNING: Procedure proc1 recompile with compilation errors. ALTER PROCEDURE SELECT object_type,valid from pg_object obj join pg_proc proc on obj.object_oid = proc.oid and proc.proname = 'proc1'; object_type | valid -------------+------- P | f (1 row) call proc1(); NOTICE: table "table1" does not exist, skipping CONTEXT: SQL statement "drop table if exists table1" PL/SQL function proc1() line 3 at SQL statement proc1 ------- (1 row)

Configuration Item	Behavior
	SELECT object_type,valid from pg_object obj join pg_proc proc on obj.object_oid = proc.oid and proc.proname = 'proc1'; object_type | valid -------------+------- P | t (1 row) When a function, stored procedure, or package is created or recompiled, the verification function is executed. If this alarm is falsely reported, the **valid** column of pg_object changes to **false**. In the execution phase, no verification is performed. When the execution is successful, the **valid** column of pg_object changes to **true**.

a_format_version

Parameter description: Specifies the database platform compatibility configuration item. The value of this parameter is an enumerated string.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string.

Default value: ""

NOTE

- Currently, only **Table 14-16** is supported.
- Set a character string for the compatibility configuration item, for example, **set a_format_version='10c'**.

Table 14-16 Compatibility configuration items

Configuration Item	Behavior
10c	Compatible version of platform A

a_format_dev_version

Parameter description: Specifies the database platform minor version compatibility configuration item. The value of this parameter is an enumerated string.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string.

Default value: ""

NOTE

- Currently, only **Table 14-17** is supported.
- Set a character string for the compatibility configuration item, for example, **set a_format_dev_version='s1'**.

Table 14-17 Compatibility configuration items

Configuration Item	Behavior
s1	• Compatible minor version of platform A, which affects functions TRUNC(date, fmt), ROUND(date, fmt), NVL2, LPAD, RPAD, ADD_MONTHS, MONTHS_BETWEEN, REGEXP_REPLACE, REGEXP_COUNT, TREAT, EMPTY_CLOB, INSTRB, trunc(number), greatest, least, mod, round(number), cast, to_date, to_timestamp, chr, rtrim, translate, to_char, to_number, and to_timestamp_tz. • Data type casting: A decimal character string is rounded off when it is converted to an integer (int1/int2/int4/int8/int16). • Data type casting: Implicit conversion from timestamp with time zone to timestamp without time zone is supported.
s2	• Compatible minor version of platform A, which affects functions such as dump, to_single_byte, to_multi_byte, nls_upper, nls_lower, initcap, ascii2, asciistr, unistr, vsize, cosh, remainder, sinh, tanh, nanvl, current_date, current_timestamp, dbtimezone, numtodsinterval, numtoyminterval, new_time, sessiontimezone, sys_extract_utc, tz_offset, to_binary_double, to_binary_float, to_dsinterval, to_yminterval, lnnvl, ora_hash, rawtohex2, bit2coding, and bit4coding. • Supports all behaviors when the compatibility configuration item is set to **s1**.
s3	• Compatible minor version of platform A. If the parameter is enabled, nested calling of functions without parameters is supported. • Supports all behaviors when the compatibility configuration item is set to **s2**.
s4	• Compatible minor version of platform A, which affects functions such as nchr(cvalue int|bigint), to_timestamp_tz, getclobval(xml), and getstringval(xml). • Supports all behaviors when the compatibility configuration item is set to **s3**.
s5	• Compatible minor version of platform A. If the parameter is enabled, the composite type with the same name as a function is preferentially parsed. The sys_guid() function is affected. • Supports all behaviors when the compatibility configuration item is set to **s4**.

b_format_version

Parameter description: Specifies the database platform compatibility behavior configuration item that controls the forward compatibility in B-compatible mode.

NOTE

- **b_format_version** takes effect only when **sql_compatibility** is set to **B**.
- If this parameter is set to a non-empty string, **b_format_behavior_compat_options** is set to **'ALL'** and **bytea_output** parameter is set to **'escape'** simultaneously. If this parameter is set to an empty string and takes effect, the **b_format_behavior_compat_options** and **bytea_output** are set to the original values.

Parameter type: string.

Unit: none

Value range: an empty string **''** or **'5.7'**

Default value: an empty string **''**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 1 GUC parameters**.

Setting suggestion: none.

b_format_dev_version

Parameter description: Specifies the database platform minor version compatibility configuration item.

NOTE

b_format_dev_version takes effect only when **sql_compatibility** is set to **B** and **b_format_version** is set to **5.7**.

Parameter type: string.

Unit: none

Value range: an empty string **''** or a compatibility configuration item in **Table 14-18**.

Table 14-18 Compatibility configuration items

Configuration Item	Behavior
s1	1. The following parameters are influenced: If this parameter is enabled, the **datetime** option in the **disable_keyword_options** parameter is removed, indicating that DATETIME is used as a non-reserved keyword. *datetime* can be used as a table name, column name, or alias, but cannot be used as a function name, stored procedure name, or parameter name of a function or stored procedure. 2. The following functions are influenced: curdate, from_days, date_format, str_to_date, current_date, datediff, timestampdiff, date_add, subtime, month, time_to_sec, to_days, to_seconds, dayname, monthname, convert_tz, sec_to_time, addtime, adddate, date_sub, timediff, last_day, weekday, from_unixtime, unix_timestamp, subdate, day, year, weekofyear, dayofmonth, dayofyear, week, yearweek, dayofweek, time_format, hour, minute, second, microsecond, quarter, utc_date, get_format, extract, makedate, period_add, timestamppadd, period_diff, utc_time, utc_timestamp, sysdate, current_timestamp, maketime, curtime, current_time, localtime, localtimestamp, now, lc_time_names, default_week_format, and json_object. 3. The following types are influenced: a. Be compatible with the integer type tinyint with the value range changed to –128 to 127. b. Be compatible with the character string types char and varchar. The precision *n* of char(*n*) and varchar(*n*) is changed from the byte length to the character length. c. Be compatible with the text types tinytext, mediumtext, and longtext. These types are mapped to the text type after the parameter is enabled. d. Be compatible with binary types tinyblob, blob, mediumblob, and longblob. These types are mapped to the bytea type after the parameter is enabled. e. Be compatible with floating-point types double, float, and real. Among them, double is mapped to the float8 type, double(p, s) is mapped to the numeric type, float(p, s) is mapped to the numeric type, real is mapped to float8, and real(p, s) is mapped to the numeric type. f. Be compatible with high-precision types numeric, dec, and decimal. If the precision and scale are not specified, the default precision is changed to **10** and the scale is changed to **0**.

Configuration Item	Behavior
	g. Be compatible with time types datetime, timestamp, time, and date. Replace datetime[(*p*)] with a timestamp without time zone[(*p*)]. Replace timestamp[(p)] with a timestamp with time zone[(p)]. The input, output, range, and precision specifications of these types are changed. For details, see "SQL Reference > Data Type" in *Developer Guide*. h. Be compatible with integer types tinyint, smallint, int, and bigint. The display width and ZEROFILL attributes of these types take effect after the parameter is enabled. 4. The following syntax is influenced: The column constraint ON UPDATE update_expr can be specified. 5. The following operators are influenced: a. An error is reported when the || operator between bytea types is used. b. The REGEXP operator is supported.

Configuration Item	Behavior
s2	The compatibility behavior controlled by s1 is included. In addition, the following impacts are included: 1. The following parameters are influenced: a. The **auto_increment_cache** parameter takes effect only when this option is enabled. b. When this option is enabled, the **multi_insert_min_rows** parameter takes effect for auto-increment columns. c. When this option is enabled, **standard_conforming_strings** and **escape_string_warning** are set to **off**. d. The **collation_connection** and **character_set_connection** parameters take effect only when this option is enabled. 2. The following functions are affected: a. When **0**, **NULL**, and definite values are imported or batch inserted into the auto-increment column, the auto-increment count is updated immediately when the definite values are inserted, and then **0** or **NULL** increases automatically based on the definite values. b. The like operator does not report an error when an escape character is at the end of the matching string. c. The sorting rule priorities of character sets and collations will be changed. For details, see section 7.4.7 in *Developer Guide (Centralized)*. d. After the parameter is enabled, the collation of foreign keys cannot be inconsistent with that of columns. 3. The following syntax is influenced: a. The CREATE TABLE table_name LIKE source_table syntax is supported. b. The syntaxes CREATE TABLE table_name LIKE source_table and CREATE TABLE table_name (LIKE source_table) cannot specify **INCLUDING** and **EXCLUDING** options. By default, **INCLUDING ALL** is specified. c. The LOAD DATA syntax is supported. Some syntax functions in gs_loader that are consistent with the LOAD DATA syntax will change. d. The collate clause can be specified by set names. e. The syntaxes for changing table names, such as ALTER TABLE and RENAME TABLE, have impact in the following scenario:

Configuration Item	Behavior
	If the character string corresponding to the new table name starts with "#MySQL50#" and is followed by other characters, "#MySQL50#" will be ignored. If the old and new table names are the same, no error is reported.

Default value: an empty string **''**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 1 GUC parameters**.

Setting suggestion: none.

m_format_dev_version

Parameter description: Specifies the database platform minor version compatibility configuration item.

NOTE

m_format_dev_version takes effect only when **sql_compatibility** is set to **M**.

Parameter type: string.

Unit: none

Value range: an empty string **''** or a compatibility configuration item in **Table 14-19**.

Table 14-19 Compatibility configuration items

Configuration Item	Behavior
s1	The following syntax is influenced: 1. Disable the SELECT FETCH FIRST WORS ONLY syntax. 2. Disable the TRUNCATE CASCADE/RESTRICT syntax. 3. USING INDEX TABLESPACE tablespace_name syntax cannot be specified when a primary key is defined using CREATE TABLE. 4. The semantics of CASCADE/RESTRIC syntax in DROP TABLE/VIEW/COLUMN is ignored, and the default behavior is RESTRIC. 5. If the CREATE TABLE REFERENCES syntax is used as a column constraint, its semantics is changed to ignore the foreign key definition.

Default value: an empty string **''**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 1 GUC parameters**.

Setting suggestion: none.

sql_mode

Parameter description: Specifies the SQL behavior control configuration item in B-compatible and M-compatible modes.

NOTE

sql_mode takes effect when **sql_compatibility** is set to **B**, **b_format_version** is set to **'5.7'**, and **b_format_dev_version** is set to **'s1'**, or when **sql_mode** takes effect only when **sql_compatibility** is set to **M**.

Parameter type: string.

Unit: none

Value range:

An empty string **''** or a value in the range of **'strict_trans_tables,only_full_group_by,no_zero_in_date,no_zero_date,error_for_division_by_zero,no_auto_create_user,no_engine_substitution,pad_char_to_full_length,no_auto_value_on_zero'** in B-compatible mode.

In M-compatible mode, the parameters supported in B-compatible mode, **no_unsigned_subtraction**, **ansi_quotes**, **allow_invalid_dates**, and **real_as_float** are supported.

The meaning of each option value is described in **Table 14-20**.

Table 14-20 Compatibility configuration items

Configuration Item	Behavior	B-compatible Parameter Configuration	M-compatible Parameter Configuration
strict_trans_tables	Currently, only data types and system functions in B-compatible and M-compatible databases can be verified. If this parameter is set, its format and range are strictly verified. If an invalid value is entered or the value exceeds the range, an error is reported during parsing. If this parameter is not set, the format and range of the input parameter are loosely verified. If an invalid value is entered or the value exceeds the range, a warning is reported during parsing and the value **0** of the corresponding data is returned.	The options **strict_trans_tables**, **only_full_group_by**, **no_zero_in_date**, **no_zero_date**, and **error_for_division_by_zero** can only be set or canceled at the same time.	It can be set and canceled independently.
only_full_group_by	Projection columns that contain non-GROUP BY keys and that are not constants and aggregate functions are not allowed.		It can be set and canceled independently.
no_zero_in_date	The year, month, and day of the DATE cannot be **0**.		It can be set and canceled independently.
no_zero_date	The value of DATE cannot be **0** (**0000-00-00**).		It can be set and canceled independently.
error_for_division_by_zero	The value cannot be divided by 0.		It can be set and canceled independently.
no_auto_create_user	This item has no actual function. It is used only for compatibility that an error is not reported when the SET SQL_MODE statement contains this option.	It can be set and canceled independently.	It can be set and canceled independently.

Configuration Item	Behavior	B-compatible Parameter Configuration	M-compatible Parameter Configuration
no_engine_substitution	This item has no actual function. It is used only for compatibility that an error is not reported when the SET SQL_MODE statement contains this option.	It can be set and canceled independently.	It can be set and canceled independently.
pad_char_to_full_length	Be used for formatted output of CHAR columns in a table. If there are CHAR columns, a string with spaces at the end is output. Otherwise, a string without spaces at the end is output.	It can be set and canceled independently.	It can be set and canceled independently.
no_auto_value_on_zero	If this option is included, the value **0** inserted into the **AUTO_INCREMENT** column does not trigger auto-increment.	It can be set and canceled independently.	It can be set and canceled independently.
no_unsigned_subtraction	Unsigned numbers cannot be subtracted. If unsigned integers are subtracted and the result is negative, an error is returned.	-	It can be set and canceled independently.
ansi_quotes	ANSI_QUOTES mode is enabled. In this mode, double quotation marks are treated as identifier quotes rather than string quotes, and you must quote the entire name of a table or column with double quotation marks instead of backquotes.	-	It can be set and canceled independently.
allow_invalid_dates	If this option is enabled, MySQL allows invalid dates to be inserted, for example, '0000-00-00'.	-	It can be set and canceled independently.
real_as_float	By default, the REAL type is regarded as the DOUBLE type. If this option is enabled, the REAL type is regarded as the FLOAT type.	-	It can be set and canceled independently.

Default value:
'strict_trans_tables,only_full_group_by,no_zero_in_date,no_zero_date,error_for_division_by_zero,no_auto_create_user,no_engine_substitution'

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none.

auto_increment_increment

Parameter description: Specifies the auto-increment step of an auto-increment column. The auto-increment value is calculated by the following formula: **auto_increment_offset** + *N* × **auto_increment_increment**. *N* is a positive integer. If the parameter value is smaller than that of **auto_increment_offset**, an error occurs when the values in the auto-increment column automatically increase.

Parameter type: integer.

Unit: none

Value range: 1 to 65535

Default value: **1**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none.

auto_increment_offset

Parameter description: Specifies the initial value of an auto-increment column. The auto-increment value is calculated by the following formula: **auto_increment_offset** + *N* × **auto_increment_increment**. *N* is a positive integer. If the parameter value is greater than that of **auto_increment_increment**, an error occurs when the values in the auto-increment column automatically increase.

Parameter type: integer.

Unit: none

Value range: 1 to 65535

Default value: **1**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none.

auto_increment_cache

Parameter description: Specifies the number of reserved auto-increment cache values when auto-increment is triggered by batch insertion or import of auto-increment columns. When auto-increment values are reserved, the auto-increment counter value is updated to the maximum auto-increment cache value. Before the cache values are used up, the auto-increment counter value remains unchanged, and the triggered auto-increment uses the cache values.

NOTE

- The reserved cache values are valid only in the statement. If the reserved auto-increment cache values are used up and subsequent INSERT statements trigger auto-increment based on the auto-increment counter, the values in the auto-increment column in the table are discontinuous.
- When auto-increment is triggered by parallel import or insertion of auto-increment columns, the cache value reserved for each parallel thread is used only in the thread. If the cache value is not used up, the values of auto-increment columns in the table are discontinuous.
- When you add an auto-increment column to a table with data or modify a column to an auto-increment column, the existing data triggers auto-increment. The reserved auto-increment cache value is also affected by this parameter.
- This parameter does not affect the auto-increment column in the local temporary table.
- This parameter is valid only when **b_format_version** is set to **'5.7'** and **b_format_dev_version** is set to **'s2'**.

Default value: **0**

Parameter type: integer.

Unit: none

Value range: 0 to *INT_MAX*

- If this parameter is set to **0**, the auto-increment cache values are automatically reserved.
  - When auto-increment is triggered for the first time, if the number of rows to be inserted into the auto-increment column is known, the number is the reserved value.

    For example, the number of rows to be inserted cannot be obtained as the value of auto-increment that is triggered by INSERT INTO table SELECT ... or COPY FROM. When the ALTER TABLE statement is executed to rewrite table data, if auto-increment is triggered, reltuples in the statistics is used as the number of rows to be reserved. INSERT INTO table VALUES(...),(...),... is distributed to different DNs. Therefore, in some execution plans, DNs cannot obtain the number of rows to be inserted.
  - If the number of rows is unknown, 2^n values are reserved each time. For example, one value is reserved in the first auto-increment, two values are reserved in the second auto-increment, four values are reserved in the third auto-increment, and eight values are reserved for in fourth auto-increment. However, if the number of reserved values exceeds 65535, 65535 values are reserved.
- If this parameter is not set to **0**, the number of reserved cache values is the value of this parameter.
  - When auto-increment is triggered for the first time, if the number of rows to be inserted into the auto-increment column is known, the number is the reserved value.
  - If the number of rows is unknown, the value of **auto_increment_cache** is the number of auto-increment values reserved each time.

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: The default value is recommended. However, if the auto-increment values are discontinuous in this case, you can adjust the parameter value based on the amount of data to be inserted in batches. Setting this parameter to a larger value improves the batch insertion performance but the auto-increment values are more likely to be discontinuous.

disable_keyword_options

Parameter description: Specifies database compatibility behavior. Multiple items are separated by commas (,). An identifier with this parameter set will not be used as a keyword.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range (non-M-compatible mode): a string. The following keywords are supported: auto_increment, change, charset, columns, compile, completion, containing, convert, csn, datetime, db4aishot, dbtimezone, discard_path, distributed, dumpfile, ends, entityescaping, escaped, evalname, event, events, expdp, extend, gsiusable, gsivalid, gsiwaitall, finish, ilm_pidx_list, impdp, ifnull, invisible, json_object, lines, link, lnnvl, load_discard, locked, mark, nocache, noentityescaping, noextend, noscale, nvl2, ordinality, outfile, performance, pivot, public, recover, regexp_like, scale, schedule, separator, sessiontimezone, shrink, slave, specification, starting, starts, subpartitions, substr, unpivot, verify, visible, wellformed, xmltype, regexp, rlike, and zerofill.

Default value (non-M-compatible mode): **"datetime,regexp,rlike,zerofill"**.

Value range (M-compatible mode): a string. The following keywords are supported: active, admin, array, authentication, buckets, bulk, challenge_response, clone, component, cume_dist, definition, dense_rank, description, empty, enforced, engine_attribute, except, exclude, factor, failed_login_attempts, finish, first_value, following, generate, geomcollection, get_master_public_key, get_source_public_key, grouping, groups, gtid_only, histogram, history, inactive, initial, initiate, intersect, invisible, json_table, json_value, keyring, lag, last_value, lateral, lead, locked, master_compression_algorithms, master_public_key_path, master_tls_ciphersuites, master_zstd_compression_level, member, nested, nowait, nth_value, ntile, nulls, of, off, oj, old, optional, ordinality, organization, others, over, password_lock_time, path, percent_rank, persist, persist_only, preceding, privilege_checks_user, process, random, rank, recursive, reference, registration, replica, replicas, require_row_format, resource, respect, restart, retain, returning, reuse, role, row_number, secondary, secondary_engine, secondary_engine_attribute, secondary_load, secondary_unload, skip, source_auto_position, source_bind, source_compression_algorithms, source_connect_retry, source_delay, source_heartbeat_period, source_host, source_log_file, source_log_pos, source_password, source_port, source_public_key_path, source_retry_count, source_ssl, source_ssl_ca, source_ssl_capath, source_ssl_cert, source_ssl_cipher, source_ssl_crl, source_ssl_crlpath, source_ssl_key, source_ssl_verify_server_cert, source_tls_ciphersuites, source_tls_version, source_user, source_zstd_compression_level, srid, stream, system, thread_priority, ties, tls, unbounded, unregister, url, vcpu, visible, window, zone, lc_collate, least, load_bad, load_discard, location, minvalue, move, nocycle, node, nomaxvalue, nominvalue, nvl, nvl2, oids, operator, owned, prepared, recyclebin, reindex, reject, relative, scroll, sequence, setof, shippable, size, slice, smalldatetime, smalldatetime_format, split, stable, stdin, stdout, strict, substring, sysdate, trim, unusable, vacuum, valid,

varchar2, verbose, version, within, xmlattributes, xmlconcat, xmlelement, xmlforest, xmlpi, xmlroot, and xmltype.

Default value (M-compatible mode): **""**

NOTE

If this parameter is enabled, some functions used as keywords will become invalid. Exercise caution when setting this parameter.

disable_plsql_keyword_options

Parameter description: Specifies the database compatibility behavior, that is, whether to use an identifier as a non-keyword. Values of this parameter are separated by commas (,).

Parameter type: string.

Unit: none

Value range:

- PIPE
- PIPELINED
- RANGE
- REPLACE
- SUBTYPE
- ''

Default value: ''

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none

NOTE

- If this parameter is enabled, some functions used as keywords will become invalid. Exercise caution when setting this parameter.
- To cancel the function of shielding the plsql keyword, leave this parameter empty.

plpgsql.variable_conflict

Parameter description: Sets the priority of using stored procedure variables and table columns with the same name.

This is a USERSET parameter. Set it based on method 3 provided in **Table 14-1**.

Value range: a string.

- **error** indicates that a compilation error is reported when the name of a stored procedure variable is the same as that of a table column.
- **use_variable** indicates that if the name of a stored procedure variable is the same as that of a table column, the variable is used preferentially.
- **use_column** indicates that if the name of a stored procedure variable is the same as that of a table column, the column name is used preferentially.

Default value: **error**

td_compatible_truncation

Parameter description: Specifies whether to enable features compatible with a Teradata database. You can set this parameter to **on** when connecting to a database compatible with the Teradata database, so that when you perform the **INSERT** operation, overlong strings are truncated based on the allowed maximum length before being inserted into char- and varchar-type columns in the target table. This ensures all data is inserted into the target table without errors reported.

NOTE

The string truncation function cannot be used if the **INSERT** statement includes a foreign table.

If inserting multi-byte character data (such as Chinese characters) to database with the character set byte encoding (such as SQL_ASCII or LATIN1), and the character data crosses the truncation position, the string is truncated based on its bytes instead of characters. Unexpected result will occur in tail after the truncation. If you want correct truncation result, you are advised to adopt encoding set such as UTF8, which has no character data crossing the truncation position.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that overlong strings are truncated.
- **off** indicates that overlong strings are not truncated.

Default value: **off**

uppercase_attribute_name

Parameter description: Specifies whether to return column names in uppercase to the client. This parameter is used only in the ORA-compatible mode and centralized environment.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that column names are returned to the client in uppercase.
- **off** indicates that column names are not returned to the client in uppercase.

Default value: **off**

character_set_connection

Parameter description: Specifies the character set of constant strings. If this parameter is modified, **collation_connection** is changed to the default collation of the character set.

- This parameter takes effect when **sql_compatibility** is set to **'B'**, **b_format_version** is set to **'5.7'**, and **b_format_dev_version** is set to **'s2'**.
- This parameter takes effect in M-compatible mode.

Parameter type: character

Unit: none

Value range:

- Character sets supported when **sql_compatibility** is set to **'B'**. For details, see "COLLATE collation" in "SQL Reference > SQL Syntax > C > CREATE TABLE" in *Developer Guide*.
- Character sets within the value range supported in M-compatible mode. For details, see "SQL Reference > Character Set and Collation" in the *M-compatibility Development Guide*.
- Currently, the value cannot be different from that of the current database character set.

Default value: same as the value of **server_encoding**.

Setting method: This is a USERSET parameter, which can only be set using method 3, and cannot be set using the guc tools. For details about how to set this parameter, see **Table 14-1**.

Setting suggestion: none.

collation_connection

Parameter description: Specifies the collation of a constant string. If this parameter is modified, **character_set_connection** is changed to the default character set of the collation.

- This parameter takes effect when **sql_compatibility** is set to **'B'**, **b_format_version** is set to **'5.7'**, and **b_format_dev_version** is set to **'s2'**.
- This parameter takes effect in M-compatible mode.

Parameter type: character

Unit: none

Value range:

- Character sets supported when **sql_compatibility** is set to **'B'**. For details, see "COLLATE collation" in "SQL Reference > SQL Syntax > C > CREATE TABLE" in *Developer Guide*.
- Character sets within the value range supported in M-compatible mode. For details, see "SQL Reference > Character Set and Collation" in the *M-compatibility Development Guide*.
- Currently, this parameter cannot be set to a value other than the collation corresponding to the current database character set.

Default value: default collation of the current **server_encoding**. If there is no default collation, the value is **'default'**.

Setting method: This is a USERSET parameter, which can only be set using method 3, and cannot be set using the guc tools. For details about how to set this parameter, see **Table 14-1**.

Setting suggestion: none.

character_set_results

Parameter description: Specifies the character set of the returned result.

- This parameter takes effect when **sql_compatibility** is set to **'B'**, **b_format_version** is set to **'5.7'**, and **b_format_dev_version** is set to **'s2'**.
- This parameter takes effect in M-compatible mode.

Parameter type: character

Unit: none

Value range:

- Character sets supported when **sql_compatibility** is set to **'B'**. For details, see "COLLATE collation" in "SQL Reference > SQL Syntax > C > CREATE TABLE" in *Developer Guide*.
- Character sets within the value range supported in M-compatible mode. For details, see "SQL Reference > Character Set and Collation" in the *M-compatibility Development Guide*.
- You can also set this parameter to **null** or **''**. In this case, the character set of the database is output.

Default value: same as the value of **server_encoding**.

Setting method: This is a USERSET parameter, which can only be set using method 3, and cannot be set using the guc tools. For details about how to set this parameter, see **Table 14-1**.

Setting suggestion: none.

lastval_supported

Parameter description: Specifies whether the lastval function can be used.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the lastval function can be used and the nextval function cannot be pushed down.
- **off** indicates that the lastval function cannot be used and the nextval function can be pushed down.

Default value: **off**

enable_copy_error_log

Parameter description: Enables or disables the error table **pgxc_copy_error_log**.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: indicates that the error table is enabled.
- **off**: indicates that the error table is disabled.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none.

loader_support_nul_character

Parameter description: Specifies the database platform minor version compatibility configuration item.

Parameter type: string.

Unit: none

Value range: '', **'s1'**, and **'s2'**. For details, see **Table 14-22**.

Default value: ''

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none.

NOTE

- This GUC parameter needs to be set when gs_loader is used to enable fault tolerance for nul characters (0x00).
- For details, see "Client Tools > gs_loader" in *Tool Reference*.

Table 14-21 Compatibility configuration items

Configuration Item	Behavior
s1	Specifies how gs_loader processes nul characters in data files during data import. If a data file contains the nul character, the data is truncated based on the position of the nul character. The data before the nul character is imported to the table, and the data after the nul character is truncated and discarded. This is used for forward compatibility of the function.
s2	Specifies how gs_loader processes nul characters in data files during data import. If a data file contains the nul character, the nul character is converted to the space character ' ' (0x20), and then processed, determined, and imported.
Empty	The default parameter settings do not affect any functions.

a_format_copy_version

Parameter description: Specifies the database platform minor version compatibility configuration item. The value of this parameter is an enumerated string.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. When using **gs_loader** to import new features, you need to set the corresponding values.

Value range: a string.

Default value: ''

NOTE

- Currently, only **Table 14-22** is supported.
- Supports setting character string for compatibility configuration. For details, see "Client Tools > gs_loader" in *Tool Reference*. You can set the **a_format_copy_version** parameter by using **guc_param**.

Table 14-22 Compatibility configuration items

Configuration Item	Behavior
s1	• Supports gs_loader specifying data type (CHAR[(length)]/ INTEGER external[(length)]/FLOAT external[(length)]/ DECIMAL external[(length)]/TIMESTAMP/DATE/DATE EXTERNAL/INTEGER/SMALLINT/RAW[(length)]) to import data. • Supports gs_loader converting expressions and extending scenarios for columns.

enable_volatile_match_index

Parameter description: Specifies whether volatile functions can match indexes. This parameter is valid only when **DBCOMPATIBILITY** is set to **A**. There are semantic risks when the volatile function matches indexes. The stable and immutable functions can match indexes by default and comply with semantics. It is strongly recommended that you set this parameter based on the actual variability of the function instead of enabling this parameter.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **off**

enable_union_all_order

Parameter description: Specifies whether UNION ALL supports subquery order preserving when the main query is not sorted.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **on**

enable_immutable_optimization

Parameter description: Specifies whether immutable functions can be optimized. This parameter is valid only when **DBCOMPATIBILITY** is set to **A**. If a function with the immutable definition violates the immutable semantics, the call result, value, and impact on the caller are not defined.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: enabled.
- **off**: disabled.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-2**.

Setting suggestion: none.

enable_object_special_character

Parameter description: Determines whether the value of the **schema** parameter in the control file can contain any special characters in ["$'\] when the CREATE EXTENSION statement is executed and "@extschema@" is used in the script file.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-2**.

Value range: Boolean

- **on** indicates that the value can contain any special characters in ["$'\].
- **off** indicates that the value cannot contain any special characters in ["$'\].

Default value: **off**

NOTICE

The extended function is for internal use only. You are advised not to use it.

a_format_disable_func

Parameter description: Disables a specified system function. The value of this parameter consists of multiple system function OIDs separated by commas (,). The system function for which this parameter is set cannot be called.

When a system function cannot meet user requirements and a user-defined function with the same name is required, you can use this function.

Parameter type: string.

Unit: none

Value range: a string consisting of multiple system function OIDs separated by commas (,).

NOTE

This parameter can only be used to disable added system functions corresponding to the database platform compatibility behavior configuration items (**a_format_version** and **a_format_dev_version**). For details, see **Table 14-23**.

Table 14-23 System functions that can be disabled

Database Platform Compatibility Configuration Item	System Function That Can Be Disabled
10c,s1	anyarray array_extendnull(anyarray,int4,int4); -- **funcoid**: 6018 clob empty_clob(); -- **funcoid**: 3825 int4 instrb(text,text); -- **funcoid**: 3240 int4 instrb(text,text,int4); -- **funcoid**: 3241 int4 instrb(text,text,int4,int4); -- **funcoid**: 3242 numeric months_between(timestamp,timestamp); -- **funcoid**: 1522 timestamp round(timestamp); -- **funcoid**: obtains the OID by using the **select oid from pg_proc where proname='round' and pronamespace=11 and pronargs=1 and allargtypes[0]=1114** query statement. timestamp round(timestamp,text); -- **funcoid**: 4465 timestamp to_date(text,text,bool); -- **funcoid**: 1524 timestamp to_date(text,text,text,bool); -- **funcoid**: 1525 numeric to_number(text,text,bool); -- **funcoid**: 1787 numeric to_number(text,text,text,bool); -- **funcoid**: 1788 timestamp to_timestamp(text,text,bool); -- **funcoid**: 606 timestamp to_timestamp(text,text,text,bool); -- **funcoid**: 607 timestamptz to_timestamp_tz(text); -- **funcoid**: 1806 timestamptz to_timestamp_tz(text,text); -- **funcoid**: 1807 timestamptz to_timestamp_tz(text,text,bool); -- **funcoid**: 1808 timestamptz to_timestamp_tz(text,text,text,bool); -- **funcoid**: 1809

Database Platform Compatibility Configuration Item	System Function That Can Be Disabled
10c,s2	text DBTimezone(); -- **funcoid**: 5562 int8 ascii2(text); -- **funcoid**: 1625 text asciistr(text); -- **funcoid**: 1626 text asciistr(blob); -- **funcoid**: 1629 int4 bit2coding(text); -- **funcoid**: 9311 int4 bit4coding(text); -- **funcoid**: 9325 float8 cosh(float8); -- **funcoid**: 1548 numeric cosh(numeric); -- **funcoid**: 1549 timestamptz current_timestamp(numeric); -- **funcoid**: 3257 text dump(any); -- **funcoid**: 9086 text dump(any,int4); -- **funcoid**: 9088 text dump(any,int4,int4); -- **funcoid**: 9089 text dump(any,int4,int4,int4); -- **funcoid**: 9090 float4 nanvl(float4,float4); -- **funcoid**: 7112 float4 nanvl(float4,numeric); -- **funcoid**: 7115 float8 nanvl(float8,float8); -- **funcoid**: 7113 float4 nanvl(numeric,float4); -- **funcoid**: 7116 numeric nanvl(numeric,numeric); -- **funcoid**: 7114 timestamp new_time(timestamp,text,text); -- **funcoid**: 374 text nls_lower(text); -- **funcoid**: 4082 text nls_lower(text,text); -- **funcoid**: 4083 text nls_upper(text); -- **funcoid**: 4084 text nls_upper(text,text); -- **funcoid**: 4085 interval numtoyminterval(numeric,text); -- **funcoid**: 9333 int8 ora_hash(any); -- **funcoid**: 6127 int8 ora_hash(any,int8); -- **funcoid**: 6128 text rawtohex2(any); -- **funcoid**: 9540 numeric remainder(int8,int8); -- **funcoid**: 9767 numeric remainder(int2,int2); -- **funcoid**: 9765 numeric remainder(int4,int4); -- **funcoid**: 9766 float4 remainder(float4,float4); -- **funcoid**: 9771 float4 remainder(float4,numeric); -- **funcoid**: 9768 float8 remainder(float8,float8); -- **funcoid**: 9770 float4 remainder(numeric,float4); -- **funcoid**: 9769 numeric remainder(numeric,numeric); -- **funcoid**: 9761

Database Platform Compatibility Configuration Item	System Function That Can Be Disabled
	numeric remainder(int1,int1); -- **funcoid**: 9764 text session_time_zone(); -- **funcoid**: 9571 float8 sinh(float8); -- **funcoid**: 1546 numeric sinh(numeric); -- **funcoid**: 1547 timestamp sys_extract_utc(timestamp); -- **funcoid**: 5258 timestamp sys_extract_utc(timestamptz); -- **funcoid**: 5259 float8 tanh(float8); -- **funcoid**: 9762 numeric tanh(numeric); -- **funcoid**: 9763 float8 to_binary_double(text); -- **funcoid**: 9669 float8 to_binary_double(text,text); -- **funcoid**: 9670 float8 to_binary_double(text,text,bool); -- **funcoid**: 9671 float8 to_binary_double(text,text,text,bool); -- **funcoid**: 9672 float4 to_binary_float(text); -- **funcoid**: 9673 float4 to_binary_float(text,text); -- **funcoid**: 9674 float4 to_binary_float(text,text,bool); -- **funcoid**: 9675 float4 to_binary_float(text,text,text,bool); -- **funcoid**: 9676 blob to_blob(any); -- **funcoid**: 6990 interval to_dsinterval(text); -- **funcoid**: 9126 interval to_dsinterval(text,text,bool); -- **funcoid**: 9127 text to_multi_byte(text); -- **funcoid**: 9537 text to_multi_byte(blob); -- **funcoid**: 9539 varchar to_nchar(int8); -- **funcoid**: obtains the OID by using the **select oid from pg_proc where proname='to_nchar' and pronamespace=11 and pronargs=1 and allargtypes[0]=20** query statement. varchar to_nchar(int2); -- **funcoid**: obtains the OID by using the **select oid from pg_proc where proname='to_nchar' and pronamespace=11 and pronargs=1 and allargtypes[0]=21** query statement. varchar to_nchar(int4); -- **funcoid**: obtains the OID by using the **select oid from pg_proc where proname='to_nchar' and pronamespace=11 and pronargs=1 and allargtypes[0]=23;** query statement. text to_nchar(text); -- **funcoid**: obtains the OID by using the **select oid from pg_proc where proname='to_nchar' and pronamespace=11 and pronargs=1 and allargtypes[0]=25** query statement. varchar to_nchar(float4); -- **funcoid**: obtains the OID by using the **select oid from pg_proc where proname='to_nchar' and**

Database Platform Compatibility Configuration Item	System Function That Can Be Disabled
	pronamespace=11 and pronargs=1 and allargtypes[0]=700 query statement. varchar to_nchar(float8); -- **funcoid**: obtains the OID by using the **select oid from pg_proc where proname='to_nchar' and pronamespace=11 and pronargs=1 and allargtypes[0]=701** query statement. varchar to_nchar(numeric); -- **funcoid**: obtains the OID by using the **select oid from pg_proc where proname='to_nchar' and pronamespace=11 and pronargs=1 and allargtypes[0]=1700** query statement. text to_nchar(timestamp); -- **funcoid**: 5698 text to_nchar(timestamptz); -- **funcoid**: 5699 text to_nchar(anyset); -- **funcoid**: 5700 text to_nchar(int8,text); -- **funcoid**: 5694 text to_nchar(int4,text); -- **funcoid**: 5693 text to_nchar(float4,text); -- **funcoid**: 5695 text to_nchar(float8,text); -- **funcoid**: 5696 text to_nchar(timestamp,text); -- **funcoid**: 5697 text to_nchar(timestamptz,text); -- **funcoid**: 5691 text to_nchar(interval,text); -- **funcoid**: 5690 text to_nchar(numeric,text); -- **funcoid**: 5692 text to_single_byte(text); -- **funcoid**: 9536 text to_single_byte(blob); -- **funcoid**: 9538 interval to_yminterval(text); -- **funcoid**: 9124 interval to_yminterval(text,text,bool); -- **funcoid**: 9125 text tz_offset(text); -- **funcoid**: 706 text unistr(text); -- **funcoid**: 9081 text unistr(blob); -- **funcoid**: 9082 int4 vsize(any); -- **funcoid**: 9083
10c,s4	clob getclobval(xml); -- **funcoid**: 8011 varchar getstringval(xml); -- **funcoid**: 6976 nvarchar2 nchr(int8); -- **funcoid**: 1694 timestamptz to_timestamp_tz(text,text,text); -- **funcoid**: 1804 timestamptz to_timestamp_tz(text,text,text,text,bool); -- **funcoid**: 1805

Default value: ''

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-2**.

Setting suggestion: If the database platform compatibility behavior configuration items (**a_format_version** and **a_format_dev_version**) are disabled, the corresponding added system functions are unavailable by default. You do not need to use this parameter to disable the functions.

enable_convert_illegal_char

Parameter description: Specifies whether invalid characters in the command output are not verified and are displayed as placeholders.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The parameter is enabled. Special characters are replaced by the symbols specified by the **convert_illegal_char_mode** parameter during query.
- **off**: The parameter is disabled. If the query result contains characters that do not comply with the current character set encoding rule, an error is reported after verification.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-2**.

Setting suggestion: Retain the default value. Enable this parameter only when the data contains special characters and errors should not be reported for special characters.

NOTE

1. When the database character set is utf8, zhs16gbk, gb18030, gb18030-2022, or latin1, **enable_convert_illegal_char = on** takes effect. If the character set of the database client is different from that of the database server, invalid characters are displayed as placeholders.
2. Special character range: The special characters mentioned in this document include only fully abnormal encoding and hybrid encoding. The \u0000 character is not supported. If the character code contains the \u0000 character, the character is truncated at \u0000, which affects data integrity.
3. If the character sets of the database client and server are different, special characters beyond the character set of the server can be written to the database only by using the dbe_raw.cast_to_varchar2() function or the import and export tool.
4. When the GUC parameter is enabled, the behaviors of the special characters in the functions and advanced package functions listed in the following table are as follows:
   - When the character sets of the client and server are the same, no error is reported during the query of special characters. The behavior is the same as that before the GUC parameter is enabled.
   - If the character sets of the client and server are different, special characters are displayed as placeholders, which use question marks (?) by default.
   - You are advised not to use functions to process character strings that contain special characters. The functions listed in the following table do not report errors when processing character strings that contain special characters, and the correctness of the results cannot be ensured.

Table 14-24 Functions and advanced package functions supporting special characters

No.	Function Name/Advanced Package Function Name
1	bit_length(string)
2	btrim(string text [, characters text])
3	char_length(string) character_length(string)
4	chr(cvalue int|bigint) chr(integer)
5	concat(str1,str2)

55	PKG_UTIL.RAW_CAST_TO_VARCHAR2
56	DBE_OUTPUT.PUT
57	DBE_OUTPUT.PUT_LINE

fix_func_selection

Parameter description: Specifies whether to optimize the function matching policy.

The catlist sequence issue occurs in this case: If a user-defined function conflicts with a system function, the function selected by the database depends on the registration sequence of the system function in the database system.

Parameter type: string.

Unit: none

Value range: **''** and **catlist**.

- '': No optimization is performed. The value is the same as that in versions earlier than 505.1.0.
- **catlist**: The catlist sequence is optimized. (The non-B-compatible mode is optimized. In non-B-compatible mode, system functions are always preferentially selected and executed.) The B-compatible mode is the same as that in versions earlier than 505.1.0. An error message indicating that the function is not unique may be displayed, or a system function may be selected for execution.

Default value:

- **catlist**: default value of the newly installed database
- '': default value of the database in versions earlier than 505.1.0 after the database is upgraded.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

max_allowed_packet

Parameter description: Specifies the database configuration item in M-compatible mode.

Originally, this parameter specifies the maximum length of a data packet for communications between the database and the client in M-compatible mode. Currently, this parameter is only used to limit the maximum return values of some functions. It affects the upper limit of the return values of the string functions REPEAT, REPLACE, and SPACE, and affects the value of *N* in the CAST(expr AS BINARY(N)) and CONVERT(expr AS BINARY(N)) functions. This is a PGC_SIGHUP parameter.

Parameter type: integer.

Unit: byte

Value range: 1024 to 1073741824. The value must be a multiple of 1024. Otherwise, the value is rounded down to the nearest multiple.

Default value: **4194304**

Setting suggestion: Retain the default value **4194304**.

div_precision_increment

Parameter description: Specifies the database configuration item in M-compatible mode.

This is a session-level parameter, which is used to set the value of precision that the division result can improve. The final precision is the precision of the first operation parameter added by the value of this parameter.

Parameter type: integer.

Unit: none

Value range: 0 to 30

Default value: **4**

Setting suggestion: none.

enable_m_format_hook

Parameter description: Specifies the database configuration item in M-compatible mode.

This parameter specifies whether the hook in M-compatible mode takes effect.

Parameter type: Boolean.

Unit: none

Value range:

- **ON**: The M-compatible database allows the corresponding parser and executor hooks to be mounted.
- **OFF**: The M-compatible database does not mount the corresponding parser and executor hooks.

Default value: **ON**

Setting suggestion: This parameter is used only for external tools that are not fully adapted and cannot be used by users.

gs_format_behavior_compat_options

Parameter description: **gs_format_behavior_compat_options** is used to select configuration items of GaussDB internal system functions.

Parameter type: string.

Unit: none

Value range: Currently, only the compatibility configuration items listed in **Table 14-25** are supported. Compatibility configuration items are separated by commas (,).

Default value: **'sqrt_karatsuba'**

Table 14-25 gs_format_behavior compatibility configuration items

Configuration Item	Behavior
'sqrt_karatsuba'	• If this parameter is set, the Karatsuba square root algorithm is used when the sqrt function is called. The Karatsuba algorithm has higher performance but its precision may be different from that of the Newton iteration algorithm in rare cases. • If this parameter is not set, the default Newton iteration algorithm is used to calculate the square root for the sqrt algorithm.

Configuration Item	Behavior
'allow_textconcat_null'	• If this parameter is set, the value of the corresponding character string is returned when a character string is combined with the **null** value in PG-compatible mode. -- Run the following command in PG-compatible mode: gaussdb=# set gs_format_behavior_compat_options='allow_textconcat_null'; SET gaussdb=# select 'a' || null || 'b'; ?column? ---------- ab (1 row) • If this parameter is not set, **NULL** is returned when a character string is combined with the **null** value in PG-compatible mode.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Determines whether some compatibility features are available. If you want to modify this parameter, make sure you understand its meaning and modify it with caution to avoid risks caused by misoperations.

14.3.16.3 Product Version of the Cloud Service

This section describes the version parameters of the cloud service.

product_version

Parameter description: Specifies the version of a cloud service product.

Parameter type: string

Unit: none

Value range: none

Default value: empty

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: The following rules must be met to avoid errors.

- The value can contain a maximum of 50 characters.
- The value cannot contain vertical bars (|), semicolons (;), ampersands (&), dollar signs ($), ampersands (>), ampersands (<), ampersands (`), backslashes (\), exclamation marks (!), or newline characters.

hotpatch_version

Parameter description: Specifies the hot patch version of a cloud service product.

Parameter type: string

Unit: none

Value range: none

Default value: empty

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: The following rules must be met to avoid errors.

- The value can contain a maximum of 1500 characters.
- The value cannot contain vertical bars (|), semicolons (;), ampersands (&), dollar signs ($), ampersands (>), ampersands (<), ampersands (`), backslashes (\), exclamation marks (!), or newline characters.

14.3.17 Fault Tolerance

This section describes parameters used for controlling how the server processes an error occurring in the database system.

exit_on_error

Parameter description: If this function is enabled, errors of the ERROR level will be escalated to PANIC errors, and core stacks will be generated. It is mainly used to locate problems and test services.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-2**.

Value range: Boolean

- **on**: Errors of the ERROR level will be escalated to PANIC errors.
- **off**: Errors of the ERROR level will not be escalated.

Default value: **off**

restart_after_crash

Parameter description: If this parameter is set to **on** and a backend process crashes, GaussDB automatically reinitializes the backend process.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-2**.

Value range: Boolean

- **on**: The availability of the database is maximized.

  In some circumstances (for example, when a management tool, such as xCAT, is used to manage GaussDB), setting this parameter to **on** maximizes the availability of the database.
- **off**: A management tool is enabled to obtain control permission and take proper measures when a backend process crashes.

Default value: **on**

omit_encoding_error

Parameter description: If this parameter is set to **on** and the client character set of the database is encoded in UTF-8 format, character encoding conversion errors will be recorded in logs. Additionally, converted characters that have conversion errors will be ignored and replaced with question marks (?).

This is a USERSET parameter. Set it based on instructions provided in **Table 14-2**.

Value range: Boolean

- **on**: Characters with conversion errors will be ignored and replaced with question marks (?), and error information will be recorded in logs.
- **off**: Characters with conversion errors cannot be converted and error information will be directly displayed.

Default value: **off**

max_query_retry_times

This parameter has been discarded in the current version.

cn_send_buffer_size

Parameter description: Specifies the size of the data buffer used for data transmission on the primary database node.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-2**.

Value range: an integer ranging from 8 to 128. The unit is KB.

Default value: **8KB**

data_sync_retry

Parameter description: Specifies whether to keep running the database when updated data fails to be written into disks by using the fsync function. In some OSs, no error is reported even if fsync fails after the second attempt. As a result, data is lost.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-2**.

Value range: Boolean

- **on**: The database keeps running and fsync is called again after fsync fails to synchronize data to the disk.
- **off**: A PANIC-level error is reported and the database is stopped after fsync fails.

Default value: **off**

remote_read_mode

Parameter description: Specifies whether to enable the remote read function. This function allows pages on the standby node to be read when reading pages on the primary node fails.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: enumerated values

- **off** indicates that the remote read function is disabled.
- **non_authentication** indicates that the remote read function is enabled but certificate authentication is not required.
- **authentication** indicates that the remote read function is enabled and certificate authentication is required.

Default value: **authentication**

14.3.18 Connection Pool Parameters

When a connection pool is used to access the database, database connections are established and then stored in the memory as objects during system running. When you need to access the database, no new connection is established. Instead, an existing idle connection is selected from the connection pool. After you finish accessing the database, the database does not disable the connection but puts it back into the connection pool. The connection can be used for the next access request.

cache_connection

Parameter description: Specifies whether to recycle the connections of a connection pool.

This parameter is a **SIGHUP** parameter. Set it based on instructions provided in **Table 14-2**.

Value range: Boolean

- **on** indicates that the connections of a connection pool will be recycled.
- **off** indicates that the connections of a connection pool will not be recycled.

Default value: **on**

14.3.19 Transaction

This section describes the settings and value ranges of database transaction parameters.

transaction_isolation

Parameter description: Specifies the isolation level of the current transaction.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string of case-sensitive characters. The values include:

- **serializable**: This value is equivalent to REPEATABLE READ in GaussDB.
- **read committed** indicates that only the data in committed transactions is read.
- **repeatable read** indicates that only the data committed before a transaction starts is read. Uncommitted data or data committed in other concurrent transactions cannot be read.
- **default**: The value is the same as that of **default_transaction_isolation**.

Default value: read committed

transaction_read_only

Parameter description: Specifies that the current transaction is a read-only transaction.

This parameter has a fixed value **on** during database restoration or on the standby node. Otherwise, set this parameter to the value of **default_transaction_read_only**.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the current transaction is a read-only transaction.
- **off** indicates that the current transaction can be a read/write transaction.

Default value: **off**

xc_maintenance_mode

Parameter description: Specifies whether the system is in maintenance mode.

This is a SUSET parameter. Set it based on method 3 provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

NOTICE

Enable the maintenance mode with caution to avoid data inconsistencies in the database.

Default value: **off**

allow_concurrent_tuple_update

Parameter description: Specifies whether to allow concurrent update.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

Default value: **on**

transaction_deferrable

Parameter description: Specifies whether to delay the execution of a read-only serial transaction without incurring an execution failure. Assume this parameter is set to **on**. When the server detects that the tuples read by a read-only transaction are being modified by other transactions, it delays the execution of the read-only transaction until the other transactions finish modifying the tuples. This parameter is reserved and does not take effect in this version. Similar to this parameter, the **default_transaction_deferrable** parameter is used to specify whether to allow delayed execution of a transaction.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: allowed.
- **off**: not allowed.

Default value: **off**

enable_show_any_tuples

Parameter description: This parameter is available only in a read-only transaction and is used for analysis. When this parameter is set to **on** or **true**, all versions of tuples in the table are displayed.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** or **true** indicates that all versions of tuples in the table are displayed.
- **off** or **false** indicates that no versions of tuples in the table are displayed.

Default value: **off**

NOTE

In the TOAST scenario, if DML operations (mainly INSERT+UPDATE or INSERT+DELETE) are performed before and after the REINDEX operation, and the read-only transaction is started and the GUC parameter is enabled after the REINDEX operation, historical data in the TOAST table or TOAST index table can be queried separately in the released version. However, when historical data in the TOAST column is queried in the main table, the error message "missing chunk number xxx" is displayed.

replication_type

Parameter description: Specifies whether the current database is deployed in standalone or one-primary-multiple-standby mode.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Do not set the value of this parameter.

Value range: 0 to 2

- **2** indicates the standalone mode. In this mode, no standby node can be added.
- **1** indicates the one-primary-multiple-standby mode, covering all scenarios. This mode is recommended.
- **0**: reserved parameter.

Default value: **1**

pgxc_node_name

Parameter description: Specifies the name of a node.

This is a POSTMASTER parameter. Set it based on **Table 14-2**.

When a standby node requests to replicate logs on the primary node, if the **application_name** parameter is not set, the **pgxc_node_name** parameter is used as the name of the streaming replication slot of the standby node on the primary node. The streaming replication slot is named in the following format: Value of this parameter_IP address of the standby node_Port number of the standby node. The IP address and port number of the standby node are obtained from the IP address and port number of the standby node specified by the **replconninfo** parameter. The maximum length of a streaming replication slot name is 61 characters. If the length of the concatenated string exceeds 61 characters, the truncated **pgxc_node_name** will be used for concatenation to ensure that the length of the streaming replication slot name is less than or equal to 61 characters.

CAUTION

After this parameter is modified, the database instance will fail to be connected. You are advised not to modify this parameter.

Value range: a string

Default value: current node name

enable_defer_calculate_snapshot

Parameter description: Specifies the delay in calculating **xmin** and **oldestxmin**. Calculation is triggered only when 1000 transactions are executed or the interval is 1s. If this parameter is set to **on**, the overhead of calculating snapshots can be reduced in heavy-load scenarios, but the progress of updating **oldestxmin** is slow, affecting tuple recycling. If this parameter is set to **off**, **xmin** and **oldestxmin** can be calculated in real time, but the overhead for calculating snapshots increases.

Parameter type: Boolean

Unit: none

Value range:

- **on** indicates that snapshots **xmin** and **oldestxmin** are calculated with a delay.

- **off** indicates that snapshots **xmin** and **oldestxmin** are calculated in real time.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on **Table 14-2**.

seqscan_csn_cache_num

Parameter description: Specifies the size of the CSN cache. The cache is used only when the Seq Scan scans the heap table page through the MVCC snapshot to determine the visibility. If this parameter is set to **0**, the CSN cache mechanism is not used.

This is a PGC_SIGHUP parameter. Set it based on **Table 14-2**.

Value range: an integer ranging from 0 to 1000.

Default value: **100**.

14.3.20 Replication Parameters of Two Database Instances

RepOriginId

Parameter description: This is a session-level GUC parameter. In bidirectional logical replication, set it to a non-zero value to avoid infinite data replication.

This is a USERSET parameter. Set it based on method 3 provided in **Table 14-1**.

Value range: an integer ranging from 0 to 2147483647

Default value: **0**

stream_cluster_run_mode

Parameter description: Specifies whether a DN is in the primary or standby instance in dual-instance streaming DR scenarios. For single-instance scenarios, the primary instance is used by default.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: enumerated values

- **cluster_primary** indicates that the node is in the primary instance.
- **cluster_standby** indicates that the node is in the standby instance.

Default value: **cluster_primary**

enable_roach_standby_cluster

Parameter description: Sets the standby database instances to read-only in dual-database instance mode. Only the sysadmin user can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the read-only mode is enabled for the standby database instances.
- **off** indicates that the read-only mode is disabled for the standby database instances. In this case, the standby database instances can be read and written.

Default value: **off**

hadr_process_type

Parameter description: Specifies a process ID of a streaming replication-based remote DR solution, an intra-city dual-DC HA solution, or an intra-city dual-DC HA solution that supports streaming replication-based remote DR.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-2**.

Value range: enumerated values.

- **none** indicates that there is no process.
- **failover** indicates that the DR database instance is being upgraded.
- **switchover_promote** indicates the process of upgrading the DR database instance to the primary one during the primary/standby database instance switchover according to a streaming replication-based remote DR solution.
- **switchover_demote** indicates the process of demoting the primary database instance to the DR one during the primary/standby database instance switchover according to the streaming replication-based remote DR solution.
- **dorado_failover** indicates the process of upgrading the DR database instance to the primary one according to the intra-city dual-DC HA solution.
- **dorado_switchover_demote** indicates the process of demoting the primary database instance to the DR one during the primary/standby database instance switchover according to the intra-city dual-DC HA solution.
- **dorado_failover_abnormal** indicates the process of promoting the DR database instance to the primary one when the shared disk of the primary database instance in the intra-city dual-DC HA solution is faulty.
- **dorado_failover_in_standby_stream** indicates the process of promoting the intra-city dual-DC standby database instance to the intra-city dual-DC primary database instance (also the remote DR database instance) when the remote database instance in the intra-city dual-DC HA solution that supports streaming replication-based remote DR is the remote DR primary database instance.
- **dorado_failover_abnormal_in_standby_stream** indicates the process of promoting the intra-city dual-DC standby database instance to the intra-city dual-DC primary database instance (also the remote DR database instance) when the remote database instance in the intra-city dual-DC HA solution that supports streaming replication-based remote DR is the remote DR primary database instance, and the shared disk of the intra-city dual-DC primary database instance (also the remote DR database instance) is faulty.

Default value: **none**

14.3.21 Developer Options

allow_system_table_mods

Parameter description: Specifies whether the structure of a system catalog or the name of a system schema can be modified.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the structure of the system catalog or the name of the system schema can be modified.
- **off** indicates that the structure of the system catalog or the name of the system schema cannot be modified.

Default value: **off**

CAUTION

You are advised not to change the default value of this parameter. If this parameter is set to **on**, system catalogs may be damaged and the database may fail to be started.

allow_create_sysobject

Parameter description: Specifies whether objects such as functions, stored procedures, synonyms, aggregate functions, and operators can be created or modified in the system schema. The system schema refers to the schema provided by the database after initialization, excluding the public schema. The OID of the system schema is usually smaller than 16384.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that initial users and system administrators can create or modify objects such as functions, stored procedures, synonyms, and aggregate functions in the system schema. The sysadmin user has permissions to create or replace, alter, grant, and revoke system objects by default. For details about whether other users are allowed to create these objects, see the permission requirements of the corresponding schema.
- **off** indicates that all users are not allowed to create or modify objects such as functions, stored procedures, synonyms, aggregate functions, and operators in the system schema. The sysadmin user does not have permissions to create or replace, alter, grant, and revoke system objects by default.

Default value: **on**

debug_assertions

Parameter description: Specifies whether to enable various assertion checks. It can assist in debugging. When an exception or a crash occurs, enable this

parameter to identify programming defects. To use this parameter, the macro USE_ASSERT_CHECKING must be defined (through the configure option **--enable-cassert**) during the GaussDB compilation.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that various assertion checks are enabled.
- **off** indicates that various assertion checks are disabled.

NOTE

If you compile GaussDB with the assertion check enabled, **debug_assertions** is set to **on** by default.

Default value: **off**

ignore_checksum_failure

Parameter description: Specifies whether to ignore check failures (but still generates an alarm) and continues reading data. Continuing reading data may result in breakdown, damaged data being transferred or hidden, failure of data recovery from remote nodes, or other serious problems. You are advised not to modify the settings.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that data check errors are ignored.
- **off** indicates that data check errors are reported.

Default value: **off**

ignore_system_indexes

Parameter description: Specifies whether to ignore system indexes when reading system catalog (but still update the indexes when modifying the tables).

This is a BACKEND parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

This parameter is useful for recovering data from tables whose system indexes are damaged.

Value range: Boolean

- **on** indicates that system indexes are ignored.
- **off** indicates that system indexes are not ignored.

Default value: **off**

post_auth_delay

Parameter description: Specifies the delay in the connection to the server after a successful authentication. Developers can attach a debugger to the server startup process.

This is a BACKEND parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 2147. The unit is s.

Default value: **0**

NOTE

This parameter is used only for commissioning and fault locating. To prevent impact on service running, ensure that the default value **0** is used in the production environment. If this parameter is set to a value other than **0**, the cluster may be abnormal due to a long authentication delay.

pre_auth_delay

Parameter description: Specifies the period of delaying authentication after the connection to the server is started. Developers can attach a debugger to the authentication procedure.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 60. The unit is s.

Default value: **0**

NOTE

This parameter is used only for commissioning and fault locating. To prevent impact on service running, ensure that the default value **0** is used in the production environment. If this parameter is set to a value other than **0**, the cluster may be abnormal due to a long authentication delay.

trace_notify

Parameter description: Specifies whether to enable the function of generating debugging output for the **LISTEN** and **NOTIFY** commands. The level of **client_min_messages** or **log_min_messages** must be **debug1** or lower so that debugging output can be recorded in the client or server logs, respectively.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the output function is enabled.
- **off** indicates that the output function is disabled.

Default value: **off**

trace_recovery_messages

Parameter description: Specifies whether to enable logging of recovery-related debugging output. This parameter allows users to overwrite the normal setting of

log_min_messages, but only for specific messages. This is intended for the use in debugging the standby node.

This is a SIGHUP parameter. Set it based on instructions provided in Table 14-1.

Value range: enumerated values. Valid values include **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, and **log**. For details about the parameter values, see log_min_messages.

Default value: **log**

NOTE

- **log** indicates that recovery-related debugging information will not be logged.
- Except the default value **log**, each of the other values indicates that recovery-related debugging information at the specified level will also be logged. Common settings of **log_min_messages** enable logs to be unconditionally recorded into server logs.

trace_sort

Parameter description: Specifies whether to print information about resource usage during sorting operations. This parameter is available only when the macro TRACE_SORT is defined during the GaussDB compilation. However, TRACE_SORT is currently defined by default.

This is a USERSET parameter. Set it based on instructions provided in Table 14-1.

Value range: Boolean

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

Default value: **off**

zero_damaged_pages

Parameter description: Specifies whether to detect a damaged page header that causes GaussDB to report an error, aborting the current transaction.

This is a SUSET parameter. Set it based on instructions provided in Table 14-1.

Value range: Boolean

Setting this parameter to **on** causes the system to report a warning, zero out the damaged page, and continue processing. This behavior will destroy data, including all the rows on the damaged page. However, it allows you to bypass the error and retrieve rows from any undamaged pages that may be present in the table. Therefore, it is useful for restoring data if corruption has occurred due to a hardware or software error. In most cases, you are advised not to set this parameter to **on** if you want to restore data from damaged pages.

Default value: **off**

remotetype

Parameter description: Specifies the remote connection type.

This is a BACKEND parameter. Set it based on instructions provided in Table 14-1.

Value range: enumerated values. Valid values are **application**, **datanode**, and **internaltool**.

Default value: **application**

max_user_defined_exception

Parameter description: Specifies the maximum number of exceptions. The default value cannot be changed.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer. Currently, only the fixed value **1000** is supported.

Default value: **1000**

enable_fast_numeric

Parameter description: Specifies whether to enable optimization for numeric data calculation. Calculation of numeric data is time-consuming. Numeric data is converted into int64- or int128-type data to improve numeric data calculation performance.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** or **true** indicates that optimization for numeric data calculation is enabled.
- **off** or **false** indicates that optimization for numeric data calculation is disabled.

Default value: **on**

enable_compress_spill

Parameter description: Specifies whether to enable the compression function of writing data to disk.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** or **true** indicates that optimization for writing data to disk is enabled.
- **off** or **false** indicates that optimization for writing data to a disk is disabled.

Default value: **on**

resource_track_log

Parameter description: Specifies the log level of self-diagnosis. Currently, this parameter takes effect only on multi-column statistics.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string

- **summary**: Brief diagnosis information is displayed.

- **detail**: Detailed diagnosis information is displayed.

Currently, the two parameter values differ only when there is an alarm about multi-column statistics not collected. If the parameter is set to **summary**, such an alarm will not be displayed. If it is set to **detail**, such an alarm will be displayed.

Default value: **summary**

show_acce_estimate_detail

Parameter description: The estimation information is generally used by O&M personnel during maintenance, and it may affect the output display of the EXPLAIN statement. Therefore, this parameter is disabled by default. The estimation information is displayed only if the **verbose** option of the EXPLAIN statement is enabled. (Due to specification changes, the current version no longer supports this feature. Do not use it.)

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the estimation information is displayed in the output of the EXPLAIN statement.
- **off** indicates that the estimation information is not displayed in the output of the EXPLAIN statement.

Default value: **off**

NOTE

The current version does not support database acceleration. Therefore, this parameter does not take effect after being set.

support_batch_bind

Parameter description: Specifies whether to batch bind and execute PBE statements through interfaces such as JDBC, ODBC, and libpq.

Parameter type: Boolean

Unit: none

Value range:

- **on** indicates that batch binding and execution are used.
- **off** indicates that batch binding and execution are not used.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

numa_distribute_mode

Parameter description: Specifies the distribution of some shared data and threads among NUMA nodes. This parameter is used to optimize the performance of

large-scale Arm servers with multiple NUMA nodes. Generally, you do not need to set this parameter.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. The valid values are **'none'** and **'all'**.

- **none** indicates that this function is disabled.
- **all** indicates that some shared data and threads are distributed to different NUMA nodes to reduce the number of remote access times and improve performance. Currently, this function applies only to Arm servers with multiple NUMA nodes. All NUMA nodes must be available for database processes. You cannot select only some NUMA nodes.

NOTE

In the current version, **numa_distribute_mode** cannot be set to **all** on the x86 architecture.

Default value: **'none'**

log_pagewriter

Parameter description: Specifies whether to display the page refresh information of a thread and details about an incremental check point after the incremental check point is enabled. You are advised not to set this parameter to **true** because a large amount of information will be generated.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

Default value: **on**

advance_xlog_file_num

Parameter description: Specifies the number of Xlog files that are periodically initialized in advance in the background. This parameter is used to prevent the Xlog file initialization from affecting the performance during transaction commit. However, such a fault may occur only when the system is overloaded. Therefore, you do not need to set this parameter.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 1000000. The value **0** indicates that initialization is not performed in advance. For example, the value **10** indicates that the background thread periodically initializes 10 Xlog files in advance based on the write location of the current Xlog.

Default value: **0**

enable_beta_opfusion

Parameter description: Specifies whether to accelerate the execution of SQL statements, such as aggregate functions and sorting in TPC-C when **enable_opfusion** is set to **on**.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **off**

enable_csqual_pushdown

Parameter description: Specifies whether to push down filter criteria for a rough check during query.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that a rough check is performed with filter criteria delivered during query.
- **off** indicates that a rough check is performed without filter criteria delivered during query.

Default value: **on**

string_hash_compatible

Parameter description: Specifies whether to use the same method to calculate char-type hash values and varchar- or text-type hash values. Based on the setting of this parameter, you can determine whether a redistribution is required when a distribution key is converted from a char-type data distribution into a varchar- or text-type data distribution.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the same calculation method is used and a redistribution is not required.
- **off** indicates that different calculation methods are used and a redistribution is required.

NOTE

Calculation methods differ in the length of input strings used for calculating hash values. (For a char-type hash value, spaces following a string are not counted as the length. For a text- or varchar-type hash value, the spaces are counted.) The hash value affects the calculation result of queries. To avoid query errors, do not modify this parameter during database running once it is set.

Default value: **off**

pldebugger_timeout

Parameter description: Specifies the timeout interval for the pldebugger server to wait for a response from the debug end.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to 86400. The unit is second.

Default value: **15min**

plsql_show_all_error

Parameter description: Specifies whether to skip errors and continue compiling PL/SQL objects. For details about the impact, see "Schema > DBE_PLDEVELOPER" in *Developer Guide*.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

Default value: **off**

ustore_attr

Parameter description: This parameter is used to control the information statistics of Ustore tables, rollback type, UB-tree index type, and data verification during the running of key modules (including data, indexes, rollback segments, and replay). This parameter helps R&D engineers locate faults.

Parameter type: string

Unit: none

Value range: This parameter is set in key-value mode. The mapping between keys and values is as follows: If multiple key-value pairs are used, use semicolons (;) to separate them. For example, ustore_attr='ustore_verify_level=FAST;ustore_verify_module=UPAGE:UBTREE:UNDO:REDO'.

- **ustore_verify_level**: verification level.

  Value range: a string of case-insensitive characters. For details, see the following table.

  Table 14-26 Parameter value meaning of ustore_verify_level

Parameter Value	Description
NONE	**NONE** indicates that the verification function is disabled. You are advised to enable this function to test performance.
FAST	Indicates fast verification. Few content is to be verified and the impact on performance is minimized. The value is **NORMAL** for compatibility with earlier versions.
COMPLETE	Indicates complete verification. The verification content is the largest and the performance is greatly affected. The value is **SLOW** for compatibility with earlier versions.

Default value: **FAST**

- **ustore_verify_module**: module that controls verification.

  Value range: The value can be one or more of **UPAGE**, **UBTREE**, **UNDO**, **REDO**, and **ROACH**, or it can be **ALL** or **NULL** (case-insensitive). When multiple values are used, separate them with colons (:). For example, **ustore_verify_module=UPAGE:UBTREE:UNDO:REDO**.

  When the ROACH module is enabled, the value of the **ustore_verify_level** parameter is ignored during the ROACH backup. By default, the level of verification is the highest and the performance is greatly affected. Therefore, exercise caution when using this parameter.

  Table 14-27 Parameter value meaning of ustore_verify_module

Parameter Value	Description
UPAGE	Indicates that data page verification is enabled.
UBTREE	Indicates that UB-tree index verification is enabled.
UNDO	Indicates that rollback segment data verification is enabled.
REDO	Indicates that data page verification for the REDO process is enabled.
ROACH	This parameter is discarded. The verification has been removed from the underlying logic. **ustore_verify_module** can be set to **roach** but it does not take effect.
ALL	Indicates that data verification is enabled for the UPAGE, UBTREE, UNDO, REDO, and ROACH modules.
NULL	Indicates that data verification for the UPAGE, UBTREE, UNDO, REDO, and ROACH modules is disabled.

  Default value: **UPAGE:UBTREE:UNDO**

- **index_trace_level**: specifies whether to enable index tracing and controls the printing level. After this function is enabled, information about index tuples that meet the conditions is printed based on the printing level during index scan.

  Value range: a string. The values are described in the following table.

  Default value: **NO**

  Table 14-28 Parameter value meaning of index_trace_level

Parameter Value	Description
NO	No additional information is printed.

Parameter Value	Description
NORMAL	Information about visible index tuples is printed, including: • ID and offset of the index page where the current index tuple is located • Current tuple status • TID and partOid corresponding to the current tuple • xmin and xmax information corresponding to the current tuple • Current tuple content (if **enable_log_tuple** is set to **on**).
VISIBILITY	On the basis of **NORMAL**, the information about the index tuples that do not pass the visibility check is printed and whether the index tuples are visible is marked.
SHOWHIKEY	On the basis of **VISIBILITY**, the system tries to print the information about the HIKEY tuple on the page.
ALL	Information about all tuples on the scanned index page is printed.

- **enable_log_tuple**: specifies whether to print the contents of related tuples when printing log-level prompts for troubleshooting and locating.

  Value range: **on** or **off** (case-insensitive)

  Default value: **off**

  Note: This parameter has been discarded.
- **enable_ustore_sync_rollback**: specifies whether to enable synchronous rollback for Ustore tables.

  Value range: Boolean

  Default value: **true**
- **enable_ustore_async_rollback**: specifies whether to enable asynchronous rollback for Ustore tables.

  Value range: Boolean

  Default value: **true**
- **enable_ustore_page_rollback**: specifies whether to enable page rollback for Ustore tables.

  Value range: Boolean

  Default value: **true**
- **enable_ustore_partial_seqscan**: specifies whether to enable partial scan for Ustore tables.

  Value range: Boolean

  Default value: **false**
- **enable_candidate_buf_usage_count**: specifies whether to enable buffer usage statistics.

Value range: Boolean

Default value: **false**

- **ustats_tracker_naptime**: specifies the interval for collecting statistics on Ustore tables.

  Value range: [1,INT_MAX/1000]

  Default value: **20**, in seconds.

- **umax_search_length_for_prune**: specifies the maximum search depth of the prune operation on the Ustore table.

  Value range: [1,INT_MAX/1000]

  Default value: **10**

NOTE

When setting **ustore_attr**, do not leave spaces or other characters before and after the equal sign (=) between key and value, for example, **ustore_attr='ustore_verify_level = FAST;**. Otherwise, the parameter is invalid during kernel code verification and the parameter setting fails.

Default value: an empty string

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

CAUTION

Exercise caution when setting the **ustore_attr** parameter. You are advised to modify this parameter with the assistance of engineers.

index_txntype

Parameter description: Determines whether the index type of UB-tree is PCR or RCR. PCR supports flashback query based on indexes, but RCR does not.

Parameter type: string

Unit: none

Value range: **'PCR'** or **'RCR'**.

Default value: an empty string

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised to set it to "'RCR".

enable_segment_remain_cleanup

Parameter description: Specifies which the residual segment-page cleanup feature is to be enabled.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: indicates that the old type of residual segment-page cleanup is enabled.
  - Query interfaces: gs_stat_remain_segment_info and gs_local_stat_remain_segment_info.
  - Cleanup interfaces: gs_free_remain_segment and gs_local_free_remain_segment.
- **off**: indicates that the new type of residual segment-page cleanup is enabled.
  - Query interfaces: GS_SEG_SPC_REMAIN_SEGMENTS and GS_SEG_SPC_REMAIN_EXTENTS.
  - Cleanup interfaces: gs_seg_free_spc_remain_segment and gs_seg_free_spc_remain_extent.

CAUTION

Do not change the cleanup mode unless necessary. Otherwise, residual segment-page data may fail to be cleaned up or other exceptions may occur.

Default value: **off**

convert_illegal_char_mode

Parameter description: Specifies the placeholders of invalid characters that can be displayed on the client.

Parameter type: string

Unit: none

Value range: 95 characters whose decimal codes range from 32 to 126 in the ASCII coding table.

Default value: **'?'**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none

default_segment

Parameter description: Specifies whether to create a segment-page table by default.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: A segment-page table is created by default when the segment field is not specified.
- **off**: A page table is created by default when the segment field is not specified.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none.

CAUTION

- If **--undostoragetype** is set to **'page'** or is not set during database initialization, the data of Ustore is forcibly stored in page mode, but Astore is not affected.

14.3.22 Auditing

14.3.22.1 Audit Switch

audit_enabled

Parameter description: Specifies whether to enable or disable the audit thread. After the audit thread is enabled, the auditing information written by the background thread can be read from the pipe and written into audit files.

Parameter type: Boolean

Unit: none

Value range:

- **on** indicates that the auditing function is enabled.
- **off** indicates that the auditing function is disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

audit_directory

Parameter description: Specifies the storage directory of audit files. The path can be relative to the **data** directory or an absolute path. Only the sysadmin user can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string

Default value: pg_audit. If **om** is used for database deployment, audit logs are stored in *$GAUSSLOG*/**pg_audit/***Instance name*.

NOTICE

- You need to set different audit file directories for different DNs. Otherwise, audit logs will be abnormal.
- If the value of **audit_directory** in the configuration file is an invalid path, the audit function cannot be used.

NOTE

- Valid path: Users have read and write permissions on the path.
- Invalid path: Users do not have read or write permission on the path.

audit_data_format

Parameter description: Audits the format of log files. Currently, only the binary format is supported. Only the sysadmin user can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string

Default value: **binary**

audit_rotation_interval

Parameter description: Specifies the interval of creating an audit log file. If the difference between the current time and the time when the previous audit log file is created is greater than the value of this parameter, a new audit log file will be generated.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to *INT_MAX*/60. The unit is min.

Default value: 1d

NOTICE

Do not adjust this parameter unless necessary. Otherwise, **audit_resource_policy** may fail to take effect. To control the storage space and time of audit logs, set the **audit_resource_policy**, **audit_space_limit**, and **audit_file_remain_time** parameters.

audit_rotation_size

Parameter description: Specifies the maximum capacity of an audit log file. If the total number of messages in an audit log exceeds the value of this parameter, the server will generate a new audit log file.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1024 to 1048576. The unit is KB.

Default value: **10 MB**

NOTICE

- Do not adjust this parameter unless necessary. Otherwise, **audit_resource_policy** may fail to take effect. To control the storage space and time of audit logs, set the **audit_resource_policy**, **audit_space_limit**, and **audit_file_remain_time** parameters.
- If the space occupied by a single record in an audit log file exceeds the value of this parameter, the log file is regarded as an invalid log file.

audit_resource_policy

Parameter description: Specifies the policy for determining whether audit logs are preferentially stored by space or time.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that audit logs are preferentially stored by space. A maximum of **audit_space_limit** logs can be stored.
- **off** indicates that audit logs are preferentially stored by time. A minimum duration of **audit_file_remain_time** logs must be stored.

Default value: **on**

audit_file_remain_time

Parameter description: Specifies the minimum duration required for recording audit logs. This parameter is valid only when **audit_resource_policy** is set to **off**.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 730. The unit is day. **0** indicates that the storage duration is not limited.

Default value: **90**

audit_space_limit

Parameter description: Specifies the total disk space occupied by audit files.

Parameter type: integer

Unit: KB

Value range: 1024 KB to 1024 GB

Default value: **1GB**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

In the multi-audit thread scenario, the minimum disk space occupied by audit files is the product of values of **audit_thread_num** and **audit_rotation_size**. Ensure that the value of **audit_space_limit** is greater than the product of values of **audit_thread_num** and **audit_rotation_size**.

audit_file_remain_threshold

Parameter description: Specifies the maximum number of audit files in the audit directory.

Parameter type: integer

Unit: none

Value range: an integer ranging from 100 to 1048576

Default value:

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. For details, see the following notes:

1048576 (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory); **1024** (4-core CPU/16 GB memory)

NOTICE

- Ensure that this parameter is set to **1048576**. Do not adjust this parameter unless necessary. Otherwise, **audit_resource_policy** may fail to take effect. To control the storage space and time of audit logs, set the **audit_resource_policy**, **audit_space_limit**, and **audit_file_remain_time** parameters.
- In the multi-audit thread scenario, do not adjust this parameter unless necessary. Ensure that the value of this parameter is greater than or equal to the value of **audit_thread_num**. Otherwise, the audit function cannot be used and the database is abnormal.

audit_thread_num

Parameter description: Specifies the number of threads used for auditing.

Parameter type: integer

Unit: none

Value range: 1 to 48

Default value: **1**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

- The larger the number of threads, the greater the impact on system performance.
- The larger the number of threads, the more CPU and I/O resources are occupied.

NOTICE

- When **audit_dml_state** is enabled and high performance is required, you are advised to increase the value of this parameter to ensure that audit messages can be processed and recorded in a timely manner.

14.3.22.2 User and Permission Audit

audit_login_logout

Parameter description: Specifies whether to audit users' login (including login success and failure) and logout.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 7.

- **0** indicates that the function of auditing users' logins and logouts is disabled.
- **1** indicates that only successful user logins are audited.
- **2** indicates that only failed user logins are audited.
- **3** indicates that successful and failed user logins are audited.
- **4** indicates that only user logouts are audited.
- **5** indicates that successful user logouts and logins are audited.
- **6** indicates that failed user logouts and logins are audited.
- **7** indicates that successful user logins, failed user logins, and logouts are audited.

Default value: **7**

audit_database_process

Parameter description: Specifies whether to audit the database startup, stop, switchover, and recovery.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer, **0** or **1**.

- **0** indicates that the function of auditing database startup, stop, switchover, and recovery is disabled.
- **1** indicates that the function of auditing database startup, stop, switchover, and recovery is enabled.

Default value: **1**

NOTICE

When the database is started, the standby DN is promoted to primary. Therefore, the DN type in the audit log is **system_switch** when the DN is started.

audit_user_locked

Parameter description: Specifies whether to audit the users' locking and unlocking.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer, **0** or **1**.

- **0** indicates that the function of auditing user's locking and unlocking is disabled.
- **1** indicates that the function of auditing user's locking and unlocking is enabled.

Default value: **1**

audit_user_violation

Parameter description: Specifies whether to audit the access violation operations of a user.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer, **0** or **1**.

- **0** indicates that the function of auditing the access violation operations of a user is disabled.
- **1** indicates that the function of auditing the access violation operations of a user is enabled.

Default value: **0**

audit_grant_revoke

Parameter description: Specifies whether to audit the granting and revoking of user permissions.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer, **0** or **1**.

- **0** indicates that the function of auditing the granting and recycling of a user's permission is disabled.
- **1** indicates that the function of auditing the granting and recycling of a user's permission is enabled.

Default value: **1**

audit_security_label

Parameter description: Specifies whether to audit the creation, deletion, and application of user security labels.

Parameter type: integer.

Unit: none

Value range: **0** or **1**

- **0** indicates that the creation, deletion, and application of user security labels are not audited.
- **1** indicates that the creation, deletion, and application of user security labels are audited.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If this parameter is enabled, the system performance may be affected.

audit_internal_event

Parameter description: Specifies whether to audit the connections and operations of internal tools CM Agent, gs_clean, and WDRXdb.

Parameter type: Boolean.

Unit: none

Value range:

- **off**: The login, logout, and operations of internal tools CM Agent, gs_clean, and WDRXdb are not audited.
- **on**: The login, logout, and operations of internal tools CM Agent, gs_clean, and WDRXdb are audited.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

NOTICE

Internal tools on the database server also generate audit logs. By default, **audit_internal_event** is disabled to reduce space occupied by audit logs and improve audit log query performance.

full_audit_users

Parameter description: Specifies the full audit user list. Audit logs are recorded for all auditable operations performed by users in the list.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. Use commas (,) to separate multiple usernames.

Default value: an empty string.

no_audit_client

Parameter description: Specifies the names and IP addresses of clients that do not need to be audited. The parameter format is *client name*@*IP address*, which is the same as that of the **client_conninfo** column in the pg_query_audit function, for example, **cm_agent@127.0.0.1 or gs_clean@127.0.0.1**.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. Use commas (,) to separate multiple configuration items.

Default value: an empty string.

NOTICE

- If the executed SQL statement meets the configuration requirements of **full_audit_users** and **no_audit_client**, the **no_audit_client** is preferentially configured and no audit logs are recorded.
- Audit logs are generated for communication among tools or nodes in the database server. To save space occupied by audit logs and improve the query performance of audit logs, you can configure the **no_audit_client** parameter not to audit the low-risk scenarios.

14.3.22.3 Operation Auditing

audit_system_object

Parameter description: Specifies whether to audit the operations such as CREATE, DROP, and ALTER on database objects. Database objects include databases, users, schemas, and tables. You can change the value of this parameter to audit only the operations on required database objects. In the scenario where the leader node is forcibly elected, you are advised to set **audit_system_object** to the maximum value and audit all DDL objects.

Parameter type: integer

Unit: none

Value range: 0 to 536870911

- **0** indicates that the operations such as CREATE, DROP, and ALTER are not audited.
- A non-zero value indicates that the operations such as CREATE, DROP, and ALTER on a certain or some database objects are audited.

Value description:

The value of this parameter is calculated by 29 binary bits. The 29 binary bits represent 29 types of database objects. If the corresponding binary bit is set to **0**,

the operations such as CREATE, DROP, and ALTER on corresponding database objects are not audited. If it is set to **1**, the operations such as CREATE, DROP, and ALTER are audited. For details about the audit contents represented by these 29 binary bits, see **Table 14-29**.

When SQL patches are audited and **audit_dml_state_select** is enabled, an SQL patch operation will be audited twice and recorded as DML and DDL operations in the audit log, respectively.

Default value: **67121159** (decimal), corresponding to 00100 0000 0000 0011 0000 0000 0111 in binary, indicating that DDL operations on the four database objects DATABASE, SCHEMA, USER, and SQLPatch are audited.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set the type of database objects to be audited based on service requirements.

- The more types of objects to be audited, the greater the impact on system performance.
- The more objects to be audited, the more CPU and I/O resources are occupied.

Table 14-29 Meaning of each value for the **audit_system_object** parameter

Binary Bit	Description	Value Range
Bit 0	Specifies whether to audit the CREATE, DROP, and ALTER operations on databases.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 1	Specifies whether to audit the CREATE, DROP, and ALTER operations on schemas.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 2	Specifies whether to audit the CREATE, DROP, and ALTER operations on users.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.

Binary Bit	Description	Value Range
Bit 3	Specifies whether to audit the CREATE, DROP, ALTER, and TRUNCATE operations on tables.	• **0** indicates that the CREATE, DROP, ALTER, and TRUNCATE operations on these objects are not audited. • **1** indicates that the CREATE, DROP, ALTER, and TRUNCATE operations on these objects are audited.
Bit 4	Specifies whether to audit the CREATE, DROP, and ALTER operations on indexes.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 5	Specifies whether to audit the CREATE and DROP operations on VIEW and MATVIEW objects.	• **0** indicates that the CREATE and DROP operations on these objects are not audited. • **1** indicates that the CREATE and DROP operations on these objects are audited.
Bit 6	Specifies whether to audit the CREATE, DROP, and ALTER operations on triggers.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 7	Specifies whether to audit the CREATE, DROP, and ALTER operations on procedures/functions.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 8	Specifies whether to audit the CREATE, DROP, and ALTER operations on tablespaces.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 9	Specifies whether to audit the CREATE, DROP, and ALTER operations on resource pools.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.

Binary Bit	Description	Value Range
Bit 10	Specifies whether to audit the CREATE, DROP, and ALTER operations on workloads.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 11	Specifies whether to audit the CREATE, DROP, and ALTER operations on server objects.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 13	Reserved	-
Bit 14	Specifies whether to audit the CREATE, DROP, and ALTER operations on ROW LEVEL SECURITY objects.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 15	Specifies whether to audit the CREATE, DROP, and ALTER operations on types.	• **0** indicates that the CREATE, DROP, and ALTER operations on types are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on types are audited.
Bit 16	Specifies whether to audit the CREATE, DROP, and ALTER operations on text search objects (CONFIGURATION and DICTIONARY).	• **0** indicates that the CREATE, DROP, and ALTER operations on text search objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on text search objects are audited.
Bit 17	Specifies whether to audit the CREATE, DROP, and ALTER operations on directories.	• **0** indicates that the CREATE, DROP, and ALTER operations on directories are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on directories are audited.

Binary Bit	Description	Value Range
Bit 18	Specifies whether to audit the CREATE, DROP, and ALTER operations on synonyms.	• **0** indicates that the CREATE, DROP, and ALTER operations on synonyms are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on synonyms are audited.
Bit 19	Specifies whether to audit the CREATE, DROP, and ALTER operations on sequences.	• **0** indicates that the CREATE, DROP, and ALTER operations on sequences are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on sequences are audited.
Bit 20	Specifies whether to audit the CREATE and DROP operations on CMK and CEK objects.	• **0** indicates that the CREATE, ALTER, and DROP operations on CMKs and CEKs are not audited. • **1** indicates that the CREATE, ALTER, and DROP operations on CMKs and CEKs are audited.
Bit 21	Specifies whether to audit the CREATE, DROP, and ALTER operations on PACKAGE objects.	• **0** indicates that the CREATE, DROP, and ALTER operations on packages are not audited. • **1** indicates that the operations are audited.
Bit 22	Specifies whether to audit the CREATE and DROP operations on MODEL objects.	• **0** indicates that the CREATE and ALTER operations on models are not audited. • **1** indicates that the CREATE and DROP operations are audited.
Bit 24	Specifies whether to audit the ALTER and DROP operations on the gs_global_config objects.	• **0** indicates that the ALTER and DROP operations on the gs_global_config objects are not audited. • **1** indicates that the ALTER and DROP operations on the gs_global_config objects are audited.
Bit 25	Specifies whether to audit the CREATE, DROP, and ALTER operations on FOREIGN DATA WRAPPER objects.	• **0** indicates that the CREATE, DROP, and ALTER operations on FOREIGN DATA WRAPPER objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on FOREIGN DATA WRAPPER objects are audited.

Binary Bit	Description	Value Range
Bit 26	Specifies whether to audit the CREATE, ENABLE, DISABLE, and DROP operations on SQL patches.	• **0** indicates that the CREATE, ENABLE, DISABLE, and DROP operations on SQL patches are not audited. • **1** indicates that the CREATE, ENABLE, DISABLE, and DROP operations on SQL patches are audited.
Bit 27	Specifies whether to audit the CREATE, ALTER, and DROP operations on events.	• **0** indicates that the CREATE, ENABLE, DISABLE, and DROP operations on events are not audited. • **1** indicates that the CREATE, ENABLE, DISABLE, and DROP operations on events are not audited.
Bit 28	Specifies whether to audit the CREATE, ALTER, and DROP operations on database links. Currently, the database link function is not supported.	• **0** indicates that the CREATE, ALTER, and DROP operations on database links are not audited. • **1** indicates that the CREATE, ALTER, and DROP operations on database links are audited.

audit_dml_state

Parameter description: Specifies whether to audit the INSERT, UPDATE, DELETE, and MERGE operations on a specific table.

Parameter type: integer

Unit: none

Value range: **0** or **1**

- **0** indicates that the INSERT, UPDATE, DELETE, and MERGE operations on a specific table are not audited.
- **1** indicates that the INSERT, UPDATE, DELETE, and MERGE operations on a specific table are audited.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

audit_dml_state_select

Parameter description: Specifies whether to audit the SELECT operation.

Parameter type: integer

Unit: none

Value range: **0** or **1**

- **0** indicates that the SELECT auditing function is disabled.
- **1** indicates that the SELECT auditing function is enabled.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

audit_function_exec

Parameter description: Specifies whether to record the audit information during the execution of the stored procedures, anonymous blocks, or user-defined functions (excluding system functions).

Parameter type: integer

Unit: none

Value range: **0** or **1**

- **0** indicates that the stored procedures, anonymous blocks, or user-defined functions (excluding system functions) are not audited.
- **1** indicates that the stored procedures, anonymous blocks, or user-defined functions (excluding system functions) are audited.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

audit_system_function_exec

Parameter description: Specifies whether to record audit logs when system functions in the whitelist are executed.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer, **0** or **1**

- **0** indicates that the function of auditing the execution of system functions is disabled.
- **1** indicates that the function of auditing system function execution is enabled.

Default value: **0**

The following table lists the whitelist of system functions that can be recorded and audited.

set_working_grand_version_num_manually	set_config	pg_cancel_backend	pg_cancel_session	pg_reload_conf	pg_rotate_logfile
pg_terminate_session	pg_terminate_backend	pg_create_restore_point	pg_start_backup	pg_stop_backup	pg_switch_xlog
pg_cbm_rotate_file	pg_cbm_get_merged_file	pg_cbm_recycle_file	pg_enable_delay_ddl_recycle	pg_disable_delay_ddl_recycle	gs_roach_stop_backup
gs_roach_enable_delay_ddl_recycle	gs_roach_disable_delay_ddl_recycle	gs_roach_switch_xlog	pg_last_xlog_receive_location	pg_xlog_replay_pause	pg_xlog_replay_resume
gs_pitr_clean_history_global_barriers	gs_pitr_archive_slot_force_advance	pg_create_physical_replication_slot_extern	gs_set_obs_delete_location	gs_hadr_do_switchover	gs_set_obs_delete_location_with_slotname
gs_streaming_dr_in_switchover	gs_upload_obs_file	gs_download_obs_file	gs_set_obs_file_context	gs_get_hadr_key_cn	pg_advisory_lock
pg_advisory_lock_shared	pg_advisory_unlock	pg_advisory_unlock_shared	pg_advisory_unlock_all	pg_advisory_xact_lock	pg_advisory_xact_lock_shared
pg_try_advisory_lock	pg_try_advisory_lock_shared	pg_try_advisory_xact_lock	pg_try_advisory_xact_lock_shared	pg_create_logical_replication_slot	pg_drop_replication_slot
pg_logical_slot_peek_changes	pg_logical_slot_get_changes	pg_logical_slot_get_binary_changes	pg_replication_slot_advance	pg_replication_origin_create	pg_replication_origin_drop
pg_replication_origin_session_setup	pg_replication_origin_session_reset	pg_replication_origin_session_progress	pg_replication_origin_xact_setup	pg_replication_origin_xact_reset	pg_replication_origin_advance
local_space_shrink	gs_space_shrink	pg_free_remain_segment	gs_fault_inject	gs_repair_file	local_clear_bad_block_info
gs_repair_page	-	-	-	-	-

audit_copy_exec

Parameter description: Specifies whether to audit the COPY operation.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer, **0** or **1**

- **0** indicates that auditing the COPY operation is disabled.
- **1** indicates that auditing the COPY operation is enabled.

Default value: **1**

audit_set_parameter

Parameter description: Specifies whether to audit the SET operation.

Parameter type: integer

Unit: none

Value range: **0** or **1**

- **0** indicates that auditing the SET operation is disabled.
- **1** indicates that auditing the SET operation is enabled.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

audit_xid_info

Parameter description: Specifies whether to record the transaction ID of the SQL statement in the **detail_info** column of the audit log.

Parameter type: integer

Unit: none

Value range: **0** or **1**

- **0** indicates that the function of recording transaction IDs in the audit log is disabled.
- **1** indicates that the function of recording transaction IDs in the audit log is enabled.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

NOTICE

If this function is enabled, the **detail_info** information in the audit log starts with *xid*. For example:

```
detail_info: xid=14619 , create table t1(id int);
```

If transaction IDs do not exist, **xid=NA** is recorded.

enableSeparationOfDuty

Parameter description: Specifies whether the separation of three duties is enabled.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the separation of duties is enabled.
- **off** indicates that the separation of duties is disabled.

Default value: **off**

enable_nonsysadmin_execute_direct

Parameter description: Specifies whether non-system administrators and non-monitor administrator are allowed to execute the EXECUTE DIRECT ON statement.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that any user is allowed to execute the EXECUTE DIRECT ON statement.
- **off** indicates that only the system administrator and monitor administrator are allowed to execute the EXECUTE DIRECT ON statement.

Default value: **off**

enable_access_server_directory

Parameter description: Specifies whether to allow non-initial users to create, modify, and delete directories.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that non-initial users have the permission to create, modify, and delete directories.
- **off** indicates that non-initial users do not have the permission to create, modify, and delete directories.

Default value: **off**

NOTICE

- For security purposes, only the initial user can create, modify, and delete DIRECTORY objects by default.
- If **enable_access_server_directory** is enabled, users with the SYSADMIN permission and users who inherit the gs_role_directory_create permission of the built-in role can create directories. A user with the SYSADMIN permission, the owner of a directory, a user who is granted with the DROP permission for the directory, or a user who inherits the gs_role_directory_drop permission of the built-in role can delete the directory. A user with the SYSADMIN permission and the owner of a directory object can change the owner of the directory, and the user must be a member of the new owning role.

14.3.23 CM Parameters

Modifying CM parameters affects the running mechanism of GaussDB. You are advised to ask GaussDB engineers to do it for you. For details about how to modify the CM parameters, see method 1 in **Table 14-2**.

14.3.23.1 CM Agent Parameters

log_dir

Parameter description: Specifies the directory where CM Agent logs are stored. The value can be an absolute path, or a path relative to the CM Agent data directory.

Value range: a string. Any modification of this parameter takes effect only after CM Agent is restarted. For details about how to modify this parameter, see **Table 14-2**.

Default value: **"log"**, indicating that CM Agent logs are generated in the CM Agent data directory.

log_file_size

Parameter description: Specifies the size of a log file. If a log file exceeds the specified size, a new one is created to record log information.

Value range: an integer ranging from 0 to 2047. The unit is MB. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **16MB**

log_min_messages

Parameter description: Specifies which message levels are written to the CM Agent log. Each level covers all the levels following it. The lower the level is, the fewer messages will be written into the log.

Value range: enumerated type. Valid values are **debug5**, **debug1**, **warning**, **error**, **log**, and **fatal**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **warning**

incremental_build

Parameter description: Specifies whether a standby DN is incrementally built. If this parameter is enabled, a standby DN is incrementally built.

Value range: Boolean. The value can be **on** or **off**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **on**

alarm_component

Parameter description: Specifies the location of the alarm component that processes alarms.

Value range: a string. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

- If **--alarm-type** in the gs_preinstall script is set to **5**, no third-party component is connected and alarms are written into system_alarm logs. In this case, the value of **alarm_component** is **/opt/huawei/snas/bin/snas_cm_cmd**.
- If **--alarm-type** in the gs_preinstall script is set to **1**, a third-party component is connected. In this case, the value of **alarm_component** is the absolute path of the executable program of the third-party component.

Default value: **/opt/huawei/snas/bin/snas_cm_cmd**

alarm_report_interval

Parameter description: Specifies the interval at which an alarm is reported. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Value range: a non-negative integer. The unit is s.

Default value: **1**

alarm_report_max_count

Parameter description: Specifies the maximum number of times an alarm is reported. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Value range: a non-negative integer

Default value: **1**

agent_report_interval

Parameter description: Specifies the interval at which CM Agent reports the instance status.

Value range: an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **1**

agent_phony_dead_check_interval

Parameter description: Specifies the interval at which CM Agent checks whether the DN process is suspended.

Value range: an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **10**

agent_check_interval

Parameter description: Specifies the interval at which CM Agent queries the status of instances, such as the DNs.

Value range: an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **2**

agent_heartbeat_timeout

Parameter description: Specifies the heartbeat timeout interval for CM Agent to connect to CM Server.

Value range: an integer ranging from 2 to 2^{31} – 1. The unit is second. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **8**

agent_connect_timeout

Parameter description: Specifies the time to wait before the attempt of CM Agent to connect to CM Server times out.

Value range: an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **1**

agent_connect_retries

Parameter description: Specifies the number of times CM Agent tries to connect to the CM Server.

Value range: an integer. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **15**

agent_kill_instance_timeout

Parameter description: Specifies the interval from the time when CM Agent fails to connect to the primary CM Server to the time when CM Agent terminates all instances on the node.

Value range: an integer. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **0**, indicating that the operation of stopping all instances on the node is not initiated.

security_mode

Parameter description: Specifies whether DNs are started in secure mode. If this parameter is enabled, DNs are started in secure mode. Otherwise, DNs are started in non-secure mode.

Value range: Boolean. The value can be **on** or **off**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **off**

upgrade_from

Parameter description: Specifies the internal version number of the database before an in-place upgrade. Do not modify the value of this parameter.

Value range: a non-negative integer. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **0**

process_cpu_affinity

Parameter description: Specifies whether to bind a primary DN process to a CPU core before starting the process. If this parameter is set to **0**, core binding is not performed. If it is set to another value, core binding is performed, and the number of physical CPU cores is 2^n. Only Arm is supported.

Value range: an integer ranging from 0 to 2. The modification of this parameter takes effect only after the database and CM Agent are restarted. For details about how to modify the parameter, see **Table 14-2**.

Default value: **0**

log_threshold_check_interval

Parameter description: Specifies the interval for compressing and clearing logs.

Parameter type: integer

Unit: second

Value range: 0 to 2147483647

Default value: **1800**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. You can adjust the value based on the disk space and scenario requirements.

dilatation_shard_count_for_disk_capacity_alarm

Parameter description: Specifies the number of shards to be added in the scale-out scenario. This parameter is used to calculate the threshold for reporting a disk capacity alarm.

NOTE

The parameter value must be the same as the actual number of shards to be added.

Value range: an integer ranging from 0 to 2^{32} – 1. If this parameter is set to **0**, the disk scale-out alarm is not reported. If this parameter is set to a value greater than **0**, the disk scale-out alarm is reported and the threshold is calculated based on the number of shards specified by this parameter. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **1**

log_max_size

Parameter description: Specifies the maximum size of a log file.

Parameter type: integer

Unit: MB

Value range: 0 to 2147483647

Default value: **10240**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. You can adjust the value based on the disk space and scenario requirements.

log_max_count

Parameter description: Specifies the maximum number of logs that can be stored on hard disks.

Parameter type: integer

Unit: none

Value range: 0 to 10000

Default value: **10000**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. You can adjust the value based on the disk space and scenario requirements.

log_saved_days

Parameter description: Specifies the number of days for storing logs.

Parameter type: integer

Unit: day

Value range: 0 to 1000

Default value: **90**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. You can adjust the value based on the disk space and scenario requirements.

enable_log_compress

Parameter description: Specifies whether to enable log compression.

Value range: Boolean. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

- **on** indicates that log compression is enabled.
- **off** indicates that log compression is disabled.

Default value: **on**

agent_backup_open

Parameter description: Specifies the DR database instance settings. After this parameter is enabled, CM runs in DR database instance mode.

Value range: an integer ranging from 0 to 1. Any modification of this parameter takes effect only after CM Agent is restarted. For details about how to modify this parameter, see **Table 14-1**.

- **0**: disabled.
- **1**: enabled.

Default value: **0**

enable_xc_maintenance_mode

Parameter description: Specifies whether the pgxc_node system catalog can be modified when the database instance is in read-only mode.

Value range: Boolean. Any modification of this parameter takes effect only after CM Agent is restarted. For details about how to modify this parameter, see **Table 14-1**.

- **on** indicates that the pgxc_node system catalog can be modified.
- **off** indicates that the pgxc_node system catalog cannot be modified.

Default value: **on**

unix_socket_directory

Parameter description: Specifies the directory location of the Unix socket.

Value range: a string. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-1**.

Default value: ''

enable_dcf

Parameter description: Specifies the status of the DCF mode.

Value range: Boolean. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-1**.

- **0**: disabled.
- **1**: enabled.

Default value: **off**

disaster_recovery_type

Parameter description: Specifies the type of the DR relationship between the primary and standby database instances.

Value range: an integer ranging from 0 to 2. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-1**.

- **0** indicates that no DR relationship is established.
- **1** indicates that the OBS DR relationship is established.
- **2** indicates that the streaming DR relationship is established.

Default value: **0**

enable_e2e_rto

Parameter description: Specifies whether to enable the E2E RTO function. After this function is enabled, the hang-up detection period and network detection timeout interval are shortened. The CM can reach the E2E RTO indicator (RTO for a single instance ≤ 10s; RTO for combined faults ≤ 30s).

Parameter type: integer

Unit: none

Value range:

- **1**: enabled.
- **0**: disabled.

Default value:

14.3.23.2 CM Server Parameters

log_dir

Parameter description: Specifies the directory where CM Server logs are stored. The value can be an absolute path, or a path relative to the CM Server data directory.

Value range: a string. The modification takes effect after CM Server is restarted. For details about how to modify this parameter, see **Table 14-2**.

Default value: **"log"**, indicating that CM Server logs are generated in the CM Server data directory.

log_file_size

Parameter description: Specifies the size of a log file. If a log file exceeds the specified size, a new one is created to record log information.

Value range: an integer ranging from 0 to 2047. The unit is MB. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **16MB**

log_min_messages

Parameter description: Specifies which message levels are written to the CM Server log. Each level covers all the levels following it. The lower the level is, the fewer messages will be written into the log.

Value range: enumerated type. Valid values are **debug5**, **debug1**, **log**, **warning**, **error**, and **fatal**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **warning**

thread_count

Parameter description: Specifies the number of threads in the agent thread pool.

Parameter type: string

Unit: none

Value range: This parameter consists of two parts: '**worker_thread_count** and **io_ratio**. The meanings of the two parts are as follows:

- **worker_thread_count**: specifies the number of AgentWorker threads. The value ranges from 2 to 1000.
- **io_ratio**: specifies the ratio of I/O threads to worker threads. The value *n* indicates that one AgentIO thread corresponds to *n* AgentWorker threads. The value ranges from 1 to 100. At least one AgentIO thread is required.

Default value: **"(1000,1)"**

Setting method: Refer to the **set cm parameters** table in "Unified Database Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the reload command for the settings to take effect.

Setting suggestion: Retain the default value. If you want to adjust the value, make sure you understand the parameter meaning and adjust the value with caution to avoid risks caused by misoperations.

alarm_component

Parameter description: Specifies the location of the alarm component that processes alarms.

Value range: a string. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

- If **--alarm-type** in the gs_preinstall script is set to **5**, no third-party component is connected and alarms are written into system_alarm logs. In this case, the value of **alarm_component** is **/opt/huawei/snas/bin/snas_cm_cmd**.
- If **--alarm-type** in the **gs_preinstall** script is set to **1**, a third-party component is connected. In this case, the value of **alarm_component** is the absolute path of the executable program of the third-party component.

Default value: **/opt/huawei/snas/bin/snas_cm_cmd**

instance_failover_delay_timeout

Parameter description: Specifies the delay in CM Server failover after the primary CM Server breakdown is detected.

Value range: an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **0**

instance_heartbeat_timeout

Parameter description: Specifies the time to wait before the instance heartbeat times out.

Value range: an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **6**

cmserver_ha_connect_timeout

Parameter description: Specifies the time to wait before the connection between the primary and standby CM Servers times out.

Value range: an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: 2

cmserver_ha_heartbeat_timeout

Parameter description: Specifies the time to wait before the heartbeat between the primary and standby CM Servers times out.

Value range: an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **6**

phony_dead_effective_time

Parameter description: Specifies the maximum number of times DN processes are detected as zombie. If the number of times a process is detected as zombie is greater than the specified value, the process is considered to be a zombie process and will be restarted.

Value range: an integer. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **5**

enable_transaction_read_only

Parameter description: Specifies whether the database is in read-only mode.

Value range: Boolean values **on**, **off**, **true**, **false**, **yes**, **no**, **1**, and **0**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **on**

datastorage_threshold_check_interval

Parameter description: Specifies the interval for checking the disk usage. The system checks the disk usage at the interval specified by the user.

Value range: an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **10**

datastorage_threshold_value_check

Parameter description: Specifies the usage threshold of a read-only disk in a database. When the disk usage of the data directory exceeds the specified value, the database is automatically set to read-only mode. In the read-only mode, log replay cannot be restricted. Pay attention to the cluster disk capacity and handle read-only alarms in a timely manner to prevent the disk space from being used up; otherwise, the database cannot be quickly restored.

Parameter type: integer

Unit: percentage

Value range: 1 to 99.

Default value: **85**

Setting method: The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Setting suggestion: Retain the default value. You can adjust this parameter based on the disk space. When adjusting this parameter, you are advised to adjust the **max_size_for_xlog_retention** parameter of the DN at the same time to prevent the instance read-only threshold from being triggered by backup operations.

max_datastorage_threshold_check

Parameter description: Specifies the maximum interval for checking the disk usage. After you modify the read-only mode parameter, the system automatically checks whether the disk usage reaches the threshold at the specified interval.

Value range: an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **43200**

cmserver_ha_status_interval

Parameter description: Specifies the interval between synchronizations of primary and standby CM Server status.

Value range: an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **1**

cmserver_self_vote_timeout

Parameter description: Specifies the time to wait before the CM Server self-voting times out.

Value range: an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **6**

alarm_report_interval

Parameter description: Specifies the interval at which an alarm is reported.

Value range: a non-negative integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **3**

alarm_report_max_count

Parameter description: Specifies the maximum number of times an alarm is reported.

Value range: a non-negative integer. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **1**

enable_az_auto_switchover

Parameter description: Specifies whether to enable automatic AZ switchover. If this parameter is enabled, CM Server automatically switches over services among AZs. Otherwise, when a DN is faulty, services will not be automatically switched to another AZ even if the current AZ is unavailable. You can run the switchover command to manually switch services to another AZ.

Value range: a non-negative integer. **0**: disabled; **1**: enabled. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **1**

instance_keep_heartbeat_timeout

Parameter description: The CM Agent periodically checks the instance status and reports the status to the CM Server. If the instance status cannot be detected for a long time and the accumulated number of times exceeds the value of this parameter, the CM Server delivers a command to the CM Agent to restart the instance.

Value range: an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **40**

az_switchover_threshold

Parameter description: If the failure rate of a DN shard in an AZ (Number of faulty DN shards/Total number of DN shards x 100%) exceeds the specified value, automatic AZ switchover is triggered.

Value range: an integer ranging from 0 to 100. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **100**

az_check_and_arbitrate_interval

Parameter description: Specifies the interval for checking the AZ status. If an AZ is abnormal, automatic AZ switchover is triggered.

Value range: an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: 2

az_connect_check_interval

Parameter description: Specifies the interval at which the network connection between AZs is checked.

Value range: an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **60**

az_connect_check_delay_time

Parameter description: Specifies the delay between two retries to check the network connection between AZs.

Value range: an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **150**

cmserver_demote_delay_on_etcd_fault

Parameter description: Specifies the interval at which CM Server switches from the primary state to the standby state due to unhealthy ETCD.

Value range: an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **8**

instance_phony_dead_restart_interval

Parameter description: Specifies the interval at which the CM Agent process restarts and kills a zombie DN. The interval between two consecutive kill operations cannot be less than the value of this parameter. Otherwise, the CM Agent process does not deliver commands.

Value range: an integer. The unit is s. The minimum value that takes effect is **1800**. If this parameter is set to a value less than **1800**, the value **1800** takes effect. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: 21600

cm_auth_method

Parameter description: Specifies the port authentication mode of the CM. **trust** indicates that port authentication is not configured. **gss** indicates that Kerberos

port authentication is used. Note that you can change the value to **gss** only after the Kerberos server and client are successfully installed. Otherwise, the CM cannot communicate properly, affecting the database status.

Value range: **gss** or **trust**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **trust**

cm_krb_server_keyfile

Parameter description: Specifies the location of the key file on the Kerberos server. The value must be an absolute path. The file is usually stored in the *${GAUSSHOME}*/**kerberos** directory and ends with keytab. The file name is the same as the name of the user who runs the database. This parameter is used together with **cm_auth_method**. If the **cm_auth_method** parameter is changed to **gss**, **cm_krb_server_keyfile** must also be configured as the correct path. Otherwise, the database status will be affected.

Value range: a string. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: *${GAUSSHOME}*/**kerberos/***{UserName}*.**keytab**. The default value cannot take effect and is used only as a prompt.

cm_server_arbitrate_delay_base_time_out

Parameter description: Specifies the basic delay duration for CM Server arbitration. If the primary CM Server is disconnected, the arbitration starts to be timed. If the disconnection duration exceeds the arbitration delay duration, a new primary CM Server will be selected. The arbitration delay duration is determined by the basic delay duration, the node index (server ID), and the incremental delay duration. The formula is as follows: Arbitration delay duration = Basic delay duration + Node index x Incremental delay duration

Value range: an integer. The unit is s. The index should be larger than 0. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: 10

cm_server_arbitrate_delay_incrememtal_time_out

Parameter description: Specifies the incremental delay duration for CM Server arbitration. If the primary CM Server is disconnected, the arbitration starts to be timed. If the disconnection duration exceeds the arbitration delay duration, a new primary CM Server will be selected. The arbitration delay duration is determined by the basic delay duration, the node index (server ID), and the incremental delay duration. The formula is as follows: Arbitration delay duration = Basic delay duration + Node index x Incremental delay duration

Value range: an integer. The unit is s. The index should be larger than 0. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **3**

force_promote

Parameter description: Specifies whether CM Server enables forcible switchover (that is, when the cluster status is unknown, the basic functions of the cluster are available at the cost of data loss). The value **0** indicates that forcible startup is disabled, and the value **1** indicates that forcible startup is enabled. This parameter applies to DNs.

Value range: an integer, **0** or **1**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **0**

switch_rto

Parameter description: Specifies the delay for the forcible switchover of CM Server. When **force_promote** is set to **1** and a shard in the database does not have primary CM Server, the system starts timing. After the delay, forcible switchover is executed.

Value range: an integer ranging from 60 to 2147483647. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **600**

enable_finishredo_retrieve

Parameter description: Specifies whether to retrieve data of Xlogs that have been cut off by redo after a forcible CM Server switchover. If this parameter is set to **on**, data is automatically retrieved after a forcible switchover.

Parameter type: Boolean

Unit: none

Value range:

- **off**: disabled.
- **on**: enabled.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: If you can accept the loss of some data caused by forcible service (system) switchover, set this parameter to **on** when the service recovery has the highest priority.

backup_open

Parameter description: Specifies the DR database instance settings. After this parameter is enabled, CM runs in DR database instance mode.

Value range: an integer ranging from 0 to 1. The modification takes effect after CM Server is restarted. This parameter cannot be enabled for a non-DR database instance. For details about how to modify this parameter, see **Table 14-2**.

- **0**: disabled.
- **1**: enabled.

Default value: **0**

enable_dcf

Parameter description: Specifies the status of the DCF mode.

Value range: Boolean. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

- **0**: disabled.
- **1**: enabled.

Default value: **off**

install_type

Parameter description: Specifies the settings related to the DR database instance. It is used to distinguish whether the database instance is based on Dorado.

Value range: an integer ranging from 0 to 2. The modification takes effect after CM Server is restarted. This parameter cannot be enabled for a non-DR database instance. For details about how to modify this parameter, see **Table 14-2**.

- **0** indicates the database instance for which the DR relationship is not established.
- **1** indicates a Dorado-based database instance.
- **2** indicates a streaming-based database instance.

Default value: **0**

enable_ssl

Parameter description: Specifies whether to enable SSL.

Value range: Boolean. After this function is enabled, the SSL certificate is used to encrypt communication. The modification takes effect after CM Server is restarted. For details about how to modify this parameter, see **Table 14-2**.

- **on** indicates that SSL is enabled.
- **off** indicates that SSL is disabled.
- **Default value**: **off**

NOTICE

To ensure security, you are advised not to disable it. After this function is disabled, the CM does not use encrypted communication and all information is transmitted in plaintext, which may bring security risks such as eavesdropping, tampering, and spoofing.

ssl_cert_expire_alert_threshold

Parameter description: Specifies the SSL certificate expiration alarm time.

Value range: an integer. The unit is day. If the certificate expiration time is less than the value of this parameter, an alarm indicating that the certificate is about to expire is reported. The modification takes effect after CM Server is restarted. For details about how to modify this parameter, see **Table 14-2**.

Default value: **90**

ssl_cert_expire_check_interval

Parameter description: Specifies the period for checking whether the SSL certificate expires.

Value range: an integer. The unit is s. The modification takes effect after CM Server is restarted. For details about how to modify this parameter, see **Table 14-2**.

Default value: **86400**

delay_arbitrate_timeout

Parameter description: Specifies the waiting time for a node in the same AZ as the primary DN to be promoted to primary after redo replay.

Value range: an integer, in the range [0,21474836] (unit: second). The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **0**

ddb_type

Parameter description: Specifies whether to switch between ETCD and DCC modes.

Value range: an integer. **0**: ETCD; **1**: DCC. The modification takes effect after CM Server is restarted. For details about how to modify this parameter, see **Table 14-2**.

Default value: **0**

ddb_log_level

Parameter description: Sets the DDB log level.

To disable the log function, set this parameter to **"NONE"**, which cannot be used together with the following log levels:

To enable the log function, set this parameter to one or a combination of the following log levels: **"RUN_ERR|RUN_WAR|RUN_INF|DEBUG_ERR|DEBUG_WAR|DEBUG_INF|TRACE|PROFILE|OPER"**. If two or more log levels are used together, separate them with vertical bars (|). The log level cannot be set to an empty string.

Value range: a string containing one or a combination of the following log levels: **RUN_ERR|RUN_WAR|RUN_INF|DEBUG_ERR|DEBUG_WAR|DEBUG_INF|TRACE|PROFILE|OPER**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **RUN_ERR|RUN_WAR|DEBUG_ERR|OPER|RUN_INF|PROFILE**

ddb_log_backup_file_count

Parameter description: Specifies the maximum number of log files that can be saved.

Value range: an integer ranging from 1 to 100. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **10**

ddb_max_log_file_size

Parameter description: Specifies the maximum number of bytes in a log.

Value range: a string, in the range [1M,1000M]. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **10M**

ddb_log_suppress_enable

Parameter description: Specifies whether to enable the log suppression function.

Value range: an integer. **0**: disabled; **1**: enabled. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **1**

ddb_election_timeout

Parameter description: Specifies the DCC election timeout period.

Value range: an integer, in the range [1,600], in seconds. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 14-2**.

Default value: **3**

enable_synclist_single_inst

Parameter description: Specifies whether to reduce copies to one primary and zero standby.

Parameter type: Boolean

Unit: none

Value range:

- **off**: This function is disabled.
- **on**: This function is enabled.

Default value: **off**

Setting method: Refer to the **set cm parameters** table in "Unified Database Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the reload command for the settings to take effect.

Setting suggestion: Retain the default value.

enable_e2e_rto

Parameter description: Specifies whether to enable the E2E RTO function. After this function is enabled, the hang-up detection period and network detection timeout interval are shortened. The CM can reach the E2E RTO indicator (RTO for a single instance ≤ 10s; RTO for combined faults ≤ 30s).

Parameter type: integer

Unit: none

Value range:

- **1**: enabled.
- **0**: disabled.

Default value:

14.3.24 Upgrade Parameters

IsInplaceUpgrade

Parameter description: Specifies whether an upgrade is ongoing. This parameter cannot be modified by users. Only the sysadmin user can access this parameter.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates an upgrade is ongoing.
- **off** indicates no upgrade is ongoing.

Default value: **off**

inplace_upgrade_next_system_object_oids

Parameter description: Indicates the OID of a new system object during the in-place upgrade. The value of this parameter cannot be changed.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string

Default value: empty

upgrade_mode

Parameter description: Specifies the upgrade mode.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Value range: an integer ranging from 0 to *INT_MAX*

- **0** indicates that no upgrade is ongoing.
- **1** indicates that a local upgrade is ongoing.
- **2** indicates that a grayscale upgrade is ongoing.

Default value: **0**

NOTE

Special case: When the gray upgrade is used, if the major version upgrade policy is selected, that is, the upgrade script needs to be executed and the binary package needs to be replaced, the value of **upgrade_mode** is set to **2**;iIf the minor version upgrade policy is selected, that is, only the binary package needs to be replaced, the value of **upgrade_mode** is not set to **2**.

14.3.25 Miscellaneous Parameters

enable_default_ustore_table

Parameter description: Specifies whether to enable the Ustore by default. If this parameter is set to **on**, all created tables are Ustore tables.

Parameter type: Boolean.

Value range:

- **on** indicates that the Ustore is enabled by default.
- **off** indicates that the Ustore is disabled by default.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. Note that the **track_counts** and **track_activities** parameters must be enabled when the Ustore table is used. Otherwise, space bloat may occur.

enable_ustore

Parameter description: Specifies whether to enable the Ustore. If this parameter is set to **on**, Ustore tables can be created. Note that the **track_counts** and **track_activities** parameters must be enabled when the Ustore table is used. Otherwise, space bloat may occur.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: [off,on]

Default value: **on**

enable_segment_datafile_preallocate

Parameter description: Specifies whether to allocate disk space immediately during segment-page file extension. If this parameter is set to **on**, the system preferentially uses fallocate to allocate disk space immediately during file expansion. If the system does not support fallocate, the system applies for disk space by writing zeros byte by byte. If this parameter is set to **off**, the system does not allocate disk space immediately during file expansion and hole files are created.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: [off,on]

Default value: **on**

reserve_space_for_nullable_atts

Parameter description: Specifies whether to reserve space for the nullable attribute of an Ustore table. If this parameter is set to **on**, space is reserved for the nullable attribute of the Ustore table by default.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: [off,on]

Default value: **on**

server_version

Parameter description: Specifies the server version number.

This is a fixed parameter of the INTERNAL type. It can be viewed but cannot be modified. This parameter is not recommended. To query the server version, use the opengauss_version() function.

Value range: a string.

Default value: **9.2.4**

server_version_num

Parameter description: Specifies the server version number.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Value range: an integer

Default value: **90204**

block_size

Parameter description: Specifies the block size of the current database.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Value: **8192**

Default value: **8192**

segment_size

Parameter description: Specifies the segment file size of the current database.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Unit: 8 KB

Default value: **131072**, that is, 1 GB.

max_index_keys

Parameter description: Specifies the maximum number of index keys supported by the current database.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Default value: **32**

integer_datetimes

Parameter description: Specifies whether the date and time are in the 64-bit integer format.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Value range: Boolean

- **on**: yes.
- **off**: no.

Default value: **on**

lc_collate

Parameter description: Specifies the locale in which sorting of textual data is done.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Default value: Determined by the configuration during the database installation and deployment.

lc_ctype

Parameter description: Specifies the locale that determines character classifications. For example, it specifies what a letter and its upper-case equivalent are.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Default value: Determined by the configuration during the database installation and deployment.

max_identifier_length

Parameter description: Specifies the maximum identifier length.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Value range: an integer.

Default value: **63**

server_encoding

Parameter description: Specifies the database encoding (character set).

By default, gs_initdb will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Default value: determined by the current system environment when the database is created.

basebackup_timeout

Parameter description: Specifies the timeout interval for a connection that has no read or write operations after a backup transfer is complete.

When the gs_basebackup tool is used for transmission and a high compression rate is specified, the transmission of the tablespace may time out (the client needs to compress the transmitted data).

Value range: an integer ranging from 0 to *INT_MAX*. The unit is s. **0** indicates that archiving timeout is disabled.

Default value: 600s

datanode_heartbeat_interval

Parameter description: Specifies the interval at which heartbeat messages are sent between heartbeat threads. You are advised to set this parameter to a value no more than **wal_receiver_timeout**/2.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1000 to 60000. The unit is ms.

Default value: **1s**

max_concurrent_autonomous_transactions

Parameter description: Specifies the maximum number of autonomous transaction connections, that is, the maximum number of concurrent autonomous transactions executed at the same time. If this parameter is set to **0**, autonomous transactions cannot be executed.

Parameter type: integer.

Unit: none

Value range: 0–10000. The theoretical maximum value is **10000**, and the actual maximum value is a dynamic value. The calculation formula is 262143 –

job_queue_processes – **autovacuum_max_workers** – **max_inner_tool_connections** – **max_connections** – **AUXILIARY_BACKENDS** – **AV_LAUNCHER_PROCS**. The values of **job_queue_processes**, **autovacuum_max_workers**, **max_inner_tool_connections**, and **max_connections** depend on the settings of the corresponding GUC parameters. **AUXILIARY_BACKENDS** indicates the number of reserved auxiliary threads, which is fixed to **20**. **AV_LAUNCHER_PROCS** indicates the number of reserved launcher threads for autovacuum, which is fixed to **2**.

Default value: **200** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory); **150** (96-core CPU/768 GB memory); **120** (80-core CPU/640 GB memory) **100** (64-core CPU/512 GB memory); **80** (60-core CPU/480 GB memory); **40** (32-core CPU/256 GB memory); **20** (16-core CPU/128 GB memory); **10** (8-core CPU/64 GB memory, 4-core CPU/32 GB memory, 4-core CPU/16 GB memory)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Suggestion: Set this parameter based on actual service requirements and hardware configurations. It is recommended that this parameter be set to a value less than or equal to 1/10 of **max_connections**. If you only increase the value of this parameter but do not adjust the memory parameters in the same proportion, the memory may be insufficient and the error message "memory is temporarily unavailable" is displayed when the service load is heavy.

NOTE

If the value range of this parameter is changed during the upgrade and the value is changed before the commit operation, you need to change the value range to the value allowed before the upgrade if you roll back the upgrade. Otherwise, the database may fail to be started.

enable_seqscan_fusion

Parameter description: Specifies whether to enable SeqScan optimization.

This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that SeqScan optimization is enabled.
- **off** indicates that SeqScan optimization is disabled.

Default value: **off**

NOTE

This parameter can be used to optimize only the execution time of the SeqScan operator in the EXPLAIN ANALYZE statement.

cluster_run_mode

Parameter description: Specifies whether a DN belongs to the primary or standby database instance in the dual-database instance DR scenario. For a single database instance, use the default primary database instance.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: enumerated values

- **cluster_primary** indicates the primary database instance.
- **cluster_standby** indicates the standby database instance.

Default value: **cluster_primary**

acceleration_with_compute_pool

Parameter description: Determines whether to use the computing resource pool for acceleration when an OBS is queried. (Due to specification changes, the current version no longer supports this feature. Do not use it.)

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the query covering the OBS is accelerated based on the cost when the computing resource pool is available.
- **off** indicates that no query is accelerated using the computing resource pool.

Default value: **off**

dfs_partition_directory_length

Parameter description: Specifies the maximum directory name length for the partition directory of a table partitioned by VALUE in the HDFS.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: 92 to 7999

Default value: **512**

max_resource_package

Parameter description: Specifies the maximum number of threads that each DN can run concurrently on an acceleration database instance on the cloud.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: 0 to 2147483647

Default value: **0**

enable_gpi_auto_update

Parameter description: Determines whether global indexes are updated by default in partition DDL commands.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- The value **on** indicates that global indexes are updated regardless of whether the partition DDL commands contain the UPDATE GLOBAL INDEX clause.
- The value **off** indicates that global indexes are not updated unless the partition DDL commands contain the UPDATE GLOBAL INDEX clause.

Default value: **off**

enable_gsplsql_execopt

Parameter description: Determines whether to optimize the execution of stored procedure functions in Tuple mode.

Execution modes of stored procedure functions are as follows:

- Statement mode: Use the perform or call procedure() function to call stored procedures, during which every SQL statement in the stored procedures is executed separately.
- Tuple mode: Use **targetlist** or **trigger** to call stored procedures. The calling environment is one tuple input in the execution state.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that when a stored procedure function is cyclically executed in Tuple mode, the information that does not change during the initialization of the stored procedure is allocated and recorded to avoid invalid repeated calling during the execution.
- **off** indicates that the default calling logic is used and information is initialized in each loop.

Default value: **on**

multi_insert_min_rows

Parameter description: Specifies the minimum estimated number of rows to be inserted in batches. You can run **explain (verbose on)** to check whether the execution plan contains "Batch Insert."

Parameter type: integer.

Unit: none

Value range: –1 to 2147483647. **–1** indicates that batch insertion is not used. If the value is greater than or equal to **0**, the estimated number of rows to be inserted is greater than or equal to **multi_insert_min_rows**, and batch insertion is used for the INSERT SELECT statement to improve performance.

Default value: **1000**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised to use the default value or a value greater than **1000**. If the number of inserted data rows is small, batch insertion may deteriorate the insertion performance.

NOTE

- **Specification**

  By default, the batch insertion rate of an Astore table can be improved by about 50%, and the batch insertion rate of a Ustore table can be improved by about 60%.

- **Constraint**

  In addition to the **multi_insert_min_rows** parameter constraint, batch insertion has the following constraints:

  1. Statements other than INSERT SELECT are not supported.
  2. Tables that contain BEFORE and INSTEAD triggers are not supported because the data to be inserted may be changed.
  3. SQL statements cannot contain the volatile function because a new transaction is started each time a volatile function is executed. However, if batch insertion is used, the snapshot obtained by the volatile function may be different from that obtained by common insertion.
  4. The SQL statement cannot contain RETURNING.
  5. The UPSERT clause is not supported.
  6. Batch insertion cannot be used for unlogged tables, temporary tables, or global temporary tables. Otherwise, the performance may deteriorate.
  7. Tables containing auto increment columns are supported only when **b_format_version** is set to **'5.7'** or **b_format_dev_version** is set to **'s2'**.

Example:

```
-- Create tables and data.
create table t(id int, c1 varchar(20), c2 varchar(40), c3 varchar(50)) with (storage_type=astore);
create table t_tmp(id int, c1 varchar(20), c2 varchar(40), c3 varchar(50))  with (storage_type=astore);
insert into t_tmp values (generate_series(1, 1000), '1111111111111111111', '222222222222222222',
'33333333333333333333333333333333');
analyze t_tmp;

-- Insert 1000 rows of data for 1000 times. Batch insertion takes 1.2s while non-batch insertion takes 2.68s.
Using batch insertion improves the performance by more than 50%.
set multi_insert_min_rows=-1;
DECLARE
    start_time bigint;
    end_time bigint;
BEGIN
    start_time := dbe_utility.get_time();
    for i in 1 .. 1000 loop
        insert into t select * from t_tmp;
    end loop;
    end_time := dbe_utility.get_time();
    dbe_output.print_line('Time consumed:' ||(end_time - start_time)/100);
END;
/
Time consumed: 2.68

set multi_insert_min_rows=0;
DECLARE
    start_time bigint;
    end_time bigint;
BEGIN
    start_time := dbe_utility.get_time();
    for i in 1 .. 1000 loop
        insert into t select * from t_tmp;
    end loop;
    end_time := dbe_utility.get_time();
    dbe_output.print_line('Time consumed:' ||(end_time - start_time)/100);
END;
/
Time consumed: 1.2
```

enable_force_smp

Parameter description: Specifies whether to forcibly enable SMP. When this parameter is enabled, the cost of starting the stream thread is empty by default. When the degree of parallelism is set and the operator supports parallelism, the parallel path is forcibly selected.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that SMP is forcibly enabled.
- **off** indicates that SMP is not forcibly enabled.

Default value: **off**

NOTICE

- This parameter is valid only for operators that support SMP. For details, contact the administrator.
- In addition, the constraints on forcibly enabling SMP are as follows:
  1. The SMP feature improves the performance through operator parallelism and occupies more system resources, including CPU, memory, and I/O. It is used to save time at the cost of resources. By setting parallelism, SMP improves system performance in appropriate scenarios when resources are sufficient.
  2. If the scenarios are inappropriate (for example, the data volume is small) or resources are insufficient, the performance may deteriorate.
  3. This parameter is not supported in scenarios where SMP is not applicable.

enable_partrouting_optimization

Parameter description: Specifies whether to optimize the insertion of partitioned tables.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the insertion of partitioned tables is optimized. For the INSERT SELECT statement, if the SELECT statement contains a constant partition key, partition routing needs to be performed only once for the INSERT statement, improving performance.
- **off** indicates that the insertion of partitioned tables is not optimized. Before inserting each piece of data, you need to perform partition routing to determine the partitioned table to be inserted.

Default value: **on**

NOTE

Constraints for optimizing the insertion of partitioned tables:

1. Only the INSERT SELECT statement is supported.
2. INSERT INTO ta SELECT FROM tb: For all partition key values inserted to table **a**, the column values in the corresponding SELECT result set must be constants. (This column is optional because the default values are constants.)

   (1) INSERT INTO ta SELECT c,d FROM b WHERE tb.c='1' or SELECT '1' as c, d FROM tb: The result column **tb.c** is a constant.

   (2) INSERT INTO ta SELECT c,d FROM b WHERE tb.c=func('1');: If func() is neither a volatile function nor a stable/immutable function that contains non-constant parameters, **tb.c** can be determined as a constant.

   (3) If the column value is the return value of an aggregate function, for example, INSERT INTO ta SELECT count(c),d FROM b WHERE tb.c='1' group by c, d;, the count(c) cannot be determined as a constant.
3. The UPSERT clause is not supported.
4. Tables that contain BEFORE and INSTEAD triggers are not supported because the data to be inserted may be changed.

14.3.26 Wait Events

enable_instr_track_wait

Parameter description: Specifies whether to enable real-time collection of wait event information.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU and 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 1.4% by enabling or disabling this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the function of collecting wait event information is enabled.
- **off** indicates that the function of collecting wait event information is disabled.

Default value: **on**

14.3.27 Query

instr_unique_sql_count

Parameter description: Specifies the maximum number of unique SQL records to be collected. The value **0** indicates that the function of collecting unique SQL information is disabled.

If the value is changed from a larger one to a smaller one, the original data in the system will be cleared and re-collected (the standby node does not support this function). There is no impact if the value is changed from a smaller one to a larger one.

When the number of unique SQL records generated in the system (to view the statistics, query **dbe_perf.statement** or **dbe_perf.summary_statement**) is greater

than the value of **instr_unique_sql_count**, the extra unique SQL records are not collected.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU and 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 3% by enabling or disabling this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 2147483647.

Default value: **200000**

instr_unique_sql_combination_options

Parameter description: Specifies the configuration items of combining unique SQL statements of the same type. The value of this parameter consists of multiple configuration items separated by commas (,).

If this feature is enabled, the IDs of unique SQL statements of the same type are normalized, and the generated unique SQL strings are normalized.

Parameter type: string.

Unit: none

Value range: See **Table 14-30**.

NOTICE

- When configuring the combination function, set the character string based on **Table 14-30**. Use commas (,) to separate multiple configuration items, for example, **set instr_unique_sql_combination_options='in_clause';**.
- If this parameter is left blank, this function is disabled, for example, **set instr_unique_sql_combination_options='';**.

Table 14-30 Configuration items of the combination function

Configuration Item	Behavior Control
in_clause	Combines only fixed parameters and precompiled binding parameters in the IN clause of the SELECT IN() statement. Example 1: **select * from table where column in (1,2,3);** Unique SQL string after combination: **select * from table where column in (1... n);** Example 2: **select * from table where column in ($1,$2,$3);** Unique SQL string after combination: **select * from table where column in (1... $n);** Example 3: **select * from example_table where column in (1,2,$1,3,$2);** Unique SQL string after combination: **select * from example_table where column in (1...n,$1...$n);** Example 4: **select * from example_table where (column1, column2) in ((1, 'a'), (2, 'b'), (3, 'c'));** Unique SQL string after combination: **select * from example_table where (column1, column2) in ((1...n));**

Default value: **'in_clause'**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: By default, this function is disabled during the upgrade and enabled when a new instance is delivered.

CAUTION

- If this feature is used, the unique SQL IDs of the query statements involved in combination are changed, which affects the SQL statements for which SQL patch has been created.
- For values of the bigint, real, float4, blob, numeric, decimal, number, dec, or integer type, if **in()** contains a single parameter or multiple parameters, two different **unique_sql_id** values are generated.

instr_unique_sql_track_type

Parameter description: Specifies which SQL statements are recorded in Unique SQL.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: enumerated values

- **top**: Only top-level SQL statements are recorded.
- **all**: All SQL statements are recorded.

Default value: **all**

NOTE

The default value of the parameter is **all**. Compared with **top**, if the parameter is set to **all**, additional statistics about statements in the stored procedure are recorded, which causes performance loss for the execution of the stored procedure and more severe impact on the performance of statements that are executed quickly, such as simple expressions in the stored procedure.

enable_instr_rt_percentile

Parameter description: Specifies whether to enable the function of calculating the response time of 80% and 95% SQL statements in the system.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

Default value: **on**

percentile

Parameter description: Specifies the percentage of SQL statements whose response time is to be calculated by the background calculation thread.

This is an INTERNAL parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string.

Default value: **80,95**

instr_rt_percentile_interval

Parameter description: Specifies the interval at which the background calculation thread calculates the SQL response time.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 3600. The unit is s.

Default value: **10s**

enable_instr_cpu_timer

Parameter description: Specifies whether to capture the CPU time consumed during SQL statement execution.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU and 256 GB memory. When the Benchmark SQL 5.0

tool is used to test performance, the performance fluctuates by about 3.5% by enabling or disabling this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the CPU time consumed during SQL statement execution is captured.
- **off** indicates that the CPU time consumed during SQL statement execution is not captured.

Default value: **on**

enable_stmt_track

Parameter description: Specifies whether to enable the full/slow SQL statement feature.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU and 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 1.2% by enabling or disabling this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: Full/Slow SQL capture is enabled.
- **off**: Full /Slow SQL capture is disabled.

Default value: **on**

track_stmt_parameter

Parameter description: After **track_stmt_parameter** is enabled, the executed statements recorded in **statement_history** are not normalized. The complete SQL statement information can be displayed to help the database administrator locate faults. For a simple query, the complete statement information is displayed. For a PBE statement, the complete statement information and information about each variable value are displayed. The format is "query string; parameters: $1=value1,$2=value2, ..." This parameter is used to display complete SQL information and is not controlled by the **track_activity_query_size** parameter.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: The function of displaying complete SQL statement information is enabled.
- **off**: The function of displaying complete SQL statement information is disabled.

Default value: **off**

track_stmt_session_slot

Parameter description: Specifies the maximum number of full/slow SQL statements that can be cached in a session. If the number of full/slow SQL statements exceeds this value, new statements will not be traced until the flush thread flushes the cached statements to the disk to reserve idle space.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647.

Default value: 1000

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value, that is, the maximum number of full SQL slots that can be reserved for each session. If the value of this parameter is too large, a large amount of memory is occupied. If the value of this parameter is too small, full SQL statements may be lost.

track_stmt_details_size

Parameter description: Specifies the maximum size of execution events that can be collected by a single statement.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 100000000. The unit is byte.

Default value: **4096**

track_stmt_retention_time

Parameter description: Specifies the retention period of full/slow SQL statement records. This is a combination of parameters. This parameter is read every 60 seconds and records exceeding the retention period are deleted. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string consisting of two parts in the format of 'full sql retention time, slow sql retention time'.

- **full sql retention time** indicates the retention period of full SQL statements. The value ranges from 0 to 86400. The unit is second.
- **slow sql retention time** indicates the retention period of slow SQL statements. The value ranges from 0 to 604800. The unit is second.

Default value: **3600,604800**

track_stmt_stat_level

Parameter description: Determines the level of statement execution tracing.

Parameter type: character

Unit: none

Value range:

This parameter consists of two parts in the format of 'full sql stat level, slow sql stat level'.

The first part indicates the tracing level of full SQL statements. The value can be **OFF**, **L0**, **L1**, or **L2**.

The second part indicates the tracing level of slow SQL statements. The value can be **OFF**, **L0**, **L1**, or **L2**.

NOTE

If the tracing level of full SQL statements is not **OFF**, the current SQL statement tracing level is a higher level (L2 > L1 > L0) of full and slow SQL statements. For details about the levels, see "System Catalogs and System Views > System Catalogs > STATEMENT_HISTORY > STATEMENT_HISTORY columns" in *Developer Guide*.

Default value: **"OFF,L0"**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If the full SQL tracing function is enabled, the performance is affected and a large amount of disk space may be occupied.

enable_auto_clean_unique_sql

Parameter description: Specifies whether to enable the automatic elimination function of unique SQL statements when the number of unique SQL statements generated in the system is greater than or equal to the value of **instr_unique_sql_count**.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The automatic elimination function of unique SQL statements is enabled.
- **off**: The automatic elimination function of unique SQL statements is disabled.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set the value based on service requirements. If this function is enabled, certain disk space can be saved, but WDRs may be lost.

CAUTION

Some snapshot information comes from unique SQL statements. Therefore, when automatic elimination is enabled, if the selected start snapshot and end snapshot exceed the elimination time, the WDR report cannot be generated.

asp_log_directory

Parameter description: Specifies the directory for storing ASP log files on the server when **asp_flush_mode** is set to **all** or **file**. The value can be an absolute path, or relative to the **data** directory. Only the sysadmin user can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

If the value of **asp_log_directory** in the configuration file is an invalid path, the database instance cannot be restarted.

NOTE

- Valid path: Users have read and write permissions on the path.
- Invalid path: Users do not have read or write permission on the path.

Value range: a string

Default value: specified during installation.

enable_slow_query_log (Discarded)

Parameter description: Specifies whether to write the slow query information to the log file. This parameter is discarded in this version.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: indicates that slow query information needs to be written into log files.
- **off**: indicates that slow query information does not need to be written into log files.

Default value: **on**

query_log_file (Discarded)

Parameter description: Specifies the name of a slow query log file on the server. If **enable_slow_query_log** is set to **ON**, slow query records are written into log files. Only the sysadmin user can access this parameter. Generally, log file names are generated in strftime mode. Therefore, the system time can be used to define log file names, which are implemented using the escape character %. This function has been discarded in this version.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

You are advised to use the escape character % to specify the log file names for efficient management of log files.

Value range: a string

Default value: slow_query_log-%Y-%m-%d_%H%M%S.log

query_log_directory (Discarded)

Parameter description: Specifies the directory for storing low query log files when **enable_slow_query_log** is set to **on**. Only the sysadmin user can access this parameter. It can be an absolute path or a relative path (relative to the data directory), which has been discarded in this version.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

NOTICE

If the value of **query_log_directory** in the configuration file is an invalid path, the database instance cannot be restarted.

NOTE

Valid path: Users have read and write permissions on the path.

Invalid path: Users do not have read or write permission on the path.

Value range: a string

Default value: specified during installation.

perf_directory

Parameter description: Specifies the directory of the output file of the performance view dotting task. Only the sysadmin user can access this parameter. The value can be an absolute path, or relative to the data directory.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

NOTE

- Valid path: Users have read and write permissions on the path.
- Invalid path: Users do not have read or write permission on the path.

Value range: a string

Default value: specified during installation.

unique_sql_retention_time

Parameter description: Specifies the memory cleanup interval for the unique SQL hash table. The default value is 30 minutes.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to 3650. The unit is minute.

Default value: **30min**

track_stmt_standby_chain_size

Parameter description: Specifies the maximum memory and disk space occupied by fast/slow SQL statement records on the standby node. This is a combination of parameters. Only the SysAdmin user can access the database.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string

This parameter consists of four parts in the format of 'Full SQL memory size, Full SQL disk size, Slow SQL memory size, Slow SQL disk size'.

Full SQL and slow SQL statements are stored in different locations. Therefore, four additional values are used for control.

- **Full SQL memory size** indicates the maximum memory space reserved for fast SQL statements. The value range is [16,1024], in MB.
- **Full SQL disk size** indicates the maximum disk space occupied by reserved fast SQL statements. The value range is [512,1048576], in MB.
- **Slow SQL memory size** indicates the maximum memory space reserved for slow SQL statements. The value range is [16,1024], in MB.
- **Slow SQL disk size** indicates the maximum disk space reserved for slow SQL statements. The value range is [512,1048576], in MB.

The memory size cannot be greater than the disk size.

Default value: **32, 1024, 16, 512**

track_stmt_flush_mode

Parameter description: Specifies the storage mode of full SQL statements.

Parameter type: character

Unit: none

Value range:

This parameter consists of two parts in the format of 'full sql flush mode, slow sql flush mode':

- The first part indicates the full SQL tracing mode. The value can be **MEMORY** or **FILE**. If this parameter is set to **MEMORY**, full SQL statements are recorded in the memory. If this parameter is set to **FILE**, full SQL statements are recorded in disk files.
- The second part indicates the slow SQL tracing mode. In the current version, the value can only be **FILE**. If this parameter is set to **FILE**, slow SQL statements are recorded in disk files.

Default value: **"FILE,FILE"**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: If this parameter is set to **"MEMORY,FILE"**, the kernel supports full SQL statements, which occupies certain shared memory. The memory size is specified by the **track_stmt_shm_size** parameter.

track_stmt_shm_size

Parameter description: Specifies the size of the full SQL shared memory.

Parameter type: integer

Unit: byte

Value range: 134217728 to 1073741824

Default value: **134217728**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

14.3.28 System Performance Snapshot

enable_wdr_snapshot

Parameter description: Specifies whether to enable the database monitoring snapshot function.

Parameter type: Boolean

Unit: none

Value range:

- **on** indicates that the database monitoring snapshot function is enabled.
- **off** indicates that the database monitoring snapshot function is disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

NOTE

You are advised not to enable it in the following scenarios:

- In multi-table and multi-database scenarios, WDR snapshot records snapshots in each database in serial mode, which takes a long time. Therefore, you are advised not to enable it.
- In the multi-table scenario, the query speed of the pg_stat_all_tables is slow due to the performance problems of some internal tables. In this case, the WDR snapshot function is slow. Therefore, you are advised not to enable it.
- If WDR snapshot is performed when there are a large number of DDL statements, WDR snapshot may fail. Therefore, you are advised not to enable it.

enable_wdr_snapshot_standby

Parameter description: Specifies whether to enable the database monitoring snapshot function on the standby node.

Parameter type: Boolean

Unit: none

Value range:

- **on** indicates that the database monitoring snapshot function is enabled on the standby node.
- **off** indicates that the database monitoring snapshot function is disabled on the standby node.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If you want to adjust the value, make sure you understand the parameter meaning and adjust the value with caution to avoid risks caused by misoperations.

enable_show_standby_name

Parameter description: Specifies whether to display the names that distinguish the primary and standby nodes of the same shard. After this function is enabled, different names are returned when **dbe_perf.node_name** is queried on different nodes of the same shard.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: The function of distinguishing primary and standby node names is enabled.
- **off**: The function of distinguishing primary and standby node names is disabled.

Default value: **off**

wdr_snapshot_retention_days

Parameter description: Specifies the number of days database monitoring snapshots are retained. If the number of snapshots generated during database running exceeds the maximum number of snapshots that can be generated within the retention period (24 x 8 = 192 by default), the system deletes the snapshots with the smallest ID at an interval specified by the value of **wdr_snapshot_interval**.

NOTE

This parameter is valid only when **enable_wdr_snapshot** is set to **on**.

Parameter type: integer

Unit: day

Value range: 1 to 30

Default value: **8**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. A larger parameter value indicates higher disk usage.

wdr_snapshot_query_timeout

Parameter description: Specifies the execution timeout for the SQL statements associated with database monitoring snapshot operations. If the statement execution is not complete and no result is returned within the specified time, the snapshot operation fails.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The value **0** indicates that this parameter does not take effect.

Value range: an integer ranging from 0 to *INT_MAX*. The unit is second.

Default value: **100s**

wdr_snapshot_interval

Parameter description: Specifies the interval at which the backend thread snapshot automatically takes snapshots of the database monitoring data.

NOTE

This parameter is valid only when **enable_wdr_snapshot** is set to **on**.

Parameter type: integer

Unit: minute

Value range: 10 to 60

Default value: **60**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **60** without a unit, **wdr_snapshot_interval** indicates 60 minutes. If the value is **1h**, **wdr_snapshot_interval** indicates 1 hour. If the unit is required, the value must be **min**, **h**, or **d**.

Setting suggestion: Retain the default value. If the retention period is fixed, a smaller value of this parameter indicates a larger disk usage.

wdr_snapshot_space_threshold

Parameter description: Specifies the threshold at which the space used by snapshots is controlled. When the space used by snapshots reaches 50% of the value of this parameter, the control logic of the database is enabled to stabilize the space used by the snapshots.

NOTE

- This parameter is valid only when **enable_wdr_snapshot** is set to **on**.
- If this parameter is set to a value smaller than the space used by the snapshots, the space usage does not shrink. Instead, the control logic is enabled to control the snapshot growth and stabilize the space used by the snapshots.

Parameter type: integer

Unit: KB

Value range: 0–107374182400

Default value: **0**, indicating that the function of controlling the space used by snapshots based on the space threshold is disabled.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on the actual scenario.

wdr_snapshot_full_backup_interval

Parameter description: Specifies the interval at which a full WDR snapshot is created. The interval specified by this parameter is about a number instead of time. For example, if the parameter is set to **12**, a full snapshot and then 11 incremental snapshots are generated for each group. If the parameter is set to **1**, all snapshots generated are full snapshots.

NOTE

- This parameter is valid only when **enable_wdr_snapshot** is set to **on**.
- If you change the value of this parameter after multiple snapshots have been generated, the next snapshot will be a full snapshot. For example, after five WDR incremental snapshots have been generated, if the parameter value is changed to **10**, a full snapshot will be generated before a new interval starts.
- When a snapshot is deleted, other snapshots in the same group are deleted. The number of snapshots to be deleted depends on the value of this parameter when the earliest group of snapshots are generated and is irrelevant to the current value.

Parameter type: integer

Unit: none

Value range: 1 to 24

Default value: **12**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on the actual scenario. If this parameter is set to a smaller value, more full snapshots are generated, but fewer snapshots that can be retained with the same space used.

asp_flush_mode

Parameter description: Specifies the mode for the ASP to update data to the disk. The value can be **'file'** (default value), **'table'** (system catalog), or **'all'** (system catalog and file). Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string, which can be **'table'**, **'file'**, or **'all'**

Default value: **'table'**

asp_flush_rate

Parameter description: When the number of samples reaches the value of **asp_sample_num**, the samples in the memory are updated to the disk based on a certain proportion. **asp_flush_rate** indicates the update proportion. If this parameter is set to **10**, it indicates that the update ratio is 10:1.

Parameter type: integer

Unit: none

Value range: 1 to 10

Default value: **10**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

asp_log_filename

Parameter description: Specifies the file name format when writing files using ASP. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string

Default value: **"asp-***%Y-%m-%d_%H%M%S***.log"**

asp_retention_days

Parameter description: Specifies the maximum number of days for reserving ASP samples when they are written to the system catalog.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to 7

Default value: **2**

asp_sample_interval

Parameter description: Specifies the sampling interval.

Parameter type: integer

Unit: second

Value range: 1 to 10

Default value: **1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

asp_sample_num

Parameter description: Specifies the maximum number of samples allowed in the LOCAL_ACTIVE_SESSION view. Only the sysadmin user can access this parameter.

Parameter type: integer

Unit: none

Value range: 10 to 100000

Default value: **100000** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory); **36000** (4-core CPU/16 GB memory)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If you want to adjust the value, make sure you understand the parameter meaning and adjust the value with caution to avoid risks caused by misoperations.

enable_asp

Parameter description: Specifies whether to enable the active session profile function.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: The active session profile function is enabled.
- **off**: The active session profile function is disabled.

Default value: **on**

gs_perf_interval

Parameter description: Specifies the interval at which the stacks are collected automatically. For details about the automatic stack collection function determined by this parameter, see "Maintainability > Built-in perf Tool" in *Feature Description*.

Parameter type: integer

Unit: minute

Value range: **0** or 5–60. The value **0** indicates that the automatic stack collection function is disabled. The values 5 to 60 indicate the interval at which the stacks are collected automatically.

NOTE

If you attempt to set this parameter to a value ranging from 1 to 4, this parameter will be automatically adjusted to the default value **5**.

Default value: **5**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

gs_perf_retention_days

Parameter description: Specifies the retention period of flame graph files. For details about the automatic stack collection function determined by this parameter, see "Maintainability > Built-in perf Tool" in *Feature Description*.

Parameter type: integer

Unit: day

Value range: 1 to 8

Default value: **3**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

14.3.29 Security Configuration

enable_security_policy

Parameter description: Specifies whether the unified audit and dynamic data masking policies take effect.

NOTE

Unified audit: The unified audit mechanism is a technology that implements efficient security audit management by customizing audit policies. After the administrator defines the audit object and audit behaviors, if the task executed by a user is associated with an audit policy, the corresponding audit behavior is generated and the audit log is recorded. For details, see "Database Security > Unified Audit" in *Feature Description*.

Dynamic data masking: The dynamic data masking mechanism is a technology that protects privacy data by customizing masking policies. It can effectively prevent unauthorized users from accessing sensitive information while retaining original data. For details, see "Database Security > Dynamic Data Masking" in *Feature Description*.

Parameter type: Boolean

Unit: none

Value range:

on: The security policy is enabled.

off: The security policy is disabled.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. Set this parameter to **on** when a security policy is required. However, this occupies system resources and affects system performance.

use_elastic_search

Parameter description: Specifies whether to send unified audit logs to Elasticsearch. If **enable_security_policy** and this parameter are enabled, unified audit logs are sent to Elasticsearch through HTTP or HTTPS (used by default). After this parameter is enabled, ensure that the Elasticsearch service corresponding to **elastic_search_ip_addr** can be properly connected. Otherwise, the process fails to be started.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

on: Unified audit logs are sent to Elasticsearch.

off: Unified audit logs are not sent to Elasticsearch.

Default value: **off**

elastic_search_ip_addr

Parameter description: Specifies the IP address of the Elasticsearch system. If HTTPS is used, the format is **https://***ip*:*port*:*username*. If HTTP is used, the format is **http://***ip*:*port*. In the preceding command, *ip* indicates the IP address of the Elasticsearch server. *port* indicates the listening port for Elasticsearch HTTP communication, and the value ranges from 9200 to 9299. *username* indicates the username used for registering an Elasticsearch account. The initial user is **elastic**. If HTTPS is used, related certificates need to be configured. For details, see "Unified Auditing" in the *Security Hardening Guide*.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string.

Default value: **''**

is_sysadmin

Parameter description: Specifies whether the current user is an initial user.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Value range: Boolean

on indicates that the user is an initial user.

off indicates that the user is not an initial user.

Default value: **off**

enable_tde

Parameter description: Specifies whether to enable the TDE function. Before creating an encrypted table, set this parameter to **on** and set the **tde_key_info** parameter to configure the key information.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean.

on: The TDE function is enabled.

off: The TDE function is disabled.

Default value: **off**

NOTICE

- If this parameter is set to **on**, ensure that the key information in the **tde_key_info** parameter is correctly configured and the key service can be accessed properly. Otherwise, the database cannot be started properly.
- After this parameter is set to **on** and an encrypted table is created, if this parameter is set to **off** again, data in the existing encrypted table cannot be encrypted or decrypted. As a result, the database is abnormal.

tde_key_info

Parameter description: If TDE is enabled, transparent data needs to access the external key service to implement key management. This parameter is used to configure information about the key service, such as the service address, identity authentication information, and project information.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. For details, see "Security Management > Configuring TDE" in *Administrator Guide*.

Default value: **""**

tde_index_default_encrypt

Parameter description: After this parameter is enabled, if you create an index whose base table is an encrypted table, the database automatically sets the index as an encrypted index, copies encryption parameters such as the encryption algorithms and keys of the base table for the index, and encrypts the data of the index before storing it.

Parameter type: Boolean

Unit: none

Value range:

on: Encryption parameters are automatically set for indexes of encrypted tables.

off: Encryption parameters are not automatically set for indexes in encrypted tables.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

block_encryption_mode

Parameter description: Specifies the block encryption mode used by the aes_encrypt and aes_decrypt functions for encryption and decryption.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: enumerated values. Valid values are **aes-128-cbc**, **aes-192-cbc**, **aes-256-cbc**, **aes-128-cfb1**, **aes-192-cfb1**, **aes-256-cfb1**, **aes-128-cfb8**, **aes-192-cfb8**, **aes-256-cfb8**, **aes-128-cfb128**, **aes-192-cfb128**, **aes-256-cfb128**, **aes-128-ofb**, **aes-192-ofb**, and **aes-256-ofb**. **aes** indicates the encryption or decryption algorithm. **128**, **192**, and **256** indicate the key length (unit: bit). **cbc**, **cfb1**, **cfb8**, **cfb128**, and **ofb** indicate the block encryption or decryption mode.

Default value: **aes-128-cbc**

enable_mac_check

Parameter description: Specifies whether label-based mandatory access control takes effect.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean.

on indicates that label-based mandatory access control takes effect.

off indicates that label-based mandatory access control does not take effect.

Default value: **off**

enable_rls_match_index

Parameter description: Specifies whether indexes of a base table can be scanned based on target predicate conditions in row-level security scenarios. Target scenario: The row level security (RLS) policies are set and enabled in the base table, and the query predicate contains the unleakproof system function or like operator.

Value range: Boolean.

on: Base table indexes can be scanned in the target scenario.

off: Base table indexes cannot be scanned in the target scenario.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If hotspot query statements belong to the target scenario and there are few row-level access policies in the base table, enabling this function significantly improves query performance.

NOTE

- The modification of this parameter affects the generation of the execution plan in the target scenario. You can manually invalidate the cache plan by reconnecting to the system or creating operators.
- If this parameter is enabled, the generation of the bitmap scanning operator is affected, and the RLS policy predicate is inserted into the Recheck filter condition. Therefore, when the operator is switched to the lossy mode and there are many RLS policies, the performance is affected.

14.3.30 Global Temporary Table

max_active_global_temporary_table

Parameter description: Specifies whether global temporary tables can be created. The value of this parameter determines the memory reserved in the shared cache for hash tables required by global temporary tables. The total number of active global temporary tables in all sessions is not forcibly limited.

Parameter type: integer

Unit: none

Value range: 0 to 1000000

- **0**: The global temporary table function is disabled.
- > 0: The global temporary table function is enabled.

Default value: **1000**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

vacuum_gtt_defer_check_age

Parameter description: Checks the differences between the global temporary table relfrozenxid and the ordinary table after VACUUM is executed. WARNING is generated if the difference value exceeds the specified parameter value. Use the default value for this parameter.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 1000000

Default value: **10000**

enable_gtt_concurrent_truncate

Parameter description: Specifies whether to support concurrent execution of TRUNCATE TABLE and DML operations on global temporary tables and concurrent execution of TRUNCATE TABLE on global temporary tables.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**/**true** indicates that the preceding operations can be performed concurrently.
- **off**/**false** indicates that the preceding operations cannot be performed concurrently.

Default value: **on**

14.3.31 HyperLogLog

hll_default_log2m

Parameter description: Specifies the number of buckets for HLL data. The number of buckets affects the precision of distinct values calculated by HLL. The more buckets there are, the smaller the deviation is. The deviation range is as follows: $[-1.04/2^{log2m*1/2}, +1.04/2^{log2m*1/2}]$

Parameter type: integer

Unit: none

Value range: 10 to 16.

Default value: **14**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value or adjust the value based on service requirements.

hll_default_log2explicit

Parameter description: Specifies the default threshold for switching from the explicit mode to the sparse mode.

Parameter type: integer

Unit: none

Value range: 0–12 The value **0** indicates that the explicit mode is skipped. The value 1 to 12 indicates that the mode is switched when the number of distinct values reaches $2^{hll\_default\_log2explicit}$.

Default value: **10**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value or adjust the value based on service requirements.

hll_default_log2sparse

Parameter description: Specifies the default threshold for switching from the **sparse** mode to the **full** mode.

Parameter type: integer

Unit: none

Value range: 0–14 The value **0** indicates that the explicit mode is skipped. The value 1 to 14 indicates that the mode is switched when the number of distinct values reaches $2^{hll\_default\_log2sparse}$.

Default value: **12**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value or adjust the value based on service requirements.

hll_duplicate_check

Parameter description: Specifies whether duplicatecheck is enabled by default.

Parameter type: Boolean

Unit: none

Value range:

- **0**: The function is disabled by default.
- **1**: The function is enabled by default.

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value or adjust the value based on service requirements.

14.3.32 User-defined Functions

udf_memory_limit

Parameter description: Controls the maximum physical memory that can be used when each database node executes UDFs. This parameter does not take effect in the current version. Use **FencedUDFMemoryLimit** and **UDFWorkerMemHardLimit** to control virtual memory used by fenced udf worker.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer. The value range is from 200 x 1024 to *max_process_memory* and the unit is KB.

Default value: **200MB**

FencedUDFMemoryLimit

Parameter description: Specifies the virtual memory used by each fenced udf worker process.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 KB to 2147483647 KB. The unit can also be MB or GB. **0** indicates that the memory is not limited.

Default value: **0**

UDFWorkerMemHardLimit

Parameter description: Specifies the maximum value of **fencedUDFMemoryLimit**.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 KB to 2147483647 KB. The unit can also be MB or GB.

Default value: **1GB**

14.3.33 Scheduled Task

job_queue_processes

Parameter description: Specifies the number of jobs that can be concurrently executed. This parameter is a POSTMASTER parameter. You can set it using **gs_guc**, and you need to restart **gaussdb** to make the setting take effect.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: 0 to 1000

Function:

- Setting **job_queue_processes** to **0** indicates that the scheduled job function is disabled and that no job will be executed. (Enabling scheduled jobs may affect the system performance. At sites where this function is not required, you are advised to disable it.)
- Setting **job_queue_processes** to a value that is greater than **0** indicates that the scheduled job function is enabled and this value is the maximum number of jobs that can be concurrently processed.

After the scheduled job function is enabled, the job_scheduler thread polls the **pg_job** system catalog at a scheduled interval. The scheduled job check is performed every second by default.

Too many concurrent jobs consume many system resources, so you need to set the number of concurrent jobs to be processed. If the current number of concurrent jobs reaches the value of **job_queue_processes** and some of them expire, these jobs will be postponed to the next polling period. Therefore, you are advised to set the polling interval (the **Interval** parameter of the **submit** interface) based on the execution duration of each job to avoid the problem that jobs in the next polling period cannot be properly processed because of overlong job execution time.

Note: If the number of concurrent jobs is large and the value is too small, these jobs will wait in queues. However, a large parameter value leads to large resource consumption. You are advised to set this parameter to **100** and change it based on the system resource condition.

Default value: **10**

enable_prevent_job_task_startup

Parameter description: Specifies whether to start the job thread.

Value range: Boolean

Unit: none

- **on** indicates that the job thread is not started.
- **off** indicates that the job thread is started.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

14.3.34 Thread Pool

enable_thread_pool

Parameter description: Specifies whether to enable the thread pool function. This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. You are advised to disable this parameter in performance-sensitive scenarios with low-concurrency and persistent connection and enable this parameter in other scenarios.

Value range: Boolean

- **on** indicates that the thread pool function is enabled.
- **off** indicates that the thread pool function is disabled.

Default value: **on**

thread_pool_attr

Parameter description: Specifies the detailed attributes of the thread pool function. This parameter is valid only when **enable_thread_pool** is set to **on**. Only the sysadmin user can access this parameter.

Parameter type: string

Unit: none

Value range:

This parameter consists of three parts: **'thread_num'**, **'group_num'**, and **'cpubind_info'**. The meanings of the three parts are as follows:

- **thread_num** is the total number of initial threads in the thread pool, which can be dynamically expanded. The value ranges from 0 to 4096. The value **0** indicates that the database automatically configures the number of threads in the thread pool based on the number of CPU cores. If the value is greater than **0**, the number of threads in the thread pool is the same as the value of **thread_num**. You are advised to set the thread pool size based on the

hardware configuration. The formula is as follows: Value of **thread_num** = Number of CPU cores x 3–5. The maximum value of **thread_num** is **4096**.

- **group_num** indicates the number of thread groups in the thread pool. The value ranges from 0 to 64. The value **0** indicates that the database automatically configures the number of thread groups in the thread pool based on the number of NUMA groups. If the value is greater than **0**, the number of thread groups in the thread pool is the same as the value of **group_num**.
- **cpubind_info** specifies whether the thread pool is bound to a core. The available configuration modes are as follows: 1. **'(nobind)'**: The thread is not bound to a core. 2. **'(allbind)'**: Use all CPU cores that can be queried in the current system to bind threads. 3. **'(nodebind: 1, 2)'**: Use the CPU cores in NUMA groups 1 and 2 to bind threads. 4. **'(cpubind: 0-30)'**: Use CPU cores 0 to 30 to bind threads. 5. **'(numabind: 0-30)'**: Use CPU cores 0 to 30 in the NUMA group to bind threads. This parameter is case-insensitive. This parameter does not take effect in the resource multi-tenancy mode.

Default value: **'4096,2,(nobind)'** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory); **'2048,2,(nobind)'** (96-core CPU/768 GB memory, 80-core CPU/640 GB memory); **'1024,2,(nobind)'** (64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory); **'512,2,(nobind)'** (16-core CPU/128 GB memory); **'256,2,(nobind)'** (8-core CPU/64 GB memory); **'128,2,(nobind)'** (4-core CPU/32 GB memory); **'32,1,(nobind)'** (4-core CPU/16 GB memory)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: When the memory is sufficient and the CPU performance is good, increase the value of this parameter if the service requires more connections.

thread_pool_stream_attr

Parameter description: Specifies the detailed attributes of the stream thread pool function. This parameter is valid only when **enable_thread_pool** is set to **on** and only takes effect on DNs. Only the sysadmin user can access this parameter. This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string, consisting of one or more characters

This parameter consists of four parts: **'stream_thread_num'**, **'stream_proc_ratio'**, **'group_num'**, and **'cpubind_info'**. The meanings of the four parts are as follows:

- **stream_thread_num** indicates the total number of threads in the stream thread pool. The value ranges from 0 to 4096. The value **0** indicates that the database automatically configures the number of threads in the thread pool based on the number of CPU cores. If the value is greater than **0**, the number of threads in the thread pool is the same as the value of **stream_thread_num**. You are advised to set the thread pool size based on the hardware configuration. The formula is as follows: Value of **stream_thread_num** = Number of CPU cores x 3–5. The maximum value of **stream_thread_num** is **4096**.
- **stream_proc_ratio** indicates the ratio of proc resources reserved for stream threads. The value is a floating-point number. The default value is **0.2**. The

reserved proc resources are calculated as follows: **stream_proc_ratio** x **stream_thread_num**.

- **group_num** indicates the number of thread groups in the thread pool. The value ranges from 0 to 64. The value **0** indicates that the database automatically configures the number of thread groups in the thread pool based on the number of NUMA groups. If the value is greater than **0**, the number of thread groups in the thread pool is the same as the value of **group_num**. The value of **group_num** in **thread_pool_stream_attr** must be the same as that in **thread_pool_attr**. If they are set to different values, the value of **group_num** in **thread_pool_attr** is used.
- **cpubind_info** specifies whether the thread pool is bound to a core. The available configuration modes are as follows: 1. **'(nobind)'**: The thread is not bound to a core. 2. **'(allbind)'**: Use all CPU cores that can be queried in the current system to bind threads. 3. **'(nodebind: 1, 2)'**: Use the CPU cores in NUMA groups 1 and 2 to bind threads. 4. **'(cpubind: 0-30)'**: Use CPU cores 0 to 30 to bind threads. 5. **'(numabind: 0-30)'**: Use CPU cores 0 to 30 in the NUMA group to bind threads. This parameter is case-insensitive. The value of **cpubind_info** in **thread_pool_stream_attr** must be the same as that in **thread_pool_attr**. If they are set to different values, the value of **cpubind_info** in **thread_pool_attr** is used.

Default value:

stream_thread_num: **16**

stream_proc_ratio: **0.2**

group_num and **cpubind_info**: For details, see **thread_pool_attr**.

resilience_threadpool_reject_cond

Parameter description: Specifies the percentage of thread pool usage for escape from overload. This parameter takes effect only when the GUC parameters **use_workload_manager** and **enable_thread_pool** are enabled. This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string, consisting of one or more characters

This parameter consists of **recover_threadpool_percent** and **overload_threadpool_percent**. The meanings of the two parts are as follows:

- **recover_threadpool_percent**: specifies the thread pool usage when the thread pool recovers to the normal state. When the thread pool usage is less than the value of this parameter, the escape from overload function is disabled and new connections are allowed. The value ranges from 0 to *INT_MAX*. The value indicates a percentage.
- **overload_threadpool_percent**: specifies thread pool usage when the thread pool is overloaded. If the thread pool usage is greater than the value of this parameter, the current thread pool is overloaded. In this case, the escape from overload function is enabled to kill sessions and forbid new connections. The value ranges from 0 to *INT_MAX*. The value indicates a percentage.

Default value: **'0,0'**, indicating that the thread pool escape function is disabled.

Example:

```
resilience_threadpool_reject_cond = '50,90'
```

When the thread pool usage exceeds 90%, new connections are forbidden and stacked sessions are killed. When the thread pool usage decreases to 50%, session killing is stopped and new connections are allowed.

NOTICE

- The thread pool usage can be queried in the DBE_PERF.local_threadpool_status view. The initial number of threads in the thread pool can be obtained by querying the **thread_pool_attr** parameter.
- If this parameter is set to a small value, the thread pool escape from overload process is frequently triggered. As a result, ongoing sessions are forcibly logged out, and new connections fail to be connected for a short period of time. Therefore, exercise caution when setting this parameter based on the actual thread pool usage.
- The values of **recover_threadpool_percent** and **overload_threadpool_percent** can be **0** at the same time. In addition, the value of **recover_threadpool_percent** must be smaller than that of **overload_threadpool_percent**. Otherwise, the setting does not take effect.

14.3.35 Backup and Restoration

operation_mode

Parameter description: Specifies whether the system enters the backup and restoration mode.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the system is in the backup and restoration mode.
- **off** indicates that the system is not in the backup and restoration mode.

Default value: **off**

enable_cbm_tracking

Parameter description: This parameter must be enabled when Roach is used to perform full and incremental backups. If this parameter is disabled, the backup will fail.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: The cbm tracking is enabled.
- **off**: The cbm tracking is disabled.

Default value: **off**

max_size_for_xlog_retention

Parameter description: Specifies when to forcibly update the backup replication slot or logical replication slot to prevent the disk from being full and the instance from being read-only because logs cannot be recycled during backup or logical decoding. It is recommended that the value of this parameter be a little smaller than the value of **datastorage_threshold_value_check** of the CM Server component to prevent the instance from entering the read-only state.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: –100 to 2147483647

- The value **0** indicates that this function is disabled.
- A negative value indicates that the backup replication slot or logic replication slot is forcibly updated when the disk usage exceeds the threshold and logs are recycled due to blocked backup operation or logical decoding. For example, **–80** indicates that the disk usage exceeds 80% of the threshold.
- A positive value indicates that the backup replication slot or logic replication slot is forcibly updated when the size of stacked logs exceeds the threshold and logs are recycled due to blocked backup operation or logical decoding. For example, **32** indicates that the backup replication slot lags behind the redo location of the current checkpoint by more than 32 log segments. (The size of each log segment is 16 MB.)

Default value: **–80**

max_cbm_retention_time

Parameter description: Specifies the interval at which CBM backup files are forcibly recycled. If CBM files cannot be recycled during backup, the disk will be full and the instance will be read-only. You are advised to set this parameter based on the full backup interval.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: 86400 to 2147483647

- The unit is second.
- The minimum value is 1 day.
- The default value is 2 weeks.

Default value: 1209600

14.3.36 Undo

undo_space_limit_size

Parameter description: Specifies the threshold for forcibly recycling undo space. When the undo space usage reaches 80% of the threshold, forcible recycling starts. You are advised to set **undo_space_limit_size** to a value greater than or equal to that of **undo_limit_size_per_transaction**.

Parameter type: integer

Unit: page (8 KB)

Value range: 102400 to 2147483647. The default unit is page.

Default value: **256GB**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, the value **10000** indicates 10000 pages, and the value **10000KB** indicates 10000 KB. If the value contains a unit, the value can be KB, MB, or GB, but cannot be TB.

Setting suggestion: Retain the default value. If the disk space is too small to meet the default value requirements, set this parameter to a smaller value. If long transactions or large transactions exist in your service, set **undo_space_limit_size** to a larger value based on the disk usage. For details about the value setting, see the **info** column of the **gs_stat_undo** system function in "SQL Reference > Functions and Operators > System Administration Functions > Undo System Functions > gs_stat_undo parameters" in *Developer Guide*.

undo_limit_size_per_transaction

Parameter description: Specifies the undo space threshold of a single transaction. If the threshold is reached, the transaction is rolled back due to an error. You are advised to set **undo_limit_size_per_transaction** to a value less than or equal to that of **undo_space_limit_size**. If the value of **undo_limit_size_per_transaction** is greater than that of **undo_space_limit_size**, the displayed value is the same as the configured value when you run the **show undo_limit_size_per_transaction** command to query the parameter value. The only difference is that the smaller value between **undo_space_limit_size** and **undo_limit_size_per_transaction** is used as the actual undo space threshold of a single transaction.

Parameter type: integer

Unit: page (8 KB)

Value range: 256 to 2147483647. The default unit is page. If this parameter is set to a value greater than 134217728 (that is, 1 TB), the value **134217728** takes effect.

Default value: **32GB**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **10000**, the **undo_limit_size_per_transaction** is 10000 pages. If the value is **10000 KB**, the **undo_limit_size_per_transaction** is 10000 KB. If the value contains a unit, the value can be KB, MB, or GB, but cannot be TB.

Setting suggestion: Retain the default value. If the disk or memory space is too small to meet the requirements of the default value, set this parameter to a smaller value. If long transactions or large transactions exist in your service, and the number of Undo records generated in a single transaction is greater than the value of this parameter, set **undo_limit_size_per_transaction** to a larger value based on the disk usage. For details about the value setting, see the info column of the **gs_stat_undo** system function in "SQL Reference > Functions and Operators > System Administration Functions > Undo System Functions > gs_stat_undo parameters" in *Developer Guide*. If **undo_limit_size_per_transaction** is set to a value greater than 1 TB, the system performance and stability may be affected. Therefore, if the parameter is set to a value greater than 134217728 (that is, 1 TB), the configured value is displayed when you run the **show**

undo_limit_size_per_transaction command to query the parameter value, but the value **134217728** takes effect.

14.3.37 DCF Parameters Settings

enable_dcf

Parameter description: Specifies whether to enable the DCF mode.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean. The value can be **on** or **off**. **on** indicates that the current log replication mode is DCF, and **off** indicates that the current log replication mode is not DCF.

Default value: **off**

dcf_ssl

Parameter description: This parameter is no longer used. The DCF reuses the GUC parameter **ssl**. For details, see section "Security and Authentication."

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean. The value can be **on** or **off**. The value **on** indicates that SSL is used, and the value **off** indicates that SSL is not used.

Default value: **on**

dcf_config

Parameter description: Specifies the DCF cluster configuration information, which is configured by the OM during installation and cannot be modified after installation.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Default value: a character string, which is configured by the OM during installation.

dcf_data_path

Parameter description: Specifies the DCF data path, which is configured by the OM during installation and cannot be modified after installation.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Default value: a string, which is the **dcf_data** directory under the data directory of the DN.

dcf_log_path

Parameter description: Specifies the DCF log path, which is configured by the OM during installation and cannot be modified after installation.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Default value: a string, which is the **dcf_log** directory under the data directory of the DN.

dcf_node_id

Parameter description: Specifies the ID of the DN where the DCF is located. This parameter is defined by the user during installation and mode switching.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Default value: an integer, which is specified by users during installation.

dcf_max_workers

Parameter description: Specifies the largest number of DCF callback function threads. The DCF needs to apply for the shared memory and semaphore before it invokes the function registered by the DN with the DCF through the callback function.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 262143.

Default value: **40**

dcf_truncate_threshold

Parameter description: Specifies the threshold for a DN to truncate DCF logs.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to 2147483647.

Default value: **100000**

dcf_election_timeout

Parameter description: Specifies the timeout interval for selecting the DCF leader and follower. The election timeout interval depends on the status of the network between DNs. If the timeout interval is short and the network quality is poor, timeout occurs. After the network recovers, the election becomes normal. You are advised to set a proper timeout interval based on the current network status. Restriction on the DCF node clock: The maximum clock difference between DCF nodes is less than half of the election timeout interval. In DCF manual election mode, to ensure timely CM arbitration, do not modify this parameter. Instead, use the default election timeout interval.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to 600, in seconds.

Default value: **3**

dcf_enable_auto_election_priority

Parameter description: Specifies whether the DCF priority can be automatically adjusted. The value **0** indicates that automatic adjustment is not allowed, and the value **1** indicates that automatic adjustment is allowed.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer, **0** or **1**.

Default value: **1**

dcf_election_switch_threshold

Parameter description: Specifies the DCF threshold for preventing frequent switchover to primary. It is recommended that this parameter be set based on the maximum fault duration acceptable for user services.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 2147483647, in seconds.

Default value: **0**

dcf_run_mode

Parameter description: Specifies the DCF election mode. The value **0** indicates the automatic election mode, the value **1** indicates the manual election mode, and the value **2** indicates that the election mode is disabled. Currently, the election mode can be disabled only in minority restoration scenarios. If the election mode is disabled, the database instance will become unavailable.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Note: The working mode of an instance can be switched only when the instance is running properly. Otherwise, the instance is still abnormal after the switching. The DCF working mode configured in GUC parameters must be the same as that configured by using cm_ctl. That is, both DCF working modes must be set to manual or automatic at the same time.

For example, to set the DCF manual mode, run the following command:

```
cm_ctl set --param --server -k dn_arbitrate_mode=quorum
cm_ctl reload --param --server
gs_guc reload -Z datanode -I all -N all  -c "dcf_run_mode=1"
```

To set the DCF automatic mode, run the following command:

```
cm_ctl set --param --server -k dn_arbitrate_mode=paxos
cm_ctl reload --param --server
gs_guc reload -Z datanode -I all -N all  -c "dcf_run_mode=0"
```

Value range: **0**, **1**, or **2**

Default value: **1**

dcf_log_level

Parameter description: Specifies the DCF log level.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string

- To disable the log function, set this parameter to **"NONE"**, which cannot be used together with the following log levels:
- To enable the log function, set this parameter to one or a combination of the following log levels: **"RUN_ERR|RUN_WAR|RUN_INF|DEBUG_ERR|DEBUG_WAR|DEBUG_INF|TRACE|PROFILE|OPER"**.

  If two or more log levels are used together, separate them with vertical bars (|). The log level cannot be set to an empty string.

Default value: **"RUN_ERR|RUN_WAR|DEBUG_ERR|OPER|RUN_INF|PROFILE"**

dcf_log_backup_file_count

Parameter description: Specifies the number of DCF run log backups.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to 1000.

Default value: **100**

dcf_max_log_file_size

Parameter description: Specifies the maximum size of a DCF run log file.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to 1000, in MB.

Default value: **10**

dcf_socket_timeout

Parameter description: Specifies the timeout interval for the DCF communication module to connect to the socket. This parameter takes effect upon the system restart. In an environment where the network quality is poor, if the timeout interval is set to a small value, a connection may fail to be set up. In this case, you need to increase the value.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 10 to 600000, in ms.

Default value: **5000**

dcf_connect_timeout

Parameter description: Specifies the timeout interval for the DCF communication module to set up a connection. This parameter takes effect upon the system restart. In an environment where the network quality is poor, if the timeout interval is set to a small value, a connection may fail to be set up. In this case, you need to increase the value.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 10 to 600000, in ms.

Default value: 60000

dcf_mec_fragment_size

Parameter description: Specifies the fragment size of the DCF communication module. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 32 to 10240, in KB.

Default value: **64**

dcf_stg_pool_max_size

Parameter description: Specifies the maximum size of the memory pool of the DCF storage module. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 32 to 2147483647, in MB.

Default value: **2048**

dcf_stg_pool_init_size

Parameter description: Specifies the minimum size of the memory pool of the DCF storage module. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 32 to 2147483647, in MB.

Default value: **32**

dcf_mec_pool_max_size

Parameter description: Specifies the maximum size of the memory pool of the DCF communication module. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 32 to 2147483647, in MB.

Default value: **200**

dcf_flow_control_disk_rawait_threshold

Parameter description: Specifies the disk waiting threshold for DCF flow control.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 2147483647, in μs.

Default value: **100000**

dcf_flow_control_net_queue_message_num_threshold

Parameter description: Specifies the threshold for the number of messages in a network queue for DCF flow control.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 2147483647.

Default value: 1024

dcf_flow_control_cpu_threshold

Parameter description: Specifies the threshold for DCF CPU flow control.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 2147483647, in percentage (%).

Default value: **100**

dcf_mec_batch_size

Parameter description: Specifies the number of batch messages for DCF communication. When the value is **0**, the DCF automatically adjusts the value based on the network and the amount of data to be written. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 1024.

Default value: **0**

dcf_mem_pool_max_size

Parameter description: Specifies the maximum DCF memory. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 32 to 2147483647, in MB.

Default value: **2048**

dcf_mem_pool_init_size

Parameter description: Specifies the initial size of the DCF memory. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 32 to 2147483647, in MB.

Default value: **32**

dcf_compress_algorithm

Parameter description: Specifies the compression algorithm for DCF run log transmission.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer

- The value **0** indicates no compression.
- **1** indicates the LZ4 compression algorithm.

Default value: **0**

dcf_compress_level

Parameter description: Specifies the compression level for DCF log transmission. Before this parameter takes effect, a valid compression algorithm must be configured, that is, the **dcf_compress_algorithm** parameter is set.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to 22.

If compression is disabled, the configured compression level does not take effect.

Default value: **1**

dcf_mec_channel_num

Parameter description: Specifies the number of DCF communication channels. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to 64.

Default value: **1**

dcf_rep_append_thread_num

Parameter description: Specifies the number of DCF log replication threads. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to 1000.

Default value: **2**

dcf_mec_agent_thread_num

Parameter description: Specifies the number of DCF communication working threads. This parameter takes effect upon the system restart. It is recommended

that the value of **dcf_mec_agent_thread_num** be greater than or equal to 2 x Number of nodes x Value of **dcf_mec_channel_num**.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to 1000.

Default value: **10**

dcf_mec_reactor_thread_num

Parameter description: Specifies the number of reactor threads used by the DCF. This parameter takes effect upon the system restart. It is recommended that the ratio of the value of **dcf_mec_reactor_thread_num** to the value of **dcf_mec_agent_thread_num** be 1:40.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to 100.

Default value: **1**

dcf_log_file_permission

Parameter description: Specifies the attribute of the DCF run log file. The parameter setting takes effect after the system is restarted. This parameter is configured during installation and cannot be modified. To allow other users in the same group to access logs, ensure that all parent directories can be accessed by other users in the same group. That is, if **dcf_log_path_permission** is set to **750**, **dcf_log_file_permission** can only be set to **600** or **640**. If **dcf_log_path_permission** is set to **700**, **dcf_log_file_permission** must be set to **600**.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: enumerated type. The value can be **600** or **640**.

Default value: **600**

dcf_log_path_permission

Parameter description: Specifies the attribute of the DCF run log directory. The parameter setting takes effect after the system is restarted. This parameter is configured during installation and cannot be modified. To allow other users in the same group to access the log path, set this parameter to **750**. Otherwise, set this parameter to **700**.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: enumerated type. The value can be **700** or **750**.

Default value: **700**

dcf_majority_groups

Parameter description: Sets the DCF policy-based majority function. For a group that requires this parameter, at least one standby node in the group receives logs. That is, there is a synchronous standby node in the group. If nodes are added to or deleted from the DCF instance or the group value of a node in the instance is changed, you need to modify the configuration accordingly. When modifying this parameter, ensure that the value of **group** exists and is valid.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string

- To disable the policy-based majority function, enter an empty string **""**.
- To enable the function, configure valid group values separated by commas (,). The group values must exist in **dcf_config**. For example, if the group values 1 and 2 are added to the DCF policy-based majority configuration, you can set this parameter to **"1,2"**. If the group value does not exist in **dcf_config** or other characters are configured, the DCF considers the configured group invalid.

Default value: an empty string

CAUTION

If all nodes in a group are faulty after the parameter is configured, you need to remove the group from the parameter list when performing node build operations (node recovery or node replacement without changing the IP address) on a node. After the node recovers, you can configure the group again.

dcf_node_id_map

Parameter description: Specifies the dictionary mapping between standby DN names and DCF node IDs. The parameter setting takes effect after the system is restarted. This parameter is configured during installation and cannot be modified. This parameter is used in DCF cluster installation, upgrade, and node replacement scenarios. The value of **standby_name** configured in the GUC parameter **synchronous_standby_names** must be included in this dictionary.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string. The configuration format is 'standby_name1:dcf_node_id1,standby_name2:dcf_node_id2'. The values of standby DN names and the corresponding DCF node IDs are separated by commas (,).

Default value: an empty string

dcf_candidate_names

Parameter description: Specifies the DCF candidate list. That is, names of DNs that may be selected as the primary node. In DCF automatic mode, the election policy is controlled by this parameter. DNs not in the list cannot be elected as a primary node.

Parameter type: string

Unit: none

Value range: a string in the format of 'dn_name1,dn_name2,dn_name3'. The parameter depends on **dcf_node_id_map**. DN names must be in **dcf_node_id_map** and separated by commas (,).

Default value: an empty string

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none

dcf_thread_effective_time

Parameter description: Specifies the effective time of the DCF flushing thread. This parameter is used to determine whether the disk I/O hangs. If the DCF control log cannot update and I/O resources cannot be accessed within the period specified by this parameter, the DCF considers that the thread I/O hangs and the switchover is triggered. If this parameter is set to **0**, the I/O hang detection is disabled.

Parameter type: integer

Unit: second

Value range: 0 to 1000

Default value: 160

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none

dcf_pri_leader_timeout

Parameter description: Specifies the timeout interval for priority-based leader election. In DCF automatic mode, after priority-based leader election is enabled, the backup node triggers priority-based leader election. If the backup node is not elected as the leader within the timeout interval, the election is canceled. If this parameter is set to **0**, the priority-based selection of the primary node waits until the election is successful.

Parameter type: integer

Unit: second

Value range: 0 to 3600

Default value: **60**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none

dcf_static_leader_timeout

Parameter description: Specifies the timeout interval for preferentially electing the old leader. In DCF automatic mode, after the cluster is restarted, the old leader is preferentially elected. If the election fails within the timeout interval, the election is canceled.

Parameter type: integer

Unit: second

Value range: 0 to 600

Default value: **60**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: none

14.3.38 Flashback

This section describes parameters related to the flashback function. In this version, only the Ustore engine supports flashback, while the Astore engine does not support flashback.

enable_recyclebin

Parameter description: Specifies whether the recycle bin is enabled or disabled in real time.

Parameter type: Boolean

Value range:

- **on** indicates that the recycle bin is enabled in real time.
- **off** indicates that the recycle bin is disabled in real time.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: To use the flashback table function, set **enable_recyclebin** to **on**.

recyclebin_retention_time

Parameter description: Specifies the retention period of objects in the recycle bin. The objects will be automatically deleted after the retention period expires.

Parameter type: integer

Unit: s

Value range: 1 to 2147483647.

Default value: **15 min** (900s)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **900** without a unit, **recyclebin_retention_time** indicates 900s. If the value is **15min**, **recyclebin_retention_time** indicates 15 minutes. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

version_retention_age

Parameter description: Specifies the number of transactions retained in earlier versions. The earlier versions with the number of transactions larger than the value of this parameter will be recycled and cleared.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 576460752303423487. **0** means no delay.

Default value: **0**

CAUTION

This parameter has been deprecated.

vacuum_defer_cleanup_age

Parameter description: Determines whether a dead tuple can be physically deleted based on the global minimum active transaction **oldestxmin**. If the value is less than **oldestxmin**, the dead tuple is physically deleted. If **vacuum_defer_cleanup_age** is set to a value greater than 0, the recycling of dead tuples needs to be delayed. In this case, the result of **oldestxmin** minus **vacuum_defer_cleanup_age** is used as the new threshold for clearing dead tuples.

For example, if **oldestxmin** and **vacuum_defer_cleanup_age** are set to **200** and **50**, respectively, the new threshold is 150 (that is, 200 – 50). The tuples whose XID < 150 will be physically deleted.

Parameter type: integer

Unit: none

Value range: 0 to 1000000. **0** means no delay.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

undo_retention_time

Parameter description: Specifies the period for retaining undo logs of earlier versions.

Parameter type: integer

Unit: s

Value range: 0 to 259200.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

CAUTION

1. If this parameter is set to **0** during the Ustore flashback query, the snapshot information at the flashback point will be cleared. In earlier versions, no flashback query can be performed. When a flashback query is performed, the error message "cannot find the restore point" is displayed.
2. If the time within which the undo logs of earlier versions need to be retained is time1 and the SQL statement execution time for the flashback query is time2, you need to set **undo_retention_time** to a value greater than time1 + time2. That is, set **undo_retention_time** to a value greater than time1 + time2 + 3s. You are advised to set **undo_retention_time** to a value equal to time1 + 1.5 x time2. For example, if you want to retain the logs of earlier versions within the latest 3 hours, and the SQL statement execution time for the flashback query is 1 hour, set **undo_retention_time** to a value equal to 3 hours + 1.5 x 1 hour, that is, 4.5 hours.

14.3.39 Rollback Parameters

max_undo_workers

Parameter description: Specifies the number of undo worker threads invoked during asynchronous rollback. The parameter setting takes effect after the system is restarted.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to 100

Default value: **5**

14.3.40 AI Features

enable_hypo_index

Parameter description: Specifies whether the database optimizer considers the created virtual index when executing **EXPLAIN**. By executing **EXPLAIN** on a specific query statement, you can evaluate whether the index can improve the execution efficiency of the query statement based on the execution plan provided by the optimizer.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: A virtual index is created when the **EXPLAIN** command is executed.
- **off**: No virtual index is created when the **EXPLAIN** command is executed.

Default value: **off**

db4ai_snapshot_mode

Parameter description: There are two snapshot modes: MSS (materialized mode, storing data entities) and CSS (computing mode, storing incremental information).

Parameter type: string

Unit: none

Value range: **"MSS"** or **"CSS"**

- **MSS**: materialized mode. The DB4AI stores data entities when snapshots are created.
- **CSS**: computing mode. The DB4AI stores incremental information when snapshots are created.

Default value: "MSS"

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. Switch the mode as required.

db4ai_snapshot_version_delimiter

Parameter description: Specifies the delimiter for the snapshot version of a data table.

Parameter type: string

Unit: none

Value range: a string of one character, such as **@** and **#**. Note that **!** is invalid.

Default value: **"@"**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

db4ai_snapshot_version_separator

Parameter description: Specifies the delimiter for the snapshot subversion of a data table.

Parameter type: string

Unit: none

Value range: a string of one character, such as **@** and **#**. Note that **?** is invalid.

Default value: **"."**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

enable_ai_stats

Parameter description: Specifies whether to create or use intelligent statistics.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that intelligent statistics are created and used.
- **off** indicates that intelligent statistics are not created or used.

Default value: **on**

multi_stats_type

Parameter description: Specifies the type of statistics to be created when **enable_ai_stats** is set to **on**.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: enumerated values. Valid values include **"BAYESNET"**, **"MCV"**, and **"ALL"**.

- **"BAYESNET"**: Only intelligent statistics are created.
- **"MCV"**: Only traditional statistics are created.
- **"ALL"**: Both traditional statistics and intelligent statistics are created.

Default value: **"BAYESNET"**

ai_stats_cache_limit

Parameter description: Specifies the maximum number of models that can be cached when **enable_ai_stats** is set to **on**.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 30 to 1000

Default value: **100**

enable_operator_prefer

Parameter description: Specifies whether to enable the operator preference rule. If the estimated costs are similar, the parameterized path is preferred for table join.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that parameterized path preference is enabled.
- **off** indicates that parameterized path preference is disabled.

Default value: **off**

CAUTION

There are two prerequisites for this parameter to take effect:

- The parameterized path is generated.
- The estimated cost of the parameterized path is similar to that of other index scan operators.

enable_cachedplan_mgr

Parameter description: Specifies whether to enable the adaptive plan selection function. Adaptive plan selection solves the performance issue caused by the traditional single cache plan that cannot change according to the query condition parameter, and avoids frequent calling of query optimizers. Users can enable this function and maintain multiple cache plans for adapting to different query parameters, improving query execution performance.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the multi-plan cache function is allowed.
- **off** indicates that the multi-plan cache function is not allowed.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. Enabling this parameter helps improve the query performance. If this parameter is disabled, the query performance may deteriorate.

max_stmt_aplan_num

Parameter description: Specifies the maximum number of candidate plans per query in adaptive plan selection.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 20

Default value: **5**

recommend_session_aplan_memory

Parameter description: Specifies the maximum memory size of candidate plans of each session in adaptive plan selection. If the size is greater than or equal to the value of this parameter, no new candidate plan will be inserted into the memory. The unit is KB.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1024 to 102400

Default value: **5120**

repick_plan_min_duration

Parameter description: Specifies the lower limit of the detected plan. During policy detection, if the execution time of the detected policy is not less than that of the cplan multiplied by the value of **repick_plan_min_duration**, an error is reported. If this parameter is set to **0**, the error reporting mechanism is disabled.

This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to *INT_MAX*

Default value: **0**

enable_adaptive_cost

Parameter description: Determines whether to enable the feedback-based optimizer cardinality and cost correction functions. If this parameter is enabled, the processes of collecting operator information and estimating cardinality are enabled, and the thread for starting backend model maintenance is enabled; otherwise, the thread exits.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The operator information and cardinality estimation processes are enabled.
- **off**: The operator information and cardinality estimation processes are disabled.

Default value:

- **on**: default value of the newly installed database.
- **off**: default value of the database in versions earlier than 505.1.0 after the database is upgraded.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. Enable or disable this parameter based on the actual requirement.

enable_feedback_cardest

Parameter description: Specifies whether to enable the feedback-based optimizer cardinality and cost correction functions. This parameter is used by developers to diagnose model-related problems. Typically **enable_adaptive_cost** is set to **off**. If it is set to **on**, the operator information is still collected and the API of cardinality estimation feedback is still called. However, in this case, the thread for backend automatic model maintenance is not enabled. Developers can use the

gs_acm_analyze_workload_manual() function to manually train models for diagnosing problems.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The operator information is collected, and the API of cardinality estimation feedback is still called. However, the backend automatic model maintenance thread is not enabled.
- **off**: The **enable_adaptive_cost** parameter takes full control.

Default value:

- **on**: default value of the newly installed database.
- **off**: default value of the database in versions earlier than 505.1.0 after the database is upgraded.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised to retain the default value so that developers can diagnose model-related problems. If this parameter is not required, you can disable it and the **enable_adaptive_cost** parameter can take full control. However, this operation will compromise flexibility.

adaptive_cardest_strategy

Parameter description: Specifies the preference of the selection cardinality estimation model.

Value type: enumerated type

Unit: none

Value range: **"auto"**, **"use_statistics"**, and **"use_feedback"**.

- **"auto"**: adaptive mode. In this mode, the system automatically determines whether to use the statistical method or feedback method based on the estimation accuracy in the history.
- **"use_statistics"**: Statistics are preferentially used for cardinality estimation.
- **"use_feedback"**: The feedback model is preferentially used for cardinality estimation.

Default value: **"auto"**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

maximal_feedback_model_num

Parameter description: Specifies the maximum number of cardinality feedback models. If the actual number exceeds the value of this parameter, no new models will be trained.

Parameter type: integer.

Unit: none

Value range: –1 to 1000000. The value **–1** indicates that there is no upper limit.

Default value: **10000**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If this parameter is set to an excessively small value, the cardinality estimation feedback function may fail because the system cannot train enough new models. If this parameter is set to an excessively large value, the system performance may deteriorate.

feedback_model_cache_limit

Parameter description: Specifies the maximum number of cardinality feedback models that can be cached in the global memory.

Parameter type: integer.

Unit: none

Value range: 10 to 100000

Default value: **500**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If this parameter is set to an excessively large or small value, the system performance deteriorates.

feedback_model_expired_time

Parameter description: Specifies the timeout interval for cardinality feedback models, which is used to clear expired models periodically.

Parameter type: integer.

Unit: millisecond

Value range: 500–2147483647

Default value: **1000*60*60*24**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If the timeout interval is too long, the system performance deteriorates. If the timeout interval is too short, unexpired models may be deleted, affecting functions.

feedback_collection_expired_time

Parameter description: Specifies the timeout interval for cardinality feedback models, which is used to clear expired operator models periodically.

Parameter type: integer.

Unit: millisecond

Value range: 50–2147483647

Default value: **1000*60*60**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If the timeout interval is too long, the system performance deteriorates. If the timeout interval is too short, unexpired models may be deleted, affecting functions.

adaptive_cost_min_time

Parameter description: Specifies the execution duration threshold of SQL statements for cardinality feedback collection. Only the feedback of statements whose execution duration is greater than the value of this parameter is collected.

Parameter type: integer.

Unit: millisecond

Value range: 0 to 2147483647

Default value: 1000

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised to set this parameter to 20% of the execution duration of slow queries to be tuned. If this parameter is set to a small value, the system performance may deteriorate by about 1%. If this parameter is set to a large value, the query that can be automatically optimized does not take effect.

cost_update_window_size

Parameter description: Specifies the size of the sliding window for collecting data for regression.

Parameter type: integer.

Unit: none

Value range: 1–20

Default value: **5**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

adaptive_costest_strategy

Parameter description: Specifies whether the new or old cost model is used for cost evaluation.

Value type: enumerated type

Unit: none

Value range: **"L0"** and **"L1"**

- **"L0"**: The new cost model is triggered only when the cardinality estimation is correct (for example, using the cardinality estimation feedback).
- **"L1"**: The new cost model is preferentially used for calculation.

Default value: **"L0"**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

adaptive_costmodel_calibration_interval

Parameter description: Specifies the interval at which the cost model correction logic is triggered.

Parameter type: integer.

Unit: millisecond

Value range: 0 to 2147483647. The value **0** indicates that the cost models are not automatically corrected.

Default value: **1000*60*60**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If this parameter is set to an excessively small value, the cost model frequently triggers the correction function, resulting in performance deterioration. If this parameter is set to an excessively large value, the model cannot be corrected in a timely manner, resulting in poor performance.

unix_socket_directory

Parameter description: Specifies the path for storing files in the unix_socket communication mode. You can set this parameter only in the configuration file **gaussdb.conf**. Before enabling the fenced mode, you need to set this GUC parameter.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a string of 0 or more characters

Default value: ''

enable_ai_watchdog

Parameter description: Enables or disables the AI watchdog function.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **on**

enable_ai_watchdog_forcible_oom_detection

Parameter description: Forcibly enables or disables the OOM detection function of the AI watchdog. If this parameter is disabled, the system automatically determines whether to enable the OOM detection function based on the current database specifications. In automatic determination mode, the OOM detection function is enabled only when **max_process_memory** is set to **64GB** or a larger value. The OOM detection function depends on the information obtained by the memory management module. Therefore, if the memory management module is disabled or invalid, the OOM detection function cannot be enabled.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: enabled.
- **off**: disabled.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If this function is enabled, the system performance may be affected.

enable_ai_watchdog_healing

Parameter description: Enables or disables the self-healing function of the AI watchdog.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **on**

ai_watchdog_max_cpu_usage

Parameter description: Specifies the expected upper limit of the database CPU usage. The value is normalized based on the multi-core situation. If this parameter is set to **0**, the system does not check the CPU usage.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a floating-point number ranging from 0 to 1.

Default value: **0.8**

ai_watchdog_oom_dynamic_used_threshold

Parameter description: Specifies the expected upper limit of the dynamic memory usage of the database.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a floating-point number ranging from 0 to 1.

Default value: 0.95

ai_watchdog_oom_growth_confidence

Parameter description: Specifies the confidence level of the OOM detection algorithm.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a floating-point number ranging from 0.1 to 1.

Default value: 0.95

ai_watchdog_oom_malloc_failures

Parameter description: Specifies the maximum number of consecutive memory allocation failures tolerated. If the number of consecutive memory allocation failures exceeds this value, the OOM detection function may be triggered.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to 32000.

Default value: **50**

ai_watchdog_oom_other_used_memory_threshold

Parameter description: Specifies the expected upper limit of memory usage of other parts of the database, in MB.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 1 to 1048576.

Default value: 20480

ai_watchdog_oom_process_threshold

Parameter description: Specifies the expected percentage of the database process usage to the value of **max_process_memory**. When the threshold is reached, memory leakage determination is triggered. The value can be greater than 1.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a floating-point number ranging from 0 to 10.

Default value: 1.1

ai_watchdog_oom_shared_threshold

Parameter description: Specifies the expected upper limit of the shared memory usage of the database.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a floating-point number ranging from 0 to 1.

Default value: 0.4

ai_watchdog_rto_restriction_time

Parameter description: Specifies the RTO threshold of the AI watchdog self-healing function. If the RTO threshold is exceeded, self-healing is not performed. The unit is second.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 36000.

Default value: **600**

ai_watchdog_tolerance_times

Parameter description: Specifies the maximum number of consecutive abnormal events that can be tolerated by the AI watchdog before self-healing is started. This parameter can be used to avoid incorrect operations.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 100.

Default value: 4

ai_watchdog_tps_threshold

Parameter description: Specifies the lower limit of the expected TPS usage of the database instance. If the TPS usage is lower than the value of this parameter, the exception determination logic is triggered.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 32000.

Default value: **2**

ai_watchdog_wait_time

Parameter description: Adjusts the waiting time, in seconds. To prevent the database from frequently performing self-healing operations, the database waits for a period of time after startup.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 36000.

Default value: **1800**

ai_watchdog_warning_retention

Parameter description: Specifies the maximum number of alarm records that the AI watchdog can retain in the dbe_perf.ai_watchdog_detection_warnings view.

This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: an integer ranging from 0 to 32000.

Default value: 20

14.3.41 Global SysCache Parameters

enable_global_syscache

Parameter description: Specifies whether to enable the global system cache function.

Parameter type: Boolean

Unit: none

Value range:

- **on** indicates that the global system cache function is enabled.
- **off** indicates that the global system cache function is disabled.

Default value: **on**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Enable this function to reduce the memory usage of the system cache and improve the concurrent expansion capability. You are advised to use this parameter together with the thread pool parameter. After this parameter is enabled, you are advised to set **wal_level** of the standby node to **hot_standby** or higher if you need to access the standby node.

global_syscache_threshold

Parameter description: Specifies the maximum memory usage of the global system cache. To use this parameter, you need to enable the **enable_global_syscache** parameter.

Parameter type: integer

Unit: KB

Value range: 16384 to 1073741824

Default value: **163840** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory); **65536** (4-core CPU/16 GB memory)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: MIN(Number of hot databases,Number of threads) x Memory size allocated to each database.

That is, **global_syscache_threshold** = **min(count(hot dbs), count(threads))** x **memofdb**.

The number of hot databases refers to the number of frequently accessed databases. In thread pool mode, the number of threads is the sum of the number of threads in the thread pool and the number of background threads. In non-thread pool mode, the number of hot databases is used.

memofdb indicates the average memory allocated to each database. The background noise memory of each database is 2 MB. Each time a table or index is added, 11 KB memory is added.

If this parameter is set to a small value, memory is frequently evicted, and a large number of memory fragments cannot be recycled. As a result, memory control fails.

14.3.42 Restoring Data on the Standby Node

standby_page_repair

Parameter description: Specifies whether to enable automatic page repair during replay on the standby node. In the current version, only the CRC check failure type can be repaired. Bad blocks in hash bucket tables, heap table FSM files, and VM files cannot be repaired. This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that the standby node automatically detects and repairs pages during replay.
- **off** indicates that the standby node does not automatically detect and repair pages during replay.

Default value: **on**

CAUTION

If a large number of physical bad blocks are continuously injected to the standby node, the replay performance of the standby node is affected, and Xlogs may be stacked on the standby node.

14.3.43 Delimiter

delimiter_name

Parameter description: Saves the name of a delimiter.

When the gsql client identifies delimiters, it immediately sends one or more input SQL statements to the server for execution. When there are many input statements and semicolons (;) exist in the statements, you can specify a special

symbol as the delimiter. This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

This parameter can be set only on the gsql client by running the **DELIMITER** command.

Value range: a string, consisting of one or more characters.

Default value: **";"**

14.3.44 Global PL/SQL Cache Parameters

enable_global_plsqlcache

Parameter description: Specifies whether to globally cache compilation products of packages, stored procedures, and functions, and cache execution products at the session level. Enabling this function can reduce the memory usage of database nodes in high concurrency scenarios.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: Boolean

- **on** indicates that compilation products are cached globally.
- **off** indicates that global cache is not performed.

Default value: **on**

max_execute_functions

Parameter description: Specifies the number of execution products of stored procedures and functions in a session. This parameter must be set when **enable_global_plsqlcache** is set to **on**. Otherwise, the setting is invalid.

If the number of execution products is greater than the value of **max_execute_functions**, only the most recently invoked execution products (the number is specified by **max_execute_functions**) are retained and others are cleared.

This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Value range: a value ranging from 1 to 2147483647.

Default value: **1000**

max_compile_packages

Parameter description: Specifies the maximum number of package compilation results stored in the server.

Parameter type: integer

Unit: none

Value range: 0 to 2147483647. The value **0** indicates that this function is disabled and the number of package compilation products is not controlled. The default

value of this parameter can be adjusted based on different specifications. The recommended value can be obtained by rounding down the value of (**max_process_memory** x 2%)/4.4, in MB.

The value 4.4 MB is the average value obtained based on the simulation statistics in the lab. You need to observe the value in the actual scenario. If the value does not comply with the actual scenario, you need to adjust the value to adjust the memory usage of the stored procedure.

Default value:

Default values for different specifications are calculated by rounding down (**max_process_memory** x 2%)/4.4, in MB.

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Storing too many package compilation results may occupy a large amount of memory. Setting this parameter to a proper value helps reduce memory usage and improve system performance.

14.3.45 Ledger Database

enable_ledger

Parameter description: Specifies whether to enable the ledger database. If this parameter is set to **on**, the ledger database is enabled, and a new tamper-proof mode can be created and the common mode can be changed to the tamper-proof mode.

Parameter type: Boolean

Unit: none

Value range:

- **on** indicates that the ledger database is enabled.
- **off** indicates that the ledger database is disabled.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: The ledger database is disabled by default. To enable it, set **enable_ledger** to **on**.

ledger_hist_level

Parameter description: Specifies whether to record SQL statements in the global blockchain table.

Parameter type: int

Unit: none

Value range:

- **0**: SQL statements are not recorded in the global blockchain table.

- **1**: SQL statements are recorded in the global blockchain table.

Default value: **1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value **1**.

14.3.46 Creating an Index Online

delete_cctmp_table

Parameter description: Specifies whether to delete temporary tables generated during Ustore online index creation or rebuilding.

Parameter type: Boolean

Unit: none

Value range:

- **on**: indicates that the temporary tables are deleted.
- **off**: indicates that the temporary tables are retained.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is enabled by default. Set this parameter to **off** if you want to retain temporary tables generated during online index creation or rebuilding.

14.3.47 Data Lifecycle Management: OLTP Table Compression

enable_ilm

Parameter description: Specifies whether to enable the OLTP table compression of data lifecycle management.

Parameter type: Boolean

Unit: none

Value range:

- **on**: enabled.
- **off**: disabled

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestions: The default value is **off**. To enable this feature, contact Huawei engineers to purchase a license and then set this parameter to **on**.

14.3.48 Vector Database Parameters

maintenance_work_mem

Parameter description: Specifies the maximum amount of memory used in maintenance operations.

Parameter type: numeric

Unit: KB

Value range: [1024,2147483647] or [1MB, 2048GB)

Default value: **65536**/**64MB**

Level: session level

diskann_probe_ncandidates

Parameter description: Specifies the size of the candidate set when the gsdiskann index is used to retrieve vectors.

Parameter type: numeric

Unit: none

Value range: [1,32768]

Default value: **128**

Level: session level

NOTE

The **diskann_probe_ncandidates** parameter can be set and take effect for some queries that use the gsdiskann index. If this parameter is set to a large value, the query performance deteriorates. If this parameter is set to a small value, the recall rate is low. The recommended value is **128**. You are advised to obtain the optimal parameter configuration through experiments.

gsivfflat_probes

Parameter description: Specifies the number of inverted tables to be searched. If it exceeds the total number of inverted tables, the entire table is searched.

Parameter type: numeric

Unit: none

Value range: [1,32768]

Default value: **5**

Level: session level

NOTE

A larger value of **gsivfflat_probes** indicates a longer search time but more accurate results. You are advised to set **gsivfflat_probes** to 3% the value of **nlist** during index creation. You are advised to obtain the optimal parameter configuration through experiments.

gsivfflat_secondary_probes

Parameter description: Specifies the number of level-2 inverted tables to be searched. If it exceeds the total number of level-2 inverted tables, the entire table is searched.

Parameter type: numeric

Unit: none

Value range: [1,32768]

Default value: **5**

Level: session level

NOTE

With the same effect as that of **gsivfflat_probes**, **gsivfflat_secondary_probes** takes effect only when the vector index is a double-layer index. This parameter can effectively accelerate the query speed. You are advised to set it to a value ranging from 1/4 to 1/2 of **ivf_nlist2**. You are advised to obtain the optimal parameter configuration through experiments.

enable_vectordb

Parameter description: Specifies whether vector indexes can be created and whether vector indexes can be added, modified, and queried.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: enabled.
- **off**: disabled.

Default value: **on**

Level: Global parameter (SIGHUP).

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Table 14-31 GUC parameters related to the vector database

GUC Parameter	Level	Value Range/Default Value	Description
maintenance_work_mem	Session	[1024,2147483647]/[1MB,2048GB) (**65536**/**64MB**)	Maximum amount of memory used in maintenance operations. The default unit is KB.

GUC Parameter	Level	Value Range/Default Value	Description
diskann_probe_ncandidates	Session	[1, 32768](128)	Size of the candidate set when the gsdiskann index is used to retrieve vectors.
gsivfflat_probes	Session	[1, 32768](5)	Number of inverted tables to be searched. If it exceeds the total number of inverted tables, the entire table is searched.
gsivfflat_secondary_probes	Session	[1, 32768](5)	Number of level-2 inverted tables to be searched. If it exceeds the total number of level-2 inverted tables, the entire table is searched.
enable_vectordb	Global parameter (SIGHUP)	[off, on](on)	An advance feature that specifies whether vector indexes can be created and whether vector indexes can be added, modified, and queried.

14.3.49 Enhanced TOAST

enable_enhance_toast_table

Parameter description: Specifies whether the enhanced TOAST out-of-line storage table is used.

Parameter type: Boolean

Unit: none

Value range:

- **on**: enabled.
- **off**: disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: The default value of this parameter is **on**. To disable the enhanced TOAST out-of-line storage function, set this parameter to **off**.

14.3.50 Reserved Parameters

NOTE

The parameters below are reserved and do not take effect in this version.

acce_min_datasize_per_thread

enable_constraint_optimization

enable_hadoop_env

enable_hdfs_predicate_pushdown

enable_orc_cache

schedule_splits_threshold

backend_version

undo_zone_count

version_retention_age

max_que_size

Discarded Parameters

max_query_retry_times

tde_cmk_id

transparent_encrypted_string

transparent_encrypt_kms_url

transparent_encrypt_kms_region

hll_default_regwidth

hll_default_expthresh

hll_default_sparseon

hll_max_sparse

enable_compress_hll

time_to_target_rpo

15 FAQ

15.1 What is the maximum number of columns in a single GaussDB table?

Answer: 1600. The value varies according to the column type. The column type is not verified during table creation but is verified during data storage. For example, for a column of the bigint type, each column stores 8-byte data. If there are 1600 columns, 12800 bytes need to be stored, which exceeds 8 KB on a page, and an error is reported during insertion.

15.2 How do I query the partition and index information of a partitioned table?

Answer: You can use either of the following methods:

- You can use the pg_get_tabledef() function to view the definition of a table. The returned information includes table creation SQL statements, comments, indexes, and constraints.

  Example:
  ```
  gaussdb=#SELECT pg_get_tabledef('table_name');
  ```
- You can query the pg_partition view for partition information and the pg_indexes view for index information.

15.3 What is OID?

Answer: Object identifier (OID) is the unique identifier of a database object, which can be a database, table, index, or view.

15.4 What is UDF?

Answer: You can define a function and embed the user-defined function (UDF) in GaussDB to implement specific functions to meet different service scenarios.

15.5 What wildcards are supported in GaussDB? How do I use them?

Answer: GaussDB supports the following three types of wildcards:

- %: indicates any number of characters, including 0. It is used in the LIKE and NOT LIKE statements.
- _: indicates a character, which is used in LIKE and NOT LIKE statements.
- *: indicates any number of characters, including 0. It is used in some meta-commands.

  Examples:

```
-- Use wildcards to indicate any number of characters and query the tbl_test table for the data that starts with col1 and ends with ab.
gaussdb=#SELECT * FROM tbl_test WHERE col1 LIKE 'ab%';

-- Use a wildcard to query the data of any single character string starting with a and ending with b in the col1 column of the tbl_test table.
gaussdb=#SELECT * FROM tbl_test WHERE col1 LIKE 'a_b';

-- Query all tables whose names start with tbl.
gaussdb=#\dt tbl*
```

15.6 Is there a limit on the length of a database object name?

Answer: When a database object is created, the name cannot exceed 63 bytes. If the name exceeds 63 bytes, the database truncates the last byte (not the character). As a result, half a character may appear.

15.7 How do I view the creation time of a table?

Answer: See the value of the **created** column in the PG_TABLES system view.

```
-- Create a table.
gaussdb=#CREATE TABLE test(id int, name varchar(10));

-- Query the time when the test table is created.
gaussdb=#SELECT tablename,created FROM pg_tables WHERE tablename = 'test';
 tablename |              created
-----------+-------------------------------
 test      | 2024-01-12 14:50:59.611988+08
(1 row)
```

15.8 How do I create indexes in parallel?

Answer: Refer to the following method:

```
-- Set maintenance_work_mem based on the actual situation.
gaussdb=#SET maintenance_work_mem = '8GB';

-- Create a table.
gaussdb=#CREATE TABLE table_name (col1 int, col2 int);
```

```
-- Change the number of threads for creating indexes for a table based on the actual situation.
gaussdb=#ALTER TABLE table_name SET (parallel_workers=4);

-- Create an index.
gaussdb=#CREATE INDEX index_name ON table_name(col1);

-- Reset the parallel_workers parameter for the table.
gaussdb=#ALTER TABLE table_name RESET (parallel_workers);

-- Delete the index.
DROP INDEX index_name;

-- Drop the table.
gaussdb=#DROP TABLE table_name;
```

15.9 How do I create an auto-increment column?

Answer: GaussDB supports the creation of auto-increment columns. You can specify the SERIAL data type when creating a table.

Example:

```
gaussdb=#CREATE TABLE table_name(id serial, name varchar(20));
```

You can also use the following method:

```
-- Create a sequence.
gaussdb=#CREATE SEQUENCE tbl_person_id_seq;
-- Create the tbl_persion table. The value of the id column is automatically increased based on the sequence specified by tbl_person_id_seq.
gaussdb=#CREATE TABLE tbl_persion(
    id int NOT NULL DEFAULT nextval('tbl_person_id_seq'::regclass),
    name varchar(20));
```

15.10 Can I query the GaussDB memory usage through SQL statements?

Answer: You can query the context name, level, total size, and available size of the shared memory in the pg_shared_memory_detail view.

```
gaussdb=#SELECT * FROM pg_shared_memory_detail;
```

15.11 What are the differences between LIMIT 2, LIMIT 2,3 and LIMIT 2 OFFSET 3?

Answer: LIMIT and OFFSET are keywords used to limit the number of query results returned in the SELECT statement.

- **LIMIT 2**: Only the first two rows of data are returned.
- **LIMIT 2,3**: A total of three rows of data from the third row are returned.
- **LIMIT 2 OFFSET 3**: A total of two rows of data from the fourth row are returned.

15.12 How do I create a column whose default value is the current time?

Answer: When creating a table, set the default value of the column to **CURRENT_TIMESTAMP**.

```
gaussdb=#CREATE TABLE tbl (id int, modtime date DEFAULT CURRENT_TIMESTAMP);
```

15.13 How do I determine whether a column is null?

Answer: Use IS NUL and IS NOT NULL to determine whether a column is null. For example:

```
gaussdb=#SELECT * FROM tab WHERE col1 IS NULL;
```

15.14 How do I obtain the username for connecting to a database?

Answer: Run the following command to query the current username:

```
gaussdb=#SELECT current_user;
```

15.15 How do I query the time difference between two time points?

Answer: You can use the following method to calculate the time difference:

- Use the age() function to calculate the time difference between two time points.

```
gaussdb=#SELECT age(timestamp '2001-04-10 14:00:00', timestamp '2001-04-06 13:00:00');
       age
-----------------
 4 days 01:00:00
(1 row)
```

- Convert strings to the date type and then subtract them.

```
gaussdb=#SELECT ('2001-04-10 14:00:00'::date - '2001-04-06 13:00:00'::date);
 ?column?
----------
        4
(1 row)
```

- Use the date_part() function to obtain the value of the subdomain in a date or time value.

```
gaussdb=#SELECT date_part('day', '2001-04-10 14:00:00'::timestamp - '2001-04-06
13:00:00'::timestamp);
 date_part
-----------
         4
(1 row)
```

15.16 What are the types of SQL languages?

Answer: SQL languages are classified into the following types:

- Data definition language (DDL) is used to define or modify an object in a database, such as a table, an index, or a view.
- Data manipulation language (DML) is used to perform operations on data in database tables, such as inserting, updating, querying, or deleting data.
- Data control language (DCL) is used to set or change the permissions of database users or roles.

15.17 What is the function of a trigger?

Answer: A trigger is a special stored procedure that is triggered and executed by events.

- Constraints can be strengthened to maintain data integrity and consistency.
- Operations in the database can be traced. Unauthorized updates and changes are not allowed.
- Concatenated operations can be performed.

15.18 What are the four characteristics of correctly executing database transactions?

Answer: During data write or update, the database management system (DBMS) must meet the following requirements: Atomicity, Consistency, Isolation, and Durability (ACID) to ensure that transactions are correctly executed.

- Atomicity: also called indivisibility. All operations in a transaction are either completed or not completed, and do not end in an intermediate phase. If an error occurs during transaction execution, the transaction is rolled back to the state before the transaction starts, just as if the transaction has never been executed.
- Consistency: The database integrity is not damaged before and after a transaction starts. This means that the written data must fully comply with all preset rules, including the accuracy of the data, the serialization of the data, and the spontaneous completion of the scheduled work by the subsequent database.
- Isolation: also called independence. Transactions are often executed concurrently. Isolation ensures that concurrent execution of transactions leaves the database in the same state that would have been obtained if the transactions were executed sequentially. Transaction isolation is divided into different levels, including read uncommitted, read committed, repeatable read, and serializable.
- Durability: Once a transaction has been committed, it will remain committed even in the case of a system failure.

15.19 What are the differences between the DROP, TRUNCATE, and DELETE methods in GaussDB?

Answer: The differences between the DROP, TRUNCATE, and DELETE methods lie in the deletion speed and scope. The details are as follows:

- The DROP statement can be used to delete an entire table, including the table structure, data, indexes, and permissions.
- The deletion speed of the TRUNCATE statement is medium. The TRUNCATE statement can delete all data in a table but does not delete the table structure.
- The deletion speed of the DELETE statement is the slowest. You can delete data from a table based on conditions, excluding the table structure.

15.20 How many bytes does a Chinese character occupy in GaussDB?

Answer: It depends on the character set encoding of the database. For the GBK character set, a Chinese character occupies two bytes. For the UTF8 character set, a Chinese character occupies three bytes.
