- **ShortWord**: Words of this length or less will be dropped at the start and end of a headline. The default value of three eliminates common English articles.
- **HighlightAll**: Boolean flag. If **true** the whole document will be used as the headline, ignoring the preceding three parameters.
- **MaxFragments**: Maximum number of text excerpts or fragments to display. The default value of zero selects a non-fragment-oriented headline generation method. A value greater than zero selects fragment-based headline generation. This method finds text fragments with as many query words as possible and stretches those fragments around the query words. As a result query words are close to the middle of each fragment and have words on each side. Each fragment will be of at most **MaxWords** and words of length **ShortWord** or less are dropped at the start and end of each fragment. If not all query words are found in the document, then a single fragment of the first **MinWords** in the document will be displayed.
- **FragmentDelimiter**: When more than one fragment is displayed, the fragments will be separated by this string.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Any unspecified options receive these defaults:

```
StartSel=<b>, StopSel=</b>,
MaxWords=35, MinWords=15, ShortWord=3, HighlightAll=FALSE,
MaxFragments=0, FragmentDelimiter=" ... "
```

For example:

```
openGauss=# SELECT ts_headline('english',
'The most common type of search
is to find all documents containing given query terms
and return them in order of their similarity to the
query.',
to_tsquery('english', 'query & similarity'));
                        ts_headline
------------------------------------------------------------
 containing given <b>query</b> terms
 and return them in order of their <b>similarity</b> to the
 <b>query</b>.
(1 row)

openGauss=# SELECT ts_headline('english',
'The most common type of search
is to find all documents containing given query terms
and return them in order of their similarity to the
query.',
to_tsquery('english', 'query & similarity'),
'StartSel = <, StopSel = >');
                       ts_headline
-------------------------------------------------------
 containing given <query> terms
 and return them in order of their <similarity> to the
 <query>.
(1 row)
```

ts_headline uses the original document, not a **tsvector** summary, so it can be slow and should be used with care.

12.8.4 Additional Features

12.8.4.1 Manipulating tsvector

GaussDB provides functions and operators that can be used to manipulate documents that are already in tsvector type.

- tsvector || tsvector

  The tsvector concatenation operator returns a new tsvector which combines the lexemes and positional information of the two tsvectors given as arguments. Positions and weight labels are retained during the concatenation. Positions appearing in the right-hand tsvector are offset by the largest position mentioned in the left-hand tsvector, so that the result is nearly equivalent to the result of performing **to_tsvector** on the concatenation of the two original document strings. (The equivalence is not exact, because any stop-words removed from the end of the left-hand argument will not affect the result, whereas they would have affected the positions of the lexemes in the right-hand argument if textual concatenation were used.)

  One advantage of using concatenation in the tsvector form, rather than concatenating text before applying **to_tsvector**, is that you can use different configurations to parse different sections of the document. Also, because the **setweight** function marks all lexemes of the given tsvector the same way, it is

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

necessary to parse the text and do **setweight** before concatenating if you want to label different parts of the document with different weights.

- setweight(vector tsvector, weight "char") returns tsvector

  setweight returns a copy of the input tsvector in which every position has been labeled with the given weight, either **A**, **B**, **C**, or **D**. (**D** is the default for new tsvectors and as such is not displayed on output.) These labels are retained when tsvectors are concatenated, allowing words from different parts of a document to be weighted differently by ranking functions.

  NOTICE

  Note that weight labels apply to positions, not lexemes. If the input tsvector has been stripped of positions then **setweight** does nothing.

- length(vector tsvector) returns integer

  Returns the number of lexemes stored in the tsvector.

- strip(vector tsvector) returns tsvector

  Returns a tsvector which lists the same lexemes as the given tsvector, but which lacks any position or weight information. While the returned tsvector is much less useful than an unstripped tsvector for relevance ranking, it will usually be much smaller.

12.8.4.2 Manipulating Queries

GaussDB provides functions and operators that can be used to manipulate queries that are already in **tsquery** type.

- tsquery && tsquery

  Returns the AND-combination of the two given queries.

- tsquery || tsquery

  Returns the OR-combination of the two given queries.

- !! tsquery

  Returns the negation (NOT) of the given query.

- numnode(query tsquery) returns integer

  Returns the number of nodes (lexemes plus operators) in a **tsquery**. This function is useful to determine if the query is meaningful (returns > 0), or contains only stop words (returns 0). For example:

```
openGauss=# SELECT numnode(plainto_tsquery('the any'));
NOTICE:  text-search query contains only stop words or doesn't contain lexemes, ignored
CONTEXT:  referenced column: numnode
 numnode
---------
       0

openGauss=# SELECT numnode('foo & bar'::tsquery);
 numnode
---------
       3
```

- querytree(query tsquery) returns text

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Returns the portion of a **tsquery** that can be used for searching an index. This function is useful for detecting unindexable queries, for example those containing only stop words or only negated terms. For example:

```
openGauss=# SELECT querytree(to_tsquery('!defined'));
 querytree
-----------
 T
(1 row)
```

12.8.4.3 Rewriting Queries

The **ts_rewrite** family of functions searches a given **tsquery** for occurrences of a target subquery, and replace each occurrence with a substitute subquery. In essence this operation is a **tsquery** specific version of substring replacement. A target and substitute combination can be thought of as a query rewrite rule. A collection of such rewrite rules can be a powerful search aid. For example, you can expand the search using synonyms (that is, new york, big apple, nyc, gotham) or narrow the search to direct the user to some hot topic.

- ts_rewrite (query tsquery, target tsquery, substitute tsquery) returns tsquery

  This form of **ts_rewrite** simply applies a single rewrite rule: **target** is replaced by **substitute** wherever it appears in query. For example:

  ```
  openGauss=# SELECT ts_rewrite('a & b'::tsquery, 'a'::tsquery, 'c'::tsquery);
   ts_rewrite
  ------------
   'b' & 'c'
  ```

- ts_rewrite (query tsquery, select text) returns tsquery

  This form of **ts_rewrite** accepts a starting query and a SQL select command, which is given as a text string. The **select** must yield two columns of **tsquery** type. For each row of the select result, occurrences of the first column value (the target) are replaced by the second column value (the substitute) within the current **query** value.

  NOTE

  Note that when multiple rewrite rules are applied in this way, the order of application can be important; so in practice you will want the source query to **ORDER BY** some ordering key.

  Consider a real-life astronomical example. We will expand query supernovae using table-driven rewriting rules:

  ```
  openGauss=# CREATE TABLE tsearch.aliases (id int, t tsquery, s tsquery);

  openGauss=# INSERT INTO tsearch.aliases VALUES(1, to_tsquery('supernovae'),
  to_tsquery('supernovae|sn'));

  openGauss=# SELECT ts_rewrite(to_tsquery('supernovae & crab'), 'SELECT t, s FROM tsearch.aliases');

            ts_rewrite
  ---------------------------------
   'crab' & ( 'supernova' | 'sn' )
  ```

  We can change the rewriting rules just by updating the table:

  ```
  openGauss=# UPDATE tsearch.aliases
  SET s = to_tsquery('supernovae|sn & !nebulae')
  WHERE t = to_tsquery('supernovae');

  openGauss=# SELECT ts_rewrite(to_tsquery('supernovae & crab'), 'SELECT t, s FROM tsearch.aliases');

                  ts_rewrite
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-----------------------------------------------
 'crab' & ( 'supernova' | 'sn' & !'nebula' )
```

Rewriting can be slow when there are many rewriting rules, since it checks every rule for a possible match. To filter out obvious non-candidate rules we can use the containment operators for the **tsquery** type. In the example below, we select only those rules which might match the original query:

```
openGauss=# SELECT ts_rewrite('a & b'::tsquery, 'SELECT t,s FROM tsearch.aliases WHERE ''a &
b''::tsquery @> t');

 ts_rewrite
------------
 'b' & 'a'
(1 row)
openGauss=# DROP TABLE tsearch.aliases;
```

12.8.4.4 Gathering Document Statistics

The function **ts_stat** is useful for checking your configuration and for finding stop-word candidates.

```
ts_stat(sqlquery text, [ weights text, ]
        OUT word text, OUT ndoc integer,
        OUT nentry integer) returns setof record
```

sqlquery is a text value containing an SQL query which must return a single **tsvector** column. **ts_stat** executes the query and returns statistics about each distinct lexeme (word) contained in the **tsvector** data. The columns returned are:

- **word text**: the value of a lexeme
- **ndoc integer**: number of documents (**tsvector**s) the word occurred in
- **nentry integer**: total number of occurrences of the word

If **weights** are supplied, only occurrences having one of those weights are counted. For example, to find the ten most frequent words in a document collection:

```
openGauss=# SELECT * FROM ts_stat('SELECT to_tsvector(''english'', sr_reason_sk) FROM
tpcds.store_returns WHERE sr_customer_sk < 10') ORDER BY nentry DESC, ndoc DESC, word LIMIT 10;
  word | ndoc | nentry
------+------+--------
 32   |    2 |      2
 33   |    2 |      2
 1    |    1 |      1
 10   |    1 |      1
 13   |    1 |      1
 14   |    1 |      1
 15   |    1 |      1
 17   |    1 |      1
 20   |    1 |      1
 22   |    1 |      1
(10 rows)
```

The same, but counting only word occurrences with weight **A** or **B**:

```
openGauss=# SELECT * FROM ts_stat('SELECT to_tsvector(''english'', sr_reason_sk) FROM
tpcds.store_returns WHERE sr_customer_sk < 10', 'a') ORDER BY nentry DESC, ndoc DESC, word LIMIT 10;
 word | ndoc | nentry
------+------+--------
(0 rows)
```

12.8.5 Parser

Text search parsers are responsible for splitting raw document text into tokens and identifying each token's type, where the set of types is defined by the parser itself.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Note that a parser does not modify the text at all — it simply identifies plausible word boundaries. Because of this limited scope, there is less need for application-specific custom parsers than there is for custom dictionaries.

Currently, GaussDB provides the following built-in parsers: pg_catalog.default for English configuration, and pg_catalog.ngram and pg_catalog.pound for full text search in texts containing Chinese, or both Chinese and English.

The built-in parser is named **pg_catalog.default**. It recognizes 23 token types, shown in **Table 12-97**.

Table 12-97 Default parser's token types

Alias	Description	Example
asciiword	Word, all ASCII letters	elephant
word	Word, all letters	mañana
numword	Word, letters and digits	beta1
asciihword	Hyphenated word, all ASCII	up-to-date
hword	Hyphenated word, all letters	lógico-matemática
numhword	Hyphenated word, letters and digits	postgresql-beta1
hword_asciipart	Hyphenated word part, all ASCII	postgresql in the context postgresql-beta1
hword_part	Hyphenated word part, all letters	lógico or matemática in the context lógico-matemática
hword_numpart	Hyphenated word part, letters and digits	beta1 in the context postgresql-beta1
email	Email address	foo@example.com
protocol	Protocol head	http://
url	URL	example.com/stuff/index.html
host	Host	example.com
url_path	URL path	/stuff/index.html, in the context of a URL
file	File or path name	/usr/local/foo.txt, if not within a URL
sfloat	Scientific notation	-1.23E+56
float	Decimal notation	-1.234
int	Signed integer	-1234
uint	Unsigned integer	1234

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alias	Description	Example
version	Version number	8.3.0
tag	XML tag	<a href="dictionaries.html">
entity	XML entity	&
blank	Space symbols	(any whitespace or punctuation not otherwise recognized)

Note: The parser's notion of a "letter" is determined by the database's locale setting, specifically **lc_ctype**. Words containing only the basic ASCII letters are reported as a separate token type, since it is sometimes useful to distinguish them. In most European languages, token types word and asciiword should be treated alike.

email does not support all valid email characters as defined by RFC 5322. Specifically, the only non-alphanumeric characters supported for email user names are period, dash, and underscore.

It is possible for the parser to identify overlapping tokens in the same piece of text. As an example, a hyphenated word will be reported both as the entire word and as each component:

```
openGauss=# SELECT alias, description, token FROM ts_debug('english','foo-bar-beta1');
      alias      |              description               |     token
-----------------+----------------------------------------+---------------
 numhword        | Hyphenated word, letters and digits    | foo-bar-beta1
 hword_asciipart | Hyphenated word part, all ASCII        | foo
 blank           | Space symbols                          | -
 hword_asciipart | Hyphenated word part, all ASCII        | bar
 blank           | Space symbols                          | -
 hword_numpart   | Hyphenated word part, letters and digits | beta1
```

This behavior is desirable since it allows searches to work for both the whole compound word and for components. Here is another instructive example:

```
openGauss=# SELECT alias, description, token FROM ts_debug('english','http://example.com/stuff/
index.html');
  alias   |  description  |            token
----------+---------------+------------------------------
 protocol | Protocol head | http://
 url      | URL           | example.com/stuff/index.html
 host     | Host          | example.com
 url_path | URL path      | /stuff/index.html
```

N-gram is a mechanical word segmentation method, and applies to no semantic Chinese segmentation scenarios. The N-gram segmentation method ensures the completeness of the segmentation. However, to cover all the possibilities, it but adds unnecessary words to the index, resulting in a large number of index items. N-gram supports Chinese coding, including GBK and UTF-8. Six built-in token types are shown in **Table 12-98**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-98 Token types

Alias	Description
zh_words	chinese words
en_word	english word
numeric	numeric data
alnum	alnum string
grapsymbol	graphic symbol
multisymbol	multiple symbol

Pound segments words in a fixed format. It is used to segment to-be-parsed nonsense Chinese and English words that are separated by fixed separators. It supports Chinese encoding (including GBK and UTF8) and English encoding (including ASCII). Pound has six pre-configured token types (as listed in **Table 12-99**) and supports five separators (as listed in **Table 12-100**). The default, the separator is **#**. Pound The maximum length of a token is 256 characters.

Table 12-99 Token types

Alias	Description
zh_words	chinese words
en_word	english word
numeric	numeric data
alnum	alnum string
grapsymbol	graphic symbol
multisymbol	multiple symbol

Table 12-100 Separator types

Separator	Description
@	Special character
#	Special character
$	Special character
%	Special character
/	Special character

12.8.6 Dictionaries

12.8.6.1 Overview

A dictionary is used to define stop words, that is, words to be ignored in full-text retrieval.

A dictionary can also be used to normalize words so that different derived forms of the same word will match. A normalized word is called a lexeme.

In addition to improving retrieval quality, normalization and removal of stop words can reduce the size of the **tsvector** representation of a document, thereby improving performance. Normalization and removal of stop words do not always have linguistic meaning. Users can define normalization and removal rules in dictionary definition files based on application environments.

A dictionary is a program that receives a token as input and returns:

- An array of lexemes if the input token is known to the dictionary (note that one token can produce more than one lexeme).
- A single lexeme with the **TSL_FILTER** flag set (which is automatically set in a filtering dictionary and is not perceived by users), to replace the original token with a new token to be passed to subsequent dictionaries (a dictionary that does this is called a filtering dictionary).
- An empty array if the input token is known to the dictionary but is a stop word.
- **NULL** if the dictionary does not recognize the token.

GaussDB provides predefined dictionaries for many languages and also provides five predefined dictionary templates, **Simple**, **Synonym**, **Thesaurus**, **Ispell**, and **Snowball**. These templates can be used to create new dictionaries with custom parameters.

When using full-text retrieval, you are advised to:

- In the text search configuration, configure a parser together with a set of dictionaries to process the parser's output tokens. For each token type that the parser can return, a separate list of dictionaries is specified by the configuration. When a token of that type is found by the parser, each dictionary in the list is consulted in turn, until a dictionary recognizes it as a known word. If it is identified as a stop word, or no dictionary recognizes the token, it will be discarded and not indexed or searched for. Generally, the first dictionary that returns a non-**NULL** output determines the result, and any remaining dictionaries are not consulted. However, a filtering dictionary can replace the input token with a modified one, which is then passed to subsequent dictionaries.
- The general rule for configuring a list of dictionaries is to place first the most narrow, most specific dictionary, then the more general dictionaries, finishing with a very general dictionary, like a **Snowball** stemmer dictionary or a **Simple** dictionary, which recognizes everything. In the following example, for an astronomy-specific search (**astro_en** configuration), you can configure the token type **asciiword** (ASCII word) with a **Synonym** dictionary of astronomical terms, a general English **Ispell** dictionary, and a **Snowball** English stemmer dictionary:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
openGauss=# ALTER TEXT SEARCH CONFIGURATION astro_en
  ADD MAPPING FOR asciiword WITH astro_syn, english_ispell, english_stem;
```

A filtering dictionary can be placed anywhere in the list, except at the end where it would be useless. Filtering dictionaries are useful to partially normalize words to simplify the task of later dictionaries.

12.8.6.2 Stop Words

Stop words are words that are very common, appear in almost every document, and have no discrimination value. Therefore, they can be ignored in the context of full text searching. Each type of dictionaries treats stop words in different ways. For example, **Ispell** dictionaries first normalize words and then check the list of stop words, while **Snowball** dictionaries first check the list of stop words.

For example, every English text contains words like **a** and **the**, so it is useless to store them in an index. However, stop words affect the positions in **tsvector**, which in turn affect ranking.

```
openGauss=# SELECT to_tsvector('english','in the list of stop words');
        to_tsvector
----------------------------
 'list':3 'stop':5 'word':6
```

The missing positions 1, 2, and 4 are because of stop words. Ranks calculated for documents with and without stop words are quite different:

```
openGauss=# SELECT ts_rank_cd (to_tsvector('english','in the list of stop words'), to_tsquery('list & stop'));
 ts_rank_cd
------------
        .05

openGauss=# SELECT ts_rank_cd (to_tsvector('english','list stop words'), to_tsquery('list & stop'));
 ts_rank_cd
------------
         .1
```

12.8.6.3 Simple Dictionary

A **Simple** dictionary operates by converting the input token to lower case and checking it against a list of stop words. If the token is found in the list, an empty array will be returned, causing the token to be discarded. If it is not found, the lower-cased form of the word is returned as the normalized lexeme. In addition, you can set **Accept** to **false** for **Simple** dictionaries (default: **true**) to report non-stop-words as unrecognized, allowing them to be passed on to the next dictionary in the list.

Precautions

- Most types of dictionaries rely on dictionary configuration files. The name of a configuration file can only be lowercase letters, digits, and underscores (_).
- A dictionary cannot be created in **pg_temp** mode.
- Dictionary configuration files must be stored in UTF-8 encoding. They will be translated to the actual database encoding, if that is different, when they are read into the server.
- Generally, a session will read a dictionary configuration file only once, when it is first used within the session. To modify a configuration file, run the **ALTER TEXT SEARCH DICTIONARY** statement to update and reload the file.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Step 1 Create a **Simple** dictionary.

```
openGauss=# CREATE TEXT SEARCH DICTIONARY public.simple_dict (
    TEMPLATE = pg_catalog.simple,
    STOPWORDS = english
);
```

english.stop is the full name of a file of stop words. For details about the syntax and parameters for creating a **Simple** dictionary, see **CREATE TEXT SEARCH DICTIONARY**.

Step 2 Use the **Simple** dictionary.

```
openGauss=# SELECT ts_lexize('public.simple_dict','YeS');
 ts_lexize
-----------
 {yes}
(1 row)

openGauss=# SELECT ts_lexize('public.simple_dict','The');
 ts_lexize
-----------
 {}
(1 row)
```

Step 3 Set **Accept=false** so that the **Simple** dictionary returns **NULL** instead of a lower-cased non-stop word.

```
openGauss=# ALTER TEXT SEARCH DICTIONARY public.simple_dict ( Accept = false );
ALTER TEXT SEARCH DICTIONARY
openGauss=# SELECT ts_lexize('public.simple_dict','YeS');
 ts_lexize
-----------

(1 row)

openGauss=# SELECT ts_lexize('public.simple_dict','The');
 ts_lexize
-----------
 {}
(1 row)
```

----End

12.8.6.4 Synonym Dictionary

A **Synonym** dictionary is used to define, identify, and convert synonyms of a token. Phrases are not supported. Synonyms of phrases can be defined in a **Thesaurus** dictionary. For details, see **Thesaurus Dictionary**.

Examples

- A **Synonym** dictionary can be used to overcome linguistic problems. For example, to prevent an English stemmer dictionary from reducing the word 'Paris' to 'pari', define a **Paris paris** line in the **Synonym** dictionary and put it before the **english_stem** dictionary.

```
openGauss=# SELECT * FROM ts_debug('english', 'Paris');
   alias   |   description   | token |  dictionaries  |  dictionary  | lexemes
-----------+-----------------+-------+----------------+--------------+---------
 asciiword | Word, all ASCII | Paris | {english_stem} | english_stem | {pari}
(1 row)

openGauss=# CREATE TEXT SEARCH DICTIONARY my_synonym (
    TEMPLATE = synonym,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    SYNONYMS = my_synonyms,
    FILEPATH = 'file:///home/dicts/'
);

openGauss=# ALTER TEXT SEARCH CONFIGURATION english
    ALTER MAPPING FOR asciiword
    WITH my_synonym, english_stem;

openGauss=# SELECT * FROM ts_debug('english', 'Paris');
   alias   |   description   | token |       dictionaries        | dictionary | lexemes
-----------+-----------------+-------+---------------------------+------------+---------
 asciiword | Word, all ASCII | Paris | {my_synonym,english_stem} | my_synonym | {paris}
(1 row)

openGauss=# SELECT * FROM ts_debug('english', 'paris');
   alias   |   description   | token |       dictionaries        | dictionary | lexemes
-----------+-----------------+-------+---------------------------+------------+---------
 asciiword | Word, all ASCII | Paris | {my_synonym,english_stem} | my_synonym | {paris}
(1 row)

openGauss=# ALTER TEXT SEARCH DICTIONARY my_synonym ( CASESENSITIVE=true);

openGauss=# SELECT * FROM ts_debug('english', 'Paris');
   alias   |   description   | token |       dictionaries        | dictionary | lexemes
-----------+-----------------+-------+---------------------------+------------+---------
 asciiword | Word, all ASCII | Paris | {my_synonym,english_stem} | my_synonym | {paris}
(1 row)

openGauss=# SELECT * FROM ts_debug('english', 'paris');
   alias   |   description   | token |       dictionaries        | dictionary | lexemes
-----------+-----------------+-------+---------------------------+------------+---------
 asciiword | Word, all ASCII | Paris | {my_synonym,english_stem} | my_synonym | {pari}
(1 row)
```

The full name of the **Synonym** dictionary file is **my_synonyms.syn**, and the dictionary is stored in the *Connected CN*/**home/dicts/** directory. For details about the syntax and parameters for creating a **Synonym** dictionary, see **CREATE TEXT SEARCH DICTIONARY**.

- An asterisk (*) can be placed at the end of a synonym in the configuration file. This indicates that the synonym is a prefix. The asterisk is ignored when the entry is used in to_tsvector(), but when it is used in to_tsquery(), the result will be a query item with the prefix match marker (see **Manipulating Queries**).

  Assume that the content in the dictionary file **synonym_sample.syn** is as follows:

  ```
  postgres        pgsql
  postgresql      pgsql
  postgre pgsql
  gogle   googl
  indices index*
  ```

  Create and use a dictionary.

  ```
  openGauss=# CREATE TEXT SEARCH DICTIONARY syn (
      TEMPLATE = synonym,
      SYNONYMS = synonym_sample
  );

  openGauss=# SELECT ts_lexize('syn','indices');
   ts_lexize
  -----------
   {index}
  (1 row)

  openGauss=# CREATE TEXT SEARCH CONFIGURATION tst (copy=simple);

  openGauss=# ALTER TEXT SEARCH CONFIGURATION tst ALTER MAPPING FOR asciiword WITH syn;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
openGauss=# SELECT to_tsvector('tst','indices');
 to_tsvector
-------------
 'index':1
(1 row)

openGauss=# SELECT to_tsquery('tst','indices');
 to_tsquery
------------
 'index':*
(1 row)

openGauss=# SELECT 'indexes are very useful'::tsvector;
            tsvector
---------------------------------
 'are' 'indexes' 'useful' 'very'
(1 row)

openGauss=# SELECT 'indexes are very useful'::tsvector @@ to_tsquery('tst','indices');
 ?column?
----------
 t
(1 row)
```

12.8.6.5 Thesaurus Dictionary

A **Thesaurus** dictionary (sometimes abbreviated as TZ) is a collection of relationships between words and phrases, such as broader terms (BT), narrower terms (NT), preferred terms, non-preferred terms, and related terms. Based on definitions in the dictionary file, a TZ replaces all non-preferred terms by one preferred term and, optionally, preserves the original terms for indexing as well. A TZ is an extension of a **Synonym** dictionary with added phrase support.

Precautions

- A TZ has the capability to recognize phrases and therefore it must remember its state and interact with the parser to determine whether to handle the next token or stop accumulation. A TZ must be configured carefully. For example, if an AZ is configured to handle only **asciiword** tokens, a TZ definition like **one 7** will not work because the token type **uint** is not assigned to the TZ.
- TZs are used during indexing, so any change in the TZ's parameters requires reindexing. For most other dictionary types, small changes such as adding or removing stop words does not force reindexing.

Procedure

Step 1 Create a TZ named **thesaurus_astro**.

thesaurus_astro is a simple astronomical TZ that defines two astronomical word combinations (word+synonym).

```
supernovae stars : sn
crab nebulae : crab
```

Run the following statement to create the TZ:

```
openGauss=# CREATE TEXT SEARCH DICTIONARY thesaurus_astro (
    TEMPLATE = thesaurus,
    DictFile = thesaurus_astro,
    Dictionary = pg_catalog.english_stem,
    FILEPATH = 'file:///home/dicts/'
);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The full name of the TZ file is **thesaurus_astro.ths**, and the TZ is stored in the *Connected CN*/**home/dicts/** directory. **pg_catalog.english_stem** is the subdictionary (a **Snowball** English stemmer) used for input normalization. The subdictionary has its own configuration (for example, stop words), which is not shown here. For details about the syntax and parameters for creating a **Thesaurus** dictionary, see **CREATE TEXT SEARCH DICTIONARY**.

Step 2 Bind the TZ to the desired token types in the text search configuration.

```
openGauss=# ALTER TEXT SEARCH CONFIGURATION russian
    ALTER MAPPING FOR asciiword, asciihword, hword_asciipart
    WITH thesaurus_astro, english_stem;
```

Step 3 Use the TZ.

- Test the TZ.

  The **ts_lexize** function is not very useful for testing the TZ because the function processes its input as a single token. Instead, you can use the **plainto_tsquery**, **to_tsvector**, or **to_tsquery** function which will break their input strings into multiple tokens.

  ```
  openGauss=# SELECT plainto_tsquery('russian','supernova star');
   plainto_tsquery
  -----------------
   'sn'
  (1 row)

  openGauss=# SELECT to_tsvector('russian','supernova star');
   to_tsvector
  -------------
   'sn':1
  (1 row)

  openGauss=# SELECT to_tsquery('russian','"supernova star"');
   to_tsquery
  ------------
   'sn'
  (1 row)
  ```

  supernova star matches **supernovae stars** in **thesaurus_astro** because the **english_stem** stemmer is specified in the **thesaurus_astro** definition. The stemmer removed **e** and **s**.

- To index the original phrase, include it in the right-hand part of the definition.

  ```
  supernovae stars : sn supernovae stars

  openGauss=# ALTER TEXT SEARCH DICTIONARY thesaurus_astro (
      DictFile = thesaurus_astro,
      FILEPATH = 'file:///home/dicts/');

  openGauss=# SELECT plainto_tsquery('russian','supernova star');
         plainto_tsquery
  -----------------------------
   'sn' & 'supernova' & 'star'
  (1 row)
  ```

----End

12.8.6.6 Ispell Dictionary

An **Ispell** dictionary is a morphological dictionary, which can normalize different linguistic forms of a word into the same lexeme. For example, an English **Ispell** dictionary can match all declensions and conjugations of the search term **bank**, such as, **banking**, **banked**, **banks**, **banks'**, and **bank's**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

GaussDB does not provide any predefined **Ispell** dictionaries or dictionary files. The .dict files and .affix files support multiple open-source dictionary formats, including **Ispell**, **MySpell**, and **Hunspell**.

Procedure

Step 1 Obtain the dictionary definition file (.dict) and affix file (.affix).

You can use an open-source dictionary (available on OpenOffice). The name extensions of the open-source dictionary may be .aff and .dic. In this case, you need to change them to .affix and .dict. In addition, for some dictionary files (for example, Norwegian dictionary files), you need to run the following commands to convert the character encoding to UTF-8:

```
iconv -f ISO_8859-1 -t UTF-8 -o nn_no.affix nn_NO.aff
iconv -f ISO_8859-1 -t UTF-8 -o nn_no.dict nn_NO.dic
```

Step 2 Create an **Ispell** dictionary.

```
openGauss=# CREATE TEXT SEARCH DICTIONARY norwegian_ispell (
    TEMPLATE = ispell,
    DictFile = nn_no,
    AffFile = nn_no,
    FilePath = 'file:///home/dicts'
);
```

The full names of the **Ispell** dictionary files are **nn_no.dict** and **nn_no.affix**, and the dictionary is stored in the *Connected CN*/**home/dicts/** directory. For details about the syntax and parameters for creating an **Ispell** dictionary, see **CREATE TEXT SEARCH DICTIONARY**.

Step 3 Use the **Ispell** dictionary to split compound words.

```
openGauss=# SELECT ts_lexize('norwegian_ispell', 'sjokoladefabrikk');
      ts_lexize
---------------------
 {sjokolade,fabrikk}
(1 row)
```

MySpell does not support compound words. **Hunspell** supports compound words. GaussDB supports only the basic compound word operations of **Hunspell**. Generally, **Ispell** dictionaries recognize a limited set of words, so they should be followed by another broader dictionary, for example, a **Snowball** dictionary, which recognizes everything.

----End

12.8.6.7 Snowball Dictionary

A **Snowball** dictionary is based on a project by Martin Porter and is used for stem analysis, providing stemming algorithms for many languages. GaussDB provides predefined **Snowball** dictionaries of many languages. You can query the **PG_TS_DICT** system catalog to view the predefined **Snowball** dictionaries and supported stemming algorithms.

A **Snowball** dictionary recognizes everything, no matter whether it is able to simplify the word. Therefore, it should be placed at the end of the dictionary list. It is useless to place it before any other dictionary because a token will never pass it through to the next dictionary.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

For details about the syntax of **Snowball** dictionaries, see **CREATE TEXT SEARCH DICTIONARY**.

12.8.7 Configuration Examples

Text search configuration specifies the following components required for converting a document into a **tsvector**:

- A parser, decomposes a text into tokens.
- Dictionary list, converts each token into a lexeme.

Each time when the **to_tsvector** or **to_tsquery** function is invoked, a text search configuration is required to specify a processing procedure. The GUC parameter **default_text_search_config** specifies the default text search configuration, which will be used if the text search function does not explicitly specify a text search configuration.

GaussDB provides some predefined text search configurations. You can also create user-defined text search configurations. In addition, to facilitate the management of text search objects, multiple **gsql** meta-commands are provided to display information about text search objects. For details, see "Client Tool > Meta-Command Reference" in *Tool Reference*.

Procedure

Step 1 Create a text search configuration **ts_conf** by copying the predefined text search configuration **english**.

```
openGauss=# CREATE TEXT SEARCH CONFIGURATION ts_conf ( COPY = pg_catalog.english );
CREATE TEXT SEARCH CONFIGURATION
```

Step 2 Create a **Synonym** dictionary.

Assume that the definition file **pg_dict.syn** of the **Synonym** dictionary contains the following contents:

```
postgres    pg
pgsql       pg
postgresql  pg
```

Run the following statement to create the **Synonym** dictionary:

```
openGauss=# CREATE TEXT SEARCH DICTIONARY pg_dict (
    TEMPLATE = synonym,
    SYNONYMS = pg_dict,
    FILEPATH = 'file:///home/dicts'
);
```

Step 3 Create an **Ispell** dictionary **english_ispell** (the dictionary definition file is from the open source dictionary).

```
openGauss=# CREATE TEXT SEARCH DICTIONARY english_ispell (
   TEMPLATE = ispell,
   DictFile = english,
   AffFile = english,
   StopWords = english,
   FILEPATH = 'file:///home/dicts'
);
```

Step 4 Modify the text search configuration **ts_conf** and change the dictionary list for tokens of certain types. For details about token types, see **Parser**.

```
openGauss=# ALTER TEXT SEARCH CONFIGURATION ts_conf
   ALTER MAPPING FOR asciiword, asciihword, hword_asciipart,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
                word, hword, hword_part
  WITH pg_dict, english_ispell, english_stem;
```

Step 5 In the text search configuration, set non-index or set the search for tokens of certain types.

```
openGauss=# ALTER TEXT SEARCH CONFIGURATION ts_conf
   DROP MAPPING FOR email, url, url_path, sfloat, float;
```

Step 6 Use the text retrieval commissioning function ts_debug() to test the text search configuration **ts_conf**.

```
openGauss=# SELECT * FROM ts_debug('ts_conf', '
PostgreSQL, the highly scalable, SQL compliant, open source object-relational
database management system, is now undergoing beta testing of the next
version of our software.
');
```

Step 7 You can set the default text search configuration of the current session to **ts_conf**. This setting is valid only for the current session.

```
openGauss=# \dF+ ts_conf
    Text search configuration "public.ts_conf"
Parser: "pg_catalog.default"
     Token      |            Dictionaries
----------------+------------------------------------
 asciihword     | pg_dict,english_ispell,english_stem
 asciiword      | pg_dict,english_ispell,english_stem
 file           | simple
 host           | simple
 hword          | pg_dict,english_ispell,english_stem
 hword_asciipart | pg_dict,english_ispell,english_stem
 hword_numpart  | simple
 hword_part     | pg_dict,english_ispell,english_stem
 int            | simple
 numhword       | simple
 numword        | simple
 uint           | simple
 version        | simple
 word           | pg_dict,english_ispell,english_stem

openGauss=# SET default_text_search_config = 'public.ts_conf';
SET
openGauss=# SHOW default_text_search_config;
 default_text_search_config
----------------------------
 public.ts_conf
(1 row)
```

----End

12.8.8 Testing and Debugging Text Search

The behavior of a custom text search configuration can easily become confusing. The functions described in this section are useful for testing text search objects. You can test a complete configuration, or test parsers and dictionaries separately.

12.8.8.1 Testing a Configuration

The function ts_debug allows easy testing of a text search configuration.

```
ts_debug([ config regconfig, ] document text,
        OUT alias text,
        OUT description text,
        OUT token text,
        OUT dictionaries regdictionary[],
        OUT dictionary regdictionary,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    OUT lexemes text[])
    returns setof record
```

ts_debug displays information about every token of document as produced by the parser and processed by the configured dictionaries. It uses the configuration specified by **config**, or **default_text_search_config** if that argument is omitted.

ts_debug returns one row for each token identified in the text by the parser. The columns returned are:

- **alias text**: short name of the token type
- **description text**: description of the token type
- **token text**: text of the token
- **dictionaries regdictionary[]**: dictionaries selected by the configuration for this token type
- **dictionary regdictionary**: dictionary that recognized the token, or NULL if none did
- **lexemes text[]**: lexeme produced by the dictionary that recognized the token, or NULL if none did; an empty array ({}) means the token was recognized as a stop word

Here is a simple example:

```
openGauss=# SELECT * FROM ts_debug('english','a fat  cat sat on a mat - it ate a fat rats');
  alias   |   description   | token |  dictionaries  |  dictionary  | lexemes
-----------+-----------------+-------+----------------+--------------+---------
 asciiword | Word, all ASCII | a     | {english_stem} | english_stem | {}
 blank     | Space symbols   |       | {}             |              |
 asciiword | Word, all ASCII | fat   | {english_stem} | english_stem | {fat}
 blank     | Space symbols   |       | {}             |              |
 asciiword | Word, all ASCII | cat   | {english_stem} | english_stem | {cat}
 blank     | Space symbols   |       | {}             |              |
 asciiword | Word, all ASCII | sat   | {english_stem} | english_stem | {sat}
 blank     | Space symbols   |       | {}             |              |
 asciiword | Word, all ASCII | on    | {english_stem} | english_stem | {}
 blank     | Space symbols   |       | {}             |              |
 asciiword | Word, all ASCII | a     | {english_stem} | english_stem | {}
 blank     | Space symbols   |       | {}             |              |
 asciiword | Word, all ASCII | mat   | {english_stem} | english_stem | {mat}
 blank     | Space symbols   |       | {}             |              |
 blank     | Space symbols   | -     | {}             |              |
 asciiword | Word, all ASCII | it    | {english_stem} | english_stem | {}
 blank     | Space symbols   |       | {}             |              |
 asciiword | Word, all ASCII | ate   | {english_stem} | english_stem | {ate}
 blank     | Space symbols   |       | {}             |              |
 asciiword | Word, all ASCII | a     | {english_stem} | english_stem | {}
 blank     | Space symbols   |       | {}             |              |
 asciiword | Word, all ASCII | fat   | {english_stem} | english_stem | {fat}
 blank     | Space symbols   |       | {}             |              |
 asciiword | Word, all ASCII | rats  | {english_stem} | english_stem | {rat}
(24 rows)
```

12.8.8.2 Testing an Age Parser

The **ts_parse** function allows direct testing of a text search parser.

```
ts_parse(parser_name text, document text,
    OUT tokid integer, OUT token text) returns setof record
```

ts_parse parses the given **document** and returns a series of records, one for each token produced by parsing. Each record includes a **tokid** showing the assigned token type and a **token** which is the text of the token. For example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
openGauss=# SELECT * FROM ts_parse('default', '123 - a number');
 tokid | token
-------+--------
    22 | 123
    12 |
    12 | -
     1 | a
    12 |
     1 | number
(6 rows)
```

The **ts_token_type** function returns the token type and description of the specified parser.

```
ts_token_type(parser_name text, OUT tokid integer,
              OUT alias text, OUT description text) returns setof record
```

ts_token_type returns a table which describes each type of token the specified parser can recognize. For each token type, the table gives the integer **tokid** that the parser uses to label a token of that type, the **alias** that names the token type in configuration commands, and a short description. For example:

```
openGauss=# SELECT * FROM ts_token_type('default');
 tokid |      alias      |                description
-------+-----------------+-------------------------------------------
     1 | asciiword       | Word, all ASCII
     2 | word            | Word, all letters
     3 | numword         | Word, letters and digits
     4 | email           | Email address
     5 | url             | URL
     6 | host            | Host
     7 | sfloat          | Scientific notation
     8 | version         | Version number
     9 | hword_numpart   | Hyphenated word part, letters and digits
    10 | hword_part      | Hyphenated word part, all letters
    11 | hword_asciipart | Hyphenated word part, all ASCII
    12 | blank           | Space symbols
    13 | tag             | XML tag
    14 | protocol        | Protocol head
    15 | numhword        | Hyphenated word, letters and digits
    16 | asciihword      | Hyphenated word, all ASCII
    17 | hword           | Hyphenated word, all letters
    18 | url_path        | URL path
    19 | file            | File or path name
    20 | float           | Decimal notation
    21 | int             | Signed integer
    22 | uint            | Unsigned integer
    23 | entity          | XML entity
(23 rows)
```

12.8.8.3 Testing a Dictionary

The **ts_lexize** function facilitates dictionary testing.

ts_lexize(dict regdictionary, token text) returns text[] ts_lexize returns an array of lexemes if the input **token** is known to the dictionary, or an empty array if the token is known to the dictionary but it is a stop word, or **NULL** if it is an unknown word.

For example:

```
openGauss=# SELECT ts_lexize('english_stem', 'stars');
 ts_lexize
-----------
 {star}
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
openGauss=# SELECT ts_lexize('english_stem', 'a');
 ts_lexize
-----------
 {}
```

NOTICE

The **ts_lexize** function expects a single **token**, not text.

12.8.9 Limitations

The current limitations of GaussDB's text search features are:

- The length of each lexeme must be less than 2K bytes.
- The length of a **tsvector** (lexemes + positions) must be less than 1 megabyte.
- Position values in **tsvector** must be greater than 0 and no more than 16383.
- No more than 256 positions per lexeme. Excessive positions, if any, will be discarded.
- The number of nodes (lexemes + operators) in a tsquery must be less than 32768.

12.9 System Operation

GaussDB text runs SQL statements to perform different system operations, such as setting variables, displaying the execution plan, and collecting garbage data.

Setting Variables

For details about how to set various parameters for a session or transaction, see **SET**.

Displaying the Execution Plan

For details about how to display the execution plan that GaussDB makes for SQL statements, see **EXPLAIN**.

Specifying a Checkpoint in Transaction Logs

By default, WALs periodically specify checkpoints in a transaction log. **CHECKPOINT** forces an immediate checkpoint when the related command is issued, without waiting for a regular checkpoint scheduled by the system. For details, see **CHECKPOINT**.

Collecting Unnecessary Data

For details about how to collect garbage data and analyze a database as required, For details, see **VACUUM**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Collecting Statistics

For details about how to collect statistics on tables in databases, see **ANALYZE | ANALYSE**.

Setting the Constraint Check Mode for the Current Transaction

For details about how to set the constraint check mode for the current transaction, see **SET CONSTRAINTS**.

12.10 Controlling Transactions

A transaction is a user-defined sequence of database operations, which form an integral unit of work.

Starting a Transaction

GaussDB starts a transaction using **START TRANSACTION** and **BEGIN**. For details, see **START TRANSACTION** and **BEGIN**.

Setting a Transaction

GaussDB sets a transaction using **SET TRANSACTION** or **SET LOCAL TRANSACTION**. For details, see **SET TRANSACTION**.

Committing a Transaction

GaussDB commits all operations of a transaction using **COMMIT** or **END**. For details, see **COMMIT | END**.

Rolling Back a Transaction

If a fault occurs during a transaction and the transaction cannot proceed, the system performs rollback to cancel all the completed database operations related to the transaction. For details, see **ROLLBACK**.

NOTE

If an execution request (not in a transaction block) received in the database contains multiple statements, the request is packed into a transaction. If one of the statements fails, the entire request will be rolled back.

12.11 DDL Syntax Overview

Data definition language (DDL) is used to define or modify an object in a database, such as a table, an index, or a view.

NOTE

GaussDB does not support DDL if its CN is unavailable. For example, if a CN in the cluster is faulty, creating a database or a table will fail.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Defining a client master key (CMK).

CMKs are used to encrypt column encryption keys (CEKs) for the encrypted database feature. CMK definition includes creating and deleting a CMK. For details about related SQL statements, see **Table 12-101**.

Table 12-101 SQL statements for defining a CMK

Function	SQL Statement
Creating a CMK	**CREATE CLIENT MASTER KEY**
Deleting a CMK	**DROP CLIENT MASTER KEY**

Defining a Column Encryption Key (CEK)

CEKs are used to encrypt data for the encrypted database feature. CEK definition includes creating and deleting a CEK. For details about related SQL statements, see **Table 12-101**.

Table 12-102 SQL statements for defining a CEK

Function	SQL Statement
Creating a CEK	**CREATE COLUMN ENCRYPTION KEY**
Deleting a CEK	**DROP COLUMN ENCRYPTION KEY**

Defining a Database

A database is the warehouse for organizing, storing, and managing data. Defining a database includes: creating a database, altering the database attributes, and dropping the database. For details about related SQL statements, see **Table 12-103**.

Table 12-103 SQL statements for defining a database

Function	SQL Statement
Creating a database	**CREATE DATABASE**
Altering database attributes	**ALTER DATABASE**
Dropping a Database	**DROP DATABASE**

Defining a Schema

A schema is the set of a group of database objects and is used to control the access to the database objects. For details about related SQL statements, see **Table 12-104**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-104 SQL statements for defining a schema

Function	SQL Statement
Creating a schema	CREATE SCHEMA
Altering schema attributes	ALTER SCHEMA
Dropping a schema	DROP SCHEMA

Defining a Tablespace

A tablespace is used to manage data objects and corresponds to a catalog on a disk. For details about related SQL statements, see **Table 12-105**.

Table 12-105 SQL statements for defining a tablespace

Function	SQL Statement
Creating a tablespace	CREATE TABLESPACE
Altering tablespace attributes	ALTER TABLESPACE
Dropping a tablespace	DROP TABLESPACE

Defining a Table

A table is a special data structure in a database and is used to store data objects and relationship between data objects. For details about related SQL statements, see **Table 12-106**.

Table 12-106 SQL statements for defining a table

Function	SQL Statement
Creating a table	CREATE TABLE
Altering table attributes	ALTER TABLE
Dropping a table	DROP TABLE

Defining a Partitioned Table

A partitioned table is a logical table used to improve query performance and does not store data (data is stored in common tables). For details about related SQL statements, see **Table 12-107**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-107 SQL statements for defining a partitioned table

Function	SQL Statement
Creating a partitioned table	CREATE TABLE PARTITION
Create a partition	ALTER TABLE PARTITION
Altering partitioned table attributes	ALTER TABLE PARTITION
Deleting a partition	ALTER TABLE PARTITION
Dropping a partitioned table	DROP TABLE

Defining an Index

An index indicates the sequence of values in one or more columns in a database table. It is a data structure that improves the speed of data access to specific information in a database table. For details about related SQL statements, see **Table 12-108**.

Table 12-108 SQL statements for defining an index

Function	SQL Statement
Creating an index	CREATE INDEX
Altering index attributes	ALTER INDEX
Dropping an index	DROP INDEX
Rebuilding an index	REINDEX

Defining a Stored Procedure

A stored procedure is a set of SQL statements for achieving specific functions and is stored in the database after compiling. Users can specify a name and provide parameters (if necessary) to execute the stored procedure. For details about related SQL statements, see **Table 12-109**.

Table 12-109 SQL statements for defining a stored procedure

Function	SQL Statement
Creating a stored procedure	CREATE PROCEDURE
Dropping a stored procedure	DROP PROCEDURE

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Defining a Function

In GaussDB, a function is similar to a stored procedure, which is a set of SQL statements. The function and stored procedure are used the same. For details about related SQL statements, see **Table 12-110**.

Table 12-110 SQL statements for defining a function

Function	SQL Statement
Creating a function	**CREATE FUNCTION**
Altering function attributes	**ALTER FUNCTION**
Dropping a function	**DROP FUNCTION**

Defining a View

A view is a virtual table exported from one or more basic tables. It is used to control data accesses of users. **Table 12-111** lists the related SQL statements.

Table 12-111 SQL statements for defining a view

Function	SQL Statement
Creating a view	**CREATE VIEW**
Dropping a view	**DROP VIEW**

Defining a Cursor

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers to context regions. With a cursor, the stored procedure can control alterations in context areas. For details, see **Table 12-112**.

Table 12-112 SQL statements for defining a cursor

Function	SQL Statement
Creating a cursor	**CURSOR**
Moving a cursor	**MOVE**
Fetching data from a cursor	**FETCH**
Closing a cursor	**CLOSE**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Defining a Resource Pool

A resource pool is a system catalog used by the resource load management module to specify attributes related to resource management, such as Cgroups. (The current feature is a lab feature. Contact Huawei technical support before using it.) For details about related SQL statements, see **Table 12-113**.

Table 12-113 SQL statements for defining a resource pool

Function	SQL Statement
Creating a resource pool	**CREATE RESOURCE POOL**
Altering resource attributes	**ALTER RESOURCE POOL**
Dropping a resource pool	**DROP RESOURCE POOL**

Defining a Workload Group

A workload group is a system catalog used by the resource load management module to specify the number of concurrent SQL statements in the associated resource pool. (The current feature is a lab feature. Contact Huawei technical support before using it.) For details about related SQL statements, see **Table 12-114**.

Table 12-114 SQL statements for defining a workload group

Function	SQL Statement
Creating a workload group	**CREATE WORKLOAD GROUP**
Altering the attributes of a workload group	**ALTER WORKLOAD GROUP**
Dropping a workload group	**DROP WORKLOAD GROUP**

Defining Application Mapping

Application mapping is a system catalog used by the resource load management module to associate with a workload group. (The current feature is a lab feature. Contact Huawei technical support before using it.) After a user connects to a database, the user can specify a workload group to associate SQL statements to certain resources. For details about related SQL statements, see **Table 12-115**.

Table 12-115 SQL statements for defining application mapping

Function	SQL Statement
Creating application mapping	**CREATE APP WORKLOAD GROUP MAPPING**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Function	SQL Statement
Altering application mapping attributes	ALTER APP WORKLOAD GROUP MAPPING
Dropping application mapping	DROP APP WORKLOAD GROUP MAPPING

12.12 DML Syntax Overview

Data manipulation language (DML) is used to perform operations on data in database tables, such as inserting, updating, querying, or deleting data.

Inserting Data

Inserting data refers to adding one or multiple records to a database table. For details, see **INSERT**.

Updating Data

Updating data refers to modifying one or multiple records in a database table. For details, see **UPDATE**.

Querying Data

The database query statement **SELECT** is used to search required information in a database. For details, see **SELECT**.

Deleting Data

GaussDB provides two statements for deleting data from database tables. To delete data meeting specified conditions from a database table, see **DELETE**. To delete all data from a database table, see **TRUNCATE**.

TRUNCATE can quickly delete all data from a database table, which achieves the effect same as that running **DELETE** to delete data without specifying conditions from each table. Deletion efficiency using **TRUNCATE** is faster because **TRUNCATE** does not scan tables. Therefore, **TRUNCATE** is useful in large tables.

Copying Data

GaussDB provides a statement for copying data between tables and files. For details, see **COPY**.

Locking a Table

GaussDB provides multiple lock modes to control concurrent accesses to table data. For details, see **LOCK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Calling a Function

GaussDB provides three statements for calling functions. These statements are the same in the syntax structure. For details, see **CALL**.

Session Management

A session is a connection established between the user and the database. **Table 12-116** lists the related SQL statements.

Table 12-116 SQL statements related to sessions

Function	SQL Statement
Altering a session	**ALTER SESSION**
Killing a session	**ALTER SYSTEM KILL SESSION**

12.13 DCL Syntax Overview

Data control language (DCL) is used to create users and roles and set or modify database users or role rights.

Defining a Role

A role is used to manage permissions. For database security, management and operation permissions can be granted to different roles. For details about related SQL statements, see **Table 12-117**.

Table 12-117 SQL statements for defining a role

Function	SQL Statement
Creating a role	**CREATE ROLE**
Altering role attributes	**ALTER ROLE**
Dropping a role	**DROP ROLE**

Defining a User

A user is used to log in to a database. Different permissions can be granted to users for managing data accesses and operations of the users. For details about related SQL statements, see **Table 12-118**.

Table 12-118 SQL statements for defining a user

Function	SQL Statement
Creating a user	**CREATE USER**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Function	SQL Statement
Altering user attributes	**ALTER USER**
Dropping a user	**DROP USER**

Granting Rights

GaussDB provides a statement for granting rights to data objects and roles. For details, see **GRANT**.

Revoking Rights

GaussDB provides a statement for revoking rights. For details, see **REVOKE**.

Setting Default Rights

GaussDB allows users to set rights for objects that will be created in the future. For details, see **ALTER DEFAULT PRIVILEGES**.

12.14 SQL Syntax

12.14.1 ABORT

Function

ABORT rolls back the current transaction and cancels the changes in the transaction.

This command is equivalent to **ROLLBACK**, and is present only for historical reasons. Now **ROLLBACK** is recommended.

Precautions

ABORT has no impact outside a transaction, but will provoke a warning.

Syntax

```
ABORT [ WORK | TRANSACTION ] ;
```

Parameter Description

WORK | TRANSACTION

Optional keyword has no effect except increasing readability.

Examples

```
-- Create the customer_demographics_t1 table.
openGauss=# CREATE TABLE customer_demographics_t1
(
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    CD_DEMO_SK                INTEGER               NOT NULL,
    CD_GENDER                 CHAR(1)                     ,
    CD_MARITAL_STATUS         CHAR(1)                     ,
    CD_EDUCATION_STATUS       CHAR(20)                    ,
    CD_PURCHASE_ESTIMATE      INTEGER                     ,
    CD_CREDIT_RATING          CHAR(10)                    ,
    CD_DEP_COUNT              INTEGER                     ,
    CD_DEP_EMPLOYED_COUNT     INTEGER                     ,
    CD_DEP_COLLEGE_COUNT      INTEGER
)
WITH (ORIENTATION = COLUMN,COMPRESSION=MIDDLE)
DISTRIBUTE BY HASH (CD_DEMO_SK);

-- Insert data.
openGauss=# INSERT INTO customer_demographics_t1 VALUES(1920801,'M', 'U', 'DOCTOR DEGREE', 200,
'GOOD', 1, 0,0);

-- Start a transaction.
openGauss=# START TRANSACTION;

-- Update the column.
openGauss=# UPDATE customer_demographics_t1 SET cd_education_status= 'Unknown';

-- Abort the transaction. All updates are rolled back.
openGauss=# ABORT;

-- Query data.
openGauss=# SELECT * FROM customer_demographics_t1 WHERE cd_demo_sk = 1920801;
cd_demo_sk | cd_gender | cd_marital_status | cd_education_status  | cd_purchase_estimate | cd_credit_rating
| cd_dep_count | cd_dep_employed_count | cd_dep_college_count
------------+-----------+-------------------+----------------------+----------------------+------------------
+--------------+-----------------------+----------------------
   1920801 | M         | U                 | DOCTOR DEGREE        |                  200 | GOOD             |            1
|                0 |                     0
(1 row)

-- Delete the table.
openGauss=# DROP TABLE customer_demographics_t1;
```

Helpful Links

SET TRANSACTION, **COMMIT | END**, and **ROLLBACK**

12.14.2 ALTER APP WORKLOAD GROUP MAPPING

Function

ALTER APP WORKLOAD GROUP MAPPING modifies the workload group associated with an application mapping group. Only users who have the **ALTER** permission on the current database can modify application mapping group.

Precautions

None

Syntax

```
ALTER APP WORKLOAD GROUP MAPPING app_name
    WITH ( WORKLOAD_GPNAME = wg_name );
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter Description

- **app_name**

  Specifies the name of an application mapping group. The name of an application mapping group must be unique in the current database.

  Value range: a string. It must comply with the naming convention.

- **wg_name**

  Specifies a Workload Cgroup name.

  Value range: a string, which indicates the created workload group.

Examples

```
-- Create a resource pool and specify the High Timeshare Workload Cgroup under the DefaultClass Cgroup.
openGauss=# CREATE RESOURCE POOL pool1 WITH (CONTROL_GROUP="High");

-- Create a workload group and associate it with the created resource pool.
openGauss=# CREATE WORKLOAD GROUP wg_hr1 USING RESOURCE POOL pool1;

-- Create a default application mapping group and associate it with the default workload group.
openGauss=# CREATE APP WORKLOAD GROUP MAPPING app_wg_map1;

-- Change the name of the workload group associated with an application mapping group.
openGauss=# ALTER APP WORKLOAD GROUP MAPPING app_wg_map1
WITH(WORKLOAD_GPNAME=wg_hr1);

-- Delete the application mapping group.
openGauss=# DROP APP WORKLOAD GROUP MAPPING app_wg_map1;

-- Delete the workload group.
openGauss=# DROP WORKLOAD GROUP wg_hr1;

-- Delete the resource pool.
openGauss=# DROP RESOURCE POOL pool1;
```

Helpful Links

CREATE APP WORKLOAD GROUP MAPPING and **DROP APP WORKLOAD GROUP MAPPING**

12.14.3 ALTER AUDIT POLICY

Function

ALTER AUDIT POLICY modifies the unified audit policy.

Precautions

- Only user **poladmin**, user **sysadmin**, or the initial user can perform this operation.
- The unified audit policy takes effect only after **enable_security_policy** is set to **on**. For details, see "Database Configuration > Database Security Management Policies > Unified Auditing" in the *Security Hardening Guide*.

Syntax

```
ALTER AUDIT POLICY [ IF EXISTS ] policy_name { ADD | REMOVE } { [ privilege_audit_clause ]
[ access_audit_clause ] };
ALTER AUDIT POLICY [ IF EXISTS ] policy_name MODIFY ( filter_group_clause );
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
ALTER AUDIT POLICY [ IF EXISTS ] policy_name DROP FILTER;
ALTER AUDIT POLICY [ IF EXISTS ] policy_name COMMENTS policy_comments;
ALTER AUDIT POLICY [ IF EXISTS ] policy_name { ENABLE | DISABLE };
```

- privilege_audit_clause
  ```
  PRIVILEGES { DDL | ALL }
  ```
- access_audit_clause
  ```
  ACCESS { DML | ALL }
  ```
- filter_group_clause
  ```
  FILTER ON { ( FILTER_TYPE ( filter_value [, ... ] ) ) [, ... ] }
  ```

Parameter Description

- **policy_name**

  Specifies the audit policy name, which must be unique.

  Value range: a string. It must comply with the naming convention rule.

- **DDL**

  Specifies the operations that will be audited within the database: ALTER, ANALYZE, COMMENT, CREATE, DROP, GRANT, REVOKE, SET, SHOW, LOGIN_ACCESS, LOGIN_FAILURE, LOGOUT, and LOGIN.

- **ALL**

  Indicates all operations supported by the specified DDL statements in the database.

- **DML**

  Specifies the operations that are audited within the database: COPY, DEALLOCATE, DELETE_P, EXECUTE, REINDEX, INSERT, PREPARE, SELECT, TRUNCATE, and UPDATE.

- **FILTER_TYPE**

  Specifies the types of information to be filtered by the audit: **IP**, **ROLES**, and **APP**.

- **filter_value**

  Indicates the detailed information to be filtered.

- **policy_comments**

  Records description information of audit policies.

- **ENABLE|DISABLE**

  Enables or disables the unified audit policy. If **ENABLE|DISABLE** is not specified, **ENABLE** is used by default.

Examples

See **Examples** in **CREATE AUDIT POLICY**.

Helpful Links

CREATE AUDIT POLICY and **DROP AUDIT POLICY**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.14.4 ALTER COORDINATOR

Function

ALTER COORDINATOR changes the value of **nodeis_active** on a specified node in the **pgxc_node** system catalog. This operation can be performed on any normal CN in the cluster and also specifies the node on which the system catalog is to be modified.

Precautions

- *ALTER COORDINATOR* is a statement used to modify the system catalog. Only the administrator and internal maintenance mode (for example, CM) can execute this statement. This statement is dedicated for the CN removal feature and must be used together with other operations. You are not advised to run it by yourself.
- After this statement is executed, **select reload_active_coordinator()** needs to be called to update the connection pool information of the node on which the system catalog is modified.

Syntax

```
ALTER COORDINATOR nodename SET status
    WITH (nodename1[, nodename2, nodename3 ...]);
```

Parameter Description

- **nodename**

  Specifies the node name corresponding to a row of records in the **pgxc_node** system catalog. After the node name is specified, the value of **nodeis_active** in the record is changed.

  Value range: a string. Only CNs are supported. Ensure that the node name has a corresponding record in the **pgxc_node** system catalog.

- **status**

  Specifies the updated value of **nodeis_acitve** in the **pgxc_node** system catalog.

  Value range:

  - FALSE

  - TRUE

- **nodename1[, nodename2, nodename3 ...]**

  Specifies the range of nodes on which the SQL statement is executed. When **ALTER COORDINATOR** is executed, the SQL statement is automatically delivered to all nodes in the range. The current execution node must be included.

  Value range: a string. Only CNs are supported. Ensure that the node name has a corresponding record in the **pgxc_node** system catalog and the node state is normal. Otherwise, the SQL statement fails to be executed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

The cluster has three CNs, namely, cn_5001, cn_5002, and cn_5003, which are running properly.

If cn_5001 is faulty and needs to be removed from the cluster within the specified time, run the following SQL statement on cn_5002 and cn_5003 to change the value of **nodeis_active** corresponding to cn_5001 in the **pgxc_node** system catalog to **false**:

```
ALTER COORDINATOR cn_5001 SET False WITH (cn_5002,cn_5003).
```

After cn_5001 is recovered, run the following SQL statement on cn_5002 and cn_5003 to change the value of **nodeis_active** corresponding to cn_5001 in the **pgxc_node** system catalog to **true**:

```
ALTER COORDINATOR cn_5001 SET True WITH (cn_5002,cn_5003).
```

12.14.5 ALTER DATABASE

Function

ALTER DATABASE modifies a database, including its name, owner, connection limitation, and object isolation.

Precautions

- Only the database owner or a user granted with the ALTER permission can run the **ALTER DATABASE** command. The system administrator has this permission by default. The following is permission constraints depending on attributes to be modified:
  - To modify the database name, you must have the **CREATEDB** permission.
  - To modify a database owner, you must be a database owner or system administrator and a member of the new owner role, with the **CREATEDB** permission.
  - To modify the default tablespace of the database, you must have the **CREATE** permission on the new tablespace. This statement physically migrates tables and indexes in a default tablespace to a new tablespace. Note that tables and indexes outside the default tablespace are not affected.
- You are not allowed to rename a database in use. To rename it, connect to another database.

Syntax

- Modify the maximum number of connections to the database.
  ```
  ALTER DATABASE database_name
    [ [ WITH ] CONNECTION LIMIT connlimit ];
  ```
- Rename the database.
  ```
  ALTER DATABASE database_name
    RENAME TO new_name;
  ```
- Change the database owner.
  ```
  ALTER DATABASE database_name
    OWNER TO new_owner;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Change the default tablespace of the database.

```
ALTER DATABASE database_name
  SET TABLESPACE new_tablespace;
```

  NOTE

  If some tables or objects in the database have been created in **new_tablespace**, the default tablespace of the database cannot be changed to **new_tablespace**. An error will be reported during the execution.

- Modify the object isolation attribute of the database.

```
ALTER DATABASE database_name [ WITH ] { ENABLE | DISABLE } PRIVATE OBJECT;
```

  NOTE

  - To modify the object isolation attribute of a database, the database must be connected. Otherwise, the modification will fail.
  - For a new database, the object isolation attribute is disabled by default. After the database object isolation attribute is enabled, the database automatically adds row-level access control policies to the system catalogs **PG_CLASS**, **PG_ATTRIBUTE**, **PG_PROC**, **PG_NAMESPACE**, **PGXC_SLICE** and **PG_PARTITION**. Common users can only view the objects (tables, functions, views, and columns) that they have the permission to access. This attribute does not take effect for administrators. After this attribute is enabled, administrators can still view all database objects.

Description

- **database_name**

  Specifies the name of the database whose attributes are to be modified.

  Value range: a string. It must comply with the naming convention.

- **connlimit**

  Specifies the maximum number of concurrent connections that can be made to this database (excluding administrators' connections).

  Value range: The value must be an integer, preferably from 1 to 50. The default value **-1** indicates that there is no restriction on the number of concurrent connections.

- **new_name**

  Specifies the new name of a database.

  Value range: a string. It must comply with the naming convention.

- **new_owner**

  Specifies the new owner of a database.

  Value range: a string. It must be a valid username.

- **new_tablespace**

  Specifies the new default tablespace of a database. The tablespace exists in the database. The default tablespace is **pg_default**.

  Value range: a string. It must be a valid tablespace name.

- **configuration_parameter**

  value

  Sets a specified database session parameter to a specified value. If the value is **DEFAULT** or **RESET**, the default setting is used in the new session. **OFF** closes the setting.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

The current version does not support setting database-level parameters.

Value range: a string

- DEFAULT
- OFF
- RESET

- **FROM CURRENT**

  Sets the value of the database based on the current connected session.

- **RESET configuration_parameter**

  Resets the specified database session parameter.

NOTICE

The current version does not support resetting database-level parameters.

- **RESET ALL**

  Resets all database session parameters.

NOTICE

The current version does not support resetting database-level parameters.

NOTE

- Modify the default tablespace of a database by moving the table or index in the old tablespace into the new tablespace. This operation does not affect the tables or indexes in other non-default tablespaces.
- The modified database session parameter values will take effect in the next session.
- After setting the parameters, you need to manually run the **CLEAN CONNECTION** command to clear the old connections. Otherwise, the parameter values between cluster nodes may be inconsistent.

Example

See **Examples** in **CREATE DATABASE**.

Helpful Links

CREATE DATABASE and **DROP DATABASE**.

12.14.6 ALTER DATA SOURCE

Function

ALTER DATA SOURCE modifies the attributes and content of the data source object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The attributes include the name and owner. The content includes the type, version, and connection options.

Precautions

- Only the initial user, system administrator, and owner have the permission to modify data sources.
- To change the owner, the new owner must be the initial user or a system administrator.
- If the **password** option is displayed, ensure that the **datasource.key.cipher** and **datasource.key.rand** files exist in the *$GAUSSHOME*/**bin** directory of each node in the cluster. If the two files do not exist, use the **gs_guc** tool to generate them and use the **gs_ssh** tool to release them to the *$GAUSSHOME*/**bin** directory on each node in the cluster.

Syntax

```
ALTER DATA SOURCE src_name
   [TYPE  'type_str']
   [VERSION  {'version_str' | NULL}]
   [OPTIONS ( { [ ADD | SET | DROP ] optname ['optvalue'] } [, ...] )];
ALTER DATA SOURCE src_name RENAME TO src_new_name;
ALTER DATA SOURCE src_name OWNER TO new_owner;
```

Parameter Description

- **src_name**

  Specifies the data source name to be modified.

  Value range: a string. It must comply with the naming convention.

- **TYPE**

  Changes the original **TYPE** value of the data source to the specified value.

  Value range: an empty string or a non-empty string

- **VERSION**

  Changes the original **VERSION** value of the data source to the specified value.

  Value range: an empty string, a non-empty string, or null

- **OPTIONS**

  Specifies the column to be added, modified, or deleted. The value of optname should be unique. Comply with the following rules to set this parameter:

  To add a column, you can omit **ADD** and simply specify the column name, which cannot be an existing column name.

  To modify a column, specify **SET** and an existing column name.

  To delete a column, specify **DROP** and an existing column name. Do not set **optvalue**.

- **src_new_name**

  Specifies the new data source name.

  Value range: a string. It must comply with the naming convention.

- **new_user**

  Specifies the new owner of an object.

  Value range: a string. It must be a valid username.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
-- Create an empty data source object.
openGauss=# CREATE DATA SOURCE ds_test1;

-- Rename the data source.
openGauss=# ALTER DATA SOURCE ds_test1 RENAME TO ds_test;

-- Change the owner.
openGauss=# CREATE USER user_test1 IDENTIFIED BY 'Gs@123456';
openGauss=# ALTER USER user_test1 WITH SYSADMIN;
openGauss=# ALTER DATA SOURCE ds_test OWNER TO user_test1;

-- Modify TYPE and VERSION.
openGauss=# ALTER DATA SOURCE ds_test TYPE 'MPPDB_TYPE' VERSION 'XXX';

-- Add a column.
openGauss=# ALTER DATA SOURCE ds_test OPTIONS (add dsn 'mppdb', username 'test_user');

-- Modify a column.
openGauss=# ALTER DATA SOURCE ds_test OPTIONS (set dsn 'unknown');

-- Delete a column.
openGauss=# ALTER DATA SOURCE ds_test OPTIONS (drop username);

-- Delete the data source and user objects.
openGauss=# DROP DATA SOURCE ds_test;
openGauss=# DROP USER user_test1;
```

Helpful Links

CREATE DATA SOURCE and **DROP DATA SOURCE**

12.14.7 ALTER DEFAULT PRIVILEGES

Function

ALTER DEFAULT PRIVILEGES allows you to set the permissions that will be applied to objects created in the future. (It does not affect permissions granted to existing objects.)

Precautions

Currently, you can change only the permissions for tables (including views), sequences, functions, types, client master keys of encrypted databases, and column encryption keys.

Syntax

```
ALTER DEFAULT PRIVILEGES
    [ FOR { ROLE | USER } target_role [, ...] ]
    [ IN SCHEMA schema_name [, ...] ]
    abbreviated_grant_or_revoke;
```

- **abbreviated_grant_or_revoke** grants or revokes permissions on some objects.

  ```
  grant_on_tables_clause
    | grant_on_sequences_clause
    | grant_on_functions_clause
    | grant_on_types_clause
    | grant_on_client_master_keys_clause
    | grant_on_column_encryption_keys_clause
    | revoke_on_tables_clause
    | revoke_on_sequences_clause
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
| revoke_on_functions_clause
| revoke_on_types_clause
| revoke_on_client_master_keys_clause
| revoke_on_column_encryption_keys_clause
```

- **grant_on_tables_clause** grants permissions on tables.

```
GRANT { { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | ALTER | DROP |
COMMENT | INDEX | VACUUM }
   [, ...] | ALL [ PRIVILEGES ] }
   ON TABLES
   TO { [ GROUP ] role_name | PUBLIC } [, ...]
   [ WITH GRANT OPTION ]
```

- **grant_on_sequences_clause** grants permissions on sequences.

```
GRANT { { SELECT | UPDATE | USAGE | ALTER | DROP | COMMENT }
   [, ...] | ALL [ PRIVILEGES ] }
   ON SEQUENCES
   TO { [ GROUP ] role_name | PUBLIC } [, ...]
   [ WITH GRANT OPTION ]
```

- **grant_on_functions_clause** grants permissions on functions.

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
   ON FUNCTIONS
   TO { [ GROUP ] role_name | PUBLIC } [, ...]
   [ WITH GRANT OPTION ]
```

- **grant_on_types_clause** grants permissions on types.

```
GRANT { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
   ON TYPES
   TO { [ GROUP ] role_name | PUBLIC } [, ...]
   [ WITH GRANT OPTION ]
```

- **grant_on_client_master_keys_clause** grants permissions on CMKs.

```
GRANT { { USAGE  | DROP } [, ...] | ALL [ PRIVILEGES ] }
   ON CLIENT_MASTER_KEYS
   TO { [ GROUP ] role_name | PUBLIC } [, ...]
   [ WITH GRANT OPTION ]
```

- **grant_on_column_encryption_keys_clause** grants permissions on column encryption keys.

```
GRANT { { USAGE | DROP } [, ...] | ALL [ PRIVILEGES ] }
   ON COLUMN_ENCRYPTION_KEYS
   TO { [ GROUP ] role_name | PUBLIC } [, ...]
   [ WITH GRANT OPTION ]
```

- **revoke_on_tables_clause** revokes permissions on tables.

```
REVOKE [ GRANT OPTION FOR ]
   { { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | ALTER | DROP | COMMENT |
INDEX | VACUUM }
   [, ...] | ALL [ PRIVILEGES ] }
   ON TABLES
   FROM { [ GROUP ] role_name | PUBLIC } [, ...]
   [ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```

- **revoke_on_sequences_clause** revokes permissions on sequences.

```
REVOKE [ GRANT OPTION FOR ]
   { { SELECT | UPDATE | USAGE | ALTER | DROP | COMMENT }
   [, ...] | ALL [ PRIVILEGES ] }
   ON SEQUENCES
   FROM { [ GROUP ] role_name | PUBLIC } [, ...]
   [ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```

- **revoke_on_functions_clause** revokes permissions on functions.

```
REVOKE [ GRANT OPTION FOR ]
   { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
   ON FUNCTIONS
   FROM { [ GROUP ] role_name | PUBLIC } [, ...]
   [ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```

- **revoke_on_types_clause** revokes permissions on types.

```
REVOKE [ GRANT OPTION FOR ]
   { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  ON TYPES
  FROM { [ GROUP ] role_name | PUBLIC } [, ...]
  [ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```

- **revoke_on_client_master_keys_clause** revokes permissions on CMKs.

```
REVOKE [ GRANT OPTION FOR ]
  { { USAGE | DROP } [, ...] | ALL [ PRIVILEGES ] }
  ON CLIENT_MASTER_KEYS
  FROM { [ GROUP ] role_name | PUBLIC } [, ...]
  [ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```

- **revoke_on_column_encryption_keys_clause** revokes permissions on CEKs.

```
REVOKE [ GRANT OPTION FOR ]
  { { USAGE | DROP } [, ...] | ALL [ PRIVILEGES ] }
  ON COLUMN_ENCRYPTION_KEYS
  FROM { [ GROUP ] role_name | PUBLIC } [, ...]
  [ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```

Parameter Description

- **target_role**

  Specifies the name of an existing role. If **FOR ROLE/USER** is omitted, the current role is assumed.

  Value range: an existing role name

- **schema_name**

  Specifies the name of an existing schema.

  target_role must have the **CREATE** permission for **schema_name**.

  Value range: an existing schema name

- **role_name**

  Specifies the name of an existing role to grant or revoke permissions for.

  Value range: an existing role name

NOTICE

To drop a role for which the default permissions have been granted, reverse the changes in its default permissions or use **DROP OWNED BY** to get rid of the default permission entry for the role.

Examples

```
-- Grant the SELECT permission on all the tables (and views) in tpcds to every user.
openGauss=# ALTER DEFAULT PRIVILEGES IN SCHEMA tpcds GRANT SELECT ON TABLES TO PUBLIC;

-- Create a common user jack.
openGauss=# CREATE USER jack PASSWORD 'xxxxxxxxxx';

-- Grant the INSERT permission on all the tables in tpcds to the user jack.
openGauss=# ALTER DEFAULT PRIVILEGES IN SCHEMA tpcds GRANT INSERT ON TABLES TO jack;

-- Revoke the preceding permissions.
openGauss=# ALTER DEFAULT PRIVILEGES IN SCHEMA tpcds REVOKE SELECT ON TABLES FROM PUBLIC;
openGauss=# ALTER DEFAULT PRIVILEGES IN SCHEMA tpcds REVOKE INSERT ON TABLES FROM jack;

-- Delete user jack.
openGauss=# DROP USER jack;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Helpful Links

GRANT and **REVOKE**

12.14.8 ALTER DIRECTORY

Function

ALTER DIRECTORY modifies a directory.

Precautions

- Currently, only the directory owner can be changed.
- When **enable_access_server_directory** is set to **off**, only the initial user is allowed to change the directory owner. When **enable_access_server_directory** is set to **on**, users with the **SYSADMIN** permission and the directory object owner can change the directory object owner, and the user who changes the owner is required to be a member of the new owner.

Syntax

```
ALTER DIRECTORY directory_name
    OWNER TO new_owner;
```

Parameter Description

directory_name

Specifies the name of a directory to be modified. The value must be an existing directory name.

Examples

```
-- Create a directory.
openGauss=# CREATE OR REPLACE DIRECTORY  dir  as '/tmp/';

-- Change the owner of the directory.
openGauss=# ALTER DIRECTORY dir OWNER TO system;

-- Delete the foreign table.
openGauss=# DROP DIRECTORY dir;
```

Helpful Links

CREATE DIRECTORY and **DROP DIRECTORY**

12.14.9 ALTER FOREIGN TABLE (for Import and Export)

Function

ALTER FOREIGN TABLE modifies a foreign table.

Precautions

When multi-layer quotation marks are used for sensitive columns (such as **password** and **secret_access_key**) in OPTIONS, the semantics is different from

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.

Syntax

- Set the attributes of a foreign table.

```
ALTER FOREIGN TABLE [ IF EXISTS ]  table_name
    OPTIONS ( {[ ADD | SET | DROP ] option ['value']}[, ... ]);
```

- Set a new owner.

```
ALTER FOREIGN TABLE [ IF EXISTS ] tablename
    OWNER TO new_owner;
```

- Set foreign table column options.

```
ALTER FOREIGN TABLE [ IF EXISTS ] table_name
    ALTER column_name OPTIONS;
```

Parameter Description

- **table_name**

  Specifies the name of an existing foreign table to be modified.

  Value range: an existing table name

- **option**

  Specifies the name of the option to be modified.

  Value range: See **Parameter Description** in **CREATE FOREIGN TABLE**.

- **value**

  Specifies the new value of **option**.

Examples

```
-- Create a foreign table.
openGauss=# CREATE FOREIGN TABLE tpcds.customer_ft
(
    c_customer_sk             integer               ,
    c_customer_id             char(16)              ,
    c_current_cdemo_sk        integer               ,
    c_current_hdemo_sk        integer               ,
    c_current_addr_sk         integer               ,

CREATE FOREIGN TABLE (for Import and Export) and **DROP FOREIGN TABLE**

12.14.10 ALTER FUNCTION

Function

ALTER FUNCTION modifies the attributes of a customized function.

Precautions

Only the function owner or a user granted with the **ALTER** permission can run the **ALTER FUNCTION** command. The system administrator has this permission by default. The following is permission constraints depending on attributes to be modified:

- If a function involves operations on temporary tables, **ALTER FUNCTION** cannot be used.
- To modify the owner or schema of a function, you must be a function owner or system administrator and a member of the new owner role.
- Only the system administrator and initial user can change the schema of a function to public.

Syntax

- Modify the additional parameters of the customized function.

  ```
  ALTER FUNCTION function_name ( [ { [ argname ] [ argmode ] argtype} [, ...] ] )
      action [ ... ] [ RESTRICT ];
  ```

  The syntax of the **action** clause is as follows:

  ```
  {CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT}
   | {IMMUTABLE | STABLE | VOLATILE}
   | {SHIPPABLE | NOT SHIPPABLE}
   | {NOT FENCED | FENCED}
   | [ NOT ] LEAKPROOF
   | { [ EXTERNAL ] SECURITY INVOKER | [ EXTERNAL ] SECURITY DEFINER }
   | AUTHID { DEFINER | CURRENT_USER }
   | COST execution_cost
   | ROWS result_rows
   | SET configuration_parameter { { TO | = } { value | DEFAULT }| FROM CURRENT}
   | RESET {configuration_parameter | ALL}
  ```

- Rename the customized function.

  ```
  ALTER FUNCTION funname ( [ { [ argname ] [ argmode ] argtype} [, ...] ] )
      RENAME TO new_name;
  ```

- Change the owner of the customized function.

  ```
  ALTER FUNCTION funname ( [ { [ argname ] [ argmode ] argtype} [, ...] ] )
      OWNER TO new_owner;
  ```

- Modify the schema of the customized function.

  ```
  ALTER FUNCTION funname ( [ { [ argname ] [ argmode ] argtype} [, ...] ] )
      SET SCHEMA new_schema;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter Description

- **function_name**

  Specifies the name of the function to be modified.

  Value range: an existing function name

- **argmode**

  Specifies whether a parameter is an input or output parameter.

  Value range: **IN**, **OUT**, and **IN OUT**

- **argname**

  Parameter name.

  Value range: a string. It must comply with the naming convention.

- **argtype**

  Specifies the parameter type.

  Value range: a valid type. For details, see **Data Type**.

- **CALLED ON NULL INPUT**

  Declares that some parameters of the function can be invoked in normal mode if the parameter values are null. Omitting this parameter is the same as specifying it.

- **RETURNS NULL ON NULL INPUT**

  STRICT

  Specifies that the function always returns **NULL** whenever any of its parameters is **NULL**. If **STRICT** is specified, the function will not be executed when there are null parameters; instead a null result is assumed automatically.

  RETURNS NULL ON NULL INPUT and **STRICT** have the same functions.

- **IMMUTABLE**

  Specifies that the function always returns the same result if the parameter values are the same.

- **STABLE**

  Specifies that the function cannot modify the database, and that within a single table scan it will consistently return the same result for the same parameter value, but its result varies by SQL statements.

- **VOLATILE**

  Specifies that the function value can change in a single table scan and no optimization is performed.

- **SHIPPABLE**
- **NOT SHIPPABLE**

  Specifies whether the function can be pushed down to DN for execution.

  Functions of the **IMMUTABLE** type can always be pushed down to DN.

  Functions of the **STABLE** or **VOLATILE** type can be pushed down to DN only if their attribute is **SHIPPABLE**.

- **LEAKPROOF**

  Specifies that the function has no side effect and the parameter contains only the return value. **LEAKROOF** can be set only by the system administrator.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **EXTERNAL**

  (Optional) The purpose is to be compatible with SQL. This feature applies to all functions, not only external functions.

- **SECURITY INVOKER**

  AUTHID CURREN_USER

  Specifies that the function will be executed with the permissions of the user who invokes it. Omitting this parameter is the same as specifying it.

  SECURITY INVOKER and **AUTHID CURREN_USER** have the same functions.

- **SECURITY DEFINER**

  AUTHID DEFINER

  Specifies that the function will be executed with the permissions of the user who created it.

  AUTHID DEFINER and **SECURITY DEFINER** have the same functions.

- **COST execution_cost**

  Estimates the execution cost of a function.

  The unit of **execution_cost** is **cpu_operator_cost**.

  Value range: a positive integer

- **ROWS result_rows**

  Estimates the number of rows returned by the function. This is only allowed when the function is declared to return a set.

  Value range: a positive number. The default value is **1000**.

- **configuration_parameter**
  - **value**

    Sets a specified database session parameter to a specified value. If the value is **DEFAULT** or **RESET**, the default setting is used in the new session. **OFF** closes the setting.

    Value range: a string

    - DEFAULT
    - OFF
    - RESET

    Specifies the default value.
  - **from current**

    Uses the value of **configuration_parameter** of the current session.

- **new_name**

  Specifies the new name of a function. To change the schema of a function, you must have the **CREATE** permission on the new schema.

  Value range: a string. It must comply with the naming convention.

- **new_owner**

  Specifies the new owner of a function. To change the owner of a function, the new owner must have the **CREATE** permission on the schema to which the function belongs.

  Value range: an existing user role

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **new_schema**

  Specifies the new schema of a function.

  Value range: an existing schema

Examples

See **Examples** in **CREATE FUNCTION**.

Helpful Links

CREATE FUNCTION and **DROP FUNCTION**

12.14.11 ALTER GLOBAL CONFIGURATION

Function

ALTER GLOBAL CONFIGURATION adds and modifies the **gs_global_config** system catalog and adds the value of **key-value**.

Precautions

Only the initial database user can run this command.

The keyword cannot be changed to **weak_password**.

Syntax

```
ALTER GLOBAL CONFIGURATION with(paraname=value, paraname=value...);
```

Parameter Description

The parameter name and value are of the text type.

12.14.12 ALTER GROUP

Function

ALTER GROUP modifies the attributes of a user group.

Precautions

ALTER GROUP is an alias for **ALTER ROLE**, and it is not a standard SQL syntax and not recommended. Users can use **ALTER ROLE** directly.

Syntax

- Add users to a group.

  ```
  ALTER GROUP group_name
    ADD USER user_name [, ... ];
  ```

- Remove users from a group.

  ```
  ALTER GROUP group_name
    DROP USER user_name [, ... ];
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Change the name of the group.

```
ALTER GROUP group_name
   RENAME TO new_name;
```

Parameter Description

See **Parameter Description** in **ALTER ROLE**.

Examples

```
-- Add users to a user group.
openGauss=# ALTER GROUP super_users ADD USER lche, jim;

-- Remove users from a user group.
openGauss=# ALTER GROUP super_users DROP USER jim;

-- Change the name of a user group.
openGauss=# ALTER GROUP super_users RENAME TO normal_users;
```

Helpful Links

CREATE GROUP, **DROP GROUP**, and **ALTER ROLE**

12.14.13 ALTER INDEX

Function

ALTER INDEX modifies the definition of an existing index.

It has the following forms:

- IF EXISTS

  Sends a notice instead of an error if the specified index does not exist.
- RENAME TO

  Changes only the name of the index. The stored data is not affected.
- SET TABLESPACE

  This option changes the index tablespace to the specified tablespace and moves index-related data files to the new tablespace.
- SET ({ STORAGE_PARAMETER = value } [, ...])

  Changes one or more index-method-specific storage parameters of an index. Note that the index content will not be modified immediately by this statement. You may need to use **REINDEX** to recreate the index based on different parameters to achieve the expected effect.
- RESET ({ storage_parameter } [, ...])

  Resets one or more index-method-specific storage parameters of an index to the default value. Similar to the **SET** statement, **REINDEX** may be used to completely update the index.
- [MODIFY PARTITION index_partition_name] UNUSABLE

  Sets the indexes on a table or index partition to be unavailable.
- REBUILD [PARTITION index_partition_name]

  Rebuilds indexes on a table or an index partition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- RENAME PARTITION

  Renames an index partition.
- MOVE PARTITION

  Modifies the tablespace to which an index partition belongs.

Precautions

Only the index owner or a user who has the INDEX permission on the table where the index resides can run the **ALTER INDEX** command. The system administrator has this permission by default.

Syntax

- Rename a table index.
```
ALTER INDEX [ IF EXISTS ] index_name
    RENAME TO new_name;
```
- Change the tablespace to which a table index belongs.
```
ALTER INDEX [ IF EXISTS ] index_name
    SET TABLESPACE tablespace_name;
```
- Modify the storage parameter of a table index.
```
ALTER INDEX [ IF EXISTS ] index_name
    SET ( {storage_parameter = value} [, ... ] );
```
- Reset the storage parameter of a table index.
```
ALTER INDEX [ IF EXISTS ] index_name
    RESET ( storage_parameter [, ... ] ) ;
```
- Set a table index or an index partition to be unavailable.
```
ALTER INDEX [ IF EXISTS ] index_name
    [ MODIFY PARTITION index_partition_name ] UNUSABLE;
```

  NOTE

  The syntax cannot be used for column-store tables.
- Rebuild a table index or index partition.
```
ALTER INDEX index_name
    REBUILD [ PARTITION index_partition_name ];
```
- Rename an index partition.
```
ALTER INDEX [ IF EXISTS ] index_name
    RENAME PARTITION index_partition_name TO new_index_partition_name;
```
- Modify the tablespace to which an index partition belongs.
```
ALTER INDEX [ IF EXISTS ] index_name
    MOVE PARTITION index_partition_name TABLESPACE new_tablespace;
```

Parameter Description

- **index_name**

  Specifies the index name to be modified.
- **new_name**

  Specifies the new name of the index.

  Value range: a string. It must comply with the naming convention rule.
- **tablespace_name**

  Specifies the tablespace name.

  Value range: an existing tablespace name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **storage_parameter**

  Specifies the name of an index-method-specific parameter.
- **value**

  Specifies the new value for an index-method-specific storage parameter. This might be a number or a word depending on the parameter.
- **new_index_partition_name**

  Specifies the new name of the index partition.
- **index_partition_name**

  Specifies the name of an index partition.
- **new_tablespace**

  Specifies a new tablespace.

Examples

See **Examples** in **CREATE INDEX**.

Helpful Links

CREATE INDEX, **DROP INDEX**, and **REINDEX**

12.14.14 ALTER LANGUAGE

This version does not support this syntax.

12.14.15 ALTER LARGE OBJECT

Function

ALTER LARGE OBJECT changes the owner of a large object.

Precautions

Only a system administrator or the owner of the to-be-modified large object can run **ALTER LARGE OBJECT**.

Syntax

```
ALTER LARGE OBJECT large_object_oid
    OWNER TO new_owner;
```

Parameter Description

- **large_object_oid**

  Specifies the OID of the large object to be modified.

  Value range: an existing large object name
- **OWNER TO new_owner**

  Specifies the new owner of the object.

  Value range: an existing username/role name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

None

12.14.16 ALTER MASKING POLICY

Function

ALTER MASKING POLICY modifies anonymization policies.

Precautions

- Only user **poladmin**, user **sysadmin**, or the initial user can perform this operation.
- The masking policy takes effect only after **enable_security_policy** is set to **on**. For details about how to enable the masking policy, see "Database Configuration > Database Security Management Policies > Dynamic Data Masking" in the *Security Hardening Guide*.
- For details about the execution effect and supported data types of preset masking functions, see "Database Security > Dynamic Data Masking" in *Feature Description*.

Syntax

- Modify the policy description.
```
ALTER MASKING POLICY policy_name COMMENTS policy_comments;
```
- Modify the anonymization method.
```
ALTER MASKING POLICY policy_name [ADD | REMOVE | MODIFY] masking_actions[, ...]*;
```
The syntax of **masking_action**.
```
    masking_function ON LABEL(label_name[, ...]*)
```
- Modify the scenarios where the anonymization policies take effect.
```
ALTER MASKING POLICY policy_name MODIFY(FILTER ON FILTER_TYPE(filter_value[, ...]*)[, ...]*);
```
- Removes the filters of the anonymization policies.
```
ALTER MASKING POLICY policy_name DROP FILTER;
```
- Enable or disable the anonymization policies.
```
ALTER MASKING POLICY policy_name [ENABLE | DISABLE];
```

Parameter Description

- **policy_name**

  Specifies the anonymization policy name, which must be unique.

  Value range: a string. It must comply with the naming convention.

- **policy_comments**

  Adds or modifies description of anonymization policies.

- **masking_function**

  Specifies eight preset anonymization methods or user-defined functions. Schema is supported.

  maskall is not a preset function. It is hard-coded and cannot be displayed by running **\df**.

  The preset anonymization methods are as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
maskall | randommasking | creditcardmasking | basicemailmasking | fullemailmasking |
shufflemasking | alldigitsmasking | regepmasking
```

- **label_name**

  Specifies the resource label name.

- **FILTER_TYPE**

  Specifies the types of information to be filtered by the policies: **IP**, **ROLES**, and **APP**.

- **filter_value**

  Indicates the detailed information to be filtered, such as the IP address, app name, and username.

- **ENABLE|DISABLE**

  Enables or disables the masking policy. If **ENABLE|DISABLE** is not specified, **ENABLE** is used by default.

Examples

```
-- Create users dev_mask and bob_mask.
openGauss=# CREATE USER dev_mask PASSWORD 'dev@1234';
openGauss=# CREATE USER bob_mask PASSWORD 'bob@1234';

-- Create table tb_for_masking.
openGauss=# CREATE TABLE tb_for_masking(col1 text, col2 text, col3 text);

-- Create a resource label for label sensitive column col1.
openGauss=# CREATE RESOURCE LABEL mask_lb1 ADD COLUMN(tb_for_masking.col1);

-- Create a resource label for label sensitive column col2.
openGauss=# CREATE RESOURCE LABEL mask_lb2 ADD COLUMN(tb_for_masking.col2);

-- Create an anonymization policy for the operation of accessing sensitive column col1.
openGauss=# CREATE MASKING POLICY maskpol1 maskall ON LABEL(mask_lb1);

-- Add description for anonymization policy maskpol1.
openGauss=# ALTER MASKING POLICY maskpol1 COMMENTS 'masking policy for tb_for_masking.col1';

-- Modify anonymization policy maskpol1 to add an anonymization method.
openGauss=# ALTER MASKING POLICY maskpol1 ADD randommasking ON LABEL(mask_lb2);

-- Modify anonymization policy maskpol1 to remove an anonymization method.
openGauss=# ALTER MASKING POLICY maskpol1 REMOVE randommasking ON LABEL(mask_lb2);

-- Modify anonymization policy maskpol1 to modify an anonymization method.
openGauss=# ALTER MASKING POLICY maskpol1 MODIFY randommasking ON LABEL(mask_lb1);

-- Modify anonymization policy maskpol1 so that it takes effect only for scenarios where users are
dev_mask and bob_mask, client tools are psql and gsql, and the IP addresses are 10.20.30.40 and
127.0.0.0/24.
openGauss=# ALTER MASKING POLICY maskpol1 MODIFY (FILTER ON ROLES(dev_mask, bob_mask),
APP(psql, gsql), IP('10.20.30.40', '127.0.0.0/24'));

-- Modify anonymization policy maskpol1 so that it takes effect for all user scenarios.
openGauss=# ALTER MASKING POLICY maskpol1 DROP FILTER;

-- Disable anonymization policy maskpol1.
openGauss=# ALTER MASKING POLICY maskpol1 DISABLE;
```

12.14.17 ALTER MATERIALIZED VIEW

Function

ALTER MATERIALIZED VIEW changes multiple auxiliary attributes of an existing materialized view.

Statements and actions that can be used for **ALTER MATERIALIZED VIEW** are a subset of **ALTER TABLE** and have the same meaning when used for materialized views. For details, see **ALTER TABLE**.

Precautions

- Only the owner of a materialized view or a system administrator has the **ALTER TMATERIALIZED VIEW** permission.
- The materialized view structure cannot be modified.

Syntax

- Change the owner of a materialized view.
```
ALTER MATERIALIZED VIEW [ IF EXISTS ] mv_name
    OWNER TO new_owner;
```
- Modify the column of a materialized view.
```
ALTER MATERIALIZED VIEW [ IF EXISTS ] mv_name
    RENAME [ COLUMN ] column_name TO new_column_name;
```
- Rename a materialized view.
```
ALTER MATERIALIZED VIEW [ IF EXISTS ] mv_name
    RENAME TO new_name;
```

Parameter Description

- **mv_name**

  Specifies the name of an existing materialized view, which can be schema-qualified.

  Value range: a string. It must comply with the naming convention.
- **column_name**

  Specifies the name of a new or existing column.

  Value range: a string. It must comply with the naming convention.
- **new_column_name**

  Specifies the new name of an existing column.
- **new_owner**

  Specifies the user name of the new owner of a materialized view.
- **new_name**

  Specifies the new name of a materialized view.

Examples

```
-- Rename the materialized view foo to bar.
openGauss=# ALTER MATERIALIZED VIEW foo RENAME TO bar;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Helpful Links

CREATE INCREMENTAL MATERIALIZED VIEW, **CREATE MATERIALIZED VIEW**, **DROP MATERIALIZED VIEW**, **REFRESH INCREMENTAL MATERIALIZED VIEW**, and **REFRESH MATERIALIZED VIEW**

12.14.18 ALTER NODE

Function

ALTER NODE modifies the definition of an existing node.

Precautions

ALTER NODE is an interface of the cluster management tool and is used to manage clusters. Only administrators have the permission to use this interface. You are not advised to use this interface, because doing so affects the cluster.

Syntax

```
ALTER NODE nodename WITH
 (
   [ TYPE = nodetype,]
   [ HOST = hostname,]
   [ PORT = portnum,]
   [ HOST1 = 'hostname',]
   [ PORT1 = portnum,]
   [ HOSTPRIMARY [ = boolean ],]
   [ PRIMARY [ = boolean ],]
   [ PREFERRED [ = boolean ],]
   [ SCTP_PORT = portnum,]
   [ CONTROL_PORT = portnum,]
   [ SCTP_PORT1 = portnum,]
   [ CONTROL_PORT1 = portnum, ]
   [ NODEIS_CENTRAL [ = boolean ]]
 );
```

NOTE

The port whose number is specified by **PORT** is used for internal communications between nodes. Unlike the port connecting to an external client, it can be queried in the **pgxc_node** table.

Parameter Description

See **Parameter Description** in **CREATE NODE**.

Helpful Links

CREATE NODE and **DROP NODE**

12.14.19 ALTER NODE GROUP

Function

ALTER NODE GROUP modifies the information about a node group.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- Only the system administrator or a user who has the **ALTER** permission of a node group can modify the information about the node group.
- Node group modification is an internal operation of the system. Except **SET DEFAULT**, other operations must be performed in maintenance mode (by invoking **set xc_maintenance_mode=on;**).
- **ALTER NODE GROUP** can be used only within a database. To avoid data inconsistency in DBMS, do not manually run this SQL statement.

Syntax

```
ALTER NODE GROUP groupname
   | SET DEFAULT
   | RENAME TO new_group_name
   | SET VCGROUP RENAME TO new_group_name
   | SET NOT VCGROUP
   | SET TABLE GROUP new_group_name
   | COPY BUCKETS FROM src_group_name
   | ADD NODE ( nodename [, ... ] )
   | DELETE NODE ( nodename [, ... ] )
   | RESIZE TO dest_group_name
   | SET VCGROUP WITH GROUP new_group_name
```

Parameter Description

- **groupname**

  Specifies the name of the node group to be modified.

  Value range: a string. It must comply with the naming convention.

- **SET DEFAULT**

  Sets **in_redistribution** to **'y'** for all node groups excluding the one specified by **groupname**. To be compatible with earlier versions, this syntax is retained and does not need to be executed in maintenance mode.

- **RENAME TO new_group_name**

  Renames the node group specified by **groupname** to **new_group_name**.

- **SET VCGROUP RENAME TO new_group_name**

  Converts a physical cluster into a logical cluster. (The current feature is a lab feature. Contact Huawei technical support before using it.) After the conversion, **groupname** is the logical cluster name, and the original physical cluster name is changed to **new_group_name**.

- **SET NOT VCGROUP**

  Converts all logical clusters to common node groups and changes **group_kind** from **'v'** to **'n'** for all of them. (The current feature is a lab feature. Contact Huawei technical support before using it.)

- **SET TABLE GROUP new_group_name**

  Changes all the **group_names** in the **pgroup** columns of the **pgxc_class** tables on all CNs to **new_group_name**.

- **COPY BUCKETS FROM src_group_name**

  Copies values in the **group_members** and **group_buckets** columns from the node group specified by **src_group_name** to the node group specified by **groupname**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **ADD NODE (nodename [, ...])**

  Adds nodes from the node group specified by **groupname**. After the statement execution, the new nodes are registered with the **PGXC_NODE** system catalog. This statement only modifies the system catalog and does not add nodes or redistribute data. Do not invoke this statement.

- **DELETE NODE (nodename [, ...])**

  Deletes nodes from the node group specified by **groupname**. The deleted nodes still exist in the **PGXC_NODE** system catalog. This statement only modifies the system catalog and does not delete nodes or redistribute data. Do not invoke this statement.

- **RESIZE TO dest_group_name**

  Specifies a resize flag for the cluster. Set **groupname** to the source node group before data redistribution and **is_installation** of the node group to **FALSE**. Set **desst_group_name** to the destination node group and **is_installation** of the node group to **TRUE**.

- **SET VCGROUP WITH GROUP new_group_name**

  Converts a physical cluster into a logical cluster. After the conversion, **groupname** is still the physical cluster, and **new_group_name** is the name of the logical cluster. (The current feature is a lab feature. Contact Huawei technical support before using it.)

12.14.20 ALTER RESOURCE LABEL

Function

ALTER RESOURCE LABEL modifies resource labels.

Precautions

Only user **poladmin**, user **sysadmin**, or the initial user can perform this operation.

Syntax

```
ALTER RESOURCE LABEL label_name (ADD|REMOVE)
  label_item_list[, ...]*;
```

- label_item_list
  ```
  resource_type(resource_path[, ...]*)
  ```
- resource_type
  ```
  TABLE | COLUMN | SCHEMA | VIEW | FUNCTION
  ```

Parameter Description

- **label_name**

  Specifies the resource label name.

  Value range: a string. It must comply with the naming convention.

- **resource_type**

  Specifies the type of database resources to be labeled.

- **resource_path**

  Specifies the path of database resources.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
-- Create basic table table_for_label.
openGauss=# CREATE TABLE table_for_label(col1 int, col2 text);

-- Create resource label table_label.
openGauss=# CREATE RESOURCE LABEL table_label ADD COLUMN(table_for_label.col1);

-- Attach resource label table_label to col2.
openGauss=# ALTER RESOURCE LABEL table_label ADD COLUMN(table_for_label.col2)

-- Remove table_label from an item.
openGauss=# ALTER RESOURCE LABEL table_label REMOVE COLUMN(table_for_label.col1);
```

Helpful Links

5.1.13.14.61-CREATE RESOURCE LABEL and 5.1.13.14.102-DROP RESOURCE LABEL

12.14.21 ALTER RESOURCE POOL

The current feature is a lab feature. Contact Huawei technical support before using it.

Function

ALTER RESOURCE POOL changes the Cgroup of a resource pool.

Precautions

Only a user with the **ALTER** permission on the current database can perform this operation.

Syntax

```
ALTER RESOURCE POOL pool_name
    WITH ({MEM_PERCENT= pct | CONTROL_GROUP="group_name" | ACTIVE_STATEMENTS=stmt |
MAX_DOP = dop | MEMORY_LIMIT='memory_size' | io_limits=io_limits | io_priority='io_priority'}[, ... ]);
```

Parameter Description

- **pool_name**

  Specifies the name of a resource pool.

  The resource pool must already exist.

  Value range: a string. It must comply with the naming convention.

- **group_name**

  Specifies the name of a Cgroup.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- You can use either double quotation marks ("") or single quotation marks (') in the syntax when setting the name of a Cgroup.
- The value of **group_name** is case-sensitive.
- If **group_name** is not specified, the string "Medium" will be used by default in the syntax, indicating the **Medium** Timeshare Cgroup under **DefaultClass**.
- If an administrator specifies a Workload Cgroup under Class, for example, **control_group** set to **class1:workload1**, the resource pool will be associated with the **workload1** Cgroup under **class1**. The level of **Workload** can also be specified. For example, **control_group** is set to **class1:workload1:1**.
- If a database user specifies the Timeshare string (**Rush**, **High**, **Medium**, or **Low**) in the syntax, for example, **control_group** is set to **High**, the resource pool will be associated with the **High** Timeshare Cgroup under **DefaultClass**.
- In multi-tenant scenarios, the Cgroup associated with a group resource pool is a Class Cgroup, and that associated with a service resource pool is a Workload Cgroup. Additionally, switching Cgroups between different resource pools is not allowed.

Value range: an existing Cgroup.

- **stmt**

  Specifies the maximum number of statements that can be concurrently executed in a resource pool.

  Value range: numeric data ranging from –1 to 2147483647

- **dop**

  Specifies the maximum statement concurrency degree for a resource pool, equivalent to the number of threads that can be created for executing a statement.

  Value range: numeric data ranging from 1 to 2147483647

- **memory_size**

  Specifies the maximum memory size of a resource pool.

  Value range: a string from 1 KB to 2047 GB

- **mem_percent**

  Specifies the proportion of available resource pool memory to the total memory or group user memory.

  In multi-tenant scenarios, **mem_percent** of group users or service users ranges from 1 to 100. The default value is **20**.

  In common scenarios, **mem_percent** of common users is an integer ranging from 0 to 100. The default value is **0**.

  NOTE

  When both of **mem_percent** and **memory_limit** are specified, only **mem_percent** takes effect.

- **io_limits**

  Specifies the upper limit of IOPS in a resource pool.

  Row-store is measured by 10,000 IOPS, while column-store is measured by IOPS.

- **io_priority**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the I/O priority for jobs that consume many I/O resources. It takes effect when the I/O usage reaches 90%.

There are three priorities: **Low**, **Medium**, and **High**. If you do not want to control I/O resources, set this parameter to **None**, which is the default value.

NOTE

The settings of **io_limits** and **io_priority** are valid only for complex jobs, such as batch import (using **INSERT INTO SELECT**, **COPY FROM**, or **CREATE TABLE AS**), complex queries involving over 500 MB data on each DN, and **VACUUM FULL**.

Examples

The following example assumes that the user has created the **class1** Cgroup and three Workload Cgroups under **class1**: **Low**, **wg1**, and **wg2**.

```
-- Create a resource pool.
openGauss=# CREATE RESOURCE POOL pool1;

-- Specify the High Timeshare Workload Cgroup under the DefaultClass Cgroup.
openGauss=# ALTER RESOURCE POOL pool1 WITH (CONTROL_GROUP="High");

-- Specify the Low Timeshare Workload Cgroup under the class1 Cgroup.
openGauss=# ALTER RESOURCE POOL pool1 WITH (CONTROL_GROUP="class1:Low");

-- Specify the wg1 Workload Cgroup under the class1 Cgroup.
openGauss=# ALTER RESOURCE POOL pool1 WITH (CONTROL_GROUP="class1:wg1");

-- Specify the wg2 Workload Cgroup under the class1 Cgroup.
openGauss=# ALTER RESOURCE POOL pool1 WITH (CONTROL_GROUP="class1:wg2:3");
-- Delete the resource pool pool1.
openGauss=# DROP RESOURCE POOL pool1;
```

12.14.22 ALTER ROLE

Function

ALTER ROLE modifies role attributes.

Precautions

None

Syntax

- Modify the permissions of a role.

  ```
  ALTER ROLE role_name [ [ WITH ] option [ ... ] ];
  ```

  The **option** clause for granting permissions is as follows:

  ```
  {CREATEDB | NOCREATEDB}
    | {CREATEROLE | NOCREATEROLE}
    | {INHERIT | NOINHERIT}
    | {AUDITADMIN | NOAUDITADMIN}
    | {SYSADMIN | NOSYSADMIN}
    | {MONADMIN | NOMONADMIN}
    | {OPRADMIN | NOOPRADMIN}
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  | {POLADMIN | NOPOLADMIN}
  | {USEFT | NOUSEFT}
  | {LOGIN | NOLOGIN}
  | {REPLICATION | NOREPLICATION}
  | {INDEPENDENT | NOINDEPENDENT}
  | {VCADMIN | NOVCADMIN}
  | {PERSISTENCE | NOPERSISTENCE}
  | CONNECTION LIMIT connlimit
  | [ ENCRYPTED | UNENCRYPTED ] PASSWORD 'password'[EXPIRED]
  | [ ENCRYPTED | UNENCRYPTED ] IDENTIFIED BY 'password' [ REPLACE 'old_password' | EXPIRED ]
  | [ ENCRYPTED | UNENCRYPTED ] PASSWORD { 'password' | DISABLE | EXPIRED }
  | [ ENCRYPTED | UNENCRYPTED ] IDENTIFIED BY { 'password' [ REPLACE 'old_password' ] |
DISABLE }
  | VALID BEGIN 'timestamp'
  | VALID UNTIL 'timestamp'
  | RESOURCE POOL 'respool'
  | USER GROUP 'groupuser'
  | PERM SPACE 'spacelimit'
  | TEMP SPACE 'tmpspacelimit'
  | SPILL SPACE 'spillspacelimit'
  | NODE GROUP logic_cluster_name
  | PGUSER
```

- Rename a role.

```
ALTER ROLE role_name
  RENAME TO new_name;
```

- Lock or unlock.

```
ALTER ROLE role_name
  ACCOUNT { LOCK | UNLOCK };
```

- Set parameters for a role.

```
ALTER ROLE role_name [ IN DATABASE database_name ]
  SET configuration_parameter {{ TO | = } { value | DEFAULT } | FROM CURRENT};
```

- Reset parameters for a role.

```
ALTER ROLE role_name
  [ IN DATABASE database_name ] RESET {configuration_parameter|ALL};
```

Parameter Description

- **role_name**

  Specifies a role name.

  Value range: an existing role name. If a role name contains uppercase letters, enclose the name with double quotation marks ("").

- **IN DATABASE database_name**

  Modifies the parameters of a role in a specified database.

- **SET configuration_parameter**

  Sets parameters for a role. Session parameters modified by **ALTER ROLE** apply to a specified role and take effect in the next session triggered by the role.

  NOTICE

  The current version does not support setting user-level parameters.

  Value range:

  For details about the values of **configuration_parameter** and **value**, see **SET**.

  DEFAULT: clears the value of **configuration_parameter**.
  configuration_parameter will inherit the default value of the new session generated for the role.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

FROM CURRENT: uses the value of **configuration_parameter** of the current session.

- **RESET configuration_parameter/ALL**

  Clears the value of **configuration_parameter**. The statement has the same effect as that of **SET configuration_parameter TO DEFAULT**.

  NOTICE

  The current version does not support the resetting of user-level parameters.

  Value range: **ALL** indicates that the values of all parameters are cleared.

- **ACCOUNT LOCK | ACCOUNT UNLOCK**
  - **ACCOUNT LOCK**: locks an account to forbid login to databases.
  - **ACCOUNT UNLOCK**: unlocks an account to allow login to databases.
- **PGUSER**

  In the current version, the **PGUSER** permission of a role cannot be modified.

- **PASSWORD/IDENTIFIED BY** 'password'

  Resets or changes the user password. Except the initial user, other administrators and common users need to enter the correct old password when changing their own passwords. Only the initial user, the system administrator (**sysadmin**), or users who have the permission to create users (**CREATEROLE**) can reset the password of a common user without entering the old password. The initial user can reset passwords of system administrators. System administrators cannot reset passwords of other system administrators.

- **EXPIRED**

  Invalidates the password. Only initial users, system administrators (**sysadmin**), and users who have the permission to create users (**CREATEROLE**) can invalidate user passwords. System administrators can invalidate their own passwords or the passwords of other system administrators. The password of the initial user cannot be invalidated.

  The user whose password is invalid can log in to the database but cannot perform the query operation. The query operation can be performed only after the password is changed or the administrator resets the password.

For details about other parameters, see **Parameter Description** in **CREATE ROLE**.

Examples

See **Examples** in **CREATE ROLE**.

12.14.23 ALTER ROW LEVEL SECURITY POLICY

Function

ALTER ROW LEVEL SECURITY POLICY modifies an existing row-level access control policy, including the policy name and the users and expressions affected by the policy.

Precautions

Only the table owner or a system administrator can perform this operation.

Syntax

```
ALTER [ ROW LEVEL SECURITY ] POLICY [ IF EXISTS ] policy_name ON table_name RENAME TO
new_policy_name;

ALTER [ ROW LEVEL SECURITY ] POLICY policy_name ON table_name
    [ TO { role_name | PUBLIC } [, ...] ]
    [ USING ( using_expression ) ];
```

Parameter Description

- policy_name

  Specifies the name of a row-level access control policy.

- table_name

  Specifies the name of a table to which a row-level access control policy is applied.

- new_policy_name

  Specifies the new name of a row-level access control policy.

- role_name

  Specifies names of users affected by a row-level access control policy. PUBLIC indicates that the row-level access control policy will affect all users.

- using_expression

  Specifies an expression defined for a row-level access control policy. The return value is of the Boolean type.

Examples

```
-- Create the all_data data sheet.
openGauss=# CREATE TABLE all_data(id int, role varchar(100), data varchar(100));

-- Create a row-level access control policy to specify that the current user can view only their own data.
openGauss=# CREATE ROW LEVEL SECURITY POLICY all_data_rls ON all_data USING(role =
CURRENT_USER);
openGauss=# \d+ all_data
                        Table "public.all_data"
 Column |          Type          | Modifiers | Storage  | Stats target | Description
--------+------------------------+-----------+----------+--------------+-------------
 id     | integer                |           | plain    |              |
 role   | character varying(100) |           | extended |              |
 data   | character varying(100) |           | extended |              |

CREATE ROW LEVEL SECURITY POLICY and **DROP ROW LEVEL SECURITY POLICY**

12.14.24 ALTER SCHEMA

Function

ALTER SCHEMA alters the attributes of a schema.

Precautions

Only the owner of a schema or users granted with the ALTER permission on the schema can run the **ALTER SCHEMA** command. The system administrator has this permission by default. To modify a schema owner, you must be the schema owner or system administrator and a member of the new owner role.

Only the initial user is allowed to change the owner of the **pg_catalog** system schema. Changing the names of the built-in schemas of the system may make

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

some functions unavailable or even affect the normal running of the database. By default, the names of the built-in schemas of the system cannot be changed. To ensure forward compatibility, you can change the names of the built-in schemas only when the system is being started or upgraded or when **allow_system_table_mods** is set to **on**.

Syntax

- Modify the tamper-proof attribute of a schema.
  ```
  ALTER SCHEMA schema_name { WITH | WITHOUT } BLOCKCHAIN
  ```
- Rename a schema.
  ```
  ALTER SCHEMA schema_name
    RENAME TO new_name;
  ```
- Change the owner of a schema.
  ```
  ALTER SCHEMA schema_name
    OWNER TO new_owner;
  ```

Parameter Description

- **schema_name**

  Specifies the name of an existing schema.

  Value range: an existing schema name

- **RENAME TO new_name**

  Rename a schema.

  new_name: new name of the schema.

  Value range: a string. It must comply with the identifier naming convention.

- **OWNER TO new_owner**

  Change the owner of a schema. To do this as a non-administrator, you must be a direct or indirect member of the new owning role, and that role must have the CREATE permission on the database.

  new_owner: new owner of the schema.

  Value range: an existing username or role name.

- **{ WITH | WITHOUT } BLOCKCHAIN**

  Modify the tamper-proof attribute of a schema. Common row-store tables with the tamper-proof attribute are tamper-proof history tables, excluding foreign tables, temporary tables, and system catalogs. The tamper-proof attribute can be modified only when no table is contained in the schema. The tamper-proof attribute of the **toast table** schema, **dbe_perf** schema, and **blockchain** schema cannot be modified. This syntax can be used to convert between normal and tamper-proof modes only if the schema does not contain any tables.

Examples

```
-- Create the ds schema.
openGauss=# CREATE SCHEMA ds;

-- Rename the current schema ds to ds_new.
openGauss=# ALTER SCHEMA ds RENAME TO ds_new;

-- Create user jack.
openGauss=# CREATE USER jack PASSWORD 'xxxxxxxxxx';
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Change the owner of ds_new to jack.
openGauss=# ALTER SCHEMA ds_new OWNER TO jack;

-- Modify the tamper-proof attribute of ds_new.
openGauss=# ALTER SCHEMA ds_new WITH BLOCKCHAIN;

-- Delete user jack and schema ds_new.
openGauss=# DROP SCHEMA ds_new;
openGauss=# DROP USER jack;
```

Helpful Links

CREATE SCHEMA and DROP SCHEMA

12.14.25 ALTER SEQUENCE

Function

ALTER SEQUENCE modifies the parameters of an existing sequence.

Precautions

- Only the sequence owner or a user granted with the ALTER permission can run the **ALTER SEQUENCE** command. The system administrator has this permission by default. To modify a sequence owner, you must be the sequence owner or system administrator and a member of the new owner role.
- In the current version, you can modify only the owner, owning column, and maximum value. To modify other parameters, delete the sequence and create it again. Then, use the **Setval** function to restore parameter values.
- **ALTER SEQUENCE MAXVALUE** cannot be used in transactions, functions, and stored procedures.
- After the maximum value of a sequence is changed, the cache of the sequence in all sessions is cleared.
- The **ALTER SEQUENCE** statement blocks the invoking of **nextval**, **setval**, **currval**, and **lastval**.

Syntax

Change the owning column of a sequence.

```
ALTER SEQUENCE [ IF EXISTS ] name
    [MAXVALUE maxvalue | NO MAXVALUE | NOMAXVALUE]
    [ OWNED BY { table_name.column_name | NONE } ] ;
```

Change the owner of a sequence.

```
ALTER SEQUENCE [ IF EXISTS ] name OWNER TO new_owner;
```

Parameter Description

- name

  Specifies the name of the sequence to be modified.

- IF EXISTS

  Sends a notice instead of an error when you are modifying a nonexisting sequence.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- OWNED BY

  Associates a sequence with a specified column included in a table. In this way, the sequence will be deleted when you delete its associated column or the table where the column belongs to.

  If the sequence has been associated with another table before you use this option, the new association will overwrite the old one.

  The associated table and sequence must be owned by the same user and in the same schema.

  If **OWNED BY NONE** is used, all existing associations will be deleted.

- new_owner

  Specifies the username of the new owner of the sequence. To change the owner, you must also be a direct or indirect member of the new role, and this role must have **CREATE** permission on the sequence's schema.

Examples

```
-- Create an ascending sequence named serial, which starts from 101.
openGauss=# CREATE SEQUENCE serial START 101;

-- Create a table and specify default values for the sequence.
openGauss=# CREATE TABLE T1(C1 bigint default nextval('serial'));

-- Change the owning column of serial to T1.C1.
openGauss=# ALTER SEQUENCE serial OWNED BY T1.C1;

-- Delete the sequence.
openGauss=# DROP SEQUENCE serial cascade;
openGauss=# DROP TABLE T1;
```

Helpful Links

CREATE SEQUENCE and **DROP SEQUENCE**

12.14.26 ALTER SERVER

Function

ALTER SERVER adds, modifies, or deletes the parameters of an existing server. You can query existing servers from the **pg_foreign_server** system catalog. The current feature is a lab feature. Contact Huawei technical support before using it.

Precautions

Only the server owner or a user granted with the ALTER permission can run the **ALTER SERVER** command. The system administrator has this permission by default. To change the owner of a server, the current user must be the owner of the server or the system administrator, and the user must be a member of the new owner role.

When multi-layer quotation marks are used for sensitive columns (such as **password** and **secret_access_key**) in OPTIONS, the semantics is different from that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

- Change the parameters for a foreign server.

```
ALTER SERVER server_name [ VERSION 'new_version' ]
    [ OPTIONS ( {[ ADD | SET | DROP ] option ['value']} [, ... ] ) ];
```

In **OPTIONS**, **ADD**, **SET**, and **DROP** are operations to be performed. If these operations are not specified, **ADD** operations will be performed by default. **option** and **value** are the parameters of the corresponding operation.

- Change the owner of a foreign server.

```
ALTER SERVER server_name
    OWNER TO new_owner;
```

- Change the name of a foreign server.

```
ALTER SERVER server_name
    RENAME TO new_name;
```

Parameter Description

The parameters for modifying the server are as follows:

- **server_name**

  Specifies the name of the server to be modified.

- **new_version**

  Specifies the new version of the server.

- The server parameters in **OPTIONS** are as follows:
  - **encrypt**

    Specifies whether to encrypt data. This parameter can be set only when **type** is set to **OBS**. The default value is **off**.

    Value range:

    - **on** indicates that data is encrypted.
    - **off** indicates that data is not encrypted.

  - **access_key**

    Specifies the access key (AK) (obtained by users from the OBS console) used for the OBS access protocol. When you create a foreign table, the AK value is encrypted and saved to the metadata table of the database. This parameter is available only when **type** is set to **OBS**.

  - **secret_access_key**

    Specifies the SK value (obtained by users from the OBS console) used for the OBS access protocol. When you create a foreign table, the SK value is encrypted and saved to the metadata table of the database. This parameter is available only when **type** is set to **OBS**.

- **new_owner**

  Specifies the new owner of the server. To change the owner, you must be the owner of the foreign server and a direct or indirect member of the new owner role, and must have the **USAGE** permission on the encapsulator of the foreign server.

- **new_name**

  Specifies the new name of the server.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Helpful Links

CREATE SERVER, **CREATE SERVER**

12.14.27 ALTER SESSION

Function

ALTER SESSION defines or modifies the conditions or parameters that affect the current session. Modified session parameters are kept until the current session is disconnected.

Precautions

- If the **START TRANSACTION** statement is not executed before the **SET TRANSACTION** statement, the transaction is ended instantly and the statement does not take effect.
- You can use the **transaction_mode(s)** method declared in the **START TRANSACTION** statement to avoid using the **SET TRANSACTION** statement.

Syntax

- Set transaction parameters of a session.

```
ALTER SESSION SET [ SESSION CHARACTERISTICS AS ] TRANSACTION
   { ISOLATION LEVEL { READ COMMITTED | READ UNCOMMITTED } | { READ ONLY  | READ
WRITE } } [, ...] ;
```

- Set other running parameters of a session.

```
ALTER SESSION SET
   {{config_parameter { { TO  | =  }  { value | DEFAULT }
     | FROM CURRENT }} | CURRENT_SCHEMA [ TO | = ] { schema | DEFAULT }
     | TIME ZONE time_zone
     | SCHEMA schema
     | NAMES encoding_name
     | ROLE role_name PASSWORD 'password'
     | SESSION AUTHORIZATION { role_name PASSWORD 'password' | DEFAULT }
     | XML OPTION { DOCUMENT | CONTENT }
   } ;
```

Parameter Description

For details about the descriptions of parameters related to **ALTER SESSION**, see **Parameter Description** of the SET syntax.

Examples

```
-- Create the ds schema.
openGauss=# CREATE SCHEMA ds;

-- Set the search path of a schema.
openGauss=# SET SEARCH_PATH TO ds, public;

-- Set the time/date type to the traditional postgres format (date before month).
openGauss=# SET DATESTYLE TO postgres, dmy;

-- Set the character code of the current session to UTF8.
openGauss=# ALTER SESSION SET NAMES 'UTF8';

-- Set the time zone to Berkeley of California.
openGauss=# SET TIME ZONE 'PST8PDT';
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Set the time zone to Italy.
openGauss=# SET TIME ZONE 'Europe/Rome';

-- Set the current schema.
openGauss=# ALTER SESSION SET CURRENT_SCHEMA TO tpcds;

-- Set XML OPTION to DOCUMENT.
openGauss=# ALTER SESSION SET XML OPTION DOCUMENT;

-- Create the role joe, and set the session role to joe.
openGauss=# CREATE ROLE joe WITH PASSWORD 'xxxxxxxxxx';
openGauss=# ALTER SESSION SET SESSION AUTHORIZATION joe PASSWORD 'xxxxxxxxxxx';

-- Switch to the default user.
openGauss=> ALTER SESSION SET SESSION AUTHORIZATION default;

-- Delete the ds schema.
openGauss=# DROP SCHEMA ds;

-- Delete the role joe.
openGauss=# DROP ROLE joe;
```

SET

12.14.28 ALTER SYNONYM

Function

ALTER SYNONYM modifies the attributes of the **SYNONYM** object.

Precautions

- Currently, only the owner of the **SYNONYM** object can be changed.
- Only the system administrator has the permission to modify the owner of the **SYNONYM** object.
- The new owner must have the **CREATE** permission on the schema where the **SYNONYM** object resides.

Syntax

```
ALTER SYNONYM synonym_name
    OWNER TO new_owner;
```

Parameter Description

- **synonym**

  Specifies the name of the synonym to be modified, which can contain the schema name.

  Value range: a string. It must comply with the naming convention.

- **new_owner**

  Specifies the new owner of the **SYNONYM** object.

  Value range: a string. It must be a valid username.

Examples

```
-- Create synonym t1.
openGauss=#  CREATE OR REPLACE SYNONYM t1 FOR ot.t1;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Create a user u1.
openGauss=# CREATE USER u1 PASSWORD 'user@111';

-- Change the owner of synonym t1 to u1.
openGauss=# ALTER SYNONYM t1 OWNER TO u1;

-- Delete synonym t1.
openGauss=# DROP SYNONYM t1;

-- Delete user u1.
openGauss=# DROP USER u1;
```

Helpful Links

CREATE SYNONYM and DROP SYNONYM

12.14.29 ALTER SYSTEM KILL SESSION

Function

ALTER SYSTEM KILL SESSION ends a session.

Precautions

None

Syntax

```
ALTER SYSTEM KILL SESSION 'session_sid, serial' [ IMMEDIATE ];
```

Parameter Description

- **session_sid, serial**

  Specifies **SID** and **SERIAL** of a session (see examples for format).

  Value range: **SID** and **SERIAL** of all sessions that can be queried from the system catalog **dv_sessions**

- **IMMEDIATE**

  Specifies that a session will be ended instantly after the statement is executed.

Examples

```
-- Query session information.
openGauss=# SELECT sid,serial#,username FROM dv_sessions;

       sid       | serial# | username
-----------------+---------+----------
 140131075880720 |       0 | omm
 140131025549072 |       0 | omm
 140131073779472 |       0 | omm
 140131071678224 |       0 | omm
 140131125774096 |       0 |
 140131127875344 |       0 |
 140131113629456 |       0 |
 140131094742800 |       0 |
(8 rows)

-- End the session whose SID is 140131075880720.
openGauss=#  ALTER SYSTEM KILL SESSION '140131075880720,0' IMMEDIATE;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.14.30 ALTER TABLE

Function

ALTER TABLE modifies tables, including modifying table definitions, renaming tables, renaming specified columns in tables, renaming table constraints, setting table schemas, enabling or disabling row-level access control, and adding or updating multiple columns.

Precautions

- The owner of a table, users granted with the ALTER permission on the table, or users granted with the ALTER ANY TABLE permission can run the **ALTER TABLE** command. The system administrator has the permission to run the command by default. To modify the owner or schema of a table, you must be a table owner or system administrator and a member of the new owner role.
- The tablespace of a partitioned table cannot be modified, but the tablespace of the partition can be modified.
- The storage parameter **ORIENTATION** cannot be modified.
- Currently, SET SCHEMA can only set schemas to user schemas. It cannot set a schema to a system internal schema.
- The distribution key (or column) of a table cannot be modified.
- Column-store tables support only PARTIAL CLUSTER KEY table-level constraints, but do not support primary and foreign key table-level constraints.
- In a column-store table, you can perform ADD COLUMN, ALTER TYPE, SET STATISTICS, DROP COLUMN operations, and change table name and space. The types of new and modified columns should be the **Data Type** supported by column-store. The **USING** option of **ALTER TYPE** only supports constant expression and expression involved in the column.
- The column constraints supported by column-store tables include **NULL**, **NOT NULL**, and **DEFAULT** constant values. Only the **DEFAULT** value can be modified (by SET DEFAULT or DROP DEFAULT). Currently, **NULL** and **NOT NULL** constraints cannot be modified.
- Auto-increment columns cannot be added, or a column whose **DEFAULT** value contains the nextval() expression cannot be added.
- Row access control cannot be enabled for foreign tables and temporary tables.
- When you delete a PRIMARY KEY constraint by constraint name, the NOT NULL constraint is not deleted. If necessary, manually delete the NOT NULL constraint.
- When JDBC is used, the **DEFAULT** value can be set through **PrepareStatement**.
- If you add a column using **ADD COLUMN**, all existing rows in the table are initialized to the column's default value (**NULL** if no DEFAULT clause is specified).

  If no DEFAULT value is specified for the new column, **NULL** is used, and no full table update is triggered.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If the new column has a DEFAULT value, the column must meet all the following requirements. Otherwise, the entire table is updated, leading to additional overheads and affecting online services.

1. The data type is BOOL, BYTEA, SMALLINT, BIGINT, SMALLINT, INTEGER, NUMERIC, FLOAT, DOUBLE PRECISION, CHAR, VARCHAR, TEXT, TIMESTAMPTZ, TIMESTAMP, DATE, TIME, TIMETZ, or INTERVAL.

2. The length of the DEFAULT value of the added column cannot exceed 128 bytes.

3. The DEFAULT value of the added column does not contain the volatile function.

4. The DEFAULT value is required and cannot be NULL.

If you are not sure whether condition 3 is met, check whether the **provolatile** attribute of the function in the PG_RPOC system catalog is **'v'**.

Syntax

- Modify the definition of a table.

```
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name ) }
    action [, ... ];
```

The **action** can be one of the following clauses:

```
column_clause
    | ADD table_constraint [ NOT VALID ]
    | ADD table_constraint_using_index
    | VALIDATE CONSTRAINT constraint_name
    | DROP CONSTRAINT [ IF EXISTS ]  constraint_name [ RESTRICT | CASCADE ]
    | CLUSTER ON index_name
    | SET WITHOUT CLUSTER
    | SET ( {storage_parameter = value} [, ... ] )
    | RESET ( storage_parameter [, ... ] )
    | OWNER TO new_owner
    | SET TABLESPACE new_tablespace
    | SET {COMPRESS|NOCOMPRESS}
    | TO { GROUP groupname | NODE ( nodename [, ... ] ) }
    | ADD NODE ( nodename [, ... ] )
    | DELETE NODE ( nodename [, ... ] )
    | UPDATE SLICE LIKE table_name
    | DISABLE TRIGGER [ trigger_name | ALL | USER ]
    | ENABLE TRIGGER [ trigger_name | ALL | USER ]
    | ENABLE REPLICA TRIGGER trigger_name
    | ENABLE ALWAYS TRIGGER trigger_name
    | DISABLE/ENABLE [ REPLICA | ALWAYS ] RULE
    | DISABLE ROW LEVEL SECURITY
    | ENABLE ROW LEVEL SECURITY
    | FORCE ROW LEVEL SECURITY
    | NO FORCE ROW LEVEL SECURITY
    | ENCRYPTION KEY ROTATION
    | INHERIT parent_table
    | NO INHERIT parent_table
    | DISTRIBUTE BY { REPLICATION | { [ HASH ] ( column_name ) } }
    | OF type_name
    | NOT OF
    | REPLICA IDENTITY { DEFAULT | USING INDEX index_name | FULL | NOTHING }
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- **ADD table_constraint [NOT VALID]**

  Adds a table constraint.

- **ADD table_constraint_using_index**

  Adds a primary key constraint or unique constraint to a table based on the existing unique index.

- **VALIDATE CONSTRAINT constraint_name**

  Validates a foreign key or a check-class constraint created with the **NOT VALID** option, and scans the entire table to ensure that all rows meet the constraint. Nothing happens if the constraint is already marked valid.

- **DROP CONSTRAINT [IF EXISTS] constraint_name [RESTRICT | CASCADE]**

  Drops a table constraint.

- **CLUSTER ON index_name**

  Selects the default index for future CLUSTER operations. Actually, the table is not re-clustered.

- **SET WITHOUT CLUSTER**

  Deletes the most recently used CLUSTER index from the table. This affects future CLUSTER operations that do not specify an index.

- **SET ({storage_parameter = value} [, ...])**

  Changes one or more storage parameters for the table.

- **RESET (storage_parameter [, ...])**

  Resets one or more storage parameters to their defaults. As with **SET**, a table rewrite might be needed to update the table entirely.

- **OWNER TO new_owner**

  Changes the owner of a table, sequence, or view to the specified user.

- **SET TABLESPACE new_tablespace**

  Changes the table's tablespace to the specified tablespace and moves the data files associated with the table to the new tablespace. Indexes on the table, if any, are not moved; but they can be moved separately with additional **SET TABLESPACE** option in ALTER INDEX.

- **SET {COMPRESS|NOCOMPRESS}**

  Sets the compression feature of a table. The table compression feature affects only the storage mode of data inserted in a batch subsequently and does not affect storage of existing data. Setting the table compression feature will result in the fact that there are both compressed and uncompressed data in the table. Row-store tables do not support compression.

- **TO { GROUP groupname | NODE (nodename [, ...]) }**

  The syntax is only available in extended mode (when GUC parameter **support_extended_features** is **on**). Exercise caution when enabling the mode. It is mainly used for tools like internal dilatation tools. Common users should not use the mode. This command only modifies the logical mapping relationship of the table distribution nodes and does not migrate the table's metadata and data on the DN.

- **ADD NODE (nodename [, ...])**

  It is only available for internal scale-out tools. Common users should not use the syntax.

- **DELETE NODE (nodename [, ...])**

  It is only available for internal scale-in tools. Common users should not use the syntax.

- **UPDATE SLICE LIKE table_name**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This syntax is used by internal scaling tools and cannot be used by common users.

- **DISABLE TRIGGER [trigger_name | ALL | USER]**

  Disables a single trigger specified by **trigger_name**, disables all triggers, or disables only user triggers (excluding internally generated constraint triggers, for example, deferrable unique constraint triggers and exclusion constraints triggers).

  NOTE

  Exercise caution when using this function because data integrity cannot be ensured as expected if the triggers are not executed.

- **| ENABLE TRIGGER [trigger_name | ALL | USER]**

  Enables a single trigger specified by **trigger_name**, enables all triggers, or enables only user triggers.

- **| ENABLE REPLICA TRIGGER trigger_name**

  Determines that the trigger firing mechanism is affected by the configuration variable **session_replication_role**. When the replication role is **origin** (default value) or **local**, a simple trigger is fired.

  When ENABLE REPLICA is configured for a trigger, it is triggered only when the session is in replica mode.

- **| ENABLE ALWAYS TRIGGER trigger_name**

  Determines that all triggers are fired regardless of the current replication mode.

- **| DISABLE/ENABLE [REPLICA | ALWAYS] RULE**

  Enables or disables a rule for tables. Disabled rules are still visible in the system, but are not applied during query rewriting. The ON SELECT rule cannot be disabled because it is related to the view implementation. Rules configured as ENABLE REPLICA are enabled only when the session is in replica mode, while those configured as ENABLE ALWAYS can be enabled regardless of the replica mode. Rule triggering is also affected by configuration variables in **session_replication_role**, which is similar to the preceding trigger setting.

- **| DISABLE/ENABLE ROW LEVEL SECURITY**

  Enables or disables row-level access control for a table.

  If row-level access control is enabled for a data table but no row-level access control policy is defined, the row-level access to the data table is not affected. If row-level access control for a table is disabled, the row-level access to the table is not affected even if a row-level access control policy has been defined. For details, see **CREATE ROW LEVEL SECURITY POLICY**.

- **| NO FORCE/FORCE ROW LEVEL SECURITY**

  Forcibly enables or disables row-level access control for a table.

  By default, the table owner is not affected by the row-level access control feature. However, if row-level access control is forcibly enabled, the table owner (excluding system administrators) will be affected. System administrators are not affected by any row-level access control policies.

- **| ENCRYPTION KEY ROTATION**

  Rotation of the transparent data encryption key.

  The data encryption key rotation of a table can be performed only when the transparent encryption function is enabled for the database and **enable_tde** of the table is set to **on**. After the key rotation operation is performed, the system automatically applies for a new KMS key. After the key rotation, the data encrypted using the old key is decrypted using the old key, and the newly written data is encrypted using the new key. To ensure the security of encrypted data, you can periodically update the key based on the amount of new data in the encryption table. It is recommended that the key be updated every two to three years.

- **INHERIT parent_table**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Adds the target data table to a specified parent data table as a new child data table. After that, the query for the parent data table will contain the data in the target data table. Before being added as a child data table, the target data table must contain all the columns in the parent data table. These columns must have matching data categories, and if they have NOT NULL constraints in the parent data table, they must also have NOT NULL constraints in the child data table. For all CHECK constraints in the parent data table, there must be corresponding constraints in the child data table, unless the parent data table is marked as non-inheritable.

- **NO INHERIT parent_table**

  Generates the target data table from the child data table of a specified parent data table. Queries for the parent data table will no longer contain records generated from the target data table.

- **DISTRIBUTE BY { REPLICATION | { [HASH] (column_name) } }**

  Specifies how the table is distributed or replicated between DNs.

- **OF type_name**

  Joins a table to a composite type, which is similar to table creation by using the **CREATE TABLE OF** option. The name and type of a table column must exactly match those defined in the composite type, but the OID system column can be different. The table cannot be inherited from any other table. These restrictions ensure that the **CREATE TABLE OF** option allows the same table definition.

- **NOT OF**

  Removes the association between a table and a type.

- **REPLICA IDENTITY { DEFAULT | USING INDEX index_name | FULL | NOTHING }**

  Specifies the record level of old tuples in UPDATE and DELETE statements on a table in logical replication scenarios.

  - **DEFAULT**: The old value of the primary key column is recorded. If there is no primary key, no old value is recorded.
  - **USING INDEX**: Old values of columns covered by the named indexes are recorded. These values must be unique, non-local, and non-deferrable, and contain the values of columns marked with **NOT NULL**.
  - **FULL**: Old values of all columns in the row are recorded.
  - **NOTHING**: Information in old rows is recorded.

  In logical replication scenarios, when the UPDATE and DELETE statements of a table are parsed, the parsed old tuples consist of the information recorded in this method. For tables with primary keys, this option can be set to **DEFAULT** or **FULL**. For a table without a primary key, set this parameter to **FULL**. Otherwise, the old tuple will be parsed as empty during decoding. You are not advised to set this parameter to **NOTHING** in common scenarios because old tuples are always parsed as empty.

– The **column_clause** can be one of the following clauses:

```
ADD [ COLUMN ] column_name data_type [ compress_mode ] [ COLLATE collation ]
[ column_constraint [ ... ] ]
| MODIFY column_name data_type
| MODIFY column_name [ CONSTRAINT constraint_name ] NOT NULL [ ENABLE ]
| MODIFY column_name [ CONSTRAINT constraint_name ] NULL
| DROP [ COLUMN ] [ IF EXISTS ] column_name [ RESTRICT | CASCADE ]
| ALTER [ COLUMN ] column_name [ SET DATA ] TYPE data_type [ COLLATE collation ] [ USING
expression ]
| ALTER [ COLUMN ] column_name { SET DEFAULT expression | DROP DEFAULT }
| ALTER [ COLUMN ] column_name { SET | DROP } NOT NULL
| ALTER [ COLUMN ] column_name SET STATISTICS [PERCENT] integer
| ADD STATISTICS (( column_1_name, column_2_name [, ...] ))
| DELETE STATISTICS (( column_1_name, column_2_name [, ...] ))
| ALTER [ COLUMN ] column_name SET ( {attribute_option = value} [, ... ] )
| ALTER [ COLUMN ] column_name RESET ( attribute_option [, ... ] )
| ALTER [ COLUMN ] column_name SET STORAGE { PLAIN | EXTERNAL | EXTENDED | MAIN }
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- **ADD [COLUMN] column_name data_type [compress_mode] [COLLATE collation] [column_constraint [...]]**

  Adds a column to a table. If a column is added with ADD COLUMN, all existing rows in the table are initialized with the column's default value (**NULL** if no DEFAULT clause is specified).

- **ADD ({ column_name data_type [compress_mode] } [, ...])**

  Adds columns in the table.

- **MODIFY ({ column_name data_type | column_name [CONSTRAINT constraint_name] NOT NULL [ENABLE] | column_name [CONSTRAINT constraint_name] NULL } [, ...])**

  Modifies the data type of an existing column in the table.

- **DROP [COLUMN] [IF EXISTS] column_name [RESTRICT | CASCADE]**

  Drops a column from a table. Indexes and constraints related to the column are automatically dropped. If an object not belonging to the table depends on the column, CASCADE must be specified, such as foreign key reference and view.

  The DROP COLUMN statement does not physically remove the column, but simply makes it invisible to SQL operations. Subsequent INSERT and UPDATE operations in the table will store a **NULL** value for the column. Therefore, column deletion takes a short period of time but does not immediately release the tablespace on the disks, because the space occupied by the deleted column is not reclaimed. The space will be reclaimed when VACUUM is executed.

- **ALTER [COLUMN] column_name [SET DATA] TYPE data_type [COLLATE collation] [USING expression]**

  Modifies the type of a column in a table. Indexes and simple table constraints on the column will automatically use the new data type by reparsing the originally supplied expression.

- **ALTER [COLUMN] column_name { SET DEFAULT expression | DROP DEFAULT }**

  Sets or removes the default value for a column. The default values only apply to subsequent INSERT operations; they do not cause rows already in the table to change. Defaults can also be created for views, in which case they are inserted into INSERT statements on the view before the view's ON INSERT rule is applied.

- **ALTER [COLUMN] column_name { SET | DROP } NOT NULL**

  Changes whether a column is marked to allow null values or to reject null values. You can only use SET NOT NULL when the column contains no null values.

- **ALTER [COLUMN] column_name SET STATISTICS [PERCENT] integer**

  Specifies the per-column statistics-gathering target for subsequent ANALYZE operations. The target can be set in the range from 0 to 10000. Set it to **–1** to revert to using the default system statistics target.

- **{ADD | DELETE} STATISTICS ((column_1_name, column_2_name [, ...]))**

  Adds or deletes the declaration of collecting multi-column statistics to collect multi-column statistics as needed when **ANALYZE** is performed for a table or a database. (The current feature is a lab feature. Contact Huawei technical support before using it.) The statistics about a maximum of 32 columns can be collected at a time. You are not allowed to add or delete such declaration for system catalogs or foreign tables.

- **ALTER [COLUMN] column_name SET ({attribute_option = value} [, ...])**

  ALTER [COLUMN] column_name RESET (attribute_option [, ...])

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Sets or resets per-attribute options.

Currently, the only defined per-attribute options are **n_distinct** and **n_distinct_inherited**. **n_distinct** affects statistics of a table, while **n_distinct_inherited** affects the statistics of the table and its subtables. Currently, only **SET/RESET n_distinct** is supported, and **SET/RESET n_distinct_inherited** is forbidden.

- **ALTER [COLUMN] column_name SET STORAGE { PLAIN | EXTERNAL | EXTENDED | MAIN }**

  Sets the storage mode for a column. This clause specifies whether this column is held inline or in a secondary table, and whether the data should be compressed. It is set only for row-store tables and is invalid for column-store tables. If it is set for column-store tables, an error will be displayed when the statement is executed. SET STORAGE itself does not change anything in the table. It sets the strategy to be pursued during future table updates.

  - **column_constraint** is as follows:

```
[ CONSTRAINT constraint_name ]
   { NOT NULL |
     NULL |
     CHECK ( expression ) |
     DEFAULT default_expr  |
     UNIQUE index_parameters |
     PRIMARY KEY index_parameters |
     ENCRYPTED WITH ( COLUMN_ENCRYPTION_KEY = column_encryption_key,
ENCRYPTION_TYPE = encryption_type_value ) |
     REFERENCES reftable [ ( refcolumn ) ] [ MATCH FULL |  MATCH PARTIAL | MATCH
SIMPLE ]
       [ ON DELETE action ] [ ON UPDATE action ] }
   [ DEFERRABLE | NOT DEFERRABLE ][ INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
```

  - **compress_mode** of a column is as follows:

```
{ DELTA | PREFIX | DICTIONARY | NUMSTR | NOCOMPRESS }
```

- **table_constraint_using_index** used to add the primary key constraint or unique constraint based on the unique index is as follows:

```
[ CONSTRAINT constraint_name ]
   { UNIQUE | PRIMARY KEY } USING INDEX index_name
   [ DEFERRABLE | NOT DEFERRABLE ][ INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
```

- **table_constraint** is as follows:

```
[ CONSTRAINT constraint_name ]
   { CHECK ( expression ) |
     UNIQUE ( column_name [, ... ] ) index_parameters |
     PRIMARY KEY ( column_name [, ... ] ) index_parameters |
     PARTIAL CLUSTER KEY ( column_name [, ... ] )  |
     FOREIGN KEY ( column_name [, ... ] ) REFERENCES reftable [ ( refcolumn [, ... ] ) ]
       [ MATCH FULL | MATCH PARTIAL | MATCH SIMPLE ] [ ON DELETE action ] [ ON UPDATE
ACTION ] }
   [ DEFERRABLE | NOT DEFERRABLE ][ INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
```

  index_parameters is as follows:

```
[ WITH ( {storage_parameter = value} [, ... ] ) ]
   [ USING INDEX TABLESPACE tablespace_name ]
```

- Rename a table. The renaming does not affect stored data.

```
ALTER TABLE [ IF EXISTS ] table_name
   RENAME TO new_table_name;
```

- Rename the specified column in the table.

```
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name )}
   RENAME [ COLUMN ] column_name TO new_column_name;
```

- Rename the constraint of the table.

```
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name ) }
   RENAME CONSTRAINT constraint_name TO new_constraint_name;
```

- Set the schema of the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
ALTER TABLE [ IF EXISTS ] table_name
    SET SCHEMA new_schema;
```

NOTE

- The schema setting moves the table into another schema. Associated indexes and constraints owned by table columns are migrated as well. Currently, the schema for sequences cannot be changed. If the table has sequences, delete the sequences, and create them again or delete the ownership between the table and sequences. In this way, the table schema can be changed.
- To change the schema of a table, you must also have the CREATE permission on the new schema. To add the table as a new child of a parent table, you must own the parent table as well. To alter the owner, you must also be a direct or indirect member of the new owning role, and that role must have the CREATE permission on the table's schema. These restrictions enforce that the user can only recreate and delete the table. However, a system administrator can alter the ownership of any table anyway.
- All the actions except for RENAME and SET SCHEMA can be combined into a list of multiple alterations to apply in parallel. For example, it is possible to add several columns or alter the type of several columns in a single statement. This is useful with large tables, since only one pass over the tables need be made.
- Adding a CHECK or NOT NULL constraint will scan the table to validate that existing rows meet the constraint.
- Adding a column with a non-NULL default value or changing the type of an existing column will rewrite the entire table. Rewriting a large table may take much time and temporarily needs doubled disk space.

- Add columns.

```
ALTER TABLE [ IF EXISTS ] table_name
    ADD ( { column_name data_type [ compress_mode ] [ COLLATE collation ] [ column_constraint [ ... ] ]} [, ...] );
```

- Update columns.

```
ALTER TABLE [ IF EXISTS ] table_name
    MODIFY ( { column_name data_type | column_name [ CONSTRAINT constraint_name ] NOT NULL [ ENABLE ] | column_name [ CONSTRAINT constraint_name ] NULL } [, ...] );
```

Parameter Description

- **IF EXISTS**

  Sends a notice instead of an error if no tables have identical names. The notice prompts that the table you are querying does not exist.

- **table_name [*] | ONLY table_name | ONLY (table_name)**

  table_name is the name of the table that you need to modify.

  If **ONLY** is specified, only the table is modified. If **ONLY** is not specified, the table and all subtables are modified. You can explicitly add the asterisk (*) option following the table name to specify that all subtables are scanned, which is the default operation.

- **constraint_name**

  Specifies the name of an existing constraint to drop.

- **index_name**

  Specifies the name of an index.

- **storage_parameter**

  Specifies the name of a storage parameter.

  The following options are added for online scaling :

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **append_mode** (enumerated type)

  Scales a table online or offline, or stops scaling it. You can modify certain content in the table during online scaling but cannot do so during offline scaling.

  To modify a table that is being scaled, append new data so that they can be recorded as incremental data.

  - **on**: scales a table online . New data will be appended.
  - **off**: stops scaling. New data will be written in normal mode, and options for online scaling will not be displayed in **pg_class.reloptions**.
  - **read_only**: scales a table offline, during which no other operations can be performed on the table.
  - **end_catchup**: reports errors for the write service in the last round of data increment. The read service is executed normally.

- **rel_cn_oid** (OID type)

  Records the OID of tables on the current CN to generate **delete_delta** on the DNs.

  If **append_mode** is set to **on**, **rel_cn_oid** must be specified.

  The **append_mode** and **rel_cn_oid** options are used only for online scaling tools.

- **exec_step** (integer)

  Records resumable transmission steps in **relOptions** of the temporary table.

  Value range: [1,4]

  It can be used only for data redistribution.

- **create_time** (long integer)

  Records the time when the temporary table is created during resumable transmission in **relOptions** of the temporary table.

  Only the data redistribution tool is supported.

- **wait_clean_cbi** (string type)

  Specifies whether the current global index contains the residual tuple generated during bucket migration for scaling. After scaling, **wait_clean_cbi** is set to **y**. After the residual tuple is cleared in the vacuum process, **wait_clean_cbi** is set to **n**.

  This option is used only in scaling tools.

The following option is added for creating an index:

- **parallel_workers** (int type)

  Number of bgworker threads started when an index is created. For example, value **2** indicates that two bgworker threads are started to create indexes concurrently.

  Value range: [0,32]. The value **0** indicates that this function is disabled.

  Default value: If this parameter is not set, the concurrent index creation function is disabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The following option is added to the replication table:

- **primarynode** (Boolean type)

  Default value: **off**

  When **primarynode** is set to **on**, the primary node is selected for the replication table. Generally, the primary node is the first node recorded in the nodeoids field in the **pgxc_class** table. When the IUD operation is performed on the replication table, the operation is delivered to the primary node first. After the result is received, the operation is delivered to other DNs.

Transparent data encryption options:

- **enable_tde** (Boolean type)

  Specifies whether transparent data encryption is enabled for a table. Before enabling this function, ensure that the **enable_tde** in "GUC Parameter" has been enabled, the KMS service has been enabled, and the cluster master key ID in **tde_cmk_id** in "GUC Parameter" has been correctly configured.

  This parameter supports only row-store tables. Column-store tables and temporary tables are not supported. The Ustore storage engine is not supported. This parameter can be modified only when **enable_tde** is specified during table creation. Changing the encryption state does not change the encryption algorithm and key information.

  Value range: **on** and **off** **on** indicates that transparent data encryption is enabled. After the value is changed from **off** to **on**, new data is automatically encrypted when being written to the data page, and old data is automatically encrypted when the data page is updated. **off** indicates that transparent data encryption is disabled. After the value is changed from **on** to **off**, newly written data is not encrypted, old encrypted data can be automatically decrypted when being read, and data is not encrypted when being written back to the data page.

  Default value: **off**

- **hasuids** (Boolean type)

  Default value: **off**

  If this parameter is set to **on**, a unique table-level ID is allocated to a tuple when the tuple is updated.

- **new_owner**

  Specifies the name of the new table owner.

- **new_tablespace**

  Specifies the new name of the tablespace to which the table belongs.

- column_name, column_1_name, column_2_name

  Specifies the name of a new or existing column.

- **data_type**

  Specifies the type of a new column or a new type of an existing column.

- **compress_mode**

  Compression option of a table field. The clause specifies the compression algorithm preferentially used by the column. Row-store tables do not support compression.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **collation**

  Specifies the collation rule name of a column. The optional COLLATE clause specifies a collation for the new column; if omitted, the collation is the default for the new column. You can run the **select * from pg_collation** command to query collation rules from the **pg_collation** system catalog. The default collation rule is the row starting with **default** in the query result.

- **USING expression**

  Specifies how to compute the new column value from the old; if omitted, the default conversion is an assignment cast from old data type to new. A USING clause must be provided if there is no implicit or assignment cast from the old to new type.

  NOTE

  USING in ALTER TYPE can specify any expression involving the old values of the row; that is, it can refer to any columns other than the one being cast. This allows general casting to be done with the ALTER TYPE syntax. Because of this flexibility, the USING expression is not applied to the column's default value (if any); the result might not be a constant expression as required for a default. This means that when there is no implicit or assignment cast from old to new type, ALTER TYPE might fail to convert the default even though a USING clause is supplied. In such cases, drop the default with DROP DEFAULT, perform ALTER TYPE, and then use SET DEFAULT to add a suitable new default. Similar considerations apply to indexes and constraints involving the column.

- **NOT NULL | NULL**

  Sets whether the column allows null values.

- **integer**

  Specifies the constant value of a signed integer. When using PERCENT, the range of **integer** is from 0 to 100.

- **attribute_option**

  Specifies an attribute option.

- **PLAIN | EXTERNAL | EXTENDED | MAIN**

  Specifies a column-store mode.

  - **PLAIN** must be used for fixed-length values (such as integers). It must be inline and uncompressed.
  - **MAIN** is for inline, compressible data.
  - **EXTERNAL** is for external, uncompressed data. Use of **EXTERNAL** will make substring operations on **text** and **bytea** values run faster, at the penalty of increased storage space.
  - **EXTENDED** is for external, compressed data. **EXTENDED** is the default for most data types that support non-**PLAIN** storage.

- **CHECK (expression)**

  New rows or rows to be updated must satisfy for an expression to be true. If any row produces a false result, an error is raised and the database is not modified.

  A check constraint specified as a column constraint should reference only the column's values, while an expression appearing in a table constraint can reference multiple columns.

  Currently, CHECK (expression) does not include subqueries and cannot use variables apart from the current column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **DEFAULT default_expr**

  Assigns a default data value for a column.

  The data type of the default expression must match the data type of the column.

  The default expression will be used in any insert operation that does not specify a value for the column. If there is no default value for a column, then the default value is null.

- **UNIQUE index_parameters**

  UNIQUE (column_name [, ...]) index_parameters

  Specifies that a group of one or more columns of a table can contain only unique values.

- **PRIMARY KEY index_parameters**

  PRIMARY KEY (column_name [, ...]) index_parameters

  Specifies that a column or columns of a table can contain only unique (non-duplicate) and non-null values.

- **DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE**

  Sets whether the constraint can be deferrable.

  - **DEFERRABLE**: deferrable to the end of the transaction and checked using **SET CONSTRAINTS**.
  - **NOT DEFERRABLE**: checks immediately after the execution of each command.
  - **INITIALLY IMMEDIATE**: checks immediately after the execution of each statement.
  - **INITIALLY DEFERRED**: checks when the transaction ends.

- **WITH ({storage_parameter = value} [, ...])**

  Specifies an optional storage parameter for a table or an index.

- **tablespace_name**

  Specifies the name of the tablespace where the index locates.

- **COMPRESS|NOCOMPRESS**

  - **NOCOMPRESS**: The existing compression feature of the table will not be changed.
  - **COMPRESS**: The table compression feature will be triggered by batch tuple insertion. Row-store tables do not support compression.

- **new_table_name**

  Specifies the new table name.

- **new_column_name**

  Specifies the new name of a specific column in a table.

- **new_constraint_name**

  Specifies the new name of a table constraint.

- **new_schema**

  Specifies the new schema name.

- **CASCADE**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Automatically drops objects that depend on the dropped column or constraint (for example, views referencing the column).

- **RESTRICT**

  Refuses to drop the column or constraint if there are any dependent objects. This is the default processing.

- **schema_name**

  Specifies the schema name of a table.

Examples

See **Examples** in **CREATE TABLE**.

Helpful Links

CREATE TABLE and **DROP TABLE**

12.14.31 ALTER TABLE PARTITION

Function

ALTER TABLE PARTITION modifies table partitions, including adding, deleting, splitting, merging, clearing, swapping, and renaming partitions, moving partition tablespaces, and modifying partition attributes.

Precautions

- The tablespace for the added partition cannot be **PG_GLOBAL**.
- The name of the added partition must be different from names of existing partitions in the partition table.
- The partition key of the added partition must be the same type as that of the partitioned table. The key value of the added partition must exceed the upper limit of the last partition range.
- If the number of partitions in the target partitioned table reaches the maximum (**1048575**), no more partitions can be added.
- If a partitioned table has only one partition, the partition cannot be deleted.
- Use **PARTITION FOR()** to choose partitions. The number of specified values in the brackets should be the same as the column number in customized partition, and they must be consistent.
- The **Value** partition table does not support the **Alter Partition** operation.
- Column-store tables and row-store tables cannot be partitioned.
- Only the partitioned table owner or a user granted with the ALTER permission can run the **ALTER TABLE PARTITION** command. The system administrator has this permission by default.

Syntax

- Modify the syntax of the table partition.

```
ALTER TABLE [ IF EXISTS ] { table_name  [*] | ONLY table_name | ONLY ( table_name  )}
    action [, ... ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

action indicates the following clauses for maintaining partitions. For the partition continuity when multiple clauses are used for partition maintenance, GaussDB does **DROP PARTITION** and then **ADD PARTITION**, and finally runs the rest clauses in sequence.

```
move_clause |
   exchange_clause |
   row_clause |
   merge_clause |
   modify_clause |
   split_clause |
   add_clause |
   drop_clause
```

- The **move_clause** syntax is used to move the partition to a new tablespace.

  ```
  MOVE PARTITION { partion_name | FOR ( partition_value [, ...] ) } TABLESPACE tablespacename
  ```

- The **exchange_clause** syntax is used to move the data from a general table to a specified partition.

  ```
  EXCHANGE PARTITION { ( partition_name ) | FOR ( partition_value [, ...] ) }
     WITH TABLE {[ ONLY ] ordinary_table_name | ordinary_table_name * | ONLY
  ( ordinary_table_name )}
     [ { WITH | WITHOUT } VALIDATION ] [ VERBOSE ] [ UPDATE GLOBAL INDEX ]
  ```

  The ordinary table and partition whose data is to be exchanged must meet the following requirements:

  - The number of columns of the ordinary table is the same as that of the partition, and their information should be consistent, including: column name, data type, constraint, collation information, storage parameter, and compression information.
  - The compression information of the ordinary table and partition should be consistent.
  - The distribution key information of the ordinary table and partition should be consistent.
  - The number and information of indexes of the ordinary table and partition should be consistent.
  - The number and information of constraints of the ordinary table and partition should be consistent.
  - The ordinary table cannot be a temporary table.
  - When the built-in security policy is enabled, a common table cannot contain columns bound to a dynamic data anonymization policy.

  When the exchange is done, the data and tablespace of the ordinary table and partition are exchanged. The statistics of the ordinary table and partition are no longer inaccurate after the exchange, and they should be analyzed again. If the DROP COLUMN operation is performed on an ordinary or partitioned table, the deleted column still exists physically. Therefore, you need to ensure that the deleted column of the ordinary table is strictly aligned with that of the partition.

- The **row_clause** syntax is used to set row movement of a partitioned table.

  ```
  { ENABLE | DISABLE } ROW MOVEMENT
  ```

- The **merge_clause** syntax is used to merge partitions into one.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
MERGE PARTITIONS { partition_name } [, ...] INTO PARTITION partition_name
    [ TABLESPACE tablespacename ] [ UPDATE GLOBAL INDEX ]
```

- The **modify_clause** syntax is used to set whether a partition index is usable.

```
MODIFY PARTITION partition_name { UNUSABLE LOCAL INDEXES | REBUILD UNUSABLE LOCAL INDEXES }
```

- The **split_clause** syntax is used to split one partition into partitions.

```
SPLIT PARTITION { partition_name | FOR ( partition_value [, ...] ) } { split_point_clause | no_split_point_clause } [ UPDATE GLOBAL INDEX ]
```

  - The **split_point_clause** syntax is used to specify a split point.

```
AT ( partition_value ) INTO ( PARTITION partition_name [ TABLESPACE tablespacename ] , PARTITION partition_name [ TABLESPACE tablespacename ] )
```

    NOTICE

    - Column-store tables and row-store tables cannot be partitioned.
    - The size of the split point should be in the range of partition keys of the partition of to be split. The split point can only split one partition into two new partitions.

  - The **no_split_point_clause** syntax does not specify a split point.

```
INTO { ( partition_less_than_item [, ...] ) | ( partition_start_end_item [, ...] ) }
```

    NOTICE

    - The first new partition key specified by **partition_less_than_item** should be greater than that of the previously split partition (if any), and the last partition key specified by **partition_less_than_item** should equal that of the partition being split.
    - The first new partition key specified by **partition_start_end_item** should equal that of the former partition (if any), and the last partition key specified by **partition_start_end_item** should equal that of the partition being split.
    - **partition_less_than_item** supports a maximum of 4 partition keys, while **partition_start_end_item** supports only one partition key. For details about the supported data types, see **•PARTITION BY RANGE(part...**.
    - **partition_less_than_item** and **partition_start_end_item** cannot be used in the same statement.

  - The syntax of **partition_less_than_item** is as follows:

```
PARTITION partition_name VALUES LESS THAN ( { partition_value | MAXVALUE }  [, ...] )
    [ TABLESPACE tablespacename ]
```

  - The syntax of **partition_start_end_item** is as follows. For details about the constraints, see **partition_start_end_item syntax**.

```
PARTITION partition_name {
      {START(partition_value) END (partition_value) EVERY (interval_value)} |
      {START(partition_value) END ({partition_value | MAXVALUE})} |
      {START(partition_value)} |
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
        {END({partition_value | MAXVALUE})}
    } [TABLESPACE tablespace_name]
```

  - The **add_clause** syntax is used to add one or more partitions to a specified partitioned table.

```
ADD PARTITION ( partition_col1_name = partition_col1_value [, partition_col2_name = partition_col2_value ] [, ...] )
   [ LOCATION 'location1' ]
   [ PARTITION (partition_colA_name = partition_colA_value [, partition_colB_name = partition_colB_value ] [, ...] ) ]
   [ LOCATION 'location2' ]
ADD {partition_less_than_item | partition_start_end_item}
```

  - The **drop_clause** syntax is used to remove a partition from a specified partitioned table.

```
DROP PARTITION  { partition_name | FOR (  partition_value [, ...] )  } [ UPDATE GLOBAL INDEX ]
```

- The syntax for modifying the name of a partition is as follows:

```
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name  )}
   RENAME PARTITION { partion_name | FOR ( partition_value [, ...] ) } TO partition_new_name;
```

Parameter Description

- **table_name**

  Specifies the name of a partitioned table.

  Value range: an existing table name

- **partition_name**

  Specifies the name of a partition.

  Value range: an existing partition name

- **tablespacename**

  Specifies which tablespace the partition moves to.

  Value range: an existing tablespace name

- **partition_value**

  Specifies the key value of a partition.

  The value specified by **PARTITION FOR (partition_value [, ...])** can uniquely identify a partition.

  Value range: partition keys for the partition to be renamed

- **UNUSABLE LOCAL INDEXES**

  Sets all the indexes unusable in the partition.

- **REBUILD UNUSABLE LOCAL INDEXES**

  Rebuilds all the indexes in the partition.

- **ENABLE/DISABLE ROW MOVEMET**

  Sets row movement.

  If the tuple value is updated on the partition key during the **UPDATE** action, the partition where the tuple is located is altered. Setting this parameter enables error messages to be reported or movement of the tuple between partitions.

  Value range:

  - **ENABLE**: Row movement is enabled.
  - **DISABLE**: Row movement is disabled.

  By default, this parameter is disabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **ordinary_table_name**

  Specifies the name of the ordinary table whose data is to be migrated.

  Value range: an existing table name

- **{ WITH | WITHOUT } VALIDATION**

  Checks whether the ordinary table data meets the specified partition key range of the partition to be migrated.

  Value range:

  - **WITH**: checks whether the ordinary table data meets the partition key range of the partition to be migrated. If any data does not meet the required range, an error is reported.
  - **WITHOUT**: does not check whether the ordinary table data meets the partition key range of the partition to be migrated.

  The default value is **WITH**.

  The check is time consuming, especially when the data volume is large. Therefore, use **WITHOUT** when you are sure that the current ordinary table data meets the partition key range of the partition to be migrated.

- **VERBOSE**

  When **VALIDATION** is **WITH**, if the ordinary table contains data that is out of the partition key range, insert the data to the correct partition. If there is no correct partition where the data can be inserted to, an error is reported.

  NOTICE

  Only when **VALIDATION** is **WITH**, **VERBOSE** can be specified.

- **partition_new_name**

  Specifies the new name of a partition.

  Value range: a string. It must comply with the naming convention.

- **UPDATE GLOBAL INDEX**

  If this parameter is used, all global indexes in a partitioned table are updated to ensure that correct data can be queried using global indexes.

  If this parameter is not used, all global indexes in a partitioned table will become invalid.

Examples

See **Examples** in **CREATE TABLE PARTITION**.

Helpful Links

CREATE TABLE PARTITION and **DROP TABLE**

12.14.32 ALTER TABLESPACE

Function

ALTER TABLESPACE modifies the attributes of a tablespace.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- The **ALTER TABLESPACE** syntax cannot be used in the current version.
- Only the tablespace owner or a user granted with the ALTER permission can run the **ALTER TABLESPACE** command. The system administrator has this permission by default. To modify a tablespace owner, you must be the tablespace owner or system administrator and a member of the new owner role.
- The **ALTER TABLESPACE** operation on a row-store table cannot be performed in a transaction block.
- To change the owner, you must also be a direct or indirect member of the new owning role.

  NOTE

  If **new_owner** is the same as **old_owner**, the current user will not be verified. A message indicating successful **ALTER** execution is displayed.

Syntax

- The syntax of renaming a tablespace is as follows:
```
ALTER TABLESPACE tablespace_name
  RENAME TO new_tablespace_name;
```
- The syntax of setting the owner of a tablespace is as follows:
```
ALTER TABLESPACE tablespace_name
  OWNER TO new_owner;
```
- The syntax of setting the attributes of a tablespace is as follows:
```
ALTER TABLESPACE tablespace_name
  SET ( {tablespace_option = value} [, ... ] );
```
- The syntax of resetting the attributes of a tablespace is as follows:
```
ALTER TABLESPACE tablespace_name
  RESET ( { tablespace_option } [, ...] );
```
- The syntax of setting the quota of a tablespace is as follows:
```
ALTER TABLESPACE tablespace_name
  RESIZE MAXSIZE { UNLIMITED | 'space_size'};
```

Parameter Description

- **tablespace_name**

  Specifies the tablespace to be modified.

  Value range: an existing table name
- **new_tablespace_name**

  Specifies the new name of a tablespace.

  The new name cannot start with **PG_**.

  Value range: a string. It must comply with the naming convention.
- **new_owner**

  Specifies the new owner of the tablespace.

  Value range: an existing username
- **tablespace_option**

  Sets or resets the parameters of a tablespace.

  Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - seq_page_cost: sets the optimizer to calculate the cost of obtaining disk pages in sequence. The default value is **1.0**.
  - **random_page_cost**: sets the optimizer to calculate the cost of obtaining disk pages in a non-sequential manner. The default value is **4.0**.

    NOTE

    - The value of **random_page_cost** is relative to that of **seq_page_cost**. It is meaningless when the value is equal to or less than the value of **seq_page_cost**.
    - The prerequisite for the default value **4.0** is that the optimizer uses indexes to scan table data and the hit ratio of table data in the cache is about 90%.
    - If the size of the table data space is smaller than that of the physical memory, decrease the value to a proper level. On the contrary, if the hit ratio of table data in the cache is lower than 90%, increase the value.
    - If random-access memory like SSD is adopted, the value can be decreased to a certain degree to reflect the cost of true random scan.

  Value range: a positive floating point number

- **RESIZE MAXSIZE**

  Resets the maximum size of tablespace.

  Value range:

  - **UNLIMITED**: No limit is set for the tablespace.
  - Determined by **space_size**. For details about the format, see **CREATE TABLESPACE**.

    NOTE

    - If the adjusted quota is smaller than the current tablespace usage, the adjustment is successful. You need to decrease the tablespace usage to a value less than the new quota before writing data to the tablespace.
    - You can also use the following statement to change the value of **MAXSIZE**:

      ```
      ALTER TABLESPACE tablespace_name RESIZE MAXSIZE
       { 'UNLIMITED' | 'space_size'};
      ```

Examples

See **Examples** in **CREATE TABLESPACE**.

CREATE TABLESPACE and **DROP TABLESPACE**

12.14.33 ALTER TEXT SEARCH CONFIGURATION

Function

ALTER TEXT SEARCH CONFIGURATION modifies the definition of a text search configuration. You can modify its mappings from token types to dictionaries, change the configuration's name or owner, or modify the parameters.

The **ADD MAPPING FOR** form installs a list of dictionaries to be consulted for the specified token types; an error will be generated if there is already a mapping for any of the token types.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The **ALTER MAPPING FOR** form removes existing mapping for those token types and then adds specified mappings.

ALTER MAPPING REPLACE ... WITH ... and **ALTER MAPPING FOR... REPLACE ... WITH ...** options replace **old_dictionary** with **new_dictionary**. Note that only when **pg_ts_config_map** has tuples corresponding to **maptokentype** and **old_dictionary**, the update will succeed. If the update fails, no messages are returned.

The **DROP MAPPING FOR** form deletes all dictionaries for the specified token types in the text search configuration. If **IF EXISTS** is not specified and the string type mapping specified by **DROP MAPPING FOR** does not exist in text search configuration, an error will occur in the database.

Precautions

- If a search configuration is referenced (to create indexes), users are not allowed to modify the text search configuration.
- To use **ALTER TEXT SEARCH CONFIGURATION**, you must be the owner of the configuration.

Syntax

- Add text search configuration string mapping.

```
ALTER TEXT SEARCH CONFIGURATION name
    ADD MAPPING FOR token_type [, ... ] WITH dictionary_name [, ... ];
```

- Modify the text search configuration dictionary syntax.

```
ALTER TEXT SEARCH CONFIGURATION name
    ALTER MAPPING FOR token_type [, ... ] REPLACE old_dictionary WITH new_dictionary;
```

- Modify the text search configuration string.

```
ALTER TEXT SEARCH CONFIGURATION name
    ALTER MAPPING FOR token_type [, ... ] WITH dictionary_name [, ... ];
```

- Change the text search configuration dictionary.

```
ALTER TEXT SEARCH CONFIGURATION name
    ALTER MAPPING REPLACE old_dictionary WITH new_dictionary;
```

- Remove text search configuration string mapping.

```
ALTER TEXT SEARCH CONFIGURATION name
    DROP MAPPING [ IF EXISTS ] FOR token_type [, ... ];
```

- Rename the owner of text search configuration.

```
ALTER TEXT SEARCH CONFIGURATION name OWNER TO new_owner;
```

- Rename the text search configuration.

```
ALTER TEXT SEARCH CONFIGURATION name RENAME TO new_name;
```

- Rename the namespace of text search configuration.

```
ALTER TEXT SEARCH CONFIGURATION name SET SCHEMA new_schema;
```

- Modify the attributes of the text search configuration.

```
ALTER TEXT SEARCH CONFIGURATION name SET ( { configuration_option = value } [, ...] );
```

- Reset the attributes of text search configuration.

```
ALTER TEXT SEARCH CONFIGURATION name RESET ( {configuration_option} [, ...] );
```

Parameter Description

- **name**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the name (optionally schema-qualified) of an existing text search configuration.

- **token_type**

  Specifies the name of a token type that is emitted by the configuration's parser. For details, see **Parser**.

- **dictionary_name**

  Specifies the name of a text search dictionary. If multiple dictionaries are listed, they are searched in the specified order.

- **old_dictionary**

  Specifies the name of a text search dictionary to be replaced in the mapping.

- **new_dictionary**

  Specifies the name of a text search dictionary to be substituted for **old_dictionary**.

- **new_owner**

  Specifies the new owner of the text search configuration.

- **new_name**

  Specifies the new name of the text search configuration.

- **new_schema**

  Specifies the new schema for the text search configuration.

- **configuration_option**

  Specifies the text search configuration option. For details, see **CREATE TEXT SEARCH CONFIGURATION**.

- **value**

  Specifies the value of text search configuration option.

Examples

```
-- Create a text search configuration.
openGauss=# CREATE TEXT SEARCH CONFIGURATION english_1 (parser=default);
CREATE TEXT SEARCH CONFIGURATION

-- Add text search configuration string mapping.
openGauss=# ALTER TEXT SEARCH CONFIGURATION english_1 ADD MAPPING FOR word WITH
simple,english_stem;
ALTER TEXT SEARCH CONFIGURATION

-- Add text search configuration string mapping.
openGauss=# ALTER TEXT SEARCH CONFIGURATION english_1 ADD MAPPING FOR email WITH
english_stem, french_stem;
ALTER TEXT SEARCH CONFIGURATION

-- Query information about the text search configuration.
openGauss=# SELECT b.cfgname,a.maptokentype,a.mapseqno,a.mapdict,c.dictname FROM
pg_ts_config_map a,pg_ts_config b, pg_ts_dict c WHERE a.mapcfg=b.oid AND a.mapdict=c.oid AND
b.cfgname='english_1' ORDER BY 1,2,3,4,5;
  cfgname  | maptokentype | mapseqno | mapdict |   dictname
-----------+--------------+----------+---------+--------------
 english_1 |            2 |        1 |    3765 | simple
 english_1 |            2 |        2 |   12960 | english_stem
 english_1 |            4 |        1 |   12960 | english_stem
 english_1 |            4 |        2 |   12964 | french_stem
(4 rows)

-- Add text search configuration string mapping.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
openGauss=# ALTER TEXT SEARCH CONFIGURATION english_1 ALTER MAPPING REPLACE french_stem with german_stem;
ALTER TEXT SEARCH CONFIGURATION

-- Query information about the text search configuration.
openGauss=# SELECT b.cfgname,a.maptokentype,a.mapseqno,a.mapdict,c.dictname FROM pg_ts_config_map a,pg_ts_config b, pg_ts_dict c WHERE a.mapcfg=b.oid AND a.mapdict=c.oid AND b.cfgname='english_1' ORDER BY 1,2,3,4,5;
  cfgname  | maptokentype | mapseqno | mapdict |   dictname
-----------+--------------+----------+---------+--------------
 english_1 |            2 |        1 |    3765 | simple
 english_1 |            2 |        2 |   12960 | english_stem
 english_1 |            4 |        1 |   12960 | english_stem
 english_1 |            4 |        2 |   12966 | german_stem
(4 rows)
```

See **Examples** in **CREATE TEXT SEARCH CONFIGURATION**.

Helpful Links

CREATE TEXT SEARCH CONFIGURATION and **DROP TEXT SEARCH CONFIGURATION**

12.14.34 ALTER TEXT SEARCH DICTIONARY

Function

ALTER TEXT SEARCH DICTIONARY modifies the definition of a full-text search dictionary, including its parameters, name, owner, and schema.

Precautions

- Predefined dictionaries do not support the **ALTER** operations.
- Only the owner of a dictionary or a system administrator can perform the **ALTER** operations.
- After a dictionary is created or modified, any modification to the customized dictionary definition file in the **filepath** directory does not affect the dictionary in the database. To use these modifications in the database, run the **ALTER TEXT SEARCH DICTIONARY** statement to update the definition file of the corresponding dictionary.

Syntax

- Modify the dictionary definition.
  ```
  ALTER TEXT SEARCH DICTIONARY name (
      option [ = value ] [, ... ]
  );
  ```
- Rename a dictionary.
  ```
  ALTER TEXT SEARCH DICTIONARY name RENAME TO new_name;
  ```
- Set the schema of the dictionary.
  ```
  ALTER TEXT SEARCH DICTIONARY name SET SCHEMA new_schema;
  ```
- Change the owner of the dictionary.
  ```
  ALTER TEXT SEARCH DICTIONARY name OWNER TO new_owner;
  ```

Parameter Description

- **name**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the name of an existing dictionary. (If you do not specify a schema name, the dictionary in the current schema will be used.)

Value range: an existing dictionary name

- **option**

  Specifies the name of a parameter to be modified. Each type of dictionaries has a template containing their custom parameters. Parameters function in a way irrelevant to their setting sequence. For details about the parameters, see **option**.

  NOTE

  - The value of **TEMPLATE** in the dictionary cannot be changed.
  - To specify a dictionary, specify both the dictionary definition file path (**FILEPATH**) and the file name.
  - The name of a dictionary definition file can contain only lowercase letters, digits, and underscores (_).

- **value**

  Specifies the new value of a parameter. If the equal sign (=) and *value* are omitted, the previous settings of the option are deleted and the default value is used.

  Value range: valid values defined by **option**.

- **new_name**

  Specifies the new name of a dictionary.

  Value range: a string, which complies with the identifier naming convention. A value can contain a maximum of 63 characters.

- **new_owner**

  Specifies the new owner of a dictionary.

  Value range: an existing username

- **new_schema**

  Specifies the new schema of a dictionary.

  Value range: an existing schema

Examples

```
-- Modify the definition of stop words in Snowball dictionaries. Retain the values of other parameters.
openGauss=# ALTER TEXT SEARCH DICTIONARY my_dict ( StopWords = newrussian, FilePath = 'file:///home/dicts' );

-- Modify the Language parameter in Snowball dictionaries and delete the definition of stop words.
openGauss=# ALTER TEXT SEARCH DICTIONARY my_dict (Language = dutch, StopWords);

-- Update the dictionary definition and do not change any other content.
openGauss=# ALTER TEXT SEARCH DICTIONARY my_dict ( dummy );
```

12.14.35 ALTER TRIGGER

Function

ALTER TRIGGER renames a trigger.

NOTE

Currently, only the name can be modified.

Precautions

Only the owner of a table where the trigger is created and a system administrator can run the **ALTER TRIGGER** statement.

Syntax

```
ALTER TRIGGER trigger_name ON table_name RENAME TO new_name;
```

Parameter Description

- **trigger_name**

  Specifies the name of the trigger to be modified.

  Value range: an existing trigger

- **table_name**

  Specifies the name of the table where the trigger to be modified is located.

  Value range: an existing table having a trigger

- **new_name**

  Specifies the new name after modification.

  Value range: a string that complies with the identifier naming convention. A value contains a maximum of 63 characters and cannot be the same as other triggers on the same table.

Examples

For details, see **CREATE TRIGGER**.

Helpful Links

CREATE TRIGGER, **DROP TRIGGER**, and **ALTER TABLE**

12.14.36 ALTER TYPE

Function

ALTER TYPE modifies the definition of a type.

Precautions

Only the type owner or a user granted with the ALTER permission can run the **ALTER TYPE** command. The system administrator has this permission by default.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

To modify the owner or schema of a type, you must be a type owner or system administrator and a member of the new owner role.

Syntax

- Modify a type.

```
ALTER TYPE name action [, ... ]
ALTER TYPE name OWNER TO { new_owner | CURRENT_USER | SESSION_USER }
ALTER TYPE name RENAME ATTRIBUTE attribute_name TO new_attribute_name [ CASCADE | RESTRICT ]
ALTER TYPE name RENAME TO new_name
ALTER TYPE name SET SCHEMA new_schema
ALTER TYPE name ADD VALUE [ IF NOT EXISTS ] new_enum_value [ { BEFORE | AFTER } neighbor_enum_value ]
ALTER TYPE name RENAME VALUE existing_enum_value TO new_enum_value

where action is one of:
    ADD ATTRIBUTE attribute_name data_type [ COLLATE collation ] [ CASCADE | RESTRICT ]
    DROP ATTRIBUTE [ IF EXISTS ] attribute_name [ CASCADE | RESTRICT ]
    ALTER ATTRIBUTE attribute_name [ SET DATA ] TYPE data_type [ COLLATE collation ] [ CASCADE | RESTRICT ]
```

- Add a new attribute to a composite type.

```
ALTER TYPE name ADD ATTRIBUTE attribute_name data_type [ COLLATE collation ] [ CASCADE | RESTRICT ]
```

- Delete an attribute from a composite type.

```
ALTER TYPE name DROP ATTRIBUTE [ IF EXISTS ] attribute_name [ CASCADE | RESTRICT ]
```

- Change the type of an attribute in a composite type.

```
ALTER TYPE name ALTER ATTRIBUTE attribute_name [ SET DATA ] TYPE data_type [ COLLATE collation ] [ CASCADE | RESTRICT ]
```

- Change the owner of a type.

```
ALTER TYPE name OWNER TO { new_owner | CURRENT_USER | SESSION_USER }
```

- Change the name of a type or the name of an attribute in a composite type.

```
ALTER TYPE name RENAME TO new_name
ALTER TYPE name RENAME ATTRIBUTE attribute_name TO new_attribute_name [ CASCADE | RESTRICT ]
```

- Move a type to a new schema.

```
ALTER TYPE name SET SCHEMA new_schema
```

- Add a new value to an enumerated type.

```
ALTER TYPE name ADD VALUE [ IF NOT EXISTS ] new_enum_value [ { BEFORE | AFTER } neighbor_enum_value ]
```

- Change an enumerated value in the value list.

```
ALTER TYPE name RENAME VALUE existing_enum_value TO new_enum_value
```

Parameter Description

- **name**

  Specifies the name of an existing type that needs to be modified (optionally schema-qualified).

- **new_name**

  Specifies the new name of the type.

- **new_owner**

  Specifies the new owner of the type.

- **new_schema**

  Specifies the new schema of the type.

- **attribute_name**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the name of the attribute to be added, modified, or deleted.

- **new_attribute_name**

  Specifies the new name of the attribute to be renamed.

- **data_type**

  Specifies the data type of the attribute to be added, or the new type of the attribute to be modified.

- **new_enum_value**

  Specifies a new enumerated value. It is a non-null string with a maximum length of 64 bytes.

- **neighbor_enum_value**

  Specifies an existing enumerated value before or after which a new enumerated value will be added.

- **existing_enum_value**

  Specifies an enumerated value to be changed. It is a non-null string with a maximum length of 64 bytes.

- **CASCADE**

  Determines that the type to be modified, its associated records, and subtables that inherit the type will all be updated.

- **RESTRICT**

  Refuses to update the associated records of the modified type. This is the default action.

NOTICE

- **ADD ATTRIBUTE**, **DROP ATTRIBUTE**, and **ALTER ATTRIBUTE** can be combined for processing. For example, it is possible to add several attributes or change the types of several attributes at the same time in one command.
- To modify a schema of a type, you must have the **CREATE** permission on the new schema. To alter the owner, you must be a direct or indirect member of the new owner role, and that member must have **CREATE** permission on the schema of this type (these restrictions enforce that the alter owner will not do anything that cannot be done by deleting and rebuilding the type). However, the system administrator can modify the rights of any type in any way. To add an attribute or modify the type of an attribute, you must also have the **USAGE** permission of this type.

Example

See **Examples** in **CREATE TYPE**.

Helpful Links

CREATE TYPE and **DROP TYPE**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.14.37 ALTER USER

Function

ALTER USER modifies the attributes of a database user.

Precautions

Session parameters modified by **ALTER USER** apply to a specified user and take effect in the next session.

Syntax

- Modify user permissions or other information.

```
ALTER USER user_name [ [ WITH ] option [ ... ] ];
```

The **option** clause is as follows:

```
{ CREATEDB | NOCREATEDB }
    | { CREATEROLE | NOCREATEROLE }
    | { INHERIT | NOINHERIT }
    | { AUDITADMIN | NOAUDITADMIN }
    | { SYSADMIN | NOSYSADMIN }
    | {MONADMIN | NOMONADMIN}
    | {OPRADMIN | NOOPRADMIN}
    | {POLADMIN | NOPOLADMIN}
    | { USEFT | NOUSEFT }
    | { LOGIN | NOLOGIN }
    | { REPLICATION | NOREPLICATION }
    | {INDEPENDENT | NOINDEPENDENT}
    | {VCADMIN | NOVCADMIN}
    | {PERSISTENCE | NOPERSISTENCE}
    | CONNECTION LIMIT connlimit
    | [ ENCRYPTED | UNENCRYPTED ] PASSWORD { 'password' [EXPIRED] | DISABLE | EXPIRED }
    | [ ENCRYPTED | UNENCRYPTED ] IDENTIFIED BY { 'password' [ REPLACE 'old_password' |
EXPIRED ] | DISABLE }
    | VALID BEGIN 'timestamp'
    | VALID UNTIL 'timestamp'
    | RESOURCE POOL 'respool'
    | USER GROUP 'groupuser'
    | PERM SPACE 'spacelimit'
    | TEMP SPACE 'tmpspacelimit'
    | SPILL SPACE 'spillspacelimit'
    | NODE GROUP logic_cluster_name
    | PGUSER
```

- Change the username.

```
ALTER USER user_name
    RENAME TO new_name;
```

- Lock or unlock.

```
ALTER USER user_name
    ACCOUNT { LOCK | UNLOCK };
```

Parameter Description

- **user_name**

  Specifies the current username.

  Value range: an existing username. If a username contains uppercase letters, enclose the name with double quotation marks ("").

- **new_password**

  Specifies a new password.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The new password must:

- Differ from the old password.
- Contain at least eight characters. This is the default length.
- Differ from the username or the username spelled backward.
- Contain at least three types of the following four types of characters: uppercase characters (A to Z), lowercase characters (a to z), digits (0 to 9), and special characters, including: ~!@#$%^&*()-_=+\|[{}];:,<.>/? If the password contains characters other than the preceding characters, an error will be reported during statement execution.

Value range: a string

- **old_password**

  Specifies the old password.

- **ACCOUNT LOCK | ACCOUNT UNLOCK**
  - **ACCOUNT LOCK**: locks an account to forbid login to databases.
  - **ACCOUNT UNLOCK**: unlocks an account to allow login to databases.
- **PGUSER**

  In the current version, the **PGUSER** attribute of a user cannot be modified.

For details about other parameters, see "Parameter Description" in **CREATE ROLE** and **ALTER ROLE**.

NOTICE

The current version does not support the setting of user-level parameters.

Examples

See **Examples** in **CREATE USER**.

Helpful Links

CREATE ROLE, **CREATE USER**, and **DROP USER**

12.14.38 ALTER VIEW

Function

ALTER VIEW modifies all auxiliary attributes of a view. (To modify the query definition of a view, use **CREATE OR REPLACE VIEW**.)

Precautions

Only the view owner or a user granted with the ALTER permission can run the **ALTER VIEW** command. The system administrator has this permission by default. The following is permission constraints depending on attributes to be modified:

- To modify the schema of a view, you must be the owner of the view or system administrator and have the CREATE permission on the new schema.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- To modify the owner of a view, you must be the owner of the view or system administrator and a member of the new owner role, with the CREATE permission on the schema of the view.
- Do not change the type of a column in a view.

Syntax

- Set the default value of a view column.
```
ALTER VIEW [ IF EXISTS ] view_name
    ALTER [ COLUMN ] column_name SET DEFAULT expression;
```
- Remove the default value of a view column.
```
ALTER VIEW [ IF EXISTS ] view_name
    ALTER [ COLUMN ] column_name DROP DEFAULT;
```
- Change the owner of a view.
```
ALTER VIEW [ IF EXISTS ] view_name
    OWNER TO new_owner;
```
- Rename a view.
```
ALTER VIEW [ IF EXISTS ] view_name
    RENAME TO new_name;
```
- Set the schema of a view.
```
ALTER VIEW [ IF EXISTS ] view_name
    SET SCHEMA new_schema;
```
- Set the options of a view.
```
ALTER VIEW [ IF EXISTS ] view_name
    SET ( { view_option_name [ = view_option_value ] } [, ... ] );
```
- Reset the options of a view.
```
ALTER VIEW [ IF EXISTS ] view_name
    RESET ( view_option_name [, ... ] );
```

Parameter Description

- **IF EXISTS**

  If this option is used, no error is generated when the view does not exist, and only a message is displayed.
- **view_name**

  Specifies the view name, which can be schema-qualified.

  Value range: a string. It must comply with the naming convention.
- **column_name**

  Specifies an optional list of names to be used for columns of the view. If not given, the column names are deduced from the query.

  Value range: a string. It must comply with the naming convention.
- **SET/DROP DEFAULT**

  Sets or deletes the default value of a column. This parameter does not take effect.
- **new_owner**

  Specifies the new owner of a view.
- **new_name**

  Specifies the new view name.
- **new_schema**

  Specifies the new schema of the view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **view_option_name [= view_option_value]**

  Specifies an optional parameter for a view.

  Currently, **view_option_name** supports only the **security_barrier** parameter. This parameter is used when the view attempts to provide row-level security.

  Value range: Boolean type. It can be **TRUE** or **FALSE**.

Examples

```
-- Create a view consisting of rows with c_customer_sk less than 150.
openGauss=# CREATE VIEW tpcds.customer_details_view_v1 AS
    SELECT * FROM tpcds.customer
    WHERE c_customer_sk < 150;

-- Rename a view.
openGauss=# ALTER VIEW tpcds.customer_details_view_v1 RENAME TO customer_details_view_v2;

-- Change the schema of a view.
openGauss=# ALTER VIEW tpcds.customer_details_view_v2 SET schema public;

-- Delete a view.
openGauss=# DROP VIEW public.customer_details_view_v2;
```

CREATE VIEW and **DROP VIEW**

12.14.39 ALTER WORKLOAD GROUP

Function

ALTER WORKLOAD GROUP modifies a workload group and sets the number of concurrent SQL statements.

Precautions

Only a user with the **ALTER** permission on the current database can perform this operation.

Syntax

```
ALTER WORKLOAD GROUP wg_name
    USING RESOURCE POOL pool_name [ WITH ( ACT_STATEMENTS = count ) ];
```

Parameter Description

- **wg_name**

  Specifies the workload group name.

  NOTE

  The workload group must be unique in a database.

  Value range: a string. It must comply with the naming convention.

- **pool_name**

  Specifies the name of a resource pool.

  Value range: a string that indicates an existing resource pool

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **counts**

  Specifies the number of concurrent SQL statements in the resource pool that the workload group belongs to.

  Value range: an integer ranging from –1 to 2147483647

Examples

```
-- Create a resource pool named pool1.
openGauss=# CREATE RESOURCE POOL pool1;

-- Create a workload group named group1.
openGauss=# CREATE WORKLOAD GROUP group1;

-- Change the maximum number of concurrent SQL statements in workload group group1 to 10. The workload group is associated with the resource pool pool1.
openGauss=# ALTER WORKLOAD GROUP group1 USING RESOURCE POOL pool1 WITH (ACT_STATEMENTS=10);

-- Delete workload group group1 and resource pool pool1.
openGauss=# DROP WORKLOAD GROUP group1;
openGauss=# DROP RESOURCE POOL pool1;
```

Helpful Links

CREATE WORKLOAD GROUP and DROP WORKLOAD GROUP

12.14.40 ANALYZE | ANALYSE

Function

ANALYZE collects statistics on ordinary tables in a database, and stores the results in the **PG_STATISTIC** system catalog. The execution plan generator uses these statistics to determine which one is the most effective execution plan.

If no parameter is specified, **ANALYZE** analyzes each table and partitioned table in the current database. You can also specify the **table_name**, **column**, and **partition_name** parameters to restrict the analysis to a specific table, column, or partitioned table.

ANALYZE | ANALYSE VERIFY is used to check whether data files of common tables (row-store and column-store tables) in a database are damaged.

Precautions

Non-temporary tables cannot be analyzed in an anonymous block, transaction block, function, or stored procedure. Temporary tables in a stored procedure can be analyzed but their statistics updates cannot be rolled back.

The **ANALYZE VERIFY** operation is used to detect abnormal scenarios. The **RELEASE** version is required. In the **ANALYZE VERIFY** scenario, remote read is not triggered. Therefore, the remote read parameter does not take effect. If the system detects that a page is damaged due to an error in a key system table, the system directly reports an error and does not continue the detection.

With no table specified, **ANALYZE** processes all the tables that the current user has permission to analyze in the current database. With a table specified, **ANALYZE** processes only that table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

To perform ANALYZE operation to a table, you must be a table owner or a user granted the VACUUM permission on the table. By default, the system administrator has this permission. However, database owners are allowed to **ANALYZE** all tables in their databases, except shared catalogs. (The restriction for shared catalogs means that a true database-wide **ANALYZE** can only be executed by the system administrator). **ANALYZE** skips tables on which users do not have permissions.

ANALYZE does not collect columns for which comparison or equivalent operations cannot be performed, for example, columns of the cursor type.

Syntax

- Collect statistics information about a table.
```
{ ANALYZE | ANALYSE } [ VERBOSE ]
    [ table_name [ ( column_name [, ...] ) ] ];
```
- Collect partition statistics on a partitioned table. This syntax is not supported currently.
```
{ ANALYZE | ANALYSE } [ VERBOSE ]
    table_name [ ( column_name [, ...] ) ] PARTITION ( patrition_name ) ;
```

  NOTE

  An ordinary partitioned table supports the syntax but not the function of collecting statistics about specified partitions.
- Collect statistics about a foreign table.
```
{ ANALYZE | ANALYSE } [ VERBOSE ]
    { foreign_table_name | FOREIGN TABLES };
```
- Collect statistics about multiple columns. (The current feature is a lab feature. Contact Huawei technical support before using it.)
```
{ ANALYZE | ANALYSE } [ VERBOSE ]
    table_name (( column_1_name, column_2_name [, ...] ));
```

  NOTE

  - When collecting statistics about multiple columns, set GUC parameter **default_statistics_target** to a negative value to sample data in percentage.
  - The statistics about a maximum of 32 columns can be collected at a time.
  - You are not allowed to collect statistics about multiple columns in system catalogs.
  - In logical cluster mode, only the administrator can perform ANALYZE on all tables in the database. Users associated with a logical cluster collect statistics only on tables in the logical cluster. (The current feature is a lab feature. Contact Huawei technical support before using it.)
- Check the data files in the current database.
```
{ ANALYZE | ANALYSE } VERIFY { FAST | COMPLETE };
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- In fast mode, DML operations need to be performed on the tables to be verified concurrently. As a result, an error is reported during the verification. In the current fast mode, data is directly read from the disk. When other threads modify files concurrently, the obtained data is incorrect. Therefore, you are advised to perform the verification offline.
- You can perform operations on the entire database. Because a large number of tables are involved, you are advised to save the result **gsql -d database -p port -f "verify.sql"> verify_warning.txt 2>&1** in redirection mode.
- Temporary tables and unlogged tables are not supported.
- NOTICE is used to check only tables that are visible to external systems. The detection of internal tables is included in the external tables on which NOTICE depends and is not displayed externally.
- This statement can be executed with error tolerance. The **Assert** of the debug version may cause the core to fail to execute commands. Therefore, you are advised to perform the operations in release mode.
- If a key system table is damaged during a full database operation, an error is reported and the operation stops.

- Check data files of tables and indexes.

```
{ ANALYZE | ANALYSE } VERIFY { FAST  |COMPLETE } table_name | index_name [ CASCADE ];
```

NOTE

- Operations on ordinary tables and index tables are supported, but **CASCADE** operations on indexes of index tables are not supported. The **CASCADE** mode is used to process all index tables of the primary table. When the index tables are checked separately, the **CASCADE** mode is not required.
- Temporary tables and unlogged tables are not supported.
- When the primary table is checked, the internal tables of the primary table, such as the toast table and cudesc table, are also checked.
- When the system displays a message indicating that the index table is damaged, you are advised to run the **reindex** command to recreate the index.

- Check the data files of the table partition.

```
{ ANALYZE | ANALYSE } VERIFY { FAST | COMPLETE } table_name PARTITION { (patrition_name) }
[ CASCADE ];
```

NOTE

- You can check a single partition of a table, but cannot perform the **CASCADE** operation on the indexes of an index table.
- Temporary tables and unlogged tables are not supported.

Parameter Description

- **VERBOSE**

  Enables the display of progress messages.

  NOTE

  If **VERBOSE** is specified, **ANALYZE** displays the progress information, indicating the table that is being processed. Statistics about tables are also displayed.

- **table_name**

  Specifies the name (possibly schema-qualified) of a specific table to analyze. If omitted, all regular tables (but not foreign tables) in the current database are analyzed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Currently, you can use ANALYZE to collect statistics on foreign tables of row-store tables and column-store tables.

Value range: an existing table name

- **column_name**, column_1_name, column_2_name

  Specifies the name of a specific column to analyze. All columns are analyzed by default.

  Value range: an existing column name

- **partition_name**

  Assumes the table is a partitioned table. You can specify **partition_name** following the keyword **PARTITION** to analyze the statistics of this table. Currently, **ANALYZE** can be performed on partitioned tables, but statistics of specified partitions cannot be analyzed.

  Value range: a partition name of a table

- **foreign_table_name**

  Specifies the name of the specific table to be analyzed (possibly schema-qualified).

  Value range: an existing table name

- **FOREIGN TABLES**

  Analyzes all foreign tables accessible to the current user.

- **index_name**

  Specifies the name of the specific index table to be analyzed (possibly schema-qualified).

  Value range: an existing table name

- **FAST|COMPLETE**

  For a row-store table, the **FAST** mode verifies the CRC and page header of the row-store table. If the verification fails, an alarm is generated. In **COMPLETE** mode, the pointer and tuple of the row-store table are parsed and verified. For a column-store table, the **FAST** mode verifies the CRC and magic of the column-store table. If the verification fails, an alarm is generated. In **COMPLETE** mode, the CU of the column-store table is parsed and verified.

- **CASCADE**

  In **CASCADE** mode, all indexes of the current table are verified.

Examples

-- Create a table.

```
openGauss=# CREATE TABLE customer_info
(
WR_RETURNED_DATE_SK       INTEGER                   ,
WR_RETURNED_TIME_SK       INTEGER                   ,
WR_ITEM_SK                INTEGER             NOT NULL,
WR_REFUNDED_CUSTOMER_SK   INTEGER
)
DISTRIBUTE BY HASH (WR_ITEM_SK);
```

-- Create a partitioned table.

```
openGauss=# CREATE TABLE customer_par
(
WR_RETURNED_DATE_SK       INTEGER                   ,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
WR_RETURNED_TIME_SK       INTEGER                       ,
WR_ITEM_SK                INTEGER                NOT NULL,
WR_REFUNDED_CUSTOMER_SK   INTEGER
)
DISTRIBUTE BY HASH (WR_ITEM_SK)
PARTITION BY RANGE(WR_RETURNED_DATE_SK)
(
PARTITION P1 VALUES LESS THAN(2452275),
PARTITION P2 VALUES LESS THAN(2452640),
PARTITION P3 VALUES LESS THAN(2453000),
PARTITION P4 VALUES LESS THAN(MAXVALUE)
)
ENABLE ROW MOVEMENT;
```

-- Run **ANALYZE** to update statistics.

```
openGauss=# ANALYZE customer_info;
```

-- Run **ANALYZE VERBOSE** statement to update statistics and display table information.

```
openGauss=# ANALYZE VERBOSE customer_info;
INFO:  analyzing "cstore.pg_delta_3394584009"(cn_5002 pid=53078)
INFO:  analyzing "public.customer_info"(cn_5002 pid=53078)
INFO:  analyzing "public.customer_info" inheritance tree(cn_5002 pid=53078)
ANALYZE
```

NOTE

If any environment-related fault occurs, check the logs of the CN.

-- Delete the table.

```
openGauss=# DROP TABLE customer_info;
openGauss=# DROP TABLE customer_par;
```

12.14.41 BEGIN

Function

BEGIN may be used to initiate an anonymous block or a single transaction. This section describes the syntax of **BEGIN** used to initiate an anonymous block. For details about the **BEGIN** syntax that initiates transactions, see **START TRANSACTION**.

An anonymous block is a structure that can dynamically create and execute stored procedure code instead of permanently storing code as a database object in the database.

Precautions

None

Syntax

- Enable an anonymous block.

```
[DECLARE [declare_statements]]
BEGIN
execution_statements
END;
/
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Start a transaction.

```
BEGIN [ WORK | TRANSACTION ]
 [
  {
    ISOLATION LEVEL { READ COMMITTED | READ UNCOMMITTED | SERIALIZABLE | REPEATABLE
READ }
    | { READ WRITE | READ ONLY }
   } [, ...]
 ];
```

Parameter Description

- **declare_statements**

  Declares a variable, including its name and type, for example, **sales_cnt int**.

- **execution_statements**

  Specifies the statement to be executed in an anonymous block.

  Value range: an existing function name

Examples

```
-- Generate a string using an anonymous block.
openGauss=# BEGIN
dbe_output.print_line('Hello');
END;
/
```

Helpful Links

START TRANSACTION

12.14.42 CALL

Function

CALL calls defined functions and stored procedures.

Precautions

The owner of a function or stored procedure, users granted with the **EXECUTE** permission on the function or stored procedure, or users granted with the **EXECUTE ANY FUNCTION** permission can call the function or stored procedure. The system administrator has the permission to call the function or stored procedure by default.

Syntax

```
CALL [ schema. ] { func_name | procedure_name } ( param_expr );
```

Parameter Description

- **schema**

  Specifies the name of the schema where a function or stored procedure is located.

- **func_name**

  Specifies the name of the function or stored procedure to be called.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: an existing role name

- **param_expr**

  Specifies a list of parameters in the function. Use := or => to separate a parameter name and its value. This method allows parameters to be placed in any order. If only parameter values are in the list, the value order must be the same as that defined in the function or stored procedure.

  Value range: an existing function parameter name or stored procedure parameter name

  NOTE

  The parameters include input parameters (whose name and type are separated by **IN**) and output parameters (whose name and type are separated by **OUT**). When you run the **CALL** statement to call a function or stored procedure, the parameter list must contain an output parameter for non-overloaded functions. You can set the output parameter to a variable or any constant. For details, see **Examples**. For an overloaded package function, the parameter list can have no output parameter, but the function may not be found. If an output parameter is contained, it must be a constant.

Examples

```
-- Create a function func_add_sql, calculate the sum of two integers, and return the result.
openGauss=# CREATE FUNCTION func_add_sql(num1 integer, num2 integer) RETURN integer
AS
BEGIN
RETURN num1 + num2;
END;
/

-- Transfer by parameter value.
openGauss=# CALL func_add_sql(1, 3);

-- Transfer by naming tag method.
openGauss=# CALL func_add_sql(num1 => 1,num2 => 3);
openGauss=# CALL func_add_sql(num2 := 2, num1 := 3);

-- Delete the function.
openGauss=# DROP FUNCTION func_add_sql;

-- Create a function with output parameters.
openGauss=# CREATE FUNCTION func_increment_sql(num1 IN integer, num2 IN integer, res OUT integer)
RETURN integer
AS
BEGIN
res := num1 + num2;
END;
/

-- Transfer a constant as an output parameter.
openGauss=# CALL func_increment_sql(1,2,1);

-- Transfer a variable as an output parameter.
openGauss=# DECLARE
res int;
BEGIN
func_increment_sql(1, 2, res);
dbe_output.print_line(res);
END;
/
-- Create an overloaded function.
openGauss=# create or replace procedure package_func_overload(col int, col2 out int) package
as
declare
    col_type text;
begin
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    col := 122;
        dbe_output.print_line('two out parameters ' || col2);
end;
/

openGauss=# create or replace procedure package_func_overload(col int, col2 out varchar)
package
as
declare
   col_type text;
begin
    col2 := '122';
        dbe_output.print_line('two varchar parameters ' || col2);
end;
/
-- Call the function.
openGauss=# call package_func_overload(1, 'test');
openGauss=# call package_func_overload(1, 1);

-- Delete the function.
openGauss=# DROP FUNCTION func_increment_sql;
```

12.14.43 CHECKPOINT

Function

A checkpoint is a point in the transaction log sequence at which all data files have been updated to reflect the information in the log. All data files will be flushed to a disk.

CHECKPOINT forces a transaction log checkpoint. By default, WALs periodically specify checkpoints in a transaction log. You may use **gs_guc** to specify run-time parameters **checkpoint_segments**, **checkpoint_timeout**, and **incremental_checkpoint_timeout** to adjust the atomized checkpoint intervals.

Precautions

- Only the system administrator and O&M administrator can invoke **CHECKPOINT**.
- **CHECKPOINT** forces an immediate checkpoint when the related command is issued, without waiting for a regular checkpoint scheduled by the system.

Syntax

```
CHECKPOINT;
```

Parameter Description

None

Examples

```
-- Set a checkpoint.
openGauss=# CHECKPOINT;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.14.44 CLEAN CONNECTION

Function

Clear idle or invalid network connections between the current CN and other specified CNs or DNs. This statement is used to clear the specified database and idle or invalid connections of a specified user cached in the current CN on a specified CN.

Precautions

1. In non-force mode, this function only clears connections between database cluster nodes (CNs/DNs) and does not affect client connections.
2. This function clears only idle and invalid connections cached on the CN. Normal connections that are being used are not cleared.
3. This function takes effect only on CNs and does not take effect on DNs.
4. You can query the **PG_STAT_GET_POOLER_STATUS()** function to check the cache connection and verify the clearing effect.
5. You are advised to perform this operation only when the network connection of the database is abnormal.

Syntax

```
CLEAN CONNECTION
   TO { COORDINATOR ( nodename [, ... ] ) | NODE ( nodename [, ... ] )| ALL [ CHECK ] [ FORCE ] }
   { FOR DATABASE dbname | TO USER username | FOR DATABASE dbname TO USER username };
```

Parameter Description

- **CHECK**

  This parameter can be specified only when the node list is specified as **TO ALL**. Setting this parameter will check whether a database is accessed by other sessions before its connections are cleared. If any sessions are detected before **DROP DATABASE** is executed, an error will be reported and the database will not be deleted.

- **FORCE**

  This parameter can be specified only when the node list is TO ALL. If this parameter is specified, all threads related to the specified dbname and username in the current CN receive the SIGTERM signal, the corresponding session is forcibly closed, the transaction is terminated, and the network connection is cleared.

- **COORDINATOR (nodename ,nodename ... }) | NODE (nodename , nodename ...) | ALL**

  This command is used to delete the idle or invalid connections between the current CN node and a specified node. There are three scenarios:

  – **COORDINATOR**: Delete the idle or invalid connections from the current CN to a specified CN.

  – **NODE**: Delete the idle or invalid connections from the current CN to a specified DN.

  – **ALL**: Delete the idle or invalid connections from the current CN to all nodes, including CNs and DNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: **nodename** is an existing node name.

- **dbname**

  Deletes connections to a specified database from the current CN. If this parameter is not specified, connections to all databases will be deleted.

  Value range: an existing database name

- **username**

  Deletes connections to a specified user from the current CN. If this parameter is not specified, connections of all users will be deleted.

  Value range: an existing username

Examples

```
-- Create user jack.
openGauss=# CREATE USER jack PASSWORD 'xxxxxxxxxx';

-- Delete the idle and invalid connections between the current CN and dn1 and dn2 in the template1 database.
openGauss=# CLEAN CONNECTION TO NODE (dn_6001_6002,dn_6003_6004) FOR DATABASE template1;

-- Delete the idle and invalid connections between the current CN and dn1 that are related to user jack.
openGauss=# CLEAN CONNECTION TO NODE (dn_6001_6002) TO USER jack;

-- Delete the connections between the current CN related to the postgres database and all nodes.
openGauss=# CLEAN CONNECTION TO ALL FORCE FOR DATABASE postgres;

-- Delete user jack.
openGauss=# DROP USER jack;
```

12.14.45 CLOSE

Function

CLOSE frees the resources associated with an open cursor.

Precautions

- After a cursor is closed, no subsequent operations are allowed on it.
- A cursor should be closed when it is no longer needed.
- Every non-holdable open cursor is implicitly closed when a transaction is terminated by **COMMIT** or **ROLLBACK**.
- A holdable cursor is implicitly closed if the transaction that created it aborts by **ROLLBACK**.
- If the cursor creation transaction is successfully committed, the holdable cursor remains open until an explicit **CLOSE** operation is executed, or the client disconnects.
- GaussDB does not have an explicit **OPEN** cursor statement. A cursor is considered open when it is declared. You can view all available cursors by querying the **pg_cursors** system view.

Syntax

```
CLOSE { cursor_name | ALL } ;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter Description

- **cursor_name**

  Specifies the name of a cursor to be closed.

- **ALL**

  Closes all open cursors.

Examples

See **Examples** in **FETCH**.

Helpful Links

FETCH and **MOVE**

12.14.46 CLUSTER

Function

CLUSTER is used to cluster a table based on an index.

CLUSTER instructs GaussDB to cluster the table specified by **table_name** based on the index specified by **index_name**. The index must have been defined by **table_name**.

When a table is clustered, it is physically reordered based on the index information. Clustering is a one-time operation. When the table is subsequently updated, the changes are not clustered. That is, no attempt is made to store new or updated rows according to their index order.

When a table is clustered, GaussDB records which index the table was clustered by. The form **CLUSTER table_name** reclusters the table using the same index as before. You can also use the **CLUSTER** or **SET WITHOUT CLUSTER** form of **ALTER TABLE** to set the index to be used for future cluster operations, or to clear any previous settings.

CLUSTER without any parameter reclusters all the previously-clustered tables in the current database that the calling user owns, or all such tables if called by an administrator.

When a table is being clustered, an **ACCESS EXCLUSIVE** lock is acquired on it. This prevents any other database operations (both read and write) from operating on the table until the **CLUSTER** is finished.

Precautions

- Only row-store B-tree indexes support **CLUSTER**.
- In the case where you are accessing single rows randomly within a table, the actual order of the data in the table is unimportant. However, if you tend to access some data more than others, and there is an index that groups them together, it is helpful by using **CLUSTER**. If you are requesting a range of indexed values from a table, or a single indexed value that has multiple rows that match, **CLUSTER** will help because once the index identifies the table page for the first row that matches, all other rows that match are probably

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

already on the same table page, and so you save disk accesses and speed up the query.

- When an index scan is used, a temporary copy of the table is created that contains the table data in the index order. Temporary copies of each index on the table are created as well. Therefore, you need free space on disk at least equal to the sum of the table size and the total index size.
- Because **CLUSTER** remembers which indexes are clustered, one can cluster the tables manually the first time, then set up a time like **VACUUM** without any parameters, so that the desired tables are periodically reclustered.
- Because the optimizer records statistics about the ordering of tables, it is advisable to run **ANALYZE** on the newly clustered table. Otherwise, the optimizer might make poor choices of query plans.
- **CLUSTER** cannot be executed in transactions.
- If the **xc_maintenance_mode** parameter is not enabled, **CLUSTER** skips all system catalogs.

Syntax

- Cluster a table.
  ```
  CLUSTER [ VERBOSE ] table_name [ USING index_name ];
  ```
- Cluster a partition.
  ```
  CLUSTER [ VERBOSE ] table_name PARTITION ( partition_name ) [ USING index_name ];
  ```
- Recluster a table.
  ```
  CLUSTER [ VERBOSE ];
  ```

Parameter Description

- **VERBOSE**

  Enables the display of progress messages.
- **table_name**

  Specifies the table name.

  Value range: an existing table name
- **index_name**

  Specifies the index name.

  Value range: an existing index name
- **partition_name**

  Specifies the partition name.

  Value range: an existing partition name

Examples

```
-- Create a partitioned table.
openGauss=# CREATE TABLE tpcds.inventory_p1
(
    INV_DATE_SK             INTEGER             NOT NULL,
    INV_ITEM_SK             INTEGER             NOT NULL,
    INV_WAREHOUSE_SK        INTEGER             NOT NULL,
    INV_QUANTITY_ON_HAND    INTEGER
)
DISTRIBUTE BY HASH(INV_ITEM_SK)
PARTITION BY RANGE(INV_DATE_SK)
(
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    PARTITION P1 VALUES LESS THAN(2451179),
    PARTITION P2 VALUES LESS THAN(2451544),
    PARTITION P3 VALUES LESS THAN(2451910),
    PARTITION P4 VALUES LESS THAN(2452275),
    PARTITION P5 VALUES LESS THAN(2452640),
    PARTITION P6 VALUES LESS THAN(2453005),
    PARTITION P7 VALUES LESS THAN(MAXVALUE)
);

-- Create an index named ds_inventory_p1_index1.
openGauss=# CREATE INDEX ds_inventory_p1_index1 ON tpcds.inventory_p1 (INV_ITEM_SK) LOCAL;

-- Cluster the tpcds.inventory_p1 table.
openGauss=# CLUSTER tpcds.inventory_p1 USING ds_inventory_p1_index1;

-- Cluster the p3 partition.
openGauss=# CLUSTER tpcds.inventory_p1 PARTITION (p3) USING ds_inventory_p1_index1;

-- Cluster the tables that can be clustered in the database.
openGauss=# CLUSTER;

-- Delete the index.
openGauss=# DROP INDEX tpcds.ds_inventory_p1_index1;

-- Drop the partitioned table.
openGauss=# DROP TABLE tpcds.inventory_p1;
```

Suggestions

- cluster
  - It is recommended that you run **ANALYZE** on a newly clustered table. Otherwise, the optimizer might make poor choices of query plans.
  - **CLUSTER** cannot be executed in transactions.

12.14.47 COMMENT

Function

COMMENT defines or changes the comment of an object.

Precautions

- Each object stores only one comment. Therefore, you need to modify a comment and issue a new **COMMENT** command to the same object. To delete the comment, write **NULL** at the position of the text string. When an object is deleted, the comment is automatically deleted.
- Currently, there is no security protection for viewing comments. Any user connected to a database can view all the comments for objects in the database. For shared objects such as databases, roles, and tablespaces, comments are stored globally so any user connected to any database in the cluster can see all the comments for shared objects. Therefore, do not put security-critical information in comments.
- To comment objects, you must be an object owner or user granted the COMMENT permission. The system administrator has this permission by default.
- Roles do not have owners, so the rule for **COMMENT ON ROLE** is that you must be an administrator to comment on an administrator role, or have the **CREATEROLE** permission to comment on non-administrator roles. A system administrator can comment on all objects.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

```
COMMENT ON
{
  AGGREGATE agg_name (agg_type [, ...] ) |
  CAST (source_type AS target_type) |
  COLLATION object_name |
  COLUMN { table_name.column_name | view_name.column_name } |
  CONSTRAINT constraint_name ON table_name |
  CONVERSION object_name |
  DATABASE object_name |
  DOMAIN object_name |
  EXTENSION object_name |
  FOREIGN DATA WRAPPER object_name |

  TABLESPACE object_name |
  TEXT SEARCH CONFIGURATION object_name |
  TEXT SEARCH DICTIONARY object_name |
  TEXT SEARCH PARSER object_name |
  TEXT SEARCH TEMPLATE object_name |
  TYPE object_name |
  VIEW object_name
}
  IS 'text';
```

Parameter Description

- **agg_name**

  Specifies the new name of an aggregation function.

- **agg_type**

  Specifies the data type of the aggregation function parameters.

- **source_type**

  Specifies the source data type of the cast.

- **target_type**

  Specifies the target data type of the cast.

- **object_name**

  Specifies the name of an object.

- **table_name.column_name**

  view_name.column_name

  Specifies the column whose comment is defined or modified. You can add the table name or view name as the prefix.

- **constraint_name**

  Specifies the table constraint whose comment is defined or modified.

- **table_name**

  Specifies the name of a table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **function_name**

  Specifies the function whose comment is defined or modified.

- **argmode,argname,argtype**

  Specifies the schema, name, and type of the function parameters.

- **large_object_oid**

  Specifies the OID of the large object whose comment is defined or modified.

- **operator_name**

  Specifies the name of the operator.

- **left_type,right_type**

  Specifies the data type of the operator parameters (optionally schema-qualified). If the prefix or suffix operator does not exist, the **NONE** option can be added.

- **text**

  Specifies the comment content.

Examples

```
openGauss=# CREATE TABLE tpcds.customer_demographics_t2
(
   CD_DEMO_SK               INTEGER               NOT NULL,
   CD_GENDER                CHAR(1)                     ,
   CD_MARITAL_STATUS        CHAR(1)                     ,
   CD_EDUCATION_STATUS      CHAR(20)                    ,
   CD_PURCHASE_ESTIMATE     INTEGER                     ,
   CD_CREDIT_RATING         CHAR(10)                    ,
   CD_DEP_COUNT             INTEGER                     ,
   CD_DEP_EMPLOYED_COUNT    INTEGER                     ,
   CD_DEP_COLLEGE_COUNT     INTEGER
)
WITH (ORIENTATION = COLUMN,COMPRESSION=MIDDLE)
DISTRIBUTE BY HASH (CD_DEMO_SK);

-- Comment out the tpcds.customer_demographics_t2.cd_demo_sk column.
openGauss=# COMMENT ON COLUMN tpcds.customer_demographics_t2.cd_demo_sk IS 'Primary key of
customer demographics table.';

-- Create a view consisting of rows with c_customer_sk less than 150.
openGauss=# CREATE VIEW tpcds.customer_details_view_v2 AS
   SELECT *
   FROM tpcds.customer
   WHERE c_customer_sk < 150;

-- Comment out the tpcds.customer_details_view_v2 view.
openGauss=# COMMENT ON VIEW tpcds.customer_details_view_v2 IS 'View of customer detail';

-- Delete the view.
openGauss=# DROP VIEW tpcds.customer_details_view_v2;

-- Delete tpcds.customer_demographics_t2.
openGauss=# DROP TABLE tpcds.customer_demographics_t2;
```

12.14.48 COMMIT | END

Function

COMMIT or **END** commits all operations of a transaction.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

Only the creator of a transaction or a system administrator can run the **COMMIT** command. The creation and commit operations must be in different sessions.

Syntax

```
{ COMMIT | END } [ WORK | TRANSACTION ] ;
```

Parameter Description

- **COMMIT | END**

  Commits the current transaction and makes all changes made by the transaction become visible to others.

- **WORK | TRANSACTION**

  Specifies an optional keyword, which has no effect except increasing readability.

Examples

```
-- Create a table.
openGauss=# CREATE TABLE tpcds.customer_demographics_t2
(
    CD_DEMO_SK               INTEGER               NOT NULL,
    CD_GENDER                CHAR(1)                       ,
    CD_MARITAL_STATUS        CHAR(1)                       ,
    CD_EDUCATION_STATUS      CHAR(20)                      ,
    CD_PURCHASE_ESTIMATE     INTEGER                       ,
    CD_CREDIT_RATING         CHAR(10)                      ,
    CD_DEP_COUNT             INTEGER                       ,
    CD_DEP_EMPLOYED_COUNT    INTEGER                       ,
    CD_DEP_COLLEGE_COUNT     INTEGER
)
WITH (ORIENTATION = COLUMN,COMPRESSION=MIDDLE)
DISTRIBUTE BY HASH (CD_DEMO_SK);

-- Start a transaction.
openGauss=# START TRANSACTION;

-- Insert data.
openGauss=# INSERT INTO tpcds.customer_demographics_t2 VALUES(1,'M', 'U', 'DOCTOR DEGREE', 1200,
'GOOD', 1, 0, 0);
openGauss=# INSERT INTO tpcds.customer_demographics_t2 VALUES(2,'F', 'U', 'MASTER DEGREE', 300,
'BAD', 1, 0, 0);

-- Commit the transaction to make all changes permanent.
openGauss=# COMMIT;

-- Query data.
openGauss=# SELECT * FROM tpcds.customer_demographics_t2;

-- Delete the tpcds.customer_demographics_t2 table.
openGauss=# DROP TABLE tpcds.customer_demographics_t2;
```

ROLLBACK

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.14.49 COMMIT PREPARED

Function

COMMIT PREPARED commits a prepared two-phase transaction.

Precautions

- The function is only available in maintenance mode (when GUC parameter **xc_maintenance_mode** is **on**). Exercise caution when enabling the mode. It is used by maintenance engineers for troubleshooting. Common users should not use the mode.
- Only the transaction creators or system administrators can run the **COMMIT PREPARED** command. The creation and commit operations must be in different sessions.
- The transaction function is maintained automatically by the database, and should be not visible to users.

Syntax

```
COMMIT PREPARED transaction_id ;
COMMIT PREPARED transaction_id WITH CSN;
```

Parameter Description

- **transaction_id**

  Specifies the identifier of the transaction to be committed. The identifier must be different from those for current prepared transactions.

- **CSN(commit sequence number)**

  Specifies the sequence number of the transaction to be committed. It is a 64-bit, incremental, unsigned number.

Examples

```
--Commit the transaction whose identifier is trans_test.
openGauss=# COMMIT PREPARED 'trans_test';
```

Helpful Links

PREPARE TRANSACTION and **ROLLBACK PREPARED**

12.14.50 COPY

Function

COPY copies data between tables and files.

COPY FROM copies data from a file to a table, and **COPY TO** copies data from a table to a file.

Precautions

- When the **enable_copy_server_files** parameter is disabled, only the initial user is allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

statement. When the **enable_copy_server_files** parameter is enabled, users with the **SYSADMIN** permission or users who inherit the **gs_role_copy_files** permission of the built-in role are allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME** statement. By default, database configuration files and key files are not allowed, and you can run **COPY FROM FILENAME** or **COPY TO FILENAME** for certificate files and audit logs to prevent unauthorized users from viewing or modifying sensitive files. When **enable_copy_server_files** is enabled, the administrator can use the GUC parameter **safe_data_path** to set the path for common users to import and export to the subpath of the set path. If this GUC parameter is not set (by default), the path used by common users is not blocked.

- **COPY** applies only to tables but not views.
- **COPY TO** requires the select permission on the table to be read, and **COPY FROM** requires the insert permission on the table to be inserted.
- If a list of columns is specified, **COPY** copies only the data of the specified columns between the file and the table. If a table has any columns that are not in the column list, **COPY FROM** inserts default values for those columns.
- If a data source file is specified, the server must be able to access the file. If **STDIN** is specified, data flows between the client and the server. When entering data, use the **TAB** key to separate the columns of the table and use a backslash and a period (\.) in a new row to indicate the end of the input.
- **COPY FROM** throws an error if any row in the data file contains more or fewer columns than expected.
- The end of the data can be represented by a line that contains only backslashes and periods (\.). If data is read from a file, the end flag is unnecessary. If data is copied between client applications, an end tag must be provided.
- In **COPY FROM**, **\N** is an empty string. To enter the actual value **\N**, use **\\N**.
- **COPY FROM** does not support data preprocessing during data import, such as expression operation and default value filling. If you need to preprocess data during the import, you need to import the data to a temporary table and then run SQL statements to insert the data to the table through operations. However, this method causes I/O expansion and reduces the import performance.
- When a data format error occurs during **COPY FROM** execution, the transaction is rolled back. However, the error information is insufficient, making it difficult to locate the error data from a large amount of raw data.
- **COPY FROM** and **COPY TO** apply to low concurrency and local import and export of a small amount of data.

Syntax

- Copy data from a file to a table.

```
COPY table_name [ ( column_name [, ...] ) ]
    FROM { 'filename' | STDIN }
    [ [ USING ] DELIMITERS 'delimiters' ]
    [ WITHOUT ESCAPING ]
    [ LOG ERRORS ]
    [ REJECT LIMIT 'limit' ]
    [ [ WITH ] ( option [, ...] ) ]
    | copy_option
    | TRANSFORM  ( { column_name [ data_type ] [ AS transform_expr ] } [, ...] )
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    | FIXED FORMATTER ( { column_name( offset, length ) } [, ...] ) [ ( option [, ...] ) | copy_option
[  ...] ] ];
```

NOTE

In the syntax, **FIXED FORMATTER ({ column_name(offset, length) } [, ...])** and non-conflicting items of **[copy_option [...]]** can be in any sequence.

- Copy data from a table to a file.

```
COPY table_name [ ( column_name [, ...] ) ]
    TO { 'filename' | STDOUT }
    [ [ USING ] DELIMITERS 'delimiters' ]
    [ WITHOUT ESCAPING ]
    [ [ WITH ] ( option [, ...] ) ]
    | copy_option
    | FIXED FORMATTER ( { column_name( offset, length ) } [, ...] ) [ ( option [, ...] ) | copy_option
[  ...] ] ];

COPY query
    TO { 'filename' | STDOUT }
    [ WITHOUT ESCAPING ]
    [ [ WITH ] ( option [, ...] ) ]
    | copy_option
    | FIXED FORMATTER ( { column_name( offset, length ) } [, ...] ) [ ( option [, ...] ) | copy_option
[  ...] ] ];
```

NOTE

1. The syntax constraints of **COPY TO** are as follows:

   (query) is incompatible with **[USING] DELIMITERS**. If the data comes from a query result, **COPY TO** cannot specify **[USING] DELIMITERS**.

2. Use spaces to separate **copy_option** following **FIXED FORMATTTER**.
3. **copy_option** is the native parameter, while **option** is the parameter imported by a compatible foreign table.
4. In the syntax, **FIXED FORMATTER ({ column_name(offset, length) } [, ...])** and non-conflicting items of **[copy_option [...]]** can be in any sequence.

The syntax of the optional parameter **option** is as follows:

```
FORMAT 'format_name'
| OIDS [ boolean ]
| DELIMITER 'delimiter_character'
| NULL 'null_string'
| HEADER [ boolean ]
| FILEHEADER 'header_file_string'
| FREEZE [ boolean ]
| QUOTE 'quote_character'
| ESCAPE 'escape_character'
| EOL 'newline_character'
| NOESCAPING [ boolean ]
| FORCE_QUOTE { ( column_name [, ...] ) | * }
| FORCE_NOT_NULL ( column_name [, ...] )
| ENCODING 'encoding_name'
| IGNORE_EXTRA_DATA [ boolean ]
| FILL_MISSING_FIELDS [ boolean ]
| COMPATIBLE_ILLEGAL_CHARS [ boolean ]
| DATE_FORMAT 'date_format_string'
| TIME_FORMAT 'time_format_string'
| TIMESTAMP_FORMAT 'timestamp_format_string'
| SMALLDATETIME_FORMAT 'smalldatetime_format_string'
```

The syntax of the optional parameter **copy_option** is as follows:

```
OIDS
| NULL 'null_string'
| HEADER
| FILEHEADER 'header_file_string'
| FREEZE
| FORCE_NOT_NULL column_name [, ...]
| FORCE_QUOTE { column_name [, ...] | * }
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
| BINARY
| CSV
| QUOTE [ AS ] 'quote_character'
| ESCAPE [ AS ] 'escape_character'
| EOL 'newline_character'
| ENCODING 'encoding_name'
| IGNORE_EXTRA_DATA
| FILL_MISSING_FIELDS
| COMPATIBLE_ILLEGAL_CHARS
| DATE_FORMAT 'date_format_string'
| TIME_FORMAT 'time_format_string'
| TIMESTAMP_FORMAT 'timestamp_format_string'
| SMALLDATETIME_FORMAT 'smalldatetime_format_string'
```

Parameter Description

- **query**

  Specifies that the results are to be copied.

  Valid value: a **SELECT** or **VALUES** command in parentheses

- **table_name**

  Specifies the name (possibly schema-qualified) of an existing table.

  Value range: an existing table name

- **column_name**

  Specifies an optional list of columns to be copied.

  Value range: any columns. All columns will be copied if no column list is specified.

- **STDIN**

  Specifies that input comes from the standard input.

- **STDOUT**

  Specifies that output goes to the standard output.

- **FIXED**

  Fixes column length. When the column length is fixed, **DELIMITER**, **NULL**, and **CSV** cannot be specified. When **FIXED** is specified, **BINARY**, **CSV**, and **TEXT** cannot be specified by **option** or **copy_option**.

  NOTE

  The definition of fixed length is as follows:

  1. The column length of each record is the same.
  2. Spaces are used for column padding. Columns of the numeric type are left-aligned and columns of the string type are right-aligned.
  3. No delimiters are used between columns.

- **[USING] DELIMITERS 'delimiters'**

  The string that separates columns within each row (line) of the file, and it cannot be larger than 10 bytes.

  Value range: The delimiter cannot include any of the following characters: \.abcdefghijklmnopqrstuvwxyz0123456789

  Value range: The default value is a tab character in text format and a comma in CSV format.

- **WITHOUT ESCAPING**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies, in the TEXT format, whether to escape the backslash (\) and its following characters.

Value range: text only

- **LOG ERRORS**

  If this parameter is specified, the error tolerance mechanism for data type errors in the **COPY FROM** statement is enabled. Row errors are recorded in the **public.pgxc_copy_error_log** table in the database for future reference.

  Value range: a value set while data is imported using **COPY FROM**.

  NOTE

  The restrictions of this error tolerance parameter are as follows:

  - This error tolerance mechanism captures only the data type errors (**DATA_EXCEPTION**) that occur during data parsing of **COPY FROM** on a CN. Other errors, such as network errors between CNs and DNs or expression conversion errors on DNs, are not captured.
  - Before enabling error tolerance for **COPY FROM** for the first time in a database, check whether the **public.pgxc_copy_error_log** table exists. If it does not, call the **copy_error_log_create()** function to create it. If it does, copy its data elsewhere, delete it, and call the **copy_error_log_create()** function to create the table. For details about columns in the **public.pgxc_copy_error_log** table, see **Table 12-56**.
  - While a **COPY FROM** statement with specified **LOG ERRORS** is being executed, if **public.pgxc_copy_error_log** does not exist or does not have the table definitions compliant with those predefined in **copy_error_log_create()**, an error will be reported. Ensure that the error table is created using the **copy_error_log_create()** function. Otherwise, **COPY FROM** statements with error tolerance may fail to be run.
  - If existing error tolerance parameters (for example, **IGNORE_EXTRA_DATA**) of the **COPY** statement are enabled, the error of the corresponding type will be processed as specified by the parameters and no error will be reported. Therefore, the error table does not contain such error data.
  - The coverage scope of this error tolerance mechanism is the same as that of a GDS foreign table. You are advised to filter query results based on table names or the timestamp of marking the start of **COPY FROM** statement execution. For details about error handling, see **Handling Import Errors**.

- **LOG ERRORS DATA**

  The differences between **LOG ERRORS DATA** and **LOG ERRORS** are as follows:

  a. **LOG ERRORS DATA** fills the **rawrecord** column in the error tolerance table.

  b. Only users with the **super** permission can use the **LOG ERRORS DATA** parameter.

  CAUTION

  If error content is too complex, it may fail to be written to the error tolerance table by using **LOG ERRORS DATA**, causing the task failure.

  For errors that cannot be read in certain code, the error codes are ERRCODE_CHARACTER_NOT_IN_REPERTOIRE and ERRCODE_UNTRANSLATABLE_CHARACTER. The rawrecord column is not recorded.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **REJECT LIMIT 'limit'**

  Used with the **LOG ERROR** parameter to set the upper limit of the tolerated errors in the **COPY FROM** statement. If the number of errors exceeds the limit, later errors will be reported based on the original mechanism.

  Value range: a positive integer (1 to 2147483647) or **unlimited**

  Default value: If **LOG ERRORS** is not specified, an error will be reported. If **LOG ERRORS** is specified, the default value is **0**.

  NOTE

  Different from the GDS error tolerance mechanism, in the error tolerance mechanism described in **LOG ERRORS**, the count of **REJECT LIMIT** is calculated based on the number of data parsing errors on the CN where the **COPY FROM** statement is run, not based on the number of errors on each DN.

- **FORMATTER**

  Defines the place of each column in the data file in fixed length mode. Defines the place of each column in the data file in the **column(***offset*,*length***)** format.

  Value range:

  – The value of **offset** must be larger than 0. The unit is byte.

  – The value of **length** must be larger than 0. The unit is byte.

  The total length of all columns must be less than 1 GB.

  Replace columns that are not in the file with null.

- **OPTION { option_name ' value ' }**

  Specifies all types of parameters of a compatible foreign table.

  – FORMAT

    Specifies the format of the source data file in the foreign table.

    Value range: **CSV**, **TEXT**, **FIXED**, and **BINARY**

    - The CSV file can process newline characters efficiently, but cannot process certain special characters well.
    - The TEXT file can process certain special characters efficiently, but cannot process newline characters well.
    - In FIXED files, the column length of each record is the same. Spaces are used for padding, and the excessive part will be truncated.
    - All data in the BINARY file is stored/read as binary format rather than as text. It is faster than the text and CSV formats, but a binary-format file is less portable.

    Default value: **TEXT**

  – OIDS

    Copies the OID for each row.

    NOTE

    An error is raised if OIDs are specified for a table that does not have OIDs, or in the case of copying a query.

    Value range: **true/on** and **false/off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **false**

- DELIMITER

  Specifies the character that separates columns within each row (line) of the file.

  NOTE

  - The value of **delimiter** cannot be **\r** or **\n**.
  - A delimiter cannot be the same as the null value. The delimiter for the CSV format cannot be same as the **quote** value.
  - The delimiter for the TEXT format data cannot contain lowercase letters, digits, or special characters (.\).
  - The data length of a single row should be less than 1 GB. A row that has many columns using long delimiters cannot contain much valid data.
  - You are advised to use multi-character delimiters or invisible delimiters. For example, you can use multi-characters (such as $^&) and invisible characters (such as 0x07, 0x08, and 0x1b).
  - To use a tab to isolate CSV data, set **delimiter** to **E'\t'**.

  Value range: a multi-character delimiter within 10 bytes

  Default value:

  - A tab character in text format
  - A comma (,) in CSV format
  - No delimiter in FIXED format

- NULL

  Specifies the string that represents a null value.

  Value range:

  - A null value cannot be **\r** or **\n**. The maximum length is 100 characters.
  - A null value cannot be the same as the **delimiter** or **quote** value.

  Default value:

  - The default value for the CSV format is an empty string without quotation marks.
  - The default value for the TEXT format is **\N**.

- HEADER

  Specifies whether a file contains a header with the names of each column in the file. **header** is available only for CSV and FIXED files.

  When data is imported, if **header** is **on**, the first row of the data file will be identified as the header and ignored. If **header** is **off**, the first row will be identified as a data row.

  When data is exported, if header is **on**, **fileheader** must be specified. If **header** is **off**, an exported file does not contain a header.

  Value range: **true/on** and **false/off**

  Default value: **false**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- QUOTE

  Specifies a quoted character string for a CSV file.

  Default value: single quotation marks ('')

  NOTE

  - The value of **quote** cannot be the same as that of the **delimiter** or **null** parameter.
  - The value of **quote** must be a single-byte character.
  - Invisible characters are recommended, such as 0x07, 0x08, and 0x1b.

- ESCAPE

  Specifies an escape character for a CSV file. The value must be a single-byte character.

  Default value: single quotation marks ('') If the value is the same as that of **quote**, it will be replaced by **\0**.

- EOL 'newline_character'

  Specifies the newline character style of the imported or exported data file.

  Value range: multi-character newline characters within 10 bytes. Common newline characters include **\r** (0x0D), **\n** (0x0A), and **\r\n** (0x0D0A). Special newline characters include **$** and **#**.

  NOTE

  - The EOL parameter supports only the TEXT format for data import and export and does not support the CSV or FIXED format for data import. For forward compatibility, the EOL parameter can be set to **0x0D** or **0x0D0A** for data export in the CSV or FIXED format.
  - The value of **EOL** cannot be the same as that of the **delimiter** or **null** parameter.
  - The EOL parameter value cannot contain the following characters: .abcdefghijklmnopqrstuvwxyz0123456789.

- FORCE_QUOTE { (column_name [, ...]) | * }

  In **CSV COPY TO** mode, forces quotation marks to be used for all non-null values in each specified column. Null values are not quoted.

  Value range: an existing column name

- FORCE_NOT_NULL (column_name [, ...])

  Assigns a value to a specified column in **CSV COPY FROM** mode.

  Value range: an existing column name

- ENCODING

  Specifies that the file is encoded in the **encoding_name**. If this option is omitted, the current encoding format is used by default.

- IGNORE_EXTRA_DATA

  Specifies whether to ignore excessive columns when the number of data source files exceeds the number of foreign table columns. This parameter is used only during data import.

  Value range: **true/on** and **false/off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **true/on**: If the number of columns in a data source file is greater than that defined by the foreign table, the extra columns at the end of a row are ignored.
- **false/off**: If the number of columns in a data source file is greater than that defined by the foreign table, the following error message is reported:
  ```
  extra data after last expected column
  ```

Default value: **false**

NOTICE

If a newline character at the end of a row is missing and the row and another row are integrated into one, data in another row is ignored after the parameter is set to **true**.

- COMPATIBLE_ILLEGAL_CHARS

  Specifies whether to tolerate invalid characters during data import. The parameter is valid only for data import using **COPY FROM**.

  Value range: **true/on** and **false/off**

  - **true/on**: No error message is reported and data import is not interrupted when there are invalid characters. Invalid characters are converted into valid ones, and then imported to the database.
  - **false/off**: An error occurs when there are invalid characters, and the import stops.

  Default value: **false/off**

  NOTE

  The rules for converting invalid characters are as follows:

  1. **\0** is converted to a space.
  2. Other invalid characters are converted to question marks.
  3. When **compatible_illegal_chars** is set to **true**/**on**, after invalid characters such as **NULL**, **DELIMITER**, **QUOTE**, and **ESCAPE** are converted to spaces or question marks, an error message stating "illegal chars conversion may confuse COPY escape 0x20" will be displayed to remind you of possible parameter confusion caused by the conversion.

- FILL_MISSING_FIELDS

  Specifies how to handle the problem that the last column of a row in a source data file is lost during data import.

  Value range: **true/on** and **false/off**

  Default value: **false/off**

- DATE_FORMAT

  Specifies the DATE format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.

  Value range: a valid DATE value. For details, see **Date and Time Processing Functions and Operators**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

If Oracle is specified as the compatible database, the DATE format is **TIMESTAMP**. For details, see **timestamp_format** below.

- TIME_FORMAT

  Specifies the TIME format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.

  Value range: a valid TIME value. Time zones cannot be used. For details, see **Date and Time Processing Functions and Operators**.

- TIMESTAMP_FORMAT

  Specifies the TIMESTAMP format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.

  Value range: a valid TIMESTAMP value. Time zones cannot be used. For details, see **Date and Time Processing Functions and Operators**.

- SMALLDATETIME_FORMAT

  Specifies the SMALLDATETIME format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.

  Value range: a valid SMALLDATETIME value. For details, see **Date and Time Processing Functions and Operators**.

- **COPY_OPTION { option_name ' value ' }**

  Specifies all types of native parameters of **COPY**.

  - OIDS

    Specifies the internal OID to be copied for each row.

    NOTE

    An error is raised if OIDs are specified for a table that does not have OIDs, or in the case of copying a query.

  - NULL null_string

    Specifies that a string represents a null value in a data file.

    NOTICE

    When using **COPY FROM**, any data item that matches this string will be stored as a null value, so make sure that you use the same string as you used with **COPY TO**.

    Value range:

    - A null value cannot be **\r** or **\n**. The maximum length is 100 characters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- A null value cannot be the same as the **delimiter** or **quote** value.

Default value:

- The default value for the TEXT format is **\N**.
- The default value for the CSV format is an empty string without quotation marks.

– HEADER

Specifies whether a file contains a header with the names of each column in the file. **header** is available only for CSV and FIXED files.

When data is imported, if **header** is **on**, the first row of the data file will be identified as the header and ignored. If **header** is **off**, the first row will be identified as a data row.

When data is exported, if header is **on**, **fileheader** must be specified. If **header** is **off**, an exported file does not contain a header.

– FILEHEADER

Specifies a file that defines the content in the header for exported data. The file contains data description of each column.

NOTICE

- This parameter is available only when **header** is **on** or **true**.
- **fileheader** specifies an absolute path.
- The file can contain only one row of header information, and ends with a newline character. Excess rows will be discarded. (Header information cannot contain newline characters.)
- The length of the file including the newline character cannot exceed 1 MB.

– FREEZE

Sets the **COPY** loaded data row as **frozen**, like these data have executed **VACUUM FREEZE**.

This is a performance option of initial data loading. The data will be frozen only when the following three requirements are met:

- The table being loaded has been created or truncated in the same transaction before copying.
- There are no cursors open in the current transaction.
- There are no original snapshots in the current transaction.

NOTE

When **COPY** is completed, all the other sessions will see the data immediately. However, this violates the general principle of MVCC visibility, and users should understand that this may cause potential risks.

– FORCE NOT NULL column_name [, ...]

Assigns a value to a specified column in **CSV COPY FROM** mode.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: an existing column

- FORCE QUOTE { column_name [, ...] | * }

  In **CSV COPY TO** mode, forces quotation marks to be used for all non-null values in each specified column. Null values are not quoted.

  Value range: an existing column name

- BINARY

  Specifies that data is stored and read in binary mode instead of text mode. In binary mode, you cannot declare **DELIMITER**, **NULL**, or **CSV**. When **BINARY** is specified, **CSV**, **FIXED**, and **TEXT** cannot be specified through **option** or **copy_option**.

- CSV

  Enables the CSV mode. When **CSV** is specified, **BINARY**, **FIXED**, and **TEXT** cannot be specified through **option** or **copy_option**.

- QUOTE [AS] 'quote_character'

  Specifies a quoted character string for a CSV file.

  Default value: single quotation marks ('')

  NOTE

  - The value of **quote** cannot be the same as that of the **delimiter** or **null** parameter.
  - The value of **quote** must be a single-byte character.
  - Invisible characters are recommended, such as 0x07, 0x08, and 0x1b.

- ESCAPE [AS] 'escape_character'

  Specifies an escape character for a CSV file. The value must be a single-byte character.

  The default value is single quotation marks (''). If the value is the same as that of **quote**, it will be replaced by **\0**.

- EOL 'newline_character'

  Specifies the newline character style of the imported or exported data file.

  Value range: multi-character newline characters within 10 bytes. Common newline characters include **\r** (0x0D), **\n** (0x0A), and **\r\n** (0x0D0A). Special newline characters include **$** and **#**.

  NOTE

  - The **EOL** parameter supports only the TEXT format for data import and export and does not support the CSV or FIXED format. For forward compatibility, the **EOL** parameter can be set to **0x0D** or **0x0D0A** for data export in the CSV or FIXED format.
  - The value of **EOL** cannot be the same as that of the **delimiter** or **null** parameter.
  - The EOL parameter value cannot contain the following characters: .abcdefghijklmnopqrstuvwxyz0123456789.

- ENCODING 'encoding_name'

  Specifies the name of a file encoding format.

  Value range: a valid encoding format

  Default value: current encoding format

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- IGNORE_EXTRA_DATA

  true/on: If the number of columns in a data source file is greater than that defined by the foreign table, the extra columns at the end of a row are ignored. This parameter is used only during data import.

  If this parameter is not used and the number of columns in the data source file is greater than that defined in the foreign table, the following error information is displayed:

  ```
  extra data after last expected column
  ```

- COMPATIBLE_ILLEGAL_CHARS

  Specifies that invalid characters are tolerated during data import. Invalid characters are converted and then imported to the database. No error is reported and the import is not interrupted. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.

  If this parameter is not used, an error is reported when invalid characters are encountered during the import, and the import is interrupted.

  NOTE

  The rules for converting invalid characters are as follows:

  1. **\0** is converted to a space.

  2. Other invalid characters are converted to question marks.

  3. When **compatible_illegal_chars** is set to **true**/**on**, after invalid characters such as **NULL**, **DELIMITER**, **QUOTE**, and **ESCAPE** are converted to spaces or question marks, an error message stating "illegal chars conversion may confuse COPY escape 0x20" will be displayed to remind you of possible parameter confusion caused by the conversion.

- FILL_MISSING_FIELDS

  Specifies how to handle the problem that the last column of a row in a source data file is lost during data import.

  Value range: **true/on** and **false/off**

  Default value: **false/off**

  NOTICE

  Do not specify this option. Currently, it does not enable error tolerance, but will make the parser ignore the said errors during data parsing on the CN. Such errors will not be recorded in the **COPY** error table (enabled using **LOG ERRORS REJECT LIMIT**) but will be reported later by DNs. Therefore, do not specify this option.

- DATE_FORMAT 'date_format_string'

  Specifies the DATE format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.

  Value range: a valid DATE value For details, see **Date and Time Processing Functions and Operators**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

If Oracle is specified as the compatible database, the DATE format is **TIMESTAMP**. For details, see **timestamp_format** below.

- TIME_FORMAT 'time_format_string'

  Specifies the TIME format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.

  Value range: a valid TIME value. Time zones are not supported. For details, see **Date and Time Processing Functions and Operators**.

- TIMESTAMP_FORMAT 'timestamp_format_string'

  Specifies the TIMESTAMP format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.

  Value range: a valid TIMESTAMP value. Time zones cannot be used. For details, see **Date and Time Processing Functions and Operators**.

- SMALLDATETIME_FORMAT 'smalldatetime_format_string'

  Specifies the SMALLDATETIME format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.

  Value range: a valid SMALLDATETIME value For details, see **Date and Time Processing Functions and Operators**.

- TRANSFORM ({ column_name [data_type] [AS transform_expr] } [, ...])

  Specify the conversion expression of each column in the table. **data_type** specifies the data type of the column in the expression parameter. **transform_expr** is the target expression that returns the result value whose data type is the same as that of the target column in the table. For details about the expression, see **Expressions**.

NOTE

COPY FROM does not support expression conversion for distribution columns.

The following special backslash sequences are recognized by **COPY FROM**:

- **\b**: Backslash (ASCII 8)
- **\f**: Form feed (ASCII 12)
- **\n**: Newline character (ASCII 10)
- **\r**: Carriage return character (ASCII 13)
- **\t**: Tab (ASCII 9)
- **\v**: Vertical tab (ASCII 11)
- **\digits**: Backslash followed by one to three octal digits specifies that the ASCII value is the character with that numeric code.
- **\xdigits**: Backslash followed by an x and one or two hex digits specifies the character with that numeric code.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Permission Control Examples

```
openGauss=> copy t1 from '/home/xy/t1.csv';
ERROR:  COPY to or from a file is prohibited for security concerns
HINT:  Anyone can COPY to stdout or from stdin. gsql's \copy command also works for anyone.
openGauss=> grant gs_role_copy_files to xxx;
```

This error occurs because a non-initial user does not have the COPY permission. To solve this problem, enable the **enable_copy_server_files** parameter. Then, the administrator can use the COPY function, and common users need to join the **gs_role_copy_files** group.

Examples

```
-- Copy the data from tpcds.ship_mode to the /home/omm/ds_ship_mode.dat file:
openGauss=# COPY tpcds.ship_mode TO '/home/omm/ds_ship_mode.dat';

-- Output tpcds.ship_mode to stdout.
openGauss=# COPY tpcds.ship_mode TO stdout;

-- Create the tpcds.ship_mode_t1 table.
openGauss=# CREATE TABLE tpcds.ship_mode_t1
(
    SM_SHIP_MODE_SK           INTEGER               NOT NULL,
    SM_SHIP_MODE_ID           CHAR(16)              NOT NULL,
    SM_TYPE                   CHAR(30)                      ,
    SM_CODE                   CHAR(10)                      ,
    SM_CARRIER                CHAR(20)                      ,
    SM_CONTRACT               CHAR(20)
)
WITH (ORIENTATION = COLUMN,COMPRESSION=MIDDLE)
DISTRIBUTE BY HASH(SM_SHIP_MODE_SK );

-- Copy data from stdin to the tpcds.ship_mode_t1.
openGauss=# COPY tpcds.ship_mode_t1 FROM stdin;

-- Copy data from the /home/omm/ds_ship_mode.dat file to the tpcds.ship_mode_t1 table.
openGauss=# COPY tpcds.ship_mode_t1 FROM '/home/omm/ds_ship_mode.dat';

-- Copy data from the /home/omm/ds_ship_mode.dat file to the tpcds.ship_mode_t1 table, convert the data using the TRANSFORM expression, and insert the 10 characters on the left of the SM_TYPE column into the table.
openGauss=# COPY tpcds.ship_mode_t1 FROM '/home/omm/ds_ship_mode.dat' TRANSFORM (SM_TYPE AS LEFT(SM_TYPE, 10));

-- Copy data from the /home/omm/ds_ship_mode.dat file to the tpcds.ship_mode_t1 table, with the import format set to TEXT (format 'text'), the delimiter set to \t' (delimiter E'\t'), excessive columns ignored (ignore_extra_data 'true'), and characters not escaped (noescaping 'true').
openGauss=# COPY tpcds.ship_mode_t1 FROM '/home/omm/ds_ship_mode.dat' WITH(format 'text', delimiter E'\t', ignore_extra_data 'true', noescaping 'true');

-- Copy data from the /home/omm/ds_ship_mode.dat file to the tpcds.ship_mode_t1 table, with the import format set to FIXED, fixed-length format specified (FORMATTER(SM_SHIP_MODE_SK(0, 2), SM_SHIP_MODE_ID(2,16), SM_TYPE(18,30), SM_CODE(50,10), SM_CARRIER(61,20), SM_CONTRACT(82,20))), excessive columns ignored (ignore_extra_data), and headers included (header).
openGauss=# COPY tpcds.ship_mode_t1 FROM '/home/omm/ds_ship_mode.dat' FIXED FORMATTER(SM_SHIP_MODE_SK(0, 2), SM_SHIP_MODE_ID(2,16), SM_TYPE(18,30), SM_CODE(50,10), SM_CARRIER(61,20), SM_CONTRACT(82,20)) header ignore_extra_data;

-- Delete tpcds.ship_mode_t1.
openGauss=# DROP TABLE tpcds.ship_mode_t1;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.14.51 CREATE APP WORKLOAD GROUP MAPPING

Function

ALTER APP WORKLOAD GROUP MAPPING creates an application mapping group and associates it with an existing workload group.

Precautions

Only a user with the **CREATE** permission on the current database can perform this operation.

Syntax

```
CREATE APP WORKLOAD GROUP MAPPING app_name
    [ WITH ( WORKLOAD_GPNAME  = workload_gpname ) ];
```

Parameter Description

- **app_name**

  Specifies the name of an application mapping group. The name of an application mapping group must be unique in the current database.

  Value range: a string. It must comply with the naming convention.

- **workload_gpname**

  Specifies the workload group name.

  Value range: a string, which indicates the created workload group.

Examples

```
-- Create a resource pool and specify the High Timeshare Workload Cgroup under the DefaultClass Cgroup.
openGauss=# CREATE RESOURCE POOL pool1 WITH (CONTROL_GROUP="High");

-- Create a workload group and associate it with the created resource pool.
openGauss=# CREATE WORKLOAD GROUP group1 USING RESOURCE POOL pool1;

-- Create an application mapping group and associate it with the created workload group.
openGauss=# CREATE APP WORKLOAD GROUP MAPPING app_wg_map1 WITH
(WORKLOAD_GPNAME=group1);

-- Create a default application mapping group and associate it with the default workload group.
openGauss=# CREATE APP WORKLOAD GROUP MAPPING app_wg_map2;

-- Delete the application mapping group.
openGauss=# DROP APP WORKLOAD GROUP MAPPING app_wg_map1;
openGauss=# DROP APP WORKLOAD GROUP MAPPING app_wg_map2;

-- Delete the workload group.
openGauss=# DROP WORKLOAD GROUP group1;

-- Delete the resource pool.
openGauss=# DROP RESOURCE POOL pool1;
```

Helpful Links

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.14.52 CREATE AUDIT POLICY

Function

CREATE AUDIT POLICY creates a unified audit policy.

Precautions

Only user **poladmin**, user **sysadmin**, or the initial user can perform this operation.

The masking policy takes effect only after the security policy is enabled, that is, **enable_security_policy** is set to **on**. For details, see "Database Configuration > Database Security Management Policies > Unified Auditing" in the *Security Hardening Guide*.

Syntax

```
CREATE AUDIT POLICY [ IF NOT EXISTS ] policy_name { { privilege_audit_clause | access_audit_clause }
[ filter_group_clause ] [ ENABLE | DISABLE ] };
```

- privilege_audit_clause
  ```
  PRIVILEGES { DDL | ALL } [ ON LABEL ( resource_label_name [, ... ] ) ]
  ```
- access_audit_clause
  ```
  ACCESS { DML | ALL } [ ON LABEL ( resource_label_name [, ... ] ) ]
  ```
- filter_group_clause
  ```
  FILTER ON { ( FILTER_TYPE ( filter_value [, ... ] ) ) [, ... ] }
  ```

Parameter Description

- **policy_name**

  Specifies the audit policy name, which must be unique.

  Value range: a string. It must comply with the naming convention.

- **DDL**

  Specifies the operations that are audited within the database: **CREATE**, **ALTER**, **DROP**, **ANALYZE**, **COMMENT**, **GRANT**, **REVOKE**, **SET**, **SHOW**, **LOGIN_ANY**, **LOGIN_FAILURE**, **LOGIN_SUCCESS**, and **LOGOUT**.

- **ALL**

  Indicates all operations supported by the specified DDL statements in the database.

- **resource_label_name**

  Specifies the resource label name.

- **DML**

  Specifies the operations that are audited within the database: **SELECT**, **COPY**, **DEALLOCATE**, **DELETE**, **EXECUTE**, **INSERT**, **PREPARE**, **REINDEX**, **TRUNCATE**, and **UPDATE**.

- **FILTER_TYPE**

  Specifies the types of information to be filtered by the policy, including **APP**, **ROLES**, and **IP**.

- **filter_value**

  Indicates the detailed information to be filtered.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **ENABLE|DISABLE**

  Enables or disables the unified audit policy. If **ENABLE|DISABLE** is not specified, **ENABLE** is used by default.

Examples

```
-- Create users dev_audit and bob_audit.
openGauss=# CREATE USER dev_audit PASSWORD 'dev@1234';
openGauss=# CREATE USER bob_audit password 'bob@1234';

-- Create table tb_for_audit.
openGauss=# CREATE TABLE tb_for_audit(col1 text, col2 text, col3 text);

-- Create a resource label.
openGauss=# CREATE RESOURCE LABEL adt_lb0 add TABLE(tb_for_audit);

-- Perform the CREATE operation on the database to create an audit policy.
openGauss=# CREATE AUDIT POLICY adt1 PRIVILEGES CREATE;

-- Perform the SELECT operation on the database to create an audit policy.
openGauss=# CREATE AUDIT POLICY adt2 ACCESS SELECT;

-- Create an audit policy to audit only the CREATE operations performed on the adt_lb0 resource by users dev_audit and bob_audit.
openGauss=# CREATE AUDIT POLICY adt3 PRIVILEGES CREATE ON LABEL(adt_lb0) FILTER ON ROLES(dev_audit, bob_audit);

-- Create an audit policy to audit only the SELECT, INSERT, and DELETE operations performed on the adt_lb0 resource by users dev_audit and bob_audit using client tools psql and gsql on the servers whose IP addresses are 10.20.30.40 and 127.0.0.0/24.
openGauss=# CREATE AUDIT POLICY adt4 ACCESS SELECT ON LABEL(adt_lb0), INSERT ON LABEL(adt_lb0), DELETE FILTER ON ROLES(dev_audit, bob_audit), APP(psql, gsql), IP('10.20.30.40', '127.0.0.0/24');
```

Helpful Links

ALTER AUDIT POLICY and **DROP AUDIT POLICY**

12.14.53 CREATE BARRIER

Function

CREATE BARRIER creates a barrier for cluster nodes. The barrier can be used for data restoration.

Precautions

Generally, **CREATE BARRIER** is used only for backup and restoration. Therefore, **CREATE BARRIER** can be executed only in the following scenarios:

- The database initial user can run this command.
- If the backup and restoration mode is enabled on the CN, that is, the GUC parameter **operation_mode** is set to **on**, users with the **OPRADMIN** permission can run this command.

Syntax

```
CREATE BARRIER [ barrier_name  ] ;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter Description

barrier_name

(Optional) Specifies the name of a barrier.

Value range: a string. It must comply with the naming convention.

Examples

```
-- Create a barrier without specifying its name.
openGauss=# CREATE BARRIER;

-- Specify the barrier name.
openGauss=# CREATE BARRIER 'barrier1';
```

12.14.54 CREATE CLIENT MASTER KEY

Function

CREATE CLIENT MASTER KEY creates a CMK object that can be used to encrypt a CEK object.

Precautions

This syntax is specific to a fully-encrypted database.

When using gsql to connect to a database server, you need to use the **-C** parameter to enable the fully-encrypted database.

In the CMK object created using this syntax, only the method for reading keys from independent key management tools, services, or components is stored. The key itself is not stored.

Syntax

```
CREATE CLIENT MASTER KEY client_master_key_name WITH (KEY_STORE = key_store_name, KEY_PATH =
"key_path_value", ALGORITHM = algorithm_type);
```

Parameter Description

- **client_master_key_name**

  This parameter is used as the name of a key object. In the same namespace, the value of this parameter must be unique.

  Value range: a string. It must comply with the identifier naming convention.

- **KEY_STORE**

  Tool or service that independently manages keys. Currently, only the key management tool gs_ktool provided by GaussDB and the online key management service huawei_kms provided by Huawei Cloud are supported.
  Value range: **gs_ktool** and **huawei_kms**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

Because only the client interacts with **KEY_STORE**, the types supported by the **KEY_STORE** parameter in this syntax vary according to the client. When gsql is used to execute this syntax, **KEY_STORE** supports only gs_ktool. When JDBC is used to execute this syntax, **KEY_STORE** supports only huawei_kms.

- **KEY_PATH**

  Key in the key management tool or service. The **KEY_STORE** and **KEY_PATH** parameters can be used to uniquely identify a key entity. When **KEY_STORE** is set to **gs_ktool**, the value is **gs_ktool** or **KEY_ID**. When **KEY_STORE** is set to **huawei_kms**, the value is a 36-byte key ID.

  NOTE

  The CMK object created by this syntax stores the **KEY_STORE** and **KEY_PATH** information. When the key entity needs to be read, GaussDB can automatically read the specified key entity from the specified **KEY_STORE** based on the information stored in the CMK object. Therefore, in this syntax, the **KEY_PATH** parameter should point to an existing key entity.

- **ALGORITHM**

  Encryption algorithm used by the key entity. When **KEY_STORE** is set to **gs_ktool**, the value can be **AES_256_CBC** or **SM4**. When **KEY_STORE** is set to **huawei_kms**, the value is **AES_256**.

Example (Using gsql to Connect to the Database Server)

```
-- (1) Use the key management tool gs_ktool to create a key. The tool returns the ID of the newly generated key.
[cmd] gs_ktool -g

-- (2) Use a privileged account to create a common user named alice.
openGauss=# CREATE USER alice PASSWORD '********';
-- (3) Use a common account alice to connect to the encrypted database and execute the syntax.
gsql -p 57101 postgres -U alice -r -C
gsql((GaussDB Kernel VxxxRxxxCxx build f521c606) compiled at 2021-09-16 14:55:22 commit 2935 last mr 6385 release)
Non-SSL connection (SSL connection is recommended when requiring high-security)
Type "help" for help.

openGauss=>

-- Create a CMK object.
openGauss=> CREATE CLIENT MASTER KEY alice_cmk WITH ( KEY_STORE = gs_ktool , KEY_PATH = "gs_ktool/1" , ALGORITHM = AES_256_CBC);
```

Example (Using JDBC to Connect to the Database Server)

```
/*
 * (1) Log in to the Huawei Cloud official website (https://www.huaweicloud.com), choose Console > Service List > Data Encryption Workshop > Key Management Service, and create a key.
 *     KMS is a key management service provided by Huawei Cloud. You can also use APIs to manage keys. For details, see the following public document of Huawei Cloud:
 *    (https://support.huaweicloud.com/dew_faq/dew_01_0053.html)
 */

/*
 * (2) Establish a connection to the database server and execute the syntax. In the URL, set enable_ce to 1.
 *      Note: The code in this section is used as an example. Consider using the minimum code to implement the most basic functions.
 */
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
import java.sql.*;

public class CrtCmkTest {
    public static void main(String[] args) {
        String driver = "org.postgresql.Driver";
        try {
            Class.forName(driver);
        } catch (Exception e) {
            e.printStackTrace();
            return;
        }

        /* Information used to establish a connection to the database server */
        String dbUrl = "jdbc:postgresql://localhost:19900/postgres?enable_ce=1";
        String dbUser = "alice";
        String dbPassword = "********";

       /*
        * Used to access the identity authentication information of Huawei Cloud KMS and KMS project information.
        * Note: All parameters in this part can be found on the page displayed after you choose Console > My Credential on the Huawei Cloud official website.
        */
        String iamUser = "alice_for_kms";
        String iamPassword = "********";
        String kmsDomain = "hw00000000";
        String kmsProjectName = "cn-east-3";
        String kmsProjectId = "0000000000000000000000000000000";

        /* SQL statement for creating a CMK object */
        String sql = "CREATE CLIENT MASTER KEY alice_cmk WITH ( " +
         "KEY_STORE = huawei_kms, KEY_PATH = \"00000000-0000-0000-0000-000000000000\" , ALGORITHM = AES_256);";

        try {
            Connection conn = DriverManager.getConnection(dbUrl, dbUser, dbPassword);
            conn.setClientInfo("iamUser", iamUser);
            conn.setClientInfo("iamPassword", iamPassword);
            conn.setClientInfo("kmsDomain", kmsDomain);
            conn.setClientInfo("kmsProjectName", kmsProjectName);
            conn.setClientInfo("kmsProjectId", kmsProjectId );
            Statement stmt = conn.createStatement();
            System.out.println("results: " + stmt.executeUpdate(sql));
        } catch (SQLException e) {
            e.printStackTrace();
        }
    }
}
```

12.14.55 CREATE COLUMN ENCRYPTION KEY

Function

CREATE COLUMN ENCRYPTION KEY creates a CEK that can be used to encrypt a specified column in a table.

Precautions

This syntax is specific to a fully-encrypted database.

When using **gsql** to connect to a database server, you need to use the **-C** parameter to enable the fully-encrypted database.

The CEK object created using this syntax can be used for column-level encryption. When defining a column in a table, you can specify a CEK object to encrypt the column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

```
CREATE COLUMN ENCRYPTION KEY column_encryption_key_name WITH VALUES(CLIENT_MASTER_KEY =
client_master_key_name, ALGORITHM = algorithm_type, ENCRYPTED_VALUE = encrypted_value);
```

Parameter Description

- **column_encryption_key_name**

  This parameter is used as the name of a key object. In the same namespace, the value of this parameter must be unique.

  Value range: a string. It must comply with the naming convention.

- **CLIENT_MASTER_KEY**

  Specifies the CMK used to encrypt the CEK. The value is the CMK object name, which is created using the **CREATE CLIENT MASTER KEY** syntax.

- **ALGORITHM**

  Encryption algorithm to be used by the CEK. The value can be **AEAD_AES_256_CBC_HMAC_SHA256**, **AEAD_AES_128_CBC_HMAC_SHA256**, or **SM4_SM3**.

- **ENCRYPTED_VALUE (optional)**

  Specifies the key password defined by the user. The key password contains 28 to 256 characters. The security strength of a key containing 28 characters complies with AES128. If AES256 is used, the key password must contain 39 characters. If this parameter is not specified, a 256-bit key is automatically generated.

NOTICE

- SM algorithm constraints: SM2, SM3, and SM4 are Chinese national cryptography standards. To avoid legal risks, these algorithms must be used together. If you specify the SM4 algorithm to encrypt CEKs when creating a CMK, you must specify the SM3 and SM4 algorithms (SM4_SM3) to encrypt data when creating CEKs.
- Constraints on the **ENCRYPTED_VALUE** field: If the CMK generated by Huawei KMS is used to encrypt the CEK and the **ENCRYPTED_VALUE** field is used to transfer the key in the **CREATE COLUMN ENCRYPTION KEY** syntax, the length of the input key must be an integer multiple of 16 bytes.

Examples

```
-- Create a CEK.
openGauss=> CREATE COLUMN ENCRYPTION KEY a_cek WITH VALUES (CLIENT_MASTER_KEY = a_cmk,
ALGORITHM  = AEAD_AES_256_CBC_HMAC_SHA256);
CREATE COLUMN ENCRYPTION KEY
openGauss=> CREATE COLUMN ENCRYPTION KEY another_cek WITH VALUES (CLIENT_MASTER_KEY =
a_cmk, ALGORITHM  = SM4_SM3);
CREATE COLUMN ENCRYPTION KEY
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.14.56 CREATE CONVERSION

Function

CREATE CONVERSION defines a new conversion between two character set encodings.

Precautions

- The **DEFAULT** parameter indicates that the conversion between the source encoding and the target encoding is executed by default between the client and the server. To support this usage, bidirectional conversion must be defined, that is, both conversion from A to B and conversion from B to A are supported.
- To perform conversion, you must have the EXECUTE permission on function and the CREATE permission on the target schema.
- SQL_ASCII cannot be used for either source encoding or target encoding because the server behavior is hardwired when SQL_ASCII "encoding" is involved.
- You can remove user-defined conversions using DROP CONVERSION.

Syntax

```
CREATE [ DEFAULT ] CONVERSION name
    FOR source_encoding TO dest_encoding FROM function_name
```

Parameter Description

- **DEFAULT**

  Specifies that the conversion is the default conversion from the source encoding to the target encoding. There should be only one default conversion for each encoding pair in a schema.

- **name**

  Specifies the name of the conversion, which can be restricted by the schema. If not restricted by a schema, the conversion is defined in the current schema. The conversion name must be unique in a schema.

- **source_encoding**

  Source encoding name.

- **dest_encoding**

  Target encoding name.

- **function_name**

  Function used for conversion. A function name can be restricted by a schema. If not, the function is found in the path.

  ```
  conv_proc(
      integer, -- Source encoding ID
      integer, -- Target encoding ID
      cstring, -- Source character string (C character string ending with a null value)
      internal,-- Target (filled with a null-terminated C character string)
      integer  -- Length of the source string
  ) RETURNS void;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example

```
-- Use myfunc to create an encoding conversion from UTF8 to LATIN1.
CREATE CONVERSION myconv FOR 'UTF8' TO 'LATIN1' FROM myfunc;
```

12.14.57 CREATE DATABASE

Function

CREATE DATABASE is used to create a database. By default, the new database will be created only by cloning the standard system database **template0**.

Precautions

- A user that has the **CREATEDB** permission or a system administrator can create a database.
- **CREATE DATABASE** cannot be executed inside a transaction block.
- If an error message similar to "could not initialize database directory" is displayed during database creation, the possible cause is that the permission on the data directory in the file system is insufficient or the disk is full.

Syntax

```
CREATE DATABASE database_name
   [ [ WITH ] { [ OWNER [=] user_name ] |
            [ TEMPLATE [=] template ] |
            [ ENCODING [=] encoding ] |
            [ LC_COLLATE [=] lc_collate ] |
            [ LC_CTYPE [=] lc_ctype ] |
            [ DBCOMPATIBILITY [=] compatibilty_type ] |
            [ TABLESPACE [=] tablespace_name ] |
            [ CONNECTION LIMIT [=] connlimit ]}[...] ];
```

Parameter Description

- **database_name**

  Specifies the database name.

  Value range: a string. It must comply with the naming convention.

- **OWNER [=] user_name**

  Specifies the owner of the new database. If omitted, the default owner is the current user.

  Value range: an existing username

- **TEMPLATE [=] template**

  Specifies a template name. That is, the template from which the database is created. GaussDB creates a database by copying data from a template database. GaussDB has two default template databases **template0** and **template1** and a default user database **postgres**.

  Value range: **template0**

- **ENCODING [=] encoding**

  Specifies the character encoding used by the database. The value can be a string (for example, **SQL_ASCII**) or an integer.

  If this parameter is not specified, the encoding of the template database is used by default. By default, the codes of the template databases **template0**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

and **template1** are related to the operating system environment. The character encoding of **template1** cannot be changed. To change the encoding, use **template0** to create a database.

Common values are **GBK**, **UTF8**, **Latin1**, and **GB18030**. The supported character sets are as follows:

Table 12-119 Supported character sets

Name	Description	Language	Server-side Encoding	ICU Support	Number of Bytes/ Characters	Alias
BIG5	Big Five	Traditional Chinese	No	No	1–2	WIN950, Windows950
EUC_CN	Extended UNIX Code-CN	Simplified Chinese	Yes	Yes	1–3	-
EUC_JP	Extended UNIX Code-JP	Japanese	Yes	Yes	1–3	-
EUC_JIS_2004	Extended UNIX Code-JP, JIS X 0213	Japanese	Yes	No	1–3	-
EUC_KR	Extended UNIX Code-KR	Korean	Yes	Yes	1–3	-
EUC_TW	Extended UNIX Code-Taiwan, China	Traditional Chinese	Yes	Yes	1–3	-
GB18030	National standards	Chinese	Yes	No	1–4	-
GBK	Extended national standards	Simplified Chinese	Yes	No	1–2	WIN936, Windows936

Name	Description	Language	Server-side Encoding	ICU Support	Number of Bytes/ Characters	Alias
WIN1257	Windows CP1257	Baltic languages	Yes	Yes	1	-
WIN1258	Windows CP1258	Vietnamese	Yes	Yes	1	ABC, TCVN, TCVN5712, VSCII

CAUTION

Note that not all client APIs support the preceding character sets.

The SQL_ASCII setting performs quite differently from other settings. If the character set of the server is SQL_ASCII, the server interprets the byte values 0 to 127 according to the ASCII standard. The byte values 128 to 255 are regarded as the characters that cannot be parsed. If this parameter is set to SQL_ASCII, no code conversion occurs. Therefore, this setting is not basically used to declare the specified encoding used, because this declaration ignores the encoding. In most cases, if you use any non-ASCII data, it is unwise to use the SQL_ASCII setting because the database will not be able to help you convert or verify non-ASCII characters.

NOTICE

- The character set encoding of the new database must be compatible with the local settings (**LC_COLLATE** and **LC_CTYPE**).
- When the specified character encoding set is **GBK**, some uncommon Chinese characters cannot be directly used as object names. This is because the byte encoding overlaps with the ASCII characters @A-Z[\]^_`a-z{|} when the second byte of the GBK ranges from 0x40 to 0x7E. **@[\]^_'{|}** is an operator in the database. If it is directly used as an object name, a syntax error will be reported. For example, the GBK hexadecimal code is **0x8240**, and the second byte is **0x40**, which is the same as the ASCII character @. Therefore, the character cannot be used as an object name. If you do need to use this function, you can add double quotation marks ("") to avoid this problem when creating and accessing objects.

- **LC_COLLATE [=] lc_collate**

  Specifies the character set used by the new database. For example, set this parameter by using **lc_collate = 'zh_CN.gbk'**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The use of this parameter affects the sort order of strings (for example, the order of using **ORDER BY** for execution and the order of using indexes on text columns). By default, the sorting order of the template database is used.

Value range: character sets supported by the OS.

- **LC_CTYPE [=] lc_ctype**

  Specifies the character class used by the new database. For example, set this parameter by using **lc_ctype = 'zh_CN.gbk'**. The use of this parameter affects the classification of characters, such as uppercase letters, lowercase letters, and digits. By default, the character classification of the template database is used.

  Value range: character classes supported by the OS.

  NOTE

  The value ranges of **lc_collate** and **lc_ctype** depend on the character sets supported by the local environment. For example, in the Linux operating system, you can run the **locale -a** command to obtain the list of character sets supported by the operating system. When using the **lc_collate** and **lc_ctype** parameters, you can select the required character sets and character classes.

- **DBCOMPATIBILITY [=] compatibilty_type**

  Specifies the compatible database type. The default value is **MySQL**.

  Value range: **MYSQL**, **TD**, **ORA**, and **PG**. MySQL, Teradata, Oracle and PostgreSQL are compatible, respectively.

  NOTE

  - For ORA compatibility, the database treats empty strings as **NULL** and replaces **DATE** with **TIMESTAMP(0) WITHOUT TIME ZONE**.
  - When a character string is converted to an integer, if the input is invalid, the input will be converted to 0 due to MYSQL compatibility, and an error will be reported due to other compatibility issues.
  - For PG compatibility, CHAR and VARCHAR are counted by character. For other compatibility types, they are counted by byte. For example, for the UTF-8 character set, CHAR(3) can store three Chinese characters in PG compatibility scenarios, but can store only one Chinese character in other compatibility scenarios.

- **TABLESPACE [=] tablespace_name**

  Specifies the tablespace of the database.

  Value range: an existing tablespace name

- **CONNECTION LIMIT [=] connlimit**

  Specifies the maximum number of concurrent connections that can be made to the new database.

  NOTICE

  - The system administrator is not restricted by this parameter.
  - **connlimit** is calculated for each CN. The number of connections in a cluster is calculated using the following formula: Number of connections in a cluster = **connlimit** x Number of normal CNs.

  Value range: an integer greater than or equal to -1 The default value is **-1**, indicating that there is no limit.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The restrictions on character encoding are as follows:

- If the locale is set to **C** (or **POSIX**), all encoding types are allowed. For other locale settings, the character encoding must be the same as that of the locale.
- The encoding and region settings must match the template database, except that **template0** is used as a template. This is because other databases may contain data that does not match the specified encoding, or may contain indexes whose sorting order is affected by **LC_COLLATE** and **LC_CTYPE**. Copying this data will invalidate the indexes in the new database. **template0** does not contain any data or indexes that may be affected.

Examples

```
-- Create users jim and tom.
openGauss=# CREATE USER jim PASSWORD 'xxxxxxxxxx';
openGauss=# CREATE USER tom PASSWORD 'xxxxxxxxxx';

-- Create database music using GBK (the local encoding type is also GBK).
openGauss=# CREATE DATABASE music ENCODING 'GBK' template = template0;

-- Create database music2 and specify user jim as its owner.
openGauss=# CREATE DATABASE music2 OWNER jim;

-- Create database music3 using template template0 and specify user jim as its owner.
openGauss=# CREATE DATABASE music3 OWNER jim TEMPLATE template0;

-- Set the maximum number of connections to database music to 10.
openGauss=# ALTER DATABASE music CONNECTION LIMIT= 10;

-- Rename database music to music4.
openGauss=# ALTER DATABASE music RENAME TO music4;

-- Change the owner of database music2 to user tom.
openGauss=# ALTER DATABASE music2 OWNER TO tom;

-- Delete the database.
openGauss=# DROP DATABASE music2;
openGauss=# DROP DATABASE music3;
openGauss=# DROP DATABASE music4;

-- Delete the jim and tom users.
openGauss=# DROP USER jim;
openGauss=# DROP USER tom;

-- Create a database compatible with the TD format.
openGauss=# CREATE DATABASE td_compatible_db DBCOMPATIBILITY 'TD';

-- Create a database compatible with the ORA format.
openGauss=# CREATE DATABASE ora_compatible_db DBCOMPATIBILITY 'ORA';

-- Delete the databases that are compatible with the TD and ORA formats.
openGauss=# DROP DATABASE td_compatible_db;
openGauss=# DROP DATABASE ora_compatible_db;
```

Helpful Links

ALTER DATABASE and **DROP DATABASE**

Suggestions

- **create database**

  Database cannot be created in a transaction.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **ENCODING**

  If the new database Encoding does not match the template database (SQL_ASCII) (**'GBK'**, **'UTF8'**, **'LATIN1'**, or **'GB18030'**), **template [=] template0** must be specified.

12.14.58 CREATE DATA SOURCE

Function

CREATE DATA SOURCE creates an external data source object, which defines the information about the database that GaussDB will connect to.

Precautions

- The data source name must be unique in the database and comply with the identifier naming rules. Its length cannot exceed 63 bytes. Otherwise, it will be truncated.
- Only the system administrator or initial user has the permission to create data sources. The user who creates the object is the default owner of the object.
- If the **password** option is displayed, ensure that the **datasource.key.cipher** and **datasource.key.rand** files exist in the *$GAUSSHOME*/**bin** directory of each node in the cluster. If the two files do not exist, use the **gs_guc** tool to generate them and use the **gs_ssh** tool to release them to the *$GAUSSHOME*/**bin** directory on each node in the cluster.

Syntax

```
CREATE DATA SOURCE src_name
   [TYPE 'type_str']
   [VERSION {'version_str' | NULL}]
   [OPTIONS (optname 'optvalue' [, ...])];
```

Parameter Description

- **src_name**

  Specifies the name of the new data source, which must be unique in the database.

  Value range: a string. It must comply with the naming convention.

- **TYPE**

  Specifies the type of the data source. This parameter can be left empty, and its default value will be used.

  Value range: an empty string or a non-empty string

- **VERSION**

  Specifies the version number of the new data source object. This parameter can be left empty or set to null.

  Value range: an empty string, a non-empty string, or null

- **OPTIONS**

  Specifies the options of the data source object. This parameter can be left empty or specified using the following keywords:

  – optname

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the option name.

Value range: **dsn**, **username**, **password**, and **encoding**. The value is case-insensitive.

- **dsn** corresponds to the DSN in the ODBC configuration file.
- **username** and **password** indicate the username and password for connecting to the destination database.

  The user name and password entered by the user are encrypted in the GaussDB background to ensure security. The key file required for encryption must be generated using the **gs_guc** tool and released to the *$GAUSSHOME*/**bin** directory of each node in the cluster using the **gs_ssh** tool. **username** and **password** shall not contain the prefix **encryptOpt**. Otherwise, the values of **username** and **password** will be considered as encrypted ciphertext.
- **encoding** indicates the character string encoding mode used for interaction with the destination database (including the sent SQL statements and returned data of the character type). Its validity is not checked during object creation. Whether data can be encoded and decoded depends on whether the encoding you specified can be used in the database.

– optvalue

Specifies the option value.

Value range: an empty string or a non-empty string

Examples

```
-- Create an empty data source object that does not contain any information.
openGauss=# CREATE DATA SOURCE ds_test1;

-- Create a data source object with TYPE information and VERSION being null.
openGauss=# CREATE DATA SOURCE ds_test2 TYPE 'MPPDB' VERSION NULL;

-- Create a data source object that contains only OPTIONS.
openGauss=# CREATE DATA SOURCE ds_test3 OPTIONS (dsn 'GaussDB', encoding 'utf8');

-- Create a data source object that contains TYPE, VERSION, and OPTIONS.
openGauss=# CREATE DATA SOURCE ds_test4 TYPE 'unknown' VERSION '11.2.3' OPTIONS (dsn 'GaussDB',
username 'userid', password 'pwd@123456', encoding '');

-- Delete the data source object.
openGauss=# DROP DATA SOURCE ds_test1;
openGauss=# DROP DATA SOURCE ds_test2;
openGauss=# DROP DATA SOURCE ds_test3;
openGauss=# DROP DATA SOURCE ds_test4;
```

ALTER DATA SOURCE and **DROP DATA SOURCE**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.14.59 CREATE DIRECTORY

Function

CREATE DIRECTORY creates a directory. The directory defines an alias for a path in the server file system and is used to store data files used by users. Users can read and write these files through the **dbe_file** advanced package.

The read and write permissions for the directory can be granted to specified users to provide permission control for **dbe_file**.

Precautions

- When **enable_access_server_directory** is set to **off**, only the initial user is allowed to create directory objects. When **enable_access_server_directory** is set to **on**, the user with the SYSADMIN permission and the user who inherits the **gs_role_directory_create** permission of the built-in role can create directory objects.
- By default, the user who creates a directory has the read and write permissions on the directory.
- The default owner of a directory is the user who creates the directory.
- A directory cannot be created for the following paths:
  - The path contains special characters.
  - The path is a relative path.
  - The path is a symbolic link.
- The following validity check is performed during directory creation:
  - Check whether the path exists in the OS. If it does not exist, a message is displayed, indicating the potential risks.
  - Check whether the database initial user **omm** has the read, write, and execution permissions on the created directory. If the user does not have all the permissions, a message is displayed, indicating the potential risks.
- In a cluster, ensure that the path is the same on all the nodes. Otherwise, the path may fail to be found on some nodes when the directory is used.

Syntax

```
CREATE [OR REPLACE] DIRECTORY directory_name
AS 'path_name';
```

Parameter Description

- **directory_name**

  Specifies name of a directory.

  Value range: a string. It must comply with the naming convention.

- **path_name**

  Specifies the OS path for which a directory is to be created.

  Value range: a valid OS path

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
-- Create a directory.
openGauss=# CREATE OR REPLACE DIRECTORY  dir  as '/tmp/';
```

ALTER DIRECTORY and **DROP DIRECTORY**

12.14.60 CREATE FOREIGN TABLE (for Import and Export)

CREATE FOREIGN TABLE creates a GDS foreign table.

Function

CREATE FOREIGN TABLE creates a GDS foreign table in the current database for concurrent data import and export. The GDS foreign table can be read-only or write-only, used for concurrent data import and export, respectively. The OBS foreign table is read-only by default.

Precautions

- The foreign table is owned by the user who runs the statement.
- The distribution mode of a GDS foreign table does not need to be explicitly specified. The default mode is **ROUNDROBIN**.
- All constraints (including column and row constraints) are invalid to the GDS foreign table.
- When multi-layer quotation marks are used for sensitive columns (such as **password** and **secret_access_key**) in OPTIONS, the semantics is different from that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.

Syntax

```
CREATE FOREIGN TABLE [ IF NOT EXISTS  ] table_name
   ( [ { column_name type_name POSITION ( offset, length ) | LIKE source_table } [, ...] ] )
   SERVER gsmpp_server
   OPTIONS (  { option_name ' value '  }  [, ...] )
   [ { WRITE ONLY  |  READ ONLY  }]
   [ WITH error_table_name | LOG INTO error_table_name]
   [REMOTE LOG 'name']
   [PER NODE REJECT LIMIT 'value']
   [ TO { GROUP groupname | NODE ( nodename [, ... ] ) } ];
```

Parameter Overview

CREATE FOREIGN TABLE provides multiple parameters, which are classified as follows:

- Mandatory parameters
  - **table_name**
  - **column_name**
  - **type_name**
  - **SERVER gsmpp_server**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **OPTIONS**
- Optional parameters
  - Data source location parameter in foreign tables: **location**
  - Data format parameters
    - **format**
    - **header** (only for CSV and FIXED source data files)
    - **fileheader** (only for CSV and FIXED source data files)
    - **out_filename_prefix**
    - **delimiter**
    - **quote** (only for CSV source data files)
    - **escape** (only for CSV source data files)
    - **null**
    - **noescaping** (only for TEXT source data files)
    - **encoding**
    - **eol**
  - Error-tolerance parameters
    - **fill_missing_fields**
    - **ignore_extra_data**
    - **reject_limit**
    - **compatible_illegal_chars**
    - **WITH error_table_name**
    - **LOG INTO error_table_nam...**
    - **REMOTE LOG 'name'**
    - **PER NODE REJECT LIMIT 'v...**

Parameter Description

- **IF NOT EXISTS**

  Sends a notice, but does not throw an error, if a table with the same name exists.
- **table_name**

  Specifies the name of a foreign table.

  Value range: a string. It must comply with the naming convention.
- **column_name**

  Specifies the name of a column in the foreign table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string. It must comply with the naming convention.

- **type_name**

  Specifies the data type of the column.

- **POSITION(offset,length)**

  Defines the place of each column in the data file in fixed length mode.

  NOTE

  offset is the start of the column in the source file, and **length** is the length of the column.

  Value range: **offset** must be greater than 0, and its unit is byte.

  The length of each record must be less than or equal to 1 GB. By default, columns not in the file are replaced with null.

- **SERVER gsmpp_server**

  Specifies the server name of the foreign table. For the GDS foreign table, its server is created by the initial database, which is **gsmpp_server**.

- **OPTIONS ({ option_name ' value ' } [, ...])**

  Specifies all types of parameters of foreign table data.

  – location

    Specifies the data source location of the foreign table, which can be expressed through URLs or in local files. Separate URLs and local files with vertical bars (|).

    NOTE

    - For a read-only foreign table imported by GDS from a remote server in parallel, its URL must end with its corresponding schema or file name. (Read-only is the default file attribute.)

      For example: **gsfs://192.168.0.90:5000/***, **file:///data/data.txt**, or **gsfs:// 192.168.0.90:5000/* | gsfs:// 192.168.0.91:5000/***.

    - For a writable foreign table exported by GDS to a remote server in parallel, its URL does not need to contain a file name. If the data source is local, for example, **file:///data/**, only one data source in the foreign table can be specified, and the hosting directory must be created in advance on each node. If the data source location is a remote URL, for example, **gsfs:// 192.168.0.90:5000/**, multiple data sources can be specified. If the number of exported data file locations is less than or equal to the number of DNs, when you use the foreign table for export, data is evenly distributed to each data source location. If the number of exported data file locations is greater than the number of DNs, when you export data, the data is evenly distributed to data source locations corresponding to the DNs. Blank data files are created on the excess data source locations.
    - For a read-only foreign table imported by GDS from a remote server in parallel, the number of URLs must be less than the number of DNs, and URLs in the same location cannot be used.
    - If the URL begins with **gsfss://**, data is imported and exported in encryption mode, and DOP cannot exceed 10.

  – format

    Specifies the format of the data source file in a foreign table.

    Value range: **CSV**, **TEXT**, and **FIXED**. The default value is **TEXT**.

    ▪ In CSV files, escape sequences are processed as common strings. Therefore, newline characters are processed as data.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- In TEXT files, escape sequences are processed as they are. Therefore, newline characters are not processed as data.
- In FIXED files, the column length of each record is the same and spaces are used for padding.

NOTE

- An escape sequence is a string starting with a backslash (\), including **\b** (backspace), **\f** (form feed), **\n** (new line), **\r** (carriage return), **\t** (horizontal tab), **\v** (vertical tab), *****digit* (octal number), and **\x***digit* (hexadecimal number). In TEXT files, strings are processed as they are. In files of other formats, strings are processed as data.
- **FIXED** is defined as follows (**POSITION** must be specified for each column when **FIXED** is used.):
  1. The column length of each record is the same.
  2. Spaces are used for column padding. Columns of the numeric type are left-aligned and columns of the string type are right-aligned.
  3. No delimiters are used between columns.

– header

Specifies whether a file contains a header with the names of each column in the file. **header** is available only for CSV and FIXED files.

When data is imported, if **header** is **on**, the first row of the data file will be identified as the header and ignored. If **header** is **off**, the first row will be identified as a data row.

When data is exported, if header is **on**, **fileheader** must be specified. **fileheader** is used to specify the export header file format. If **header** is **off**, an exported file does not contain a header.

Value range: **true/on** and **false/off** The default value is **false/off**.

– fileheader

Specifies a file that defines the content in the header for exported data. The file contains one row of data description of each column.

For example, to add a header in a file containing product information, define the file as follows:

The information of products.\n

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- This parameter is available only when **header** is **on** or **true**. The file must be prepared in advance.
- In **Remote** mode, the definition file must be put to the working directory of the GDS (the **-d** directory specified when the GDS is started).
- In **Local** mode, the definition file must be put to the same path of each node, and **fileheader** specifies the absolute path.
- The file can contain only one row of header information, and end with a newline character. Excess rows will be discarded. (Header information cannot contain newline characters).
- The length of the file including the newline character cannot exceed 1 MB.

– out_filename_prefix

Specifies the name prefix of the data file exported using GDS from a write-only foreign table.

NOTICE

- The file name prefix must be valid and compliant with the restrictions of the file system in the physical environment where the GDS is deployed. Otherwise, the file will fail to be created.
  - The prefix of the specified export file name does not contain invalid characters, including but not limited to: '/', '?', '*', ':', '|', '\\', '<', '>', '@', '#', '$', '&', '(', ')', '+', '-'. The allowed characters are [a-z]*[A-Z]*[0-9]* and '_'.
  - The file name prefix cannot contain feature columns reserved for the Windows and Linux OS, including but not limited to:

    "con", "aux", "nul", "prn", "com0", "com1", "com2", "com3", "com4", "com5", "com6", "com7", "com8", "com9", "lpt0", "lpt1", "lpt2", "lpt3", "lpt4", "lpt5", "lpt6", "lpt7", "lpt8", and "lpt9".
  - The total length of the absolute path consisting of the exported file prefix, the path specified by **gds –d**, and **.dat.x** should be as required by the file system where GDS is deployed.
  - It is required that the prefix can be correctly parsed and identified by the receiver (including but not limited to the original database where it was exported) of the data file. Identify and modify the option that causes the file name resolution problem (if any).
- To concurrently perform export jobs, do not use the same file name prefix for them. Otherwise, the exported files may overwrite each other or be lost in the OS or file system.

– delimiter

Specifies the column delimiter of data. Use the default delimiter if it is not set. The default delimiter in the TEXT format is a tab and that in the CSV format is a comma (,). No delimiter is used in the FIXED format.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The value of **delimiter** cannot be **\r** or **\n**.
- A delimiter cannot be the same as the null value. The delimiter for the CSV format cannot be same as the **quote** value.
- The delimiter of TEXT data cannot contain any of the following characters: \.abcdefghijklmnopqrstuvwxyz0123456789.
- The data length of a single row should be less than 1 GB. A row that has many columns using long delimiters cannot contain much valid data.
- You are advised to use a multi-character, such as the combination of the dollar sign ($), caret (^), and ampersand (&), or invisible characters, such as 0x07, 0x08, and 0x1b as the delimiter.

Value range:

The value of **delimiter** can be a multi-character delimiter whose length is less than or equal to 10 bytes.

– quote

Specifies which characters in a CSV source data file will be quoted. The default value is single quotation marks (').

NOTE

- The value of **quote** cannot be the same as that of the **delimiter** or **null** parameter.
- The value of **quote** must be a single-byte character.
- Invisible characters are recommended, such as 0x07, 0x08, and 0x1b.

– escape

Specifies which characters in a CSV source data file are escape characters. Escape characters can only be single-byte characters.

The default value is single quotation marks ('). If the value is the same as that of **quote**, it will be replaced by **\0**.

– null

Specifies the string that represents a null value.

NOTE

- A null value cannot be **\r** or **\n**. The maximum length is 100 characters.
- A null value cannot be the same as the **delimiter** or **quote** value.

Value range:

- The default value is **\n** for the TEXT format.
- The default value for the CSV format is an empty string without quotation marks.

– noescaping

Specifies, in the TEXT format, whether to escape the backslash (\) and its following characters.

NOTE

noescaping is available only for TEXT source data files.

Value range: **true/on** and **false/off** The default value is **false/off**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- encoding

  Specifies the encoding of a data file, that is, the encoding used to parse, check, and generate a data file. Its default value is the default **client_encoding** value of the current database.

  Before you import foreign tables, it is recommended that you set **client_encoding** to the file encoding format, or a format matching the character set of the file. Otherwise, parsing and check errors may occur, leading to import errors, rollback, or even invalid data import. In a foreign table used for export, you are also advised to set this parameter because the export result using the default character set may not be what you expected.

  If this parameter is not specified when you create a foreign table, a warning message will be displayed on the client.

  NOTE

  Currently, GDS foreign tables cannot parse data files using multiple encoding formats during data import and cannot write such data files during data export.

- fill_missing_fields

  Specifies how to handle the problem that the last column of a row in a source data file is lost during data import.

  Value range: **true/on** and **false/off** The default value is **false/off**.

  - **true/on**: If the last column in a row of a data source file is missing during data loading, the column is set to null and no import error message is reported.
  - **false/off**: If the last column in a row of a data source file is missing during data import, the following error message is reported:
    ```
    missing data for column "tt"
    ```

- ignore_extra_data

  Specifies whether to ignore excessive columns when the number of data source files exceeds the number of foreign table columns. This parameter is used only during data import.

  Value range: **true/on** and **false/off** The default value is **false/off**.

  - **true/on**: If the number of columns in a data source file is greater than that defined by the foreign table, the extra columns at the end of a row are ignored.
  - **false/off**: If the number of columns in a data source file is greater than that defined by the foreign table, the following error message is reported:
    ```
    extra data after last expected column
    ```

NOTICE

If a newline character at the end of a row is missing and the row and another row are integrated into one, data in another row is ignored after the parameter is set to **true**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- reject_limit

  Specifies the maximum number of data format errors allowed during a data import task. If the number of errors does not reach the maximum number, the data import task can still be executed.

  NOTICE

  You are advised to replace this syntax with **PER NODE REJECT LIMIT 'value'**.

  Data format errors include the following: a column is lost, an extra column exists, a data type is incorrect, and encoding is incorrect. Once a non-data-format error occurs, the whole data import process is stopped.

  Value range: a positive integer or **unlimited**

  The default value is **0**, indicating that error information is returned immediately.

  NOTE

  Enclose positive integer values with single quotation marks ('').

- mode

  Specifies the data import policy during a specific data import process.

  Value range:

  - **Normal** (default): supports all file types (CSV, TEXT, FIXED). Enable GDS to help data import.
  - **Shared**: supports the TEXT format. It does not need assistance from GDS, but requires that all the user data be mounted to the same path of the same nodes through NFS.
  - **Private**: User data has been stored in the same local directories of DNs.

- eol

  Specifies the newline character style of the imported or exported data file.

  Value range: multi-character newline characters within 10 bytes. Common newline characters include **\r** (0x0D), **\n** (0x0A), and **\r\n** (0x0D0A). Special newline characters include **$** and **#**.

  NOTE

  - The **eol** parameter supports only the TEXT format for data import and export and does not support the CSV or FIXED format for data import. For forward compatibility, the **EOL** parameter can be set to **0x0D** or **0x0D0A** for data export in the CSV or FIXED format.
  - The value of **EOL** cannot be the same as that of the **delimiter** or **null** parameter.
  - The **EOL** parameter value cannot contain the following characters: .abcdefghijklmnopqrstuvwxyz0123456789.

- fix

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the length of fixed-length data. The unit is byte. This syntax is available only for READ ONLY foreign tables.

Value range: less than 1 GB, and greater than or equal to the total length specified by **POSITION** (The total length is the sum of **offset** and **length** in the last column of the table definition.)

- out_fix_alignment

  Specifies how the columns of the types BYTEAOID, CHAROID, NAMEOID, TEXTOID, BPCHAROID, VARCHAROID, NVARCHAR2OID, and CSTRINGOID are aligned during fixed-length export.

  Value range: **align_left** and **align_right**

  Default value: **align_right**

NOTICE

The bytea data type must be in hexadecimal format (for example, \XXXX) or octal format (for example, \XXX\XXX\XXX). The data to be imported must be left-aligned (that is, the column data starts with either of the two formats instead of spaces). Therefore, if the exported file needs to be imported using a GDS foreign table and the file data length is less than that specified by the foreign table formatter, the exported file must be left aligned. Otherwise, an error is reported during the import.

- date_format

  Specifies the DATE format for data import. This syntax is available only for READ ONLY foreign tables.

  Value range: a valid DATE value For details, see **Date and Time Processing Functions and Operators**.

  NOTE

  If Oracle is specified as the compatible database, the DATE format is **TIMESTAMP**. For details, see **timestamp_format** below.

- time_format

  Specifies the TIME format for data import. This syntax is available only for READ ONLY foreign tables.

  Value range: a valid TIME value. Time zones are not supported. For details, see **Date and Time Processing Functions and Operators**.

- timestamp_format

  Specifies the TIMESTAMP format for data import. This syntax is available only for READ ONLY foreign tables.

  Value range: a valid TIMESTAMP value. Time zones cannot be used. For details, see **Date and Time Processing Functions and Operators**.

- smalldatetime_format

  Specifies the SMALLDATETIME format for data import. This syntax is available only for READ ONLY foreign tables.

  Value range: a valid SMALLDATETIME value For details, see **Date and Time Processing Functions and Operators**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

– compatible_illegal_chars

Specifies whether to tolerate invalid characters during data import. This syntax is available only for READ ONLY foreign tables.

Value range: **true/on** and **false/off** The default value is **false/off**.

- **true/on**: No error message is reported and data import is not interrupted when there are invalid characters. Invalid characters are converted into valid ones, and then imported to the database.
- **false/off**: An error occurs when there are invalid characters, and the import stops.

NOTE

The rules for converting invalid characters are as follows:

1. **\0** is converted to a space.

2. Other invalid characters are converted to question marks.

3. When **compatible_illegal_chars** is set to **true/on**, after invalid characters such as **NULL**, **DELIMITER**, **QUOTE**, and **ESCAPE** are converted to spaces or question marks, an error message stating "illegal chars conversion may confuse COPY escape 0x20" will be displayed to remind you of possible parameter confusion caused by the conversion.

- **READ ONLY**

  Specifies whether a foreign table is read-only. This parameter is available only for data import.

- **WRITE ONLY**

  Specifies whether a foreign table is write-only. This parameter is available only for data import.

- **WITH error_table_name**

  Specifies the table where data format errors generated during parallel data import are recorded. You can query the error information table after data is imported to obtain error details. This parameter is available only after **reject_limit** is set.

  NOTE

  To be compatible with PostgreSQL open source interfaces, you are advised to replace this syntax with **LOG INTO**.

  Value range: a string. It must comply with the naming convention.

- **LOG INTO error_table_name**

  Specifies the table where data format errors generated during parallel data import are recorded. You can query the error information table after data is imported to obtain error details.

  NOTE

  This parameter is available only after **PER NODE REJECT LIMIT** is set.

  Value range: a string. It must comply with the naming convention.

- **REMOTE LOG 'name'**

  Specifies that the data format error information is saved as files in GDS. **name** is the prefix of the error data file.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **PER NODE REJECT LIMIT 'value'**

  Specifies the maximum number of data format errors allowed on each DN during data import. If the number of errors exceeds the specified value on any DN, data import fails, an error is reported, and the system exits data import.

  NOTICE

  This syntax specifies the error tolerance of a single node.

  Data format errors include the following: a column is lost, an extra column exists, a data type is incorrect, and encoding is incorrect. Once a non-data-format error occurs, the whole data import process is stopped.

  Value range: an integer or **unlimited**. The default value is 0, indicating that error information is returned immediately.

- **TO { GROUP groupname | NODE (nodename [, ...]) }**

  Currently, **TO GROUP** is not supported. **TO NODE** is used for internal scale-out tools.

Examples

```
-- Create a foreign table to import data from GDS servers 192.168.0.90 and 192.168.0.91 in text format. Record errors that occur during data import to the err_HR_staffS table.
openGauss=# CREATE FOREIGN TABLE foreign_HR_staffS
(
  staff_ID       NUMBER(6) ,
  FIRST_NAME     VARCHAR2(20),
  LAST_NAME      VARCHAR2(25),
  EMAIL          VARCHAR2(25),
  PHONE_NUMBER   VARCHAR2(20),
  HIRE_DATE      DATE,
  employment_ID  VARCHAR2(10),
  SALARY         NUMBER(8,2),
  COMMISSION_PCT NUMBER(2,2),
  MANAGER_ID     NUMBER(6),
  section_ID  NUMBER(4)
) SERVER gsmpp_server OPTIONS (location 'gsfs://192.168.0.90:5000/* | gsfs://192.168.0.91:5000/*', format 'TEXT', delimiter E'\x20',  null '') WITH err_HR_staffS;
-- Create a foreign table to import data from GDS servers 192.168.0.90 and 192.168.0.91 in text format and record error messages in the import process to the err_HR_staffS table. A maximum of two data format errors are allowed during the import.
CREATE FOREIGN TABLE foreign_HR_staffS_ft3
(
  staff_ID       NUMBER(6) ,
  FIRST_NAME     VARCHAR2(20),
  LAST_NAME      VARCHAR2(25),
  EMAIL          VARCHAR2(25),
  PHONE_NUMBER   VARCHAR2(20),
  HIRE_DATE      DATE,
  employment_ID  VARCHAR2(10),

) SERVER gsmpp_server OPTIONS (location 'file:///output_data/', format 'csv', delimiter '|', header 'on')
WRITE ONLY;
```

```
-- Delete the foreign table.
openGauss=# DROP FOREIGN TABLE foreign_HR_staffS;
openGauss=# DROP FOREIGN TABLE foreign_HR_staffS_ft1;
openGauss=# DROP FOREIGN TABLE foreign_HR_staffS_ft2;
openGauss=# DROP FOREIGN TABLE foreign_HR_staffS_ft3;
```

Helpful Links

ALTER FOREIGN TABLE (for Import and Export) and **DROP FOREIGN TABLE**

Suggestions

- delimiter
  - A delimiter cannot be **\r** or **\n**, or the same as the null value. The delimiter of CSV data cannot be same as the **quote** value.
  - The data length of a single row should be less than 1 GB. A row that has many columns using long delimiters cannot contain much valid data.
  - You are advised to use a multi-character, such as the combination of the dollar sign ($), caret (^), and ampersand (&), or invisible characters, such as 0x07, 0x08, and 0x1b as the delimiter.
- quote
  - The value of **quote** cannot be the same as that of the **delimiter** or null parameter. The value must be a single-byte character.
  - Invisible characters are recommended, such as 0x07, 0x08, and 0x1b.
- mode Normal
  - Supports all file types (including CSV, TEXT, and FIXED). To import data, you need to enable GDS on the data server.
- mode Shared

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - Supports the TEXT format. It does not need assistance from GDS, but requires that all the user data be mounted to the same path of the same nodes through NFS.
- mode Private
  - This mode is used when user data has been stored in the same local directories of DNs.

12.14.61 CREATE FUNCTION

Function

CREATE FUNCTION creates a function.

Precautions

- If the parameters or return values of a function have precision, the precision is not checked.
- When creating a function, you are advised to explicitly specify the schemas of tables in the function definition. Otherwise, the function may fail to be executed.
- **current_schema** and **search_path** specified by **SET** during function creation are invalid. **search_path** and **current_schema** before and after function execution should be the same.
- If a function has output parameters, the **SELECT** statement uses the default values of the output parameters when calling the function. When the **CALL** statement calls the function, it requires that the output parameters must be specified. When the **CALL** statement calls an overloaded **PACKAGE** function, it can use the default values of the output parameters. For details, see examples in **CALL**.
- Only the functions compatible with PostgreSQL or those with the **PACKAGE** attribute can be overloaded. After **REPLACE** is specified, a new function is created instead of replacing a function if the number of parameters, parameter type, or return value is different.
- You can use the **SELECT** statement to specify different parameters using identical functions, but cannot use the **CALL** statement to call identical functions without the **PACKAGE** attribute.
- When you create a function, you cannot insert other agg functions out of the avg function or other functions.
- In non-logical cluster mode, return values, parameters, and variables cannot be set to the tables of the Node Groups that are not installed in the system by default. The internal statements of SQL functions cannot be executed on such tables.
- In logical cluster mode, if return values and parameters of the function are user tables, all the tables must be in the same logical cluster. If the function body involves operations on multiple logical cluster tables, the function cannot be set to **IMMUTABLE** or **SHIPPABLE**, preventing the function from being pushed down to a DN. (The current feature is a lab feature. Contact Huawei technical support before using it.)
- In logical cluster mode, the parameters and return values of the function cannot use **%type** to reference a table column type. Otherwise, the function

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

will fail to be created. (The current feature is a lab feature. Contact Huawei technical support before using it.)

- By default, the permissions to execute new functions are granted to **PUBLIC**. For details, see **GRANT**. By default, a user inherits the permissions of the **PUBLIC** role. Therefore, other users also have the permission to execute a function and view the definition of the function. In addition, to execute a function, other users must have the USAGE permission on the schema of the function. When creating a function, the user can revoke the default execution permissions from **PUBLIC** and grant them to other users as needed. To avoid the time window during which new functions can be accessed by all users, create functions and set function execution permissions in a transaction. After the database object isolation attribute is enabled, common users can view only the definitions of functions that they have the permission to execute. For details about how to enable the attribute, see *Security Hardening Guide*.
- If a function is defined as an IMMUTABLE or SHIPPABLE function, avoid INSERT, UPDATE, DELETE, MERGE, and DDL operations on the function because the CN needs to determine the execution node for these operations. Otherwise, an error may occur. If DDL operations are performed on a function of the IMMUTABLE or SHIPPABLE type, database objects on each node may be inconsistent. To resolve this problem, create the **VOLATILE plpgsql** function on the CN, run the **EXECUTE** statement in the function definition to dynamically execute the DDL operation for repairing system objects, and then use the EXECUTE DIRECT ON syntax to call the repair function on the specified DN.
- When calling functions without parameters inside another function, you can omit brackets and call functions using their names directly.
- When functions with output parameters are called inside another function which is an assignment expression, you can omit the output parameters of the called functions.
- Oracle-compatible functions support viewing, exporting, and importing parameter comments.
- Oracle-compatible functions support viewing, exporting, and importing comments between IS/AS and plsql_body.
- Users granted with the **CREATE ANY FUNCTION** permission can create or replace functions in the user schemas.
- The default permission on a function is **SECURITY INVOKER**. If you want to change the default permission to **SECURITY DEFINER**, you need to set the GUC parameter **behavior_compat_options** to **'plsql_security_definer'**. For details about the **SECURITY DEFINER** permission, see sections "Database Configuration > Permission Management" in *Security Hardening Guide*.

Syntax

- Syntax (compatible with PostgreSQL) for creating a customized function:

```
CREATE [ OR REPLACE  ] FUNCTION function_name
    ( [  { argname [ argmode  ] argtype [  { DEFAULT  | :=  | =  } expression  ]}  [, ...]  ] )
    [ RETURNS rettype [ DETERMINISTIC  ]  | RETURNS TABLE (  { column_name column_type  }
[, ...] )]
    LANGUAGE lang_name
    [
      {IMMUTABLE  | STABLE  | VOLATILE }
       | {SHIPPABLE | NOT SHIPPABLE}
       | WINDOW
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
      | [ NOT  ] LEAKPROOF
      | {CALLED ON NULL INPUT  | RETURNS NULL ON NULL INPUT | STRICT }
      | {[ EXTERNAL  ] SECURITY INVOKER | [ EXTERNAL  ] SECURITY DEFINER | AUTHID DEFINER  |
AUTHID CURRENT_USER}
      | {fenced | not fenced}
      | {PACKAGE}

      | COST execution_cost
      | ROWS result_rows
      | SET configuration_parameter { {TO | =} value | FROM CURRENT }}
   ][...]
  {
     AS 'definition'
     | AS 'obj_file', 'link_symbol'
  }
```

- Oracle syntax of creating a customized function:

```
CREATE [ OR REPLACE  ] FUNCTION function_name
   ( [  { argname [ argmode  ] argtype [  { DEFAULT | := | =  } expression  ] }  [, ...]  ] )
   RETURN rettype [ DETERMINISTIC  ]
   [
      {IMMUTABLE  | STABLE  | VOLATILE }
      | {SHIPPABLE | NOT SHIPPABLE}
      | {PACKAGE}
      | {FENCED | NOT FENCED}

Parameter Description

- **function_name**

  Specifies the name of the function to create (optionally schema-qualified).

  Value range: a string. It must comply with the identifier naming convention.

- **argname**

  Specifies the parameter name of the function.

  Value range: a string. It must comply with the identifier naming convention.

- **argmode**

  Specifies the parameter mode of the function.

  Value range: **IN**, **OUT**, **INOUT**, and **VARIADIC**. The default value is **IN**. Only the parameter of the **OUT** mode can be followed by **VARIADIC**. The parameters of **OUT** and **INOUT** cannot be used in the function definition of **RETURNS TABLE**.

  NOTE

  VARIADIC specifies parameters of the array type.

- **argtype**

Specifies the data type of a function parameter. You can use **%ROWTYPE** to indirectly reference the type of a table, or **%TYPE** to indirectly reference the type of a column in a table or composite type.

- **expression**

  Specifies the default expression of a parameter.

- **rettype**

  Specifies the return data type. Same as **argtype**, **%TYPE** or **%ROWTYPE** can also be used to indirectly reference types.

  When there is **OUT** or **IN OUT** parameter, the **RETURNS** clause can be omitted. If the clause exists, the result type of the clause must be the same as that of the output parameter. If there are multiple output parameters, the result type of the clause is **RECORD**. Otherwise, the result type of the clause is the same as that of a single output parameter.

  The **SETOF** modifier indicates that the function will return a set of items, rather than a single item.

- **column_name**

  Specifies the column name.

- **column_type**

  Specifies the column type.

- **definition**

  Specifies a string constant defining a function. Its meaning depends on the language. It can be an internal function name, a path pointing to a target file, a SQL query, or text in a procedural language.

- **LANGUAGE lang_name**

  Specifies the name of the language that is used to implement the function. It can be **SQL**, **C**, **internal**, or the name of a customized process language. To ensure downward compatibility, the name can use single quotation marks. Contents in single quotation marks must be capitalized.

  Due to compatibility issues, no matter which language is specified when an O-style database is created, the language used is plpgsql.

- **WINDOW**

  Specifies that the function is a window function. This is currently only useful for functions written in C. The **WINDOW** attribute cannot be changed when replacing an existing function definition.

  NOTICE

  For a customized window function, the value of **LANGUAGE** can only be **internal**, and the referenced internal function must be a window function.

- **IMMUTABLE**

  Specifies that the function always returns the same result if the parameter values are the same.

- **STABLE**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies that the function cannot modify the database, and that within a single table scan it will consistently return the same result for the same parameter value, but its result varies by SQL statements.

- **VOLATILE**

  Specifies that the function value can change in a single table scan and no optimization is performed.

- **SHIPPABLE**

  NOT SHIPPABLE

  Specifies whether the function can be pushed down to DNs for execution.

  - Functions of the **IMMUTABLE** type can always be pushed down to DNs.
  - Functions of the **STABLE** or **VOLATILE** type can be pushed down to DNs only if their attribute is **SHIPPABLE**.

NOTICE

If **SHIPPABLE**/**IMMUABLE** is specified for a function or stored procedure, the function or stored procedure cannot contain **EXCEPTION** or invoke functions or stored procedures that contain **EXCEPTION**.

- **PACKAGE**

  Specifies whether the function can be overloaded.

  - All PACKAGE and non-PACKAGE functions cannot be overloaded or replaced.
  - PACKAGE functions do not support parameters of the VARIADIC type.
  - The **PACKAGE** attribute of functions cannot be modified.

- **LEAKPROOF**

  Specifies that the function has no side effects. **LEAKPROOF** can be set only by the system administrator.

- **CALLED ON NULL INPUT**

  Declares that some parameters of the function can be invoked in normal mode if the parameter values are null. This parameter can be omitted.

- **RETURNS NULL ON NULL INPUT**

  STRICT

  Specifies that the function always returns null whenever any of its parameters is null. If this parameter is specified, the function is not executed when there are null parameters; instead a null result is returned automatically.

  RETURNS NULL ON NULL INPUT and **STRICT** have the same functions.

- **EXTERNAL**

  The keyword **EXTERNAL** is allowed for SQL conformance, but it is optional since, unlike in SQL, this feature applies to all functions not only external ones.

- **SECURITY INVOKER**

  AUTHID CURRENT_USER

  Specifies that the function will be executed with the permissions of the user who invokes it. This parameter can be omitted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

SECURITY INVOKER and **AUTHID CURRENT_USER** have the same functions.

- **SECURITY DEFINER**

  AUTHID DEFINER

  Specifies that the function will be executed with the permissions of the user who created it.

  AUTHID DEFINER and **SECURITY DEFINER** have the same functions.

- **FENCED**

  NOT FENCED

  Indicates whether the function is executed in fenced mode or not fenced mode. In **NOT FENCED** mode, a function is executed in a CN or DN process. In **FENCED** mode, a function is executed in a new fork process, which does not affect CN or DN processes.

  Application scenarios:

  – Develop or debug a function in **FENCED** mode and execute it in **NOT FENCED** mode. This reduces the overhead of the fork process and communication.

  – Perform complex OS operations, such as opening a file, and processing signals and threads in FENCED mode; otherwise, the GaussDB database execution may be affected.

  – Customize C functions. (The current feature is a lab feature. Contact Huawei technical support before using it.) If this parameter is not specified, the default value **FENCED** is used.

  – Customize PL/Java function. If this parameter is not specified, the default value **FENCED** is used and the **NOT FENCED** execution mode is not supported. (The current feature is a lab feature. Contact Huawei technical support before using it.)

  – Customize PL/pgSQL functions. If this parameter is not specified, the default value **NOT FENCED** is used and the **FENCED** execution mode is not supported.

- **COST execution_cost**

  Estimates the execution cost of a function.

  The unit of **execution_cost** is **cpu_operator_cost**.

  Value range: a positive integer

- **ROWS result_rows**

  Estimates the number of rows returned by the function. This is only allowed when the function is declared to return a set.

  Value range: a positive number. The default value is **1000**.

- **configuration_parameter**

  – **value**

    Sets a specified database session parameter to a specified value. If the value is **DEFAULT** or **RESET**, the default setting is used in the new session. **OFF** closes the setting.

    Value range: a string

    - DEFAULT

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - OFF
  - RESET

  Specifies the default value.
- **from current**

  Uses the value of **configuration_parameter** of the current session.

- **obj_file, link_symbol**

  (Used for C functions) Specifies the absolute path of the dynamic library using *obj_file* and the link symbol (function name in C programming language) of the function using *link_symbol*. (The current feature is a lab feature. Contact Huawei technical support before using it.)

- **plsql_body**

  Specifies the PL/SQL stored procedure body.

NOTICE

When a user is created in the function body, the plaintext password is recorded in the log. You are not advised to do it.

Examples

```
-- Define a function as SQL query.
openGauss=# CREATE FUNCTION func_add_sql(integer, integer) RETURNS integer
    AS 'select $1 + $2;'
    LANGUAGE SQL
    IMMUTABLE
    RETURNS NULL ON NULL INPUT;

-- Add an integer by parameter name using PL/pgSQL.
openGauss=# CREATE OR REPLACE FUNCTION func_increment_plsql(i integer) RETURNS integer AS $$
        BEGIN
                RETURN i + 1;
        END;
$$ LANGUAGE plpgsql;

-- Return the RECORD type.
CREATE OR REPLACE FUNCTION compute(i int, out result_1 bigint, out result_2 bigint)
returns SETOF RECORD
as $$
begin
    result_1 = i + 1;
    result_2 = i * 10;
return next;
end;
$$language plpgsql;

-- Return a record containing multiple output parameters.
openGauss=# CREATE FUNCTION func_dup_sql(in int, out f1 int, out f2 text)
    AS $$ SELECT $1, CAST($1 AS text) || ' is text' $$
    LANGUAGE SQL;

openGauss=# SELECT * FROM func_dup_sql(42);

-- Compute the sum of two integers and return the result (if the input is null, the returned result is null).
openGauss=# CREATE FUNCTION func_add_sql2(num1 integer, num2 integer) RETURN integer
AS
BEGIN
RETURN num1 + num2;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
END;
/
-- Create an overloaded function with the PACKAGE attribute:
openGauss=# create or replace function package_func_overload(col int, col2  int)
return integer package
as
declare
    col_type text;
begin
     col := 122;
         dbe_output.print_line('two int parameters ' || col2);
         return 0;
end;
/

openGauss=# create or replace function package_func_overload(col int, col2 smallint)
return integer package
as
declare
    col_type text;
begin
     col := 122;
         dbe_output.print_line('two smallint parameters ' || col2);
         return 0;
end;
/

-- Alter the execution rule of function add to IMMUTABLE (that is, the same result is returned if the
parameter remains unchanged).
openGauss=# ALTER FUNCTION func_add_sql2(INTEGER, INTEGER) IMMUTABLE;

-- Alter the name of function add to add_two_number.
openGauss=# ALTER FUNCTION func_add_sql2(INTEGER, INTEGER) RENAME TO add_two_number;

-- Change the owner of function add to omm.
openGauss=# ALTER FUNCTION add_two_number(INTEGER, INTEGER) OWNER TO omm;

-- Delete the function.
openGauss=# DROP FUNCTION add_two_number;
openGauss=# DROP FUNCTION func_increment_sql;
openGauss=# DROP FUNCTION func_dup_sql;
openGauss=# DROP FUNCTION func_increment_plsql;
openGauss=# DROP FUNCTION func_add_sql;
```

  - Do not run **ANALYZE** in a function or stored procedure.

12.14.62 CREATE GROUP

Function

CREATE GROUP creates a user group.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

CREATE GROUP is an alias for **CREATE ROLE**, and it is not a standard SQL syntax and not recommended. Users can use **CREATE ROLE** directly.

Syntax

```
CREATE GROUP group_name [ [ WITH ] option [ ... ] ]
    [ ENCRYPTED | UNENCRYPTED ] { PASSWORD | IDENTIFIED BY } { 'password' [ EXPIRED ] | DISABLE };
```

The syntax of the optional **action** clause is as follows:

```
where option can be:
{SYSADMIN | NOSYSADMIN}
    | {MONADMIN | NOMONADMIN}
    | {OPRADMIN | NOOPRADMIN}
    | {POLADMIN | NOPOLADMIN}
    | {AUDITADMIN | NOAUDITADMIN}
    | {CREATEDB | NOCREATEDB}
    | {USEFT | NOUSEFT}
    | {CREATEROLE | NOCREATEROLE}
    | {INHERIT | NOINHERIT}
    | {LOGIN | NOLOGIN}
    | {REPLICATION | NOREPLICATION}
    | {INDEPENDENT | NOINDEPENDENT}
    | {VCADMIN | NOVCADMIN}
    | {PERSISTENCE | NOPERSISTENCE}
    | CONNECTION LIMIT connlimit
    | VALID BEGIN 'timestamp'
    | VALID UNTIL 'timestamp'
    | RESOURCE POOL 'respool'
    | USER GROUP 'groupuser'
    | PERM SPACE 'spacelimit'
    | NODE GROUP logic_group_name
    | IN ROLE role_name [, ...]
    | IN GROUP role_name [, ...]
    | ROLE role_name [, ...]
    | ADMIN role_name [, ...]
    | USER role_name [, ...]
    | SYSID uid
    | DEFAULT TABLESPACE tablespace_name
    | PROFILE DEFAULT
    | PROFILE profile_name
    | PGUSER
```

Parameter Description

See **Parameter Description** in **CREATE ROLE**.

12.14.63 CREATE INCREMENTAL MATERIALIZED VIEW

Function

CREATE INCREMENTAL MATERIALIZED VIEW creates an incremental materialized view, and you can refresh the data of the materialized view by using **REFRESH MATERIALIZED VIEW** (full refresh) and **REFRESH INCREMENTAL MATERIALIZED VIEW** (incremental refresh).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

CREATE INCREMENTAL MATERIALIZED VIEW is similar to **CREATE TABLE AS**, but it remembers the query used to initialize the view, so it can refresh data later. A materialized view has many attributes that are the same as those of a table, but does not support temporary materialized views.

Precautions

- Incremental materialized views cannot be created on temporary tables or global temporary tables.
- Incremental materialized views support only simple filter queries and UNION ALL queries of base tables.
- The distribution column cannot be specified when an incremental materialized view is created.
- After an incremental materialized view is created, most DDL operations in the base table are no longer supported.
- The IUD operation cannot be performed on incremental materialized views.
- After an incremental materialized view is created, you need to run the **REFRESH** command to synchronize the materialized view with the base table when the base table data changes.

Syntax

```
CREATE INCREMENTAL MATERIALIZED VIEW mv_name
   [ (column_name [, ...] ) ]
   [ TABLESPACE tablespace_name ]
   AS query;
```

Parameter Description

- **mv_name**

  Name (optionally schema-qualified) of the materialized view to be created.

  Value range: a string. It must comply with the naming convention.

- **column_name**

  Column name in the new materialized view. The materialized view supports specified columns. The number of specified columns must be the same as the number of columns in the result of the subsequent query statement. If no column name is provided, the column name is obtained from the output column name of the query.

  Value range: a string. It must comply with the naming convention.

- **TABLESPACE tablespace_name**

  Tablespace to which the new materialized view belongs. If the tablespace is not specified, the default tablespace is used.

- **AS query**

  SELECT or **TABLE** command. This query will be run in a security-constrained operation.

Examples

```
-- Create an ordinary table.
openGauss=# CREATE TABLE my_table (c1 int, c2 int);
-- Create an incremental materialized view.
openGauss=# CREATE INCREMENTAL MATERIALIZED VIEW my_imv AS SELECT * FROM my_table;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Write data to the base table.
openGauss=# INSERT INTO my_table VALUES(1,1),(2,2);
-- Incrementally refresh the incremental materialized view my_imv.
openGauss=# REFRESH INCREMENTAL MATERIALIZED VIEW my_imv;
```

12.14.64 CREATE INDEX

Function

CREATE INDEX-bak defines a new index.

Indexes are primarily used to enhance database performance (though inappropriate use can result in database performance deterioration). You are advised to create indexes on:

- Columns that are often queried
- Join conditions. For a query on joined columns, you are advised to create a composite index on the columns, For example, for **select * from t1 join t2 on t1.a=t2.a and t1.b=t2.b**, you can create a composite index on columns **a** and **b** in table **t1**.
- Columns having filter criteria (especially scope criteria) of a **where** clause
- Columns that appear after **order by**, **group by**, and **distinct**

Partitioned tables do not support partial index creation (when indexes contain the GLOBAL or LOCAL keyword or the created index is a GLOBAL index).

Precautions

- Indexes consume storage and computing resources. Creating too many indexes has negative impact on database performance (especially the performance of data import. Therefore, you are advised to import the data before creating indexes). Therefore, create indexes only when they are necessary.
- All functions and operators used in an index definition must be immutable, that is, their results must depend only on their parameters and never on any outside influence (such as the contents of another table or the current time). This restriction ensures that the behavior of the index is well-defined. To use a customized function in an index expression or **WHERE** clause, remember to mark the function **immutable** when you create it.
- When creating a unique index on a partitioned table, ensure that the index contains distribution columns. If an index does not contain a partition key, only global partition indexes can be created.
- Column-store tables support B-tree and psort indexes. If the two indexes are used, you cannot create expression, partial, and unique indexes.
- Column-store tables support GIN indexes, rather than partial indexes and unique indexes. If GIN indexes are used, you can create expression indexes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

However, an expression in this situation cannot contain empty splitters, empty columns, or multiple columns.

- A user granted the **CREATE ANY INDEX** permission can create indexes in both the public and user schemas.
- If a user-defined function is called in the expression index, the expression index function is executed based on the permission of the function creator.

Syntax

- Create an index on a table.

```
CREATE [ UNIQUE ] INDEX [ CONCURRENTLY ] [ [schemaname.]index_name ] ON table_name
[ USING method ]
    ({ { column_name | ( expression ) } [ COLLATE collation ] [ opclass ] [ ASC | DESC ] [ NULLS
{ FIRST | LAST } ] }[, ...] )
    [ WITH ( {storage_parameter = value} [, ... ] ) ]
    [ TABLESPACE tablespace_name ]
    [ WHERE predicate ];
```

- Create an index on a partitioned table.

```
CREATE [ UNIQUE ] INDEX [ [schemaname.]index_name ] ON table_name [ USING method ]
    ( { { column_name | ( expression ) } [ COLLATE collation ] [ opclass ] [ ASC | DESC ] [ NULLS
LAST ] } [, ...] )
    [ LOCAL [ ( { PARTITION index_partition_name [ TABLESPACE index_partition_tablespace ] }
[, ...] ) ] | GLOBAL ]
    [ WITH ( { storage_parameter = value } [, ...] ) ]
    [ TABLESPACE tablespace_name ]
    [ WHERE predicate ];
```

Parameter Description

- **UNIQUE**

  Creates a unique index. In this way, the system checks whether new values are unique in the index column. Attempts to insert or update data which would result in duplicate entries will generate an error.

  Currently, only B-tree indexes and UB-tree indexes in row-store tables support unique indexes.

- **CONCURRENTLY**

  Create an index (with ShareUpdateExclusiveLock) in a mode that does not block DML. When an index is created, other statements cannot access the table on which the index depends. If this keyword is specified, DML is not blocked during the creation.

  - This option can only specify a name of one index.
  - **CREATE INDEX** can be run within a transaction, but **CREATE INDEX CONCURRENTLY** cannot be run within a transaction.
  - Column-store tables and partitioned tables do not support index creation by using **CONCURRENTLY**. For temporary tables, you can use **CONCURRENTLY** to create indexes. However, indexes are created in blocking mode because no other sessions concurrently access the temporary tables and the blocking mode is more cost-effective.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- This keyword is specified when an index is created. The entire table needs to be scanned twice and built. When the table is scanned for the first time, an index is created and the read and write operations are not blocked. During the second scan, changes that have occurred since the first scan are merged and updated.
- The table needs to be scanned and built twice, and all existing transactions that may modify the table must be completed. This means that the creation of the index takes a longer time than normal. In addition, the CPU and I/O consumption also affects other services.
- If an index build fails, it leaves an "unusable" index. This index is ignored by the query, but it still consumes the update overhead. In this case, you are advised to run the **DROP INDEX IF EXISTS** statement to delete the index and run the **CONCURRENTLY** statement to create the index again.
- After the second scan, index creation must wait for any transaction that holds a snapshot earlier than the snapshot taken by the second scan to terminate. In addition, ShareUpdateExclusiveLock (level 4) added during index creation conflicts with a lock whose level is greater than or equal to 4. Therefore, when such an index is created, the system is prone to hang or deadlock. Example:
  - If two sessions create an index by using **CONCURRENTLY** for the same table, a deadlock occurs.
  - If a session creates an index by using **CONCURRENTLY** for a table and another session drops a table, a deadlock occurs.
  - There are three sessions. Session 1 locks table **a** and does not commit it. Session 2 creates an index by using **CONCURRENTLY** for table **b**. Session 3 writes data to table **a**. Before the transaction of session 1 is committed, session 2 is blocked.
  - When an index is created by using **CONCURRENTLY** for a table concurrently with the TRUNCATE operation on the same table, a deadlock occurs.
  - The transaction isolation level is set to repeatable read (read committed by default). Two sessions are started. Session 1 writes data to table **a** and does not commit it. Session 2 creates an index by using **CONCURRENTLY** for table **b**. Before the transaction of session 1 is committed, session 2 is blocked.
- When an index is being created or fails to be created, you need to check the index progress or status. You can query the **gs_get_index_status('schema_name', 'index_name')** function to check the index status on all nodes. The input parameters **schema_name** and **index_name** are used to specify the index schema name and index name, respectively. The return values are **node_name**, **indisready**, and **indisvalid**, indicating the node name, whether the index can be inserted on the node, and whether the index is available on the node. The index is available only when **indisready** and **indisvalid** on all nodes are set to **true**; otherwise, wait until the index creation is complete. If the index fails to be created, delete the index and create it again.

- **schema_name**

  Specifies the schema name.

  Value range: an existing schema name

- **index_name**

  Specifies the name of the index to create. No schema name can be included here; the index is always created in the same schema as its parent table.

  Value range: a string. It must comply with the naming convention.

- **table_name**

  Specifies the name of the table to be indexed (optionally schema-qualified).

  Value range: an existing table name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **USING method**

  Specifies the name of the index method to be used.

  Value range:

  - **btree**: B-tree indexes store key values of data in a B+ tree structure. This structure helps users to quickly search for indexes. B-tree supports comparison queries with a scope specified.
  - **gin**: GIN indexes are reverse indexes and can process values that contain multiple keys (for example, arrays).
  - **gist**: GiST indexes are suitable for the set data type and multidimensional data types, such as geometric and geographic data types.
  - **Psort**: psort index. It is used to perform partial sort on column-store tables.

  Row-store tables support the following index types: **btree** (default), **gin**, and **gist**. Column-store tables support the following index types: **Psort** (default), **btree**, and **gin**. Global temporary tables do not support GIN and GiST indexes.

- **column_name**

  Specifies the name of the column on which an index is to be created.

  Multiple columns can be specified if the index method supports multi-column indexes. A global index supports a maximum of 31 columns, and other indexes support a maximum of 32 columns.

- **expression**

  Specifies an expression based on one or more columns of the table. The expression usually must be written with surrounding parentheses, as shown in the syntax. However, the parentheses can be omitted if the expression has the form of a function call.

  Expression can be used to obtain fast access to data based on some transformation of the basic data. For example, an index computed on **upper(col)** would allow the clause **WHERE upper(col) = 'JIM'** to use an index.

  If an expression contains **IS NULL**, the index for this expression is invalid. In this case, you are advised to create a partial index.

- **COLLATE collation**

  Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **select * from pg_collation** command to query collation rules from the **pg_collation** system catalog. The default collation rule is the row starting with **default** in the query result.

- **opclass**

  Specifies the name of an operator class. An operator class can be specified for each column of an index. The operator class identifies the operators to be used by the index for that column. For example, a B-tree index on the type int4 would use the **int4_ops** class; this operator class includes comparison functions for values of type int4. In practice, the default operator class for the column's data type is sufficient. The operator class applies to data with multiple sorts. For example, users might want to sort a complex-number data type either by absolute value or by real part. They could do this by defining two operator classes for the data type and then selecting the proper class when making an index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **ASC**

  Specifies an ascending (default) sort order.

- **DESC**

  Specifies a descending sort order.

- **NULLS FIRST**

  Specifies that null values appear before non-null values in the sort ordering. This is the default when **DESC** is specified.

- **NULLS LAST**

  Specifies that null values appear after non-null values in the sort ordering. This is the default when **DESC** is not specified.

- **WITH ({storage_parameter = value} [, ...])**

  Specifies the storage parameter used for an index.

  Value range:

  Only index GIN supports parameters **FASTUPDATE** and **GIN_PENDING_LIST_LIMIT**. Indexes other than GIN and psort support the **FILLFACTOR** parameter.

  – FILLFACTOR

    The fill factor of an index is a percentage from 10 to 100.

    Value range: 10–100

  – FASTUPDATE

    Specifies whether fast update is enabled for the GIN index.

    Value range: **ON** and **OFF**

    Default value: **ON**

  – GIN_PENDING_LIST_LIMIT

    Specifies the maximum capacity of the pending list of the GIN index when fast update is enabled for the GIN index.

    Value range: 64–2147483647. The unit is KB.

    Default value: The default value of **gin_pending_list_limit** depends on **gin_pending_list_limit** specified in GUC parameters. By default, the value is **4**.

  – CROSSBUCKET

    Specifies whether cross-hash bucket indexes are used. Only B-tree indexes are supported.

    Value range: **ON** and **OFF**

    Default: **ON**

- **TABLESPACE tablespace_name**

  Specifies the tablespace for an index. If no tablespace is specified, the default tablespace is used.

  Value range: an existing table name

- **WHERE predicate**

  Creates a partial index. A partial index is an index that contains entries for only a portion of a table, usually a portion that is more useful for indexing than the rest of the table. For example, if you have a table that contains both

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

billed and unbilled orders where the unbilled orders take up a small fraction of the total table and yet that is an often used portion, you can improve performance by creating an index on just that portion. In addition, **WHERE** with **UNIQUE** can be used to enforce uniqueness over a subset for a table.

Value range: The predicate expression can only refer to columns of the underlying table, but it can use all columns, not just the ones being indexed. Currently, subqueries and aggregate expressions are forbidden in **WHERE**. You are not advised to use a predicate of numeric types such as int, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

For a partitioned table index, if the created index contains the GLOBAL or LOCAL keyword or the created index is a GLOBAL index, the WHERE clause cannot be used to create an index.

- **PARTITION index_partition_name**

  Specifies the name of an index partition.

  Value range: a string. It must comply with the naming convention.

- **TABLESPACE index_partition_tablespace**

  Specifies the tablespace of an index partition.

  Value range: If this parameter is not specified, the value of **index_tablespace** is used.

Examples

```
-- Create the tpcds.ship_mode_t1 table.
openGauss=# create schema tpcds;
openGauss=# CREATE TABLE tpcds.ship_mode_t1
(
    SM_SHIP_MODE_SK           INTEGER               NOT NULL,
    SM_SHIP_MODE_ID           CHAR(16)              NOT NULL,
    SM_TYPE                   CHAR(30)                      ,
    SM_CODE                   CHAR(10)                      ,
    SM_CARRIER                CHAR(20)                      ,

Helpful Links

ALTER INDEX and **DROP INDEX**

Suggestions

- create index

  You are advised to create indexes on:

  - Columns that are often queried
  - Join conditions. For a query on joined columns, you are advised to create a composite index on the columns, For example, for **select * from t1 join t2 on t1.a=t2.a and t1.b=t2.b**, you can create a composite index on columns **a** and **b** in table **t1**.
  - Columns having filter criteria (especially scope criteria) of a **where** clause
  - Columns that appear after **order by**, **group by**, and **distinct**

  Constraints:

  - An index of an ordinary table supports a maximum of 32 columns. A GLOBAL index of a partitioned table supports a maximum of 31 columns.
  - The size of a single index cannot exceed the size of the index page (8 KB). The size of a B-tree, UB-tree, or GIN index cannot exceed one third of the page size.
  - Partial indexes cannot be created in a partitioned table.
  - When creating a unique index on a partitioned table, ensure that the index contains distribution columns. If an index does not contain a partition key, only global partition indexes can be created.

12.14.65 CREATE LANGUAGE

This version does not support this syntax.

12.14.66 CREATE MASKING POLICY

Function

CREATE MASKING POLICY creates a masking policy.

Precautions

Only user **poladmin**, user **sysadmin**, or the initial user can perform this operation.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The masking policy takes effect only after the security policy is enabled, that is, **enable_security_policy** is set to **on**. For details, see "Database Configuration > Database Security Management Policies > Dynamic Data Masking" in the *Security Hardening Guide*.

For details about the execution effect and supported data types of preset masking functions, see "Database Security > Dynamic Data Masking" in *Feature Description*.

Syntax

```
CREATE MASKING POLICY policy_name masking_clause[, ...]* policy_filter [ENABLE | DISABLE];
```

- masking_clause
  ```
  masking_function ON LABEL(label_name[, ...]*)
  ```
- masking_function

  maskall is not a preset function. It is hard-coded and cannot be displayed by running **\df**.

  Eight preset masking methods or user-defined functions
  ```
  maskall | randommasking | creditcardmasking | basicemailmasking | fullemailmasking |
  shufflemasking | alldigitsmasking | regexpmasking
  ```
- policy_filter:
  ```
  FILTER ON FILTER_TYPE(filter_value [,...]*)[,...]*
  ```
- FILTER_TYPE:
  ```
  IP | APP | ROLES
  ```

Parameter Description

- **policy_name**

  Specifies the audit policy name, which must be unique.

  Value range: a string. It must comply with the naming convention.
- **label_name**

  Specifies the resource label name.
- **masking_clause**

  Specifies the masking function to be used to anonymize database resources labeled by **label_name**. **schema.function** can be used to specify the masking function.
- **policy_filter**

  Specifies the users for which the masking policy takes effect. If this parameter is left empty, the masking policy takes effect for all users.
- **FILTER_TYPE**

  Specifies the types of information to be filtered by the policy, including **IP**, **APP**, and **ROLES**.
- **filter_value**

  Indicates the detailed information to be filtered, such as the IP address, app name, and username.
- **ENABLE|DISABLE**

  Enables or disables the masking policy. If **ENABLE|DISABLE** is not specified, **ENABLE** is used by default.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
-- Create users dev_mask and bob_mask.
openGauss=# CREATE USER dev_mask PASSWORD 'dev@1234';
openGauss=# CREATE USER bob_mask PASSWORD 'bob@1234';

-- Create table tb_for_masking.
openGauss=# CREATE TABLE tb_for_masking(col1 text, col2 text, col3 text);

-- Create a resource label for label sensitive column col1.
openGauss=# CREATE RESOURCE LABEL mask_lb1 ADD COLUMN(tb_for_masking.col1);

-- Create a resource label for label sensitive column col2.
openGauss=# CREATE RESOURCE LABEL mask_lb2 ADD COLUMN(tb_for_masking.col2);

-- Create a masking policy for the operation of accessing sensitive column col1.
openGauss=# CREATE MASKING POLICY maskpol1 maskall ON LABEL(mask_lb1);

-- Create a masking policy that takes effect only for scenarios where users are dev_mask and bob_mask,
client tools are psql and gsql, and IP addresses are 10.20.30.40, and 127.0.0.0/24.
openGauss=# CREATE MASKING POLICY maskpol2 randommasking ON LABEL(mask_lb2) FILTER ON
ROLES(dev_mask, bob_mask), APP(psql, gsql), IP('10.20.30.40', '127.0.0.0/24');
```

12.14.67 CREATE MATERIALIZED VIEW

CREATE MATERIALIZED VIEW creates a full materialized view, and you can use **REFRESH MATERIALIZED VIEW** (full refresh) to refresh the data in the materialized view.

CREATE MATERIALIZED VIEW is similar to **CREATE TABLE AS**, but it remembers the query used to initialize the view, so it can refresh data later. A materialized view has many attributes that are the same as those of a table, but does not support temporary materialized views.

Precautions

- Full materialized views cannot be created in temporary tables or global temporary tables.
- Full materialized views do not support NodeGroups.
- After a full materialized view is created, most DDL operations in the base table are no longer supported.
- IUD operations cannot be performed on full materialized views.
- After a full materialized view is created, if the base table data changes, you need to run the refresh command to synchronize the materialized view with the base table.

Syntax

```
CREATE MATERIALIZED VIEW mv_name
   [ (column_name [, ...] ) ]
   [ WITH ( {storage_parameter = value} [, ... ] ) ]
   [ TABLESPACE tablespace_name ]
   AS query;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter Description

- **mv_name**

  Name (optionally schema-qualified) of the materialized view to be created.

  Value range: a string. It must comply with the naming convention.

- **column_name**

  Column name in the new materialized view. The materialized view supports specified columns. The number of specified columns must be the same as the number of columns in the result of the subsequent query statement. If no column name is provided, the column name is obtained from the output column name of the query.

  Value range: a string. It must comply with the naming convention.

- **WITH (storage_parameter [= value] [, ...])**

  Specifies an optional storage parameter for a table or an index. For details, see **CREATE TABLE**.

- **TABLESPACE tablespace_name**

  Tablespace to which the new materialized view belongs. If the tablespace is not specified, the default tablespace is used.

- **AS query**

  SELECT, **TABLE**, or **VALUES** command This query will be run in a security-constrained operation.

Examples

```
-- Create an ordinary table.
openGauss=# CREATE TABLE my_table (c1 int, c2 int);
-- Create a full materialized view.
openGauss=# CREATE MATERIALIZED VIEW my_mv AS SELECT * FROM my_table;
-- Write data to the base table.
openGauss=# INSERT INTO my_table VALUES(1,1),(2,2);
-- Fully refresh the full materialized view my_mv.
openGauss=# REFRESH MATERIALIZED VIEW my_mv;
```

12.14.68 CREATE MODEL

This syntax is not supported in distributed scenarios.

12.14.69 CREATE NODE

Function

CREATE NODE creates a cluster node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

CREATE NODE GROUP is an interface of the cluster management tool. You are not advised to use this interface, because doing so affects the cluster. Only the administrator has the permission to use this interface.

Syntax

```
CREATE NODE nodename WITH
 (
   [ TYPE = nodetype,]
   [ HOST = hostname,]
   [ PORT = portnum,]
   [ HOST1 = 'hostname',]
   [ PORT1 = portnum,]
   [ HOSTPRIMARY [ = boolean ],]
   [ PRIMARY [ = boolean ],]
   [ PREFERRED [ = boolean ],]
   [ SCTP_PORT = portnum,]
   [ CONTROL_PORT = portnum,]
   [ SCTP_PORT1 = portnum,]
   [ CONTROL_PORT1 = portnum ]
 );
```

Parameter Description

- **nodename**

  Specifies the node name.

  Value range: a string. It must comply with the naming convention.

- **TYPE = nodetype**

  Specifies the type of a node.

  Value range:

  – 'coordinator'

  – 'datanode'

- **HOST = hostname**

  Specifies the primary server name or IP address of a node.

- **PORT = portnum**

  Specifies the primary server port to which a node is bound.

- **HOST1 = hostname**

  Specifies the name or IP address of the standby server of a node.

- **PORT1 = portnum**

  Specifies the port number of the standby server to which a node is bound.

- **HOSTPRIMARY**

- **PRIMARY = boolean**

  Specifies whether the node is a primary node or not. A primary node allows read/write operations. A non-primary node allows only read operations.

  Value range:

  – **true**

  – **false** (default value)

- **PREFERRED = boolean**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies whether the node is a preferred node for read operations.

Value range:

- **true**
- **false** (default value)

- **SCTP_PORT = portnum**

  Specifies the port used by the TCP proxy communication library or SCTP communication library (Due to specification changes, the current version no longer supports the current feature. Do not use this feature.) of the primary node to listen on the data transmission channel. The TCP protocol is used to listen on connections.

- **CONTROL_PORT = portnum**

  Specifies the port used by the TCP proxy communication library of the primary node to listen on the control transmission channel. The TCP protocol is used to listen on connections.

- **SCTP_PORT1 = portnum**

  Specifies the port used by the TCP proxy communication library or SCTP communication library (Due to specification changes, the current version no longer supports the current feature. Do not use this feature.) of the standby node to listen on the data transmission channel. The TCP protocol is used to listen on connections.

- **CONTROL_PORT 1= portnum**

  Specifies the port used by the TCP proxy communication library of the standby node to listen on the control transmission channel. The TCP protocol is used to listen on connections.

Helpful Links

ALTER NODE and **DROP NODE**

12.14.70 CREATE NODE GROUP

Function

CREATE NODE GROUP creates a cluster node group.

Precautions

- **CREATE NODE GROUP** is an interface of the cluster management tool.
- Only a system administrator has the permission.

Syntax

```
CREATE NODE GROUP groupname
   [WITH ( nodename [, ... ] )] [bucketcnt bucket_cnt]
   [ BUCKETS [ ( bucketnumber [, ... ] ) ] ] [VCGROUP] [DISTRIBUTE FROM src_group_name] [groupparent
parent_group_name];
```

Parameter Description

- **groupname**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the name of a node group.

Value range: a string. It must comply with the naming convention. A value can contain a maximum of 63 characters.

NOTE

A node group name supports all ASCII characters, but you are advised to name a node group according to the naming convention.

- **nodename**

  Specifies the node name.

  Value range: a string. It must comply with the naming convention. A value can contain a maximum of 63 characters.

  If this parameter is not specified, the value of **bucketcnt** must be specified, indicating that child node groups belonging to the installation node group will be created.

- bucketcnt bucket_cnt

  bucket_cnt indicates the number of buckets.

  The value range is [32,16384) and the value must be a power of 2.

  If this parameter is not specified, the value of **WITH** must be specified.

- **BUCKETS [(bucketnumber [, ...])]**

  Designed for internal use of the cluster management tool. You are not advised to use it directly. Otherwise, the cluster may be affected.

- **VCGROUP**

  Creates a node group used as a logical cluster. (The current feature is a lab feature. Contact Huawei technical support before using it.)

- **DISTRIBUTE FROM src_group_name**

  Creates a node group to redistribute data in the node group specified by **src_group_name**. (The current feature is a lab feature. Contact Huawei technical support before using it.) You are not advised to use this clause, because it may lead to data distribution errors or node group unavailability.

- groupparent parent_group_name

  parent_group_name indicates the name of the parent node group to which the current child node group belongs.

Helpful Links

DROP NODE GROUP

12.14.71 CREATE PROCEDURE

Function

CREATE PROCEDURE creates a stored procedure.

Precautions

- If the parameters or return values of a stored procedure have precision, the precision is not checked.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- When creating a stored procedure, you are advised to explicitly specify the schemas of all operations on table objects in the stored procedure definition. Otherwise, the stored procedure may fail to be executed.
- **current_schema** and **search_path** specified by **SET** during stored procedure creation are invalid. **search_path** and **current_schema** before and after function execution should be the same.
- If a stored procedure has output parameters, the **SELECT** statement uses the default values of the output parameters when calling the procedure. When the **CALL** statement calls the stored procedure or a non-overloaded function, output parameters must be specified. When the **CALL** statement calls an overloaded **PACKAGE** function, it can use the default values of the output parameters. For details, see examples in **CALL**.
- A stored procedure with the **PACKAGE** attribute can use overloaded functions.
- When you create a procedure, you cannot insert aggregate functions or other functions out of the average function.
- If a function is defined as **IMMUTABLE** or **SHIPPABLE**, avoid **INSERT**, **UPDATE**, **DELETE**, **MERGE**, and **DDL** operations in the function because the CN needs to determine the execution node for these operations. Otherwise, an error may occur.
- The stored procedure does not support operations that will return a set.
- When stored procedures without parameters are called in another stored procedure, you can omit brackets and call stored procedures using their names directly.
- When functions with output parameters are called in a stored procedure which is an assignment expression, you can omit the output parameters of the called functions.
- The stored procedure supports viewing, exporting, and importing parameter comments.
- The stored procedure supports viewing, exporting, and importing parameter comments between IS/AS and plsql_body.
- Users granted with the **CREATE ANY FUNCTION** permission can create or replace stored procedures in the user schemas.
- The default permission on a stored procedure is **SECURITY INVOKER**. If you want to change the default permission to **SECURITY DEFINER**, you need to set the GUC parameter **behavior_compat_options** to **'plsql_security_definer'**. For details about the **SECURITY DEFINER** permission, see sections "Database Configuration > Permission Management" in *Security Hardening Guide*.

Syntax

```
openGauss=# CREATE [ OR REPLACE ] PROCEDURE procedure_name
   [ ( {[ argname ] [ argmode ] argtype [ { DEFAULT | := | = } expression ]}[,...]) ]
   [
     { IMMUTABLE | STABLE | VOLATILE }
     | { SHIPPABLE | NOT SHIPPABLE }
     | {PACKAGE}
     | [ NOT ] LEAKPROOF
     | { CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }
     | {[ EXTERNAL ] SECURITY INVOKER | [ EXTERNAL ] SECURITY DEFINER | AUTHID DEFINER | AUTHID
CURRENT_USER}
     | COST execution_cost
     | SET configuration_parameter { [ TO | = ] value | FROM CURRENT }
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
   ][ ... ]
 { IS | AS }
plsql_body
/
```

Parameter Description

- **OR REPLACE**

  Replaces the original definition when two stored procedures are with the same name.

- **procedure_name**

  Specifies the name of the stored procedure that is created (optionally with schema names).

  Value range: a string. It must comply with the naming convention.

- **argmode**

  Specifies the mode of an argument.

  NOTICE

  VARIADIC specifies parameters of the array type.

  Value range: **IN**, **OUT**, **INOUT**, and **VARIADIC**. The default value is **IN**. Only the parameter of the **OUT** mode can be followed by **VARIADIC**. The parameters of **OUT** and **INOUT** cannot be used in procedure definition of **RETURNS TABLE**.

- **argname**

  Specifies the argument name.

  Value range: a string. It must comply with the identifier naming convention.

- **argtype**

  Specifies the data type of the parameter. You can use **%ROWTYPE** to indirectly reference the type of a table, or **%TYPE** to indirectly reference the type of a column in a table or composite type.

  Value range: a valid data type

- **IMMUTABLE, STABLE,**...

  Specifies a constraint. The function of each parameter is similar to that of **CREATE FUNCTION**. For details, see **CREATE FUNCTION**.

- **plsql_body**

  Specifies the PL/SQL stored procedure body.

  NOTICE

  When you create a user, or perform other operations requiring password input in a stored procedure, the system catalog and CSV log record the password in plaintext. Therefore, you are advised not to perform such operations in the stored procedure.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **NOTE**
>
> No specific order is applied to **argname** and **argname**. The following order is advised: **argname**, **argmode**, and **argtype**.

Examples

```
-- Create a stored procedure.
openGauss=# CREATE OR REPLACE PROCEDURE prc_add
(
    param1    IN   INTEGER,
    param2    IN OUT  INTEGER
)
AS
BEGIN
   param2:= param1 + param2;
   dbe_output.print_line('result is: '||to_char(param2));
END;
/

-- Call the stored procedure.
openGauss=# SELECT prc_add(2,3);

-- Create a stored procedure whose parameter type is VARIADIC.
openGauss=# CREATE OR REPLACE PROCEDURE pro_variadic (var1 VARCHAR2(10) DEFAULT 'hello!',var4
VARIADIC int4[])
AS
BEGIN
    dbe_output.print_line(var1);
END;
/

-- Execute the stored procedure.
openGauss=# SELECT pro_variadic(var1=>'hello', VARIADIC var4=> array[1,2,3,4]);

-- Create a stored procedure with the permission of the user who calls it.
openGauss=# CREATE TABLE tb1(a integer);
openGauss=#  CREATE PROCEDURE insert_data(v integer)
SECURITY INVOKER
AS
BEGIN
    INSERT INTO tb1 VALUES(v);
END;
/

-- Call the stored procedure.
openGauss=#  CALL insert_data(1);

-- Create a stored procedure with the PACKAGE attribute.
openGauss=# create or replace procedure package_func_overload(col int, col2 out varchar)
package
as
declare
    col_type text;
begin
     col2 := '122';
         dbe_output.print_line('two varchar parameters ' || col2);
end;
/
-- Delete the stored procedure.
openGauss=# DROP PROCEDURE prc_add;
openGauss=# DROP PROCEDURE pro_variadic;
openGauss=# DROP PROCEDURE insert_data;
openGauss=# DROP PROCEDURE package_func_overload;
```

12.14.72 CREATE RESOURCE LABEL

Function

CREATE RESOURCE LABEL creates a resource label.

Precautions

Only user **poladmin**, user **sysadmin**, or the initial user can perform this operation.

Syntax

```
CREATE RESOURCE LABEL [IF NOT EXISTS] label_name ADD label_item_list[, ...]*;
```

- label_item_list
  ```
  resource_type(resource_path[, ...]*)
  ```
- resource_type
  ```
  TABLE | COLUMN | SCHEMA | VIEW | FUNCTION
  ```

Parameter Description

- **label_name**

  Specifies the resource label name, which must be unique.

  Value range: a string. It must comply with the naming convention.
- **resource_type**

  Specifies the type of database resources to be labeled.
- **resource_path**

  Specifies the path of database resources.

Examples

```
-- Create table tb_for_label.
openGauss=# CREATE TABLE tb_for_label(col1 text, col2 text, col3 text);

-- Create schema schema_for_label.
openGauss=# CREATE SCHEMA schema_for_label;

-- Create view view_for_label.
openGauss=# CREATE VIEW view_for_label AS SELECT 1;

-- Create function func_for_label.
openGauss=# CREATE FUNCTION func_for_label RETURNS TEXT AS $$ SELECT col1 FROM tb_for_label; $$
LANGUAGE SQL;

-- Create a resource label based on the table.
openGauss=# CREATE RESOURCE LABEL IF NOT EXISTS table_label add TABLE(public.tb_for_label);

-- Create a resource label based on the columns.
openGauss=# CREATE RESOURCE LABEL IF NOT EXISTS column_label add
COLUMN(public.tb_for_label.col1);

-- Create a resource label based on the schema.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
openGauss=# CREATE RESOURCE LABEL IF NOT EXISTS schema_label add SCHEMA(schema_for_label);

-- Create a resource label based on the view.
openGauss=# CREATE RESOURCE LABEL IF NOT EXISTS view_label add VIEW(view_for_label);

12.14.73 CREATE RESOURCE POOL

The current feature is a lab feature. Contact Huawei technical support before using it.

Function

CREATE RESOURCE POOL creates a resource pool and specifies the Cgroup of the resource pool.

Precautions

Only a user with the **CREATE** permission on the current database can perform this operation.

Syntax

```
CREATE RESOURCE POOL pool_name
    [WITH ({MEM_PERCENT=pct | CONTROL_GROUP="group_name" | ACTIVE_STATEMENTS=stmt |
MAX_DOP = dop | MEMORY_LIMIT='memory_size' | io_limits=io_limits | io_priority='io_priority' |
nodegroup="nodegroupname" | is_foreign=boolean }[, ... ])];
```

Parameter Description

- **pool_name**

  Specifies the name of a resource pool.

  The name of the resource pool cannot be same as that of an existing resource pool.

  Value range: a string. It must comply with the naming convention.

- **group_name**

  Specifies the name of a Cgroup.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- You can use either double quotation marks ("") or single quotation marks (') in the syntax when setting the name of a Cgroup.
- The value of **group_name** is case-sensitive.
- If **group_name** is not specified, the string "Medium" will be used by default in the syntax, indicating the **Medium** Timeshare Cgroup under **DefaultClass**.
- If an administrator specifies a Workload Cgroup under Class, for example, **control_group** set to **class1:workload1**, the resource pool will be associated with the **workload1** Cgroup under **class1**. The level of **Workload** can also be specified. For example, **control_group** is set to **class1:workload1:1**.
- If a database user specifies the Timeshare string (**Rush**, **High**, **Medium**, or **Low**) in the syntax, for example, **control_group** is set to **High**, the resource pool will be associated with the **High** Timeshare Cgroup under **DefaultClass**.
- In multi-tenant scenarios, the Cgroup associated with a group resource pool is a Class Cgroup, and that associated with a service resource pool is a Workload Cgroup. Additionally, switching Cgroups between different resource pools is not allowed.

Value range: a string. It must comply with the rule in the description, which specifies the created Cgroup.

- **stmt**

  Specifies the maximum number of statements that can be concurrently executed in a resource pool.

  Value range: numeric data ranging from –1 to 2147483647

- **dop**

  Specifies the maximum statement concurrency degree for a resource pool, equivalent to the number of threads that can be created for executing a statement.

  Value range: numeric data ranging from 1 to 2147483647

- **memory_size**

  Specifies the maximum memory size of a resource pool.

  Value range: a string from 1 KB to 2047 GB

- **mem_percent**

  Specifies the proportion of available resource pool memory to the total memory or group user memory.

  In multi-tenant scenarios, **mem_percent** of group users or service users ranges from 1 to 100. The default value is **20**.

  In common scenarios, **mem_percent** of common users ranges from 0 to 100. The default value is **0**.

  NOTE

  When both of **mem_percent** and **memory_limit** are specified, only **mem_percent** takes effect.

- **io_limits**

  Specifies the upper limit of IOPS in a resource pool.

  Row-store is measured by 10,000 IOPS, while column-store is measured by IOPS.

- **io_priority**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the I/O priority for jobs that consume many I/O resources. It takes effect when the I/O usage reaches 90%.

There are three priorities: **Low**, **Medium**, and **High**. If you do not want to control I/O resources, use the default value **None**.

NOTE

The settings of **io_limits** and **io_priority** are valid only for complex jobs, such as batch import (using **INSERT INTO SELECT**, **COPY FROM**, or **CREATE TABLE AS**), complex queries involving over 500 MB data on each DN, and **VACUUM FULL**.

- **nodegroup**

  Specifies the name of a logical cluster. (The current feature is a lab feature. Contact Huawei technical support before using it.) The logical cluster must already exist.

  If the logical cluster name contains uppercase letters or special characters or begins with a digit, enclose the name with double quotation marks ("") in SQL statements.

- **is_foreign**

  Specifies that the current resource pool is used to control the resources of common users who are not associated with the logical cluster. (The current feature is a lab feature. Contact Huawei technical support before using it.) The logical cluster is specified by the **nodegroup** column of the resource pool.

  NOTE

  - **nodegroup** must specify an existing logical cluster, and cannot be **elastic_group** or the default node group (**group_version1**), which is generated during cluster installation.
  - If **is_foreign** is set to **true**, the resource pool cannot be associated with users. That is, **CREATE USER... RESOURCE POOL** cannot be used to configure resource pools for users. The resource pool automatically checks whether the users are associated with its logical cluster. If they are not, they will be controlled by the resource pool when performing operations on DNs in the logical cluster.

Examples

This example assumes that Cgroups have been created by users in advance.

```
-- Create a default resource pool, and associate it with the Medium Timeshare Cgroup under Workload under DefaultClass.
openGauss=# CREATE RESOURCE POOL pool1;

-- Create a resource pool and specify the High Timeshare Workload Cgroup under the DefaultClass Cgroup.
openGauss=# CREATE RESOURCE POOL pool2 WITH (CONTROL_GROUP="High");

-- Create a resource pool, and associate it with the Low Timeshare Cgroup under Workload under class1.
openGauss=# CREATE RESOURCE POOL pool3 WITH (CONTROL_GROUP="class1:Low");

-- Create a resource pool, and associate it with the wg1 Workload Cgroup under class1.
openGauss=# CREATE RESOURCE POOL pool4 WITH (CONTROL_GROUP="class1:wg1");

-- Create a resource pool, and associate it with the wg2 Workload Cgroup under class1.
openGauss=# CREATE RESOURCE POOL pool5 WITH (CONTROL_GROUP="class1:wg2:3");

-- Delete the resource pool.
openGauss=# DROP RESOURCE POOL pool1;
openGauss=# DROP RESOURCE POOL pool2;
openGauss=# DROP RESOURCE POOL pool3;
openGauss=# DROP RESOURCE POOL pool4;
openGauss=# DROP RESOURCE POOL pool5;
```

12.14.74 CREATE ROLE

Function

CREATE ROLE creates a role.

A role is an entity that owns database objects and permissions. In different environments, a role can be considered a user, a group, or both.

Precautions

- **CREATE ROLE** adds a role to a database. The role does not have the **LOGIN** permission.
- Only the user who has the **CREATE ROLE** permission or a system administrator is allowed to create roles.

Syntax

```
CREATE ROLE role_name [ [ WITH ] option [ ... ] ] [ ENCRYPTED | UNENCRYPTED ] { PASSWORD |
IDENTIFIED BY } { 'password' [EXPIRED] | DISABLE };
```

The syntax of role information configuration clause **option** is as follows:

```
{SYSADMIN | NOSYSADMIN}
   | {MONADMIN | NOMONADMIN}
   | {OPRADMIN | NOOPRADMIN}
   | {POLADMIN | NOPOLADMIN}
   | {AUDITADMIN | NOAUDITADMIN}
   | {CREATEDB | NOCREATEDB}
   | {USEFT | NOUSEFT}
   | {CREATEROLE | NOCREATEROLE}
   | {INHERIT | NOINHERIT}
   | {LOGIN | NOLOGIN}
   | {REPLICATION | NOREPLICATION}
   | {INDEPENDENT | NOINDEPENDENT}
   | {VCADMIN | NOVCADMIN}
   | {PERSISTENCE | NOPERSISTENCE}
   | CONNECTION LIMIT connlimit
   | VALID BEGIN 'timestamp'
   | VALID UNTIL 'timestamp'
   | RESOURCE POOL 'respool'
   | USER GROUP 'groupuser'
   | PERM SPACE 'spacelimit'
   | TEMP SPACE 'tmpspacelimit'
   | SPILL SPACE 'spillspacelimit'
   | NODE GROUP logic_cluster_name
   | IN ROLE role_name [, ...]
   | IN GROUP role_name [, ...]
   | ROLE role_name [, ...]
   | ADMIN rol e_name [, ...]
   | USER role_name [, ...]
   | SYSID uid
   | DEFAULT TABLESPACE tablespace_name
   | PROFILE DEFAULT
   | PROFILE profile_name
   | PGUSER
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter Description

- **role_name**

  Specifies the name of a role.

  Value range: a string. It must comply with the identifier naming convention and can contain a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the role name. If a role name contains uppercase letters, the database automatically converts the uppercase letters into lowercase letters. To create a role name that contains uppercase letters, enclose the role name with double quotation marks ("").

- **password**

  Specifies the login password.

  The new password must:

  – Contain at least eight characters. This is the default length.

  – Differ from the role name or the role name spelled backward.

  – Contain at least three of the following character types: uppercase characters, lowercase characters, digits, and special characters (limited to ~!@#$ %^&*()-_=+\|[{}];:,<.>/?). If the password contains characters other than the preceding characters, an error will be reported during statement execution.

  – The password can also be a ciphertext character string that meets the format requirements. This mode is mainly used to import user data. You are not advised to use it directly. If a ciphertext password is used, the user must know the plaintext corresponding to the ciphertext password and ensure that the plaintext password meets the complexity requirements. The database does not verify the complexity of the ciphertext password. Instead, the security of the ciphertext password is ensured by the user.

  – Be enclosed by single quotation marks when a role is created.

  Value range: a character string that cannot be empty.

- **EXPIRED**

  When creating a user, you can select **EXPIRED**. That is, you can create a user whose password is invalid. The user cannot perform simple query or extended query. The statement can be executed only after the password is changed.

- **DISABLE**

  By default, you can change your password unless it is disabled. To disable the password of a user, use this parameter. After the password of a user is disabled, the password will be deleted from the system. The user can connect to the database only through external authentication, for example, Kerberos authentication. Only administrators can enable or disable a password. Common users cannot disable the password of an initial user. To enable a password, run **ALTER USER** and specify the password.

- **ENCRYPTED | UNENCRYPTED**

  Controls whether the password is stored encrypted in the system catalogs. According to product security requirement, the password must be stored encrypted. Therefore, **UNENCRYPTED** is forbidden in GaussDB. If the password string has already been encrypted in the SHA256 format, it is stored encrypted as it was, regardless of whether **ENCRYPTED** or **UNENCRYPTED** is

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

specified (since the system cannot decrypt the specified encrypted password string). This allows reloading of encrypted passwords during dump/restore.

- **SYSADMIN | NOSYSADMIN**

  Determines whether a new role is a system administrator. Roles having the **SYSADMIN** attribute have the highest permission.

  Value range: If not specified, **NOSYSADMIN** is the default.

  When separation of duties is enabled, users with the SYSADMIN permission do not have the permission to create users.

- **MONADMIN | NOMONADMIN**

  Determines whether a role is a monitoring administrator.

  Value range: If not specified, **NOMONADMIN** is the default.

- **OPRADMIN | NOOPRADMIN**

  Determines whether a role is an O&M administrator.

  Value range: If not specified, **NOOPRADMIN** is the default.

- **POLADMIN | NOPOLADMIN**

  Determines whether a role is a security policy administrator.

  Value range: If not specified, **NOPOLADMIN** is the default.

- **AUDITADMIN | NOAUDITADMIN**

  Determines whether a role has the audit and management attributes.

  If not specified, **NOAUDITADMIN** is the default.

- **CREATEDB | NOCREATEDB**

  Determines a role's permission to create databases.

  A new role does not have the permission to create databases.

  Value range: If not specified, **NOCREATEDB** is the default.

- **USEFT | NOUSEFT**

  This parameter is reserved and not used in this version.

- **CREATEROLE | NOCREATEROLE**

  Determines whether a role will be permitted to create new roles (that is, execute **CREATE ROLE** and **CREATE USER**). A role with the **CREATEROLE** permission can also modify and delete other roles.

  Value range: If not specified, **NOCREATEROLE** is the default.

  - When separation of duties is disabled, users with the CREATEROLE permission can create users with the CREATEROLE, AUDITADMIN, MONADMIN, POLADMIN, or CREATEDB permission and common users.
  - When separation of duties is enabled, users with the CREATEROLE permission can create users with the CREATEROLE, MONADMIN, POLADMIN, or CREATEDB permission and common users.

- **INHERIT | NOINHERIT**

  Determines whether a role "inherits" the permissions of roles in the same group. It is not recommended.

- **LOGIN | NOLOGIN**

  Determines whether a role is allowed to log in to a database. A role having the **LOGIN** attribute can be considered as a user.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: If not specified, **NOLOGIN** is the default.

- **REPLICATION | NOREPLICATION**

  Determines whether a role is allowed to initiate streaming replication or put the system in and out of backup mode. A role having the **REPLICATION** attribute is specific to replication.

  If not specified, **NOREPLICATION** is the default.

- **INDEPENDENT | NOINDEPENDENT**

  Defines private, independent roles. For a role with the **INDEPENDENT** attribute, administrators' permissions to control and access this role are separated. The rules are as follows:

  – Administrators have no permission to add, delete, query, modify, copy, or authorize the corresponding table objects without the authorization from the **INDEPENDENT** role.

  – If permissions related to private user tables are granted to non-private users, the system administrator will obtain the same permissions.

  – System administrators and security administrators with the **CREATEROLE** attribute have no permission to modify the inheritance relationship of the **INDEPENDENT** role without the authorization of the **INDEPENDENT** role.

  – System administrators have no permission to modify the owner of the table objects for the **INDEPENDENT** role.

  – System administrators and security administrators with the **CREATEROLE** attribute have no permission to remove the **INDEPENDENT** attribute of the **INDEPENDENT** role.

  – System administrators and security administrators with the **CREATEROLE** attribute have no permission to change the database password of the **INDEPENDENT** role. The **INDEPENDENT** role must manage its own password. If the password is lost, it cannot be reset.

  – The **SYSADMIN** attribute of a user cannot be changed to the **INDEPENDENT** attribute.

  – Operations performed by users in the **INDEPENDENT** role are recorded in audit logs based on the audit policy.

- **VCADMIN | NOVCADMIN**

  Defines the role of a logical cluster administrator. A logical cluster administrator has the following permissions other than permissions of common users:

  – Create, modify, and delete resource pools in the associated logical cluster. (The current feature is a lab feature. Contact Huawei technical support before using it.)

  – Grant the access permission on the associated logical cluster to other users or roles, or revoke the access permission from those users or roles.

- **PERSISTENCE | NOPERSISTENCE**

  Defines a permanent user. Only the initial user is allowed to create, modify, and delete permanent users with the **PERSISTENCE** attribute.

- **CONNECTION LIMIT**

  Specifies how many concurrent connections the role can make.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- The system administrator is not restricted by this parameter.
- **connlimit** is calculated for each CN. The number of connections in a cluster is calculated using the following formula: Number of connections in a cluster = **connlimit** x Number of normal CNs.

Value range: an integer greater than or equal to -1. The default value is **-1**, which means unlimited.

- **VALID BEGIN**

  Sets a date and time when the role's password takes effect. If this clause is omitted, the password takes effect immediately.

- **VALID UNTIL**

  Sets a date and time after which the role's password is no longer valid. If this clause is omitted, the password will be valid for all time.

- **RESOURCE POOL**

  Sets the name of resource pool used by the role. The name belongs to the system catalog **pg_resource_pool**.

- **USER GROUP 'groupuser'**

  Creates a sub-user.

- **PERM SPACE**

  Sets the space available for a user.

- **TEMP SPACE**

  Sets the space allocated to the temporary table of a user.

- **SPILL SPACE**

  Sets the operator disk flushing space of a user.

- **NODE GROUP**

  Specifies the name of the logical cluster associated with a user. (The current feature is a lab feature. Contact Huawei technical support before using it.) If the name of the logical cluster contains uppercase characters or special characters, enclose the name with double quotation marks ("").

- **IN ROLE**

  Lists one or more existing roles to which the new role will be immediately added as a new member. It is not recommended.

- **IN GROUP**

  Specifies an obsolete spelling of **IN ROLE**. It is not recommended.

- **ROLE**

  Lists one or more existing roles which are automatically added as members of the new role.

- **ADMIN**

  Similar to **ROLE**. However, **ADMIN** grants permissions of new roles to other roles.

- **USER**

  Specifies an obsolete spelling of the **ROLE** clause.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **SYSID**

  The **SYSID** clause is ignored.
- **DEFAULT TABLESPACE**

  The **DEFAULT TABLESPACE** clause is ignored.
- **PROFILE**

  The **PROFILE** clause is ignored.
- **PGUSER**

  In the current version, this attribute is reserved only for forward compatibility.

Examples

```
-- Create role manager whose password is xxxxxxxxxx:
openGauss=# CREATE ROLE manager IDENTIFIED BY 'xxxxxxxxxx';

-- Create a role with its validity from January 1, 2015 to January 1, 2026.
openGauss=# CREATE ROLE miriam WITH LOGIN PASSWORD 'xxxxxxxxxxx' VALID BEGIN '2015-01-01'
VALID UNTIL '2026-01-01';

-- Change the password of role manager to abcd@123.
openGauss=# ALTER ROLE manager IDENTIFIED BY 'abcd@123' REPLACE 'xxxxxxxxxx';

-- Change role manager to the system administrator.
openGauss=# ALTER ROLE manager SYSADMIN;

-- Delete role manager.
openGauss=# DROP ROLE manager;

-- Delete role miriam.
openGauss=# DROP ROLE miriam;
```

SET ROLE, **ALTER ROLE**, **DROP ROLE**, **GRANT**, and **REVOKE**

12.14.75 CREATE ROW LEVEL SECURITY POLICY

Function

CREATE ROW LEVEL SECURITY POLICY creates a row-level access control policy for a table.

The policy takes effect only after row-level access control is enabled (by running **ALTER TABLE... ENABLE ROW LEVEL SECURITY**). Otherwise, this statement does not take effect.

Currently, row-level access control affects the read (**SELECT**, **UPDATE**, **DELETE**) of data tables and does not affect the write (**INSERT** and **MERGE INTO**) of data tables. The table owner or system administrators can create an expression in the **USING** clause. When the client reads the data table, the database server combines the expressions that meet the condition and applies it to the execution plan in the statement rewriting phase of a query. For each tuple in a data table, if the expression returns **TRUE**, the tuple is visible to the current user; if the expression returns **FALSE** or **NULL**, the tuple is invisible to the current user.

A row-level access control policy name is specific to a table. A data table cannot have row-level access control policies with the same name. Different data tables can have the same row-level access control policy.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Row-level access control policies can be applied to specified operations (**SELECT**, **UPDATE**, **DELETE**, and **ALL**). **ALL** indicates that **SELECT**, **UPDATE**, and **DELETE** will be affected. For a new row-level access control policy, the default value **ALL** will be used if you do not specify the operations that will be affected.

Row-level access control policies can be applied to a specified user (role) or to all users (**PUBLIC**). For a new row-level access control policy, the default value **PUBLIC** will be used if you do not specify the user that will be affected.

Precautions

- Row-level access control policies can be defined for row-store tables, row-store partitioned tables, column-store tables, column-store partitioned tables, replication tables, unlogged tables, and hash tables.
- Row-level access control policies cannot be defined for foreign tables and temporary tables.
- Row-level access control policies cannot be defined for views.
- A maximum of 100 row-level access control policies can be defined for a table.
- System administrators are not affected by row-level access control policies and can view all data in a table.
- Tables queried by using SQL statements, views, functions, and stored procedures are affected by row-level access control policies.

Syntax

```
CREATE [ ROW LEVEL SECURITY ] POLICY policy_name ON table_name
    [ AS { PERMISSIVE | RESTRICTIVE } ]
    [ FOR { ALL | SELECT | UPDATE | DELETE } ]
    [ TO { role_name | PUBLIC | CURRENT_USER | SESSION_USER } [, ...] ]
    USING ( using_expression )
```

Parameter Description

- **policy_name**

  Specifies the name of a row-level access control policy to be created. The names of row-level access control policies for a table must be unique.

- **table_name**

  Specifies the name of a table to which a row-level access control policy is applied.

- PERMISSIVE | RESTRICTIVE

  PERMISSIVE enables the permissive policy for row-level access control. The conditions of the permissive policy are joined through the OR expression. **RESTRICTIVE** enables the restrictive policy for row-level access control. The conditions of the restrictive policy are joined through the AND expression. The join methods are as follows:

  (using_expression_permissive_1 OR using_expression_permissive_2 ...) AND (using_expression_restrictive_1 AND using_expression_restrictive_2 ...)

  The default value is **PERMISSIVE**.

- **command**

  Specifies the SQL operations affected by a row-level access control policy, including **ALL**, **SELECT**, **UPDATE**, and **DELETE**. If this parameter is not

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

specified, the default value **ALL** will be used, covering **SELECT**, **UPDATE**, and **DELETE**.

If *command* is set to **SELECT**, only tuple data that meets the condition (the return value of *using_expression* is **TRUE**) can be queried. The operations that are affected include **SELECT**, **UPDATE.... RETURNING**, and **DELETE... RETURNING**.

If *command* is set to **UPDATE**, only tuple data that meets the condition (the return value of *using_expression* is **TRUE**) can be updated. The operations that are affected include **UPDATE**, **UPDATE ... RETURNING**, and **SELECT ... FOR UPDATE/SHARE**.

If *command* is set to **DELETE**, only tuple data that meets the condition (the return value of *using_expression* is **TRUE**) can be deleted. The operations that are affected include **DELETE** and **DELETE ... RETURNING**.

The following table describes the relationship between row-level access control policies and SQL statements.

Table 12-120 Relationship between row-level access control policies and SQL statements.

Command	SELECT/ALL policy	UPDATE/ALL policy	DELETE/ALL policy
SELECT	Existing row	No	No
SELECT FOR UPDATE/SHARE	Existing row	Existing row	No
UPDATE	No	Existing row	No
UPDATE RETURNING	Existing row	Existing row	No
DELETE	No	No	Existing row
DELETE RETURNING	Existing row	No	Existing row

- **role_name**

  Specifies database users affected by a row-level access control policy.

  If this parameter is not specified, the default value **PUBLIC** will be used, indicating that all database users will be affected. You can specify multiple affected database users.

  NOTICE

  System administrators are not affected by row access control.

- **using_expression**

  Specifies an expression defined for a row-level access control policy (return type: Boolean).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The expression cannot contain aggregate functions or window functions. In the statement rewriting phase of a query, if row-level access control for a data table is enabled, the expressions that meet the specified conditions will be added to the plan tree. The expression is calculated for each tuple in the data table. For **SELECT**, **UPDATE**, and **DELETE**, row data is visible to the current user only when the return value of the expression is **TRUE**. If the expression returns **FALSE**, the tuple is invisible to the current user. In this case, the user cannot view the tuple through the **SELECT** statement, update the tuple through the **UPDATE** statement, or delete the tuple through the **DELETE** statement.

Examples

```
-- Create user alice.
postgres=# CREATE USER alice PASSWORD 'xxxxxxxxx';

-- Create user bob.
postgres=# CREATE USER bob PASSWORD 'xxxxxxxxx';

-- Create the data table all_data.
openGauss=# CREATE TABLE public.all_data(id int, role varchar(100), data varchar(100));

-- Insert data into the data table.
openGauss=# INSERT INTO all_data VALUES(1, 'alice', 'alice data');
openGauss=# INSERT INTO all_data VALUES(2, 'bob', 'bob data');
openGauss=# INSERT INTO all_data VALUES(3, 'peter', 'peter data');

-- Grant the read permission on the all_data table to users alice and bob.
openGauss=# GRANT SELECT ON all_data TO alice, bob;

-- Enable row-level access control.
openGauss=# ALTER TABLE all_data ENABLE ROW LEVEL SECURITY;

-- Create a row-level access control policy to specify that the current user can view only their own data.
openGauss=# CREATE ROW LEVEL SECURITY POLICY all_data_rls ON all_data USING(role =
CURRENT_USER);

-- View information about the all_data table.
openGauss=# \d+ all_data
                        Table "public.all_data"
 Column |          Type          | Modifiers | Storage  | Stats target | Description
--------+------------------------+-----------+----------+--------------+-------------
 id     | integer                |           | plain    |              |
 role   | character varying(100) |           | extended |              |
 data   | character varying(100) |           | extended |              |
Row Level Security Policies:
    POLICY "all_data_rls"
      USING (((role)::name = "current_user"()))
Has OIDs: no
Distribute By: HASH(id)
Location Nodes: ALL DATANODES
Options: orientation=row, compression=no, enable_rowsecurity=true

-- Run SELECT.
openGauss=# SELECT * FROM all_data;
 id | role  |    data
----+-------+------------
  1 | alice | alice data
  2 | bob   | bob data
  3 | peter | peter data
(3 rows)

-- Grant the login permission to the user.
openGauss=# ALTER USER alice LOGIN;

openGauss=# EXPLAIN(COSTS OFF) SELECT * FROM all_data;

DROP ROW LEVEL SECURITY POLICY

12.14.76 CREATE SCHEMA

Function

CREATE SCHEMA creates a schema.

Named objects are accessed either by "qualifying" their names with the schema name as a prefix, or by setting a search path that includes the desired schema. When creating named objects, you can also use the schema name as a prefix.

Optionally, **CREATE SCHEMA** can include sub-commands to create objects within the new schema. The sub-commands are treated essentially the same as separate commands issued after creating the schema. If the **AUTHORIZATION** clause is used, all the created objects are owned by this user.

Precautions

- Only a user with the **CREATE** permission on the current database can perform this operation.
- The owner of an object created by a system administrator in a schema with the same name as a common user is the common user, not the system administrator.

Syntax

- Create a schema based on a specified name.
  ```
  CREATE SCHEMA schema_name
     [ AUTHORIZATION user_name ] [WITH BLOCKCHAIN] [ schema_element [ ... ] ];
  ```
- Create a schema based on a username.
  ```
  CREATE SCHEMA AUTHORIZATION user_name [ schema_element [ ... ] ];
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter Description

- **schema_name**

  Specifies the schema name.

  NOTICE

  The name must be unique.

  The schema name cannot start with **pg_**.

  Value range: a string. It must comply with the naming convention.

- **AUTHORIZATION user_name**

  Specifies the owner of a schema. If **schema_name** is not specified, **user_name** will be used as the schema name. In this case, **user_name** can only be a role name.

  Value range: an existing username or role name

- **WITH BLOCKCHAIN**

  Specifies the tamper-proof attribute of a schema. A common row-store table in tamper-proof mode is a tamper-proof user table.

- **schema_element**

  Specifies an SQL statement defining an object to be created within the schema. Currently, only **CREATE TABLE**, **CREATE VIEW**, **CREATE INDEX**, **CREATE PARTITION**, and **GRANT** are accepted as clauses within **CREATE SCHEMA**.

  Objects created by sub-commands are owned by the user specified by **AUTHORIZATION**.

NOTE

If objects in the schema on the current search path are with the same name, specify the schemas for different objects. You can run **SHOW SEARCH_PATH** to check the schemas on the current search path.

Examples

```
-- Create the role1 role.
openGauss=# CREATE ROLE role1 IDENTIFIED BY 'xxxxxxxxxx';

-- Create a schema named role1 for the role1 role. The owner of the films and winners tables created by the clause is role1.
openGauss=# CREATE SCHEMA AUTHORIZATION role1
    CREATE TABLE films (title text, release date, awards text[])
    CREATE VIEW winners AS
    SELECT title, release FROM films WHERE awards IS NOT NULL;

-- Delete the schema.
openGauss=# DROP SCHEMA role1 CASCADE;
-- Delete the user.
openGauss=# DROP USER role1 CASCADE;
```

Helpful Links

ALTER SCHEMA and DROP SCHEMA

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.14.77 CREATE SEQUENCE

Function

CREATE SEQUENCE adds a sequence to the current database. The owner of a sequence is the user who creates the sequence.

Precautions

- A sequence is a special table that stores arithmetic columns. Such a table is controlled by DBMS. It has no actual meaning and is usually used to generate unique identifiers for rows or tables.
- If a schema name is given, the sequence is created in the specified schema; otherwise, it is created in the current schema. The sequence name must be different from the names of other sequences, tables, indexes, views in the same schema.
- After the sequence is created, functions **nextval()** and **generate_series(1,N)** insert data to the table. Make sure that the number of times for invoking **nextval** is greater than or equal to N+1. Otherwise, errors will be reported because the number of times for invoking function **generate_series()** is N+1.
- A user granted with the CREATE ANY SEQUENCE permission can create sequences in the public and user schemas.

Syntax

```
CREATE SEQUENCE name [ INCREMENT [ BY ] increment ]
    [ MINVALUE minvalue | NO MINVALUE | NOMINVALUE ] [ MAXVALUE maxvalue | NO MAXVALUE |
NOMAXVALUE]
    [ START [ WITH ] start ] [ CACHE cache ] [ [ NO ] CYCLE | NOCYCLE ]
    [ OWNED BY { table_name.column_name | NONE } ];
```

Parameter Description

- **name**

  Specifies the name of a sequence to be created.

  Value range: a sting containing only lowercase letters, uppercase letters, special characters #_$, and digits

- **increment**

  Specifies the step for a sequence. A positive number generates an ascending sequence, and a negative number generates a decreasing sequence.

  The default value is **1**.

- **MINVALUE minvalue | NO MINVALUE| NOMINVALUE**

  Specifies the minimum value of the sequence. If **MINVALUE** is not declared, or **NO MINVALUE** is declared, the default value of the ascending sequence is **1**, and that of the descending sequence is **$-2^{63}-1$**. **NOMINVALUE** is equivalent to **NO MINVALUE**.

- **MAXVALUE maxvalue | NO MAXVALUE| NOMAXVALUE**

  Specifies the maximum value of the sequence. If **MAXVALUE** is not declared, or **NO MAXVALUE** is declared, the default value of the ascending sequence is **$2^{63}-1$**, and that of the descending sequence is **-1**. **NOMAXVALUE** is equivalent to **NO MAXVALUE**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **start**

  Specifies the start value of the sequence. The default value for an ascending sequence is **minvalue** and that for a descending sequence is **maxvalue**.

- **cache**

  Specifies the number of sequences stored in the memory for quick access purposes.

  Default value **1** indicates that one sequence can be generated each time.

  NOTE

  - It is not recommended that you define **cache** and **maxvalue** or **minvalue** at the same time. The continuity of sequences cannot be ensured after **cache** is defined because unacknowledged sequences may be generated, causing waste of sequences. If there are requirements on the concurrency performance, see the **session_sequence_cache** parameter.
  - cache specifies the value that a single CN/DN applies for from the GTM at a time. **session_sequence_cache** specifies the value of the cache that a single session applies for from the CN/DN at a time. The value is automatically discarded after the session ends.

- **CYCLE**

  Recycles sequences after the number of sequences reaches **maxvalue** or **minvalue**.

  If **NO CYCLE** is specified, any invocation of **nextval** would return an error after the number of sequences reaches **maxvalue** or **minvalue**.

  NOCYCLE is equivalent to **NO CYCLE**.

  The default value is **NO CYCLE**.

  If **CYCLE** is specified, the sequence uniqueness cannot be ensured.

- **OWNED BY**-

  Associates a sequence with a specified column included in a table. In this way, the sequence will be deleted when you delete its associated column or the table where the column belongs to. The associated table and sequence must be owned by the same user and in the same schema. **OWNED BY** only establishes the association between a table column and the sequence. Sequences on the column do not increase automatically when data is inserted.

  The default value **OWNED BY NONE** indicates that such association does not exist.

  NOTICE

  You are not advised to use the sequence created using **OWNED BY** in other tables. If multiple tables need to share a sequence, the sequence must not belong to a specific table.

Examples

Create an ascending sequence named **serial**, which starts from 101.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
openGauss=# CREATE SEQUENCE serial
 START 101
 CACHE 20;
```

Select the next number from the sequence.

```
openGauss=# SELECT nextval('serial');
 nextval
 ---------
     101
```

Select the next number from the sequence.

```
openGauss=# SELECT nextval('serial');
 nextval
 ---------
     102
```

Create a sequence associated with the table.

```
openGauss=# CREATE TABLE customer_address
(
    ca_address_sk             integer               not null,
    ca_address_id             char(16)              not null,
    ca_street_number          char(10)                      ,
    ca_street_name            varchar(60)                   ,
    ca_street_type            char(15)                      ,
    ca_suite_number           char(10)                      ,
    ca_city                   varchar(60)                   ,
    ca_county                 varchar(30)                   ,
    ca_state                  char(2)                       ,
    ca_zip                    char(10)                      ,
    ca_country                varchar(20)                   ,
    ca_gmt_offset             decimal(5,2)                  ,
    ca_location_type          char(20)
);

openGauss=# CREATE SEQUENCE serial1
 START 101
 CACHE 20
OWNED BY customer_address.ca_address_sk;
-- Delete the sequence.
openGauss=# DROP TABLE customer_address;
openGauss=# DROP SEQUENCE serial cascade;
openGauss=# DROP SEQUENCE serial1 cascade;
```

DROP SEQUENCE and **ALTER SEQUENCE**

12.14.78 CREATE SERVER

Function

CREATE SERVER creates a foreign server.

A foreign server stores OBS server information or other homogeneous cluster information.

Precautions

Only a system administrator and users with permission to use a specified **FOREIGN DATA WRAPPER** can create a foreign server. The authorization syntax is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
GRANT USAGE ON FOREIGN DATA WRAPPER fdw_name TO username
```

fdw_name is the name of the **FOREIGN DATA WRAPPER**, and **username** is the name of the user creating a foreign server.

When multi-layer quotation marks are used for sensitive columns (such as **password** and **secret_access_key**) in OPTIONS, the semantics is different from that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.

Syntax

```
CREATE SERVER server_name
    FOREIGN DATA WRAPPER fdw_name
    OPTIONS ( { option_name ' value ' } [, ...] ) ;
```

Parameter Description

- **server_name**

  Specifies the server name.

  Value range: a string containing no more than 63 characters

- **FOREIGN DATA WRAPPER fdw_name**

  Specifies the name of the foreign data wrapper.

  Value range: **fdw_name** is the data wrapper created by the system during database initialization. Currently, **fdw_name** can only be **gc_fdw** for other homogeneous clusters. You can also create **dist_fdw**, **file_fdw**, and **log_fdw**.

- **OPTIONS ({ option_name ' value ' } [, ...])**

  Specifies the parameters for the foreign server. The detailed parameter description is as follows:

  – encrypt

    Specifies whether data is encrypted. This parameter is available only when **type** is **OBS**. The default value is **on**.

    Value range:

    - **on** indicates that data is encrypted and HTTPS is used for communication.
    - **off** indicates that data is not encrypted and HTTP is used for communication.

  – access_key

    Specifies the access key (AK) (obtained by users from the OBS console) used for the OBS access protocol. When you create a foreign table, the AK value is encrypted and saved to the metadata table of the database. This parameter is available only when **type** is set to **OBS**.

  – secret_access_key

    Specifies the secret key (SK) value (obtained by users from the OBS console) used for the OBS access protocol. When you create a foreign table, the SK value is encrypted and saved to the metadata table of the database. This parameter is available only when **type** is set to **OBS**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

Create **my_server**, in which **file_fdw** is the built-in foreign data wrapper.

```
-- Create my_server.
gaussdb=# CREATE SERVER my_server FOREIGN DATA WRAPPER file_fdw;

-- Delete my_server.
gaussdb=# DROP SERVER my_server;
```

Create another server in the homogeneous cluster, where **gc_fdw** is the foreign data wrapper in the database.

```
-- Create a server.
gaussdb=# CREATE SERVER server_remote FOREIGN DATA WRAPPER GC_FDW OPTIONS
   (address '10.146.187.231:8000,10.180.157.130:8000' ,
  dbname 'test',
  username 'test',
  password '********'
);

-- Delete the server.
gaussdb=# DROP SERVER server_remote;
```

ALTER SERVER and **DROP SERVER**

12.14.79 CREATE SYNONYM

Function

CREATE SYNONYM creates a synonym object. A synonym is an alias of a database object and is used to record the mapping between database object names. You can use synonyms to access associated database objects.

Precautions

- The user of a synonym should be its owner.
- If the schema name is specified, create a synonym in the specified schema. Otherwise create a synonym in the current schema.
- Database objects that can be accessed using synonyms include tables, views, functions, and stored procedures.
- To use synonyms, you must have the required permissions on associated objects.
- The following DML statements support synonyms: **SELECT**, **INSERT**, **UPDATE**, **DELETE**, **EXPLAIN**, and **CALL**.
- The **CREATE SYNONYM** statement of an associated function or stored procedure cannot be used in a stored procedure. You are advised to use synonyms existing in the **pg_synonym** system catalog in the stored procedure.
- You are not advised to create synonyms for temporary tables. To create a synonym, you need to specify the schema name of the target temporary table. Otherwise, the synonym cannot be used normally. In addition, you need to run the **DROP SYNONYM** command before the current session ends.
- After an original object is deleted, the synonym associated with the object will not be deleted in cascading mode. If you continue to access the synonym, an error message is displayed, indicating that the synonym has expired.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Synonyms cannot be created for encrypted tables that contain encrypted columns and views, functions, and stored procedures based on encrypted tables.

Syntax

```
CREATE [ OR REPLACE ] SYNONYM synonym_name
    FOR object_name;
```

Parameter Description

- **synonym**

  Specifies the name of the synonym to be created, which can contain the schema name.

  Value range: a string. It must comply with the naming convention.

- **object_name**

  Specifies the name of an object that is associated (optionally with schema names).

  Value range: a string. It must comply with the naming convention.

  NOTE

  object_name can be the name of an object that does not exist.

CAUTION

Do not create aliases for functions that contain passwords and other sensitive information, such as the encryption function gs_encrypt and the decryption function gs_decrypt or use aliases to call the functions to prevent sensitive information leakage.

Examples

```
-- Create schema ot.
openGauss=# CREATE SCHEMA ot;

-- Create table ot.t1 and its synonym t1.
openGauss=# CREATE TABLE ot.t1(id int, name varchar2(10)) DISTRIBUTE BY hash(id);
openGauss=# CREATE OR REPLACE SYNONYM t1 FOR ot.t1;

-- Use synonym t1.
openGauss=# SELECT * FROM t1;
openGauss=# INSERT INTO t1 VALUES (1, 'ada'), (2, 'bob');
openGauss=# UPDATE t1 SET t1.name = 'cici' WHERE t1.id = 2;

-- Create synonym v1 and its associated view ot.v_t1.
openGauss=# CREATE SYNONYM v1 FOR ot.v_t1;
openGauss=# CREATE VIEW ot.v_t1 AS SELECT * FROM ot.t1;

-- Use synonym v1.
openGauss=# SELECT * FROM v1;

-- Create overloaded function ot.add and its synonym add.
openGauss=# CREATE OR REPLACE FUNCTION ot.add(a integer, b integer) RETURNS integer AS
$$
SELECT $1 + $2
$$
LANGUAGE sql;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
openGauss=# CREATE OR REPLACE FUNCTION ot.add(a decimal(5,2), b decimal(5,2)) RETURNS
decimal(5,2) AS
$$
SELECT $1 + $2
$$
LANGUAGE sql;

openGauss=# CREATE OR REPLACE SYNONYM add FOR ot.add;

-- Use synonym add.
openGauss=# SELECT add(1,2);
openGauss=# SELECT add(1.2,2.3);

-- Create stored procedure ot.register and its synonym register.
openGauss=# CREATE PROCEDURE ot.register(n_id integer, n_name varchar2(10))
SECURITY INVOKER
AS
BEGIN
    INSERT INTO ot.t1 VALUES(n_id, n_name);
END;
/

openGauss=# CREATE OR REPLACE SYNONYM register FOR ot.register;

-- Use synonym register to invoke the stored procedure.
openGauss=# CALL register(3,'mia');

-- Delete the synonym.
openGauss=# DROP SYNONYM t1;
openGauss=# DROP SYNONYM IF EXISTS v1;
openGauss=# DROP SYNONYM IF EXISTS add;
openGauss=# DROP SYNONYM register;
openGauss=# DROP SCHEMA ot CASCADE;
```

Helpful Links

ALTER SYNONYM and **DROP SYNONYM**

12.14.80 CREATE TABLE

Function

CREATE TABLE creates an initially empty table in the current database. The table will be owned by the creator.

Precautions

- For details about the data types supported by column-store tables, see **Data Types Supported by Column-store Tables**.
- It is recommended that the number of column-store tables do not exceed 1000.
- The primary key constraint and unique constraint in the table must contain distribution keys.
- Distribution columns do not support the UPDATE operation.
- If an error occurs during table creation, after it is fixed, the system may fail to delete the empty disk files created before the last automatic clearance. This problem seldom occurs and does not affect system running of the database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Column-store tables support only **PARTIAL CLUSTER KEY** table-level constraints, but do not support primary and foreign key table-level constraints.
- Only the **NULL**, **NOT NULL**, and **DEFAULT** constant values can be used as column-store table constraints.
- Whether column-store tables support a delta table is specified by the **enable_delta_store** parameter. The threshold for storing data into a delta table is specified by the **deltarow_threshold** parameter.
- When JDBC is used, the **DEFAULT** value can be set through **PrepareStatement**.
- Row-store tables do not support table-level **FOREIGN KEY** constraints.
- According to the concurrency control policy, if the **DROP TABLE IF EXIST** and **CREATE IF EXIST** statements are performed on the same table concurrently, one of the two will be rolled back. (The current feature is a lab feature. Contact Huawei technical support before using it.)
- A user granted with the **CREATE ANY TABLE** permission can create tables in the public and user schemas. To create a table that contains serial columns, you must also be granted with the **CREATE ANY SEQUENCE** permission to create sequences.

NOTICE

If GaussDB creates unlimited tables, CNs may be affected as follows:

- Resource exhaustion: Each table occupies certain disk space. Unlimited table creation will occupy a large amount of memory and disk space, which may exhaust CN resources. As a result, the system breaks down or becomes unstable.
- Performance deterioration: Unlimited table creation causes a large number of I/O operations and CPU computing, and the metadata information of the database becomes large, which may deteriorate the CN performance, including operations such as insert, query, update, and deletion. As a result, the system responds slowly or cannot meet service requirements.
- Security issues: Excessive tables make database management and maintenance difficult. Creating unlimited tables may cause security issues such as data leakage or data loss. Database stability decreases, causing immeasurable loss to enterprises.

Therefore, plan the number and size of GaussDB databases properly to avoid unlimited table creation and ensure system stability, reliability, and security.

Syntax

- Create a table.

```
CREATE [ [ GLOBAL | LOCAL ] [ TEMPORARY | TEMP ] | UNLOGGED ] TABLE [ IF NOT EXISTS ]
table_name
    ({ column_name data_type [ compress_mode ] [ COLLATE collation ] [ column_constraint [ ... ] ]
       | table_constraint
       | LIKE source_table [ like_option [...] ] }
       [, ... ])
    [ WITH ( {storage_parameter = value} [, ... ] ) ]
    [ ON COMMIT { PRESERVE ROWS | DELETE ROWS } ]
    [ COMPRESS | NOCOMPRESS ]
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
[ TABLESPACE tablespace_name ]
[ DISTRIBUTE BY { REPLICATION | HASH ( column_name [, ...] )
| RANGE ( column_name [, ...] ) { SLICE REFERENCES tablename | ( slice_less_than_item [, ...] )
| ( slice_start_end_item [, ...] ) }
| LIST ( column_name [, ...] ) { SLICE REFERENCES tablename | ( slice_values_item [, ...] ) }
} ]
[ TO { GROUP groupname | NODE ( nodename [, ... ] ) } ];
```

- **column_constraint** is as follows:

```
[ CONSTRAINT constraint_name ]
{ NOT NULL |
  NULL |
  CHECK ( expression ) |
  DEFAULT default_expr |
  UNIQUE [ index_parameters ] |
  PRIMARY KEY [ index_parameters ] |
  ENCRYPTED WITH ( COLUMN_ENCRYPTION_KEY = column_encryption_key,
ENCRYPTION_TYPE = encryption_type_value ) }
  REFERENCES reftable [ ( refcolumn ) ] [ MATCH FULL | MATCH PARTIAL | MATCH SIMPLE ]
    [ ON DELETE action ] [ ON UPDATE action ] }
[ DEFERRABLE | NOT DEFERRABLE ] [ INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
```

- **compress_mode** of a column is as follows:

```
{ DELTA | PREFIX | DICTIONARY | NUMSTR | NOCOMPRESS }
```

- **table_constraint** is as follows:

```
[ CONSTRAINT constraint_name ]
{ CHECK ( expression ) |
  UNIQUE ( column_name [, ... ] ) [ index_parameters ] |
  PRIMARY KEY ( column_name [, ... ] ) [ index_parameters ] |
  PARTIAL CLUSTER KEY ( column_name [, ... ] ) }
[ DEFERRABLE | NOT DEFERRABLE ][ INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
```

- **like_option** is as follows:

```
{ INCLUDING | EXCLUDING } { DEFAULTS | CONSTRAINTS | INDEXES | STORAGE | COMMENTS |
PARTITION | RELOPTIONS | DISTRIBUTION | ALL }
```

- Range distribution rules

  slice_less_than_item is as follows:

  SLICE slice_name VALUES LESS THAN ({ literal | MAXVALUE } [, ...])
  [DATANODE dn_name]

  slice_start_end_item is as follows:

  SLICE slice_name_prefix {

  { START (literal) END (literal) EVERY (literal) } |

  { START (literal) END ({ literal | MAXVALUE }) } |

  { START (literal) } |

  { END ({ literal | MAXVALUE }) }

  }

- The LIST distribution rule **slice_values_item** is as follows:

  SLICE slice_name VALUES (list_values_item) [DATANODE dn_name]

  list_values_item is as follows:

  { DEFAULT | { partition_values_list [, ...] } }

  partition_values_list is as follows:

  { (literal [, ...]) }

index_parameters is as follows:

```
[ WITH ( {storage_parameter = value} [, ... ] ) ]
[ USING INDEX TABLESPACE tablespace_name ]
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter Description

- **UNLOGGED**

  If this keyword is specified, the created table is an unlogged table. Data written to unlogged tables is not written to the WALs, which makes them considerably faster than ordinary tables. However, an unlogged table is automatically truncated after conflicts, operating system restart, database restart, primary/standby switchover, power-off, or abnormal shutdown, incurring data loss risks. The contents of an unlogged table are also not replicated to standby servers. Any indexes created on an unlogged table are not automatically logged as well.

  Usage scenario: Unlogged tables do not ensure data security. Users can back up data before using unlogged tables; for example, users should back up the data before a system upgrade.

  Troubleshooting: If data is missing in the indexes of unlogged tables due to some unexpected operations such as an unclean shutdown, users should re-create the indexes with errors.

- **GLOBAL | LOCAL**

  When creating a temporary table, you can specify the **GLOBAL** or **LOCAL** keyword before **TEMP** or **TEMPORARY**. Currently, the two keywords are used to be compatible with the SQL standard. A local temporary table will be created by GaussDB regardless of whether **GLOBAL** or **LOCAL** is specified.

- **TEMPORARY | TEMP**

  If **TEMP** or **TEMPORARY** is specified, the created table is a temporary table. A temporary table is automatically dropped at the end of the current session. Therefore, you can create and use temporary tables in the current session as long as the connected CN in the session is normal. Temporary tables are created only in the current session. If a DDL statement involves operations on temporary tables, a DDL error will be generated. Therefore, you are not advised to perform operations on temporary tables in DDL statements. **TEMP** is equivalent to **TEMPORARY**.

  NOTICE

  - Temporary tables are visible to the current session through the schema starting with **pg_temp** start. Users should not delete schema started with **pg_temp** or **pg_toast_temp**.
  - If **TEMPORARY** or **TEMP** is not specified when you create a table but its schema is set to that starting with **pg_temp_** in the current session, the table will be created as a temporary table.
  - A temporary table is visible only to the current session. Therefore, it cannot be used together with **\parallel on**.
  - Temporary tables do not support DN faults or primary/standby switchovers.

- **IF NOT EXISTS**

  Sends a notice, but does not throw an error, if a table with the same name exists.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **table_name**

  Specifies the name of the table to be created.

  NOTICE

  Some processing logic of materialized views determines whether a table is the log table of a materialized view or a table associated with a materialized view based on the table name prefix. Therefore, do not create a table whose name prefix is **mlog_** or **matviewmap_**. Otherwise, some functions of the table are affected.

- **column_name**

  Specifies the name of a column to be created in the new table.

- **data_type**

  Specifies the data type of the column.

- **compress_mode**

  Specifies whether to compress a table column. The option specifies the algorithm preferentially used by table columns. Row-store tables do not support compression.

  Value range: **DELTA**, **PREFIX**, **DICTIONARY**, **NUMSTR**, and **NOCOMPRESS**

- **COLLATE collation**

  Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **select * from pg_collation** command to query collation rules from the **pg_collation** system catalog. The default collation rule is the row starting with **default** in the query result.

- **LIKE source_table [like_option ...]**

  Specifies a table from which the new table automatically inherits all column names, their data types, and their not-null constraints, as well as the default expression declared as serial.

  The new table and the original table are decoupled after creation is complete. Changes to the original table will not be applied to the new table, and it is not possible to include data of the new table in scans of the original table.

  Columns and constraints copied by **LIKE** are not merged with the same name. If the same name is specified explicitly or in another **LIKE** clause, an error is reported.

  - The default expressions are copied from the original table to the new table only if **INCLUDING DEFAULTS** is specified. The default behavior is to exclude default expressions, resulting in the copied columns in the new table having default values null.
  - The **CHECK** constraints are copied from the original table to the new table only when **INCLUDING CONSTRAINTS** is specified. Other types of constraints are never copied to the new table. Not-null constraints are always copied to the new table. These rules also apply to column constraints and table constraints.
  - Any indexes on the original table will not be created on the new table, unless the **INCLUDING INDEXES** clause is specified.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **STORAGE** settings for the copied column definitions are copied only if **INCLUDING STORAGE** is specified. The default behavior is to exclude **STORAGE** settings.
- If **INCLUDING COMMENTS** is specified, comments for the copied columns, constraints, and indexes are copied. The default behavior is to exclude comments.
- If **INCLUDING PARTITION** is specified, the partition definitions of the source table are copied to the new table, and the new table no longer uses the **PARTITION BY** clause. The default behavior is to exclude partition definition of the original table.
- If **INCLUDING RELOPTIONS** is specified, the new table will copy the storage parameter (that is, **WITH** clause) of the source table. The default behavior is to exclude partition definition of the storage parameter of the original table.
- If **INCLUDING DISTRIBUTION** is specified, the distribution information of the original table is copied to the new table, including distribution type and key, and the new table no longer use the **DISTRIBUTE BY** clause. The default behavior is to exclude distribution information of the original table.
- **INCLUDING ALL** contains the meaning of **INCLUDING DEFAULTS**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING STORAGE**, **INCLUDING COMMENTS**, **INCLUDING PARTITION**, **INCLUDING RELOPTIONS**, and **INCLUDING DISTRIBUTION**.

NOTICE

- If the source table contains a sequence with the **SERIAL**, **BIGSERIAL**, or **SMALLSERIRAL** data type, or a column in the source table is a sequence by default and the sequence is created for this table by using **CREATE SEQUENCE... OWNED BY**, these sequences will not be copied to the new table, and another sequence specific to the new table will be created. This is different from earlier versions. To share a sequence between the source table and new table, create a shared sequence (do not use **OWNED BY**) and set a column in the source table to this sequence.
- You are not advised to set a column in the source table to the sequence specific to another table especially when the table is distributed in specific node groups, because doing so may result in **CREATE TABLE ... LIKE** execution failures. In addition, doing so may cause the sequence to become invalid in the source sequence because the sequence will also be deleted from the source table when it is deleted from the table that the sequence is specific to. To share a sequence among multiple tables, you are advised to create a shared sequence for them.

- **WITH ({ storage_parameter = value } [, ...])**

  Specifies an optional storage parameter for a table or an index. The WITH clause for a table can contain **OIDS=TRUE** or **OIDS** to specify that each row in the new table is assigned an OID. If **OIDS=FALSE** is specified, no OID is assigned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

When using **Numeric** of any precision to define a column, specifies precision **p** and scale **s**. When precision and scale are not specified, the input will be displayed.

The description of parameters is as follows:

- FILLFACTOR

  The fill factor of a table is a percentage from 10 to 100. **100** (complete filling) is the default value. When a smaller fill factor is specified, **INSERT** operations pack table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives **UPDATE** a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate. The parameter has no meaning for column–store tables.

  Value range: 10 to 100

- ORIENTATION

  Storage mode (row store or column store) of table data. This parameter cannot be modified once it is set.

  Value range:

  - **ROW** indicates that table data is stored in rows.

    ROW applies to the OLTP service, which has many interactive transactions. An interaction involves many columns in the table. Using ROW can improve the efficiency.

  - **COLUMN** indicates that the data is stored in columns.

    COLUMN applies to the data warehouse service, which has a large amount of aggregation computing, and involves a few column operations.

  Default value:

  If an ordinary tablespace is specified, the default is **ROW**.

- COMPRESSION

  Specifies the compression level of table data. It determines the compression ratio and time. Generally, the higher the level of compression, the higher the ratio, the longer the time; and the lower the level of compression, the lower the ratio, the shorter the time. The actual compression ratio depends on the distribution mode of table data loaded. Row-store tables do not support compression.

  Value range:

  The valid values for column-store tables are **YES**, **NO**, **LOW**, **MIDDLE**, and **HIGH**, and the default value is **LOW**.

- COMPRESSLEVEL

  Specifies the table data compression ratio and duration at the same compression level. This divides a compression level into sublevels, providing more choices for compression ratio and duration. As the value becomes greater, the compression ratio becomes higher and duration longer at the same compression level.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 0 to 3. The default value is **0**.

- MAX_BATCHROW

  Specifies the maximum number of rows in a storage unit during data loading. The parameter is only valid for column-store tables.

  Value range: 10000 to 60000

- PARTIAL_CLUSTER_ROWS

  Specifies the number of records to be partially clustered for storage during data loading. The parameter is only valid for column-store tables.

  Value range: 600000 to 2147483647

- DELTAROW_THRESHOLD

  Specifies the upper limit of to-be-imported rows for triggering the data import to a delta table when data of a column-store table is to be imported. This parameter takes effect only if **enable_delta_store** is set to **on**. The parameter is only valid for column-store tables.

  Value range: 0 to 9999. The default value is **100**.

- segment

  The table data is stored in segmented paging mode. This parameter supports only row-store tables. Column-store tables, temporary tables, and unlogged tables are not supported. The Ustore storage engine is not supported.

  Value range: **on** and **off**

  Default value: **off**

- hashbucket

  Creates a hash table that uses buckets. This parameter supports only row-store tables, including row-store range tables.

  Value range: **on** and **off**

  Default value: **off**

NOTICE

- In current version, DDL operations on hash bucket tables are affected. Therefore, you are not advised to frequently perform DDL operations on hash bucket tables.
- Hash bucket tables are bound to segmented paging storage, that is, when **hashbucket** is set to **on**, **segment** is set to **on**.

- bucketcnt

  Specifies the number of buckets of a bucket table when the table is created. The value of this parameter must correspond to a child node group.

  The value ranges from 32 to 16384 and must be an integer power of 2.

  Default value: **16384**.

- enable_tde

  Creates a transparent encryption table. Before enabling this function, ensure that **enable_tde** in "GUC Parameter" has been enabled, the KMS

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

service has been enabled, and the cluster master key ID in **tde_cmk_id** in "GUC Parameter" has been correctly configured. This parameter supports only row-store tables. Column-store tables and temporary tables are not supported. The Ustore storage engine is not supported.

Value range: **on** and **off** If this parameter is set to **on**, transparent data encryption is enabled. If this parameter is set to **off**, transparent data encryption is disabled but the encryption function will be enabled later. When a table is created, a data encryption key will be applied from KMS.

Default value: **off**

- encrypt_algo

  Specifies the transparent data encryption algorithm. Before enabling this function, ensure that **enable_tde** must be set for a table. The encryption algorithm can be specified only when a table is created. Different tables support different encryption algorithms. After the table is created, the encryption algorithm cannot be changed.

  Value range: a string. The value can be **AES_128_CTR** or **SM4_CTR**.

  If **enable_tde** is not set, the default value is null. If **enable_tde** is set to **on** or **off** and **encrypt_algo** is not set, the value is **AES_128_CTR**.

- parallel_workers

  Number of bgworker threads started when an index is created. For example, value **2** indicates that two bgworker threads are started to create indexes concurrently.

  Value range: [0,32], int type. The value **0** indicates that this function is disabled.

  Default value: If this parameter is not set, the concurrent index creation function is disabled.

- dek_cipher

  Ciphertext of the key used for transparent data encryption. When **enable_tde** is enabled, the system automatically applies for ciphertext creation. You cannot specify the ciphertext. The key rotation function can be used to update the key.

  Value range: a string.

  If encryption is disabled, the default value is null by default.

- cmk_id

  ID of the cluster master key used for transparent data encryption. When **enable_tde** is enabled, the value is obtained from **tde_cmk_id** in "GUC Parameter" and cannot be specified or modified by users.

  Value range: a string.

  If encryption is disabled, the default value is null by default.

- hasuids

  If this parameter is set to **on**, a unique table-level ID is allocated to a tuple when the tuple is updated.

  Value range: **on** and **off**

  Default value: **off**

- **WITHOUT OIDS**

  It is equivalent to **WITH (OIDS=FALSE)**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **ON COMMIT { PRESERVE ROWS | DELETE ROWS }**

  ON COMMIT determines what to do when you commit a temporary table creation operation. Currently, the **PRESERVE ROWS** and **DELETE ROWS** options are supported.

  - **PRESERVE ROWS** (default): No special action is taken at the ends of transactions. The temporary table and its table data are unchanged.
  - **DELETE ROWS**: All rows in the temporary table will be deleted at the end of each transaction block.

- **COMPRESS | NOCOMPRESS**

  If you specify **COMPRESS** in the **CREATE TABLE** statement, the compression feature is triggered in case of a bulk **INSERT** operation. If this feature is enabled, a scan is performed for all tuple data within the page to generate a dictionary and then the tuple data is compressed and stored. If **NOCOMPRESS** is specified, the table is not compressed. Row-store tables do not support compression.

  Default value: **NOCOMPRESS**, that is, tuple data is not compressed before storage.

- **TABLESPACE tablespace_name**

  Specifies the tablespace where the new table is created. If not specified, the default tablespace is used.

- **DISTRIBUTE BY**

  Specifies how the table is distributed or replicated between DNs.

  Value range:

  - **REPLICATION**: Each row in the table exists on all DNs, that is, each DN has complete table data.
  - **HASH (column_name)**: Each row of the table will be placed into specified DNs based on the hash value of the specified column.
  - **RANGE(column_name)**: maps a specified column based on the range and distributes data to the corresponding DNs.
  - **LIST(column_name)**: maps a specified column based on a specific value and distributes data to the corresponding DNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- When **DISTRIBUTE BY { HASH | RANGE | LIST } (column_name)** is specified, the primary key and its unique index must contain the **column_name** column.
- When **DISTRIBUTE BY { HASH | RANGE | LIST } (column_name)** is specified for a referenced table, the foreign key of the referencing table must contain the **column_name** column.
- For a RANGE distribution policy using the VALUE LESS THAN clause, a maximum of four distribution key columns are supported. The distribution rules are as follows:

  1. The comparison starts from the first column of values to be inserted.

  2. If the value of the first column is smaller than the boundary value of the current column in the local shard, values are directly inserted.

  3. If the value of the first column is equal to the boundary value of the current column in the local shard, compare the value of the second column with the boundary value of the next column in the local shard. If the value of the second column is smaller than the boundary value of the next column in the local shard, values are directly inserted. If they are still equal, continue to the comparison until the value of the column is smaller than the boundary value of the column in the local shard, and then insert the values.

  4. If the values of the all columns are greater than the boundary value of the current column in the local shard, compare the value with that in the next shard.

Default value: **HASH(column_name)**. Set **column_name** to the primary key (if any) of the table or the column whose first data type supports distribution keys.

column_name supports the following data types:

- Integer types: **TINYINT**, **SMALLINT**, **INT**, **BIGINT**, and **NUMERIC/DECIMAL**
- Character types: **CHAR**, **BPCHAR**, **VARCHAR**, **VARCHAR2**, **NVARCHAR2**, and **TEXT**
- Date/time types: **DATE**, **TIME**, **TIMETZ**, **TIMESTAMP**, **TIMESTAMPTZ**, **INTERVAL**, and **SMALLDATETIME**

NOTE

When you create a table, the choices of distribution keys and partition keys have major impact on SQL query performance. Therefore, select appropriate distribution keys and partition keys with strategies.

- Select appropriate distribution keys.

  A hash table's distribution key should evenly distribute data on each DN to prevent skewing the data or distributing it unevenly across DNs. Determine appropriate distribution keys based on the following principles:

  1. Determine whether data is skewed.

     Connect to the database and run the following statement to check the number of tuples on each each DN. Replace *tablename* with the actual name of the table to be analyzed.

     ```
     openGauss=# SELECT a.count,b.node_name FROM (SELECT count(*) AS count,xc_node_id FROM tablename GROUP BY xc_node_id) a, pgxc_node b WHERE a.xc_node_id=b.node_id ORDER BY a.count DESC;
     ```

     If tuple numbers vary greatly (several times or tenfold) in each each DN, a data skew occurs. Change the data distribution key based on the following principle:

  2. Recreate a table to change its distribution keys. **ALTER TABLE** cannot change distribution keys. Therefore, you need to recreate a table when changing its distribution keys.

     Principles for selecting distribution keys are as follows:

     The value of the distribution key should be discrete so that data can be evenly distributed on each DN. You can select the primary key of the table as the distribution key. For example, for a person information table, choose the ID card number column as the distribution key.

     With the above principle met, you can select join conditions as distribution keys so that join tasks can be pushed down to DNs, reducing the amount of data transferred between the DNs.

- Select appropriate partition keys.

  In range partitioning, a table is partitioned based on ranges defined by one or more columns, with no overlap between the ranges of values assigned to different partitions. Each range has a dedicated partition for data storage.

  Modify partition keys to make the query result stored in the same or least partitions (partition pruning). Obtain consecutive I/O to improve the query performance.

  In actual services, time is used to filter query objects. Therefore, you can use time as a partition key, and change the key value based on the total data volume and data volume of a single query.

- RANGE/LIST distribution

  If no DN is specified for the shards of a RANGE/LIST distribution table, the database uses the Round Robin algorithm to allocate DNs to the shards. In addition, if RANGE/LIST distribution is used, you are advised to define as many shards as possible when creating a table for future capacity expansion. If the defined number of shards is less than the number of DNs before scale-out, data redistribution cannot be performed on new DNs. Note that the sharding rules are designed by users. In some extreme cases, scale-out may not solve the problem of insufficient storage space.

- **TO { GROUP groupname | NODE (nodename [, ...]) }**

  TO GROUP specifies the node group to which the table to be created belongs. **TO NODE** is used for internal scale-out tools.

- **CONSTRAINT constraint_name**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the name of a column or table constraint. The optional constraint clauses specify constraints that new or updated rows must satisfy for an INSERT or UPDATE operation to succeed.

There are two ways to define constraints:

- A column constraint is defined as part of a column definition, and it is bound to a particular column.
- A table constraint is not bound to a particular column but can apply to more than one column.

- **NOT NULL**

  The column is not allowed to contain null values.

- **NULL**

  The column is allowed to contain null values. This is the default setting.

  This clause is only provided for compatibility with non-standard SQL databases. It is not recommended.

- **CHECK (expression)**

  Specifies an expression producing a Boolean result where the INSERT or UPDATE operation of new or updated rows can succeed only when the expression result is **TRUE** or **UNKNOWN**; otherwise, an error is thrown and the database is not altered.

  A check constraint specified as a column constraint should reference only the column's values, while an expression appearing in a table constraint can reference multiple columns.

  NOTE

  <>NULL and **!=NULL** are invalid in an expression. Change them to **is NOT NULL**.

- **DEFAULT default_expr**

  Assigns a default data value for a column. The value can be any variable-free expressions. (Subqueries and cross-references to other columns in the current table are not allowed.) The data type of the default expression must match the data type of the column.

  The default expression will be used in any insert operation that does not specify a value for the column. If there is no default value for a column, then the default value is null.

- **UNIQUE index_parameters**

  UNIQUE (column_name [, ...]) index_parameters

  Specifies that a group of one or more columns of a table can contain only unique values.

  For the purpose of a unique constraint, null is not considered equal.

  NOTE

  If **DISTRIBUTE BY REPLICATION** is not specified, the column table that contains only unique values must contain distribution keys.

- **PRIMARY KEY index_parameters**

  PRIMARY KEY (column_name [, ...]) index_parameters

  Specifies that a column or columns of a table can contain only unique (non-duplicate) and non-null values.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Only one primary key can be specified for a table.

NOTE

If **DISTRIBUTE BY REPLICATION** is not specified, the column set with a primary key constraint must contain distribution keys.

- **REFERENCES**

  The distributed database of the current version does not support the REFERENCES clause.

- **DEFERRABLE | NOT DEFERRABLE**

  Controls whether the constraint can be deferred. A constraint that is not deferrable will be checked immediately after every command. Checking of constraints that are deferrable can be postponed until the end of the transaction using the **SET CONSTRAINTS** command. **NOT DEFERRABLE** is the default value. Currently, only **UNIQUE** and **PRIMARY KEY** constraints accept this clause. All the other constraints are not deferrable.

- **PARTIAL CLUSTER KEY**

  Specifies a partial cluster key for storage. When importing data to a column-store table, you can perform local data sorting by specified columns (single or multiple).

- **INITIALLY IMMEDIATE | INITIALLY DEFERRED**

  If a constraint is deferrable, this clause specifies the default time to check the constraint.

  – If the constraint is **INITIALLY IMMEDIATE** (default value), it is checked after each statement.

  – If the constraint is **INITIALLY DEFERRED**, it is checked only at the end of the transaction.

  The constraint check time can be altered using the **SET CONSTRAINTS** statement.

- **USING INDEX TABLESPACE tablespace_name**

  Allows selection of the tablespace in which the index associated with a **UNIQUE** or **PRIMARY KEY** constraint will be created. If not specified, **default_tablespace** is consulted, or the default tablespace in the database if **default_tablespace** is empty.

- **ENCRYPTION_TYPE = encryption_type_value**

  For the encryption type in the ENCRYPTED WITH constraint, the value of **encryption_type_value** is **DETERMINISTIC** or **RANDOMIZED**.

Examples

```
-- Create a simple table.
openGauss=# CREATE TABLE tpcds.warehouse_t1
(
    W_WAREHOUSE_SK            INTEGER               NOT NULL,
    W_WAREHOUSE_ID            CHAR(16)              NOT NULL,
    W_WAREHOUSE_NAME          VARCHAR(20)                   ,
    W_WAREHOUSE_SQ_FT         INTEGER                       ,
    W_STREET_NUMBER           CHAR(10)                      ,
    W_STREET_NAME             VARCHAR(60)                   ,
    W_STREET_TYPE             CHAR(15)                      ,
    W_SUITE_NUMBER            CHAR(10)                      ,
    W_CITY                    VARCHAR(60)                   ,
    W_COUNTY                  VARCHAR(30)                   ,
```

Helpful Links

ALTER TABLE, **DROP TABLE**, and **CREATE TABLESPACE**

Suggestions

- UNLOGGED
  - The unlogged table and its indexes do not use the WAL log mechanism during data writing. Their write speed is much higher than that of ordinary tables. Therefore, they can be used for storing intermediate result sets of complex queries to improve query performance.
  - The unlogged table has no primary/standby mechanism. In case of system faults or abnormal breakpoints, data loss may occur. Therefore, the unlogged table cannot be used to store basic data.
- TEMPORARY | TEMP
  - A temporary table is automatically dropped at the end of a session.
  - The temporary table is visible only to the current CN.
- LIKE
  - The new table automatically inherits all column names, data types, and not-null constraints from this table. The new table is irrelevant to the original table after the creation.
- LIKE INCLUDING DEFAULTS
  - The default expressions are copied from the original table to the new table only if **INCLUDING DEFAULTS** is specified. The default behavior is to exclude default expressions, resulting in the copied columns in the new table having default values null.
- LIKE INCLUDING CONSTRAINTS
  - The **CHECK** constraints are copied from the original table to the new table only when **INCLUDING CONSTRAINTS** is specified. Other types of constraints are never copied to the new table. Not-null constraints are always copied to the new table. These rules also apply to column constraints and table constraints.
- LIKE INCLUDING INDEXES
  - Any indexes on the original table will not be created on the new table, unless the **INCLUDING INDEXES** clause is specified.
- LIKE INCLUDING STORAGE

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **STORAGE** settings for the copied column definitions are copied only if **INCLUDING STORAGE** is specified. The default behavior is to exclude **STORAGE** settings.
- LIKE INCLUDING COMMENTS
  - If **INCLUDING COMMENTS** is specified, comments for the copied columns, constraints, and indexes are copied. The default behavior is to exclude comments.
- LIKE INCLUDING PARTITION
  - If **INCLUDING PARTITION** is specified, the partition definitions of the source table are copied to the new table, and the new table no longer uses the **PARTITION BY** clause. The default behavior is to exclude partition definition of the original table.
- LIKE INCLUDING RELOPTIONS
  - If **INCLUDING RELOPTIONS** is specified, the new table will copy the storage parameter (that is, **WITH** clause) of the source table. The default behavior is to exclude partition definition of the storage parameter of the original table.
- LIKE INCLUDING DISTRIBUTION
  - If **INCLUDING DISTRIBUTION** is specified, the distribution information of the original table is copied to the new table, including distribution type and key, and the new table no longer use the **DISTRIBUTE BY** clause. The default behavior is to exclude distribution information of the original table.
- LIKE INCLUDING ALL
  - **INCLUDING ALL** contains the meaning of **INCLUDING DEFAULTS**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING STORAGE**, **INCLUDING COMMENTS**, **INCLUDING PARTITION**, **INCLUDING RELOPTIONS**, and **INCLUDING DISTRIBUTION**.
- ORIENTATION ROW
  - Creates a row-store table. Row-store applies to the OLTP service, which has many interactive transactions. An interaction involves many columns in the table. Using row-store can improve the efficiency.
- ORIENTATION COLUMN
  - Creates a column-store table. Column store applies to the data warehouse service, which has a large amount of aggregation computing, and involves a few column operations.
- DISTRIBUTE BY
  - It is recommended that a fact table or dimension table containing a large amount of data be created as a distribution table. Each row of the table will be placed into specified DNs based on the hash value of the specified column. The syntax is **distribute by hash (column_name)**.
  - It is recommended that a dimension table containing a small amount of data be created as a replication table. Each row in the table exists on all DNs. That is, each DN has complete table data. The syntax is **distribute by replication**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.14.81 CREATE TABLESPACE

Function

CREATE TABLESPACE creates a tablespace in a database.

Precautions

- The system administrator or a user who inherits the **gs_role_tablespace** permission of the built-in role can create a tablespace.
- Do not run **CREATE TABLESPACE** in a transaction block.
- If executing **CREATE TABLESPACE** fails but the internal directory (or file) has been created, the directory (or file) will remain. You need to manually clear it before creating the tablespace again. If there are residual files of soft links for the tablespace in the data directory, delete the residual files, and then perform O&M operations.
- **CREATE TABLESPACE** cannot be used for two-phase transactions. If it fails on some nodes, the execution cannot be rolled back.
- For details about how to prepare for creating tablespaces, see the description of parameters below.
- You are not advised to use user-defined tablespaces in scenarios such as Huawei Cloud.

  This is because user-defined tablespaces are usually used with storage media other than the main storage (storage device where the default tablespace is located, such as a disk) to isolate I/O resources that can be used by different services. Storage devices use standard configurations and do not have other available storage media in scenarios such as Huawei Cloud. If the user-defined tablespace is not properly used, the system cannot run stably for a long time and the overall performance is affected. Therefore, you are advised to use the default tablespace.

Syntax

```
CREATE TABLESPACE tablespace_name
    [ OWNER user_name ] [ RELATIVE ] LOCATION 'directory' [ MAXSIZE 'space_size' ]
    [with_option_clause];
```

The **with_option_clause** syntax for creating a general tablespace is as follows:

```
WITH ( {filesystem= { 'general'| "general" | general} |
    random_page_cost = { 'value ' | value } |
    seq_page_cost = { 'value ' | value }}[,...])
```

Parameter Description

- **tablespace_name**

  Specifies name of the tablespace to be created.

  The tablespace name must be distinct from the name of any existing tablespace in the cluster and cannot start with "pg", which are reserved for system catalog spaces.

  Value range: a string. It must comply with the naming convention.

- **OWNER user_name**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the name of the user who will own the tablespace. If omitted, the default owner is the current user.

Only system administrators can create tablespaces, but they can use the **OWNER** clause to assign ownership of tablespaces to other users.

Value range: a string. It must be an existing user.

- **RELATIVE**

  Specifies a relative path. The location directory is relative to each CN/DN data directory.

  Directory hierarchy: the relative path of the CN or DN directory **/pg_location/** A relative path contains a maximum of two levels.

  If this parameter is not specified, the absolute tablespace path is used. The **LOCATION** directory must be an absolute path.

- **LOCATION directory**

  Specifies the directory for the table space. When creating an absolute tablespace path, ensure that the directory meets the following requirements:

  – The GaussDB system user must have the read and write permissions on the directory, and the directory must be empty. If the directory does not exist, the system automatically creates it.
  – The directory must be an absolute path, and does not contain special characters, such as dollar sign ($) and greater-than sign (>).
  – The directory cannot be specified under the database data directory.
  – The directory must be a local path.

  Value range: a string. It must be a valid directory.

- **MAXSIZE 'space_size'**

  Specifies the maximum size of a tablespace on a single DN.

  Value range: a string consisting of a positive integer and unit. The unit can be KB, MB, GB, TB, or PB currently. The unit of parsed value is KB and cannot exceed the range that can be expressed in 64 bits, which is 1 KB to 9007199254740991 KB.

- **random_page_cost**

  Specifies the cost of randomly reading the page overhead.

  Value range: 0 to 1.79769e+308

  Default value: value of the GUC parameter **random_page_cost**

- **seq_page_cost**

  Specifies the cost of reading the page overhead in specified order.

  Value range: 0 to 1.79769e+308

  Default value: value of GUC parameter **seq_page_cost**

Examples

```
-- Create a tablespace.
openGauss=# CREATE TABLESPACE ds_location1 RELATIVE LOCATION 'test_tablespace/test_tablespace_1';

-- Create user joe.
openGauss=# CREATE ROLE joe IDENTIFIED BY 'xxxxxxxxxxx';

-- Create user jay.
openGauss=# CREATE ROLE jay IDENTIFIED BY 'xxxxxxxxxxx';
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Create a tablespace and set its owner to user joe.
openGauss=# CREATE TABLESPACE ds_location2 OWNER joe RELATIVE LOCATION 'test_tablespace/
test_tablespace_2';

-- Rename the ds_location1 tablespace to ds_location3.
openGauss=# ALTER TABLESPACE ds_location1 RENAME TO ds_location3;

-- Change the owner of the ds_location2 tablespace.
openGauss=# ALTER TABLESPACE ds_location2 OWNER TO jay;

-- Delete the tablespace.
openGauss=# DROP TABLESPACE ds_location2;
openGauss=# DROP TABLESPACE ds_location3;

-- Delete the user.
openGauss=# DROP ROLE joe;
openGauss=# DROP ROLE jay;
```

Helpful Links

CREATE DATABASE, **CREATE TABLE**, **CREATE INDEX**, **DROP TABLESPACE**, and **ALTER TABLESPACE**

Suggestions

- create tablespace

  You are not advised to create tablespaces in a transaction.

12.14.82 CREATE TABLE AS

Function

CREATE TABLE AS creates a table from the results of a query.

It creates a table and fills it with data obtained using **SELECT**. The table columns have the names and data types associated with the output columns of **SELECT** (except that you can override the **SELECT** output column names by giving an explicit list of new column names).

CREATE TABLE AS queries a source table once and writes the data in a new table. The result in the query view changes with the source table. In contrast, the view re-computes and defines its **SELECT** statement at each query.

Precautions

- This statement cannot be used to create a partitioned table.
- If an error occurs during table creation, after it is fixed, the system may fail to delete the disk files that are created before the last automatic clearance and whose size is not 0. This problem seldom occurs and does not affect system running of the database.

Syntax

```
CREATE [ [ GLOBAL | LOCAL ] [ TEMPORARY | TEMP ] | UNLOGGED ] TABLE table_name
    [ (column_name [, ...] ) ]
    [ WITH ( {storage_parameter = value} [, ... ] ) ]
    [ COMPRESS | NOCOMPRESS ]
    [ TABLESPACE tablespace_name ]
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
[ DISTRIBUTE BY { REPLICATION | { [HASH ] ( column_name ) } } ]
[ TO { GROUP groupname | NODE ( nodename [, ... ] ) } ]
AS query
[ WITH [ NO ] DATA ];
```

Parameter Description

- **UNLOGGED**

  Specifies that the table is created as an unlogged table. Data written to unlogged tables is not written to the WALs, which makes them considerably faster than ordinary tables. However, they are not crash-safe: an unlogged table is automatically truncated after a crash or unclean shutdown. The contents of an unlogged table are also not replicated to standby servers. Any indexes created on an unlogged table are automatically unlogged as well.

  – Usage scenario: Unlogged tables do not ensure data security. Users can back up data before using unlogged tables; for example, users should back up the data before a system upgrade.

  – Troubleshooting: If data is missing in the indexes of unlogged tables due to some unexpected operations such as an unclean shutdown, users should re-create the indexes with errors.

- **GLOBAL | LOCAL**

  When creating a temporary table, you can specify the **GLOBAL** or **LOCAL** keyword before **TEMP** or **TEMPORARY**. Currently, the two keywords are used to be compatible with the SQL standard. A local temporary table will be created by the GaussDB regardless of whether **GLOBAL** or **LOCAL** is specified.

- **TEMPORARY | TEMP**

  If **TEMP** or **TEMPORARY** is specified, the created table is a temporary table. Temporary tables are classified into global temporary tables and local temporary tables. If the keyword **GLOBAL** is specified when a temporary table is created, the table is a global temporary table. Otherwise, the table is a local temporary table.

  The metadata of the global temporary table is visible to all sessions. After the sessions end, the metadata still exists. The user data, indexes, and statistics of a session are isolated from those of another session. Each session can only view and modify the data submitted by itself. Global temporary tables have two schemas: **ON COMMIT PRESERVE ROWS** and **ON COMMIT PRESERVE ROWS**. In session-based **ON COMMIT PRESERVE ROWS** schema, user data is automatically cleared when a session ends. In transaction-based **ON COMMIT DELETE ROWS** schema, user data is automatically cleared when the commit or rollback operation is performed. If the **ON COMMIT** option is not specified during table creation, the session level is used by default. Different from local temporary tables, you can specify a schema that does not start with **pg_temp_** when creating a global temporary table.

  A local temporary table is automatically dropped at the end of the current session. Therefore, temporary tables can still be created and used in the current session when the database node connected to the current session is faulty. Temporary tables are created only in the current session. If a DDL statement involves operations on temporary tables, a DDL error will be generated. Therefore, you are not advised to perform operations on temporary tables in DDL statements. **TEMP** is equivalent to **TEMPORARY**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- Local temporary tables are visible to the current session through the schema starting with **pg_temp**. Users should not delete schema started with **pg_temp** or **pg_toast_temp**.
- If **TEMPORARY** or **TEMP** is not specified when you create a table and its schema is set to the schema of the **pg_temp_** start in the current session, the table will be created as a temporary table.
- If global temporary tables and indexes are being used by other sessions, do not perform **ALTER** or **DROP**.
- The DDL of a global temporary table affects only the user data and indexes of the current session. For example, **TRUNCATE**, **REINDEX**, and **ANALYZE** are valid only for the current session.

- **table_name**

  Specifies the name of the table to be created.

  Value range: a string. It must comply with the naming convention.

- **column_name**

  Specifies the name of a column to be created in the new table.

  Value range: a string. It must comply with the naming convention.

- **WITH (storage_parameter [= value] [, ...])**

  Specifies an optional storage parameter for a table or an index. See details of parameters below.

  – FILLFACTOR

    The fill factor of a table is a percentage from 10 to 100. **100** (complete filling) is the default value. When a smaller fill factor is specified, **INSERT** operations pack table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives **UPDATE** a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate. The parameter is only valid for row–store tables.

    Value range: 10–100

  – ORIENTATION

    Value range:

    COLUMN: The data will be stored in columns.

    ROW (default value): The data will be stored in rows.

  – COMPRESSION

    Specifies the compression level of table data. It determines the compression ratio and time. Generally, the higher the level of compression, the higher the ratio, the longer the time; and the lower the level of compression, the lower the ratio, the shorter the time. The actual compression ratio depends on the distribution mode of table data loaded.

    Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The valid values for column-store tables are **YES**, **NO**, **LOW**, **MIDDLE**, and **HIGH**, and the default value is **LOW**.

Row-store tables do not support compression.

- MAX_BATCHROW

  Specifies the maximum number of rows in a storage unit during data loading. The parameter is only valid for column-store tables.

  Value range: 10000 to 60000

- hashbucket

  Creates a hash table that uses buckets. This parameter supports only row-store tables, including row-store range tables.

  Value range: **on** and **off**

  Default value: **off**

NOTICE

In current version, DDL operations on hash bucket tables are affected. Therefore, you are not advised to frequently perform DDL operations on hash bucket tables.

- **COMPRESS / NOCOMPRESS**

  Specifies keyword **COMPRESS** during the creation of a table, so that the compression feature is triggered in case of bulk **INSERT** operations. If this feature is enabled, a scan is performed for all tuple data within the page to generate a dictionary and then the tuple data is compressed and stored. If **NOCOMPRESS** is specified, the table is not compressed. Row-store tables do not support compression.

  Default value: **NOCOMPRESS**, that is, tuple data is not compressed before storage.

- **TABLESPACE tablespace_name**

  Specifies that the new table will be created in the **tablespace_name** tablespace. If not specified, the default tablespace is used.

- **DISTRIBUTE BY**

  Specifies how the table is distributed or replicated between DNs.

  - **REPLICATION**: Each row in the table exists on all DNs, that is, each DN has complete table data.
  - **HASH (column_name)**: Each row of the table will be placed into specified DNs based on the hash value of the specified column.

NOTICE

- When **DISTRIBUTE BY HASH (column_name)** is specified, the primary key and its unique index must contain the **column_name** column.
- When **DISTRIBUTE BY HASH (column_name)** is specified for a referenced table, the foreign key of the referencing table must contain the **column_name** column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **HASH(column_name)**, primary key column of **column_name** (if any) or column of the first data type that can be used as a distribution key.

column_name supports the following data types:

- Integer types: **TINYINT**, **SMALLINT**, **INT**, **BIGINT**, and **NUMERIC/DECIMAL**
- Character types: **CHAR**, **BPCHAR**, **VARCHAR**, **VARCHAR2**, and **NVARCHAR2**
- Date/time types: **DATE**, **TIME**, **TIMETZ**, **TIMESTAMP**, **TIMESTAMPTZ**, **INTERVAL**, and **SMALLDATETIME**

- **TO { GROUP groupname | NODE (nodename [, ...]) }**

  TO GROUP specifies the node group to which the table to be created belongs. **TO NODE** is used for internal scale-out tools.

- **AS query**

  Specifies a **SELECT** or **VALUES** command, or an **EXECUTE** command that runs a prepared **SELECT** or **VALUES** query.

- **[WITH [NO] DATA]**

  Specifies whether the data produced by the query should be copied to the new table. By default, the data will be copied. If the value **NO** is used, only the table structure will be copied.

Examples

```
-- Create the tpcds.store_returns table.
openGauss=# CREATE TABLE tpcds.store_returns
(
    W_WAREHOUSE_SK            INTEGER               NOT NULL,
    W_WAREHOUSE_ID            CHAR(16)              NOT NULL,
    sr_item_sk                VARCHAR(20)                ,
    W_WAREHOUSE_SQ_FT         INTEGER
);
-- Create the tpcds.store_returns_t1 table and insert numbers that are greater than 16 in the sr_item_sk column of the tpcds.store_returns table.
openGauss=# CREATE TABLE tpcds.store_returns_t1 AS SELECT * FROM tpcds.store_returns WHERE sr_item_sk > '4795';

-- Copy tpcds.store_returns to create the tpcds.store_returns_t2 table.
openGauss=# CREATE TABLE tpcds.store_returns_t2 AS table tpcds.store_returns;

-- Delete the table.
openGauss=# DROP TABLE tpcds.store_returns_t1 ;
openGauss=# DROP TABLE tpcds.store_returns_t2 ;
openGauss=# DROP TABLE tpcds.store_returns;
```

Helpful Links

CREATE TABLE and **SELECT**

12.14.83 CREATE TABLE PARTITION

Function

CREATE TABLE PARTITION creates a partitioned table. Partitioning refers to splitting what is logically one large table into smaller physical pieces based on specific schemes. The table based on the logic is called a partitioned table, and

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

each physical piece is called a partition. Data is stored on these physical partitions, instead of the logical partitioned table.

The common forms of partitioning include range partitioning, hash partitioning, list partitioning, and value partitioning. Currently, row-store and column-store tables support only range partitioning.

In range partitioning, a table is partitioned based on ranges defined by one or more columns, with no overlap between the ranges of values assigned to different partitions. Each range has a dedicated partition for data storage.

The partitioning policy for range partitioning refers to how data is inserted into partitions. Currently, range partitioning only allows the use of the range partitioning policy.

In range partitioning, a table is partitioned based on partition key values. If a record can be mapped to a partition, it is inserted into the partition; if it cannot, an error message is returned. Range partitioning is the most commonly used partitioning policy.

Partitioning can provide several benefits:

- Query performance can be improved drastically in certain situations, particularly when most of the heavily accessed rows of the table are in a single partition or a small number of partitions. Partitioning narrows the range of data search and improves data access efficiency.
- In the case of an insert or update operation on most portions of a single partition, performance can be improved by taking advantage of continuous scan of that partition instead of partitions scattered across the whole table.
- Frequent loading or deletion operations on records in a separate partition can be accomplished by reading or removing that partition. It also avoids the VACUUM overload caused by bulk DELETE operations.

Precautions

- When specifying a partition for query, for example, **select * from tablename partition** (*partitionname*), ensure that the keyword **partition** is correct. If it is incorrect, no error is reported during the query. In this case, the query is performed based on the table alias.
- In distributed mode, you can only use SELECT to specify partitions. If other syntax is used to specify partitions, an error is reported and no alias conversion is performed.

Syntax

```
CREATE TABLE [ IF NOT EXISTS ] partition_table_name
( [
   { column_name data_type [ COLLATE collation ] [ column_constraint [ ... ] ]
   | table_constraint
   | LIKE source_table [ like_option [...] ] }
   [, ... ]
] )
   [ WITH ( {storage_parameter = value} [, ... ] ) ]
   [ COMPRESS | NOCOMPRESS ]
   [ TABLESPACE tablespace_name ]
   [ DISTRIBUTE BY { REPLICATION | { [ HASH ] ( column_name ) } } ]
   [ TO { GROUP groupname | NODE ( nodename [, ... ] ) } ]
   PARTITION BY {
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    {RANGE (partition_key) ( partition_less_than_item [, ... ] )} |
    {RANGE (partition_key) ( partition_start_end_item [, ... ] )}
  } [ { ENABLE | DISABLE } ROW MOVEMENT ];
```

- **column_constraint** is as follows:

```
[ CONSTRAINT constraint_name ]
{ NOT NULL |
  NULL |
  CHECK ( expression ) |
  DEFAULT default_expr |
  UNIQUE [ index_parameters ] |
  PRIMARY KEY [ index_parameters |
  REFERENCES reftable [ ( refcolumn ) ] [ MATCH FULL | MATCH PARTIAL | MATCH SIMPLE ]
    [ ON DELETE action ] [ ON UPDATE action ] }
[ DEFERRABLE | NOT DEFERRABLE ][ INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
```

- **table_constraint** is as follows:

```
[ CONSTRAINT constraint_name ]
{ CHECK ( expression ) |
  UNIQUE ( column_name [, ... ] ) [ index_parameters ] |
  PRIMARY KEY ( column_name [, ... ] ) [ index_parameters |
  FOREIGN KEY ( column_name [, ... ] ) REFERENCES reftable [ ( refcolumn [, ... ] ) ]

[ DEFERRABLE | NOT DEFERRABLE ][ INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
```

- **like_option** is as follows:

```
{ INCLUDING | EXCLUDING } { DEFAULTS | CONSTRAINTS | INDEXES | STORAGE | COMMENTS |
RELOPTIONS | DISTRIBUTION | ALL }
```

- **index_parameters** is as follows:

```
[ WITH ( {storage_parameter = value} [, ... ] ) ]
[ USING INDEX TABLESPACE tablespace_name ]
```

- partition_less_than_item:

```
PARTITION partition_name VALUES LESS THAN ( { partition_value | MAXVALUE } ) [TABLESPACE
tablespace_name]
```

- partition_start_end_item:

```
PARTITION partition_name {
      {START(partition_value) END (partition_value) EVERY (interval_value)} |
      {START(partition_value) END ({partition_value | MAXVALUE})} |
      {START(partition_value)} |
      {END({partition_value | MAXVALUE})}
} [TABLESPACE tablespace_name]
```

Parameter Description

- **IF NOT EXISTS**

  Sends a notice, but does not throw an error, if a table with the same name exists.

- **partition_table_name**

  Specifies the name of a partitioned table.

  Value range: a string. It must comply with the naming convention.

- **column_name**

  Specifies the name of a column to be created in the new table.

  Value range: a string. It must comply with the naming convention.

- **data_type**

  Specifies the data type of the column.

- **COLLATE collation**

  Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **CONSTRAINT constraint_name**

  Specifies the name of a column or table constraint. The optional constraint clauses specify constraints that new or updated rows must satisfy for an insert or update operation to succeed. You can run the **select * from pg_collation** command to query collation rules from the **pg_collation** system catalog. The default collation rule is the row starting with **default** in the query result.

  There are two ways to define constraints:

  – A column constraint is defined as part of a column definition, and it is bound to a particular column.

  – A table constraint is not bound to a particular column but can apply to more than one column.

- **LIKE source_table [like_option ...]**

  Specifies a table from which the new table automatically copies all column names, their data types, and their not-null constraints.

  Unlike **INHERITS**, the new table and original table are decoupled after creation is complete. Changes to the original table will not be applied to the new table, and it is not possible to include data of the new table in scans of the original table.

  Default expressions for the copied column definitions will be copied only if **INCLUDING DEFAULTS** is specified. The default behavior is to exclude default expressions, resulting in the copied columns in the new table having default values null.

  Not-null constraints are always copied to the new table. **CHECK** constraints will only be copied if **INCLUDING CONSTRAINTS** is specified; other types of constraints will never be copied. These rules also apply to column constraints and table constraints.

  Unlike those of **INHERITS**, columns and constraints copied by **LIKE** are not merged with similarly named columns and constraints. If the same name is specified explicitly or in another **LIKE** clause, an error is reported.

  – Any indexes on the original table will not be created on the new table, unless the **INCLUDING INDEXES** clause is specified.

  – **STORAGE** settings for the copied column definitions are copied only if **INCLUDING STORAGE** is specified. The default behavior is to exclude **STORAGE** settings.

  – If **INCLUDING COMMENTS** is specified, comments for the copied columns, constraints, and indexes are copied. The default behavior is to exclude comments.

  – If **INCLUDING RELOPTIONS** is specified, the new table will copy the storage parameter (that is, **WITH** clause) of the source table. The default behavior is to exclude partition definition of the storage parameter of the source table.

  – If **INCLUDING DISTRIBUTION** is specified, the new table will copy the distribution information of the source table, including distribution type and key, and the new table cannot use **DISTRIBUTE BY** clause. The default behavior is to exclude distribution information of the original table.

  – **INCLUDING ALL** contains the meaning of **INCLUDING DEFAULTS**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

STORAGE, **INCLUDING COMMENTS**, **INCLUDING RELOPTIONS**, and **INCLUDING DISTRIBUTION**.

- **WITH (storage_parameter [= value] [, ...])**

  Specifies an optional storage parameter for a table or an index. Optional parameters are as follows:

  - FILLFACTOR

    The fill factor of a table is a percentage from 10 to 100. **100** (complete filling) is the default value. When a smaller fill factor is specified, **INSERT** operations pack table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives **UPDATE** a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate. The parameter has no meaning for column–store tables.

    Value range: 10–100

  - ORIENTATION

    Determines the storage mode of the data in the table.

    Value range:

    - **COLUMN**: The data will be stored in columns.
    - **ROW** (default value): The data will be stored in rows.

    NOTICE

    orientation cannot be modified.

  - COMPRESSION

    - Valid values for column-store tables are **LOW**, **MIDDLE**, **HIGH**, **YES**, and **NO**, and the compression level increases accordingly. The default is **LOW**.
    - Row-store tables do not support compression.

  - MAX_BATCHROW

    Specifies the maximum number of rows in a storage unit during data loading. The parameter is only valid for column-store tables.

    Value range: 10000 to 60000

  - PARTIAL_CLUSTER_ROWS

    Specifies the number of records to be partially clustered for storage during data loading. The parameter is only valid for column-store tables.

    Value range: a number greater than or equal to 100000 The value is a multiple of *MAX_BATCHROW*.

  - DELTAROW_THRESHOLD

    A reserved parameter. The parameter is only valid for column-store tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 0 to 9999

- hashbucket

  Creates a hash table that uses buckets. This parameter supports only row-store tables, including row-store range tables.

  Value range: **on** and **off**

  Default value: **off**

NOTICE

In current version, DDL operations on hash bucket tables are affected. Therefore, you are not advised to frequently perform DDL operations on hash bucket tables.

- **COMPRESS / NOCOMPRESS**

  Specifies keyword **COMPRESS** during the creation of a table, so that the compression feature is triggered in case of bulk **INSERT** operations. If this feature is enabled, a scan is performed for all tuple data within the page to generate a dictionary and then the tuple data is compressed and stored. If **NOCOMPRESS** is specified, the table is not compressed.

  Default value: **NOCOMPRESS**, that is, tuple data is not compressed before storage. Row-store tables do not support compression.

- **TABLESPACE tablespace_name**

  Specifies that the new table will be created in the **tablespace_name** tablespace. If not specified, the default tablespace is used.

- **DISTRIBUTE BY**

  Specifies how the table is distributed or replicated between DNs.

  Value range:

  - **REPLICATION**: Each row in the table exists on all DNs, that is, each DN has complete table data.
  - **HASH (column_name)**: Each row of the table will be placed into specified DNs based on the hash value of the specified column.

NOTICE

- When **DISTRIBUTE BY HASH (column_name)** is specified, the primary key and its unique index must contain the **column_name** column.
- When **DISTRIBUTE BY HASH (column_name)** in a referenced table is specified, the foreign key of the reference table must contain the **column_name** column.

Default value: **HASH(column_name)**, primary key column of **column_name** (if any) or column of the first data type that can be used as a distribution key.

column_name supports the following data types:

- INTEGER TYPES: TINYINT, SMALLINT, INT, BIGINT, NUMERIC/DECIMAL
- CHARACTER TYPES: CHAR, BPCHAR, VARCHAR, VARCHAR2, NVARCHAR2

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - DATA/TIME TYPES: DATE, TIME, TIMETZ, TIMESTAMP, TIMESTAMPTZ, INTERVAL, SMALLDATETIME

- **TO { GROUP groupname | NODE (nodename [, ...]) }**

  TO GROUP specifies the node group to which the table to be created belongs. **TO NODE** is used for internal scale-out tools.

- **PARTITION BY RANGE(partition_key)**

  Creates a range partition. **partition_key** is the name of the partition key.

  (1) Assume that the **VALUES LESS THAN** syntax is used.

  NOTICE

  In this case, a maximum of four partition keys are supported.

  Data types supported by the partition keys are as follows: **SMALLINT**, **INTEGER**, **BIGINT**, **DECIMAL**, **NUMERIC**, **REAL**, **DOUBLE PRECISION**, **CHARACTER VARYING**(*n*), **VARCHAR**(*n*), **CHARACTER**(*n*), **CHAR**(*n*), **CHARACTER**, **CHAR**, **TEXT**, **NVARCHAR2**, **NAME**, **TIMESTAMP[(p)] [WITHOUT TIME ZONE]**, **TIMESTAMP[(p)] [WITH TIME ZONE]**, and **DATE**.

  (2) Assume that the **START END** syntax is used.

  NOTICE

  In this case, only one partition key is supported.

  Data types supported by the partition key are as follows: **SMALLINT**, **INTEGER**, **BIGINT**, **DECIMAL**, **NUMERIC**, **REAL**, **DOUBLE PRECISION**, **TIMESTAMP[(p)] [WITHOUT TIME ZONE]**, **TIMESTAMP[(p)] [WITH TIME ZONE]**, and **DATE**.

- **PARTITION partition_name VALUES LESS THAN ({ partition_value | MAXVALUE })**

  Specifies information of partitions. **partition_name** is the name of a range partition. **partition_value** is the upper limit of a range partition, and the value depends on the type of **partition_key**. *MAXVALUE* usually specifies the upper limit of the last range partition.

  NOTICE

  - Each partition requires an upper limit.
  - The data type of the upper limit must be the same as that of the partition key.
  - In a partition list, partitions are arranged in ascending order of upper limits. A partition with a smaller upper limit value is placed before another partition with a larger one.

- **PARTITION partition_name {START (partition_value) END (partition_value) EVERY (interval_value)} | {START (partition_value) END**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

(partition_value|MAXVALUE)} | {START(partition_value)} | {END (partition_value | MAXVALUE)}

Specifies information of partitions.

- **partition_name**: name or name prefix of a range partition. It is the name prefix only in the following cases (assuming that **partition_name** is **p1**):
  - If **START**+**END**+**EVERY** is used, the names of partitions will be defined as **p1_1**, **p1_2**, and the like. For example, if **PARTITION p1 START(1) END(4) EVERY(1)** is defined, the generated partitions are [1, 2), [2, 3), and [3, 4), and their names are **p1_1**, **p1_2**, and **p1_3**. In this case, **p1** is a name prefix.
  - If the defined statement is in the first place and has **START** specified, the range (*MINVALUE*, **START**) will be automatically used as the first actual partition, and its name will be **p1_0**. The other partitions are then named **p1_1**, **p1_2**, and the like. For example, if **PARTITION p1 START(1), PARTITION p2 START(2)** is defined, generated partitions are (*MINVALUE*, 1), [1, 2), and [2, *MAXVALUE*), and their names will be **p1_0**, **p1_1**, and **p2**. In this case, **p1** is a name prefix and **p2** is a partition name. **MINVALUE** means the minimum value.
- **partition_value**: start value or end value of a range partition. The value depends on **partition_key** and cannot be *MAXVALUE*.
- **interval_value**: width of each partition for dividing the [**START**, **END**) range. It cannot be *MAXVALUE*. If the value of (**END** – **START**) divided by **EVERY** has a remainder, the width of only the last partition is less than the value of **EVERY**.
- *MAXVALUE* usually specifies the upper limit of the last range partition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

1. If the defined statement is in the first place and has **START** specified, the range (*MINVALUE*, **START**) will be automatically used as the first actual partition.
2. The **START END** syntax must comply with the following rules:
   - The value of **START** (if any, same for the following situations) in each **partition_start_end_item** must be smaller than that of **END**.
   - In two adjacent **partition_start_end_item** statements, the value of the first **END** must be equal to that of the second **START**.
   - The value of **EVERY** in each **partition_start_end_item** must be a positive number (in ascending order) and must be smaller than **END** minus **START**.
   - Each partition includes the start value (unless it is *MINVALUE*) and excludes the end value. The format is as follows: [**START**, **END**).
   - Partitions created by the same **partition_start_end_item** belong to the same tablespace.
   - If **partition_name** is a name prefix of a partition, the length must not exceed 57 bytes. If there are more than 57 bytes, the prefix will be automatically truncated.
   - When creating or modifying a partitioned table, ensure that the total number of partitions in the table does not exceed the maximum value (32767).
3. In statements for creating partitioned tables, **START END** and **LESS THAN** cannot be used together.
4. The **START END** syntax in a partitioned table creation SQL statement will be replaced by the **VALUES LESS THAN** syntax when **gs_dump** is executed.

- **{ ENABLE | DISABLE } ROW MOVEMENT**

  Sets row movement.

  If the tuple value is updated on the partition key during the **UPDATE** action, the partition where the tuple is located is altered. Setting this parameter enables error messages to be reported or movement of the tuple between partitions.

  Value range:

  – **ENABLE**: Row movement is enabled.

  – **DISABLE** (default value): Row movement is disabled.

  If the row movement is enabled, an error may be reported when update and delete operations are performed concurrently. The causes are as follows:

  The old data is marked as deleted under the update and delete operations. If the row movement is enabled, the cross-partition update occurs when the partition key is updated, the kernel marks the old data in the old partition as deleted and adds a data to the new partition. As a result, the new data cannot be found by querying the old data.

  If data in the same row is concurrently operated, the cross-partition and non-cross-partition data results have different behaviors in the following three concurrency scenarios: update and update concurrency, delete and delete concurrency, update and delete concurrency.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

a. For non-cross-partition data, no error is reported for the second operation after the first operation is performed.

   If the first operation is update, the latest data can be found and operated after the second operation is performed.

   If the first operation is delete, the second operation is terminated when the current data is deleted and the latest data cannot be found.

b. For the cross-partition data result, an error is reported for the second operation after the first operation is performed.

   If the first operation is update, the second operation cannot find the latest data because the new data is in the new partition. The operation fails and an error is reported.

   If the first operation is delete, performing the second operation can find that the current data is deleted and the latest data cannot be found, but cannot determine whether the operation of deleting the old data is update or delete. If the operation is update, an error is reported. If the operation is delete, the second operation is terminated. To ensure the data correctness, an error is reported.

If the update and update concurrency, and update and delete concurrency are performed, the error can be solved only when the operations are performed serially. If the delete and delete concurrency are performed, the error can be solved by disabling the row movement.

- **NOT NULL**

  The column is not allowed to contain null values. **ENABLE** can be omitted.

- **NULL**

  Specifies that the column is allowed to contain null values. This is the default setting.

  This clause is only provided for compatibility with non-standard SQL databases. It is not recommended.

- **CHECK (condition) [NO INHERIT]**

  Specifies an expression producing a Boolean result where the insert or update operation of new or updated rows can succeed only when the expression result is **TRUE** or **UNKNOWN**; otherwise, an error is thrown and the database is not altered.

  A check constraint specified as a column constraint should reference only the column's values, while an expression appearing in a table constraint can reference multiple columns.

  A constraint marked with **NO INHERIT** will not propagate to child tables.

  ENABLE can be omitted.

- **DEFAULT default_expr**

  Assigns a default data value for a column. The value can be any variable-free expressions. (Subqueries and cross-references to other columns in the current table are not allowed.) The data type of the default expression must match the data type of the column.

  The default expression will be used in any insert operation that does not specify a value for the column. If there is no default value for a column, then the default value is null.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **UNIQUE index_parameters**

  UNIQUE (column_name [, ...]) index_parameters

  Specifies that a group of one or more columns of a table can contain only unique values.

  For the purpose of a unique constraint, null is not considered equal.

  NOTE

  If **DISTRIBUTE BY REPLICATION** is not specified, the column table that contains only unique values must contain distribution keys.

- **PRIMARY KEY index_parameters**

  PRIMARY KEY (column_name [, ...]) index_parameters

  Specifies that a column or columns of a table can contain only unique (non-duplicate) and non-null values.

  Only one primary key can be specified for a table.

  NOTE

  If **DISTRIBUTE BY REPLICATION** is not specified, the column set with a primary key constraint must contain distribution keys.

- **DEFERRABLE | NOT DEFERRABLE**

  Controls whether the constraint can be deferred. A constraint that is not deferrable will be checked immediately after every command. Checking of constraints that are deferrable can be postponed until the end of the transaction using the **SET CONSTRAINTS** command. **NOT DEFERRABLE** is the default value. Currently, only **UNIQUE** and **PRIMARY KEY** constraints accept this clause. All the other constraints are not deferrable.

- **INITIALLY IMMEDIATE | INITIALLY DEFERRED**

  If a constraint is deferrable, this clause specifies the default time to check the constraint.

  – If the constraint is **INITIALLY IMMEDIATE** (default value), it is checked after each statement.
  – If the constraint is **INITIALLY DEFERRED**, it is checked only at the end of the transaction.

  The constraint check time can be altered using the **SET CONSTRAINTS** statement.

- **USING INDEX TABLESPACE tablespace_name**

  Allows selection of the tablespace in which the index associated with a **UNIQUE** or **PRIMARY KEY** constraint will be created. If not specified, **default_tablespace** is consulted, or the default tablespace in the database if **default_tablespace** is empty.

Examples

- Example 1: Create a range-partitioned table **tpcds.web_returns_p1**. The table has eight partitions and their partition keys are of the integer type. The ranges of the partitions are: wr_returned_date_sk < 2450815, 2450815 ≤ wr_returned_date_sk < 2451179, 2451179 ≤ wr_returned_date_sk < 2451544, 2451544 ≤ wr_returned_date_sk < 2451910, 2451910 ≤ wr_returned_date_sk < 2452275, 2452275 ≤ wr_returned_date_sk < 2452640, 2452640 ≤ wr_returned_date_sk < 2453005, and wr_returned_date_sk ≥ 2453005.

12.14.84 CREATE TEXT SEARCH CONFIGURATION

Function

CREATE TEXT SEARCH CONFIGURATION creates a text search configuration. A text search configuration specifies a text search parser that can divide a string into tokens, plus dictionaries that can be used to determine which tokens are of interest for searching.

Precautions

- If only the parser is specified, the new text search configuration initially has no mapping from token types to dictionaries, and therefore will ignore all words. Subsequently, **ALTER TEXT SEARCH CONFIGURATION** must be used to create mapping to make the configuration useful. If **COPY** is specified, the parser, mapping and parameters of the text search configuration is copied automatically.
- If the schema name is given, the text search configuration will be created in the specified schema. Otherwise, the configuration will be created in the current schema.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The user who defines a text search configuration becomes its owner.
- **PARSER** and **COPY** options are mutually exclusive, because when an existing configuration is copied, its parser selection is copied too.
- If only the parser is specified, the new text search configuration initially has no mapping from token types to dictionaries, and therefore will ignore all words.

Syntax

```
CREATE TEXT SEARCH CONFIGURATION name
    ( PARSER = parser_name | COPY = source_config )
    [ WITH ( {configuration_option = value} [, ...] )];
```

Parameter Description

- **name**

  Specifies the name of the text search configuration to be created. The name can be schema-qualified.

- **parser_name**

  Specifies the name of the text search parser to use for this configuration.

- **source_config**

  Specifies the name of an existing text search configuration to copy.

- **configuration_option**

  Specifies parameters for the text search configuration, particularly for the parser executed by **parser_name** or contained by **source_config**.

  Value range: The default and **ngram** parsers are supported. The parser of default type has no corresponding **configuration_option**. Table 12-121 lists **configuration_option** for **ngram** parsers.

  Table 12-121 Configuration parameters for **ngram** parsers

Parser	Parameter	Description	Value Range
ngram	gram_size	Length of word segmentation	Integer, 1 to 4 Default value: **2**
	punctuation_ignore	Whether to ignore punctuations	• **true** (default value): Ignore punctuations. • **false**: Do not ignore punctuations.
	grapsymbol_ignore	Whether to ignore graphical characters	• **true**: Ignore graphical characters. • **false** (default value): Do not ignore graphical characters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
-- Create a text search configuration.
openGauss=# CREATE TEXT SEARCH CONFIGURATION ngram2 (parser=ngram) WITH (gram_size = 2,
grapsymbol_ignore = false);

-- Create a text search configuration.
openGauss=# CREATE TEXT SEARCH CONFIGURATION ngram3 (copy=ngram2) WITH (gram_size = 2,
grapsymbol_ignore = false);

-- Add type mapping.
openGauss=# ALTER TEXT SEARCH CONFIGURATION ngram2 ADD MAPPING FOR multisymbol WITH
simple;

-- Create user joe.
openGauss=# CREATE USER joe IDENTIFIED BY 'xxxxxxxxxx';

-- Change the owner of the text search configuration.
openGauss=# ALTER TEXT SEARCH CONFIGURATION ngram2 OWNER TO joe;

-- Change the schema of the text search configuration.
openGauss=# ALTER TEXT SEARCH CONFIGURATION ngram2 SET SCHEMA joe;

-- Rename the text search configuration.
openGauss=# ALTER TEXT SEARCH CONFIGURATION joe.ngram2 RENAME TO ngram_2;

-- Delete the type mapping.
openGauss=# ALTER TEXT SEARCH CONFIGURATION joe.ngram_2 DROP MAPPING IF EXISTS FOR
multisymbol;

-- Delete the text search configuration.
openGauss=# DROP TEXT SEARCH CONFIGURATION joe.ngram_2;
openGauss=# DROP TEXT SEARCH CONFIGURATION ngram3;

-- Delete the schema and user joe.
openGauss=# DROP SCHEMA IF EXISTS joe CASCADE;
openGauss=# DROP ROLE IF EXISTS joe;
```

ALTER TEXT SEARCH CONFIGURATION and **DROP TEXT SEARCH CONFIGURATION**

12.14.85 CREATE TEXT SEARCH DICTIONARY

Function

CREATE TEXT SEARCH DICTIONARY creates a full-text retrieval dictionary. A dictionary is used to identify and process particular words during full-text retrieval.

Dictionaries are created by using predefined templates (defined in the **PG_TS_TEMPLATE** system catalog). Five types of dictionaries can be created, **Simple**, **Ispell**, **Synonym**, **Thesaurus**, and **Snowball**. These dictionaries are used to handle different types of tasks.

Precautions

- A user with the **SYSADMIN** permission can create a dictionary. Then, the user automatically becomes the owner of the dictionary.
- A dictionary cannot be created in **pg_temp** mode.
- After a dictionary is created or modified, any modification to the customized dictionary definition file will not affect the dictionary in the database. To

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

make such modifications take effect in the dictionary in the database, run the **ALTER** statement to update the definition file of the dictionary.

Syntax

```
CREATE TEXT SEARCH DICTIONARY name (
    TEMPLATE = template
    [, option = value [, ... ]]
);
```

Parameter Description

- **name**

  Specifies the name of a dictionary to be created. (If you do not specify a schema name, the dictionary will be created in the current schema.)

  Value range: a string, which complies with the identifier naming convention. A value can contain a maximum of 63 characters.

- **template**

  Specifies a template name.

  Value range: templates (**Simple**, **Synonym**, **Thesaurus**, **Ispell**, and **Snowball**) defined in the **PG_TS_TEMPLATE** system catalog

- **option**

  Specifies a parameter name. Each type of dictionaries has a template containing their custom parameters. Parameters function in a way irrelevant to their setting sequence.

  – Parameters for a **Simple** dictionary

    - **STOPWORDS**

      Specifies the name of a file listing stop words. The default file name extension is .stop. In the file, each line defines a stop word. Dictionaries will ignore blank lines and spaces in the file and convert stop-word phrases into lowercase.

    - **ACCEPT**

      Specifies whether to accept a non-stop word as recognized. Default value: **true**

      If **ACCEPT=true** is set for a **Simple** dictionary, no token will be passed to subsequent dictionaries. In this case, you are advised to place the **Simple** dictionary at the end of the dictionary list. If **ACCEPT=false** is set, you are advised to place the **Simple** dictionary before at least one dictionary in the list.

    - **FILEPATH**

      Specifies the directory for storing dictionary files. The directory can be a local directory or an OBS directory. (The OBS directory can be specified only in security mode. You can add the securitymode option during startup to enter the security mode.) The local directory format is **file://***absolute_path*. The OBS directory format is **obs://***bucket_name***/path accesskey=ak secretkey=sk region=rg**. The default value is the directory where predefined dictionary files are located. If any of the **FILEPATH** and **STOPWORDS** parameters is specified, the other one must also be specified.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Parameters for a **Synonym** dictionary

  - **SYNONYM**

    Specifies the name of the definition file for a **Synonym** dictionary. The default file name extension is .syn.

    The file is a list of synonyms. Each line is in the format of *token synonym*, that is, token and its synonym separated by a space.

  - **CASESENSITIVE**

    Specifies whether tokens and their synonyms are case sensitive. The default value is **false**, indicating that tokens and synonyms in dictionary files will be converted into lowercase. If this parameter is set to **true**, they will not be converted into lowercase.

  - **FILEPATH**

    Specifies the directory for storing **Synonym** dictionary files. The directory can be a local directory or an OBS directory. (The OBS directory can be specified only in security mode. You can add the **securitymode** option during startup to enter the security mode.) The local directory format is **file://***absolute_path*. The OBS directory format is **obs://***bucket_name***/path accesskey=ak secretkey=sk region=rg**. The default value is the directory where predefined dictionary files are located.

- Parameters for a **Thesaurus** dictionary

  - **DICTFILE**

    Specifies the name of a dictionary definition file. The default file name extension is .ths.

    The file is a list of synonyms. Each line is in the format of *sample words* **:** *indexed words*. The colon (:) is used as a separator between a phrase and its substitute word. If multiple sample words are matched, the TZ selects the longest one.

  - **DICTIONARY**

    Specifies the name of a subdictionary used for word normalization. This parameter is mandatory and only one subdictionary name can be specified. The specified subdictionary must exist. It is used to identify and normalize input text before phrase matching.

    If an input word cannot be recognized by the subdictionary, an error will be reported. In this case, remove the word or update the subdictionary to make the word recognizable. In addition, an asterisk (*) can be placed at the beginning of an indexed word to skip the application of a subdictionary on it, but all sample words must be recognizable by the subdictionary.

    If the sample words defined in the dictionary file contain stop words defined in the subdictionary, use question marks (?) to replace them. Assume that **a** and **the** are stop words defined in the subdictionary.

    ```
    ? one ? two : swsw
    ```

    a one the two and **the one a two** will be matched and output as **swsw**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **FILEPATH**

  Specifies the directory for storing dictionary definition files. The directory can be a local directory or an OBS directory. (The OBS directory can be specified only in security mode. You can add the securitymode option during startup to enter the security mode.) The local directory format is **file://***absolute_path*. The OBS directory format is **obs://***bucket_name***/path accesskey=ak secretkey=sk region=rg**. The default value is the directory where predefined dictionary files are located.

– Parameters for an **Ispell** dictionary

  - **DICTFILE**

    Specifies the name of a dictionary definition file. The default file name extension is .dict.

  - **AFFFILE**

    Specifies the name of an affix file. The default file name extension is .affix.

  - **STOPWORDS**

    Specifies the name of a file listing stop words. The default file name extension is .stop. The file content format is the same as that of the file for a **Simple** dictionary.

  - **FILEPATH**

    Specifies the directory for storing dictionary files. The directory can be a local directory or an OBS directory. (The OBS directory can be specified only in security mode. You can add the **securitymode** option during startup to enter the security mode.) The local directory format is **file://***absolute_path*. The OBS directory format is **obs://***bucket_name***/path accesskey=ak secretkey=sk region=rg**. The default value is the directory where predefined dictionary files are located.

– Parameters for a **Snowball** dictionary

  - **LANGUAGE**

    Specifies the name of a language whose stemming algorithm will be used. According to spelling rules in the language, the algorithm normalizes the variants of an input word into a basic word or a stem.

  - **STOPWORDS**

    Specifies the name of a file listing stop words. The default file name extension is .stop. The file content format is the same as that of the file for a **Simple** dictionary.

  - **FILEPATH**

    Specifies the directory for storing dictionary definition files. You can specify a local directory or an OBS directory. (The OBS directory can be specified only in security mode. You can enter the security mode by adding the **securitymode** option during startup.) The local directory format is **file://***absolute_path*. The OBS directory format is **obs://***bucket_name***/path accesskey=ak secretkey=sk region=rg**. The

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

default value is the directory where predefined dictionary files are located. If any of the **FILEPATH** and **STOPWORDS** parameters is specified, the other one must also be specified.

NOTE

The name of a dictionary definition file can contain only lowercase letters, digits, and underscores (_).

- **value**

  Specifies a parameter value. If the value is not an identifier or a number, enclose it with single quotation marks (''). You can also enclose identifiers and numbers.

Examples

See examples in **Configuration Examples**.

ALTER TEXT SEARCH DICTIONARY and **CREATE TEXT SEARCH DICTIONARY**

12.14.86 CREATE TRIGGER

Function

CREATE TRIGGER creates a trigger. The trigger will be associated with the specified table or view, and will execute the specified function operations are performed.

Precautions

- Currently, triggers can be created only on ordinary row-store tables, instead of on column-store tables, temporary tables, or unlogged tables.
- If multiple triggers of the same kind are defined for the same event, they will be fired in alphabetical order by name.
- Triggers are usually used for data association and synchronization between multiple tables. SQL execution performance is greatly affected. Therefore, you are advised not to use this statement when a large amount of data needs to be synchronized and performance requirements are high.
- When a trigger meets the following conditions, the trigger statement and trigger itself can be pushed together down to a DN for execution, improving the trigger execution performance:
  - Switch **enable_trigger_shipping** and **enable_fast_query_shipping** on.
  - The trigger function used by the source table is a PL/pgSQL function (recommended).
  - The source and target tables have the same type and number of distribution keys, are both row-store tables, and belong to the same node group.
  - The **INSERT**, **UPDATE**, or **DELETE** statement on the source table contains an expression about equality comparison between all the distribution keys and the *NEW* or *OLD* variable.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - The **INSERT**, **UPDATE**, or **DELETE** statement on the source table can be pushed down without a trigger.
  - There are only six types of triggers (**INSERT BEFORE FOR EACH ROW**, **INSERT AFTER FOR EACH ROW**, **UPDATE BEFORE FOR EACH ROW**, **UPDATE AFTER FOR EACH ROW**, **DELETE BEFORE FOR EACH ROW**, and **DELETE AFTER FOR EACH ROW**) on the source table, and all the triggers can be pushed down.
- The **INSERT ON DUPLICATE KEY UPDATE** statement cannot fire a trigger.
- When a trigger statement is executed, the permission is determined by the trigger creator.
- To create a trigger, you must have the TRIGGER permission on the specified table.

Syntax

```
CREATE [ CONSTRAINT ] TRIGGER trigger_name { BEFORE | AFTER | INSTEAD OF } { event [ OR ... ] }
   ON table_name
   [ FROM referenced_table_name ]
   { NOT DEFERRABLE | [ DEFERRABLE ] { INITIALLY IMMEDIATE | INITIALLY DEFERRED } }
   [ FOR [ EACH ] { ROW | STATEMENT } ]
   [ WHEN ( condition ) ]
   EXECUTE PROCEDURE function_name ( arguments );
```

Events include:

```
   INSERT
   UPDATE [ OF column_name [, ... ] ]
   DELETE
   TRUNCATE
```

Parameter Description

- **CONSTRAINT**

  (Optional) Creates a constraint trigger. That is, the trigger is used as a constraint. This is the same as a regular trigger except that the timing of the trigger firing can be adjusted using **SET CONSTRAINTS**. Constraint triggers must be **AFTER ROW** triggers.

- **trigger_name**

  Specifies the name of the trigger to be created. This must be distinct from the name of any other trigger for the same table. The name cannot be schema-qualified — the trigger inherits the schema of its table. For a constraint trigger, this is also the name to use when modifying the trigger's behavior using **SET CONSTRAINTS**.

  Value range: a string, which complies with the identifier naming convention and contains a maximum of 63 characters.

- **BEFORE**

  Specifies that the function is called before the event.

- **AFTER**

  Specifies that the function is called after the event. A constraint trigger can only be specified as **AFTER**.

- **INSTEAD OF**

  Specifies that the function is called instead of the event.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **event**

  Specifies the event that will fire the trigger. Values are **INSERT**, **UPDATE**, **DELETE**, and **TRUNCATE**. Multiple events can be specified using **OR**.

  For **UPDATE** events, it is possible to specify a list of columns using this syntax:

  ```
  UPDATE OF column_name1 [, column_name2 ... ]
  ```

  The trigger will only fire if at least one of the listed columns is mentioned as a target of the **UPDATE** statement. **INSTEAD OF UPDATE** events do not allow a list of columns.

- **table_name**

  Specifies the name of the table for which the trigger is created.

  Value range: name of an existing table in the database

- **referenced_table_name**

  Specifies the name of another table referenced by the constraint. This option is used for foreign-key constraints. It can only be specified for constraint triggers. Because foreign keys are not supported currently, this option is not recommended for general use.

  Value range: name of an existing table in the database

- **DEFERRABLE | NOT DEFERRABLE**

  Specifies the start time of the trigger. It can only be specified for constraint triggers. They determine whether the constraint is deferrable.

  For details, see **CREATE TABLE**.

- **INITIALLY IMMEDIATE | INITIALLY DEFERRED**

  If the constraint is deferrable, the two clauses specify the default time to check the constraint. It can only be specified for constraint triggers.

  For details, see **CREATE TABLE**.

- **FOR EACH ROW | FOR EACH STATEMENT**

  Specifies the frequency of firing the trigger.

  - **FOR EACH ROW** indicates that the trigger should be fired once for every row affected by the trigger event.
  - **FOR EACH STATEMENT** indicates that the trigger should be fired just once per SQL statement.

  If neither is specified, the default is **FOR EACH STATEMENT**. Constraint triggers can only be marked as **FOR EACH ROW**.

- **condition**

  Specifies whether the trigger function will actually be executed. If **WHEN** is specified, the function will be called only when **condition** returns **true**.

  In **FOR EACH ROW** triggers, the **WHEN** condition can refer to columns of the old and/or new row values by writing **OLD.***column name* or **NEW.***column name* respectively. In addition, **INSERT** triggers cannot refer to **OLD**, and **DELETE** triggers cannot refer to **NEW**.

  INSTEAD OF triggers do not support **WHEN** conditions.

  Currently, **WHEN** expressions cannot contain subqueries.

  Note that for constraint triggers, evaluation of the **WHEN** condition is not deferred, but occurs immediately after the row update operation is performed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If the condition does not evaluate to **true**, then the trigger is not queued for deferred execution.

- **function_name**

  Specifies a user-defined function, which must be declared as taking no parameters and returning type trigger. This is executed when a trigger fires.

- **arguments**

  Specifies an optional comma-separated list of parameters to be provided to the function when the trigger is executed. The parameters are literal string constants. Simple names and numeric constants can also be written here, but they will all be converted to strings. Check the description of the implementation language of the trigger function to find out how these parameters can be accessed within the function.

  NOTE

  The following details trigger types:

  - **INSTEAD OF** triggers must be marked as **FOR EACH ROW** and can be defined only on views.
  - **BEFORE** and **AFTER** triggers on a view must be marked as **FOR EACH STATEMENT**.
  - **TRUNCATE** triggers must be marked as **FOR EACH STATEMENT**.

Table 12-122 Types of triggers supported on tables and views

When	Event	Row-Level	Statement-Level
BEFORE	INSERT/UPDATE/DELETE	Tables	Tables and views
	TRUNCATE	Not supported.	Tables
AFTER	INSERT/UPDATE/DELETE	Tables	Tables and views
	TRUNCATE	Not supported.	Tables
INSTEAD OF	INSERT/UPDATE/DELETE	Views	Not supported.
	TRUNCATE	Not supported.	Not supported.

Table 12-123 Special variables in PL/pgSQL functions

Variable	Description
NEW	New tuple for **INSERT** and **UPDATE** operations. This variable is **NULL** for **DELETE** operations.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Variable	Description
OLD	Old tuple for **UPDATE** and **DELETE** operations. This variable is **NULL** for **INSERT** operations.
TG_NAME	Trigger name.
TG_WHEN	Trigger timing (**BEFORE**, **AFTER**, or **INSTEAD OF**).
TG_LEVEL	Trigger frequency (**ROW** or **STATEMENT**).
TG_OP	Trigger event (**INSERT**, **UPDATE**, **DELETE**, or **TRUNCATE**).
TG_RELID	OID of the table where the trigger resides.
TG_RELNAME	Name of the table where the trigger resides. (This variable has been replaced by **TG_TABLE_NAME**.)
TG_TABLE_NAME	Name of the table where the trigger resides.
TG_TABLE_SCHEMA	Schema of the table where the trigger resides.
TG_NARGS	Number of parameters for the trigger function.
TG_ARGV[]	List of parameters for the trigger function.

Examples

```
-- Create a source table and a destination table.
openGauss=# CREATE TABLE test_trigger_src_tbl(id1 INT, id2 INT, id3 INT);
openGauss=# CREATE TABLE test_trigger_des_tbl(id1 INT, id2 INT, id3 INT);

-- Create a trigger function.
openGauss=# CREATE OR REPLACE FUNCTION tri_insert_func() RETURNS TRIGGER AS
        $$
        DECLARE
        BEGIN
                INSERT INTO test_trigger_des_tbl VALUES(NEW.id1, NEW.id2, NEW.id3);
                RETURN NEW;
        END
        $$ LANGUAGE PLPGSQL;

openGauss=# CREATE OR REPLACE FUNCTION tri_update_func() RETURNS TRIGGER AS
        $$
        DECLARE
        BEGIN
                UPDATE test_trigger_des_tbl SET id3 = NEW.id3 WHERE id1=OLD.id1;
                RETURN OLD;
        END
        $$ LANGUAGE PLPGSQL;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
openGauss=# CREATE OR REPLACE FUNCTION TRI_DELETE_FUNC() RETURNS TRIGGER AS
        $$
        DECLARE
        BEGIN
                DELETE FROM test_trigger_des_tbl WHERE id1=OLD.id1;
                RETURN OLD;
        END
        $$ LANGUAGE PLPGSQL;

-- Create an INSERT trigger.
openGauss=# CREATE TRIGGER insert_trigger
        BEFORE INSERT ON test_trigger_src_tbl
        FOR EACH ROW
        EXECUTE PROCEDURE tri_insert_func();

-- Create an UPDATE trigger.
openGauss=# CREATE TRIGGER update_trigger
        AFTER UPDATE ON test_trigger_src_tbl
        FOR EACH ROW
        EXECUTE PROCEDURE tri_update_func();

-- Create a DELETE trigger.
openGauss=# CREATE TRIGGER delete_trigger
        BEFORE DELETE ON test_trigger_src_tbl
        FOR EACH ROW
        EXECUTE PROCEDURE tri_delete_func();

-- Execute the INSERT event and check the trigger results.
openGauss=# INSERT INTO test_trigger_src_tbl VALUES(100,200,300);
openGauss=# SELECT * FROM test_trigger_src_tbl;
openGauss=# SELECT * FROM test_trigger_des_tbl;  // Check whether the trigger operation takes effect.

-- Execute the UPDATE event and check the trigger results.
openGauss=# UPDATE test_trigger_src_tbl SET id3=400 WHERE id1=100;
openGauss=# SELECT * FROM test_trigger_src_tbl;
openGauss=# SELECT * FROM test_trigger_des_tbl;  // Check whether the trigger operation takes effect.

-- Execute the DELETE event and check the trigger results.
openGauss=# DELETE FROM test_trigger_src_tbl WHERE id1=100;
openGauss=# SELECT * FROM test_trigger_src_tbl;
openGauss=# SELECT * FROM test_trigger_des_tbl;  // Check whether the trigger operation takes effect.

-- Modify a trigger.
openGauss=# ALTER TRIGGER delete_trigger ON test_trigger_src_tbl RENAME TO delete_trigger_renamed;

-- Disable insert_trigger.
openGauss=# ALTER TABLE test_trigger_src_tbl DISABLE TRIGGER insert_trigger;

-- Disable all triggers on the current table.
openGauss=# ALTER TABLE test_trigger_src_tbl DISABLE TRIGGER ALL;

-- Delete triggers.
openGauss=# DROP TRIGGER insert_trigger ON test_trigger_src_tbl;
openGauss=# DROP TRIGGER update_trigger ON test_trigger_src_tbl;
openGauss=# DROP TRIGGER delete_trigger_renamed ON test_trigger_src_tbl;
```

12.14.87 CREATE TYPE

Function

CREATE TYPE registers a new data type for use in the current database. The user who defines a type becomes its owner. Types are designed only for row-store tables.

The following data types can be created: composite type, base type, shell type, enumerated type, and set type.

- Composite type

  A composite type is specified by a list of attribute names and data types. If the data type of an attribute is collatable, the attribute's collation rule can also be specified. This is essentially the same as the row type of a table, but using **CREATE TYPE** avoids the need to create an actual table when all that is wanted is to define a type. A stand-alone composite type is useful as the parameter or return type of a function.

  To create a composite type, you must have the **USAGE** permission on all of its attribute types.

- Base type

  You can create a base type (scalar type). Generally, the functions required by a base type have to be coded in C or another low-level language.

- Shell type

  A shell type is simply a placeholder for a type to be defined later; it is created by issuing **CREATE TYPE** with no parameters except for the type name. Shell types are needed as forward references when base types are created.

- Enumerated type

  An enumerated type is a list of one or more quoted labels, each of which must be 1 to 64 bytes long.

- Set type

  It is similar to an array but has no length limit. It is mainly used in stored procedures.

- A user granted with the CREATE ANY TYPE permission can create types in the public and user schemas.

Precautions

If a schema name is given then the type is created in the specified schema. Otherwise, it is created in the current schema. The type name must be distinct from the name of any existing type or domain in the same schema. (Because tables have associated data types, the type name must also be distinct from the name of any existing table in the same schema.)

Syntax

```
CREATE TYPE name AS
    ( [ attribute_name data_type [ COLLATE collation ] [, ... ] ] )

CREATE TYPE name (
    INPUT = input_function,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    OUTPUT = output_function
    [ , RECEIVE = receive_function ]
    [ , SEND = send_function ]
    [ , TYPMOD_IN = type_modifier_input_function ]
    [ , TYPMOD_OUT = type_modifier_output_function ]
    [ , ANALYZE = analyze_function ]
    [ , INTERNALLENGTH = { internallength | VARIABLE } ]
    [ , PASSEDBYVALUE ]
    [ , ALIGNMENT = alignment ]
    [ , STORAGE = storage ]
    [ , LIKE = like_type ]
    [ , CATEGORY = category ]
    [ , PREFERRED = preferred ]
    [ , DEFAULT = default ]
    [ , ELEMENT = element ]
    [ , DELIMITER = delimiter ]
    [ , COLLATABLE = collatable ]
)

CREATE TYPE name

CREATE TYPE name AS ENUM
    ( [ 'label' [, ... ] ] )

CREATE TYPE name AS TABLE OF data_type
```

Parameter Description

Composite type

- **name**

  Specifies the name (optionally schema-qualified) of the type to be created.

- **attribute_name**

  Specifies the name of an attribute (column) for the composite type.

- **data_type**

  Specifies the name of an existing data type to become a column of the composite type. You can use **%ROWTYPE** to indirectly reference the type of a table, or **%TYPE** to indirectly reference the type of a column in a table or composite type.

- **collation**

  Specifies the name of an existing collation rule to be associated with a column of the composite type. You can run the **select * from pg_collation** command to query collation rules from the **pg_collation** system catalog. The default collation rule is the row starting with **default** in the query result.

Base type

When creating a base type, you can place parameters in any order. The **input_function** and **output_function** parameters are mandatory, and other parameters are optional.

- **input_function**

  Specifies the name of a function that converts data from the type's external textual form to its internal form.

  The input function may be declared as taking one parameter of type cstring or taking three parameters of types cstring, oid, and integer.

  – The first parameter is the input text as a C string,

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - the second parameter is the type's own OID (except for array types, which instead receive their element type's OID),
  - and the third is the typmod of the destination column, if known (**-1** will be passed if not).

  The input function must return a value of the data type itself. Usually, an input function should be declared **STRICT**; if it is not, it will be called with a **NULL** first parameter when reading a **NULL** input value. The function must still return **NULL** in this case, unless it raises an error. (This case is mainly meant to support domain input functions, which might need to reject **NULL** inputs.)

  NOTE

  The input and output functions can be declared to have results or parameters of the new type, when they have to be created before the new type can be created. The type should first be defined as a shell type, which is a placeholder type that has no attributes except a name and an owner. This is done by issuing the **CREATE TYPE** *name* statement, with no additional parameters. Then the I/O functions can be defined referencing the shell type. Finally, **CREATE TYPE** with a full definition replaces the shell entry with a complete, valid type definition, after which the new type can be used normally.

- **output_function**

  Specifies the name of a function that converts data from the type's internal form to its external textual form.

  The output function must be declared as taking one parameter of the new data type. The output function must return type cstring. Output functions are not invoked for **NULL** values.

- **receive_function**

  (Optional) Specifies the name of a function that converts data from the type's external binary form to its internal form.

  If this function is not supplied, the type cannot participate in binary input. The binary representation should be chosen to be cheap to convert to internal form, while being reasonably portable. (For example, the standard integer data types use network byte order as the external binary representation, while the internal representation is in the machine's native byte order.) The receive function should perform adequate checking to ensure that the value is valid.

  The receive function may be declared as taking one parameter of type internal or taking three parameters of types internal, oid, integer.

  - The first parameter is a pointer to a StringInfo buffer holding the received byte string;
  - the latter two are the same as for the text input function.

  The receive function must return a value of the data type itself. Usually, a receive function should be declared **STRICT**; if it is not, it will be called with a **NULL** first parameter when reading a **NULL** input value. The function must still return **NULL** in this case, unless it raises an error. (This case is mainly meant to support domain receive functions, which might need to reject **NULL** inputs.)

- **send_function**

  (Optional) Specifies the name of a function that converts data from the type's internal form to its external binary form.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If this function is not supplied, the type cannot participate in binary output. The send function must be declared as taking one parameter of the new data type. The send function must return type bytea. Send functions are not invoked for **NULL** values.

- **type_modifier_input_function**

  (Optional) Specifies the name of a function that converts an array of modifiers for a type to its internal format.

- **type_modifier_output_function**

  (Optional) Specifies the name of a function that converts the internal format of modifiers for a type to its external text format.

  NOTE

  type_modifier_input_function and **type_modifier_output_function** are needed if the type supports modifiers, that is optional constraints attached to a type declaration, such as char(5) or numeric(30,2). GaussDB allows user-defined types to take one or more simple constants or identifiers as modifiers. However, this information must be capable of being packed into a single non-negative integer value for storage in the system catalogs. Declared modifiers are passed to **type_modifier_input_function** in the cstring array format. It must check the values for validity (throwing an error if they are wrong), and if they are correct, return a single non-negative integer value that will be stored as the column "typmod". Type modifiers will be rejected if the type does not have a **type_modifier_input_function**. The **type_modifier_output_function** converts the internal integer typmod value back to the correct form for user display. It must return a cstring value that is the exact string to append to the type name; for example numeric's function might return (30,2). It is allowed to omit the **type_modifier_output_function**, in which case the default display format is just the stored typmod integer value enclosed in parentheses.

- **analyze_function**

  (Optional) Specifies the name of a function that performs statistical analysis for the data type.

  By default, **ANALYZE** will attempt to gather statistics using the type's "equals" and "less-than" operators, if there is a default b-tree operator class for the type. For non-scalar types, this behavior is likely to be unsuitable, so it can be overridden by specifying a custom analysis function. The analysis function must be declared to take one parameter of type internal and return a Boolean result.

- **internallength**

  (Optional) Specifies the length in bytes of the new type's internal representation. The default assumption is that it is variable-length.

  While the details of the new type's internal representation are only known to the I/O functions and other functions you create to work with the type, there are several attributes of the internal representation that must be declared to GaussDB. Foremost of these is **internallength**. Base data types can be fixed-length, in which case **internallength** is a positive integer, or variable length, indicated by setting **internallength** to **VARIABLE**. (Internally, this is represented by setting **typlen** to **-1**.) The internal representation of all variable-length types must start with a 4-byte integer giving the total length of this value of the type.

- **PASSEDBYVALUE**

  (Optional) Indicates that values of this data type are passed by value, rather than by reference. You cannot pass by value types whose internal

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

representation is larger than the size of the Datum type (4 bytes on most machines, 8 bytes on a few).

- **alignment**

  (Optional) Specifies the storage alignment requirement of the data type. If specified, it must be **char**, **int2**, **int4**, or **double**; the default is **int4**.

  The allowed values equate to alignment on 1, 2, 4, or 8 byte boundaries. Note that variable-length types must have an alignment of at least 4, since they necessarily contain an int4 as their first component.

- **storage**

  (Optional) Specifies the storage strategy for the data type.

  If specified, it must be **plain**, **external**, **extended**, or **main**; the default is **plain**.

  - **plain** specifies that data of the type will always be stored in-line and not compressed. (Only **plain** is allowed for fixed-length types.)
  - **extended** specifies that the system will first try to compress a long data value, and will move the value out of the main table row if it is still too long.
  - **external** allows the value to be moved out of the main table, but the system will not try to compress it.
  - **main** allows compression, but discourages moving the value out of the main table. (Data items with this storage strategy might still be moved out of the main table if there is no other way to make a row fit, but they will be kept in the main table preferentially over **extended** and **external** items.)

    All **storage** values other than **plain** imply that the functions of the data type can handle values that have been toasted. The specific other value given merely determines the default **TOAST** storage strategy for columns of a toastable data type; users can pick other strategies for individual columns using **ALTER TABLE SET STORAGE**.

- **like_type**

  (Optional) Specifies the name of an existing data type that the new type will have the same representation as. The values of **internallength**, **passedbyvalue**, **alignment**, and **storage** are copied from that type, unless overridden by explicit specification elsewhere in this **CREATE TYPE** statement.

  Specifying representation in this way is especially useful when the low-level implementation of a new type references an existing type.

- **category**

  (Optional) Specifies the category code (a single ASCII character) for this type. The default is **U** for a user-defined type. You may also choose other ASCII characters to create custom categories.

- **preferred**

  (Optional) Specifies whether a type is preferred within its type category. If it is, the value will be **TRUE**, else **FALSE**. The default is **FALSE**. Be very careful about creating a preferred type within an existing type category, as this could cause surprising changes in behavior.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The **category** and **preferred** parameters can be used to help control which implicit cast will be applied in ambiguous situations. Each data type belongs to a category named by a single ASCII character, and each type is either preferred or not within its category. The parser will prefer casting to preferred types (but only from other types within the same category) when this rule is helpful in resolving overloaded functions or operators. For types that have no implicit casts to or from any other types, it is sufficient to leave these settings at the defaults. However, for a group of related types that have implicit casts, it is often helpful to mark them all as belonging to a category and select one or two of the most general types as being preferred within the category. The **category** parameter is especially useful when adding a user-defined type to an existing built-in category, such as the numeric or string types. However, it is also possible to create entirely-user-defined type categories. Select any ASCII character other than an uppercase letter to name such a category.

- **default**

  (Optional) Specifies the default value for the data type. If this is omitted, the default is null.

  A default value can be specified, in case a user wants columns of the data type to default to something other than the null value. Specify the default with the **DEFAULT** keyword. (Such a default can be overridden by an explicit **DEFAULT** clause attached to a particular column.)

- **element**

  (Optional) Specifies the type of array elements when an array type is created. For example, to define an array of 4-byte integers (int4), specify **ELEMENT = int4**.

- **delimiter**

  (Optional) Specifies the delimiter character to be used between values in arrays made of this type.

  delimiter can be set to a specific character. The default delimiter is the comma (,). Note that the delimiter is associated with the array element type, not the array type itself.

- **collatable**

  (Optional) Specifies whether this type's operations can use collation information. If they can, the value will be **TRUE**, else **FALSE** (default).

  If **collatable** is **TRUE**, column definitions and expressions of the type may carry collation information through use of the **COLLATE** clause. It is up to the implementations of the functions operating on the type to actually make use of the collation information; this does not happen automatically merely by marking the type collatable.

- **label**

  (Optional) Represents the textual label associated with one value of an enumerated type. It is a string of 1 to 63 characters.

NOTE

Whenever a user-defined type is created, GaussDB automatically creates an associated array type whose name consists of the element type's name prepended with an underscore (_).

Examples

```
-- Create a composite type, create a table, insert data, and make a query.
openGauss=# CREATE TYPE compfoo AS (f1 int, f2 text);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
openGauss=# CREATE TABLE t1_compfoo(a int, b compfoo);
openGauss=# CREATE TABLE t2_compfoo(a int, b compfoo);
openGauss=# INSERT INTO t1_compfoo values(1,(1,'demo'));
openGauss=# INSERT INTO t2_compfoo select * from t1_typ5;
openGauss=# SELECT (b).f1 FROM t1_compfoo;
openGauss=# SELECT * FROM t1_compfoo t1 join t2_compfoo t2 on (t1.b).f1=(t1.b).f1;

-- Rename the data type.
openGauss=# ALTER TYPE compfoo RENAME TO compfoo1;

-- Change the owner of the user-defined type compfoo1 to usr1.
CREATE USER usr1 PASSWORD 'xxxxxxxxxxx';
openGauss=# ALTER TYPE compfoo1 OWNER TO usr1;

-- Change the schema of the user-defined type compfoo1 to usr1.
openGauss=# ALTER TYPE compfoo1 SET SCHEMA usr1;

Add a new attribute to the data type.
openGauss=# ALTER TYPE usr1.compfoo1 ADD ATTRIBUTE f3 int;

Delete the compfoo1 type.
openGauss=# DROP TYPE usr1.compfoo1 cascade;

Delete related tables and users.
openGauss=# DROP TABLE t1_compfoo;
openGauss=# DROP TABLE t2_compfoo;
openGauss=# DROP SCHEMA usr1;
openGauss=# DROP USER usr1;

-- Create an enumerated type.
openGauss=# CREATE TYPE bugstatus AS ENUM ('create', 'modify', 'closed');

-- Add a label.
openGauss=# ALTER TYPE bugstatus ADD VALUE IF NOT EXISTS 'regress' BEFORE 'closed';

-- Rename the label.
openGauss=# ALTER TYPE bugstatus RENAME VALUE 'create' TO 'new';

-- Create a set type.
openGauss=# CREATE TYPE compfoo_table AS TABLE OF compfoo;

-- Compile the .so file and create a shell type.
openGauss=# CREATE TYPE complex;
-- This statement creates a placeholder for the type to be defined so that the type can be referenced when its I/O functions are defined. Then, you can define I/O functions. Note that the functions must be declared to take the NOT FENCED mode during creation.
openGauss=# CREATE FUNCTION
complex_in(cstring)
    RETURNS complex
    AS 'filename'
    LANGUAGE C IMMUTABLE STRICT not fenced;

openGauss=# CREATE FUNCTION
complex_out(complex)
    RETURNS cstring
    AS 'filename'
    LANGUAGE C IMMUTABLE STRICT not fenced;

openGauss=# CREATE FUNCTION
complex_recv(internal)

RETURNS complex

AS 'filename'

LANGUAGE C IMMUTABLE STRICT not fenced;

openGauss=# CREATE FUNCTION
complex_send(complex)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
RETURNS bytea

AS 'filename'

LANGUAGE C IMMUTABLE STRICT not fenced;
-- Finally, provide a complete definition of the data type.
openGauss=# CREATE TYPE complex (

internallength = 16,

input = complex_in,

output = complex_out,

receive = complex_recv,

send = complex_send,

alignment = double
);
```

The C functions corresponding to the input, output, receive, and send functions are defined as follows:

```
-- Define a structure body Complex.
typedef struct Complex {
    double      x;
    double      y;
} Complex;

-- Define an input function.
PG_FUNCTION_INFO_V1(complex_in);

Datum
complex_in(PG_FUNCTION_ARGS)
{
    char       *str = PG_GETARG_CSTRING(0);
    double      x,
                y;
    Complex    *result;

    if (sscanf(str, " ( %lf , %lf )", &x, &y) != 2)
        ereport(ERROR,
                (errcode(ERRCODE_INVALID_TEXT_REPRESENTATION),
                 errmsg("invalid input syntax for complex: \"%s\"",
                        str)));

    result = (Complex *) palloc(sizeof(Complex));
    result->x = x;
    result->y = y;
    PG_RETURN_POINTER(result);
}

-- Define an output function.

}
```

Helpful Links

ALTER TYPE and **DROP TYPE**

12.14.88 CREATE USER

Function

CREATE USER creates a user.

Precautions

- A user created using the **CREATE USER** statement has the **LOGIN** permission by default.
- When you run the **CREATE USER** command to create a user, the system creates a schema with the same name as the user in the database where the command is executed.
- The owner of an object created by a system administrator in a schema with the same name as a common user is the common user, not the system administrator.

Syntax

```
CREATE USER user_name [ [ WITH ] option [ ... ] ] [ ENCRYPTED | UNENCRYPTED ] { PASSWORD |
IDENTIFIED BY } { 'password' [EXPIRED] | DISABLE };
```

The **option** clause is used to configure information, including permissions and properties.

```
{SYSADMIN | NOSYSADMIN}
    | {MONADMIN | NOMONADMIN}
    | {OPRADMIN | NOOPRADMIN}
    | {POLADMIN | NOPOLADMIN}
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```

| ROLE role_name [, ...]
| ADMIN role_name [, ...]
| USER role_name [, ...]
| SYSID uid
| DEFAULT TABLESPACE tablespace_name
| PROFILE DEFAULT
| PROFILE profile_name
| PGUSER
```

Parameter Description

- **user_name**

  Specifies the name of the user to be created.

  Value range: a string. It must comply with the naming convention. A value can contain a maximum of 63 characters. If a username contains uppercase letters, the database automatically converts the uppercase letters into lowercase letters. To create a username that contains uppercase letters, enclose the username with double quotation marks ("").

- **password**

  Specifies the login password.

  The new password must:

  – Contain at least eight characters. This is the default length.

  – Differ from the username or the username spelled backward.

  – Contain at least three of the following character types: uppercase characters, lowercase characters, digits, and special characters (limited to ~!@#$ %^&*()-_=+\|[{}];:,<.>/?). If the password contains characters other than the preceding characters, an error will be reported during statement execution.

  – The password can also be a ciphertext character string that meets the format requirements. This mode is mainly used to import user data. You are not advised to use it directly. If a ciphertext password is used, the user must know the plaintext corresponding to the ciphertext password and ensure that the plaintext password meets the complexity requirements. The database does not verify the complexity of the ciphertext password. Instead, the security of the ciphertext password is ensured by the user.

  – Be enclosed by single quotation marks when a user is created.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string

For details about other parameters, see **Parameter Description** in "CREATE ROLE".

Examples

```
-- Create the jim user and set its login password to xxxxxxxxxx.
openGauss=# CREATE USER jim PASSWORD 'xxxxxxxxxx';

-- Alternatively, you can run the following statement:
openGauss=# CREATE USER kim IDENTIFIED BY 'xxxxxxxxxx';

-- To create a user with the CREATEDB permission, add the CREATEDB keyword.
openGauss=# CREATE USER dim CREATEDB PASSWORD 'xxxxxxxxxx';

-- Change the login password of jim from xxxxxxxxxx to Abcd@123.
openGauss=# ALTER USER jim IDENTIFIED BY 'Abcd@123' REPLACE 'xxxxxxxxxx';

-- Add the CREATEROLE permission to jim.
openGauss=# ALTER USER jim CREATEROLE;

-- Lock jim.
openGauss=# ALTER USER jim ACCOUNT LOCK;

-- Delete users.
openGauss=# DROP USER kim CASCADE;
openGauss=# DROP USER jim CASCADE;
openGauss=# DROP USER dim CASCADE;
```

Helpful Links

ALTER USER, **CREATE ROLE**, and **DROP USER**

12.14.89 CREATE VIEW

Function

CREATE VIEW creates a view. A view is a virtual table, not a base table. Only view definition is stored in the database and view data is not. The data is stored in a base table. If data in the base table changes, the data in the view changes accordingly. In this sense, a view is like a window through which users can know their interested data and data changes in the database.

Precautions

A user granted with the **CREATE ANY TABLE** permission can create views in the public and user schemas.

Syntax

```
CREATE [ OR REPLACE ] [ TEMP | TEMPORARY ] VIEW view_name [ ( column_name [, ...] ) ]
    [ WITH ( {view_option_name [= view_option_value]} [, ... ] ) ]
    AS query;
```

NOTE

You can use **WITH(security_barrier)** to create a relatively secure view. This prevents attackers from printing base table data by using the **RAISE** statement of low-cost functions.

After a view is created, you are not allowed to use REPLACE to modify column names in the view or delete the columns.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter Description

- **OR REPLACE**

  Redefines the view if it already exists.

- **TEMP | TEMPORARY**

  Creates a temporary view.

- **view_name**

  Specifies the name (optionally schema-qualified) of the view to be created.

  Value range: a string. It must comply with the identifier naming convention.

- **column_name**

  Specifies an optional list of names to be used for columns of the view. If not given, the column names are deduced from the query.

  Value range: a string. It must comply with the identifier naming convention.

- **view_option_name [= view_option_value]**

  Specifies an optional parameter for a view.

  Currently, **view_option_name** supports only the **security_barrier** parameter. This parameter is used when the view attempts to provide row-level security.

  Value range: **TRUE** or **FALSE**

- **query**

  Specifies a **SELECT** or **VALUES** statement that will provide the columns and rows of the view.

NOTICE

If **query** contains a clause specifying the partition of a partitioned table, the OID of the specified partition is hardcoded to the system catalog when the view is created. If the partition DDL syntax that causes the change in the OID of the specified partition is used, for example, DROP, SPLIT, or MERGE, the view is unavailable. In this case, you need to create a view.

Examples

```
-- Create a view consisting of columns whose spcname is pg_default.
openGauss=# CREATE VIEW myView AS
    SELECT * FROM pg_tablespace WHERE spcname = 'pg_default';

-- Query the view.
openGauss=# SELECT * FROM myView ;

-- Delete the view.
openGauss=# DROP VIEW myView;
```

12.14.90 CREATE WORKLOAD GROUP

Function

CREATE WORKLOAD GROUP creates a workload group, associates it with a resource pool, and specifies the number of concurrent SQL statements in the resource pool.

Precautions

Only a user with the **CREATE** permission on the current database can perform this operation.

Syntax

```
CREATE WORKLOAD GROUP wg_name
    [ USING RESOURCE POOL pool_name [ WITH ( ACT_STATEMENTS = counts) ] ];
```

Parameter Description

- **wg_name**

  Specifies the workload group name.

  NOTE

  The workload group must be unique in a database.

  Value range: a string. It must comply with the naming convention.

- **pool_name**

  Specifies the name of a resource pool.

  Value range: a string. It must comply with the naming convention.

- **counts**

  Specifies the number of concurrent SQL statements in the resource pool that the workload group belongs to.

  Value range: an integer ranging from –1 to 2147483647

Examples

```
-- Create a default workload group in the default resource pool.
openGauss=# CREATE WORKLOAD GROUP wg_name1;

-- Create the resource pool pool1.
openGauss=# CREATE RESOURCE POOL pool1;

-- Create a workload group and associate it with pool1.
openGauss=# CREATE WORKLOAD GROUP wg_name2 USING RESOURCE POOL pool1;

-- Create a workload group, associate it with pool1, and set the number of concurrent SQL statements to 10.
openGauss=# CREATE WORKLOAD GROUP wg_name3 USING RESOURCE POOL pool1 WITH (ACT_STATEMENTS=10);

-- Delete the created workload groups and resource pool.
openGauss=# DROP WORKLOAD GROUP wg_name1;
openGauss=# DROP WORKLOAD GROUP wg_name2;
openGauss=# DROP WORKLOAD GROUP wg_name3;
openGauss=# DROP RESOURCE POOL pool1;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Helpful Links

ALTER WORKLOAD GROUP and **DROP WORKLOAD GROUP**

12.14.91 CREATE WEAK PASSWORD DICTIONARY

Function

CREATE WEAK PASSWORD DICTIONARY inserts one or more weak passwords into the **gs_global_config** table.

Precautions

- Only the initial user, system administrator, and security administrator have the permission to execute this syntax.
- Passwords in the weak password dictionary are stored in the **gs_global_config** system catalog.
- The weak password dictionary is empty by default. You can use this syntax to add one or more weak passwords.
- When a user attempts to execute this syntax to insert a weak password that already exists in the **gs_global_config** table, only one weak password is retained in the table.

Syntax

```
CREATE WEAK PASSWORD DICTIONARY
    [WITH VALUES] ( {'weak_password'} [, ...] );
```

Parameter Description

weak_password

Weak password

Value range: a character string.

Example

```
-- Insert a single weak password into the gs_global_config system catalog.
openGauss=# CREATE WEAK PASSWORD DICTIONARY WITH VALUES ('password1');

-- Insert multiple weak passwords into the gs_global_config system catalog.
openGauss=# CREATE WEAK PASSWORD DICTIONARY WITH VALUES ('password2'),('password3');

-- Clear all weak passwords in the gs_global_config system catalog.
openGauss=# DROP WEAK PASSWORD DICTIONARY;

-- View existing weak passwords.
openGauss=# SELECT * FROM gs_global_config WHERE NAME LIKE 'weak_password';
```

Helpful Links

13.14.119-DROP WEAK PASSWORD DICTIONARY

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.14.92 CURSOR

Function

CURSOR defines a cursor to retrieve a small number of rows at a time out of a larger query.

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers pointing to context regions. With cursors, stored procedures can control alterations in context regions.

Precautions

- **CURSOR** is used only in transaction blocks.
- Generally, **CURSOR** and **SELECT** both have text returns. Since data is stored in binary format in the system, the system needs to convert the data from the binary format to the text format. If data is returned in text format, client applications need to convert the data back to the binary format for processing. **FETCH** implements conversion between binary data and text data.
- Binary cursors should be used carefully. Text usually occupies larger space than binary data. A binary cursor returns internal binary data, which is easier to operate. A text cursor returns text, which is easier to retrieve and therefore reduces workload on the client. As an example, if a query returns a value of one from an integer column, you would get a string of 1 with a default cursor, whereas with a binary cursor you would get a 4-byte field containing the internal representation of the value (in big-endian byte order).

Syntax

```
CURSOR cursor_name
    [ BINARY ]  [ NO SCROLL ]  [ { WITH | WITHOUT } HOLD ]
    FOR query ;
```

Parameter Description

- **cursor_name**

  Specifies the name of the cursor to be created.

  Value range: a string. It must comply with the naming convention.

- **BINARY**

  Causes the cursor to return data in binary rather than in text format.

- **NO SCROLL**

  Specifies how the cursor retrieves rows.

  - **NO SCROLL**: specifies that the cursor cannot be used to retrieve rows in a nonsequential fashion.
  - Unspecified: Based on the query's execution plan, the system automatically determines whether the cursor can be used to retrieve rows in a nonsequential fashion.

- **WITH HOLD | WITHOUT HOLD**

  Specifies whether the cursor can continue to be used after the transaction that created it successfully commits.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **WITH HOLD**: The cursor can continue to be used after the transaction that created it successfully commits.
  - **WITHOUT HOLD**: The cursor cannot be used outside of the transaction that created it.
  - If neither **WITH HOLD** nor **WITHOUT HOLD** is specified, the default is **WITHOUT HOLD**.
  - Cross-node transactions (for example, DDL-contained transactions created in a coordinator cluster) do not support **WITH HOLD**.

- **query**

  Uses a **SELECT** or **VALUES** clause to specify the rows to be returned by the cursor.

  Value range: **SELECT** or **VALUES** clause

Examples

See **Examples** in **FETCH**.

Helpful Links

FETCH

12.14.93 DEALLOCATE

Function

DEALLOCATE deallocates a previously prepared statement. If you do not explicitly deallocate a prepared statement, it is deallocated when the session ends.

The **PREPARE** keyword is always ignored.

Precautions

None

Syntax

```
DEALLOCATE [ PREPARE ] { name | ALL };
```

Parameter Description

- **name**

  Specifies the name of the prepared statement to be deallocated.

- **ALL**

  Deallocates all prepared statements.

Examples

None

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.14.94 DECLARE

Function

DECLARE defines a cursor to retrieve a small number of rows at a time out of a larger query and can be the start of an anonymous block.

This section describes usage of cursors. The usage of anonymous blocks is available in **BEGIN**.

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers pointing to context regions. With cursors, stored procedures can control alterations in context regions.

Generally, **CURSOR** and **SELECT** both have text returns. Since data is stored in binary format in the system, the system needs to convert the data from the binary format to the text format. If data is returned in text format, client applications need to convert the data back to the binary format for processing. **FETCH** implements conversion between binary data and text data.

Precautions

- **CURSOR** is used only in transaction blocks.
- Binary cursors should be used carefully. Text usually occupies larger space than binary data. A binary cursor returns internal binary data, which is easier to operate. A text cursor returns text, which is easier to retrieve and therefore reduces workload on the client. As an example, if a query returns a value of one from an integer column, you would get a string of 1 with a default cursor, whereas with a binary cursor you would get a 4-byte field containing the internal representation of the value (in big-endian byte order).

Syntax

- Define a cursor.

```
DECLARE cursor_name [ BINARY ] [ NO SCROLL ]
    CURSOR [ { WITH | WITHOUT } HOLD ] FOR query ;
```

- Enable an anonymous block.

```
[DECLARE [declare_statements]]
BEGIN
execution_statements
END;
/
```

Parameter Description

- **cursor_name**

  Specifies the name of the cursor to be created.

  Value range: a string. It must comply with the naming convention.

- **BINARY**

  Causes the cursor to return data in binary rather than in text format.

- **NO SCROLL**

  Specifies how the cursor retrieves rows.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **NO SCROLL**: specifies that the cursor cannot be used to retrieve rows in a nonsequential fashion.
  - Unspecified: Based on the query's execution plan, the system automatically determines whether the cursor can be used to retrieve rows in a nonsequential fashion.

- **WITH HOLD**

  WITHOUT HOLD

  Specifies whether the cursor can continue to be used after the transaction that created it successfully commits.
  - **WITH HOLD**: The cursor can continue to be used after the transaction that created it successfully commits.
  - **WITHOUT HOLD**: The cursor cannot be used outside of the transaction that created it.
  - If neither **WITH HOLD** nor **WITHOUT HOLD** is specified, the default is **WITHOUT HOLD**.

- **query**

  Uses a **SELECT** or **VALUES** clause to specify the rows to be returned by the cursor.

  Value range: **SELECT** or **VALUES** clause

- **declare_statements**

  Declares a variable, including its name and type, for example, **sales_cnt int**.

- **execution_statements**

  Specifies the statement to be executed in an anonymous block.

  Value range: an existing function name

Examples

For details about how to start a transaction, see **Examples** in **BEGIN**.

For details about how to define a cursor, see **Examples** in **FETCH**.

Helpful Links

BEGIN and **FETCH**

12.14.95 DELETE

Function

DELETE deletes rows that satisfy the **WHERE** clause from the specified table. If the **WHERE** clause is absent, the effect is to delete all rows in the table. The result is a valid, but an empty table.

Precautions

- The owner of a table, users granted with the **DELETE** permission on the table, or users granted with the **DELETE ANY TABLE** permission can delete data from the table. The system administrator has the permission to delete data

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

from the table by default, as well as the **SELECT** permission on any table in the **USING** clause or whose values are read in **condition**.

- For row-store tables, **DELETE** can be used if the tables have primary key constraints or the execution plan can be pushed down.
- For column-store tables, **DELETE** can be used only when the execution plan can be pushed down.
- For column-store tables, the **RETURNING** clause is currently not supported.
- For a time series table, only deletion by time is supported. The **RETURNING** clause is not supported.

Syntax

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
DELETE [/*+ plan_hint */] [FROM] [ ONLY ] table_name [ * ] [ [ AS ] alias ]
    [ USING using_list ]
    [ WHERE condition | WHERE CURRENT OF cursor_name ]
    [ RETURNING { * | { output_expr [ [ AS ] output_name ] } [, ...] } ];
```

Parameter Description

- **WITH [RECURSIVE] with_query [, ...]**

  Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table.

  If **RECURSIVE** is specified, it allows a **SELECT** subquery to reference itself by name.

  Format of **with_query**:

  ```
  with_query_name [ ( column_name [, ...] ) ] AS [ [ NOT ] MATERIALIZED ]
  ( {select | values | insert | update | delete} )
  ```

  – **with_query_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.

  – **column_name** specifies the column name displayed in the subquery result set.

  – Each subquery can be a **SELECT**, **VALUES**, **INSERT**, **UPDATE** or **DELETE** statement.

  – You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE.

  - If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery cannot be jointly optimized with the **SELECT** statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.
  - If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the trunk statement to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.

- **plan_hint** clause

  Follows the **DELETE** keyword in the **/*+ */** format. It is used to optimize the plan of a **DELETE** statement block. For details, see **Hint-based Tuning**. In

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

each statement, only the first **/*+** *plan_hint* ***/** comment block takes effect as a hint. Multiple hints can be written.

- **ONLY**

  If **ONLY** is specified before the table name, matching rows are deleted from the named table only. If **ONLY** is not specified, matching rows are also deleted from any tables inheriting from the named table.

- **table_name**

  Specifies the name (optionally schema-qualified) of the table to delete rows from.

  Value range: an existing table name

- **alias**

  Specifies a substitute name for the target table.

  Value range: a string. It must comply with the identifier naming convention.

- **using_list**

  Specifies the **USING** clause.

- **condition**

  Specifies an expression that returns a value of type Boolean. Only rows for which this expression returns **true** will be deleted. You are not advised to use numeric types such as int for **condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

- **WHERE CURRENT OF cursor_name**

  This parameter is reserved.

- **output_expr**

  Specifies an expression to be computed and returned by the **DELETE** statement after each row is deleted. The expression can use any column names of the table. Write ***** to return all columns.

- **output_name**

  Specifies a name to use for a returned column.

  Value range: a string. It must comply with the identifier naming convention.

Examples

```
-- Create the tpcds.customer_address_bak table.
openGauss=# CREATE TABLE tpcds.customer_address_bak AS TABLE tpcds.customer_address;

-- Delete employees whose ca_address_sk is smaller than 14888 from the tpcds.customer_address_bak table.
openGauss=# DELETE FROM tpcds.customer_address_bak WHERE ca_address_sk < 14888;

-- Delete all data from the tpcds.customer_address_bak table.
openGauss=# DELETE FROM tpcds.customer_address_bak;

Delete the tpcds.customer_address_bak table.
openGauss=# DROP TABLE tpcds.customer_address_bak;
```

Suggestions

- delete

  To delete all records in a table, use the **truncate** syntax.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.14.96 DO

Function

DO executes an anonymous code block.

The code block is treated as though it were the body of a function with no parameters, returning **void**. It is parsed and executed a single time.

Precautions

- The procedural language to be used must already have been installed into the current database by means of **CREATE LANGUAGE**. **plpgsql** is installed by default, but other languages are not.
- The user must have the **USAGE** permission on the procedural language, or must be a system administrator if the language is untrusted.

Syntax

```
DO [ LANGUAGE lang_name ] code;
```

Parameter Description

- **lang_name**

  Specifies the name of the procedural language the code is written in. If omitted, the default is **plpgsql**.

- **code**

  Specifies the procedural language code to be executed. This must be specified as a string literal.

Examples

```
-- Create the webuser user.
openGauss=# CREATE USER webuser PASSWORD 'xxxxxxxxxx';

-- Grant all permissions on all views in the tpcds schema to the webuser user.
openGauss=# DO $$DECLARE r record;
BEGIN
    FOR r IN SELECT c.relname,n.nspname FROM pg_class c,pg_namespace n
            WHERE c.relnamespace = n.oid AND n.nspname = 'tpcds' AND relkind IN ('r','v')
    LOOP
        EXECUTE 'GRANT ALL ON ' || quote_ident(r.table_schema) || '.' || quote_ident(r.table_name) || ' TO
webuser';
    END LOOP;
END$$;

-- Delete the webuser user.
openGauss=# DROP USER webuser CASCADE;
```

12.14.97 DROP APP WORKLOAD GROUP MAPPING

Function

DROP APP WORKLOAD GROUP MAPPING deletes an app workload group mapping.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

Only a user with the **DROP** permission on the current database can perform this operation.

Syntax

```
DROP APP WORKLOAD GROUP MAPPING [ IF EXISTS ] app_name;
```

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified app workload group mapping does not exist.

- **app_name**

  Specifies the name of the app workload group mapping to be deleted. The name was specified during **CREATE APP WORKLOAD GROUP MAPPING**.

  Value range: a string. It must comply with the naming convention.

Examples

See **Examples** in **CREATE APP WORKLOAD GROUP MAPPING**.

Helpful Links

ALTER APP WORKLOAD GROUP MAPPING and **CREATE APP WORKLOAD GROUP MAPPING**

12.14.98 DROP AUDIT POLICY

Function

DROP AUDIT POLICY deletes an audit policy.

Precautions

Only user **poladmin**, user **sysadmin**, or the initial user can perform this operation.

Syntax

```
DROP AUDIT POLICY [IF EXISTS] policy_name;
```

Parameter Description

policy_name

Specifies the audit policy name, which must be unique.

Value range: a string. It must comply with the naming convention.

Examples

See **Examples** in **CREATE AUDIT POLICY**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Helpful Links

CREATE AUDIT POLICY and **ALTER AUDIT POLICY**

12.14.99 DROP CLIENT MASTER KEY

Function

DROP CLIENT MASTER KEY deletes a CMK.

Precautions

- Only the CMK owner or a user who has been granted the DROP permission can run this command. By default, the system administrator has this permission.
- This command can only be used to delete the metadata information recorded in the system catalog of the database, but cannot be used to delete the CMK file. You need to use KeyTool to delete the CMK file.

Syntax

```
DROP CLIENT MASTER KEY [ IF EXISTS ] client_master_key_name [CASCADE];
```

Parameter Description

- **IF EXISTS**

  If a specified CMK does not exist, a notice rather than an error is issued.
- **client_master_key_name**

  Name of a CMK to be deleted.

  Value range: a string. It is the name of an existing CMK.
- **CASCADE**

  Indicates automatically deleting objects that depend on the CMK.

Examples

```
-- Delete a CMK object.
openGauss=> DROP CLIENT MASTER KEY ImgCMK CASCADE;
NOTICE:  drop cascades to column setting: imgcek
DROP GLOBAL SETTING
```

12.14.100 DROP COLUMN ENCRYPTION KEY

Function

CREATE COLUMN ENCRYPTION KEY deletes a column encryption key (CEK).

Precautions

Only the CEK owner or a user who has been granted the DROP permission can run this command. By default, the system administrator has this permission.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

```
DROP COLUMN ENCRYPTION KEY [ IF EXISTS ] column_encryption_key_name [CASCADE];
```

Parameter Description

- **IF EXISTS**

  If a specified CEK does not exist, a notice rather than an error is issued.

- **column_encryption_key_name**

  Name of a CEK to be deleted.

  Value range: a string. It is the name of an existing CEK.

Examples

```
-- Delete a CEK object.
openGauss=# DROP COLUMN ENCRYPTION KEY ImgCEK CASCADE;
ERROR:  cannot drop column setting: imgcek cascadely because encrypted column depend on it.
HINT:  we have to drop encrypted column: name, ... before drop column setting: imgcek cascadely.
```

12.14.101 DROP DATABASE

Function

DROP DATABASE deletes a database.

Precautions

- Only the database owner or a user granted with the DROP permission can run the **DROP DATABASE** command. The system administrator has this permission by default.
- The preinstalled POSTGRES, TEMPLATE0, and TEMPLATE1 databases are protected and therefore cannot be deleted. To check databases in the current service, run the gsql statement **\l**.
- If any users are connected to the database, the database cannot be deleted. To check the current database connections, open the **dv_sessions** view.
- **DROP DATABASE** cannot be executed within a transaction block.
- Before deleting a database, run the **CLEAN CONNECTION TO ALL FORCE FOR DATABASE** *XXXX* command to forcibly stop the existing user connections and backend threads, preventing database deletion failures caused by running backend threads. Forcibly stopping backend threads may cause data inconsistency in the current database. Therefore, execute this command only when you are sure to delete the database.
- If **DROP DATABASE** fails and is rolled back, run **DROP DATABASE IF EXISTS** again.

NOTICE

DROP DATABASE cannot be undone.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

```
DROP DATABASE [ IF EXISTS ] database_name ;
```

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified database does not exist.
- **database_name**

  Specifies the name of the database to be deleted.

  Value range: an existing database name

Examples

See **Examples** in **CREATE DATABASE**.

Helpful Links

CREATE DATABASE

Suggestions

- drop database

  Do not delete databases during transactions.

12.14.102 DROP DATA SOURCE

Function

DROP DATA SOURCE deletes a data source.

Precautions

Only an owner, system administrator, or initial user can delete a data source.

Syntax

```
DROP DATA SOURCE [IF EXISTS] src_name [CASCADE | RESTRICT];
```

Parameter Description

- **src_name**

  Specifies the name of the data source to be deleted.

  Value range: a string. It must comply with the naming convention.
- **IF EXISTS**

  Reports a notice instead of an error if the specified data source does not exist.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the data source.
  - **RESTRICT**: refuses to delete the data source if any objects depend on it. This is the default action.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Currently, no objects depend on data sources. Therefore, **CASCADE** is equivalent to **RESTRICT**, and they are reserved to ensure backward compatibility.

Examples

```
-- Create a data source.
openGauss=# CREATE DATA SOURCE ds_tst1;

-- Delete the data source.
openGauss=# DROP DATA SOURCE ds_tst1 CASCADE;
openGauss=# DROP DATA SOURCE IF EXISTS ds_tst1 RESTRICT;
```

Helpful Links

CREATE DATA SOURCE and **ALTER DATA SOURCE**

12.14.103 DROP DIRECTORY

Function

DROP DIRECTORY deletes a directory.

Precautions

When **enable_access_server_directory** is set to **off**, only the initial user is allowed to delete directory objects. When **enable_access_server_directory** is set to **on**, a user with the SYSADMIN permission, the owner of the directory object, a user who is granted with the DROP permission of the directory, or a user who inherits the **gs_role_directory_drop** permission of the built-in role can delete directory objects.

Syntax

```
DROP DIRECTORY [ IF EXISTS ] directory_name;
```

Parameter Description

- **directory_name**

  Specifies the name of the directory to be deleted.

  Value range: an existing directory name

Examples

```
-- Create a directory.
openGauss=# CREATE OR REPLACE DIRECTORY  dir  as '/tmp/';

-- Delete a foreign table.
openGauss=# DROP DIRECTORY dir;
```

Helpful Links

CREATE DIRECTORY and **ALTER DIRECTORY**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.14.104 DROP FOREIGN TABLE

Function

DROP FOREIGN TABLE deletes a foreign table.

Precautions

DROP FOREIGN TABLE forcibly deletes the specified table and the indexes depending on the table. After the table is deleted, the functions and stored procedures that need to use this table cannot be executed.

Syntax

```
DROP FOREIGN TABLE [ IF EXISTS ]
    table_name [, ...] [ CASCADE | RESTRICT ];
```

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified table does not exist.

- **table_name**

  Specifies the name of the table to be deleted.

  Value range: an existing table name

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects (such as views) that depend on the table.
  - **RESTRICT**: refuses to delete the table if any objects depend on it. This is the default action.

Examples

See **Examples** in **CREATE FOREIGN TABLE**.

Helpful Links

ALTER FOREIGN TABLE (for Import and Export) and **CREATE FOREIGN TABLE (for Import and Export)**

12.14.105 DROP FUNCTION

Function

DROP FUNCTION deletes a function.

Precautions

If a function involves operations on temporary tables, **DROP FUNCTION** cannot be used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Only the function owner or a user granted with the DROP permission can run the **DROP FUNCTION** command. The system administrator has this permission by default.

Syntax

```
DROP FUNCTION [ IF EXISTS ] function_name
[ ( [ { [ argname ] [ argmode ] argtype} [, ...] ] ) [ CASCADE | RESTRICT ] ];
```

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified function does not exist.

- **function_name**

  Specifies the name of the function to be deleted.

  Value range: an existing function name

- **argmode**

  Specifies the parameter mode of the function.

- **argname**

  Specifies the parameter name of the function.

- **argtype**

  Specifies the parameter type of the function.

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects (such as operators) that depend on the function.
  - **RESTRICT**: refuses to delete the function if any objects depend on it. This is the default action.

Examples

See **Examples** in **CREATE FUNCTION**.

Helpful Links

ALTER FUNCTION and **CREATE FUNCTION**

12.14.106 DROP GLOBAL CONFIGURATION

Function

DROP GLOBAL CONFIGURATION deletes parameter values from the **gs_global_config** system catalog.

Precautions

Only the initial database user can run this command.

The **weak_password** keyword cannot be deleted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

```
DROP GLOBAL CONFIGURATION Parameter name, Parameter name...;
```

Parameter Description

The parameter is a parameter that already exists in the **gs_global_config** system catalog. If you delete a parameter that does not exist, an error will be reported.

12.14.107 DROP GROUP

Function

DROP GROUP deletes a user group. **DROP GROUP** is an alias for **DROP ROLE**.

Precautions

DROP GROUP is available only to users with the **CREATE ROLE** permission granted by the administrator.

Syntax

```
DROP GROUP [ IF EXISTS ] group_name [, ...];
```

Parameter Description

See **Parameter Description** in **DROP ROLE**.

Helpful Links

- **CREATE GROUP**
- **ALTER GROUP**
- **DROP ROLE**

12.14.108 DROP INDEX

Function

DROP INDEX deletes an index.

Precautions

Only the index owner, a user of a schema where the index resides, or a user who has the INDEX permission on the table where the index resides can run the **DROP INDEX** command. The system administrator has this permission by default.

Syntax

```
DROP INDEX [ IF EXISTS ]
  index_name [, ...] [ CASCADE | RESTRICT ];
```

Parameter Description

- **IF EXISTS**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Reports a notice instead of an error if the specified index does not exist.

- **index_name**

  Specifies the name of the index to be deleted.

  Value range: an existing index

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the index.
  - **RESTRICT**: refuses to delete the index if any objects depend on it. This is the default action.

Examples

See **Examples** in **CREATE INDEX**.

Helpful Links

ALTER INDEX and **CREATE INDEX**

12.14.109 DROP LANGUAGE

This version does not support this syntax.

12.14.110 DROP MASKING POLICY

Function

DROP MASKING POLICY deletes an anonymization policy.

Precautions

Only user **poladmin**, user **sysadmin**, or the initial user can perform this operation.

Syntax

```
DROP MASKING POLICY [ IF EXISTS ] policy_name;
```

Parameter Description

policy_name

Specifies the audit policy name, which must be unique.

Value range: a string. It must comply with the naming convention.

Examples

```
-- Delete an anonymization policy.
openGauss=# DROP MASKING POLICY IF EXISTS maskpol1;

-- Delete a group of anonymization policies.
openGauss=# DROP MASKING POLICY IF EXISTS maskpol1, maskpol2, maskpol3;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Helpful Links

5.1.13.14.14-ALTER MASKING POLICY and 5.13.14.59-CREATE MASKING POLICY

12.14.111 DROP MATERIALIZED VIEW

Function

DROP MATERIALIZED VIEW deletes an existing materialized view from the database.

Precautions

The owner of a materialized view, owner of the schema of the materialized view, users granted with the DROP permission on the materialized view, or users granted with the DROP ANY TABLE permission can run the **DROP MATERIALIZED VIEW** command. By default, the system administrator has the permission to run the command.

Syntax

```
DROP MATERIALIZED VIEW [ IF EXISTS ] mv_name [, ...] [ CASCADE | RESTRICT ];
```

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified materialized view does not exist.

- **mv_name**

  Name of the materialized view to be deleted.

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on a materialized view.
  - **RESTRICT**: refuses to delete a materialized view if any objects depend on it. This is the default value.

Examples

```
-- Delete the materialized view named my_mv.
openGauss=# DROP MATERIALIZED VIEW my_mv;
```

Helpful Links

ALTER MATERIALIZED VIEW, CREATE INCREMENTAL MATERIALIZED VIEW, CREATE MATERIALIZED VIEW, CREATE TABLE, REFRESH INCREMENTAL MATERIALIZED VIEW, and REFRESH MATERIALIZED VIEW

12.14.112 DROP MODEL

This syntax is not supported in distributed scenarios.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.14.113 DROP NODE

Function

DROP NODE deletes a node.

Precautions

CREATE NODE GROUP is an interface of the cluster management tool. You are not advised to use this interface, because doing so affects the cluster. Only the administrator has the permission to use this interface.

Syntax

```
DROP NODE [ IF EXISTS ] nodename [WITH ( cnnodename [, ... ] )];
```

Parameter Description

IF EXISTS

Reports a notice instead of an error if the specified node does not exist.

nodename

Specifies the name of the node to be deleted.

Value range: an existing node name

cnnodename

Specifies the CN name. If it is specified, **DROP NODE** will be executed on both the connected CN and the specified CN. If it is not specified, DN deletion must be performed on all CNs, and CN deletion must be performed on all CNs except the CN to be deleted.

Value range: an existing CN name

Helpful Links

- **CREATE NODE**
- **ALTER NODE**

12.14.114 DROP NODE GROUP

Function

DROP NODE GROUP deletes a node group.

Precautions

- **DROP NODE GROUP** is an interface of the cluster management tool.
- Only the system administrator or a user who has the **DROP** permission can perform this operation.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

```
DROP NODE GROUP groupname [DISTRIBUTE FROM src_group_name];
```

Parameter Description

groupname

Specifies the name of the node group to be deleted.

Value range: an existing node group name

DISTRIBUTE FROM src_group_name

If the node group to be deleted originates from the logical cluster node group specified by **src_group_name**, set **src_group_name** to specify the logical cluster node group to which node information will be synchronized after redistribution. (The current feature is a lab feature. Contact Huawei technical support before using it.) This statement is used only for redistribution during scale-out. You are not advised to use it, because it may lead to data distribution errors and logical cluster unavailability.

Helpful Links

CREATE NODE GROUP

12.14.115 DROP OWNED

Function

DROP OWNED deletes the database objects owned by a database role.

Precautions

- This interface will revoke the role's permissions on all objects in the current database and shared objects (databases and tablespaces).
- **DROP OWNED** is often used to prepare for removing one or more roles. Because **DROP OWNED** affects only the objects in the current database, you need to run this statement in each database that contains the objects owned by the role to be removed.
- Using the **CASCADE** option may cause this statement to recursively remove objects owned by other users.
- The databases and tablespaces owned by the role will not be removed.

Syntax

```
DROP OWNED BY name [, ...] [ CASCADE | RESTRICT ];
```

Parameter Description

- **name**

  Specifies the role name.

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the objects to be deleted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **RESTRICT**: refuses to delete the objects if other objects depend on them. This is the default action.

Helpful Links

REASSIGN OWNED and **DROP ROLE**

12.14.116 DROP PROCEDURE

Function

DROP PROCEDURE deletes a stored procedure.

Precautions

None

Syntax

```
DROP PROCEDURE [ IF EXISTS  ] procedure_name ;
```

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified stored procedure does not exist.

- **procedure_name**

  Specifies the name of the stored procedure to be deleted.

  Value range: an existing stored procedure name

Examples

See **Examples** in **CREATE PROCEDURE**.

Helpful Links

CREATE PROCEDURE

12.14.117 DROP RESOURCE LABEL

Function

DROP RESOURCE LABEL deletes a resource label.

Precautions

Only user **poladmin**, user **sysadmin**, or the initial user can perform this operation.

Syntax

```
DROP RESOURCE LABEL [IF EXISTS] policy_name[, ...]*;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter Description

label_name

Specifies the resource label name.

Value range: a string. It must comply with the naming convention.

Examples

```
-- Delete a resource label.
openGauss=# DROP RESOURCE LABEL IF EXISTS res_label1;

-- Delete a group of resource labels.
openGauss=# DROP RESOURCE LABEL IF EXISTS res_label1, res_label2, res_label3;
```

Helpful Links

5.1.13.14.17-ALTER RESOURCE LABEL and **5.1.13.14.64-CREATE RESOURCE LABEL**

12.14.118 DROP RESOURCE POOL

The current feature is a lab feature. Contact Huawei technical support before using it.

Function

DROP RESOURCE POOL deletes a resource pool.

NOTE

The resource pool cannot be deleted if it is associated with a role.

Precautions

Only a user with the **DROP** permission on the current database can perform this operation.

Syntax

```
DROP RESOURCE POOL [ IF EXISTS ] pool_name;
```

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified resource pool does not exist.

- **pool_name**

  Specifies the name of the resource pool to be deleted.

  Value range: a string. It must comply with the naming convention.

NOTE

In a multi-tenant scenario, deleting a group resource pool also deletes the related service resource pools. A resource pool can be deleted only when it is not associated with any users.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

See **Examples** in **CREATE RESOURCE POOL**.

Helpful Links

ALTER RESOURCE POOL and **CREATE RESOURCE POOL**

12.14.119 DROP ROLE

Function

DROP ROLE deletes a role.

Precautions

None

Syntax

```
DROP ROLE [ IF EXISTS ] role_name [, ...];
```

Parameter Description

- **IF EXISTS**
  Reports a notice instead of an error if the specified role does not exist.
- **role_name**
  Specifies the name of the role to be deleted.
  Value range: an existing role name

Examples

See **Examples** in **CREATE ROLE**.

Helpful Links

CREATE ROLE, **ALTER ROLE**, and **SET ROLE**

12.14.120 DROP ROW LEVEL SECURITY POLICY

Function

DROP ROW LEVEL SECURITY POLICY deletes a row-level access control policy from a table.

Precautions

Only the owner of a table or a system administrator has the **DROP ROW LEVEL SECURITY POLICY** permission.

Syntax

```
DROP [ ROW LEVEL SECURITY ] POLICY [ IF EXISTS ] policy_name ON table_name [ CASCADE | RESTRICT ]
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified row-level access control policy does not exist.

- **policy_name**

  Specifies the name of a row-level access control policy to be deleted.

  – table_name

    Specifies the name of the table containing the row-level access control policy.

  – CASCADE/RESTRICT

    Currently, no objects depend on row-level access control policies. Therefore, **CASCADE** is equivalent to **RESTRICT**, and they are reserved to ensure backward compatibility.

Examples

```
-- Create the data table all_data.
openGauss=# CREATE TABLE all_data(id int, role varchar(100), data varchar(100));

-- Create a row-level access control policy.
openGauss=# CREATE ROW LEVEL SECURITY POLICY all_data_rls ON all_data USING(role =
CURRENT_USER);

-- Delete a row-level access control policy.
openGauss=# DROP ROW LEVEL SECURITY POLICY all_data_rls ON all_data;
```

Helpful Links

ALTER ROW LEVEL SECURITY POLICY and **CREATE ROW LEVEL SECURITY POLICY**

12.14.121 DROP SCHEMA

Function

DROP SCHEMA deletes a schema from the current database.

Precautions

Only the schema owner or a user granted with the DROP permission can run the **DROP SCHEMA** command. The system administrator has this permission by default.

Syntax

```
DROP SCHEMA [ IF EXISTS ] schema_name [, ...] [ CASCADE | RESTRICT ];
```

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified schema does not exist.

- **schema_name**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the name of the schema to be deleted.

Value range: an existing schema name

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes all the objects contained in the schema.
  - **RESTRICT**: refuses to delete the schema if the schema contains objects. This is the default action.

NOTICE

Schemas beginning with **pg_temp** or **pg_toast_temp** are for internal use. Do not delete them. Otherwise, unexpected consequences may be incurred.

NOTE

The schema currently being used cannot be deleted. To delete it, switch to another schema first.

Examples

See **Examples** in **CREATE SCHEMA**.

Helpful Links

ALTER SCHEMA and **CREATE SCHEMA**

12.14.122 DROP SEQUENCE

Function

DROP SEQUENCE deletes a sequence from the current database.

Precautions

Only the owner of a sequence, the owner of the schema of the sequence, or users granted with the DROP permission on the sequence can delete the sequence. By default, the system administrator has the permission to delete the sequence.

Syntax

```
DROP SEQUENCE [ IF EXISTS ] { [schema.] sequence_name } [ , ... ] [ CASCADE | RESTRICT ];
```

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified sequence does not exist.
- **name**

  Specifies the name of the sequence to be deleted.
- **CASCADE**

  Automatically deletes the objects that depend on the sequence.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **RESTRICT**

  Refuses to delete the sequence if any objects depend on it. This is the default action.

Examples

```
-- Create an ascending sequence named serial, starting from 101.
openGauss=# CREATE SEQUENCE serial START 101;

-- Delete a sequence.
openGauss=# DROP SEQUENCE serial;
```

Helpful Links

ALTER SEQUENCE and **DROP SEQUENCE**

12.14.123 DROP SERVER

Function

DROP SERVER deletes a data server.

Precautions

Only the server owner or a user granted with the DROP permission can run the **DROP SERVER** command. The system administrator has this permission by default.

Syntax

```
DROP SERVER [ IF EXISTS ] server_name [ {CASCADE | RESTRICT} ] ;
```

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified data server does not exist.

- **server_name**

  Specifies the name of the data server to be deleted.

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the data server.
  - **RESTRICT**: refuses to delete the server if any objects depend on it. This is the default action.

Examples

See **Examples** in **CREATE SERVER**.

Helpful Links

ALTER SERVER and **CREATE SERVER**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.14.124 DROP SYNONYM

Function

DROP SYNONYM deletes a synonym.

Precautions

Only the owner of a synonym or a system administrator has the **DROP SYNONYM** permission.

Syntax

```
DROP SYNONYM [ IF EXISTS ] synonym_name [ CASCADE | RESTRICT ];
```

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified synonym does not exist.

- **synonym_name**

  Specifies the name (optionally schema-qualified) of the synonym to be deleted.

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects (such as views) that depend on the synonym.
  - **RESTRICT**: refuses to delete the synonym if any objects depend on it. This is the default action.

Examples

See **Examples** in **CREATE SYNONYM**.

Helpful Links

ALTER SYNONYM and **CREATE SYNONYM**

12.14.125 DROP TABLE

Function

DROP TABLE deletes a table.

Precautions

DROP TABLE forcibly deletes the specified table and the indexes depending on the table. After the table is deleted, the functions and stored procedures that need to use this table cannot be executed. Deleting a partitioned table also deletes all partitions in the table.

The owner of a table, the owner of the schema of the table, users granted with the DROP permission on the table, or users granted with the DROP ANY TABLE

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

permission can delete the specified table. The system administrator has the permission to delete the specified table by default.

Syntax

```
DROP TABLE [ IF EXISTS ]
   { [schema.]table_name } [, ...] [ CASCADE | RESTRICT ];
```

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified table does not exist.

- **schema**

  Specifies the schema name.

- **table_name**

  Specifies the table name.

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects (such as views) that depend on the table.
  - **RESTRICT**: refuses to delete the table if any objects depend on it. This is the default action.

Examples

See **Examples** in **CREATE TABLE**.

Helpful Links

ALTER TABLE and **CREATE TABLE**

12.14.126 DROP TABLESPACE

Function

DROP TABLESPACE deletes a tablespace.

Precautions

- Only the tablespace owner or a user granted with the DROP permission can run the **DROP TABLESPACE** command. The system administrator has this permission by default.
- The tablespace to be deleted should not contain any database objects. Otherwise, an error will be reported.
- **DROP TABLESPACE** cannot be rolled back and therefore cannot be run in transaction blocks.
- During execution of **DROP TABLESPACE**, database queries by other sessions using **\db** may fail and need to be reattempted.
- If **DROP TABLESPACE** fails to be executed, run **DROP TABLESPACE IF EXISTS**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

```
DROP TABLESPACE [ IF EXISTS ] tablespace_name;
```

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified tablespace does not exist.

- **tablespace_name**

  Specifies the name of the tablespace to be deleted.

  Value range: an existing tablespace name

Examples

See **Examples** in **CREATE TABLESPACE**.

Helpful Links

ALTER TABLESPACE and **CREATE TABLESPACE**

Suggestions

- drop tablespace

  Do not delete tablespaces during transactions.

12.14.127 DROP TEXT SEARCH CONFIGURATION

Function

DROP TEXT SEARCH CONFIGURATION deletes a text search configuration.

Precautions

Only the owner of a text search configuration has the **DROP TEXT SEARCH CONFIGURATION** permission.

Syntax

```
DROP TEXT SEARCH CONFIGURATION [ IF EXISTS ] name [ CASCADE | RESTRICT ];
```

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified text search configuration does not exist.

- **name**

  Specifies the name (optionally schema-qualified) of the text search configuration to be deleted.

- **CASCADE**

  Automatically deletes the objects that depend on the text search configuration.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **RESTRICT**

  Refuses to delete the text search configuration if any objects depend on it. This is the default action.

Examples

See **Examples** in **CREATE TEXT SEARCH CONFIGURATION**.

Helpful Links

ALTER TEXT SEARCH CONFIGURATION and **CREATE TEXT SEARCH CONFIGURATION**

12.14.128 DROP TEXT SEARCH DICTIONARY

Function

DROP TEXT SEARCH DICTIONARY deletes a full-text retrieval dictionary.

Precautions

- Predefined dictionaries do not support the **DROP** operation.
- Only the owner of a dictionary or a system administrator has the **DROP TEXT SEARCH DICTIONARY** permission.
- Execute **DROP...CASCADE** only when necessary because this operation will delete the text search configurations that use this dictionary.

Syntax

```
DROP TEXT SEARCH DICTIONARY [ IF EXISTS ] name [ CASCADE | RESTRICT ]
```

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified full-text retrieval dictionary does not exist.

- **name**

  Specifies the name (optionally schema-qualified) of the full-text retrieval dictionary to be deleted. (If you do not specify a schema name, the dictionary will be deleted in the current schema by default.)

  Value range: an existing dictionary name

- **CASCADE**

  Automatically deletes the objects that depend on the full-text retrieval dictionary and other objects that depend on these objects.

  If any text search configuration uses the dictionary, the **DROP** statement will fail. You can add **CASCADE** to delete all text search configurations and dictionaries that use this dictionary.

- **RESTRICT**

  Refuses to delete the full-text retrieval dictionary if any object depends on it. This is the default action.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
-- Delete the english dictionary.
DROP TEXT SEARCH DICTIONARY english;
```

Helpful Links

ALTER TEXT SEARCH DICTIONARY and **CREATE TEXT SEARCH DICTIONARY**

12.14.129 DROP TRIGGER

Function

DROP TRIGGER deletes a trigger.

Precautions

Only the owner of a trigger or a system administrator has the **DROP TRIGGER** permission.

Syntax

```
DROP TRIGGER [ IF EXISTS ] trigger_name ON table_name [ CASCADE | RESTRICT ];
```

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified trigger does not exist.

- **trigger_name**

  Specifies the name of the trigger to be deleted.

  Value range: an existing trigger name

- **table_name**

  Specifies the name of the table containing the trigger.

  Value range: name of the table containing the trigger

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the trigger.
  - **RESTRICT**: refuses to delete the trigger if any objects depend on it. This is the default action.

Examples

For details, see **Examples** in **CREATE TRIGGER**.

Helpful Links

CREATE TRIGGER, **ALTER TRIGGER**, and **ALTER TABLE**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.14.130 DROP TYPE

Function

DROP TYPE deletes a user-defined data type.

Precautions

Only the type owner or a user granted with the DROP permission can run the **DROP TYPE** command. The system administrator has this permission by default.

Syntax

```
DROP TYPE [ IF EXISTS ] name [, ...] [ CASCADE | RESTRICT ]
```

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified type does not exist.

- **name**

  Specifies the name (optionally schema-qualified) of the type to be deleted.

- **CASCADE**

  Automatically deletes the objects (such as fields, functions, and operators) that depend on the type.

  RESTRICT

  Refuses to delete the type if any objects depend on it. This is the default action.

Examples

See **Examples** in **CREATE TYPE**.

Helpful Links

CREATE TYPE and **ALTER TYPE**

12.14.131 DROP USER

Function

DROP USER deletes a user and the schema with the same name as the user.

Precautions

- **CASCADE** is used to delete the objects (excluding databases) that depend on the user. **CASCADE** cannot delete locked objects unless the objects are unlocked or the processes locking the objects are killed.
- In GaussDB, the **postgresql.conf** file contains the **enable_kill_query** parameter. This parameter affects **CASCADE**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - If **enable_kill_query** is **on** and **CASCADE** is used, the statement automatically kills the processes locking dependent objects and then deletes the specified user.
  - If **enable_kill_query** is **off** and **CASCADE** is used, the statement waits until the processes locking dependent objects stop and then deletes the specified user.
- If the dependent objects are other databases or reside in other databases, manually delete them before deleting the user from the current database. **DROP USER** cannot delete objects across databases.
- Before deleting a user, you need to delete all the objects owned by the user and revoke the user's permissions on other objects. Alternatively, you can specify CASCADE to delete the objects owned by the user and the granted permissions.
- In a multi-tenant scenario, the service user will also be deleted when you delete a user group. If you want to use **CASCADE**, set **CASCADE** for the service user as well. If any error is reported for one user, other users cannot be deleted either.
- If the user has an error table specified when the GDS foreign table is created, the user cannot be deleted by specifying the **CASCADE** keyword in the **DROP USER** statement.
- If a data source depends on the user, the user cannot be deleted directly. You need to manually delete the data source first.

Syntax

```
DROP USER [ IF EXISTS ] user_name [, ...] [ CASCADE | RESTRICT ];
```

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified user does not exist.

- **user_name**

  Specifies the name of the user to be deleted.

  Value range: an existing username

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes objects that depend on the user and revokes the permissions granted to the user.
  - **RESTRICT**: refuses to delete a user if the user has any dependent objects or has been granted permissions on other objects. This is the default value.

    NOTE

    In GaussDB, the **postgresql.conf** file contains the **enable_kill_query** parameter. This parameter affects **CASCADE**.

    - If **enable_kill_query** is **on** and **CASCADE** is used, the statement automatically kills the processes locking dependent objects and then deletes the specified user.
    - If **enable_kill_query** is **off** and **CASCADE** is used, the statement waits until the processes locking dependent objects stop and then deletes the specified user.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

See **Examples** in **CREATE USER**.

Helpful Links

ALTER USER and **CREATE USER**

12.14.132 DROP VIEW

Function

DROP VIEW forcibly deletes a view from the database.

Precautions

The owner of a view, owner of the schema of the view, users granted with the DROP permission on the view, or users granted with the DROP ANY TABLE permission can run the **DROP VIEW** command. By default, the system administrator has the permission to run the command.

Syntax

```
DROP VIEW [ IF EXISTS ] view_name [, ...] [ CASCADE | RESTRICT ];
```

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified view does not exist.

- **view_name**

  Specifies the name of the view to be deleted.

  Value range: an existing view name

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects (such as other views) that depend on the view.
  - **RESTRICT**: refuses to delete the view if any objects depend on it. This is the default action.

Examples

See **Examples** in **CREATE VIEW**.

Helpful Links

ALTER VIEW and **CREATE VIEW**

12.14.133 DROP WORKLOAD GROUP

Function

DROP WORKLOAD GROUP deletes a workload group.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

Only a user with the **DROP** permission on the current database can perform this operation.

Syntax

```
DROP WORKLOAD GROUP [ IF EXISTS ] wg_name;
```

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified workload group does not exist.

- **wg_name**

  Specifies the name of the workload group to be deleted. The workload group must be unique in a database.

  Value range: an existing workload group name

Examples

See **Examples** in **CREATE WORKLOAD GROUP**.

Helpful Links

ALTER WORKLOAD GROUP and **CREATE WORKLOAD GROUP**

12.14.134 DROP WEAK PASSWORD DICTIONARY

Function

DROP WEAK PASSWORD DICTIONARY clears all weak passwords in **gs_global_config**.

Precautions

Only the initial user, system administrator, and security administrator have the permission to execute this syntax.

Syntax

```
DROP WEAK PASSWORD DICTIONARY;
```

Description

None.

Example

See **CREATE WEAK PASSWORD DICTIONARY**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Helpful Links

13.14.82-CREATE WEAK PASSWORD DICTIONARY

12.14.135 EXECUTE

Function

EXECUTE executes a prepared statement. Because a prepared statement exists only in the lifetime of the session, the prepared statement must be created earlier in the current session by using the **PREPARE** statement.

Precautions

If the **PREPARE** statement creating the prepared statement declares some parameters, the parameter set passed to the **EXECUTE** statement must be compatible. Otherwise, an error will occur.

Syntax

```
EXECUTE name [ ( parameter [, ...] ) ];
```

Parameter Description

- **name**

  Specifies the name of the prepared statement to be executed.

- **parameter**

  Specifies a parameter of the prepared statement. It must be an expression that generates a value compatible with the data type of the parameter specified when the prepared statement was created.

Examples

```
-- Create the reason table.
openGauss=# CREATE TABLE tpcds.reason (
    CD_DEMO_SK          INTEGER          NOT NULL,
    CD_GENDER           character(16)            ,
    CD_MARITAL_STATUS   character(100)
)
;

-- Insert data.
openGauss=# INSERT INTO tpcds.reason VALUES(51, 'AAAAAAAADDAAAAAA', 'reason 51');

-- Create the reason_t1 table.
openGauss=# CREATE TABLE tpcds.reason_t1 AS TABLE tpcds.reason;

-- Create a prepared statement for an INSERT statement and execute the prepared statement.
openGauss=# PREPARE insert_reason(integer,character(16),character(100)) AS INSERT INTO
tpcds.reason_t1 VALUES($1,$2,$3);

openGauss=# EXECUTE insert_reason(52, 'AAAAAAAADDAAAAAA', 'reason 52');

-- Delete the reason and reason_t1 tables.
openGauss=# DROP TABLE tpcds.reason;
openGauss=# DROP TABLE tpcds.reason_t1;
```

12.14.136 EXECUTE DIRECT

Function

EXECUTE DIRECT executes an SQL statement on a specified node. Generally, the execution of SQL statements is automatically allocated to proper nodes by the cluster load. **EXECUTE DIRECT** is mainly used for database maintenance and testing.

Precautions

- When **enable_nonsysadmin_execute_direct** is **off**, only a system administrator has the **EXECUTE DIRECT** permission.
- To ensure data consistency across nodes, **EXECUTE DIRECT** can execute only **SELECT**; it cannot execute DDL, DML, or transaction statements.
- When the stddev aggregation calculation is performed on the specified DN using such statements, the result set is returned in triplet. For example, {3, 8, 30} indicates that the count result is 3, the sum result is 8, and the sum of squares is 30. When the AVG aggregation calculation is performed on the specified DN using such statements, the result set is returned in a binary tuple, for example, {4,2}. The result of count is 4, and that of sum is 2. Note: When data is stored in columns, the result of calling the AVG function is not defined. Use the **stddev_samp** function.
- When multiple nodes are specified, aggregate functions are not supported. If the query contains an aggregate function, the message "EXECUTE DIRECT on multinode not support agg functions." is returned.
- CN nodes do not store user table data. Therefore, do not execute **SELECT** for querying user tables on a CN node.
- If the SQL statement to be executed is also **EXECUTE DIRECT**, do not nest it into **EXECUTE DIRECT**; instead, directly execute the inner **EXECUTE DIRECT**.
- The query result of the **agg** function is inconsistent with that on the CN. Multiple pieces of information are returned. The **array_avg** function is not supported.

Syntax

```
EXECUTE DIRECT ON ( nodename [, ... ] ) query ;
EXECUTE DIRECT ON { COORDINATORS | DATANODES | ALL } query;
```

Parameter Description

- **nodename**

  Specifies the node name.

  Value range: an existing node name
- **query**

  Specifies the SQL statement to be executed.
- COORDINATORS

  Run the query statement on all CNs.
- DATANODES

  Run the query statement on all DNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- ALL
  Run the query statement on all CNs and DNs.

Examples

```
-- Query the node distribution status of the current cluster.
openGauss=# SELECT * FROM pgxc_node;
 node_name   | node_type | node_port |   node_host    | node_port1 |   node_host1   | hostis_primary |
nodeis_primary | nodeis_preferred |   node_id   | sctp_port | control_port | sctp_port1 | control_port1

-1736975100 |         0 |            0 |          0 |             0
(6 rows)

-- Query records in the tpcds.customer_address table on dn_6001_6002.
openGauss=# EXECUTE DIRECT ON(dn_6001_6002) 'select count(*) from tpcds.customer_address';
 count
-------
 16922
(1 row)

-- Query records in the tpcds.customer_address table.
openGauss=# SELECT count(*) FROM tpcds.customer_address;
 count
-------
 50000
(1 row)
```

12.14.137 EXPLAIN

Function

EXPLAIN shows the execution plan of an SQL statement.

The execution plan shows how the tables referenced by the statement will be scanned - by plain sequential scan, index scan, etc. - and if multiple tables are referenced, what join algorithms will be used to bring together the required rows from each input table.

The most critical part of the display is the estimated statement execution cost, which is the planner's guess at how long it will take to run the statement.

The **ANALYZE** option causes the statement to be actually executed, not only planned. The total elapsed time expended within each plan node (in milliseconds) and total number of rows it actually returned are added to the display. This is useful for seeing whether the planner's estimates are close to reality.

Precautions

The statement is actually executed when the **ANALYZE** option is used. If you wish to use **EXPLAIN ANALYZE** on an **INSERT**, **UPDATE**, **DELETE**, **CREATE TABLE AS**, or

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

EXECUTE statement without letting the statement affect your data, use this approach:

```
START TRANSACTION;
EXPLAIN ANALYZE ...;
ROLLBACK;
```

Syntax

- Display the execution plan of an SQL statement, which supports multiple options and has no requirements for the order of options.

  ```
  EXPLAIN [ (  option  [, ...] )  ] statement;
  ```

  The syntax of the **option** clause is as follows:

  ```
  ANALYZE [ boolean ] |
     ANALYSE [ boolean ] |
     VERBOSE [ boolean ] |
     COSTS [ boolean ] |
     CPU [ boolean ] |
     DETAIL [ boolean ] |
     NODES [ boolean ] |
     NUM_NODES [ boolean ] |
     BUFFERS [ boolean ] |
     TIMING [ boolean ] |
     PLAN [ boolean ] |
     FORMAT { TEXT | XML | JSON | YAML }
  ```

- Display the execution plan of an SQL statement, where options are in order.

  ```
  EXPLAIN  { [  { ANALYZE  | ANALYSE  }  ] [ VERBOSE  ]  | PERFORMANCE  } statement;
  ```

Parameter Description

- **statement**

  Specifies the SQL statement to explain.

- **ANALYZE boolean | ANALYSE boolean**

  Specifies whether to display actual run times and other statistics.

  Value range:

  - **TRUE** (default): displays them.
  - **FALSE**: does not display them.

- **VERBOSE boolean**

  Specifies whether to display additional information regarding the plan.

  Value range:

  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.

- **COSTS boolean**

  Specifies whether to display the estimated total cost of each plan node, estimated number of rows, estimated width of each row.

  Value range:

  - **TRUE** (default): displays them.
  - **FALSE**: does not display them.

- **CPU boolean**

  Specifies whether to display CPU usage.

  Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **DETAIL boolean**

  Specifies whether to display DN information.

  Value range:
  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **NODES boolean**

  Specifies whether to display information about the nodes executed by query.

  Value range:
  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **NUM_NODES boolean**

  Specifies whether to display the number of executing nodes.

  Value range:
  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **BUFFERS boolean**

  Specifies whether to display buffer usage.

  Value range:
  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **TIMING boolean**

  Specifies whether to display the actual startup time and time spent on the output node.

  Value range:
  - **TRUE** (default): displays them.
  - **FALSE**: does not display them.
- **PLAN** boolean

  Specifies whether to store the execution plan in **PLAN_TABLE**. If this parameter is set to **on**, the execution plan is stored in **PLAN_TABLE** and not displayed on the screen. Therefore, this parameter cannot be used together with other parameters when it is set to **on**.

  Value range:
  - **TRUE** (default): The execution plan is stored in **PLAN_TABLE** and not displayed on the screen. If the plan is stored successfully, "EXPLAIN SUCCESS" is returned.
  - **FALSE**: The execution plan is not stored in **PLAN_TABLE** but is displayed on the screen.
- **FORMAT**

  Specifies the output format.

  Value range: **TEXT**, **XML**, **JSON**, and **YAML**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **TEXT**

- **PERFORMANCE**

  Prints all relevant information in execution.

Examples

```
-- Create the tpcds.customer_address_p1 table.
openGauss=# CREATE TABLE tpcds.customer_address_p1 AS TABLE tpcds.customer_address;

-- Change the value of explain_perf_mode to normal.
openGauss=# SET explain_perf_mode=normal;

-- Display an execution plan for simple queries in the table.
openGauss=# EXPLAIN SELECT * FROM tpcds.customer_address_p1;
QUERY PLAN
--------------------------------------------------
Data Node Scan  (cost=0.00..0.00 rows=0 width=0)
Node/s: All DNs
(2 rows)

-- Generate an execution plan in JSON format (with explain_perf_mode being normal).
openGauss=# EXPLAIN(FORMAT JSON) SELECT * FROM tpcds.customer_address_p1;
             QUERY PLAN
-------------------------------------
 [                             +
  {                            +
    "Plan": {                    +
      "Node Type": "Data Node Scan",+
      "Startup Cost": 0.00,        +
      "Total Cost": 0.00,          +
      "Plan Rows": 0,              +
      "Plan Width": 0,             +
      "Node/s": "All DNs"     +
    }                            +
  }                            +
 ]
(1 row)

-- If there is an index and we use a query with an indexable WHERE condition, EXPLAIN might show a
different plan.
openGauss=# EXPLAIN SELECT * FROM tpcds.customer_address_p1 WHERE ca_address_sk=10000;
QUERY PLAN
--------------------------------------------------
Data Node Scan  (cost=0.00..0.00 rows=0 width=0)

ANALYZE | ANALYSE

12.14.138 EXPLAIN PLAN

Function

EXPLAIN PLAN saves information about an execution plan into the **PLAN_TABLE** table. Different from the **EXPLAIN** statement, **EXPLAIN PLAN** only saves plan information; it does not print information on the screen.

Syntax

```
EXPLAIN PLAN
[ SET STATEMENT_ID = string ]
FOR statement ;
```

Parameter Description

- **PLAN**: saves plan information into **PLAN_TABLE**. If information is stored successfully, "EXPLAIN SUCCESS" is returned.
- **STATEMENT_ID**: tags each query. The tag information will be stored in **PLAN_TABLE**.

  NOTE

  If **SET STATEMENT_ID** is not specified when the **EXPLAIN PLAN** statement is executed, **STATEMENT_ID** is left empty by default. In addition, the value of **STATEMENT_ID** cannot exceed 30 bytes. Otherwise, an error will be reported.

Precautions

- **EXPLAIN PLAN** cannot be executed on DNs.
- Plan information cannot be collected for SQL statements that failed to be executed.
- Data in **PLAN_TABLE** is in a session-level lifecycle. Sessions are isolated from users, and therefore users can only view the data of the current session and current user.
- **PLAN_TABLE** cannot be joined with GDS foreign tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- For a query that cannot be pushed down, object information cannot be collected and only such information as **REMOTE_QUERY** and **CTE** can be collected. For details, see **Example 2**.

Example 1

You can perform the following steps to collect execution plans of SQL statements by running **EXPLAIN PLAN**:

Step 1 Run the **EXPLAIN PLAN** statement.

NOTE

After the **EXPLAIN PLAN** statement is executed, plan information is automatically stored in **PLAN_TABLE**. **INSERT**, **UPDATE**, and **ANALYZE** cannot be performed on **PLAN_TABLE**.

For details about **PLAN_TABLE**, see **PLAN_TABLE**.

```
explain plan set statement_id='TPCH-Q4' for
select
o_orderpriority,
count(*) as order_count
from
orders
where
o_orderdate >= '1993-07-01'::date
and o_orderdate < '1993-07-01'::date + interval '3 month'
and exists (
select
*
from
lineitem
where
l_orderkey = o_orderkey
and l_commitdate < l_receiptdate
)
group by
o_orderpriority
order by
o_orderpriority;
```

Step 2 Query **PLAN_TABLE.**

```
SELECT * FROM PLAN_TABLE;
```

```
 statement_id | plan_id  | id |      operation      |   options   | object_name | object_type | object_owner |                projection
--------------+----------+----+---------------------+-------------+-------------+-------------+--------------+-------------------------------------------
 TPCH-Q4      | 16781167 |  1 | ROW ADAPTER         |             |             |             |              | ORDERS.O_ORDERPRIORITY, (PG_CATALOG.COUNT(*))
 TPCH-Q4      | 16781167 |  2 | VECTOR SORT         |             |             |             |              | ORDERS.O_ORDERPRIORITY, (PG_CATALOG.COUNT(*))
 TPCH-Q4      | 16781167 |  3 | VECTOR AGGREGATE    | HASHED      |             |             |              | ORDERS.O_ORDERPRIORITY, PG_CATALOG.COUNT(*)
 TPCH-Q4      | 16781167 |  4 | VECTOR STREAMING    | GATHER      |             |             |              | ORDERS.O_ORDERPRIORITY, (COUNT(*))
 TPCH-Q4      | 16781167 |  5 | VECTOR AGGREGATE    | HASHED      |             |             |              | ORDERS.O_ORDERPRIORITY, COUNT(*)
 TPCH-Q4      | 16781167 |  6 | VECTOR NESTED LOOPS | SEMI        |             |             |              | ORDERS.O_ORDERPRIORITY
 TPCH-Q4      | 16781167 |  7 | TABLE ACCESS        | CSTORE SCAN | ORDERS      | TABLE       | TPCH         | ORDERS.O_ORDERPRIORITY, ORDERS.O_ORDERKEY
 TPCH-Q4      | 16781167 |  8 | VECTOR MATERIALIZE  |             |             |             |              | LINEITEM.L_ORDERKEY
 TPCH-Q4      | 16781167 |  9 | TABLE ACCESS        | CSTORE SCAN | LINEITEM    | TABLE       | TPCH         | LINEITEM.L_ORDERKEY
```

Step 3 Delete data from **PLAN_TABLE**.

```
DELETE FROM PLAN_TABLE WHERE xxx;
```

----End

Example 2

For a query that cannot be pushed down, only such information as **REMOTE_QUERY** and **CTE** can be collected from **PLAN_TABLE** after **EXPLAIN PLAN** is executed.

Scenario 1: The optimizer generates a plan for pushing down statements. In this case, only **REMOTE_QUERY** can be collected.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
explain plan set statement_id = 'test remote query' for
select
current_user
from
customer;
```

Query **PLAN_TABLE.**

```
SELECT * FROM PLAN_TABLE;
```

```
   statement_id    | plan_id  | id |   operation    |  options  |   object_name    | object_type  | object_owner |  projection
-------------------+----------+----+----------------+-----------+------------------+--------------+--------------+--------------
 test remote query | 29360133 |  1 | NESTED LOOPS   | CARTESIAN |                  |              |              | 'apple'::name
 test remote query | 29360133 |  2 | DATA NODE SCAN |           | customer         | REMOTE_QUERY |              |
 test remote query | 29360133 |  3 | DATA NODE SCAN |           | customer_address | REMOTE_QUERY |              |
(3 rows)
```

Scenario 2: For a query with **WITH RECURSIVE** that cannot be pushed down, only **CTE** can be collected.

Disable **enable_stream_recursive** so that the query cannot be pushed down.

```
set enable_stream_recursive = off;
```

Run the **EXPLAIN PLAN** statement.

```
explain plan set statement_id = 'cte can not be push down'
for
with recursive rq as
(
  select id, name from  chinamap where id = 11
  union all
  select origin.id, rq.name || ' > ' || origin.name
  from rq join chinamap origin on origin.pid = rq.id
)
select id, name from rq order by 1;
```

Query **PLAN_TABLE**.

```
SELECT * FROM PLAN_TABLE;
```

```
       statement_id       | plan_id  | id | operation | options | object_name | object_type | object_owner |   projection
--------------------------+----------+----+-----------+---------+-------------+-------------+--------------+----------------
 cte can not be push down | 25166071 |  1 | SORT      |         |             |             |              | rq.id, rq.name
 cte can not be push down | 25166071 |  2 | CTE SCAN  |         | rq          | CTE         |              | rq.id, rq.name
(2 rows)
```

12.14.139 FETCH

Function

FETCH retrieves rows using a previously created cursor.

A cursor has an associated position, which is used by **FETCH**. The cursor position can be before the first row of the query result, on any particular row of the result, or after the last row of the result.

- When created, a cursor is positioned before the first row.
- After fetching some rows, the cursor is positioned on the row most recently retrieved.
- If **FETCH** runs off the end of the available rows then the cursor is left positioned after the last row, or before the first row if fetching backward.
- **FETCH ALL** or **FETCH BACKWARD ALL** will always leave the cursor positioned after the last row or before the first row.

Precautions

- If the cursor is declared with **NO SCROLL**, backward fetches like **FETCH BACKWARD** are not allowed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The forms **NEXT**, **PRIOR**, **FIRST**, **LAST**, **ABSOLUTE**, and **RELATIVE** fetch a single row after moving the cursor appropriately. If there is no such row, an empty result is returned, and the cursor is left positioned before the first row (backward fetch) or after the last row (forward fetch) as appropriate.
- The forms using **FORWARD** and **BACKWARD** retrieve the indicated number of rows moving in the forward or backward direction, leaving the cursor positioned on the last-returned row or after (backward fetch)/before (forward fetch) all rows if the **count** exceeds the number of rows available.
- **RELATIVE 0**, **FORWARD 0**, and **BACKWARD 0** all request fetching the current row without moving the cursor, that is, re-fetching the most recently fetched row. This will succeed unless the cursor is positioned before the first row or after the last row; in which case, no row is returned.
- If the cursor of **FETCH** involves a column-store table, backward fetches like **BACKWARD**, **PRIOR**, and **FIRST** are not allowed.

Syntax

```
FETCH [ direction { FROM | IN } ] cursor_name;
```

The **direction** clause specifies optional parameters.

```
NEXT
  | PRIOR
  | FIRST
  | LAST
  | ABSOLUTE count
  | RELATIVE count
  | count
  | ALL
  | FORWARD
  | FORWARD count
  | FORWARD ALL
  | BACKWARD
  | BACKWARD count
  | BACKWARD ALL
```

Parameter Description

- **direction_clause**

  Defines the fetch direction.

  Value range:

  – **NEXT** (default value)

    Fetches the next row.

  – PRIOR

    Fetches the prior row.

  – FIRST

    Fetches the first row of the query (same as **ABSOLUTE 1**).

  – LAST

    Fetches the last row of the query (same as **ABSOLUTE -1**).

  – ABSOLUTE count

    Fetches the *count*'th row of the query.

    ABSOLUTE fetches are not any faster than navigating to the desired row with a relative move: the underlying implementation must traverse all the intermediate rows anyway.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a possibly-signed integer

- If *count* is positive, the *count*'th row of the query will be fetched. If *count* is less than the current cursor position, rewind is required, which is currently not supported.
- If *count* is negative or 0, backward scanning is required, which is currently not supported.

– RELATIVE count

Fetches the *count*'th succeeding row or the *count*'th prior row if count is negative.

Value range: a possibly-signed integer

- If *count* is positive, the *count*'th succeeding row will be fetched.
- If *count* is negative or 0, backward scanning is required, which is currently not supported.
- If the current row contains no data, **RELATIVE 0** returns null.

– count

Fetches the next *count* rows (same as **FORWARD** *count*).

– ALL

Fetches all remaining rows (same as **FORWARD ALL**).

– FORWARD

Fetches the next row (same as **NEXT**).

– FORWARD count

Fetches the next or prior *count* rows (same as **RELATIVE** *count*).

– FORWARD ALL

Fetches all remaining rows.

– BACKWARD

Fetches the prior row (same as **PRIOR**).

– BACKWARD count

Fetches the prior *count* rows (scanning backwards).

Value range: a possibly-signed integer

- If *count* is positive, *count* prior rows will be fetched.
- If *count* is a negative, *count* succeeding rows will be fetched.
- **BACKWARD 0** re-fetches the current row, if any.

– BACKWARD ALL

Fetches all prior rows (scanning backwards).

- **{ FROM | IN } cursor_name**

  Specifies the cursor name using the keyword **FROM** or **IN**.

  Value range: an existing cursor name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
-- (For the SELECT statement, traverse a table using a cursor.) Start a transaction.
openGauss=# START TRANSACTION;

-- Set up cursor1.
openGauss=# CURSOR cursor1 FOR SELECT * FROM tpcds.customer_address ORDER BY 1;

-- Fetch the first three rows in cursor1.
openGauss=# FETCH FORWARD 3 FROM cursor1;
 ca_address_sk |  ca_address_id   | ca_street_number |    ca_street_name    | ca_street_type  | ca_suite_number
|     ca_city     |    ca_county    | ca_state |   ca_zip   |  ca_country   | ca_gmt_offset |   ca_location_type
---------------+------------------+------------------+----------------------+-----------------+-----------------
+-----------------+-----------------+----------+------------+---------------+---------------+----------------------
           1 | AAAAAAAABAAAAAAA | 18               | Jackson              | Parkway         | Suite 280       |

CLOSE and **MOVE**

12.14.140 GRANT

Function

GRANT grants permissions to roles and users.

GRANT is used in the following scenarios:

- **Granting system permissions to roles or users**

  System permissions are also called user attributes, including **SYSADMIN**, **CREATEDB**, **CREATEROLE**, **AUDITADMIN**, **MONADMIN**, **OPRADMIN**, **POLADMIN**, **INHERIT**, **REPLICATION**, **VCADMIN**, and **LOGIN**.

  They can be specified only by the **CREATE ROLE** or **ALTER ROLE** statement. The **SYSADMIN** permissions can be granted and revoked using **GRANT ALL PRIVILEGE** and **REVOKE ALL PRIVILEGE**, respectively. System permissions cannot be inherited by a user from a role, and cannot be granted using **PUBLIC**.

- **Granting database object permissions to roles or users**

  Grant permissions on a database object (table, view, column, database, function, schema, or tablespace) to a role or user.

  GRANT gives specific permissions on a database object to one or more roles. These permissions are added to those already granted, if any.

  The keyword **PUBLIC** indicates that the permissions are to be granted to all roles, including those that might be created later. **PUBLIC** can be thought of as an implicitly defined group that always includes all roles. Any particular role will have the sum of permissions granted directly to it, permissions granted to any role it is presently a member of, and permissions granted to **PUBLIC**.

  If **WITH GRANT OPTION** is specified, the recipient of the permission can in turn grant it to others. Without a grant option, the recipient cannot do that. This option cannot be granted to **PUBLIC**, which is a unique GaussDB attribute.

  GaussDB grants the permissions on certain types of objects to **PUBLIC**. By default, permissions on tables, columns, sequences, foreign data sources, foreign servers, schemas, and tablespaces are not granted to **PUBLIC**, but the following permissions are granted to **PUBLIC**: **CONNECT** and **CREATE TEMP TABLE** permissions on databases, **EXECUTE** permission on functions, and

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

USAGE permission on languages and data types (including domains). An object owner can revoke the default permissions granted to **PUBLIC** and grant permissions to other users as needed. For security purposes, you are advised to create an object and set its permissions in the same transaction so that other users do not have time windows to use the object. In addition, you can restrict the permissions of the **PUBLIC** user group by referring to t"Permission Management" in *Security Hardening Guide*. These default permissions can be modified using the **ALTER DEFAULT PRIVILEGES** command.

By default, an object owner has all permissions on the object. For security purposes, the owner can discard some permissions. However, the **ALTER**, **DROP**, **COMMENT**, **INDEX**, **VACUUM**, and re-grantable permissions of the object are inherent permissions implicitly owned by the owner.

- **Granting the permissions of one role or user to others**

  Grant the permissions of one role or user to others. In this case, every role or user can be regarded as a set of one or more database permissions.

  If **WITH ADMIN OPTION** is specified, the recipients can in turn grant the permissions to other roles or users or revoke the permissions they have granted to other roles or users. If recipients' permissions are changed or revoked later, the grantees' permissions will also change.

  Database administrators can grant or revoke permissions for any roles or users. Roles with the **CREATEROLE** permission can grant or revoke permissions for non-admin roles.

- **Granting ANY permissions to roles or users**

  Grant ANY permissions to a specified role or user. For details about the value range of the ANY permissions, see the syntax. If **WITH ADMIN OPTION** is specified, the grantee can grant the ANY permissions to or revoke them from other roles or users. The ANY permissions can be inherited by a role but cannot be granted to **PUBLIC**. An initial user and the system administrator when separation of duties is disabled can grant the ANY permissions to or revoke them from any role or user.

  Currently, the following ANY permissions are supported: **CREATE ANY TABLE**, **ALTER ANY TABLE**, **DROP ANY TABLE**, **SELECT ANY TABLE**, **INSERT ANY TABLE**, **UPDATE ANY TABLE**, **DELETE ANY TABLE**, **CREATE ANY SEQUENCE**, **CREATE ANY INDEX**, **CREATE ANY FUNCTION**, **EXECUTE ANY FUNCTION**, **CREATE ANY PACKAGE**, **EXECUTE ANY PACKAGE**, and **CREATE ANY TYPE**. For details about the ANY permission scope, see **Table 12-124**.

Precautions

- It is not allowed to grant the ANY permissions to **PUBLIC** or revoke the ANY permissions from **PUBLIC**.
- The ANY permissions are database permissions and are valid only for database objects that are granted with the permissions. For example, **SELECT ANY TABLE** only allows a user to view all user table data in the current database, but the user does not have the permission to view user tables in other databases.
- Even if a user is granted with the ANY permissions, the user cannot perform INSERT, DELETE, UPDATE, or SELECT operations on the objects of private users.
- The ANY permissions and the original permissions do not affect each other.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If a user is granted with the **CREATE ANY TABLE** permission, the owner of a table created in a schema with the same name as the user is the creator of the schema. When the user performs other operations on the table, the user needs to be granted with the corresponding operation permission.
- Exercise caution when granting the CREATE ANY FUNMCTION permission to users to prevent other users from using SECURITY DEFINER functions for privilege escalation.

Syntax

- Grant the table or view access permission to a user or role.

```
GRANT { { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | TRIGGER | ALTER | DROP
| COMMENT | INDEX | VACUUM } [, ...]
    | ALL [ PRIVILEGES ] }
  ON { [ TABLE ] table_name [, ...]
    | ALL TABLES IN SCHEMA schema_name [, ...] }
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the column access permission to a user or role.

```
GRANT { {{ SELECT | INSERT | UPDATE | REFERENCES | COMMENT } ( column_name [, ...] )} [, ...]
    | ALL [ PRIVILEGES ] ( column_name [, ...] ) }
  ON [ TABLE ] table_name [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the sequence access permission to a specified user or role.

```
GRANT { { SELECT | UPDATE | USAGE | ALTER | DROP | COMMENT } [, ...]
    | ALL [ PRIVILEGES ] }
  ON { [ SEQUENCE ] sequence_name [, ...]
    | ALL SEQUENCES IN SCHEMA schema_name [, ...] }
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the database access permission to a user or role.

```
GRANT { { CREATE | CONNECT | TEMPORARY | TEMP | ALTER | DROP | COMMENT } [, ...]
    | ALL [ PRIVILEGES ] }
  ON DATABASE database_name [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the domain access permission to a user or role.

```
GRANT { USAGE | ALL [ PRIVILEGES ] }
  ON DOMAIN domain_name [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

  NOTE

  In the current version, the domain access permission cannot be granted.

- Grant the CMK access permission to a specified user or role.

```
GRANT { { USAGE | DROP } [, ...] | ALL [ PRIVILEGES ] }
  ON { CLIENT_MASTER_KEY client_master_key
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the column encryption key (CEK) access permission to a specified user or role.

```
GRANT { { USAGE | DROP } [, ...]| ALL [ PRIVILEGES ] }
  ON { COLUMN_ENCRYPTION_KEY column_encryption_key
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the foreign data source access permission to a user or role.

```
GRANT { USAGE | ALL [ PRIVILEGES ] }
  ON FOREIGN DATA WRAPPER fdw_name [, ...]
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the foreign server access permission to a user or role.

```
GRANT { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
  ON FOREIGN SERVER server_name [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the function access permission to a user or role.

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
  ON { FUNCTION {function_name ( [ {[ argmode ] [ arg_name ] arg_type} [, ...] ] )} [, ...]
    | ALL FUNCTIONS IN SCHEMA schema_name [, ...] }
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the procedural procedure access permission to a user or role.

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
  ON { PROCEDURE {proc_name ( [ {[ argmode ] [ arg_name ] arg_type} [, ...] ] )} [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the procedural language access permission to a user or role.

```
GRANT { USAGE | ALL [ PRIVILEGES ] }
  ON LANGUAGE lang_name [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

NOTE

In the current version, all users can create C functions, whereas only users with the **sysadmin** permission can create Java and internal functions.

- When a user with the **sysadmin** permission grants the permission for creating C functions to others, the user must specify a recipient and cannot use **GRANT USAGE ON LANGUAGE C TO PUBLIC**.
- When a user with the **sysadmin** permission grants the permission for creating C functions to others, the user cannot specify **WITH GRANT OPTION**.

- Grant the sub-cluster access permission to a user or role.

```
GRANT { { CREATE | USAGE | COMPUTE | ALTER | DROP } [, ...] | ALL [ PRIVILEGES ] }
  ON NODE GROUP group_name [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

NOTE

When the **create** permission of a sub-cluster is granted to a specified user or role, the **usage** and **compute** permissions are granted to the specified user or role by default.

- Grant the schema access permission to a user or role.

```
GRANT { { CREATE | USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
  ON SCHEMA schema_name [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

NOTE

When you grant table or view permissions to other users, you also need to grant the **USAGE** permission on the schema that the tables and views belong to. Without the **USAGE** permission, the users with table or view permissions can only see the object names, but cannot access them.

- Grant the large object access permission to a specified user or role.

```
GRANT { { SELECT | UPDATE } [, ...] | ALL [ PRIVILEGES ] }
  ON LARGE OBJECT loid [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **NOTE**
>
> In the current version, the large object access permission cannot be granted.

- Grant the tablespace access permission to a user or role.

```
GRANT { { CREATE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
    ON TABLESPACE tablespace_name [, ...]
    TO { [ GROUP ] role_name | PUBLIC } [, ...]
    [ WITH GRANT OPTION ];
```

- Grant the type access permission to a user or role.

```
GRANT { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
    ON TYPE type_name [, ...]
    TO { [ GROUP ] role_name | PUBLIC } [, ...]
    [ WITH GRANT OPTION ];
```

> **NOTE**
>
> In the current version, the type access permission cannot be granted.

- Grant the data source permission to a role.

```
GRANT { USAGE | ALL [PRIVILEGES]}
  ON DATA SOURCE src_name [, ...]
  TO { [GROUP] role_name | PUBLIC } [, ...]
  [WITH GRANT OPTION];
```

- Grant the directory permission to a role.

```
GRANT { { READ | WRITE | ALTER | DROP } [, ...] | ALL [PRIVILEGES] }
  ON DIRECTORY directory_name [, ...]
  TO { [GROUP] role_name | PUBLIC } [, ...]
  [WITH GRANT OPTION];
```

- Grant the package permission to a role.

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
  ON PACKAGE package_name [, ...]
  TO { [GROUP] role_name | PUBLIC } [, ...]
  [WITH GRANT OPTION];
```

> **NOTE**
>
> In the current version, the package access permission cannot be granted.

- Grant a role's permissions to another user or role.

```
GRANT role_name [, ...]
  TO role_name [, ...]
  [ WITH ADMIN OPTION ];
```

- Grant the **sysadmin** permission to a role.

```
GRANT ALL { PRIVILEGES | PRIVILEGE }
  TO role_name;
```

- Grant the ANY permissions to another user or role.

```
GRANT { CREATE ANY TABLE | ALTER ANY TABLE | DROP ANY TABLE | SELECT ANY TABLE | INSERT
ANY TABLE | UPDATE ANY TABLE |
  DELETE ANY TABLE | CREATE ANY SEQUENCE | CREATE ANY INDEX | CREATE ANY FUNCTION |
EXECUTE ANY FUNCTION |
  CREATE ANY PACKAGE | EXECUTE ANY PACKAGE | CREATE ANY TYPE } [, ...]
  TO [ GROUP ] role_name [, ...]
  [ WITH ADMIN OPTION ];
```

> **NOTE**
>
> In the current version, the package access permission cannot be granted.

Parameter Description

The possible permissions are:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **SELECT**

  Allows **SELECT** from any table, view, or sequence.

- **INSERT**

  Allows **INSERT** of a new row into a table.

- **UPDATE**

  Allows **UPDATE** of any column of a table. **SELECT ... FOR UPDATE** and **SELECT ... FOR SHARE** also require this permission on at least one column, in addition to the **SELECT** permission.

- **DELETE**

  Allows **DELETE** of a row from a table.

- **TRUNCATE**

  Allows **TRUNCATE** on a table.

- **REFERENCES**

  Allows creation of a foreign key constraint referencing a table. This permission is required on both referencing and referenced tables.

- **TRIGGER**

  Allows the creation of a trigger on the specified table.

- **CREATE**
  - For databases, allows new schemas to be created within the database.
  - For schemas, allows new objects to be created within the schema. To rename an existing object, you must own the object and have the **CREATE** permission on the schema of the object.
  - For tablespaces, allows tables to be created within the tablespace, and allows databases and schemas to be created that have the tablespace as their default tablespace.
  - For sub-clusters, allows tables to be created within the sub-cluster.

- **CONNECT**

  Allows the grantee to connect to the database.

- **EXECUTE**

  Allows calling a function, including use of any operators that are implemented on top of the function.

- **USAGE**
  - For procedural languages, allows use of the language for the creation of functions in that language.
  - For schemas, allows access to objects contained in the schema. Without this permission, it is still possible to see the object names.
  - For sequences, allows use of the **nextval** function.
  - For sub-clusters, allows users who can access objects contained in the schema to access tables in the sub-cluster.
  - For data sources, specifies access permissions or is used as **ALL PRIVILEGES**.
  - For a key object, **USAGE** is the permission to use the key.

- **COMPUTE**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

For computing sub-clusters, allows users to perform elastic computing in the sub-cluster that they have the compute permission on.

- **ALTER**

  Allows users to modify the attributes of a specified object, excluding the owner and schema of the object.

- **DROP**

  Allows users to delete specified objects.

- **COMMENT**

  Allows users to define or modify comments of a specified object.

- **INDEX**

  Allows users to create indexes on specified tables, manage indexes on the tables, and perform REINDEX and CLUSTER operations on the tables.

- **VACUUM**

  Allows users to perform ANALYZE and VACUUM operations on specified tables.

- **ALL PRIVILEGES**

  Grants all available permissions to a user or role at a time. Only a system administrator has the **GRANT ALL PRIVILEGES** permission.

GRANT parameters are as follows:

- **role_name**

  Specifies the username.

- **table_name**

  Specifies the table name.

- **column_name**

  Specifies the column name.

- **schema_name**

  Specifies the schema name.

- **database_name**

  Specifies the database name.

- **function_name**

  Specifies the function name.

- **sequence_name**

  Specifies the sequence name.

- **domain_name**

  Specifies the domain type name.

- **fdw_name**

  Specifies the foreign data wrapper name.

- **lang_name**

  Specifies the language name.

- **type_name**

  Specifies the type name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **group_name**
  Specifies the sub-cluster name.
- **src_name**
  Specifies the data source name.
- **argmode**
  Specifies the parameter mode.
  Value range: a string. It must comply with the naming convention.
- **arg_name**
  Specifies the parameter name.
  Value range: a string. It must comply with the naming convention.
- **arg_type**
  Specifies the parameter type.
  Value range: a string. It must comply with the naming convention.
- **loid**
  Specifies the identifier of the large object that includes this page.
  Value range: a string. It must comply with the identifier naming convention.
- **tablespace_name**
  Specifies the tablespace name.
- client_master_key
  Name of the CMK.
  Value range: a string. It must comply with the identifier naming convention.
- column_encryption_key
  Name of the column encryption key.
  Value range: a string. It must comply with the identifier naming convention.
- **directory_name**
  Specifies the directory name.
  Value range: a string. It must comply with the identifier naming convention.
- **WITH GRANT OPTION**
  If **WITH GRANT OPTION** is specified, the recipient of the permission can in turn grant it to others. Without a grant option, the recipient cannot do that. Grant options cannot be granted to **PUBLIC**.

When a non-owner of an object attempts to GRANT permissions on the object:

- The statement will fail outright if the user has no permissions whatsoever on the object.
- As long as some permission is available, the statement will proceed, but it will grant only those permissions for which the user has grant options.
- The **GRANT ALL PRIVILEGES** forms will issue a warning message if no grant options are held, while the other forms will issue a warning if grant options for any of the permissions specifically named in the statement are not held.

NOTE

Database administrators can access all objects, regardless of object permission settings. It is unwise to operate as a system administrator except when necessary.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- WITH ADMIN OPTION

  If **WITH ADMIN OPTION** is specified for a role, the grantee can grant the role to other roles or users or revoke the role from other roles or users.

  For the ANY permissions, if **WITH ADMIN OPTION** is specified, the grantee can grant the ANY permissions to or revoke them from other roles or users.

Table 12-124 ANY permissions

Permission	Description
CREATE ANY TABLE	Users can create tables or views in the public and user schemas. The users must be granted with the permission to create sequences to create a table that contains serial columns.
ALTER ANY TABLE	Users' **ALTER** permission on tables or views in the public and user schemas. If the users want to modify the unique index of a table to add a primary key constraint or unique constraint to the table, the users must be granted with the index permission on the table.
DROP ANY TABLE	Users' **DROP** permission on tables or views in the public and user schemas.
SELECT ANY TABLE	Users' **SELECT** permission on tables or views in the public and user schemas, which is still subject to row-level access control.
UPDATE ANY TABLE	Users' **UPDATE** permission on tables or views in the public and user schemas, which is still subject to row-level access control.
INSERT ANY TABLE	Users' **INSERT** permission on tables or views in the public and user schemas.
DELETE ANY TABLE	Users' **DELETE** permission on tables or views in the public and user schemas, which is still subject to row-level access control.
CREATE ANY FUNCTION	Users can create functions or stored procedures in the user schemas.
EXECUTE ANY FUNCTION	Users' **EXECUTE** permission on functions or stored procedures in the public and user schemas.
CREATE ANY PACKAGE	In the current version, the package access permission cannot be granted.
EXECUTE ANY PACKAGE	In the current version, the package access permission cannot be granted.
CREATE ANY TYPE	Users can create types in the public and user schemas.
CREATE ANY SEQUENCE	Users can create sequences in the public and user schemas.
CREATE ANY INDEX	Users can create indexes in the public and user schemas. The users must be granted with the permission to create tablespaces to create a partitioned table index in a tablespace.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

If a user is granted with any ANY permission, the user has the USAGE permission on the public and user schemas but does not have the USAGE permission on the system schemas except **public** listed in **Table 16-1**.

Examples

Example: Granting system permissions to a user or role

Create the **joe** user and grant the **sysadmin** permission to it.

```
openGauss=# CREATE USER joe PASSWORD 'xxxxxxxxxx';
openGauss=# GRANT ALL PRIVILEGES TO joe;
```

Then **joe** has the **sysadmin** permission.

Example: Granting object permissions to a user or role

1. Revoke the **sysadmin** permission from the **joe** user. Grant the usage permission of the **tpcds** schema and all permissions on the **tpcds.reason** table to **joe**.

   ```
   openGauss=# REVOKE ALL PRIVILEGES FROM joe;
   openGauss=# GRANT USAGE ON SCHEMA tpcds TO joe;
   openGauss=# GRANT ALL PRIVILEGES ON tpcds.reason TO joe;
   ```

   Then **joe** has all permissions on the **tpcds.reason** table, including create, retrieve, update, and delete.

2. Grant the retrieve permission of **r_reason_sk**, **r_reason_id**, and **r_reason_desc** columns and the update permission of the **r_reason_desc** column in the **tpcds.reason** table to **joe**.

   ```
   openGauss=# GRANT select (r_reason_sk,r_reason_id,r_reason_desc),update (r_reason_desc) ON tpcds.reason TO joe;
   ```

   Then **joe** has the retrieve permission of **r_reason_sk** and **r_reason_id** columns in the **tpcds.reason** table. To enable **joe** to grant these permissions to other users, execute the following statement:

   ```
   openGauss=# GRANT select (r_reason_sk, r_reason_id) ON tpcds.reason TO joe WITH GRANT OPTION;
   ```

   Grant the connection and schema creation permissions of the **postgres** database to **joe**, and allow **joe** to grant these permissions to other users.

   ```
   openGauss=# GRANT create,connect on database postgres TO joe WITH GRANT OPTION;
   ```

   Create the **tpcds_manager** role, grant the access and object creation permissions of the **tpcds** schema to **tpcds_manager**, but do not allow **tpcds_manager** to grant these permissions to others.

   ```
   openGauss=# CREATE ROLE tpcds_manager PASSWORD 'xxxxxxxxxx';
   openGauss=# GRANT USAGE,CREATE ON SCHEMA tpcds TO tpcds_manager;
   ```

   Grant all permissions on the **tpcds_tbspc** tablespace to **joe**, but do not allow **joe** to grant these permissions to others.

   ```
   openGauss=# CREATE TABLESPACE tpcds_tbspc RELATIVE LOCATION 'tablespace/tablespace_1';
   openGauss=# GRANT ALL ON TABLESPACE tpcds_tbspc TO joe;
   ```

Example: Granting the permissions of one user or role to others

1. Create the **manager** role, grant **joe**'s permissions to **manager**, and allow **manager** to grant these permissions to others.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
openGauss=# CREATE ROLE manager PASSWORD 'xxxxxxxxxx';
openGauss=# GRANT joe TO manager WITH ADMIN OPTION;
```

2. Create the **senior_manager** user and grant **manager**'s permissions to it.

```
openGauss=# CREATE ROLE senior_manager PASSWORD 'xxxxxxxxxx';
openGauss=# GRANT manager TO senior_manager;
```

3. Revoke permissions and delete users.

```
openGauss=# REVOKE manager FROM joe;
openGauss=# REVOKE senior_manager FROM manager;
openGauss=# DROP USER manager;
```

Example: Granting the CMK or CEK permission to other user or role

1. Connect to an encrypted database.

```
gsql -p 57101 postgres -r -C
openGauss=# \! gs_ktool -g
GENERATE
1
openGauss=#  CREATE CLIENT MASTER KEY MyCMK1 WITH ( KEY_STORE = gs_ktool , KEY_PATH =
"gs_ktool/1" , ALGORITHM = AES_256_CBC);
CREATE CLIENT MASTER KEY
openGauss=# CREATE COLUMN ENCRYPTION KEY MyCEK1 WITH VALUES (CLIENT_MASTER_KEY =
MyCMK1, ALGORITHM = AEAD_AES_256_CBC_HMAC_SHA256);
CREATE COLUMN ENCRYPTION KEY
```

2. Create a role **newuser** and grant the key permission to **newuser**.

```
openGauss=# CREATE USER newuser PASSWORD 'xxxxxxxxx';
CREATE ROLE
openGauss=# GRANT ALL ON SCHEMA public TO newuser;
GRANT
openGauss=# GRANT USAGE ON COLUMN_ENCRYPTION_KEY MyCEK1 to newuser;
GRANT
openGauss=# GRANT USAGE ON CLIENT_MASTER_KEY MyCMK1 to newuser;
GRANT
```

3. Set the user to connect to a database and use a CEK to create an encrypted table.

```
openGauss=# SET SESSION AUTHORIZATION newuser PASSWORD 'xxxxxxxxx';
openGauss=>  CREATE TABLE acltest1 (x int, x2 varchar(50) ENCRYPTED WITH
(COLUMN_ENCRYPTION_KEY = MyCEK1, ENCRYPTION_TYPE = DETERMINISTIC));
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'x' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
openGauss=> SELECT has_cek_privilege('newuser', 'MyCEK1', 'USAGE');
 has_cek_privilege
-------------------
 t
(1 row)
```

4. Revoke permissions and delete users.

```
openGauss=# REVOKE USAGE ON COLUMN_ENCRYPTION_KEY MyCEK1 FROM newuser;
openGauss=# REVOKE USAGE ON CLIENT_MASTER_KEY MyCMK1 FROM newuser;
openGauss=# DROP TABLE newuser.acltest1;
openGauss=# DROP COLUMN ENCRYPTION KEY MyCEK1;
openGauss=# DROP CLIENT MASTER KEY MyCMK1;
openGauss=# DROP SCHEMA IF EXISTS newuser CASCADE;
openGauss=# REVOKE ALL ON SCHEMA public FROM newuser;
openGauss=# DROP ROLE IF EXISTS newuser;
```

Example: Revoking permissions and deleting roles and users

```
openGauss=# REVOKE ALL PRIVILEGES ON tpcds.reason FROM joe;
openGauss=# REVOKE ALL PRIVILEGES ON SCHEMA tpcds FROM joe;
openGauss=# REVOKE ALL ON TABLESPACE tpcds_tbspc FROM joe;
openGauss=# DROP TABLESPACE tpcds_tbspc;
openGauss=# REVOKE USAGE,CREATE ON SCHEMA tpcds FROM tpcds_manager;
openGauss=# DROP ROLE tpcds_manager;
openGauss=# DROP ROLE senior_manager;
openGauss=# DROP USER joe CASCADE;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

REVOKE and **ALTER DEFAULT PRIVILEGES**

12.14.141 INSERT

Function

INSERT inserts new rows into a table.

Precautions

- The owner of a table, users granted with the **INSERT** permission on the table, or users granted with the **INSERT ANY TABLE** permission can insert data into the table. The system administrator has the permission to insert data into the table by default.
- Use of the **RETURNING** clause requires the **SELECT** permission on all columns mentioned in **RETURNING**.
- For column-store tables, the **RETURNING** clause is currently not supported.
- If **ON DUPLICATE KEY UPDATE** is used, you must have the **SELECT** and **UPDATE** permissions on the table and the **SELECT** permission on the unique constraint (primary key or unique index).
- If you use the **query** clause to insert rows from a query, you need to have the **SELECT** permission on any table or column used in the query.
- If you use the query clause to insert data from the dynamic data anonymization column, the inserted result is the anonymized value and cannot be restored.
- When you connect to a database compatible to Teradata and **td_compatible_truncation** is **on**, a long string will be automatically truncated. If later **INSERT** statements (not involving foreign tables) insert long strings to columns of char- and varchar-typed columns in the target table, the system will truncate the long strings to ensure no strings exceed the maximum length defined in the target table.

  NOTE

  If inserting multi-byte character data (such as Chinese characters) to a database with the character set byte encoding (SQL_ASCII, LATIN1), and the character data crosses the truncation position, the string is truncated based on its bytes instead of characters. Unexpected result will occur in tail after the truncation. If you want correct truncation result, you are advised to adopt encoding set such as UTF8, which has no character data crossing the truncation position.

Syntax

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
INSERT [/*+ plan_hint */] INTO table_name [ AS alias ] [ ( column_name [, ...] ) ]
    { DEFAULT VALUES
    | VALUES {( { expression | DEFAULT } [, ...] ) }[, ...]
    | query }
    [ ON DUPLICATE KEY UPDATE { NOTHING | { column_name = { expression | DEFAULT } } [, ...] [ WHERE
condition ] } ]
    [ RETURNING {* | {output_expression [ [ AS ] output_name ] }[, ...]} ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter Description

- **WITH [RECURSIVE] with_query [, ...]**

  Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table.

  If **RECURSIVE** is specified, it allows a **SELECT** subquery to reference itself by name.

  Format of **with_query**:

  ```
  with_query_name [ ( column_name [, ...] ) ] AS [ [ NOT ] MATERIALIZED ]
  ( {select | values | insert | update | delete} )
  ```

  – **with_query_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.

  -- **column_name** specifies the column name displayed in the subquery result set.

  Each subquery can be a **SELECT**, **VALUES**, **INSERT**, **UPDATE** or **DELETE** statement.

  – You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE.

  – If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery cannot be jointly optimized with the SELECT statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.

  – If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the trunk statement to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.

  NOTE

  INSERT ON DUPLICATE KEY UPDATE does not support the **WITH** and **WITH RECURSIVE** clauses.

- **plan_hint** clause

  Follows the **INSERT** keyword in the **/*+ */** format. It is used to optimize the plan of an **INSERT** statement block. For details, see **Hint-based Tuning**. In each statement, only the first **/*+** *plan_hint* ***/** comment block takes effect as a hint. Multiple hints can be written.

- **table_name**

  Specifies the name of the target table where data will be inserted.

  Value range: an existing table name

- **column_name**

  Specifies the name of a column in a table.

  – The column name can be qualified with a subfield name or array subscript, if needed.

  – Each column not present in the explicit or implicit column list will be filled with a default value, either its declared default value or **NULL** if

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

there is none. Inserting into only some fields of a composite column leaves the other fields null.

- The target column names **column_name** can be listed in any order. If no list of column names is given at all, the default is all the columns of the table in their declared order.
- The target columns are the first *N* column names, if there are only *N* columns supplied by the **value** clause or **query**.
- The values provided by the **value** clause and query are associated with the corresponding columns from left to right in the table.

Value range: an existing column

- **expression**

  Specifies an expression or a value to assign to the corresponding column.

  - In the **INSERT ON DUPLICATE KEY UPDATE** statement, expression can be **VALUES(***column_name***)** or **EXCLUDED.***column_name*, indicating that the value of **column_name** corresponding to the conflict row is referenced. Note that **VALUES(***column_name***)** cannot be nested in an expression (for example, **VALUES(***column_name***)+1**). **EXCLUDED** is not subject to this restriction.
  - If single-quotation marks are inserted in a column, the single-quotation marks need to be used for escape.
  - If the expression for any column is not of the correct data type, automatic type conversion will be attempted. If the attempt fails, data insertion fails, and the system returns an error message.

- **DEFAULT**

  Specifies the default value of a field. The value is **NULL** if no default value is assigned to it.

- **query**

  Specifies a query statement (SELECT statement) that uses the query result as the inserted data.

- **RETURNING**

  Returns the inserted rows. The syntax of the **RETURNING** list is identical to that of the output list of **SELECT**. Note that **INSERT ON DUPLICATE KEY UPDATE** does not support the **RETURNING** clause.

- **output_expression**

  Specifies an expression used to calculate the output result of the **INSERT** statement after each row is inserted.

  Value range: The expression can use any field in the table. You can use the asterisk (*) to return all fields of the inserted row.

- **output_name**

  Specifies a name to use for a returned column.

  Value range: a string. It must comply with the naming convention.

- **ON DUPLICATE KEY UPDATE**

  For a table with a unique constraint (**UNIQUE INDEX** or **PRIMARY KEY**), if the inserted data violates the unique constraint, the **UPDATE** clause is executed to update the conflicting rows. If the clause of **UPDATE** is **NOTHING**, no operation will be performed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

For a table without a unique constraint, only insert is performed.

- Triggers are not supported. The **INSERT** or **UPDATE** trigger of the target table is not fired.
- The unique constraint or primary key of **DEFERRABLE** is not supported.
- If a table has multiple unique constraints and the inserted data violates multiple unique constraints, only the first row that has a conflict is updated. (The check sequence is closely related to index maintenance. Generally, the conflict check is performed on the index that is created first.)
- Distribution columns and unique index columns cannot be updated.
- Column-store tables do not support this operation.
- The **WHERE** clause of **UPDATE** does not contain sublinks.

Examples

```
-- Create the tpcds. reason_t2 table:
openGauss=# CREATE TABLE tpcds.reason_t2
(
  r_reason_sk    integer,
  r_reason_id    character(16),
  r_reason_desc  character(100)
);

-- Insert a record into a table:
openGauss=# INSERT INTO tpcds.reason_t2(r_reason_sk, r_reason_id, r_reason_desc) VALUES (1,
'AAAAAAAABAAAAAAA', 'reason1');

-- Insert a record into the table, which is equivalent to the previous syntax:
openGauss=# INSERT INTO tpcds.reason_t2 VALUES (2, 'AAAAAAAABAAAAAAA', 'reason2');

-- Insert multiple records into the table.
openGauss=# INSERT INTO tpcds.reason_t2 VALUES (3, 'AAAAAAAACAAAAAAA','reason3'),(4,
'AAAAAAAADAAAAAAA', 'reason4'),(5, 'AAAAAAAAEAAAAAAA','reason5');

-- Insert records whose r_reason_sk in the tpcds.reason table is less than 5:
openGauss=# INSERT INTO tpcds.reason_t2 SELECT * FROM tpcds.reason WHERE r_reason_sk <5;

-- Create a unique index for the table:
openGauss=# CREATE UNIQUE INDEX reason_t2_u_index ON tpcds.reason_t2(r_reason_sk);

-- Insert multiple records into the table. If the records conflict, update the r_reason_id field in the conflict
data row to BBBBBBBBCAAAAAAA.
openGauss=# INSERT INTO tpcds.reason_t2 VALUES (5, 'BBBBBBBBCAAAAAAA','reason5'),(6,
'AAAAAAAADAAAAAAA', 'reason6') ON DUPLICATE KEY UPDATE r_reason_id = 'BBBBBBBBCAAAAAAA';

-- Delete the tpcds.reason_t2 table.
openGauss=# DROP TABLE tpcds.reason_t2;
```

Suggestions

VALUES

When you run the **INSERT** statement to insert data in batches, you are advised to combine multiple records into one statement to improve data loading performance. Example: **INSERT INTO sections VALUES (30, 'Administration', 31, 1900),(40, 'Development', 35, 2000), (50, 'Development' , 60 , 2001);**

If values of an insert statement are distributed on a DN, GaussDB can push the statement down to the corresponding DN for execution. Currently, only constants, simple expressions, and pushdown functions (**provolatile** in **pg_proc** is set to **'i'**)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

are supported. If a column in the table has a default value, the value must be a constant or a simple expression. Neither a single-value statement nor a multi-value statement can be pushed down to a single DN.

12.14.142 LOCK

Function

LOCK TABLE obtains a table-level lock.

GaussDB always tries to select the lock mode with minimum constraints when automatically requesting a lock for a statement referenced by a table. Use **LOCK** if users need a more strict lock mode. For example, suppose an application runs a transaction at the Read Committed isolation level and needs to ensure that data in a table remains stable in the duration of the transaction. To achieve this, you could obtain **SHARE** lock mode over the table before the query. This will prevent concurrent data changes and ensure subsequent reads of the table see a stable view of committed data. It is because the **SHARE** lock mode conflicts with the **ROW EXCLUSIVE** lock acquired by writers, and your **LOCK TABLE name IN SHARE MODE** statement will wait until any concurrent holders of **ROW EXCLUSIVE** mode locks commit or roll back. Therefore, once you obtain the lock, there are no uncommitted writes outstanding; furthermore none can begin until you release the lock.

The kernel can automatically cancel services when the scale-out redistribution tool waits for a lock.

Precautions

- **LOCK TABLE** is useless outside a transaction block: the lock would remain held only to the completion of the statement. If **LOCK TABLE** is out of any transaction block, an error is reported.
- If no lock mode is specified, then **ACCESS EXCLUSIVE**, the most restrictive mode, is used.
- LOCK TABLE ... **IN ACCESS SHARE MODE** requires the **SELECT** permission on the target table. All other forms of **LOCK** require table-level **UPDATE** and/or the **DELETE** permission.
- There is no **UNLOCK TABLE** statement. Locks are always released at transaction end.
- **LOCK TABLE** only deals with table-level locks, and so the mode names involving **ROW** are all misnomers. These mode names should generally be read as indicating the intention of the user to acquire row-level locks within the locked table. Also, **ROW EXCLUSIVE** mode is a shareable table lock. Note that all lock modes have the same semantics as long as LOCK TABLE is involved. The only difference lies in whether locks conflict with each other. For details about the rules, see **Table 12-125**.
- If the xc_maintenance_mode parameter is not enabled, an error is reported when an ACCESS EXCLUSIVE lock is applied for a system catalog.
- Only the redistribution tool can use the automatic CANCEL service interface.

Syntax

```
LOCK [ TABLE ] {[ ONLY ] name [, ...]| {name [ * ]} [, ...]}
    [ IN {ACCESS SHARE | ROW SHARE | ROW EXCLUSIVE | SHARE UPDATE EXCLUSIVE | SHARE | SHARE
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
ROW EXCLUSIVE | EXCLUSIVE | ACCESS EXCLUSIVE} MODE ]
    [ NOWAIT ][CANCELABLE];
```

Parameter Description

Table 12-125 Lock mode conflicts

Requested Lock Mode/ Current Lock Mode	ACCESS SHARE	ROW SHARE	ROW EXCLUSIVE	SHARE UPDATE EXCLUSIVE	SHARE	SHARE ROW EXCLUSIVE	EXCLUSIVE	ACCESS EXCLUSIVE
ACCESS SHARE	-	-	-	-	-	-	-	X
ROW SHARE	-	-	-	-	-	-	X	X
ROW EXCLUSIVE	-	-	-	-	X	X	X	X
SHARE UPDATE EXCLUSIVE	-	-	-	X	X	X	X	X
SHARE	-	-	X	X	-	X	X	X
SHARE ROW EXCLUSIVE	-	-	X	X	X	X	X	X
EXCLUSIVE	-	X	X	X	X	X	X	X
ACCESS EXCLUSIVE	X	X	X	X	X	X	X	X

LOCK parameters are as follows:

- **name**

  Specifies the name (optionally schema-qualified) of an existing table to lock.

  Tables are locked one-by-one in the order specified in the **LOCK TABLE** statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: an existing table name

- **ONLY**

  If **ONLY** is specified, only that table is locked. If **ONLY** is not specified, the table and all its sub-tables are locked.

- **ACCESS SHARE**

  Allows only read operations on a table. In general, any SQL statements that only read a table and do not modify it will acquire this lock mode. The **SELECT** statement acquires a lock of this mode on referenced tables.

- **ROW SHARE**

  Allows concurrent read of a table but does not allow any other operations on the table.

  SELECT FOR UPDATE and **SELECT FOR SHARE** automatically acquire the **ROW SHARE** lock on the target table and add the **ACCESS SHARE** lock to other referenced tables except **FOR SHARE** and **FOR UPDATE**.

  For a partitioned table, **SELECT FOR SHARE** obtains the **ROW EXCLUSIVE** lock of the partition object on the DN for concurrency control. (The current feature is a lab feature. Contact Huawei technical support before using it.)

- **ROW EXCLUSIVE**

  Allows concurrent read of a table but does not allow modification of data in the table like **ROW SHARE**. **UPDATE**, **DELETE**, and **INSERT** automatically acquire the **ROW SHARE** lock on the target table and add the **ACCESS SHARE** lock to other referenced tables. Generally, all statements that modify table data acquire the **ROW EXCLUSIVE** lock for tables.

- **SHARE UPDATE EXCLUSIVE**

  Protects a table against concurrent schema changes and **VACUUM** runs.

  The VACUUM (without FULL), ANALYZE, and CREATE INDEX CONCURRENTLY statements automatically request this lock.

- **SHARE**

  Allows concurrent queries of a table but does not allow modification of the table.

  The CREATE INDEX (without CONCURRENTLY) statement automatically requests this lock.

- **SHARE ROW EXCLUSIVE**

  Protects a table against concurrent data changes, and is self-exclusive so that only one session can hold it at a time.

  No SQL statements automatically acquire this lock mode.

- **EXCLUSIVE**

  Allows concurrent queries of the target table but does not allow any other operations.

  This mode allows only concurrent **ACCESS SHARE** locks; that is, only reads from the table can proceed in parallel with a transaction holding this lock mode.

  No SQL statements automatically acquire this lock mode on user tables. However, it will be acquired on some system catalogs in case of some operations.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **ACCESS EXCLUSIVE**

  Guarantees that the holder is the only transaction accessing the table in any way.

  Acquired by the **ALTER TABLE**, **DROP TABLE**, **TRUNCATE**, **REINDEX**, **CLUSTER**, and **VACUUM FULL** statements.

  This is also the default lock mode for **LOCK TABLE** statements that do not specify a mode explicitly.

- **NOWAIT**

  Specifies that LOCK TABLE does not wait for any conflicting locks to be released. If the lock cannot be obtained immediately, the command exits and an error message is displayed.

  If **NOWAIT** is not specified, **LOCK TABLE** obtains a table-level lock, waiting if necessary for any conflicting locks to be released.

- **CANCELABLE**

  Allows the waiting thread to send CANCEL signals to the holding threads and waiting threads.

  Only the redistribution tool can use this parameter. An error message is displayed when the parameter is used by users.

Example

```
-- Obtain a SHARE lock on a primary key table when going to perform inserts into a foreign key table:
openGauss=# START TRANSACTION;

openGauss=# LOCK TABLE tpcds.reason IN SHARE MODE;

openGauss=# SELECT r_reason_desc FROM tpcds.reason WHERE r_reason_sk=5;
r_reason_desc
-----------
 Parts missing
(1 row)

openGauss=# COMMIT;

-- Obtain a SHARE ROW EXCLUSIVE lock on a primary key table when going to perform a delete operation.
openGauss=# CREATE TABLE tpcds.reason_t1 AS TABLE tpcds.reason;

openGauss=# START TRANSACTION;

openGauss=# LOCK TABLE tpcds.reason_t1 IN SHARE ROW EXCLUSIVE MODE;

openGauss=# DELETE FROM tpcds.reason_t1 WHERE r_reason_desc IN(SELECT r_reason_desc FROM
tpcds.reason_t1 WHERE r_reason_sk < 6 );

openGauss=# DELETE FROM tpcds.reason_t1 WHERE r_reason_sk = 7;

openGauss=# COMMIT;

-- Delete the tpcds.reason_t1 table.
openGauss=# DROP TABLE tpcds.reason_t1;
```

12.14.143 MOVE

Function

Repositions a cursor without retrieving any data. **MOVE** works exactly like the **FETCH** statement, except it only repositions the cursor and does not return rows.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

None

Syntax

```
MOVE [ direction [ FROM | IN ] ] cursor_name;
```

The **direction** clause specifies optional parameters.

```
NEXT
  | PRIOR
  | FIRST
  | LAST
  | ABSOLUTE count
  | RELATIVE count
  | count
  | ALL
  | FORWARD
  | FORWARD count
  | FORWARD ALL
  | BACKWARD
  | BACKWARD count
  | BACKWARD ALL
```

Parameter Description

MOVE statement parameters are the same as **FETCH** statement parameters. For details, see **Parameter Description** in **FETCH**.

NOTE

On successful completion, a **MOVE** statement returns a tag of the form **MOVE count**. The **count** is the number of rows that a **FETCH** statement with the same parameters would have returned (possibly zero).

Examples

```
-- Start a transaction.
openGauss=# START TRANSACTION;

-- Define a cursor named cursor1.
openGauss=# CURSOR cursor1 FOR SELECT * FROM tpcds.reason;

-- Skip the first three rows of cursor1:
openGauss=# MOVE FORWARD 3 FROM cursor1;

-- Fetch the first four rows from cursor1:
openGauss=# FETCH 4 FROM cursor1;
 r_reason_sk |   r_reason_id    |                                r_reason_desc
-------------+------------------
+-----------------------------------------------------------------------------------------------------
           4 | AAAAAAAAEAAAAAAA | Not the product that was
ordred
           5 | AAAAAAAAFAAAAAAA | Parts missing
           6 | AAAAAAAAGAAAAAAA | Does not work with a product that I
have
           7 | AAAAAAAAHAAAAAAA | Gift
exchange
(4 rows)

-- Close the cursor.
openGauss=# CLOSE cursor1;

-- End the transaction.
openGauss=# END;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Helpful Links

CLOSE and **FETCH**

12.14.144 MERGE INTO

Function

MERGE INTO conditionally matches data in a target table with that in a source table. If data matches, **UPDATE** is executed on the target table; if data does not match, **INSERT** is executed. You can use this syntax to run **UPDATE** and **INSERT** at a time for convenience

Precautions

- You have the **INSERT** and **UPDATE** permissions for the target table and the **SELECT** permission for the source table.
- **MERGE INTO** cannot be executed during redistribution.
- If the source table of the **MERGE INTO** operation contains data columns that are dynamically anonymized, the result of inserting data to or updating data in the target table is the anonymized value and cannot be restored.

Syntax

```
MERGE [/*+ plan_hint */] INTO table_name [ [ AS ] alias ]
USING { { table_name | view_name } | subquery } [ [ AS ] alias ]
ON ( condition )
[
  WHEN MATCHED THEN
  UPDATE SET { column_name = { expression | subquery | DEFAULT } |
         ( column_name [, ...] ) = ( { expression | subquery | DEFAULT } [, ...] ) } [, ...]
  [ WHERE condition ]
]
[
  WHEN NOT MATCHED THEN
  INSERT { DEFAULT VALUES |
  [ ( column_name [, ...] ) ] VALUES ( { expression | subquery | DEFAULT } [, ...] ) [, ...] [ WHERE condition ] }
];
NOTICE: 'subquery' in the UPDATE and INSERT clauses are only avaliable in CENTRALIZED mode!
```

Parameter Description

- **plan_hint** clause

  Follows the **MERGE** keyword in the **/*+ */** format. It is used to optimize the plan of a **MERGE** statement block. For details, see **Hint-based Tuning**. In each statement, only the first **/*+** *plan_hint* ***/** comment block takes effect as a hint. Multiple hints can be written.

- **INTO** clause

  Specifies the target table that is being updated or has data being inserted. If the target table is a replication table, the default value of a column (such as auto-increment column) in the target table cannot be the **volatile** function. If **enable_stream_operator** is set to **off**, the target table must contain a primary key or **UNIQUE** and **NOT NULL** constraints.

  - **talbe_name**

    Specifies the name of the target table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **alias**

    Specifies the alias of the target table.

    Value range: a string. It must comply with the naming convention.

- **USING** clause

  Specifies the source table, which can be a table, view, or subquery. If the target table is a replication table, the **USING** clause cannot contain non-replication tables.

- **ON** clause

  Specifies the condition used to match data between the source and target tables. Columns in the condition cannot be updated.

- **WHEN MATCHED** clause

  Performs **UPDATE** if data in the source table matches that in the target table based on the condition.

  Distribution keys cannot be updated. System catalogs and system columns cannot be updated.

- **WHEN NOT MATCHED** clause

  Performs **INSERT** if data in the source table does not match that in the target table based on the condition.

  An **INSERT** clause can contain only one **VALUES**.

  The order of **WHEN MATCHED** and **WHEN NOT MATCHED** clauses can be reversed. One of them can be used by default, but they cannot be both used at one time. Two **WHEN MATCHED** or **WHEN NOT MATCHED** clauses cannot be specified at the same time.

- **DEFAULT**

  Specifies the default value of a column.

  The value is **NULL** if no default value is assigned to it.

- **WHERE condition**

  Specifies the conditions for the **UPDATE** and **INSERT** clauses. The two clauses will be executed only when the conditions are met. The default value can be used. System columns cannot be referenced in **WHERE condition**. You are not advised to use numeric types such as int for **condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

Examples

```
-- Create the target table products and source table newproducts, and insert data to them.
openGauss=# CREATE TABLE products
(
product_id INTEGER,
product_name VARCHAR2(60),
category VARCHAR2(60)
);

openGauss=# INSERT INTO products VALUES (1501, 'vivitar 35mm', 'electrncs');
openGauss=# INSERT INTO products VALUES (1502, 'olympus is50', 'electrncs');
openGauss=# INSERT INTO products VALUES (1600, 'play gym', 'toys');
openGauss=# INSERT INTO products VALUES (1601, 'lamaze', 'toys');
openGauss=# INSERT INTO products VALUES (1666, 'harry potter', 'dvd');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
openGauss=# CREATE TABLE newproducts
(
product_id INTEGER,
product_name VARCHAR2(60),
category VARCHAR2(60)
);

openGauss=# INSERT INTO newproducts VALUES (1502, 'olympus camera', 'electrncs');
openGauss=# INSERT INTO newproducts VALUES (1601, 'lamaze', 'toys');
openGauss=# INSERT INTO newproducts VALUES (1666, 'harry potter', 'toys');
openGauss=# INSERT INTO newproducts VALUES (1700, 'wait interface', 'books');

-- Run MERGE INTO.
openGauss=# MERGE INTO products p
USING newproducts np
ON (p.product_id = np.product_id)
WHEN MATCHED THEN
  UPDATE SET p.product_name = np.product_name, p.category = np.category WHERE p.product_name !=
'play gym'
WHEN NOT MATCHED THEN
  INSERT VALUES (np.product_id, np.product_name, np.category) WHERE np.category = 'books';
MERGE 4

-- Query updates.
openGauss=# SELECT * FROM products ORDER BY product_id;
 product_id |  product_name  | category
------------+----------------+-----------
       1501 | vivitar 35mm   | electrncs
       1502 | olympus camera | electrncs
       1600 | play gym       | toys
       1601 | lamaze         | toys
       1666 | harry potter   | toys
       1700 | wait interface | books
(6 rows)

-- Delete the table.
openGauss=# DROP TABLE products;
openGauss=# DROP TABLE newproducts;
```

12.14.145 PREDICT BY

This syntax is not supported in distributed scenarios.

12.14.146 PREPARE

Function

PREPARE creates a prepared statement.

A prepared statement is a performance optimizing object on the server. When the **PREPARE** statement is executed, the specified query is parsed, analyzed, and rewritten. When **EXECUTE** is executed, the prepared statement is planned and executed. This avoids repetitive parsing and analysis. After the **PREPARE** statement is created, it exists throughout the database session. Once it is created (even if in a transaction block), it will not be deleted when a transaction is rolled back. It can only be deleted by explicitly invoking **DEALLOCATE** or automatically deleted when the session ends.

Precautions

None

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

```
PREPARE name [ ( data_type [, ...] ) ] AS statement;
```

Parameter Description

- **name**

  Specifies the name of a prepared statement. It must be unique in the session.

- **data_type**

  Specifies the type of an argument.

- **statement**

  Specifies a **SELECT**, **INSERT**, **UPDATE**, **DELETE**, **MERGE INTO**, or **VALUES** statement.

Examples

See **Examples** in **EXECUTE**.

Helpful Links

DEALLOCATE

12.14.147 PREPARE TRANSACTION

Function

Prepares the current transaction for two-phase commit.

After this statement, the transaction is no longer associated with the current session; instead, its state is fully stored on disk, and there is a high probability that it can be committed successfully, even if a database crash occurs before the commit is requested.

Once prepared, a transaction can later be committed or rolled back with **COMMIT PREPARED** or **ROLLBACK PREPARED**, respectively. Those statements can be issued from any session, not only the one that executed the original transaction.

From the point of view of the issuing session, **PREPARE TRANSACTION** is not unlike a **ROLLBACK** statement: after executing it, there is no active current transaction, and the effects of the prepared transaction are no longer visible. (The effects will become visible again if the transaction is committed.)

If the **PREPARE TRANSACTION** statement fails for any reason, it becomes a **ROLLBACK** and the current transaction is canceled.

Precautions

- The transaction function is maintained automatically by the database, and should be not visible to users.
- The distributed system does not allow users to call the customized PREPARE TRANSACTION operation.
- When running the **PREPARE TRANSACTION** statement, increase the value of **max_prepared_transactions** in configuration file **postgresql.conf**. You are

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

advised to set **max_prepared_transactions** to a value not less than that of **max_connections** so that one pending prepared transaction is available for each session.

Syntax

```
PREPARE TRANSACTION transaction_id;
```

Parameter Description

transaction_id

Specifies an arbitrary identifier that later identifies this transaction for **COMMIT PREPARED** or **ROLLBACK PREPARED**. The identifier must be different from those for current prepared transactions.

Value range: The identifier must be written as a string literal, and must be less than 200 bytes long.

Helpful Links

COMMIT PREPARED and **ROLLBACK PREPARED**

12.14.148 REASSIGN OWNED

Function

Changes the owner of the database object.

REASSIGN OWNED requires that the system change owners of all the database objects owned by **old_roles** to **new_role**.

Precautions

- **REASSIGN OWNED** is often executed before role deletion.
- To run the REASSIGN OWNED statement, you must have the permissions of the original and target roles.

Syntax

```
REASSIGN OWNED BY old_role [, ...] TO new_role;
```

Parameter Description

- **old_role**

  Specifies the role name of the old owner.
- **new_role**

  Specifies the role name of the new owner.

Examples

None

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.14.149 REINDEX

Function

REINDEX rebuilds an index using the data stored in the index's table, replacing the old copy of the index.

There are several scenarios in which **REINDEX** can be used:

- An index has become corrupted, and no longer contains valid data.
- An index has become "bloated", that is, it contains many empty or nearly-empty pages.
- You have altered a storage parameter (such as a fill factor) for an index, and wish that the change takes full effect.

Precautions

REINDEX DATABASE and **REINDEX SYSTEM** type cannot be performed in transaction blocks.

Syntax

- Rebuild a general index.

```
REINDEX { INDEX | [INTERNAL] TABLE | DATABASE | SYSTEM } name [ FORCE ];
```

- Rebuild an index partition.

```
REINDEX  { INDEX|  [INTERNAL] TABLE} name
   PARTITION partition_name [ FORCE  ];
```

Parameter Description

- **INDEX**

  Recreates the specified index.

- **INTERNAL TABLE**

  Recreates the Desc table index of a column-store table. The TOAST table (if any) of the table is reindexed as well.

- **TABLE**

  Recreates all indexes of a specified table. If a table has a TOAST table, the table will also be reindexed. If an index on the table has been invalidated by running **alter unusable**, the index cannot be recreated.

- **DATABASE**

  Recreates all indexes within the current database.

- **SYSTEM**

  Recreates all indexes on system catalogs within the current database. Indexes on user tables are not processed.

- **name**

  Specifies the name of the index, table, or database whose index needs to be recreated. Tables and indexes can be schema-qualified.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **NOTE**
>
> **REINDEX DATABASE** and **SYSTEM** can create indexes for only the current database. Therefore, **name** must be the same as the current database name.

- **FORCE**

  Discarded parameter. It is currently reserved for compatibility with earlier versions.

- **partition_name**

  Specifies the name of the partition or index partition to be recreated.

  Value range:

  - If **REINDEX INDEX** is used, specify the name of an index partition.
  - If it is **REINDEX TABLE**, specify the name of a partition.
  - If it is **REINDEX INTERNAL TABLE**, specify the name of a partition in a column-store partitioned table.

NOTICE

REINDEX DATABASE and **REINDEX SYSTEM** type cannot be performed in transaction blocks.

Examples

```
-- Create a row-store table tpcds.customer_t1 and create an index on the c_customer_sk column in the table.
openGauss=# CREATE TABLE tpcds.customer_t1
(
    c_customer_sk             integer               not null,
    c_customer_id             char(16)              not null,
    c_current_cdemo_sk        integer                       ,
    c_current_hdemo_sk        integer                       ,
    c_current_addr_sk         integer                       ,
    c_first_shipto_date_sk    integer                       ,
    c_first_sales_date_sk     integer                       ,
    c_salutation              char(10)                      ,
    c_first_name              char(20)                      ,
    c_last_name               char(30)                      ,
    c_preferred_cust_flag     char(1)                       ,
    c_birth_day               integer                       ,
    c_birth_month             integer                       ,
    c_birth_year              integer                       ,
    c_birth_country           varchar(20)                   ,
    c_login                   char(13)                      ,
    c_email_address           char(50)                      ,
    c_last_review_date        char(10)
)
WITH (orientation = row);
DISTRIBUTE BY HASH (c_customer_sk);

openGauss=# CREATE INDEX tpcds_customer_index1 ON tpcds.customer_t1 (c_customer_sk);

openGauss=# INSERT INTO tpcds.customer_t1 SELECT * FROM tpcds.customer WHERE c_customer_sk < 10;

-- Rebuild a single index:
openGauss=# REINDEX INDEX tpcds.tpcds_customer_index1;

-- Rebuild all indexes in the tpcds.customer_t1 table:
openGauss=# REINDEX TABLE tpcds.customer_t1;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Delete the tpcds.customer_t1 table:
openGauss=# DROP TABLE tpcds.customer_t1;
```

Suggestions

- INTERNAL TABLE

  This scenario is used for fault recovery. You are not advised to perform concurrent operations.

- DATABASE

  You are not advised to reindex a database in a transaction.

- SYSTEM

  You are not advised to reindex system catalogs in transactions.

12.14.150 REFRESH INCREMENTAL MATERIALIZED VIEW

Function

REFRESH INCREMENTAL MATERIALIZED VIEW refreshes a materialized view in materialized mode.

Precautions

- Incremental refresh supports only incremental materialized views.
- To refresh a materialized view, you must have the SELECT permission on the base table.

Syntax

```
REFRESH INCREMENTAL MATERIALIZED VIEW mv_name;
```

Parameter Description

- **mv_name**

  Name of the materialized view to be refreshed.

Examples

```
-- Create an ordinary table.
openGauss=# CREATE TABLE my_table (c1 int, c2 int);
-- Create an incremental materialized view.
openGauss=# CREATE INCREMENTAL MATERIALIZED VIEW my_imv AS SELECT * FROM my_table;
-- Write data to the base table.
openGauss=# INSERT INTO my_table VALUES(1,1),(2,2);
-- Incrementally refresh the incremental materialized view my_imv.
openGauss=# REFRESH INCREMENTAL MATERIALIZED VIEW my_imv;
```

Helpful Links

ALTER MATERIALIZED VIEW, **CREATE INCREMENTAL MATERIALIZED VIEW**, **CREATE MATERIALIZED VIEW**, **CREATE TABLE**, **DROP MATERIALIZED VIEW**, and **REFRESH MATERIALIZED VIEW**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.14.151 REFRESH MATERIALIZED VIEW

Function

REFRESH MATERIALIZED VIEW refreshes materialized views in full refresh mode.

Precautions

- Full refreshing can be performed on both full and incremental materialized views.
- To refresh a materialized view, you must have the SELECT permission on the base table.

Syntax

```
REFRESH MATERIALIZED VIEW mv_name;
```

Parameter Description

- **mv_name**

  Name of the materialized view to be refreshed.

Examples

```
-- Create an ordinary table.
openGauss=# CREATE TABLE my_table (c1 int, c2 int);
-- Create a full materialized view.
openGauss=# CREATE MATERIALIZED VIEW my_mv AS SELECT * FROM my_table;
-- Create an incremental materialized view.
openGauss=# CREATE INCREMENTAL MATERIALIZED VIEW my_imv AS SELECT * FROM my_table;
-- Write data to the base table.
openGauss=# INSERT INTO my_table VALUES(1,1),(2,2);
-- Fully refresh the full materialized view my_mv.
openGauss=# REFRESH MATERIALIZED VIEW my_mv;
-- Fully refresh the incremental materialized view my_imv.
openGauss=# REFRESH MATERIALIZED VIEW my_imv;
```

Helpful Links

ALTER MATERIALIZED VIEW, **CREATE INCREMENTAL MATERIALIZED VIEW**, **CREATE MATERIALIZED VIEW**, **CREATE TABLE**, **DROP MATERIALIZED VIEW**, and **REFRESH INCREMENTAL MATERIALIZED VIEW**

12.14.152 RELEASE SAVEPOINT

Function

Destroys a savepoint previously defined in the current transaction.

Destroying a savepoint makes it unavailable as a rollback point, but it has no other user visible behavior. It does not undo the effects of statements executed after the savepoint was established. To do that, use **ROLLBACK TO SAVEPOINT**. Destroying a savepoint when it is no longer needed allows the system to reclaim some resources earlier than transaction end.

RELEASE SAVEPOINT also destroys all savepoints that were established after the named savepoint was established.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- Specifying a savepoint name that was not previously defined causes an error.
- It is not possible to release a savepoint when the transaction is in an aborted state.
- If multiple savepoints have the same name, only the one that was most recently defined is released.

Syntax

```
RELEASE [ SAVEPOINT ] savepoint_name;
```

Parameter Description

savepoint_name

Specifies the name of the savepoint you want to destroy.

Examples

```
-- Create a table.
openGauss=# CREATE TABLE tpcds.table1(a int);

-- Start a transaction.
openGauss=# START TRANSACTION;

-- Insert data.
openGauss=# INSERT INTO tpcds.table1 VALUES (3);

-- Establish a savepoint.
openGauss=# SAVEPOINT my_savepoint;

-- Insert data.
openGauss=# INSERT INTO tpcds.table1 VALUES (4);

-- Delete the savepoint.
openGauss=# RELEASE SAVEPOINT my_savepoint;

-- Commit the transaction.
openGauss=# COMMIT;

-- Query the table content, which should contain both 3 and 4.
openGauss=# SELECT * FROM tpcds.table1;

-- Delete the table.
openGauss=# DROP TABLE tpcds.table1;
```

Helpful Links

SAVEPOINT and **ROLLBACK TO SAVEPOINT**

12.14.153 RESET

Function

Restores run-time parameters to their default values. The default values are parameter default values complied in the **postgresql.conf** configuration file.

RESET is an alternative spelling for:

SET configuration_parameter TO DEFAULT

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

RESET and **SET** have the same transaction behavior. Their impact will be rolled back.

Syntax

```
RESET {configuration_parameter | CURRENT_SCHEMA | TIME ZONE | TRANSACTION ISOLATION LEVEL | SESSION AUTHORIZATION | ALL };
```

Parameter Description

- **configuration_parameter**

  Specifies the name of a settable run-time parameter.

  Value range: run-time parameters. You can view them by running the **SHOW ALL** statement.

  NOTE

  Some parameters that viewed by **SHOW ALL** cannot be set by **SET**. For example, **max_datanodes**.

- **CURRENT_SCHEMA**

  Specifies the current schema.

- **TIME ZONE**

  Specifies the time zone.

- **TRANSACTION ISOLATION LEVEL**

  Specifies the transaction isolation level.

- **SESSION AUTHORIZATION**

  Specifies the session authorization.

- **ALL**

  Resets all settable run-time parameters to default values.

Examples

```
-- Reset timezone to the default value:
openGauss=# RESET timezone;

-- Set all parameters to their default values:
openGauss=# RESET ALL;
```

Helpful Links

SET and **SHOW**

12.14.154 REVOKE

Function

REVOKE revokes permissions from one or more roles.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

If a non-owner user of an object attempts to **REVOKE** permission on the object, the statement is executed based on the following rules:

- If the user has no permissions whatsoever on the object, the statement will fail outright.
- If an authorized user has some permissions, only the permissions with authorization options are revoked.
- If the authorized user does not have the authorization option, the **REVOKE ALL PRIVILEGES** form will issue an error message. For other forms of statements, if the permission specified in the statement does not have the corresponding authorization option, the statement will issue a warning.

Syntax

- Revoke the permission on a specified table or view.

```
REVOKE [ GRANT OPTION FOR ]
    { { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | ALTER | DROP | COMMENT |
INDEX | VACUUM }[, ...]
    | ALL [ PRIVILEGES ] }
    ON { [ TABLE ] table_name [, ...]
        | ALL TABLES IN SCHEMA schema_name [, ...] }
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified field in a table.

```
REVOKE [ GRANT OPTION FOR ]
    { {{ SELECT | INSERT | UPDATE | REFERENCES | COMMENT } ( column_name [, ...] )}[, ...]
    | ALL [ PRIVILEGES ] ( column_name [, ...] ) }
    ON [ TABLE ] table_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified sequence.

```
REVOKE [ GRANT OPTION FOR ]
    { { SELECT | UPDATE | ALTER | DROP | COMMENT }[, ...]
    | ALL [ PRIVILEGES ] }
    ON { [ SEQUENCE ] sequence_name [, ...]
        | ALL SEQUENCES IN SCHEMA schema_name [, ...] }
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified database.

```
REVOKE [ GRANT OPTION FOR ]
    { { CREATE | CONNECT | TEMPORARY | TEMP | ALTER | DROP | COMMENT } [, ...]
    | ALL [ PRIVILEGES ] }
    ON DATABASE database_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified domain.

```
REVOKE [ GRANT OPTION FOR ]
    { USAGE | ALL [ PRIVILEGES ] }
    ON DOMAIN domain_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the specified CMK permission.

```
REVOKE [ GRANT OPTION FOR ]
    { { USAGE | DROP } [, ...] | ALL [PRIVILEGES] }
    ON CLIENT_MASTER_KEYS client_master_keys_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the specified CEK permission.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
REVOKE [ GRANT OPTION FOR ]
    { { USAGE | DROP } [, ...] | ALL [PRIVILEGES]}
    ON COLUMN_ENCRYPTION_KEYS column_encryption_keys_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified directory.

```
REVOKE [ GRANT OPTION FOR ]
    { { READ | WRITE | ALTER | DROP } [, ...] | ALL [ PRIVILEGES ] }
    ON DIRECTORY directory_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified external data source.

```
REVOKE [ GRANT OPTION FOR ]
   { USAGE | ALL [ PRIVILEGES ] }
    ON FOREIGN DATA WRAPPER fdw_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified external server.

```
REVOKE [ GRANT OPTION FOR ]
    { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
    ON FOREIGN SERVER server_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified function.

```
REVOKE [ GRANT OPTION FOR ]
    { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
    ON { FUNCTION {function_name ( [ {[ argmode ] [ arg_name ] arg_type} [, ...] ] )} [, ...]
       | ALL FUNCTIONS IN SCHEMA schema_name [, ...] }
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified stored procedure.

```
REVOKE [ GRANT OPTION FOR ]
    { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
    ON { PROCEDURE {proc_name ( [ {[ argmode ] [ arg_name ] arg_type} [, ...] ] )} [, ...]
       | ALL PROCEDURE IN SCHEMA schema_name [, ...] }
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified procedural language.

```
REVOKE [ GRANT OPTION FOR ]
   { USAGE | ALL [ PRIVILEGES ] }
    ON LANGUAGE lang_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified large object.

```
REVOKE [ GRANT OPTION FOR ]
    { { SELECT | UPDATE } [, ...] | ALL [ PRIVILEGES ] }
    ON LARGE OBJECT loid [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified schema.

```
REVOKE [ GRANT OPTION FOR ]
    { { CREATE | USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
    ON SCHEMA schema_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified tablespace.

```
REVOKE [ GRANT OPTION FOR ]
    { { CREATE  | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
    ON TABLESPACE tablespace_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
REVOKE [ GRANT OPTION FOR ]
  { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
   ON TYPE type_name [, ...]
   FROM { [ GROUP ] role_name | PUBLIC } [, ...]
   [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified sub-cluster.

```
REVOKE [ GRANT OPTION FOR ]
   { { CREATE | USAGE | COMPUTE  | ALTER | DROP } [, ...] | ALL [ PRIVILEGES ] }
   ON NODE GROUP group_name [, ...]
   FROM { [ GROUP ] role_name | PUBLIC } [, ...]
   [ CASCADE | RESTRICT ];
```

  NOTE

  When the **create** permission on a sub-cluster is revoked, the **usage** and **compute** permissions are revoked by default.

- Revoke the permission on a data source object.

```
REVOKE [ GRANT OPTION FOR ]
  { USAGE | ALL [PRIVILEGES] }
   ON DATA SOURCE src_name [, ...]
   FROM {[GROUP] role_name | PUBLIC} [, ...]
   [ CASCADE | RESTRICT ];
```

- Revoke the permission on a directory object.

```
REVOKE [ GRANT OPTION FOR ]
  { { READ | WRITE } [, ...] | ALL [PRIVILEGES] }
  ON DIRECTORY directory_name [, ...]
  FROM {[GROUP] role_name | PUBLIC} [, ...]
  [ CASCADE | RESTRICT ];
```

- Revoke the permission on a package object.

```
REVOKE [ GRANT OPTION FOR ]
  { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
  ON PACKAGE package_name [, ...]
  FROM {[GROUP] role_name | PUBLIC} [, ...]
  [ CASCADE | RESTRICT ];
```

- Revoke permissions from a role.

```
REVOKE [ ADMIN OPTION FOR ]
   role_name [, ...] FROM role_name [, ...]
   [ CASCADE | RESTRICT ];
```

- Revoke the sysadmin permission from a role.

```
REVOKE ALL { PRIVILEGES | PRIVILEGE } FROM role_name;
```

- Revoke the ANY permissions.

```
REVOKE [ ADMIN OPTION FOR ]
 { CREATE ANY TABLE | ALTER ANY TABLE | DROP ANY TABLE | SELECT ANY TABLE | INSERT ANY
TABLE | UPDATE ANY TABLE |
 DELETE ANY TABLE | CREATE ANY SEQUENCE | CREATE ANY INDEX | CREATE ANY FUNCTION |
EXECUTE ANY FUNCTION |
 CREATE ANY PACKAGE | EXECUTE ANY PACKAGE | CREATE ANY TYPE } [, ...]
 FROM [ GROUP ] role_name [, ...];
```

Parameter Description

The keyword **PUBLIC** indicates an implicitly defined group that has all roles.

For details about permission types and parameters, see section "GRANT".

Permissions of a role include the permissions directly granted to the role, permissions inherited from the parent role, and permissions granted to **PUBLIC**. Therefore, revoking the **SELECT** permission for an object from **PUBLIC** does not necessarily mean that the **SELECT** permission for the object has been revoked from all roles, because the **SELECT** permission directly granted to roles and inherited from parent roles remains. Similarly, if the **SELECT** permission is revoked

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

from a user but is not revoked from **PUBLIC**, the user can still run the **SELECT** statement.

If **GRANT OPTION FOR** is specified, the permission cannot be granted to others, but permission itself is not revoked.

If user A holds the **UPDATE** permissions on a table and the **WITH GRANT OPTION** and has granted them to user B, the permissions that user B holds are called dependent permissions. If the permissions or the grant option held by user A is revoked, the dependent permissions still exist. Those dependent permissions are also revoked if **CASCADE** is specified.

A user can only revoke permissions that were granted directly by that user. For example, if user A has granted permission with grant option (**WITH ADMIN OPTION**) to user B, and user B has in turn granted it to user C, then user A cannot revoke the permission directly from C. However, user A can revoke the grant option held by user B and use **CASCADE**. In this way, the permission of user C is automatically revoked. For another example, if both user A and user B have granted the same permission to C, A can revoke his own grant but not B's grant, so C will still effectively have the permission.

If the role executing **REVOKE** holds permissions indirectly via more than one role membership path, it is unspecified which containing role will be used to execute the statement. In such cases, you are advised to use **SET ROLE** to become the specific role you want to do the **REVOKE** as, and then execute REVOKE. Failure to do so may lead to deleting permissions not intended to delete, or not deleting any permissions at all.

Examples

See **Examples** in section "GRANT".

Helpful Links

GRANT

12.14.155 ROLLBACK

Function

ROLLBACK rolls back the current transaction and backs out all updates in the transaction.

ROLLBACK backs out of all changes that a transaction makes to a database if the transaction fails to be executed due to a fault.

Precautions

If a **ROLLBACK** statement is executed out of a transaction, no error occurs, but a notice is displayed.

Syntax

```
ROLLBACK [ WORK | TRANSACTION ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter Description

WORK | TRANSACTION

Specifies the optional keyword that more clearly illustrates the syntax.

Examples

```
-- Start a transaction.
openGauss=# START TRANSACTION;

-- Back out all changes.
openGauss=# ROLLBACK;
```

Helpful Links

COMMIT | END

12.14.156 ROLLBACK PREPARED

Function

Cancels a transaction ready for two-phase committing.

Precautions

- The function is only available in maintenance mode (when GUC parameter **xc_maintenance_mode** is **on**). Exercise caution when enabling the mode. It is used by maintenance engineers for troubleshooting. Common users should not use the mode.
- Only the user that initiates a transaction or the system administrator can roll back the transaction.
- The transaction function is maintained automatically by the database, and should be not visible to users.

Syntax

```
ROLLBACK PREPARED transaction_id ;
```

Parameter Description

transaction_id

Specifies the identifier of the transaction to be committed. The identifier must be different from those for current prepared transactions.

Helpful Links

COMMIT PREPARED and **PREPARE TRANSACTION**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.14.157 ROLLBACK TO SAVEPOINT

Function

Rolls back to a savepoint. It implicitly destroys all savepoints that were established after the named savepoint.

Rolls back all statements that were executed after the savepoint was established. The savepoint remains valid and can be rolled back to again later, if needed.

Precautions

- Specifying a savepoint name that has not been established is an error.
- Cursors have somewhat non-transactional behavior with respect to savepoints. Any cursor that is opened inside a savepoint will be closed when the savepoint is rolled back. If a previously opened cursor is affected by a **FETCH** or **MOVE** statement inside a savepoint that is later rolled back, the cursor remains at the position that **FETCH** left it pointing to (that is, the cursor motion caused by **FETCH** is not rolled back). Closing a cursor is not undone by rolling back, either. A cursor whose execution causes a transaction to abort is put in a cannot-execute state, so while the transaction can be restored using **ROLLBACK TO SAVEPOINT**, the cursor can no longer be used.
- Use **ROLLBACK TO SAVEPOINT** to roll back to a savepoint. Use **RELEASE SAVEPOINT** to destroy a savepoint but keep the effects of the statements executed after the savepoint was established.

Syntax

```
ROLLBACK [ WORK | TRANSACTION ] TO [ SAVEPOINT ] savepoint_name;
```

Parameter Description

savepoint_name

Rolls back to a savepoint.

Examples

```
-- Undo the effects of the statements executed after my_savepoint was established:
openGauss=# START TRANSACTION;
openGauss=# SAVEPOINT my_savepoint;
openGauss=# ROLLBACK TO SAVEPOINT my_savepoint;
-- Cursor positions are not affected by savepoint rollback.
openGauss=# DECLARE foo CURSOR FOR SELECT 1 UNION SELECT 2;
openGauss=# SAVEPOINT foo;
openGauss=# FETCH 1 FROM foo;
 ?column?
----------
        1
openGauss=# ROLLBACK TO SAVEPOINT foo;

SAVEPOINT and **RELEASE SAVEPOINT**

12.14.158 SAVEPOINT

Function

SAVEPOINT establishes a new savepoint within the current transaction.

A savepoint is a special mark inside a transaction. It allows all statements that are executed after it was established to be rolled back, restoring the transaction state to what it was at the time of the savepoint.

Precautions

- Use **ROLLBACK TO SAVEPOINT** to roll back to a savepoint. Use **RELEASE SAVEPOINT** to destroy a savepoint but keep the effects of the statements executed after the savepoint was established.
- Savepoints can only be established when inside a transaction block. Multiple savepoints can be defined in a transaction.
- In the case of an unexpected termination of a distributed thread or process caused by a node or connection failure, or of an error caused by the inconsistency between source and destination table structures in a COPY FROM operation, the transaction cannot be rolled back to the established savepoint. Instead, the entire transaction will be rolled back.
- According to the SQL standard, when a savepoint with the same name is created, the previous savepoint with the same name is automatically deleted. In GaussDB, the old savepoint is retained, but only the latest one is used during rollback or release. Releasing the newer savepoint with **RELEASE SAVEPOINT** will cause the older one to again become accessible to **ROLLBACK TO SAVEPOINT** and **RELEASE SAVEPOINT**. In addition, **SAVEPOINT** fully complies with the SQL standard.

Syntax

```
SAVEPOINT savepoint_name;
```

Parameter Description

savepoint_name

Specifies the name of the new savepoint.

Examples

```
-- Create a table.
openGauss=# CREATE TABLE table1(a int);

-- Start a transaction.
openGauss=# START TRANSACTION;

-- Insert data.
openGauss=# INSERT INTO table1 VALUES (1);

-- Create a savepoint.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
openGauss=# SAVEPOINT my_savepoint;

-- Insert data.
openGauss=# INSERT INTO table1 VALUES (2);

-- Roll back the savepoint.
openGauss=# ROLLBACK TO SAVEPOINT my_savepoint;

-- Insert data.
openGauss=# INSERT INTO table1 VALUES (3);

-- Commit the transaction.
openGauss=# COMMIT;

-- Query the content of the table. You can see 1 and 3 at the same time, but cannot see 2 because 2 is
rolled back.
openGauss=# SELECT * FROM table1;

-- Delete the table.
openGauss=# DROP TABLE table1;

-- Create a table.
openGauss=# CREATE TABLE table2(a int);

-- Start a transaction.
openGauss=# START TRANSACTION;

-- Insert data.
openGauss=# INSERT INTO table2 VALUES (3);

-- Create a savepoint.
openGauss=# SAVEPOINT my_savepoint;

-- Insert data.
openGauss=# INSERT INTO table2 VALUES (4);

-- Roll back the savepoint.
openGauss=# RELEASE SAVEPOINT my_savepoint;

-- Commit the transaction.
openGauss=# COMMIT;

-- Query the table content. You can see 3 and 4 at the same time.
openGauss=# SELECT * FROM table2;

-- Delete the table.
openGauss=# DROP TABLE table2;
```

RELEASE SAVEPOINT and **ROLLBACK TO SAVEPOINT**

12.14.159 SELECT

Function

SELECT retrieves data from a table or view.

Serving as an overlaid filter for a database table, **SELECT** filters required data from the table using SQL keywords.

Precautions

- The owner of a table, users granted with the **SELECT** permission on the table, or users granted with the **SELECT ANY TABLE** permission can read data in the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

table or view. The system administrator has the permission to read data in the table or view by default.

- Using **SELECT** can join ordinary tables, but cannot join ordinary and GDS foreign tables. That is, the **SELECT** statement cannot contain both an ordinary table and a GDS foreign table.
- You must have the **SELECT** permission on each field used in the SELECT statement.
- **UPDATE** permission is required when **FOR UPDATE** or **FOR SHARE** is used.

Syntax

- Querying Data

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
SELECT [/*+ plan_hint */] [ ALL | DISTINCT [ ON ( expression [, ...] ) ] ]
   { * | {expression [ [ AS ] output_name ]} [, ...] }
   [ FROM from_item [, ...] ]
   [ WHERE condition ]
   [ GROUP BY grouping_element [, ...] ]
   [ HAVING condition [, ...] ]
   [ WINDOW {window_name AS ( window_definition )} [, ...] ]
   [ { UNION | INTERSECT | EXCEPT | MINUS } [ ALL | DISTINCT ] select ]
   [ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS { FIRST |
LAST } ]} [, ...] ]
   [ LIMIT { [offset,] count | ALL } ]
   [ OFFSET start [ ROW | ROWS ] ]
   [ FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY ]
   [ {FOR { UPDATE | SHARE } [ OF table_name [, ...] ] [ NOWAIT | WAIT N]} [...] ]
TABLE { ONLY { (table_name) | table_name } | table_name [ * ]};
```

NOTE

In condition and expression, you can use the aliases of expressions in **targetlist** in compliance with the following rules:

- Reference only within the same level.
- Only reference aliases in **targetlist**.
- Reference a prior expression in a subsequent expression.
- The **volatile** function cannot be used.
- The **Window** function cannot be used.
- Aliases cannot be referenced in the **join on** condition.
- An error is reported if **targetlist** contains multiple referenced aliases.

- The subquery **with_query** is as follows:

```
with_query_name [ ( column_name [, ...] ) ]
   AS [ [ NOT ] MATERIALIZED ] ( {select | values | insert | update | delete} )
```

- The specified query source **from_item** is as follows:

```
{[ ONLY ] table_name [ * ] [ partition_clause ] [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
[ TABLESAMPLE sampling_method ( argument [, ...] ) [ REPEATABLE ( seed ) ] ]
|( select ) [ AS ] alias [ ( column_alias [, ...] ) ]
|with_query_name [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
|function_name ( [ argument [, ...] ] ) [ AS ] alias [ ( column_alias [, ...] | column_definition [, ...] ) ]
|function_name ( [ argument [, ...] ] ) AS ( column_definition [, ...] )
|from_item [ NATURAL ] join_type from_item [ ON join_condition | USING ( join_column [, ...] ) ]}
```

- The **group** clause is as follows:

```
( )
| expression
| ( expression [, ...] )
| ROLLUP ( { expression | ( expression [, ...] ) } [, ...] )
| CUBE ( { expression | ( expression [, ...] ) } [, ...] )
| GROUPING SETS ( grouping_element [, ...] )
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The specified partition **partition_clause** is as follows:
```
PARTITION { ( partition_name ) |
      FOR (  partition_value [, ...] ) }
```

  NOTE

  The specified partition applies only to ordinary tables.

- The sorting order **nlssort_expression_clause** is as follows:
```
NLSSORT ( column_name, ' NLS_SORT = { SCHINESE_PINYIN_M | generic_m_ci } ' )
```
  The second parameter can be **generic_m_ci**, which supports only the case-insensitive order for English characters.
- Simplified query syntax, equivalent to **select * from table_name**.
```
TABLE { ONLY {(table_name)| table_name} | table_name [ * ]};
```

Parameter Description

- **WITH [RECURSIVE] with_query [, ...]**

  Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table.

  If **RECURSIVE** is specified, it allows a **SELECT** subquery to reference itself by name.

  The detailed format of **with_query** is as follows: **with_query_name [(column_name [, ...])] AS [[NOT] MATERIALIZED] ({select | values | insert | update | delete})**

  - **with_query_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.
  - **column_name** specifies the column name displayed in the subquery result set.
  - Each subquery can be a **SELECT**, **VALUES**, **INSERT**, **UPDATE** or **DELETE** statement.
  - You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE. Currently, only inline execution is supported for stream plans. In this case, this syntax does not take effect.
    - If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery cannot be jointly optimized with the SELECT statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.
    - If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the SELECT statement trunk to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.
- **plan_hint** clause

  Follows the **SELECT** keyword in the /*+<*Plan hint*> */ format. It is used to optimize the plan of a **SELECT** statement block. For details, see **Hint-based**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Tuning. In each statement, only the first **/*+** *plan_hint* ***/** comment block takes effect as a hint. Multiple hints can be written.

- **ALL**

  Specifies that all rows that meet the conditions are returned. This is the default behavior and can be omitted.

- **DISTINCT [ON (expression [, ...])]**

  Removes all duplicate rows from the **SELECT** result set so one row is kept from each group of duplicates.

  Retains only the first row in the set of rows that have the same result calculated on the given expression.

  NOTICE

  DISTINCT ON expression is explained with the same rule of **ORDER BY**. Unless you use **ORDER BY** to ensure that the required row appears first, you cannot know what the first row is.

- **SELECT list**

  Specifies the name of a column in the table to be queried. The value can be a part of the column name or all of the column names. The wildcard (*) is used to represent the column name.

  You may use the **AS output_name** clause to give an alias for an output column. The alias is used for the displaying of the output column. The name, value, and type keywords can be used as column aliases.

  Column names can be expressed in the following formats:

  – Manually input column names which are spaced using commas (,).
  – Columns computed in the **FROM** clause.

- **FROM clause**

  Specifies one or more source tables for **SELECT**.

  The **FROM** clause can contain the following elements:

  – table_name

    Specifies the name of a table or view. The schema name can be added before the table name or view name, for example, schema_name.table_name.

  – alias

    Gives a temporary alias to a table to facilitate the quotation by other queries.

    An alias is used for brevity or to eliminate ambiguity for self-joins. If an alias is provided, it completely replaces the actual name of the table.

  – TABLESAMPLE *sampling_method* (*argument* [, ...]) [REPEATABLE (*seed*)]

    The **TABLESAMPLE** clause following *table_name* specifies that the specified *sampling_method* should be used to retrieve the subset of rows in the table.

    The optional **REPEATABLE** clause specifies the number of seeds used to generate random numbers in the sampling method. The seed value can

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

be any non-null constant value. If the table was not changed during the query, the two queries having the same seed and *argument* values will select the same sampling in this table. However, different seed values usually generate different samples. If **REPEATABLE** is not specified, a new random sample will be selected for each query based on the seed generated by the system.

- column_alias

  Specifies the column alias.

- PARTITION

  Queries data in the specified partition in a partitioned table.

- partition_name

  Specifies the name of a partition.

- partition_value

  Specifies the value of the specified partition key. If there are many partition keys, use the **PARTITION FOR** clause to specify the value of the only partition key you want to use.

- subquery

  Performs a subquery in the **FROM** clause. A temporary table is created to save subquery results.

- with_query_name

  Specifies that the **WITH** clause can also be used as the source of the **FROM** clause and can be referenced by the name of the **WITH** query.

- function_name

  Function name Function calls can appear in the **FROM** clause.

- join_type

  The options are as follows:

  - [INNER] JOIN

    A **JOIN** clause combines two **FROM** items. You can use parentheses to determine the order of nesting. In the absence of parentheses, **JOIN** nests left-to-right.

    In any case, **JOIN** binds more tightly than the commas separating **FROM** items.

  - LEFT [OUTER] JOIN

    Returns all rows that meet join conditions in the Cartesian product, plus those rows that do not match the right table rows in the left table by join conditions. This left-hand row is extended to the full width of the joined table by inserting **NULL** values for the right-hand columns. Note that only the **JOIN** clause's own condition is considered while the system decides which rows have matches. Outer conditions are applied afterward.

  - RIGHT [OUTER] JOIN

    Returns all the joined rows, plus one row for each unmatched right-hand row (extended with **NULL** on the left).

    This is just a notational convenience, since you could convert it to a **LEFT OUTER JOIN** by switching the left and right inputs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- FULL [OUTER] JOIN

  Returns all the joined rows, pluses one row for each unmatched left-hand row (extended with **NULL** on the right), and pluses one row for each unmatched right-hand row (extended with **NULL** on the left).

- CROSS JOIN

  Is equivalent to **INNER JOIN ON (TRUE)**, which means no rows are removed by qualification. These join types are just a notational convenience, since they do nothing you could not do with plain **FROM** and **WHERE**.

  NOTE

  For the **INNER** and **OUTER** join types, a join condition must be specified, namely exactly one of **NATURAL ON**, **join_condition**, or **USING (join_column [, ...])**. For **CROSS JOIN**, none of these clauses can appear.

CROSS JOIN and **INNER JOIN** produce a simple Cartesian product, the same result as you get from listing the two items at the top level of **FROM**.

– ON join_condition

  Defines which rows have matches in joins. Example: ON left_table.a = right_table.a You are not advised to use numeric types such as int for **join_condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

– USING(join_column[, ...])

  ON left_table.a = right_table.a AND left_table.b = right_table.b ... abbreviation. Corresponding columns must have the same name.

– NATURAL

  Is a shorthand for a **USING** list that mentions all columns in the two tables that have the same names.

– from item

  Specifies the name of the query source object connected.

- **WHERE clause**

  Forms an expression for row selection to narrow down the query range of **SELECT**. **condition** indicates any expression that returns a value of Boolean type. Rows that do not meet this condition will not be retrieved. You are not advised to use numeric types such as int for **condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

  In the **WHERE** clause, you can use the operator (+) to convert a table join to an outer join. However, this method is not recommended because it is not the standard SQL syntax and may raise syntax compatibility issues during platform migration. There are many restrictions on using the operator (+):

  a. It can appear only in the **WHERE** clause.
  b. If a table join has been specified in the **FROM** clause, the operator (+) cannot be used in the **WHERE** clause.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

c. The operator (+) can work only on columns of tables or views, instead of on expressions.

d. If table A and table B have multiple join conditions, the operator (+) must be specified in all the conditions. Otherwise, the operator (+) will not take effect, and the table join will be converted into an inner join without any prompt information.

e. Tables specified in a join condition where the operator (+) works cannot cross queries or subqueries. If tables where the operator (+) works are not in the **FROM** clause of the current query or subquery, an error will be reported. If a peer table for the operator (+) does not exist, no error will be reported and the table join will be converted into an inner join.

f. Expressions where the operator (+) is used cannot be directly connected through **OR**.

g. If a column where the operator (+) works is compared with a constant, the expression becomes a part of the join condition.

h. A table cannot have multiple foreign tables.

i. The operator (+) can appear only in the following expressions: comparison, NOT, ANY, ALL, IN, NULLIF, IS DISTINCT FROM, and IS OF. It is not allowed in other types of expressions. In addition, these expressions cannot be connected through **AND** or **OR**.

j. The operator (+) can be used to convert a table join only to a left or right outer join, instead of a full join. That is, the operator (+) cannot be specified on both tables of an expression.

NOTICE

For the **WHERE** clause, if special character "%", "_", or "\" is queried in **LIKE**, add the slash "\" before each character.

- **GROUP BY clause**

  Condenses query results into a single row all selected rows that share the same values for the grouped expressions.

  – CUBE ({ expression | (expression [, ...]) } [, ...])

    A CUBE grouping is an extension to the GROUP BY clause that creates subtotals for all of the possible combinations of the given list of grouping columns (or expressions). In terms of multidimensional analysis, CUBE generates all the subtotals that could be calculated for a data cube with the specified dimensions. Notice that n elements of a CUBE translate to 2n grouping sets. For example, if the CUBE clause contains three expressions (n = 3), the number of result sets = $2^n = 2^3 = 8$ groups. Rows grouped on the values of *n* expressions are called regular rows, and the rest are called superaggregate rows.

  – GROUPING SETS (grouping_element [, ...])

    Is another extension to the **GROUP BY** clause. It allows users to specify multiple **GROUP BY** clauses. This improves efficiency by trimming away unnecessary data. After you specify the set of groups that you want to create using a **GROUPING SETS** expression within a **GROUP BY** clause, the database does not need to compute a whole **ROLLUP** or **CUBE**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

If the **SELECT** list expression quotes some ungrouped fields and no aggregate function is used, an error is displayed. This is because multiple values may be returned for ungrouped fields.

- **HAVING clause**

  Selects special groups by working with the **GROUP BY** clause. The **HAVING** clause compares some attributes of groups with a constant. Only groups that matching the logical expression in the **HAVING** clause are extracted.

- **WINDOW clause**

  The general format is **WINDOW window_name AS (window_definition) [, ...]**. **window_name** is a name can be referenced by **window_definition**. **window_definition** can be expressed in the following forms:

  [existing_window_name]

  [PARTITION BY expression [, ...]]

  [ORDER BY expression [ASC | DESC | USING operator] [NULLS { FIRST | LAST }] [, ...]]

  [frame_clause]

  frame_clause defines a **window frame** for the window function. The window function (not all window functions) depends on **window frame** and **window frame** is a set of relevant rows of the current query row. **frame_clause** can be expressed in the following forms:

  [RANGE | ROWS] frame_start

  [RANGE | ROWS] BETWEEN frame_start AND frame_end

  frame_start and **frame_end** can be expressed in the following forms:

  UNBOUNDED PRECEDING

  value PRECEDING

  CURRENT ROW

  value FOLLOWING

  UNBOUNDED FOLLOWING

NOTICE

For the query of column storage table, only **row_number** window function is supported, and **frame_clause** is not supported.

- **UNION clause**

  Computes the set union of the rows returned by the involved **SELECT** statements.

  The **UNION** clause has the following constraints:

  – By default, the result of **UNION** does not contain any duplicate rows unless the **ALL** clause is declared.

  – Multiple **UNION** operators in the same **SELECT** statement are evaluated left to right, unless otherwise specified by parentheses.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **FOR UPDATE** cannot be specified either for a **UNION** result or for any input of a **UNION**.

  General format:

  select_statement UNION [ALL] select_statement

  - **select_statement** can be any **SELECT** statement without an **ORDER BY**, **LIMIT**, or **FOR UPDATE** statement.
  - **ORDER BY** and **LIMIT** can be attached to the subexpression if it is enclosed in parentheses.

- **INTERSECT clause**

  Computes the set intersection of rows returned by the involved **SELECT** statements. The result of **INTERSECT** does not contain any duplicate rows.

  The **INTERSECT** clause has the following constraints:

  - Multiple **INTERSECT** operators in the same **SELECT** statement are evaluated left to right, unless otherwise specified by parentheses.
  - Processing **INTERSECT** preferentially when **UNION** and **INTERSECT** operations are executed for results of multiple **SELECT** statements.

  General format:

  select_statement INTERSECT select_statement

  select_statement can be any **SELECT** statement without a **FOR UPDATE** clause.

- **EXCEPT clause**

  Has the following common form:

  select_statement EXCEPT [ALL] select_statement

  select_statement can be any **SELECT** statement without a **FOR UPDATE** clause.

  The **EXCEPT** operator computes the set of rows that are in the result of the left **SELECT** statement but not in the result of the right one.

  The result of **EXCEPT** does not contain any duplicate rows unless the **ALL** clause is declared. To execute **ALL**, a row that has *m* duplicates in the left table and *n* duplicates in the right table will appear MAX(*m*–*n*, 0) times in the result set.

  Multiple **EXCEPT** operators in the same **SELECT** statement are evaluated left to right, unless parentheses dictate otherwise. **EXCEPT** binds at the same level as **UNION**.

  Currently, **FOR UPDATE** cannot be specified either for an **EXCEPT** result or for any input of an **EXCEPT**.

- **MINUS clause**

  Has the same function and syntax as **EXCEPT** clause.

- **ORDER BY clause**

  Sorts data retrieved by **SELECT** in descending or ascending order. If the **ORDER BY** expression contains multiple columns:

  - If two columns are equal according to the leftmost expression, they are compared according to the next expression and so on.
  - If they are equal according to all specified expressions, they are returned in an implementation-dependent order.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - When used with the **DISTINCT** keyword, the columns to be sorted in **ORDER BY** must be included in the columns of the result set retrieved by the SELECT statement.
  - When used with the **GROUP BY** clause, the columns to be sorted in **ORDER BY** must be included in the columns of the result set retrieved by the SELECT statement.

NOTICE

To support Chinese pinyin order, specify the **UTF-8**, **GB18030**, or **GBK** encoding mode during database initiation. The statements are as follows:

initdb –E UTF8 –D ../data –locale=zh_CN.UTF-8, initdb -E GB18030 -D ../data -locale=zh_CN.GB18030, or initdb –E GBK –D ../data –locale=zh_CN.GBK.

- **LIMIT clause**

  Consists of two independent sub-clauses:

  LIMIT { count | ALL }

  OFFSET start count specifies the maximum number of rows to return, while **start** specifies the number of rows to skip before starting to return rows. When both are specified, **start** rows are skipped before starting to count the **count** rows to be returned.

- **OFFSET clause**

  The SQL: 2008 standard has introduced a different clause:

  OFFSET start { ROW | ROWS }

  start specifies the number of rows to skip before starting to return rows.

- **FETCH { FIRST | NEXT } [count] { ROW | ROWS } ONLY**

  If **count** is omitted in a **FETCH** clause, it defaults to **1**.

- **FOR UPDATE clause**

  Locks rows retrieved by **SELECT**. This ensures that the rows cannot be modified or deleted by other transactions until the current transaction ends. That is, other transactions that attempt **UPDATE**, **DELETE**, or **SELECT FOR UPDATE** of these rows will be blocked until the current transaction ends.

  To prevent the operation from waiting for the commit of other transactions, you can use **NOWAIT**. If the selected row cannot be locked immediately, an error is reported immediately when you execute **SELECT FOR UPDATE NOWAIT**. If you use **WAIT N** and the selected row cannot be locked immediately, the operation needs to wait for *N* seconds (the value of *N* is of the int type with a range of $0 \leq N \leq 2147483$). If the lock is obtained within *N* seconds, the operation is performed normally. Otherwise, an error is reported.

  FOR SHARE behaves similarly, except that it acquires a shared rather than exclusive lock on each retrieved row. A share lock blocks other transaction from performing **UPDATE**, **DELETE**, or **SELECT FOR UPDATE** on these rows, but it does not prevent them from performing **SELECT FOR SHARE**.

  If specified tables are named in **FOR UPDATE** or **FOR SHARE**, then only rows coming from those tables are locked. Any other tables used in **SELECT** are simply read as usual. Otherwise, locking all tables in the statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If **FOR UPDATE** or **FOR SHARE** is applied to a view or sub-query, it affects all tables used in the view or sub-query.

Multiple **FOR UPDATE** and **FOR SHARE** clauses can be written if it is necessary to specify different locking behaviors for different tables.

If the same table is mentioned (or implicitly affected) by both **FOR UPDATE** and **FOR SHARE** clauses, it is processed as **FOR UPDATE**. Similarly, a table is processed as **NOWAIT** if that is specified in any of the clauses affecting it.

NOTICE

- For SQL statements containing **FOR UPDATE** or **FOR SHARE**, their execution plans will be pushed down to DNs. If the pushdown fails, an error will be reported.
- The query of column-store tables does not support **for update/share**.

- **NLS_SORT**

  Specifies that a field is sorted in a special order. Currently, only Chinese Pinyin and case-insensitive sorting are supported. To support this sorting mode, you need to set the encoding format to UTF8, GB18030, or GBK when creating a database. If you set the encoding format to another format, for example, SQL_ASCII, an error may be reported or the sorting mode may be invalid.

  Value range:

  – **SCHINESE_PINYIN_M**, sorted by Pinyin order.

  – **generic_m_ci**: sorted in case-insensitive order (optional; only English characters are supported in the case-insensitive order.)

- **PARTITION clause**

  Queries data in the specified partition in a partitioned table.

Example

```
-- Obtain the temp_t temporary table by a subquery and query all records in this table.
openGauss=# WITH temp_t(name,isdba) AS (SELECT usename,usesuper FROM pg_user) SELECT * FROM
temp_t;

-- Query all r_reason_sk records in the tpcds.reason table and delete duplicate records.
openGauss=# SELECT DISTINCT(r_reason_sk) FROM tpcds.reason;

-- Example of a LIMIT clause: Obtain a record from the table.
openGauss=# SELECT * FROM tpcds.reason LIMIT 1;

-- Query all records and sort them in alphabetic order.
openGauss=# SELECT r_reason_desc FROM tpcds.reason ORDER BY r_reason_desc;

-- Use table aliases to obtain data from the pg_user and pg_user_status tables:
openGauss=# SELECT a.usename,b.locktime FROM pg_user a,pg_user_status b WHERE a.usesysid=b.roloid;

-- Example of the FULL JOIN clause: Join data in the pg_user and pg_user_status tables.
openGauss=# SELECT a.usename,b.locktime,a.usesuper FROM pg_user a FULL JOIN pg_user_status b on
a.usesysid=b.roloid;

-- Example of the GROUP BY clause: Filter data based on query conditions, and group the results.
openGauss=# SELECT r_reason_id, AVG(r_reason_sk) FROM tpcds.reason GROUP BY r_reason_id HAVING
AVG(r_reason_sk) > 25;

-- Example of the GROUP BY CUBE clause: Filter data based on query conditions, and group the results.
openGauss=# SELECT r_reason_id,AVG(r_reason_sk) FROM tpcds.reason GROUP BY
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
CUBE(r_reason_id,r_reason_sk);

-- Example of the GROUP BY GROUPING SETS clause: Filter data based on query conditions, and group the
results.
openGauss=# SELECT r_reason_id,AVG(r_reason_sk) FROM tpcds.reason GROUP BY GROUPING
SETS((r_reason_id,r_reason_sk),r_reason_sk);

-- Example of the UNION clause: Merge the names started with W and N in the r_reason_desc column in
the tpcds.reason table.
openGauss=# SELECT r_reason_sk, tpcds.reason.r_reason_desc
    FROM tpcds.reason
    WHERE tpcds.reason.r_reason_desc LIKE 'W%'
UNION
SELECT r_reason_sk, tpcds.reason.r_reason_desc
    FROM tpcds.reason
    WHERE tpcds.reason.r_reason_desc LIKE 'N%';

-- Example of the NLS_SORT clause: Sort by Chinese Pinyin.
openGauss=# SELECT * FROM tpcds.reason ORDER BY NLSSORT( r_reason_desc, 'NLS_SORT =
SCHINESE_PINYIN_M');

-- sorting by case-insensitive order (optional; only English characters are supported in the case-insensitive
order.)
openGauss=# SELECT * FROM tpcds.reason ORDER BY NLSSORT( r_reason_desc, 'NLS_SORT =
generic_m_ci');

-- Create a partitioned table tpcds.reason_p.
openGauss=# CREATE TABLE tpcds.reason_p
(
  r_reason_sk integer,
  r_reason_id character(16),
  r_reason_desc character(100)
)
PARTITION BY RANGE (r_reason_sk)
(
  partition P_05_BEFORE values less than (05),
  partition P_15 values less than (15),
  partition P_25 values less than (25),
  partition P_35 values less than (35),
  partition P_45_AFTER values less than (MAXVALUE)
)
;

-- Insert data.

openGauss=# DROP TABLE tpcds.reason_p;
```

12.14.160 SELECT INTO

Function

Defines a new table based on a query result and inserts data obtained by query to the new table.

Different from **SELECT**, data found by **SELECT INTO** is not returned to the client. The table columns have the same names and data types as the output columns of the **SELECT**.

Precautions

CREATE TABLE AS provides functions similar to **SELECT INTO** in functions and provides a superset of functions provided by **SELECT INTO**. You are advised to use **CREATE TABLE AS**, because **SELECT INTO** cannot be used in a stored procedure.

Syntax

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
SELECT [ ALL | DISTINCT [ ON ( expression [, ...] ) ] ]
   { * | {expression [ [ AS ] output_name ]} [, ...] }
   INTO [ UNLOGGED ] [ TABLE ] new_table
   [ FROM from_item [, ...] ]
   [ WHERE condition ]
   [ GROUP BY expression [, ...] ]
   [ HAVING condition [, ...] ]
   [ WINDOW {window_name AS ( window_definition )} [, ...] ]
   [ { UNION | INTERSECT | EXCEPT | MINUS } [ ALL | DISTINCT ] select ]
   [ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS { FIRST |
LAST } ]} [, ...] ]
   [ LIMIT { count | ALL } ]
   [ OFFSET start [ ROW | ROWS ] ]
   [ FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY ]
   [ {FOR { UPDATE | SHARE } [ OF table_name [, ...] ] [ NOWAIT | WAIT N]} [...] ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter Description

INTO [UNLOGGED] [TABLE] new_table

Specifies that the table is created as an unlogged table. Data written to unlogged tables is not written to the WALs, which makes them considerably faster than ordinary tables. However, they are not crash-safe: an unlogged table is automatically truncated after a crash or unclean shutdown. The contents of an unlogged table are also not replicated to standby servers. Any indexes created on an unlogged table are automatically unlogged as well.

new_table specifies the name of the new table.

NOTE

For details about other **SELECT INTO** parameters, see **Parameter Description** in SELECT.

Examples

```
-- Add the values that are less than 5 in the r_reason_sk field in the tpcds.reason table to the new table.
openGauss=# SELECT * INTO tpcds.reason_t1 FROM tpcds.reason WHERE r_reason_sk < 5;
INSERT 0 6

-- Delete the tpcds.reason_t1 table.
openGauss=# DROP TABLE tpcds.reason_t1;
```

Helpful Links

SELECT

Suggestions

- **DATABASE**

  You are not advised to reindex a database in a transaction.
- **SYSTEM**

  You are not advised to reindex system catalogs in transactions.

12.14.161 SET

Function

Modifies a run-time parameter.

Precautions

Most run-time parameters can be modified by executing **SET**. Some parameters cannot be modified after a server or session starts.

Syntax

- Set the system time zone.

  ```
  SET [ SESSION | LOCAL ] TIME ZONE { timezone | LOCAL | DEFAULT };
  ```
- Set the schema of the table.

  ```
  SET [ SESSION | LOCAL ]
    {CURRENT_SCHEMA { TO | = } { schema | DEFAULT }
    | SCHEMA 'schema'};
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Set client encoding.
  ```
  SET [ SESSION | LOCAL ] NAMES encoding_name;
  ```
- Set XML parsing mode.
  ```
  SET [ SESSION | LOCAL ] XML OPTION { DOCUMENT | CONTENT };
  ```
- Set other running parameters.
  ```
  SET [ LOCAL | SESSION ]
    { {config_parameter { { TO | = } { value | DEFAULT }
                        | FROM CURRENT }}};
  ```

Parameter Description

- **SESSION**

  Specifies that the specified parameters take effect for the current session. This is the default value if neither **SESSION** nor **LOCAL** appears.

  If **SET** or **SET SESSION** is executed within a transaction that is later aborted, the effects of the **SET** statement disappear when the transaction is rolled back. Once the surrounding transaction is committed, the effects will persist until the end of the session, unless overridden by another **SET**.

- **LOCAL**

  Specifies that the specified parameters take effect for the current transaction. After **COMMIT** or **ROLLBACK**, the session-level setting takes effect again.

  The effects of **SET LOCAL** last only till the end of the current transaction, whether committed or not. A special case is **SET** followed by **SET LOCAL** within a single transaction: the **SET LOCAL** value will be seen until the end of the transaction, but afterward (if the transaction is committed) the **SET** value will take effect.

- **TIME ZONE timezone**

  Specifies the local time zone for the current session.

  Value range: a valid local time zone. The corresponding run-time parameter is **TimeZone**. The default value is **PRC**.

- **CURRENT_SCHEMA**

  schema

  Specifies the current schema.

  Value range: an existing schema name

- **SCHEMA schema**

  Specifies the current schema. Here the schema is a string.

  Example: set schema 'public';

- **NAMES encoding_name**

  Specifies the client character encoding. This statement is equivalent to **set client_encoding to encoding_name**.

  Value range: a valid character encoding name. The run-time parameter corresponding to this option is **client_encoding**. The default encoding is **UTF8**.

- **XML OPTION option**

  Specifies the XML parsing mode.

  Value range: **CONTENT** (default), **DOCUMENT**

- **config_parameter**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the name of a configurable run-time parameter. You can use **SHOW ALL** to view available run-time parameters.

NOTE

Some parameters that viewed by **SHOW ALL** cannot be set by **SET**. For example, **max_datanodes**.

- **value**

  Specifies the new value of **config_parameter**. This parameter can be specified as string constants, identifiers, numbers, or comma-separated lists of these. **DEFAULT** can be written to indicate resetting the parameter to its default value.

Examples

```
-- Set the search path of a schema.
openGauss=# SET search_path TO tpcds, public;

-- Set the date style to the traditional POSTGRES style (date placed before month):
openGauss=# SET datestyle TO postgres;
```

RESET and **SHOW**

12.14.162 SET CONSTRAINTS

Function

Sets the behavior of constraint checking within the current transaction.

IMMEDIATE constraints are checked at the end of each statement. **DEFERRED** constraints are not checked until transaction commit. Each constraint has its own **IMMEDIATE** or **DEFERRED** mode.

Upon creation, a constraint is given one of three characteristics **DEFERRABLE INITIALLY DEFERRED**, **DEFERRABLE INITIALLY IMMEDIATE**, or **NOT DEFERRABLE**. The third class is always **IMMEDIATE** and is not affected by the **SET CONSTRAINTS** statement. The first two classes start every transaction in specified modes, but its behaviors can be changed within a transaction by **SET CONSTRAINTS**.

SET CONSTRAINTS with a list of constraint names changes the mode of just those constraints (which must all be deferrable). If multiple constraints match a name, the name is affected by all of these constraints. **SET CONSTRAINTS ALL** changes the modes of all deferrable constraints.

When **SET CONSTRAINTS** changes the mode of a constraint from **DEFERRED** to **IMMEDIATE**, the new mode takes effect retroactively: any outstanding data modifications that would have been checked at the end of the transaction are instead checked during the execution of the **SET CONSTRAINTS** statement. If any such constraint is violated, the **SET CONSTRAINTS** fails (and does not change the constraint mode). Therefore, **SET CONSTRAINTS** can be used to force checking of constraints to occur at a specific point in a transaction.

Only foreign key constraints are affected by this setting. Check and unique constraints are always checked immediately when a row is inserted or modified.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

SET CONSTRAINTS sets the behavior of constraint checking only within the current transaction. Therefore, if you execute this statement outside of a transaction block (**START TRANSACTION/COMMIT** pair), it will not appear to have any effect.

Syntax

```
SET CONSTRAINTS { ALL | { name } [, ...] } { DEFERRED | IMMEDIATE };
```

Parameter Description

- **name**

  Specifies the constraint name.

  Value range: an existing table name, which can be found in the system catalog **pg_constraint**.

- **ALL**

  Specifies all constraints.

- **DEFERRED**

  Specifies that constraints are not checked until transaction commit.

- **IMMEDIATE**

  Specifies that constraints are checked at the end of each statement.

Examples

```
-- Set that constraints are checked when a transaction is committed.
openGauss=# SET CONSTRAINTS ALL DEFERRED;
```

12.14.163 SET ROLE

Function

Sets the current user identifier of the current session.

Precautions

- Users of the current session must be members of specified **rolename**, but the system administrator can choose any roles when separation of duties is disabled.
- Executing this statement may add rights of a user or restrict rights of a user. If the role of a session user has the **INHERITS** attribute, it automatically has all rights of roles that **SET ROLE** enables the role to be. In this case, **SET ROLE** physically deletes all rights directly granted to session users and rights of its belonging roles and only leaves rights of the specified roles. If the role of the session user has the **NOINHERITS** attribute, **SET ROLE** deletes rights directly granted to the session user and obtains rights of the specified role.

Syntax

- Set the current user identifier of the current session.

  ```
  SET [ SESSION | LOCAL ] ROLE role_name PASSWORD 'password';
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Reset the current user identifier to that of the current session.
  ```
  RESET ROLE;
  ```

Parameter Description

- **SESSION**

  Specifies that the statement takes effect only for the current session. This parameter is used by default.

  Value range: a string. It must comply with the naming convention.

- **LOCALE**

  Specifies that the specified statement takes effect only for the current transaction.

- **role_name**

  Indicates the role name.

  Value range: a string. It must comply with the naming convention.

- **password**

  Specifies the password of a role. It must comply with the password convention.

- **RESET ROLE**

  Resets the current user identifier.

Examples

```
-- Create a role paul.
openGauss=# CREATE ROLE paul IDENTIFIED BY 'xxxxxxxxxx';

-- Set the current user to paul.
openGauss=# SET ROLE paul PASSWORD 'xxxxxxxxxx';

-- View the current session user and the current user.
openGauss=# SELECT SESSION_USER, CURRENT_USER;

-- Reset the current user.
openGauss=# RESET role;

-- Delete the user.
openGauss=# DROP USER paul;
```

12.14.164 SET SESSION AUTHORIZATION

Function

Sets the session user identifier and the current user identifier of the current SQL session to a specified user.

Precautions

The session identifier can be changed only when the initial session user has the system administrator rights. Otherwise, the system supports the statement only when the authenticated user name is specified.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

- Set the session user identifier and the current user identifier of the current session.

```
SET [ SESSION | LOCAL ] SESSION AUTHORIZATION role_name PASSWORD 'password';
```

- Reset the identifiers of the session and current users to the initially authenticated user names.

```
{SET [ SESSION | LOCAL ] SESSION AUTHORIZATION DEFAULT
    | RESET SESSION AUTHORIZATION};
```

Parameter Description

- **SESSION**

  Specifies that the specified parameters take effect for the current session.

  Value range: a string. It must comply with the naming convention.

- **LOCALE**

  Specifies that the specified statement takes effect only for the current transaction.

- **role_name**

  Username

  Value range: a string. It must comply with the naming convention.

- **password**

  Specifies the password of a role. It must comply with the password convention.

- **DEFAULT**

  Resets the identifiers of the session and current users to the initially authenticated user names.

Examples

```
-- Create a role paul.
openGauss=# CREATE ROLE paul IDENTIFIED BY 'xxxxxxxxx';

-- Set the current user to paul.
openGauss=# SET SESSION AUTHORIZATION paul password 'xxxxxxxxxx';

-- View the current session user and the current user.
openGauss=# SELECT SESSION_USER, CURRENT_USER;

-- Reset the current user.
openGauss=# RESET SESSION AUTHORIZATION;

-- Delete the user.
openGauss=# DROP USER paul;
```

Reference

SET ROLE

12.14.165 SET TRANSACTION

Function

SET TRANSACTION sets characteristics of a transaction. Available transaction characteristics include the transaction separation level and transaction access

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

mode (read/write or read only). You can set the current transaction characteristics using **LOCAL** or the default transaction characteristics of a session using **SESSION**.

Precautions

The current transaction characteristics must be set in a transaction, that is, **START TRANSACTION** or **BEGIN** must be executed before **SET TRANSACTION** is executed. Otherwise, the setting does not take effect.

Syntax

Set the isolation level and access mode of the transaction.

```
{ SET [ LOCAL ] TRANSACTION|SET SESSION CHARACTERISTICS AS TRANSACTION }
  { ISOLATION LEVEL { READ COMMITTED | READ UNCOMMITTED | SERIALIZABLE | REPEATABLE READ }
  | { READ WRITE | READ ONLY } } [, ...]
```

Parameter Description

- **LOCAL**

  Specifies that the specified statement takes effect only for the current transaction.

- **SESSION**

  Specifies that the specified parameters take effect for the current session.

  Value range: a string. It must comply with the naming convention.

- **ISOLATION_LEVEL_CLAUSE**

  Specifies the transaction isolation level that determines the data that a transaction can view if other concurrent transactions exist.

  NOTE

  - The isolation level cannot be changed after data is modified using **INSERT**, **DELETE**, **UPDATE**, **FETCH**, or **COPY** in the current transaction.

  Value range:

  - **READ COMMITTED**: Only committed data is read. It is the default value.
  - **READ UNCOMMITTED**: Uncommitted data is probably read. This isolation level is provided to handle CN breakdown emergencies. On this isolation level, you are advised to only read data to prevent inconsistency.
  - **REPEATABLE READ**: Only the data committed before transaction start is read. Uncommitted data or data committed in other concurrent transactions cannot be read.
  - **SERIALIZABLE**: Currently, this isolation level is not supported in GaussDB. It is equivalent to **REPEATABLE READ**.

- **READ WRITE | READ ONLY**

  Specifies the transaction access mode (read/write or read only).

  NOTE

  The access mode of the default transaction feature of the session can be set only when the database is started or by sending the HUP signal.

Examples

```
-- Start a transaction and set its isolation level to READ COMMITTED and access mode to READ ONLY.
openGauss=# START TRANSACTION;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
openGauss=# SET LOCAL TRANSACTION ISOLATION LEVEL READ COMMITTED READ ONLY;
openGauss=# COMMIT;
```

12.14.166 SHOW

Function

Shows the current value of a run-time parameter.

Precautions

None

Syntax

```
SHOW
 {
   [VARIABLES LIKE] configuration_parameter |
   CURRENT_SCHEMA |
   TIME ZONE |
   TRANSACTION ISOLATION LEVEL |
   SESSION AUTHORIZATION |
   ALL
 };
```

Parameter Description

See **Parameter Description** in RESET.

Examples

```
-- Show the value of timezone.
openGauss=# SHOW timezone;

-- Show all parameters.
openGauss=# SHOW ALL;

-- Show all parameters whose names contain var.
openGauss=# SHOW VARIABLES LIKE var;
```

Helpful Links

SET and **RESET**

12.14.167 SHUTDOWN

Function

SHUTDOWN shuts down the currently connected database node.

Precautions

Only the administrator can run this command.

Syntax

```
SHUTDOWN
 {
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
      |
  fast  |
  immediate
};
```

Parameter Description

- **""**

  If the shutdown mode is not specified, the default mode **fast** is used.

- **fast**

  Rolls back all active transactions, forcibly disconnects the client, and shuts down the database node without waiting for the client to disconnect.

- **immediate**

  Shuts down the server forcibly. Fault recovery will occur on the next startup.

Examples

```
-- Shut down the current database node.
openGauss=# SHUTDOWN;

-- Shut down the current database node in fast mode.
openGauss=# SHUTDOWN FAST;
```

12.14.168 START TRANSACTION

Function

Starts a transaction. If the isolation level or read/write mode is specified, a new transaction will have those characteristics. You can also specify them using **SET TRANSACTION**.

Precautions

None

Syntax

Format 1: START TRANSACTION

```
START TRANSACTION
 [
   {
     ISOLATION LEVEL { READ COMMITTED | READ UNCOMMITTED | SERIALIZABLE | REPEATABLE READ }
     | { READ WRITE | READ ONLY }
   } [, ...]
 ];
```

Format 2: BEGIN

```
BEGIN [ WORK | TRANSACTION ]
 [
   {
     ISOLATION LEVEL { READ COMMITTED | READ UNCOMMITTED | SERIALIZABLE | REPEATABLE READ }
     | { READ WRITE | READ ONLY }
    } [, ...]
 ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter Description

- **WORK | TRANSACTION**

  Specifies the optional keyword in BEGIN format without functions.

- **ISOLATION LEVEL**

  Specifies the transaction isolation level that determines the data that a transaction can view if other concurrent transactions exist.

  NOTE

  The isolation level of a transaction cannot be reset after the first clause (**INSERT**, **DELETE**, **UPDATE**, **FETCH**, **COPY**) for modifying data is executed in the transaction.

  Value range:

  - READ COMMITTED: Only committed data is read. It is the default value.
  - **READ UNCOMMITTED**: Uncommitted data is probably read. This isolation level is provided to handle CN breakdown emergencies. On this isolation level, you are advised to only read data to prevent inconsistency.
  - **REPEATABLE READ**: Only the data committed before transaction start is read. Uncommitted data or data committed in other concurrent transactions cannot be read.
  - **SERIALIZABLE**: Currently, this isolation level is not supported in GaussDB. It is equivalent to **REPEATABLE READ**.

- **READ WRITE | READ ONLY**

  Specifies the transaction access mode (read/write or read only).

Examples

```
-- Start a transaction in default mode.
openGauss=# START TRANSACTION;
openGauss=# SELECT * FROM tpcds.reason;
openGauss=# END;

-- Start a transaction in default mode.
openGauss=# BEGIN;
openGauss=# SELECT * FROM tpcds.reason;
openGauss=# END;

-- Start a transaction with the isolation level being READ COMMITTED and the access mode being READ WRITE:
openGauss=# START TRANSACTION ISOLATION LEVEL READ COMMITTED READ WRITE;
openGauss=# SELECT * FROM tpcds.reason;
openGauss=# COMMIT;
```

Helpful Links

COMMIT | END, **ROLLBACK**, **SET TRANSACTION**

12.14.169 TRUNCATE

Function

Quickly removes all rows from a database table.

It has the same effect as an unqualified **DELETE** on each table, but it is faster since it does not actually scan the tables. This is most useful on large tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- **TRUNCATE TABLE** has the same function as a **DELETE** statement with no **WHERE** clause, emptying a table.
- **TRUNCATE TABLE** uses less system and transaction log resources as compared with **DELETE**.
  - **DELETE** deletes a row each time, and records the deletion of each row in the transaction log.
  - **TRUNCATE TABLE** deletes all rows in a table by releasing the data page storing the table data, and records the releasing of the data page only in the transaction log.
- The differences between **TRUNCATE**, **DELETE**, and **DROP** are as follows:
  - **TRUNCATE TABLE** deletes content, releases space, but does not delete definitions.
  - **DELETE TABLE** deletes content, but does not delete definitions nor release space.
  - **DROP TABLE** deletes content and definitions, and releases space.

Syntax

- Delete data from a table.

```
TRUNCATE [ TABLE ] [ ONLY ] {table_name [ * ]} [, ... ]
    [ CONTINUE IDENTITY ] [ CASCADE | RESTRICT ];
```

- Truncate the data in a partition.

```
ALTER TABLE [ IF EXISTS  ] { [ ONLY  ] table_name
                        | table_name *
                        | ONLY ( table_name )  }
    TRUNCATE PARTITION { partition_name
                    | FOR (  partition_value  [, ...] )  } [ UPDATE GLOBAL INDEX ];
```

Parameter Description

- **ONLY**

  Specifies that if **ONLY** is specified, only the specified table is cleared. Otherwise, the table and all its subtables (if any) are cleared.

- **table_name**

  Specifies the name (optionally schema-qualified) of the table to delete rows from.

  Value range: an existing table name

- **CONTINUE IDENTITY**

  Does not change the values of sequences. It is the default value.

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically truncates all tables that have foreign-key references to any of the named tables, or to any tables added to the group due to **CASCADE**.
  - **RESTRICT** (default): refuses to truncate if any of the tables have foreign-key references from tables that are not listed in the statement.

- **partition_name**

  Specifies the partition in the target partitioned table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: an existing table name

- **partition_value**

  Specifies the value of the specified partition key.

  The value specified by **PARTITION FOR** can uniquely identify a partition.

  Value range: value range of the partition key for the partition to be renamed

  NOTICE

  When the **PARTITION FOR** clause is used, the entire partition where **partition_value** is located is cleared.

- **UPDATE GLOBAL INDEX**

  If this parameter is used, all global indexes in a partitioned table are updated to ensure that correct data can be queried using global indexes.

  If this parameter is not used, all global indexes in a partitioned table will become invalid.

Examples

```
-- Create a table.
openGauss=# CREATE TABLE tpcds.reason_t1 AS TABLE tpcds.reason;

-- Clear the tpcds.reason_t1 table.
openGauss=# TRUNCATE TABLE tpcds.reason_t1;

-- Delete the table.
openGauss=# DROP TABLE tpcds.reason_t1;
-- Create a partitioned table.
openGauss=# CREATE TABLE tpcds.reason_p
(
  r_reason_sk integer,
  r_reason_id character(16),
  r_reason_desc character(100)
)PARTITION BY RANGE (r_reason_sk)
(
  partition p_05_before values less than (05),
  partition p_15 values less than (15),
  partition p_25 values less than (25),
  partition p_35 values less than (35),
  partition p_45_after values less than (MAXVALUE)
);

-- Insert data.
openGauss=# INSERT INTO tpcds.reason_p SELECT * FROM tpcds.reason;

-- Clear the p_05_before partition.
openGauss=# ALTER TABLE tpcds.reason_p TRUNCATE PARTITION p_05_before;

-- Clear the p_15 partition.
openGauss=# ALTER TABLE tpcds.reason_p TRUNCATE PARTITION for (13);

-- Clear the partitioned table.
openGauss=# TRUNCATE TABLE tpcds.reason_p;

-- Delete the table.
openGauss=# DROP TABLE tpcds.reason_p;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.14.170 UPDATE

Function

Updates data in a table. Changes the values of the specified columns in all rows that satisfy the condition. The WHERE clause clarifies conditions. The SET clause specifies the columns to be modified and columns that not specified in the SET clause retain their previous values.

Precautions

- The owner of a table, users granted with the UPDATE permission on the table, or users granted with the UPDATE ANY TABLE permission can update data in the table. The system administrator has the permission to update data in the table by default.
- You must have the SELECT permission on all tables involved in the expressions or conditions.
- The distribution key (or column) of a table cannot be modified.
- For column-store tables, the RETURNING clause is currently not supported.
- Column-store tables do not support non-deterministic update. If you update data in one row with multiple rows of data in a column-store table, an error will be reported.
- Memory space that records update operations in column-store tables is not recycled. You need to clean it by executing **VACUUM FULL table_name**.
- Currently, UPDATE cannot be used in column-store replication tables.

Syntax

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
UPDATE [/*+ plan_hint */] [ ONLY ] table_name [ * ] [ [ AS ] alias ]
SET {column_name = { expression | DEFAULT }
   |( column_name [, ...] ) = {( { expression | DEFAULT } [, ...] ) |sub_query }}[, ...]
   [ FROM from_list] [ WHERE condition ]
   [ RETURNING {*
            | {output_expression [ [ AS ] output_name ]} [, ...] }];

where sub_query can be:
SELECT [ ALL | DISTINCT [ ON ( expression [, ...] ) ] ]
{ * | {expression [ [ AS ] output_name ]} [, ...] }
[ FROM from_item [, ...] ]
[ WHERE condition ]
[ GROUP BY grouping_element [, ...] ]
[ HAVING condition [, ...] ]
[ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS { FIRST |
LAST } ]} [, ...] ]
[ LIMIT { [offset,] count | ALL } ]
```

Parameter Description

- **WITH [RECURSIVE] with_query [, ...]**

  Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table.

  If **RECURSIVE** is specified, it allows a **SELECT** subquery to reference itself by name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The detailed format of **with_query** is as follows: **with_query_name [(column_name [, ...])] AS [[NOT] MATERIALIZED] ({select | values | insert | update | delete})**

- **with_query_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.
- **column_name** specifies the column name displayed in the subquery result set.
- Each subquery can be a **SELECT**, **VALUES**, **INSERT**, **UPDATE** or **DELETE** statement.
- You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE.
  - If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery cannot be jointly optimized with the SELECT statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.
  - If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the SELECT statement trunk to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.

- **plan_hint** clause

  Follows the UPDATE keyword in the **/*+ */** format. It is used to optimize the plan of an UPDATE statement block. For details, see **Hint-based Tuning**. In each statement, only the first **/*+** *plan_hint* ***/** comment block takes effect as a hint. Multiple hints can be written.

- **table_name**

  Specifies the name (optionally schema-qualified) of the table to be updated.

  Value range: an existing table name

- **alias**

  Specifies the alias of the target table.

  Value range: a string. It must comply with the naming convention.

- **column_name**

  Specifies the name of the column to be modified.

  You can refer to this column by specifying the target table alias and the column name. For example:

  UPDATE foo AS f SET f.col_name = 'postgres';

  Value range: an existing column

- **expression**

  Specifies a value assigned to a column or an expression that assigns the value.

- **DEFAULT**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the default value of a column.

The value is **NULL** if no default value is assigned to it.

- **sub_query**

  Specifies a subquery.

  This statement can be executed to update a table with information for other tables in the same database. For details about clauses in the SELECT statement, see **SELECT**.

  When a single column is updated, the ORDER BY and LIMIT clauses can be used. When multiple columns are updated, the ORDER BY and LIMIT clauses cannot be used.

- **from_list**

  Specifies a list of table expressions, allowing columns from other tables to appear in the WHERE condition. This is similar to the list of tables that can be specified in the FROM clause of a SELECT statement.

  NOTICE

  Note that the target table cannot appear in the **from_list**, unless you intend a self-join (in which case it must appear with an alias in the **from_list**).

- **condition**

  Specifies an expression that returns a value of type Boolean. Only rows for which this expression returns **true** are updated. You are not advised to use numeric types such as int for **condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

- **output_expression**

  Specifies an expression to be computed and returned by the UPDATE statement after each row is updated.

  Value range: any table and table columns listed in FROM. The asterisk (*) indicates that all fields are returned.

- **output_name**

  Specifies a name to use for a returned column.

Examples

```
-- Create the student1 table.
openGauss=# CREATE TABLE student1
(
  stuno     int,
  classno   int
)
DISTRIBUTE BY hash(stuno);

-- Insert data.
openGauss=# INSERT INTO student1 VALUES(1,1);
openGauss=# INSERT INTO student1 VALUES(2,2);
openGauss=# INSERT INTO student1 VALUES(3,3);

-- View data.
openGauss=# SELECT * FROM student1;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Update the values of all records.
openGauss=# UPDATE student1 SET classno = classno*2;

-- View data.
openGauss=# SELECT * FROM student1;

-- Delete the table.
openGauss=# DROP TABLE student1;
```

12.14.171 VACUUM

Function

VACUUM recycles storage space occupied by tables or **B-Tree** indexes. In normal database operation, rows that have been deleted are not physically removed from their table; they remain present until a **VACUUM** is done. Therefore, it is necessary to do **VACUUM** periodically, especially on frequently-updated tables.

Precautions

- With no table specified, **VACUUM** processes all the tables that the current user has permission to vacuum in the current database. With a parameter, **VACUUM** processes only that table.
- To perform **VACUUM** operation to a table, you must be a table owner or a user granted the **VACUUM** permission on the table. By default, the system administrator has this permission. However, database owners are allowed to **VACUUM** all tables in their databases, except shared catalogs. (The restriction for shared catalogs means that a true database-wide **VACUUM** can only be executed by the system administrator). **VACUUM** skips over any tables that the calling user does not have the permission to vacuum.
- **VACUUM** cannot be executed inside a transaction block.
- It is recommended that active production databases be vacuumed frequently (at least nightly), in order to remove dead rows. After adding or deleting a large number of rows, it might be a good idea to run **VACUUM ANALYZE** for the affected table. This will update the system catalogs with the results of all recent changes, and allow the query planner to make better choices in planning queries.
- **FULL** is recommended only in special scenarios. For example, you wish to physically narrow the table to decrease the occupied disk space after deleting most rows of a table. **VACUUM FULL** usually shrinks a table more than **VACUUM** does. The **FULL** option does not clear indexes. You are advised to periodically run the **REINDEX** statement. Deleting all indexes, running **VACUUM FULL**, and rebuilding indexes is usually a faster choice. If the physical space usage does not decrease after you run the statement, check whether there are other active transactions (that have started before you delete data transactions and not ended before you run **VACUUM FULL**). If there are such transactions, run this statement again when the transactions quit.
- **VACUUM** causes a substantial increase in I/O traffic, which might cause poor performance for other active sessions. Therefore, it is sometimes advisable to use the cost-based VACUUM delay feature.
- When **VERBOSE** is specified, **VACUUM** prints progress messages to indicate which table is currently being processed. Various statistics about the tables

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

are printed as well. However, if you execute **VACUUM** and specify the **VERBOSE** option for column-store tables, no information is returned.

- When the option list is surrounded by parentheses, the options can be written in any order. If there are no brackets, the options must be given in the order displayed in the syntax.
- **VACUUM** and **VACUUM FULL** clear deleted tuples after the delay specified by **vacuum_defer_cleanup_age**.
- **VACUUM ANALYZE** executes a VACUUM operation and then an ANALYZE operation for each selected table. This is a handy combination form for routine maintenance scripts.
- Plain **VACUUM** (without **FULL**) simply reclaims space and makes it available for reuse. This form of statement can operate in parallel with normal reading and writing of the table, as an exclusive lock is not obtained. **VACUUM FULL** executes wider processing, including moving rows across blocks to compress tables so they occupy the minimum number of disk blocks. This form is much slower and requires an exclusive lock on each table while it is being processed.
- When you do **VACUUM** to a column-store table, the following operations are internally performed: data in the delta table is migrated to the primary table, and the delta and desc tables of the primary table are vacuumed. **VACUUM** does not reclaim the storage space of the delta table. To reclaim it, do **VACUUM DELTAMERGE** to the column-store table.
- The function of **VACUUM FULL** is the same as that of **Compaction**. Therefore, **VACUUM FULL** can be executed only when the **Compaction** function is disabled.
- If the **xc_maintenance_mode** parameter is not enabled, **VACUUM FULL** skips all system catalogs.
- If you run **VACUUM FULL** immediately after running **DELETE**, the space will not be reclaimed. After executing **DELETE**, execute 1000 non-**SELECT** transactions, or wait for 1s and then execute one transaction. Then, run **VACUUM FULL** to reclaim the space.

Syntax

- Reclaim space and update statistics information, no requirements for keyword orders.

```
VACUUM [ ( { FULL | FREEZE | VERBOSE | {ANALYZE | ANALYSE }} [,...] ) ]
    [ table_name [ (column_name [, ...] ) ] ] [ PARTITION ( partition_name ) ];
```

- Reclaim space, without updating statistics information.

```
VACUUM [ FULL [COMPACT] ] [ FREEZE ] [ VERBOSE ] [ table_name ] [ PARTITION
( partition_name ) ];
```

- Reclaim space and update statistics information, and require keywords in order.

```
VACUUM [ FULL ] [ FREEZE ] [ VERBOSE ] { ANALYZE | ANALYSE } [ VERBOSE ]
    [ table_name [ (column_name [, ...] ) ] ] [ PARTITION ( partition_name ) ];
```

Parameter Description

- **FULL**

  Selects "FULL" vacuum, which can reclaim more space, but takes much longer and exclusively locks the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> NOTE
>
> Using **FULL** will cause statistics missing. To collect statistics, add the keyword **ANALYZE** to **VACUUM FULL**.

- **FREEZE**

  Is equivalent to running **VACUUM** with the **vacuum_freeze_min_age** parameter set to **zero**.

- **VERBOSE**

  Prints a detailed VACUUM activity report for each table.

- **ANALYZE | ANALYSE**

  Updates statistics used by the planner to determine the most efficient way to execute a query.

- **table_name**

  Specifies the name (optionally schema-qualified) of a specific table to vacuum.

  Value range: name of a specific table to vacuum Defaults are all tables in the current database.

- **column_name**

  Specifies the name of the column to be analyzed. This parameter must be used together with **ANALYZE**.

  Value range: name of a specific field to analyze Defaults are all columns.

- **PARTITION**

  COMPACT and **PARTITION** cannot be used at the same time.

- **partition_name**

  Specifies the partition name of the table to be cleared. Defaults are all partitions.

- **DELTAMERGE**

  (For column-store tables) Migrates data from the delta table to primary tables. For a column-store table, this operation is controlled by **deltarow_threshold**. For details, see **enable_delta_store** and **Parameter Description**.

  > NOTE
  >
  > The following DFX functions are provided to return the data storage in the delta table of a column-store table:
  >
  > - **pgxc_get_delta_info(TEXT)**: The input parameter is a column-store table name. The delta table information on each node is collected and displayed, including the number of active tuples, table size, and maximum block ID.
  > - **get_delta_info(TEXT)**: The input parameter is a column-store table name. The system summarizes the results returned from pgxc_get_delta_info and returns the total number of active tuples, total table size, and maximum block ID in the delta table.

Examples

```
-- Create an index in the tpcds.reason table:
CREATE UNIQUE INDEX ds_reason_index1 ON tpcds.reason(r_reason_sk);

-- Do VACUUM to the tpcds.reason table that has indexes:
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
openGauss=# VACUUM (VERBOSE, ANALYZE) tpcds.reason;

-- Drop an index.
openGauss=# DROP INDEX ds_reason_index1 CASCADE;
openGauss=# DROP TABLE tpcds.reason;
```

Suggestions

- vacuum
  - **VACUUM** cannot be executed inside a transaction block.
  - It is recommended that active production databases be vacuumed frequently (at least nightly), in order to remove dead rows. It is strongly recommended that you run **VACUUM ANALYZE** after adding or deleting a large number of records.
  - **FULL** is recommended only in special scenarios. For example, you wish to physically narrow the table to decrease the occupied disk space after deleting most rows of a table.
  - Before performing the VACUUM FULL operation, you are advised to delete all indexes in related tables, run **VACUUM FULL**, and then re-create the index.

12.14.172 VALUES

Function

Computes a row or a set of rows based on given values. It is most commonly used to generate a constant table within a large statement.

Precautions

- **VALUES** lists with large numbers of rows should be avoided, as you might encounter out-of-memory failures or poor performance. **VALUES** appearing within **INSERT** is a special case, because the desired column types are known from the **INSERT**'s target table, and need not be inferred by scanning the **VALUES** list. In this case, **VALUE** can handle larger lists than are practical in other contexts.
- If more than one row is specified, all the rows must have the same number of elements.

Syntax

```
VALUES {( expression [, ...] )} [, ...]
   [ ORDER BY { sort_expression [ ASC | DESC | USING operator ] } [, ...] ]
   [ LIMIT { count | ALL } ]
   [ OFFSET start [ ROW | ROWS ] ]
   [ FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY ];
```

Parameter Description

- **expression**

  Specifies a constant or expression to compute and insert at the indicated place in the resulting table or set of rows.

  In a **VALUES** list appearing at the top level of an **INSERT**, an expression can be replaced by **DEFAULT** to indicate that the destination column's default

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

value should be inserted. **DEFAULT** cannot be used when **VALUES** appears in other contexts.

- **sort_expression**

  Specifies an expression or integer constant indicating how to sort the result rows.

- **ASC**

  Specifies an ascending sort order.

- **DESC**

  Specifies a descending sort order.

- **operator**

  Specifies a sorting operator.

- **count**

  Specifies the maximum number of rows to return.

- **OFFSET start { ROW | ROWS }**

  Specifies the maximum number of returned rows, whereas **start** specifies the number of rows to skip before starting to return rows.

- **FETCH { FIRST | NEXT } [count] { ROW | ROWS } ONLY**

  The **FETCH** clause restricts the total number of rows starting from the first row of the return query result, and the default value of **count** is **1**.

Examples

See **Examples** in INSERT.

12.15 Appendix

12.15.1 GIN Indexes

12.15.1.1 Introduction

Generalized Inverted Index (GIN) is designed for handling cases where the items to be indexed are composite values, and the queries to be handled by the index need to search for element values that appear within the composite items. For example, the items could be documents, and the queries could be searches for documents containing specific words.

We use the word "item" to refer to a composite value that is to be indexed, and the word "key" to refer to an element value. GIN stores and searches for keys, not item values.

A GIN index stores a set of (key, posting list) key-value pairs, where a posting list is a set of row IDs in which the key occurs. The same row ID can appear in multiple posting lists, since an item can contain more than one key. Each key value is stored only once, so a GIN index is very compact for cases where the same key appears many times.

GIN is generalized in the sense that the GIN access method code does not need to know the specific operations that it accelerates. Instead, it uses custom strategies

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

defined for particular data types. The strategy defines how keys are extracted from indexed items and query conditions, and how to determine whether a row that contains some of the key values in a query actually satisfies the query.

12.15.1.2 Scalability

The GIN interface has a high level of abstraction, requiring the access method implementer only to implement the semantics of the data type being accessed. The GIN layer itself takes care of concurrency, logging and searching the tree structure.

All it takes to get a GIN access method working is to implement multiple user-defined methods, which define the behavior of keys in the tree and the relationships between keys, indexed items, and indexable queries. In short, GIN combines extensibility with generality, code reuse, and a clean interface.

There are four methods that an operator class for GIN must provide:

- int compare(Datum a, Datum b)

  Compares two keys (not indexed items) and returns an integer less than zero, zero, or greater than zero, indicating whether the first key is less than, equal to, or greater than the second. Null keys are never passed to this function.

- Datum *extractValue(Datum itemValue, int32 *nkeys, bool **nullFlags)

  Returns an array of keys given an item to be indexed. The array of returned keys must be stored into ***nkeys**. If any of the keys can be null, also palloc an array of ***nkeys** bool fields, store its address at ***nullFlags**, and set these null flags as needed. ***nullFlags** can be left **NULL** (its initial value) if all keys are not-null. The returned value can be **NULL** if the item contains no keys.

- Datum *extractQuery(Datum query, int32 *nkeys, StrategyNumber n, bool **pmatch, Pointer **extra_data, bool **nullFlags, int32 *searchMode)

  Returns a palloc'd array of keys given a value to be queried; that is, query is the value on the right-hand side of an indexable operator whose left-hand side is the indexed column. n is the strategy number of the operator within the operator class. Often, **extractQuery** will need to consult n to determine the data type of query and the method it should use to extract key values. The number of returned keys must be stored into ***nkeys**. If any of the keys can be null, also palloc an array of ***nkeys** bool fields, store its address at ***nullFlags**, and set these null flags as needed. ***nullFlags** can be left NULL (its initial value) if all keys are non-null. The returned value can be NULL if the query contains no keys.

  searchMode is an output argument that allows **extractQuery** to specify details about how the search will be done. If ***searchMode** is set to **GIN_SEARCH_MODE_DEFAULT** (which is the value it is initialized to before call), only items that match at least one of the returned keys are considered candidate matches. If ***searchMode** is set to **GIN_SEARCH_MODE_INCLUDE_EMPTY**, then in addition to items containing at least one matching key, items that contain no keys at all are considered candidate matches. (This mode is useful for implementing is-subset-of operators, for example.) If ***searchMode** is set to **GIN_SEARCH_MODE_ALL**, then all non-null items in the index are considered candidate matches, whether they match any of the returned keys or not.

  pmatch is an output argument for use when partial match is supported. To use it, **extractQuery** must allocate an array of *nkeys Booleans and store its

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

address at ***pmatch**. Each element of the array should be set to **TRUE** if the corresponding key requires partial match, **FALSE** if not. If ***pmatch** is set to **NULL** then GIN assumes partial match is not required. The variable is initialized to NULL before call, so this argument can simply be ignored by operator classes that do not support partial match.

extra_data is an output argument that allows **extractQuery** to pass additional data to the **consistent** and **comparePartial** methods. To use it, **extractQuery** must allocate an array of ***nkeys** pointers and store its address at ***extra_data**, then store whatever it wants to into the individual pointers. The variable is initialized to **NULL** before call, so this argument can simply be ignored by operator classes that do not require extra data. If ***extra_data** is set, the whole array is passed to the **consistent** method, and the appropriate element to the **comparePartial** method.

- bool consistent(bool check[], StrategyNumber n, Datum query, int32 nkeys, Pointer extra_data[], bool *recheck, Datum queryKeys[], bool nullFlags[])

  Returns **TRUE** if an indexed item satisfies the query operator with StrategyNumber **n** (or might satisfy it, if the recheck indication is returned). This function does not have direct access to the indexed item's value, since GIN does not store items explicitly. Rather, what is available is knowledge about which key values extracted from the query appear in a given indexed item. The check array has length **nkeys**, which is the same as the number of keys previously returned by **extractQuery** for this query datum. Each element of the check array is **TRUE** if the indexed item contains the corresponding query key, for example, if (check[i] == TRUE), the i-th key of the **extractQuery** result array is present in the indexed item. The original query datum is passed in case the **consistent** method needs to consult it, and so are the **queryKeys[]** and **nullFlags[]** arrays previously returned by **extractQuery**. **extra_data** is the extra-data array returned by **extractQuery**, or **NULL** if none.

  When **extractQuery** returns a null key in **queryKeys[]**, the corresponding **check[]** element is **TRUE** if the indexed item contains a null key; that is, the semantics of **check[]** are like **IS NOT DISTINCT FROM**. The **consistent** function can examine the corresponding **nullFlags[]** element if it needs to tell the difference between a regular value match and a null match.

  On success, ***recheck** should be set to **TRUE** if the heap tuple needs to be rechecked against the query operator, or **FALSE** if the index test is exact. That is, a **FALSE** return value guarantees that the heap tuple does not match the query; a **TRUE** return value with ***recheck** set to **FALSE** guarantees that the heap tuple matches the query; and a **TRUE** return value with ***recheck** set to **TRUE** means that the heap tuple might match the query, so it needs to be fetched and rechecked by evaluating the query operator directly against the originally indexed item.

Optionally, an operator class for GIN can supply the following method:

- int comparePartial(Datum partial_key, Datum key, StrategyNumber n, Pointer extra_data)

  Compares a partial-match query key to an index key. Returns an integer whose sign indicates the result: less than zero means the index key does not match the query, but the index scan should continue; zero means that the index key matches the query; greater than zero indicates that the index scan should stop because no more matches are possible. The strategy number **n** of

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

the operator that generated the partial match query is provided, in case its semantics are needed to determine when to end the scan. Also, **extra_data** is the corresponding element of the extra-data array made by **extractQuery**, or **NULL** if none. Null keys are never passed to this function.

To support "partial match" queries, an operator class must provide the **comparePartial** method, and its **extractQuery** method must set the **pmatch** parameter when a partial-match query is encountered. For details, see **Partial Match Algorithm**.

The actual data types of the various Datum values mentioned in this section vary depending on the operator class. The item values passed to **extractValue** are always of the operator class's input type, and all key values must be of the class's **STORAGE** type. The type of the query argument passed to **extractQuery**, consistent and **triConsistent** is whatever is specified as the right-hand input type of the class member operator identified by the strategy number. This need not be the same as the item type, so long as key values of the correct type can be extracted from it.

12.15.1.3 Implementation

Internally, a GIN index contains a B-tree index constructed over keys, where each key is an element of one or more indexed items (a member of an array, for example) and where each tuple in a leaf page contains either a pointer to a B-tree of heap pointers (a "posting tree"), or a simple list of heap pointers (a "posting list") when the list is small enough to fit into a single index tuple along with the key value.

Multi-column GIN indexes are implemented by building a single B-tree over composite values (column number, key value). The key values for different columns can be of different types.

GIN Fast Update Technique

Updating a GIN index tends to be slow because of the intrinsic nature of inverted indexes: inserting or updating one heap row can cause many inserts into the index. After the table is vacuumed or if the pending list becomes larger than **work_mem**, the entries are moved to the main GIN data structure using the same bulk insert techniques used during initial index creation. This greatly increases the GIN index update speed, even counting the additional vacuum overhead. Moreover the overhead work can be done by a background process instead of in foreground query processing.

The main disadvantage of this approach is that searches must scan the list of pending entries in addition to searching the regular index, and so a large list of pending entries will slow searches significantly. Another disadvantage is that, while most updates are fast, an update that causes the pending list to become "too large" will incur an immediate cleanup cycle and be much slower than other updates. Proper use of autovacuum can minimize both of these problems.

If consistent response time (of entity cleanup and of update) is more important than update speed, use of pending entries can be disabled by turning off the **fastupdate** storage parameter for a GIN index. For details, see **CREATE INDEX**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Partial Match Algorithm

GIN can support "partial match" queries, in which the query does not determine an exact match for one or more keys, but the possible matches fall within a narrow range of key values (within the key sorting order determined by the **compare** support method). The **extractQuery** method, instead of returning a key value to be matched exactly, returns a key value that is the lower bound of the range to be searched, and sets the **pmatch** flag true. The key range is then scanned using the **comparePartial** method. **comparePartial** must return zero for a matching index key, less than zero for a non-match that is still within the range to be searched, or greater than zero if the index key is past the range that could match.

12.15.1.4 GIN Tips and Tricks

Create vs. Insert

Insertion into a GIN index can be slow due to the likelihood of many keys being inserted for each item. So, for bulk insertions into a table it is advisable to drop the GIN index and recreate it after finishing bulk insertion. GUC parameters related to GIN index creation and query performance as follows:

- maintenance_work_mem

  Build time for a GIN index is very sensitive to the **maintenance_work_mem** setting;

- work_mem

  During a series of insertions into an existing GIN index that has **fastupdate** enabled, the system will clean up the pending-entry list whenever the list grows larger than **work_mem**. To avoid fluctuations in observed response time, it is desirable to have pending-list cleanup occur in the background (that is, via autovacuum). Foreground cleanup operations can be avoided by increasing **work_mem** or making **autovacuum** more aggressive. However, increasing **work_mem** means that if a foreground cleanup occurs, it will take even longer.

- gin_fuzzy_search_limit

  The primary goal of developing GIN indexes was to support highly scalable full-text search in GaussDB. A full-text search often returns a very large set of results. This often happens when the query contains very frequent words, so that the large result set is not even useful. Since reading many tuples from the disk and sorting them could take a lot of time, this is unacceptable for production.

  To facilitate controlled execution of such queries, GIN has a configurable soft upper limit on the number of rows returned: the **gin_fuzzy_search_limit** configuration parameter. The default value **0** indicates that there is no limit on the returned set. If a non-zero limit is set, then the returned set is a subset of the whole result set, chosen at random.

12.15.2 Extended Functions

The following table lists the extended functions supported by GaussDB and they are for reference only.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Type	Name	Description
Trigger function	pg_get_triggerdef(trigger_oid)	Gets **CREATE** [**CONSTRAINT**] **TRIGGER** command for triggers.
	pg_get_triggerdef(trigger_oid, pretty_bool)	Gets **CREATE** [**CONSTRAINT**] **TRIGGER** command for triggers.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13 Stored Procedures

13.1 Overview

In GaussDB, business rules and logics are saved as stored procedures.

A stored procedure is a combination of SQL, PL/SQL, and Java statements. Stored procedures can move the code that executes business rules from applications to databases. Therefore, the code storage can be used by multiple programs at a time.

For details about how to create and call a stored procedure, see **CREATE PROCEDURE**.

13.2 Data Types

A data type refers to a value set and an operation set defined on the value set. The GaussDB database consists of tables, each of which is defined by its own columns. Each column corresponds to a data type. GaussDB uses corresponding functions to perform operations on data based on data types. For example, GaussDB can perform addition, subtraction, multiplication, and division operations on data of numeric values.

13.3 Data Type Conversion

Certain data types in the database support implicit data type conversions, such as assignments and parameters called by functions. For other data types, you can use the type conversion functions provided by GaussDB, such as the **CAST** function, to forcibly convert them.

Table 13-1 lists common implicit data type conversions in GaussDB.

NOTICE

The valid value range of **DATE** supported by GaussDB is from 4713 B.C. to 294276 A.D.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-1 Implicit data type conversions

Raw Data Type	Target Data Type	Remarks
CHAR	VARCHAR2	-
CHAR	NUMBER	Raw data must consist of digits.
CHAR	DATE	Raw data cannot exceed the valid date range.
CHAR	RAW	-
CHAR	CLOB	-
VARCHAR2	CHAR	-
VARCHAR2	NUMBER	Raw data must consist of digits.
VARCHAR2	DATE	Raw data cannot exceed the valid date range.
VARCHAR2	CLOB	-
NUMBER	CHAR	-
NUMBER	VARCHAR2	-
DATE	CHAR	-
DATE	VARCHAR2	-
RAW	CHAR	-
RAW	VARCHAR2	-
CLOB	CHAR	-
CLOB	VARCHAR2	-
CLOB	NUMBER	Raw data must consist of digits.
INT4	CHAR	-

13.4 Arrays and Records

13.4.1 Arrays

Use of Array Types

Before the use of arrays, an array type needs to be defined:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Define an array type immediately after the **AS** keyword in a stored procedure. Run the following statement:

```
TYPE array_type IS VARRAY(size) OF data_type;
```

Related parameters are as follows:

- **array_type**: indicates the name of the array type to be defined.
- **VARRAY**: indicates the array type to be defined.
- **size**: indicates the maximum number of members in the array type to be defined. The value is a positive integer.
- **data_type**: indicates the types of members in the array type to be created.

NOTE

- In GaussDB, an array automatically increases. If an access violation occurs, a **NULL** value will be returned, and no error message will be reported.
- The scope of an array type defined in a stored procedure takes effect only in this storage process.
- It is recommended that you use one of the preceding methods to define an array type. If both methods are used to define the same array type, GaussDB prefers the array type defined in a stored procedure to declare array variables.

GaussDB supports the access of content in an array by using parentheses, and the **extend**, **count**, **first**, **last prior**, **next**, **exists**, **trim**, and **delete** functions.

NOTE

If the stored procedure contains DML statements (**SELECT**, **UPDATE**, **INSERT**, or **DELETE**), DML statements can access array elements only using brackets. In this way, it may be separated from the function expression area.

Examples

```
-- Perform array operations in the stored procedure.
openGauss=# CREATE OR REPLACE PROCEDURE array_proc AS
DECLARE
    TYPE ARRAY_INTEGER IS VARRAY(1024) OF INTEGER;--Define the array type.
    ARRINT ARRAY_INTEGER: = ARRAY_INTEGER();  --Declare the variable of the array type.
BEGIN
    ARRINT.EXTEND(10);
    FOR I IN 1..10 LOOP
        ARRINT(I) := I;
    END LOOP;
    DBE_OUTPUT.PRINT_LINE(ARRINT.COUNT);
    DBE_OUTPUT.PRINT_LINE(ARRINT(1));
    DBE_OUTPUT.PRINT_LINE(ARRINT(10));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.FIRST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.LAST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.NEXT(ARRINT.FIRST)));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.PRIOR(ARRINT.LAST)));
    ARRINT.TRIM();
    IF ARRINT.EXISTS(10) THEN
       DBE_OUTPUT.PRINT_LINE('Exist 10th element');
    ELSE
       DBE_OUTPUT.PRINT_LINE('Not exist 10th element');
    END IF;
    DBE_OUTPUT.PRINT_LINE(ARRINT.COUNT);
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.FIRST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.LAST));
    ARRINT.DELETE();
END;
/
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Call the stored procedure.
openGauss=# CALL array_proc();

-- Delete the stored procedure.
openGauss=# DROP PROCEDURE array_proc;
```

13.4.2 Records

Record Variables

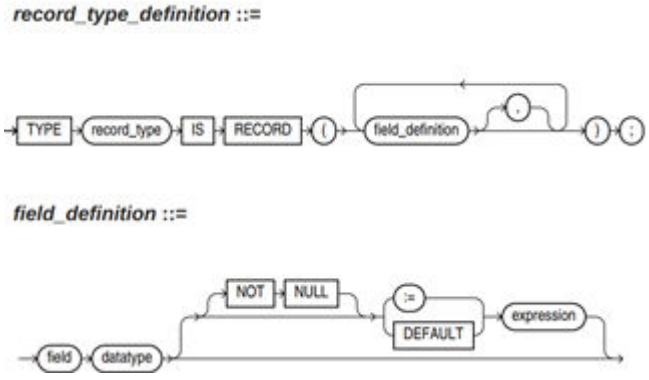
Perform the following operations to create a record variable:

Define a record type and use this type to declare a variable.

Syntax

For the syntax of the record type, see **Figure 13-1**.

Figure 13-1 Syntax of the record type



The above syntax diagram is explained as follows:

- *record_type*: specifies the record type.
- *field*: specifies member variables of this type.
- *datatype*: specifies data types for the member variables.
- *expression*: specifies the expression for setting a default value.

NOTE

In GaussDB:

- When assigning values to record variables, you can:
  - Declare a record type and define member variables of this type when you declare a function or stored procedure.
  - Assign the value of a record variable to another record variable.
  - Use **SELECT INTO** or **FETCH** to assign values to record variables.
  - Assign the **NULL** value to a record variable.
- The **INSERT** and **UPDATE** statements cannot use a record variable to insert or update data.
- Just like a variable, a record column of the compound type does not have a default value in the declaration.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
The table used in the following stored procedure is defined as follows:
openGauss=# \d emp_rec
               Table "public.emp_rec"
  Column  |              Type              | Modifiers
----------+--------------------------------+-----------
 empno    | numeric(4,0)                   | not null
 ename    | character varying(10)          |
 job      | character varying(9)           |
 mgr      | numeric(4,0)                   |
 hiredate | timestamp(0) without time zone |
 sal      | numeric(7,2)                   |
 comm     | numeric(7,2)                   |
 deptno   | numeric(2,0)                   |

-- Perform array operations in the stored procedure.
openGauss=# CREATE OR REPLACE FUNCTION regress_record(p_w VARCHAR2)
RETURNS
VARCHAR2  AS $$
DECLARE

  -- Declare a record type.
  type rec_type is record (name  varchar2(100), epno int);
  employer rec_type;

  -- Use %type to declare a record type.
  type rec_type1 is record (name  emp_rec.ename%type, epno int not null :=10);
  employer1 rec_type1;

  -- Declare a record type with a default value.
  type rec_type2 is record (
       name varchar2 not null := 'SCOTT',
       epno int not null :=10);
   employer2 rec_type2;
   CURSOR C1 IS  select ename,empno from emp_rec order by 1 limit 1;

BEGIN
     -- Assign a value to a member record variable.
    employer.name := 'WARD';
    employer.epno = 18;
    raise info 'employer name: % , epno:%', employer.name, employer.epno;

     -- Assign the value of a record variable to another variable.
    employer1 := employer;
    raise info 'employer1 name: % , epno: %',employer1.name, employer1.epno;

     -- Assign the NULL value to a record variable.
    employer1 := NULL;
    raise info 'employer1 name: % , epno: %',employer1.name, employer1.epno;

     -- Obtain the default value of a record variable.
    raise info 'employer2 name: % ,epno: %', employer2.name, employer2.epno;

     -- Use a record variable in the FOR loop.
     for employer in select ename,empno from emp_rec order by 1  limit 1
         loop
             raise info 'employer name: % , epno: %', employer.name, employer.epno;
         end loop;

     -- Use a record variable in the SELECT INTO statement.
     select ename,empno  into employer2 from emp_rec order by 1 limit 1;
     raise info 'employer name: % , epno: %', employer2.name, employer2.epno;

     -- Use a record variable in a cursor.
     OPEN C1;
     FETCH C1 INTO employer2;
     raise info 'employer name: % , epno: %', employer2.name, employer2.epno;
     CLOSE C1;
     RETURN employer.name;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
END;
$$
LANGUAGE plpgsql;

-- Call the stored procedure.
openGauss=# CALL regress_record('abc');

-- Delete the stored procedure.
openGauss=# DROP PROCEDURE regress_record;
```

13.5 DECLARE Syntax

13.5.1 Basic Structure

Structure

A PL/SQL block can contain a sub-block which can be placed in any section. The following describes the architecture of a PL/SQL block:

- Declaration section: declares variables, types, cursors, and regional stored procedures and functions used in the PL/SQL block.
  ```
  DECLARE
  ```

  NOTE

  This section is optional if no variables need to be declared.

  - An anonymous block may omit the **DECLARE** keyword if no variable needs to be declared.
  - For a stored procedure, **AS** is used, which is equivalent to **DECLARE**. The **AS** keyword must be reserved even if there is no variable declaration section.
- Execution section: specifies procedure and SQL statements. It is the main section of a program and is mandatory.
  ```
  BEGIN
  ```
- Exception-handling section: processes errors. It is optional.
  ```
  EXCEPTION
  ```
- **End**
  ```
  END;
  /
  ```

NOTICE

You are not allowed to use consecutive tabs in the PL/SQL block because they may result in an exception when the **gsql** tool is executed with the **-r** parameter specified.

Types

PL/SQL blocks are classified into the following types:

- Anonymous block: a dynamic block that can be executed only for once. For details about the syntax, see **Figure 13-2**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Subprogram: a stored procedure, function, operator, or advanced package stored in a database. A subprogram created in a database can be called by other programs.

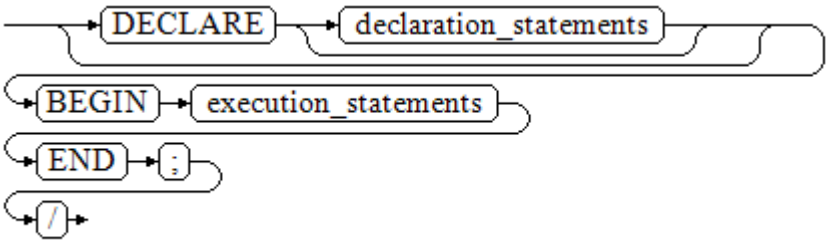
13.5.2 Anonymous Blocks

An anonymous block applies to a script infrequently executed or a one-off activity. An anonymous block is executed in a session and is not stored.

Syntax

Figure 13-2 shows the syntax diagrams for an anonymous block.

Figure 13-2 anonymous_block::=



Details about the syntax diagram are as follows:

- The execution section of an anonymous block starts with a **BEGIN** statement, has a break with an **END** statement, and ends with a semicolon (;). Type a slash (/) and press **Enter** to execute the statement.

  NOTICE

  The terminator "/" must be written in an independent row.

- The declaration section includes the variable definition, type, and cursor definition.
- A simplest anonymous block does not execute any commands. However, at least one statement, even a **NULL** statement, must be presented in any implementation blocks.

Examples

The following lists basic anonymous block programs:

```
-- Null statement block
openGauss=# BEGIN
    NULL;
END;
/

-- Display information on the console.
openGauss=# BEGIN
    dbe_output.print_line('hello world!');
END;
/
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Display variable content on the console.
openGauss=# DECLARE
    my_var VARCHAR2(30);
BEGIN
    my_var :='world';
    dbe_output.print_line('hello'||my_var);
END;
/
```

13.5.3 Subprograms

A subprogram stores stored procedures, functions, operators, and advanced packages. A subprogram created in a database can be called by other programs.

13.6 Basic Statements

During PL/SQL programming, you may define some variables, assign values to variables, and call other stored procedures. The following sections describe basic PL/SQL statements, including variable definition statements, value assignment statements, call statements, and return statements.

NOTE

You are not advised to call the SQL statements containing passwords in the stored procedures because authorized users may view the stored procedure file in the database and password information is leaked. If a stored procedure contains other sensitive information, permission to access this procedure must be configured, preventing information leakage.

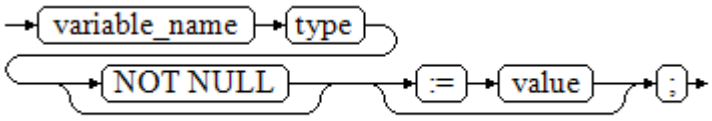
13.6.1 Variable Definition Statements

This section describes the declaration of variables in the PL/SQL and the scope of this variable in codes.

Variable Declaration

For details about the variable declaration syntax, see **Figure 13-3**.

Figure 13-3 declare_variable::=



The above syntax diagram is explained as follows:

- **variable_name** indicates the name of a variable.
- **type** indicates the type of a variable.
- **value** indicates the initial value of the variable. (If the initial value is not given, NULL is taken as the initial value.) **value** can also be an expression.

Example

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
openGauss=# DECLARE
   emp_id  INTEGER := 7788; -- Define a variable and assign a value to it.
BEGIN
   emp_id := 5*7784; -- Assign a value to the variable.
END;
/
```

In addition to the declaration of basic variable types, **%TYPE** and **%ROWTYPE** can be used to declare variables related to table columns or table structures.

%TYPE Attribute

%TYPE declares a variable to be of the same data type as a previously declared variable (for example, a column in a table). For example, if you want to define the **my_name** variable whose data type is the same as the data type of the **firstname** column in the **employee** table, you can define the variable as follows:

```
my_name employee.firstname%TYPE
```

In this way, you can declare **my_name** without the need of knowing the data type of **firstname** in **employee**, and the data type of **my_name** can be automatically updated when the data type of **firstname** changes.

%ROWTYPE Attribute

%ROWTYPE declares data types of a set of data. It stores a row of table data or results fetched from a cursor. For example, if you want to define a set of data with the same column names and column data types as the **employee** table, you can define the data as follows:

```
my_employee employee%ROWTYPE
```

NOTE

In the environment with multiple CNs, the **%ROWTYPE** and **%TYPE** attributes of the temporary table cannot be declared in a stored procedure. The temporary table is valid only in the current session. During compilation, other CNs cannot view the temporary table of the current CN. Therefore, if there are multiple CNs, the system displays a message indicating that the temporary table does not exist.

Scope of a Variable

The scope of a variable indicates the accessibility and availability of the variable in code block. In other words, a variable takes effect only within its scope.

- To define a function scope, a variable must declare and create a **BEGIN-END** block in the declaration section. The necessity of such declaration is also determined by block structure, which requires that a variable has different scopes and lifetime during a process.
- A variable can be defined multiple times in different scopes, and inner definition can cover outer one.
- A variable defined in an outer block can also be used in a nested block. However, the outer block cannot access variables in the nested block.

Example

```
openGauss=# DECLARE
   emp_id  INTEGER :=7788; -- Define a variable and assign a value to it.
   outer_var  INTEGER :=6688; -- Define a variable and assign a value to it.
BEGIN
   DECLARE
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    emp_id INTEGER :=7799; -- Define a variable and assign a value to it.
    inner_var  INTEGER :=6688; -- Define a variable and assign a value to it.
  BEGIN
    dbe_output.print_line('inner emp_id ='||emp_id); -- Display the value 7799.
    dbe_output.print_line('outer_var ='||outer_var); -- Reference a variable of an outer block.
  END;
  dbe_output.print_line('outer emp_id ='||emp_id); -- Display the value 7788.
END;
/
```

13.6.2 Assignment Statements

Variable Syntax

Figure 13-4 shows the syntax diagram for assigning a value to a variable.

Figure 13-4 assignment_value::=

The above syntax diagram is explained as follows:

- *variable_name*: specifies the name of a variable.
- *value* can be a value or an expression. The type of *value* must be compatible with the type of *variable_name*.

Variable Value Assignment Example

```
openGauss=# DECLARE
  emp_id  INTEGER := 7788; --Assignment
BEGIN
  emp_id := 5; --Assignment
  emp_id := 5*7784;
END;
/
```

INTO/BULK COLLECT INTO

INTO and **BULK COLLECT INTO** store values returned by statements in a stored procedure to variables. **BULK COLLECT INTO** allows some or all returned values to be temporarily stored in an array.

Example

```
openGauss=# DECLARE
  my_id integer;
BEGIN
  select id into my_id from customers limit 1; -- Assign a value.
END;
/

openGauss=# DECLARE
  type id_list is varray(6) of customers.id%type;
  id_arr id_list;
BEGIN
  select id bulk collect into id_arr from customers order by id DESC limit 20; -- Assign values in batches.
END;
/
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

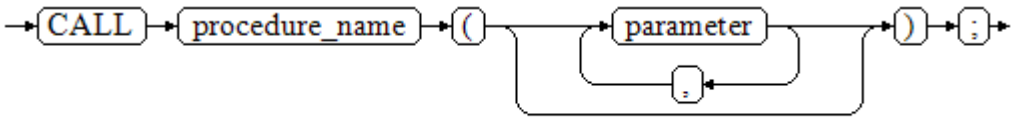
BULK COLLECT INTO can only assign values to arrays in batches. Use **LIMIT** properly to prevent performance deterioration caused by excessive operations on data.

13.6.3 Call Statements

Syntax

Figure 13-5 shows the syntax diagram for calling a clause.

Figure 13-5 call_clause::=



The above syntax diagram is explained as follows:

- *procedure_name*: specifies the name of a stored procedure.
- *parameter*: specifies the parameters for the stored procedure. You can set no parameter or multiple parameters.

Examples

```
-- Create the stored procedure proc_staffs.
openGauss=# CREATE OR REPLACE PROCEDURE proc_staffs
(
section     NUMBER(6),
salary_sum out NUMBER(8,2),
staffs_count out INTEGER
)
IS
BEGIN
SELECT sum(salary), count(*) INTO salary_sum, staffs_count FROM hr.staffs where section_id = section;
END;
/

-- Create the stored procedure proc_return.
openGauss=# CREATE OR REPLACE PROCEDURE proc_return
AS
v_num NUMBER(8,2);
v_sum INTEGER;
BEGIN
proc_staffs(30, v_sum, v_num);  --Call a statement.
dbe_output.print_line(v_sum||'#'||v_num);
RETURN;  --Return a statement.
END;
/

-- Call the stored procedure proc_return.
openGauss=# CALL proc_return();

-- Delete stored procedures.
openGauss=# DROP PROCEDURE proc_staffs;
openGauss=# DROP PROCEDURE proc_return;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
--Create the function func_return.
openGauss=# CREATE OR REPLACE FUNCTION func_return returns void
language plpgsql
AS $$
DECLARE
v_num INTEGER := 1;
BEGIN
dbe_output.print_line(v_num);
RETURN;  --Return a statement.
END $$;

-- Call the function func_return.
openGauss=#  CALL func_return();

-- Delete the function.
openGauss=#  DROP FUNCTION func_return;
```

13.7 Dynamic Statements

13.7.1 Executing Dynamic Query Statements

You can perform dynamic queries using **EXECUTE IMMEDIATE** or **OPEN FOR** in GaussDB. **EXECUTE IMMEDIATE** dynamically executes **SELECT** statements and **OPEN FOR** combines use of cursors. If you need to store query results in a dataset, use **OPEN FOR**.

EXECUTE IMMEDIATE

Figure 13-6 shows the syntax diagram.

Figure 13-6 EXECUTE IMMEDIATE dynamic_select_clause::=

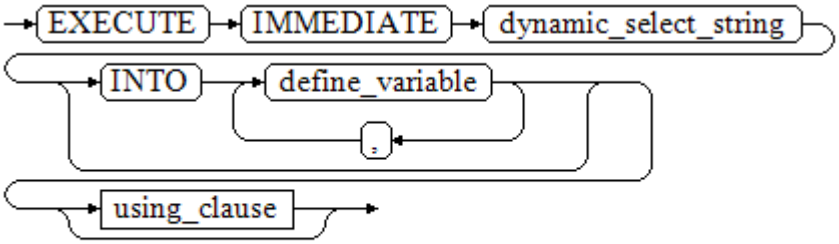


Figure 13-7 shows the syntax diagram for **using_clause**.

Figure 13-7 using_clause::=

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The above syntax diagram is explained as follows:

- *define_variable*: specifies a variable to store single-row query results.
- **USING IN** *bind_argument*: specifies the variable whose value is passed to the dynamic SQL statement. The variable is used when a dynamic placeholder exists in *dynamic_select_string*.
- **USING OUT** *bind_argument*: specifies the variable that stores a value returned by the dynamic SQL statement.

NOTICE

- In query statements, **INTO** and **OUT** cannot coexist.
- A placeholder name starts with a colon (:) followed by digits, characters, or strings, corresponding to *bind_argument* in the **USING** clause.
- *bind_argument* can only be a value, variable, or expression. It cannot be a database object such as a table name, column name, and data type. That is, *bind_argument* cannot be used to transfer schema objects for dynamic SQL statements. If a stored procedure needs to transfer database objects through *bind_argument* to construct dynamic SQL statements (generally, DDL statements), you are advised to use double vertical bars (||) to concatenate *dynamic_select_clause* with a database object.
- A dynamic PL/SQL block allows duplicate placeholders. That is, a placeholder can correspond to only one *bind_argument* in the **USING** clause.

Example:

```
--Retrieve values from dynamic statements (INTO clause).
openGauss=# DECLARE
  staff_count  VARCHAR2(20);
BEGIN
  EXECUTE IMMEDIATE 'select count(*) from hr.staffs'
    INTO staff_count;
  dbe_output.print_line(staff_count);
END;
/

--Pass and retrieve values (the INTO clause is used before the USING clause).
openGauss=# CREATE OR REPLACE PROCEDURE dynamic_proc
AS
  staff_id     NUMBER(6) := 200;
  first_name   VARCHAR2(20);
  salary       NUMBER(8,2);
BEGIN
  EXECUTE IMMEDIATE 'select first_name, salary from hr.staffs where staff_id = :1'
     INTO first_name, salary
     USING IN staff_id;
  dbe_output.print_line(first_name || ' ' || salary);
END;
/

-- Call the stored procedure.
openGauss=# CALL dynamic_proc();

-- Delete the stored procedure.
openGauss=# DROP PROCEDURE dynamic_proc;
```

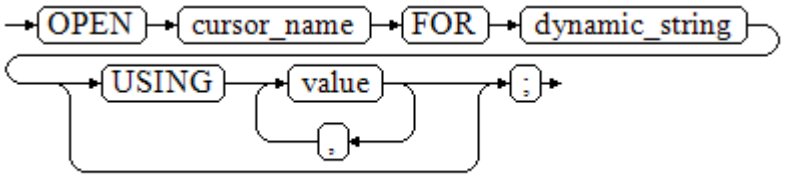
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

OPEN FOR

Dynamic query statements can be executed by using **OPEN FOR** to open dynamic cursors.

Figure 13-8 shows the syntax diagram.

Figure 13-8 open_for::=



Parameter description:

- *cursor_name*: specifies the name of the cursor to be opened.
- *dynamic_string*: specifies the dynamic query statement.
- **USING** *value*: applies when a placeholder exists in *dynamic_string*.

For details about use of cursors, see **Cursors**.

Example:

```
openGauss=# DECLARE
    name          VARCHAR2(20);
    phone_number  VARCHAR2(20);
    salary        NUMBER(8,2);
    sqlstr        VARCHAR2(1024);

    TYPE app_ref_cur_type IS REF CURSOR; -- Define the cursor type.
    my_cur app_ref_cur_type; -- Define the cursor variable.

BEGIN
    sqlstr := 'select first_name,phone_number,salary from hr.staffs
        where section_id = :1';
    OPEN my_cur FOR sqlstr USING '30'; -- Open the cursor. USING is optional.
    FETCH my_cur INTO name, phone_number, salary; -- Retrieve the data.
    WHILE my_cur%FOUND LOOP
        dbe_output.print_line(name||'#'||phone_number||'#'||salary);
        FETCH my_cur INTO name, phone_number, salary;
    END LOOP;
    CLOSE my_cur; -- Close the cursor.
END;
/
```

13.7.2 Executing Dynamic Non-Query Statements

Syntax

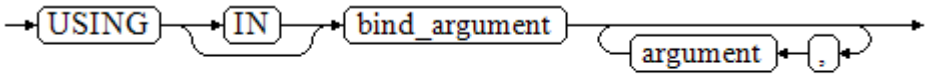
Figure 13-9 shows the syntax diagram.

Figure 13-9 noselect::=

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 13-10 shows the syntax diagram for **using_clause**.

Figure 13-10 using_clause::=



The above syntax diagram is explained as follows:

USING IN *bind_argument* is used to specify the variable whose value is passed to the dynamic SQL statement. The variable is used when a placeholder exists in *dynamic_noselect_string*. That is, a placeholder is replaced by the corresponding *bind_argument* when a dynamic SQL statement is executed. Note that *bind_argument* can only be a value, variable, or expression, and cannot be a database object such as a table name, column name, and data type. If a stored procedure needs to transfer database objects through *bind_argument* to construct dynamic SQL statements (generally, DDL statements), you are advised to use double vertical bars (||) to concatenate *dynamic_select_clause* with a database object. In addition, a dynamic PL/SQL block allows duplicate placeholders. That is, a placeholder can correspond to only one *bind_argument*.

Examples

```
-- Create a table.
openGauss=# CREATE TABLE sections_t1
(
   section       NUMBER(4) ,
   section_name  VARCHAR2(30),
   manager_id    NUMBER(6),
   place_id      NUMBER(4)
)
DISTRIBUTE BY hash(manager_id);

-- Declare a variable.
openGauss=# DECLARE
   section       NUMBER(4) := 280;
   section_name  VARCHAR2(30) := 'Info support';
   manager_id    NUMBER(6) := 103;
   place_id      NUMBER(4) := 1400;
   new_colname   VARCHAR2(10) := 'sec_name';
BEGIN
-- Execute the query.
    EXECUTE IMMEDIATE 'insert into sections_t1 values(:1, :2, :3, :4)'
       USING section, section_name, manager_id,place_id;
-- Execute the query (duplicate placeholders).
    EXECUTE IMMEDIATE 'insert into sections_t1 values(:1, :2, :3, :1)'
       USING section, section_name, manager_id;
-- Run the ALTER statement. You are advised to use double vertical bars (||) to concatenate the dynamic
DDL statement with a database object.
    EXECUTE IMMEDIATE 'alter table sections_t1 rename section_name to ' || new_colname;
END;
/

-- Query data.
openGauss=# SELECT * FROM sections_t1;

-- Delete the table.
openGauss=# DROP TABLE sections_t1;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.7.3 Dynamically Calling Stored Procedures

This section describes how to dynamically call store procedures. You must use anonymous statement blocks to package stored procedures or statement blocks and append **IN** and **OUT** behind the **EXECUTE IMMEDIATE...USING** statement to input and output parameters.

Syntax

Figure 13-11 shows the syntax diagram.

Figure 13-11 call_procedure::=

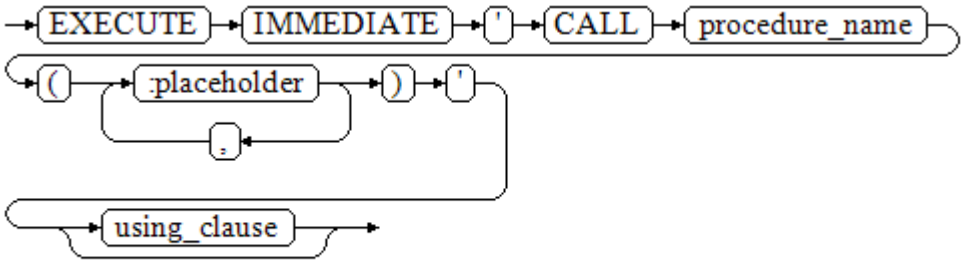


Figure 13-12 shows the syntax diagram for **using_clause**.

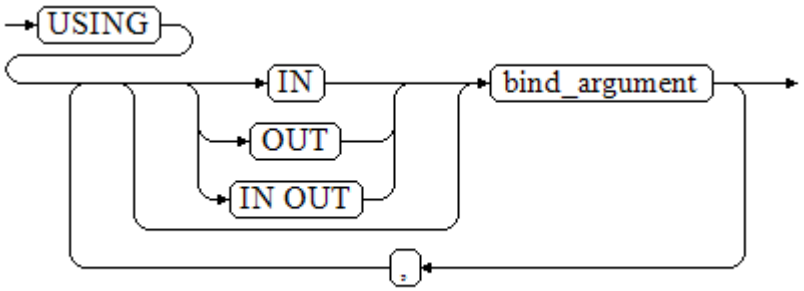
Figure 13-12 using_clause::=



The above syntax diagram is explained as follows:

- **CALL** *procedure_name*: calls the stored procedure.
- **[:placeholder1,:placeholder2,...]**: specifies the placeholder list of the stored procedure parameters. The numbers of the placeholders and parameters are the same.
- **USING [IN|OUT|IN OUT]** *bind_argument*: specifies the variable whose value is passed to the stored procedure parameter. The modifiers in front of *bind_argument* and of the corresponding parameter are the same.

Examples

```
--Create the stored procedure proc_add.
openGauss=# CREATE OR REPLACE PROCEDURE proc_add
(
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    param1    in   INTEGER,
    param2    out  INTEGER,
    param3    in   INTEGER
)
AS
BEGIN
   param2:= param1 + param3;
END;
/

openGauss=# DECLARE
    input1 INTEGER:=1;
    input2 INTEGER:=2;
    statement  VARCHAR2(200);
    param2     INTEGER;
BEGIN
   --Declare the call statement.
    statement := 'call proc_add(:col_1, :col_2, :col_3)';
   --Execute the statement.
    EXECUTE IMMEDIATE statement
        USING IN input1, OUT param2, IN input2;
    dbe_output.print_line('result is: '||to_char(param2));
END;
/

-- Delete the stored procedure.
openGauss=# DROP PROCEDURE proc_add;
```

13.7.4 Dynamically Calling Anonymous Blocks

This section describes how to execute anonymous blocks in dynamic statements. Append **IN** and **OUT** behind the **EXECUTE IMMEDIATE...USING** statement to input and output parameters.

Syntax

Figure 13-13 shows the syntax diagram.

Figure 13-13 call_anonymous_block::=

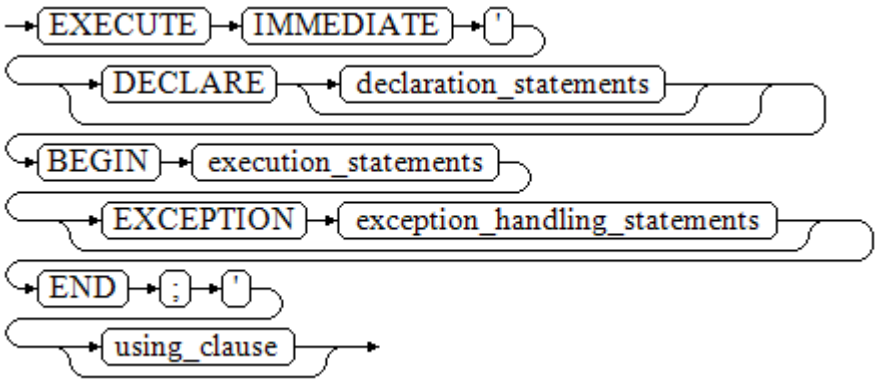


Figure 13-14 shows the syntax diagram for **using_clause**.

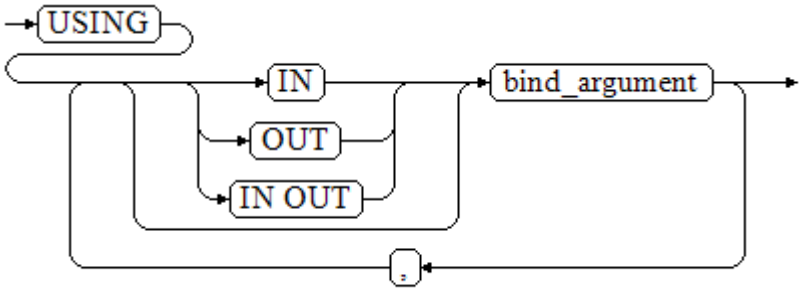
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 13-14 using_clause::=



The above syntax diagram is explained as follows:

- The execution section of an anonymous block starts with a **BEGIN** statement, has a break with an **END** statement, and ends with a semicolon (;).
- **USING [IN|OUT|IN OUT]** *bind_argument*: specifies the variable whose value is passed to the stored procedure parameter. The modifiers in front of *bind_argument* and of the corresponding parameter are the same.
- The input and output parameters in the middle of an anonymous block are designated by placeholders. The numbers of the placeholders and the parameters are the same. The sequences of the parameters corresponding to the placeholders and the **USING** parameters are the same.
- Currently in GaussDB, when dynamic statements call anonymous blocks, placeholders cannot be used to pass input and output parameters in an **EXCEPTION** statement.

Examples

```
--Create the stored procedure dynamic_proc.
openGauss=# CREATE OR REPLACE PROCEDURE dynamic_proc
AS
  staff_id     NUMBER(6) := 200;
  first_name   VARCHAR2(20);
  salary       NUMBER(8,2);
BEGIN
   --Execute the anonymous block.
   EXECUTE IMMEDIATE 'begin select first_name, salary into :first_name, :salary from hr.staffs where
staff_id= :dno; end;'
      USING OUT first_name, OUT salary, IN staff_id;
  dbe_output.print_line(first_name|| ' ' || salary);
END;
/

-- Call the stored procedure.
openGauss=# CALL dynamic_proc();

-- Delete the stored procedure.
openGauss=# DROP PROCEDURE dynamic_proc;
```

13.8 Control Statements

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.8.1 RETURN Statements

In GaussDB, data can be returned in either of the following ways: **RETURN**, **RETURN NEXT**, or **RETURN QUERY**. **RETURN NEXT** and **RETURN QUERY** are used only for functions and cannot be used for stored procedures.

13.8.1.1 RETURN

Syntax

Figure 13-15 shows the syntax diagram for a return statement.

Figure 13-15 return_clause::=

The above syntax diagram is explained as follows:

This statement returns control from a stored procedure or function to a caller.

Examples

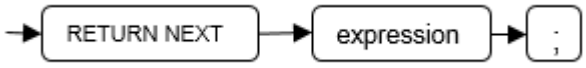
See **Examples** for call statement examples.

13.8.1.2 RETURN NEXT and RETURN QUERY

Syntax

When creating a function, specify **SETOF** *datatype* for the return values.

return_next_clause::=



return_query_clause::=

The above syntax diagram is explained as follows:

If a function needs to return a result set, use **RETURN NEXT** or **RETURN QUERY** to add results to the result set, and then continue to execute the next statement of the function. As the **RETURN NEXT** or **RETURN QUERY** statement is executed repeatedly, more and more results will be added to the result set. After the function is executed, all results are returned.

RETURN NEXT can be used for scalar and compound data types.

RETURN QUERY has a variant **RETURN QUERY EXECUTE**. You can add dynamic queries and add parameters to the queries by **USING**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
openGauss=# CREATE TABLE t1(a int);
openGauss=# INSERT INTO t1 VALUES(1),(10);

--RETURN NEXT
openGauss=# CREATE OR REPLACE FUNCTION fun_for_return_next() RETURNS SETOF t1 AS $$
DECLARE
  r t1%ROWTYPE;
BEGIN
  FOR r IN select * from t1
  LOOP
    RETURN NEXT r;
  END LOOP;
  RETURN;
END;
$$ LANGUAGE PLPGSQL;
openGauss=# call fun_for_return_next();
 a
---
 1
 10
(2 rows)

-- RETURN QUERY
openGauss=# CREATE OR REPLACE FUNCTION fun_for_return_query() RETURNS SETOF t1 AS $$
DECLARE
  r t1%ROWTYPE;
BEGIN
  RETURN QUERY select * from t1;
END;
$$
language plpgsql;
openGauss=# call fun_for_return_next();
 a
---
 1
 10
(2 rows)
```

13.8.2 Conditional Statements

Conditional statements are used to decide whether given conditions are met. Operations are executed based on the decisions made.

GaussDB supports five usages of **IF**:

- IF_THEN

  Figure 13-16 IF_THEN::=

  
  IF_THEN is the simplest form of **IF**. If the condition is true, statements are executed. If it is false, they are skipped.

  Example:

  ```
  openGauss=# IF v_user_id <> 0 THEN
      UPDATE users SET email = v_email WHERE user_id = v_user_id;
  END IF;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- IF_THEN_ELSE

  Figure 13-17 IF_THEN_ELSE::=

  
  IF-THEN-ELSE statements add **ELSE** branches and can be executed if the condition is false.

  Example:

  ```
  openGauss=# IF parentid IS NULL OR parentid = ''
  THEN
      RETURN;
  ELSE
      hp_true_filename(parentid); -- Call the stored procedure.
  END IF;
  ```

- IF_THEN_ELSE IF

  IF statements can be nested in the following way:

  ```
  openGauss=# IF sex = 'm' THEN
      pretty_sex := 'man';
  ELSE
      IF sex = 'f' THEN
          pretty_sex := 'woman';
      END IF;
  END IF;
  ```

  Actually, this is a way of an **IF** statement nesting in the **ELSE** part of another **IF** statement. Therefore, an **END IF** statement is required for each nesting **IF** statement and another **END IF** statement is required to end the parent **IF-ELSE** statement. To set multiple options, use the following form:

- IF_THEN_ELSIF_ELSE

  Figure 13-18 IF_THEN_ELSIF_ELSE::=

  
  Example:

  ```
  IF number_tmp = 0 THEN
      result := 'zero';
  ELSIF number_tmp > 0 THEN
      result := 'positive';
  ELSIF number_tmp < 0 THEN
      result := 'negative';
  ELSE
      result := 'NULL';
  END IF;
  ```

- IF_THEN_ELSEIF_ELSE

  ELSEIF is an alias of **ELSIF**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
CREATE OR REPLACE PROCEDURE proc_control_structure(i in integer)
AS
   BEGIN
      IF i > 0 THEN
         raise info 'i:% is greater than 0. ',i;
      ELSIF i < 0 THEN
         raise info 'i:% is smaller than 0. ',i;
      ELSE
         raise info 'i:% is equal to 0. ',i;
      END IF;
      RETURN;
   END;
/

CALL proc_control_structure(3);

-- Delete the stored procedure.
DROP PROCEDURE proc_control_structure;
```

13.8.3 Loop Statements

Simple LOOP Statements

Syntax diagram

Figure 13-19 loop::=

Example

```
CREATE OR REPLACE PROCEDURE proc_loop(i in integer, count out integer)
AS
   BEGIN
      count:=0;
      LOOP
      IF count > i THEN
         raise info 'count is %. ', count;
         EXIT;
      ELSE
         count:=count+1;
      END IF;
      END LOOP;
   END;
/

CALL proc_loop(10,5);
```

NOTICE

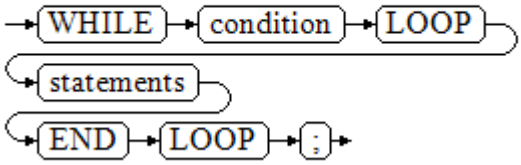
The loop must be exploited together with **EXIT**; otherwise, a dead loop occurs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

WHILE_LOOP Statements

Syntax diagram

Figure 13-20 while_loop::=



If the conditional expression is true, a series of statements in the WHILE statement are repeatedly executed and the condition is decided each time the loop body is executed.

Example

```
CREATE TABLE integertable(c1 integer) DISTRIBUTE BY hash(c1);
CREATE OR REPLACE PROCEDURE proc_while_loop(maxval in integer)
AS
    DECLARE
    i int :=1;
    BEGIN
        WHILE i < maxval LOOP
            INSERT INTO integertable VALUES(i);
            i:=i+1;
        END LOOP;
    END;
/

-- Invoke a function.
CALL proc_while_loop(10);

-- Delete the stored procedure and table.
DROP PROCEDURE proc_while_loop;
DROP TABLE integertable;
```

FOR_LOOP (*Integer variable*) *Statement*

Syntax diagram

Figure 13-21 for_loop::=

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The variable **name** is automatically defined as the **integer** type and exists only in this loop. The variable name falls between lower_bound and upper_bound.
- When the keyword **REVERSE** is used, the lower bound must be greater than or equal to the upper bound; otherwise, the loop body is not executed.

Example

```
-- Loop from 0 to 5.
CREATE OR REPLACE PROCEDURE proc_for_loop()
AS
   BEGIN
   FOR I IN 0..5 LOOP
      DBE_OUTPUT.PRINT_LINE('It is '||to_char(I) || ' time;') ;
   END LOOP;
END;
/

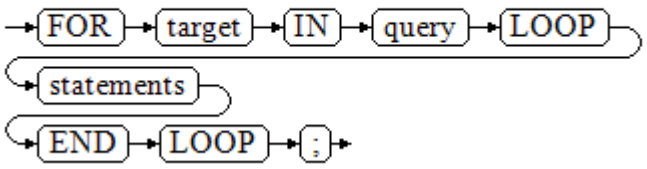
-- Invoke a function.
CALL proc_for_loop();

-- Delete the stored procedure.
DROP PROCEDURE proc_for_loop;
```

FOR_LOOP Query Statements

Syntax diagram

Figure 13-22 for_loop_query::=



NOTE

The variable **target** is automatically defined, its type is the same as that in the **query** result, and it is valid only in this loop. The target value is the query result.

Example

```
-- Display the query result from the loop.
CREATE OR REPLACE PROCEDURE proc_for_loop_query()
AS
   record VARCHAR2(50);
BEGIN
   FOR record IN SELECT spcname FROM pg_tablespace LOOP
   dbe_output.print_line(record);
   END LOOP;
END;
/

-- Invoke a function.
CALL proc_for_loop_query();

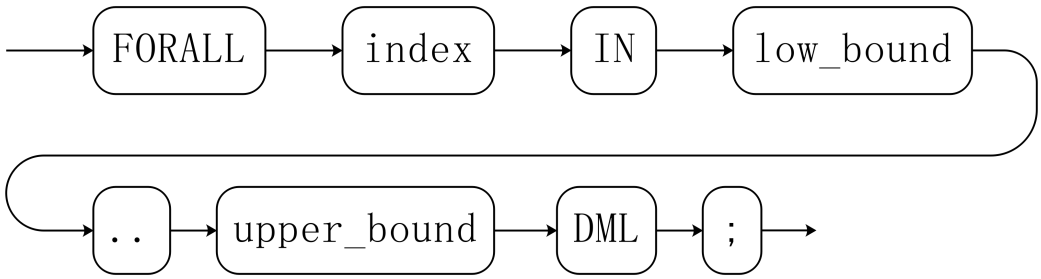
-- Delete the stored procedure.
DROP PROCEDURE proc_for_loop_query;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

FORALL Batch Query Statements

Syntax diagram

Figure 13-23 forall::=



NOTE

The variable **index** is automatically defined as the **integer** type and exists only in this loop. The index value falls between low_bound and upper_bound.

Example

```
CREATE TABLE TEST_t1 (
  title NUMBER(6),
  did VARCHAR2(20),
  data_period VARCHAR2(25),
  kind VARCHAR2(25),
  interval VARCHAR2(20),
  time DATE,
  isModified VARCHAR2(10)
)
DISTRIBUTE BY hash(did);

INSERT INTO TEST_t1 VALUES( 8, 'Donald', 'OConnell', 'DOCONNEL', '650.507.9833', to_date('21-06-1999',
'dd-mm-yyyy'), 'SH_CLERK' );

CREATE OR REPLACE PROCEDURE proc_forall()
AS
BEGIN
    FORALL i IN 100..120
        update TEST_t1 set title = title + 100*i;
END;
/

-- Invoke a function.
CALL proc_forall();

-Query the invocation result of the stored procedure.
SELECT * FROM TEST_t1 WHERE title BETWEEN 100 AND 120;

-- Delete the stored procedure and table.
DROP PROCEDURE proc_forall;
DROP TABLE TEST_t1;
```

13.8.4 Branch Statements

Syntax

Figure 13-24 shows the syntax diagram for a return statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 13-24 case_when::=

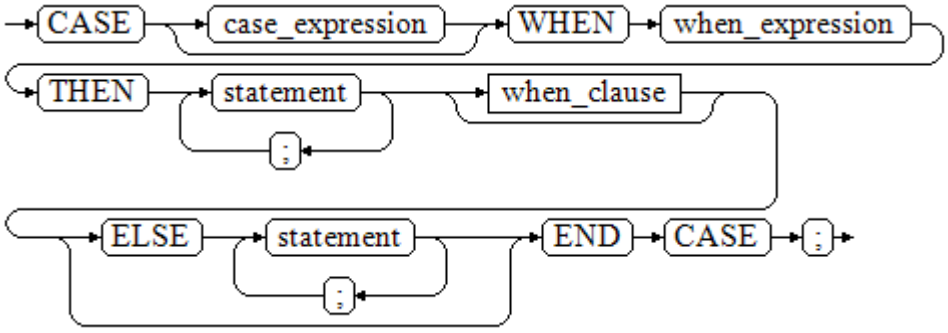


Figure 13-25 shows the syntax diagram for **when_clause**.

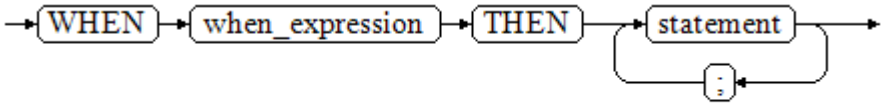
Figure 13-25 when_clause::=



Parameter description:

- *case_expression*: specifies the variable or expression.
- *when_expression*: specifies the constant or conditional expression.
- *statement*: specifies the statement to be executed.

Examples

```
CREATE OR REPLACE PROCEDURE proc_case_branch(pi_result in integer, pi_return out integer)
AS
   BEGIN
      CASE pi_result
         WHEN 1 THEN
            pi_return := 111;
         WHEN 2 THEN
            pi_return := 222;
         WHEN 3 THEN
            pi_return := 333;
         WHEN 6 THEN
            pi_return := 444;
         WHEN 7 THEN
            pi_return := 555;
         WHEN 8 THEN
            pi_return := 666;
         WHEN 9 THEN
            pi_return := 777;
         WHEN 10 THEN
            pi_return := 888;
         ELSE
            pi_return := 999;
      END CASE;
      raise info 'pi_return : %',pi_return ;
END;
/

CALL proc_case_branch(3,0);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Delete the stored procedure.
DROP PROCEDURE proc_case_branch;
```

13.8.5 NULL Statements

In PL/SQL programs, **NULL** statements are used to indicate "nothing should be done", equal to placeholders. They grant meanings to some statements and improve program readability.

Syntax

The following shows example use of **NULL** statements.

```
DECLARE
   ...
BEGIN
   ...
   IF v_num IS NULL THEN
      NULL; --No data needs to be processed.
   END IF;
END;
/
```

13.8.6 Error Trapping Statements

By default, any error occurring in a PL/SQL function aborts execution of the function, and indeed of the surrounding transaction as well. You can trap errors and restore from them by using a **BEGIN** block with an **EXCEPTION** clause. The syntax is an extension of the normal syntax for a **BEGIN** block:

```
[<<label>>]
[DECLARE
   declarations]
BEGIN
   statements
EXCEPTION
   WHEN condition [OR condition ...] THEN
      handler_statements
   [WHEN condition [OR condition ...] THEN
      handler_statements
   ...]
END;
```

If no error occurs, this form of block simply executes all the statements, and then control passes to the next statement after **END**. But if an error occurs within the statements, further processing of the statements is abandoned, and control passes to the **EXCEPTION** list. The list is searched for the first condition matching the error that occurred. If a match is found, the corresponding **handler_statements** are executed, and then control passes to the next statement after **END**. If no match is found, the error propagates out as though the **EXCEPTION** clause were not there at all: Error codes can be used to catch other error codes of the same type.

The error can be caught by an enclosing block with **EXCEPTION**, or if there is none it aborts processing of the function.

The condition names can be any of those shown in *Error Code Reference*. The special condition name **OTHERS** matches every error type except **QUERY_CANCELED**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If a new error occurs within the selected **handler_statements**, it cannot be caught by this **EXCEPTION** clause, but is propagated out. A surrounding **EXCEPTION** clause could catch it.

When an error is caught by an **EXCEPTION** clause, the local variables of the PL/SQL function remain as they were when the error occurred, but all changes to persistent database state within the block are rolled back.

Example:

```
CREATE TABLE mytab(id INT,firstname VARCHAR(20),lastname VARCHAR(20)) DISTRIBUTE BY hash(id);

INSERT INTO mytab(firstname, lastname) VALUES('Tom', 'Jones');

CREATE FUNCTION fun_exp() RETURNS INT
AS $$
DECLARE
   x INT :=0;
   y INT;
BEGIN
   UPDATE mytab SET firstname = 'Joe' WHERE lastname = 'Jones';
   x := x + 1;
   y := x / 0;
EXCEPTION
   WHEN division_by_zero THEN
      RAISE NOTICE 'caught division_by_zero';
      RETURN x;
END;$$
LANGUAGE plpgsql;

call fun_exp();
NOTICE:  caught division_by_zero
 fun_exp
---------
       1
(1 row)

select * from mytab;
 id | firstname | lastname
----+-----------+----------
    | Tom       | Jones
(1 row)

DROP FUNCTION fun_exp();
DROP TABLE mytab;
```

When control reaches the assignment to **y**, it will fail with a **division_by_zero** error. This will be caught by the **EXCEPTION** clause. The value returned in the **RETURN** statement will be the incremented value of **x**.

NOTE

A block containing an **EXCEPTION** clause is more expensive to enter and exit than a block without one. Therefore, do not use **EXCEPTION** without need.

In the following scenario, an exception cannot be caught, and the entire transaction rolls back. The threads of the nodes participating the stored procedure exit abnormally due to node failure and network fault, or the source data is inconsistent with that of the table structure of the target table during the COPY FROM operation.

Example: Exceptions with **UPDATE**/**INSERT**

This example uses exception handling to perform either **UPDATE** or **INSERT**, as appropriate:

```
CREATE TABLE db (a INT, b TEXT);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
CREATE FUNCTION merge_db(key INT, data TEXT) RETURNS VOID AS
$$
BEGIN
    LOOP

-- First try to update the key
        UPDATE db SET b = data WHERE a = key;
        IF found THEN
            RETURN;
        END IF;
-- Not there, so try to insert the key. If someone else inserts the same key concurrently, we could get a
unique-key failure.
        BEGIN
            INSERT INTO db(a,b) VALUES (key, data);
            RETURN;
        EXCEPTION WHEN unique_violation THEN
        -- Do nothing, and loop to try the UPDATE again.
        END;
     END LOOP;
END;
$$
LANGUAGE plpgsql;

SELECT merge_db(1, 'david');
SELECT merge_db(1, 'dennis');

--Delete FUNCTION and TABLE:
DROP FUNCTION merge_db;
DROP TABLE db ;
```

13.8.7 GOTO Statements

A **GOTO** statement unconditionally transfers the control from the current statement to a labeled statement. The **GOTO** statement changes the execution logic. Therefore, use this statement only when necessary. Alternatively, you can use the **EXCEPTION** statement to handle issues in special scenarios. To run a **GOTO** statement, the labeled statement must be unique.

Syntax

label declaration ::=

goto statement ::=

Examples

```
openGauss=# CREATE OR REPLACE PROCEDURE GOTO_test()
AS
DECLARE
    v1  int;
BEGIN
    v1  := 0;
        LOOP
        EXIT WHEN v1 > 100;
                v1 := v1 + 2;
                if v1 > 25 THEN
                        GOTO pos1;
                END IF;
        END LOOP;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
<<pos1>>
v1 := v1 + 10;
raise info 'v1 is %. ', v1;
END;
/

call GOTO_test();
```

Constraints

Using **GOTO** statements has the following constraints:

- A **GOTO** statement does not allow multiple labeled statements even if the statements are in different blocks.

```
BEGIN
 GOTO pos1;
 <<pos1>>
 SELECT * FROM ...
 <<pos1>>
 UPDATE t1 SET ...
END;
```

- A **GOTO** statement cannot transfer control to the **IF**, **CASE**, or **LOOP** statement.

```
BEGIN
  GOTO pos1;
  IF valid THEN
    <<pos1>>
    SELECT * FROM ...
  END IF;
END;
```

- A **GOTO** statement cannot transfer control from one **IF** clause to another, or from one **WHEN** clause in the **CASE** statement to another.

```
BEGIN
  IF valid THEN
    GOTO pos1;
    SELECT * FROM ...
  ELSE
    <<pos1>>
    UPDATE t1 SET ...
  END IF;
END;
```

- A **GOTO** statement cannot transfer control from an outer block to an inner **BEGIN-END** block.

```
BEGIN
  GOTO pos1;
  BEGIN
    <<pos1>>
    UPDATE t1 SET ...
  END;
END;
```

- A **GOTO** statement cannot transfer control from an exception handler to the current **BEGIN-END** block. However, a **GOTO** statement can transfer control to the upper-layer **BEGIN-END** block.

```
BEGIN
  <<pos1>>
  UPDATE t1 SET ...
  EXCEPTION
    WHEN condition THEN
      GOTO pos1;
END;
```

- To branch to a position that does not have an executable statement, add the **NULL** statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DECLARE
  done  BOOLEAN;
BEGIN
  FOR i IN 1..50 LOOP
    IF done THEN
      GOTO end_loop;
    END IF;
    <<end_loop>>  -- not allowed unless an executable statement follows
    NULL; -- add NULL statement to avoid error
  END LOOP;  -- raises an error without the previous NULL
END;
/
```

13.9 Transaction Statements

A stored procedure itself is automatically in a transaction. A transaction is automatically started when the most peripheral stored procedure is called. In addition, the transaction is automatically committed when the calling ends, or is rolled back when an exception occurs during calling. In addition to automatic transaction control, you can also use COMMIT/ROLLBACK to control transactions in stored procedures. Running the COMMIT/ROLLBACK commands in a stored procedure will commit or roll back the current transaction and automatically starts a new transaction. All subsequent operations will be performed in the new transaction.

A savepoint is a special mark inside a transaction. It allows all commands that are executed after it was established to be rolled back, restoring the transaction state to what it was at the time of the savepoint. In a stored procedure, you can use savepoints to manage transactions. Currently, you can create, roll back, and release savepoints. If a savepoint for rollback is used in a stored procedure, only the modification of the current transaction is rolled back. The execution process of the stored procedure is not changed, and the values of local variables in the stored procedure are not rolled back.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

COMMIT/ROLLBACK can be used in the following contexts:

1. COMMIT/ROLLBACK/SAVEPOINT can be used in stored procedures/functions in PL/SQL.
2. COMMIT, ROLLBACK, and SAVEPOINT can be used in stored procedures/functions that contain EXCEPTION.
3. COMMIT, ROLLBACK, and SAVEPOINT can be used in EXCEPTION statements of stored procedures.
4. A stored procedure that contains COMMIT, ROLLBACK, or SAVEPOINT (which means the stored procedure is controlled by BEGIN, START, or END) can be called in a transaction block.
5. A stored procedure that contains savepoints can be invoked in a subtransaction and an externally defined savepoint is used to roll back the transaction to the savepoint defined outside the stored procedure.
6. A savepoint defined in the stored procedure can be viewed outside the stored procedure. That is, the modification of the transaction can be rolled back to the savepoint defined in the stored procedure.
7. COMMIT, ROLLBACK, and SAVEPOINT, as well as IF, FOR, CURSOR LOOP, and WHILE, can be called in most contexts and statements in PL/SQL.

The following content can be committed or rolled back:

1. DDL statements after COMMIT/ROLLBACK can be committed or rolled back.
2. DML statements after COMMIT/ROLLBACK can be committed.
3. GUC parameters in stored procedures can be committed or rolled back.

Syntax

```
Define a savepoint.
   SAVEPOINT savepoint_name;
Roll back a savepoint.
   ROLLBACK TO [SAVEPOINT] savepoint_name;
Release a savepoint.
   RELEASE [SAVEPOINT] savepoint_name;
```

Examples

NOTE

COMMIT/ROLLBACK can be used in PL/SQL stored procedures.

```
CREATE TABLE EXAMPLE1(COL1 INT);

CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE()
AS
BEGIN
   FOR i IN 0..20 LOOP
      INSERT INTO EXAMPLE1(COL1) VALUES (i);
      IF i % 2 = 0 THEN
         COMMIT;
      ELSE
         ROLLBACK;
      END IF;
   END LOOP;
END;
/
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- COMMIT/ROLLBACK can be used in stored procedures that contain EXCEPTION.
- COMMIT/ROLLBACK can be used in EXCEPTION statements of stored procedures.
- DDL statements after COMMIT/ROLLBACK can be committed or rolled back.

```
CREATE OR REPLACE PROCEDURE TEST_COMMIT_INSERT_EXCEPTION_ROLLBACK()
AS
BEGIN
 DROP TABLE IF EXISTS TEST_COMMIT;
 CREATE TABLE TEST_COMMIT(A INT, B INT);
 INSERT INTO TEST_COMMIT SELECT 1, 1;
 COMMIT;
       CREATE TABLE TEST_ROLLBACK(A INT, B INT);
 RAISE EXCEPTION 'RAISE EXCEPTION AFTER COMMIT';
EXCEPTION
   WHEN OTHERS THEN
 INSERT INTO TEST_COMMIT SELECT 2, 2;
 ROLLBACK;
END;
/
```

NOTE

A stored procedure that contains COMMIT/ROLLBACK (which means the stored procedure is controlled by /BEGIN/START/END) can be called in a transaction block.

```
BEGIN;
   CALL TEST_COMMIT_INSERT_EXCEPTION_ROLLBACK();
END;
```

NOTE

COMMIT/ROLLBACK, including IF, FOR, CURSOR LOOP, and WHILE, can be called in most PL/SQL contexts and statements.

```
CREATE OR REPLACE PROCEDURE TEST_COMMIT2()
IS
BEGIN
   DROP TABLE IF EXISTS TEST_COMMIT;
   CREATE TABLE TEST_COMMIT(A INT);
   FOR I IN REVERSE 3..0 LOOP
 INSERT INTO TEST_COMMIT SELECT I;
 COMMIT;
   END LOOP;
   FOR I IN REVERSE 2..4 LOOP
 UPDATE TEST_COMMIT SET A=I;
 COMMIT;
   END LOOP;
EXCEPTION
WHEN OTHERS THEN
 INSERT INTO TEST_COMMIT SELECT 4;
   COMMIT;
END;
/
```

NOTE

GUC parameters in stored procedures can be committed or rolled back.

```
SHOW explain_perf_mode;
SHOW enable_force_vector_engine;

CREATE OR REPLACE PROCEDURE GUC_ROLLBACK()
AS
BEGIN
   SET enable_force_vector_engine = on;
   COMMIT;
   SET explain_perf_mode TO pretty;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    ROLLBACK;
END;
/

call GUC_ROLLBACK();
SHOW explain_perf_mode;
SHOW enable_force_vector_engine;
SET enable_force_vector_engine = off;
```

NOTE

Savepoints can be used in PL/SQL stored procedures to roll back partial transaction modifications.

```
CREATE OR REPLACE PROCEDURE STP_SAVEPOINT_EXAMPLE1()
AS
BEGIN
    INSERT INTO EXAMPLE1 VALUES(1);
    SAVEPOINT s1;
    INSERT INTO EXAMPLE1 VALUES(2);
    ROLLBACK TO s1;  -- Roll back the insertion of record 2.
    INSERT INTO EXAMPLE1 VALUES(3);
END;
/
```

NOTE

You can use a savepoint in a PL/SQL stored procedure to roll back to a savepoint defined outside the stored procedure.

```
CREATE OR REPLACE PROCEDURE STP_SAVEPOINT_EXAMPLE2()
AS
BEGIN
    INSERT INTO EXAMPLE1 VALUES(2);
    ROLLBACK TO s1;  -- Roll back the insertion of record 2.
    INSERT INTO EXAMPLE1 VALUES(3);
END;
/

BEGIN;
INSERT INTO EXAMPLE1 VALUES(1);
SAVEPOINT s1;
CALL STP_SAVEPOINT_EXAMPLE2();
SELECT * FROM EXAMPLE1;
COMMIT;
```

NOTE

You can use a savepoint defined outside the stored procedure to roll back to a savepoint in a PL/SQL stored procedure.

```
CREATE OR REPLACE PROCEDURE STP_SAVEPOINT_EXAMPLE3()
AS
BEGIN
    INSERT INTO EXAMPLE1 VALUES(1);
    SAVEPOINT s1;
    INSERT INTO EXAMPLE1 VALUES(2);
END;
/

BEGIN;
INSERT INTO EXAMPLE1 VALUES(3);
CALL STP_SAVEPOINT_EXAMPLE3();
ROLLBACK TO SAVEPOINT s1; -- Roll back the insertion of record 2 to the stored procedure.
SELECT * FROM EXAMPLE1;
COMMIT;
```

NOTE

The COMMIT and ROLLBACK statements can be invoked in a function.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
CREATE OR REPLACE FUNCTION FUNCTION_EXAMPLE1() RETURN INT
AS
EXP INT;
BEGIN
    FOR i IN 0..20 LOOP
        INSERT INTO EXAMPLE1(col1) VALUES (i);
        IF i % 2 = 0 THEN
            COMMIT;
        ELSE
            ROLLBACK;
        END IF;
    END LOOP;
    SELECT COUNT(*) FROM EXAMPLE1 INTO EXP;
    RETURN EXP;
END;
/
```

Constraints

CAUTION

- COMMIT/ROLLBACK cannot be used in the following contexts:
  1. COMMIT, ROLLBACK, and SAVEPOINT cannot be called in stored procedures other than PL/SQL, such as PLJava and PLPython.
  2. After SAVEPOINT is called in a transaction block, stored procedures that contain COMMIT/ROLLBACK cannot be called.
  3. Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in TRIGGER.
  4. COMMIT, ROLLBACK, and SAVEPOINT cannot be invoked in EXECUTE statements.
  5. Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in CURSOR statements.
  6. Stored procedures that contain IMMUTABLE or SHIPPABLE cannot call COMMIT, ROLLBACK, SAVEPOINT or another stored procedure that contain COMMIT, ROLLBACK, or SAVEPOINT.
  7. Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in SQL statements other than SELECT PROC and CALL PROC.
  8. COMMIT, ROLLBACK, or SAVEPOINT cannot be called in a stored procedure whose header contains GUC parameters.
  9. COMMIT, ROLLBACK, or SAVEPOINT cannot be called in expressions or CURSOR and EXECUTE statements.
  10. Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in the return values and expression calculation of stored procedures.
  11. Savepoints defined outside a stored procedure cannot be released in the stored procedure.
  12. A stored procedure transaction and its autonomous transaction are two independent transactions and cannot use savepoints defined in each other's transaction.
- The following content cannot be committed or rolled back:
  1. Variables declared or imported in stored procedures cannot be committed or rolled back.
  2. In stored procedures, GUC parameters that take effect only after a restart cannot be committed or rolled back.

There are the following constraints on the use of COMMIT/ROLLBACK in a stored procedure:

NOTE

A TRIGGER stored procedure cannot contain COMMIT/ROLLBACK or called another stored procedure that contains COMMIT/ROLLBACK.

```
CREATE OR REPLACE FUNCTION FUNCTION_TRI_EXAMPLE2() RETURN TRIGGER
AS
EXP INT;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
BEGIN
    FOR i IN 0..20 LOOP
        INSERT INTO EXAMPLE1(col1) VALUES (i);
        IF i % 2 = 0 THEN
            COMMIT;
        ELSE
            ROLLBACK;
        END IF;
    END LOOP;
    SELECT COUNT(*) FROM EXAMPLE1 INTO EXP;
END;
/

CREATE TRIGGER TRIGGER_EXAMPLE AFTER DELETE ON EXAMPLE1
FOR EACH ROW EXECUTE PROCEDURE FUNCTION_TRI_EXAMPLE2();

DELETE FROM EXAMPLE1;
```

NOTE

Stored procedures that contain IMMUTABLE or SHIPPABLE cannot call COMMIT/ROLLBACK or another stored procedure that contains COMMIT/ROLLBACK.

```
CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE1()
IMMUTABLE
AS
BEGIN
    FOR i IN 0..20 LOOP
        INSERT INTO EXAMPLE1 (col1) VALUES (i);
        IF i % 2 = 0 THEN
            COMMIT;
        ELSE
            ROLLBACK;
        END IF;
    END LOOP;
END;
/
```

NOTE

Variables declared or imported in stored procedures cannot be committed or rolled back.

```
CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE2(EXP_OUT OUT INT)
AS
EXP INT;
BEGIN
    EXP_OUT := 0;
    COMMIT;
    DBE_OUTPUT.PRINT_LINE('EXP IS:'||EXP);
    EXP_OUT := 1;
    ROLLBACK;
    DBE_OUTPUT.PRINT_LINE('EXP IS:'||EXP);
END;
/
```

NOTE

Calling in SQL statements (other than Select Procedure) is not supported.

```
CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE3()
AS
BEGIN
    FOR i IN 0..20 LOOP
        INSERT INTO EXAMPLE1 (col1) VALUES (i);
        IF i % 2 = 0 THEN
            EXECUTE IMMEDIATE 'COMMIT';
        ELSE
            EXECUTE IMMEDIATE 'ROLLBACK';
        END IF;
    END LOOP;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
END;
/
```

NOTE

COMMIT/ROLLBACK cannot be called in a stored procedure whose header contains GUC parameters.

```
CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE4()
SET ARRAY_NULLS TO "ON"
AS
BEGIN
   FOR i IN 0..20 LOOP
      INSERT INTO EXAMPLE1 (col1) VALUES (i);
      IF i % 2 = 0 THEN
         COMMIT;
      ELSE
         ROLLBACK;
      END IF;
   END LOOP;
END;
/
```

NOTE

A stored procedure object whose cursor is open cannot contain COMMIT/ROLLBACK.

```
CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE5(INTIN IN INT, INTOUT OUT INT)
AS
BEGIN
INTOUT := INTIN + 1;
COMMIT;
END;
/

CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE6()
AS
CURSOR CURSOR1(EXPIN INT)
IS SELECT TRANSACTION_EXAMPLE5(EXPIN);
INTEXP INT;
BEGIN
   FOR i IN 0..20 LOOP
      OPEN CURSOR1(i);
      FETCH CURSOR1 INTO INTEXP;
      INSERT INTO EXAMPLE1(COL1) VALUES (INTEXP);
      IF i % 2 = 0 THEN
         COMMIT;
      ELSE
         ROLLBACK;
      END IF;
      CLOSE CURSOR1;
   END LOOP;
END;
/
```

NOTE

COMMIT/ROLLBACK cannot be called in expressions or CURSOR/EXECUTE statements.

```
CREATE OR REPLACE PROCEDURE exec_func1()
AS
BEGIN
   CREATE TABLE TEST_exec(A INT);
COMMIT;
END;
/
CREATE OR REPLACE PROCEDURE exec_func2()
AS
BEGIN
EXECUTE exec_func1();
COMMIT;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
END;
/
```

NOTE

Return values and expression calculation of stored procedures are not supported.

```
CREATE OR REPLACE PROCEDURE exec_func3(RET_NUM OUT INT)
AS
BEGIN
   RET_NUM := 1+1;
COMMIT;
END;
/
CREATE OR REPLACE PROCEDURE exec_func4(ADD_NUM IN INT)
AS
SUM_NUM INT;
BEGIN
SUM_NUM := ADD_NUM + exec_func3();
COMMIT;
END;
/
```

NOTE

Savepoints defined outside a stored procedure cannot be released in the stored procedure.

```
CREATE OR REPLACE PROCEDURE STP_SAVEPOINT_EXAMPLE3()
AS
BEGIN
   INSERT INTO EXAMPLE1 VALUES(2);
   RELEASE SAVEPOINT s1; -- Release the savepoint defined outside the stored procedure.
   INSERT INTO EXAMPLE1 VALUES(3);
END;
/

BEGIN;
INSERT INTO EXAMPLE1 VALUES(1);
SAVEPOINT s1;
CALL STP_SAVEPOINT_EXAMPLE3();
COMMIT;
```

13.10 Other Statements

13.10.1 Lock Operations

GaussDB provides multiple lock modes to control concurrent accesses to table data. These modes are used when MVCC cannot give expected behaviors. Alike, most GaussDB commands automatically apply appropriate locks to ensure that called tables are not deleted or modified in an incompatible manner during command execution. For example, when concurrent operations exist, **ALTER TABLE** cannot be executed on the same table.

13.10.2 Cursor Operations

GaussDB provides cursors as a data buffer for users to store execution results of SQL statements. Each cursor region has a name. Users can use SQL statements to obtain records one by one from cursors and grant the records to master variables, then being processed further by host languages.

Cursor operations include cursor definition, open, fetch, and close operations.

For the complete example of cursor operations, see **Explicit Cursor**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.11 Cursors

13.11.1 Overview

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers pointing to context regions. With cursors, stored procedures can control alterations in context regions.

NOTICE

If JDBC is used to call a stored procedure whose returned value is a cursor, the returned cursor cannot be used.

Cursors are classified into explicit cursors and implicit cursors. **Table 13-2** shows the usage conditions of explicit and implicit cursors for different SQL statements.

Table 13-2 Cursor usage conditions

SQL Statement	Cursor
Non-query statements	Implicit
Query statements with single-line results	Implicit or explicit
Query statements with multi-line results	Explicit

13.11.2 Explicit Cursor

An explicit cursor is used to process query statements, particularly when query results are multiple records.

Procedure

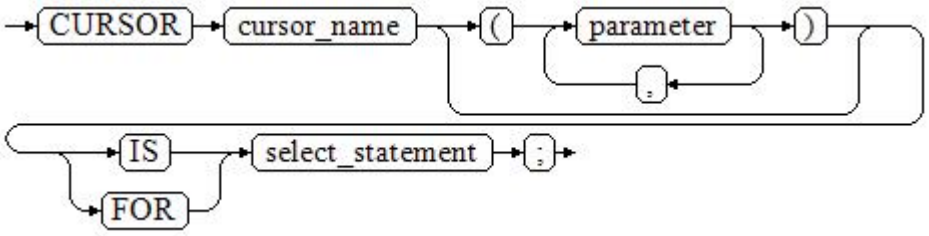
An explicit cursor performs the following six PL/SQL steps to process query statements:

Step 1 Define a static cursor: Define a cursor name and its corresponding **SELECT** statement.

Figure 13-26 shows the syntax diagram for defining a static cursor.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 13-26 static_cursor_define::=



Parameter description:

- *cursor_name*: defines a cursor name.
- *parameter*: specifies cursor parameters. Only input parameters are allowed. Its format is as follows:
  ```
  parameter_name datatype
  ```
- *select_statement*: specifies a query statement.

NOTE

The system automatically determines whether the cursor can be used for backward fetching based on the execution plan.

Define a dynamic cursor: Define a **ref** cursor, which means that the cursor can be opened dynamically by a set of static SQL statements. Define the type of the **ref** cursor first, and then the cursor variable of this cursor type. Dynamically bind a **SELECT** statement through **OPEN FOR** when the cursor is opened.

Figure 13-27 and **Figure 13-28** show the syntax diagrams for defining a dynamic cursor.

Figure 13-27 cursor_typename::=

GaussDB supports the dynamic cursor type **sys_refcursor**. A function or stored procedure can use the **sys_refcursor** parameter to pass on or pass out the cursor result set. A function can return **sys_refcursor** to return the cursor result set.

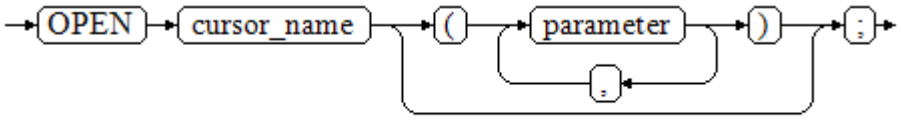
Figure 13-28 dynamic_cursor_define::=

Step 2 Open the static cursor: Execute the **SELECT** statement corresponding to the cursor. The query result is placed in the workspace and the pointer directs to the head of the workspace to identify the cursor result set. If the cursor query statement carries the **FOR UPDATE** option, the **OPEN** statement locks the data rows corresponding to the cursor result set in the database table.

Figure 13-29 shows the syntax diagram for opening a static cursor.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

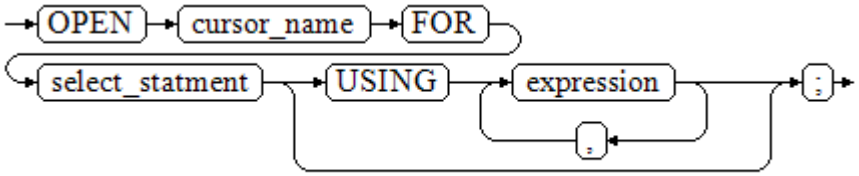
Figure 13-29 open_static_cursor::=



Open the dynamic cursor: Use the **OPEN FOR** statement to open the dynamic cursor and the SQL statement is dynamically bound.

Figure 13-30 shows the syntax diagrams for opening a dynamic cursor.

Figure 13-30 open_dynamic_cursor::=

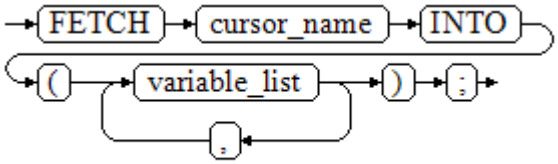


A PL/SQL program cannot use the **OPEN** statement to repeatedly open a cursor.

Step 3 Fetch cursor data: Retrieve data rows in the result set and place them in specified output variables.

Figure 13-31 shows the syntax diagrams for fetching cursor data.

Figure 13-31 fetch_cursor::=



Step 4 Process the record.

Step 5 Continue to process until the active set has no record.

Step 6 Close the cursor: After you fetch and process the data in the cursor result set, close the cursor in time to release system resources used by the cursor and invalidate the workspace of the cursor so that the **FETCH** statement cannot be used to fetch data any more. A closed cursor can be reopened by an **OPEN** statement.

Figure 13-32 shows the syntax diagram for closing a cursor.

Figure 13-32 close_cursor::=

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Attributes

Cursor attributes are used to control program procedures or know program status. When a DML statement is executed, the PL/SQL opens a built-in cursor and processes its result. A cursor is a memory segment for maintaining query results. It is opened when a DML statement is executed and closed when the execution is finished. An explicit cursor has the following attributes:

- **%FOUND**: Boolean attribute, which returns **TRUE** if the last fetch returns a row.
- **%NOTFOUND**: Boolean attribute, which works opposite to the **%FOUND** attribute.
- **%ISOPEN**: Boolean attribute, which returns **TRUE** if the cursor has been opened.
- **%ROWCOUNT**: numeric attribute, which returns the number of records fetched from the cursor.

Examples

```
-- Specify the method for passing cursor parameters.
CREATE OR REPLACE PROCEDURE cursor_proc1()
AS
DECLARE
   DEPT_NAME VARCHAR(100);
   DEPT_LOC NUMBER(4);
   -- Define a cursor.
   CURSOR C1 IS
      SELECT section_name, place_id FROM hr.sections WHERE section_id <= 50;
   CURSOR C2(sect_id INTEGER) IS
      SELECT section_name, place_id FROM hr.sections WHERE section_id <= sect_id;
   TYPE CURSOR_TYPE IS REF CURSOR;
   C3 CURSOR_TYPE;
   SQL_STR VARCHAR(100);
BEGIN
   OPEN C1;-- Open the cursor.
   LOOP
      -- Fetch data from the cursor.
      FETCH C1 INTO DEPT_NAME, DEPT_LOC;
      EXIT WHEN C1%NOTFOUND;
      DBE_OUTPUT.PRINT_LINE(DEPT_NAME||'---'||DEPT_LOC);
   END LOOP;
   CLOSE C1;-- Close the cursor.

   OPEN C2(10);
   LOOP
      FETCH C2 INTO DEPT_NAME, DEPT_LOC;
      EXIT WHEN C2%NOTFOUND;
      DBE_OUTPUT.PRINT_LINE(DEPT_NAME||'---'||DEPT_LOC);
   END LOOP;
   CLOSE C2;

   SQL_STR := 'SELECT section_name, place_id FROM hr.sections WHERE section_id <= :DEPT_NO;';
   OPEN C3 FOR SQL_STR USING 50;
   LOOP
      FETCH C3 INTO DEPT_NAME, DEPT_LOC;
      EXIT WHEN C3%NOTFOUND;
      DBE_OUTPUT.PRINT_LINE(DEPT_NAME||'---'||DEPT_LOC);
   END LOOP;
   CLOSE C3;
END;
/

CALL cursor_proc1();
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DROP PROCEDURE cursor_proc1;
-- Give a salary raise to employees whose salary is lower than 3000 by adding 500.
CREATE TABLE hr.staffs_t1 AS TABLE hr.staffs;

CREATE OR REPLACE PROCEDURE cursor_proc2()
AS
DECLARE
  V_EMPNO  NUMBER(6);
  V_SAL    NUMBER(8,2);
  CURSOR C IS SELECT staff_id, salary FROM hr.staffs_t1;
BEGIN
  OPEN C;
  LOOP
    FETCH C INTO V_EMPNO, V_SAL;
    EXIT WHEN C%NOTFOUND;
    IF V_SAL<=3000 THEN
        UPDATE hr.staffs_t1 SET salary =salary + 500 WHERE staff_id = V_EMPNO;
    END IF;
  END LOOP;
  CLOSE C;
END;
/

CALL cursor_proc2();

-- Delete the stored procedure.
DROP PROCEDURE cursor_proc2;
DROP TABLE hr.staffs_t1;
-- Use function parameters of the SYS_REFCURSOR type.
CREATE OR REPLACE PROCEDURE proc_sys_ref(O OUT SYS_REFCURSOR)
IS
C1 SYS_REFCURSOR;
BEGIN
OPEN C1 FOR SELECT section_ID FROM HR.sections ORDER BY section_ID;
O := C1;
END;
/

DECLARE
C1 SYS_REFCURSOR;
TEMP NUMBER(4);
BEGIN
proc_sys_ref(C1);
LOOP
  FETCH C1 INTO TEMP;
  DBE_OUTPUT.PRINT_LINE(C1%ROWCOUNT);
  EXIT WHEN C1%NOTFOUND;
END LOOP;
END;
/

-- Delete the stored procedure.
DROP PROCEDURE proc_sys_ref;
```

13.11.3 Implicit Cursor

Implicit cursors are automatically set by the system for non-query statements such as modify or delete operations, along with their workspace. Implicit cursors are named **SQL**, which is defined by the system.

Overview

Implicit cursor operations, such as definition, open, value-grant, and close operations, are automatically performed by the system and do not need users to process. Users can use only attributes related to implicit cursors to complete

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

operations. In workspace of implicit cursors, the data of the latest SQL statement is stored and is not related to explicit cursors defined by users.

Format call: **SQL%**

NOTE

INSERT, **UPDATE**, **DELETE**, and **SELECT** statements do not need defined cursors.

Attributes

An implicit cursor has the following attributes:

- **SQL%FOUND**: Boolean attribute, which returns **TRUE** if the last fetch returns a row.
- **SQL%NOTFOUND**: Boolean attribute, which works opposite to the **SQL %FOUND** attribute.
- **SQL%ROWCOUNT**: numeric attribute, which returns the number of records fetched from the cursor.
- **SQL%ISOPEN**: Boolean attribute, whose value is always **FALSE**. Close implicit cursors immediately after an SQL statement is run.

Examples

```
-- Delete all employees in a department from the EMP table. If the department has no employees, delete the department from the DEPT table.
CREATE TABLE hr.staffs_t1 AS TABLE hr.staffs;
CREATE TABLE hr.sections_t1 AS TABLE hr.sections;

CREATE OR REPLACE PROCEDURE proc_cursor3()
AS
   DECLARE
   V_DEPTNO NUMBER(4) := 100;
   BEGIN
      DELETE FROM hr.staffs WHERE section_ID = V_DEPTNO;
      -- Proceed based on cursor status.
      IF SQL%NOTFOUND THEN
      DELETE FROM hr.sections_t1 WHERE section_ID = V_DEPTNO;
      END IF;
   END;
/

CALL proc_cursor3();

-- Delete the stored procedure and the temporary table.
DROP PROCEDURE proc_cursor3;
DROP TABLE hr.staffs_t1;
DROP TABLE hr.sections_t1;
```

13.11.4 Cursor Loop

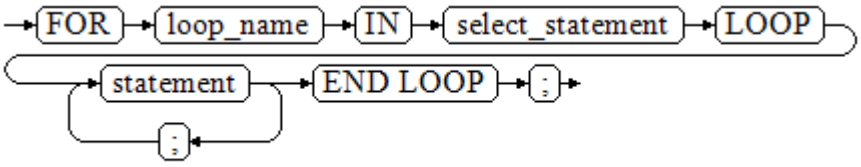
Use of cursors in **WHILE** and **LOOP** statements is called a cursor loop. Generally, **OPEN**, **FETCH**, and **CLOSE** statements are called in this kind of loop. The following describes a loop that simplifies a cursor loop without the need for these operations. This mode is applicable to a static cursor loop, without executing four steps about a static cursor.

Syntax

Figure 13-33 shows the syntax diagram of the **FOR AS** loop.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 13-33 FOR_AS_loop::=



Precautions

- The **UPDATE** operation for the queried table is not allowed in the loop statement.
- The variable *loop_name* is automatically defined and is valid only in this loop. Its type is the same as that in the query result of *select_statement*. The value of *loop_name* is the query result of *select_statement*.
- The **%FOUND**, **%NOTFOUND**, and **%ROWCOUNT** attributes access the same internal variable in GaussDB. Transactions and the anonymous block do not support multiple cursor accesses at the same time.

Examples

```
BEGIN
FOR ROW_TRANS IN
        SELECT first_name FROM hr.staffs
    LOOP
        DBE_OUTPUT.PRINT_LINE (ROW_TRANS.first_name );
    END LOOP;
END;
/

-- Create a table.
CREATE TABLE integerTable1( A INTEGER) DISTRIBUTE BY hash(A);
CREATE TABLE integerTable2( B INTEGER) DISTRIBUTE BY hash(B);
INSERT INTO integerTable2 VALUES(2);

-- Multiple cursors share the parameters of cursor attributes.
DECLARE
   CURSOR C1 IS SELECT A FROM integerTable1;-- Declare the cursor.
   CURSOR C2 IS SELECT B FROM integerTable2;
   PI_A INTEGER;
   PI_B INTEGER;
BEGIN
    OPEN C1;-- Open the cursor.
   OPEN C2;
   FETCH C1 INTO PI_A; ---- The values of C1%FOUND and C2%FOUND are FALSE.
   FETCH C2 INTO PI_B; ---- The values of C1%FOUND and C2%FOUND are TRUE.
   -- Determine the cursor status.
   IF C1%FOUND THEN
      IF C2%FOUND THEN
        DBE_OUTPUT.PRINT_LINE('Dual cursor share paremeter.');
      END IF;
   END IF;
    CLOSE C1;-- Close the cursor.
   CLOSE C2;
END;
/

-- Delete the temporary table.
DROP TABLE integerTable1;
DROP TABLE integerTable2;
```

13.12 Advanced Packages

Advanced packages have two sets of interfaces. The first set is basic interfaces, and the second set is secondary encapsulation interfaces that are used improve usability. The second set is recommended.

13.12.1 Basic Interfaces

13.12.1.1 PKG_SERVICE

Table 13-3 lists all interfaces supported by the **PKG_SERVICE** package.

Table 13-3 PKG_SERVICE

Interface	Description
PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE	Checks whether a context is registered.
PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS	Deregisters all registered contexts.
PKG_SERVICE.SQL_REGISTER_CONTEXT	Registers a context.
PKG_SERVICE.SQL_UNREGISTER_CONTEXT	Deregisters a context.
PKG_SERVICE.SQL_SET_SQL	Sets a SQL statement for a context. Currently, only the **SELECT** statement is supported.
PKG_SERVICE.SQL_RUN	Executes the configured SQL statement on a context.
PKG_SERVICE.SQL_NEXT_ROW	Reads the next row of data in a context.
PKG_SERVICE.SQL_GET_VALUE	Reads a dynamically defined column value in a context.
PKG_SERVICE.SQL_SET_RESULT_TYPE	Dynamically defines a column of a context based on the type OID.
PKG_SERVICE.JOB_CANCEL	Removes a scheduled task by task ID.
PKG_SERVICE.JOB_FINISH	Disables or enables scheduled task execution.
PKG_SERVICE.JOB_SUBMIT	Submits a scheduled task. Job ID can be automatically generated by the system or specified manually.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Interface	Description
PKG_SERVICE.JOB_UPDATE	Modifies user-definable attributes of a scheduled task, including the task content, next-execution time, and execution interval.
PKG_SERVICE.SUBMIT_ON_NODES	Submits a task to all nodes. The task ID is automatically generated by the system.
PKG_SERVICE.ISUBMIT_ON_NODES	Submits a job to all nodes. The job ID is specified by the user.
PKG_SERVICE.SQL_GET_ARRAY_RESULT	Obtains the array value returned in the context.
PKG_SERVICE.SQL_GET_VARIABLE_RESULT	Obtains the column value returned in the context.

- PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE

  This function checks whether a context is registered. This function transfers the ID of the context to be queried. If the context exists, **TRUE** is returned. Otherwise, **FALSE** is returned.

  The prototype of the **PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE** function is as follows:

  ```
  PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE(
   context_id      IN INTEGER
  )
  RETURN BOOLEAN;
  ```

  Table 13-4 PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE interface parameters

Parameter	Description
context_id	ID of the context to be queried

- PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS

  This function cancels all contexts.

  The prototype of the **PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS** function is as follows:

  ```
  PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS(
  )
  RETURN VOID;
  ```

- PKG_SERVICE.SQL_REGISTER_CONTEXT

  This function opens a context, which is the prerequisite for the subsequent operations in the context. This function does not transfer any parameter. It automatically generates context IDs in an ascending order and returns values to integer variables.

  The prototype of the **PKG_SERVICE.SQL_REGISTER_CONTEXT** function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_SQL.REGISTER_CONTEXT(
)
RETURN INTEGER;
```

- PKG_SERVICE.SQL_UNREGISTER_CONTEXT

  This function closes a context, which is the end of each operation in the context. If this function is not called when the stored procedure ends, the memory is still occupied by the context. Therefore, remember to close a context when you do not need to use it. If an exception occurs, the stored procedure exits but the context is not closed. Therefore, you are advised to include this interface in the exception handling of the stored procedure.

  The prototype of the **PKG_SERVICE.SQL_UNREGISTER_CONTEXT** function is as follows:

```
PKG_SERVICE.SQL_UNREGISTER_CONTEXT(
 context_id     IN INTEGER
)
RETURN INTEGER;
```

Table 13-5 PKG_SERVICE.SQL_UNREGISTER_CONTEXT interface parameters

Parameter	Description
context_id	ID of the context to be closed

- PKG_SERVICE.SQL_SET_SQL

  This function parses the query statement of a given context. The input query statement is executed immediately. Currently, only the **SELECT** query statement can be parsed. The statement parameters can be transferred only through the **TEXT** type. The length cannot exceed 1 GB.

  The prototype of the **PKG_SERVICE.SQL_SET_SQL** function is as follows:

```
PKG_SERVICE.SQL_SET_SQL(
context_id     IN INTEGER,
query_string   IN TEXT,
language_flag  IN INTEGER
)
RETURN BOOLEAN;
```

Table 13-6 PKG_SERVICE.SQL_SET_SQL interface parameters

Parameter	Description
context_id	ID of the context whose query statement is to be parsed
query_string	Query statement to be parsed
language_flag	Version language number. Currently, only **1** is supported.

- PKG_SERVICE.SQL_RUN

  This function executes a given context. It receives a context ID first, and the data obtained after execution is used for subsequent operations. Currently, only the **SELECT** query statement can be executed.

  The prototype of the **PKG_SERVICE.SQL_RUN** function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
PKG_SERVICE.SQL_RUN(
context_id     IN INTEGER,
)
RETURN INTEGER;
```

Table 13-7 PKG_SERVICE.SQL_RUN interface parameters

Parameter	Description
context_id	ID of the context whose query statement is to be parsed

- PKG_SERVICE.SQL_NEXT_ROW

  This function returns the number of data rows returned after the SQL statement is executed. Each time the interface is executed, the system obtains a set of new rows until all data is read.

  The prototype of the **PKG_SERVICE.SQL_NEXT_ROW** function is as follows:

```
PKG_SERVICE.SQL_NEXT_ROW(
context_id     IN INTEGER,
)
RETURN INTEGER;
```

Table 13-8 PKG_SERVICE.SQL_NEXT_ROW interface parameters

Parameter	Description
context_id	ID of the context to be executed

- PKG_SERVICE.SQL_GET_VALUE

  This function returns the context element value in a specified position of a context and accesses the data obtained by **PKG_SERVICE.SQL_NEXT_ROW**.

  The prototype of the **PKG_SERVICE.SQL_GET_VALUE** function is as follows:

```
PKG_SERVICE.SQL_GET_VALUE(
context_id          IN    INTEGER,
pos                 IN    INTEGER,
col_type            IN    ANYELEMENT
)
RETURN ANYELEMENT;
```

Table 13-9 PKG_SERVICE.SQL_GET_VALUE interface parameters

Parameter	Description
context_id	ID of the context to be executed
pos	Position of a dynamically defined column in the query
col_type	Variable of any type, which defines the return value type of columns

- PKG_SERVICE.SQL_SET_RESULT_TYPE

  This function defines columns returned from a given context and can be used only for contexts defined by **SELECT**. The defined columns are identified by

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

the relative positions in the query list. The prototype of **PKG_SERVICE.SQL_SET_RESULT_TYPE** is as follows:

```
PKG_SERVICE.SQL_SET_RESULT_TYPE(
context_id      IN INTEGER,
pos             IN INTEGER,
coltype_oid     IN ANYELEMENT,
maxsize         IN INTEGER
)
RETURN INTEGER;
```

Table 13-10 PKG_SERVICE.SQL_SET_RESULT_TYPE interface parameters

Parameter	Description
context_id	ID of the context to be executed
pos	Position of a dynamically defined column in the query
coltype_oid	Variable of any type. The OID of the corresponding type can be obtained based on the variable type.
maxsize	Length of a defined column

- PKG_SERVICE.JOB_CANCEL

  The stored procedure **CANCEL** deletes a specified task.

  The prototype of the **PKG_SERVICE.JOB_CANCEL** function is as follows:

  ```
  PKG_SERVICE.JOB_CANCEL(
  job  IN  INTEGER);
  ```

  Table 13-11 PKG_SERVICE.JOB_CANCEL interface parameters

Parameter	Type	Input/ Output Parameter	Empty or Not	Description
id	integer	IN	No	Specifies the job ID.

  Example:

  ```
  CALL PKG_SERVICE.JOB_CANCEL(101);
  ```

- PKG_SERVICE.JOB_FINISH

  The stored procedure **FINISH** disables or enables a scheduled task.

  The prototype of the **PKG_SERVICE.JOB_FINISH** function is as follows:

  ```
  PKG_SERVICE.JOB_FINISH(
  id          IN   INTEGER,
  broken      IN   BOOLEAN,
  next_time   IN   TIMESTAMP  DEFAULT  sysdate);
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-12 PKG_SERVICE.JOB_FINISH interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
id	integer	IN	No	Specifies the job ID.
broken	Boolean	IN	No	Specifies the status flag, **true** for broken and **false** for not broken. The current job is updated based on the parameter value **true** or **false**. If the parameter is left empty, the job status remains unchanged.
next_time	timestamp	IN	Yes	Specifies the next execution time. The default value is the current system time. If **broken** is set to **true**, **next_time** is updated to **'4000-1-1'**. If **broken** is set to **false** and **next_time** is not empty, **next_time** is updated for the job. If **next_time** is empty, it will not be updated. This parameter can be omitted, and its default value will be used in this case.

- PKG_SERVICE.JOB_SUBMIT

  The stored procedure **JOB_SUBMIT** submits a scheduled task provided by the system.

  The prototype of the **PKG_SERVICE.JOB_SUBMIT** function is as follows:

```
PKG_SERVICE.JOB_SUBMIT(
id            IN   BIGINT,
content       IN   TEXT,
next_date     IN   TIMESTAMP DEFAULT sysdate,
interval_time IN   TEXT  DEFAULT 'null',
job           OUT  INTEGER);
```

  NOTE

  When a scheduled task (using **JOB**) is created, the system binds the current database and the username to the task by default. This function can be called by using **call** or **select**. If you call this function by using **select**, there is no need to specify output parameters. To call this function within a stored procedure, use **perform**. If the committed SQL statement task uses a non-public schema, specify the schema to a table schema or a function schema, or add **set current_schema = xxx** before the SQL statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-13 PKG_SERVICE.JOB_SUBMIT interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
id	bigint	IN	No	Specifies the job ID. If the input ID is **NULL**, a job ID is generated internally.
context	text	IN	No	Specifies the SQL statement to be executed. One or multiple DMLs, anonymous blocks, and statements for calling stored procedures, or all three combined are supported.
next_time	timestamp	IN	No	Specifies the next time the job will be executed. The default value is the current system time (**sysdate**). If the specified time has past, the job is executed at the time it is submitted.
interval_time	text	IN	Yes	Calculates the next time to execute the job. It can be an interval expression, or **sysdate** followed by a numeric value, for example, **sysdate+1.0/24**. If this parameter is left empty or set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward.
job	integer	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When **pkg_service.job_submit** is called using **select**, this parameter can be omitted.

Example:

```
SELECT PKG_SERVICE.JOB_SUBMIT(NULL, 'call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate
+1');

SELECT PKG_SERVICE.JOB_SUBMIT(NULL, 'call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate
+1.0/24');

CALL PKG_SERVICE.JOB_SUBMIT(NULL, 'INSERT INTO T_JOB  VALUES(1);  call pro_1(); call pro_2();',
add_months(to_date('201701','yyyymm'),1), 'date_trunc(''day'',SYSDATE) + 1 +(8*60+30.0)/
(24*60)' ,jobid);

SELECT PKG_SERVICE.JOB_SUBMIT (101, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
```

- PKG_SERVICE.JOB_UPDATE

  The stored procedure **UPDATE** modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

  The prototype of the **PKG_SERVICE.JOB_UPDATE** function is as follows:

```
PKG_SERVICE.JOB_UPDATE(
id              IN   BIGINT,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
next_time      IN   TIMESTAMP,
interval_time  IN   TEXT,
content        IN   TEXT);
```

Table 13-14 PKG_SERVICE.JOB_UPDATE interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
id	integer	IN	No	Specifies the job ID.
next_time	timestamp	IN	Yes	Specifies the next execution time. If this parameter is left empty, the system does not update the **next_time** parameter for the specified job. Otherwise, the system updates the **next_time** parameter for the specified job.
interval_time	text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the **interval_time** parameter for the specified job. Otherwise, the system updates the **interval_time** parameter for the specified job after necessary validity check. If this parameter is set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward.
content	text	IN	Yes	Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the **content** parameter for the specified job. Otherwise, the system updates the **content** parameter for the specified job.

Example:

```
CALL PKG_SERVICE.JOB_UPDATE(101, 'call userproc();', sysdate, 'sysdate + 1.0/1440');
CALL PKG_SERVICE.JOB_UPDATE(101, 'insert into tbl_a values(sysdate);', sysdate, 'sysdate + 1.0/1440');
```

- PKG_SERVICE.SUBMIT_ON_NODES

  The stored procedure **SUBMIT_ON_NODES** creates a scheduled task on all CNs and DNs. Only users **sysadmin** and **monitor admin** have this permission.

  The prototype of the **PKG_SERVICE.SUBMIT_ON_NODES** function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
PKG_SERVICE.SUBMIT_ON_NODES(
node_name    IN   NAME,
database     IN   NAME,
what         IN   TEXT,
next_date    IN   TIMESTAMP WITHOUT TIME ZONE,
job_interval IN   TEXT,
job          OUT  INTEGER);
```

Table 13-15 PKG_SERVICE.SUBMIT_ON_NODES interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
node_name	text	IN	No	Specifies the job execution node. Currently, the value can only be **ALL_NODE** (indicating that the job is executed on all nodes) or **CCN** (indicating that the job is executed on the central coordinator node).
database	text	IN	No	Database used by a cluster job. When the node type is **ALL_NODE**, the value can only be **postgres**.
what	text	IN	No	Specifies the SQL statement to be executed. One or multiple DMLs, anonymous blocks, and statements for calling stored procedures, or all three combined are supported.
nextdate	timestamp	IN	No	Specifies the next time the job will be executed. The default value is the current system time (**sysdate**). If the specified time has past, the job is executed at the time it is submitted.
job_interval	text	IN	No	Calculates the next time to execute the job. It can be an interval expression, or **sysdate** followed by a numeric value, for example, **sysdate+1.0/24**. If this parameter is left empty or set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward.
job	integer	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When **dbms.submit_on_nodes** is called using **select**, this parameter can be omitted.

Example:

```
select pkg_service.submit_on_nodes('ALL_NODE', 'postgres', 'select
capture_view_to_json(''dbe_perf.statement'', 0);', sysdate, 'interval ''60 second''');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
select pkg_service.submit_on_nodes('CCN', 'postgres', 'select
capture_view_to_json(''dbe_perf.statement'', 0);', sysdate, 'interval ''60 second''');
```

- PKG_SERVICE.ISUBMIT_ON_NODES

  ISUBMIT_ON_NODES has the same syntax function as **SUBMIT_ON_NODES**, but the first parameter of **ISUBMIT_ON_NODES** is an input parameter, that is, a specified task ID. In contrast, that last parameter of **ISUBMIT_ON_NODES** is an output parameter, indicating the task ID automatically generated by the system. Only users **sysadmin** and **monitor admin** have this permission.

- PKG_SERVICE.SQL_GET_ARRAY_RESULT

  This function is used to return the value of the bound OUT parameter of the array type and obtain the OUT parameter in a stored procedure.

  The prototype of the **PKG_SERVICE.SQL_GET_ARRAY_RESULT** function is as follows:

```
PKG_SERVICE.SQL_GET_ARRAY_RESULT(
    context_id in int,
    pos in VARCHAR2,
    column_value inout anyarray,
    result_type in anyelement
);
```

Table 13-16 PKG_SERVICE.SQL_GET_ARRAY_RESULT parameters

Parameter	Description
context_id	ID of the context to be queried
pos	Name of the bound parameter
column_value	Return value
result_type	Return type

- PKG_SERVICE.SQL_GET_VARIABLE_RESULT

  This function is used to return the value of the bound OUT parameter of the non-array type and obtain the OUT parameter in a stored procedure.

  The prototype of the **PKG_SERVICE.SQL_GET_VARIABLE_RESULT** function is as follows:

```
PKG_SERVICE.SQL_GET_VARIABLE_RESULT(
    context_id in int,
    pos in VARCHAR2,
    result_type in anyelement
)
RETURNS anyelement;
```

Table 13-17 PKG_SERVICE.SQL_GET_VARIABLE_RESULT parameters

Parameter	Description
context_id	ID of the context to be queried
pos	Name of the bound parameter
result_type	Return type

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.12.1.2 PKG_UTIL

Table 13-18 lists all interfaces supported by the **PKG_UTIL** package.

Table 13-18 PKG_UTIL

Interface	Description
PKG_UTIL.LOB_GET_LENGTH	Obtains the length of a LOB.
PKG_UTIL.LOB_READ	Reads a part of a LOB.
PKG_UTIL.LOB_WRITE	Writes the source object to the target object in the specified format.
PKG_UTIL.LOB_APPEND	Appends a specified number of characters of the source LOB to the target LOB.
PKG_UTIL.LOB_COMPARE	Compares two LOBs based on the specified length.
PKG_UTIL.LOB_MATCH	Returns the position of the *N*th occurrence of a character string in a LOB.
PKG_UTIL.LOB_RESET	Resets the character in specified position of a LOB to a specified character.
PKG_UTIL.IO_PRINT	Displays character strings.
PKG_UTIL.RAW_GET_LENGTH	Obtains the length of RAW data.
PKG_UTIL.RAW_CAST_FROM_VARCHAR2	Converts VARCHAR2 data to RAW data.
PKG_UTIL.RAW_CAST_FROM_BINARY_INTEGER	Converts binary integers to RAW data.
PKG_UTIL.RAW_CAST_TO_BINARY_INTEGER	Converts RAW data to binary integers.
PKG_UTIL.SET_RANDOM_SEED	Sets a random seed.
PKG_UTIL.RANDOM_GET_VALUE	Returns a random value.
PKG_UTIL.FILE_SET_DIRNAME	Sets the directory to be operated.
PKG_UTIL.FILE_OPEN	Opens a file based on the specified file name and directory.
PKG_UTIL.FILE_SET_MAX_LINE_SIZE	Sets the maximum length of a line to be written to a file.
PKG_UTIL.FILE_IS_CLOSE	Checks whether a file handle is closed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Interface	Description
PKG_UTIL.FILE_READ	Reads data of a specified length from an open file handle.
PKG_UTIL.FILE_READLINE	Reads a line of data from an open file handle.
PKG_UTIL.FILE_WRITE	Writes the data specified in the buffer to a file.
PKG_UTIL.FILE_WRITELINE	Writes the buffer to a file and adds newline characters.
PKG_UTIL.FILE_NEWLINE	Adds a line.
PKG_UTIL.FILE_READ_RAW	Reads binary data of a specified length from an open file handle.
PKG_UTIL.FILE_WRITE_RAW	Writes binary data to a file.
PKG_UTIL.FILE_FLUSH	Writes data from a file handle to a physical file.
PKG_UTIL.FILE_CLOSE	Closes an open file handle.
PKG_UTIL.FILE_REMOVE	Deletes a physical file. To do so, you must have the corresponding permission.
PKG_UTIL.FILE_RENAME	Renames a file on the disk, similar to **mv** in Unix.
PKG_UTIL.FILE_SIZE	Returns the size of a file.
PKG_UTIL.FILE_BLOCK_SIZE	Returns the number of blocks contained in a file.
PKG_UTIL.FILE_EXISTS	Checks whether a file exists.
PKG_UTIL.FILE_GETPOS	Specifies the offset of a returned file, in bytes.
PKG_UTIL.FILE_SEEK	Sets the offset for file position.
PKG_UTIL.FILE_CLOSE_ALL	Closes all file handles opened in a session.
PKG_UTIL.EXCEPTION_REPORT_ERROR	Throws an exception.

- PKG_UTIL.LOB_GET_LENGTH

  This function obtains the length of the input data.

  The prototype of the **PKG_UTIL.LOB_GET_LENGTH** function is as follows:

  ```
  PKG_UTIL.LOB_GET_LENGTH(
  lob      IN   anyelement
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
)
RETURN INTEGER;
```

Table 13-19 PKG_UTIL.LOB_GET_LENGTH interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
lob	clob/blob	IN	No	Indicates the object whose length is to be obtained.

- PKG_UTIL.LOB_READ

  This function reads an object and returns the specified part.

  The prototype of the **PKG_UTIL.LOB_READ** function is as follows:

```
PKG_UTIL.LOB_READ(
lob       IN   anyelement,
len       IN   int,
start     IN   int,
mode      IN   int
)
RETURN ANYELEMENT
```

Table 13-20 PKG_UTIL.LOB_READ interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
lob	clob/blob	IN	No	Specifies CLOB or BLOB data.
len	int	IN	No	Specifies the length of the returned result.
start	int	IN	No	Specifies the offset to the first character.
mode	int	IN	No	Specifies the type of the read operation. **0** indicates **READ**, **1** indicates **TRIM**, and **2** indicates **SUBSTR**.

- PKG_UTIL.LOB_WRITE

  This function writes the source object to the target object based on the specified parameters and returns the target object.

  The prototype of the **PKG_UTIL.LOB_WRITE** function is as follows:

```
PKG_UTIL.LOB_WRITE(
dest_lob    INOUT   blob,
src_lob     IN      raw
len         IN      int,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
start_pos   IN      int
)
RETURN BLOB;
PKG_UTIL.LOB_WRITE(
dest_lob    INOUT   clob,
src_lob     IN      varchar2
len         IN      int,
start_pos   IN      int
)
RETURN CLOB;
```

Table 13-21 PKG_UTIL.LOB_WRITE interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
dest_lob	clob/blob	INOUT	No	Specifies the target object that data will be written to.
src_lob	clob/blob	IN	No	Specifies the source object to be written.
len	int	IN	No	Specifies the write length of the source object.
start_pos	int	IN	No	Specifies the write start position of the target object.

- PKG_UTIL.LOB_APPEND

  This function appends the source object to the target BLOB/CLOB and returns the target BLOB/CLOB.

  The prototype of the **PKG_UTIL.LOB_APPEND** function is as follows:

```
PKG_UTIL.LOB_APPEND(
dest_lob    INOUT   blob,
src_lob     IN      blob,
len         IN      int default NULL
)
RETURN BLOB;

PKG_UTIL.LOB_APPEND(
dest_lob    INOUT   clob,
src_lob     IN      clob,
len         IN      int default NULL
)
RETURN CLOB;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-22 PKG_UTIL.LOB_APPEND interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
dest_lob	blob/clob	INOUT	No	Specifies the target BLOB/CLOB that data will be written to.
src_lob	blob/clob	IN	No	Specifies the source BLOB/CLOB to be written.
len	int	IN	Yes	Specifies the length of the source object to be written. If the value is **NULL**, the entire source object is written by default.

- PKG_UTIL.LOB_COMPARE

  This function checks whether objects are the same based on the specified start position and size. If **lob1** is larger, **1** is returned. If **lob2** is larger, **–1** is returned. If **lob1** is equal to **lob2**, **0** is returned.

  The prototype of the **PKG_UTIL.LOB_COMPARE** function is as follows:

```
PKG_UTIL.LOB_COMPARE(
lob1        IN   anyelement,
lob2        IN   anyelement,
len         IN   int default 1073741771,
start_pos1      IN   int default 1,
start_pos2      IN   int default 1
)
RETURN INTEGER;
```

Table 13-23 PKG_UTIL.LOB_COMPARE interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
lob1	clob/blob	IN	No	Indicates the character string for comparison.
lob2	clob/blob	IN	No	Indicates the character string for comparison.
len	int	IN	No	Indicates the length to be compared.
start_pos1	int	IN	No	Specifies the start offset of **lob1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Empty or Not	Description
start_pos2	int	IN	No	Specifies the start offset of **lob2**.

- PKG_UTIL.LOB_MATCH

  This function returns the position where a pattern is displayed in a LOB for the *match_n*th time.

  The prototype of the **PKG_UTIL.LOB_MATCH** function is as follows:

```
PKG_UTIL.LOB_MATCH(
lob          IN   anyelement,
pattern      IN   anyelement,
start        IN   int,
match_nth    IN   int default 1
)
RETURN INTEGER;
```

  Table 13-24 PKG_UTIL.LOB_MATCH interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
lob	clob/blob	IN	No	Indicates the character string for comparison.
pattern	clob/blob	IN	No	Specifies the pattern to be matched.
start	int	IN	No	Specifies the start position for LOB comparison.
match_nth	int	IN	No	Specifies the matching times.

- PKG_UTIL.LOB_RESET

  This function clears a character string and resets the string to the value of **value**.

  The prototype of the **PKG_UTIL.LOB_RESET** function is as follows:

```
PKG_UTIL.LOB_RESET(
lob          IN   blob,
len          IN   int,
start        IN   int,
value         IN   int default 0
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
)
RETURN record;
```

Table 13-25 PKG_UTIL.LOB_RESET interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
lob	blob	IN	No	Indicates the character string for reset.
len	int	IN	No	Specifies the length of the string to be reset.
start	int	IN	No	Specifies the start position for reset.
value	int	IN	Yes	Sets characters. Default value: **'0'**

- PKG_UTIL.IO_PRINT

  This function outputs a string.

  The prototype of the **PKG_UTIL.IO_PRINT** function is as follows:

```
PKG_UTIL.IO_PRINT(
format      IN   text,
is_one_line IN   boolean
)
RETURN void;
```

Table 13-26 PKG_UTIL.IO_PRINT interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
format	text	IN	No	Indicates the character string to be output.
is_one_line	boolean	IN	No	Indicates whether to output the string as a line.

- PKG_UTIL.RAW_GET_LENGTH

  This function obtains the length of RAW data.

  The prototype of the **PKG_UTIL.RAW_GET_LENGTH** function is as follows:

```
PKG_UTIL.RAW_GET_LENGTH(
value      IN   raw
)
RETURN integer;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-27 PKG_UTIL.RAW_GET_LENGTH interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
raw	raw	IN	No	Indicates the object whose length is to be obtained.

- PKG_UTIL.RAW_CAST_FROM_VARCHAR2

  This function converts VARCHAR2 data to RAW data.

  The prototype of the **PKG_UTIL.RAW_CAST_FROM_VARCHAR2** function is as follows:

```
PKG_UTIL.RAW_CAST_FROM_VARCHAR2(
str      IN   varchar2
)
RETURN raw;
```

Table 13-28 PKG_UTIL.RAW_CAST_FROM_VARCHAR2 interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
str	varchar2	IN	No	Indicates the source data to be converted

- PKG_UTIL.RANDOM_SET_SEED

  This function sets a random seed.

  The prototype of the **PKG_UTIL.RANDOM_SET_SEED** function is as follows:

```
PKG_UTIL.RANDOM_SET_SEED(
seed        IN   int
)
RETURN integer;
```

Table 13-29 PKG_UTIL.RANDOM_SET_SEED parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
seed	int	IN	No	Sets a random seed.

- PKG_UTIL.RANDOM_GET_VALUE

  The **RANDOM_GET_VALUE** function returns a 15-digit random number ranging from 0 to 1.

  The prototype of the **PKG_UTIL.RANDOM_GET_VALUE** function is as follows:

```
PKG_UTIL.RANDOM_GET_VALUE(
)
RETURN numeric;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- PKG_UTIL.FILE_SET_DIRNAME

  This function sets the directory to be operated. It must be called to set directory for each operation involving a single directory.

  The prototype of the **PKG_UTIL.FILE_SET_DIRNAME** function is as follows:

  ```
  PKG_UTIL.FILE_SET_DIRNAME(
  dir  IN  text
  )
  RETURN bool
  ```

  Table 13-30 PKG_UTIL.FILE_SET_DIRNAME interface parameters

Parameter	Description
dirname	Directory of a file. It is a string, indicating an object name. **NOTE** File directories need to be added to the system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist will be reported. Functions that involve **location** as parameters also comply with this rule.

- PKG_UTIL.FILE_OPEN

  This function opens a file. A maximum of 50 files can be opened at a time. This function returns a handle of the **INTEGER** type.

  The prototype of the **PKG_UTIL.FILE_OPEN** function is as follows:

  ```
  PKG_UTIL.FILE_OPEN(
  file_name    IN  text,
  open_mode    IN  integer)
  ```

  Table 13-31 PKG_UTIL.FILE_OPEN interface parameters

Parameter	Description
file_name	File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the **OPEN** function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).
open_mode	File opening mode, including **r** (read), **w** (write), and **a** (append). **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- PKG_UTIL.FILE_SET_MAX_LINE_SIZE

  This function sets the maximum length of a line to be written to a file.

  The prototype of the **PKG_UTIL.FILE_SET_MAX_LINE_SIZE** function is as follows:

  ```
  PKG_UTIL.FILE_SET_MAX_LINE_SIZE(
  max_line_size in integer)
  RETURN BOOL
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-32 PKG_UTIL.FILE_SET_MAX_LINE_SIZE interface parameters

Parameter	Description
max_line_size	Maximum number of characters in each line, including newline characters. The minimum value is **1** and the maximum is **32767**. If this parameter is not specified, the default value **1024** is used.

- PKG_UTIL.FILE_IS_CLOSE

  This function checks whether a file handle is closed.

  The prototype of the **PKG_UTIL.FILE_IS_CLOSE** function is as follows:

```
PKG_UTIL.FILE_IS_CLOSE(
file in integer
)
RETURN BOOL
```

Table 13-33 PKG_UTIL.FILE_IS_CLOSE interface parameters

Parameter	Description
file	Opened file handle

- PKG_UTIL.FILE_READ

  This function reads a line of data from an open file handle based on the specified length.

  The prototype of the **PKG_UTIL.FILE_READ** function is as follows:

```
PKG_UTIL.FILE_READ(
file     IN   integer,
buffer   OUT  text,
len      IN   bigint default 1024)
```

Table 13-34 PKG_UTIL.FILE_READ interface parameters

Parameter	Description
file	File handle opened by calling the **OPEN** function. The file must be opened in read mode. Otherwise, the **INVALID_OPERATION** exception is thrown.
buffer	Buffer used to receive data
len	Number of bytes read from a file

- PKG_UTIL.FILE_READLINE

  This function reads a line of data from an open file handle based on the specified length.

  The prototype of the **PKG_UTIL.FILE_READLINE** function is as follows:

```
PKG_UTIL.FILE_READLINE(
file    IN  integer,
buffer  OUT text,
len     IN  integer default NULL)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-35 PKG_UTIL.FILE_READLINE interface parameters

Parameter	Description
file	File handle opened by calling the **OPEN** function. The file must be opened in read mode. Otherwise, the **INVALID_OPERATION** exception is thrown.
buffer	Buffer used to receive data
len	Number of bytes read from a file. The default value is **NULL**. If the default value **NULL** is used, **max_line_size** is used to specify the line size.

- PKG_UTIL.FILE_WRITE

  This function writes the data specified in the buffer to a file.

  The prototype of the **PKG_UTIL.FILE_WRITE** function is as follows:

```
PKG_UTIL.FILE_WRITE(
file in integer,
buffer in text
)
RETURN BOOL
```

Table 13-36 PKG_UTIL.FILE_WRITE interface parameters

Parameter	Description
file	Opened file handle
buffer	Text data to be written to a file. The maximum buffer size is 32767 bytes. If no value is specified, the default value is 1024 bytes. Before the writing is performed, the buffer occupied by **PUT** operations cannot exceed 32767 bytes. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- PKG_UTIL.FILE_NEWLINE

  This function writes a line terminator to an open file. The line terminator is related to the platform.

  The prototype of the **PKG_UTIL.FILE_NEWLINE** function is as follows:

```
PKG_UTIL.FILE_NEWLINE(
file in integer
)
RETURN BOOL
```

Table 13-37 PKG_UTIL.FILE_NEWLINE interface parameters

Parameter	Description
file	Opened file handle

- PKG_UTIL.FILE_WRITELINE

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Writes a line to a file.

The prototype of the **PKG_UTIL.FILE_WRITELINE** function is as follows:

```
PKG_UTIL.FILE_WRITELINE(
file in integer,
buffer in text
)
RETURN BOOL
```

Table 13-38 PKG_UTIL.FILE_WRITELINE parameters

Parameter	Description
file	Opened file handle
buffer	Content to be written

- PKG_UTIL.FILE_READ_RAW

  This function reads binary data of a specified length from an open file handle and returns the read binary data. The return type is **raw**.

  The prototype of the **PKG_UTIL.FILE_READ_RAW** function is as follows:

  ```
  PKG_UTIL.FILE_READ_RAW(
  file      in integer,
  length    in integer default NULL
  )
  RETURN raw
  ```

  Table 13-39 PKG_UTIL.FILE_READ_RAW interface parameters

Parameter	Description
file	Opened file handle
length	Length of the data to be read. The default value is **NULL**. By default, all data in the file is read. The maximum size is 1 GB.

- PKG_UTIL.FILE_WRITE_RAW

  This function writes the input binary object **RAW** to an opened file. If the insertion is successful, **true** is returned.

  The prototype of the **PKG_UTIL.FILE_WRITE_RAW** function is as follows:

  ```
  PKG_UTIL.FILE_WRITE_RAW(
  file in integer,
  r    in raw
  )
  RETURN BOOL
  ```

  Table 13-40 PKG_UTIL.FILE_WRITE_RAW parameters

Parameter	Description
file	Opened file handle

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
r	Data to be written to the file **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- PKG_UTIL.FILE_FLUSH

  Data in a file handle must be written into a physical file. Data in the buffer must have a line terminator. Refresh is important if a file must be read when it is opened. For example, debugging information can be refreshed to a file so that it can be read immediately.

  The prototype of the **PKG_UTIL.FILE_FLUSH** function is as follows:

  ```
  PKG_UTIL.FILE_FLUSH (
  file in integer
  )
  RETURN VOID
  ```

  Table 13-41 PKG_UTIL.FILE_FLUSH interface parameters

Parameter	Description
file	Opened file handle

- PKG_UTIL.FILE_CLOSE

  This function closes an open file handle.

  The prototype of the **PKG_UTIL.FILE_CLOSE** function is as follows:

  ```
  PKG_UTIL.FILE_CLOSE (
  file in integer
  )
  RETURN BOOL
  ```

  Table 13-42 PKG_UTIL.FILE_CLOSE interface parameters

Parameter	Description
file	Opened file handle

- PKG_UTIL.FILE_REMOVE

  This function deletes a disk file. To perform this operation, you must have required permissions.

  The prototype of the **PKG_UTIL.FILE_REMOVE** function is as follows:

  ```
  PKG_UTIL.FILE_REMOVE(
  file_name in text
  )
  RETURN VOID
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-43 PKG_UTIL.FILE_REMOVE interface parameters

Parameter	Description
filen_ame	Name of the file to be deleted

- PKG_UTIL.FILE_RENAME

  The function renames a file on the disk, similar to **mv** in Unix.

  The prototype of the **PKG_UTIL.FILE_RENAME** function is as follows:

```
PKG_UTIL.FILE_RENAME(
src_dir in text,
src_file_name in text,
dest_dir in text,
dest_file_name in text,
overwrite boolean default false)
```

Table 13-44 PKG_UTIL.FILE_RENAME interface parameters

Parameter	Description
src_dir	Source file directory (case-sensitive) **NOTE** • File directories need to be added to the system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist will be reported. Functions that involve **location** as parameters also comply with this rule. • When the GUC parameter **safe_data_path** is enabled, you can only use the advanced package to read and write files in the file path specified by **safe_data_path**.
src_file_name	Source file name
dest_dir	Target file directory (case-sensitive) **NOTE** • File directories need to be added to the system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist will be reported. Functions that involve **location** as parameters also comply with this rule. • When the GUC parameter **safe_data_path** is enabled, you can only use the advanced package to read and write files in the file path specified by **safe_data_path**.
dest_file_name	Target file name
overwrite	The default value is **false**. If a file with the same name exists in the destination directory, the file will not be rewritten.

- PKG_UTIL.FILE_SIZE

  This function returns the size of a specified file.

  The prototype of the **PKG_UTIL.FILE_SIZE** function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
bigint PKG_UTIL.FILE_SIZE(
file_name in text
)return bigint
```

Table 13-45 PKG_UTIL.FILE_SIZE interface parameters

Parameter	Description
file_name	File name

- PKG_UTIL.FILE_BLOCK_SIZE

  This function returns the number of blocks contained in a specified file.

  The prototype of the **PKG_UTIL.FILE_BLOCK_SIZE** function is as follows:

  ```
  bigint PKG_UTIL.FILE_BLOCK_SIZE(
  file_name in text
  )return bigint
  ```

  Table 13-46 PKG_UTIL.FILE_BLOCK_SIZE interface parameters

Parameter	Description
file_name	File name

- PKG_UTIL.FILE_EXISTS

  This function checks whether a file exists.

  The prototype of the **PKG_UTIL.FILE_EXISTS** function is as follows:

  ```
  PKG_UTIL.FILE_EXISTS(
  file_name in text
  )
  RETURN BOOL
  ```

  Table 13-47 PKG_UTIL.FILE_EXISTS interface parameters

Parameter	Description
file_name	File name

- PKG_UTIL.FILE_GETPOS

  This function specifies the offset of a returned file, in bytes.

  The prototype of the **PKG_UTIL.FILE_GETPOS** function is as follows:

  ```
  PKG_UTIL.FILE_GETPOS(
  file in integer
  )
  RETURN BIGINT
  ```

  Table 13-48 PKG_UTIL.FILE_GETPOS interface parameters

Parameter	Description
file	Opened file handle

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- PKG_UTIL.FILE_SEEK

  This function adjusts the position of a file pointer forward or backward based on the specified number of bytes.

  The prototype of the **PKG_UTIL.FILE_SEEK** function is as follows:

```
void PKG_UTIL.FILE_SEEK(
file in integer,
start in bigint
)
RETURN VOID
```

  Table 13-49 PKG_UTIL.FILE_SEEK interface parameters

Parameter	Description
file	Opened file handle
start	File offset, in bytes.

- PKG_UTIL.FILE_CLOSE_ALL

  This function closes all file handles opened in a session.

  The prototype of the **PKG_UTIL.FILE_CLOSE_ALL** function is as follows:

```
PKG_UTIL.FILE_CLOSE_ALL(
)
RETURN VOID
```

  Table 13-50 PKG_UTIL.FILE_CLOSE_ALL interface parameters

Parameter	Description
None	None

- PKG_UTIL.EXCEPTION_REPORT_ERROR

  This function throws an exception.

  The prototype of the **PKG_UTIL.EXCEPTION_REPORT_ERROR** function is as follows:

```
PKG_UTIL.EXCEPTION_REPORT_ERROR(
code integer,
log text,
flag boolean DEFAULT false
)
RETURN INTEGER
```

  Table 13-51 PKG_UTIL.EXCEPTION_REPORT_ERROR interface parameters

Parameter	Description
code	Error code displayed when an exception occurs.
log	Log information displayed when an exception occurs.
flag	Reserved. The default value is **false**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- PKG_UTIL.app_read_client_info
  Reads the client information.
  The prototype of the **PKG_UTIL.app_read_client_info** function is as follows:

```
PKG_UTIL.app_read_client_info(
OUT buffer text
)return text
```

Table 13-52 PKG_UTIL.app_read_client_info parameters

Parameter	Description
buffer	Client information returned

- PKG_UTIL.app_set_client_info
  Sets the client information.
  The prototype of the **PKG_UTIL.app_set_client_info** function is as follows:

```
PKG_UTIL.app_set_client_info(
str text
)
```

Table 13-53 PKG_UTIL.app_set_client_info interface parameters

Parameter	Description
str	Client information to be set

- PKG_UTIL.lob_converttoblob
  Converts a CLOB to a BLOB. **amount** indicates the conversion length.
  The prototype of the **PKG_UTIL.lob_converttoblob** function is as follows:

```
PKG_UTIL.lob_converttoblob(
dest_lob blob,
src_clob clob,
amount integer,
dest_offset integer,
src_offset integer
)return raw
```

Table 13-54 PKG_UTIL.lob_converttoblob interface parameters

Parameter	Description
dest_lob	Target LOB
src_clob	CLOB to be converted
amount	Conversion length
dest_offset	Start position of the target LOB
src_offset	Start position of the source CLOB

- PKG_UTIL.lob_converttoclob
  Converts a BLOB to a CLOB. **amount** indicates the conversion length.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the **PKG_UTIL.lob_converttoclob** function is as follows:

```
PKG_UTIL.lob_converttoclob(
dest_lob clob,
src_blob blob,
amount integer,
dest_offset integer,
src_offset integer
)return text
```

Table 13-55 PKG_UTIL.lob_converttoclob interface parameters

Parameter	Description
dest_lob	Target LOB
src_blob	BLOB to be converted
amount	Conversion length
dest_offset	Start position of the target LOB
src_offset	Start position of the source CLOB

- PKG_UTIL.lob_texttoraw

  Converts the text type to the raw type.

  The prototype of the **PKG_UTIL.lob_texttoraw** function is as follows:

  ```
  PKG_UTIL.lob_texttoraw(
  src_lob clob
  )
  RETURN raw
  ```

  Table 13-56 PKG_UTIL.lob_texttoraw parameters

Parameter	Description
src_lob	LOB to be converted

- PKG_UTIL.match_edit_distance_similarity

  Calculates the difference between two character strings.

  The prototype of the **PKG_UTIL.match_edit_distance_similarity** function is as follows:

  ```
  PKG_UTIL.match_edit_distance_similarity(
  str1 text,
  str2 text
  )
  RETURN INTEGER
  ```

  Table 13-57 PKG_UTIL.match_edit_distance_similarity parameters

Parameter	Description
str1	First character string
str2	Second character string

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- PKG_UTIL.raw_cast_to_varchar2

  Converts the raw type to the varchar2 type.

  The prototype of the **PKG_UTIL.raw_cast_to_varchar2** function is as follows:

```
PKG_UTIL.raw_cast_to_varchar2(
str raw
)
RETURN varchar2
```

  Table 13-58 PKG_UTIL.raw_cast_to_varchar2 interface parameters

Parameter	Description
str	Hexadecimal string

- PKG_UTIL.session_clear_context

  Clears the session context.

  The prototype of the **PKG_UTIL.session_clear_context** function is as follows:

```
PKG_UTIL.session_clear_context(
namespace text,
client_identifier text,
attribute text
)
RETURN INTEGER
```

  Table 13-59 PKG_UTIL.session_clear_context parameters

Parameter	Description
namespace	Namespace of an attribute
client_identifier	Usually same as the value of **namespace**. If this parameter is set to **null**, all namespaces are modified by default.
attribute	Attribute value to be cleared

- PKG_UTIL.session_search_context

  Searches for an attribute value.

  The prototype of the **PKG_UTIL.session_clear_context** function is as follows:

```
PKG_UTIL.session_clear_context(
namespace text,
attribute text
)
RETURN INTEGER
```

  Table 13-60 PKG_UTIL.session_clear_context parameters

Parameter	Description
namespace	Namespace of an attribute
attribute	Attribute value to be cleared

- PKG_UTIL.session_set_context

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Sets an attribute value.

The prototype of the **PKG_UTIL.session_set_context** function is as follows:

```
PKG_UTIL.session_set_context(
namespace text,
attribute text,
value text
)
RETURN INTEGER
```

Table 13-61 PKG_UTIL.session_set_context parameters

Parameter	Description
namespace	Namespace of an attribute
attribute	Attribute to be set
value	Attribute value

- PKG_UTIL.utility_get_time

  Prints the Unix timestamp.

  The prototype of the **PKG_UTIL.utility_get_time** function is as follows:

  ```
  PKG_UTIL.utility_get_time()
  RETURN bigint
  ```

- PKG_UTIL.utility_format_error_backtrace

  Displays the error stack of a stored procedure.

  The prototype of the **PKG_UTIL.utility_format_error_backtrace** function is as follows:

  ```
  PKG_UTIL.utility_format_error_backtrace()
  RETURN text
  ```

- PKG_UTIL.utility_format_error_stack

  Displays the error information about a stored procedure.

  The prototype of the **PKG_UTIL.utility_format_error_stack** function is as follows:

  ```
  PKG_UTIL.utility_format_error_stack()
  RETURN text
  ```

- PKG_UTIL.utility_format_call_stack

  Displays the call stack of a stored procedure.

  The prototype of the **PKG_UTIL.utility_format_call_stack** function is as follows:

  ```
  PKG_UTIL.utility_format_call_stack()
  RETURN text
  ```

13.12.2 Secondary Encapsulation Interfaces (Recommended)

13.12.2.1 DBE_LOB

Interface Description

Table 13-62 provides all interfaces supported by the **DBE_LOB** package.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-62 DBE_LOB

Interface	Description
DBE_LOB.GET_LENGTH	Obtains and returns the specified length of a LOB.
DBE_LOB.OPEN	Opens a LOB and returns a LOB descriptor.
DBE_LOB.READ	Loads a part of LOB content to the buffer based on the specified length and initial position offset.
DBE_LOB.WRITE	Copies content in the buffer to a LOB based on the specified length and initial position offset.
DBE_LOB.WRITE_APPEND	Copies content in the buffer to the end part of a LOB based on the specified length.
DBE_LOB.COPY	Copies content in a BLOB to another BLOB based on the specified length and initial position offset.
DBE_LOB.ERASE	Deletes content in a BLOB based on the specified length and initial position offset.
DBE_LOB.CLOSE	Closes a LOB descriptor.
DBE_LOB.MATCH	Returns the position of the *M*th occurrence of a character string in a LOB.
DBE_LOB.COMPARE	Compares two LOBs or a certain part of two LOBs.
DBE_LOB.SUBSTR	Reads the substring of a LOB and returns the number of read bytes or the number of characters.
DBE_LOB.STRIP	Truncates the LOB of a specified length. After the execution is complete, the length of the LOB is set to the length specified by the **newlen** parameter.
DBE_LOB.CREATE_TEMPORARY	Creates a temporary BLOB or CLOB.
DBE_LOB.FREETEMPORARY	Deletes a temporary BLOB or CLOB.
DBE_LOB.APPEND	Adds the content of a LOB to another LOB.
DBE_LOB.FILEOPEN	Opens a database-external file and returns a file descriptor.
DBE_LOB.FILECLOSE	Closes an external file opened by **FILEOPEN**.
DBE_LOB.LOADFROMFILE	Reads a database-external file to a BLOB file.
DBE_LOB.LOADBLOBFROMFILE	Reads a database-external file to a BLOB file.
DBE_LOB.LOADCLOBFROMFILE	Reads a database-external file to a CLOB file.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Interface	Description
DBE_LOB.CONVERTTOBLOB	Converts a CLOB file to a BLOB file.
DBE_LOB.CONVERTTOCLOB	Converts a BLOB file to a CLOB file.

- DBE_LOB.GET_LENGTH

  The stored procedure **GET_LENGTH** obtains and returns the specified length of a LOB.

  The function prototype of **DBE_LOB.GET_LENGTH** is as follows:

```
DBE_LOB.GET_LENGTH (
lob    IN   BLOB)
RETURN INTEGER;

DBE_LOB.GET_LENGTH (
lob    IN   CLOB)
RETURN INTEGER;
```

  Table 13-63 DBE_LOB.GET_LENGTH interface parameters

Parameter	Description
lob	BLOB/CLOB whose length is to be obtained

- DBE_LOB.OPEN

  This stored procedure opens a LOB and returns a LOB descriptor. This process is used only for compatibility.

  The function prototype of **DBE_LOB.OPEN** is as follows:

```
DBE_LOB.OPEN (
lob    INOUT   BLOB
);

DBE_LOB.OPEN (
lob  INOUT    CLOB
);

DBE_LOB.OPEN (
bfile dbe_lob.bfile,
open_mode text DEFAULT 'null'::text
);
```

  Table 13-64 DBE_LOB.OPEN interface parameters

Parameter	Description
lob	BLOB or CLOB that is opened

- DBE_LOB.READ

  The stored procedure **READ** loads a part of LOB content to the buffer based on the specified length and initial position offset.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The function prototype of **DBE_LOB.READ** is as follows:

```
DBE_LOB.READ (
lob     IN     BLOB,
len     IN     INTEGER,
start   IN     INTEGER,
buffer  OUT    RAW);

DBE_LOB.READ (
lob     IN     CLOB,
len     INOUT  INTEGER,
start   IN     INTEGER,
buffer  OUT    VARCHAR2);
```

Table 13-65 DBE_LOB.READ interface parameters

Parameter	Description
lob	BLOB/CLOB to be read
len	Length of read content **NOTE** If the length is negative, the error message "ERROR: argument 2 is null, invalid, or out of range." is displayed.
start	Indicates where to start reading the LOB content, that is, the offset bytes to initial position of LOB content.
buffer	Target buffer to store the read LOB content

- DBE_LOB.WRITE

  The stored procedure **WRITE** copies content in the buffer to LOB variables based on the specified length and initial position.

  The prototype of the **DBE_LOB.WRITE** function is as follows:

```
DBE_LOB.WRITE (
dest_lob   INOUT    BLOB,
len        IN       INTEGER,
start      IN       INTEGER,
src_lob    IN       RAW);

DBE_LOB.WRITE (
dest_lob   INOUT   CLOB,
len        IN      INTEGER,
start      IN      INTEGER,
src_lob    IN      VARCHAR2);
```

Table 13-66 DBE_LOB.WRITE interface parameters

Parameter	Description
dest_lob	BLOB/CLOB to be written
len	Length of written content **NOTE** If the length of written content is shorter than 1 or longer than the length of content to be written, an error is reported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
start	Indicates where to start writing the LOB content, that is, the offset bytes to initial position of LOB content. **NOTE** If the offset value is less than 1, an error is reported. If the offset value is greater than the maximum length of LOB type contents, no error is reported.
src_lob	Content to be written

- DBE_LOB.WRITE_APPEND

  The stored procedure **WRITE_APPEND** copies content in the buffer to the end part of a LOB based on the specified length.

  The function prototype of **DBE_LOB.WRITE_APPEND** is as follows:

```
DBE_LOB.WRITE_APPEND (
dest_lob    INOUT    BLOB,
len         IN       INTEGER,
src_lob     IN       RAW);

DBE_LOB.WRITE_APPEND (
dest_lob    INOUT     CLOB,
len         IN       INTEGER,
src_lob     IN       VARCHAR2);
```

Table 13-67 DBE_LOB.WRITE_APPEND interface parameters

Parameter	Description
dest_lob	BLOB/CLOB to be written
len	Length of written content **NOTE** If the length of written content is shorter than 1 or longer than the length of content to be written, an error is reported.
src_lob	Content to be written

- DBE_LOB.COPY

  The stored procedure **COPY** copies content in a BLOB to another BLOB based on the specified length and initial position offset.

  The function prototype of **DBE_LOB.COPY** is as follows:

```
DBE_LOB.COPY (
dest_lob     INOUT    BLOB,
src_lob      IN       BLOB,
len          IN       INTEGER,
dest_start   IN       INTEGER  DEFAULT 1,
src_start    IN       INTEGER  DEFAULT 1);
```

Table 13-68 DBE_LOB.COPY interface parameters

Parameter	Description
dest_lob	BLOB to be pasted

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
src_lob	BLOB to be copied
len	Length of copied content **NOTE** If the length of copied content is shorter than 1 or longer than the maximum length of BLOB, an error is reported.
dest_start	Indicates where to start pasting the BLOB content, that is, the offset bytes to initial position of BLOB content. **NOTE** If the offset is shorter than 1 or longer than the maximum length of BLOB, an error is reported.
src_start	Indicates where to start copying the BLOB content, that is, the offset bytes to initial position of BLOB content. **NOTE** If the offset is shorter than 1 or longer than the length of source BLOB, an error is reported.

- DBE_LOB.ERASE

  The stored procedure **ERASE** deletes content in BLOB based on the specified length and initial position offset.

  The prototype of the **DBE_LOB.ERASE** function is as follows:

```
DBE_LOB.ERASE (
lob       INOUT   BLOB,
len       INOUT   INTEGER,
start     IN      INTEGER DEFAULT 1);
```

  Table 13-69 DBE_LOB.ERASE interface parameters

Parameter	Description
lob	BLOB whose content is to be deleted
len	Length of content to be deleted **NOTE** If the length of deleted content is shorter than 1 or longer than the maximum length of BLOB, an error is reported.
start	Indicates where to start deleting the BLOB content, that is, the offset bytes to initial position of BLOB content. **NOTE** If the offset is shorter than 1 or longer than the maximum length of BLOB, an error is reported.

- DBE_LOB.CLOSE

  The stored procedure CLOSE closes the LOB descriptor that has been opened.

  The prototype of the **DBE_LOB.CLOSE** function is as follows:

```
DBE_LOB.CLOSE(
lob     IN      BLOB);

DBE_LOB.CLOSE (
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
lob     IN     CLOB);

DBE_LOB.CLOSE (
file     IN     INTEGER);
```

Table 13-70 DBE_LOB.CLOSE interface parameters

Parameter	Description
lob	BLOB/CLOB to be disabled

- DBE_LOB.MATCH

  This function returns the *N*th occurrence position of **pattern** in a LOB. **NULL** is returned for any of the following conditions: offset < 1 or offset > **LOBMAXSIZE**; *n*th < 1 or *n*th > **LOBMAXSIZE**

  The function prototype of **DBE_LOB.MATCH** is as follows:

```
DBE_LOB.MATCH (
lob             IN     BLOB,
pattern         IN     RAW,
start_index     IN     INTEGER  DEFAULT 1,
match_index     IN     INTEGER  DEFAULT 1)
RETURN INTEGER;

DBE_LOB.MATCH (
lob             IN     CLOB,
pattern         IN     VARCHAR2 ,
start_index     IN     INTEGER  DEFAULT 1,
match_index     IN     INTEGER  DEFAULT 1)
RETURN INTEGER;
```

Table 13-71 DBE_LOB.MATCH interface parameters

Parameter	Description
lob	BLOB/CLOB descriptor to be searched for
pattern	Matched pattern. It is **RAW** for BLOB and **TEXT** for CLOB.
start_index	For BLOB, the absolute offset is in the unit of byte. For CLOB, the offset is in the unit of character. The matching start position is 1.
match_index	Number of pattern matching times. The minimum value is 1.

- DBE_LOB.COMPARE

  This function compares two LOBs or a certain part of two LOBs.

  – If the two parts are equal, **0** is returned. Otherwise, a non-zero value is returned.
  – If the first LOB is smaller than the second, **-1** is returned. If the first LOB is larger than the second, **1** is returned.
  – If any of the **len**, **start1**, and **start2** parameters is invalid, **NULL** is returned. The valid offset range is 1 to **LOBMAXSIZE**.

  The function prototype of **DBE_LOB.COMPARE** is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_LOB.COMPARE (
lob1     IN     BLOB,
lob2     IN     BLOB,
len      IN     INTEGER DEFAULT DBE_LOB.LOBMAXSIZE,
start1   IN     INTEGER DEFAULT 1,
start2   IN     INTEGER DEFAULT 1)
RETURN INTEGER;

DBE_LOB.COMPARE (
lob1     IN     CLOB,
lob2     IN     CLOB,
len      IN     INTEGER DEFAULT DBE_LOB.LOBMAXSIZE,
start1   IN     INTEGER DEFAULT 1,
start2   IN     INTEGER DEFAULT 1)
RETURN INTEGER;
```

Table 13-72 DBE_LOB.COMPARE interface parameters

Parameter	Description
lob1	First BLOB/CLOB to be compared
lob2	Second BLOB/CLOB to be compared
len	Number of characters or bytes to be compared. The maximum value is **DBE_LOB.LOBMAXSIZE**.
start1	Offset of the first LOB descriptor. The initial position is 1.
start2	Offset of the second LOB descriptor. The initial position is 1.

- DBE_LOB.SUBSTR

  This function reads the substring of a LOB and returns the number of read bytes or the number of characters. **NULL** is returned for any of the following conditions: amount > 1 or amount < 32767; offset < 1 or offset > **LOBMAXSIZE**

  The prototype of the **DBE_LOB.SUBSTR** function is as follows:

```
DBE_LOB.SUBSTR (
lob      IN     BLOB,
len      IN     INTEGER DEFAULT  32767,
start    IN     INTEGER DEFAULT  1)
RETURN RAW;

DBE_LOB.SUBSTR (
lob      IN     CLOB,
len      IN     INTEGER DEFAULT  32767,
start    IN     INTEGER DEFAULT  1)
RETURN VARCHAR2;
```

Table 13-73 DBE_LOB.SUBSTR interface parameters

Parameter	Description
lob	LOB descriptor of the substring to be read. For BLOB, the return value is the number of read bytes. For CLOB, the return value is the number of characters.
len	Number of bytes or characters to be read.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
start	Number of characters or bytes offset from the start position.

- DBE_LOB.STRIP

  This stored procedure truncates the LOB of a specified length. After this stored procedure is executed, the length of the LOB is set to the length specified by the **newlen** parameter. If an empty LOB is truncated, no execution result is displayed. If the specified length is longer than the length of the LOB, an exception occurs.

  The prototype of the **DBE_LOB.STRIP** function is as follows:

```
DBE_LOB.STRIP (
lob       IN OUT     BLOB,
newlen    IN       INTEGER);

DBE_LOB.STRIP (
lob       IN OUT     CLOB,
newlen    IN       INTEGER);
```

  Table 13-74 DBE_LOB.STRIP interface parameters

Parameter	Description
lob	BLOB to be read
newlen	After truncation, the new LOB length for BLOB is in the unit of byte and that for CLOB is in the unit of character.

- DBE_LOB.CREATE_TEMPORARY

  This stored procedure creates a temporary BLOB or CLOB and is used only for syntax compatibility.

  The function prototype of **DBE_LOB.CREATE_TEMPORARY** is as follows:

```
DBE_LOB.CREATE_TEMPORARY (
locator          INOUT      BLOB,
cache            IN         BOOLEAN,
keep_alive_time   IN         INTEGER);

DBE_LOB.CREATE_TEMPORARY (
locator          INOUT      CLOB,
cache            IN         BOOLEAN,
keep_alive_time   IN         INTEGER);
```

  Table 13-75 DBE_LOB.CREATE_TEMPORARY interface parameters

Parameter	Description
locator	LOB descriptor
cache	Used only for syntax compatibility.
keep_alive_time	Used only for syntax compatibility.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_LOB.APPEND

  The stored procedure **APPEND** loads a part of BLOB content to the buffer based on the specified length and initial position offset.

  The function prototype of **DBE_LOB.APPEND** is as follows:

```
DBE_LOB.APPEND (
dest_lob    INOUT       BLOB,
src_lob     IN          BLOB);

DBE_LOB.APPEND (
dest_lob    INOUT       CLOB,
src_lob     IN          CLOB);
```

  Table 13-76 DBE_LOB.APPEND interface parameters

Parameter	Description
dest_lob	BLOB/CLOB to be written
src_lob	BLOB/CLOB to be read

- DBE_LOB.FREETEMPORARY

  The stored procedure is used to release LOB files created by **CREATE_TEMPORARY**.

  The **DBE_LOB.FREETEMPORARY** function prototype is as follows:

```
DBE_LOB.FREETEMPORARY (
lob_loc    INOUT       BLOB);

DBE_LOB.FREETEMPORARY (
lob_loc    INOUT       CLOB);
```

  Table 13-77 DBE_LOB.FREETEMPORARY interface parameters

Parameter	Description
lob_loc	BLOB or CLOB to be released.

- DBE_LOB.FILEOPEN

  This function is used to open a database-external file of the BFILE type and return the file descriptor corresponding to the file.

  The BFILE type is defined as follows:

```
DBE_LOB.BFILE (
directory    text,
filename     text);
```

  The **DBE_LOB.FILEOPEN** function prototype is as follows:

```
DBE_LOB.FILEOPEN (
file         IN    DBE_LOB.BFILE,
open_mode    IN    text)
RETURN integer;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-78 DBE_LOB.FILEOPEN parameters

Parameter	Description
file	Specifies the database-external file to be opened. The BFILE type contains the file path and file name.
open_mode	Specifies the file open mode (**w**, **r**, or **a**).

- DBE_LOB.FILECLOSE

  This function is used to close an external BFILE file.

  The **DBE_LOB.FILECLOSE** function prototype is as follows:

```
DBE_LOB.FILECLOSE (
file     IN     integer);
```

Table 13-79 DBE_LOB.FILECLOSE interface parameters

Parameter	Description
file	Specifies the database-external file to be closed (the file descriptor is returned by **FILEOPEN**).

- DBE_LOB.LOADFROMFILE

  This is used to read an external BFILE file to a BLOB file.

  The prototype of the **DBE_LOB.LOADFROMFILE** function is as follows:

```
DBE_LOB.LOADFROMFILE (
dest_lob      IN     BLOB,
src_file      IN     INTEGER,
amount        IN     INTEGER,
dest_offset   IN     INTEGER,
src_offset    IN     INTEGER)
RETURN raw;
```

Table 13-80 DBE_LOB.LOADFROMFILE interface parameters

Parameter	Description
dest_lob	Target BLOB file. The BFILE file will be read to this file.
src_bfile	Source BFILE file to be read.
amount	Size of a BLOB file. If the size of a file exceeds this threshold, the file will not be saved to the BLOB file.
dest_offset	Offset length of the BLOB file. If **dest_offset** is set to **1**, data is loaded from the start position of the file. The rest may be deduced by analogy.
src_offset	Offset length of the BFILE file. If **src_offset** is set to **1**, data is read from the start position of the file. The rest may be deduced by analogy.

- DBE_LOB.LOADBLOBFROMFILE

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This is used to read an external BFILE file to a BLOB file.

The prototype of the **DBE_LOB.LOADBLOBFROMFILE** function is as follows:

```
DBE_LOB.LOADBLOBFROMFILE (
dest_lob      IN    BLOB,
src_file     IN    INTEGER,
amount        IN    INTEGER,
dest_offset   IN    INTEGER,
src_offset    IN    INTEGER)
RETURN raw;
```

Table 13-81 DBE_LOB.LOADBLOBFROMFILE interface parameters

Parameter	Description
dest_lob	Target BLOB file. The BFILE file will be read to this file.
src_bfile	Source BFILE file to be read.
amount	Size of a BLOB file. If the size of a file exceeds this threshold, the file will not be saved to the BLOB file.
dest_offset	Offset length of the BLOB file. If **dest_offset** is set to **1**, data is loaded from the start position of the file. The rest may be deduced by analogy.
src_offset	Offset length of the BFILE file. If **src_offset** is set to **1**, data is read from the start position of the file. The rest may be deduced by analogy.

- DBE_LOB.LOADCLOBFROMFILE

  This is used to read an external BFILE file to a CLOB file.

  The prototype of the **DBE_LOB.LOADCLOBFROMFILE** function is as follows:

  ```
  DBE_LOB.LOADCLOBFROMFILE (
  dest_lob      IN    CLOB,
  src_file     IN    INTEGER,
  amount        IN    INTEGER,
  dest_offset   IN    INTEGER,
  src_offset    IN    INTEGER)
  RETURN raw;
  ```

  Table 13-82 DBE_LOB.LOADCLOBFROMFILE interface parameters

Parameter	Description
dest_lob	Target CLOB file. The BFILE file will be read to this file.
src_bfile	Source BFILE file to be read.
amount	Size of a CLOB file. If the size of a file exceeds this threshold, the file will not be saved to the CLOB file.
dest_offset	Offset length of the CLOB file. If **dest_offset** is set to **1**, data is loaded from the start position of the file. The rest may be deduced by analogy.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
src_offset	Offset length of the BFILE file. If **src_offset** is set to **1**, data is read from the start position of the file. The rest may be deduced by analogy.

- DBE_LOB.CONVERTTOBLOB

  This function is used to convert a CLOB file to a BLOB file.

  The prototype of the **DBE_LOB.CONVERTTOBLOB** function is as follows:

```
DBE_LOB.CONVERTTOBLOB(
dest_blob     IN   BLOB,
src_clob      IN   CLOB,
amount        IN   INTEGER default 32767,
dest_offset   IN   INTEGER default 1,
src_offset    IN   INTEGER default 1)
RETURN raw;
```

  Table 13-83 DBE_LOB.CONVERTTOBLOB interface parameters

Parameter	Description
dest_lob	Target BLOB file, which is converted from a CLOB file.
src_bfile	Source CLOB file to be read.
amount	Size of a BLOB file. If the size of a file exceeds this threshold, the file will not be saved to the BLOB file.
dest_offset	Offset length of the BLOB file. If **dest_offset** is set to **1**, data is loaded from the start position of the file. The rest may be deduced by analogy.
src_offset	Offset length of the CLOB file. If **src_offset** is set to **1**, data is read from the start position of the file. The rest may be deduced by analogy.

- DBE_LOB.CONVERTTOCLOB

  This function is used to convert a BLOB file to a CLOB file.

  The prototype of the **DBE_LOB.CONVERTTOCLOB** function is as follows:

```
DBE_LOB.CONVERTTOCLOB(
dest_clob     IN   CLOB,
src_blob      IN   BLOB,
amount        IN   INTEGER default 32767,
dest_offset   IN   INTEGER default 1,
src_offset    IN   INTEGER default 1)
RETURN text;
```

  Table 13-84 DBE_LOB.CONVERTTOCLOB interface parameters

Parameter	Description
dest_lob	Target CLOB file, which is converted from a BLOB file.
src_bfile	Source BLOB file to be read.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
amount	Size of a CLOB file. If the size of a file exceeds this threshold, the file will not be saved to the CLOB file.
dest_offset	Offset length of the CLOB file. If **dest_offset** is set to **1**, data is loaded from the start position of the file. The rest may be deduced by analogy.
src_offset	Offset length of the BLOB file. If **src_offset** is set to **1**, data is read from the start position of the file. The rest may be deduced by analogy.

Examples

```
-- Obtain the length of a string.
SELECT DBE_LOB.GET_LENGTH('12345678');

DECLARE
myraw  RAW(100);
amount INTEGER :=2;
buffer INTEGER :=1;
begin
DBE_LOB.READ('123456789012345',amount,buffer,myraw);
dbe_output.print_line(myraw);
end;
/

CREATE TABLE blob_Table (t1 blob) DISTRIBUTE BY REPLICATION;
CREATE TABLE blob_Table_bak (t2 blob) DISTRIBUTE BY REPLICATION;
INSERT INTO blob_Table VALUES('abcdef');
INSERT INTO blob_Table_bak VALUES('22222');

DECLARE
str varchar2(100) := 'abcdef';
source raw(100);
dest blob;
copyto blob;
amount int;
PSV_SQL varchar2(100);
PSV_SQL1 varchar2(100);
a int :=1;
len int;
BEGIN
source := dbe_raw.cast_from_varchar2_to_raw(str);
amount := dbe_raw.get_length(source);

PSV_SQL :='select * from blob_Table for update';
PSV_SQL1 := 'select * from blob_Table_bak for update';

EXECUTE IMMEDIATE PSV_SQL into dest;
EXECUTE IMMEDIATE PSV_SQL1 into copyto;

DBE_LOB.WRITE(dest, amount, 1, source);
DBE_LOB.WRITE_APPEND(dest, amount, source);

DBE_LOB.ERASE(dest, a, 1);
DBE_OUTPUT.PRINT_LINE(a);
DBE_LOB.COPY(copyto, dest, amount, 10, 1);
perform DBE_LOB.CLOSE(dest);
RETURN;
END;
/
```

```
-- Delete the table.
DROP TABLE blob_Table;
DROP TABLE blob_Table_bak;
```

13.12.2.2 DBE_RANDOM

Interface Description

Table 13-85 lists all interfaces supported by the **DBE_RANDOM** package.

Table 13-85 DBE_RANDOM interface parameters

Interface	Description
DBE_RANDOM.SET_SEED	Sets a seed for a random number.
DBE_RANDOM.GET_VALUE	Generates a random number between a specified **low** and a specified **high**.

- DBE_RANDOM.SET_SEED

  The stored procedure **SEED** is used to set a seed for a random number. The function prototype of **DBE_RANDOM.SET_SEED** is as follows:

  ```
  DBE_RANDOM.SET_SEED (seed  IN  INTEGER);
  ```

  Table 13-86 DBE_RANDOM.SET_SEED interface parameters

Parameter	Description
seed	Generates a seed for a random number.

- DBE_RANDOM.GET_VALUE

  The stored procedure **VALUE** generates a random number between a specified **low** and a specified **high**. The function prototype of **DBE_RANDOM.GET_VALUE** is as follows:

  ```
  DBE_RANDOM.GET_VALUE(
  min  IN  NUMBER default 0,
  max  IN  NUMBER default 1)
  RETURN NUMBER;
  ```

  Table 13-87 DBE_RANDOM.GET_VALUE interface parameters

Parameter	Description
min	Sets the low bound for a random number. The generated random number is greater than or equal to **min**.
max	Sets the high bound for a random number. The generated random number is less than **max**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The only requirement is that the parameter type is **NUMERIC** regardless of the right and left bound values.
- **DBE_RANDOM** implements pseudo-random numbers. Therefore, if the initial value (seed) remains unchanged, the sequence of the pseudo-random numbers also remains unchanged.
- The generated random number contains 15 valid digits.

Examples

```
-- Generate a random number between 0 and 1.
SELECT DBE_RANDOM.GET_VALUE(0,1);

-- For integers within a specified range, add the arguments min and max, and truncate the decimals from the result (the maximum value is not included as a possible value). Therefore, for integers from 0 to 99, you can use the following code:
SELECT TRUNC(DBE_RANDOM.GET_VALUE(0,100));
```

13.12.2.3 DBE_OUTPUT

Interface Description

DBE_OUTPUT provides all interfaces supported by the **DBE_OUTPUT** package.

Table 13-88 DBE_OUTPUT

Interface	Description
DBE_OUTPUT.PRINT_LINE	Outputs the specified text with newline characters.
DBE_OUTPUT.PRINT	Outputs the specified text without newline characters.
DBE_OUTPUT.SET_BUFFER_SIZE	Sets the size of the output buffer. If the size is not specified, the buffer can contain a maximum of 20000 bytes. If the size is set to a value less than or equal to 2000 bytes, the buffer can contain a maximum of 2000 bytes.

- DBE_OUTPUT.PRINT_LINE

The stored procedure **PRINT_LINE** writes a row of text carrying a line end symbol in the buffer. The function prototype of **DBE_OUTPUT.PRINT_LINE** is as follows:

```
DBE_OUTPUT.PRINT_LINE (
format IN VARCHAR2);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-89 DBE_OUTPUT.PRINT_LINE interface parameters

Parameter	Description
format	Specifies the text that was written to the buffer.

- DBE_OUTPUT.PRINT

The stored procedure **PRINT** outputs the specified text to the front of the specified text without adding a newline character. The function prototype of **DBE_OUTPUT.PRINT** is as follows:

```
DBE_OUTPUT.PRINT (
format IN VARCHAR2);
```

Table 13-90 DBE_OUTPUT.PRINT interface parameters

Parameter	Description
format	Specifies the text that was written to the specified text.

- DBE_OUTPUT.SET_BUFFER_SIZE

The stored procedure **SET_BUFFER_SIZE** sets the output buffer size. If the size is not specified, it contains a maximum of 20000 bytes. The function prototype of **DBE_OUTPUT.SET_BUFFER_SIZE** is as follows:

```
DBE_OUTPUT.SET_BUFFER_SIZE (
size IN INTEGER default 20000);
```

Table 13-91 DBE_OUTPUT.SET_BUFFER_SIZE interface parameters

Parameter	Description
size	Sets the output buffer size.

Examples

```
BEGIN
    DBE_OUTPUT.SET_BUFFER_SIZE(50);
    DBE_OUTPUT.PRINT('hello, ');
    DBE_OUTPUT.PRINT_LINE('database!');-- Output "hello, database!".
END;
/
```

13.12.2.4 DBE_RAW

Interface Description

Table 13-92 provides all interfaces supported by the **DBE_RAW** package.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-92 DBE_RAW

Interface	Description
DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW	Converts a value of the **INTEGER** type to a binary representation (**RAW** type).
DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER	Converts a binary representation (**RAW** type) to a value of the **INTEGER** type.
DBE_RAW.GET_LENGTH	Obtains the length of a **RAW** object.
DBE_RAW.CAST_FROM_VARCHA...	Converts a value of the **VARCHAR2** type to a binary representation (**RAW** type).
DBE_RAW.CAST_TO_VARCHAR2	Converts a value of the **RAW** type to a value of the **VARCHAR2** type.
DBE_RAW.SUBSTR	Returns the substring of the **RAW** type.
DBE_RAW.BIT_OR	Performs the bitwise OR operation on raw data.

NOTICE

RAW data is represented as hexadecimal characters externally, and stored as binary characters internally. For example, one byte of **RAW** data with bits **11001011** is displayed and entered as **'CB'**.

- DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW

  The stored procedure **CAST_FROM_BINARY_INTEGER_TO_RAW** converts a value of the **INTEGER** type to a binary representation (**RAW** type).

  The function prototype of **DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW** is as follows:

  ```
  DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW (
  value         IN  INTEGER,
  endianess     IN  INTEGER DEFAULT 1)
  RETURN RAW;
  ```

  Table 13-93 DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW interface parameters

Parameter	Description
value	Specifies the **INTEGER** value to be converted to the **RAW** value.
endianess	Specifies the **INTEGER** value **1** or **2** for the byte sequence. (**1** indicates **BIG_ENDIAN** and **2** indicates **LITTLE-ENDIAN**.)

- DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER

  The stored procedure **CAST_FROM_RAW_TO_BINARY_INTEGER** converts a binary representation (**RAW** type) to a value of the **INTEGER** type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The function prototype of **DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER** is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER (
value          IN  RAW,
endianess      IN  INTEGER DEFAULT 1)
RETURN BINARY_INTEGER;
```

Table 13-94 DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER interface parameters

Parameter	Description
value	Specifies an **INTEGER** value in a binary representation (**RAW** type).
endianess	Specifies the **INTEGER** value **1** or **2** for the byte sequence. (**1** indicates **BIG_ENDIAN** and **2** indicates **LITTLE-ENDIAN**.)

- DBE_RAW.GET_LENGTH

  The stored procedure **GET_LENGTH** returns the length of a **RAW** object.

  The function prototype of **DBE_RAW.GET_LENGTH** is as follows:

  ```
  DBE_RAW.GET_LENGTH(
  value     IN    RAW)
  RETURN INTEGER;
  ```

  Table 13-95 DBE_RAW.GET_LENGTH interface parameters

Parameter	Description
value	Specifies a **RAW** object.

- DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW

  The stored procedure **CAST_FROM_VARCHAR2_TO_RAW** converts a **VARCHAR2** object to a **RAW** object.

  The function prototype of **DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW** is as follows:

  ```
  DBE_RAW.CAST_TO_RAW(
  str     IN    VARCHAR2)
  RETURN RAW;
  ```

  Table 13-96 DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW interface parameters

Parameter	Description
c	Specifies a **VARCHAR2** object to be converted.

- DBE_RAW.CAST_TO_VARCHAR2

  The stored procedure **CAST_TO_VARCHAR2** converts a **RAW** object to a **VARCHAR2** object.

  The **DBE_RAW.CAST_TO_VARCHAR2** function prototype is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_RAW.CAST_TO_VARCHAR2(
str     IN    RAW)
RETURN VARCHAR2;
```

Table 13-97 DBE_RAW.CAST_TO_VARCHAR2 interface parameters

Parameter	Description
str	Specifies a **RAW** object to be converted.

- DBE_RAW.BIT_OR

  The stored procedure **BIT_OR** calculates the bitwise OR result of two raw data records.

  The **DBE_RAW.BIT_OR** function prototype is as follows:

```
DBE_RAW.BIT_OR(
str1     IN    RAW,
str2     IN    RAW)
RETURN RAW;
```

Table 13-98 DBE_RAW.BIT_OR interface parameters

Parameter	Description
str1	First character string of the bitwise OR operation
str2	Second character string of the bitwise OR operation

- DBE_RAW.SUBSTR

  The stored procedure **SUBSTR** truncates an object of the **RAW** type based on the start bit and length.

  The **DBE_RAW.SUBSTR** function prototype is as follows:

```
DBE_RAW.SUBSTR(
   IN lob_loc raw,
   IN off_set integer default 1,
   IN amount integer default 32767)
RETURN RAW;
```

Table 13-99 DBE_RAW.SUBSTR interface parameters

Parameter	Description
lob_loc	Source raw character string
off_set	Start position of a substring. The default value is **1**.
amount	Length of a substring. The default value is **32767**.

Examples

```
--Perform operations on RAW data in a stored procedure.
CREATE OR REPLACE PROCEDURE proc_raw
AS
str varchar2(100) := 'abcdef';
source raw(100);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
amount integer;
BEGIN
source := dbe_raw.cast_from_varchar2_to_raw(str);--Convert the type.
 amount := dbe_raw.get_length(source);--Obtain the length.
dbe_output.print_line(amount);
END;
/

-- Call the stored procedure.
CALL proc_raw();

-- Delete the stored procedure.
DROP PROCEDURE proc_raw;
```

13.12.2.5 DBE_TASK

Interface Description

Table 13-100 lists all interfaces supported by the **DBE_TASK** package.

Table 13-100 DBE_TASK

Interface	Description
DBE_TASK.SUBMIT	Submits a scheduled task. The job ID is automatically generated by the system.
DBE_TASK.JOB_SUBMIT	Same as DBE_TASK.SUBMIT. However, It provides syntax compatibility parameters.
DBE_TASK.ID_SUBMIT	Submits a scheduled task. The job ID is specified by the user.
DBE_TASK.CANCEL	Removes a scheduled task by job ID.
DBE_TASK.RUN	Executes a scheduled task.
DBE_TASK.FINISH	Disables or enables scheduled task execution.
DBE_TASK.UPDATE	Modifies user-definable attributes of a scheduled task, including the task content, next-execution time, and execution interval.
DBE_TASK.CHANGE	Same as DBE_TASK.UPDATE. However, It provides syntax compatibility parameters.
DBE_TASK.CONTENT	Modifies the task content attribute of a scheduled task.
DBE_TASK.NEXT_TIME	Modifies the next-execution time attribute of a scheduled task.
DBE_TASK.INTERVAL	Modifies the execution interval attribute of a scheduled task.

- DBE_TASK.SUBMIT

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The stored procedure **SUBMIT** submits a scheduled task provided by the system.

The function prototype of **DBE_TASK.SUBMIT** is as follows:

```
DBE_TASK.SUBMIT(
what          IN   TEXT,
next_time     IN   TIMESTAMP DEFAULT sysdate,
interval_time IN   TEXT  DEFAULT 'null',
id            OUT  INTEGER
)RETURN INTEGER;
```

NOTE

When a scheduled task is created (using **DBE_TASK**), the system binds the current database and the username to the task by default. This function can be called by using **call** or **select**. If you call this function by using **select**, there is no need to specify output parameters. To call this function within a stored procedure, use **perform**. If the committed SQL statement task uses a non-public schema, specify the schema to a table schema or a function schema, or add **set current_schema = xxx** before the SQL statement.

Table 13-101 DBE_TASK.SUBMIT interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
what	text	IN	No	SQL statement to be executed. One or multiple DDLs (excluding database-related operations), DMLs, anonymous blocks, and statements for calling stored procedures, or all four combined are supported.
next_time	timestamp	IN	No	Specifies the next time the job will be executed. The default value is the current system time (**sysdate**). If the specified time has past, the job is executed at the time it is submitted.
interval_time	text	IN	Yes	Calculates the next time to execute the job. It can be an interval expression, or **sysdate** followed by a numeric value, for example, **sysdate+1.0/24**. If this parameter is left empty or set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward.
id	integer	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When SELECT is used for calling, this parameter cannot be added. When CALL is used for calling, this parameter must be added.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

When you create a user using the **what** parameter, the plaintext password of the user is recorded in the log. Therefore, you are not advised to do so. Tasks created using this API may not be highly available. You are advised to use **PKG_SERVICE.SUBMIT_ON_NODES** to create a task and specify the CCN as the job execution node.

Example:

```
select DBE_TASK.SUBMIT('call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate+1');

select DBE_TASK.SUBMIT('call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate+1.0/24');

CALL DBE_TASK.SUBMIT('INSERT INTO T_JOB  VALUES(1);  call pro_1(); call pro_2();',
add_months(to_date('201701','yyyymm'),1), 'date_trunc(''day'',SYSDATE) + 1 +(8*60+30.0)/
(24*60)' ,:jobid);

DECLARE
    jobid int;
BEGIN
    PERFORM DBE_TASK.SUBMIT('call pro_xxx();', sysdate, 'interval ''5 minute''', jobid);
END;
/
```

- DBE_TASK.JOB_SUBMIT

  The stored procedure **SUBMIT** submits a scheduled task provided by the system. In addition, it provides additional compatibility parameters.

  The **DBE_TASK.JOB_SUBMIT** function prototype is as follows:

```
DBE_TASK.JOB_SUBMIT(
job           OUT  INTEGER,
what           IN   TEXT,
next_date      IN   TIMESTAMP  DEFAULT sysdate,
job_interval  IN   TEXT       DEFAULT 'null',
no_parse       IN   BOOLEAN    DEFAULT false,
instance       IN   INTEGER    DEFAULT 0,
force          IN   BOOLEAN    DEFAULT false
)RETURN INTEGER;
```

Table 13-102 DBE_TASK.JOB_SUBMIT interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job	integer	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When **dbe.job_submit** is called using SELECT, this parameter can be omitted.
what	text	IN	No	SQL statement to be executed. One or multiple DDLs (excluding database-related operations), DMLs, anonymous blocks, and statements for calling stored procedures, or all four combined are supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
next_date	timestamp	IN	Yes	Specifies the next time the job will be executed. The default value is the current system time (**sysdate**). If the specified time has past, the job is executed at the time it is submitted.
job_interval	text	IN	Yes	Calculates the next time to execute the job. It can be an interval expression, or **sysdate** followed by a numeric value, for example, **sysdate+1.0/24**. If this parameter is left empty or set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward.
no_parse	boolean	IN	Yes	The default value is **false**, which is used only for syntax compatibility.
instance	integer	IN	Yes	The default value is **0**, which is used only for syntax compatibility.
force	boolean	IN	Yes	The default value is **false**, which is used only for syntax compatibility.

Example:

```
DECLARE
    id integer;
BEGIN
    id = DBE_TASK.JOB_SUBMIT(
        what => 'insert into t1 values (1, 2)',
        job_interval => 'sysdate + 1' --daily
    );
END;
/
```

- DBE_TASK.ID_SUBMIT

  ID_SUBMIT has the same syntax function as **SUBMIT**, but the first parameter of **ID_SUBMIT** is an input parameter, that is, a specified job ID. In contrast, that last parameter of **ID_SUBMIT** is an output parameter, indicating the job ID automatically generated by the system.

  ```
  DBE_TASK.ID_SUBMIT(
  id            IN   BIGINT,
  what          IN   TEXT,
  next_time     IN   TIMESTAMP DEFAULT sysdate,
  interval_time IN   TEXT  DEFAULT 'null');
  ```

  Example:

  ```
  CALL dbe_task.id_submit(101, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
  ```

- DBE_TASK.CANCEL

  The stored procedure **CANCEL** deletes a specified task.

  The function prototype of **DBE_TASK.CANCEL** is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
CANCEL(id  IN  INTEGER);
```

Table 13-103 DBE_TASK.CANCEL interface parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	integer	IN	No	Specifies the job ID.

Example:

```
CALL dbe_task.cancel(101);
```

- DBE_TASK.RUN

  The stored procedure runs a scheduled task.

  The prototype of the **DBE_TASK.RUN** function is as follows:

  ```
  DBE_TASK.RUN(
  job          IN   BIGINT,
  force        IN   BOOLEAN DEFAULT FALSE);
  ```

  Table 13-104 DBE_TASK.RUN interface parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
job	bigint	IN	No	Specifies the job ID.
force	Boolean	IN	Yes	Used only for syntax compatibility.

  Example:

  ```
  BEGIN
     DBE_TASK.ID_SUBMIT(12345, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
     DBE_TASK.RUN(12345);
  END;
  /
  ```

- DBE_TASK.FINISH

  The stored procedure **FINISH** disables or enables a scheduled task.

  The function prototype of **DBE_TASK.FINISH** is as follows:

  ```
  DBE_TASK.FINISH(
  id           IN   INTEGER,
  broken       IN   BOOLEAN,
  next_time    IN   TIMESTAMP  DEFAULT  sysdate);
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-105 DBE_TASK.FINISH interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	integer	IN	No	Specifies the job ID.
broken	Boolean	IN	No	Specifies the status flag, **true** for broken and **false** for not broken. The current job is updated based on the parameter value **true** or **false**. If the parameter is left empty, the job status remains unchanged.
next_time	timestamp	IN	Yes	Specifies the next execution time. The default value is the current system time. If **broken** is set to **true**, **next_time** is updated to **'4000-1-1'**. If **broken** is set to **false** and **next_time** is not empty, **next_time** is updated for the job. If **next_time** is empty, it will not be updated. This parameter can be omitted, and its default value will be used in this case.

Example:

```
CALL dbe_task.finish(101, true);
CALL dbe_task.finish(101, false, sysdate);
```

- DBE_TASK.UPDATE

  The stored procedure **UPDATE** modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

  The **DBE_TASK.UPDATE** function prototype is as follows:

```
dbe_task.UPDATE(
id              IN     INTEGER,
content         IN     TEXT,
next_time       IN     TIMESTAMP,
interval_time   IN  TEXT);
```

Table 13-106 DBE_TASK.UPDATE interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	integer	IN	No	Specifies the job ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
content	text	IN	Yes	Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the **content** parameter for the specified job. Otherwise, the system updates the **content** parameter for the specified job.
next_time	timestamp	IN	Yes	Specifies the next execution time. If this parameter is left empty, the system does not update the **next_time** parameter for the specified job. Otherwise, the system updates the **next_time** parameter for the specified job.
interval_time	text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the **interval_time** parameter for the specified job. Otherwise, the system updates the **interval_time** parameter for the specified job after necessary validity check. If this parameter is set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward.

Example:

```
CALL dbe_task.update(101, 'call userproc();', sysdate, 'sysdate + 1.0/1440');
CALL dbe_task.update(101, 'insert into tbl_a values(sysdate);', sysdate, 'sysdate + 1.0/1440');
```

- DBE_TASK.CHANGE

  The stored procedure **UPDATE** modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

  The prototype of the **DBE_TASK.CHANGE** function is as follows:

```
DBE_TASK.CHANGE(
job             IN    INTEGER,
what            IN    TEXT       DEFAULT NULL,
next_date       IN    TIMESTAMP  DEFAULT NULL,
job_interval    IN    TEXT       DEFAULT NULL,
instance        IN    INTEGER    DEFAULT NULL,
force           IN    BOOLEAN    DEFAULT false);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-107 DBE_TASK.CHANGE interface parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
job	integer	IN	No	Specifies the job ID.
what	text	IN	Yes	Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the **what** parameter for the specified job. Otherwise, the system updates the **what** parameter for the specified job.
next_date	timestamp	IN	Yes	Specifies the next execution time. If this parameter is left empty, the system does not update the **next_time** parameter for the specified job. Otherwise, the system updates the **next_date** parameter for the specified job.
job_interval	text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the **job_interval** parameter for the specified job. Otherwise, the system updates the **job_interval** parameter for the specified job after necessary validity check. If this parameter is set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward.
instance	integer	IN	Yes	Used only for syntax compatibility.
force	boolean	IN	No	Used only for syntax compatibility.

```
BEGIN
    DBE_TASK.CHANGE(
        job => 1234,
        what => 'insert into t2 values (2);'
    );
END;
/
```

- DBE_TASK.CONTENT

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The stored procedure **CONTENT** modifies the procedures to be executed by a specified task.

The function prototype of **DBE_TASK.CONTENT** is as follows:

```
DBE_TASK.CONTENT(
id          IN     INTEGER,
content     IN TEXT);
```

Table 13-108 DBE_TASK.CONTENT interface parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	integer	IN	No	Specifies the job ID.
content	text	IN	No	Specifies the name of the stored procedure or SQL statement block that is executed.

NOTE

- If the value specified by the **content** parameter is one or multiple executable SQL statements, program blocks, or stored procedures, this procedure can be executed successfully; otherwise, it will fail to be executed.
- If the value specified by the **content** parameter is a simple statement such as **INSERT** and **UPDATE**, a schema name must be added in front of the table name.

Example:

```
CALL dbe_task.content(101, 'call userproc();');
CALL dbe_task.content(101, 'insert into tbl_a values(sysdate);');
```

- DBE_TASK.NEXT_TIME

  The stored procedure **NEXT_TIME** modifies the next-execution time attribute of a task.

  The function prototype of **DBE_TASK.NEXT_TIME** is as follows:

```
DBE_TASK.NEXT_TIME(
id          IN    BIGINT,
next_time   IN    TEXT);
```

Table 13-109 DBE_TASK.NEXT_TIME interface parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	bigint	IN	No	Specifies the job ID.
next_time	text	IN	No	Specifies the next execution time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

If the specified **next_time** value is earlier than the current date, the job is executed once immediately.

Example:

```
CALL dbe_task.next_time(101, sysdate);
```

- DBE_TASK.INTERVAL

  The stored procedure **INTERVAL** modifies the execution interval attribute of a task.

  The function prototype of **DBE_TASK.INTERVAL** is as follows:

```
DBE_TASK.INTERVAL(
id             IN      INTEGER,
interval_time      IN    TEXT);
```

Table 13-110 DBE_TASK.INTERVAL interface parameters

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
id	integer	IN	No	Specifies the job ID.
interval_time	text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty or set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward. **interval** must be a valid time or interval type.

Example:

```
CALL dbe_task.interval(101, 'sysdate + 1.0/1440');
```

NOTE

For a job that is currently running (that is, **job_status** is **'r'**), it is not allowed to use **cancel**, **update**, **next_time**, **content**, or **interval** to delete or modify job parameters.

Constraints

1. After a job is created by using **SUMMIT/ID_SUBMIT**, the job belongs to the current coordinator (that is, the job is scheduled and executed only on the current coordinator). Other coordinators do not schedule and execute the job. If the coordinator node is faulty, the job cannot be properly executed. You are advised to use the **PKG_SERVICE.SUBMIT_ON_NODES** API to specify the job execution node as CCN to ensure that the job is still available when a node is

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

faulty. Not all coordinators can query, modify, and delete tasks created on other CNs.

2. You can create, update, and delete tasks only using the procedures provided by the **dbe_task** package. These procedures synchronize task information between different CNs and associate primary keys between the **pg_job** and **pg_job_proc** catalogs. If you use DML statements to add, delete, or modify records in the **pg_job** catalog, task information will become inconsistent between CNs and system catalogs may fail to be associated, compromising internal task management.
3. Each task created by a user is bound to a CN. If the CN fails while a task is being executed, the task status cannot be updated in real time and will stay at **'r'**. The task status will be updated to **'s'** only after the CN recovers. When a CN fails, all tasks on this CN cannot be scheduled or executed until the CN is restored manually, or deleted and then replaced.
4. For each task, the bound CN updates the real-time task information (including the task status, last execution start time, last execution end time, next execution start time, the number of execution failures [if any]) to the **pg_job** catalog, and synchronizes the information to other CNs, ensuring consistent task information between different CNs. In the case of faults on other CNs, task information synchronization is reattempted by the bound CN, which increases task execution time. Although task information fails to be synchronized between CNs, task information can still be properly updated in the **pg_job** catalog on the bound CN and the task can be executed successfully. After the faulty CN recovers, task information such as task execution time and status in its **pg_job** catalog may be incorrect and will be updated only after the task is executed again on the bound CN.
5. For each job, a thread is established to execute it. If multiple jobs are triggered concurrently as scheduled, the system will need some time to start the required threads, resulting in a latency of 0.1 ms in job execution.

13.12.2.6 DBE_UTILITY

Interface Description

Table 13-111 provides all interfaces supported by the **DBE_UTILITY** package.

Table 13-111 DBE_UTILITY

Interface	Description
DBE_UTILITY.FORMAT_ERROR...	Outputs a call stack of an abnormal stored procedure.
DBE_UTILITY.FORMAT_ERROR...	Outputs detailed information about the stored procedure exception.
DBE_UTILITY.FORMAT_CALL_...	Output a call stack of a stored procedure.
DBE_UTILITY.GET_TIME	Outputs the current time, which is used to obtain the execution duration.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_UTILITY.FORMAT_ERROR_BACKTRACE

The stored procedure **FORMAT_ERROR_BACKTRACE** returns the call stack where an error occurs during execution. The **DBE_UTILITY.FORMAT_ERROR_BACKTRACE** function prototype is as follows:

```
DBE_UTILITY.FORMAT_ERROR_BACKTRACE()
RETURN TEXT;
```

- DBE_UTILITY.FORMAT_ERROR_STACK

The stored procedure **FORMAT_ERROR_STACK** returns the detailed information about the error location when an error occurs during the execution. The **DBE_UTILITY.FORMAT_ERROR_STACK** function prototype is as follows:

```
DBE_UTILITY.FORMAT_ERROR_STACK()
RETURN TEXT;
```

- DBE_UTILITY.FORMAT_CALL_STACK

The stored procedure **FORMAT_CALL_STACK** sets the call stack of the output function. The **DBE_UTILITY.FORMAT_CALL_STACK** function prototype is as follows:

```
DBE_UTILITY.FORMAT_CALL_STACK()
RETURN TEXT;
```

- DBE_UTILITY.GET_TIME

The stored procedure **GET_TIME** sets the output time, which is usually used for difference. A separate return value is meaningless. The **DBE_UTILITY.GET_TIME** function prototype is as follows:

```
DBE_UTILITY.GET_TIME()
RETURN BIGINT;
```

Example

```
CREATE OR REPLACE PROCEDURE test_get_time1()
AS
declare
    start_time  bigint;
    end_time  bigint;
BEGIN
    start_time:= dbe_utility.get_time ();
    pg_sleep(1);
    end_time:=dbe_utility.get_time ();
    dbe_output.print_line(end_time - start_time);
END;
/
```

13.12.2.7 DBE_SQL

Interface Description

Table 13-112 lists interfaces supported by the **DBE_SQL** package.

Table 13-112 DBE_SQL

Interface	Description
DBE_SQL.REGISTER_CONTEXT	Opens a cursor.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Interface	Description
DBE_SQL.SQL_UNREGISTER_CONTEXT	Closes an open cursor.
DBE_SQL.SQL_SET_SQL	Passes a set of SQL statements to a cursor.
DBE_SQL.SQL_RUN	Performs a set of dynamically defined operations on a cursor.
DBE_SQL.NEXT_ROW	Reads a row of cursor data.
DBE_SQL.SET_RESULT_TYPE	Dynamically defines a column.
DBE_SQL.SET_RESULT_TYPE_CHAR	Dynamically defines a column of the **CHAR** type.
DBE_SQL.SET_RESULT_TYPE_INT	Dynamically defines a column of the **INT** type.
DBE_SQL.SET_RESULT_TYPE_LONG	Dynamically defines a column of the **LONG** type.
DBE_SQL.SET_RESULT_TYPE_RAW	Dynamically defines a column of the **RAW** type.
DBE_SQL.SET_RESULT_TYPE_TEXT	Dynamically defines a column of the **TEXT** type.
DBE_SQL.SET_RESULT_TYPE_UNKNOWN	Dynamically defines a column of an unknown type.
DBE_SQL.GET_RESULT	Reads a dynamically defined column value.
DBE_SQL.GET_RESULT_CHAR	Reads a dynamically defined column value of the **CHAR** type.
DBE_SQL.GET_RESULT_INT	Reads a dynamically defined column value of the **INT** type.
DBE_SQL.GET_RESULT_LONG	Reads a dynamically defined column value of the **LONG** type.
DBE_SQL.GET_RESULT_RAW	Reads a dynamically defined column value of the **RAW** type.
DBE_SQL.GET_RESULT_TEXT	Reads a dynamically defined column value of the **TEXT** type.
DBE_SQL.GET_RESULT_UNKNOWN	Reads a dynamically defined column value of an unknown type.
DBE_SQL.DBE_SQL_GET_RES....	Reads a dynamically defined column value of the **CHAR** type.
DBE_SQL.DBE_SQL_GET_RES....	Reads a dynamically defined column value of the **LONG** type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Interface	Description
DBE_SQL.DBE_SQL_GET_RES....	Reads a dynamically defined column value of the **RAW** type.
DBE_SQL.IS_ACTIVE	Checks whether a cursor is opened.
DBE_SQL.LAST_ROW_COUNT	Compatible interface. This function is not supported currently.
DBE_SQL.RUN_AND_NEXT	Reserved interface. This function is not supported currently.
DBE_SQL.SQL_BIND_VARIABL...	Binds a value to a variable in a statement.
DBE_SQL.SQL_BIND_ARRAY	Binds a group of values to a variable in a statement.
DBE_SQL.SET_RESULT_TYPE_...	Dynamically defines a column of the **INT** array type.
DBE_SQL.SET_RESULT_TYPE_...	Dynamically defines a column of the **TEXT** array type.
DBE_SQL.SET_RESULT_TYPE_...	Dynamically defines a column of the **RAW** array type.
DBE_SQL.SET_RESULT_TYPE_...	Dynamically defines a column of the **BYTEA** array type.
DBE_SQL.SET_RESULT_TYPE_...	Dynamically defines a column of the **CHAR** array type.
DBE_SQL.SET_RESULTS_TYPE	Dynamically defines a column of the array type.
DBE_SQL.GET_RESULTS_INT	Reads a dynamically defined column value of the **INT** array type.
DBE_SQL.GET_RESULTS_TEXT	Reads a dynamically defined column value of the **TEXT** array type.
DBE_SQL.GET_RESULTS_RAW	Reads a dynamically defined column value of the **RAW** array type.
DBE_SQL.GET_RESULTS_BYTE...	Reads a dynamically defined column value of the **BYTEA** array type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Interface	Description
DBE_SQL.GET_RESULTS_CHAR	Reads a dynamically defined column value of the **CHAR** array type.
DBE_SQL.GET_RESULTS	Reads a dynamically defined column value.
DBE_SQL.SQL_DESCRIBE_COL...	Describes the column information read by the cursor.
DBE_SQL.DESC_REC	Stores the type of the column information read by the cursor.
DBE_SQL.DESC_TAB	The TABLE type of DESC_REC.
DBE_SQL.DATE_TABLE	The TABLE type of DATE.
DBE_SQL.NUMBER_TABLE	The TABLE type of NUMBER.
DBE_SQL.VARCHAR2_TABLE	The TABLE type of VARCHAR2.
DBE_SQL.BIND_VARIABLE	Binds parameters.
DBE_SQL.SQL_SET_RESULTS_...	Dynamically defines a column of the array type.
DBE_SQL.SQL_GET_VALUES_C	Reads a dynamically defined column value.
DBE_SQL.GET_VARIABLE_RES...	Reads the return value of an SQL statement.
DBE_SQL.GET_VARIABLE_RES...	Reads the return value of an SQL statement. (The value is of the **CHAR** type.)
DBE_SQL.GET_VARIABLE_RES...	Reads the return value of an SQL statement. (The value is of the **RAW** type.)
DBE_SQL.GET_VARIABLE_RES...	Reads the return value of an SQL statement. (The value is of the **TEXT** type.)
DBE_SQL.GET_VARIABLE_RES...	Reads the return value of an SQL statement. (The value is of the **INT** type.)
DBE_SQL.GET_ARRAY_RESULT...	Reads the return value of an SQL statement. (The value is of the **TEXT** array type.)
DBE_SQL.GET_ARRAY_RESULT...	Reads the return value of an SQL statement. (The value is of the **RAW** array type.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Interface	Description
DBE_SQL.GET_ARRAY_RESULT...	Reads the return value of an SQL statement. (The value is of the **CHAR** array type.)
DBE_SQL.GET_ARRAY_RESULT...	Reads the return value of an SQL statement. (The value is of the **INT** array type.)

NOTE

- You are advised to use **dbe_sql.set_result_type** and **dbe_sql.get_result** to define columns.
- If the size of the result set is greater than the value of **work_mem**, the result set will be spilled to a disk temporarily. The value of **work_mem** must be no greater than 512 MB.

- DBE_SQL.REGISTER_CONTEXT

  This function opens a cursor, which is the prerequisite for the subsequent **dbe_sql** operations. This function does not transfer any parameter. It automatically generates cursor IDs in an ascending order and returns values to integer variables.

  The prototype of the **DBE_SQL.REGISTER_CONTEXT** function is as follows:

  ```
  DBE_SQL.REGISTER_CONTEXT(
  )
  RETURN INTEGER;
  ```

- DBE_SQL.SQL_UNREGISTER_CONTEXT

  This function closes a cursor, which is the end of each **dbe_sql** operation. If this function is not called when the stored procedure ends, the memory is still occupied by the cursor. Therefore, remember to close a cursor when you do not need to use it. If an exception occurs, the stored procedure exits but the cursor is not closed. Therefore, you are advised to include this interface in the exception handling of the stored procedure.

  The prototype of the **DBE_SQL.SQL_UNREGISTER_CONTEXT** function is as follows:

  ```
  DBE_SQL.SQL_UNREGISTER_CONTEXT(
  context_id      IN INTEGER
  )
  RETURN INTEGER;
  ```

  Table 13-113 DBE_SQL.SQL_UNREGISTER_CONTEXT interface parameters

Parameter	Description
context_id	ID of the cursor to be closed

- DBE_SQL.SQL_SET_SQL

  This function is used to parse the query statement of a specified cursor. The statement parameters can be transferred only through the **TEXT** type. The length cannot exceed 1 GB.

  The prototype of the **DBE_SQL.SQL_SET_SQL** function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_SQL.SQL_SET_SQL(
context_id     IN INTEGER,
query_string IN TEXT,
language_flag        IN INTEGER
)
RETURN BOOLEAN;
```

Table 13-114 DBE_SQL.SQL_SET_SQL interface parameters

Parameter	Description
context_id	ID of the cursor whose query statement is to be parsed
query_string	Query statement to be parsed
language_flag	Version language number. Currently, only **1** is supported.

- DBE_SQL.SQL_RUN

  This function executes a given cursor. It receives a cursor ID first, and the data obtained after execution is used for subsequent operations.

  The prototype of the **DBE_SQL.SQL_RUN** function is as follows:

```
DBE_SQL.SQL_RUN(
context_id     IN INTEGER,
)
RETURN INTEGER;
```

Table 13-115 DBE_SQL.SQL_RUN interface parameters

Parameter	Description
context_id	ID of the cursor whose query statement is to be parsed

- DBE_SQL.NEXT_ROW

  This function returns the number of data rows that meet query conditions. Each time the interface is executed, the system obtains a set of new rows until all data is read.

  The prototype of the **DBE_SQL.NEXT_ROW** function is as follows:

```
DBE_SQL.NEXT_ROW(
context_id     IN INTEGER,
)
RETURN INTEGER;
```

Table 13-116 DBE_SQL.NEXT_ROW interface parameters

Parameter	Description
context_id	ID of the cursor to be executed

- DBE_SQL.SET_RESULT_TYPE

  This function defines columns returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE_SQL.SET_RESULT_TYPE** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE(
context_id     IN INTEGER,
pos     IN INTEGER,
column_ref   IN ANYELEMENT,
maxsize     IN INTEGER default 1024
)
RETURN INTEGER;
```

Table 13-117 DBE_SQL.SET_RESULT_TYPE interface parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query
column_ref	Variable of any type. You can select an appropriate interface to dynamically define columns based on variable types.
maxsize	Length of a defined column

- DBE_SQL.SET_RESULT_TYPE_CHAR

  This function defines columns of the **CHAR** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_CHAR** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_CHAR(
context_id     IN INTEGER,
pos     IN INTEGER,
column_ref       IN TEXT,
column_size     IN INTEGER
)
RETURN INTEGER;
```

Table 13-118 DBE_SQL.SET_RESULT_TYPE_CHAR interface parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query
column_ref	Parameter to be defined
column_size	Length of a dynamically defined column

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_SQL.SET_RESULT_TYPE_INT

  This function defines columns of the **INT** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_INT** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_INT(
context_id     IN INTEGER,
pos     IN INTEGER
)
RETURN INTEGER;
```

  Table 13-119 DBE_SQL.SET_RESULT_TYPE_INT interface parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query

- DBE_SQL.SET_RESULT_TYPE_LONG

  This function defines columns of a long type (not **LONG**) returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type. The maximum size of a long column is 1 GB.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_LONG** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_LONG(
context_id     IN INTEGER,
pos     IN INTEGER
)
RETURN INTEGER;
```

  Table 13-120 DBE_SQL.SET_RESULT_TYPE_LONG interface parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query

- DBE_SQL.SET_RESULT_TYPE_RAW

  This function defines columns of the **RAW** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_RAW** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_RAW(
context_id     IN INTEGER,
pos     IN INTEGER,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
column_ref      IN RAW,
column_size     IN INTEGER
)
RETURN INTEGER;
```

Table 13-121 DBE_SQL.SET_RESULT_TYPE_RAW interface parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query
column_ref	Parameter of the **RAW** type
column_size	Column length

- DBE_SQL.SET_RESULT_TYPE_TEXT

  This function defines columns of the **TEXT** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_TEXT** function is as follows:

  ```
  DBE_SQL.DEFINE_COLUMN_CHAR(
  context_id     IN INTEGER,
  pos     IN INTEGER,
  maxsize     IN INTEGER
  )
  RETURN INTEGER;
  ```

  Table 13-122 DBE_SQL.SET_RESULT_TYPE_TEXT interface parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query
maxsize	Maximum length of the defined **TEXT** type

- DBE_SQL.SET_RESULT_TYPE_UNKNOWN

  This function processes columns of unknown data types returned from a given cursor. It is used only for the system to report an error and exist when the type cannot be identified.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_UNKNOWN** function is as follows:

  ```
  DBE_SQL.SET_RESULT_TYPE_UNKNOWN(
  context_id     IN INTEGER,
  pos     IN INTEGER,
  col_type       IN TEXT
  )
  RETURN INTEGER;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-123 DBE_SQL.SET_RESULT_TYPE_UNKNOWN interface parameters

Parameter	Description
context_id	ID of the cursor to be executed
posn	Position of a dynamically defined column in the query
col_type	Dynamically defined parameter

- DBE_SQL.GET_RESULT

  This function returns the cursor element value in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the **DBE_SQL.GET_RESULT** function is as follows:

```
DBE_SQL.GET_RESULT(
context_id               IN    INTEGER,
pos              IN    INTEGER,
column_value             INOUT ANYELEMENT
)
RETURN ANYELEMENT;
```

Table 13-124 DBE_SQL.GET_RESULT interface parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query
column_value	Return value of a defined column

- DBE_SQL.GET_RESULT_CHAR

  This stored procedure returns the value of the **CHAR** type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the **DBE_SQL.GET_RESULT_CHAR** function is as follows:

```
DBE_SQL.GET_RESULT_CHAR(
context_id          IN    INTEGER,
pos                 IN    INTEGER,
tr                  INOUT CHARACTER,
err                 INOUT NUMERIC,
actual_length       INOUT INTEGER
);
```

Table 13-125 DBE_SQL.GET_RESULT_CHAR interface parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query
tr	Return value

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
err	Error No. It is an output parameter. The input parameter must be a variable. Currently, the output value is **–1** regardless of the input parameter.
actual_length	Length of a return value

The overloaded function of the **DBE_SQL.GET_RESULT_CHAR** function is as follows:

```
DBE_SQL.GET_RESULT_CHAR(
context_id          IN    INTEGER,
pos                 IN    INTEGER,
tr                  INOUT CHARACTER
);
```

Table 13-126 DBE_SQL.GET_RESULT_CHAR interface parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query
tr	Return value

- DBE_SQL.GET_RESULT_INT

  This function returns the value of the **INT** type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**. The prototype of the **DBE_SQL.GET_RESULT_INT** function is as follows:

  ```
  DBE_SQL.GET_RESULT_INT(
  context_id              IN    INTEGER,
  pos                 IN    INTEGER
  )
  RETURN INTEGER;
  ```

  Table 13-127 DBE_SQL.GET_RESULT_INT interface parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query

- DBE_SQL.GET_RESULT_LONG

  This function returns the value of a long type (not **LONG** or **BIGINT**) in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the **DBE_SQL.GET_RESULT_LONG** function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_SQL.GET_RESULT_LONG(
context_id          IN INTEGER,
pos                 IN      INTEGER,
lgth                IN    INTEGER,
off_set             IN   INTEGER,
vl                INOUT     TEXT,
vl_length           INOUT    INTEGER
)
RETURN RECORD;
```

Table 13-128 DBE_SQL.GET_RESULT_LONG interface parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query
lgth	Length of a return value
off_set	Start position of a return value
vl	Return value
vl_length	Length of a return value

- DBE_SQL.GET_RESULT_RAW

  This stored procedure returns the value of the RAW type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the **DBE_SQL.GET_RESULT_RAW** stored procedure is as follows:

```
DBE_SQL.GET_RESULT_RAW(
context_id          IN  INTEGER,
pos                 IN      INTEGER,
tr                INOUT     RAW,
err               INOUT     NUMERIC,
actual_length       INOUT INTEGER
);
```

Table 13-129 DBE_SQL.GET_RESULT_RAW interface parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query
tr	Returned column value
err	Error No. It is an output parameter. The input parameter must be a variable. Currently, the output value is **–1** regardless of the input parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
actual_length	Length of a return value. The value longer than this length will be truncated.

The overloaded function of the **DBE_SQL.GET_RESULT_RAW** function is as follows:

```
DBE_SQL.GET_RESULT_RAW(
context_id          IN  INTEGER,
pos                 IN          INTEGER,
tr                  INOUT       RAW
);
```

Table 13-130 DBE_SQL.GET_RESULT_RAW interface parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query
tr	Returned column value

- DBE_SQL.GET_RESULT_TEXT

  This function returns the value of the **TEXT** type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the **DBE_SQL.GET_RESULT_TEXT** function is as follows:

  ```
  DBE_SQL.GET_RESULT_TEXT(
  context_id          IN  INTEGER,
  pos                 IN          INTEGER
  )
  RETURN TEXT;
  ```

  Table 13-131 DBE_SQL.GET_RESULT_TEXT interface parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query

- DBE_SQL.GET_RESULT_UNKNOWN

  This function returns the value of an unknown type in a specified position of a cursor. It serves as an error handling interface when the type is not unknown.

  The prototype of the **DBE_SQL.GET_RESULT_UNKNOWN** function is as follows:

  ```
  DBE_SQL.GET_RESULT_UNKNOWN(
  context_id          IN    INTEGER,
  pos                 IN          INTEGER,
  col_type            IN      TEXT
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
)
RETURN TEXT;
```

Table 13-132 DBE_SQL.GET_RESULT_UNKNOWN interface parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query
col_type	Returned parameter type

- DBE_SQL.DBE_SQL_GET_RESULT_CHAR

  This function returns the value of the **CHAR** type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**. Different from **DBE_SQL.GET_RESULT_CHAR**, the length of the return value is not set and the entire string is returned.

  The prototype of the **DBE_SQL.DBE_SQL_GET_RESULT_CHAR** function is as follows:

```
DBE_SQL.DBE_SQL_GET_RESULT_CHAR(
context_id     IN    INTEGER,
pos            IN    INTEGER
)
RETURN CHARACTER;
```

Table 13-133 DBE_SQL.GET_RESULT_CHAR interface parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query

- DBE_SQL.DBE_SQL_GET_RESULT_LONG

  This function returns the value of a long type (not **LONG** or **BIGINT**) in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  Different from **DBE_SQL.GET_RESULT_LONG**, the length of the return value is not set and the entire BIGINT value is returned.

  The prototype of the **DBE_SQL.DBE_SQL_GET_RESULT_LONG** function is as follows:

```
DBE_SQL.DBE_SQL_GET_RESULT_LONG(
context_id          IN INTEGER,
pos                 IN INTEGER
)
RETURN BIGINT;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-134 DBE_SQL.DBE_SQL_GET_RESULT_LONG interface parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query

- DBE_SQL.DBE_SQL_GET_RESULT_RAW

  This function returns the value of the **RAW** type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  Different from **DBE_SQL.GET_RESULT_RAW**, the length of the return value is not set and the entire string is returned.

  The prototype of the **DBE_SQL.DBE_SQL_GET_RESULT_RAW** function is as follows:

```
DBE_SQL.GET_RESULT_RAW(
context_id          IN  INTEGER,
pos                 IN      INTEGER,
tr                  INOUT   RAW
)
RETURN RAW;
```

Table 13-135 DBE_SQL.GET_RESULT_RAW interface parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query

- DBE_SQL.IS_ACTIVE

This function returns the status of a cursor. The status can be **open**, **parse**, **execute**, or **define**. If the status is **open**, the value is **TRUE**. If the status is unknown, an error is reported. In other cases, the value is **FALSE**.

The prototype of the **DBE_SQL.IS_ACTIVE** function is as follows:

```
DBE_SQL.IS_ACTIVE(
context_id              IN    INTEGER
)
RETURN BOOLEAN;
```

Table 13-136 DBE_SQL.IS_ACTIVE interface parameters

Parameter	Description
context_id	ID of the cursor to be queried

- DBE_SQL.SQL_BIND_VARIABLE

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This function is used to bind a parameter to an SQL statement. When an SQL statement is executed, the SQL statement is executed based on the bound value.

The prototype of the **DBE_SQL.SQL_BIND_VARIABLE** function is as follows:

```
DBE_SQL.SQL_BIND_VARIABLE(
    context_id in int,
    query_string in text,
    language_flag in anyelement,
    out_value_size in int default null
)
RETURNS void;
```

Table 13-137 DBE_SQL.SQL_BIND_VARIABLE interface parameters

Parameter	Description
context_id	ID of the cursor to be queried
query_string	Name of the bound variable
language_flag	Bound value
out_value_size	Size of the return value. Default: **null**

- DBE_SQL.SQL_BIND_ARRAY

  This function is used to bind a set of parameters to an SQL statement. When an SQL statement is executed, the SQL statement is executed based on the bound array.

  The prototype of the **DBE_SQL.SQL_BIND_ARRAY** function is as follows:

```
DBE_SQL.SQL_BIND_ARRAY(
    IN context_id int,
    IN query_string text,
    IN value anyarray
)
RETURNS void;
DBE_SQL.SQL_BIND_ARRAY(
    IN context_id int,
    IN query_string text,
    IN value anyarray,
    IN lower_index int,
    IN higher_index int
)
RETURNS void;
```

Table 13-138 DBE_SQL.SQL_BIND_ARRAY interface parameters

Parameter	Description
context_id	ID of the cursor to be queried
query_string	Name of the bound variable
value	Bound array
lower_index	Minimum subscript of the bound array

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
higher_index	Maximum subscript of the bound array

- DBE_SQL.SET_RESULT_TYPE_INTS

  This function defines columns of the **INT** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_INTS** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_INTS(
    IN context_id int,
    IN pos int,
    IN column_ref anyarray,
    IN cnt int,
    IN lower_bnd int
)
RETURNS integer;
```

  Table 13-139 DBE_SQL.SET_RESULT_TYPE_INTS interface parameters

Parameter	Description
context_id	ID of the cursor to be queried
pos	Position of a dynamically defined column in the query
column_ref	Type of the returned array
cnt	Number of values obtained at a time
lower_bnd	The start subscript when an array is returned

- DBE_SQL.SET_RESULT_TYPE_TEXTS

  This function defines columns of the **TEXT** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_TEXTS** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_TEXTS(
    IN context_id int,
    IN pos int,
    IN column_ref anyarray,
    IN cnt int,
    IN lower_bnd int,
    IN maxsize int
)
RETURNS integer;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-140 DBE_SQL.SET_RESULT_TYPE_TEXTS interface parameters

Parameter	Description
context_id	ID of the cursor to be queried
pos	Position of a dynamically defined column in the query
column_ref	Type of the returned array
cnt	Number of values obtained at a time
lower_bnd	The start subscript when an array is returned
maxsize	Maximum length of the defined **TEXT** type

- DBE_SQL.SET_RESULT_TYPE_RAWS

  This function defines columns of the **RAW** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_RAWS** function is as follows:

```
DBE_SQL.set_result_type_raws(
    IN context_id int,
    IN pos int,
    IN column_ref anyarray,
    IN cnt int,
    IN lower_bnd int,
    IN column_size int
)
RETURNS integer;
```

Table 13-141 DBE_SQL.SET_RESULT_TYPE_RAWS interface parameters

Parameter	Description
context_id	ID of the cursor to be queried
pos	Position of a dynamically defined column in the query
column_ref	Type of the returned array
cnt	Number of values obtained at a time
lower_bnd	The start subscript when an array is returned
column_size	Column length

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_SQL.SET_RESULT_TYPE_BYTEAS

  This function defines columns of the **BYTEA** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_BYTEAS** function is as follows:

```
DBE_SQL.set_result_type_byteas(
    IN context_id int,
    IN pos int,
    IN column_ref anyarray,
    IN cnt int,
    IN lower_bnd int,
    IN column_size int
)
RETURNS integer;
```

  Table 13-142 DBE_SQL.SET_RESULT_TYPE_BYTEAS interface parameters

Parameter	Description
context_id	ID of the cursor to be queried
pos	Position of a dynamically defined column in the query
column_ref	Type of the returned array
cnt	Number of values obtained at a time
lower_bnd	The start subscript when an array is returned
column_size	Column length

- DBE_SQL.SET_RESULT_TYPE_CHARS

  This function defines columns of the **CHAR** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_CHARS** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_CHARS(
    IN context_id int,
    IN pos int,
    IN column_ref anyarray,
    IN cnt int,
    IN lower_bnd int,
    IN column_size int
)
RETURNS integer;
```

Table 13-143 DBE_SQL.SET_RESULT_TYPE_CHARS interface parameters

Parameter	Description
context_id	ID of the cursor to be queried
pos	Position of a dynamically defined column in the query
column_ref	Type of the returned array
cnt	Number of values obtained at a time
lower_bnd	The start subscript when an array is returned
column_size	Column length

- DBE_SQL.SET_RESULTS_TYPE

  This function defines columns returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULTS_TYPE** function is as follows:

```
DBE_SQL.SET_RESULTS_TYPE(
    IN context_id int,
    IN pos int,
    IN column_ref anyarray,
    IN cnt int,
    IN lower_bnd int,
    IN maxsize int  DEFAULT 1024
) returns void;
```

Table 13-144 DBE_SQL.SET_RESULTS_TYPE interface parameters

Parameter	Description
context_id	ID of the cursor to be queried
pos	Position of a dynamically defined column in the query
column_ref	Type of the returned array
cnt	Number of values obtained at a time
lower_bnd	The start subscript when an array is returned
maxsize	Maximum length of the defined type

- DBE_SQL.GET_RESULTS_INT

  This function returns the value of the **INT** array type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the **DBE_SQL.GET_RESULTS_INT** function is as follows:

```
DBE_SQL.GET_RESULTS_INT(
    IN context_id int,
    IN pos int,
    INOUT column_value anyarray
);
```

Table 13-145 DBE_SQL.GET_RESULTS_INT interface parameters

Parameter	Description
context_id	ID of the cursor to be queried
pos	Position of a dynamically defined column in the query
column_value	Return value

- DBE_SQL.GET_RESULTS_TEXT

  This function returns the value of the **TEXT** array type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the **DBE_SQL.GET_RESULTS_TEXT** function is as follows:

  ```
  DBE_SQL.GET_RESULTS_TEXT(
      IN context_id int,
      IN pos int,
      INOUT column_value anyarray
  );
  ```

  Table 13-146 DBE_SQL.GET_RESULTS_TEXT interface parameters

Parameter	Description
context_id	ID of the cursor to be queried
pos	Position of a dynamically defined column in the query
column_value	Return value

- DBE_SQL.GET_RESULTS_RAW

  This function returns the value of the **RAW** array type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the **DBE_SQL.GET_RESULTS_RAW** function is as follows:

  ```
  DBE_SQL.GET_RESULTS_RAW(
      IN context_id int,
      IN pos int,
      INOUT column_value anyarray
  );
  ```

  Table 13-147 DBE_SQL.GET_RESULTS_RAW interface parameters

Parameter	Description
context_id	ID of the cursor to be queried

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
pos	Position of a dynamically defined column in the query
column_value	Return value

- DBE_SQL.GET_RESULTS_BYTEA

  This function returns the value of the **BYTEA** array type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the **DBE_SQL.GET_RESULTS_BYTEA** function is as follows:

```
DBE_SQL.GET_RESULTS_BYTEA(
    IN context_id int,
    IN pos int,
    INOUT column_value anyarray
);
```

  Table 13-148 DBE_SQL.GET_RESULTS_BYTEA interface parameters

Parameter	Description
context_id	ID of the cursor to be queried
pos	Position of a dynamically defined column in the query
column_value	Return value

- DBE_SQL.GET_RESULTS_CHAR

  This function returns the value of the **CHAR** array type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the **DBE_SQL.GET_RESULTS_CHAR** function is as follows:

```
DBE_SQL.GET_RESULTS_CHAR(
    IN context_id int,
    IN pos int,
    INOUT column_value anyarray
);
```

  Table 13-149 DBE_SQL.GET_RESULTS_CHAR interface parameters

Parameter	Description
context_id	ID of the cursor to be queried
pos	Position of a dynamically defined column in the query
column_value	Return value

- DBE_SQL.GET_RESULTS

  This function returns the value of the array type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **NOTE**
>
> The bottom-layer mechanism of DBE_SQL.GET_RESULTS is implemented through arrays. When different arrays are used to obtain the return value of the same column, NULL values are filled in the array due to discontinuous internal indexes to ensure the continuity of array indexes. As a result, the length of the returned result array is different from that of the Oracle database.

The prototype of the **DBE_SQL.GET_RESULTS** function is as follows:

```
DBE_SQL.GET_RESULTS(
    IN context_id int,
    IN pos int,
    INOUT column_value anyarray
);
```

Table 13-150 DBE_SQL.GET_RESULTS interface parameters

Parameter	Description
context_id	ID of the cursor to be queried
pos	Position of a dynamically defined column in the query
column_value	Return value

- DBE_SQL.SQL_DESCRIBE_COLUMNS

  This function is used to describe column information and can be used only for cursors defined by **SELECT**.

  The prototype of the **DBE_SQL.SQL_DESCRIBE_COLUMNS** function is as follows:

```
DBE_SQL.SQL_DESCRIBE_COLUMNS(
    context_id in int,
    col_cnt inout int,
    desc_t inout dbe_sql.desc_tab
)RETURNS record ;
```

Table 13-151 DBE_SQL.SQL_DESCRIBE_COLUMNS interface parameters

Parameter	Description
context_id	ID of the cursor to be queried
col_cnt	Number of columns returned
desc_t	Description of the returned column

- DBE_SQL.DESC_REC

  This type is a composite type and is used to store the description of the **SQL_DESCRIBE_COLUMNS** API.

  The prototype of the **DBE_SQL.DESC_REC** function is as follows:

```
CREATE TYPE DBE_SQL.DESC_REC AS (
    col_type          int,
    col_max_len       int,
    col_name          VARCHAR2(32),
    col_name_len      int,
```

```
    col_schema_name     VARCHAR2(32),
    col_schema_name_len int,
    col_precision       int,
    col_scale           int,
    col_charsetid       int,
    col_charsetform     int,
    col_null_ok         BOOLEAN
);
```

- DBE_SQL.DESC_TAB

  This type is the TABLE type of DESC_REC and is implemented through the TABLE OF syntax.

  The prototype of the **DBE_SQL.DESC_TAB** function is as follows:

  ```
  CREATE TYPE DBE_SQL.DESC_TAB AS TABLE OF DBE_SQL.DESC_REC;
  ```

- DBE_SQL.DATE_TABLE

  This type is the TABLE type of DATE and is implemented through the TABLE OF syntax.

  The prototype of the **DBE_SQL.DATE_TABLE** function is as follows:

  ```
  CREATE TYPE DBE_SQL.DATE_TABLE AS TABLE OF DATE;
  ```

- DBE_SQL.NUMBER_TABLE

  This type is the TABLE type of NUMBER and is implemented through the TABLE OF syntax.

  The prototype of the **DBE_SQL.NUMBER_TABLE** function is as follows:

  ```
  CREATE TYPE DBE_SQL.NUMBER_TABLE AS TABLE OF NUMBER;
  ```

- DBE_SQL.VARCHAR2_TABLE

  This type is the TABLE type of VARCHAR2 and is implemented through the TABLE OF syntax.

  The prototype of the **DBE_SQL.VARCHAR2** function is as follows:

  ```
  CREATE TYPE DBE_SQL.VARCHAR2_TABLE AS TABLE OF VARCHAR2(2000);
  ```

- DBE_SQL.BIND_VARIABLE

  This function is used to bind parameters. You are advised to use **DBE_SQL.SQL_BIND_VARIABLE**.

- DBE_SQL.SQL_SET_RESULTS_TYPE_C

  This function is used to dynamically define a column of the array type. You are not advised to use it.

  The prototype of the **DBE_SQL.SQL_SET_RESULTS_TYPE_C** function is as follows:

  ```
  DBE_SQL.sql_set_results_type_c(
     context_id in int,
     pos in int,
     column_ref in anyarray,
     cnt in int,
     lower_bnd in int,
     col_type in anyelement,
     maxsize in int
  )return integer;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-152 DBE_SQL.SQL_SET_RESULTS_TYPE_C parameters

Parameter	Description
context_id	ID of the cursor to be queried
pos	Position of a dynamically defined column in the query
column_ref	Type of the returned array
cnt	Number of values obtained at a time
lower_bnd	Start subscript when an array is returned
col_type	Variable type corresponding to the returned array type
maxsize	Maximum length of the defined type

- DBE_SQL.SQL_GET_VALUES_C

  This function is used to read a dynamically defined column value. You are not advised to use it.

  The prototype of the **DBE_SQL.SQL_GET_VALUES_C** function is as follows:

```
DBE_SQL.sql_get_values_c(
    context_id in int,
    pos in int,
    results_type inout anyarray,
    result_type in anyelement
)return anyarray;
```

Table 13-153 DBE_SQL.SQL_GET_VALUES_C parameters

Parameter	Description
context_id	ID of the cursor to be queried
pos	Parameter position
results_type	Obtained result
result_type	Type of the obtained result

- DBE_SQL.GET_VARIABLE_RESULT

  This function is used to return the value of the bound OUT parameter and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_VARIABLE_RESULT** function is as follows:

```
DBE_SQL.get_variable_result(
    IN context_id int,
    IN pos VARCHAR2,
    INOUT column_value anyelement
);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-154 DBE_SQL.GET_VARIABLE_RESULT interface parameters

Parameter	Description
context_id	ID of the cursor to be queried
pos	Name of the bound parameter
column_value	Return value

- DBE_SQL.GET_VARIABLE_RESULT_CHAR

  This function is used to return the value of the bound OUT parameter of the **CHAR** type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_VARIABLE_RESULT_CHAR** function is as follows:

```
DBE_SQL.get_variable_result_char(
    IN context_id int,
    IN pos VARCHAR2
)
RETURNS char
```

Table 13-155 DBE_SQL.GET_VARIABLE_RESULT_CHAR interface parameters

Parameter	Description
context_id	ID of the cursor to be queried
pos	Name of the bound parameter

- DBE_SQL.GET_VARIABLE_RESULT_RAW

  This function is used to return the value of the bound OUT parameter of the **RAW** type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_VARIABLE_RESULT_RAW** function is as follows:

```
CREATE OR REPLACE FUNCTION DBE_SQL.get_variable_result_raw(
    IN context_id int,
    IN pos VARCHAR2,
    INOUT value anyelement
)
RETURNS anyelement
```

Table 13-156 DBE_SQL.GET_VARIABLE_RESULT_RAW interface parameters

Parameter	Description
context_id	ID of the cursor to be queried
pos	Name of the bound parameter
value	Return value

- DBE_SQL.GET_VARIABLE_RESULT_TEXT

  This function is used to return the value of the bound OUT parameter of the **TEXT** type and obtain the OUT parameter in a stored procedure.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the **DBE_SQL.GET_VARIABLE_RESULT_TEXT** function is as follows:

```
CREATE OR REPLACE FUNCTION DBE_SQL.get_variable_result_text(
    IN context_id int,
    IN pos VARCHAR2
)
RETURNS text
```

Table 13-157 DBE_SQL.GET_VARIABLE_RESULT_TEXT interface parameters

Parameter	Description
context_id	ID of the cursor to be queried
pos	Name of the bound parameter

- DBE_SQL.GET_VARIABLE_RESULT_INT

  This function is used to return the value of the bound OUT parameter of the **INT** type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_VARIABLE_RESULT_INT** function is as follows:

  ```
  DBE_SQL.get_variable_result_int(
      IN context_id int,
      IN pos VARCHAR2,
      INOUT value anyelement
  )
  RETURNS anyelement
  ```

  Table 13-158 DBE_SQL.GET_VARIABLE_RESULT_INT interface parameters

Parameter	Description
context_id	ID of the cursor to be queried
pos	Name of the bound parameter
value	Return value

- DBE_SQL.GET_ARRAY_RESULT_TEXT

  This function is used to return the value of the bound OUT parameter of the **TEXT** array type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_ARRAY_RESULT_TEXT** function is as follows:

  ```
  DBE_SQL.get_array_result_text(
      IN context_id int,
      IN pos VARCHAR2,
      INOUT column_value anyarray
  )
  ```

  Table 13-159 DBE_SQL.GET_ARRAY_RESULT_TEXT interface parameters

Parameter	Description
context_id	ID of the cursor to be queried

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
pos	Name of the bound parameter
column_value	Return value

- DBE_SQL.GET_ARRAY_RESULT_RAW

  This function is used to return the value of the bound OUT parameter of the **RAW** array type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_ARRAY_RESULT_RAW** function is as follows:

```
DBE_SQL.get_array_result_raw(
    IN context_id int,
    IN pos VARCHAR2,
    INOUT column_value anyarray
)
```

  Table 13-160 DBE_SQL.GET_ARRAY_RESULT_RAW interface parameters

Parameter	Description
context_id	ID of the cursor to be queried
pos	Name of the bound parameter
column_value	Return value

- DBE_SQL.GET_ARRAY_RESULT_CHAR

  This function is used to return the value of the bound OUT parameter of the **CHAR** array type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_ARRAY_RESULT_CHAR** function is as follows:

```
DBE_SQL.get_array_result_char(
    IN context_id int,
    IN pos VARCHAR2,
    INOUT column_value anyarray
)
```

  Table 13-161 DBE_SQL.GET_ARRAY_RESULT_CHAR interface parameters

Parameter	Description
context_id	ID of the cursor to be queried
pos	Name of the bound parameter
column_value	Return value

- DBE_SQL.GET_ARRAY_RESULT_INT

  This function is used to return the value of the bound OUT parameter of the **INT** array type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_ARRAY_RESULT_INT** function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_SQL.get_array_result_int(
    IN context_id int,
    IN pos VARCHAR2,
    INOUT column_value anyarray
)
```

Table 13-162 DBE_SQL.GET_ARRAY_RESULT_INT interface parameters

Parameter	Description
context_id	ID of the cursor to be queried
pos	Name of the bound parameter
column_value	Return value

Examples

```
-- Perform operations on RAW data in a stored procedure.
openGauss=# create or replace procedure pro_dbe_sql_all_02(in_raw raw,v_in int,v_offset int)
as
context_id int;
v_id int;
v_info bytea :=1;
query varchar(2000);
execute_ret int;
define_column_ret_raw bytea :='1';
define_column_ret int;
begin
drop table if exists pro_dbe_sql_all_tb1_02 ;
create table pro_dbe_sql_all_tb1_02(a int ,b blob);
insert into pro_dbe_sql_all_tb1_02 values(1,HEXTORAW('DEADBEEE'));
insert into pro_dbe_sql_all_tb1_02 values(2,in_raw);
query := 'select * from pro_dbe_sql_all_tb1_02 order by 1';
-- Open a cursor.
context_id := dbe_sql.register_context();
-- Compile the cursor.
dbe_sql.sql_set_sql(context_id, query, 1);
-- Define columns.
define_column_ret:= dbe_sql.set_result_type(context_id,1,v_id);
define_column_ret_raw:= dbe_sql.set_result_type_raw(context_id,2,v_info,10);
-- Execute the cursor.
execute_ret := dbe_sql.sql_run(context_id);
loop
exit when (dbe_sql.next_row(cursorid) <= 0);
-- Obtain values.
dbe_sql.get_result(context_id,1,v_id);
dbe_sql.get_result_raw(context_id,2,v_info,v_in,v_offset);
-- Output the result.
dbe_output.print_line('id:'|| v_id || ' info:' || v_info);
end loop;
-- Close the cursor.
dbe_sql.sql_unregister_context(context_id);
end;
/
-- Call the stored procedure.
openGauss=# call pro_dbe_sql_all_02(HEXTORAW('DEADBEEF'),0,1);

-- Delete the stored procedure.
openGauss=# DROP PROCEDURE pro_dbe_sql_all_02;
```

13.12.2.8 DBE_FILE

Interface Description

Table 13-163 lists all interfaces supported by the **DBE_FILE** package.

Table 13-163 DBE_FILE

Interface	Description
DBE_FILE.OPEN	Opens a file based on the specified directory and file name.
DBE_FILE.IS_CLOSE	Checks whether a file handle is opened.
DBE_FILE.READ_LINE	Reads a line of data from an open file handle based on the specified length.
DBE_FILE.WRITE	Writes the data specified in the buffer to a file.
DBE_FILE.NEW_LINE	Writes one or more line terminators to an open file.
DBE_FILE.WRITE_LINE	Writes a string from the buffer to an open file.
DBE_FILE.FORMAT_WRITE	This is a formatted **PUT** stored procedure similar to **printf()**.
DBE_FILE.GET_RAW	Reads binary data from an open file handle.
DBE_FILE.PUT_RAW	Writes the input binary data to the file.
DBE_FILE.FLUSH	Writes data from a file handle to a physical file.
DBE_FILE.CLOSE	Closes an open file handle.
DBE_FILE.CLOSE_ALL	Closes all file handles opened in a session.
DBE_FILE.REMOVE	Deletes a disk file. To perform this operation, you must have required permissions.
DBE_FILE.RENAME	Renames files on the disk, similar to **mv** in Unix.
DBE_FILE.COPY	Copies data in a continuous area to a new file. If **start_line** and **end_line** are omitted, the entire file is copied.
DBE_FILE.GET_ATTR	Reads and returns the attributes of a disk file.
DBE_FILE.SEEK	Adjusts the position of a file pointer forward or backward based on the specified number of bytes.
DBE_FILE.GET_POS	Specifies the offset of a returned file, in bytes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_FILE.OPEN

  This function opens a file. You can specify the maximum number of characters in each line. A maximum of 50 files can be opened at a time. This function returns a handle of the **INTEGER** type.

  The prototype of the **DBE_FILE.OPEN** function is as follows:

```
DBE_FILE.OPEN (
dir             IN    VARCHAR2,
file_name       IN   VARCHAR2,
open_mode       IN    VARCHAR2,
max_line_size   IN    INTEGER DEFAULT 1024)
RETURN INTEGER;
```

  Table 13-164 DBE_FILE.OPEN interface parameters

Parameter	Description
dir	Directory of a file. It is a string, indicating an object name. **NOTE** • File directories need to be added to the system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist will be reported. Functions that involve **location** as parameters also comply with this rule. • When the GUC parameter **safe_data_path** is enabled, you can only use the advanced package to read and write files in the file path specified by **safe_data_path**.
file_name	File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the **OPEN** function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).
open_mode	File opening mode, including **r** (read), **w** (write), and **a** (append). **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
max_line_size	Maximum number of characters in each line, including newline characters. The minimum value is **1** and the maximum is **32767**. If this parameter is not specified, the default value **1024** is used.

- DBE_FILE.IS_CLOSE

  This function detects a file handle to check whether the file is opened. A Boolean value is returned. If an invalid file handle is detected, the **INVALID_FILEHANDLE** exception is thrown.

  The prototype of the **DBE_FILE.IS_CLOSE** function is as follows:

```
DBE_FILE.IS_CLOSE (
file     IN     INTEGER)
RETURN BOOLEAN;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-165 DBE_FILE.IS_CLOSE interface parameters

Parameter	Description
file IN INTEGER	File handle to be detected

- DBE_FILE.READ_LINE

  This stored procedure reads text from an open file handle and stores the result in the buffer. The procedure reads data until a line end (excluding line terminator), file end, or the value specified by the **len** parameter. The length of the read data cannot exceed the value of the **max_line_size** parameter in the **OPEN** function.

  The prototype of the **DBE_FILE.READ_LINE** function is as follows:

  ```
  DBE_FILE.READ_LINE (
  file      IN   INTEGER,
  buffer    OUT  VARCHAR2,
  len       IN   INTEGER DEFAULT NULL)
  ```

  Table 13-166 DBE_FILE.READ_LINE interface parameters

Parameter	Description
file	File handle opened by calling the **OPEN** function. The file must be opened in read mode. Otherwise, the **INVALID_OPERATION** exception is thrown.
buffer	Buffer used to receive data
len	Number of bytes read from a file. The default value is **NULL**. If the default value **NULL** is used, **max_linesize** is used to specify the line size.

- DBE_FILE.WRITE

  This stored procedure writes data in the buffer to a file. The file must be opened in write mode. Line terminators are not written.

  The prototype of the **DBE_FILE.WRITE** function is as follows:

  ```
  DBE_FILE.WRITE (
  file     IN     INTEGER,
  buffer   IN     TEXT);
  ```

  Table 13-167 DBE_FILE.WRITE interface parameters

Parameter	Description
file	This stored procedure writes data in the buffer to a file. The file must be opened in write mode. Line terminators are not written.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
buffer	Text data to be written to a file. The maximum buffer size is 32767 bytes. If no value is specified in the open state, the default value is 1024 bytes. Before the writing is performed, the buffer occupied by **WRITE** operations cannot exceed 32767 bytes. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- DBE_FILE.NEW_LINE

  This stored procedure writes one or more line terminators to an open file. The procedure is split from the **WRITE** function because line terminators are related to platforms.

  The prototype of the **DBE_FILE.NEW_LINE** function is as follows:

```
DBE_FILE.NEW_LINE (
file        IN     INTEGER,
line_nums   IN     INTEGER := 1);
```

  Table 13-168 DBE_FILE.NEW_LINE interface parameters

Parameter	Description
file	Opened file handle
line_nums	Number of terminators written to a file

- DBE_FILE.WRITE_LINE

  This stored procedure writes strings in the buffer to an open file. The file must be opened in write mode.

  The prototype of the **DBE_FILE.WRITE_LINE** function is as follows:

```
DBE_FILE.WRITE_LINE(
file      IN     INTEGER,
buffer    IN     TEXT,
flush     IN     BOOLEAN DEFAULT FALSE);
```

  Table 13-169 DBE_FILE.WRITE_LINE interface parameters

Parameter	Description
file	Opened file handle
buffer	Text data to be written to a file. The maximum buffer size is 32767 bytes. If no value is specified in the open state, the default value is 1024 bytes. Before the writing is performed, the buffer occupied by **PUT** operations cannot exceed 32767 bytes. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
flush	Whether to flush data to the disk after the writing

- DBE_FILE.FORMAT_WRITE

  This is a formatted **PUT** stored procedure similar to **printf()**.

  The prototype of the **DBE_FILE.FORMAT_WRITE** function is as follows:

```
DBE_FILE.FORMAT_WRITE (
file   IN INTEGER,
format IN VARCHAR2,
arg1   IN VARCHAR2 DEFAULT NULL,
. . .
arg6 IN VARCHAR2 DEFAULT NULL]);
```

  Table 13-170 DBE_FILE.FORMAT_WRITE interface parameters

Parameter	Description
file	Opened file handle
format	A string to be formatted, containing the text and format characters \n and %s
[arg1. . .arg6]	Six optional parameters. The parameters and the positions of characters to be formatted are in one-to-one correspondence. If the parameter corresponding to a character to be formatted is not provided, an empty string is used to replace %s.

- DBE_FILE.GET_RAW

  This function reads binary data from the opened file descriptor and returns the data using **r**.

  The prototype of the **DBE_FILE.GET_RAW** function is as follows:

```
DBE_FILE.GET_RAW (
file    IN   INTEGER,
r       OUT  RAW,
length  IN   INTEGER DEFAULT NULL);
```

  Table 13-171 DBE_FILE.GET_RAW interface parameters

Parameter	Description
file	Opened file handle
r	Output binary data
length	Length of the file to be read. The default value is **NULL**. All data in the file is read. The maximum length is 1 GB.

- DBE_FILE.PUT_RAW

  This function writes binary data to a file.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the **DBE_FILE.PUT_RAW** function is as follows:

```
DBE_FILE.PUT_RAW (
file    IN  INTEGER,
r       IN  RAW,
flush   IN  BOOLEAN DEFAULT FALSE);
```

Table 13-172 DBE_FILE.PUT_RAW interface parameters

Parameter	Description
file	Opened file handle
r	Output binary data **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
flush	Specifies whether to flush data to a file. The default value is **false**.

- DBE_FILE.FLUSH

  Data in a file handle must be written into a physical file. Data in the buffer must have a line terminator. Refresh is important if a file must be read when it is opened. For example, debugging information can be refreshed to a file so that it can be read immediately.

  The prototype of the **DBE_FILE.FLUSH** function is as follows:

  ```
  DBE_FILE.FLUSH (
  file    IN     INTEGER);
  ```

  Table 13-173 DBE_FILE.FLUSH interface parameters

Parameter	Description
file	Opened file handle

- DBE_FILE.CLOSE

  This stored procedure closes an open file handle. When the stored procedure is called, exception is thrown if there is data to be written into the buffer.

  The prototype of the **DBE_FILE.CLOSE** function is as follows:

  ```
  DBE_FILE.CLOSE (
  file IN INTEGER
  )RETURN INTEGER;
  ```

  Table 13-174 DBE_FILE.CLOSE interface parameters

Parameter	Description
file	Opened file handle

- DBE_FILE.CLOSE_ALL

  This stored procedure closes all file handles opened in a session and can be used for emergency cleanup.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the **DBE_FILE.CLOSE_ALL** function is as follows:

```
DBE_FILE.CLOSE_ALL;
```

Table 13-175 DBE_FILE.CLOSE_ALL interface parameters

Parameter	Description
None	None

- DBE_FILE.REMOVE

  This stored procedure deletes a disk file. To perform this operation, you must have required permissions for the directories and files.

  The prototype of the **DBE_FILE.REMOVE** function is as follows:

  ```
  DBE_FILE.REMOVE (
  dir          IN     VARCHAR2,
  file_name    IN     VARCHAR2);
  ```

  Table 13-176 DBE_FILE.REMOVE interface parameters

Parameter	Description
dir	File directory **NOTE** • File directories need to be added to the system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist will be reported. Functions that involve **location** as parameters also comply with this rule. • When the GUC parameter **safe_data_path** is enabled, you can only use the advanced package to read and write files in the file path specified by **safe_data_path**.
file_name	File to be deleted

- DBE_FILE.RENAME

  This function renames files on the disk, similar to **mv** in Unix.

  The prototype of the **DBE_FILE.RENAME** function is as follows:

  ```
  DBE_FILE.RENAME (
  src_dir        IN   VARCHAR2,
  src_file_name  IN   VARCHAR2,
  dest_dir       IN   VARCHAR2,
  dest_file_name IN   VARCHAR2,
  overwrite      IN   BOOLEAN DEFAULT FALSE);
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-177 DBE_FILE.RENAME interface parameters

Parameter	Description
src_dir	Directory of the original file (case-sensitive) **NOTE** • File directories need to be added to the system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist will be reported. Functions that involve **location** as parameters also comply with this rule. • When the GUC parameter **safe_data_path** is enabled, you can only use the advanced package to read and write files in the file path specified by **safe_data_path**.
src_file_name	Original file to be renamed
dest_dir	Destination directory (case-sensitive) **NOTE** • File directories need to be added to the system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist will be reported. Functions that involve **location** as parameters also comply with this rule. • When the GUC parameter **safe_data_path** is enabled, you can only use the advanced package to read and write files in the file path specified by **safe_data_path**.
dest_file_name	New file name
overwrite	The default value is **false**. If a file with the same name exists in the destination directory, the file will not be rewritten.

- DBE_FILE.COPY

  This stored procedure copies data in a continuous area to a new file. If **start_line** and **end_line** are omitted, the entire file is copied.

  The prototype of the **DBE_FILE.COPY** function is as follows:

```
DBE_FILE.COPY (
src_dir           IN     VARCHAR2,
src_file_name     IN     VARCHAR2,
dest_dir          IN     VARCHAR2,
dest_file_name    IN     VARCHAR2,
start_line        IN     INTEGER DEFAULT 1,
end_line          IN     INTEGER DEFAULT NULL);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-178 DBE_FILE.COPY interface parameters

Parameter	Description
src_dir	Directory of the original file **NOTE** • File directories need to be added to the system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist will be reported. Functions that involve **location** as parameters also comply with this rule. • When the GUC parameter **safe_data_path** is enabled, you can only use the advanced package to read and write files in the file path specified by **safe_data_path**.
src_file_name	File to be copied
dest_dir	Directory of the destination file **NOTE** • File directories need to be added to the system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist will be reported. Functions that involve **location** as parameters also comply with this rule. • When the GUC parameter **safe_data_path** is enabled, you can only use the advanced package to read and write files in the file path specified by **safe_data_path**.
dest_file_name	Destination file to which data is to be written **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
start_line	Number of the line where the copy starts. The default value is **1**.
end_line	Number of the line where the copy ends. The default value is **NULL**, indicating the end of the file.

- DBE_FILE.GET_ATTR

  This stored procedure reads and returns the attributes of a disk file.

  The prototype of the **DBE_FILE.GET_ATTR** function is as follows:

```
DBE_FILE.GET_ATTR(
location IN text,
filename IN text,
OUT fexists boolean,
OUT file_length bigint,
OUT block_size integer);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-179 DBE_FILE.GET_ATTR interface parameters

Parameter	Description
location	File directory **NOTE** • File directories need to be added to the system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist will be reported. Functions that involve **location** as parameters also comply with this rule. • When the GUC parameter **safe_data_path** is enabled, you can only use the advanced package to read and write files in the file path specified by **safe_data_path**.
filename	Name of the file to be checked
fexists	Whether the file exists
file_length	File length (unit: bytes). If the file does not exist, **NULL** is returned.
block_size	Block size of the file system (unit: byte). If the file does not exist, **NULL** is returned.

- DBE_FILE.SEEK

  This stored procedure adjusts the position of a file pointer forward or backward based on the specified number of bytes.

  The prototype of the **DBE_FILE.SEEK** function is as follows:

```
DBE_FILE.SEEK (
file            IN INTEGER,
absolute_start  IN     BIGINT DEFAULT NULL,
relative_start  IN     BIGINT DEFAULT NULL);
```

Table 13-180 DBE_FILE.SEEK interface parameters

Parameter	Description
file	Opened file handle
absolute_start	Absolute offset of a file. The default value is **NULL**.
relative_start	Relative offset of a file. A positive number indicates forward offset and a negative number indicates backward offset. The default value is **NULL**. If both **absolute_start** and this parameter are specified, the **absolute_start** parameter is used.

- DBE_FILE.GET_POS

  This function returns file offset in bytes.

  The prototype of the **DBE_FILE.FGETPOS** function is as follows:

```
DBE_FILE.GET_POS (
file    IN     INTEGER)
RETURN BIGINT;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-181 DBE_FILE.GET_POS interface parameters

Parameter	Description
file	Opened file handle

Examples

```
-- Add the /temp/ directory to the PG_DIRECTORY system catalog as a system administrator.
CREATE OR REPLACE DIRECTORY dir AS '/tmp/';
-- Open a file and write data into the file.
DECLARE
  f integer;
  dir text := 'dir';
BEGIN
  f := dbe_file.open(dir, 'sample.txt', 'w');
  PERFORM dbe_file.write_line(f, 'ABC');
  PERFORM dbe_file.write_line(f, '123'::numeric);
  PERFORM dbe_file.write_line(f, '-----');
  PERFORM dbe_file.new_line(f);
  PERFORM dbe_file.write_line(f, '*******');
  PERFORM dbe_file.new_line(f, 0);
  PERFORM dbe_file.write_line(f, '++++++++');
  PERFORM dbe_file.new_line(f, 2);
  PERFORM dbe_file.write_line(f, '########');
  PERFORM dbe_file.write(f, 'A');
  PERFORM dbe_file.write(f, 'B');
  PERFORM dbe_file.new_line(f);
  PERFORM dbe_file.format_write(f, '[1 -> %s, 2 -> %s, 3 -> %s, 4 -> %s, 5 -> %s]', 'gaussdb', 'dbe', 'file',
'get', 'line');
  PERFORM dbe_file.new_line(f);
  PERFORM dbe_file.write_line(f, '1234567890');
  f := dbe_file.close(f);
END;
/
-- Read data from the file mentioned above.
DECLARE
  f integer;
  dir text := 'dir';
BEGIN
  f := dbe_file.open(dir, 'sample.txt', 'r');
  FOR i IN 1..11 LOOP
       RAISE INFO '[%] : %', i, dbe_file.read_line(f);
  END LOOP;
END;
/
-- Offset the file handle and obtain the current file location.
DECLARE
      l_file   integer;
      l_buffer VARCHAR2(32767);
      dir text := 'dir';
      abs_offset number := 100;
      rel_offset number := NULL;
BEGIN
      l_file := dbe_file.open(dir  => dir,  file_name  => 'sample.txt',open_mode => 'R');
      dbe_output.print_line('before seek: current position is ' || dbe_file.get_pos(file => l_file)); -- before seek:
current position is 0
      dbe_file.seek(file => l_file, absolute_start=>abs_offset, relative_start=>rel_offset);
      dbe_output.print_line('fseek: current position is ' || dbe_file.get_pos(file => l_file)); -- seek: current
position is 100
      l_file := dbe_file.close(file => l_file);
END;
/
```

13.12.2.9 DBE_SESSION

Interface Description

Table 13-182 provides all interfaces supported by the **DBE_SESSION** package. **DBE_SESSION** takes effect at the session level.

Table 13-182 DBE_SESSION

Interface	Description
DBE_SESSION.SET_CONTEXT	Sets the value of an attribute in a specified context.
DBE_SESSION.CLEAR_CONTEXT	Clears the value of an attribute in a specified context.
DBE_SESSION.SEARCH_CONTEXT	Queries the value of an attribute in a specified context.

- DBE_SESSION.SET_CONTEXT

Sets the value of an attribute in a specified namespace (context). The **DBE_SESSION.SET_CONTEXT** function prototype is as follows:

```
DBE_SESSION.SET_CONTEXT(
    namespace text,
    attribute text,
    value text
)returns void;
```

Table 13-183 DBE_SESSION.SET_CONTEXT interface parameters

Parameter	Description
namespace	Name of the context to be set. If the context does not exist, create a context. The value contains a maximum of 128 characters.
attribute	Attribute name. The value contains a maximum of 128 characters.
value	Name of the value to be set. The value contains a maximum of 128 characters.

- DBE_SESSION.CLEAR_CONTEXT

Clears the value of an attribute in a specified namespace (context). The **DBE_SESSION.CLEAR_CONTEXT** function prototype is as follows:

```
DBE_SESSION.CLEAR_CONTEXT (
    namespace text,
    client_identifier text default 'null',
    attribute text
)returns void ;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-184 DBE_SESSION.CLEAR_CONTEXT interface parameters

Parameter	Description
namespace	User-specified context.
client_identifier	Client authentication. The default value is **null**. Generally, you do not need to manually set this parameter.
attribute	Attribute to be cleared.

- DBE_SESSION.SEARCH_CONTEXT

Queries the value of an attribute in a specified namespace (context). The **DBE_SESSION.SEARCH_CONTEXT** function prototype is:

```
DBE_SESSION.SEARCH_CONTEXT (
    namespace text,
    attribute text
)returns text;
```

Table 13-185 DBE_SESSION.SEARCH_CONTEXT interface parameters

Parameter	Description
namespace	User-specified context.
attribute	Attribute to be queried.

Example

```
BEGIN
    select DBE_SESSION.set_context('test', 'gaussdb', 'one');    -- Set the gaussdb attribute of the test context to one.
    select DBE_SESSION.search_context('test', 'gaussdb');
    select DBE_SESSION.clear_context('test', 'test','gaussdb');
END;
/
```

13.12.2.10 DBE_MATCH

Interface Description

Table 13-186 provides all interfaces supported by the **DBE_MATCH** package.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-186 DBE_MATCH

Interface	Description
DBE_MATCH.EDIT_DISTANCE_SIMILARITY	Compares the difference between two character strings (minimum steps of deletion, addition, and conversion) and normalizes the difference to a value ranging from 0 to 100. The value **100** indicates that the two character strings are the same, and the value **0** indicates that the two character strings are different.

- DBE_MATCH.EDIT_DISTANCE_SIMILARITY

Compares the difference between two character strings (minimum steps of deletion, addition, and conversion) and normalizes the difference to a value ranging from 0 to 100. The value **100** indicates that the two character strings are the same, and the value **0** indicates that the two character strings are different. The **DBE_MATCH.EDIT_DISTANCE_SIMILARITY** function prototype is as follows:

```
DBE_MATCH.EDIT_DISTANCE_SIMILARITY(
    str1 IN text,
    str2 IN text
)returns integer ;
```

Table 13-187 DBE_MATCH.EDIT_DISTANCE_SIMILARITY interface parameters

Parameter	Description
str1	First character string. If the value is **null**, **0** is returned.
str2	Second character string. If the value is **null**, **0** is returned.

13.12.2.11 DBE_SCHEDULER

Interface Description

The advanced package **DBE_SCHEDULER** supports more flexible creation of scheduled tasks through scheduling and programing. For details about all the supported interfaces, see **Table 13-188**.

NOTICE

The DBE_SCHEDULER does not support scheduled tasks for synchronizing data between nodes. To create scheduled tasks for multiple nodes, use the **DBE_TASK** API.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-188 DBE_SCHEDULER

Interface	Description
•CREATE_JOB	Creates a scheduled task.
•DROP_JOB	Deletes a scheduled task.
•DROP_SINGLE_JOB	Deletes a single scheduled task.
•SET_ATTRIBUTE	Sets object attributes.
•RUN_JOB	Executes a scheduled task.
•RUN_BACKEND_JOB	Runs a scheduled task in the background.
•RUN_FOREGROUND_JOB	Runs a scheduled task in the foreground.
•STOP_JOB	Stops a scheduled task.
•STOP_SINGLE_JOB	Stops a single scheduled task.
•GENERATE_JOB_NAME	Generates the name of a scheduled task.
•CREATE_PROGRAM	Creates a program.
•DEFINE_PROGRAM_ARGUMENT	Defines program parameters.
•DROP_PROGRAM	Deletes a program.
•DROP_SINGLE_PROGRAM	Deletes a single program.
•SET_JOB_ARGUMENT_VALUE	Sets the parameters of a scheduled task.
•CREATE_SCHEDULE	Creates a schedule.
•DROP_SCHEDULE	Deletes a schedule.
•DROP_SINGLE_SCHEDULE	Deletes a single schedule.
•CREATE_JOB_CLASS	Creates the class of a scheduled task.
•DROP_JOB_CLASS	Deletes the class of a scheduled task.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Interface	Description
•DROP_SINGLE_JOB_CLASS	Deletes the class of a single scheduled task.
•GRANT_USER_AUTHORIZATIO...	Grants special permissions to a user.
•REVOKE_USER_AUTHORIZATI...	Revokes special permissions from a user.
•CREATE_CREDENTIAL	Creates a certificate.
•DROP_CREDENTIAL	Destroys a certificate.
•ENABLE	Enables an object.
•ENABLE_SINGLE	Enables a single object.
•DISABLE	Disables an object.
•DISABLE_SINGLE	Disables a single object.
•EVAL_CALENDAR_STRING	Analyzes character strings in the Calendar format.
•EVALUATE_CALENDAR_STRIN...	Analyzes character strings in the Calendar format.

- DBE_SCHEDULER.CREATE_JOB

  Creates a scheduled task.

  The prototypes of the **DBE_SCHEDULER.CREATE_JOB** function are as follows:

```
-- Scheduled tasks of an inline schedule and a program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
job_type TEXT,
job_action TEXT,
number_of_arguments INTEGER             DEFAULT 0,
start_date TIMESTAMP WITH TIME ZONE     DEFAULT NULL,
repeat_interval TEXT                    DEFAULT NULL,
end_date TIMESTAMP WITH TIME ZONE       DEFAULT NULL,
job_class TEXT          DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN                         DEFAULT FALSE,
auto_drop BOOLEAN                       DEFAULT TRUE,
comments TEXT                           DEFAULT NULL,
credential_name TEXT                    DEFAULT NULL,
destination_name TEXT                   DEFAULT NULL
)

-- Reference the created scheduled tasks of the schedule and the program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
program_name TEXT,
schedule_name TEXT,
job_class TEXT          DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN                         DEFAULT FALSE,
auto_drop BOOLEAN                       DEFAULT TRUE,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
comments TEXT                       DEFAULT NULL,
job_style TEXT                     DEFAULT 'REGULAR',
credential_name TEXT               DEFAULT NULL,
destination_name TEXT              DEFAULT NULL
)

-- Reference the created program and the scheduled task of the inline schedule.
DBE_SCHEDULER.CREATE_JOB(
job_name text,
program_name TEXT,
start_date TIMESTAMP WITH TIME ZONE     DEFAULT NULL,
repeat_interval TEXT                DEFAULT NULL,
end_date TIMESTAMP WITH TIME ZONE       DEFAULT NULL,
job_class TEXT          DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN                     DEFAULT FALSE,
auto_drop BOOLEAN                   DEFAULT TRUE,
comments TEXT                       DEFAULT NULL,
job_style TEXT                     DEFAULT 'REGULAR',
credential_name TEXT               DEFAULT NULL,
destination_name TEXT              DEFAULT NULL
)

-- Reference the created schedule and the scheduled task of the inline program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
schedule_name TEXT,
job_type TEXT,
job_action TEXT,
number_of_arguments INTEGER          DEFAULT 0,
job_class TEXT          DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN                     DEFAULT FALSE,
auto_drop BOOLEAN                   DEFAULT TRUE,
comments TEXT                      DEFAULT NULL,
credential_name TEXT               DEFAULT NULL,
destination_name TEXT              DEFAULT NULL
)
```

NOTE

The scheduled task created through **DBE_SCHEDULER** does not conflict with the scheduled task in **DBE_TASK**.

The scheduled task created by **DBE_SCHEDULER** generates the corresponding **job_id**. However, the **job_id** is meaningless.

Table 13-189 DBE_SCHEDULER.CREATE_JOB interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Name of a scheduled task.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_type	text	IN	No	Inline program type of a scheduled task. The options are as follows: **PLSQL_BLOCK**: fast anonymous stored procedure **STORED_PROCEDURE**: stored procedure that is saved **EXTERNAL_SCRIPT**: external script
job_action	text	IN	No	Content executed by an inline program of a scheduled task.
number_of_arguments	integer	IN	No	Number of inline program parameters of a scheduled task.
program_name	text	IN	No	Name of the program referenced by a scheduled task.
start_date	timestamp with time zone	IN	Yes	Inline scheduling start time of a scheduled task.
repeat_interval	text	IN	Yes	Inline scheduling period of a scheduled task.
end_date	timestamp with time zone	IN	Yes	Inline scheduling expiration time of a scheduled task.
schedule_name	text	IN	No	Name of the schedule referenced by a scheduled task.
job_class	text	IN	No	Class name of a scheduled task.
enabled	boolean	IN	No	Status of a scheduled task.
auto_drop	boolean	IN	No	Automatic deletion of a scheduled task.
comments	text	IN	Yes	Comments.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_style	text	IN	No	Behavior pattern of a scheduled task. Only **REGULAR** is supported.
credential_name	text	IN	Yes	Certificate name of a scheduled task.
destination_name	text	IN	Yes	Target name of a scheduled task.

NOTICE

To create a scheduled task of the EXTERNAL_SCRIPT type, the administrator must assign related permissions and certificates and the user who starts the database must have the read permission on the external script.

- DBE_SCHEDULER.DROP_JOB

  Deletes a scheduled task.

  The prototype of the **DBE_SCHEDULER.DROP_JOB** function is as follows:

```
DBE_SCHEDULER.drop_job(
job_name text,
force boolean                   default false,
defer boolean                   default false,
commit_semantics text      default 'STOP_ON_FIRST_ERROR'
)
```

  NOTE

  DBE_SCHEDULER.DROP_JOB can specify one or more tasks, or specify a task class to delete a scheduled task.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-190 DBE_SCHEDULER.DROP_JOB interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Name or class of a scheduled task. You can specify one or more scheduled tasks. If you specify multiple scheduled tasks, separate them with commas (,).
force	boolean	IN	No	Specifies whether to delete a scheduled task. **true**: The current scheduled task is stopped and then deleted. **false**: The scheduled task fails to be deleted if it is running.
defer	boolean	IN	No	Specifies whether to delete a scheduled task. **true**: A scheduled task can be deleted after it is complete.
commit_semantics	text	IN	No	Commit rules: **STOP_ON_FIRST_ERROR**: The deletion operation performed before the first error is reported is committed. **TRANSACTIONAL**: Transaction-level commit. The deletion operation performed before an error is reported will be rolled back. **ABSORB_ERRORS**: Attempt to bypass an error and commit the deletion operation that is performed successfully.

NOTICE

The **TRANSACTIONAL** option in **commit_semantic** takes effect only when **force** is set to **false**.

- DBE_SCHEDULER.DROP_SINGLE_JOB

  Deletes a scheduled task.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the **DBE_SCHEDULER.DROP_SINGLE_JOB** function is as follows:

```
DBE_SCHEDULER.drop_single_job(
job_name text,
force boolean                   default false,
defer boolean                   default false
)
```

- DBE_SCHEDULER.SET_ATTRIBUTE

  Modifies the attributes of a scheduled task.

  The prototypes of the **DBE_SCHEDULER.SET_ATTRIBUTE** function are as follows:

```
DBE_SCHEDULER.set_attribute(
name              text,
attribute         text,
value             boolean
)

DBE_SCHEDULER.set_attribute(
name              text,
attribute         text,
value             text
)

DBE_SCHEDULER.set_attribute(
name              text,
attribute         text,
value             timestamp
)

DBE_SCHEDULER.set_attribute(
name              text,
attribute         text,
value             timestamp with time zone
)

DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value text,
value2 text                     default NULL
)
```

  NOTE

  name specifies any object in **DBE_SCHEDULE**.

Table 13-191 DBE_SCHEDULER.SET_ATTRIBUTE interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	text	IN	No	Object name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
attribute	text	IN	No	Attribute name.
value	boolean/date/timestamp/timestamp with time zone/text	IN	No	Attribute value. The options are as follows: Scheduled task-related: job_type, job_action, number_of_arguments, start_date, repeat_interval, end_date, job_class, enabled, auto_drop, comments, credential_name, destination_name, program_name, schedule_name, job_style Scheduling-related: program_action, program_type, number_of_arguments, comments Program-related: start_date, repeat_interval, end_date, comments
value2	text	IN	Yes	Additional attribute value. Reserved parameter bit. Currently, the target attribute with extra attribute values is not supported.

NOTICE

Do not use **DBE_SCHEDULER.SET_ATTRIBUTE** to leave the parameters empty.

The object name cannot be changed using **DBE_SCHEDULER.SET_ATTRIBUTE**.

Inline objects cannot be changed by DBE_SCHEDULER.SET_ATTRIBUTE.

- DBE_SCHEDULER.RUN_JOB

  Executes a scheduled task.

  The prototype of the **DBE_SCHEDULER.RUN_JOB** function is as follows:

```
DBE_SCHEDULER.run_job(
job_name text,
use_current_session boolean          default true
)
```

NOTE

DBE_SCHEDULER.RUN_JOB is used to run scheduled tasks immediately. It is independent of the scheduling of scheduled tasks and can even run at the same time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-192 DBE_SCHEDULER.RUN_JOB interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Name of a scheduled task. You can specify one or more scheduled tasks. If you specify multiple scheduled tasks, separate them with commas (,).
use_current_session	boolean	IN	No	Specifies whether to run a scheduled task. **true**: Use the current session to check whether the scheduled task can run properly. **false**: Start the scheduled task in the background. The execution result is recorded in logs.

NOTICE

Currently, **use_current_session** applies only to scheduled tasks whose **job_type** is set to **EXTERNAL_SCRIPT**.

- DBE_SCHEDULER.RUN_BACKEND_JOB

  Runs a scheduled task in the background.

  The prototype of the **DBE_SCHEDULER.RUN_BACKEND_JOB** function is as follows:

  ```
  DBE_SCHEDULER.run_backend_job(
  job_name text
  )
  ```

- DBE_SCHEDULER.RUN_FOREGROUND_JOB

  Executes a scheduled task in the current session.

  Only external tasks can be executed.

  Return value: text

  The prototype of the **DBE_SCHEDULER.RUN_FOREGROUND_JOB** function is as follows:

  ```
  DBE_SCHEDULER.run_foreground_job(
  job_name text
  )return text
  ```

- DBE_SCHEDULER.STOP_JOB

  Stops a scheduled task.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the **DBE_SCHEDULER.STOP_JOB** function is as follows:

```
DBE_SCHEDULER.stop_job(
job_name text,
force boolean                   default false,
commit_semantics text               default 'STOP_ON_FIRST_ERROR'
)
```

Table 13-193 DBE_SCHEDULER.STOP_JOB interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Name or class of a scheduled task. You can specify one or more scheduled tasks. If you specify multiple scheduled tasks, separate them with commas (,).
force	boolean	IN	No	Specifies whether to delete a scheduled task. **true**: The scheduler sends a termination signal to end the task thread immediately. **false**: The scheduler attempts to use the interrupt signal to terminate the scheduled task thread.
commit_semantics	text	IN	No	Commit rules: '**STOP_ON_FIRST_ERROR**': The interrupt operation performed before the first error is reported is committed. '**ABSORB_ERRORS**': The system attempts to bypass an error and commit the interrupt operation that is performed successfully.

- DBE_SCHEDULER.STOP_SINGLE_JOB

  Stops a single scheduled task.

  The prototype of the **DBE_SCHEDULER.STOP_SINGLE_JOB** function is as follows:

  ```
  DBE_SCHEDULER.stop_single_job(
  job_name text,
  force boolean                   default false
  )
  ```

- DBE_SCHEDULER.GENERATE_JOB_NAME

  Generates the name of a scheduled task.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the **DBE_SCHEDULER.GENERATE_JOB_NAME** function is as follows:

```
DBE_SCHEDULER.generate_job_name(
prefix text                    default 'JOB$_'
)return text
```

Table 13-194 DBE_SCHEDULER.GENERATE_JOB_NAME interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
prefix	text	IN	No	Prefix of the generated name. The default value is **'JOB$_'**. Scheduled tasks that are repeatedly executed are named as follows: job$_1, job$_2, job$_3 ...

NOTICE

When DBE_SCHEDULER.GENERATE_JOB_NAME is executed for the first time, a temporary sequence is created in **public** to store the sequence number of the current name. A common user does not have the create permission in **public**. Therefore, if a common user calls the function for the first time in the current database, the function fails to be called. In this case, you need to grant the create permission in **public** to the common user or call the API as a user with the create permission to create a temporary sequence.

- DBE_SCHEDULER.CREATE_PROGRAM

  Creates a program.

  The prototype of the **DBE_SCHEDULER.CREATE_PROGRAM** function is as follows:

  ```
  DBE_SCHEDULER.create_program(
  program_name text,
  program_type text,
  program_action text,
  number_of_arguments integer          default 0,
  enabled boolean                   default false,
  comments text                     default NULL
  )
  ```

- DBE_SCHEDULER.DEFINE_PROGRAM_ARGUMENT

  Defines program parameters.

  The **DBE_SCHEDULER.DEFINE_PROGRAM_ARGUMENT** function prototype is as follows:

  ```
  DBE_SCHEDULER.define_program_argument(
  program_name text,
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
argument_position integer,
argument_name text                  default NULL,
argument_type text,
out_argument boolean                default false
)

-- With a default value --
DBE_SCHEDULER.define_program_argument(
program_name text,
argument_position integer,
argument_name text                  default NULL,
argument_type text,
default_value text,
out_argument boolean                default false
)
```

- DBE_SCHEDULER.DROP_PROGRAM

  Deletes a program.

  The prototype of the **DBE_SCHEDULER.DROP_PROGRAM** function is as follows:

  ```
  DBE_SCHEDULER.drop_program(
  program_name text,
  force boolean                     default false
  )
  ```

- DBE_SCHEDULER.DROP_SINGLE_PROGRAM

  Deletes a single program.

  The prototype of the **DBE_SCHEDULER.DROP_SINGLE_PROGRAM** function is as follows:

  ```
  DBE_SCHEDULER.drop_single_program(
  program_name text,
  force boolean                     default false
  )
  ```

- DBE_SCHEDULER.SET_JOB_ARGUMENT_VALUE

  Sets the parameters of a scheduled task.

  The prototype of the **DBE_SCHEDULER.SET_JOB_ARGUMENT_VALUE** function is as follows:

  ```
  DBE_SCHEDULER.set_job_argument_value(
  job_name text,
  argument_position integer,
  argument_value text
  )

  DBE_SCHEDULER.set_job_argument_value(
  job_name text,
  argument_name text,
  argument_value text
  )
  ```

- DBE_SCHEDULER.CREATE_SCHEDULE

  Creates a schedule.

  The prototype of the **DBE_SCHEDULER.CREATE_SCHEDULE** function is as follows:

  ```
  DBE_SCHEDULER.create_schedule(
  schedule_name text,
  start_date timestamp with time zone     default NULL,
  repeat_interval text,
  end_date timestamp with time zone       default NULL,
  comments text                       default NULL
  )
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_SCHEDULER.DROP_SCHEDULE

  Deletes a schedule.

  The prototype of the **DBE_SCHEDULER.DROP_SCHEDULE** function is as follows:

  ```
  DBE_SCHEDULER.drop_schedule(
  schedule_name text,
  force boolean                   default false
  )
  ```

- DBE_SCHEDULER.DROP_SINGLE_SCHEDULE

  Deletes a single schedule.

  The prototype of the **DBE_SCHEDULER.DROP_SINGLE_SCHEDULE** function is as follows:

  ```
  DBE_SCHEDULER.drop_single_schedule(
  schedule_name text,
  force boolean                   default false
  )
  ```

- DBE_SCHEDULER.CREATE_JOB_CLASS

  Creates the class of a scheduled task.

  The prototype of the **DBE_SCHEDULER.CREATE_JOB_CLASS** function is as follows:

  ```
  DBE_SCHEDULER.create_job_class(
  job_class_name text,
  resource_consumer_group text          default NULL,
  service text                        default NULL,
  logging_level integer                 default 0,
  log_history integer                   default NULL,
  comments text                         default NULL
  )
  ```

- DBE_SCHEDULER.DROP_JOB_CLASS

  Deletes the class of a scheduled task.

  The prototype of the **DBE_SCHEDULER.DROP_JOB_CLASS** function is as follows:

  ```
  DBE_SCHEDULER.drop_job_class(
  job_class_name text,
  force boolean                   default false
  )
  ```

- DBE_SCHEDULER.DROP_SINGLE_JOB_CLASS

  Deletes the class of a single scheduled task.

  The prototype of the **DBE_SCHEDULER.DROP_SINGLE_JOB_CLASS** function is as follows:

  ```
  DBE_SCHEDULER.drop_single_job_class(
  job_class_name text,
  force boolean                   default false
  )
  ```

- DBE_SCHEDULER.GRANT_USER_AUTHORIZATION

  Grants the scheduled task permissions to the database user. The user who calls this function must have the SYSADMIN permission.

  The prototype of the **DBE_SCHEDULER.GRANT_USER_AUTHORIZATION** function is as follows:

  ```
  DBE_SCHEDULER.grant_user_authorization(
  username            text,
  privilege           text
  )
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_SCHEDULER.REVOKE_USER_AUTHORIZATION

  Revokes the scheduled task permissions from the database user. The user who calls this function must have the SYSADMIN permission.

  The prototype of the **DBE_SCHEDULER.REVOKE_USER_AUTHORIZATION** function is as follows:

  ```
  DBE_SCHEDULER.revoke_user_authorization(
  username              text,
  privilege             text
  )
  ```

- DBE_SCHEDULER.CREATE_CREDENTIAL

  Creates an authorization certificate. The user who calls this function must have the SYSADMIN permission.

  The prototype of the **DBE_SCHEDULER.CREATE_CREDENTIAL** function is as follows:

  ```
  DBE_SCHEDULER.create_credential(
  credential_name       text,
  username              text,
  password              text          default NULL,
  database_role         text          default NULL,
  windows_domain        text          default NULL,
  comments              text          default NULL
  )
  ```

NOTICE

The **password** parameter of **DBE_SCHEDULER.CREATE_CREDENTIAL** must be set to **NULL** or **'******'**. This parameter is used only for compatibility and does not indicate any actual meaning. Do not use the OS username corresponding to the installation user to create a certificate.

- DBE_SCHEDULER.DROP_CREDENTIAL

  Destroys an authorization certificate. The user who calls this function must have the SYSADMIN permission.

  The prototype of the **DBE_SCHEDULER.DROP_CREDENTIAL** function is as follows:

  ```
  DBE_SCHEDULER.drop_credential(
  credential_name       text,
  force boolean default false
  )
  ```

- DBE_SCHEDULER.ENABLE

  Enables an object.

  The prototype of the **DBE_SCHEDULER.ENABLE** function is as follows:

  ```
  DBE_SCHEDULER.enable(
  name text,
  commit_semantics text                 default 'STOP_ON_FIRST_ERROR'
  )
  ```

- DBE_SCHEDULER.ENABLE_SINGLE

  Enables a single object.

  The prototype of the **DBE_SCHEDULER.ENABLE_SINGLE** function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_SCHEDULER.enable_single(
name text
)
```

- DBE_SCHEDULER.DISABLE

  Disables multiple objects. The value of name is a character string separated by commas (,). Each character string separated by commas (,) is an object.

  The prototype of the **DBE_SCHEDULER.DISABLE** function is as follows:

```
DBE_SCHEDULER.disable(
name text,
force boolean                   default false,
commit_semantics text               default 'STOP_ON_FIRST_ERROR'
)
```

- DBE_SCHEDULER.DISABLE_SINGLE

  Disables a single object.

  The prototype of the **DBE_SCHEDULER.DISABLE_SINGLE** function is as follows:

```
DBE_SCHEDULER.disable_single(
name text,
force boolean                   default false
)
```

- DBE_SCHEDULER.EVAL_CALENDAR_STRING

  Analyzes the scheduling task period.

  Return type: timestamp with time zone

  The prototype of the **DBE_SCHEDULER.EVAL_CALENDAR_STRING** function is as follows:

```
DBE_SCHEDULER.evaluate_calendar_string(
IN calendar_string text,
IN start_date timestamp with time zone,
IN return_date_after timestamp with time zone
)return timestamp with time zone
```

- DBE_SCHEDULER.EVALUATE_CALENDAR_STRING

  Analyzes the scheduling task period.

  The prototype of the **DBE_SCHEDULER.EVALUATE_CALENDAR_STRING** function is as follows:

```
DBE_SCHEDULER.evaluate_calendar_string(
IN calendar_string text,
IN start_date timestamp with time zone,
IN return_date_after timestamp with time zone,
OUT next_run_date timestamp with time zone
)return timestamp with time zone
```

13.12.2.12 DBE_APPLICATION_INFO

Interface Description

Table 13-195 provides all interfaces supported by the **DBE_APPLICATION_INFO** package. **DBE_APPLICATION_INFO** applies to the current session.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-195 DBE_APPLICATION_INFO

Interface	Description
DBE_APPLICATION_INFO.SET_CLIENT_INFO	Writes client information.
DBE_APPLICATION_INFO.READ_CLIENT_INFO	Reads client information.

- DBE_APPLICATION_INFO.SET_CLIENT_INFO

Writes client information. The **DBE_APPLICATION_INFO.SET_CLIENT_INFO** function prototype is as follows:

```
DBE_APPLICATION_INFO.SET_CLIENT_INFO(
   str text
)returns void;
```

Table 13-196 DBE_APPLICATION_INFO.SET_CLIENT_INFO interface parameters

Parameter	Description
str	Writes client information.

- DBE_APPLICATION_INFO.READ_CLIENT_INFO

The **DBE_APPLICATION_INFO.READ_CLIENT_INFO** function prototype is as follows:

```
DBE_APPLICATION_INFO.READ_CLIENT_INFO(
 OUT client_info text);
```

Table 13-197 DBE_APPLICATION_INFO.READ_CLIENT_INFO interface parameters

Parameter	Description
client_info	Client information

13.13 Retry Management

Retry is a process in which the database executes a SQL statement or stored procedure (including anonymous block) again in the case of execution failure, improving the execution success rate and user experience. The database checks the error code and retry configuration to determine whether to retry.

- If the execution fails, the system rolls back the executed statements and executes the stored procedure again.

  Example:

  ```
  openGauss=# CREATE OR REPLACE PROCEDURE retry_basic ( IN  x INT)
  AS
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
BEGIN
    INSERT INTO t1 (a) VALUES (x);
    INSERT INTO t1 (a) VALUES (x+1);
END;
/

openGauss=# CALL retry_basic(1);
```

13.14 Debugging

Syntax

RAISE has the following five syntax formats:

Figure 13-34 raise_format::=

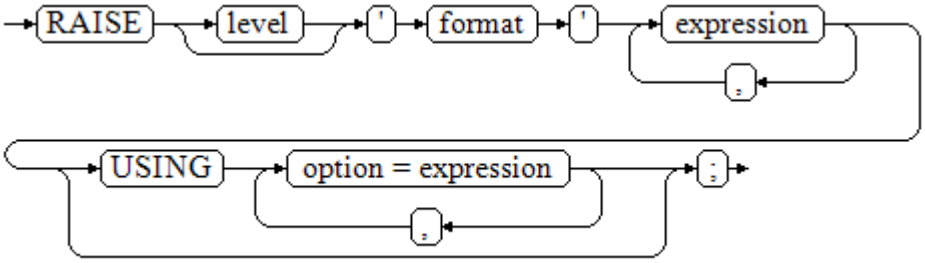

Figure 13-35 raise_condition::=

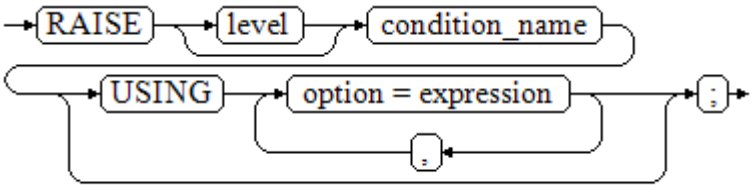

Figure 13-36 raise_sqlstate::=

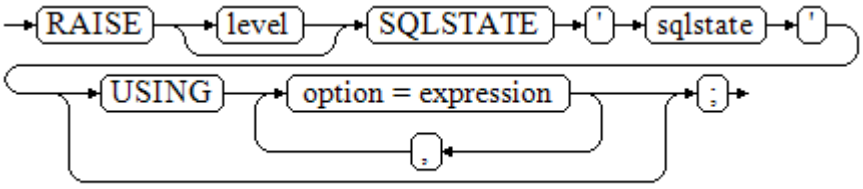

Figure 13-37 raise_option::=

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 13-38 raise::=

Parameter description:

- The level option is used to specify the error level, that is, **DEBUG**, **LOG**, **INFO**, **NOTICE**, **WARNING**, or **EXCEPTION** (default value). **EXCEPTION** throws an error that normally terminates the current transaction and the others only generate information at their levels. The **log_min_messages** and **client_min_messages** parameters control whether the error messages of specific levels are reported to the client and are written to the server log.
- **format**: specifies the error message text to be reported. It is a format string that can be appended with an expression for insertion to the message text. In a format string, **%** is replaced by the parameter value attached to format and **%%** is used to print **%**. For example:

```
--v_job_id replaces % in the string.
RAISE NOTICE 'Calling cs_create_job(%)',v_job_id;
```

- **option = expression**: inserts additional information to an error report. The keyword option can be **MESSAGE**, **DETAIL**, **HINT**, or **ERRCODE**, and each expression can be any string.
  - **MESSAGE**: specifies the error message text. This option cannot be used in a **RAISE** statement that contains a format character string in front of **USING**.
  - **DETAIL**: specifies detailed information of an error.
  - **HINT**: outputs hint information.
  - **ERRCODE**: designates an error code (**SQLSTATE**) to a report. A condition name or a five-character **SQLSTATE** error code can be used.
- **condition_name**: specifies the condition name corresponding to the error code.
- **sqlstate**: specifies the error code.

If neither a condition name nor **SQLSTATE** is specified in a **RAISE EXCEPTION** command, the **RAISE EXCEPTION (P0001)** is used by default. If no message text is designated, the condition name or **SQLSTATE** is used as the message text by default.

NOTICE

- If **SQLSTATE** designates an error code, the error code is not limited to a defined error code. It can be any error code containing five digits or ASCII (uppercase) rather than **00000**. Do not use an error code ended with three zeros because error codes of this kind are type codes and can be captured by the whole category.
- In O-compatible mode, SQLCODE is equivalent to SQLSTATE.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The syntax described in **Figure 13-38** does not append any parameter. This form is used only for the **EXCEPTION** statement in a **BEGIN** block so that the error can be re-processed.

Examples

Display error and hint information when a transaction terminates:

```
CREATE OR REPLACE PROCEDURE proc_raise1(user_id in integer)
AS
BEGIN
RAISE EXCEPTION 'Noexistence ID --> %',user_id USING HINT = 'Please check your user ID';
END;
/

call proc_raise1(300011);

-- Execution result
ERROR:  Noexistence ID --> 300011
HINT:  Please check your user ID
```

Two methods are available for setting **SQLSTATE**:

```
CREATE OR REPLACE PROCEDURE proc_raise2(user_id in integer)
AS
BEGIN
RAISE 'Duplicate user ID: %',user_id USING ERRCODE = 'unique_violation';
END;
/

\set VERBOSITY verbose
call proc_raise2(300011);

-- Execution result
ERROR:  Duplicate user ID: 300011
SQLSTATE: 23505
```

If the main parameter is a condition name or **SQLSTATE**, the following applies:

RAISE division_by_zero;

RAISE SQLSTATE '22012';

Example:

```
CREATE OR REPLACE PROCEDURE division(div in integer, dividend in integer)
AS
DECLARE
res int;
    BEGIN
    IF dividend=0 THEN
        RAISE division_by_zero;
        RETURN;
    ELSE
        res := div/dividend;
        RAISE INFO 'division result: %', res;
        RETURN;
    END IF;
    END;
/
call division(3,0);

-- Execution result
ERROR:  division_by_zero
```

Alternatively:

```
RAISE unique_violation USING MESSAGE = 'Duplicate user ID: ' || user_id;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

14 Autonomous Transaction

An autonomous transaction is an independent transaction that is started during the execution of a primary transaction. Committing and rolling back an autonomous transaction does not affect the data that has been committed by the primary transaction. In addition, an autonomous transaction is not affected by the primary transaction.

Autonomous transactions are defined in stored procedures, functions, and anonymous blocks, and are declared using the **PRAGMA AUTONOMOUS_TRANSACTION** keyword.

14.1 Stored Procedure Supporting Autonomous Transaction

An autonomous transaction can be defined in a stored procedure. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a stored procedure. The following is an example.

```
-- Create a table.
create table t2(a int, b int);
insert into t2 values(1,2);
select * from t2;

-- Create a stored procedure that contains an autonomous transaction.
CREATE OR REPLACE PROCEDURE autonomous_4(a int, b int)  AS
DECLARE
    num3 int := a;
    num4 int := b;
    PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
    insert into t2 values(num3, num4);
    dbe_output.print_line('just use call.');
END;
/
-- Create a common stored procedure that invokes an autonomous transaction stored procedure.
CREATE OR REPLACE PROCEDURE autonomous_5(a int, b int)  AS
DECLARE
BEGIN
    dbe_output.print_line('just no use call.');
    insert into t2 values(666, 666);
    autonomous_4(a,b);
    rollback;
END;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
/
-- Invoke a common stored procedure.
select autonomous_5(11,22);
-- View the table result.
select * from t2 order by a;
```

In the preceding example, a stored procedure containing an autonomous transaction is finally executed in a transaction block to be rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by the autonomous transaction.

14.2 Anonymous Block Supporting Autonomous Transaction

An autonomous transaction can be defined in an anonymous block. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating an anonymous block. The following is an example.

```
create table t1(a int ,b text);

START TRANSACTION;
DECLARE
   PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
   dbe_output.print_line('just use call.');
   insert into t1 values(1,'you are so cute,will commit!');
END;
/
insert into t1 values(1,'you will rollback!');
rollback;

select * from t1;
```

In the preceding example, an anonymous block containing an autonomous transaction is finally executed before a transaction block to be rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by the autonomous transaction.

14.3 Function Supporting Autonomous Transaction

An autonomous transaction can be defined in a function. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a function. The following is an example.

```
create table t4(a int, b int, c text);

CREATE OR REPLACE function autonomous_32(a int ,b int ,c text) RETURN int AS
DECLARE
   PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
   insert into t4 values(a, b, c);
   return 1;
END;
/
CREATE OR REPLACE function autonomous_33(num1 int) RETURN int AS
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DECLARE
    num3 int := 220;
    tmp int;
    PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
    num3 := num3/num1;
    return num3;
EXCEPTION
    WHEN division_by_zero THEN
        select autonomous_32(num3, num1, sqlerrm) into tmp;
        return 0;
END;
/

select autonomous_33(0);

select * from t4;
```

14.4 Restrictions

CAUTION

When an autonomous transaction is executed, an autonomous transaction session is started in the background. You can use **max_concurrent_autonomous_transactions** to set the maximum number of concurrent autonomous transactions. The value range is 0 to 1024.

Default value: **10**

When **max_concurrent_autonomous_transactions** is set to **0**, autonomous transactions cannot be executed.

After a new session is started for an autonomous transaction, the default session parameters are used and objects (including session-level variables, local temporary variables, and global temporary table data) of the primary session are not shared.

- A trigger function does not support autonomous transactions.

```
CREATE TABLE test_trigger_des_tbl(id1 INT, id2 INT, id3 INT);

CREATE OR REPLACE FUNCTION tri_insert_func() RETURNS TRIGGER AS
$$
DECLARE
 PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
INSERT INTO test_trigger_des_tbl VALUES(NEW.id1, NEW.id2, NEW.id3);
RETURN NEW;
END
$$ LANGUAGE PLPGSQL;
```

- Autonomous transactions cannot be invoked by non-top-layer anonymous blocks (but can only be invoked by top-layer autonomous transactions, including stored procedures, functions, and anonymous blocks).

```
create table t1(a int ,b text);

DECLARE
 --PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
 DECLARE
  PRAGMA AUTONOMOUS_TRANSACTION;
 BEGIN
  dbe_output.print_line('just use call.');
  insert into t1 values(1,'can you rollback!');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 END;
 insert into t1 values(2,'I will rollback!');
 rollback;
END;
/

select * from t1;
```

- Autonomous transactions do not support **ref_cursor** parameter transfer.

```
create table sections(section_ID int);
insert into sections values(1);
insert into sections values(1);
insert into sections values(1);
insert into sections values(1);

CREATE OR REPLACE function proc_sys_ref()
return SYS_REFCURSOR
IS
declare
  PRAGMA AUTONOMOUS_TRANSACTION;
        C1 SYS_REFCURSOR;
BEGIN
 OPEN C1 FOR SELECT section_ID FROM sections ORDER BY section_ID;
 return C1;
END;
/

CREATE OR REPLACE function proc_sys_ref(OUT C2 SYS_REFCURSOR, OUT a int)
return SYS_REFCURSOR
IS
declare
  PRAGMA AUTONOMOUS_TRANSACTION;
        C1 SYS_REFCURSOR;
BEGIN
 OPEN C1 FOR SELECT section_ID FROM sections ORDER BY section_ID;
 return C1;
END;
/
```

- Distributed autonomous transactions of the IMMUTABLE and STABLE types cannot be pushed down.

```
CREATE OR REPLACE procedure autonomous_test_in_p_116(num1 int )
IMMUTABLE
AS
DECLARE
PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
perform pg_sleep(1);
END;
/

CREATE OR REPLACE procedure autonomous_test_in_p_117(num1 int ) STABLE AS
DECLARE
PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
perform pg_sleep(1);
END;
/
```

- The distributed system does not support detection. When a deadlock occurs, a lock waiting timeout error is reported.

```
create table test_lock (id int,a date);
insert into test_lock values (10,sysdate),(11,sysdate),(12,sysdate);
CREATE OR REPLACE FUNCTION autonomous_test_lock(num1 int,num2 int) RETURNS
integer LANGUAGE plpgsql AS $$
DECLARE num3 int := 4;
PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
update test_lock set a=sysdate where id =11;
RETURN num1+num2+num3;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
END;
$$;
start transaction;
update test_lock set a=sysdate where id =11;
call autonomous_test_lock(1,1);
END;
```

- Autonomous transaction functions only return records in the out format.
- The isolation level of an autonomous transaction cannot be changed.
- Autonomous transactions do not support the **setof** return type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15 System Catalogs and System Views

15.1 Overview of System Catalogs and System Views

System catalogs store the structured metadata of GaussDB. They are the source of information used by GaussDB to control system running and are a core component of the database system.

System views provide ways to query the system catalogs and internal database status.

System catalogs and views are visible to either system administrators or all users. Some system catalogs and views have marked the need of administrator permissions, so they are accessible only to administrators.

You can delete and re-create system catalogs, add columns to them, and insert and update values in them, but doing so may make system information inconsistent and cause system faults. Generally, users should not modify system catalogs or system views, or rename their schemas. They are automatically maintained by the system.

NOTICE

- You are not advised to modify the permissions on system catalogs or system views.
- Do not add, delete, or modify system catalogs because doing so will result in exceptions or even cluster unavailability.
- The **gs_package** system catalog is used only in a centralized system. It can be queried in a distributed system but is meaningless.
- For details about field types in system catalogs and system views, see section **Data Type**.

15.2 System Catalogs

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.2.1 GS_AUDITING_POLICY

GS_AUDITING_POLICY records the main information about the unified audit. Each record corresponds to a design policy. Only the system administrator or security policy administrator can access this system catalog.

Table 15-1 GS_AUDITING_POLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
polname	name	Policy name, which must be unique
polcomments	name	Policy description field, which records policy-related description information and is represented by the **COMMENTS** keyword
modifydate	timestamp without time zone	The latest timestamp when a policy is created or modified
polenabled	boolean	Specifies whether to enable the policy. • **t** (true): enabled. • **f** (false): disabled.

15.2.2 GS_AUDITING_POLICY_ACCESS

GS_AUDITING_POLICY_ACCESS records the DML database operations about the unified audit. Only the system administrator or security policy administrator can access this system catalog.

Table 15-2 GS_AUDITING_POLICY_ACCESS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
accesstype	name	DML database operation type. For example, SELECT, INSERT, and DELETE.
labelname	name	Specifies the resource label name. This parameter corresponds to the **polname** column in the system catalog in **GS_AUDITING_POLICY**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
policyoid	oid	OID of the audit policy, corresponding to the OID in the **GS_AUDITING_POLICY** system catalog.
modifydate	timestamp without time zone	Latest creation or modification timestamp.

15.2.3 GS_AUDITING_POLICY_FILTERS

GS_AUDITING_POLICY_FILTERS records the filtering policies about the unified audit. Each record corresponds to a design policy. Only the system administrator or security policy administrator can access this system catalog.

Table 15-3 GS_AUDITING_POLICY_FILTERS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
filtertype	name	Filter type. Currently, the value is **logical_expr**.
labelname	name	Name. Currently, the value is **logical_expr**.
policyoid	oid	OID of the audit policy, corresponding to the OID in the system catalog in **GS_AUDITING_POLICY**.
modifydate	timestamp without time zone	Latest creation or modification timestamp.
logicaloperator	text	Logical character string of a filter criterion.

15.2.4 GS_AUDITING_POLICY_PRIVILEGES

GS_AUDITING_POLICY_PRIVILEGES records the DDL database operations about the unified audit. Each record corresponds to a design policy. Only the system administrator or security policy administrator can access this system catalog.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-4 GS_AUDITING_POLICY_PRIVI columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
privilegetype	name	DDL database operation type. For example, CREATE, ALTER, and DROP.
labelname	name	Specifies the resource label name. This parameter corresponds to the **polname** column in the **GS_AUDITING_POLICY** system catalog.
policyoid	oid	This parameter corresponds to OIDs in the **GS_AUDITING_POLICY** system catalog.
modifydate	timestamp without time zone	Latest creation or modification timestamp.

15.2.5 GS_ASP

GS_ASP displays the persistent ACTIVE SESSION PROFILE samples. This system catalog can be queried only in the system library.

Table 15-5 GS_ASP columns

Name	Type	Description
sampleid	bigint	Sample ID.
sample_time	timestamp with time zone	Sampling time.
need_flush_sample	boolean	Specifies whether the sample needs to be flushed to disks. • **t (true)**: yes. • **f (false)**: no.
databaseid	oid	Database ID.
thread_id	bigint	Thread ID.
sessionid	bigint	Session ID.
start_time	timestamp with time zone	Start time of a session.
event	text	Specified event name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread. The value corresponds to the level (ID) of the execution plan.
smpid	integer	Concurrent thread ID in SMP execution mode.
userid	oid	ID of a session user.
application_name	text	Name of the application.
client_addr	inet	IP address of a client.
client_hostname	text	Name of a client.
client_port	integer	TCP port number used by a client to communicate with the backend.
query_id	bigint	Debug query ID.
unique_query_id	bigint	Unique query ID.
user_id	oid	User ID in the key of the unique query.
cn_id	integer	A CN ID indicates a CN from which the unique SQL statement is obtained. The **cn_id** is in the key of the unique query.
unique_query	text	Standardized UniqueSQL text string.
locktag	text	Information of a lock that the session waits for. It can be parsed using **locktag_decode**.
lockmode	text	Mode of a lock that the session waits for. • **LW_EXCLUSIVE**: exclusive lock. • **LW_SHARED**: shared lock. • **LW_WAIT_UNTIL_FREE**: waits for the **LW_EXCLUSIVE** to be available.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
block_sessionid	bigint	Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.
wait_status	text	Provides more details about the event column.
global_sessionid	text	Global session ID.
xact_start_time	timestamp with time zone	Start time of the transaction.
query_start_time	timestamp with time zone	Time when the statement starts to be executed.
state	text	Current statement state. The value can be **active**, **idle in transaction**, **fastpath function call**, **idle in transaction (aborted)**, **disabled**, or **retrying**.

15.2.6 GS_CLIENT_GLOBAL_KEYS

GS_CLIENT_GLOBAL_KEYS records information about the CMK in the encrypted equality feature. Each record corresponds to a CMK.

Table 15-6 GS_CLIENT_GLOBAL_KEYS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
global_key_name	name	CMK name
key_namespace	oid	A namespace OID that contains this CMK
key_owner	oid	CMK owner
key_acl	aclitem[]	Access permissions that this key should have on creation
create_date	timestamp without time zone	Time when a key is created

15.2.7 GS_CLIENT_GLOBAL_KEYS_ARGS

GS_CLIENT_GLOBAL_KEYS_ARGS records the metadata about the CMK in the encrypted equality feature. Each record corresponds to a key-value pair of the CMK.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-7 GS_CLIENT_GLOBAL_KEYS_ARGS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
global_key_id	oid	CMK OID
function_name	name	The value is **encryption**.
key	name	CMK metadata name
value	bytea	Value of the CMK metadata name

15.2.8 GS_COLUMN_KEYS

GS_COLUMN_KEYS records information about the CEK in the encrypted equality feature. Each record corresponds to a CEK.

Table 15-8 GS_COLUMN_KEYS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
column_key_name	name	CEK name
column_key_distributed_id	oid	ID obtained based on the hash value of the fully qualified domain name (FQDN) of the CEK
global_key_id	oid	A foreign key, which is the CMK OID.
key_namespace	oid	A namespace OID that contains this CEK
key_owner	oid	CEK owner
create_date	timestamp with time zone	Time when a CEK is created
key_acl	aclitem[]	Access permissions that this CEK should have on creation

15.2.9 GS_COLUMN_KEYS_ARGS

GS_COLUMN_KEYS_ARGS records the metadata about the CMK in the encrypted equality feature. Each record corresponds to a key-value pair of the CMK.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-9 GS_COLUMN_KEYS_ARGS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
column_key_id	oid	CEK OID
function_name	name	The value is **encryption**.
key	name	CEK metadata name
value	bytea	Value of the CEK metadata name

15.2.10 GS_DB_PRIVILEGE

GS_DB_PRIVILEGE records the granting of ANY permissions. Each record corresponds to a piece of authorization information.

Table 15-10 GS_DB_PRIVILEGE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
roleid	oid	User ID
privilege_type	text	ANY permission of a user. For details about the value, see **Table 12-124**.
admin_option	boolean	Whether the ANY permission recorded in the **privilege_type** column can be re-granted • **t**: yes • **f**: no

15.2.11 GS_ENCRYPTED_COLUMNS

GS_ENCRYPTED_COLUMNS records information about encrypted columns in the encrypted equality feature. Each record corresponds to an encrypted column.

Table 15-11 GS_ENCRYPTED_COLUMNS columns

Name	Type	Description
rel_id	oid	Table OID
column_name	name	Name of an encrypted column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
column_key_id	oid	A foreign key, which is the CEK OID
encryption_type	tinyint	Encryption type. The value can be **2(DETERMINISTIC)** or **1(RANDOMIZED)**.
data_type_original_oid	oid	ID of the original data type of the encrypted column. For details about the values, see the oid columns in the **PG_TYPE** system catalog.
data_type_original_mod	integer	Modifiers of the original data type of the encrypted column. For details about the values, see the atttypmod columns in the **PG_ATTRIBUTE** system catalog.
create_date	timestamp with time zone	Time when an encrypted column is created

15.2.12 GS_ENCRYPTED_PROC

GS_ENCRYPTED_PROC provides information such as the parameters of encrypted functions and stored procedure functions, original data type of return values, and encrypted columns.

Table 15-12 GS_ENCRYPTED_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
func_id	oid	OID of the function, corresponding to the OID row identifier in the **pg_proc** system catalog.
prorettype_orig	integer	Original data type of the return value.
last_change	timestamp without time zone	Last modification time of the encrypted function
proargcachedcol	oidvector	OID of the encrypted column corresponding to the **INPUT** parameter of the function, corresponding to the OID row identifier in the **gs_encrypted_columns** system catalog.
proallargtypes_orig	oid[]	Original data type of all function parameters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.2.13 GS_GLOBAL_CHAIN

GS_GLOBAL_CHAIN records information about modification operations performed by users on the tamper-proof user table. Each record corresponds to a table-level modification operation. Users with the audit administrator permission can query this system catalog, but no user is allowed to modify this system catalog.

Table 15-13 GS_GLOBAL_CHAIN columns

Name	Type	Description
blocknum	bigint	Block number, which is the sequence number of the current user operation recorded in the ledger.
dbname	name	Name of the database to which the modified tamper-proof user table belongs.
username	name	Username, which is the name of the user who performs the operation of modifying the user table.
starttime	timestamp with time zone	Time when a user performs an operation.
relid	oid	OID of the modified tamper-proof user table.
relnsp	name	Schema name, which is the name of the schema to which the modified tamper-proof user table belongs.
relname	name	User table name, which is the name of the modified tamper-proof user table.
relhash	hash16	Table-level hash change amount generated by operations.
globalhash	hash32	Global digest, which is calculated based on the information of the current row and the **globalhash** of the previous row. It connects the entire table to verify the integrity of **GS_GLOBAL_CHAIN** data.
txcommand	text	SQL statement whose operations are recorded.

15.2.14 GS_GLOBAL_CONFIG

GS_GLOBAL_CONFIG records the parameter values specified by users during cluster initialization. In addition, it also stores weak passwords set by users. Initial database users can write, modify, and delete parameters in system catalogs by using **ALTER** and **DROP**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-14 GS_GLOBAL_CONFIG columns

Name	Type	Description
name	name	Specifies the preset parameter name, weak password name, or parameter required by users during cluster initialization.
value	text	Specifies the preset parameter value, weak password name, or parameter value required by users during cluster initialization.

15.2.15 GS_JOB_ATTRIBUTE

GS_JOB_ATTRIBUTE records attributes of DBE_SCHEDULER scheduled tasks, including basic attributes of scheduled tasks, scheduled task classes, certificates, authorization, programs, and schedules.

Table 15-15 GS_JOB_ATTRIBUTE columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
job_name	text	Names of scheduled tasks, scheduled task classes, certificates, programs, and schedules, and authorized user names.
attribute_name	text	Attribute names of scheduled tasks, scheduled task classes, certificates, programs, and schedules, and authorized content.
attribute_value	text	Attribute values of scheduled tasks, scheduled task classes, certificates, programs, and schedules.

15.2.16 GS_JOB_ARGUMENT

GS_JOB_ARGUMENT provides the parameter attributes of DBE_SCHEDULER scheduled tasks and programs.

Table 15-16 GS_JOB_ARGUMENT columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
argument_position	integer	Location of a parameter of a scheduled task or program.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
argument_type	name	Parameter type of a scheduled task or program.
job_name	text	Name of a scheduled task or program.
argument_name	text	Parameter name of a scheduled task or program. The scheduled task inherits the parameter name of the program. Therefore, this parameter is null.
argument_value	text	Parameter value of a scheduled task. (The program cannot bind a value.)
default_value	text	Default parameter value of a program.

15.2.17 GS_MASKING_POLICY

GS_MASKING_POLICY records the main information about dynamic data masking policies. Each record corresponds to a masking policy. Only the system administrator or security policy administrator can access this system catalog.

Table 15-17 GS_MASKING_POLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
polname	name	Policy name, which must be unique.
polcomments	name	Policy description field, which records policy-related description information and is represented by the **COMMENTS** keyword
modifydate	timestamp without time zone	Latest timestamp when a policy is created or modified.
polenabled	boolean	Specifies whether to enable the policy. • **t** (true): enabled • **f** (false): disabled

15.2.18 GS_MASKING_POLICY_ACTIONS

GS_MASKING_POLICY_ACTIONS records the masking actions of a masking policy in the dynamic data masking policies. One masking policy corresponds to one or

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

more rows of records in the catalog. Only the system administrator or security policy administrator can access this system catalog.

Table 15-18 GS_MASKING_POLICY_ACTIONS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
actiontype	name	Name of a masking function used by a masking policy
actparams	name	Parameter information transferred to a masking function
actlabelname	name	Name of a masked label
policyoid	oid	OID of a masking policy to which a record belongs, corresponding to the OID in **GS_MASKING_POLICY**.
actmodifydate	timestamp without time zone	Latest timestamp when a record is created or modified

15.2.19 GS_MASKING_POLICY_FILTERS

GS_MASKING_POLICY_FILTERS records the user filtering criteria corresponding to the dynamic data masking policies. The corresponding masking policy takes effect only when the user information meets the filter criteria. Only the system administrator or security policy administrator can access this system catalog.

Table 15-19 GS_MASKING_POLICY_FILTERS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
filtertype	name	Filter type. Currently, the value is **logical_expr**.
filterlabelname	name	Filtering range. Currently, the value is **logical_expr**.
policyoid	oid	OID of a masking policy to which a record belongs, corresponding to the OID in **GS_MASKING_POLICY**.
modifydate	timestamp without time zone	Latest timestamp when a user filter criterion is created or modified.
logicaloperator	text	Polish notation of the filter criteria.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.2.20 GS_MATVIEW

GS_MATVIEW provides information about each materialized view in the database.

Table 15-20 GS_MATVIEW columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
matviewid	oid	OID of a materialized view.
mapid	oid	OID of a map table associated with a materialized view. Each map table corresponds to one materialized view. If a full materialized view does not correspond to a map table, the value of this column is **0**.
ivm	boolean	Type of a materialized view. The value **t** indicates an incremental materialized view, and the value **f** indicates a full materialized view.
needrefresh	boolean	Reserved column.
refreshtime	timestamp	Last time when a materialized view was refreshed. If the materialized view is not refreshed, the value is null. This column is maintained only for incremental materialized views on DNs. In other cases, the value is null.

15.2.21 GS_MATVIEW_DEPENDENCY

GS_MATVIEW_DEPENDENCY provides association information about each incremental materialized view, base table, and Mlog table in the database. The Mlog table corresponding to the base table does not exist in the full materialized view. Therefore, no record is written into the Mlog table.

Table 15-21 GS_MATVIEW_DEPENDENCY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
matviewid	oid	OID of a materialized view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relid	oid	OID of a base table of a materialized view.
mlogid	oid	OID of a Mlog table which is the log table of a materialized view. Each Mlog table corresponds to one base table.
mxmin	int4	Reserved column.

15.2.22 GS_MODEL_WAREHOUSE

GS_MODEL_WAREHOUSE stores AI engine training models, including the models and detailed description of the training process.

Table 15-22 GS_MODEL_WAREHOUSE columns

Name	Data Type	Description
oid	oid	Hidden column
modelname	name	Unique constraint
modelowner	oid	OID of a model owner
createtime	timestamp without time zone	Time when a model is created
processedtuples	integer	Number of tuples involved in training
discardedtuples	integer	Number of unqualified tuples not involved in training
preprocesstime	real	Data preprocessing time
exectime	real	Training duration
iterations	integer	Iteration round
outputtype	oid	OID of the output data type
modeltype	text	AI operator type
query	text	Query statement executed to create a model
modeldata	bytea	Stored binary model information

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Data Type	Description
weight	real[]	Currently, this column applies only to GD operator models.
hyperparametersnames	text[]	Involved hyperparameter name
hyperparametersvalues	text[]	Hyperparameter value
hyperparametersoids	oid[]	OID of the data type corresponding to a hyperparameter
coefnames	text[]	Model parameter
coefvalues	text[]	Value of a model parameter
coefoids	oid[]	OID of the data type corresponding to a model parameter
trainingscoresname	text[]	Method used to measure model performance
trainingscoresvalue	real[]	Value used to measure model performance
modeldescribe	text[]	Model description

15.2.23 GS_OBSSCANINFO

GS_OBSSCANINFO defines OBS runtime information scanned in cluster acceleration scenarios. (Due to specification changes, the current version no longer supports the current feature. Do not use this feature.) Each record corresponds to a piece of runtime information of a foreign table on OBS in a query. (The current feature is a lab feature. Contact Huawei technical support before using it.)

Table 15-23 GS_OBSSCANINFO columns

Name	Type	Reference	Description
query_id	bigint	-	Query ID
user_id	text	-	Database user who performs the query
table_name	text	-	Name of a foreign table on OBS

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
file_type	text	-	Format of the file that stores underlying data
time_stamp	timestamp with time zone	-	Scanning start time
actual_time	double precision	-	Scanning execution time, in seconds
file_scanned	bigint	-	Number of files scanned
data_size	double precision	-	Size of data scanned, in bytes
billing_info	text	-	Reserved

15.2.24 GS_OPT_MODEL

GS_OPT_MODEL is a data table used when the AI engine is enabled to predict the planned time. It records the configurations, training results, features, corresponding system functions, and training history of machine learning models.

NOTE

In the distributed scenario, this system catalog is provided, but the AI capabilities are unavailable.

15.2.25 GS_POLICY_LABEL

GS_POLICY_LABEL records the resource label configuration information. One resource label corresponds to one or more records, and each record identifies the resource label to which a database resource belongs. Only the system administrator or security policy administrator can access this system catalog.

Fully Qualified Domain Name (FQDN) identifies an absolute path of a database resource.

Table 15-24 GS_POLICY_LABEL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
labelname	name	Specifies the resource label name.
labeltype	name	Resource tag type. Currently, the value is **RESOURCE**.
fqdnnamespace	oid	OID of a namespace to which an identified database resource belongs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
fqdnid	oid	OID of an identified database resource. If the database resource is a column, this column is the OID of the catalog.
relcolumn	name	Column name. If the identified database resource is a column, this column indicates the column name. Otherwise, this column is empty.
fqdntype	name	Type of the identified database resource, for example, schema, table, column, or view.

15.2.26 GS_RECYCLEBIN

GS_RECYCLEBIN records details about objects in the recycle bin of the flashback feature. Currently, the distributed system does not support the flashback feature.

15.2.27 GS_SQL_PATCH

GS_SQL_PATCH stores the status information about all SQL_PATCH statements. Currently, this function is not supported in distributed mode.

Table 15-25 GS_SQL_PATCH columns

Name	Type	Description
patch_name	name	Patch name.
unique_sql_id	bigint	Queries the global unique ID.
owner	oid	ID of the user who creates the patch.
enable	bool	Determines whether the patch takes effect.
status	"char"	Patch status (reserved field).
abort	bool	Determines whether the value is **AbortHint**.
hint_string	text	Hint text.
hint_node	pg_node_tree	Hint parsing and serialization result.
original_query	text	Original statement (reserved field).
patched_query	text	Patched statement (reserved column).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
original_query_tree	pg_node_tree	Original statement parsing result (reserved column).
patched_query_tree	pg_node_tree	Patched statement parsing result (reserved column).
description	text	Patch description.

15.2.28 GS_TXN_SNAPSHOT

GS_TXN_SNAPSHOT is a timestamp-CSN mapping table. It periodically samples and maintains an appropriate time range to estimate the CSN corresponding to the timestamp in the range. Currently, the distributed system does not support the flashback feature.

15.2.29 GS_UID

GS_UID records the unique identification meta information of the **hasuids** attribute table in the database.

Table 15-26 GS_UID columns

Name	Type	Description
relid	oid	OID of a table
uid_backup	bigint	Largest unique identifier that can be assigned to a table

15.2.30 GS_WLM_EC_OPERATOR_INFO

GS_WLM_EC_OPERATOR_INFO records operator information after an Extension Connector job ends. If the GUC parameter **enable_resource_record** is set to **on**, the system imports records from **GS_WLM_EC_OPERATOR_HISTORY** to this system catalog every 3 minutes. This operation occupies storage space and affects performance. Only users with the sysadmin permission can query this system catalog. The current feature is a lab feature. Contact Huawei technical support before using it.

Table 15-27 GS_WLM_EC_OPERATOR_INFO columns

Name	Type	Description
queryid	bigint	Internal query ID used for Extension Connector statement execution
plan_node_id	integer	Plan node ID of the execution plan of an Extension Connector operator

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
start_time	timestamp with time zone	Time when the Extension Connector operator starts to process the first data record
duration	bigint	Total execution time of the Extension Connector operator, in ms
tuple_processed	bigint	Number of elements returned by the Extension Connector operator
min_peak_memory	integer	Minimum peak memory used by the Extension Connector operator on all DNs, in MB
max_peak_memory	integer	Maximum peak memory used by the Extension Connector operator on all DNs, in MB
average_peak_memory	integer	Average peak memory used by the Extension Connector operator on all DNs, in MB
ec_status	text	Status of the Extension Connector job
ec_execute_datanode	text	Name of the DN executing the Extension Connector job
ec_dsn	text	DSN used by the Extension Connector job
ec_username	text	Username used by the Extension Connector job to access the remote cluster. This parameter is null if the remote cluster type is SPARK.
ec_query	text	Statement sent by the Extension Connector job to a remote cluster
ec_libodbc_type	text	Type of the unixODBC driver used by the Extension Connector job

15.2.31 GS_WLM_INSTANCE_HISTORY

GS_WLM_INSTANCE_HISTORY stores information about resource usage related to CNs or DNs. Each record in this system catalog indicates resource usage of an instance at a specific time point, including the memory, number of CPU cores, disk I/O, physical I/O of the process, and logical I/O of the process. This system catalog can be queried by users with the **sysadmin** permission only in Postgres.

Table 15-28 GS_WLM_INSTANCE_HISTORY columns

Name	Type	Description
instancename	text	Instance name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
timestamp	timestamp with time zone	Timestamp
used_cpu	integer	CPU usage of the instance
free_mem	integer	Unused memory of the instance, in MB
used_mem	integer	Used memory of the instance, in MB
io_await	real	Average wait time for an I/O operation on the disk used by the instance. The average value is within 10 seconds.
io_util	real	io_util value of the disk used by the instance. The average value is within 10 seconds.
disk_read	real	Disk read rate of the instance, in KB/s. The average value is within 10 seconds.
disk_write	real	Disk write rate of the instance, in KB/s. The average value is within 10 seconds.
process_read	bigint	Read rate (excluding the number of bytes read from the disk pagecache) of the corresponding instance process that reads data from a disk within 10 seconds, in KB/s
process_write	bigint	Write rate (excluding the number of bytes written to the disk pagecache) of the corresponding instance process that writes data to a disk within 10 seconds, in KB/s
logical_read	bigint	CN: N/A DN: logical read byte rate of the instance within the statistical interval (10 seconds), in KB/s
logical_write	bigint	CN: N/A DN: logical write byte rate of the instance within the statistical interval (10 seconds), in KB/s
read_counts	bigint	CN: N/A DN: total number of logical read operations of the instance within the statistical interval (10 seconds)
write_counts	bigint	CN: N/A DN: total number of logical write operations of the instance within the statistical interval (10 seconds)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.2.32 GS_WLM_OPERATOR_INFO

GS_WLM_OPERATOR_INFO displays records about operators of completed jobs. The data is dumped from the kernel to the system catalog. If **enable_resource_record** is set to **on**, the system imports records from **GS_WLM_SESSION_HISTORY** to this system catalog every 3 minutes. You are not advised to enable this function, because it occupies storage space and affects performance. This system catalog can be queried by users with the **sysadmin** permission only in Postgres.

Table 15-29 GS_WLM_OPERATOR_INFO columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution
pid	bigint	Backend thread ID
plan_node_id	integer	Plan node ID of the execution plan of a query
plan_node_name	text	Name of the operator corresponding to the plan node ID
start_time	timestamp with time zone	Time when an operator starts to process the first data record
duration	bigint	Total execution time of the operator, in ms
query_dop	integer	DOP of the operator
estimated_rows	bigint	Number of rows estimated by the optimizer
tuple_processed	bigint	Number of elements returned by the operator
min_peak_memory	integer	Minimum peak memory used by the operator on all DNs, in MB
max_peak_memory	integer	Maximum peak memory used by the operator on all DNs, in MB
average_peak_memory	integer	Average peak memory used by the operator on all DNs, in MB
memory_skew_percent	integer	Memory usage skew of the operator among DNs
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs, in MB (default value: **0**)
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs, in MB (default value: **0**)
average_spill_size	integer	Average spilled data among all DNs when a spill occurs, in MB (default value: **0**)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
spill_skew_percent	integer	DN spill skew when a spill occurs
min_cpu_time	bigint	Minimum execution time of the operator on all DNs, in ms
max_cpu_time	bigint	Maximum execution time of the operator on all DNs, in ms
total_cpu_time	bigint	Total execution time of the operator on all DNs, in ms
cpu_skew_percent	integer	Skew of the execution time among DNs
warning	text	The following warnings are displayed: • Sort/SetOp/HashAgg/HashJoin spill • Spill file size large than 256MB • Broadcast size large than 100MB • Early spill • Spill times is greater than 3 • Spill on memory adaptive • Hash table conflict

15.2.33 GS_WLM_SESSION_QUERY_INFO_ALL

GS_WLM_SESSION_QUERY_INFO_ALL records load management information about a completed job executed on the current CN. (The current feature is a lab feature. Contact Huawei technical support before using it.) Data is dumped from the kernel to this system catalog. If the GUC parameter **enable_resource_record** is set to **on**, query information in the kernel is imported to the system catalog **GS_WLM_SESSION_QUERY_INFO_ALL** every 3 minutes. This system catalog can be queried by users with the **sysadmin** permission only in Postgres.

NOTE

If no data is displayed in the queried view, contact Huawei technical support.

Table 15-30 GS_WLM_SESSION_QUERY_INFO_ALL columns

Name	Type	Description
datid	oid	OID of the database that the backend is connected to
dbname	text	Name of the database that the backend is connected to
schemaname	text	Schema name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
nodename	text	Name of the CN where the statement is executed
username	text	Username used for connecting to the backend
application_name	text	Name of the application connected to the backend
client_addr	inet	IP address of the client connected to the backend. If this column is **NULL**, it indicates either the client is connected via a Unix socket on the server or this is an internal process, such as **AUTOVACUUM**.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with this backend (**-1** if a Unix socket is used)
query_band	text	Job type, which is specified by the GUC parameter **query_band**. The default value is a null string.
block_time	bigint	Duration that the statement is blocked before being executed, including the statement parsing and optimization duration (unit: ms)
start_time	timestamp with time zone	Time when the statement starts to be executed
finish_time	timestamp with time zone	Time when the statement execution ends
duration	bigint	Execution time of the statement, in ms
estimate_total_time	bigint	Estimated execution time of the statement, in ms
status	text	Final statement execution status, which can be **finished** (normal) or **aborted** (abnormal)
abort_info	text	Exception information displayed if the final statement execution status is **aborted**
resource_pool	text	Resource pool used by the user
control_group	text	Cgroup used by the statement

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
estimate_memory	integer	Estimated memory size of the statement
min_peak_memory	integer	Minimum peak memory of the statement across all DNs, in MB
max_peak_memory	integer	Maximum peak memory of the statement across all DNs, in MB
average_peak_memory	integer	Average memory usage during statement execution, in MB
memory_skew_percent	integer	Memory usage skew of the statement among each DN
spill_info	text	Statement spill information on all DNs: ● **None**: No data is spilled to disks. ● **All**: Data is spilled to disks on all DNs. ● **[*a*:*b*]**: The statement has been spilled to disks on *a* of *b* DNs.
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs, in MB (default value: **0**)
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs, in MB (default value: **0**)
average_spill_size	integer	Average spilled data among all DNs when a spill occurs, in MB (default value: **0**)
spill_skew_percent	integer	DN spill skew when a spill occurs
min_dn_time	bigint	Minimum execution time of the statement across all DNs, in ms
max_dn_time	bigint	Maximum execution time of the statement across all DNs, in ms
average_dn_time	bigint	Average execution time of the statement across all DNs, in ms
dntime_skew_percent	integer	Execution time skew of the statement among each DN
min_cpu_time	bigint	Minimum CPU time of the statement across all DNs, in ms
max_cpu_time	bigint	Maximum CPU time of the statement across all DNs, in ms
total_cpu_time	bigint	Total CPU time of the statement across all DNs, in ms

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
cpu_skew_percent	integer	CPU time skew of the statement among DNs
min_peak_iops	integer	Minimum IOPS peak of the statement across all DNs. It is counted by ones in a column-store table and by ten thousands in a row-store table.
max_peak_iops	integer	Maximum IOPS peak of the statement across all DNs. It is counted by ones in a column-store table and by ten thousands in a row-store table.
average_peak_iops	integer	Average IOPS peak of the statement across all DNs. It is counted by ones in a column-store table and by ten thousands in a row-store table.
iops_skew_percent	integer	I/O skew of the statement among DNs
warning	text	Warning. The following warnings and warnings related to **Optimizing SQL Self-Diagnosis** are displayed: • Spill file size large than 256MB • Broadcast size large than 100MB • Early spill • Spill times is greater than 3 • Spill on memory adaptive • Hash table conflict
queryid	bigint	Internal query ID used for statement execution
query	text	Statement executed
query_plan	text	Execution plan of the statement
node_group	text	Logical cluster of the user running the statement. (The current feature is a lab feature. Contact Huawei technical support before using it.)
cpu_top1_node_name	text	Name of the node with the highest CPU usage
cpu_top2_node_name	text	Name of the node with the second highest CPU usage
cpu_top3_node_name	text	Name of the node with the third highest CPU usage.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
cpu_top4_node_name	text	Name of the node with the fourth highest CPU usage.
cpu_top5_node_name	text	Name of the node with the fifth highest CPU usage.
mem_top1_node_name	text	Name of the node with the highest memory usage
mem_top2_node_name	text	Name of the node with the second highest memory usage
mem_top3_node_name	text	Name of the node with the third highest memory usage
mem_top4_node_name	text	Name of the node with the fourth highest memory usage
mem_top5_node_name	text	Name of the node with the fifth highest memory usage.
cpu_top1_value	bigint	CPU usage
cpu_top2_value	bigint	CPU usage
cpu_top3_value	bigint	CPU usage
cpu_top4_value	bigint	CPU usage
cpu_top5_value	bigint	CPU usage
mem_top1_value	bigint	Memory usage
mem_top2_value	bigint	Memory usage
mem_top3_value	bigint	Memory usage
mem_top4_value	bigint	Memory usage
mem_top5_value	bigint	Memory usage
top_mem_dn	text	Top *N* memory usage
top_cpu_dn	text	Top *N* CPU usage
n_returned_rows	bigint	Number of rows in the result set returned by the **SELECT** statement
n_tuples_fetched	bigint	Number of rows randomly scanned

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_tuples_returned	bigint	Number of rows sequentially scanned
n_tuples_inserted	bigint	Number of rows inserted
n_tuples_updated	bigint	Number of rows updated
n_tuples_deleted	bigint	Number of rows deleted
n_blocks_fetched	bigint	Number of cache loading times
n_blocks_hit	bigint	Cache hits
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: μs)
cpu_time	bigint	CPU time (unit: μs)
execution_time	bigint	Execution time in the executor (unit: μs)
parse_time	bigint	SQL parsing time (unit: μs)
plan_time	bigint	SQL plan generation time (unit: μs)
rewrite_time	bigint	SQL rewriting time (unit: μs)
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: μs)
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: μs)
net_send_time	bigint	Network time (unit: μs)
data_io_time	bigint	I/O time (unit: μs)
is_slow_query	bigint	Specifies whether the query is a slow query. The value **1** indicates a slow query.

15.2.34 GS_WLM_USER_RESOURCE_HISTORY

GS_WLM_USER_RESOURCE_HISTORY stores information about resources used by users and is valid only on CNs. Each record in this table indicates resource usage of a user at a time point, including the memory, number of CPU cores, storage space, temporary space, operator flushing space, logical I/O traffic, number of logical I/O operations, and logical I/O rate. The memory, CPU, and I/O monitoring items record only resource usage of complex jobs. For I/O monitoring items, this parameter is valid only when **enable_logical_io_statistics** is set to **on**. The function of saving user monitoring data is enabled only when

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_user_metric_persistent is set to **on**. Data in the system catalog **GS_WLM_USER_RESOURCE_HISTORY** comes from the **PG_TOTAL_USER_RESOURCE_INFO** view. This system catalog can be queried by users with the **sysadmin** permission only in Postgres.

Table 15-31 GS_WLM_USER_RESOURCE_HISTORY

Name	Type	Description
username	text	Username
timestamp	timestamp with time zone	Timestamp
used_memory	integer	Used memory, in MB
total_memory	integer	Available memory, in MB. The value **0** indicates that the available memory is not limited and depends on the maximum memory available in the database.
used_cpu	real	Number of CPU cores in use
total_cpu	integer	Total number of CPU cores of the Cgroup associated with the user on the node
used_space	bigint	Used storage space, in KB
total_space	bigint	Available storage space, in KB. The value **-1** indicates that the storage space is not limited.
used_temp_space	bigint	Used temporary storage space, in KB
total_temp_space	bigint	Available temporary storage space, in KB. The value **-1** indicates that the maximum temporary storage space is not limited.
used_spill_space	bigint	Used space of operator flushing, in KB
total_spill_space	bigint	Available storage space for operator flushing, in KB. The value **-1** indicates that the maximum operator flushing space is not limited.
read_kbytes	bigint	Byte traffic of read operations in a monitoring period, in KB
write_kbytes	bigint	Byte traffic of write operations in a monitoring period, in KB
read_counts	bigint	Number of read operations in a monitoring period

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
write_counts	bigint	Number of write operations in a monitoring period
read_speed	real	Byte rate of read operations in a monitoring period, in KB
write_speed	real	Byte rate of write operations in a monitoring period, in KB

15.2.35 PG_AGGREGATE

PG_AGGREGATE records information about aggregate functions. Each entry in **PG_AGGREGATE** is an extension of an entry in **PG_PROC**. The **PG_PROC** entry carries the aggregate's name, input and output data types, and other information that is similar to ordinary functions.

Table 15-32 PG_AGGREGATE columns

Name	Type	Reference	Description
aggfnoid	regproc	PG_PROC.proname	PG_PROC proname of the aggregate function
aggtransfn	regproc	PG_PROC.proname	Transition function
aggcollectfn	regproc	PG_PROC.proname	Collect function
aggfinalfn	regproc	PG_PROC.proname	Final function (**0** if none)
aggsortop	oid	PG_OPERATOR.oid	Associated sort operator (**0** if none)
aggtranstype	oid	PG_TYPE.oid	Data type of the aggregate function's internal transition (state) data The possible values and their meanings are defined by the types in **pg_type.h**. The main two types are polymorphic (isPolymorphicType) and non-polymorphic.
agginitval	text	-	Initial value of the transition state. This is a text column containing the initial value in its external string representation. If this column is null, the transition state value starts from null.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
agginitcollect	text	-	Initial value of the collection state. This is a text column containing the initial value in its external string representation. If this column is null, the collection state value starts from null.
aggkind	"char"	-	Type of the aggregate function: • **n**: normal aggregate • **o**: ordered set aggregate
aggnumdirectargs	smallint	-	Number of direct parameters (non-aggregation-related parameters) of the aggregate function of the ordered set aggregate type. For an aggregate function of the normal aggregate type, the value is **0**.

15.2.36 PG_AM

PG_AM records information about index access methods. There is one row for each index access method supported by the system.

Table 15-33 PG_AM columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
amname	name	-	Name of the access method
amstrategies	smallint	-	Number of operator strategies for the access method (**0** if the access method does not have a fixed set of operator strategies)
amsupport	smallint	-	Number of support routines for the access method
amcanorder	boolean	-	Whether the access method supports ordered scans sorted by the indexed column's value • **t (true)**: supported. • **f (false)**: not supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
amcanorderbyop	boolean	-	Whether the access method supports ordered scans sorted by the result of an operator on the indexed column **t (true)**: supported. **f (false)**: not supported.
amcanbackward	boolean	-	Whether the access method supports backward scanning • **t (true)**: supported. • **f (false)**: not supported.
amcanunique	boolean	-	Whether the access method supports unique indexes • **t (true)**: supported. • **f (false)**: not supported.
amcanmulticol	boolean	-	Whether the access method supports multi-column indexes • **t (true)**: supported. • **f (false)**: not supported.
amoptionalkey	boolean	-	Whether the access method supports scanning without any constraint for the first index column • **t (true)**: supported. • **f (false)**: not supported.
amsearcharray	boolean	-	Whether the access method supports **ScalarArrayOpExpr** searches **t (true)**: supported. **f (false)**: not supported.
amsearchnulls	boolean	-	Whether the access method supports **IS NULL/NOT NULL** searches • **t (true)**: supported. • **f (false)**: not supported.
amstorage	boolean	-	Whether the index storage data type can differ from the column data type • **t (true)**: same. • **f (false)**: different.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
amclusterable	boolean	-	Whether an index of this type can be clustered on • **t (true)**: allowed. • **f (false)**: not allowed.
ampredlocks	boolean	-	Whether an index of this type manages fine-grained predicate locks • **t (true)**: allowed. • **f (false)**: not allowed.
amkeytype	oid	OID in **PG_TYPE**	Type of data stored in index (**0** if it is not a fixed type)
aminsert	regproc	**proname** in **PG_PROC**	"Insert this tuple" function
ambeginscan	regproc	**proname** in **PG_PROC**	"Prepare for index scan" function
amgettuple	regproc	**proname** in **PG_PROC**	"Next valid tuple" function (**0** if none)
amgetbitmap	regproc	**proname** in **PG_PROC**	"Fetch all valid tuples" function (**0** if none)
amrescan	regproc	**proname** in **PG_PROC**	"(Re)start index scan" function
amendscan	regproc	**proname** in **PG_PROC**	"Clean up after index scan" function
ammarkpos	regproc	**proname** in **PG_PROC**	"Mark current scan position" function
amrestrpos	regproc	**proname** in **PG_PROC**	"Restore marked scan position" function
ammerge	regproc	**proname** in **PG_PROC**	"Merge multiple indexes" function
ambuild	regproc	**proname** in **PG_PROC**	"Build new index" function
ambuildempty	regproc	**proname** in **PG_PROC**	"Build empty index" function
ambulkdelete	regproc	**proname** in **PG_PROC**	Bulk-delete function
amvacuumcleanup	regproc	**proname** in **PG_PROC**	Post-**VACUUM** cleanup function

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
amcanreturn	regproc	**proname** in PG_PROC	Function to check whether the index supports index-only scans (**0** if none)
amcostestimate	regproc	**proname** in PG_PROC	Function to estimate cost of an index scan
amoptions	regproc	**proname** in PG_PROC	Function to parse and validate **reloptions** for an index

15.2.37 PG_AMOP

PG_AMOP records information about operators associated with access method operator families. There is one row for each operator that is a member of an operator family. A family member can be either a search operator or an ordering operator. An operator can appear in more than one family, but cannot appear in more than one search position nor more than one ordering position within a family.

Table 15-34 PG_AMOP columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
amopfamily	oid	PG_OPFAMILY.oid	Operator family of this entry
amoplefttype	oid	PG_TYPE.oid	Left-hand input data type of the operator For details about the possible values and their description, see **pg_type.h**.
amoprighttype	oid	PG_TYPE.oid	Right-hand input data type of the operator For details about the possible values and their description, see **pg_type.h**.
amopstrategy	smallint	-	Number of operator strategies
amoppurpose	"char"	-	Operator purpose, either **s** for search or **o** for ordering

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
amopopr	oid	PG_OPERATOR.oid	OID of the operator
amopmethod	oid	PG_AM.oid	Operator family of the index access method
amopsortfamily	oid	PG_OPFAMILY.oid	The B-tree operator family according to which this entry sorts for an ordering operator (**0** for a search operator)

A search operator entry indicates that an index of this operator family can be searched to find all rows satisfying **WHERE indexed_column operator constant**. Obviously, such an operator must return a Boolean value, and its left-hand input type must match the index's column data type.

An ordering operator entry indicates that an index of this operator family can be scanned to return rows in the order represented by **ORDER BY indexed_column operator constant**. Such an operator could return any sortable data type, though again its left-hand input type must match the index's column data type. The exact semantics of **ORDER BY** are specified by the **amopsortfamily** column, which must reference the B-tree operator family for the operator's result type.

15.2.38 PG_AMPROC

PG_AMPROC records information about the support procedures associated with the access method operator families. There is one row for each support procedure that belongs to an operator family.

Table 15-35 PG_AMPROC columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
amprocfamily	oid	PG_OPFAMILY.oid	Operator family of this entry
amproclefttype	oid	PG_TYPE.oid	Left-hand input data type of the associated operator For details about common data types, see **Data Type**.
amprocrighttype	oid	PG_TYPE.oid	Right-hand input data type of the associated operator For details about common data types, see **Data Type**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
amprocnum	smallint	-	Support procedure number
amproc	regproc	PG_PROC .proname	OID of the procedure

The usual interpretation of the **amproclefttype** and **amprocrighttype** columns is that they identify the left and right input types of the operator(s) that a particular support procedure supports. For some access methods, these match the input data type(s) of the support procedure itself; for others not. There is a notion of "default" support procedures for an index, which are those with **amproclefttype** and **amprocrighttype** both equal to the index opclass's **opcintype**.

15.2.39 PG_APP_WORKLOADGROUP_MAPPING

PG_APP_WORKLOADGROUP_MAPPING provides load mapping group information in the database.

Table 15-36 PG_APP_WORKLOADGROUP_MAPPING columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
appname	name	Application name
workload_gpname	name	Mapped workload group name

15.2.40 PG_ATTRDEF

PG_ATTRDEF records default values of columns.

Table 15-37 PG_ATTRDEF columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
adrelid	oid	Table to which a column belongs
adnum	smallint	Number of columns
adbin	pg_node_tree	Internal representation of the default value of the column

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
adsrc	text	Internal representation of the human-readable default value
adgencol	"char"	Specifies whether a column is a generated column. The value **s** indicates that the column is a generated column, and the value **'\0** indicates that the column is a common column. The default value is **'\0**.

15.2.41 PG_ATTRIBUTE

PG_ATTRIBUTE records information about table columns.

Table 15-38 PG_ATTRIBUTE columns

Name	Type	Description
attrelid	oid	Table to which a column belongs
attname	name	Column name
atttypid	oid	Column type
attstattarget	integer	Level of details of statistics collected for this column by **ANALYZE**. ● The value **0** indicates that no statistics should be collected. ● A negative value indicates that the system default statistic object is used. ● The exact meaning of positive values is data type-dependent. For scalar data types, **attstattarget** is both the target number of "most common values" to collect, and the target number of histogram bins to create.
attlen	smallint	Copy of **typlen** in **PG_TYPE** of the column's type
attnum	smallint	Number of the column
attndims	integer	Number of dimensions if the column is an array (**0** in other cases)
attcacheoff	integer	This column is always **-1** on disk. When it is loaded into a row descriptor in the memory, it may be updated to cache the offset of the columns in the row.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
atttypmod	integer	Type-specific data supplied at the table creation time (for example, the maximum length of a **varchar** column). This column is used as the third parameter when passing to type-specific input functions and length coercion functions. The value will generally be **-1** for types that do not need ATTTYPMOD.
attbyval	boolean	Copy of **typbyval** in **PG_TYPE** of this column's type
attstorage	"char"	Copy of **typstorage** in **PG_TYPE** of this column's type
attalign	"char"	Copy of **typalign** in **PG_TYPE** of this column's type
attnotnull	boolean	A non-null constraint. It is possible to change this column to enable or disable the constraint.
atthasdef	boolean	This column has a default value, in which case there will be a corresponding entry in the **PG_ATTRDEF** table that actually defines the value.
attisdropped	boolean	Indicates that this column has been deleted and is no longer valid. A deleted column is still physically present in the table but is ignored by the analyzer, so it cannot be accessed through SQL.
attislocal	boolean	Indicates that this column is locally defined in the relationship. Note that a column can be locally defined and inherited simultaneously.
attcmprmode	tinyint	Compressed modes for a specific column. The compressed mode includes: ● ATT_CMPR_NOCOMPRESS ● ATT_CMPR_DELTA ● ATT_CMPR_DICTIONARY ● ATT_CMPR_PREFIX ● ATT_CMPR_NUMSTR
attinhcount	integer	Number of direct ancestors that this column has. A column with an ancestor cannot be dropped nor renamed.
attcollation	oid	Defined collation of a column
attacl	aclitem[]	Permissions for column-level access

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
attoptions	text[]	Column attribute. Currently, the following attributes are supported: • **n_distinct**: number of **distinct** values of a column (excluding subtables). • **n_distinct_inherited**: number of **distinct** values of a column (including subtables).
attfdwoptions	text[]	Column attribute of a foreign table. Currently, **dist_fdw**, **file_fdw**, and **log_fdw** do not use foreign table column attributes.
attinitdefval	bytea	**attinitdefval** stores the default value expression. **ADD COLUMN** in the row-store table must use this column.
attkvtype	tinyint	Specifies a key value type for a column. Types include: 0. ATT_KV_UNDEFINED: default value 1. ATT_KV_TAG: dimension 2. ATT_KV_FIELD: indicator 3. ATT_KV_TIMETAG: time column 4. ATT_KV_HIDETAG: hidden distribution column

15.2.42 PG_AUTHID

PG_AUTHID records information about database authentication identifiers (roles). The concept of users is contained in that of roles. A user is actually a role whose **rolcanlogin** has been set. Any role, whether its **rolcanlogin** is set or not, can use other roles as members.

For a cluster, only one **PG_AUTHID** exists, which is not available for every database. This system catalog is accessible only to system administrators.

Table 15-39 PG_AUTHID columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
rolname	name	Name of a role
rolsuper	boolean	Whether the role is the initial system administrator with the highest permission • **t** (true): yes • **f** (false): no

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
rolinherit	boolean	Whether the role automatically inherits permissions of roles of which it is a member • **t** (true): automatically inherited • **f** (false): not automatically inherited
rolcreaterole	boolean	Whether the role can create more roles • **t** (true): yes • **f** (false): no
rolcreatedb	boolean	Whether the role can create databases • **t** (true): yes • **f** (false): no
rolcatupdate	boolean	Whether the role can directly update system catalogs. Only the initial system administrator whose **usesysid** is **10** has this permission. It is unavailable for other users. • **t** (true): yes • **f** (false): no
rolcanlogin	boolean	Whether the role can log in (whether this role can be given as the initial session authorization identifier) • **t** (true): yes • **f** (false): no
rolreplication	boolean	Whether a role has the replication permission • **t** (true): yes • **f** (false): no
rolauditadmin	boolean	Whether the role has the audit administrator permission • **t** (true): yes • **f** (false): no
rolsystemadmin	boolean	Whether the role has system administrator permission • **t** (true): yes • **f** (false): no
rolconnlimit	integer	Maximum number of concurrent connections that this role can make (valid for roles that can log in) The value **–1** indicates there is no limit.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
rolpassword	text	Password (possibly encrypted) (null if no password)
rolvalidbegin	timestamp with time zone	Account validity start time (**NULL** if no start time).
rolvaliduntil	timestamp with time zone	Password expiry time (**NULL** if no expiration).
rolrespool	name	Resource pool that a user can use
roluseft	boolean	Whether the role can perform operations on foreign tables • **t** (true): yes • **f** (false): no
rolparentid	oid	OID of a group user to which the user belongs
roltabspace	text	Maximum size of a user data table
rolkind	"char"	Special type of user, including private users, logical cluster administrators, permanent users, and common users. (The current feature is a lab feature. Contact Huawei technical support before using it.)
rolnodegroup	oid	OID of a node group associated with a user. The node group must be a logical cluster. (The current feature is a lab feature. Contact Huawei technical support before using it.)
roltempspace	text	Maximum size of a user's temporary table, in KB.
rolspillspace	text	Maximum size of data that can be written to disks when a user executes a job, in KB.
rolexcpdata	text	Query rules that can be set by users (reserved)
rolmonitoradmin	boolean	Whether the role has monitor administrator permission • **t** (true): yes • **f** (false): no

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
roloperatoradmin	boolean	Whether the role has the O&M administrator permission • **t** (true): yes • **f** (false): no
rolpolicyadmin	boolean	Whether the role has the security policy administrator permission • **t** (true): yes • **f** (false): no

15.2.43 PG_AUTH_HISTORY

PG_AUTH_HISTORY records the authentication history of a role. This system catalog is accessible only to system administrators.

Table 15-40 PG_AUTH_HISTORY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
roloid	oid	ID of a role
passwordtime	timestamp with time zone	Time of password creation and change
rolpassword	text	Ciphertext of the role password. The encryption mode is determined by the GUC parameter **password_encryption_type**.

15.2.44 PG_AUTH_MEMBERS

PG_AUTH_MEMBERS records the membership between roles.

Table 15-41 PG_AUTH_MEMBERS columns

Name	Type	Description
roleid	oid	ID of a role that has a member
member	oid	ID of a role that is a member of ROLEID
grantor	oid	ID of a role that grants this membership

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
admin_option	boolean	Whether a member can grant membership in ROLEID to others The value cannot be false.

15.2.45 PG_CAST

PG_CAST records the conversion relationship between data types.

Table 15-42 PG_CAST columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
castsource	oid	OID of the source data type
casttarget	oid	OID of the target data type
castfunc	oid	OID of the conversion function (**0** if no conversion function is required)
castcontext	"char"	Conversion mode between the source and target data types. ● **e**: Only explicit conversion can be performed (using the CAST or :: syntax). ● **'i'**: Implicit conversion can be performed. ● **a**: Both explicit and implicit conversion can be performed between data types.
castmethod	"char"	Conversion method. ● **f**: Conversion is performed using the specified function in the **castfunc** column. ● 'b': Binary forcible conversion rather than the specified function in the **castfunc** column is performed between data types.

15.2.46 PG_CLASS

PG_CLASS records database objects and their relationship.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-43 PG_CLASS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
relname	name	Name of an object, such as a table, index, or view
relnamespace	oid	OID of the namespace that contains the relationship
reltype	oid	Data type that corresponds to the table's row type. The index is 0 because the index does not have **PG_TYPE** records.
reloftype	oid	OID of the composite type (**0** for other types)
relowner	oid	Owner of the relationship
relam	oid	Access method used, such as B-tree and hash, if this is an index
relfilenode	oid	Name of the on-disk file of this relationship (**0** if such file does not exist)
reltablespace	oid	Tablespace in which this relationship is stored. If the value is **0**, the default tablespace in this database is used. This column is meaningless if the relationship has no on-disk file.
relpages	double precision	Size of the on-disk representation of the table in pages (of size BLCKSZ). This is only an estimate used by the optimizer.
reltuples	double precision	Number of rows in the table. This is only an estimate used by the optimizer.
relallvisible	integer	Number of pages marked as all visible in the table. This column is used by the optimizer for optimizing SQL execution. It is updated by **VACUUM**, **ANALYZE**, and a few DDL statements such as **CREATE INDEX**.
reltoastrelid	oid	OID of the TOAST table associated with the table (**0** if no TOAST table exists). The TOAST table stores large columns "offline" in a secondary table.
reltoastidxid	oid	OID of the index for a TOAST table (**0** for a table other than a TOAST table)
reldeltarelid	oid	OID of a Delta table Delta tables are attached to column-store tables. They store long tail data generated during storage data import.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
reldeltaidx	oid	OID of the index for a Delta table
relcudescrelid	oid	OID of a CU description table. CU description tables (Desc tables) belong to column-store tables. They control whether storage data in the HDFS table directory is visible.
relcudescidx	oid	OID of the index for a CU description table
relhasindex	boolean	Its value is **true** if this column is a table and has (or recently had) at least one index. It is set by **CREATE INDEX** but is not immediately cleared by **DROP INDEX**. If the **VACUUM** process detects that a table has no index, it clears the **relhasindex** column and sets the value to **false**.
relisshared	boolean	Its value is **true** if the table is shared across all databases in the entire cluster. Otherwise, the value is **false**. Only certain system catalogs (such as **PG_DATABASE**) are shared.
relpersistence	"char"	• **p**: permanent table • **u**: non-log table • **t**: temporary table
relkind	"char"	• **r**: ordinary table • **i**: index • **s**: sequence • **v**: view • **c**: composite type • **t**: TOAST table • **f**: foreign table • **m**: materialized view. • **e**: STREAM object. • **o**: CONTVIEW object.
relnatts	smallint	Number of user columns in the relationship (excluding system columns). **PG_ATTRIBUTE** has the same number of rows as the user columns.
relchecks	smallint	Number of check constraints in the table. For details, see the system catalog **PG_CONSTRAINT**.
relhasoids	boolean	Its value is **true** if an OID is generated for each row of the relationship. Otherwise, the value is **false**.
relhaspkey	boolean	Its value is **true** if the table has (or once had) a primary key. Otherwise, the value is **false**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relhasrules	boolean	Its value is **true** if the table has rules. For details, see the system catalog **PG_REWRITE**.
relhastriggers	boolean	The value is **true** if the table has (or once had) triggers. Triggers of the table and view are recorded in the system catalog **PG_TRIGGER**.
relhassubclass	boolean	Its value is **true** if the table has (or once had) any inheritance child table. Otherwise, the value is **false**.
relcmprs	tinyint	Whether the compression feature is enabled for the table. Note that only batch insertion triggers compression, so ordinary CRUD does not trigger compression. ● **0**: Tables that do not support compression (primarily system catalogs, on which the compression attribute cannot be modified). ● **1**: The compression feature of the table data is NOCOMPRESS or has no specified keyword. ● **2**: The compression feature of the table data is COMPRESS.
relhasclusterkey	boolean	Whether the local cluster storage is used ● **true**: yes ● **false**: no
relrowmovement	boolean	Whether row migration is allowed when the partitioned table is updated. ● **true**: Row migration is allowed. ● **false**: Row migration is not allowed.
parttype	"char"	Whether the table or index has the property of a partitioned table ● **p**: The table or index has the property of a partitioned table. ● **n**: The table or index does not have the property of a partitioned table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relfrozenxid	xid32	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table. This column is used to track whether the table needs to be vacuumed to prevent transaction ID wraparound (or to allow **PG_CLOG** to be shrunk). The value is **0** (**InvalidTransactionId**) if the relationship is not a table. To ensure forward compatibility, this column is reserved. The **relfrozenxid64** column is added to record the information.

relacl	aclitem[]	Access permission.
		The command output of the query is as follows:
		`rolename=xxxx/yyyy --Assigning permissions to a role`
		`=xxxx/yyyy --Assigning the permission to public`
		xxxx indicates assigned permissions, and *yyyy* indicates roles with the assigned permissions. For details on permission descriptions, see **Table 15-44**.

reloptions	text[]	Table or index access method, using character strings in the format of "keyword=value"
relreplident	"char"	Identifier of a decoding column in logical decoding: • **d**: default (primary key, if any) • **n**: none • **f**: all columns • **i**: The indisreplident of the index is specified or the default index is used.
relfrozenxid64	xid	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table. This column is used to track whether the table needs to be vacuumed to prevent transaction ID wraparound (or to allow **PG_CLOG** to be shrunk). The value is **0** (**InvalidTransactionId**) if the relationship is not a table.
relbucket	oid	Specifies whether the current catalog contains hash bucket shards. A valid OID points to the specific shard information recorded in the **PG_HASHBUCKET** catalog. **NULL** indicates that hash bucket shards are not included.
relbucketkey	int2vector	Hash partition column information. **NULL** indicates that the column information is not included.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relminmxid	xid	All multi-transaction IDs before this one have been replaced with a transaction ID in the table. This column is used to track whether the table needs to be vacuumed in order to prevent multi-transaction ID wraparound or to allow **pg_clog** to be shrunk. The value is **0** (**InvalidTransactionId**) if the relationship is not a table.

Table 15-44 Description of permissions

Parameter	Parameter Description
r	SELECT (read)
w	UPDATE (write)
a	INSERT (insert)
d	DELETE
D	TRUNCATE
x	REFERENCES

T	TEMPORARY
A	ALTER
P	DROP
m	COMMENT
i	INDEX
v	VACUUM
*	Authorization options for preceding permissions

15.2.47 PG_COLLATION

PG_COLLATION describes available collations, which are essentially mappings from an SQL name to operating system locale categories.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-45 PG_COLLATION columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
collname	name	-	Collation name (unique per namespace and encoding)
collnamespace	oid	PG_NAMESPACE.oid	OID of the namespace that contains this collation
collowner	oid	PG_AUTHID.oid	Owner of the collation
collencoding	integer	-	Encoding in which the collation is applicable, or **-1** if it works for any encoding. It is compatible with PostgreSQL.
collcollate	name	-	**LC_COLLATE** for this collation object
collctype	name	-	**LC_CTYPE** for this collation object

15.2.48 PG_CONSTRAINT

PG_CONSTRAINT records check, primary key, unique, and foreign key constraints on tables.

Table 15-46 PG_CONSTRAINT columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
conname	name	Constraint name (not necessarily unique)
connamespace	oid	OID of the namespace that contains the constraint

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
contype	"char"	• **c**: check constraint • **p**: primary key constraint • **u**: unique constraint • **t**: trigger constraint • **x**: mutual exclusion constraint • **f**: foreign key constraint • **s**: clustering constraint • **i**: invalid constraint
condeferrable	boolean	Whether the constraint can be deferrable • **true**: yes • **false**: no
condeferred	boolean	Whether the constraint can be deferrable by default • **true**: yes • **false**: no
convalidated	boolean	Whether the constraint is valid. Currently, it can be set to **false** only for foreign key and check constraints. • **true**: valid • **false**: invalid
conrelid	oid	Table containing this constraint (**0** if it is not a table constraint)
contypid	oid	Domain containing this constraint (**0** if it is not a domain constraint)
conindid	oid	ID of the index associated with the constraint
confrelid	oid	Referenced table if this constraint is a foreign key. Otherwise, the value is **0**.
confupdtype	"char"	Foreign key update action code • **a**: no action • **r**: restriction • **c**: cascading • **n**: The parameter is set to **null**. • **d**: The default value is used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
confdeltype	"char"	Foreign key deletion action code • **a**: no action • **r**: restriction • **c**: cascading • **n**: The parameter is set to **null**. • **d**: The default value is used.
confmatchtype	"char"	Foreign key match type • **f**: full match • **p**: partial match • **u**: unspecified (The NULL value can be matched if **f** is specified.)
conislocal	boolean	Whether the local constraint is defined for the relationship • **true**: yes • **false**: no
coninhcount	integer	Number of direct inheritance parent tables that this constraint has. When the value is not **0**, the constraint cannot be deleted or renamed.
connoinherit	boolean	Whether the constraint can be inherited • **true**: yes • **false**: no
consoft	boolean	Whether the column indicates an informational constraint • **true**: yes • **false**: no
conopt	boolean	Whether you can use the informational constraint to optimize the execution plan • **true**: yes • **false**: no
conkey	smallint[]	Column list of the constrained control if this column is a table constraint
confkey	smallint[]	List of referenced columns if this column is a foreign key.
conpfeqop	oid[]	ID list of the equality operators for PK = FK comparisons if this column is a foreign key.
conppeqop	oid[]	ID list of the equality operators for PK = PK comparisons if this column is a foreign key.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
conffeqop	oid[]	ID list of the equality operators for FK = FK comparisons if this column is a foreign key.
conexclop	oid[]	ID list of the per-column exclusion operators if this column is an exclusion constraint
conbin	pg_node_tree	Internal representation of the expression if this column is a check constraint
consrc	text	Readable representation of the expression if this column is a check constraint.
conincluding	smallint[]	Not for constraint, but will be included in the attribute column of **INDEX**.

NOTICE

- **consrc** is not updated when referenced objects change and does not track new column names. You are advised to use **pg_get_constraintdef()** to extract the definition of a check constraint.
- **pg_class.relchecks** must agree with the number of check-constraint entries found in the table for each relationship.

15.2.49 PG_CONVERSION

PG_CONVERSION describes encoding conversion information.

Table 15-47 PG_CONVERSION columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
conname	name	-	Conversion name (unique within a namespace)
connamespace	oid	OID in PG_NAMESPACE	OID of the namespace that contains this conversion
conowner	oid	OID in PG_AUTHID	Owner of the conversion
conforencoding	integer	-	Source encoding ID
contoencoding	integer	-	Destination encoding ID
conproc	regproc	**proname** in PG_PROC	Conversion procedure

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
condefault	boolean	-	If this is the default conversion, the value is **true**. Otherwise, the value is **false**.

15.2.50 PG_DATABASE

PG_DATABASE records information about available databases.

Table 15-48 PG_DATABASE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
datname	name	Database name
datdba	oid	Owner of the database, usually the user who created it
encoding	integer	Character encoding for the database
datcollate	name	Sequence used by the database
datctype	name	Character type used by the database
datistemplate	boolean	Whether the database can be used as a template database • **true**: allowed. • **false**: not allowed.
datallowconn	boolean	If the value is **true**, users can connect to the database. If the value is **false**, no one can connect to this database. This column is used to protect the **template0** database from being altered.
datconnlimit	integer	Maximum number of concurrent connections allowed on this database. The value **-1** indicates no limit.
datlastsysoid	oid	Last system OID in the database
datfrozenxid	xid32	Tracks whether the database needs to be vacuumed to prevent transaction ID wraparound. This column is discarded in the current version. To ensure forward compatibility, this column is reserved. The **datfrozenxid64** column is added to record the information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
dattablespace	oid	Default tablespace of the database
datcompatibility	name	Database compatibility mode Currently, four compatible modes are supported: PG, ORA, MYSQL, and TD.
datacl	aclitem[]	Access permission
datfrozenxid64	xid	Tracks whether the database needs to be vacuumed to prevent transaction ID wraparound.
datminmxid	xid	All multi-transaction IDs before this one have been replaced with a transaction ID in the database. This is used to track whether the database needs to be vacuumed in order to prevent transaction ID wraparound or to allow **pg_clog** to be shrunk. It is the minimum value of **pg_class.relminmxid** of all tables in the database.

15.2.51 PG_DB_ROLE_SETTING

PG_DB_ROLE_SETTING records the default values of configuration items bound to each role and database when the database is running.

Table 15-49 PG_DB_ROLE_SETTING columns

Name	Type	Description
setdatabase	oid	Database corresponding to the configuration items (**0** if no database is specified)
setrole	oid	Role corresponding to the configuration items (**0** if no role is specified)
setconfig	text[]	Default value of the configuration item during running. For details about the configuration method, see **Table 11-2**.

15.2.52 PG_DEFAULT_ACL

PG_DEFAULT_ACL records initial permissions assigned to newly created objects.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-50 PG_DEFAULT_ACL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
defaclrole	oid	ID of the role associated with the permission
defaclnamespace	oid	Namespace associated with the permission (**0** if no ID)
defaclobjtype	"char"	Object type of the permission **r** indicates a table or view, **S** indicates a sequence, **f** indicates a function, **T** indicates a type, **K** indicates a client master key, and **k** indicates a column encryption key.
defaclacl	aclitem[]	Access permissions that this type of object should have on creation

15.2.53 PG_DEPEND

PG_DEPEND records the dependency between database objects. This information allows **DROP** commands to find which other objects must be dropped by **DROP CASCADE** or prevent dropping in the **DROP RESTRICT** case.

See also **PG_SHDEPEND**, which performs a similar function for dependencies involving objects that are shared across a database cluster.

Table 15-51 PG_DEPEND columns

Name	Type	Reference	Description
classid	oid	**PG_CLASS**.oid	OID of the system catalog where a dependent object resides
objid	oid	Any OID column	OID of the dependent object
objsubid	integer	-	Column number for a table column (**objid** and **classid** refer to the table itself); **0** for all other object types
refclassid	oid	**PG_CLASS**.oid	OID of the system catalog where a referenced object resides
refobjid	oid	Any OID column	OID of the referenced object

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
refobjsubid	integer	-	Column number for a table column (**refobjid** and **refclassid** refer to the table itself); **0** for all other object types
deptype	"char"	-	A code defining the specific semantics of this dependency

In all cases, a **PG_DEPEND** entry indicates that the referenced object cannot be dropped without also dropping the dependent object. However, there are several subflavors identified by **deptype**:

- DEPENDENCY_NORMAL (n): A normal relationship between separately created objects. The dependent object can be dropped without affecting the referenced object. The referenced object can only be dropped by specifying **CASCADE**, in which case the dependent object is dropped too. Example: a table column has a normal dependency on its data type.
- DEPENDENCY_AUTO (a): The dependent object can be dropped separately from the referenced object, and should be automatically dropped (regardless of RESTRICT or CASCADE mode) if the referenced object is dropped. Example: a named constraint on a table is made autodependent on the table, so that it will go away if the table is dropped.
- DEPENDENCY_INTERNAL (i): The dependent object was created as part of creation of the referenced object, and is only a part of its internal implementation. A DROP of the dependent object will be disallowed outright (We'll tell the user to issue a DROP against the referenced object, instead). A **DROP** of the referenced object will be propagated through to drop the dependent object whether **CASCADE** is specified or not. Example: A trigger created to enforce a foreign-key constraint is made internally dependent on the constraint's **PG_CONSTRAINT** entry.
- DEPENDENCY_EXTENSION (e): The dependent object is a member of the extension of the referenced object (see **PG_EXTENSION**). The dependent object can be dropped only via **DROP EXTENSION** on the referenced object. Functionally this dependency type acts the same as an internal dependency, but it is kept separate for clarity and to simplify **GS_DUMP**.
- DEPENDENCY_PIN (p): There is no dependent object; this type of entry is a signal that the system itself depends on the referenced object, and so that object must never be deleted. Entries of this type are created only by **initdb**. The columns for the dependent object contain zeroes.

15.2.54 PG_DESCRIPTION

PG_DESCRIPTION records optional descriptions (comments) for each database object. Descriptions of many built-in system objects are provided in the initial contents of **PG_DESCRIPTION**.

See also **PG_SHDESCRIPTION**, which provides a similar function for descriptions involving objects that are shared across a database cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-52 PG_DESCRIPTION columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this description pertains to
classoid	oid	PG_CLASS.oid	OID of the system catalog where the object appears
objsubid	integer	-	Column number for a comment on a table column (**objoid** and **classoid** refer to the table itself); **0** for all other object types
description	text	-	Arbitrary text that serves as the description of the object

15.2.55 PG_DIRECTORY

PG_DIRECTORY stores directories added by users. You can run the **CREATE DIRECTORY** statement to add directories to the system catalog. Currently, only system administrators can perform this operation.

Table 15-53 PG_DIRECTORY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
dirname	name	Name of a directory object
owner	oid	Owner of a directory object
dirpath	text	Directory path.
diracl	aclitem[]	Access permissions.

15.2.56 PG_ENUM

PG_ENUM contains entries showing the values and labels for each enumerated type. The internal representation of a given enumerated value is actually the OID of its associated row in **PG_ENUM**.

Table 15-54 PG_ENUM columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
enumtypid	oid	PG_TYPE.oid	OID of the **PG_TYPE** entry owning this enumerated value
enumsortorder	real	-	Sort position of this enumerated value within its enumerated type
enumlabel	name	-	Textual label for this enumerated value

The OIDs for **PG_ENUM** rows follow a special rule: even-numbered OIDs are guaranteed to be ordered in the same way as the sort ordering of their enumerated type. If two even OIDs belong to the same enumerated type, the smaller OID must have the smaller **enumsortorder** value. Odd-numbered OID values need bear no relationship to the sort order. This rule allows the enumerated comparison routines to avoid catalog lookups in many common cases. The routines that create and alter enumerated types attempt to assign even OIDs to enumerated values whenever possible.

When an enumerated type is created, its members are assigned sort-order positions from 1 to *n*. However, members added later might be given negative or fractional values of **enumsortorder**. The only requirement on these values is that they be correctly ordered and unique within each enumerated type.

15.2.57 PG_EXTENSION

PG_EXTENSION records information about the installed extensions. By default, GaussDB provides 14 extensions: PLPGSQL, DIST_FDW, FILE_FDW, LOG_FDW, GC_FDW, PACKAGES, ROACH_API, STREAMING, TSDB, HSTORE, DIMSEARCH, GSREDISTRIBUTE, and SECURITY_PLUGIN.

NOTE

DIMSEARCH is no longer supported in the current version due to specification changes. Do not use it.

Table 15-55 PG_EXTENSION

Name	Type	Description
extname	name	Extension name
extowner	oid	Owner of the extension
extnamespace	oid	Namespace containing the extension's exported objects
extrelocatable	boolean	Whether the extension can be relocated to another namespace. **true**: yes; **false**: no.
extversion	text	Version number of the extension

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
extconfig	oid[]	Configuration information about the extension
extcondition	text[]	Filter conditions for the extension's configuration information

15.2.58 PG_EXTENSION_DATA_SOURCE

PG_EXTENSION_DATA_SOURCE records information about external data sources. An external data source contains information about an external database, such as its password encoding. It is mainly used with Extension Connector. By default, only the sysadmin user can query this system catalog. The current feature is a lab feature. Contact Huawei technical support before using it.

Table 15-56 PG_EXTENSION_DATA_SOURCE columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
srcname	name	-	Name of an external data source
srcowner	oid	PG_AUTHID.oid	Owner of an external data source
srctype	text	-	Type of an external data source. It is **NULL** by default.
srcversion	text	-	Version of an external data source. It is **NULL** by default.
srcacl	aclitem[]	-	Access permissions.
srcoptions	text[]	-	Option used for foreign data sources, expressed in a string in the format of keyword=value

15.2.59 PG_FOREIGN_DATA_WRAPPER

PG_FOREIGN_DATA_WRAPPER records foreign-data wrapper definitions. A foreign-data wrapper is the mechanism by which external data, residing on foreign servers, is accessed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-57 PG_FOREIGN_DATA_WRAPPER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
fdwname	name	-	Name of a foreign-data wrapper
fdwowner	oid	PG_AUTHID.oid	Owner of the foreign-data wrapper
fdwhandler	oid	PG_PROC.oid	References a handler function that is responsible for supplying execution routines for the foreign-data wrapper (**0** if no handler is provided)
fdwvalidator	oid	PG_PROC.oid	References a validator function that is responsible for checking the validity of the options given to the foreign-data wrapper, as well as options for foreign servers and user mappings using the foreign-data wrapper. (**0** if no handler is provided)
fdwacl	aclitem[]	-	Access permissions
fdwoptions	text[]	-	Foreign-data wrapper specific option, expressed in a string in the format of keyword=value

15.2.60 PG_FOREIGN_SERVER

PG_FOREIGN_SERVER records foreign server definitions. A foreign server describes a source of external data, such as a remote server. Foreign servers are accessed via foreign-data wrappers.

Table 15-58 PG_FOREIGN_SERVER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
srvname	name	-	Name of a foreign server
srvowner	oid	PG_AUTHID.oid	Owner of the foreign server
srvfdw	oid	PG_FOREIGN_DATA_WRAPPER.oid	OID of the foreign-data wrapper on this foreign server

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
srvtype	text	-	Type of the server (optional)
srvversion	text	-	Version of the server (optional)
srvacl	aclitem[]	-	Access permissions
srvoptions	text[]	-	Option used for foreign servers, expressed in a string in the format of keyword=value

15.2.61 PG_FOREIGN_TABLE

PG_FOREIGN_TABLE records auxiliary information about foreign tables.

Table 15-59 PG_FOREIGN_TABLE columns

Name	Type	Description
ftrelid	oid	ID of a foreign table
ftserver	oid	Server where the foreign table is located
ftwriteonly	boolean	Whether the foreign table is writable. Values are as follows: • **t** (true): yes • **f** (false): no
ftoptions	text[]	Options of a foreign table. For details, see the syntax description of CREATE FOREIGN TABLE.

15.2.62 PG_HASHBUCKET

PG_HASHBUCKET records hash bucket information.

Table 15-60 PG_HASHBUCKET columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
bucketid	oid	Hash value calculated for a bucket vector. The hash value can be used to accelerate the search for a bucket vector.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
bucketcnt	integer	Number of shards.
bucketmapsize	integer	Total number of shards on all DNs.
bucketref	integer	Reserved column with **1** as its default value
bucketvector	oidvector_extend	Records all bucket IDs contained in the bucket information in this row. A unique index is created in this column. Tables with the same bucket ID share the **PG_HASHBUCKET** data in the same row.

15.2.63 PG_INDEX

PG_INDEX records part of index information. The rest is mostly recorded in **PG_CLASS**.

Table 15-61 PG_INDEX columns

Name	Type	Description
indexrelid	oid	OID of the **PG_CLASS** entry for this index
indrelid	oid	OID of the **PG_CLASS** entry for the table that uses this index
indnatts	smallint	Number of columns in the index
indisunique	boolean	• The index is unique if the value is **true**. • The index is not unique if the value is **false**.
indisprimary	boolean	• Primary key of the table if the value is **true**. **indisunique** should always be **true** when the value of this column is **true**. • The index is not the primary key of the table if the value is **false**.
indisexclusion	boolean	• This index supports exclusion constraints if the value is **true**. • This index does not support exclusion constraints if the value is **false**.
indimmediate	boolean	• A uniqueness check is performed upon data insertion if the value is **true**. • A uniqueness check is not performed upon data insertion if the value is **false**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
indisclustered	boolean	• The table was last clustered on this index if the value is **true**. • The table was not clustered on this index if the value is **false**.
indisusable	boolean	• This index supports INSERT/SELECT if the value is **true**. • This index does not support INSERT/SELECT if the value is **false**.
indisvalid	boolean	This index is valid for queries if the value is **true**. If the value is **false**, the index is possibly incomplete and must still be modified by **INSERT/UPDATE** operations, but it cannot safely be used for queries. If it is a unique index, the uniqueness property is also not **true**.
indcheckxmin	boolean	• If the value is **true**, queries must not use indexes until the xmin of this row in **PG_INDEX** is below their **TransactionXmin**, because the table may contain broken HOT chains with incompatible rows that they can see. • If the value is **false**, queries can use indexes.
indisready	boolean	The index is available for inserted data if the value is **true**. Otherwise, this index is ignored when data is inserted or modified.
indkey	int2vector	This is an array of **indnatts** values indicating that this index creates table columns. For example, a value of **1 3** indicates that the first and the third columns make up the index key. The value **0** in this array indicates that the corresponding index attribute is an expression over the table columns, rather than a simple column reference.
indcollation	oidvector	OID of the collation corresponding to each index column. For details, see the description of **pg_collation**.
indclass	oidvector	For each column in the index key, this contains the OID of the operator class to use. See **PG_OPCLASS** for details.
indoption	int2vector	Array of values that store per-column flag bits. The meaning of the bits is defined by the index's access method.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
indexprs	pg_node_tree	Expression trees (in **nodeToString()** representation) for index attributes that are not simple column references. It is a list with one element for each zero entry in **INDKEY**. The value is **NULL** if all index attributes are simple references.
indpred	pg_node_tree	Expression tree (in **nodeToString()** representation) for partial index predicate. If the index is not a partial index, this column is an empty string.
indisreplident	boolean	• If the value is **true**, the column of this index becomes the decoded column of logical decoding. • If the value is **false**, the column of this index is not the decoded column of logical decoding.
indnkeyatts	smallint	Total number of columns in the index. The columns that exceed the value of **indnatts** are not involved in the index query.

15.2.64 PG_INHERITS

PG_INHERITS records information about table inheritance hierarchies. There is one entry for each direct child table in the database. Indirect inheritance can be determined by following chains of entries.

Table 15-62 PG_INHERITS columns

Name	Type	Reference	Description
inhrelid	oid	PG_CLASS.oid	OID of a child table
inhparent	oid	PG_CLASS.oid	OID of a parent table
inhseqno	integer	-	If there is more than one direct parent for a child table (multiple inheritances), this number tells the order in which the inherited columns are to be arranged. The count starts at 1.

15.2.65 PG_JOB

PG_JOB records detailed information about jobs created by users. Dedicated threads poll the system catalog **PG_JOB** and trigger jobs based on scheduled job execution time, and update job status in **PG_JOB**. This system catalog belongs to the Shared Relation category. All job records are visible to all databases.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-63 PG_JOB columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
job_id	bigint	Job ID, primary key, unique (with a unique index)
current_postgres_pid	bigint	postgres thread ID of the job if the job has been executed. The default value is **-1**, indicating that the job has not yet been executed.
log_user	name	Username of the job creator
priv_user	name	Username of the job executor
dbname	name	Name of the database in which the job will be executed
node_name	name	CN node on which the job will be executed
job_status	"char"	Status of the job. The value can be **r**, **s**, **f**, or **d**. The default value is **s**. The indications are as follows: Status of job step: r=running, s=successfully finished, f=job failed, d=disable If a job fails to be executed for 16 consecutive times, **job_status** is automatically set to **d**, and no more attempt will be made on this job. Note: When you disable a scheduled task (by setting **job_queue_processes** to **0**), the thread that monitors the job execution is not started, and the job status will not be updated. You can ignore this status. Only when the scheduled task function is enabled (**job_queue_processes** is not **0**), the system updates the value of this column based on the real-time job status.
start_date	timestamp without time zone	Start time of the first job execution, accurate to millisecond
next_run_date	timestamp without time zone	Scheduled time of the next job execution, accurate to millisecond
failure_count	smallint	Number of times the job has started and failed. If a job fails to be executed for 16 consecutive times, no more attempt will be made on it.
interval	text	Job execution interval
last_start_date	timestamp without time zone	Start time of the last job execution, accurate to millisecond

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
last_end_date	timestamp without time zone	End time of the last job execution, accurate to millisecond
last_suc_date	timestamp without time zone	Start time of the last successful job execution, accurate to millisecond
this_run_date	timestamp without time zone	Start time of the ongoing job execution, accurate to millisecond
nspname	name	Name of the schema used for job execution
job_name	text	Name of the DBE_SCHEDULER scheduled task.
end_date	timestamp without time zone	Expiration time of the DBE_SCHEDULER scheduled task, accurate to millisecond.
enable	boolean	The DBE_SCHEDULER scheduled task enabling status. The options are as follows: **true**: enabled **false**: disabled
failure_msg	text	Error information about the latest task execution.

15.2.66 PG_JOB_PROC

PG_JOB_PROC records the content of each job in the **PG_JOB** table, including the PL/SQL code blocks and anonymous blocks. This part of job information is **varchar(4000)**. Storing such information in the system catalog **PG_JOB** and loading it to the shared memory will result in excessive memory usage. Therefore, such information is stored in a separate table and is retrieved when needed.

Table 15-64 PG_JOB_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
job_id	integer	Foreign key, which is associated with job_id in the system catalog **PG_JOB**
what	text	Job content, which is the program content in the DBE_SCHEDULER scheduled task.
job_name	text	Name of the DBE_SCHEDULER scheduled task or program.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.2.67 PG_LANGUAGE

PG_LANGUAGE registers programming languages. You can use them and interfaces to write functions or stored procedures.

Table 15-65 PG_LANGUAGE columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
lanname	name	-	Language name
lanowner	oid	OID in **PG_AUTHID**	Owner of the language
lanispl	boolean	-	The value is **false** for internal languages (such as SQL) and **true** for user-defined languages. Currently, **gs_dump** still uses this column to determine which languages need to be dumped, but this might be replaced by a different mechanism in the future.
lanpltrusted	boolean	-	The value is **true** if this is a trusted language, which means that it is believed not to grant access to anything outside the normal SQL execution environment. Only the initial user can create functions in untrusted languages. Otherwise, the value is **false**.
lanplcallfoid	oid	OID in **PG_PROC**	For non-internal languages, this column references the language handler, which is a special function responsible for executing all functions that are written in the particular language.
laninline	oid	OID in **PG_PROC**	This column references a function responsible for executing "inline" anonymous code blocks (DO blocks). The value is **0** if inline blocks are not supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
lanvalidator	oid	OID in PG_PROC	This column references a language validator function responsible for checking the syntax and validity of new functions when they are created. The value is **0** if no validator is provided.
lanacl	aclitem[]	-	Access permission

15.2.68 PG_LARGEOBJECT

PG_LARGEOBJECT records data making up large objects. A large object is identified by an OID assigned when it is created. Each large object is broken into segments or "pages" small enough to be conveniently stored as rows in **PG_LARGEOBJECT**. The amount of data per page is defined as **LOBLKSIZE**.

This system catalog is accessible only to system administrators.

Table 15-66 PG_LARGEOBJECT columns

Name	Type	Reference	Description
loid	oid	PG_LARGEOBJECT_METADATA.oid	Identifier of the large object that includes this page
pageno	integer	-	Page number of this page within its large object (counting from zero)
data	bytea	-	Data stored in the large object. This will never be more than **LOBLKSIZE** bytes and might be less.

Each row of **PG_LARGEOBJECT** holds data for one page of a large object, beginning at byte offset (**pageno * LOBLKSIZE**) within the object. The implementation allows sparse storage: pages might be missing, and might be shorter than **LOBLKSIZE** bytes even if they are not the last page of the object. Missing regions within a large object read as zeroes.

15.2.69 PG_LARGEOBJECT_METADATA

PG_LARGEOBJECT_METADATA records metadata associated with large objects. The actual large object data is stored in **PG_LARGEOBJECT**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-67 PG_LARGEOBJECT_METADATA columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
lomowner	oid	PG_AUTHID.oid	Owner of the large object
lomacl	aclitem[]	-	Access permissions

15.2.70 PG_NAMESPACE

PG_NAMESPACE records namespaces, that is, schema-related information. If the database object isolation attribute is enabled, users can view only the schema information that they have the permission to access.

Table 15-68 PG_NAMESPACE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
nspname	name	Name of a namespace
nspowner	oid	Owner of the namespace
nsptimeline	bigint	Timeline when the namespace is created on the DN. This column is for internal use and valid only on the DN.
nspacl	aclitem[]	Access permission. For details, see **GRANT** and **REVOKE**.
in_redistribution	"char"	Specifies whether the content is in the redistribution state. • **t** (true): yes • **f** (false): no
nspblockchain	boolean	• If the value is **true**, the tamper-proof mode is used. • If the value is **false**, the non-tamper-proof mode is used.

15.2.71 PG_OBJECT

PG_OBJECT records the creator, creation time, and last modification time of objects of specified types (ordinary tables, indexes, sequences, views, stored procedures, and functions).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-69 PG_OBJECT columns

Name	Type	Description
object_oid	oid	Object identifier
object_type	"char"	Object type • **r**: ordinary table • **i**: index • **s**: sequence • **v**: view • **p**: stored procedure and function
creator	oid	ID of the creator
ctime	timestamp with time zone	Creation time of the object
mtime	timestamp with time zone	Last modification time of the object. The modification operations include **ALTER**, **GRANT**, and **REVOKE**.
createcsn	bigint	CSN when an object is created
changecsn	bigint	CSN when DDL operations are performed on a table or an index

NOTICE

- Objects created or modified during database initialization (initdb) cannot be recorded. **PG_OBJECT** does not contain these object records.
- A database upgraded to this version cannot record objects created before the upgrade. **PG_OBJECT** does not contain these object records.
- When the preceding two types of objects are modified again, the modification time (**mtime**) is recorded. Because the creation time of the objects cannot be obtained, **ctime** is empty.
- When an object created before the upgrade is modified again, the modification time (specified by **mtime**) is recorded. When DDL operations are performed on a table or an index, the transaction commit sequence number (specified by **changecsn**) of the transaction to which the table or index belongs is recorded. Because the creation time of the object cannot be obtained, **ctime** and **createcsn** are empty.
- The time recorded by **ctime** and **mtime** is the start time of the transaction to which the current operation belongs.
- The time of object modification due to capacity expansion is also recorded.
- **createcsn** and **changecsn** record the transaction commit sequence number of the transaction to which the current operation belongs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.2.72 PG_OBSSCANINFO

PG_OBSSCANINFO defines OBS runtime information scanned in cluster acceleration scenarios. (Due to specification changes, the current version no longer supports the current feature. Do not use this feature.) Each record corresponds to a piece of runtime information of a foreign table on OBS in a query. (The current feature is a lab feature. Contact Huawei technical support before using it.)

Table 15-70 PG_OBSSCANINFO columns

Name	Type	Reference	Description
query_id	bigint	-	Query ID
user_id	text	-	Database user who performs the query
table_name	text	-	Name of a foreign table on OBS
file_type	text	-	Format of the file that stores underlying data
time_stamp	timestamp with time zone	-	Scanning start time
actual_time	double precision	-	Scanning execution time, in seconds
file_scanned	bigint	-	Number of files scanned
data_size	double precision	-	Size of data scanned, in bytes
billing_info	text	-	Reserved

15.2.73 PG_OPCLASS

PG_OPCLASS defines index access method operator classes.

Each operator class defines semantics for index columns of a particular data type and a particular index access method. An operator class essentially specifies that a particular operator family is applicable to a particular indexable column data type. The set of operators from the family that are actually usable with the indexed column are whichever ones accept the column's data type as their left-hand input.

Table 15-71 PG_OPCLASS columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
opcmethod	oid	OID in **PG_AM**	Index access method operator class served by an operator class
opcname	name	-	Name of the operator class
opcnamespace	oid	OID in **PG_NAMESPACE**	Namespace of the operator class
opcowner	oid	OID in **PG_AUTHID**	Owner of the operator class
opcfamily	oid	OID in **PG_OPFAMILY**	Operator family containing the operator class
opcintype	oid	OID in **PG_TYPE**	Data type that the operator class indexes
opcdefault	boolean	-	The value is **true** if this operator class is the default for **opcintype**.
opckeytype	oid	OID in **PG_TYPE**	Type of data stored in index, or zero if same as **opcintype**

An operator class's **opcmethod** must match the **opfmethod** of its containing operator family.

15.2.74 PG_OPERATOR

PG_OPERATOR records information about operators.

Table 15-72 PG_OPERATOR columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
oprname	name	-	Name of an operator
oprnamespace	oid	OID in **PG_NAMESPACE**	OID of the namespace that contains the operator
oprowner	oid	OID in **PG_AUTHID**	Owner of the operator
oprkind	"char"	-	• **b**: infix ("both") • **l**: prefix ("left") • **r**: postfix ("right")

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
oprcanmerge	boolean	-	Whether the operator supports merge joins • **t** (true): yes • **f** (false): no
oprcanhash	boolean	-	Whether the operator supports hash joins • **t** (true): yes • **f** (false): no
oprleft	oid	OID in **PG_TYPE**	Type of the left operand
oprright	oid	OID in **PG_TYPE**	Type of the right operand
oprresult	oid	OID in **PG_TYPE**	Type of the result
oprcom	oid	OID in **PG_OPERATOR**	Commutator of this operator, if any
oprnegate	oid	OID in **PG_OPERATOR**	Negator of this operator, if any
oprcode	regproc	**proname** in **PG_PROC**	Function that implements the operator
oprrest	regproc	**proname** in **PG_PROC**	Restriction selectivity estimation function for the operator
oprjoin	regproc	**proname** in **PG_PROC**	Join selectivity estimation function for the operator

15.2.75 PG_OPFAMILY

PG_OPFAMILY defines operator families.

Each operator family is a collection of operators and associated support routines that implement semantics specified for a particular index access method. Furthermore, the operators in a family are all compatible, in a way that is specified by the access method. The operator family allows cross-data-type operators to be used with indexes and to be reasoned about using knowledge of access method semantics.

Table 15-73 PG_OPFAMILY columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
opfmethod	oid	PG_AM.oid	Index access method used by an operator family
opfname	name	-	Name of the operator family
opfnamespace	oid	PG_NAMESPACE.oid	Namespace of the operator family
opfowner	oid	PG_AUTHID.oid	Owner of the operator family

The majority of the information defining an operator family is not in its **PG_OPFAMILY** row, but in the associated rows in **PG_AMOP**, **PG_AMPROC**, and **PG_OPCLASS**.

15.2.76 PG_PARTITION

PG_PARTITION records all partitioned tables, table partitions, TOAST tables on table partitions, and index partitions in the database. Partitioned index information is not stored in the system catalog **PG_PARTITION**.

Table 15-74 PG_PARTITION columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
relname	name	Names of the partitioned tables, table partitions, TOAST tables on table partitions, and index partitions
parttype	"char"	Object type • **r**: partitioned table • **p**: table partition • **x**: index partition • **t**: TOAST table
parentid	oid	OID of the partitioned table in **PG_CLASS** when the object is a partitioned table or table partition OID of the partitioned index when the object is an index partition
rangenum	integer	Reserved column
intervalnum	integer	Reserved column

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
partstrategy	"char"	Partition policy of the partitioned table ● **r**: range partition ● **v**: numeric partition
relfilenode	oid	Physical storage locations of the table partition, index partition, and TOAST table on the table partition
reltablespace	oid	OID of the tablespace containing the table partition, index partition, and TOAST table on the table partition
relpages	double precision	Statistics: numbers of data pages of the table partition and index partition
reltuples	double precision	Statistics: numbers of tuples of the table partition and index partition
relallvisible	integer	Statistics: number of visible data pages of the table partition and index partition
reltoastrelid	oid	OID of the TOAST table corresponding to the table partition
reltoastidxid	oid	OID of the TOAST table index corresponding to the table partition
indextblid	oid	OID of the table partition corresponding to the index partition
indisusable	boolean	Whether the index partition is available ● **t** (true): yes ● **f** (false): no
reldeltarelid	oid	OID of a Delta table
reldeltaidx	oid	OID of the index for a Delta table
relcudescrelid	oid	OID of a CU description table
relcudescidx	oid	OID of the index for a CU description table
relfrozenxid	xid32	Frozen transaction ID To ensure forward compatibility, this column is reserved. The **relfrozenxid64** column is added to record the information.
intspnum	integer	Number of tablespaces that the interval partition belongs to
partkey	int2vector	Column number of the partition key

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
intervaltablespace	oidvector	Tablespace that the interval partition belongs to. Interval partitions fall in the tablespaces in the round-robin manner.
interval	text[]	Interval value of the interval partition
boundaries	text[]	Upper boundary of the range partition and interval partition
transit	text[]	Transit of the interval partition
reloptions	text[]	Storage property of a partition used for collecting online scale-out information. Same as **pg_class.reloptions**, it is expressed in a string in the format of keyword=value.
relfrozenxid64	xid	Frozen transaction ID
relminmxid	xid	Frozen multi-transaction ID

15.2.77 PG_PLTEMPLATE

PG_PLTEMPLATE records template information for procedural languages.

Table 15-75 PG_PLTEMPLATE columns

Name	Type	Description
tmplname	name	Name of the language for which this template is used
tmpltrusted	boolean	The value is **true** if the language is considered trusted. Otherwise, the value is **false**.
tmpldbacreate	boolean	The value is **true** if the language is created by the owner of the database. Otherwise, the value is **false**.
tmplhandler	text	Name of the call handler function
tmplinline	text	Name of the anonymous block handler (**NULL** if no name of the block handler exists)
tmplvalidator	text	Name of the verification function (**NULL** if no verification function is available)
tmpllibrary	text	Path of the shared library that implements languages

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tmplacl	aclitem[]	Access permissions for template (not yet used)

15.2.78 PG_PROC

PG_PROC records information about functions or procedures.

Table 15-76 PG_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
proname	name	Function name
pronamespace	oid	OID of the namespace that contains the function
proowner	oid	Owner of the function
prolang	oid	Implementation language or call interface of the function
procost	real	Estimated execution cost
prorows	real	Estimated number of rows that are influenced
provariadic	oid	Data type of parameter element
protransform	regproc	Simplified call method for the function
proisagg	boolean	Whether the function is an aggregate function ● **t** (true): yes ● **f** (false): no
proiswindow	boolean	Whether the function is a window function ● **t** (true): yes ● **f** (false): no
prosecdef	boolean	Whether the function is a security definer (or a "setuid" function) ● **t** (true): yes ● **f** (false): no
proleakproof	boolean	Whether the function has side effects. If no leakproof treatment is provided for parameters, the function throws errors. ● **t** (true): There is no side effect. ● **f** (false): There are side effects.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
proisstrict	boolean	The function returns null if any call parameter is null. In that case, the function is actually not called at all. Functions that are not "strict" must be prepared to process null inputs.
proretset	boolean	The function returns a set (multiple values of a specified data type).
provolatile	"char"	Whether the function's result depends only on its input parameters, or is affected by outside factors. ● **i**: for "immutable" functions, which always deliver the same result for the same inputs. ● **s**: for "stable" functions, whose results (for fixed inputs) do not change within a scan. ● **v**: for "volatile" functions, whose results may change at any time. Use **v** also for functions with side-effects, so that the engine cannot get optimized if volatile functions are called.
pronargs	smallint	Number of parameters
pronargdefaults	smallint	Number of parameters that have default values
prorettype	oid	Data type of return values
proargtypes	oidvector	Array that stores the data types of function parameters. This array includes only input parameters (including **INOUT** parameters), and represents the call signature (interface) of the function.
proallargtypes	oid[]	Array that contains the data types of function parameters. This array includes all parameter types (including **OUT** and **INOUT** parameters); however, if all the parameters are **IN** parameters, this column is null. Note that array subscripting is 1-based, whereas for historical reasons, **proargtypes** is subscripted from 0.
proargmodes	"char"[]	Array with the modes of the function parameters, encoded as follows: ● **i** indicates the IN parameter. ● **o** indicates the OUT parameter. ● **b** indicates the INOUT parameter. ● **v** indicates the VARIADIC parameter. If all the parameters are **IN** parameters, this column is null. Note that subscripts correspond to positions of **proallargtypes**, not **proargtypes**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
proargnames	text[]	Array that stores the names of the function parameters. Parameters without a name are set to empty strings in the array. If none of the parameters have a name, this column is null. Note that subscripts correspond to positions of **proallargtypes**, not **proargtypes**.
proargdefaults	pg_node_tree	Expression tree of the default value. This is the list of **pronargdefaults** elements.
prosrc	text	A definition that describes a function or stored procedure. In an interpreting language, it is the function source code, a link symbol, a file name, or any body content specified when a function or stored procedure is created, depending on how a language or call is used.
probin	text	Additional information about how to call the function. Again, the interpretation is language-specific.
proconfig	text[]	Function's local settings for run-time configuration variables.
proacl	aclitem[]	Access permission. For details, see **GRANT** and **REVOKE**.
prodefaultargpos	int2vector	Position of the input parameter of a function with a default value.
fencedmode	boolean	Execution mode of a function, indicating whether the function is executed in fence or not fence mode. If the execution mode is **fence,** the function is executed in the fork process that is reworked. In the C function created by the user, the default value of fencedmode is **true**, indicating the fence mode. For built-in functions in the system, the fencedmode field is set to **false**, indicating the not fence mode.
proshippable	boolean	Specifies whether the function can be pushed down to DNs for execution. The default value is **false**. • Functions of the **IMMUTABLE** type can always be pushed down to DNs. • Functions of the **STABLE** or **VOLATILE** type can be pushed down to DNs only if their attribute is **SHIPPABLE**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
propackage	boolean	Whether the function supports overloading. The default value is **false**. ● **t** (true): supported. ● **f** (false): not supported.
prokind	"char"	Whether the object is a function or a stored procedure ● **'f'** indicates that the object is a function. ● **'p'** indicates that the object is a stored procedure.
proargsrc	text	Describes the parameter input strings of functions or stored procedures that are compatible with Oracle syntax, including parameter comments. The default value is **NULL**.
proisprivate	boolean	Whether a function is a private function in the package. The default value is **false**.
propackageid	oid	OID of the package to which the function belongs. If the function is not in the package, the value is **0**.
proargtypesext	oidvector_extend	Data type array used to store function parameters when there are a large number of function parameters. This array includes only input parameters (including **INOUT** parameters), and represents the call signature (interface) of the function.
prodefaultargposext	int2vector_extend	Position of the input parameter with a default value when the function has a large number of parameters.
allargtypes	oidvector	All stored procedure parameters (including input parameters, output parameters, and INOUT parameters), regardless of the parameter type.
allargtypesext	oidvector_extend	Data type array used to store function parameters when there are a large number of function parameters. All parameters (including input parameters, output parameters, and INOUT parameters) are included.

15.2.79 PG_PUBLICATION

PG_PUBLICATION contains all publications created in the current database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-77 PG_PUBLICATION columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
pubname	name	Publication name
pubowner	oid	Publication owner
puballtables	boolean	If the value is **true**, this publication automatically includes all tables in the database, including any tables that will be created in the future.
pubinsert	boolean	If the value is **true**, copy the INSERT operation on tables in the publication.
pubupdate	boolean	If the value is **true**, copy the UPDATE operation on tables in the publication.
pubdelete	boolean	If the value is **true**, copy the DELETE operation on tables in the publication.

15.2.80 PG_PUBLICATION_REL

PG_PUBLICATION_REL contains mappings between tables and publications in the current database. This is a many-to-many mapping.

Table 15-78 PG_PUBLICATION_REL columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
prpubid	oid	-	Reference to a publication
prrelid	oid	-	Reference to a table

15.2.81 PG_RANGE

PG_RANGE records information about range types. Entries in **PG_TYPE** are excluded.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-79 PG_RANGE columns

Name	Type	Reference	Description
rngtypid	oid	**PG_TYPE**.oid	OID of the range type
rngsubtype	oid	**PG_TYPE**.oid	OID of the element type (subtype) of this range type
rngcollation	oid	**PG_COLLATION**.oid	OID of the collation used for range comparisons (**0** if none)
rngsubopc	oid	**PG_OPCLASS**.oid	OID of the subtype's operator class used for range comparisons
rngcanonical	regproc	**PG_PROC**.proname	Name of the function to convert a range value into canonical form (**0** if none)
rngsubdiff	regproc	**PG_PROC**.proname	Name of the function to return the difference between two element values as **double precision** (**0** if none)

rngsubopc (together with **rngcollation**, if the element type is collatable) determines the sort ordering used by the range type. **rngcanonical** is used when the element type is discrete.

15.2.82 PG_REPLICATION_ORIGIN

PG_REPLICATION_ORIGIN contains all created replication sources and is shared among all databases in a cluster. Each instance has only one copy of **PG_REPLICATION_ORIGIN**, not one copy per database instance.

Table 15-80 PG_REPLICATION_ORIGIN columns

Name	Type	Description
roident	oid	Unique replication source identifier within a cluster
roname	text	External user-defined replication source name

15.2.83 PG_RESOURCE_POOL

PG_RESOURCE_POOL provides information about database resource pools.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-81 PG_RESOURCE_POOL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
respool_name	name	Name of a resource pool
mem_percent	integer	Percentage of the memory configuration
cpu_affinity	bigint	Value of cores bound to the CPU
control_group	name	Name of the Cgroup where the resource pool is located
active_statements	integer	Maximum number of concurrent statements in the resource pool
max_dop	integer	Maximum scanning concurrency during data redistribution. This column is used for scaling.
memory_limit	name	Maximum memory of the resource pool
parentid	oid	OID of the parent resource pool
io_limits	integer	Upper limit of I/O operations per second. It is counted by ones for column storage and by 10 thousands for row storage.
io_priority	name	I/O priority set for jobs that consume many I/O resources. It takes effect when I/O usage reaches 90%.
nodegroup	name	Name of the logical cluster to which the resource pool belongs. (The current feature is a lab feature. Contact Huawei technical support before using it.)
is_foreign	boolean	Whether the resource pool can be used for users outside the logical cluster. (The current feature is a lab feature. Contact Huawei technical support before using it.) If it is set to **true**, the resource pool controls the resources of common users who do not belong to the current resource pool. If it is set to **false**, the resources of common users who do not belong to the current resource pool are not controlled.
max_worker	integer	Concurrency in a table during data redistribution. This column is used only for scaling.

15.2.84 PG_REWRITE

PG_REWRITE records rewrite rules defined for tables and views.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-82 PG_REWRITE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
rulename	name	Name of a rule
ev_class	oid	Name of the table that uses the rule
ev_attr	smallint	Column to which this rule applies (always **0** to indicate the entire table)
ev_type	"char"	Event type for this rule • 1 = SELECT • 2 = UPDATE • 3 = INSERT • 4 = DELETE
ev_enabled	"char"	Controls the mode in which the rule is triggered. • **O**: The rule is triggered in origin and local modes. • **D**: The rule is disabled. • **R**: The rule is triggered in replica mode. • **A**: The rule is always triggered.
is_instead	boolean	The value is **true** if the rule is of the **INSTEAD** type.
ev_qual	pg_node_tree	Expression tree (in the form of a **nodeToString**() representation) for the rule's qualifying condition
ev_action	pg_node_tree	Query tree (in the form of a **nodeToString**() representation) for the rule's action

15.2.85 PG_RLSPOLICY

PG_RLSPOLICY records row-level access control policies.

Table 15-83 PG_RLSPOLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
polname	name	Name of an access control policy

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
polrelid	oid	OID of the table object on which the row-level access control policy takes effect
polcmd	"char"	SQL operations affected by the row-level access control policy
polpermissive	boolean	Attribute of the row-level access control policy. **t** indicates an expression that uses the OR condition, and **f** indicates an expression that uses the AND condition.
polroles	oid[]	OID list of users affected by the row-level access control policy. If this parameter is not specified, all users are affected.
polqual	pg_node_tree	Expression of the row-level access control policy

15.2.86 PG_SECLABEL

PG_SECLABEL records security labels on database objects.

See also **PG_SHSECLABEL**, which provides a similar function for security labels of database objects that are shared across a database cluster.

Table 15-84 PG_SECLABEL columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this security label pertains to
classoid	oid	**PG_CLASS**.oid	OID of the system catalog where the object appears
objsubid	integer	-	Column number for a security label on a table column
provider	text	-	Label provider associated with the label
label	text	-	Security label applied to the object

15.2.87 PG_SHDEPEND

PG_SHDEPEND records the dependency between database objects and shared objects, such as roles. Based on this information, GaussDB can ensure that those objects are unreferenced before attempting to delete them.

See also **PG_DEPEND**, which provides a similar function for dependencies involving objects within a single database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unlike most system catalogs, **PG_SHDEPEND** is shared across all databases of a cluster. There is only one copy of **PG_SHDEPEND** per database cluster, not one per database.

Table 15-85 PG_SHDEPEND columns

Name	Type	Reference	Description
dbid	oid	PG_DATABASE.oid	OID of the database where a dependent object is (**0** for a shared object)
classid	oid	PG_CLASS.oid	OID of the system catalog where the dependent object is
objid	oid	Any OID column	OID of the dependent object
objsubid	integer	-	Column number for a table column (**objid** and **classid** refer to the table itself); **0** for all other object types
refclassid	oid	PG_CLASS.oid	OID of the system catalog where a referenced object is (must be a shared catalog)
refobjid	oid	Any OID column	OID of the referenced object
deptype	"char"	-	Code segment defining the specific semantics of this dependency relationship. See the following for details.
objfile	text	-	Path of a user-defined C function library file

In all cases, a **PG_SHDEPEND** entry indicates that the referenced object cannot be dropped without also dropping the dependent object. However, there are several subflavors identified by **deptype**:

- SHARED_DEPENDENCY_OWNER (o)

  The referenced object (which must be a role) is the owner of the dependent object.

- SHARED_DEPENDENCY_ACL (a)

  The referenced object (which must be a role) is mentioned in the access control list (ACL) of the dependent object. A **SHARED_DEPENDENCY_ACL** entry is not made for the owner of the object, since the owner will have a **SHARED_DEPENDENCY_OWNER** entry anyway.

- SHARED_DEPENDENCY_PIN (p)

  There is no dependent object. This type of entry is a signal that the system itself depends on the referenced object, and so that object cannot be deleted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Entries of this type are created only by **initdb**. The columns for the dependent object contain zeroes.

- SHARED_DEPENDENCY_ DBPRIV(d)

  The referenced object (must be a role) has the ANY permission on the dependent object (the specified OID of the dependent object corresponds to a row in the **GS_DB_PRIVILEGE** system catalog).

15.2.88 PG_SHDESCRIPTION

PG_SHDESCRIPTION records optional comments for shared database objects. Descriptions can be manipulated with the **COMMENT** command and viewed with psql's **\d** commands.

See also **PG_DESCRIPTION**, which provides a similar function for descriptions involving objects within a single database.

Unlike most system catalogs, **PG_SHDESCRIPTION** is shared across all databases of a cluster. There is only one copy of **PG_SHDESCRIPTION** per cluster, not one per database.

Table 15-86 PG_SHDESCRIPTION columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this description pertains to
classoid	oid	PG_CLASS.oid	OID of the system catalog where the object appears
description	text	-	Arbitrary text that serves as the description of the object

15.2.89 PG_SHSECLABEL

PG_SHSECLABEL records security labels on shared database objects. Security labels can be manipulated with the **SECURITY LABEL** command.

For an easier way to view security labels, see **PG_SECLABELS**.

See also **PG_SECLABEL**, which provides a similar function for security labels involving objects within a single database.

Unlike most system catalogs, **PG_SHSECLABEL** is shared across all databases of a cluster. There is only one copy of **PG_SHSECLABEL** per cluster, not one per database.

Table 15-87 PG_SHSECLABEL columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this security label pertains to

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
classoid	oid	PG_CLASS.oid	OID of the system catalog where the object appears
provider	text	-	Label provider associated with the label
label	text	-	Security label applied to the object

15.2.90 PG_STATISTIC

PG_STATISTIC records statistics about tables and index columns in a database. By default, only the system administrator can access the system catalog. Common users can access the system catalog only after being authorized.

Table 15-88 PG_STATISTIC columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to
starelkind	"char"	Type of an object
staattnum	smallint	Number of the described column in the table, starting from 1
stainherit	boolean	Whether to collect statistics on objects that have inheritance relationship
stanullfrac	real	Percentage of column entries that are null
stawidth	integer	Average stored width, in bytes, of non-null entries
stadistinct	real	Number of distinct, non-null data values in the column for all DNs • A value greater than 0 is the actual number of distinct values. • A value less than 0 is the negative of a multiplier for the number of rows in the table. (For example, **stadistinct=-0.5** indicates that values in a column appear twice on average.) • The value **0** indicates that the number of distinct values is unknown.
stakindN	smallint	Code number stating that the type of statistics is stored in slot N of the **pg_statistic** row Value range: 1 to 5

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
staopN	oid	Operator used to generate the statistics stored in slot N. For example, a histogram slot shows the < operator that defines the sort order of the data. Value range: 1 to 5
stanumbersN	real[]	Numerical statistics of the appropriate type for slot N. The value is **NULL** if the slot does not involve numerical values. Value range: 1 to 5
stavaluesN	anyarray	Column data values of the appropriate type for slot N. The value is **NULL** if the slot type does not store any data values. Each array's element values are actually of the specific column's data type so there is no way to define these columns' type more specifically than anyarray. Value range: 1 to 5
stadndistinct	real	Number of unique non-null data values in the **dn1** column • A value greater than 0 is the actual number of distinct values. • A value less than 0 is the negative of a multiplier for the number of rows in the table. (For example, **stadistinct=-0.5** indicates that values in a column appear twice on average.) • The value **0** indicates that the number of distinct values is unknown.
staextinfo	text	Information about extension statistics. This is reserved.

NOTICE

PG_STATISTIC stores sensitive information about statistical objects, such as MCVs. The system administrator and authorized users can access the **PG_STATISTIC** system catalog to query the sensitive information about the statistical objects.

15.2.91 PG_STATISTIC_EXT

PG_STATISTIC_EXT displays extended statistics of tables in a database, such as statistics of multiple columns. (The current feature is a lab feature. Contact Huawei technical support before using it.) Statistics of expressions will be supported later. You can specify the extended statistics to collect. This system catalog is accessible only to users with the system administrator permission.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-89 PG_STATISTIC_EXT columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.
starelkind	"char"	Type of an object. **'c'** indicates a table, and **'p'** indicates a partition.
stainherit	boolean	Specifies whether to collect statistics for objects that have inheritance relationship. ● **t** (true): yes ● **f** (false): no
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.
stadistinct	real	Number of distinct, non-null data values in the column for all DNs. ● A value greater than 0 is the actual number of distinct values. ● A value less than 0 is the negative of a multiplier for the number of rows in the table. (For example, **stadistinct=-0.5** indicates that values in a column appear twice on average.) ● The value **0** indicates that the number of distinct values is unknown.
stadndistinct	real	Number of unique non-null data values in the **dn1** column. ● A value greater than 0 is the actual number of distinct values. ● A value less than 0 is the negative of a multiplier for the number of rows in the table. (For example, **stadistinct=-0.5** indicates that values in a column appear twice on average.) ● The value **0** indicates that the number of distinct values is unknown.
stakindN	smallint	Code number stating that the type of statistics is stored in slot N of the **pg_statistic** row. Value range: 1 to 5
staopN	oid	Operator used to generate the statistics stored in slot N. For example, a histogram slot shows the < operator that defines the sort order of the data. Value range: 1 to 5
stakey	int2vector	Array of a column ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
stanumbersN	real[]	Numerical statistics of the appropriate type for slot N. The value is **NULL** if the slot does not involve numerical values. Value range: 1 to 5
stavaluesN	anyarray	Column data values of the appropriate type for slot N. The value is **NULL** if the slot type does not store any data values. Each array's element values are actually of the specific column's data type so there is no way to define these columns' type more specifically than anyarray. Value range: 1 to 5
staexprs	pg_node_tree	Expression corresponding to the extended statistics information.

NOTICE

PG_STATISTIC_EXT stores sensitive information about statistical objects, such as MCVs. The system administrator and authorized users can access the **PG_STATISTIC_EXT** system catalog to query the sensitive information about the statistical objects.

15.2.92 PG_SUBSCRIPTION

PG_SUBSCRIPTION contains all existing logical replication subscriptions. This system catalog is accessible only to system administrators.

Unlike most system catalogs, **PG_SUBSCRIPTION** is shared across all databases in a cluster. Each cluster has only one copy of **PG_SUBSCRIPTION**, not one copy per database.

Table 15-90 PG_SUBSCRIPTION columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
subdbid	oid	OID of the database where the subscription is located
subname	name	Subscription name
subowner	oid	Subscription owner

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
subenabled	boolean	If the value is **true**, the subscription is enabled and should be replicated.
subconninfo	text	Information about the connection to the publisher database
subslotname	name	Name of the replication slot in the publisher database If this parameter is left empty, the value is **NONE**.
subsynccommit	text	Value of **synchronous_commit** of the subscription worker
subpublications	text[]	Array containing names of subscribed publications. These are publications referenced from the publisher server.

15.2.93 PG_SYNONYM

PG_SYNONYM records the mapping between synonym object names and other database object names.

Table 15-91 PG_SYNONYM columns

Name	Type	Description
oid	oid	Database object ID
synname	name	Synonym name
synnamespace	oid	OID of the namespace that contains the synonym
synowner	oid	Owner of the synonym, usually the OID of the user who created it
synobjschema	name	Schema name specified by the associated object
synobjname	name	Name of the associated object

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.2.94 PG_TABLESPACE

PG_TABLESPACE records tablespace information.

Table 15-92 PG_TABLESPACE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
spcname	name	Tablespace name
spcowner	oid	Owner of the tablespace, usually the user who created it
spcacl	aclitem[]	Access permissions. For details, see **GRANT** and **REVOKE**.
spcoptions	text[]	Options of the tablespace
spcmaxsize	text	Maximum size of the available disk space, in bytes
relative	boolean	Whether the storage path specified by the tablespace is a relative path • **t (true)**: yes. • **f (false)**: no.

15.2.95 PG_TRIGGER

PG_TRIGGER records trigger information.

Table 15-93 PG_TRIGGER columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
tgrelid	oid	OID of the table where the trigger is located
tgname	name	Trigger name
tgfoid	oid	Trigger OID
tgtype	smallint	Trigger type

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tgenabled	"char"	**O**: The trigger is triggered in origin or local mode. **D**: The trigger is disabled. **R**: The trigger is triggered in replica mode. **A**: The trigger is always triggered.
tgisinternal	boolean	Internal trigger ID. If the value is **true**, it indicates an internal trigger.
tgconstrrelid	oid	Table referenced by the integrity constraint
tgconstrindid	oid	Index of the integrity constraint
tgconstraint	oid	OID of the constraint trigger in **PG_CONSTRAINT**
tgdeferrable	boolean	Whether the constraint trigger is of the DEFERRABLE type • **t (true)**: yes. • **f (false)**: no.
tginitdeferred	boolean	Whether the trigger is of the INITIALLY DEFERRED type • **t (true)**: yes. • **f (false)**: no.
tgnargs	smallint	Number of input parameters of the trigger function
tgattr	int2vector	Column ID specified by the trigger. If no column is specified, an empty array is used.
tgargs	bytea	Parameter transferred to the trigger
tgqual	pg_node_tree	WHEN condition of the trigger (**NULL** if the WHEN condition does not exist)
tgowner	oid	Trigger owner

15.2.96 PG_TS_CONFIG

PG_TS_CONFIG contains entries representing text search configurations. A configuration specifies a particular text search parser and a list of dictionaries to use for each of the parser's output token types.

The parser is shown in the **PG_TS_CONFIG** entry, but the token-to-dictionary mapping is defined by subsidiary entries in **PG_TS_CONFIG_MAP**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-94 PG_TS_CONFIG columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
cfgname	name	-	Text search configuration name
cfgnamespace	oid	PG_NAMESPACE.oid	OID of the namespace that contains the configuration
cfgowner	oid	PG_AUTHID.oid	Owner of the configuration
cfgparser	oid	PG_TS_PARSER.oid	OID of the text search parser for this configuration
cfoptions	text[]	-	Configuration options

15.2.97 PG_TS_CONFIG_MAP

PG_TS_CONFIG_MAP contains entries showing which text search dictionaries should be consulted, and in what order, for each output token type of each text search configuration's parser.

Table 15-95 PG_TS_CONFIG_MAP columns

Name	Type	Reference	Description
mapcfg	oid	PG_TS_CONFIG.oid	OID of the PG_TS_CONFIG entry owning this map entry
maptokentype	integer	-	Token type generated by the configuration's parser
mapseqno	integer	-	Sequence number of a token type when the values of **mapcfg** or **maptokentype** are the same.
mapdict	oid	PG_TS_DICT.oid	OID of the text search dictionary to consult

15.2.98 PG_TS_DICT

PG_TS_DICT contains entries that define text search dictionaries. A dictionary depends on a text search template, which specifies all the implementation functions needed; the dictionary itself provides values for the user-settable parameters supported by the template.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This division of labor allows dictionaries to be created by unprivileged users. The parameters are specified by a text string **dictinitoption**, whose format and meaning vary depending on the template.

Table 15-96 PG_TS_DICT columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
dictname	name	-	Text search dictionary name
dictnamespace	oid	PG_NAMESPACE.oid	OID of the namespace that contains the dictionary
dictowner	oid	PG_AUTHID.oid	Owner of the dictionary
dicttemplate	oid	PG_TS_TEMPLATE.oid	OID of the text search template for the dictionary
dictinitoption	text	-	Initialization option string for the template

15.2.99 PG_TS_PARSER

PG_TS_PARSER contains entries defining text search parsers. A parser is responsible for splitting input text into lexemes and assigning a token type to each lexeme. Since a parser must be implemented by C-language-level functions, creation of new parsers is restricted to database superusers.

Table 15-97 PG_TS_PARSER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
prsname	name	-	Text search parser name
prsnamespace	oid	PG_NAMESPACE.oid	OID of the namespace that contains the parser
prsstart	regproc	PG_PROC.proname	Name of the parser's startup function
prstoken	regproc	PG_PROC.proname	Name of the parser's next-token function

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
prsend	regproc	PG_PROC.proname	Name of the parser's shutdown function
prsheadline	regproc	PG_PROC.proname	Name of the parser's headline function
prslextype	regproc	PG_PROC.proname	Name of the parser's lextype function

15.2.100 PG_TS_TEMPLATE

PG_TS_TEMPLATE contains entries defining text search templates. A template provides a framework for text search dictionaries. Since a template must be implemented by C-language-level functions, templates can be created only by database administrators.

Table 15-98 PG_TS_TEMPLATE columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
tmplname	name	-	Text search template name
tmplnamespace	oid	PG_NAMESPACE.oid	OID of the namespace that contains the template
tmplinit	regproc	PG_PROC.proname	Name of the template's initialization function
tmpllexize	regproc	PG_PROC.proname	Name of the template's lexize function

15.2.101 PG_TYPE

PG_TYPE stores information about data types.

Table 15-99 PG_TYPE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
typname	name	Data type name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
typnamespace	oid	OID of the namespace that contains the type
typowner	oid	Owner of the type
typlen	smallint	Number of bytes in the internal representation of the type for a fixed-size type. It is a negative number for a variable-length type. • The value **-1** indicates a "varlena" type (one that has a length word). • The value **-2** indicates a null-terminated C string.
typbyval	boolean	Specifies whether to pass a value (**true**) or a reference (**false**) when a value of this type is passed internally. **typbyval** is **false** if the type of **typlen** is not **1**, **2**, **4**, or **8**, because values of this type are always passed by reference of this column. **typbyval** can be **false** even if the **typlen** is passed by a parameter of this column.
typtype	"char"	• **b**: base type. • **c**: composite type (for example, a table's row type) • **d**: domain • **p**: pseudo • **r**: range • **e**: enumeration • **o**: set type For details, see **typrelid** and **typbasetype**.
typcategory	"char"	Fuzzy classification of data types, which can be used by parsers as the basis for data conversion.
typispreferred	boolean	The value is **true** if conversion is performed when data meets conversion rules specified by **typcategory**. Otherwise, the conversion is not performed.
typisdefined	boolean	Whether a type has been defined. It is **true** if the type is defined, and **false** if this is a placeholder entry for a not-yet-defined type. When it is **false**, nothing except the type name, namespace, and OID can be relied on.
typdelim	"char"	Character that separates two values of this type when parsing an array input. Note that the delimiter is associated with the array element data type, not the array data type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
typrelid	oid	If this is a composite type (see **typtype**), then this column points to the **PG_CLASS** entry that defines the corresponding table. For a free-standing composite type, the **PG_CLASS** entry does not represent a table, but it is required for the type's **PG_ATTRIBUTE** entries to link to. It is **0** for non-composite type.
typelem	oid	If **typelem** is not **0**, it identifies another row in **PG_TYPE**. The current type can be described as an array yielding values of type **typelem**. A "true" array type has a variable length (**typlen** = **-1**), but some fixed-length types (**typlen** > **0**) also have non-zero **typelem**, for example **name** and **point**. If a fixed-length type has a **typelem**, its internal representation must be a number of values of the **typelem** data type with no other data. Variable-length array types have a header defined by the array subroutines.
typarray	oid	If the value is not **0**, the corresponding type record is available in **PG_TYPE**.
typinput	regproc	Input conversion function (text format)
typoutput	regproc	Output conversion function (text format)
typreceive	regproc	Input conversion function (binary format); **0** for non-input conversion function
typsend	regproc	Output conversion function (binary format); **0** for non-output conversion function
typmodin	regproc	Type modifier input function; **0** if the type does not support modifiers
typmodout	regproc	Type modifier output function; **0** if the type does not support modifiers
typanalyze	regproc	Custom **ANALYZE** function; **0** if the standard function is used

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
typalign	"char"	Alignment required when storing a value of this type. It applies to storage on disks as well as most representations of the value. When multiple values are stored consecutively, such as in the representation of a complete row on disk, padding is inserted before a data of this type so that it begins on the specified boundary. The alignment reference is the beginning of the first datum in the sequence. Possible values are: • **c**: char alignment, that is, no alignment needed • **s**: short alignment (2 bytes on most machines) • **i**: integer alignment (4 bytes on most machines) • **d**: double alignment (8 bytes on many machines, but by no means all) **NOTICE** For types used in system tables, the size and alignment defined in **PG_TYPE** must agree with the way that the compiler lays out the column in a structure representing a table row.
typstorage	"char"	**typstorage** tells for varlena types (those with **typlen = -1**) if the type is prepared for toasting and what the default strategy for attributes of this type should be. Possible values are: • **p**: Values are always stored plain. • **e**: Value can be stored in a secondary relationship (if the relation has one, see **pg_class.reltoastrelid**). • **m**: Values can be stored compressed inline. • **x**: Values can be stored compressed inline or stored in secondary storage. **NOTICE** **m** domains can also be moved out to secondary storage, but only as a last resort (**e** and **x** domains are moved first).
typnotnull	boolean	Whether the type has a NOTNULL constraint. Currently, it is used for domains only.
typbasetype	oid	If this is a domain (see **typtype**), then **typbasetype** identifies the type that this one is based on. The value is **0** if this type is not a derived type.
typtypmod	integer	Records the **typtypmod** to be applied to domains' base types by domains (the value is **–1** if the base type does not use **typmod**). This is **–1** if this type is not a domain.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
typndims	integer	Number of array dimensions for a domain that is an array (**typbasetype** is an array type; the domain's **typelem** matches the base type's **typelem**). This is **0** for types other than domains over array types.
typcollation	oid	Sorting rule of a specified type. For details about the values, see the **PG_COLLATION** system catalog. (**0** if sequencing is not supported)
typdefaultbin	pg_node_tree	**nodeToString()** representation of a default expression for the type if the value is non-null. Currently, this column is only used for domains.
typdefault	text	The value is **NULL** if a type has no associated default value. If **typdefaultbin** is not set to **NULL**, **typdefault** must contain a default expression represented by **typdefaultbin**. If **typdefaultbin** is **NULL** and **typdefault** is not, then **typdefault** is the external representation of the type's default value, which can be fed to the type's input converter to produce a constant.
typacl	aclitem[]	Access permission

15.2.102 PG_USER_MAPPING

PG_USER_MAPPING records mappings from local users to remote.

This system catalog is accessible only to system administrators. Common users can query the **PG_USER_MAPPINGS** view.

Table 15-100 PG_USER_MAPPING columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
umuser	oid	**PG_AUTHID**.oid	OID of the local role being mapped (**0** if the user mapping is public)
umserver	oid	**PG_FOREIGN_SERVER**.oid	OID of the foreign server that contains the mapping
umoptions	text[]	-	User mapping specific options, expressed in a string in the format of keyword=value

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.2.103 PG_USER_STATUS

PG_USER_STATUS provides the states of users who access the database. This system catalog is accessible only to users with the system administrator permission.

Table 15-101 PG_USER_STATUS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
roloid	oid	ID of a role
failcount	integer	Number of failed attempts
locktime	timestamp with time zone	Time at which the role is locked
rolstatus	smallint	Role state • **0**: normal • **1**: The role is locked for a specific period of time because the failed login attempts exceed the threshold. • **2**: The role is locked by the administrator.
permspace	bigint	Size of the permanent table storage space used by a role
tempspace	bigint	Size of the temporary table storage space used by a role
password expired	smallint	Whether a password is valid. • **0**: The password is valid. • **1**: The password is invalid.

15.2.104 PG_WORKLOAD_GROUP

PG_WORKLOAD_GROUP provides workload group information in the database.

Table 15-102 PG_WORKLOAD_GROUP columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
workload_gpname	name	Workload group name
respool_oid	oid	ID bound to the resource pool

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
act_statements	integer	Maximum number of active statements in the workload group

15.2.105 PGXC_CLASS

PGXC_CLASS records replicated or distributed information for each table.

Table 15-103 PGXC_CLASS columns

Name	Type	Description
pcrelid	oid	OID of the table
pclocatortype	"char"	Locator type • **H**: Hash • **G**: Range • **L**: List • **M**: Modulo • **N**: Round Robin • **R**: Replication
pchashalgorithm	smallint	Distributed tuple using the hash algorithm
pchashbuckets	smallint	Value of a harsh container
pgroup	name	Name of the node
redistributed	"char"	Indicates that a table has been redistributed.
redis_order	integer	Redistribution sequence. Tables whose values are **0** will not be redistributed in this round of redistribution.
pcattnum	int2vector	Column number used as a distributed key
nodeoids	oidvector_extend	List of distributed table node OIDs
options	text	Extension status information. This is a reserved column in the system.

15.2.106 PGXC_GROUP

PGXC_GROUP records information about storage node groups.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-104 PGXC_GROUP columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
group_name	name	Name of a node group
in_redistribution	"char"	Whether redistribution is required. The value must be one of the following: • **n**: The node group is not redistributed. • **y**: The source node group is in redistribution. • **t**: The destination node group is in redistribution.
group_members	oidvector_extend	Node OID list of the node group
group_buckets	text	Distributed data bucket group
is_installation	boolean	Whether to install a sub-cluster • **t** (true): yes • **f** (false): no
group_acl	aclitem[]	Access permission
group_kind	"char"	Node group type. The value can be **i**, **n**, **v**, or **e**. • **i**: installation node group • **n**: node group in a common, non-logical cluster • **v**: node group in a logical cluster (The current feature is a lab feature. Contact Huawei technical support before using it.) • **e**: elastic cluster
group_parent	oid	For a child node group, this field indicates the OID of the parent node group. For a parent node group, this field is left blank.

15.2.107 PGXC_NODE

PGXC_NODE records information about cluster nodes.

Table 15-105 PGXC_NODE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
node_name	name	Node name
node_type	"char"	Node type • **C**: CN • **D**: DN • **S**: standby DN.
node_port	integer	Port ID of the node
node_host	name	Host name or IP address of a node. (If a virtual IP address is configured, its value is a virtual IP address.)
node_port1	integer	Port number of a replication node
node_host1	name	Host name or IP address of a replication node. (If a virtual IP address is configured, its value is a virtual IP address.)
hostis_primary	boolean	Whether a switchover occurs between the primary and standby servers on the current node • **t** (true): yes • **f** (false): no
nodeis_primary	boolean	Whether the current node is preferred to execute non-query operations in the **replication** table • **t** (true): yes • **f** (false): no
nodeis_preferred	boolean	Whether the current node is preferred to execute queries in the **replication** table • **t** (true): yes • **f** (false): no
node_id	integer	Node identifier. The value is obtain by calculating the value of **node_name** using the hash function.
sctp_port	integer	Port used by the TCP proxy communication library or SCTP communication library (Due to specification changes, the current version no longer supports the current feature. Do not use this feature.) of the primary node to listen on the data channel
control_port	integer	Port used by the TCP proxy communications library of the primary node to listen on the control channel

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sctp_port1	integer	Port used by the TCP proxy communication library or SCTP communication library (Due to specification changes, the current version no longer supports the current feature. Do not use this feature.) of the standby node to listen on the data channel
control_port1	integer	Port used by the TCP proxy communications library of the standby node to listen on the control channel
nodeis_central	boolean	Whether the current node is a central control node. It is used only for CNs and is invalid for DNs. • **t** (true): yes • **f** (false): no
nodeis_active	boolean	Indicates whether the current node is normal. It is used to mark whether the CN is removed and is invalid for DNs. • **t** (true): yes • **f** (false): no

15.2.108 PGXC_REDISTB

PGXC_REDISTB is created during scale-out for each database to record the redistribution status of user tables. It will be deleted after scale-out. Only users with the **connect** permission can view the information.

Table 15-106

Name	Type	Description
relname	name	Name of a user table.
nspname	name	Name of the tablespace that contains the table.
pcrelid	oid	OID of a table.
pclocatortype	character	Locator type. H: hash M: Modulo N: Round Robin R: Replicate
pchashalgorithm	smallint	Distributed tuple using the hash algorithm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
pchashbuckets	smallint	Value of a harsh container.
pgroup	name	Node group to which a table belongs.
redistributed	character	Catalog status. **i**: Table is being redistributed. **y**: Table redistribution is complete. **n**: Table has not been redistributed. **d**: The redistribution is complete, but the temporary table has not been deleted.
redis_order	interger	Table redistribution sequence. The default value is **1024**. The value **0** indicates that the table is not redistributed. A smaller value indicates that the table is redistributed first.
pcattnum	int2vector	Column number used as a distribution key.
nodeoids	oidvector_extend	Node ID of the node group where the table is located.
internal_mask	integer	Whether reloption contains internal information. Values are as follows: **0X0**: The internal mask is disabled. **0X8000**: The internal mask is enabled. **0X01**: The insert operation is not allowed in this table. **0X02**: The delete operation is not allowed in this table. **0X04**: The alter operation is not allowed in this table. **0X08**: The select operation is not allowed in this table. **0X0100**: The update operation is not allowed in this table.
table_size	bigint	Size of a table, in bytes.

15.2.109 PGXC_SLICE

PGXC_SLICE is a system catalog created for recording range distribution and list distribution details. Currently, range interval cannot be used to automatically scale out shards. It is reserved in the system catalog.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-107 PGXC_SLICE columns

Name	Type	Description
relname	name	Table name or shard name, which is distinguished by **type**.
type	"char"	When the value is **t**, relname indicates the table name. When the value is **s**, relname indicates the shard name.
strategy	"char"	**r**: range distribution table **l**: list distribution table This value will be extended for subsequent interval shards.
relid	oid	OID of the distribution table to which the tuple belongs.
referenceoid	oid	OID of the referenced distribution table, which is used for slice reference table creation syntax.
sindex	integer	Position of the current boundary in a shard when the table is a list distribution table.
interval	text[]	Reserved column
transitboundary	text[]	Reserved column
transitno	integer	Reserved column
nodeoid	oid	When **relname** is set to a shard name, **nodeoid** indicates the OID of the DN where the shard data is stored.
boundaries	text[]	When **relname** is set to a shard name, this parameter indicates the boundary value of the shard.
specified	boolean	Check whether the DN corresponding to the current segment is explicitly specified in the DDL.
sliceorder	integer	User-defined shard sequence.

15.2.110 PLAN_TABLE_DATA

PLAN_TABLE_DATA stores plan information collected by **EXPLAIN PLAN**. Different from the **PLAN_TABLE** view, the system catalog **PLAN_TABLE_DATA** stores **EXPLAIN PLAN** information collected by all sessions and users.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-108 PLAN_TABLE_DATA columns

Name	Type	Description
session_id	text	Session that inserts the data. Its value consists of a service thread start timestamp and a service thread ID. Values are constrained by **NOT NULL**.
user_id	oid	User who inserts the data. Values are constrained by **NOT NULL**.
statement_id	character varying(30)	Query tag specified by a user
plan_id	bigint	Query plan ID. The ID is automatically generated in the plan generation phase and is used by kernel engineers for debugging.
id	integer	Node ID in a plan
operation	character varying(30)	Operation description
options	character varying(255)	Operation action
object_name	name	Name of an operated object. It is defined by users.
object_type	character varying(30)	Object type
object_owner	name	Schema to which an object belongs. It is defined by users.
projection	character varying(4000)	Returned column information
cost	double precision	Execution cost estimated by the optimizer for an operator
cardinality	double precision	Number of rows estimated by the optimizer for an operator

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- **PLAN_TABLE_DATA** records data of all users and sessions on the current node. Only administrators can access all the data. Common users can view their own data in the **PLAN_TABLE** view.
- Data of inactive (exited) sessions is cleaned from **PLAN_TABLE_DATA** by **gs_clean** after being stored in this system catalog for a certain period of time (5 minutes by default). You can also manually run **gs_clean -C** to delete inactive session data from the table. For details, see **"Server Tools > gs_clean"** in **Tool Reference**.
- Data is automatically inserted into **PLAN_TABLE_DATA** after **EXPLAIN PLAN** is executed. Therefore, do not manually insert data into or update data in **PLAN_TABLE_DATA**. Otherwise, data in **PLAN_TABLE_DATA** may be disordered. When you need to delete data from a table, it is recommended that you use the **PLAN_TABLE** view or see "Server Tools > gs_clean" in the *Tool Reference*.
- Information in the **statement_id**, **object_name**, **object_owner**, and **projection** columns is stored in letter cases specified by users and information in other columns is stored in uppercase.

15.2.111 STATEMENT_HISTORY

STATEMENT_HISTORY displays information about execution statements on the current node. To query this system catalog, you must have the sysadmin permission. The result can be queried only in the system database but cannot be queried in the user database.

The constraints on the query of this system catalog are as follows:

- Data must be queried in the Postgres database. No data exists in other databases.
- This system catalog is controlled by **track_stmt_stat_level**. The default value is **OFF,L0**, where the first part controls full SQL statements, and the second part controls slow SQL statements. For details about the record level of each field, see the following table.
- For slow SQL statements, if the value of **track_stmt_stat_level** is not **OFF** and the SQL execution time exceeds the value of **log_min_duration_statement**, the SQL statement is recorded as a slow SQL statement.

Table 15-109 STATEMENT_HISTORY columns

Name	Type	Description	Record Level
db_name	name	Database name.	L0
schema_name	name	Schema name.	L0
origin_node	integer	Node name.	L0
user_name	name	Username.	L0
application_name	text	Name of the application that sends a request.	L0

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Record Level
client_addr	text	IP address of the client that sends a request.	L0
client_port	integer	Port number of the client that sends a request.	L0
unique_query_id	bigint	ID of the normalized SQL statement.	L0
debug_query_id	bigint	ID of the unique SQL statement.	L0
query	text	Normalized SQL (available only on CNs).	L0
start_time	timestamp with time zone	Time when a statement starts.	L0
finish_time	timestamp with time zone	Time when a statement ends.	L0
slow_sql_threshold	bigint	Standard for slow SQL statement execution.	L0
transaction_id	bigint	Transaction ID.	L0
thread_id	bigint	ID of an execution thread.	L0
session_id	bigint	Session ID of a user.	L0
n_soft_parse	bigint	Number of soft parsing times. The value of **n_soft_parse** plus **n_hard_parse** may be greater than that of **n_calls** because **n_calls** does not count the subquery.	L0
n_hard_parse	bigint	Number of hard parsing times. The value of **n_soft_parse** plus **n_hard_parse** may be greater than that of **n_calls** because **n_calls** does not count the subquery.	L0
query_plan	text	Statement execution plan.	L1
n_returned_rows	bigint	Number of rows in the result set returned by the SELECT statement.	L0
n_tuples_fetched	bigint	Number of rows randomly scanned.	L0

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Record Level
n_tuples_returned	bigint	Number of rows sequentially scanned.	L0
n_tuples_inserted	bigint	Number of rows inserted.	L0
n_tuples_updated	bigint	Number of rows updated.	L0
n_tuples_deleted	bigint	Number of rows deleted.	L0
n_blocks_fetched	bigint	Number of buffer block access times.	L0
n_blocks_hit	bigint	Number of buffer block hits.	L0
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: μs).	L0
cpu_time	bigint	CPU time (unit: μs).	L0
execution_time	bigint	Execution time in the executor (unit: μs).	L0
parse_time	bigint	SQL parsing time (unit: μs).	L0
plan_time	bigint	SQL plan generation time (unit: μs).	L0
rewrite_time	bigint	SQL rewriting time (unit: μs).	L0
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: μs).	L0
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: μs).	L0
data_io_time	bigint	I/O time (unit: μs).	L0
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with customer service ends, and CNs communicate with DNs through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.	L0

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Record Level
net_recv_info	text	Network status of messages received through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with customer service ends, and CNs communicate with DNs through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.	L0
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.	L0
net_stream_recv_info	text	Network status of messages received through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.	L0
lock_count	bigint	Number of locks.	L0
lock_time	bigint	Time required for locking.	L1
lock_wait_count	bigint	Number of lock waits.	L0
lock_wait_time	bigint	Time required for lock waiting.	L1

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Record Level
lock_max_count	bigint	Maximum number of locks.	L0
lwlock_count	bigint	Number of lightweight locks (reserved).	L0
lwlock_wait_count	bigint	Number of lightweight lock waits.	L0
lwlock_time	bigint	Time required for lightweight locking (reserved).	L1
lwlock_wait_time	bigint	Time required for lightweight lock waiting.	L1
details	bytea	List of statement lock events, which are recorded in chronological order. The number of records is affected by the **track_stmt_details_size** parameter. This column is binary and needs to be read using the parsing function **pg_catalog.statement_detail_decode**. For details, see **Table 12-63**. Events include: Start locking. Complete locking. Start lock waiting. Complete lock waiting. Start unlocking. Complete unlocking. Start lightweight lock waiting. Complete lightweight lock waiting.	L2
is_slow_sql	boolean	Specifies whether the SQL statement is a slow SQL statement. • **t** (true): yes • **f** (false): no	L0
trace_id	text	Driver-specific trace ID, which is associated with an application request.	L0

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Record Level
advise	text	Risks which may cause slow SQL statements. (Multiple risks may exist at the same time.) • **Cast Function Cause Index Miss.**: Index matching may fail due to implicit conversion. • **Limit too much rows.**: The SQL statement execution may slow down due to a large **limit** value. • **Proleakproof of function is false.**: The **proleakproof** of the function is set to **false**. In this case, the function does not use statistics when generating a plan due to data leakage risks. As a result, the accuracy of the generated plan is affected and the SQL statement execution may slow down.	L0

15.2.112 STREAMING_STREAM

STREAMING_STREAM records the metadata of all STREAM objects.

Table 15-110 STREAMING_STREAM column

Name	Type	Description
relid	oid	STREAM object ID.
queries	bytea	Bitmap mapping of the CONTVIEW corresponding to the STREAM.

15.2.113 STREAMING_CONT_QUERY

STREAMING_CONT_QUERY records the metadata of all CONTVIEW objects.

Table 15-111 STREAMING_CONT_QUERY columns

Name	Type	Description
id	integer	Unique identifier of the CONTVIEW object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
type	"char"	CONTVIEW type. ● **'c'** indicates that the CONTVIEW is based on the column-store model. ● **'r'** indicates that the CONTVIEW is based on the row-store model. ● **'p'** indicates that the CONTVIEW is based on the partitioned column-store model.
relid	oid	CONTVIEW object ID.
defrelid	oid	ID of the continuous computing rule view corresponding to CONTVIEW.
active	boolean	Whether the CONTVIEW is in the continuous computing state. ● **t** (true): yes ● **f** (false): no
streamrelid	oid	ID of STREAM corresponding to CONTVIEW.
matrelid	oid	ID of the materialized table corresponding to CONTVIEW.
lookupidxid	oid	ID of GROUP LOOK UP INDEX corresponding to CONTVIEW. This column is for internal use and is available only in row-store tables.
step_factor	smallint	CONTVIEW step mode. The main values are **0** (no overlapping window) and **1** (sliding window, with one step).
ttl	integer	Value of **ttl_interval** set by CONTVIEW.
ttl_attno	smallint	Number of a time column corresponding to the TTL function set by CONTVIEW.
dictrelid	oid	ID of the dictionary table corresponding to CONTVIEW.
grpnum	smallint	Number of dimension columns in the CONTVIEW continuous computing rule. This column is for internal use.
grpidx	int2vector	Index of the dimension column in TARGET LIST in the CONTVIEW continuous computing rule. This column is for internal use.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.2.114 STREAMING_REAPER_STATUS

STREAMING_REAPER_STATUS records the status information about the reaper thread of the streaming engine. Due to specification changes, the current version no longer supports the current feature. Do not use this feature.

Table 15-112 STREAMING_REAPER_STATUS columns

Name	Type	Description
id	integer	Unique identifier of the CONTVIEW object.
contquery_name	name	Name of the CONTVIEW object.
gather_interval	text	Value of **gather_interval** (time parameter for automatically aggregating historical data before a specific time) set by the CONTVIEW object.
gather_completion_time	text	Time when the latest GATHER (historical data aggregation) of the CONTVIEW object is completed.

15.3 System Views

15.3.1 ADM_COL_COMMENTS

ADM_COL_COMMENTS displays information about table column comments in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 15-113 ADM_COL_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Table owner
table_name	character varying(64)	Table name
column_name	character varying(64)	Column name
comments	text	Comments

15.3.2 ADM_CONS_COLUMNS

ADM_CONS_COLUMNS displays information about constraint columns in database tables. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the **PG_CATALOG** and **SYS** schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-114 ADM_CONS_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Constraint creator
column_name	character varying(64)	Name of a constraint-related column
constraint_name	character varying(64)	Constraint name
position	smallint	Position of the column in the table
table_name	character varying(64)	Name of a constraint-related table

15.3.3 ADM_CONSTRAINTS

ADM_CONSTRAINTS displays information about table constraints in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 15-115 ADM_CONSTRAINTS columns

Name	Type	Description
owner	character varying(64)	Constraint creator
constraint_name	character varying(64)	Constraint name
constraint_type	text	Constraint type • **c**: check constraint • **f**: foreign key constraint • **p**: primary key constraint • **u**: unique constraint
table_name	character varying(64)	Name of a constraint-related table
index_owner	character varying(64)	Owner of a constraint-related index (only for the unique constraint and primary key constraint)
index_name	character varying(64)	Name of the constraint-related index (only for the unique constraint and primary key constraint)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.4 ADM_DATA_FILES

ADM_DATA_FILES displays the description of database files. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 15-116 ADM_DATA_FILES columns

Name	Type	Description
tablespace_name	name	Name of the tablespace to which a file belongs
bytes	double precision	Length of the file in bytes

15.3.5 ADM_HIST_SNAPSHOT

ADM_HIST_SNAPSHOT records the index information and start time of WDR snapshots stored in the current system. By default, only the system administrator can access this view. Common users can access the view only after being authorized.

Table 15-117 ADM_HIST_SNAPSHOT columns

Name	Type	Description
SNAP_ID	bigint	WDR snapshot ID
BEGIN_INTERVAL_TIME	timestamp	Start time of a WDR snapshot

15.3.6 ADM_HIST_SQL_PLAN

ADM_HIST_SQL_PLAN displays plan information collected by the current user by running the **EXPLAIN PLAN** statement.

Table 15-118 ADM_HIST_SQL_PLAN columns

Name	Type	Description
SQL_ID	character varying(30)	Session that inserts the data. Its value consists of a service thread start timestamp and a service thread ID. Values are constrained by **NOT NULL**.
PLAN_HASH_VALUE	bigint	Query ID
OPERATION	character varying(30)	Operation description

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
OPTIONS	character varying(255)	Operation action
OBJECT_NAME	name	Name of an operated object. It is defined by users.

15.3.7 ADM_HIST_SQLSTAT

ADM_HIST_SQLSTAT displays information about statements executed on the current node.

Table 15-119 ADM_HIST_SQLSTAT columns

Name	Type	Description
INSTANCE_NUMBER	integer	Instance ID of a snapshot.
SQL_ID	bigint	Query ID
PLAN_HASH_VALUE	bigint	ID of the normalized SQL statement.
MODULE	text	Name of the module that is executing when the SQL statement is first parsed.
ELAPSED_TIME_DELTA	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: μs)
CPU_TIME_DELTA	bigint	CPU time (unit: μs)
EXECUTIONS_DELTA	integer	Increment in the number of executions that have occurred on this object since it was brought into the cache.
IOWAIT_DELTA	bigint	I/O time (unit: μs)
APWAIT_DELTA	integer	Delta value of the application wait time.
ROWS_PROCESSED_DELTA	bigint	Number of rows in the result set returned by the **SELECT** statement
SNAP_ID	integer	Unique snapshot ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.8 ADM_INDEXES

ADM_INDEXES displays all indexes in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 15-120 ADM_INDEXES columns

Name	Type	Description
owner	character varying(64)	Index owner
index_name	character varying(64)	Index name
table_name	character varying(64)	Name of the table corresponding to the index
uniqueness	text	Whether the index is a unique index
partitioned	character(3)	Whether the index has the property of partitioned tables
generated	character varying(1)	Whether the index name is generated by the system

15.3.9 ADM_IND_COLUMNS

ADM_IND_COLUMNS displays column information about all indexes in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 15-121 ADM_IND_COLUMNS columns

Name	Type	Description
index_owner	character varying(64)	Index owner
index_name	character varying(64)	Index name
table_owner	character varying(64)	Table owner
table_name	character varying(64)	Table name
column_name	name	Column name
column_position	smallint	Position of the column in the index

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.10 ADM_IND_EXPRESSIONS

ADM_IND_EXPRESSIONS displays information about expression indexes in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 15-122 ADM_IND_EXPRESSIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner
table_name	character varying(64)	Table name
index_owner	character varying(64)	Index owner
index_name	character varying(64)	Index name
column_expression	text	Function-based index expression of a specified column
column_position	smallint	Position of the column in the index

15.3.11 ADM_IND_PARTITIONS

ADM_IND_PARTITIONS displays information about all index partitions in the database. Each index partition of a partitioned table in the database, if present, has a row of records in **ADM_IND_PARTITIONS**. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 15-123 ADM_IND_PARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Name of the owner of the partitioned table index to which an index partition belongs
index_name	character varying(64)	Index name of the partitioned table index to which the index partition belongs
partition_name	character varying(64)	Name of the index partition
def_tablespace_name	name	Tablespace name of the index partition

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
high_value	text	Upper limit of the partition corresponding to the index partition
index_partition_usable	boolean	Whether the index partition is available • **t** (true): yes • **f** (false): no
schema	character varying(64)	Schema of the partitioned table index to which the index partition belongs

15.3.12 ADM_OBJECTS

ADM_OBJECTS displays all database objects in the database. Only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 15-124 ADM_OBJECTS columns

Name	Type	Description
owner	name	Object owner
object_name	name	Object name
object_id	oid	OID of the object
object_type	name	Object class. For example, table, schema, and index.
namespace	oid	Namespace containing the object
created	timestamp with time zone	Creation time of the object
last_ddl_time	timestamp with time zone	Last time when the object was modified

NOTICE

For details on the value ranges of **created** and **last_ddl_time**, see **PG_OBJECT**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.13 ADM_PART_INDEXES

ADM_PART_INDEXES displays information about all partitioned table indexes in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 15-125 ADM_PART_INDEXES columns

Name	Type	Description
def_tablespace_name	name	Tablespace name of the partitioned table index
index_owner	character varying(64)	Name of the owner of a partitioned table index
index_name	character varying(64)	Name of the partitioned table index
partition_count	bigint	Number of index partitions of the partitioned table index
partitioning_key_count	integer	Number of partition keys of the partitioned table
partitioning_type	text	Partition policy of the partitioned table **NOTE** Only range partitioning is supported.
schema	character varying(64)	Name of the schema to which the partitioned table index belongs
table_name	character varying(64)	Name of the partitioned table to which the partitioned table index belongs

15.3.14 ADM_PART_TABLES

ADM_PART_TABLES displays information about all partitioned tables in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 15-126 ADM_PART_TABLES columns

Name	Type	Description
table_owner	character varying(64)	Owner name of a partitioned table

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
table_name	character varying(64)	Name of the partitioned table
partitioning_type	text	Partition policy of the partitioned table **NOTE** Only range partitioning is supported.
partition_count	bigint	Number of partitions in the partitioned table
partitioning_key_count	integer	Number of partition keys of the partitioned table
def_tablespace_name	name	Tablespace name of the partitioned table
schema	character varying(64)	Schema of the partitioned table

15.3.15 ADM_PROCEDURES

ADM_PROCEDURES displays information about all stored procedures and functions in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 15-127 ADM_PROCEDURES columns

Name	Type	Description
owner	character varying(64)	Owner of a stored procedure or function
object_name	character varying(64)	Name of the stored procedure or function
argument_number	smallint	Number of input parameters in the stored procedure

15.3.16 ADM_SEQUENCES

ADM_SEQUENCES displays information about all sequences in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the **PG_CATALOG** and **SYS** schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-128 ADM_SEQUENCES columns

Name	Type	Description
sequence_owner	character varying(64)	Owner of a sequence
sequence_name	character varying(64)	Name of a sequence
min_value	int16	Minimum value of a sequence
max_value	int16	Maximum value of a sequence
increment_by	int16	Increment of a sequence
last_number	int16	Value of the previous sequence
cache_size	int16	Size of the sequence disk cache
cycle_flag	character(1)	Whether a sequence is a cycle sequence. The value can be **Y** or **N**. • **Y**: It is a cycle sequence. • **N**: It is not a cycle sequence.

15.3.17 ADM_SCHEDULER_JOBS

ADM_SCHEDULER_JOBS displays information about all DBE_SCHEDULER scheduled tasks in the database.

Table 15-129 ADM_SCHEDULER_JOBS columns

Name	Type	Description
owner	name	Owner of a scheduled task.
job_name	text	Name of a scheduled task.
job_style	text	Action mode of a scheduled task.
job_creator	name	Creator of a scheduled task.
program_name	text	Name of the program referenced by a scheduled task.
job_action	text	Program content of a scheduled task.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
number_of_arguments	text	Number of parameters of a scheduled task.
schedule_name	text	Name of the schedule referenced by a scheduled task.
start_date	timestamp without time zone	Start time of a scheduled task.
repeat_interval	text	Period of a scheduled task.
end_date	timestamp without time zone	End time of a scheduled task.
job_class	text	Name of the scheduled task class to which a scheduled task belongs.
enabled	boolean	Status of a scheduled task.
auto_drop	text	Status of the automatic deletion function of a scheduled task.
state	"char"	Status of a scheduled task.
failure_count	smallint	Number of scheduled task failures.
last_start_date	timestamp without time zone	Last time when a scheduled task was started.
next_run_date	timestamp without time zone	Next execution time of a scheduled task.
destination	text	Target name of a scheduled task.
credential_name	text	Certificate name of a scheduled task.
comments	text	Comments of a scheduled task.

15.3.18 ADM_SOURCE

ADM_SOURCE displays all stored procedures or functions in the database, and it provides columns defined by the stored procedures or functions. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-130 ADM_SOURCE columns

Name	Type	Description
owner	character varying(64)	Owner of a stored procedure or function
name	character varying(64)	Name of the stored procedure or function
text	text	Definition of the stored procedure or function

15.3.19 ADM_SYNONYMS

ADM_SYNONYMS displays all synonyms in the database. This view is accessible only to system administrators. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 15-131 ADM_SYNONYMS columns

Name	Type	Description
owner	text	Owner of a synonym
schema_name	text	Name of the schema to which the synonym belongs
synonym_name	text	Synonym name
table_owner	text	Owner of the associated object. Although the column is called **table_owner**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_name	text	Name of the associated object. Although the column is called **table_name**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
table_schema_name	text	Schema name of the associated object. Although the column is called **table_schema_name**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.

15.3.20 ADM_TABLES

ADM_TABLES displays all tables in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 15-132 ADM_TABLES columns

Name	Type	Description
owner	character varying(64)	Table owner
table_name	character varying(64)	Table name
tablespace_name	character varying(64)	Tablespace name of the table
dropped	character varying	Whether the current record is deleted • **YES**: The record is deleted. • **NO**: The record is not deleted.
num_rows	numeric	Estimated number of rows in the table
status	character varying(8)	Whether the current record is valid
temporary	character(1)	Whether the table is a temporary table • **Y**: The table is a temporary table. • **N**: The table is not a temporary table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.21 ADM_TABLESPACES

ADM_TABLESPACES displays information about available tablespaces. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 15-133 ADM_TABLESPACES columns

Name	Type	Description
tablespace_name	character varying(64)	Tablespace name

15.3.22 ADM_TAB_COLUMNS

ADM_TAB_COLUMNS displays columns in tables. Each column in a table of the database has a row in **ADM_TAB_COLUMNS**. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 15-134 ADM_TAB_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Table owner
table_name	character varying(64)	Table name
column_name	character varying(64)	Column name
data_type	character varying(128)	Data type of the column
data_length	integer	Length of the column, in bytes
data_precision	integer	Precision of the data type. This parameter is valid for the numeric data type and **NULL** for other types.
data_scale	integer	Number of decimal places. This parameter is valid for the numeric data type and **0** for other data types.
nullable	bpchar	Whether the column can be empty (**n** for the primary key constraint and non-null constraint)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
column_id	integer	Sequence number of the column when the table is created
avg_col_len	numeric	Average length of a column, in bytes
char_length	numeric	Column length (in the unit of bytes) which is valid only for varchar, nvarchar2, bpchar, and char types.
comments	text	Specifies the comment content.

15.3.23 ADM_TAB_COMMENTS

ADM_TAB_COMMENTS displays comments about all tables and views in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 15-135 ADM_TAB_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Owner of a table or view
table_name	character varying(64)	Name of the table or view
comments	text	Comments

15.3.24 ADM_TAB_PARTITIONS

ADM_TAB_PARTITIONS stores information about all partitions in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 15-136 ADM_TAB_PARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Role name
table_name	character varying(64)	Relational table name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
partition_name	character varying(64)	Partition name
high_value	text	Upper boundary of the range partition and interval partition
tablespace_name	name	Tablespace name of the partitioned table
schema	character varying(64)	Name of a namespace

15.3.25 ADM_TRIGGERS

ADM_TRIGGERS displays information about triggers in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 15-137 ADM_TRIGGERS columns

Name	Type	Description
trigger_name	character varying(64)	Trigger name
table_owner	character varying(64)	Role name
table_name	character varying(64)	Relational table name
status	character varying(64)	• **O**: The trigger is initiated in origin or local mode. • **D**: The trigger is disabled. • **R**: The trigger is initiated in replica mode. • **A**: The trigger is always initiated.

15.3.26 ADM_TYPE_ATTRS

ADM_TYPE_ATTRS displays the attributes of the current database object type.

Table 15-138 ADM_TYPE_ATTRS columns

Name	Type	Description
OWNER	oid	Owner of the type
TYPE_NAME	name	Data type name
ATTR_NAME	name	Column name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
ATTR_TYPE_MOD	integer	Type-specific data supplied at the table creation time (for example, the maximum length of a **varchar** column). This column is used as the third parameter when passing to type-specific input functions and length coercion functions. The value will generally be **–1** for types that do not need ATTTYPMOD.
ATTR_TYPE_OWNER	oid	Owner of an attribute of this type
ATTR_TYPE_NAME	name	Data type attribute name
LENGTH	smallint	Number of bytes in the internal representation of the type for a fixed-size type. It is a negative number for a variable-length type. ● The value **–1** indicates a "varlena" type (one that has a length word). ● The value **–2** indicates a null-terminated C string.
PRECISION	integer	Precision of the numeric type
SCALE	integer	Range of the numeric type
CHARACTER_SET_NAME	character(1)	Character set name of an attribute (**c** or **n**)
ATTR_NO	smalllint	Attribute number
INHERITED	character(1)	Specifies whether the attribute is inherited from the super type (**Y** or **N**).

15.3.27 ADM_USERS

ADM_USERS displays all usernames in the database. This view is accessible only to system administrators. This view exists in both PG_CATALOG and SYS schema.

Table 15-139 ADM_USERS columns

Name	Type	Description
username	character varying(64)	Name of a user

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.28 ADM_VIEWS

ADM_VIEWS displays views in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schema.

Table 15-140 ADM_VIEWS columns

Name	Type	Description
owner	character varying(64)	Owner of a view
view_name	character varying(64)	View name

15.3.29 COMM_CLIENT_INFO

COMM_CLIENT_INFO stores information about active client connections of a single node (Query the display of the view on DNs and CNs connect information on DNs). By default, only the users with system administrator permission can access this view.

Table 15-141 COMM_CLIENT_INFO columns

Name	Type	Description
node_name	text	Name of the current DN, for example, dn_6001_6002_6003.
app	text	Query a view on a DN. The app displays the client connected to the current DN, such as the coordinator (CN), GTM, or DN.
tid	bigint	Thread ID of the current thread
lwtid	integer	Lightweight thread ID of the current thread
query_id	bigint	Query ID. It is equivalent to **debug_query_id**.
socket	integer	**socket fd** is displayed if the connection is a physical connection.
remote_ip	text	Peer node IP address
remote_port	text	Peer node port
logic_id	integer	Displayed if the connection is a logical connection

15.3.30 DB_ALL_TABLES

DB_ALL_TABLES displays tables or views accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-142 DB_ALL_TABLES columns

Name	Type	Description
owner	name	Owner of a table or view
table_name	name	Name of the table or view
tablespace_name	name	Tablespace where the table or view is located

15.3.31 DB_CONSTRAINTS

DB_CONSTRAINTS displays information about constraints accessible to the current user. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 15-143 DB_CONSTRAINTS columns

Name	Type	Description
owner	character varying(64)	Constraint creator
constraint_name	character varying(64)	Constraint name
constraint_type	text	Constraint type • **c**: check constraint • **f**: foreign key constraint • **p**: primary key constraint • **u**: unique constraint
table_name	character varying(64)	Name of a constraint-related table
index_owner	character varying(64)	Owner of a constraint-related index (only for the unique constraint and primary key constraint)
index_name	character varying(64)	Name of the constraint-related index (only for the unique constraint and primary key constraint)

15.3.32 DB_CONS_COLUMNS

DB_CONS_COLUMNS displays information about constraint columns accessible to the current user. This view exists in the **PG_CATALOG** and **SYS** schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-144 DB_CONS_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Constraint creator
constraint_name	character varying(64)	Constraint name
table_name	character varying(64)	Name of a constraint-related table
column_name	character varying(64)	Name of a constraint-related column
position	smallint	Position of the column in the table

15.3.33 DB_DEPENDENCIES

DB_DEPENDENCIES displays dependencies between functions and advanced packages accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

NOTICE

In GaussDB, this table is empty without any record due to information constraints.

Table 15-145 DB_DEPENDENCIES columns

Name	Type	Description
owner	character varying(30)	Object owner
name	character varying(30)	Object name
type	character varying(17)	Object class
referenced_owner	character varying(30)	Owner of a referenced object
referenced_name	character varying(64)	Name of the referenced object
referenced_type	character varying(17)	Type of the referenced object
referenced_link_name	character varying(128)	Name of the link to the referenced object
schemaid	numeric	ID of the current schema

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
dependency_type	character varying(4)	Dependency type (**REF** indicates soft reference and **HARD** indicates direct description).

15.3.34 DB_IND_COLUMNS

DB_IND_COLUMNS displays all index columns accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 15-146 DB_IND_COLUMNS columns

Name	Type	Description
index_owner	character varying(64)	Index owner
index_name	character varying(64)	Index name
table_owner	character varying(64)	Table owner
table_name	character varying(64)	Table name
column_name	name	Column name
column_position	smallint	Position of the column in the index

15.3.35 DB_IND_EXPRESSIONS

DB_IND_EXPRESSIONS displays information about expression indexes accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 15-147 DB_IND_EXPRESSIONS columns

Name	Type	Description
index_owner	character varying(64)	Index owner
index_name	character varying(64)	Index name
table_owner	character varying(64)	Table owner
table_name	character varying(64)	Table name
column_expression	text	Function-based index expression of a specified column

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
column_position	smallint	Position of the column in the index

15.3.36 DB_INDEXES

DB_INDEXES displays information about indexes accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 15-148 DB_INDEXES columns

Name	Type	Description
owner	character varying(64)	Index owner
index_name	character varying(64)	Index name
table_name	character varying(64)	Name of the table corresponding to the index
uniqueness	text	Whether the index is a unique index
partitioned	character(3)	Whether the index has the property of partitioned tables
generated	character varying(1)	Whether the index name is generated by the system

15.3.37 DB_OBJECTS

DB_OBJECTS displays all database objects accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 15-149 DB_OBJECTS columns

Name	Type	Description
owner	name	Object owner
object_name	name	Object name
object_id	oid	OID of the object
object_type	name	Object class
namespace	oid	ID of the namespace where the object resides

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
created	timestamp with time zone	Creation time of the object
last_ddl_time	timestamp with time zone	Last time when the object was modified

NOTICE

For details on the value ranges of **created** and **last_ddl_time**, see **PG_OBJECT**.

15.3.38 DB_PROCEDURES

DB_PROCEDURES displays information about all stored procedures or functions accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 15-150 DB_PROCEDURES columns

Name	Type	Description
owner	name	Object owner
object_name	name	Object name

15.3.39 DB_SEQUENCES

DB_SEQUENCES displays all sequences accessible to the current user. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 15-151 DB_SEQUENCES columns

Name	Type	Description
sequence_owner	name	Owner of a sequence
sequence_name	name	Name of the sequence
min_value	int16	Minimum value of the sequence
max_value	int16	Maximum value of the sequence
last_number	int16	Value of the previous sequence
cache_size	int16	Size of the sequence disk cache

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
increment_by	int16	Value by which the sequence is incremented
cycle_flag	character(1)	Whether a sequence is a cycle sequence. The value can be **Y** or **N**. • **Y**: It is a cycle sequence. • **N**: It is not a cycle sequence.

15.3.40 DB_SOURCE

DB_SOURCE displays information about stored procedures or functions accessible to the current user, and provides columns defined by the stored procedures and functions. This view exists in both PG_CATALOG and SYS schema.

Table 15-152 DB_SOURCE columns

Name	Type	Description
owner	name	Object owner
name	name	Object name
type	name	Object class
text	text	Definition of the object

15.3.41 DB_SYNONYMS

DB_SYNONYMS displays all synonyms accessible to the current user.

Table 15-153 DB_SYNONYMS columns

Name	Type	Description
owner	text	Owner of a synonym
schema_name	text	Name of the schema to which the synonym belongs
synonym_name	text	Synonym name
table_owner	text	Owner of the associated object Although the column is called **table_owner**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
table_name	text	Name of the associated object Although the column is called **table_name**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_schema_name	text	Schema name of the associated object Although the column is called **table_schema_name**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.

15.3.42 DB_TAB_COLUMNS

DB_TAB_COLUMNS displays description information about columns of tables accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 15-154 DB_TAB_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Table owner
table_name	character varying(64)	Table name
column_name	character varying(64)	Column name
data_type	character varying(128)	Data type of the column
data_length	integer	Length of the column, in bytes
data_precision	integer	Precision of the data type. This parameter is valid for the numeric data type and **NULL** for other types.
data_scale	integer	Number of decimal places. This parameter is valid for the numeric data type and **0** for other data types.
nullable	bpchar	Whether the column can be empty (**n** for the primary key constraint and non-null constraint)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
column_id	integer	Column ID generated when the object is created or column is added
char_length	numeric	Length of the column, in characters. This parameter is valid only for the varchar, nvarchar2, bpchar, and char types.
avg_col_len	numeric	Average length of a column, in bytes
comments	text	Specifies the comment content.

15.3.43 DB_TAB_COMMENTS

DB_TAB_COMMENTS displays comments about all tables and views accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 15-155 DB_TAB_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Owner of a table or view
table_name	character varying(64)	Name of the table or the view
comments	text	Comments

15.3.44 DB_COL_COMMENTS

DB_COL_COMMENTS displays comment information about table columns accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 15-156 DB_COL_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Table owner
table_name	character varying(64)	Table name
column_name	character varying(64)	Column name
comments	text	Comments

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.45 DB_TABLES

DB_TABLES displays all tables accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 15-157 DB_TABLES columns

Name	Type	Description
owner	character varying(64)	Table owner
table_name	character varying(64)	Table name
tablespace_name	character varying(64)	Tablespace name of the table
num_rows	numeric	Estimated number of rows in the table
status	character varying(8)	Whether the current record is valid
temporary	character(1)	Whether the table is a temporary table • **Y**: The table is a temporary table. • **N**: The table is not a temporary table.
dropped	character varying	Whether the current record is deleted • **YES**: The record is deleted. • **NO**: The record is not deleted.

15.3.46 DB_TRIGGERS

DB_TRIGGERS displays information about triggers accessible to the current user. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 15-158 DB_TRIGGERS columns

Name	Type	Description
trigger_name	character varying(64)	Trigger name
table_owner	character varying(64)	Role name
table_name	character varying(64)	Relational table name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
status	character varying(64)	• **O**: The trigger is enabled in origin or local mode. • **D**: The trigger is disabled. • **R**: The trigger is enabled in replica mode. • **A**: The trigger is always enabled.

15.3.47 DB_USERS

DB_USERS displays all users of the database visible to the current user. However, it does not describe the users. By default, only the system administrator can access this view. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 15-159 DB_USERS columns

Name	Type	Description
user_id	oid	OID of a user
username	name	Name of a user

15.3.48 DB_VIEWS

DB_VIEWS displays the description about all views accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 15-160 DB_VIEWS columns

Name	Type	Description
owner	name	Owner of a view
view_name	name	View name
text	text	Text in the view
text_length	integer	Text length of the view

15.3.49 DV_SESSIONS

DV_SESSIONS displays all session information about the current session. By default, only the system administrator can access this view. Common users can access the view only after being authorized.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-161 DV_SESSIONS columns

Name	Type	Description
sid	bigint	OID of the active background thread of the current session
serial#	integer	Sequence number of the active background thread, which is **0** in GaussDB
user#	oid	OID of the user that has logged in to the background thread (**0** if the background thread is a global auxiliary thread)
username	name	Username of the user that has logged in to the background thread. (null if the background thread is a global auxiliary thread) The **application_name** can be identified by associating with **pg_stat_get_activity()**. Example: select s.*,a.application_name from DV_SESSIONS as s left join pg_stat_get_activity(NULL) as a on s.sid=a.sessionid;

15.3.50 DV_SESSION_LONGOPS

DV_SESSION_LONGOPS displays the progress of ongoing operations. The view can be accessed only after being authorized.

Table 15-162 DV_SESSION_LONGOPS columns

Name	Type	Description
sid	bigint	OID of the running background process
serial#	integer	Sequence number of the running background process, which is **0** in GaussDB
sofar	integer	Completed workload, which is empty in GaussDB
totalwork	integer	Total workload, which is empty in GaussDB

15.3.51 GET_GLOBAL_PREPARED_XACTS

GET_GLOBAL_PREPARED_XACTS records prepared transactions on all nodes globally.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-163 GET_GLOBAL_PREPARED_XACTS columns

Name	Type	Description
transaction	xid	XID of a prepared transaction
gid	text	GID of the prepared transaction
prepared	timestamp with time zone	Prepared time of the prepared transaction
owner	name	Owner of the prepared transaction
database	name	Database to which the prepared transaction belongs
node_name	text	Name of the node where the prepared transaction resides

15.3.52 GLOBAL_BAD_BLOCK_INFO

GLOBAL_BAD_BLOCK_INFO is executed on the CN to collect statistics on damaged data pages of all instances. The basic information about damaged pages is displayed in the query result. The execution result on the DN is empty. Based on the information, you can use the page detection and repair function in **Data Damage Detection and Repair Functions** to perform further repair operations. By default, only initial users, users with the **sysadmin** permission, users with the O&M administrator permission in the O&M mode, and monitoring users can view the information. Other users can view the information only after being granted with permissions.

Table 15-164 GLOBAL_BAD_BLOCK_INFO columns

Name	Type	Description
node_name	text	Information about the node where the current damaged page is located
spc_node	oid	ID of the tablespace corresponding to the current damaged page
db_node	oid	ID of the database corresponding to the current damaged page
rel_node	oid	Relfilenode of the relation corresponding to the current damaged page
bucket_node	integer	Bucket node of the current damaged page. It is set to **–1** for a non-segment-page table and to a value other than 0 for a segment-page table. This column is used to specify whether a table is a segment-page table during repair.
block_num	oid	Page number of the current damaged page

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
fork_num	integer	File forknum of the current damaged page
file_path	text	Relative path of the current damaged page. The logical path instead of the actual file is displayed for a segment-page table.
check_time	timestamp with time zone	Time when an error is detected on the current damaged page
repair_time	timestamp with time zone	Time when the current damaged page is repaired

15.3.53 GLOBAL_CLEAR_BAD_BLOCK_INFO

GLOBAL_CLEAR_BAD_BLOCK_INFO is executed on the CN to clear information about repaired pages in all instances. The execution result on DNs is empty. By default, only initial users, users with the **sysadmin** permission, users with the O&M administrator permission in the O&M mode, and monitoring users can view the information. Other users can view the information only after being granted with permissions.

Table 15-165 GLOBAL_BAD_BLOCK_INFO columns

Name	Type	Description
node_name	text	Node information corresponding to the current repaired page clearance result
result	boolean	Execution result of clearing repaired pages of the current instance

15.3.54 GLOBAL_COMM_CLIENT_INFO

GLOBAL_COMM_CLIENT_INFO queries information about active client connections of global nodes in a cluster. By default, only the system administrator has the permission to access this system view.

Table 15-166 GLOBAL_COMM_CLIENT_INFO columns

Name	Type	Description
node_name	text	Current node name.
app	text	app
tid	bigint	Thread ID of the current thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
lwtid	integer	Lightweight thread ID of the current thread.
query_id	bigint	Query ID. It is equivalent to **debug_query_id**.
socket	integer	Displayed if the connection is a physical connection.
remote_ip	text	Peer node IP address.
remote_port	text	Peer node port.
logic_id	integer	Displayed if the connection is a logical connection.

15.3.55 GLOBAL_STAT_HOTKEYS_INFO

GLOBAL_STAT_HOTKEYS_INFO queries the statistics of hotspot keys in the entire cluster. The query results are sorted by **count** in descending order.

Table 15-167 GLOBAL_STAT_HOTKEYS_INFO columns

Name	Type	Description
database_name	text	Name of the database where the hotspot key is located.
schema_name	text	Name of the schema where the hotspot key is located.
table_name	text	Name of the table where the hotspot key is located.
key_value	text	Value of a hotspot key.
hash_value	bigint	Hash value of the hotspot key in the database. If the table is a list or range distribution table, the value of this field is **0**.
count	numeric	Frequency of accessing the hotspot key.

15.3.56 GLOBAL_WAL_SENDER_STATUS

GLOBAL_WAL_SENDER_STATUS displays the redo log transfer and replay status of the primary DN in the current cluster. This view can be viewed only by the users with monitor admin and sysadmin permission.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-168 GLOBAL_WAL_SENDER_STATUS column

Name	Type	Description
nodename	text	Name of the primary node
source_ip	text	IP address of the primary node
source_port	integer	Port of the primary node
dest_ip	text	IP address of the standby node
dest_port	integer	Port of the standby node
sender_pid	integer	PID of the sending thread
local_role	text	Type of the primary node
peer_role	text	Type of the standby node
peer_state	text	Status of the standby node
state	text	WAL sender status
sender_sent_location	text	Sending position of the primary node
sender_write_location	text	Writing position of the primary node
sender_flush_location	text	Flushing position of the primary node
sender_replay_location	text	Redo position of the primary node
receiver_received_location	text	Receiving position of the standby node
receiver_write_location	text	Writing position of the standby node
receiver_flush_location	text	Flushing location of the standby node
receiver_replay_location	text	Redo location of the standby node

15.3.57 GS_ALL_CONTROL_GROUP_INFO

GS_ALL_CONTROL_GROUP_INFO displays all Cgroup information in a database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-169 GS_ALL_CONTROL_GROUP_INFO columns

Name	Type	Description
name	text	Name of a Cgroup
type	text	Type of the Cgroup • **GROUP_NONE**: no group. • **GROUP_TOP**: top group. • **GROUP_CLASS**: class group of the resource, which does not control any thread. • **GROUP_BAKWD**: backend thread control group. • **GROUP_DEFWD**: default control group, which controls only the query threads at this level. • **GROUP_TSWD**: time-sharing control group of each user, which controls the query thread at the bottom layer.
gid	bigint	Cgroup ID
classgid	bigint	ID of the **Class** Cgroup to which a **Workload** Cgroup belongs
class	text	**Class** Cgroup
workload	text	Workload Cgroup
shares	bigint	CPU quota allocated to the Cgroup
limits	bigint	Limit of CPUs allocated to the Cgroup
wdlevel	bigint	**Workload** Cgroup level
cpucores	text	Usage of CPU cores in the Cgroup

15.3.58 GS_AUDITING

GS_AUDITING displays all audit information about database-related operations. Only the users with system administrator or security policy administrator permission can access this view.

Table 15-170 GS_AUDITING columns

Name	Type	Description
polname	name	Policy name, which must be unique.
pol_type	text	Audit policy type. The value can be **access** or **privilege**. • **access**: DML operations are audited. • **privilege**: DDL operations are audited.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
polenabled	boolean	Specifies whether to enable the policy. • **t (true)**: enabled. • **f (false)**: disabled.
access_type	name	DML database operation type. For example, SELECT, INSERT, and DELETE.
label_name	name	Specifies the resource label name. This parameter corresponds to the **polname** column in the **GS_AUDITING_POLICY** system catalog.
priv_object	text	Describes the path of the database asset.
filter_name	text	Logical character string of a filter criterion.

15.3.59 GS_AUDITING_ACCESS

GS_AUDITING_ACCESS displays all audit information about database DML-related operations. Only the users with system administrator or security policy administrator permission can access this view.

Table 15-171 GS_AUDITING_ACCESS columns

Name	Type	Description
polname	name	Policy name, which must be unique.
pol_type	text	Audit policy type. The value **access** indicates that DML operations are audited.
polenabled	boolean	Specifies whether to enable the policy. • **t** (true): enabled • **f** (false): disabled
access_type	name	DML database operation type. For example, SELECT, INSERT, and DELETE.
label_name	name	Specifies the resource label name. This parameter corresponds to the **polname** column in the **GS_AUDITING_POLICY** system catalog.
access_object	text	Describes the path of the database asset.
filter_name	text	Logical character string of a filter criterion.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.60 GS_AUDITING_PRIVILEGE

GS_AUDITING_PRIVILEGE displays all audit information about database DDL-related operations. Only the users with system administrator or security policy administrator permission can access this view.

Name	Type	Description
polname	name	Policy name, which must be unique.
pol_type	text	Audit policy type. The value **privilege** indicates that DDL operations are audited.
polenabled	boolean	Specifies whether to enable the policy. • **t (true)**: enabled. • **f (false)**: disabled.
access_type	name	DDL database operation type. For example, CREATE, ALTER, and DROP.
label_name	name	Specifies the resource label name. This parameter corresponds to the **polname** column in the **GS_AUDITING_POLICY** system catalog.
priv_object	text	Full domain name of a database object.
filter_name	text	Logical character string of a filter criterion.

15.3.61 GS_CLUSTER_RESOURCE_INFO

GS_CLUSTER_RESOURCE_INFO displays all DNs resource summaries. This view can be queried only when **enable_dynamic_workload** is set to **on** and the view cannot be executed on DNs. Only the user with sysadmin permission can query this view.

Table 15-172 GS_CLUSTER_RESOURCE_INFO columns

Name	Type	Description
min_mem_util	integer	Minimum memory usage of a DN
max_mem_util	integer	Maximum memory usage of the DN
min_cpu_util	integer	Minimum CPU usage of the DN
max_cpu_util	integer	Maximum CPU usage of the DN
min_io_util	integer	Minimum I/O usage of the DN
max_io_util	integer	Maximum I/O usage of the DN
used_mem_rate	integer	Maximum physical memory usage

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.62 GS_DB_PRIVILEGES

GS_DB_PRIVILEGES displays the granting of ANY permissions. Each record corresponds to a piece of authorization information.

Table 15-173 GS_DB_PRIVILEGES columns

Name	Type	Description
rolename	name	Username
privilege_type	text	ANY permission of a user. For details about the value, see **Table 12-124**.
admin_option	text	Whether the ANY permission recorded in the **privilege_type** column can be re-granted • **yes** • **no**

15.3.63 GS_GET_CONTROL_GROUP_INFO

GS_GET_CONTROL_GROUP_INFO displays information about all Cgroups. Only the user with sysadmin permission can query this view.

Table 15-174 GS_GET_CONTROL_GROUP_INFO columns

Name	Type	Description
group_name	text	Name of a Cgroup.
group_type	text	Type of the Cgroup. • **GROUP_NONE**: no group. • **GROUP_TOP**: top group. • **GROUP_CLASS**: class group of the resource, which does not control any thread. • **GROUP_BAKWD**: backend thread control group. • **GROUP_DEFWD**: default control group, which controls only the query threads at this level. • **GROUP_TSWD**: time-sharing control group of each user, which controls the query thread at the bottom layer.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
gid	bigint	Cgroup ID.
classgid	bigint	ID of the **Class** Cgroup to which a **Workload** Cgroup belongs.
class	text	**Class** Cgroup.
group_workload	text	Workload Cgroup.
shares	bigint	CPU quota allocated to the Cgroup.
limits	bigint	Limit of CPUs allocated to the Cgroup.
wdlevel	bigint	Workload Cgroup level.
cpucores	text	Usage of CPU cores in the Cgroup.
nodegroup	text	Node group name.
group_kind	text	Node group type. The value must be one of the following: • **i**: installation node group • **n**: node group in a common, non-logical cluster • **v**: node group in a logical cluster (The current feature is a lab feature. Contact Huawei technical support before using it.) • **e**: elastic cluster

15.3.64 GS_GSC_MEMORY_DETAIL

GS_GSC_MEMORY_DETAIL displays the global SysCache memory usage of the current process on the current node. The data is displayed only when Global SysCache is enabled.

Note that the query is separated by the database memory context. Therefore, some memory statistics are missing. The memory context corresponding to the missing memory statistics is **GlobalSysDBCache**.

The current feature is a lab feature. Contact Huawei technical support before using it.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-175 GS_GSC_MEMORY_DETAIL columns

Name	Type	Description
db_id	text	Database ID.
totalsize	numeric	Total size of the shared memory, in bytes.
freesize	numeric	Remaining size of the shared memory, in bytes.
usedsize	numeric	Used size of the shared memory, in bytes.

15.3.65 GS_LABELS

GS_LABELS displays all configured resource labels. Only the users with system administrator or security policy administrator permission can access this view.

Name	Type	Description
labelname	name	Resource label name
labeltype	name	Resource label type This parameter corresponds to the **labeltype** column in the GS_POLICY_LABEL system catalog.
fqdntype	name	Database resource type. For example, table, schema, and index.
schemaname	name	Name of the schema to which the database resource belongs
fqdnname	name	Database resource name
columnname	name	Name of the database resource column. If the marked database resource is not a column, this parameter is left blank.

15.3.66 GS_LSC_MEMORY_DETAIL

GS_LSC_MEMORY_DETAIL displays the memory usage of the local system cache of all threads based on the MemoryContext node. The data is displayed only when Global SysCache is enabled.

The current feature is a lab feature. Contact Huawei technical support before using it.

Table 15-176 GS_LSC_MEMORY_DETAIL columns

Name	Type	Description
threadid	text	Thread start time + thread ID (string: *timestamp.sessionid*)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tid	bigint	Thread ID
thrdtype	text	Thread type. It can be any thread type in the system, such as postgresql and wlmmonitor.
contextname	text	Name of the memory context
level	smallint	Hierarchy of the memory context
parent	text	Name of the parent memory context
totalsize	bigint	Total size of the memory context, in bytes
freesize	bigint	Total size of released memory in the memory context, in bytes
usedsize	bigint	Total size of used memory in the memory context, in bytes

15.3.67 GS_MASKING

GS_MASKING displays all configured dynamic masking policies. Only the users with system administrator or security policy administrator permission can access this view.

Name	Type	Description
polname	name	Name of the masking policy
polenabled	boolean	Specifies whether to enable the masking policy.
maskaction	name	Masking function
labelname	name	Name of the label to which the masking function applies.
masking_object	text	Masking database resource object
filter_name	text	Logical expression of a filter criterion

15.3.68 GS_MATVIEWS

GS_MATVIEWS provides information about each materialized view in the database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-177 GS_MATVIEWS columns

Name	Type	Reference	Description
schemaname	name	PG_NAMESPACE.nspname	Name of the schema of a materialized view.
matviewname	name	PG_CLASS.relname	Name of a materialized view.
matviewowner	name	PG_AUTHID.Erolname	Owner of a materialized view.
tablespace	name	PG_TABLESPACE.spcname	Tablespace name of a materialized view. If the default tablespace of the database is used, the value is null.
hasindexes	boolean	-	This column is true if a materialized view has (or has recently had) any indexes.
definition	text	-	Definition of a materialized view (a reconstructed SELECT query).

15.3.69 GS_MATVIEWS

GS_MATVIEWS stores metadata of all materialized views.

Table 15-178 GS_MATVIEWS columns

Name	Type	Description
schemaname	name	Schema to which the materialized view belongs
matviewname	name	Name of a materialized view
matviewowner	name	Owner of the materialized view
tablespace	name	Tablespace to which the materialized view belongs
hasindexes	boolean	Whether an index exists in the materialized view • **t (true)**: yes. • **f (false)**: no.
definition	text	Action statement of the materialized view

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.70 GS_SESSION_CPU_STATISTICS

GS_SESSION_CPU_STATISTICS shows load management information about CPU usage of ongoing complex jobs executed by the current user. (The current feature is a lab feature. Contact Huawei technical support before using it.) Only the user with sysadmin permission can query this view.

Table 15-179 GS_SESSION_CPU_STATISTICS columns

Name	Type	Description
datid	oid	OID of the database that the backend is connected to
usename	name	Name of the user logged in to the backend
pid	bigint	Process ID of the backend
start_time	timestamp with time zone	Time when the statement starts to run
min_cpu_time	bigint	Minimum CPU time of the statement across all DNs, in ms
max_cpu_time	bigint	Maximum CPU time of the statement across all DNs, in ms
total_cpu_time	bigint	Total CPU time of the statement across all DNs, in ms
query	text	Statement being executed
node_group	text	Logical cluster of the user running the statement. (The current feature is a lab feature. Contact Huawei technical support before using it.)
top_cpu_dn	text	Top N CPU usage

15.3.71 GS_SESSION_MEMORY_STATISTICS

GS_SESSION_MEMORY_STATISTICS displays load management information about memory usage of ongoing complex jobs executed by the current user. (The current feature is a lab feature. Contact Huawei technical support before using it.) Only the user with sysadmin permission can query this view.

Table 15-180 GS_SESSION_MEMORY_STATISTICS columns

Name	Type	Description
datid	oid	OID of the database that the backend is connected to

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
usename	name	Name of the user logged in to the backend
pid	bigint	Process ID of the backend
start_time	timestamp with time zone	Time when the statement starts to run
min_peak_memory	integer	Minimum memory peak of the statement across all DNs, in MB
max_peak_memory	integer	Maximum memory peak of the statement across all DNs, in MB
spill_info	text	Statement spill information on all DNs: **None**: No data is spilled to disks on all DNs. **All**: Data is spilled to disks on all DNs. **[*a*:*b*]**: The statement has been spilled to disks on *a* of *b* DNs.
query	text	Statement being executed
node_group	text	Logical cluster of the user running the statement. (The current feature is a lab feature. Contact Huawei technical support before using it.)
top_mem_dn	text	Top N memory usage

15.3.72 GS_SQL_COUNT

GS_SQL_COUNT displays statistics about five types of running statements (**SELECT**, **INSERT**, **UPDATE**, **DELETE**, and **MERGE INTO**) on the current node of the database.

- When a common user queries the **GS_SQL_COUNT** view, statistics about the current node of the user are displayed. When an administrator queries the **GS_SQL_COUNT** view, statistics about the current node of all users are displayed.
- When the cluster or node is restarted, the statistics are cleared and will be measured again.
- The system counts when a node receives a query, including a query inside the cluster. For example, when a CN receives a query and distributes multiple queries to DNs, the queries are counted accordingly on the DNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-181 GS_SQL_COUNT columns

Name	Type	Description
node_name	name	Node name
user_name	name	Username
select_count	bigint	Statistical result of the **SELECT** statement
update_count	bigint	Statistical result of the **UPDATE** statement
insert_count	bigint	Statistical result of the **INSERT** statement
delete_count	bigint	Statistical result of the **DELETE** statement
mergeinto_count	bigint	Statistical result of the **MERGE INTO** statement
ddl_count	bigint	Number of DDL statements
dml_count	bigint	Number of DML statements
dcl_count	bigint	Number of DCL statements
total_select_elapse	bigint	Total response time of **SELECT** statements (unit: μs)
avg_select_elapse	bigint	Average response time of **SELECT** statements (unit: μs)
max_select_elapse	bigint	Maximum response time of **SELECT** statements (unit: μs)
min_select_elapse	bigint	Minimum response time of **SELECT** statements (unit: μs)
total_update_elapse	bigint	Total response time of **UPDATE** statements (unit: μs)
avg_update_elapse	bigint	Average response time of **UPDATE** statements (unit: μs)
max_update_elapse	bigint	Maximum response time of **UPDATE** statements (unit: μs)
min_update_elapse	bigint	Minimum response time of **UPDATE** statements (unit: μs)
total_insert_elapse	bigint	Total response time of **INSERT** statements (unit: μs)
avg_insert_elapse	bigint	Average response time of **INSERT** statements (unit: μs)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
max_insert_elapse	bigint	Maximum response time of **INSERT** statements (unit: μs)
min_insert_elapse	bigint	Minimum response time of **INSERT** statements (unit: μs)
total_delete_elapse	bigint	Total response time of **DELETE** statements (unit: μs)
avg_delete_elapse	bigint	Average response time of **DELETE** statements (unit: μs)
max_delete_elapse	bigint	Maximum response time of **DELETE** statements (unit: μs)
min_delete_elapse	bigint	Minimum response time of **DELETE** statements (unit: μs)

15.3.73 GS_STAT_DB_CU

GS_STAT_DB_CU queries CU hits in a database and in each node in a cluster. You can clear it using **gs_stat_reset()**. This view can be viewed only by the users with monitor admin and sysadmin permission.

Table 15-182 GS_STAT_DB_CU columns

Name	Type	Description
node_name1	text	Node name
db_name	text	Database name
mem_hit	bigint	Number of memory hits
hdd_sync_read	bigint	Number of synchronous hard disk reads
hdd_asyn_read	bigint	Number of asynchronous hard disk reads

15.3.74 GS_STAT_SESSION_CU

GS_STAT_SESSION_CU queries the CU hit rate of running sessions on each node in a cluster. This data about a session is cleared when you exit this session After the cluster is restarted, the statistics are also cleared. This view can be viewed only by the users with monitor admin and sysadmin permission.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-183 GS_STAT_SESSION_CU columns

Name	Type	Description
node_name1	text	Node name
mem_hit	integer	Number of memory hits
hdd_sync_read	integer	Number of synchronous hard disk reads
hdd_asyn_read	integer	Number of asynchronous hard disk reads

15.3.75 GS_TOTAL_NODEGROUP_MEMORY_DETAIL

GS_TOTAL_NODEGROUP_MEMORY_DETAIL returns the memory usage (in MB) of the current logical cluster of the database. If **enable_memory_limit** is set to **off**, this function cannot be used. (The current feature is a lab feature. Contact Huawei technical support before using it.)

Table 15-184 GS_TOTAL_NODEGROUP_MEMORY_DETAIL columns

Name	Type	Description
ngname	text	Name of the logical cluster (The current feature is a lab feature. Contact Huawei technical support before using it.)
memorytype	text	Memory type. The value must be one of the following: • **ng_total_memory**: total memory of the logical cluster • **ng_used_memory**: memory usage of the logical cluster • **ng_estimate_memory**: estimated memory usage of the logical cluster • **ng_foreignrp_memsize**: total memory of the external resource pool of the logical cluster • **ng_foreignrp_usedsize**: memory usage of the external resource pool of the logical cluster • **ng_foreignrp_peaksize**: peak memory usage of the external resource pool of the logical cluster • **ng_foreignrp_mempct**: percentage of the external resource pool of the logical cluster to the total memory of the logical cluster • **ng_foreignrp_estmsize**: estimated memory usage of the external resource pool of the logical cluster

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
memorymbytes	integer	Size of allocated memory-typed memory

15.3.76 GS_WLM_CGROUP_INFO

GS_WLM_CGROUP_INFO displays information about a Cgroup for a job that is being executed.

Table 15-185 GS_WLM_CGROUP_INFO columns

Name	Type	Description
cgroup_name	text	Cgroup name
priority	integer	Priority of the job
usage_percent	integer	Percentage of resources used by the Cgroup
shares	bigint	CPU quota allocated to the Cgroup
cpuacct	bigint	Allocated CPU quota
cpuset	text	Allocated CPU cores
relpath	text	Relative path of the Cgroup
valid	text	Whether the Cgroup is valid
node_group	text	Name of the logical cluster (The current feature is a lab feature. Contact Huawei technical support before using it.)

15.3.77 GS_WLM_EC_OPERATOR_STATISTICS

GS_WLM_EC_OPERATOR_STATISTICS displays operators of the Extension Connector jobs that are being executed by the current user. Only the user with sysadmin permission can query this view. The current feature is a lab feature. Contact Huawei technical support before using it.

Table 15-186 GS_WLM_EC_OPERATOR_STATISTICS columns

Name	Type	Description
queryid	bigint	Internal query ID used for Extension Connector statement execution
plan_node_id	integer	Plan node ID of the execution plan of an Extension Connector operator

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
start_time	timestamp with time zone	Time when the Extension Connector operator starts to process the first data record
ec_status	text	Status of the Extension Connector job • **EC_STATUS_INIT**: initialized. • **EC_STATUS_CONNECTED**: connected. • **EC_STATUS_EXECUTED**: executed. • **EC_STATUS_FETCHING**: fetching. • **EC_STATUS_END**: ended.
ec_execute_datanode	text	Name of the DN executing the Extension Connector job
ec_dsn	text	DSN used by the Extension Connector job
ec_username	text	Username used by the Extension Connector job to access the remote cluster (null if the remote cluster type is SPARK)
ec_query	text	Statement sent by the Extension Connector job to a remote cluster
ec_libodbc_type	text	Type of the unixODBC driver used by the Extension Connector job • Type 1: corresponds to **libodbc.so.1**. • Type 2: corresponds to **libodbc.so.2**.
ec_fetch_count	bigint	Number of data records processed by the Extension Connector job

15.3.78 GS_WLM_EC_OPERATOR_HISTORY

GS_WLM_EC_OPERATOR_HISTORY displays records of operators in Extension Connector jobs that have been executed by the current user on the current CN. The records in this view are cleared every 3 minutes. Only the user with sysadmin permission can query this view. The current feature is a lab feature. Contact Huawei technical support before using it.

- If the GUC parameter **enable_resource_record** is **on**, the records in the view are dumped to the **GS_WLM_EC_OPERATOR_INFO** system catalog and then deleted from the view every 3 minutes.
- If **enable_resource_record** is set to **off**, the records are retained in the view for 3 minutes and then deleted. Columns in the view are the same as those in **GS_WLM_EC_OPERATOR_INFO**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.79 GS_WLM_OPERATOR_HISTORY

GS_WLM_OPERATOR_HISTORY displays records of operators in jobs that have been executed by the current user on the current CN. Only the user with sysadmin permission can query this view.

Data in the kernel is cleared every 3 minutes. If the GUC parameter **enable_resource_record** is set to **on**, the records in the view are dumped to the **GS_WLM_OPERATOR_INFO** system catalog every 3 minutes and deleted from the view. If **enable_resource_record** is set to **off**, the records are retained in the view for 3 minutes and then deleted. The recorded data is the same as that described in **Table 15-29**.

15.3.80 GS_WLM_OPERATOR_STATISTICS

GS_WLM_OPERATOR_STATISTICS displays operators of the jobs that are being executed by the current user. Only the user with sysadmin permission can query this view.

Table 15-187 GS_WLM_OPERATOR_STATISTICS columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution
pid	bigint	Backend thread ID
plan_node_id	integer	Plan node ID of the execution plan
plan_node_name	text	Name of the operator corresponding to the plan node ID
start_time	timestamp with time zone	Time when an operator starts to process the first data record
duration	bigint	Total execution time of the operator, in ms
status	text	Execution status of the current operator, which can be **finished** or **running**.
query_dop	integer	DOP of the operator
estimated_rows	bigint	Number of rows estimated by the optimizer
tuple_processed	bigint	Number of elements returned by the operator
min_peak_memory	integer	Minimum peak memory used by the operator on all DNs, in MB
max_peak_memory	integer	Maximum peak memory used by the operator on all DNs, in MB

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
average_peak_memory	integer	Average peak memory used by the operator on all DNs, in MB
memory_skew_percent	integer	Memory usage skew of the operator among DNs
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs, in MB (default value: **0**)
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs, in MB (default value: **0**)
average_spill_size	integer	Average spilled data among all DNs when a spill occurs, in MB (default value: **0**)
spill_skew_percent	integer	DN spill skew when a spill occurs
min_cpu_time	bigint	Minimum execution time of the operator on all DNs, in ms
max_cpu_time	bigint	Maximum execution time of the operator on all DNs, in ms
total_cpu_time	bigint	Total execution time of the operator on all DNs, in ms
cpu_skew_percent	integer	Skew of the execution time among DNs
warning	text	The following warnings are displayed: • Sort/SetOp/HashAgg/HashJoin spill • Spill file size large than 256MB • Broadcast size large than 100MB • Early spill • Spill times is greater than 3 • Spill on memory adaptive • Hash table conflict

15.3.81 GS_WLM_REBUILD_USER_RESOURCE_POOL

GS_WLM_REBUILD_USER_RESOURCE_POOL is used to rebuild a user's resource pool information in memory on the current connection node. This view is only used as a remedy when resource pool information is missing or misplaced. Only the user with sysadmin permission can query this view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-188 Fields in **GS_WLM_REBUILD_USER_RESOURCE_POOL**

Name	Type	Description
gs_wlm_rebuild_user_resource_pool	boolean	Rebuilds information about the user resource pool in the memory. **t** indicates success, and **f** indicates failure.

15.3.82 GS_WLM_RESOURCE_POOL

GS_WLM_RESOURCE_POOL records statistics on a resource pool.

Table 15-189 GS_WLM_RESOURCE_POOL columns

Name	Type	Description
rpoid	oid	OID of a resource pool
respool	name	Name of the resource pool
control_group	name	Cgroup associated with the resource pool
parentid	oid	OID of the parent resource pool
ref_count	integer	Number of jobs associated with the resource pool
active_points	integer	Number of used points in the resource pool
running_count	integer	Number of jobs running in the resource pool
waiting_count	integer	Number of jobs queuing in the resource pool
io_limits	integer	IOPS upper limit of the resource pool
io_priority	integer	I/O priority of the resource pool

15.3.83 GS_WLM_SESSION_HISTORY

GS_WLM_SESSION_HISTORY displays load management information about a completed job executed by the current user on the current CN. (The current feature is a lab feature. Contact Huawei technical support before using it.) Only the user with the **sysadmin** or **monitor admin** permission can query this view.

The data in GaussDB is deleted every 3 minutes. If the GUC parameter **enable_resource_record** is set to **on**, the records in the view are dumped to the **GS_WLM_SESSION_QUERY_INFO_ALL** system catalog every 3 minutes and deleted from the view. If **enable_resource_record** is set to **off**, the records are retained in the view for 3 minutes and then deleted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-190 GS_WLM_SESSION_HISTORY columns

Name	Type	Description
datid	oid	OID of the database that the backend is connected to
dbname	text	Name of the database that the backend is connected to
schemaname	text	Schema name
nodename	text	Name of the CN where the statement is executed
username	text	Username used for connecting to the backend
application_name	text	Name of the application that is connected to the backend
client_addr	inet	IP address of the client connected to the backend. If this column is **null**, either the client is connected via a Unix socket on the server machine or this is an internal process such as autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will only be non-null for IP connections, and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with this backend (**-1** if a Unix socket is used)
query_band	text	Job type, which is specified by the GUC parameter **query_band**. The default value is a null string.
block_time	bigint	Duration (in ms) that a statement is blocked before being executed, including the statement parsing and optimization duration
start_time	timestamp with time zone	Time when the statement starts to run
finish_time	timestamp with time zone	Time when the statement execution ends
duration	bigint	Execution time of the statement, in ms
estimate_total_time	bigint	Estimated execution time of the statement, in ms

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
status	text	Final statement execution status, which can be **finished** (normal) or **aborted** (abnormal).
abort_info	text	Exception information displayed if the final statement execution status is **aborted**
resource_pool	text	Resource pool used by the user
control_group	text	Cgroup used by the statement
estimate_memory	integer	Estimated memory size of the statement.
min_peak_memory	integer	Minimum memory peak of the statement across all DNs, in MB
max_peak_memory	integer	Maximum memory peak of the statement across all DNs, in MB
average_peak_memory	integer	Average memory usage during statement execution, in MB
memory_skew_percent	integer	Memory usage skew of the statement among each DN
spill_info	text	Statement spill information on all DNs. ● None: No data is spilled to disks. ● All: Data is spilled to disks on all DNs. ● **[***a***:***b***]**: The statement has been spilled to disks on *a* of *b* DNs.
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs, in MB (default value: 0)
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs, in MB (default value: 0)
average_spill_size	integer	Average spilled data among all DNs when a spill occurs, in MB (default value: 0)
spill_skew_percent	integer	DN spill skew when a spill occurs
min_dn_time	bigint	Minimum execution time of the statement across all DNs, in ms
max_dn_time	bigint	Maximum execution time of the statement across all DNs, in ms
average_dn_time	bigint	Average execution time of the statement across all DNs, in ms
dntime_skew_percent	integer	Execution time skew of the statement among each DN

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
min_cpu_time	bigint	Minimum CPU time of the statement across all DNs, in ms
max_cpu_time	bigint	Maximum CPU time of the statement across all DNs, in ms
total_cpu_time	bigint	Total CPU time of the statement across all DNs, in ms
cpu_skew_percent	integer	CPU time skew of the statement among DNs
min_peak_iops	integer	Minimum IOPS peak of the statement across all DNs. It is counted by ones in a column-store table and by ten thousands in a row-store table.
max_peak_iops	integer	Maximum IOPS peak of the statement across all DNs. It is counted by ones in a column-store table and by ten thousands in a row-store table.
average_peak_iops	integer	Average IOPS peak of the statement across all DNs. It is counted by ones in a column-store table and by ten thousands in a row-store table.
iops_skew_percent	integer	I/O skew across DNs
warning	text	Warning. The following warnings and warnings related to **Optimizing SQL Self-Diagnosis** are displayed: • Spill file size large than 256MB • Broadcast size large than 100MB • Early spill • Spill times is greater than 3 • Spill on memory adaptive • Hash table conflict
queryid	bigint	Internal query ID used for statement execution
query	text	Statement executed
query_plan	text	Execution plan of the statement
node_group	text	Logical cluster of the user running the statement. (The current feature is a lab feature. Contact Huawei technical support before using it.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
cpu_top1_node_name	text	Name of the node with the highest CPU usage
cpu_top2_node_name	text	Name of the node with the second highest CPU usage
cpu_top3_node_name	text	Name of the node with the third highest CPU usage
cpu_top4_node_name	text	Name of the node with the fourth highest CPU usage
cpu_top5_node_name	text	Name of the node with the fifth highest CPU usage
mem_top1_node_name	text	Name of the node with the highest memory usage
mem_top2_node_name	text	Name of the node with the second highest CPU usage
mem_top3_node_name	text	Name of the node with the third highest CPU usage
mem_top4_node_name	text	Name of the node with the fourth highest CPU usage
mem_top5_node_name	text	Name of the node with the fifth highest CPU usage
cpu_top1_value	bigint	CPU usage
cpu_top2_value	bigint	CPU usage
cpu_top3_value	bigint	CPU usage
cpu_top4_value	bigint	CPU usage
cpu_top5_value	bigint	CPU usage
mem_top1_value	bigint	Memory usage
mem_top2_value	bigint	Memory usage
mem_top3_value	bigint	Memory usage
mem_top4_value	bigint	Memory usage
mem_top5_value	bigint	Memory usage
top_mem_dn	text	Top N memory usage

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
top_cpu_dn	text	Top N CPU usage

15.3.84 GS_WLM_SESSION_INFO

GS_WLM_SESSION_INFO displays load management information about a completed job executed by the current CN. (The current feature is a lab feature. Contact Huawei technical support before using it.) Only the user with sysadmin permission can query this view.

Data is dumped from the kernel to this system catalog. If **enable_resource_record** is set to **on**, the system imports the query information from the kernel to **GS_WLM_SESSION_QUERY_INFO_ALL** every 3 minutes. This operation occupies storage space and affects performance. You can query the **GS_WLM_SESSION_INFO** to view the top SQL statements that have been dumped. For details about the columns, see **Table 15-190**.

15.3.85 GS_WLM_SESSION_INFO_ALL

GS_WLM_SESSION_INFO_ALL displays load management information for completed jobs executed on all CNs. (The current feature is a lab feature. Contact Huawei technical support before using it.) Only the user with the **sysadmin** or **monitor admin** permission can query this view.

Table 15-191 GS_WLM_SESSION_INFO_ALL columns

Name	Type	Description
datid	oid	OID of the database that the backend is connected to
dbname	text	Name of the database that the backend is connected to
schemaname	text	Schema name
nodename	text	Name of the CN where the statement is executed
username	text	Username used for connecting to the backend
application_name	text	Name of the application connected to the backend
client_addr	inet	IP address of the client connected to the backend. If this column is **NULL**, it indicates either the client is connected via a Unix socket on the server or this is an internal process, such as **AUTOVACUUM**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with this backend (**-1** if a Unix socket is used)
query_band	text	Job type, which is specified by the GUC parameter **query_band**. The default value is a null string.
block_time	bigint	Duration that the statement is blocked before being executed, including the statement parsing and optimization duration (unit: ms)
start_time	timestamp with time zone	Time when the statement starts to be executed
finish_time	timestamp with time zone	Time when the statement execution ends
duration	bigint	Execution time of the statement (unit: ms)
estimate_total_time	bigint	Estimated execution time of the statement (unit: ms)
status	text	Final statement execution status, which can be **finished** (normal) or **aborted** (abnormal)
abort_info	text	Exception information displayed if the final statement execution status is **aborted**
resource_pool	text	Resource pool used by the user
control_group	text	Cgroup used by the statement
estimate_memory	integer	Estimated memory size of the statement
min_peak_memory	integer	Minimum peak memory of the statement across all DNs (unit: MB)
max_peak_memory	integer	Maximum peak memory of the statement across all DNs (unit: MB)
average_peak_memory	integer	Average memory usage during statement execution (unit: MB)
memory_skew_percent	integer	Memory usage skew of the statement among DNs

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
spill_info	text	Statement spill information on all DNs. • **None**: No data is spilled to disks on all DNs. • **All**: Data is spilled to disks on all DNs. • **[*a*:*b*]**: The statement has been spilled to disks on *a* of *b* DNs.
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
spill_skew_percent	integer	DN spill skew when a spill occurs
min_dn_time	bigint	Minimum execution time of the statement across all DNs (unit: ms)
max_dn_time	bigint	Maximum execution time of the statement across all DNs (unit: ms)
average_dn_time	bigint	Average execution time of the statement across all DNs (unit: ms)
dntime_skew_percent	integer	Execution time skew of the statement among DNs
min_cpu_time	bigint	Minimum CPU time of the statement across all DNs (unit: ms)
max_cpu_time	bigint	Maximum CPU time of the statement across all DNs (unit: ms)
total_cpu_time	bigint	Total CPU time of the statement across all DNs (unit: ms)
cpu_skew_percent	integer	CPU time skew of the statement among DNs
min_peak_iops	integer	Minimum peak IOPS of the statement across all DNs. It is counted by ones in a column-store table and by ten thousands in a row-store table.
max_peak_iops	integer	Maximum peak IOPS of the statement across all DNs. It is counted by ones in a column-store table and by ten thousands in a row-store table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
average_peak_iops	integer	Average peak IOPS of the statement across all DNs. It is counted by ones in a column-store table and by ten thousands in a row-store table.
iops_skew_percent	integer	I/O skew of the statement among DNs
warning	text	Warning. The following warnings and warnings related to **Optimizing SQL Self-Diagnosis** are displayed: • Spill file size large than 256MB • Broadcast size large than 100MB • Early spill • Spill times is greater than 3 • Spill on memory adaptive • Hash table conflict
queryid	bigint	Internal query ID used for statement execution
query	text	Statement executed
query_plan	text	Execution plan of the statement
node_group	text	Logical cluster of the user running the statement. (The current feature is a lab feature. Contact Huawei technical support before using it.)
cpu_top1_node_name	text	Name of the node with the 1st CPU usage
cpu_top2_node_name	text	Name of the node with the 2nd CPU usage
cpu_top3_node_name	text	Name of the node with the 3rd CPU usage
cpu_top4_node_name	text	Name of the node with the 4th CPU usage
cpu_top5_node_name	text	Name of the node with the 5th CPU usage
mem_top1_node_name	text	Name of the node with the 1st memory usage
mem_top2_node_name	text	Name of the node with the 2nd memory usage
mem_top3_node_name	text	Name of the node with the 3rd memory usage

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
mem_top4_node_name	text	Name of the node with the 4th memory usage
mem_top5_node_name	text	Name of the node with the 5th memory usage
cpu_top1_value	bigint	CPU usage
cpu_top2_value	bigint	CPU usage
cpu_top3_value	bigint	CPU usage
cpu_top4_value	bigint	CPU usage
cpu_top5_value	bigint	CPU usage
mem_top1_value	bigint	Memory usage
mem_top2_value	bigint	Memory usage
mem_top3_value	bigint	Memory usage
mem_top4_value	bigint	Memory usage
mem_top5_value	bigint	Memory usage
top_mem_dn	text	Top *N* memory usage
top_cpu_dn	text	Top *N* CPU usage
n_returned_rows	bigint	Number of rows in the result set returned by the **SELECT** statement
n_tuples_fetched	bigint	Number of rows randomly scanned
n_tuples_returned	bigint	Number of rows sequentially scanned
n_tuples_inserted	bigint	Number of rows inserted
n_tuples_updated	bigint	Number of rows updated
n_tuples_deleted	bigint	Number of rows deleted
n_blocks_fetched	bigint	Number of buffer block access times
n_blocks_hit	bigint	Number of buffer block hits

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: μs)
cpu_time	bigint	CPU time (unit: μs)
execution_time	bigint	Execution time in the executor (unit: μs)
parse_time	bigint	SQL parsing time (unit: μs)
plan_time	bigint	SQL plan generation time (unit: μs)
rewrite_time	bigint	SQL rewriting time (unit: μs)
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: μs)
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: μs)
net_send_time	bigint	Network time (unit: μs)
data_io_time	bigint	I/O time (unit: μs)
is_slow_query	bigint	Whether the record is a slow SQL record.

15.3.86 GS_WLM_USER_INFO

GS_WLM_USER_INFO displays user statistics. Only the user with sysadmin permission can query this view.

Table 15-192 GS_WLM_USER_INFO columns

Name	Type	Description
userid	oid	OID of a user
username	name	Username
sysadmin	boolean	Whether the user is the administrator • **t (true)**: yes. • **f (false)**: no.
rpoid	oid	OID of the associated resource pool
respool	name	Name of the associated resource pool
parentid	oid	OID of the user group
totalspace	bigint	Available space limit of the user

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
spacelimit	bigint	User table space limit
childcount	interger	Number of child users
childlist	text	Child user list

15.3.87 GS_WLM_USER_SESSION_INFO

GS_WLM_USER_SESSION_INFO displays load management information about all completed jobs executed by the current user on all CNs. (The current feature is a lab feature. Contact Huawei technical support before using it.) The data in this view is obtained from **GS_WLM_SESSION_QUERY_INFO_ALL**. For details on columns in the view, see **Table 15-190**. This view can be queried by users with the **sysadmin** permission only in Postgres.

15.3.88 GS_WLM_SESSION_STATISTICS

GS_WLM_SESSION_STATISTICS displays load management information about jobs being executed by the current user on the current CN. (The current feature is a lab feature. Contact Huawei technical support before using it.) Only the user with sysadmin permission can query this view.

Table 15-193 GS_WLM_SESSION_STATISTICS columns

Name	Type	Description
datid	oid	OID of the database that the backend is connected to
dbname	name	Name of the database that the backend is connected to
schemaname	text	Schema name
nodename	text	Name of the CN where the statement is executed.
username	name	Username used for connecting to the backend
application_name	text	Name of the application that is connected to the backend
client_addr	inet	IP address of the client connected to the backend. If this column is **NULL**, it indicates either the client is connected via a Unix socket on the server or this is an internal process, such as **AUTOVACUUM**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with this backend (**-1** if a Unix socket is used)
query_band	text	Job type, which is specified by the GUC parameter **query_band**. The default value is a null string.
pid	bigint	Backend thread ID
sessionid	bigint	Session ID
global_sessionid	text	Global session ID
block_time	bigint	Block time before the statement is run, in ms
start_time	timestamp with time zone	Time when the statement starts to run
duration	bigint	Duration that a statement has been executed, in ms
estimate_total_time	bigint	Estimated execution time of the statement, in ms
estimate_left_time	bigint	Estimated remaining execution time of the statement, in ms
enqueue	text	Resource status in workload management. (The current feature is a lab feature. Contact Huawei technical support before using it.)
resource_pool	name	Resource pool used by the user
control_group	text	Cgroup used by the statement
estimate_memory	integer	Estimated memory used by the statement, in MB. This parameter takes effect only if **enable_dynamic_workload** is set to **on**.
min_peak_memory	integer	Minimum memory peak of the statement across all DNs, in MB
max_peak_memory	integer	Maximum memory peak of the statement across all DNs, in MB
average_peak_memory	integer	Average memory usage during statement execution, in MB

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
memory_skew_percent	integer	Memory usage skew of the statement among each DNs
spill_info	text	Statement spill information on all DNs: • **None**: No data is spilled to disks on all DNs. • **All**: Data is spilled to disks on all DNs. • **[*a*:*b*]**: The statement has been spilled to disks on *a* of *b* DN.
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs, in MB (default value: **0**)
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs, in MB (default value: **0**)
average_spill_size	integer	Average spilled data among all DNs when a spill occurs, in MB (default value: **0**)
spill_skew_percent	integer	DN spill skew when a spill occurs
min_dn_time	bigint	Minimum execution time of the statement across all DNs, in ms
max_dn_time	bigint	Maximum execution time of the statement across all DNs, in ms
average_dn_time	bigint	Average execution time of the statement across all DNs, in ms
dntime_skew_percent	integer	Execution time skew of the statement among each DN
min_cpu_time	bigint	Minimum CPU time of the statement across all DNs, in ms
max_cpu_time	bigint	Maximum CPU time of the statement across all DNs, in ms
total_cpu_time	bigint	Total CPU time of the statement across all DNs, in ms
cpu_skew_percent	integer	CPU time skew of the statement among each DNs
min_peak_iops	integer	Minimum IOPS peak of the statement across all DNs. It is counted by ones in a column-store table and by ten thousands in a row-store table.
max_peak_iops	integer	Maximum IOPS peak of the statement across all DNs. It is counted by ones in a column-store table and by ten thousands in a row-store table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
average_peak_iops	integer	Average IOPS peak of the statement across all DNs. It is counted by ones in a column-store table and by ten thousands in a row-store table.
iops_skew_percent	integer	I/O skew across DN
warning	text	Warning. The following warnings and warnings related to **Optimizing SQL Self-Diagnosis** are displayed: • Spill file size large than 256MB • Broadcast size large than 100MB • Early spill • Spill times is greater than 3 • Spill on memory adaptive • Hash table conflict
queryid	bigint	Internal query ID used for statement execution
query	text	Statement being executed
query_plan	text	Execution plan of the statement
node_group	text	Logical cluster of the user running the statement. (The current feature is a lab feature. Contact Huawei technical support before using it.)
top_cpu_dn	text	Top N CPU usage
top_mem_dn	text	Top *N* memory usage

15.3.89 GS_WLM_WORKLOAD_RECORDS

GS_WLM_WORKLOAD_RECORDS displays the status of job executed by the current user on each CN. Only the user with sysadmin permission can query this view.

Table 15-194 GS_WLM_WORKLOAD_RECORDS columns

Name	Type	Description
node_name	text	Name of the CN where a job is executed
thread_id	bigint	Process ID of the backend
processid	integer	PID of the backend thread

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
time_stamp	bigint	Time when the statement starts to be run
username	name	Name of the user logged in to the backend
memory	integer	Memory required by the statement
active_points	integer	Number of resource points consumed by the statement in a resource pool
max_points	integer	Maximum number of resource points that can be consumed by the statement in a resource pool
priority	integer	Priority of the job The value must be within the **integer** range. A larger value indicates a higher priority.
resource_pool	text	Resource pool to which the job belongs
status	text	Job execution status. The value must be one of the following: ● pending ● running ● finished ● aborted ● unknown
control_group	text	Cgroups used by the job
enqueue	text	Queue that the job is in. The value must be one of the following: ● **GLOBAL**: global queue ● **RESPOOL**: resource pool queue ● **Active**: not in a queue
query	text	Statement being executed
node_group	text	Logical cluster name (The current feature is a lab feature. Contact Huawei technical support before using it.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.90 GV_SESSION

GV_SESSION view describes the information related to the current user's queries. The columns save the information about the last query.

Table 15-195 GV_SESSION columns

Name	Type	Description
SID	bigint	Session ID
SERIAL#	integer	Sequence number of the active backend thread, which is **0** in GaussDB.
SCHEMANAME	name	Name of the user logged in to the backend.
USER#	oid	OID of the user that has logged in to the backend thread. (**0** if the backend thread is a global auxiliary thread)
USERNAME	name	Username of the user that has logged in to the backend thread. (null if the backend thread is a global auxiliary thread)
MACHINE	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
SQL_ID	bigint	ID of a query.
CLIENT_INFO	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
EVENT	text	Queuing status of a statement. Possible values are: ● **waiting in queue**: The statement is in the queue. ● null: The statement is running.
SQL_EXEC_START	timestamp with time zone	Time when the currently active query was started, or if **state** is not **active**, when the last query was started.
PROGRAM	text	Name of the application connected to the backend.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
STATUS	text	Overall status of this backend. Possible values are: • **active**: The backend is executing a query. • **idle**: The backend is waiting for a new client command. • **idle in transaction**: The backend is in a transaction, but there is no statement being executed in the transaction. • **idle in transaction (aborted)**: The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend.

15.3.91 MPP_TABLES

MPP_TABLES displays information about tables in **PGXC_CLASS**.

Table 15-196 MPP_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that contains a table
tablename	name	Table name
tableowner	name	Table owner
tablespace	name	Tablespace containing the table
pgroup	name	Name of the node
nodeoids	oidvector_extend	List of distributed table node OIDs

15.3.92 MY_COL_COMMENTS

MY_COL_COMMENTS displays column comments of the table accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-197 MY_COL_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Table owner
table_name	character varying(64)	Table name
column_name	character varying(64)	Column name
comments	text	Comments

15.3.93 MY_CONS_COLUMNS

MY_CONS_COLUMNS displays information about primary key constraint columns in tables accessible to the current user. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 15-198 MY_CONS_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Constraint creator
table_name	character varying(64)	Name of a constraint-related table
column_name	character varying(64)	Name of a constraint-related column
constraint_name	character varying(64)	Constraint name
position	smallint	Position of the column in the table

15.3.94 MY_CONSTRAINTS

MY_CONSTRAINTS displays table constraint information accessible to the current user. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 15-199 MY_CONSTRAINTS columns

Name	Type	Description
owner	character varyiny(64)	Constraint creator
constraint_name	vcharacter varying(64)	Constraint name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
constraint_type	text	Constraint type • **c**: check constraint • **f**: foreign key constraint • **p**: primary key constraint • **u**: unique constraint
table_name	character varying(64)	Name of a constraint-related table
index_owner	character varying(64)	Owner of a constraint-related index (only for the unique constraint and primary key constraint)
index_name	character varying(64)	Name of the constraint-related index (only for the unique constraint and primary key constraint)

15.3.95 MY_INDEXES

MY_INDEXES displays index information in the current schema. This view exists in both PG_CATALOG and SYS schema.

Table 15-200 MY_INDEXES columns

Name	Type	Description
owner	character varying(64)	Index owner
index_name	character varying(64)	Index name
table_name	character varying(64)	Name of the table corresponding to the index
uniqueness	text	Whether the index is unique
partitioned	character(3)	Whether the index has the property of partitioned tables
generated	character varying(1)	Whether the index name is generated by the system

15.3.96 MY_IND_COLUMNS

MY_IND_COLUMNS displays column information about all indexes accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-201 MY_IND_COLUMNS columns

Name	Type	Description
index_owner	character varying(64)	Index owner
index_name	character varying(64)	Index name
table_owner	character varying(64)	Table owner
table_name	character varying(64)	Table name
column_name	name	Column name
column_position	smallint	Position of the column in the index

15.3.97 MY_IND_EXPRESSIONS

MY_IND_EXPRESSIONS displays information about function-based expression indexes accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 15-202 MY_IND_EXPRESSIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner
table_name	character varying(64)	Table name
index_owner	character varying(64)	Index owner
index_name	character varying(64)	Index name
column_expression	text	Function-based index expression of a specified column
column_position	smallint	Position of the column in the index

15.3.98 MY_IND_PARTITIONS

MY_IND_PARTITIONS displays information about index partitions accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-203 MY_IND_PARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Name of the owner of the partitioned table index to which an index partition belongs
index_name	character varying(64)	Index name of the partitioned table index to which the index partition belongs
partition_name	character varying(64)	Name of the index partition
def_tablespace_name	name	Tablespace name of the index partition
high_value	text	Upper limit of the partition corresponding to the index partition
index_partition_usable	boolean	Whether the index partition is available • **t (true)**: yes. • **f (false)**: no.
schema	character varying(64)	Schema of the partitioned table index to which the index partition belongs

15.3.99 MY_JOBS

MY_JOBS displays all jobs owned by the user. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 15-204 MY_JOBS columns

Name	Type	Description
job	bigint	Job ID
log_user	name	Username of the job creator
priv_user	name	Username of the job executor
dbname	name	Name of the database in which the job is created
start_date	timestamp without time zone	Job start time
start_suc	text	Start time of the successful job execution

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
last_date	timestamp without time zone	Start time of the last job execution
last_suc	text	Start time of the last successful job execution
this_date	timestamp without time zone	Start time of the ongoing job execution
this_suc	text	Start time of the ongoing successful job execution
next_date	timestamp without time zone	Schedule time of the next job execution
next_suc	text	Schedule time of the next successful job execution
broken	text	**y** if the job status is broken and **n** if otherwise
status	"char"	Status of the current job. The value can be **r**, **s**, **f**, or **d**. The default value is **r**. Status of job step: ● r=running ● s=successfully finished ● f= job failed ● d=aborted
interval	text	Time expression used to calculate the next time the job will be executed. If this parameter is set to **null**, the job will be executed once only.
failures	smallint	Number of times the job has started and failed. If a job fails to be executed for 16 consecutive times, no more attempt will be made on it.
what	text	Executable job

15.3.100 MY_OBJECTS

MY_OBJECTS displays all database objects accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-205 MY_OBJECTS columns

Name	Type	Description
object_name	name	Object name
object_id	oid	OID of the object
object_type	name	Type of the object (**TABLE**, **INDEX**, **SEQUENCE**, or **VIEW**)
namespace	oid	Namespace that the object belongs to
created	timestamp with time zone	Creation time of the object
last_ddl_time	timestamp with time zone	Last modification time of the object

NOTICE

For details on the value ranges of **created** and **last_ddl_time**, see **PG_OBJECT**.

15.3.101 MY_PART_INDEXES

MY_PART_INDEXES displays information about partitioned table indexes accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 15-206 MY_PART_INDEXES columns

Name	Type	Description
def_tablespace_name	name	Tablespace name of the partitioned table index
index_owner	character varying(64)	Name of the owner of a partitioned table index
index_name	character varying(64)	Name of the partitioned table index
partition_count	bigint	Number of index partitions of the partitioned table index
partitioning_key_count	integer	Number of partition keys of the partitioned table

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
partitioning_type	text	Partition policy of the partitioned table **NOTE** Only range partitioning is supported.
schema	character varying(64)	Schema of the partitioned table index
table_name	character varying(64)	Name of the partitioned table to which the partitioned table index belongs

15.3.102 MY_PART_TABLES

MY_PART_TABLES displays information about partitioned tables accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 15-207 MY_PART_TABLES columns

Name	Type	Description
table_owner	character varying(64)	Owner name of a partitioned table
table_name	character varying(64)	Name of the partitioned table
partitioning_type	text	Partition policy of the partitioned table **NOTE** Only range partitioning is supported.
partition_count	bigint	Number of partitions in the partitioned table
partitioning_key_count	integer	Number of partition keys of the partitioned table
def_tablespace_name	name	Tablespace name of the partitioned table
schema	character varying(64)	Schema of the partitioned table

15.3.103 MY_PROCEDURES

MY_PROCEDURES displays information about all stored procedures and functions in the current schema. This view exists in both PG_CATALOG and SYS schema.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-208 MY_PROCEDURES columns

Name	Type	Description
owner	character varying(64)	Owner of a stored procedure or function
object_name	character varying(64)	Name of the stored procedure or function
argument_number	smallint	Number of input parameters in the stored procedure

15.3.104 MY_SEQUENCES

MY_SEQUENCES displays information about sequences in the current schema. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 15-209 MY_SEQUENCES columns

Name	Type	Description
sequence_owner	name	Owner of a sequence
sequence_name	name	Name of a sequence
min_value	int16	Minimum value of a sequence
max_value	int16	Maximum value of a sequence
increment_by	int16	Value by which a sequence is incremented
cycle_flag	character(1)	Whether a sequence is a cycle sequence. The value can be **Y** or **N**. • **Y**: It is a cycle sequence. • **N**: It is not a cycle sequence.
last_number	int16	Value of the previous sequence
cache_size	int16	Size of the sequence disk cache

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.105 MY_SOURCE

MY_SOURCE displays information about stored procedures or functions in this schema, and provides columns defined by the stored procedures or the functions. This view exists in both PG_CATALOG and SYS schema.

Table 15-210 MY_SOURCE columns

Name	Type	Description
owner	character varying(64)	Owner of a stored procedure or function
name	character varying(64)	Name of the stored procedure or function
text	text	Definition of the stored procedure or function

15.3.106 MY_SYNONYMS

MY_SYNONYMS displays synonyms accessible to the current user.

Table 15-211 MY_SYNONYMS columns

Name	Type	Description
schema_name	text	Name of the schema to which the synonym belongs
synonym_name	text	Synonym name
table_owner	text	Owner of the associated object. Although the column is called **table_owner**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_name	text	Name of the associated object. Although the column is called **table_name**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
table_schema_name	text	Schema name of the associated object. Although the column is called **table_schema_name**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.

15.3.107 MY_TAB_COLUMNS

MY_TAB_COLUMNS displays information about table columns accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 15-212 MY_TAB_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Table owner
table_name	character varying(64)	Table name
column_name	character varying(64)	Column name
data_type	character varying(128)	Data type of the column
data_length	integer	Length of the column, in bytes
data_precision	integer	Precision of the data type. This parameter is valid for the numeric data type and **NULL** for other types.
data_scale	integer	Number of decimal places. This parameter is valid for the numeric data type and **0** for other data types.
nullable	bpchar	Whether the column can be empty (**n** for the primary key constraint and non-null constraint)
column_id	integer	Sequence number of the column when the table is created
avg_col_len	numeric	Average length of a column, in bytes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
char_length	numeric	Length of the column, in characters. This parameter is valid only for the varchar, nvarchar2, bpchar, and char types.
comments	text	Specifies the comment content.

15.3.108 MY_TAB_COMMENTS

MY_TAB_COMMENTS displays comments about all tables and views accessible to the current user. This view exists in both PG_CATALOG and SYS schema.

Table 15-213 MY_TAB_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Owner of a table or view
table_name	character varying(64)	Name of the table or view
comments	text	Comments

15.3.109 MY_TAB_PARTITIONS

MY_TAB_PARTITIONS displays all table partitions accessible to the current user. Each table partition of a partitioned table accessible to the current user has a piece of record in **USER_TAB_PARTITIONS**. This view exists in both PG_CATALOG and SYS schema.

Table 15-214 MY_TAB_PARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Owner name of a partitioned table
table_name	character varying(64)	Name of the partitioned table
partition_name	character varying(64)	Name of a table partition
high_value	text	Upper boundary of the table partition
tablespace_name	name	Name of the tablespace of the table partition

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
schema	character varying(64)	Schema of the partitioned table

15.3.110 MY_TABLES

MY_TABLES displays table information in the current schema. This view exists in both PG_CATALOG and SYS schema.

Table 15-215 MY_TABLES columns

Name	Type	Description
owner	character varying(64)	Table owner
table_name	character varying(64)	Table name
tablespace_name	character varying(64)	Tablespace name of the table
dropped	character varying	Whether the current record is deleted • **yes**: The record is deleted. • **no**: The record is not deleted.
num_rows	numeric	Estimated number of rows in the table
status	character varying(8)	Whether the current record is valid • **valid**: indicates that this record is valid.
temporary	character(1)	Whether the table is a temporary table • **y**: The table is a temporary table. • **n**: The table is not a temporary table.

15.3.111 MY_TRIGGERS

MY_TRIGGERS displays information about triggers accessible to the current user. This view exists in the **PG_CATALOG** and **SYS** schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-216 MY_TRIGGERS columns

Name	Type	Description
trigger_name	character varying(64)	Trigger name
table_name	character varying(64)	Relational table name
table_owner	character varying(64)	Role name
status	character varying(64)	**O**: The trigger is initiated in origin or local mode. **D**: The trigger is disabled. **R**: The trigger is initiated in replica mode. **A**: The trigger is always initiated.

15.3.112 MY_VIEWS

MY_VIEWS displays information about all views in the current schema. This view exists in both PG_CATALOG and SYS schema.

Table 15-217 MY_VIEWS columns

Name	Type	Description
owner	character varying(64)	Owner of a view
view_name	character varying(64)	View name

15.3.113 PG_AVAILABLE_EXTENSIONS

PG_AVAILABLE_EXTENSIONS displays extended information about certain database features.

Table 15-218 PG_AVAILABLE_EXTENSIONS columns

Name	Type	Description
name	name	Extension name
default_version	text	Name of the default version (**NULL** if none is specified)
installed_version	text	Currently installed version of the extension (**NULL** if no version is installed)
comment	text	Comment string from the extension's control file

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.114 PG_AVAILABLE_EXTENSION_VERSIONS

PG_AVAILABLE_EXTENSION_VERSIONS displays extension versions of certain database features.

Table 15-219 PG_AVAILABLE_EXTENSION_VERSIONS columns

Name	Type	Description
name	name	Extension name
version	text	Version name
installed	boolean	Whether this extension version is installed Otherwise, the value is **false**.
superuser	boolean	Whether only system administrators are allowed to install the extension Otherwise, the value is **false**.
relocatable	boolean	Whether the extension can be relocated to another schema Otherwise, the value is **false**.
schema	name	Name of the schema that the extension must be installed into (**NULL** if the extension is partially or fully relocatable)
requires	name[]	Names of prerequisite extensions (**NULL** if none)
comment	text	Comment string from the extension's control file

15.3.115 PG_COMM_DELAY

PG_COMM_DELAY displays the communication library delay status for a single DN.

Table 15-220 PG_COMM_DELAY columns

Name	Type	Description
node_name	text	Node name
remote_name	text	Name of the peer node
remote_host	text	IP address of the peer node
stream_num	integer	Number of logical stream connections used by the current physical connection

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
min_delay	integer	Minimum delay of the current physical connection within 1 minute, in microsecond **NOTE** A negative result is invalid. Wait until the delay status is updated and query again.
average	integer	Average delay of the current physical connection within 1 minute, in microsecond
max_delay	integer	Maximum delay of the current physical connection within 1 minute, in microsecond

15.3.116 PG_COMM_RECV_STREAM

PG_COMM_RECV_STREAM displays the receiving stream status of all the communication libraries for a single DN.

Table 15-221 PG_COMM_RECV_STREAM columns

Name	Type	Description
node_name	text	Node name
local_tid	bigint	ID of the thread using this stream
remote_name	text	Name of the peer node
remote_tid	bigint	Peer thread ID
idx	integer	Peer DN ID in the local DN
sid	integer	Stream ID in the physical connection
tcp_sock	integer	TCP socket used in the stream
state	text	Status of the stream • **UNKNOWN**: The logical connection status is unknown. • **READY**: The logical connection is ready. • **RUN**: The logical connection sends packets normally. • **HOLD**: The logical connection is waiting to send packets. • **CLOSED**: The logical connection is closed. • **TO_CLOSED**: The logical connection will be closed.
query_id	bigint	**debug_query_id** corresponding to the stream

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
pn_id	integer	**plan_node_id** of the query executed by the stream
send_smp	integer	**smpid** of the sender of the query executed by the stream
recv_smp	integer	**smpid** of the receiver of the query executed by the stream
recv_bytes	bigint	Total data volume received from the stream, in byte
time	bigint	Current lifecycle service duration of the stream, in ms
speed	bigint	Average receiving rate of the stream, in byte/s
quota	bigint	Current communication quota value of the stream, in byte
buff_usize	bigint	Current size of the data cache of the stream, in byte

15.3.117 PG_COMM_SEND_STREAM

PG_COMM_SEND_STREAM displays the sending stream status of all the communication libraries for a single DN.

Table 15-222 PG_COMM_SEND_STREAM columns

Name	Type	Description
node_name	text	Node name
local_tid	bigint	ID of the thread using this stream
remote_name	text	Name of the peer node
remote_tid	bigint	Peer thread ID
idx	integer	Peer DN ID in the local DN
sid	integer	Stream ID in the physical connection
tcp_sock	integer	TCP socket used in the stream

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Status of the stream • **UNKNOWN**: The logical connection status is unknown. • **READY**: The logical connection is ready. • **RUN**: The logical connection sends packets normally. • **HOLD**: The logical connection is waiting to send packets. • **CLOSED**: The logical connection is closed. • **TO_CLOSED**: The logical connection will be closed.
query_id	bigint	**debug_query_id** corresponding to the stream
pn_id	integer	**plan_node_id** of the query executed by the stream
send_smp	integer	**smpid** of the sender of the query executed by the stream
recv_smp	integer	**smpid** of the receiver of the query executed by the stream
send_bytes	bigint	Total data volume sent by the stream, in byte
time	bigint	Current lifecycle service duration of the stream, in ms
speed	bigint	Average sending rate of the stream, in byte/s
quota	bigint	Current communication quota value of the stream, in byte
wait_quota	bigint	Extra time generated when the stream waits the quota value, in ms

15.3.118 PG_COMM_STATUS

PG_COMM_STATUS displays the communication library status for a single DN.

Table 15-223 PG_COMM_STATUS columns

Name	Type	Description
node_name	text	Node name
rxpck_rate	integer	Receiving rate of the communication library on the node, in byte/s

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
txpck_rate	integer	Sending rate of the communication library on the node, in byte/s
rxkbyte_rate	bigint	Receiving rate of the communication library on the node, in kbyte/s
txkbyte_rate	bigint	Sending rate of the communication library on the node, in kbyte/s
buffer	bigint	Size of the buffer of the Cmailbox
memkbyte_libcomm	bigint	Communication memory size of the **libcomm** process, in bytes
memkbyte_libpq	bigint	Communication memory size of the **libpq** process, in bytes
used_pm	integer	Real-time usage of the **postmaster** thread
used_sflow	integer	Real-time usage of the **gs_sender_flow_controller** thread
used_rflow	integer	Real-time usage of the **gs_receiver_flow_controller** thread
used_rloop	integer	Highest real-time usage among multiple **gs_receivers_loop** threads
stream	integer	Total number of used logical connections.

15.3.119 PG_CONTROL_GROUP_CONFIG

PG_CONTROL_GROUP_CONFIG stores Cgroup configuration information in the system. Only the user with sysadmin permission can query this view.

Table 15-224 PG_CONTROL_GROUP_CONFIG columns

Name	Type	Description
pg_control_group_config	text	Configuration information of the Cgroup

15.3.120 PG_CURSORS

PG_CURSORS displays cursors that are currently available.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-225 PG_CURSORS columns

Name	Type	Description
name	text	Cursor name
statement	text	Query statement when the cursor is declared to change
is_holdable	boolean	**True** if the cursor is holdable (it can be accessed after the transaction that declared the cursor has committed); **false** otherwise
is_binary	boolean	Whether the cursor was declared BINARY. If it was, the value is **true**.
is_scrollable	boolean	Whether the cursor is scrollable (it allows rows to be retrieved in a nonsequential manner). If it is, the value is **true**.
creation_time	timestamp with time zone	Timestamp at which the cursor is declared

15.3.121 PG_EXT_STATS

PG_EXT_STATS allows for access to extension statistics stored in the **PG_STATISTIC_EXT** system catalog. The extension statistics means multiple columns of statistics. (The current feature is a lab feature. Contact Huawei technical support before using it.)

Table 15-226 PG_EXT_STATS columns

Name	Type	Reference	Description
schemaname	name	**PG_NAMESPACE**.nspname	Name of the schema that contains a table
tablename	name	**relname** in **PG_CLASS**	Table name
attname	int2vector	**PG_STATISTIC_EXT**.stakey	Columns to be combined for collecting statistics
inherited	boolean	-	Includes inherited sub-columns if the value is **true**; otherwise, it indicates the column in a specified table.
null_frac	real	-	Percentage of column combinations that are null to all records

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
avg_width	integer	-	Average width of column combinations, in byte
n_distinct	real	-	• Estimated number of distinct values in a column combination if the value is greater than 0 • Negative of the number of distinct values divided by the number of rows if the value is less than 0 1. The negated form is used when **ANALYZE** believes that the number of distinct values is likely to increase as the table grows. 2. The positive form is used when the column seems to have a fixed number of possible values. For example, **–1** indicates that the number of distinct values is the same as the number of rows for a column combination. • The number of distinct values is unknown if the value is **0**.
n_dndistinct	real	-	Number of unique not-null data values in the **dn1** column combination • Exact number of distinct values if the value is greater than **0**. • Negative of the number of distinct values divided by the number of rows if the value is less than **0**. For example, if a value in a column combination appears twice in average, **n_dndistinct** equals **–0.5**. • The number of distinct values is unknown if the value is **0**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
most_common_vals	anyarray	-	List of the most common values in a column combination. If this combination does not have the most common values, **most_common_vals** will be **NULL**. None of the most common values in **most_common_vals** is **NULL**.
most_common_freqs	real[]	-	List of the frequencies of the most common values, that is, the number of occurrences of each value divided by the total number of rows (**NULL** if **most_common_vals** is **NULL**)
most_common_vals_null	anyarray	-	List of the most common values in a column combination. If this combination does not have the most common values, **most_common_vals_null** will be **NULL**. At least one of the common values in **most_common_vals_null** is **NULL**.
most_common_freqs_null	real[]	-	List of the frequencies of the most common values, that is, the number of occurrences of each value divided by the total number of rows (**NULL** if **most_common_vals_null** is **NULL**)
histogram_bounds	anyarray	-	Boundary value list of the histogram

15.3.122 PG_GET_INVALID_BACKENDS

The **PG_GET_INVALID_BACKENDS** view displays information about current DN standby server backend threads connected to the CN. Only system administrator and monitor administrator can access this view.

Table 15-227 PG_GET_INVALID_BACKENDS columns

Name	Type	Description
pid	bigint	Thread ID

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
node_name	text	Node information connected to the backend thread
dbname	name	Name of the connected database
backend_start	timestamp with time zone	Backend thread startup time
query	text	Query statement executed by the backend thread

15.3.123 PG_GET_SENDERS_CATCHUP_TIME

PG_GET_SENDERS_CATCHUP_TIME displays catchup information of the currently active primary/standby instance sender thread on the DN.

Table 15-228 PG_GET_SENDERS_CATCHUP_TIME columns

Name	Type	Description
pid	bigint	Current sender thread ID
lwpid	integer	Current sender lwpid
local_role	text	Local role
peer_role	text	Peer role
state	text	Current sender's replication status
type	text	Current sender type
catchup_start	timestamp with time zone	Startup time of a catchup task
catchup_end	timestamp with time zone	End time of the catchup task

15.3.124 PG_GROUP

PG_GROUP displays the database role authentication and the relationship between roles.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-229 PG_GROUP columns

Name	Type	Description
groname	name	Group name
grosysid	oid	Group ID
grolist	oid[]	An array, including all the role IDs in this group

15.3.125 PG_INDEXES

PG_INDEXES provides access to useful information about each index in the database.

Table 15-230 PG_INDEXES columns

Name	Type	Reference	Description
schemaname	name	PG_NAMESPACE.nspname	Name of the schema that contains tables and indexes
tablename	name	PG_CLASS.relname	Name of the table for which the index serves
indexname	name	PG_CLASS.relname	Index name
tablespace	name	PG_TABLESPACE.nspname	Name of the tablespace that contains the index
indexdef	text	-	Index definition (a reconstructed **CREATE INDEX** command)

15.3.126 PG_LOCKS

PG_LOCKS displays information about locks held by open transactions.

Table 15-231 PG_LOCKS columns

Name	Type	Reference	Description
locktype	text	-	Type of the locked object: **relation**, **extend**, **page**, **tuple**, **transactionid**, **virtualxid**, **object**, **userlock**, or **advisory**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
database	oid	OID in PG_DATABASE	OID of the database in which the locked target exists • The OID is **0** if the target is a shared object. • The OID is **NULL** if the locked target is a transaction.
relation	oid	OID in PG_CLASS	OID of the relationship targeted by the lock (**NULL** if the object is not a relation or part of a relation)
page	integer	-	Page number targeted by the lock within the relation (**NULL** if the object is not a relation page or row page)
tuple	smallint	-	Row number targeted by the lock within the page (**NULL** if the object is not a row)
bucket	integer	-	Hash bucket ID
virtualxid	text	-	Virtual ID of the transaction targeted by the lock (**NULL** if the object is not a virtual transaction)
transactionid	xid	-	ID of the transaction targeted by the lock (**NULL** if the object is not a transaction)
classid	oid	OID in PG_CLASS	OID of the system catalog that contains the object (**NULL** if the object is not a general database object)
objid	oid	-	OID of the lock target within its system table (**NULL** if the target is not a general database object)
objsubid	smallint	-	Column number for a column in the table (**0** if the target is of other object type and **NULL** if the target is not a general database object)
virtualtransaction	text	-	Virtual ID of the transaction holding or awaiting this lock
pid	bigint	-	Logical ID of the server thread holding or awaiting this lock (**NULL** if the lock is held by a prepared transaction)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
sessionid	bigint	-	ID of the session that holds or waits for the lock
mode	text	-	Lock mode held or desired by this thread
granted	boolean	-	• The value is **TRUE** if the lock is a held lock. • The value is **FALSE** if the lock is an awaited lock.
fastpath	boolean	-	The value is **TRUE** if the lock is obtained through **fast-path**, and is **FALSE** if the lock is obtained through the main lock table.
locktag	text	-	Information about the lock that the session waits for. It can be parsed using the **locktag_decode()** function.
global_sessionid	text	-	Global session ID

15.3.127 PG_NODE_ENV

PG_NODE_ENV displays environment variables of the current node. Only the user with system administrator or monitor admin permission can access this system view.

Table 15-232 PG_NODE_ENV columns

Name	Type	Description
node_name	text	Current node name
host	text	Host name of the node
process	integer	Number of the node process
port	integer	Port ID of the node
installpath	text	Installation directory of the node
datapath	text	Data directory of the node
log_directory	text	Log directory of the node

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.128 PG_OS_THREADS

PG_OS_THREADS provides status information about all the threads under the current node.

Table 15-233 PG_OS_THREADS columns

Name	Type	Description
node_name	text	Current node name
pid	bigint	PID of the thread running under the current node process
lwpid	integer	Lightweight thread ID corresponding to the PID
thread_name	text	Thread name corresponding to the PID
creation_time	timestamp with time zone	Thread creation time corresponding to the PID

15.3.129 PG_POOLER_STATUS

PG_POOLER_STATUS queries the cache connection status in the pooler.

Table 15-234 PG_POOLER_STATUS columns

Name	Type	Description
database	text	Database name
user_name	text	Username
tid	bigint	In non-thread pool logic, this parameter indicates the ID of the thread connected to the CN. In thread pool logic, this parameter indicates the ID of the session connected to the CN.
node_oid	bigint	OID of the node connected
node_name	name	Name of the node connected
in_use	boolean	Whether the connection is currently used. • **t** (true): The connection is in use. • **f** (false): The connection is not in use.
node_port	integer	Port number of the connected instance node
fdsock	bigint	Peer socket
remote_pid	bigint	Peer thread ID

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
session_params	text	GUC session parameter delivered by the connection
used_count	bigint	Number of reuse times of a connection.
idx	bigint	Logical connection ID of the connected instance node.
streamid	bigint	Stream ID corresponding to each logical connection.

PG_POOLER_STATUS can only perform the query on the CN and display connection cache information about the pooler module.

15.3.130 PG_PREPARED_STATEMENTS

PG_PREPARED_STATEMENTS displays all prepared statements that are available in the current session.

Table 15-235 PG_PREPARED_STATEMENTS columns

Name	Type	Description
name	text	Identifier of the prepared statement
statement	text	Query string for creating this prepared statement. For prepared statements created through SQL, this is the PREPARE statement submitted by the client. For prepared statements created through the frontend/backend protocol, this is the text of the prepared statement itself.
prepare_time	timestamp with time zone	Timestamp when the prepared statement is created
parameter_types	regtype[]	Expected parameter types for the prepared statement in the form of an array of **regtype**. The OID corresponding to an element of this array can be obtained by converting the **regtype** value to **oid**.
from_sql	boolean	• **True** if the prepared statement was created through the PREPARE statement • **False** if the statement was prepared through the frontend/backend protocol

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.131 PG_PREPARED_XACTS

PG_PREPARED_XACTS displays information about transactions that are currently prepared for two-phase commit.

Table 15-236 PG_PREPARED_XACTS columns

Name	Type	Reference	Description
transaction	xid	-	Numeric transaction identifier of the prepared transaction
gid	text	-	Global transaction identifier that was assigned to the transaction
prepared	timestamp with time zone	-	Time at which the transaction is prepared for commit
owner	name	PG_AUTHID.rolname	Name of the user that executes the transaction
database	name	PG_DATABASE.datname	Name of the database in which the transaction is executed

15.3.132 PG_PUBLICATION_TABLES

PG_PUBLICATION_TABLES displays the mapping information between a publication and its published tables. Unlike the underlying system catalog **PG_PUBLICATION_REL**, this view expands publications defined as **FOR ALL TABLES** so that for such publications, there is one row for each eligible table.

Table 15-237 PG_PUBLICATION_TABLES columns

Name	Type	Description
pubname	name	Publication name
schemaname	name	Name of the schema that contains a table
tablename	name	Table name

15.3.133 PG_REPLICATION_ORIGIN_STATUS

PG_REPLICATION_ORIGIN_STATUS displays the replication status of the replication source.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-238 PG_REPLICATION_ORIGIN_STATUS columns

Name	Type	Description
local_id	oid	Replication source ID
external_id	text	Name of the replication source
remote_lsn	text	Remote LSN of the replication source
local_lsn	text	Local LSN of the replication source

15.3.134 PG_REPLICATION_SLOTS

PG_REPLICATION_SLOTS contains replication slot information.

Table 15-239 PG_REPLICATION_SLOTS columns

Name	Type	Description
slot_name	text	Replication slot name
plugin	text	Name of the output plug-in corresponding to the logical replication slot.
slot_type	text	Replication slot type. • **physical**: physical replication slot. • **logical**: logical replication slot.
datoid	oid	OID of the database where the replication slot resides.
database	name	Name of the database where the replication slot resides.
active	boolean	Determines whether the replication slot is activated. • **t** (true): yes • **f** (false): no
xmin	xid	XID of the earliest transaction that the database must reserve for the replication slot.
catalog_xmin	xid	XID of the earliest system catalog-involved transaction that the database must reserve for the logical replication slot.
restart_lsn	text	Physical location of the earliest Xlog required by the replication slot.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
dummy_standby	boolean	Determines whether the peer end connected to the replication slot is a secondary node. • **t** (true): yes • **f** (false): no
confirmed_flush	text	Dedicated logical replication slot. The client confirms the location of the received log.

15.3.135 PG_RLSPOLICIES

PG_RLSPOLICIES contains row-level access control policies. The initial user and users with the sysadmin attribute can view all policy information. Other users can view only the policy information in their own tables.

Table 15-240 PG_RLSPOLICIES columns

Name	Type	Description
schemaname	name	Name of the schema of the table object to which a row-level access control policy is applied
tablename	name	Name of the table object to which the row-level access control policy is applied
policyname	name	Name of the row-level access control policy
policypermissive	text	Attribute of the row-level access control policy
policyroles	name[]	List of users affected by the row-level access control policy. If this parameter is not specified, all users are affected.
policycmd	text	SQL operations affected by the row-level access control policy
policyqual	text	Expression of the row-level access control policy

15.3.136 PG_ROLES

PG_ROLES provides information about database roles. Initialization users and users with the sysadmin or createrole attribute can view information about all roles. Other users can view only their own information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-241 PG_ROLES columns

Name	Type	Reference	Description
rolname	name	N/A	Role name
rolsuper	boolean	N/A	Whether the role is the initial system administrator with the highest permission • **t** (true): yes • **f** (false): no
rolinherit	boolean	N/A	Whether the role inherits the permissions for this type of roles • **t** (true): yes • **f** (false): no
rolcreaterole	boolean	N/A	Whether the role can create other roles • **t** (true): yes • **f** (false): no
rolcreatedb	boolean	N/A	Whether the role can create databases • **t** (true): yes • **f** (false): no
rolcatupdate	boolean	N/A	Whether the role can update system tables directly. Only the initial system administrator whose **usesysid** is **10** has this permission. It is unavailable for other users. • **t** (true): yes • **f** (false): no
rolcanlogin	boolean	N/A	Whether the role can log in to the database • **t** (true): yes • **f** (false): no
rolreplication	boolean	N/A	Whether the role can be replicated • **t** (true): yes • **f** (false): no
rolauditadmin	boolean	N/A	Whether the role is an audit system administrator • **t** (true): yes • **f** (false): no

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
rolsystemadmin	boolean	N/A	Whether the role is a system administrator • **t** (true): yes • **f** (false): no
rolconnlimit	integer	N/A	Sets the maximum number of concurrent connections that this role can initiate if this role can log in. The value **–1** indicates no limit.
rolpassword	text	N/A	Not the password (always reads as ********)
rolvalidbegin	timestamp with time zone	N/A	Start time for account validity (**NULL** if start time is not specified).
rolvaliduntil	timestamp with time zone	N/A	End time for account validity (**NULL** if end time is not specified).
rolrespool	name	N/A	Resource pool that a user can use
rolparentid	oid	rolparentid in PG_AUTHID	OID of a group user to which the user belongs
roltabspace	text	N/A	Storage space of the user permanent table
rolconfig	text[]	N/A	Session defaults for runtime configuration variables
oid	oid	OID in PG_AUTHID	Role ID
roluseft	boolean	**roluseft** in PG_AUTHID	Whether the role can perform operations on foreign tables • **t** (true): yes • **f** (false): no
rolkind	"char"	N/A	Role type
nodegroup	name	N/A	Name of the logical cluster associated with the role. (The current feature is a lab feature. Contact Huawei technical support before using it.) If no logical cluster is associated, this column is left empty.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
roltempspace	text	N/A	Storage space of the user temporary table, in KB
rolspillspace	text	N/A	Operator disk spill space of the user, in KB
rolmonitoradmin	boolean	N/A	Whether the role is a monitor administrator • **t** (true): yes • **f** (false): no
roloperatoradmin	boolean	N/A	Whether the role is an O&M administrator • **t** (true): yes • **f** (false): no
rolpolicyadmin	boolean	N/A	Whether the role is a security policy administrator • **t** (true): yes • **f** (false): no

15.3.137 PG_RULES

PG_RULES provides access to query useful information about rewrite rules.

Table 15-242 PG_RULES columns

Name	Type	Description
schemaname	name	Name of the schema containing the table
tablename	name	Name of the table to which the rule applies
rulename	name	Rule name
definition	text	Rule definition (a reconstructed creation command)

15.3.138 PG_RUNNING_XACTS

PG_RUNNING_XACTS displays running transaction information on the current node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-243 PG_RUNNING_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM
gxid	xid	Transaction ID
state	tinyint	Transaction status (**3**: prepared; **0**: starting)
node	text	Node name
xmin	xid	Minimum transaction ID on the node
vacuum	boolean	Whether the current transaction is lazy vacuum • **t** (true): yes • **f** (false): no
timeline	bigint	Number of database restarts
prepare_xid	xid	Transaction ID in the **prepared** state (**0** if the state is not **prepared**)
pid	bigint	Thread ID corresponding to the transaction
next_xid	xid	Transaction ID sent from a CN to a DN

15.3.139 PG_SECLABELS

PG_SECLABELS provides information about security labels.

Table 15-244 PG_SECLABELS columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this security label pertains to
classoid	oid	PG_CLASS.oid	OID of the system catalog where the object appears
objsubid	integer	-	Column number for the security label on a table column (**objoid** and **classoid** refer to the table itself). The value is **0** for all other object types.
objtype	text	-	Type of object to which this label applies, as text

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
objnamespace	oid	PG_NAMESPACE.oid	OID of the namespace for this object, if applicable; otherwise **NULL**
objname	text	-	Text-typed name of the object to which this label applies
provider	text	PG_SECLABEL.provider	Label provider associated with the label
label	text	PG_SECLABEL.label	Security label applied to the object

15.3.140 PG_SESSION_IOSTAT

PG_SESSION_IOSTAT shows I/O load management information about the task currently executed by the user. (The current feature is a lab feature. Contact Huawei technical support before using it.) Only users with the **sysadmin** or **monitor admin** permission can query this view.

IOPS is counted by ones for column-storage and by 10 thousands for row storage.

Table 15-245 PG_SESSION_IOSTAT columns

Name	Type	Description
query_id	bigint	Job ID
mincurriops	integer	Minimum I/O of the current job on each DN
maxcurriops	integer	Maximum I/O of the current job on each DN
minpeakiops	integer	Minimum peak I/O of the current job on each DN
maxpeakiops	integer	Maximum peak I/O of the current job on each DN
io_limits	integer	**io_limits** set for the job
io_priority	text	**io_priority** set for the job
query	text	Job
node_group	text	Logical cluster of the user running the job (The current feature is a lab feature. Contact Huawei technical support before using it.)
curr_io_limits	integer	Real-time **io_limits** value when **io_priority** is used to control I/Os

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.141 PG_SESSION_WLMSTAT

PG_SESSION_WLMSTAT displays corresponding load management information about the task currently executed by the user. (The current feature is a lab feature. Contact Huawei technical support before using it.) Only the sysadmin user can query this view.

Table 15-246 PG_SESSION_WLMSTAT columns

Name	Type	Description
datid	oid	OID of the database that the backend is connected to
datname	name	Name of the database that the backend is connected to
threadid	bigint	Process ID of the backend
sessionid	bigint	Session ID
processid	integer	PID of the backend thread
usesysid	oid	OID of the user logged in to the backend
appname	text	Name of the application that is connected to the backend
usename	name	Name of the user logged in to the backend
priority	bigint	Priority of Cgroup where the statement is located
attribute	text	Attributes of the statement: • **Ordinary**: default attribute of a statement before it is parsed by the database • **Simple**: simple statements • **Complicated**: complicated statements • **Internal**: internal statement of the database • Unknown: unknown
block_time	bigint	Pending duration of the statement by now, in seconds
elapsed_time	bigint	Actual execution duration of the statement by now, in seconds
total_cpu_time	bigint	Total CPU usage duration of the statement on the DN in the last period, in seconds
cpu_skew_percent	integer	CPU usage skew percentage of the statement on the DN in the last period
statement_mem	integer	**statement_mem** used for executing the statement (reserved column)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
active_points	integer	Number of concurrently active points occupied by the statement in the resource pool
dop_value	integer	DOP value obtained by the statement from the resource pool
control_group	text	Cgroup currently used by the statement
status	text	Status of the statement, including: • **pending**: waiting to be executed • **running**: being executed • **finished**: finished normally (If **enqueue** is set to **StoredProc** or **Transaction**, this state indicates that only a part of jobs in the statement has been executed. This state persists until the finish of this statement.) • **aborted**: terminated unexpectedly • **active**: normal status except for those above • **unknown**: unknown status
enqueue	text	Queuing status of the statement, including: • **Global**: queuing in the global queue • **Respool**: queuing in the resource pool queue • **CentralQueue**: queuing on the CCN • **Transaction**: being in a transaction block • **StoredProc**: being in a stored procedure • **None**: not in the queue • **Forced None**: The transaction block statement or stored procedure statement is being forcibly executed because the statement waiting time exceeds the specified value.
resource_pool	name	Current resource pool where the statements are located
query	text	Latest query at the backend. If **state** is **active**, this column shows the executing query. In all other states, it shows the last query that was executed.
is_plana	boolean	Whether a statement occupies the resources of other logical clusters in logical cluster mode. The default value is **f** (does not occupy).
node_group	text	Logical cluster of the user running the statement (The current feature is a lab feature. Contact Huawei technical support before using it.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.142 PG_SETTINGS

PG_SETTINGS provides information about parameters of the running database.

Table 15-247 PG_SETTINGS columns

Name	Type	Description
name	text	Parameter name
setting	text	Current parameter value
unit	text	Implicit unit of the parameter
category	text	Logical group of the parameter
short_desc	text	Brief description of the parameter
extra_desc	text	Detailed description of the parameter
context	text	Context of parameter values, including **internal**, **postmaster**, **sighup**, **backend**, **superuser**, and **user**
vartype	text	Parameter type, including **bool**, **enum**, **integer**, **real**, or **string**
source	text	Method of assigning the parameter value
min_val	text	Minimum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.
max_val	text	Maximum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.
enumvals	text[]	Valid values of an enum-type parameter. If the parameter type is not enum, the value of this column is **null**.
boot_val	text	Default parameter value used upon the database startup
reset_val	text	Default parameter value used upon the database reset
sourcefile	text	Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.
sourceline	integer	Row number of the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.143 PG_SHADOW

PG_SHADOW displays the attributes of all roles marked with rolcanlogin in **PG_AUTHID**. Only the system administrator can access this system view.

The name stems from the fact that this view should not be readable by the public since it contains passwords. **PG_USER** is a publicly readable view on **PG_SHADOW** that blanks out the password column.

Table 15-248 PG_SHADOW columns

Name	Type	Reference	Description
usename	name	**rolname** in **PG_AUTHID**	Username
usesysid	oid	OID in **PG_AUTHID**	ID of this user
usecreatedb	boolean	-	Whether the user has the permission to create databases • **t** (true): yes • **f** (false): no
usesuper	boolean	-	Whether the user is a system administrator • **t** (true): yes • **f** (false): no
usecatupd	boolean	-	Whether the user can update a view. Even the system administrator cannot do this unless this column is **true**. • **t** (true): yes • **f** (false): no
userepl	boolean	-	Whether the user can initiate streaming replication and put the system in and out of backup mode • **t** (true): yes • **f** (false): no
passwd	text	-	Password (possibly encrypted); **null** if none. See **PG_AUTHID** for details about how encrypted passwords are stored.
valbegin	timestamp with time zone	-	Start time for account validity (**NULL** if start time is not specified).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
valuntil	timestamp with time zone	-	End time for account validity (**NULL** if end time is not specified).
respool	name	-	Resource pool used by the user
parent	oid	-	Parent resource pool
spacelimit	text	-	Storage space of the permanent table
useconfig	text[ ]	-	Session defaults for runtime configuration variables
tempspacelimit	text	-	Storage space of the temporary table
spillspacelimit	text	-	Operator disk flushing space
usemonitoradmin	boolean	-	Whether the user is a monitor administrator • **t** (true): yes • **f** (false): no
useoperatoradmin	boolean	-	Whether the user is an O&M administrator • **t** (true): yes • **f** (false): no
usepolicyadmin	boolean	-	Whether the user is a security policy administrator • **t** (true): yes • **f** (false): no

15.3.144 PG_SHARED_MEMORY_DETAIL

PG_SHARED_MEMORY_DETAIL queries usage information about all the shared memory contexts.

Table 15-249 PG_SHARED_MEMORY_DETAIL columns

Name	Type	Description
contextname	text	Name of the memory context
level	smallint	Hierarchy of the memory context
parent	text	Name of the parent memory context

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
totalsize	bigint	Total size of the shared memory, in bytes
freesize	bigint	Remaining size of the shared memory, in bytes
usedsize	bigint	Used size of the shared memory, in bytes

15.3.145 PG_STATS

PG_STATS provides access to the single-column statistics stored in the **pg_statistic** table. The **autovacuum_naptime** parameter specifies the interval for updating statistics recorded in the view.

Table 15-250 PG_STATS columns

Name	Type	Reference	Description
schemaname	name	PG_NAMESPACE.nspname	Name of the schema that contains a table
tablename	name	**relname** in PG_CLASS	Table name
attname	name	PG_ATTRIBUTE.attname	Field name
inherited	boolean	-	Includes inherited sub-columns if the value is **true**; otherwise, it indicates the column in a specified table.
null_frac	real	-	Percentage of column entries that are null
avg_width	integer	-	Average width in bytes of column's entries

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
n_distinct	real	-	• Estimated number of distinct values in the column if the value is greater than 0 • Negative of the number of distinct values divided by the number of rows if the value is less than 0 1. The negated form is used when **ANALYZE** believes that the number of distinct values is likely to increase as the table grows. 2. The positive form is used when the column seems to have a fixed number of possible values. For example, **–1** indicates that the number of distinct values is the same as the number of rows for a column combination.
n_dndistinct	real	-	Number of unique non-null data values in the **dn1** column • Exact number of distinct values if the value is greater than **0**. • Negative of the number of distinct values divided by the number of rows if the value is less than 0 (For example, if the value of a column appears twice in average, set **n_dndistinct=-0.5**.) • The number of distinct values is unknown if the value is **0**.
most_common_vals	anyarray	-	List of the most common values in a column. (**NULL** if no values in the column seem to be more common than any others)
most_common_freqs	real[]	-	List of the frequencies of the most common values, that is, number of occurrences of each divided by total number of rows. (**NULL** if **most_common_vals** is **NULL**)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
histogram_bounds	anyarray	-	List of values that divide the column's values into groups of equal proportion. The values in **most_common_vals**, if present, are omitted from this histogram calculation. This field is null if the field data type does not have a **<** operator or if the **most_common_vals** list accounts for the entire population.
correlation	real	-	Statistical correlation between physical row ordering and logical ordering of the column values. It ranges from -1 to +1. When the value is near to -1 or +1, an index scan on the column is estimated to be cheaper than when it is near to zero, due to reduction of random access to the disk. This column is null if the column data type does not have a < operator.
most_common_elems	anyarray	-	A list of non-null element values most often appearing
most_common_elem_freqs	real[]	-	A list of the frequencies of the most common element values
elem_count_histogram	real[]	-	A histogram of the counts of distinct non-null element values

15.3.146 PG_STAT_ACTIVITY

PG_STAT_ACTIVITY displays information about the current user's queries. The columns save information about the last query.

Table 15-251 PG_STAT_ACTIVITY columns

Name	Type	Description
datid	oid	OID of the database that the user session connects to in the backend.
datname	name	Name of the database that the user session connects to in the backend.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
pid	bigint	Thread ID of the backend.
sessionid	bigint	Session ID.
usesysid	oid	OID of the user logged in to the backend.
usename	name	Name of the user logged in to the backend.
application_name	text	Name of the application connected to the backend.
client_addr	inet	IP address of the client connected to the backend. If this column is null, it indicates either the client is connected via a Unix socket on the server or this is an internal process, such as autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (**–1** if a Unix socket is used)
backend_start	timestamp with time zone	Time when this process was started, that is, when the client connected to the server.
xact_start	timestamp with time zone	Time when current transaction was started (null if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the **query_start** column.
query_start	timestamp with time zone	Time when the currently active query was started, or if **state** is not set to **active**, when the last query was started.
state_change	timestamp with time zone	Time when **state** was last modified.
waiting	boolean	Whether the backend is currently waiting on a lock. If it is, the value is **true**. Otherwise, the value is **false**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
enqueue	text	Queuing status of a statement. Its value can be: • **waiting in queue**: The statement is in the queue. • Empty: The statement is running.
state	text	Overall status of this backend. Its value can be: • **active**: The backend is executing a query. • **idle**: The backend is waiting for a new client command. • **idle in transaction**: The backend is in a transaction, but there is no statement being executed in the transaction. • **idle in transaction** (aborted): The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend. **NOTE** Common users can view only their own session status. The state information of other accounts is empty. For example, after user **judy** is connected to the database, the state information of user **joe** and the initial user **omm** in **pg_stat_activity** is empty. SELECT datname, usename, usesysid, state,pid FROM pg_stat_activity; datname | usename | usesysid | state | pid ----------+---------+----------+--------+----------------- postgres | omm | 10 | | 139968752121616 postgres | omm | 10 | | 139968903116560 db_tpcds | judy | 16398 | active | 139968391403280 postgres | omm | 10 | | 139968643069712 postgres | omm | 10 | | 139968680818448 postgres | joe | 16390 | | 139968563377936 (6 rows)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
resource_pool	name	Resource pool used by the user.
query_id	bigint	ID of a query.
query	text	Text of this backend's most recent query. If the value of **state** is **active**, this column shows the ongoing query. In all other states, it shows the last query that was executed.
connection_info	text	A string in JSON format recording the driver type, driver version, driver deployment path, and process owner of the connected database. For details, see **connection_info**.
global_sessionid	text	Global session ID.
unique_sql_id	bigint	Unique SQL statement ID.
trace_id	text	Driver-specific trace ID, which is associated with an application request.

15.3.147 PG_STAT_ACTIVITY_NG

PG_STAT_ACTIVITY_NG displays information about all queries in the logical cluster (The current feature is a lab feature. Contact Huawei technical support before using it.) of the current user.

Table 15-252 PG_STAT_ACTIVITY_NG columns

Name	Type	Description
datid	oid	OID of the database that the user session connects to in the backend
datname	name	Name of the database that the user session connects to in the backend
pid	bigint	Process ID of the backend
sessionid	bigint	Session ID
global_sessionid	text	Global session ID
usesysid	oid	OID of the user logged in to the backend
usename	name	OID of the user logged in to the backend

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
application_name	text	Name of the application connected to the backend
client_addr	inet	IP address of the client connected to the backend. If this column is **null**, either the client is connected via a Unix socket on the server machine or this is an internal process such as autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will only be non-null for IP connections, and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with this backend (**-1** if a Unix socket is used)
backend_start	timestamp with time zone	Time when this process was started, that is, when the client connected to the server
xact_start	timestamp with time zone	Time when current transaction was started (null if no transaction is active) If the current query is the first of its transaction, this column is equal to the **query_start** column.
query_start	timestamp with time zone	Time when the currently active query was started, or if **state** is not **active**, when the last query was started
state_change	timestamp with time zone	Time when the **status** was changed in the previous time
waiting	boolean	Whether the backend is currently waiting on a lock. If it is, its value is **true**. Otherwise, the value is **false**.
enqueue	text	Queuing status of a statement. The value must be one of the following: • **waiting in queue**: The statement is in the queue. • Empty: The statement is running.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Backend status. The value must be one of the following: • **active**: The backend is executing a query. • **idle**: The backend is waiting for a new client command. • **idle in transaction**: The backend is in a transaction, but there is no statement being executed in the transaction. • **idle in transaction** (aborted): The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend. **NOTE** Common users can view only their own session status. The state information of other accounts is empty. For example, after user **judy** is connected to the database, the state information of user **joe** and the initial user **omm** in **pg_stat_activity** is empty. SELECT datname, usename, usesysid, state,pid FROM pg_stat_activity_ng; datname | usename | usesysid | state | pid ----------+---------+----------+--------+----------------- postgres | omm | 10 | | 139968752121616 postgres | omm | 10 | | 139968903116560 db_tpcds | judy | 16398 | active | 139968391403280 postgres | omm | 10 | | 139968643069712 postgres | omm | 10 | | 139968680818448 postgres | joe | 16390 | | 139968563377936 (6 rows)
resource_pool	name	Resource pool used by the user
query_id	bigint	ID of a query

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
query	text	Latest query at the backend. If **state** is **active**, this column shows the executing query. In all other states, it shows the last query that was executed.
node_group	text	Logical cluster (The current feature is a lab feature. Contact Huawei technical support before using it.) of the user running the statement

15.3.148 PG_STAT_ALL_INDEXES

PG_STAT_ALL_INDEXES contains one row for each index in the current database, showing statistics about accesses to that specific index.

Indexes can be used via either simple index scans or "bitmap" index scans. In a bitmap scan the output of several indexes can be combined via AND or OR rules, so it is difficult to associate individual heap row fetches with specific indexes when a bitmap scan is used. Therefore, a bitmap scan increments the **pg_stat_all_indexes.idx_tup_read** count(s) for the index(es) it uses, and it increments the **pg_stat_all_tables.idx_tup_fetch** count for the table, but it does not affect **pg_stat_all_indexes.idx_tup_fetch**.

Table 15-253 PG_STAT_ALL_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index
indexrelid	oid	OID of this index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	bigint	Number of index scans initiated on the index
idx_tup_read	bigint	Number of index entries returned by scans on the index
idx_tup_fetch	bigint	Number of live table rows fetched by simple index scans using the index

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.149 PG_STAT_ALL_TABLES

PG_STAT_ALL_TABLES contains one row for each table in the current database (including TOAST tables), showing statistics about accesses to that specific table.

Table 15-254 PG_STAT_ALL_TABLES columns

Name	Type	Description
relid	oid	OID of the table
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (that is, with no separate index update required)
n_live_tup	bigint	Estimated number of live rows
n_dead_tup	bigint	Estimated number of dead rows
last_vacuum	timestamp with time zone	Last time when the table was cleared
last_autovacuum	timestamp with time zone	Last time at which the table was vacuumed by the autovacuum daemon
last_analyze	timestamp with time zone	Last time when the table was analyzed
last_autoanalyze	timestamp with time zone	Last time at which the table was analyzed by the autovacuum daemon
vacuum_count	bigint	Number of times the table is cleared

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
autovacuum_count	bigint	Number of times the table has been vacuumed by the autovacuum daemon
analyze_count	bigint	Number of times the table has been manually analyzed
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon
last_data_changed	timestamp with time zone	Last time at which the table was updated (by **INSERT**/**UPDATE**/**DELETE** or **EXCHANGE**/**TRUNCATE**/**DROP** *partition*). This column is not recorded in the system catalog but is recorded on the local CN.

15.3.150 PG_STAT_BAD_BLOCK

PG_STAT_BAD_BLOCK shows statistics about Page or CU verification failures after a node is started.

Table 15-255 PG_STAT_BAD_BLOCK columns

Name	Type	Description
nodename	text	Node name
databaseid	integer	OID of a database
tablespaceid	integer	Tablespace OID
relfilenode	integer	File object ID
bucketid	smallint	ID of the bucket for consistent hashing
forknum	integer	File type. The values are as follows: **0**: main data file. **1**: FSM file. **2**: VM file. **3**: BCM file. If the value is greater than 4, it indicates a data file of each column in a column-store table.
error_count	integer	Number of verification failures

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
first_time	timestamp with time zone	Time of the first verification failure
last_time	timestamp with time zone	Time of the latest verification failure

15.3.151 PG_STAT_BGWRITER

PG_STAT_BGWRITER showing statistics about the background writer process's activity.

Table 15-256 PG_STAT_BGWRITER columns

Name	Type	Description
checkpoints_timed	bigint	Number of scheduled checkpoints that have been performed
checkpoints_req	bigint	Number of requested checkpoints that have been performed
checkpoint_write_time	double precision	Total amount of time that has been spent in the portion of checkpoint processing where files are written to disk, in milliseconds
checkpoint_sync_time	double precision	Total amount of time that has been spent in the portion of checkpoint processing where files are synchronized to disk, in milliseconds
buffers_checkpoint	bigint	Number of buffers written during checkpoints
buffers_clean	bigint	Number of buffers written by the background writer
maxwritten_clean	bigint	Number of times the background writer stopped a cleaning scan because it had written too many buffers
buffers_backend	bigint	Number of buffers written directly by a backend

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
buffers_backend_fsync	bigint	Number of times a backend had to execute its own fsync call (normally the background writer handles those even when the backend does its own write)
buffers_alloc	bigint	Number of buffers allocated
stats_reset	timestamp with time zone	Time at which these statistics were last reset

15.3.152 PG_STAT_DATABASE

PG_STAT_DATABASE contains database statistics for each database in the cluster.

Table 15-257 PG_STAT_DATABASE columns

Name	Type	Description
datid	oid	OID of a database
datname	name	Name of the database
numbackends	integer	Number of backends currently connected to this database. This is the only column in this view that returns a value reflecting the current state; all other columns return the accumulated values since the last reset.
xact_commit	bigint	Number of transactions in this database that have been committed
xact_rollback	bigint	Number of transactions in this database that have been rolled back
blks_read	bigint	Number of disk blocks read in this database
blks_hit	bigint	Number of times disk blocks were found already in the buffer cache, so that a read was not necessary (this only includes hits in the PostgreSQL buffer cache, not the operating system's file system cache)
tup_returned	bigint	Number of rows returned by queries in this database
tup_fetched	bigint	Number of rows fetched by queries in this database

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tup_inserted	bigint	Number of rows inserted by queries in this database
tup_updated	bigint	Number of rows updated by queries in this database
tup_deleted	bigint	Number of rows deleted by queries in this database
conflicts	bigint	Number of queries canceled due to database recovery conflicts (conflicts occurring only on the standby server). For details, see PG_STAT_DATABASE_CONFLICTS.
temp_files	bigint	Number of temporary files created by queries in this database. All temporary files are counted, regardless of why the temporary file was created (for example, sorting or hashing), and regardless of the **log_temp_files** setting.
temp_bytes	bigint	Total amount of data written to temporary files by queries in this database. All temporary files are counted, regardless of why the temporary file was created, and regardless of the **log_temp_files** setting.
deadlocks	bigint	Number of deadlocks detected in this database
blk_read_time	double precision	Time spent reading data file blocks by backends in this database, in milliseconds
blk_write_time	double precision	Time spent reading data file blocks by backends in this database, in milliseconds
stats_reset	timestamp with time zone	Time at which the current statistics were reset

15.3.153 PG_STAT_DATABASE_CONFLICTS

PG_STAT_DATABASE_CONFLICTS displays statistics about database conflicts.

Table 15-258 PG_STAT_DATABASE_CONFLICTS columns

Name	Type	Description
datid	oid	ID of a database

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
datname	name	Database name
confl_tablespace	bigint	Number of conflicting tablespaces
confl_lock	bigint	Number of conflicting locks
confl_snapshot	bigint	Number conflicting snapshots
confl_bufferpin	bigint	Number of conflicting buffers
confl_deadlock	bigint	Number of conflicting deadlocks

15.3.154 PG_STAT_REPLICATION

PG_STAT_REPLICATION displays information about log synchronization status, such as the locations of the sender sending logs and the receiver receiving logs.

Table 15-259 PG_STAT_REPLICATION columns

Name	Type	Description
pid	bigint	PID of the thread
usesysid	oid	User system ID
usename	name	Username
application_name	text	Program name
client_addr	inet	Client address
client_hostname	text	Client name
client_port	integer	Port of the client
backend_start	timestamp with time zone	Start time of the program
state	text	Log replication state (catch-up or consistent streaming)
sender_sent_location	text	Location where the transmit sends logs
receiver_write_location	text	Location where the receive end writes logs
receiver_flush_location	text	Location where the receive end flushes logs
receiver_replay_location	text	Location where the receive end replays logs

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sync_priority	integer	Priority of synchronous duplication (**0** indicates asynchronization.)
sync_state	text	Synchronization state: • Asynchronous replication • Synchronous replication • Potential synchronization • Qurom: switches between synchronous and asynchronous state to ensure that there are more than a certain number of synchronous standby servers. Generally, the number of synchronous standby servers is (n+1)/2-1, where **n** indicates the total number of copies. Whether the standby server is synchronous depends on whether logs are received first. For details, see the description of the **synchronous_standby_names** parameter.

15.3.155 PG_STAT_SUBSCRIPTION

PG_STAT_SUBSCRIPTION displays the detailed synchronization information about a subscription.

Table 15-260 PG_STAT_SUBSCRIPTION columns

Name	Type	Description
subid	oid	Subscription OID
subname	name	Subscription name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
pid	integer	ID of the background Apply thread
received_lsn	text	Latest LSN received from the publisher.
last_msg_send_time	timestamp with time zone	Time when the last message is sent from the publisher
last_msg_receipt_time	timestamp with time zone	Time when the last message is received by the subscriber
latest_end_lsn	text	LSN of the publisher when the last keepalive message is received
latest_end_time	timestamp with time zone	Time when the last keepalive message is received

15.3.156 PG_STAT_SYS_INDEXES

PG_STAT_SYS_INDEXES displays index status information about all the system catalogs in the **pg_catalog** and **information_schema** schemas.

Table 15-261 PG_STAT_SYS_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	bigint	Number of index scans initiated on the index
idx_tup_read	bigint	Number of index entries returned by scans on the index
idx_tup_fetch	bigint	Number of live table rows fetched by simple index scans using the index

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.157 PG_STAT_SYS_TABLES

PG_STAT_SYS_TABLES displays statistics about the system catalogs of all the namespaces in **pg_catalog** and **information_schema** schemas.

Table 15-262 PG_STAT_SYS_TABLES columns

Name	Type	Description
relid	oid	OID of the table
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)
n_live_tup	bigint	Estimated number of live rows
n_dead_tup	bigint	Estimated number of dead rows
last_vacuum	timestamp with time zone	Last time at which the table was manually vacuumed (excluding **VACUUM FULL**)
last_autovacuum	timestamp with time zone	Last time at which this table was vacuumed by the autovacuum daemon
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time at which this table was analyzed by the autovacuum daemon

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
vacuum_count	bigint	Number of times the table has been manually vacuumed (not counting **VACUUM FULL**)
autovacuum_count	bigint	Number of times the table has been vacuumed by the autovacuum daemon
analyze_count	bigint	Number of times the table has been manually analyzed
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon
last_data_changed	timestamp with time zone	Last modification time of the table data

15.3.158 PG_STAT_USER_FUNCTIONS

PG_STAT_USER_FUNCTIONS shows user-defined function status information in the namespace. (The language of the function is non-internal language.)

Table 15-263 PG_STAT_USER_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of a function
schemaname	name	Schema name
funcname	name	Function name
calls	bigint	Number of times the function has been called
total_time	double precision	Total time spent in the function and all other functions called by it
self_time	double precision	Total time spent in the function itself, excluding other functions called by it

15.3.159 PG_STAT_USER_INDEXES

PG_STAT_USER_INDEXES displays information about the index status of user-defined ordinary tables and TOAST tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-264 PG_STAT_USER_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	bigint	Number of index scans initiated on the index
idx_tup_read	bigint	Number of index entries returned by scans on the index
idx_tup_fetch	bigint	Number of live table rows fetched by simple index scans using the index

15.3.160 PG_STAT_USER_TABLES

PG_STAT_USER_TABLES displays information about user-defined ordinary tables and TOAST tables in the namespaces.

Table 15-265 PG_STAT_USER_TABLES columns

Name	Type	Description
relid	oid	OID of the table
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)
n_live_tup	bigint	Estimated number of live rows
n_dead_tup	bigint	Estimated number of dead rows
last_vacuum	timestamp with time zone	Last time at which the table was manually vacuumed (excluding **VACUUM FULL**)
last_autovacuum	timestamp with time zone	Last time at which the table was vacuumed by the autovacuum daemon
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time at which the table was analyzed by the autovacuum daemon
vacuum_count	bigint	Number of times the table has been manually vacuumed (not counting **VACUUM FULL**)
autovacuum_count	bigint	Number of times the table has been vacuumed by the autovacuum daemon
analyze_count	bigint	Number of times the table has been manually analyzed
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon
last_data_changed	timestamp with time zone	Last modification time of the table data

15.3.161 PG_STAT_XACT_ALL_TABLES

PG_STAT_XACT_ALL_TABLES displays transaction status information about all ordinary tables and TOAST tables in the namespaces.

Table 15-266 PG_STAT_XACT_ALL_TABLES columns

Name	Type	Description
relid	oid	OID of the table

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

15.3.162 PG_STAT_XACT_SYS_TABLES

PG_STAT_XACT_SYS_TABLES displays transaction status information of the system catalog in the namespace.

Table 15-267 PG_STAT_XACT_SYS_TABLES columns

Name	Type	Description
relid	oid	OID of the table
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.163 PG_STAT_XACT_USER_FUNCTIONS

PG_STAT_XACT_USER_FUNCTIONS contains statistics on the execution of each function.

Table 15-268 PG_STAT_XACT_USER_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of a function
schemaname	name	Schema name
funcname	name	Function name
calls	bigint	Number of times that the function has been called
total_time	double precision	Total time spent in the function and all other functions called by it
self_time	double precision	Total time spent in the function itself, excluding other functions called by it

15.3.164 PG_STAT_XACT_USER_TABLES

PG_STAT_XACT_USER_TABLES displays transaction status information of the user table in the namespace.

Table 15-269 PG_STAT_XACT_USER_TABLES columns

Name	Type	Description
relid	oid	OID of the table
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

15.3.165 PG_STATIO_ALL_INDEXES

PG_STATIO_ALL_INDEXES contains one row for each index in the current database, showing I/O statistics about accesses to that specific index.

Table 15-270 PG_STATIO_ALL_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_blks_read	bigint	Number of disk blocks read from the index
idx_blks_hit	bigint	Number of cache hits in the index

15.3.166 PG_STATIO_ALL_SEQUENCES

PG_STATIO_ALL_SEQUENCES contains the I/O statistics of each sequence in the current database.

Table 15-271 PG_STATIO_ALL_SEQUENCES columns

Name	Type	Description
relid	oid	OID of this sequence
schemaname	name	Name of the schema where the sequence is in
relname	name	Name of the sequence
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Cache hits in the sequence

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.167 PG_STATIO_ALL_TABLES

PG_STATIO_ALL_TABLES contains I/O statistics for each table (including the TOAST table) in the current database.

Table 15-272 PG_STATIO_ALL_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from all indexes in the table
idx_blks_hit	bigint	Number of cache hits of all indexes in the table
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table

15.3.168 PG_STATIO_SYS_INDEXES

PG_STATIO_SYS_INDEXES displays I/O status information for all system catalog indexes in a namespace.

Table 15-273 PG_STATIO_SYS_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
idx_blks_read	bigint	Number of disk blocks read from the index
idx_blks_hit	bigint	Number of cache hits in the index

15.3.169 PG_STATIO_SYS_SEQUENCES

PG_STATIO_SYS_SEQUENCES displays I/O status information about all the sequences in the namespace.

Table 15-274 PG_STATIO_SYS_SEQUENCES columns

Name	Type	Description
relid	oid	OID of this sequence
schemaname	name	Name of the schema where the sequence is in
relname	name	Name of the sequence
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Cache hits in the sequence

15.3.170 PG_STATIO_SYS_TABLES

PG_STATIO_SYS_TABLES shows I/O status information about all the system catalogs in the namespace.

Table 15-275 PG_STATIO_SYS_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from the index in the table
idx_blks_hit	bigint	Number of cache hits in the table

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table

15.3.171 PG_STATIO_USER_INDEXES

PG_STATIO_USER_INDEXES displays I/O status information about all the user relationship table indexes in the namespace.

Table 15-276 PG_STATIO_USER_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_blks_read	bigint	Number of disk blocks read from the index
idx_blks_hit	bigint	Number of cache hits in the index

15.3.172 PG_STATIO_USER_SEQUENCES

PG_STATIO_USER_SEQUENCES shows I/O status information about all the user relationship table sequences in the namespace.

Table 15-277 PG_STATIO_USER_SEQUENCES columns

Name	Type	Description
relid	oid	OID of this sequence

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
schemaname	name	Name of the schema where the sequence is in
relname	name	Name of the sequence
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Cache hits in the sequence

15.3.173 PG_STATIO_USER_TABLES

PG_STATIO_USER_TABLES displays I/O status information about all the user relationship tables in the namespace.

Table 15-278 PG_STATIO_USER_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from the index in the table
idx_blks_hit	bigint	Number of cache hits in the table
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table

15.3.174 PG_THREAD_WAIT_STATUS

PG_THREAD_WAIT_STATUS allows you to test the block waiting status about the backend thread and auxiliary thread of the current instance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-279 PG_THREAD_WAIT_STATUS columns

Name	Type	Description
node_name	text	Current node name
db_name	text	Database name
thread_name	text	Thread name
query_id	bigint	Query ID. It is equivalent to **debug_query_id**.
tid	bigint	Thread ID of the current thread
sessionid	bigint	Current session ID
lwtid	integer	Lightweight thread ID of the current thread
psessionid	bigint	Parent session ID
tlevel	integer	Level of the streaming thread
smpid	integer	Concurrent thread ID
wait_status	text	For details about the waiting status of the current thread, see **Table 15-280**.
wait_event	text	Event that the current thread is waiting for
locktag	text	Information about the lock that the current thread is waiting for
lockmode	text	Lock mode that the current thread is waiting to obtain. The values include table-level lock, row-level lock, and page-level lock modes.
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock
global_sessionid	text	Global session ID

The waiting states in the **wait_status** column are as follows:

Table 15-280 Waiting state list

Value	Description
none	Waiting for no event
acquire lock	Waiting for locking until the locking succeeds or times out
acquire lwlock	Waiting for a lightweight lock
wait io	Waiting for I/O completion

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description
wait cmd	Waiting for reading network communication packets to complete
wait pooler get conn	Waiting for pooler to obtain connections
wait pooler abort conn	Waiting for pooler to terminate connections
wait pooler clean conn	Waiting for pooler to clear connections
pooler create conn: [nodename], total N	Waiting for the pooler to set up a connection. The connection is being established with the node specified by *nodename*, and there are *N* connections waiting to be set up.
get conn	Obtaining the connection to other nodes
set cmd: [nodename]	Waiting for running the **SET**, **RESET**, **TRANSACTION BLOCK LEVEL PARA SET**, or **SESSION LEVEL PARA SET** statement on the connection. The statement is being executed on the node specified by *nodename*.
cancel query	Canceling the SQL statement that is being executed through the connection
stop query	Stopping the query that is being executed through the connection
wait node: [nodename](plevel), total N, [phase]	Waiting for receiving data from a connected node. The thread is waiting for data from the plevel thread of the node specified by *nodename*. The data of *N* connections is waiting to be returned. If *phase* is included, the possible phases are as follows: • **begin**: The transaction is being started. • **commit**: The transaction is being committed. • **rollback**: The transaction is being rolled back.
wait transaction sync: xid	Waiting for synchronizing the transaction specified by *xid*
wait wal sync	Waiting for the completion of WAL of synchronization from the specified LSN to the standby instance
wait data sync	Waiting for the completion of data page synchronization to the standby instance

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description
wait data sync queue	Waiting for putting the data pages that are in the row-store or the CU in the column-store into the synchronization queue
flush data: [nodename](plevel), [phase]	Waiting for sending data to the plevel thread of the node specified by *nodename*. If *phase* is included, the possible phase is **wait quota**, indicating that the current communication flow is waiting for the quota value.
stream get conn: [nodename], total N	Waiting for connecting to the consumer object of the node specified by *nodename* when the stream flow is initialized. There are *N* consumers waiting to be connected.
wait producer ready: [nodename](plevel), total N	Waiting for each producer to be ready when the stream flow is initialized. The thread is waiting for the procedure of the plevel thread on the *nodename* node to be ready. There are *N* producers waiting to be ready.
synchronize quit	Waiting for the threads in the stream thread group to quit when the stream plan ends
nodegroup destroy	Waiting for destroying the stream node group when the stream plan ends
wait active statement	Waiting for job execution under resource and load control.
gtm connect	Waiting for connecting to GTM
gtm get gxid	Wait for obtaining transaction IDs from GTM
gtm get snapshot	Wait for obtaining transaction snapshots from GTM
gtm begin trans	Waiting for GTM to start a transaction
gtm commit trans	Waiting for GTM to commit a transaction
gtm rollback trans	Waiting for GTM to roll back a transaction
gtm start prepare trans	Waiting for GTM to start the prepare phase of a two-phase transaction
gtm prepare trans	Waiting for GTM to complete the prepare phase of a two-phase transaction
gtm open sequence	Waiting for GTM to open a sequence
gtm close sequence	Waiting for GTM to close a sequence
gtm create sequence	Waiting for GTM to create a sequence

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description
gtm alter sequence	Waiting for GTM to modify a sequence
gtm get sequence val	Waiting for obtaining the next value of a sequence from GTM
gtm set sequence val	Waiting for GTM to set a sequence value
gtm drop sequence	Waiting for GTM to delete a sequence
gtm rename sequece	Waiting for GTM to rename a sequence
analyze: [relname], [phase]	The thread is doing **ANALYZE** to the *relname* table. If *phase* is included, the possible phase is **autovacuum**, indicating that the database automatically enables the AutoVacuum thread to execute **ANALYZE**.
vacuum: [relname], [phase]	The thread is doing **VACUUM** to the *relname* table. If *phase* is included, the possible phase is **autovacuum**, indicating that the database automatically enables the AutoVacuum thread to execute **VACUUM**.
vacuum full: [relname]	The thread is doing **VACUUM FULL** to the *relname* table.
create index	An index is being created
HashJoin - [build hash | write file]	The **HashJoin** operator is being executed. In this phase, you need to pay attention to the execution time-consuming. • **build hash**: The **HashJoin** operator is creating a hash table. • **write file**: The **HashJoin** operator is writing data to disks.
HashAgg - [build hash | write file]	The **HashAgg** operator is being executed. In this phase, you need to pay attention to the execution time-consuming. • **build hash**: The **HashAgg** operator is creating a hash table. • **write file**: The **HashAgg** operator is writing data to disks.
HashSetop - [build hash | write file]	The **HashSetop** operator is being executed. In this phase, you need to pay attention to the execution time-consuming. • **build hash**: The **HashSetop** operator is creating a hash table. • **write file**: The **HashSetop** operator is writing data to disks.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description
Sort | Sort - [fetch tuple | write file]	The **Sort** operator is used for sorting. **fetch tuple** indicates that the **Sort** operator is obtaining tuples, and **write file** indicates that the **Sort** operator is writing data to disks.
Material | Material - write file	The **Material** operator is being executed. **write file** indicates that the **Material** operator is writing data to disks.
standby read recovery conflict	The read-only mode of the standby node conflicts with the log replay mode.
standby get snapshot	The standby node obtains the snapshot in read-only mode.

If **wait_status** is **acquire lwlock**, **acquire lock**, or **wait io**, there is an event performing I/O operations or waiting for obtaining the corresponding lightweight lock or transaction lock.

The following table describes the corresponding wait events when **wait_status** is **acquire lwlock**. If **wait_event** is **extension**, the lightweight lock is dynamically allocated and is not monitored.

Table 15-281 List of wait events corresponding to lightweight locks

wait_event	Description
ShmemIndexLock	Used to protect the primary index table, a hash table, in shared memory
OidGenLock	Used to prevent different threads from generating the same OID
XidGenLock	Used to prevent two transactions from obtaining the same XID
ProcArrayLock	Used to prevent concurrent access to or concurrent modification on the ProcArray shared array
SInvalReadLock	Used to prevent concurrent execution with invalid message deletion
SInvalWriteLock	Used to prevent concurrent execution with invalid message write and deletion
WALInsertLock	Used to prevent concurrent execution with WAL insertion
WALWriteLock	Used to prevent concurrent write from a WAL buffer to a disk

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description
ControlFileLock	Used to prevent concurrent read/write or concurrent write/write on the **pg_control** file
CheckpointLock	Used to prevent multi-checkpoint concurrent execution
CLogControlLock	Used to prevent concurrent access to or concurrent modification on the Clog control data structure
SubtransControlLock	Used to prevent concurrent access to or concurrent modification on the subtransaction control data structure
MultiXactGenLock	Used to allocate a unique MultiXact ID in serial mode
MultiXactOffsetControlLock	Used to prevent concurrent read/write or concurrent write/write on **pg_multixact/offset**
MultiXactMemberControl-Lock	Used to prevent concurrent read/write or concurrent write/write on **pg_multixact/members**
RelCacheInitLock	Used to add a lock before any operations are performed on the **init** file when messages are invalid
CheckpointerCommLock	Used to send file flush requests to a checkpointer. The request structure needs to be inserted to a request queue in serial mode.
TwoPhaseStateLock	Used to prevent concurrent access to or modification on two-phase information sharing arrays
TablespaceCreateLock	Used to check whether a tablespace exists.
BtreeVacuumLock	Used to prevent **VACUUM** from clearing pages that are being used by B-tree indexes
AlterPortLock	Used to protect the CN's operation of changing the registered port number.
AutovacuumLock	Used to access the autovacuum worker array in serial mode
AutovacuumScheduleLock	Used to distribute tables requiring **VACUUM** in serial mode
AutoanalyzeLock	Used to obtain and release resources related to a task that allows for autoanalyze execution
SyncScanLock	Used to determine the start position of a relfilenode during heap scanning

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description
NodeTableLock	Used to protect a shared structure that stores CN and DN node information.
PoolerLock	Used to prevent two threads from simultaneously obtaining the same connection from a connection pool
RelationMappingLock	Used to wait for the mapping file between system catalogs and storage locations to be updated
Async Ctl	Used to protect the async buffer.
AsyncCtlLock	Used to prevent concurrent access to or concurrent modification on the sharing notification status
AsyncQueueLock	Used to prevent concurrent access to or concurrent modification on the sharing notification queue
SerializableXactHashLock	Used to prevent concurrent read/write or concurrent write/write on a sharing structure for serializable transactions
SerializableFinishedListLock	Used to prevent concurrent read/write or concurrent write/write on a shared linked list for completed serial transactions
SerializablePredicateLockList-Lock	Used to protect a linked list of serializable transactions that have locks
OldSerXidLock	Used to protect a structure that records serializable transactions that have conflicts
FileStatLock	Used to protect a data structure that stores statistics file information
SyncRepLock	Used to protect Xlog synchronization information during primary-standby replication
DataSyncRepLock	Used to protect data page synchronization information during primary-standby replication
CStoreColspaceCacheLock	Used to add a lock when CU space is allocated for a column-store table
CStoreCUCacheSweepLock	Used to add a lock when CU caches used by a column-store table are cyclically washed out
MetaCacheSweepLock	Used to add a lock when metadata is cyclically washed out

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description
dummyServerInfoCacheLock	Used to protect a global hash table where the information about cluster connections is cached. (Due to specification changes, the current version no longer supports the current feature. Do not use this feature.)
ExtensionConnectorLibLock	Used to add a lock when a specific dynamic library is loaded or uninstalled in ODBC connection initialization scenarios
SearchServerLibLock	Used to add a lock on the file read operation when a specific dynamic library is initially loaded in GPU-accelerated scenarios
LsnXlogChkFileLock	Used to serially update the Xlog flush points for primary and standby servers recorded in a specific structure
GTMHostInfoLock	Used to prevent concurrent access to or concurrent modification on GTM host information
ReplicationSlotAllocation-Lock	Used to add a lock when a primary server allocates stream replication slots during primary-standby replication
ReplicationSlotControlLock	Used to prevent concurrent update of replication slot status during primary-standby replication
ResourcePoolHashLock	Used to prevent concurrent access to or concurrent modification on a resource pool table, a hash table
WorkloadStatHashLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains SQL requests from the CN side
WorkloadIoStatHashLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains I/O information of the current DN
WorkloadCGroupHashLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains Cgroup information
OBSGetPathLock	Used to prevent concurrent read/write or concurrent write/write on an OBS path
WorkloadUserInfoLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains user information about load management. (The current feature is a lab feature. Contact Huawei technical support before using it.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description
WorkloadRecordLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains requests received by CNs during adaptive memory management
WorkloadIOUtilLock	Used to protect a structure that records **iostat** and CPU load information
WorkloadNodeGroupLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains node group information in memory
JobShmemLock	Used to protect global variables in the shared memory that is periodically read during a scheduled task where MPP is compatible with Oracle
OBSRuntimeLock	Used to obtain environment variables, for example, GASSHOME
LLVMDumpIRLock	Used to export the assembly language for dynamically generating functions. The current feature is a lab feature. Contact Huawei technical support before using it.
LLVMParseIRLock	Used to compile and parse a finished IR function from the IR file at the start position of a query. The current feature is a lab feature. Contact Huawei technical support before using it.
RPNumberLock	Used by a DN on a cluster to count the number of threads for a task where plans are being executed. (Due to specification changes, the current version no longer supports the current feature. Do not use this feature.)
ClusterRPLock	Used by a cluster to control concurrent access on cluster load data maintained in a CCN of the cluster. (Due to specification changes, the current version no longer supports the current feature. Do not use this feature.)
CriticalCacheBuildLock	Used to load caches from a shared or local cache initialization file
WaitCountHashLock	Used to protect a shared structure in user statement counting scenarios
BufMappingLock	Used to protect operations on a table mapped to shared buffer
LockMgrLock	Used to protect a common lock structure

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description
PredicateLockMgrLock	Used to protect a lock structure that has serializable transactions
OperatorRealTLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains real-time data at the operator level
OperatorHistLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains historical data at the operator level
SessionRealTLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains real-time data at the query level
SessionHistLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains historical data at the query level
CacheSlotMappingLock	Used to protect global CU cache information
BarrierLock	Used to ensure that only one thread is creating a barrier at a time
StartBlockMappingLock	Used by globalstat to obtain information such as startblockarray from pgstat.
ConsumerStateLock	Used to update the working state of the time series consumer.
DeleteConsumerLock	Used to maintain the time series consumer hash table.
NgroupDestoryLock	Adds a lock to the concurrent modification of the Node Group hash table.
NGroupMappingLock	Adds a lock to the concurrent modification of a single bucket that protects the NodeGroup hash table.
GlobalSeqLock	Used to manage global sequence numbers.
MatviewSeqnoLock	Used to manage the cache of materialized views.
GPCCommitLock	Used to protect the addition of the global Plan Cache hash table. The current feature is a lab feature. Contact Huawei technical support before using it.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description
GPCClearLock	Used to protect the clearing of the global plan cache hash table. The current feature is a lab feature. Contact Huawei technical support before using it.
GPCTimelineLock	Used to protect the timeline check of the global plan cache hash table. The current feature is a lab feature. Contact Huawei technical support before using it.
GPCMappingLock	Used to manage the global plan cache. The current feature is a lab feature. Contact Huawei technical support before using it.
GPCPrepareMappingLock	Used to manage the global plan cache. The current feature is a lab feature. Contact Huawei technical support before using it.
GPRCMappingLock	Used to manage the access and modification operations of the global cache hash table of autonomous transactions.
PldebugLock	Used to debug stored procedures and perform concurrent maintenance operations.
BufFreelistLock	Used to ensure the atomicity of free list operations in the shared buffer.
AddinShmemInitLock	Used to protect the initialization of the shared memory object.
wait active statement	Waiting for job execution under resource and load control.
wait memory	Waiting for obtaining the memory.
DnUsedSpaceHashLock	Used to update space usage information corresponding to a session.
InstanceRealTLock	Used to protect the update of the hash table that stores shared instance statistics.
IOStatLock	Used to concurrently maintain the hash table of resource management I/O statistics.

The following table describes the corresponding wait events when **wait_status** is **wait io**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-282 List of wait events corresponding to I/Os

wait_event	Description
BufFileRead	Reads data from a temporary file to a specified buffer.
BufFileWrite	Writes the content of a specified buffer to a temporary file.
ControlFileRead	Reads the **pg_control** file, mainly during database startup, checkpoint execution, and primary/standby verification.
ControlFileSync	Flushes the **pg_control** file to a disk, during database initialization.
ControlFileSyncUpdate	Flushes the **pg_control** file to a disk, mainly during database startup, checkpoint execution, and primary/standby verification.
ControlFileWrite	Writes to the **pg_control** file, during database initialization.
ControlFileWriteUpdate	Updates the **pg_control** file, mainly during database startup, checkpoint execution, and primary/standby verification.
CopyFileRead	Reads a file during file copying.
CopyFileWrite	Writes a file during file copying.
DataFileExtend	Writes a file during file name extension.
DataFileFlush	Flushes a table data file to a disk.
DataFileImmediateSync	Flushes a table data file to a disk immediately.
DataFilePrefetch	Reads a table data file asynchronously.
DataFileRead	Reads a table data file synchronously.
DataFileSync	Flushes table data file modifications to a disk.
DataFileTruncate	Truncates a table data file.
DataFileWrite	Writes a table data file.
LockFileAddToDataDirRead	Reads the **postmaster.pid** file.
LockFileAddToDataDirSync	Flushes the **postmaster.pid** file to a disk.
LockFileAddToDataDirWrite	Writes PID information into the **postmaster.pid** file.
LockFileCreateRead	Read the LockFile file **%s.lock**.
LockFileCreateSync	Flushes the LockFile file **%s.lock** to a disk.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description
LockFileCreateWRITE	Writes PID information into the LockFile file **%s.lock**.
RelationMapRead	Reads the mapping file between system catalogs and storage locations.
RelationMapSync	Flushes the mapping file between system catalogs and storage locations to a disk.
RelationMapWrite	Writes the mapping file between system catalogs and storage locations.
ReplicationSlotRead	Reads a stream replication slot file during a restart.
ReplicationSlotRestoreSync	Flushes a stream replication slot file to a disk during a restart.
ReplicationSlotSync	Flushes a temporary stream replication slot file to a disk during checkpoint execution.
ReplicationSlotWrite	Writes a temporary stream replication slot file during checkpoint execution.
SLRUFlushSync	Flushes the **pg_clog**, **pg_subtrans**, and **pg_multixact** files to a disk, mainly during checkpoint execution and database shutdown.
SLRURead	Reads the **pg_clog**, **pg_subtrans**, and **pg_multixact** files.
SLRUSync	Writes dirty pages into the **pg_clog**, **pg_subtrans**, and **pg_multixact** files, and flushes the files to a disk, mainly during checkpoint execution and database shutdown.
SLRUWrite	Writes the **pg_clog**, **pg_subtrans**, and **pg_multixact** files.
TimelineHistoryRead	Reads the timeline history file during database startup.
TimelineHistorySync	Flushes the timeline history file to a disk during database startup.
TimelineHistoryWrite	Writes to the timeline history file during database startup.
TwophaseFileRead	Reads the **pg_twophase** file, mainly during two-phase transaction commit and restoration.
TwophaseFileSync	Flushes the **pg_twophase** file to a disk, mainly during two-phase transaction commit and restoration.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description
TwophaseFileWrite	Writes the **pg_twophase** file, mainly during two-phase transaction commit and restoration.
WALBootstrapSync	Flushes an initialized WAL file to a disk during database initialization.
WALBootstrapWrite	Writes an initialized WAL file during database initialization.
WALCopyRead	Read operation generated when an existing WAL file is read for replication after archiving and restoration.
WALCopySync	Flushes a replicated WAL file to a disk after archiving and restoration.
WALCopyWrite	Write operation generated when an existing WAL file is read for replication after archiving and restoration.
WALInitSync	Flushes a newly initialized WAL file to a disk during log reclaiming or writing.
WALInitWrite	Initializes a newly created WAL file to **0** during log reclaiming or writing.
WALRead	Reads data from Xlogs during redo operations on two-phase files.
WALSyncMethodAssign	Flushes all open WAL files to a disk.
WALWrite	Writes a WAL file.

The following table describes the corresponding wait events when **wait_status** is **acquire lock**.

Table 15-283 List of wait events corresponding to transaction locks

wait_event	Description
relation	Adds a lock to a table.
extend	Adds a lock to a table being scaled out.
partition	Adds a lock to a partitioned table.
partition_seq	Adds a lock to a partition of a partitioned table.
page	Adds a lock to a table page.
tuple	Adds a lock to a tuple on a page.
transactionid	Adds a lock to a transaction ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description
virtualxid	Adds a lock to a virtual transaction ID.
object	Adds a lock to an object.
cstore_freespace	Adds a lock to idle column-store space.
userlock	Adds a lock to a user.
advisory	Adds an advisory lock.

15.3.175 PG_TABLES

PG_TABLES provides access to each table in the database.

Table 15-284 PG_TABLES columns

Name	Type	Reference	Description
schemaname	name	**PG_NAMESPACE**.nspname	Name of the schema that contains a table
tablename	name	**PG_CLASS**.relname	Table name
tableowner	name	pg_get_userbyid(**PG_CLASS**.relowner)	Table owner
tablespace	name	**PG_TABLESPACE**.spcname	Tablespace that contains the table (default value: **null**)
hasindexes	boolean	**PG_CLASS**.relhasindex	Whether the table has (or recently had) an index. If it does, the value is **true**. Otherwise, the value is **false**.
hasrules	boolean	**PG_CLASS**.relhasruls	Whether the table has rules. If it does, the value is **true**. Otherwise, the value is **false**.
hastriggers	boolean	**PG_CLASS**.RELHASTRIGGERS	The value is **true** if the table has triggers; otherwise, the value is **false**.
tablecreator	name	pg_get_userbyid(**PG_OBJECT**.creator)	Table creator.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
created	timestamp with time zone	PG_OBJECT.ctime	Time when the table is created.
last_ddl_time	timestamp with time zone	PG_OBJECT.mtime	Time when the DDL operation is performed on the table for the last time.

15.3.176 PG_TDE_INFO

PG_TDE_INFO provides encryption information of all clusters.

Table 15-285 PG_TDE_INFO columns

Name	Type	Description
is_encrypt	boolean	Whether the cluster is an encryption cluster. • **f**: Non-encryption cluster • **t**: Encryption cluster
g_tde_algo	text	Encryption algorithm • SM4-CTR-128 • AES-CTR-128
remain	text	Reserved

15.3.177 PG_TIMEZONE_ABBREVS

PG_TIMEZONE_ABBREVS displays information about all available time zones.

Table 15-286 PG_TIMEZONE_ABBREVS columns

Name	Type	Description
abbrev	text	Abbreviation of the time zone name
utc_offset	interval	Offset from UTC
is_dst	boolean	Whether DST is used. If DST is used, the value is **true**. Otherwise, the value is **false**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.178 PG_TIMEZONE_NAMES

PG_TIMEZONE_NAMES displays all time zone names that can be recognized by **SET TIMEZONE**, along with their abbreviations, UTC offsets, and daylight saving time (DST) statuses.

Table 15-287 PG_TIMEZONE_NAMES columns

Name	Type	Description
name	text	Name of the time zone
abbrev	text	Abbreviation of the time zone name
utc_offset	interval	Offset from UTC
is_dst	boolean	Whether DST is used. If DST is used, the value is **true**. Otherwise, the value is **false**.

15.3.179 PG_TOTAL_MEMORY_DETAIL

PG_TOTAL_MEMORY_DETAIL displays memory usage of a node in the database.

Table 15-288 PG_TOTAL_MEMORY_DETAIL columns

Name	Type	Description
nodename	text	Node name
memorytype	text	Memory name
memorymbytes	integer	Size of the used memory, in MB

15.3.180 PG_TOTAL_USER_RESOURCE_INFO

PG_TOTAL_USER_RESOURCE_INFO displays resource usage of all users. Only administrators can query this view. This view is valid only when **use_workload_manager** is set to **on**. I/O monitoring items are valid only when **enable_logical_io_statistics** is set to **on**.

Table 15-289 PG_TOTAL_USER_RESOURCE_INFO columns

Name	Type	Description
username	name	Username
used_memory	integer	Used memory, in MB

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
total_memory	integer	Available memory, in MB. The value **0** indicates that the available memory is not limited and depends on the maximum memory available in the database.
used_cpu	double precision	Number of CPU cores in use. CPU usage data is collected only in complex jobs, and the value is the CPU usage of the related Cgroup.
total_cpu	integer	Total number of CPU cores of the Cgroup associated with the user on the node
used_space	bigint	Used permanent table storage space, in KB
total_space	bigint	Available permanent table storage space, in KB (**-1** if the storage space is not limited)
used_temp_space	bigint	Used temporary space, in KB
total_temp_space	bigint	Total available temporary space, in KB (**-1** if the temporary space is not limited)
used_spill_space	bigint	Size of the used operator flushing space, in KB
total_spill_space	bigint	Total size of the available operator flushing space, in KB (**-1** if the space is not limited)
read_kbytes	bigint	CN: total bytes read by the user's complex jobs on all DNs in the last 5 seconds, in KB DN: total bytes read by the user's complex jobs from the instance startup time to the current time, in KB
write_kbytes	bigint	CN: total bytes written by the user's complex jobs on all DNs in the last 5 seconds, in KB DN: total bytes written by the user's complex jobs from the instance startup time to the current time, in KB
read_counts	bigint	CN: total number of read times of the user's complex jobs on all DNs in the last 5 seconds DN: total number of read times of the user's complex jobs from the instance startup time to the current time
write_counts	bigint	CN: total number of write times of the user's complex jobs on all DNs in the last 5 seconds DN: total number of write times of the user's complex jobs from the instance startup time to the current time

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
read_speed	double precision	CN: average read rate of the user's complex jobs on a single DN in the last 5 seconds, in KB/s DN: average read rate of the user's complex jobs on the DN in the last 5 seconds, in KB/s
write_speed	double precision	CN: average write rate of the user's complex jobs on a single DN in the last 5 seconds, in KB/s DN: average write rate of the user's complex jobs on a single DN in the last 5 seconds, in KB/s

15.3.181 PG_TOTAL_USER_RESOURCE_INFO_OID

PG_TOTAL_USER_RESOURCE_INFO_OID displays resource usage of all users. Only administrators can query this view. This view is valid only when **use_workload_manager** is set to **on**.

Table 15-290 PG_TOTAL_USER_RESOURCE_INFO_OID columns

Name	Type	Description
userid	oid	User ID
used_memory	integer	Used memory, in MB
total_memory	integer	Available memory, in MB. The value **0** indicates that the available memory is not limited and depends on the maximum memory available in the database.
used_cpu	double precision	Number of CPU cores in use
total_cpu	integer	Total number of CPU cores of the Cgroup associated with the user on the node
used_space	bigint	Used storage space, in KB
total_space	bigint	Available storage space, in KB. The value **-1** indicates that the space is not limited.
used_temp_space	bigint	Used temporary storage space, in KB
total_temp_space	bigint	Total available temporary space, in KB. The value **-1** indicates that the space is not limited.
used_spill_space	bigint	Used disk space for spilling, in KB

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
total_spill_space	bigint	Total available disk space for spilling, in KB. The value **-1** indicates that the space is not limited.
read_kbytes	bigint	Volume of data read from the disk, in KB.
write_kbytes	bigint	Volume of data written to the disk, in KB.
read_counts	bigint	Number of disk read times.
write_counts	bigint	Number of disk write times.
read_speed	double precision	Disk read rate, in B/ms.
write_speed	double precision	Disk write rate, in B/ms.

15.3.182 PG_USER

PG_USER provides information about database users. By default, only the initial user and users with the sysadmin attribute can view the information. Other users can view the information only after being granted permissions.

Table 15-291 PG_USER columns

Name	Type	Description
usename	name	Username
usesysid	oid	ID of this user
usecreatedb	boolean	Whether the user has the permissions to create databases • **t (true)**: yes. • **f (false)**: no.
usesuper	boolean	whether the user is the initial system administrator with the highest rights • **t (true)**: yes. • **f (false)**: no.
usecatupd	boolean	whether the user can directly update system tables. Only the initial system administrator whose **usesysid** is **10** has this permission. It is unavailable for other users. • **t (true)**: yes. • **f (false)**: no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
userepl	boolean	Whether the user has the permissions to duplicate data streams • **t (true)**: yes. • **f (false)**: no.
passwd	text	Encrypted user password. The value is displayed as ********.
valbegin	timestamp with time zone	Start time for account validity (**NULL** if start time is not specified).
valuntil	timestamp with time zone	End time for account validity (**NULL** if end time is not specified).
respool	name	Resource pool where the user is in
parent	oid	Parent user OID
spacelimit	text	Storage space of the permanent table
useconfig	text[]	Session defaults for runtime configuration variables
nodegroup	name	Name of the logical (The current feature is a lab feature. Contact Huawei technical support before using it.) associated with the user. If no logical cluster is associated, this column is left blank.
tempspacelimit	text	Storage space of the temporary table
spillspacelimit	text	Operator disk flushing space
usemonitoradmin	boolean	Whether the user is a monitor administrator • **t (true)**: yes. • **f (false)**: no.
useoperatoradmin	boolean	Whether the user is an O&M administrator • **t (true)**: yes. • **f (false)**: no.
usepolicyadmin	boolean	Whether the user is a security policy administrator • **t (true)**: yes. • **f (false)**: no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.183 PG_USER_MAPPINGS

PG_USER_MAPPINGS provides access to information about user mappings.

All users can view the report.

Table 15-292 PG_USER_MAPPINGS columns

Name	Type	Reference	Description
umid	oid	PG_USER_MAPPING.oid	OID of the user mapping
srvid	oid	PG_FOREIGN_SERVER.oid	OID of the foreign server that contains the mapping
srvname	name	PG_FOREIGN_SERVER.srvname	Name of the foreign server
umuser	oid	PG_AUTHID.oid	OID of the local role being mapped (**0** if the user mapping is public)
usename	name	-	Name of the local user to be mapped
umoptions	text[ ]	-	User mapping specific options. If the current user is the owner of the foreign server, the value is **keyword=value strings**. Otherwise, the value is **null**.

15.3.184 PG_VARIABLE_INFO

PGXC_VARIABLE_INFO records information about transaction IDs and OIDs of the current node in a cluster.

Table 15-293 PG_VARIABLE_INFO columns

Name	Type	Description
node_name	text	Node name
next_oid	oid	OID generated next time for the node
next_xid	xid	Transaction ID generated next time for the node
oldest_xid	xid	Oldest transaction ID on the node
xid_vac_limit	xid	Critical point (transaction ID) that triggers forcible autovacuum

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
oldest_xid_db	oid	OID of the database that has the minimum datafrozenxid on the node
last_extend_csn_logpage	xid	Number of the last extended csnlog page
start_extend_csn_logpage	xid	Number of the page from which csnlog extending starts
next_commit_seqno	xid	CSN generated next time for the node
latest_completed_xid	xid	Latest transaction ID on the node after the transaction commission or rollback
startup_max_xid	xid	Last transaction ID before the node is powered off

15.3.185 PG_VIEWS

PG_VIEWS provides access to basic information about each view in the database.

Table 15-294 PG_VIEWS columns

Name	Type	Reference	Description
schemaname	name	**PG_NAMESPACE**.nspname	Name of the schema that contains the view
viewname	name	**PG_CLASS**.relname	View name
viewowner	name	**PG_AUTHID**.Erolname	Owner of the view
definition	text	-	Definition of the view

15.3.186 PG_WLM_STATISTICS

PG_WLM_STATISTICS shows information about workload management after the task is complete or the exception has been handled. (The current feature is a lab feature. Contact Huawei technical support before using it.) Only the sysadmin user can query this view.

Table 15-295 PG_WLM_STATISTICS columns

Name	Type	Description
statement	text	Statement executed for exception handling
block_time	bigint	Block time before the statement is executed

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
elapsed_time	bigint	Elapsed time when the statement is executed
total_cpu_time	bigint	Total time used by the CPU on the DN when the statement is executed for exception handling
qualification_time	bigint	Period when the statement checks the inclination ratio
cpu_skew_percent	integer	CPU usage skew on the DN when the statement is executed for exception handling
control_group	text	Cgroup used when the statement is executed for exception handling
status	text	Statement status after it is executed for exception handling • **pending**: The statement is waiting to be executed. • **running**: The statement is being executed. • **finished**: The execution is finished normally. • **abort**: The execution is unexpectedly terminated.
action	text	Actions when statements are executed for exception handling • **abort**: terminating the operation. • **adjust**: executing the Cgroup adjustment operations. Currently, you can only perform the demotion operation. • **finish**: The operation is normally finished.

15.3.187 PGXC_COMM_DELAY

PGXC_COMM_DELAY displays the communication library delay status of all DNs. Only system admin and monitor admin can view the status.

Table 15-296 PGXC_COMM_DELAY columns

Name	Type	Description
node_name	text	Node name
remote_name	text	Peer node name
remote_host	text	IP address of the peer node

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
stream_num	integer	Number of logical stream connections used by the current physical connection
min_delay	integer	Minimum delay of the current physical connection within 1 minute, in microsecond **NOTE** A negative result is invalid. Wait until the delay status is updated and query again.
average	integer	Average delay of the current physical connection within 1 minute, in microsecond
max_delay	integer	Maximum delay of the current physical connection within 1 minute, in microsecond

15.3.188 PGXC_COMM_RECV_STREAM

PGXC_COMM_RECV_STREAM displays the receiving stream status of the communication libraries for all the DNs.

Table 15-297 PGXC_COMM_RECV_STREAM columns

Name	Type	Description
node_name	text	Node name
local_tid	bigint	ID of the thread using this stream
remote_name	text	Peer node name
remote_tid	bigint	Peer thread ID
idx	integer	Peer DN ID in the local DN
sid	integer	Stream ID in the physical connection
tcp_sock	integer	TCP socket used in the stream
state	text	Status of the stream • **UNKNOWN**: The logical connection status is unknown. • **READY**: The logical connection is ready. • **RUN**: The logical connection sends packets normally. • **HOLD**: The logical connection is waiting to send packets. • **CLOSED**: The logical connection is closed. • **TO_CLOSED**: The logical connection will be closed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
query_id	bigint	**debug_query_id** corresponding to the stream
pn_id	integer	**plan_node_id** of the query executed by the stream
send_smp	integer	**smpid** of the sender of the query executed by the stream
recv_smp	integer	**smpid** of the receiver of the query executed by the stream
recv_bytes	bigint	Total data volume received from the stream, in byte
time	bigint	Current lifecycle service duration of the stream, in ms
speed	bigint	Average receiving rate of the stream, in byte/s
quota	bigint	Current communication quota value of the stream, in byte
buff_usize	bigint	Current size of the data cache of the stream, in byte

15.3.189 PGXC_COMM_SEND_STREAM

PGXC_COMM_SEND_STREAM displays the sending stream status of the communication libraries for all the DNs.

Table 15-298 PGXC_COMM_SEND_STREAM columns

Name	Type	Description
node_name	text	Node name
local_tid	bigint	ID of the thread using this stream
remote_name	text	Peer node name
remote_tid	bigint	Peer thread ID
idx	integer	Peer DN ID in the local DN
sid	integer	Stream ID in the physical connection
tcp_sock	integer	TCP socket used in the stream

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Status of the stream The options are as follows: • **UNKNOWN**: The connection status is unknown. • **READY**: The connection is ready. • **RUN**: The connection sends packets normally. • **HOLD**: The connection is waiting to send packets. • **CLOSED**: The connection is closed. • **TO_CLOSED**: The connection will be closed.
query_id	bigint	**debug_query_id** corresponding to the stream
pn_id	integer	**plan_node_id** of the query executed by the stream
send_smp	integer	**smpid** of the sender of the query executed by the stream
recv_smp	integer	**smpid** of the receiver of the query executed by the stream
send_bytes	bigint	Total data volume sent by the stream, in byte
time	bigint	Current lifecycle service duration of the stream, in ms
speed	bigint	Average sending rate of the stream, in byte/s
quota	bigint	Current communication quota value of the stream, in byte
wait_quota	bigint	Extra time generated when the stream waits the quota value, in ms

15.3.190 PGXC_COMM_STATUS

PGXC_COMM_STATUS displays the communication library status for all the DNs.

Table 15-299 PGXC_COMM_STATUS columns

Name	Type	Description
node_name	text	Node name
rxpck_rate	integer	Receiving rate of the communication library on the node, in byte/s

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
txpck_rate	integer	Sending rate of the communication library on the node, in byte/s
rxkbyte_rate	bigint	Receiving rate of the communication library on the node, in kbyte/s
txkbyte_rate	bigint	Sending rate of the communication library on the node, in kbyte/s
buffer	bigint	Size of the buffer of the Cmailbox
memkbyte_libcomm	bigint	Communication memory size of the **libcomm** process, in bytes
memkbyte_libpq	bigint	Communication memory size of the **libpq** process, in bytes
used_pm	integer	Real-time usage of the postmaster thread
used_sflow	integer	Real-time usage of the **gs_sender_flow_controller** thread
used_rflow	integer	Real-time usage of the **gs_receiver_flow_controller** thread
used_rloop	integer	Highest real-time usage among multiple **gs_receivers_loop** threads
stream	integer	Total number of used logical connections.

15.3.191 PGXC_GET_STAT_ALL_TABLES

PGXC_GET_STAT_ALL_TABLES obtains information about insertion, update, and deletion operations on tables and the dirty page rate of tables. Before running **VACUUM FULL** to a system catalog with a high dirty page rate, ensure that no user is performing operations on it. This view is a new function in GaussDB. After an upgrade to this version, statistics about insert, update, and deletion operations performed before the upgrade will not be collected. You are advised to run **VACUUM FULL** to tables (excluding system catalogs) whose dirty page rate exceeds 30% or run it based on service scenarios. Only users with the system admin or monitor admin permission can view the information.

Table 15-300 PGXC_GET_STAT_ALL_TABLES columns

Name	Type	Description
relid	oid	Table OID
relname	name	Table name
schemaname	name	Schema name of the table

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_tup_ins	numeric	Number of inserted tuples
n_tup_upd	numeric	Number of updated tuples
n_tup_del	numeric	Number of deleted tuples
n_live_tup	numeric	Number of live tuples
n_dead_tup	numeric	Number of dead tuples
dirty_page_rate	numeric(5,2)	Dirty page rate (%) of a table

15.3.192 PGXC_GET_TABLE_SKEWNESS

PGXC_GET_TABLE_SKEWNESS stores the data skew on tables in the current database. Only the system administrator has the permission to access.

Table 15-301 PGXC_GET_TABLE_SKEWNESS columns

Name	Type	Description
schemaname	name	Schema name of a table
tablename	name	Table name
totalsize	numeric	Total size of the table, in bytes
avgsize	numeric(1000,0)	Average table size (total table size divided by the number of DNs), which is the ideal size of tables distributed on each DN
maxratio	numeric(4,3)	Ratio of the maximum table size on a single DN to the total table size
minratio	numeric(4,3)	Ratio of the minimum table size on a single DN to the total table size
skewsize	bigint	Table skew rate (the maximum table size on a single DN minus the minimum table size on a single DN)
skewratio	numeric(4,3)	Table skew rate (skew size divided by total table size)
skewstddev	numeric(1000,0)	Standard deviation of table distribution (For two tables of the same size, a larger deviation indicates a more severe skew.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.193 PGXC_NODE_ENV

PGXC_NODE_ENV provides environmental variables of all nodes in a cluster. This view can be viewed only by the monitor admin and sysadmin users.

Table 15-302 PGXC_NODE_ENV columns

Name	Type	Description
node_name1	text	All node names in the cluster
host1	text	Host names of all the nodes in the cluster
process1	integer	Process IDs of all the nodes in the cluster
port1	integer	Port numbers of all the nodes in the cluster
installpath1	text	Installation directory of all the nodes in the cluster
datapath1	text	Data directory of all the nodes in the cluster
log_directory1	text	Log directory of all the nodes in the cluster

15.3.194 PGXC_OS_THREADS

PGXC_OS_THREADS provides information about the thread status of all normal nodes in the current cluster. Only the system administrator and monitor administrator can access this view.

Table 15-303 PGXC_OS_THREADS columns

Name	Type	Description
node_name	text	All normal node names in the cluster
pid	bigint	IDs of running threads among all the normal node processes in the current cluster
lwpid	integer	Lightweight thread ID corresponding to the PID
thread_name	text	Thread name corresponding to the PID
creation_time	timestamp with time zone	Thread creation time corresponding to the PID

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.195 PGXC_PREPARED_XACTS

PGXC_PREPARED_XACTS displays two-phase transactions in the **prepared** phase. Only users with the system admin or monitor admin permission can view the information.

Table 15-304 PGXC_PREPARED_XACTS columns

Name	Type	Description
pgxc_prepared_xact	text	Displays the two-phase transaction in the **prepared** phase.

15.3.196 PGXC_RUNNING_XACTS

PGXC_RUNNING_XACTS displays information about running transactions on each node in the cluster. The content is the same as that displayed by **PG_RUNNING_XACTS**. Only users with the system admin or monitor admin permission can view the information.

Table 15-305 PGXC_RUNNING_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM
gxid	xid	Transaction ID
state	tinyint	Transaction status (**3**: prepared; **0**: starting)
node	text	Node name
xmin	xid	Minimum transaction ID on the node
vacuum	boolean	Whether the current transaction is lazy vacuum • **t (true)**: yes. • **f (false)**: no.
timeline	bigint	Number of database restarts
prepare_xid	xid	Transaction ID in the **prepared** state (**0** if the state is not **prepared**)
pid	bigint	Thread ID corresponding to the transaction
next_xid	xid	Transaction ID sent from a CN to a DN

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.197 PGXC_STAT_ACTIVITY

PGXC_STAT_ACTIVITY displays information about the current user's queries on all CNs in the current cluster. Only users with the **monitor admin** or **sysadmin** permission can view the view.

Table 15-306 PGXC_STAT_ACTIVITY columns

Name	Type	Description
coorname	text	Name of a CN in the current cluster
datid	oid	OID of the database that the user session connects to in the backend
datname	text	Name of the database that the user session connects to in the backend
pid	bigint	Process ID of the backend
sessionid	bigint	Session ID
usesysid	oid	OID of the user logged in to the backend
usename	text	Name of the user logged in to the backend
application_name	text	Name of the application connected to the backend
client_addr	inet	IP address of the client connected to the backend. If this column is **null**, either the client is connected via a Unix socket on the server machine or this is an internal process such as autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null for IP connections only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (**–1** if a Unix socket is used)
backend_start	timestamp with time zone	Time when this process was started, that is, when the client connected to the server
xact_start	timestamp with time zone	Time when the current transaction was started (**null** if no transaction is active). If the current query is the first of its transaction, this column is equal to the **query_start** column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
query_start	timestamp with time zone	Time when the currently active query was started, or if **state** is not **active**, when the last query was started
state_change	timestamp with time zone	Time when the last **status** was changed
waiting	boolean	Whether the backend is currently waiting on a lock. If it is, the value is **true**. Otherwise, the value is **false**.
enqueue	text	Queuing status of a statement. Its value can be: • **waiting in queue**: The statement is in the queue. • **Empty**: The statement is running.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Backend status. Its value can be: • **active**: The backend is executing a query. • **idle**: The backend is waiting for a new client command. • **idle in transaction**: The backend is in a transaction, but there is no statement being executed in the transaction. • **idle in transaction** (aborted): The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend. **NOTE** Only system administrators can view the session status of their accounts. The state information of other accounts is empty. For example, after user **judy** is connected to the database, the state information of user **joe** and the initial user **omm** in **pgxc_stat_activity** is empty. SELECT datname, usename, usesysid, state,pid FROM pgxc_stat_activity; datname | usename | usesysid | state | pid ----------+---------+----------+-------- +----------------- postgres | omm | 10 | | 139968752121616 postgres | omm | 10 | | 139968903116560 db_tpcds | judy | 16398 | active | 139968391403280 postgres | omm | 10 | | 139968643069712 postgres | omm | 10 | | 139968680818448 postgres | joe | 16390 | | 139968563377936 (6 rows)
resource_pool	name	Resource pool used by the user
query_id	bigint	ID of a query
query	text	Latest query at the backend. If **state** is **active**, this column shows the ongoing query. In all other states, it shows the last query that was executed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
connection_info	text	A string in JSON format recording the driver type, driver version, driver deployment path, and process owner of the connected database. For details, see **connection_info**.
global_sessionid	text	Global session ID
unique_sql_id	bigint	Unique SQL statement ID
trace_id	text	Driver-specific trace ID, which is associated with an application request

15.3.198 PGXC_STAT_BAD_BLOCK

PGXC_STAT_BAD_BLOCK shows statistics about Page or CU verification failures after all nodes in a cluster are started. This view can be viewed only by the monitor admin and sysadmin users.

Table 15-307 PGXC_STAT_BAD_BLOCK columns

Name	Type	Description
nodename	text	Node name
databaseid	integer	Database OID
tablespaceid	integer	Tablespace OID
relfilenode	integer	File object ID
forknum	integer	File type
error_count	integer	Number of verification failures
first_time	timestamp with time zone	Time of the first verification failure
last_time	timestamp with time zone	Time of the latest verification failure

15.3.199 PGXC_SQL_COUNT

PGXC_SQL_COUNT displays node-level and user-level statistical results for the **SELECT**, **INSERT**, **UPDATE**, **DELETE**, and **MERGE INTO** statements in real time, identifies query types with heavy load, and measures the capability of a cluster or node to perform a specific type of query. For example, you can calculate QPS based on the quantities of the five types of SQL statements at certain time points. **USER1 SELECT** is counted as **X1** at T1 and as **X2** at T2. The **SELECT** QPS of the user can be calculated as follows: (X2 – X1)/(T2 – T1). In this way, the system can

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

draw cluster-user-level QPS curve graphs and determine cluster throughput, tracing changes in the service load of each user. If there are drastic changes, the system can locate the specific statement type (such as **SELECT**, **INSERT**, **UPDATE**, **DELETE**, and **MERGE INTO**). You can also observe QPS curves to determine the time points when problems occur and then locate the problems using other tools. The curves provide a basis for optimizing cluster performance and locating problems. This view can be viewed only by the monitor admin and sysadmin users. The query can be performed only on the CN. The **execute direct on (dn)'select * from PGXC_SQL_COUNT';** statement is not supported.

Columns in the **PGXC_SQL_COUNT** view are the same as those in the **GS_SQL_COUNT** view. For details, see **Table 15-181**.

NOTE

If a **MERGE INTO** statement can be pushed down and a DN receives it, the statement will be counted on the DN and the value of the **mergeinto_count** column will be incremented by 1. If pushdown is not allowed, the DN will receive an **UPDATE** or **INSERT** statement. In this case, the **update_count** or **insert_count** column will be incremented by 1.

15.3.200 PGXC_THREAD_WAIT_STATUS

In **PGXC_THREAD_WAIT_STATUS**, you can see all the call layer hierarchy relationship between threads of the SQL statements on all the nodes in a cluster, and the waiting status of the block for each thread, so that you can easily locate the causes of process response failures and similar phenomena.

The definitions of **PGXC_THREAD_WAIT_STATUS** view and **PG_THREAD_WAIT_STATUS** view are the same, because the essence of the **PGXC_THREAD_WAIT_STATUS** view is the query summary of the **PG_THREAD_WAIT_STATUS** view on each node in the cluster.

Table 15-308 PGXC_THREAD_WAIT_STATUS columns

Name	Type	Description
node_name	text	Current node name
db_name	text	Database name
thread_name	text	Thread name
query_id	bigint	Query ID. It is equivalent to **debug_query_id**.
tid	bigint	Thread ID of the current thread
sessionid	bigint	Session ID
lwtid	integer	Lightweight thread ID of the current thread
psessionid	bigint	Parent session ID
tlevel	integer	Level of the streaming thread
smpid	integer	Concurrent thread ID
wait_status	text	Detailed information about the waiting status of the current thread

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
wait_event	text	Event that the current thread is waiting for. For details, see **Table 15-280**.
locktag	text	Information about the lock that the current thread is waiting for
lockmode	text	Lock mode that the current thread is waiting to obtain
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock
global_sessionid	text	Global session ID

Example:

If you run a statement on coordinator1 and no response is returned after a long period of time, establish another connection to coordinator1 to check the thread status on it.

```
openGauss=# select * from pg_thread_wait_status where query_id > 0;
  node_name   | db_name  | thread_name  | query_id |       tid        | lwtid | ptid  | tlevel | smpid |
wait_status   |   wait_event
--------------+----------+--------------+----------+------------------+-------+-------+--------+-------
+----------------------
 coordinator1 | postgres | gsql         | 20971544 | 140274089064208 | 22579 |       |      0 |     0 | wait node:
datanode4 |
(1 rows)
openGauss=# select * from pgxc_thread_wait_status where query_id > 0;
  node_name   | db_name  | thread_name  |     query_id      |      tid       |   sessionid    | lwtid  | psessionid |
tlevel | smpid | wait_status | wait_event
--------------+----------+--------------+-------------------+----------------+----------------+--------+------------
+--------+-------+-------------+------------
 coordinator1 | postgres | gsql         | 77687093572155050 | 47212704827136 | 47212704827136 |  63191
|            |      0 |     0 | none        |
 coordinator2 | postgres | coordinator1 | 77687093572155050 | 47403117319936 | 47403117319936 |
159322 |            |      0 |     0 | none        |
 data_node1   | postgres | coordinator1 | 77687093572155050 | 47723869374208 | 47723869374208 |
159320 |            |      0 |     0 | none        |

159321 |            |      0 |     0 | none        |
(4 rows)
```

15.3.201 PGXC_TOTAL_MEMORY_DETAIL

PGXC_TOTAL_MEMORY_DETAIL displays memory usage in the cluster. The query can be performed only on the CN. The **execute direct on (dn)'select * from PGXC_TOTAL_MEMORY_DETAIL';** statement is not supported. Only users with the sysadmin or monitor admin permission can query this view.

Table 15-309 PGXC_TOTAL_MEMORY_DETAIL columns

Name	Type	Description
nodename	text	Node name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
memorytype	text	Memory name • **max_process_memory**: memory occupied by a GaussDB cluster instance • **process_used_memory**: memory occupied by a GaussDB process • **max_dynamic_memory**: maximum dynamic memory • **dynamic_used_memory**: used dynamic memory • **dynamic_peak_memory**: dynamic memory peak • **dynamic_used_shrctx**: maximum dynamic shared memory context • **dynamic_peak_shrctx**: dynamic peak value of the shared memory context • **max_shared_memory**: maximum shared memory • **shared_used_memory**: used shared memory • **max_cstore_memory**: maximum memory allowed by column-storage • **cstore_used_memory**: memory used in column-storage • **max_sctpcomm_memory**: maximum memory allowed for the communication library • **sctpcomm_used_memory**: memory used by the communication library • **sctpcomm_peak_memory**: memory peak of the communication library • **other_used_memory**: other used memory
memorymbytes	integer	Size of the used memory, in MB

15.3.202 PGXC_VARIABLE_INFO

PGXC_VARIABLE_INFO records information about transaction IDs and OIDs of all nodes in a cluster. This view can be viewed only by the monitor admin and sysadmin users. The query can be performed only on the CN. The **execute direct on (dn)'select * from PGXC_VARIABLE_INFO';** statement is not supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-310 PGXC_VARIABLE_INFO columns

Name	Type	Description
node_name	text	Node name
next_oid	oid	OID generated next time for the node
next_xid	xid	Transaction ID generated next time for the node
oldest_xid	xid	Oldest transaction ID on the node
xid_vac_limit	xid	Critical point (transaction ID) that triggers forcible autovacuum
oldest_xid_db	oid	OID of the database that has the minimum datafrozenxid on the node
last_extend_csn_logpage	xid	Number of the last extended csnlog page
start_extend_csn_logpage	xid	Number of the page from which csnlog extending starts
next_commit_seqno	xid	CSN generated next time for the node
latest_completed_xid	xid	Latest transaction ID on the node after the transaction commission or rollback
startup_max_xid	xid	Last transaction ID before the node is powered off

15.3.203 PGXC_WLM_EC_OPERATOR_HISTORY

PGXC_WLM_EC_OPERATOR_HISTORY displays operator information of completed Extension Connector jobs executed on all CNs. Only the user with sysadmin permission can query this view. The current feature is a lab feature. Contact Huawei technical support before using it.

Records in the view are cleared every 3 minutes.

For details about the columns, see **GS_WLM_EC_OPERATOR_INFO**.

15.3.204 PGXC_WLM_EC_OPERATOR_INFO

PGXC_WLM_EC_OPERATOR_INFO displays operator information of completed Extension Connector jobs executed on all CNs. Only the user with sysadmin permission can query this view. The current feature is a lab feature. Contact Huawei technical support before using it.

The data in this view is obtained from **GS_WLM_EC_OPERATOR_INFO**.

For details about the columns, see **GS_WLM_EC_OPERATOR_INFO**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.205 PGXC_WLM_EC_OPERATOR_STATISTICS

PGXC_WLM_EC_OPERATOR_STATISTICS displays operator information about running Extension Connector jobs on all CNs. Only the user with sysadmin permission can query this view. The current feature is a lab feature. Contact Huawei technical support before using it.

For details about the columns, see **GS_WLM_EC_OPERATOR_STATISTICS**.

15.3.206 PGXC_WLM_OPERATOR_HISTORY

PGXC_WLM_OPERATOR_HISTORY displays the operator information of completed jobs that are cached in the memory on all CN nodes. Only the sysadmin user can query this view.

The data is periodically dumped to the gs_wlm_operator_info table at an interval of 3 minutes.

For details on columns in the view, see **Table 15-29**.

15.3.207 PGXC_WLM_OPERATOR_INFO

PGXC_WLM_OPERATOR_INFO displays operator information of completed jobs executed on CNs. Only the sysadmin user can query this view.

The data in this view is obtained from **GS_WLM_OPERATOR_INFO**.

For details on columns in the view, see **Table 15-29**.

15.3.208 PGXC_WLM_OPERATOR_STATISTICS

PGXC_WLM_OPERATOR_STATISTICS displays operator information about running jobs executed on CNs. Only the user with sysadmin permission can query this view.

For details on columns in the view, see **Table 15-187**.

15.3.209 PGXC_WLM_REBUILD_USER_RESPOOL

PGXC_WLM_REBUILD_USER_RESPOOL is used to rebuild a user's resource pool information in memory on all nodes, with no output. This view is only used as a remedy when resource pool information is missing or misplaced. Only the sysadmin user can query this view.

15.3.210 PGXC_WLM_SESSION_HISTORY

PGXC_WLM_SESSION_HISTORY displays load management information for completed jobs executed on all CNs. (The current feature is a lab feature. Contact Huawei technical support before using it.) Only the user with the **sysadmin** or **monitor admin** permission can query this view.

The data is periodically dumped to the **gs_wlm_session_info** table at an interval of 3 minutes. For details, see **GS_WLM_SESSION_HISTORY**.

For details on columns in the view, see **Table 15-190**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.211 PGXC_WLM_SESSION_INFO

PGXC_WLM_SESSION_INFO displays load management information for completed jobs executed on all CNs. (The current feature is a lab feature. Contact Huawei technical support before using it.) Only the sysadmin user can query this view.

The data in this view is obtained from **GS_WLM_SESSION_QUERY_INFO_ALL**.

For details on columns in the view, see **Table 15-190**.

15.3.212 PGXC_WLM_SESSION_STATISTICS

PGXC_WLM_SESSION_STATISTICS displays load management information about running jobs executed on CNs. (The current feature is a lab feature. Contact Huawei technical support before using it.) Only the sysadmin user can query this view.

For details on columns in the view, see **Table 15-193**.

15.3.213 PGXC_WLM_WORKLOAD_RECORDS

PGXC_WLM_WORKLOAD_RECORDS displays the status of job executed by the current user on CNs. Only the sysadmin user can query this view.

Table 15-311 PGXC_WLM_WORKLOAD_RECORDS columns

Name	Type	Description
node_name	text	Name of the CN where a job is executed
thread_id	bigint	Process ID of the backend
processid	integer	Lightweight process ID of a thread
time_stamp	bigint	Time when the statement starts to run
username	name	Name of the user logged in to the backend
memory	integer	Memory required by the statement
active_points	integer	Number of resource points consumed by the statement in a resource pool
max_points	integer	Maximum number of resource points in a resource pool
priority	integer	Priority of a job. A larger value indicates a higher priority.
resource_pool	text	Resource pool to which the job belongs

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
status	text	Job execution status. The value must be one of the following: • pending • running • finished • aborted • unknown
control_group	text	Cgroups used by the job
enqueue	text	Queue that the job is in. The value must be one of the following: • **GLOBAL**: global queue • **RESPOOL**: resource pool queue • **Active**: not in a queue
query	text	Statement being executed
node_group	text	Node group to which the statement belongs

15.3.214 PLAN_TABLE

PLAN_TABLE displays plan information collected by **EXPLAIN PLAN**. Plan information is in a session-level lifecycle. After a session exits, the data will be deleted. Data is isolated between sessions and between users.

Table 15-312 PLAN_TABLE columns

Name	Type	Description
statement_id	character varying(30)	Query tag specified by a user
plan_id	bigint	Query ID
id	int	ID of each operator in a generated plan
operation	character varying(30)	Operation description of an operator in a plan
options	character varying(255)	Operation action
object_name	name	Object name corresponding to the operation, which is not the object alias used in the query. The object name is defined by users.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
object_type	character varying(30)	Object type
object_owner	name	Schema to which the object belongs. It is defined by users.
projection	character varying(4000)	Returned column information
cost	float8	Execution cost estimated by the optimizer for an operator
cardinality	float8	Number of rows estimated by the optimizer for an operator

NOTE

- A valid **object_type** value consists of a relkind type defined in **PG_CLASS** (**TABLE**, **INDEX**, **SEQUENCE**, **VIEW**, **FOREIGN TABLE**, **COMPOSITE TYPE**, or **TOASTVALUE TOAST**) and the rtekind type used in the plan (**SUBQUERY**, **JOIN**, **FUNCTION**, **VALUES**, **CTE**, or **REMOTE_QUERY**).
- For RangeTableEntry (RTE), **object_owner** is the object description used in the plan. Non-user-defined objects do not have **object_owner**.
- Information in the **statement_id**, **object_name**, **object_owner**, and **projection** columns is stored in letter cases specified by users and information in other columns is stored in uppercase.
- **PLAN_TABLE** supports only **SELECT** and **DELETE** and does not support other DML operations.

15.3.215 PV_FILE_STAT

PV_FILE_STAT records statistics about data file I/O to indicate I/O performance and detect performance problems such as abnormal I/O operations.

Table 15-313 PV_FILE_STAT columns

Name	Type	Description
filenum	oid	File ID
dbid	oid	Database ID
spcid	oid	Tablespace ID
phyrds	bigint	Number of times of reading physical files
phywrts	bigint	Number of times of writing into physical files
phyblkrd	bigint	Number of times of reading physical file blocks

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
phyblkwrt	bigint	Number of times of writing into physical file blocks
readtim	bigint	Total duration of reading, in microseconds
writetim	bigint	Total duration of writing, in microseconds
avgiotim	bigint	Average duration of reading and writing, in microseconds
lstiotim	bigint	Duration of the last file reading, in microseconds
miniotim	bigint	Minimum duration of reading and writing, in microseconds
maxiowtm	bigint	Maximum duration of reading and writing, in microseconds

15.3.216 PV_INSTANCE_TIME

PV_INSTANCE_TIME records time consumption information of the current node. The time consumption information is classified into the following types:

- DB_TIME: effective time spent by jobs in multi-core scenarios
- CPU_TIME: CPU time spent
- EXECUTION_TIME: time spent in executors
- PARSE_TIME: time spent in parsing SQL statements
- PLAN_TIME: time spent on generating plans
- REWRITE_TIME: time spent for SQL rewriting
- PL_EXECUTION_TIME: execution time of the PL/pgSQL stored procedure
- PL_COMPILATION_TIME: compilation time of the PL/pgSQL stored procedure
- NET_SEND_TIME: time spent on the network
- DATA_IO_TIME: I/O time spent

Table 15-314 PV_INSTANCE_TIME columns

Name	Category	Description
stat_id	integer	Statistics ID
stat_name	text	Type name
value	bigint	Time value, in μs

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.217 PV_OS_RUN_INFO

PV_OS_RUN_INFO displays the running status of the OS.

Table 15-315 PV_OS_RUN_INFO columns

Name	Type	Description
id	integer	ID
name	text	Name of the OS running status
value	numeric	Value of the OS running status
comments	text	Remarks of the OS running status
cumulative	boolean	Whether the value of the OS running status is cumulative

15.3.218 PV_REDO_STAT

PV_REDO_STAT displays statistics on the replay of session thread logs.

Table 15-316 PV_REDO_STAT columns

Name	Type	Description
phywrts	bigint	Number of times that data is written during log replay
phyblkwrt	bigint	Number of data blocks written during log replay
writetim	bigint	Total time required for writing data during log replay
avgiotim	bigint	Average time required for writing data during log replay
lstiotim	bigint	Time consumed by the last data write operation during log replay
miniotim	bigint	Minimum time consumed by a single data write operation during log replay
maxiowtm	bigint	Maximum time consumed by a single data write operation during log replay

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.3.219 PV_SESSION_MEMORY

PV_SESSION_MEMORY collects statistics about memory usage at the session level, including all the memory allocated to Postgres and Stream threads on DNs for jobs currently executed by users.

Table 15-317 PV_SESSION_MEMORY columns

Name	Type	Description
sessid	text	Thread start time and ID
init_mem	integer	Memory allocated to the currently executed jobs before they enter the executor, in MB
used_mem	integer	Memory allocated to the currently executed jobs, in MB
peak_mem	integer	Peak memory allocated to the currently executed jobs, in MB

15.3.220 PV_SESSION_MEMORY_CONTEXT

PV_SESSION_MEMORY_CONTEXT displays statistics on memory usage of all sessions based on the MemoryContext node. This view is valid only when **enable_thread_pool** is set to **on**.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

Table 15-318 PV_SESSION_MEMORY_CONTEXT columns

Name	Type	Description
sessid	text	Session start time + session ID (character string: *timestamp.sessionid*)
threadid	bigint	ID of the thread bound to a session (**-1** if no thread is bound)
contextname	text	Name of the memory context
level	smallint	Hierarchy of the memory context
parent	text	Name of the parent memory context
totalsize	bigint	Total size of the memory context, in bytes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
freesize	bigint	Total size of released memory in the current memory context, in bytes
usedsize	bigint	Size of used memory in the memory context, in bytes. For **TempSmallContextGroup**, this parameter specifies the number of collected memory contexts.

15.3.221 PV_SESSION_MEMORY_DETAIL

PV_SESSION_MEMORY_DETAIL collects statistics about thread memory usage by the memory context. When **enable_thread_pool** is set to **on**, this view contains memory usage of all threads and sessions.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

You can run the **SELECT * FROM pv_session_memctx_detail (***threadid***,'');** statement to record information about all memory contexts of a thread into the *threadid_timestamp***.log** file in the *$GAUSSLOG*/pg_log/${node_name}/dumpmem directory. *threadid* can be obtained from **sessid** in the following table.

Table 15-319 PV_SESSION_MEMORY_DETAIL columns

Name	Type	Description
sessid	text	1. When the thread pool is disabled (**enable_thread_pool = off**), this column indicates the thread start time + session ID (string: **timestamp.sessionid**). 2. When the thread pool is enabled (**enable_thread_pool = on**): If the memory context is at the thread level, this column indicates the thread start time + thread ID (string: **timestamp.threadid**). If the memory context is at the session level, the column indicates the thread start time + session ID (string: **timestamp.sessionid**).
sesstype	text	Thread name
contextname	text	Name of the memory context
level	smallint	Hierarchy of the memory context

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
parent	text	Name of the parent memory context
totalsize	bigint	Total size of the memory context, in bytes
freesize	bigint	Total size of released memory in the current memory context, in bytes
usedsize	bigint	Size of used memory in the memory context, in bytes. For **TempSmallContextGroup**, this parameter specifies the number of collected memory contexts.

15.3.222 PV_SESSION_STAT

PV_SESSION_STAT collects statistics about session states based on session threads or the **AutoVacuum** thread.

Table 15-320 PV_SESSION_STAT columns

Name	Type	Description
sessid	text	Thread ID and start time
statid	integer	Statistics ID
statname	text	Name of the statistics session
statunit	text	Unit of the statistics session
value	bigint	Value of the statistics session

15.3.223 PV_SESSION_TIME

PV_SESSION_TIME collects statistics about the running time of session threads and time consumed in each execution phase.

Table 15-321 PV_SESSION_TIME columns

Name	Type	Description
sessid	text	Thread ID and start time
stat_id	integer	Statistics ID

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
stat_name	text	Name of the session type • **DB_TIME**: effective time spent by jobs in multi-core scenarios • **CPU_TIME**: CPU time spent • **EXECUTION_TIME**: time spent within executors • **PARSE_TIME**: time spent on parsing SQL statements • **PLAN_TIME**: time spent on generating plans • **REWRITE_TIME**: time spent on rewriting SQL statements • **PL_EXECUTION_TIME**: execution time of the PL/pgSQL stored procedure • **PL_COMPILATION_TIME**: compilation time of the PL/pgSQL stored procedure • **NET_SEND_TIME**: time spent on the network. • **DATA_IO_TIME**: I/O time spent
value	bigint	Session value

15.3.224 PV_THREAD_MEMORY_CONTEXT

PV_THREAD_MEMORY_CONTEXT displays statistics about memory usage of all threads based on MemoryContext nodes. This view is equivalent to the **PV_SESSION_MEMORY_DETAIL** view when **enable_thread_pool** is set to **off**.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

Table 15-322 PV_THREAD_MEMORY_CONTEXT columns

Name	Type	Description
threadid	text	Thread start time + thread ID (string: *timestamp.tsessionid*)
tid	bigint	Thread ID

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
thrdtype	text	Thread type It can be any thread type in the system, such as postgresql and wlmmonitor.
contextname	text	Name of the memory context
level	smallint	Hierarchy of the memory context
parent	text	Name of the parent memory context
totalsize	bigint	Total size of the memory context, in bytes
freesize	bigint	Total size of released memory in the current memory context, in bytes
usedsize	bigint	Size of used memory in the memory context, in bytes. For **TempSmallContextGroup**, this parameter specifies the number of collected memory contexts.

15.3.225 PV_TOTAL_MEMORY_DETAIL

PV_TOTAL_MEMORY_DETAIL collects statistics about memory usage of the current database node.

Table 15-323 PV_TOTAL_MEMORY_DETAIL columns

Name	Type	Description
nodename	text	Node name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
memorytype	text	Memory type. The value must be one of the following: • **max_process_memory**: memory occupied by a GaussDB cluster instance • **process_used_memory**: memory occupied by a GaussDB process • **max_dynamic_memory**: maximum dynamic memory • **dynamic_used_memory**: used dynamic memory • **dynamic_peak_memory**: dynamic memory peak • **dynamic_used_shrctx**: maximum dynamic shared memory context • **dynamic_peak_shrctx**: dynamic peak value of the shared memory context • **max_shared_memory**: maximum shared memory • **shared_used_memory**: used shared memory • **max_cstore_memory**: maximum memory allowed by column-storage • **cstore_used_memory**: memory used in column-storage • **max_sctpcomm_memory**: maximum memory allowed for the communication library • **sctpcomm_used_memory**: memory used by the communication library • **sctpcomm_peak_memory**: memory peak of the communication library • **other_used_memory**: other used memory
memorymbytes	integer	Size of allocated memory-typed memory

15.3.226 SYS_DUMMY

SYS_DUMMY is automatically created by the database based on the data dictionary. It has only one text column in only one row for storing expression calculation results. It is accessible to all users. This view exists in both PG_CATALOG and SYS schema.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 15-324 SYS_DUMMY columns

Name	Type	Description
DUMMY	text	Expression calculation result

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

16 Schemas

The following table describes the schemas supported in GaussDB.

Table 16-1 Schemas supported in GaussDB

Schema	Description
blockchain	Stores the user history table that is automatically created when a tamper-proof table is created in the ledger database. (The current feature is a lab feature. Contact Huawei technical support before using it.)
cstore	Stores auxiliary tables related to column-store tables, such as CUDesc and Delta tables.
dbe_perf	Diagnoses performance issues and is also the data source of WDR snapshots. After a database is installed, only the initial user and monitoring administrator have permission to view views and functions in the **DBE_PERF** scheme by default.
snapshot	Manages data related to WDR snapshots. By default, the initial user or monitoring administrator can access the data.
sqladvsior	Recommends distribution columns. For details, see **Distribution Column Recommendation Functions**.
sys	Provides the system information view APIs.
pg_catalog	Maintains system catalog information, including system catalogs and all built-in data types, functions, and operators.
pg_toast	Stores large objects (for internal use).
public	Public schema. By default, created tables (and other objects) are automatically put into this schema.
pkg_service	Manages information about the package service.
pkg_util	Manages information about the package tool.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Schema	Description
dbe_raw	Advanced function package dbe_raw, which is used to convert raw data, obtain substrings, and calculate the length.
dbe_session	Advanced function package **dbe_session**, which is used to set the value of a specified attribute and support user query and verification.
dbe_lob	Advanced function package **dbe_lob**, which is used to read, write, and copy large files (CLOB/BLOB).
dbe_match	Advanced function package **dbe_match**, which is used to compare character string similarity.
dbe_task	Advanced function package **dbe_task**, which is used to schedule job tasks, including submitting tasks, canceling tasks, synchronizing task status, and updating task information, so that the database can periodically execute specific tasks.
dbe_sql	Advanced function package **dbe_sql**, which is used to execute dynamic SQL statements and construct query and other commands during application running.
dbe_file	Advanced function package **dbe_file**, which is used to read, copy, write, delete, and rename external database files.
dbe_output	Advanced function package **dbe_output**, which is used to print output information.
dbe_random	Advanced function package **dbe_random**, which is used to generate random seeds and random numbers.
dbe_application_info	Advanced function package **dbe_application_info**, which is used for recording client information.
dbe_utility	Advanced function package **dbe_utility**, which is used to invoke the debugging tool in a stored procedure, for example, to print error stacks.
dbe_scheduler	Advanced function package **dbe_scheduler**, which is used to create scheduled tasks and enable the database to periodically execute specified tasks through programs and schedules. You can also perform external database tasks by authorizing and providing certificates.
information_schema	Stores information about objects defined in the current database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-2 Schemas disabled in GaussDB

Schema	Description
dbe_pldebugger	This view is used to debug plpgsql functions and stored procedures. Currently, this view is not supported. An error message "unsupported" is displayed when the interface is invoked in this view.
db4ai	Manages data of different versions in AI training.
dbe_pldeveloper	Compiles and debugs user stored procedures.
dbe_sql_util	Manages statement patches.

The following APIs are not supported in distributed deployment mode:

- bool dbe_sql_util.create_hint_sql_patch(name, bigint, text, text DEFAULT NULL::text, boolean DEFAULT true)
- bool dbe_sql_util.create_abort_sql_patch(name, bigint, text DEFAULT NULL::text, boolean DEFAULT true)
- bool dbe_sql_util.drop_sql_patch(name)
- bool dbe_sql_util.enable_sql_patch(name)
- bool dbe_sql_util.disable_sql_patch(name)
- record dbe_sql_util.show_sql_patch(patch_name name, OUT unique_sql_id bigint, OUT enable boolean, OUT abort boolean, OUT hint_str text)

16.1 Information Schema

An information schema named **INFORMATION_SCHEMA** automatically exists in all databases. An information schema consists of a group of views that contain information about objects defined in the current database. The owner of this schema is the initial database user. However, all users have only the permission to use this schema and do not have the permission to create objects such as tables and functions.

Information schemas are inherited from the open-source PGXC and PG. For details, visit the following links to see the official PGXC and PG documents:

http://postgres-xc.sourceforge.net/docs/1_1/information-schema.html

https://www.postgresql.org/docs/9.2/information-schema.html

The preceding links describe details about constraint_table_usage, domain_constraints, domain_udt_usage, domains, enabled_roles, key_column_usage, parameters, referential_constraints, applicable_roles, administrable_role_authorizations, attributes, character_sets, check_constraint_routine_usage, check_constraints, collations, collation_character_set_applicability, column_domain_usage, column_privileges, column_udt_usage, columns, constraint_column_usage, role_column_grants, routine_privileges, role_routine_grants, routines, schemata, sequences,

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

table_constraints, table_privileges, role_table_grants, tables, triggered_update_columns, triggers, udt_privileges, role_udt_grants, usage_privileges, role_usage_grants, user_defined_types, view_column_usage, view_routine_usage, view_table_usage, views, data_type_privileges, element_types, column_options, foreign_data_wrapper_options, foreign_data_wrappers, foreign_server_options, foreign_servers, foreign_table_options, foreign_tables, user_mapping_options, user_mappings, sql_features, sql_implementation_info, sql_languages, sql_packages, sql_parts, sql_sizing, and sql_sizing_profiles.

The following sections display only the views that are not listed in the preceding links.

16.1.1 _PG_FOREIGN_DATA_WRAPPERS

_PG_FOREIGN_DATA_WRAPPERS displays information about a foreign-data wrapper. Only the sysadmin user has the permission to view this view.

Table 16-3 _PG_FOREIGN_DATA_WRAPPERS columns

Name	Type	Description
oid	oid	OID of the foreign-data wrapper
fdwowner	oid	OID of the owner of the foreign-data wrapper
fdwoptions	text[]	Foreign-data wrapper specific option, expressed in a string in the format of *keyword*=*value*
foreign_data_wrapper_catalog	information_schema.sql_identifier	Name of the database where the foreign-data wrapper is located (always the current database)
foreign_data_wrapper_name	information_schema.sql_identifier	Name of the foreign-data wrapper
authorization_identifier	information_schema.sql_identifier	Role of the owner of the foreign-data wrapper
foreign_data_wrapper_language	information_schema.character_data	Programming language of the foreign-data wrapper

16.1.2 _PG_FOREIGN_SERVERS

_PG_FOREIGN_SERVERS displays information about a foreign server. Only the sysadmin user has the permission to view this view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-4 _PG_FOREIGN_SERVERS columns

Name	Type	Description
oid	oid	OID of the foreign server
srvoptions	text[]	Foreign server specific options, expressed in a string in the format of *keyword*=*value*
foreign_server_catalog	information_schema.sql_identifier	Name of the database where the foreign server is located (always the current database)
foreign_server_name	information_schema.sql_identifier	Name of the foreign server
foreign_data_wrapper_catalog	information_schema.sql_identifier	Name of the database where the foreign-data wrapper is located (always the current database)
foreign_data_wrapper_name	information_schema.sql_identifier	Name of the foreign-data wrapper
foreign_server_type	information_schema.character_data	Type of the foreign server
foreign_server_version	information_schema.character_data	Version of the foreign server
authorization_identifier	information_schema.sql_identifier	Role of the owner of the foreign server

16.1.3 _PG_FOREIGN_TABLE_COLUMNS

_PG_FOREIGN_TABLE_COLUMNS displays column information about a foreign table. Only the sysadmin user has the permission to view this view.

Table 16-5 _PG_FOREIGN_TABLE_COLUMNS columns

Name	Type	Description
nspname	name	Schema name
relname	name	Table name
attname	name	Column name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

attfdwoptions	text[]	Attribute-level foreign data wrapper options, expressed in a string in the format of *keyword*=*value*

16.1.4 _PG_FOREIGN_TABLES

_PG_FOREIGN_TABLES stores information about all foreign tables defined in the current database, whereas displays information about foreign tables accessible to the current user. Only the sysadmin user has the permission to view this view.

Table 16-6 _PG_FOREIGN_TABLES columns

Name	Type	Description
foreign_table_catalog	information_schema.sql_identifier	Name of the database where the foreign table is located (always the current database)
foreign_table_schema	name	Name of the schema that the foreign table is in
foreign_table_name	name	Name of the foreign table
ftoptions	text[]	Foreign table options
foreign_server_catalog	information_schema.sql_identifier	Name of the database where the foreign server is located (always the current database)
foreign_server_name	information_schema.sql_identifier	Name of the foreign server
authorization_identifier	information_schema.sql_identifier	Role of the owner

16.1.5 _PG_USER_MAPPINGS

_PG_USER_MAPPINGS stores mappings from local users to remote users. Only the sysadmin user has the permission to view this view.

Table 16-7 _PG_USER_MAPPINGS columns

Name	Type	Description
oid	oid	OID of the mapping from the local user to a remote user

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

umoptions	text[]	User mapping specific options, expressed in a string in the format of *keyword*=*value*
umuser	oid	OID of the local user being mapped (**0** if the user mapping is public)
authorization_identifier	information_schema.sql_identifier	Role of the local user
foreign_server_catalog	information_schema.sql_identifier	Name of the database where the foreign server is defined in
foreign_server_name	information_schema.sql_identifier	Name of the foreign server
srvowner	information_schema.sql_identifier	Owner of the foreign server

16.1.6 INFORMATION_SCHEMA_CATALOG_NAME

INFORMATION_SCHEMA_CATALOG_NAME displays the name of the current database.

Table 16-8 INFORMATION_SCHEMA_CATALOG_NAME columns

Name	Type	Description
catalog_name	information_schema.sql_identifier	Current database name

16.2 DBE_PERF Schema

In the **DBE_PERF** schema, views are used to diagnose performance issues and are also the data source of WDR snapshots. After a database is installed, only the initial user and monitoring administrator have permission to view views and functions in the **DBE_PERF** scheme by default. If the database is upgraded from an earlier version, permissions for the **DBE_PERF** schema are the same as those of the earlier version to ensure forward compatibility. Organization views are divided based on multiple dimensions, such as OS, instance, and memory. These views comply with the following naming rules:

- A view starting with **GLOBAL_** requests data from CNs and DNs and returns the data without processing the data.
- A view starting with **SUMMARY_** summarizes data in cluster. In most cases, data from CNs and DNs (sometimes only CNs) is processed, aggregated, and returned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- A view that does not start with **GLOBAL_** or **SUMMARY_** is a local view and does not request data from other CNs or DNs.

16.2.1 OS

16.2.1.1 OS_RUNTIME

OS_RUNTIME displays the running status of the current OS.

Table 16-9 OS_RUNTIME columns

Name	Type	Description
id	integer	ID
name	text	Name of the OS running status
value	numeric	Value of the OS running status
comments	text	Remarks of the OS running status
cumulative	boolean	Whether the value of the OS running status is cumulative

16.2.1.2 GLOBAL_OS_RUNTIME

GLOBAL_OS_RUNTIME records the OS running status information on all normal nodes in the cluster.

Table 16-10 GLOBAL_OS_RUNTIME columns

Name	Type	Description
node_name	name	Node name
id	integer	ID
name	text	Name of the OS running status
value	numeric	Value of the OS running status
comments	text	Remarks of the OS running status
cumulative	boolean	Whether the value of the OS running status is cumulative

16.2.1.3 OS_THREADS

OS_THREADS provides status information about all threads on the current node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-11 OS_THREADS columns

Name	Type	Description
node_name	text	Current node name
pid	bigint	ID of the thread running within the current node process
lwpid	integer	Lightweight thread ID corresponding to **pid**
thread_name	text	Name of the thread corresponding to **pid**
creation_time	timestamp with time zone	Creation time of the thread corresponding to **pid**

16.2.1.4 GLOBAL_OS_THREADS

GLOBAL_OS_THREADS records the thread status information on all normal nodes in the cluster.

Table 16-12 GLOBAL_OS_THREADS columns

Name	Type	Description
node_name	text	Current node name
pid	bigint	ID of the thread running within the current node process
lwpid	integer	Lightweight thread ID corresponding to **pid**
thread_name	text	Name of the thread corresponding to **pid**
creation_time	timestamp with time zone	Creation time of the thread corresponding to **pid**

16.2.2 Instance

16.2.2.1 INSTANCE_TIME

INSTANCE_TIME records the time consumption information on the current node. The information is classified into the following types:

- DB_TIME: effective time spent by jobs in multi-core scenarios
- CPU_TIME: CPU time spent
- EXECUTION_TIME: time spent within executors

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- PARSE_TIME: time spent on parsing SQL statements
- PLAN_TIME: time spent on generating plans
- REWRITE_TIME: time spent on rewriting SQL statements
- PL_EXECUTION_TIME: execution time of the PL/pgSQL stored procedure
- PL_COMPILATION_TIME: compilation time of the PL/pgSQL stored procedure
- NET_SEND_TIME: time spent on the network
- DATA_IO_TIME: I/O time spent

Table 16-13 INSTANCE_TIME columns

Name	Type	Description
stat_id	integer	Statistics ID
stat_name	text	Type name
value	bigint	Time value (unit: μs)

16.2.2.2 GLOBAL_INSTANCE_TIME

GLOBAL_INSTANCE_TIME records the time consumption information on all normal nodes in the cluster. For details about the time types, see the **INSTANCE_TIME** view.

Table 16-14 GLOBAL_INSTANCE_TIME columns

Name	Type	Description
node_name	name	Node name
stat_id	integer	Statistics ID
stat_name	text	Type name
value	bigint	Time value (unit: μs)

16.2.3 Memory

16.2.3.1 MEMORY_NODE_DETAIL

MEMORY_NODE_DETAIL displays memory usage of a node in the database.

Table 16-15 MEMORY_NODE_DETAIL columns

Name	Type	Description
nodename	text	Node name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
memorytype	text	Memory name
memorymbytes	integer	Size of the used memory (unit: MB)

16.2.3.2 GLOBAL_MEMORY_NODE_DETAIL

GLOBAL_MEMORY_NODE_DETAIL displays the memory usage on all normal nodes in the cluster.

Table 16-16 GLOBAL_MEMORY_NODE_DETAIL columns

Name	Type	Description
nodename	text	Node name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
memorytype	text	Memory name • **max_process_memory**: memory occupied by a cluster instance • **process_used_memory**: memory occupied by a process • **max_dynamic_memory**: maximum dynamic memory • **dynamic_used_memory**: used dynamic memory • **dynamic_peak_memory**: dynamic peak memory • **dynamic_used_shrctx**: maximum dynamic shared memory context • **dynamic_peak_shrctx**: dynamic peak value of the shared memory context • **max_shared_memory**: maximum shared memory • **shared_used_memory**: used shared memory • **max_cstore_memory**: maximum memory allowed by column-storage • **cstore_used_memory**: memory used in column-storage • **max_sctpcomm_memory**: maximum memory allowed for TCP proxy communication • **sctpcomm_used_memory**: used memory for TCP proxy communication • **sctpcomm_peak_memory**: peak memory of TCP proxy communication • **other_used_memory**: other used memory • **gpu_max_dynamic_memory**: maximum dynamic GPU memory • **gpu_dynamic_used_memory**: used dynamic GPU memory • **gpu_dynamic_peak_memory**: dynamic peak GPU memory • **pooler_conn_memory**: applied memory in the connection pool • **pooler_freeconn_memory**: memory occupied by idle connections in the connection pool • **storage_compress_memory**: memory used by the storage module for compression • **udf_reserved_memory**: reserved memory for the UDF
memorymbytes	integer	Size of the used memory (unit: MB)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

16.2.3.3 MEMORY_NODE_NG_DETAIL

MEMORY_NODE_NG_DETAIL displays memory usage of a node group.

Table 16-17 MEMORY_NODE_NG_DETAIL columns

Name	Type	Description
ngname	text	Node group name
memorytype	text	Memory name • **ng_total_memory**: total memory configured in the node group • **ng_used_memory**: used memory • **ng_estimate_memory**: memory used by the optimizer for evaluation • **ng_foreignrp_memsize**: memory configured in the foreign resource pool • **ng_foreignrp_usedsize**: memory used by the foreign resource pool • **ng_foreignrp_peaksize**: peak memory used by the foreign resource pool • **ng_foreignrp_mempct**: percentage of the system memory configured in attributes of the foreign resource pool • **ng_foreignrp_estmsize**: memory used by the optimizer for job evaluation in the foreign resource pool
memorymbytes	integer	Size of the used memory (unit: MB)

16.2.3.4 SHARED_MEMORY_DETAIL

SHARED_MEMORY_DETAIL displays the usage information about shared memory contexts on the current node.

Table 16-18 SHARED_MEMORY_DETAIL columns

Name	Type	Description
contextname	text	Name of the memory context
level	smallint	Level of the memory context
parent	text	Name of the parent memory context

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
totalsize	bigint	Total size of the shared memory (unit: byte)
freesize	bigint	Remaining size of the shared memory (unit: byte)
usedsize	bigint	Used size of the shared memory (unit: byte)

16.2.3.5 GLOBAL_SHARED_MEMORY_DETAIL

GLOBAL_SHARED_MEMORY_DETAIL displays the usage information about shared memory contexts on all normal nodes in the cluster.

Table 16-19 GLOBAL_SHARED_MEMORY_DETAIL columns

Name	Type	Description
node_name	name	Node name
contextname	text	Name of the memory context
level	smallint	Level of the memory context
parent	text	Name of the parent memory context
totalsize	bigint	Total size of the shared memory (unit: byte)
freesize	bigint	Remaining size of the shared memory (unit: byte)
usedsize	bigint	Used size of the shared memory (unit: byte)

16.2.3.6 TRACK_MEMORY_CONTEXT_DETAIL

TRACK_MEMORY_CONTEXT_DETAIL queries the detailed memory application information about the memory context set by **DBE_PERF.track_memory_context**. Only the initial user or a user with the **monadmin** permission can execute this function.

Table 16-20 TRACK_MEMORY_CONTEXT_DETAIL columns

Name	Type	Description
context_name	text	Name of the memory context

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
file	text	File to which the memory application location belongs
line	integer	Line number of the memory application location
size	bigint	Total size of memory that is applied for (unit: byte)

16.2.4 File

16.2.4.1 FILE_IOSTAT

FILE_IOSTAT records statistics about data file I/Os to indicate I/O performance and detect performance problems such as abnormal I/O operations.

Table 16-21 FILE_IOSTAT columns

Name	Type	Description
filenum	oid	File identifier
dbid	oid	Database ID
spcid	oid	Tablespace ID
phyrds	bigint	Number of times of reading physical files
phywrts	bigint	Number of times of writing into physical files
phyblkrd	bigint	Number of times of reading physical file blocks
phyblkwrt	bigint	Number of times of writing into physical file blocks
readtim	bigint	Total duration of reading (unit: μs)
writetim	bigint	Total duration of writing (unit: μs)
avgiotim	bigint	Average duration of reading and writing (unit: μs)
lstiotim	bigint	Duration of the last file reading (unit: μs)
miniotim	bigint	Minimum duration of reading and writing (unit: μs)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
maxiowtm	bigint	Maximum duration of reading and writing (unit: μs)

16.2.4.2 SUMMARY_FILE_IOSTAT

SUMMARY_FILE_IOSTAT records statistics about data file I/Os in the cluster to reflect performance issues such as exceptions in I/O operations.

Table 16-22 SUMMARY_FILE_IOSTAT columns

Name	Type	Description
filenum	oid	File identifier
dbid	oid	Database ID
spcid	oid	Tablespace ID
phyrds	numeric	Number of times of reading physical files
phywrts	numeric	Number of times of writing into physical files
phyblkrd	numeric	Number of times of reading physical file blocks
phyblkwrt	numeric	Number of times of writing into physical file blocks
readtim	numeric	Total duration of reading (unit: μs)
writetim	numeric	Total duration of writing (unit: μs)
avgiotim	bigint	Average duration of reading and writing (unit: μs)
lstiotim	bigint	Duration of the last file reading (unit: μs)
miniotim	bigint	Minimum duration of reading and writing (unit: μs)
maxiowtm	bigint	Maximum duration of reading and writing (unit: μs)

16.2.4.3 GLOBAL_FILE_IOSTAT

GLOBAL_FILE_IOSTAT displays statistics about data file I/Os on all nodes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-23 GLOBAL_FILE_IOSTAT columns

Name	Type	Description
node_name	name	Node name
filenum	oid	File identifier
dbid	oid	Database ID
spcid	oid	Tablespace ID
phyrds	bigint	Number of times of reading physical files
phywrts	bigint	Number of times of writing into physical files
phyblkrd	bigint	Number of times of reading physical file blocks
phyblkwrt	bigint	Number of times of writing into physical file blocks
readtim	bigint	Total duration of reading (unit: μs)
writetim	bigint	Total duration of writing (unit: μs)
avgiotim	bigint	Average duration of reading and writing (unit: μs)
lstiotim	bigint	Duration of the last file reading (unit: μs)
miniotim	bigint	Minimum duration of reading and writing (unit: μs)
maxiowtm	bigint	Maximum duration of reading and writing (unit: μs)

16.2.4.4 FILE_REDO_IOSTAT

FILE_REDO_IOSTAT records statistics about redo logs (WALs) on the current node.

Table 16-24 FILE_REDO_IOSTAT columns

Name	Type	Description
phywrts	bigint	Number of times writing into the WAL buffer
phyblkwrt	bigint	Number of blocks written into the WAL buffer
writetim	bigint	Duration of writing into XLOG files (unit: μs)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
avgiotim	bigint	Average duration of writing into XLOG files (unit: μs). **avgiotim** = **writetim**/**phywrts**
lstiotim	bigint	Duration of the last writing into XLOG files (unit: μs)
miniotim	bigint	Minimum duration of writing into XLOG files (unit: μs)
maxiowtm	bigint	Maximum duration of writing into XLOG files (unit: μs)

16.2.4.5 SUMMARY_FILE_REDO_IOSTAT

SUMMARY_FILE_REDO_IOSTAT displays statistics about redo logs (WALs) in the cluster.

Table 16-25 SUMMARY_FILE_REDO_IOSTAT columns

Name	Type	Description
phywrts	numeric	Number of times writing into the WAL buffer
phyblkwrt	numeric	Number of blocks written into the WAL buffer
writetim	numeric	Duration of writing into XLOG files (unit: μs)
avgiotim	bigint	Average duration of writing into XLOG files (unit: μs). **avgiotim** = **writetim**/**phywrts**
lstiotim	bigint	Duration of the last writing into XLOG files (unit: μs)
miniotim	bigint	Minimum duration of writing into XLOG files (unit: μs)
maxiowtm	bigint	Maximum duration of writing into XLOG files (unit: μs)

16.2.4.6 GLOBAL_FILE_REDO_IOSTAT

GLOBAL_FILE_REDO_IOSTAT displays statistics about redo logs (WALs) on nodes in the cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-26 GLOBAL_FILE_REDO_IOSTAT columns

Name	Type	Description
node_name	name	Node name
phywrts	bigint	Number of times writing into the WAL buffer
phyblkwrt	bigint	Number of blocks written into the WAL buffer
writetim	bigint	Duration of writing into XLOG files (unit: μs)
avgiotim	bigint	Average duration of writing into XLOG files (unit: μs). **avgiotim** = **writetim**/ **phywrts**
lstiotim	bigint	Duration of the last writing into XLOG files (unit: μs)
miniotim	bigint	Minimum duration of writing into XLOG files (unit: μs)
maxiowtm	bigint	Maximum duration of writing into XLOG files (unit: μs)

16.2.4.7 LOCAL_REL_IOSTAT

LOCAL_REL_IOSTAT displays the accumulated I/O status of all data files on the current node.

Table 16-27 LOCAL_REL_IOSTAT columns

Name	Type	Description
phyrds	bigint	Number of times of reading physical files
phywrts	bigint	Number of times of writing into physical files
phyblkrd	bigint	Number of times of reading physical file blocks
phyblkwrt	bigint	Number of times of writing into physical file blocks

16.2.4.8 GLOBAL_REL_IOSTAT

GLOBAL_REL_IOSTAT displays statistics about data file I/Os on all nodes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-28 GLOBAL_REL_IOSTAT columns

Name	Type	Description
node_name	name	Node name
phyrds	bigint	Number of times of reading physical files
phywrts	bigint	Number of times of writing into physical files
phyblkrd	bigint	Number of times of reading physical file blocks
phyblkwrt	bigint	Number of times of writing into physical file blocks

16.2.4.9 SUMMARY_REL_IOSTAT

SUMMARY_REL_IOSTAT displays statistics about data file I/Os on all nodes.

Table 16-29 SUMMARY_REL_IOSTAT columns

Name	Type	Description
phyrds	numeric	Number of times of reading physical files
phywrts	numeric	Number of times of writing into physical files
phyblkrd	numeric	Number of times of reading physical file blocks
phyblkwrt	numeric	Number of times of writing into physical file blocks

16.2.5 Object

16.2.5.1 STAT_USER_TABLES

STAT_USER_TABLES displays the status information about user-defined ordinary tables in all namespaces on the current node.

Table 16-30 STAT_USER_TABLES columns

Name	Type	Description
relid	oid	Table OID

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)
n_live_tup	bigint	Estimated number of live rows
n_dead_tup	bigint	Estimated number of dead rows
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting **VACUUM FULL**)
last_autovacuum	timestamp with time zone	Last time at which this table was vacuumed by the autovacuum daemon
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time at which this table was analyzed by the autovacuum daemon
vacuum_count	bigint	Number of times this table has been manually vacuumed (not counting **VACUUM FULL**)
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon
analyze_count	bigint	Number of times this table has been manually analyzed

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
autoanalyze_count	bigint	Number of times this table has been analyzed by the autovacuum daemon

16.2.5.2 SUMMARY_STAT_USER_TABLES

SUMMARY_STAT_USER_TABLES displays the status information about user-defined ordinary tables in all namespaces in the cluster.

Table 16-31 SUMMARY_STAT_USER_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	numeric	Number of sequential scans initiated on the table
seq_tup_read	numeric	Number of live rows fetched by sequential scans
idx_scan	numeric	Number of index scans initiated on the table
idx_tup_fetch	numeric	Number of live rows fetched by index scans
n_tup_ins	numeric	Number of rows inserted
n_tup_upd	numeric	Number of rows updated
n_tup_del	numeric	Number of rows deleted
n_tup_hot_upd	numeric	Number of rows HOT updated (with no separate index update required)
n_live_tup	numeric	Estimated number of live rows
n_dead_tup	numeric	Estimated number of dead rows
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting **VACUUM FULL**)
last_autovacuum	timestamp with time zone	Last time at which this table was vacuumed by the autovacuum daemon
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
last_autoanalyze	timestamp with time zone	Last time at which this table was analyzed by the autovacuum daemon
vacuum_count	numeric	Number of times this table has been manually vacuumed (not counting **VACUUM FULL**)
autovacuum_count	numeric	Number of times this table has been vacuumed by the autovacuum daemon
analyze_count	numeric	Number of times this table has been manually analyzed
autoanalyze_count	numeric	Number of times this table has been analyzed by the autovacuum daemon

16.2.5.3 GLOBAL_STAT_USER_TABLES

GLOBAL_STAT_USER_TABLES displays the status information about user-defined ordinary tables in all namespaces on each node.

Table 16-32 GLOBAL_STAT_USER_TABLES columns

Name	Type	Description
node_name	name	Node name
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)
n_live_tup	bigint	Estimated number of live rows
n_dead_tup	bigint	Estimated number of dead rows
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting VACUUM FULL)
last_autovacuum	timestamp with time zone	Last time at which this table was vacuumed by the autovacuum daemon
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time at which this table was analyzed by the autovacuum daemon
vacuum_count	bigint	Number of times this table has been manually vacuumed (not counting VACUUM FULL)
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon
analyze_count	bigint	Number of times this table has been manually analyzed
autoanalyze_count	bigint	Number of times this table has been analyzed by the autovacuum daemon

16.2.5.4 STAT_USER_INDEXES

STAT_USER_INDEXES displays the index status information about user-defined ordinary tables in the current database.

Table 16-33 STAT_USER_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	bigint	Number of index scans initiated on the index
idx_tup_read	bigint	Number of index entries returned by scans on the index
idx_tup_fetch	bigint	Number of live table rows fetched by simple index scans using the index

16.2.5.5 SUMMARY_STAT_USER_INDEXES

SUMMARY_STAT_USER_INDEXES displays the index status information about user-defined ordinary tables in all databases in the cluster.

Table 16-34 SUMMARY_STAT_USER_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	numeric	Number of index scans initiated on the index
idx_tup_read	numeric	Number of index entries returned by scans on the index
idx_tup_fetch	numeric	Number of live table rows fetched by simple index scans using the index

16.2.5.6 GLOBAL_STAT_USER_INDEXES

GLOBAL_STAT_USER_INDEXES displays the index status information about user-defined ordinary tables on each node.

Table 16-35 GLOBAL_STAT_USER_INDEXES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the table that the index is created for

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	bigint	Number of index scans initiated on the index
idx_tup_read	bigint	Number of index entries returned by scans on the index
idx_tup_fetch	bigint	Number of live table rows fetched by simple index scans using the index

16.2.5.7 STAT_SYS_TABLES

STAT_SYS_TABLES displays statistics about all the system catalogs in the **pg_catalog**, **information_schema**, and **pg_toast** schemas on a single node.

Table 16-36 STAT_SYS_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_live_tup	bigint	Estimated number of live rows
n_dead_tup	bigint	Estimated number of dead rows
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting **VACUUM FULL**)
last_autovacuum	timestamp with time zone	Last time at which this table was vacuumed by the autovacuum daemon
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time at which this table was analyzed by the autovacuum daemon
vacuum_count	bigint	Number of times this table has been manually vacuumed (not counting VACUUM FULL)
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon
analyze_count	bigint	Number of times this table has been manually analyzed
autoanalyze_count	bigint	Number of times this table has been analyzed by the autovacuum daemon

16.2.5.8 SUMMARY_STAT_SYS_TABLES

SUMMARY_STAT_SYS_INDEXES displays statistics about all system catalogs in the **pg_catalog**, **information_schema**, and **pg_toast** schemas in the cluster.

Table 16-37 SUMMARY_STAT_SYS_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	numeric	Number of sequential scans initiated on the table
seq_tup_read	numeric	Number of live rows fetched by sequential scans

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
idx_scan	numeric	Number of index scans initiated on the table
idx_tup_fetch	numeric	Number of live rows fetched by index scans
n_tup_ins	numeric	Number of rows inserted
n_tup_upd	numeric	Number of rows updated
n_tup_del	numeric	Number of rows deleted
n_tup_hot_upd	numeric	Number of rows HOT updated (with no separate index update required)
n_live_tup	numeric	Estimated number of live rows
n_dead_tup	numeric	Estimated number of dead rows
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting **VACUUM FULL**)
last_autovacuum	timestamp with time zone	Last time at which this table was vacuumed by the autovacuum daemon
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time at which this table was analyzed by the autovacuum daemon
vacuum_count	numeric	Number of times this table has been manually vacuumed (not counting **VACUUM FULL**)
autovacuum_count	numeric	Number of times this table has been vacuumed by the autovacuum daemon
analyze_count	numeric	Number of times this table has been manually analyzed
autoanalyze_count	numeric	Number of times this table has been analyzed by the autovacuum daemon

16.2.5.9 GLOBAL_STAT_SYS_TABLES

GLOBAL_STAT_SYS_TABLES displays statistics about all the system catalogs in the **pg_catalog**, **information_schema**, and **pg_toast** schemas on each node in the cluster.

Table 16-38 GLOBAL_STAT_SYS_TABLES columns

Name	Type	Description
node_name	name	Node name
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)
n_live_tup	bigint	Estimated number of live rows
n_dead_tup	bigint	Estimated number of dead rows
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting **VACUUM FULL**)
last_autovacuum	timestamp with time zone	Last time at which this table was vacuumed by the autovacuum daemon
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time at which this table was analyzed by the autovacuum daemon

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
vacuum_count	bigint	Number of times this table has been manually vacuumed (not counting **VACUUM FULL**)
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon
analyze_count	bigint	Number of times this table has been manually analyzed
autoanalyze_count	bigint	Number of times this table has been analyzed by the autovacuum daemon

16.2.5.10 STAT_SYS_INDEXES

STAT_SYS_INDEXES displays the index status information about all system catalogs in the **pg_catalog**, **information_schema**, and **pg_toast** schemas.

Table 16-39 STAT_SYS_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	bigint	Number of index scans initiated on the index
idx_tup_read	bigint	Number of index entries returned by scans on the index
idx_tup_fetch	bigint	Number of live table rows fetched by simple index scans using the index

16.2.5.11 SUMMARY_STAT_SYS_INDEXES

SUMMARY_STAT_SYS_INDEXES displays the index status information about all system catalogs in the **pg_catalog**, **information_schema**, and **pg_toast** schemas in the cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-40 SUMMARY_STAT_SYS_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	numeric	Number of index scans initiated on the index
idx_tup_read	numeric	Number of index entries returned by scans on the index
idx_tup_fetch	numeric	Number of live table rows fetched by simple index scans using the index

16.2.5.12 GLOBAL_STAT_SYS_INDEXES

GLOBAL_STAT_SYS_INDEXES displays the index status information about all system catalogs in the **pg_catalog**, **information_schema**, and **pg_toast** schemas on each node.

Table 16-41 GLOBAL_STAT_SYS_INDEXES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the table for this index
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	bigint	Number of index scans initiated on the index
idx_tup_read	bigint	Number of index entries returned by scans on the index
idx_tup_fetch	bigint	Number of live table rows fetched by simple index scans using the index

16.2.5.13 STAT_ALL_TABLES

STAT_ALL_TABLES displays statistics about one row for each table (including TOAST tables) in databases on the current node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-42 STAT_ALL_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)
n_live_tup	bigint	Estimated number of live rows
n_dead_tup	bigint	Estimated number of dead rows
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting **VACUUM FULL**)
last_autovacuum	timestamp with time zone	Last time at which this table was vacuumed by the autovacuum daemon
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time at which this table was analyzed by the autovacuum daemon
vacuum_count	bigint	Number of times this table has been manually vacuumed (not counting **VACUUM FULL**)
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon
analyze_count	bigint	Number of times this table has been manually analyzed

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
autoanalyze_count	bigint	Number of times this table has been analyzed by the autovacuum daemon

16.2.5.14 SUMMARY_STAT_ALL_TABLES

SUMMARY_STAT_ALL_TABLES displays statistics about a row in each table (including the TOAST table) in databases in the cluster.

Table 16-43 SUMMARY_STAT_ALL_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	numeric	Number of sequential scans initiated on the table
seq_tup_read	numeric	Number of live rows fetched by sequential scans
idx_scan	numeric	Number of index scans initiated on the table
idx_tup_fetch	numeric	Number of live rows fetched by index scans
n_tup_ins	numeric	Number of rows inserted
n_tup_upd	numeric	Number of rows updated
n_tup_del	numeric	Number of rows deleted
n_tup_hot_upd	numeric	Number of rows HOT updated (with no separate index update required)
n_live_tup	numeric	Estimated number of live rows
n_dead_tup	numeric	Estimated number of dead rows
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting **VACUUM FULL**)
last_autovacuum	timestamp with time zone	Last time at which this table was vacuumed by the autovacuum daemon
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
last_autoanalyze	timestamp with time zone	Last time at which this table was analyzed by the autovacuum daemon
vacuum_count	numeric	Number of times this table has been manually vacuumed (not counting **VACUUM FULL**)
autovacuum_count	numeric	Number of times this table has been vacuumed by the autovacuum daemon
analyze_count	numeric	Number of times this table has been manually analyzed
autoanalyze_count	numeric	Number of times this table has been analyzed by the autovacuum daemon

16.2.5.15 GLOBAL_STAT_ALL_TABLES

GLOBAL_STAT_ALL_TABLES displays statistics about a row of each table (including TOAST tables) on each node.

Table 16-44 GLOBAL_STAT_ALL_TABLES columns

Name	Type	Description
node_name	name	Node name
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_live_tup	bigint	Estimated number of live rows
n_dead_tup	bigint	Estimated number of dead rows
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting **VACUUM FULL**)
last_autovacuum	timestamp with time zone	Last time at which this table was vacuumed by the autovacuum daemon
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time at which this table was analyzed by the autovacuum daemon
vacuum_count	bigint	Number of times this table has been manually vacuumed (not counting **VACUUM FULL**)
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon
analyze_count	bigint	Number of times this table has been manually analyzed
autoanalyze_count	bigint	Number of times this table has been analyzed by the autovacuum daemon

16.2.5.16 STAT_ALL_INDEXES

STAT_ALL_INDEXES displays the access information of each index on the current node.

Table 16-45 STAT_ALL_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	bigint	Number of index scans initiated on the index

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
idx_tup_read	bigint	Number of index entries returned by scans on the index
idx_tup_fetch	bigint	Number of live table rows fetched by simple index scans using the index

16.2.5.17 SUMMARY_STAT_ALL_INDEXES

SUMMARY_STAT_ALL_INDEXES displays the access information of each index in the cluster.

Table 16-46 SUMMARY_STAT_ALL_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	numeric	Number of index scans initiated on the index
idx_tup_read	numeric	Number of index entries returned by scans on the index
idx_tup_fetch	numeric	Number of live table rows fetched by simple index scans using the index

16.2.5.18 GLOBAL_STAT_ALL_INDEXES

GLOBAL_STAT_ALL_INDEXES displays the access information of each index on each node in the cluster.

Table 16-47 GLOBAL_STAT_ALL_INDEXES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
indexrelname	name	Index name
idx_scan	bigint	Number of index scans initiated on the index
idx_tup_read	bigint	Number of index entries returned by scans on the index
idx_tup_fetch	bigint	Number of live table rows fetched by simple index scans using the index

16.2.5.19 STAT_DATABASE

STAT_DATABASE contains statistics about each database on the current node.

Table 16-48 STAT_DATABASE columns

Name	Type	Description
datid	oid	OID of the database
datname	name	Name of the database
numbackends	integer	Number of backends currently connected to this database. This is the only column in this view that returns a value reflecting the current state; all other columns return the accumulated values since the last reset.
xact_commit	bigint	Number of transactions in this database that have been committed
xact_rollback	bigint	Number of transactions in this database that have been rolled back
blks_read	bigint	Number of disk blocks read in this database
blks_hit	bigint	Number of times disk blocks were found in the buffer cache (unnecessary as the number includes only hits in the PostgreSQL buffer cache)
tup_returned	bigint	Number of rows returned by queries in this database
tup_fetched	bigint	Number of rows fetched by queries in this database
tup_inserted	bigint	Number of rows inserted by queries in this database
tup_updated	bigint	Number of rows updated by queries in this database

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tup_deleted	bigint	Number of rows deleted by queries in this database
conflicts	bigint	Number of queries canceled due to database recovery conflicts (conflicts occurring only on the standby server). For details, see **STAT_DATABASE_CONFLICTS**.
temp_files	bigint	Number of temporary files created by queries in this database. All temporary files are counted, regardless of why the temporary file was created (for example, sorting or hashing), and regardless of the **log_temp_files** setting.
temp_bytes	bigint	Total amount of data written to temporary files by queries in this database. All temporary files are counted, regardless of why the temporary file was created, and regardless of the **log_temp_files** setting.
deadlocks	bigint	Number of deadlocks detected in this database
blk_read_time	double precision	Time spent reading data file blocks by backends in this database (unit: ms)
blk_write_time	double precision	Time spent reading data file blocks by backends in this database (unit: ms)
stats_reset	timestamp with time zone	Time at which the current statistics were reset

16.2.5.20 SUMMARY_STAT_DATABASE

SUMMARY_STAT_DATABASE contains statistics about each database in the cluster.

Table 16-49 SUMMARY_STAT_DATABASE columns

Name	Type	Description
datname	name	Name of the database
numbackends	bigint	Number of backends currently connected to this database. This is the only column in this view that returns a value reflecting the current state; all other columns return the accumulated values since the last reset.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
xact_commit	numeric	Number of transactions in this database that have been committed
xact_rollback	numeric	Number of transactions in this database that have been rolled back
blks_read	numeric	Number of disk blocks read in this database
blks_hit	numeric	Number of times disk blocks were found in the buffer cache (unnecessary as the number includes only hits in the PostgreSQL buffer cache)
tup_returned	numeric	Number of rows returned by queries in this database
tup_fetched	numeric	Number of rows fetched by queries in this database
tup_inserted	bigint	Number of rows inserted by queries in this database
tup_updated	bigint	Number of rows updated by queries in this database
tup_deleted	bigint	Number of rows deleted by queries in this database
conflicts	bigint	Number of queries canceled due to database recovery conflicts (conflicts occurring only on the standby server). For details, see **STAT_DATABASE_CONFLICTS**.
temp_files	numeric	Number of temporary files created by queries in this database. All temporary files are counted, regardless of why the temporary file was created (for example, sorting or hashing), and regardless of the log_temp_files setting.
temp_bytes	numeric	Total amount of data written to temporary files by queries in this database. All temporary files are counted, regardless of why the temporary file was created, and regardless of the log_temp_files setting.
deadlocks	bigint	Number of deadlocks detected in this database
blk_read_time	double precision	Time spent reading data file blocks by backends in this database (unit: ms)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
blk_write_time	double precision	Time spent reading data file blocks by backends in this database (unit: ms)
stats_reset	timestamp with time zone	Time at which the current statistics were reset

16.2.5.21 GLOBAL_STAT_DATABASE

GLOBAL_STAT_DATABASE contains statistics about databases on each node in the cluster.

Table 16-50 GLOBAL_STAT_DATABASE columns

Name	Type	Description
node_name	name	Node name
datid	oid	OID of the database
datname	name	Name of the database
numbackends	integer	Number of backends currently connected to this database. This is the only column in this view that returns a value reflecting the current state; all other columns return the accumulated values since the last reset.
xact_commit	bigint	Number of transactions in this database that have been committed
xact_rollback	bigint	Number of transactions in this database that have been rolled back
blks_read	bigint	Number of disk blocks read in this database
blks_hit	bigint	Number of times disk blocks were found in the buffer cache (unnecessary as the number includes only hits in the database kernel buffer cache)
tup_returned	bigint	Number of rows returned by queries in this database
tup_fetched	bigint	Number of rows fetched by queries in this database
tup_inserted	bigint	Number of rows inserted by queries in this database

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tup_updated	bigint	Number of rows updated by queries in this database
tup_deleted	bigint	Number of rows deleted by queries in this database
conflicts	bigint	Number of queries canceled due to database recovery conflicts (conflicts occurring only on the standby server). For details, see **STAT_DATABASE_CONFLICTS**.
temp_files	bigint	Number of temporary files created by queries in this database. All temporary files are counted, regardless of why the temporary file was created (for example, sorting or hashing), and regardless of the log_temp_files setting.
temp_bytes	bigint	Total amount of data written to temporary files by queries in this database. All temporary files are counted, regardless of why the temporary file was created, and regardless of the **log_temp_files** setting.
deadlocks	bigint	Number of deadlocks detected in this database
blk_read_time	double precision	Time spent reading data file blocks by backends in this database (unit: ms)
blk_write_time	double precision	Time spent reading data file blocks by backends in this database (unit: ms)
stats_reset	timestamp with time zone	Time at which the current statistics were reset

16.2.5.22 STAT_DATABASE_CONFLICTS

STAT_DATABASE_CONFLICTS displays statistics about database conflicts on the current node.

Table 16-51 STAT_DATABASE_CONFLICTS columns

Name	Type	Description
datid	oid	Database ID
datname	name	Database name
confl_tablespace	bigint	Number of conflicting tablespaces

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
confl_lock	bigint	Number of conflicting locks
confl_snapshot	bigint	Number conflicting snapshots
confl_bufferpin	bigint	Number of conflicting buffers
confl_deadlock	bigint	Number of conflicting deadlocks

16.2.5.23 SUMMARY_STAT_DATABASE_CONFLICTS

SUMMARY_STAT_DATABASE_CONFLICTS displays statistics about database conflicts in the cluster.

Table 16-52 SUMMARY_STAT_DATABASE_CONFLICTS columns

Name	Type	Description
datname	name	Database name
confl_tablespace	bigint	Number of conflicting tablespaces
confl_lock	bigint	Number of conflicting locks
confl_snapshot	bigint	Number conflicting snapshots
confl_bufferpin	bigint	Number of conflicting buffers
confl_deadlock	bigint	Number of conflicting deadlocks

16.2.5.24 GLOBAL_STAT_DATABASE_CONFLICTS

GLOBAL_STAT_DATABASE_CONFLICTS displays statistics about database conflicts on each node.

Table 16-53 GLOBAL_STAT_DATABASE_CONFLICTS columns

Name	Type	Description
node_name	name	Node name
datid	oid	Database ID
datname	name	Database name
confl_tablespace	bigint	Number of conflicting tablespaces
confl_lock	bigint	Number of conflicting locks

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
confl_snapshot	bigint	Number conflicting snapshots
confl_bufferpin	bigint	Number of conflicting buffers
confl_deadlock	bigint	Number of conflicting deadlocks

16.2.5.25 STAT_XACT_ALL_TABLES

STAT_XACT_ALL_TABLES displays the transaction status information about all ordinary tables and TOAST tables in the current namespace.

Table 16-54 STAT_XACT_ALL_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

16.2.5.26 SUMMARY_STAT_XACT_ALL_TABLES

SUMMARY_STAT_XACT_ALL_TABLES displays the transaction status information about all common tables and TOAST tables in namespaces in the cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-55 SUMMARY_STAT_XACT_ALL_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	numeric	Number of sequential scans initiated on the table
seq_tup_read	numeric	Number of live rows fetched by sequential scans
idx_scan	numeric	Number of index scans initiated on the table
idx_tup_fetch	numeric	Number of live rows fetched by index scans
n_tup_ins	numeric	Number of rows inserted
n_tup_upd	numeric	Number of rows updated
n_tup_del	numeric	Number of rows deleted
n_tup_hot_upd	numeric	Number of rows HOT updated (with no separate index update required)

16.2.5.27 GLOBAL_STAT_XACT_ALL_TABLES

GLOBAL_STAT_XACT_ALL_TABLES displays the transaction status information about all ordinary tables and TOAST tables in namespaces on each node.

Table 16-56 GLOBAL_STAT_XACT_ALL_TABLES columns

Name	Type	Description
node_name	name	Node name
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

16.2.5.28 STAT_XACT_SYS_TABLES

STAT_XACT_SYS_TABLES displays the transaction status information about the system catalogs in namespaces on the current node.

Table 16-57 STAT_XACT_SYS_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

16.2.5.29 SUMMARY_STAT_XACT_SYS_TABLES

SUMMARY_STAT_XACT_SYS_TABLES displays the transaction status information about the system catalogs in namespaces in the cluster.

Table 16-58 SUMMARY_STAT_XACT_SYS_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that the table is in

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relname	name	Table name
seq_scan	numeric	Number of sequential scans initiated on the table
seq_tup_read	numeric	Number of live rows fetched by sequential scans
idx_scan	numeric	Number of index scans initiated on the table
idx_tup_fetch	numeric	Number of live rows fetched by index scans
n_tup_ins	numeric	Number of rows inserted
n_tup_upd	numeric	Number of rows updated
n_tup_del	numeric	Number of rows deleted
n_tup_hot_upd	numeric	Number of rows HOT updated (with no separate index update required)

16.2.5.30 GLOBAL_STAT_XACT_SYS_TABLES

GLOBAL_STAT_XACT_SYS_TABLES displays the transaction status information about the system catalogs in namespaces on each node.

Table 16-59 GLOBAL_STAT_XACT_SYS_TABLES columns

Name	Type	Description
node_name	name	Node name
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

16.2.5.31 STAT_XACT_USER_TABLES

STAT_XACT_USER_TABLES displays the transaction status information about the user tables in namespaces on the current node.

Table 16-60 STAT_XACT_USER_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

16.2.5.32 SUMMARY_STAT_XACT_USER_TABLES

SUMMARY_STAT_XACT_USER_TABLES displays the transaction status information about the user tables in namespaces in the cluster.

Table 16-61 SUMMARY_STAT_XACT_USER_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that the table is in
relname	name	Table name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
seq_scan	numeric	Number of sequential scans initiated on the table
seq_tup_read	numeric	Number of live rows fetched by sequential scans
idx_scan	numeric	Number of index scans initiated on the table
idx_tup_fetch	numeric	Number of live rows fetched by index scans
n_tup_ins	numeric	Number of rows inserted
n_tup_upd	numeric	Number of rows updated
n_tup_del	numeric	Number of rows deleted
n_tup_hot_upd	numeric	Number of rows HOT updated (with no separate index update required)

16.2.5.33 GLOBAL_STAT_XACT_USER_TABLES

GLOBAL_STAT_XACT_USER_TABLES displays the transaction status information about the user tables in namespaces on each node.

Table 16-62 GLOBAL_STAT_XACT_USER_TABLES columns

Name	Type	Description
node_name	name	Node name
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

16.2.5.34 STAT_XACT_USER_FUNCTIONS

STAT_XACT_USER_FUNCTIONS displays statistics about function executions in the current transaction.

Table 16-63 STAT_XACT_USER_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of the function
schemaname	name	Schema name
funcname	name	Function name
calls	bigint	Number of times the function has been called
total_time	double precision	Total time spent in this function and all other functions called by it
self_time	double precision	Total time spent in this function, excluding other functions called by it

16.2.5.35 SUMMARY_STAT_XACT_USER_FUNCTIONS

SUMMARY_STAT_XACT_USER_FUNCTIONS displays statistics about function executions in the current transaction in the cluster.

Table 16-64 SUMMARY_STAT_XACT_USER_FUNCTIONS columns

Name	Type	Description
schemaname	name	Schema name
funcname	name	Function name
calls	numeric	Number of times the function has been called
total_time	double precision	Total time spent in this function and all other functions called by it
self_time	double precision	Total time spent in this function, excluding other functions called by it

16.2.5.36 GLOBAL_STAT_XACT_USER_FUNCTIONS

GLOBAL_STAT_XACT_USER_FUNCTIONS displays statistics about function executions in transactions on each node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-65 GLOBAL_STAT_XACT_USER_FUNCTIONS columns

Name	Type	Description
node_name	name	Node name
funcid	oid	OID of the function
schemaname	name	Schema name
funcname	name	Function name
calls	bigint	Number of times the function has been called
total_time	double precision	Total time spent in this function and all other functions called by it
self_time	double precision	Total time spent in this function, excluding other functions called by it

16.2.5.37 STAT_BAD_BLOCK

STAT_BAD_BLOCK displays the information about table and index read failures on the current node.

Table 16-66 STAT_BAD_BLOCK columns

Name	Type	Description
nodename	text	Node name
databaseid	integer	OID of the database
tablespaceid	integer	OID of the tablespace
relfilenode	integer	File node of this relation
forknum	integer	Fork number
error_count	integer	Number of errors
first_time	timestamp with time zone	Time when the first bad block occurred
last_time	timestamp with time zone	Time when the last bad block occurred

16.2.5.38 SUMMARY_STAT_BAD_BLOCK

SUMMARY_STAT_BAD_BLOCK displays the information about table and index read failures in the cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-67 SUMMARY_STAT_BAD_BLOCK columns

Name	Type	Description
databaseid	integer	OID of the database
tablespaceid	integer	OID of the tablespace
relfilenode	integer	File node of this relation
forknum	bigint	Fork number
error_count	bigint	Number of errors
first_time	timestamp with time zone	Time when the first bad block occurred
last_time	timestamp with time zone	Time when the last bad block occurred

16.2.5.39 GLOBAL_STAT_BAD_BLOCK

GLOBAL_STAT_BAD_BLOCK displays the information about table and index read failures on each node.

Table 16-68 GLOBAL_STAT_BAD_BLOCK columns

Name	Type	Description
node_name	text	Node name
databaseid	integer	OID of the database
tablespaceid	integer	OID of the tablespace
relfilenode	integer	File node of this relation
forknum	integer	Fork number
error_count	integer	Number of errors
first_time	timestamp with time zone	Time when the first bad block occurred
last_time	timestamp with time zone	Time when the last bad block occurred

16.2.5.40 STAT_USER_FUNCTIONS

STAT_USER_FUNCTIONS displays the status information about user-defined functions in the current namespace. (The language of the function is non-internal language.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-69 STAT_USER_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of the function
schemaname	name	Schema name
funcname	name	Function name
calls	bigint	Number of times the function has been called
total_time	double precision	Total time spent in this function and all other functions called by it (unit: ms)
self_time	double precision	Total time spent in this function, excluding other functions called by it (unit: ms)

16.2.5.41 SUMMARY_STAT_USER_FUNCTIONS

SUMMARY_STAT_USER_FUNCTIONS collects statistics about user-defined views in the cluster.

Table 16-70 SUMMARY_STAT_USER_FUNCTIONS columns

Name	Type	Description
schemaname	name	Schema name
funcname	name	Function name
calls	numeric	Number of times that the function has been called
total_time	double precision	Total time spent in this function and all other functions called by it (unit: ms)
self_time	double precision	Total time spent in this function, excluding other functions called by it (unit: ms)

16.2.5.42 GLOBAL_STAT_USER_FUNCTIONS

GLOBAL_STAT_USER_FUNCTIONS displays statistics about user-defined functions on each node in the entire cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-71 GLOBAL_STAT_USER_FUNCTIONS columns

Name	Type	Description
node_name	name	OID of the function
funcid	oid	ID of the function
schemaname	name	Schema name
funcname	name	Function name
calls	bigint	Number of times that the function has been called
total_time	double precision	Total time spent in this function and all other functions called by it (unit: ms)
self_time	double precision	Total time spent in this function, excluding other functions called by it (unit: ms)

16.2.6 Workload

16.2.6.1 WORKLOAD_SQL_COUNT

WORKLOAD_SQL_COUNT displays the distribution of SQL statements in workloads on the current node. Common users can view only the distribution of SQL statements executed by themselves in workloads, whereas user **monadmin** can view the overall load status of workloads.

Table 16-72 WORKLOAD_SQL_COUNT columns

Name	Type	Description
workload	name	Workload name
select_count	bigint	Number of **SELECT** statements
update_count	bigint	Number of **UPDATE** statements
insert_count	bigint	Number of **INSERT** statements
delete_count	bigint	Number of **DELETE** statements
ddl_count	bigint	Number of DDL statements
dml_count	bigint	Number of DML statements
dcl_count	bigint	Number of DCL statements

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

16.2.6.2 SUMMARY_WORKLOAD_SQL_COUNT

SUMMARY_WORKLOAD_SQL_COUNT displays the distribution of SQL statements in workloads on each CN in the cluster.

Table 16-73 SUMMARY_WORKLOAD_SQL_COUNT columns

Name	Type	Description
node_name	name	Node name
workload	name	Workload name
select_count	bigint	Number of **SELECT** statements
update_count	bigint	Number of **UPDATE** statements
insert_count	bigint	Number of **INSERT** statements
delete_count	bigint	Number of **DELETE** statements
ddl_count	bigint	Number of DDL statements
dml_count	bigint	Number of DML statements
dcl_count	bigint	Number of DCL statements

16.2.6.3 WORKLOAD_TRANSACTION

WORKLOAD_TRANSACTION displays the information about transactions on the current node.

Table 16-74 WORKLOAD_TRANSACTION columns

Name	Type	Description
workload	name	Workload name
commit_counter	bigint	Number of user transactions committed
rollback_counter	bigint	Number of user transactions rolled back
resp_min	bigint	Minimum response time of user transactions (unit: μs)
resp_max	bigint	Maximum response time of user transactions (unit: μs)
resp_avg	bigint	Average response time of user transactions (unit: μs)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
resp_total	bigint	Total response time of user transactions (unit: μs)
bg_commit_counter	bigint	Number of background transactions committed
bg_rollback_counter	bigint	Number of background transactions rolled back
bg_resp_min	bigint	Minimum response time of background transactions (unit: μs)
bg_resp_max	bigint	Maximum response time of background transactions (unit: μs)
bg_resp_avg	bigint	Average response time of background transactions (unit: μs)
bg_resp_total	bigint	Total response time of background transactions (unit: μs)

16.2.6.4 SUMMARY_WORKLOAD_TRANSACTION

SUMMARY_WORKLOAD_TRANSACTION displays the information about transactions in the cluster.

Table 16-75 SUMMARY_WORKLOAD_TRANSACTION columns

Name	Type	Description
workload	name	Workload name
commit_counter	numeric	Number of user transactions committed
rollback_counter	numeric	Number of user transactions rolled back
resp_min	bigint	Minimum response time of user transactions (unit: μs)
resp_max	bigint	Maximum response time of user transactions (unit: μs)
resp_avg	bigint	Average response time of user transactions (unit: μs)
resp_total	numeric	Total response time of user transactions (unit: μs)
bg_commit_counter	numeric	Number of background transactions committed
bg_rollback_counter	numeric	Number of background transactions rolled back

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
bg_resp_min	bigint	Minimum response time of background transactions (unit: μs)
bg_resp_max	bigint	Maximum response time of background transactions (unit: μs)
bg_resp_avg	bigint	Average response time of background transactions (unit: μs)
bg_resp_total	numeric	Total response time of background transactions (unit: μs)

16.2.6.5 GLOBAL_WORKLOAD_TRANSACTION

GLOBAL_WORKLOAD_TRANSACTION displays the information about workloads on each node.

Table 16-76 GLOBAL_WORKLOAD_TRANSACTION columns

Name	Type	Description
node_name	name	Node name
workload	name	Workload name
commit_counter	bigint	Number of user transactions committed
rollback_counter	bigint	Number of user transactions rolled back
resp_min	bigint	Minimum response time of user transactions (unit: μs)
resp_max	bigint	Maximum response time of user transactions (unit: μs)
resp_avg	bigint	Average response time of user transactions (unit: μs)
resp_total	bigint	Total response time of user transactions (unit: μs)
bg_commit_counter	bigint	Number of background transactions committed
bg_rollback_counter	bigint	Number of background transactions rolled back
bg_resp_min	bigint	Minimum response time of background transactions (unit: μs)
bg_resp_max	bigint	Maximum response time of background transactions (unit: μs)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
bg_resp_avg	bigint	Average response time of background transactions (unit: μs)
bg_resp_total	bigint	Total response time of background transactions (unit: μs)

16.2.6.6 WORKLOAD_SQL_ELAPSE_TIME

WORKLOAD_SQL_ELAPSE_TIME collects statistics about SUIDs in workloads.

Table 16-77 WORKLOAD_SQL_ELAPSE_TIME columns

Name	Type	Description
workload	name	Workload name
total_select_elapse	bigint	Total response time of **SELECT** statements (unit: μs)
max_select_elapse	bigint	Maximum response time of **SELECT** statements (unit: μs)
min_select_elapse	bigint	Minimum response time of **SELECT** statements (unit: μs)
avg_select_elapse	bigint	Average response time of **SELECT** statements (unit: μs)
total_update_elapse	bigint	Total response time of **UPDATE** statements (unit: μs)
max_update_elapse	bigint	Maximum response time of **UPDATE** statements (unit: μs)
min_update_elapse	bigint	Minimum response time of **UPDATE** statements (unit: μs)
avg_update_elapse	bigint	Average response time of **UPDATE** statements (unit: μs)
total_insert_elapse	bigint	Total response time of **INSERT** statements (unit: μs)
max_insert_elapse	bigint	Maximum response time of **INSERT** statements (unit: μs)
min_insert_elapse	bigint	Minimum response time of **INSERT** statements (unit: μs)
avg_insert_elapse	bigint	Average response time of **INSERT** statements (unit: μs)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
total_delete_elapse	bigint	Total response time of **DELETE** statements (unit: μs)
max_delete_elapse	bigint	Maximum response time of **DELETE** statements (unit: μs)
min_delete_elapse	bigint	Minimum response time of **DELETE** statements (unit: μs)
avg_delete_elapse	bigint	Average response time of **DELETE** statements (unit: μs)

16.2.6.7 SUMMARY_WORKLOAD_SQL_ELAPSE_TIME

SUMMARY_WORKLOAD_SQL_ELAPSE_TIME collects statistics about SUIDs in service workloads on all CNs.

Table 16-78 SUMMARY_WORKLOAD_SQL_ELAPSE_TIM columns

Name	Type	Description
node_name	name	Node name
workload	name	Workload name
total_select_elapse	bigint	Total response time of **SELECT** statements (unit: μs)
max_select_elapse	bigint	Maximum response time of **SELECT** statements (unit: μs)
min_select_elapse	bigint	Minimum response time of **SELECT** statements (unit: μs)
avg_select_elapse	bigint	Average response time of **SELECT** statements (unit: μs)
total_update_elapse	bigint	Total response time of **UPDATE** statements (unit: μs)
max_update_elapse	bigint	Maximum response time of **UPDATE** statements (unit: μs)
min_update_elapse	bigint	Minimum response time of **UPDATE** statements (unit: μs)
avg_update_elapse	bigint	Average response time of **UPDATE** statements (unit: μs)
total_insert_elapse	bigint	Total response time of **INSERT** statements (unit: μs)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
max_insert_elapse	bigint	Maximum response time of **INSERT** statements (unit: μs)
min_insert_elapse	bigint	Minimum response time of **INSERT** statements (unit: μs)
avg_insert_elapse	bigint	Average response time of **INSERT** statements (unit: μs)
total_delete_elapse	bigint	Total response time of **DELETE** statements (unit: μs)
max_delete_elapse	bigint	Maximum response time of **DELETE** statements (unit: μs)
min_delete_elapse	bigint	Minimum response time of **DELETE** statements (unit: μs)
avg_delete_elapse	bigint	Average response time of **DELETE** statements (unit: μs)

16.2.6.8 USER_TRANSACTION

USER_TRANSACTION collects statistics about transactions executed by users. Common users can view only transactions executed by themselves, whereas user **monadmin** can view transactions executed by all users.

Table 16-79 USER_TRANSACTION columns

Name	Type	Description
username	name	Username
commit_counter	bigint	Number of user transactions committed
rollback_counter	bigint	Number of user transactions rolled back
resp_min	bigint	Minimum response time of user transactions (unit: μs)
resp_max	bigint	Maximum response time of user transactions (unit: μs)
resp_avg	bigint	Average response time of user transactions (unit: μs)
resp_total	bigint	Total response time of user transactions (unit: μs)
bg_commit_counter	bigint	Number of background transactions committed

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
bg_rollback_counter	bigint	Number of background transactions rolled back
bg_resp_min	bigint	Minimum response time of background transactions (unit: μs)
bg_resp_max	bigint	Maximum response time of background transactions (unit: μs)
bg_resp_avg	bigint	Average response time of background transactions (unit: μs)
bg_resp_total	bigint	Total response time of background transactions (unit: μs)

16.2.6.9 GLOBAL_USER_TRANSACTION

GLOBAL_USER_TRANSACTION collects statistics about transactions executed by all users.

Table 16-80 GLOBAL_USER_TRANSACTION columns

Name	Type	Description
node_name	name	Node name
username	name	Username
commit_counter	bigint	Number of user transactions committed
rollback_counter	bigint	Number of user transactions rolled back
resp_min	bigint	Minimum response time of user transactions (unit: μs)
resp_max	bigint	Maximum response time of user transactions (unit: μs)
resp_avg	bigint	Average response time of user transactions (unit: μs)
resp_total	bigint	Total response time of user transactions (unit: μs)
bg_commit_counter	bigint	Number of background transactions committed
bg_rollback_counter	bigint	Number of background transactions rolled back
bg_resp_min	bigint	Minimum response time of background transactions (unit: μs)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
bg_resp_max	bigint	Maximum response time of background transactions (unit: μs)
bg_resp_avg	bigint	Average response time of background transactions (unit: μs)
bg_resp_total	bigint	Total response time of background transactions (unit: μs)

16.2.7 Session and Thread

16.2.7.1 SESSION_STAT

SESSION_STAT collects statistics about session status on the current node based on session threads or the **AutoVacuum** thread.

Table 16-81 SESSION_STAT columns

Name	Type	Description
sessid	text	Thread start time and ID
statid	integer	Statistics ID
statname	text	Name of the statistics session
statunit	text	Unit of the statistics session
value	bigint	Value of the statistics session

16.2.7.2 GLOBAL_SESSION_STAT

GLOBAL_SESSION_STAT collects statistics about session status on each node based on session threads or the **AutoVacuum** thread.

Table 16-82 GLOBAL_SESSION_STAT columns

Name	Type	Description
node_name	name	Node name
sessid	text	Thread start time and ID
statid	integer	Statistics ID
statname	text	Name of the statistics session
statunit	text	Unit of the statistics session

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
value	bigint	Value of the statistics session

16.2.7.3 SESSION_TIME

SESSION_TIME collects statistics about the running time of session threads and time consumed in each execution phase on the current node.

Table 16-83 SESSION_TIME columns

Name	Type	Description
sessid	text	Thread start time and ID
stat_id	integer	Statistics ID
stat_name	text	Session type
value	bigint	Session value

16.2.7.4 GLOBAL_SESSION_TIME

GLOBAL_SESSION_TIME collects statistics about the running time of session threads and time consumed in each execution phase on each node.

Table 16-84 GLOBAL_SESSION_TIME columns

Name	Type	Description
node_name	name	Node name
sessid	text	Thread start time and ID
stat_id	integer	Statistics ID
stat_name	text	Session type
value	bigint	Session value

16.2.7.5 SESSION_MEMORY

SESSION_MEMORY collects statistics about memory usage at the session level in the unit of MB, including all the memory allocated to Postgres and stream threads on DNs for jobs currently executed by users.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-85 SESSION_MEMORY columns

Name	Type	Description
sessid	text	Thread start time and ID
init_mem	integer	Memory allocated to the currently executed job before the job enters the executor
used_mem	integer	Memory allocated to the currently executed job
peak_mem	integer	Peak memory allocated to the currently executed job

16.2.7.6 GLOBAL_SESSION_MEMORY

GLOBAL_SESSION_MEMORY collects statistics about memory usage at the session level on each node in the unit of MB, including all the memory allocated to Postgres and stream threads on DNs for jobs currently executed by users.

Table 16-86 GLOBAL_SESSION_MEMORY columns

Name	Type	Description
node_name	name	Node name
sessid	text	Thread start time and ID
init_mem	integer	Memory allocated to the currently executed job before the job enters the executor
used_mem	integer	Memory allocated to the currently executed job
peak_mem	integer	Peak memory allocated to the currently executed job

16.2.7.7 SESSION_MEMORY_DETAIL

SESSION_MEMORY_DETAIL collects statistics about thread memory usage by MemoryContext node.

Table 16-87 SESSION_MEMORY_DETAIL columns

Name	Type	Description
sessid	text	Thread start time and ID
sesstype	text	Thread name
contextname	text	Name of the memory context
level	smallint	Level of memory context importance

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
parent	text	Name of the parent memory context
totalsize	bigint	Size of the applied memory (unit: byte)
freesize	bigint	Size of the idle memory (unit: byte)
usedsize	bigint	Size of the used memory (unit: byte)

16.2.7.8 GLOBAL_SESSION_MEMORY_DETAIL

GLOBAL_SESSION_MEMORY_DETAIL collects statistics about thread memory usage on each node by MemoryContext node.

Table 16-88 GLOBAL_SESSION_MEMORY_DETAIL columns

Name	Type	Description
node_name	name	Node name
sessid	text	Thread start time and ID
sesstype	text	Thread name
contextname	text	Name of the memory context
level	smallint	Level of memory context importance
parent	text	Name of the parent memory context
totalsize	bigint	Size of the applied memory (unit: byte)
freesize	bigint	Size of the idle memory (unit: byte)
usedsize	bigint	Size of the used memory (unit: byte)

16.2.7.9 SESSION_STAT_ACTIVITY

SESSION_STAT_ACTIVITY displays information about threads that are running on the current node.

Table 16-89 SESSION_STAT_ACTIVITY columns

Name	Type	Description
datid	oid	OID of the database that the user session connects to in the backend
datname	name	Name of the database that the user session connects to in the backend
pid	bigint	Backend thread ID

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
usesysid	oid	OID of the user logged in to the backend
username	name	Name of the user logged in to the backend
application_name	text	Name of the application connected to the backend
client_addr	inet	IP address of the client connected to the backend. If this column is null, it indicates either the client is connected via a Unix socket on the server or this is an internal process, such as autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (**–1** if a Unix socket is used)
backend_start	timestampwith time zone	Time when this process was started, that is, when the client connected to the server
xact_start	timestampwith time zone	Time when the current transaction was started (null if no transactions are active). If the current query is the first of its transaction, the value of this column is the same as that of the **query_start** column.
query_start	timestampwith time zone	Time when the currently active query was started, or time when the last query was started if **state** is not **active**
state_change	timestampwith time zone	Time when the **state** was last changed
waiting	boolean	Whether the backend is currently waiting on a lock. If yes, the value is **true**.
enqueue	text	Resource status in workload management (The current feature is a lab feature. Contact Huawei technical support before using it.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Overall status of this backend. Its value can be: • **active**: The backend is executing a query. • **idle**: The backend is waiting for a new client command. • **idle in transaction**: The backend is in a transaction, but is not currently executing a query. • **idle in transaction (aborted)**: The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend. **NOTE** Common users can view only their own session status. The state information of other accounts is empty. For example, after the **judy** user is connected to the database, the state information of the **joe** user and the initial user **omm** in **pg_stat_activity** is empty. openGauss=# SELECT datname, usename, usesysid,state,pid FROM pg_stat_activity; datname | usename | usesysid | state | pid ----------+---------+----------+-------- +-----------------postgres | omm | 10 | | 139968752121616 postgres | omm | 10 | |139968903116560 db_tpcds | judy | 16398 | active | 139968391403280 postgres | omm | 10 | |139968643069712 postgres | omm | 10 | |139968680818448 postgres | joe | 16390 | |139968563377936 (6 rows)
resource_pool	name	Resource pool used by the user
query_id	bigint	ID of a query
query	text	Text of this backend's latest query. If the value of **state** is **active**, this column shows the ongoing query. In all other states, it shows the last query that was executed.
unique_sql_id	bigint	Unique SQL statement ID

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
trace_id	text	Driver-specific trace ID, which is associated with an application request

16.2.7.10 GLOBAL_SESSION_STAT_ACTIVITY

GLOBAL_SESSION_STAT_ACTIVITY displays information about threads that are running on each node in the cluster.

Table 16-90 GLOBAL_SESSION_STAT_ACTIVITY columns

Name	Type	Description
coorname	text	CN name
datid	oid	OID of the database that the user session connects to in the backend
datname	text	Name of the database that the user session connects to in the backend
pid	bigint	Backend thread ID
usesysid	oid	OID of the user logged in to the backend
usename	text	Name of the user logged in to the backend
application_name	text	Name of the application connected to the backend
client_addr	inet	IP address of the client connected to the backend. If this column is null, it indicates either the client is connected via a Unix socket on the server or this is an internal process, such as autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (**–1** if a Unix socket is used)
backend_start	timestampwith time zone	Time when this process was started, that is, when the client connected to the server

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
xact_start	timestampwith time zone	Time when the current transaction was started (null if no transactions are active). If the current query is the first of its transaction, the value of this column is the same as that of the **query_start** column.
query_start	timestampwith time zone	Time when the currently active query was started, or time when the last query was started if the value of **state** is not **active**
state_change	timestampwith time zone	Time when the **state** was last changed
waiting	boolean	Whether the backend is currently waiting on a lock. If yes, the value is **true**.
enqueue	text	Resource status in workload management. (The current feature is a lab feature. Contact Huawei technical support before using it.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Overall status of this backend. Its value can be: • **active**: The backend is executing a query. • **idle**: The backend is waiting for a new client command. • **idle in transaction**: The backend is in a transaction, but is not currently executing a query. • **idle in transaction (aborted)**: The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend. **NOTE** Common users can view only their own session status. The state information of other accounts is empty. For example, after the **judy** user is connected to the database, the state information of the **joe** user and the initial user **omm** in **pg_stat_activity** is empty. openGauss=# SELECT datname, usename, usesysid,state,pid FROM pg_stat_activity; datname | usename | usesysid | state | pid ----------+---------+----------+--------+-----------------postgres | omm | 10 | | 139968752121616 postgres | omm | 10 | |139968903116560 db_tpcds | judy | 16398 | active | 139968391403280 postgres | omm | 10 | |139968643069712 postgres | omm | 10 | |139968680818448 postgres | joe | 16390 | |139968563377936 (6 rows)
resource_pool	name	Resource pool used by the user
query_id	bigint	ID of a query
query	text	Text of this backend's latest query. If the value of **state** is **active**, this column shows the ongoing query. In all other states, it shows the last query that was executed.
unique_sql_id	bigint	Unique SQL statement ID

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
trace_id	text	Driver-specific trace ID, which is associated with an application request

16.2.7.11 THREAD_WAIT_STATUS

THREAD_WAIT_STATUS allows you to test the block waiting status of the backend thread and auxiliary thread in the current instance. For details about events, see **Table 16-180**.

Table 16-91 THREAD_WAIT_STATUS columns

Name	Type	Description
node_name	text	Current node name
db_name	text	Database name
thread_name	text	Thread name
query_id	bigint	Query ID. The value of this column is the same as that of **debug_query_id**.
tid	bigint	Thread ID of the current thread
sessionid	bigint	Session ID
lwtid	integer	Lightweight thread ID of the current thread
psessionid	bigint	Parent thread of the streaming thread
tlevel	integer	Level of the streaming thread
smpid	integer	Concurrent thread ID
wait_status	text	Waiting status of the current thread. For details about the wait status, see **Table 16-180**.
wait_event	text	If **wait_status** is **acquire lock**, **acquire lwlock**, or **wait io**, this column describes the lock, lightweight lock, and I/O information, respectively. If **wait_status** is not any of the three values, this column is empty.
locktag	text	Information about the lock that the current thread is waiting for
lockmode	text	Lock mode that the current thread is waiting to obtain. The values include table-level lock, row-level lock, and page-level lock modes.
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
global_sessionid	text	Global session ID

16.2.7.12 GLOBAL_THREAD_WAIT_STATUS

GLOBAL_THREAD_WAIT_STATUS allows you to test the block waiting status of backend threads and auxiliary threads on all nodes. For details about the events, see **Table 16-180**.

In **GLOBAL_THREAD_WAIT_STATUS**, you can see all the call hierarchy relationships between threads of the SQL statements on all nodes in the cluster, and the block waiting status for each thread. With this view, you can easily locate the causes of process hang and similar issues.

The definitions of **GLOBAL_THREAD_WAIT_STATUS** and **THREAD_WAIT_STATUS** are the same, because the essence of the **GLOBAL_THREAD_WAIT_STATUS** view is the query summary of the **THREAD_WAIT_STATUS** view on each node in the cluster.

Table 16-92 GLOBAL_THREAD_WAIT_STATUS columns

Name	Type	Description
node_name	text	Current node name
db_name	text	Database name
thread_name	text	Thread name
query_id	bigint	Query ID. The value of this column is the same as that of **debug_query_id**.
tid	bigint	Thread ID of the current thread
sessionid	bigint	Session ID
lwtid	integer	Lightweight thread ID of the current thread
psessionid	bigint	Parent thread of the streaming thread
tlevel	integer	Level of the streaming thread
smpid	integer	Concurrent thread ID
wait_status	text	Waiting status of the current thread. For details about the waiting status, see **Table 16-180**.
wait_event	text	If **wait_status** is **acquire lock**, **acquire lwlock**, or **wait io**, this column describes the lock, lightweight lock, and I/O information, respectively. If **wait_status** is not any of the three values, this column is empty.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
locktag	text	Information about the lock that the current thread is waiting for
lockmode	text	Lock mode that the current thread is waiting to obtain. The values include table-level lock, row-level lock, and page-level lock modes.
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock
global_sessionid	text	Global session ID

16.2.7.13 LOCAL_THREADPOOL_STATUS

LOCAL_THREADPOOL_STATUS displays the status of worker threads and sessions in the thread pool. This view is valid only when **enable_thread_pool** is set to **on**.

Table 16-93 LOCAL_THREADPOOL_STATUS columns

Name	Type	Description
node_name	text	Node name
group_id	integer	ID of the thread pool group
bind_numa_id	integer	NUMA ID to which the thread pool group is bound
bind_cpu_number	integer	Information about the CPU to which the thread pool group is bound. If no CPUs are bound, the value is **NULL**.
listener	integer	Number of listener threads in the thread pool group

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
worker_info	text	Information about threads in the thread pool, including: • **default**: number of initial threads in the thread pool • **new**: number of new threads in the thread pool • **expect**: number of expected threads in the thread pool • **actual**: number of actual threads in the thread pool • **idle**: number of idle threads in the thread pool • **pending**: number of waiting threads in the thread pool
session_info	text	Information about sessions in the thread pool, including: • **total**: number of all sessions in the thread pool • **waiting**: number of sessions waiting to be scheduled in the thread pool • **running**: number of running sessions in the thread pool • **idle**: number of idle sessions in the thread pool
stream_info	text	Information about streams in the thread pool, including: • **total**: number of all stream threads in the thread pool • **running**: number of running stream threads in the thread pool • **idle**: number of idle stream threads in the thread pool

16.2.7.14 GLOBAL_THREADPOOL_STATUS

GLOBAL_THREADPOOL_STATUS displays the status of worker threads and sessions in thread pools on all nodes. Columns in this view are the same as those in **Table 16-93**.

16.2.7.15 SESSION_CPU_RUNTIME

SESSION_CPU_RUNTIME displays CPU usage information about ongoing complex jobs executed by the current user.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-94 SESSION_CPU_RUNTIME columns

Name	Type	Description
datid	oid	OID of the database that this backend is connected to
usename	name	Name of the user logged in to the backend
pid	bigint	Backend thread ID
start_time	timestamp with time zone	Time when the statement starts to be executed
min_cpu_time	bigint	Minimum CPU time of the statement across all DNs, in ms
max_cpu_time	bigint	Maximum CPU time of the statement across all DNs, in ms
total_cpu_time	bigint	Total CPU time of the statement across all DNs, in ms
query	text	Statement being executed
node_group	text	Logical cluster of the user running the statement. (The current feature is a lab feature. Contact Huawei technical support before using it.)
top_cpu_dn	text	Top N CPU usage

16.2.7.16 SESSION_MEMORY_RUNTIME

SESSION_MEMORY_RUNTIME displays memory usage information about ongoing complex jobs executed by the current user.

Table 16-95 SESSION_MEMORY_RUNTIME columns

Name	Type	Description
datid	oid	OID of the database that this backend is connected to
usename	name	Name of the user logged in to the backend
pid	bigint	Backend thread ID
start_time	timestamp with time zone	Time when the statement starts to be executed
min_peak_memory	integer	Minimum memory peak of the statement across all DNs, in MB

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
max_peak_memory	integer	Maximum memory peak of the statement across all DNs, in MB
spill_info	text	Statement spill information on all DNs: • **None**: No data is spilled to disks on all DNs. • **All**: Data is spilled to disks on all DNs. • **[*a*:*b*]**: The statement has been spilled to disks on *a* of *b* DNs.
query	text	Statement being executed
node_group	text	Logical cluster of the user running the statement (The current feature is a lab feature. Contact Huawei technical support before using it.)
top_mem_dn	text	Top N memory usage

16.2.7.17 STATEMENT_IOSTAT_COMPLEX_RUNTIME

STATEMENT_IOSTAT_COMPLEX_RUNTIME displays I/O load management information about ongoing jobs executed by the current user. (The current feature is a lab feature. Contact Huawei technical support before using it.) IOPS is counted by ones for column store and by 10 thousands for row store.

Table 16-96 STATEMENT_IOSTAT_COMPLEX_RUNTIME columns

Name	Type	Description
query_id	bigint	Job ID
mincurriops	integer	Minimum I/O of the current job across DNs
maxcurriops	integer	Maximum I/O of the current job across DNs
minpeakiops	integer	Minimum peak I/O of the current job across DNs
maxpeakiops	integer	Maximum peak I/O of the current job across DNs
io_limits	integer	**io_limits** set for the job
io_priority	text	**io_priority** set for the job
query	text	Job
node_group	text	Logical cluster of the user running the job (The current feature is a lab feature. Contact Huawei technical support before using it.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
curr_io_limits	integer	Real-time **iolimits** value when **io_priority** is used to control I/Os.

16.2.7.18 LOCAL_ACTIVE_SESSION

LOCAL_ACTIVE_SESSION displays samples in the **ACTIVE SESSION PROFILE** memory on the current node.

Table 16-97 LOCAL_ACTIVE_SESSION columns

Name	Type	Description
sampleid	bigint	Sample ID.
sample_time	timestamp with time zone	Sampling time.
need_flush_sample	boolean	Specifies whether the sample needs to be refreshed.
databaseid	oid	Database ID.
thread_id	bigint	Thread ID.
sessionid	bigint	Session ID.
start_time	timestamp with time zone	Start time of a session.
event	text	Specified event name.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread. The value corresponds to the level (ID) of the execution plan.
smpid	integer	Concurrent thread ID in SMP execution mode.
userid	oid	ID of a session user.
application_name	text	Name of an application.
client_addr	inet	IP address of a client.
client_hostname	text	Name of a client.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
client_port	integer	TCP port number used by a client to communicate with the backend.
query_id	bigint	Debug query ID.
unique_query_id	bigint	Unique query ID.
user_id	oid	User ID in the key of the unique query.
cn_id	integer	A CN ID on a DN indicates that the unique SQL statement comes from a CN ID in a key of the unique query on a CN.
unique_query	text	Standardized UniqueSQL text string.
locktag	text	Information of a lock that the session waits for. It can be parsed using **locktag_decode**.
lockmode	text	Mode of a lock that the session waits for.
block_sessionid	bigint	Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.
final_block_sessionid	bigint	ID of the blocked session at the source end.
wait_status	text	Provides more details about the event column.
global_sessionid	text	Global session ID.
xact_start_time	timestamp with time zone	Start time of the transaction.
query_start_time	timestamp with time zone	Time when the statement starts to be executed.
state	text	Current statement state. The value can be **active**, **idle in transaction**, **fastpath function call**, **idle in transaction (aborted)**, **disabled**, or **retrying**.

16.2.7.19 GLOBAL_ACTIVE_SESSION

GLOBAL_ACTIVE_SESSION displays a summary of samples in the **ACTIVE SESSION PROFILE** memory on all nodes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-98 GLOBAL_ACTIVE_SESSION columns

Name	Type	Description
node_name	text	Node name
sampleid	bigint	Sample ID
sample_time	timestamp without time zone	Sampling time
need_flush_sample	boolean	Specifies whether the sample needs to be refreshed.
databaseid	oid	Database ID
thread_id	bigint	Thread ID
sessionid	bigint	Session ID
start_time	timestamp without time zone	Start time of a session
event	text	Specified event name
lwtid	integer	Lightweight thread ID of the current thread
psessionid	bigint	Parent thread of the streaming thread
tlevel	integer	Level of the streaming thread. The value corresponds to the level (ID) of the execution plan.
smpid	integer	Concurrent thread ID in SMP execution mode
userid	oid	ID of a session user
application_name	text	Name of an application.
client_addr	inet	IP address of a client
client_hostname	text	Name of a client
client_port	integer	TCP port number used by a client to communicate with the backend
query_id	bigint	debug query id
unique_query_id	bigint	unique query id
user_id	oid	User ID in the key of the unique query

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
cn_id	integer	A CN ID on a DN indicates that the unique SQL statement comes from a CN ID in a key of the unique query on a CN.
unique_query	text	Standardized UniqueSQL text string.
locktag	text	Information of a lock that the session waits for. It can be parsed using **locktag_decode**.
lockmode	text	Mode of a lock that the session waits for.
block_sessionid	bigint	Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.
final_block_sessionid	bigint	ID of the blocked session at the source end
wait_status	text	Provides more details about the event column.
global_sessionid	text	Global session ID
xact_start_time	timestamp with time zone	Start time of the transaction
query_start_time	timestamp with time zone	Time when the statement starts to be executed
state	text	Current statement state The value can be **active**, **idle in transaction**, **fastpath function call**, **idle in transaction (aborted)**, **disabled**, or **retrying**.

16.2.8 Transaction

16.2.8.1 TRANSACTIONS_RUNNING_XACTS

TRANSACTIONS_RUNNING_XACTS displays information about running transactions on the current node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-99 TRANSACTIONS_RUNNING_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM
gxid	xid	Transaction ID
state	tinyint	Transaction status (**3**: prepared; **0**: starting)
node	text	Node name
xmin	xid	Minimum transaction ID on the node
vacuum	boolean	Whether the current transaction is lazy vacuum
timeline	bigint	Number of database restarts
prepare_xid	xid	ID of the transaction in the **prepared** state (the value is **0** if the state is not **prepared**)
pid	bigint	Thread ID corresponding to the transaction
next_xid	xid	Transaction ID sent from a CN to a DN

16.2.8.2 SUMMARY_TRANSACTIONS_RUNNING_XACTS

SUMMARY_TRANSACTIONS_RUNNING_XACTS displays information about the running transactions on each CN in the cluster. The column content is the same as that of **transactions_running_xacts**.

Table 16-100 SUMMARY_TRANSACTIONS_RUNNING_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM
gxid	xid	Transaction ID
state	tinyint	Transaction status (**3**: prepared; **0**: starting)
node	text	Node name
xmin	xid	Minimum transaction ID on the node
vacuum	boolean	Whether the current transaction is lazy vacuum
timeline	bigint	Number of database restarts
prepare_xid	xid	ID of the transaction in the **prepared** state (the value is **0** if the state is not **prepared**)
pid	bigint	Thread ID corresponding to the transaction
next_xid	xid	Transaction ID sent from a CN to a DN

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

16.2.8.3 GLOBAL_TRANSACTIONS_RUNNING_XACTS

GLOBAL_TRANSACTIONS_RUNNING_XACTS displays information about the running transactions on each node in the cluster.

Table 16-101 GLOBAL_TRANSACTIONS_RUNNING_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM
gxid	xid	Transaction ID
state	tinyint	Transaction status (**3**: prepared; **0**: starting)
node	text	Node name
xmin	xid	Minimum transaction ID on the node
vacuum	boolean	Whether the current transaction is lazy vacuum
timeline	bigint	Number of database restarts
prepare_xid	xid	ID of the transaction in the **prepared** state (the value is **0** if the state is not **prepared**)
pid	bigint	Thread ID corresponding to the transaction
next_xid	xid	Transaction ID sent from a CN to a DN

16.2.8.4 TRANSACTIONS_PREPARED_XACTS

TRANSACTIONS_PREPARED_XACTS displays information about transactions that are currently prepared for two-phase commit.

Table 16-102 TRANSACTIONS_PREPARED_XACTS columns

Name	Type	Description
transaction	xid	Numeric transaction identifier of the prepared transaction
gid	text	Global transaction identifier that was assigned to the transaction
prepared	timestamp with time zone	Time at which the transaction is prepared for commit
owner	name	Name of the user that executes the transaction
database	name	Name of the database in which the transaction is executed

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

16.2.8.5 SUMMARY_TRANSACTIONS_PREPARED_XACTS

SUMMARY_TRANSACTIONS_PREPARED_XACTS displays information about the transactions that are ready for two-phase commit on each CN in the cluster.

Table 16-103 SUMMARY_TRANSACTIONS_PREPARED_XACTS columns

Name	Type	Description
transaction	xid	Numeric transaction identifier of the prepared transaction
gid	text	Global transaction identifier that was assigned to the transaction
prepared	timestamp with time zone	Time at which the transaction is prepared for commit
owner	name	Name of the user that executes the transaction
database	name	Name of the database in which the transaction is executed

16.2.8.6 GLOBAL_TRANSACTIONS_PREPARED_XACTS

GLOBAL_TRANSACTIONS_PREPARED_XACTS displays information about the transactions that are currently prepared for two-phase commit on each node.

Table 16-104 GLOBAL_TRANSACTIONS_PREPARED_XACTS columns

Name	Type	Description
transaction	xid	Numeric transaction identifier of the prepared transaction
gid	text	Global transaction identifier that was assigned to the transaction
prepared	timestamp with time zone	Time at which the transaction is prepared for commit
owner	name	Name of the user that executes the transaction
database	name	Name of the database in which the transaction is executed

16.2.9 Query

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

16.2.9.1 STATEMENT

STATEMENT obtains information about execution statements (normalized SQL statements) on the current node. To query a view, you must have the **sysadmin** or **monitor admin** permission. You can view all statistics about normalized SQL statements received by the CN, whereas you can view only the statistics about normalized SQL statements executed on the current DN.

Table 16-105 STATEMENT columns

Name	Type	Description
node_name	name	Node name
node_id	integer	Node ID (**node_id** in **pgxc_node**)
user_name	name	Username
user_id	oid	OID of the user
unique_sql_id	bigint	ID of the normalized SQL statement
query	text	Normalized SQL statement Note: The length is controlled by **track_activity_query_size**.
n_calls	bigint	Number of calls
min_elapse_time	bigint	Minimum execution time of the SQL statement in the kernel (unit: μs)
max_elapse_time	bigint	Maximum execution time of the SQL statement in the kernel (unit: μs)
total_elapse_time	bigint	Total execution time of the SQL statement in the kernel (unit: μs)
n_returned_rows	bigint	Number of rows in the result set returned by the **SELECT** statement
n_tuples_fetched	bigint	Number of rows randomly scanned
n_tuples_returned	bigint	Number of rows sequentially scanned
n_tuples_inserted	bigint	Number of rows inserted
n_tuples_updated	bigint	Number of rows updated
n_tuples_deleted	bigint	Number of rows deleted
n_blocks_fetched	bigint	Number of buffer block access times
n_blocks_hit	bigint	Number of buffer block hits

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_soft_parse	bigint	Number of soft parsing times. The value of **n_soft_parse** plus the value of **n_hard_parse** may be greater than the value of **n_calls** because the number of subqueries are not counted in the value of **n_calls**.
n_hard_parse	bigint	Number of hard parsing times. The value of **n_soft_parse** plus the value of **n_hard_parse** may be greater than the value of **n_calls** because the number of subqueries are not counted in the value of **n_calls**.
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: μs)
cpu_time	bigint	CPU time (unit: μs)
execution_time	bigint	Execution time in the executor (unit: μs)
parse_time	bigint	SQL parsing time (unit: μs)
plan_time	bigint	SQL plan generation time (unit: μs)
rewrite_time	bigint	SQL rewriting time (unit: μs)
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: μs)
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: μs)
data_io_time	bigint	I/O time (unit: μs)
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with customer service ends, and CNs communicate with DNs through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
net_recv_info	text	Network status of messages received through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with customer service ends, and CNs communicate with DNs through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
net_stream_recv_info	text	Network status of messages received through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
last_updated	timestamp with time zone	Last time when the statement was updated
sort_count	bigint	Sorting count
sort_time	bigint	Sorting duration (unit: μs)
sort_mem_used	bigint	Size of work memory used during sorting (unit: KB)
sort_spill_count	bigint	Count of file writing when data is flushed to disks during sorting

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sort_spill_size	bigint	File size used when data is flushed to disks during sorting (unit: KB)
hash_count	bigint	Hashing count
hash_time	bigint	Hashing duration (unit: μs)
hash_mem_used	bigint	Size of work memory used during hashing (unit: KB)
hash_spill_count	bigint	Count of file writing when data is flushed to disks during hashing
hash_spill_size	bigint	File size used when data is flushed to disks during hashing (unit: KB)

16.2.9.2 SUMMARY_STATEMENT

SUMMARY_STATEMENT displays all information (including DNs) about executed statements (normalized SQL statements) on each CN.

Table 16-106 SUMMARY_STATEMENT columns

Name	Type	Description
node_name	name	Node name
node_id	integer	Node ID (**node_id** in **pgxc_node**)
user_name	name	Username
user_id	oid	OID of the user
unique_sql_id	bigint	ID of the normalized SQL statement
query	text	Normalized SQL statement Note: The length is controlled by **track_activity_query_size**.
n_calls	bigint	Number of calls
min_elapse_time	bigint	Minimum execution time of the SQL statement in the kernel (unit: μs)
max_elapse_time	bigint	Maximum execution time of the SQL statement in the kernel (unit: μs)
total_elapse_time	bigint	Total execution time of the SQL statement in the kernel (unit: μs)
n_returned_rows	bigint	Number of rows in the result set returned by the **SELECT** statement

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_tuples_fetched	bigint	Number of rows randomly scanned
n_tuples_returned	bigint	Number of rows sequentially scanned
n_tuples_inserted	bigint	Number of rows inserted
n_tuples_updated	bigint	Number of rows updated
n_tuples_deleted	bigint	Number of rows deleted
n_blocks_fetched	bigint	Number of buffer block access times
n_blocks_hit	bigint	Number of buffer block hits
n_soft_parse	bigint	Number of soft parsing times
n_hard_parse	bigint	Number of hard parsing times
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: μs)
cpu_time	bigint	CPU time (unit: μs)
execution_time	bigint	Execution time in the executor (unit: μs)
parse_time	bigint	SQL parsing time (unit: μs)
plan_time	bigint	SQL plan generation time (unit: μs)
rewrite_time	bigint	SQL rewriting time (unit: μs)
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: μs)
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: μs)
data_io_time	bigint	I/O time (unit: μs)
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with customer service ends, and CNs communicate with DNs through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.

Name	Type	Description
net_recv_info	text	Network status of messages received through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with customer service ends, and CNs communicate with DNs through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
net_stream_recv_info	text	Network status of messages received through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
last_updated	timestamp with time zone	Last time when the statement was updated
sort_count	bigint	Sorting count
sort_time	bigint	Sorting duration (unit: μs)
sort_mem_used	bigint	Size of work memory used during sorting (unit: KB)
sort_spill_count	bigint	Count of file writing when data is flushed to disks during sorting

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sort_spill_size	bigint	File size used when data is flushed to disks during sorting (unit: KB)
hash_count	bigint	Hashing count
hash_time	bigint	Hashing duration (unit: μs)
hash_mem_used	bigint	Size of work memory used during hashing (unit: KB)
hash_spill_count	bigint	Count of file writing when data is flushed to disks during hashing
hash_spill_size	bigint	File size used when data is flushed to disks during hashing (unit: KB)

16.2.9.3 STATEMENT_COUNT

STATEMENT_COUNT displays statistics about four types of running statements (**SELECT**, **INSERT**, **UPDATE**, **DELETE**, and **MERGE INTO**) as well as DDL, DML, and DCL statements on the current node of the database.

NOTE

By querying the **STATEMENT_COUNT** view, a common user can view statistics only about this user on the current node, whereas an administrator can view statistics about all users on the current node. When the cluster or node is restarted, the statistics are cleared and the counting restarts. The system counts when a node receives a query, including a query inside the cluster. For example, when a CN receives a query and distributes multiple queries to DNs, the queries are counted accordingly on the DNs.

Table 16-107 STATEMENT_COUNT columns

Name	Type	Description
node_name	text	Node name
user_name	text	Username
select_count	bigint	Statistical result of the **SELECT** statement
update_count	bigint	Statistical result of the **UPDATE** statement
insert_count	bigint	Statistical result of the **INSERT** statement
delete_count	bigint	Statistical result of the **DELETE** statement
mergeinto_count	bigint	Statistical result of the **MERGE INTO** statement
ddl_count	bigint	Number of DDL statements
dml_count	bigint	Number of DML statements

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
dcl_count	bigint	Number of DCL statements
total_select_elapse	bigint	Total response time of **SELECT** statements (unit: μs)
avg_select_elapse	bigint	Average response time of **SELECT** statements (unit: μs)
max_select_elapse	bigint	Maximum response time of **SELECT** statements (unit: μs)
min_select_elapse	bigint	Minimum response time of **SELECT** statements (unit: μs)
total_update_elapse	bigint	Total response time of **UPDATE** statements (unit: μs)
avg_update_elapse	bigint	Average response time of **UPDATE** statements (unit: μs)
max_update_elapse	bigint	Maximum response time of **UPDATE** statements (unit: μs)
min_update_elapse	bigint	Minimum response time of **UPDATE** statements (unit: μs)
total_insert_elapse	bigint	Total response time of **INSERT** statements (unit: μs)
avg_insert_elapse	bigint	Average response time of **INSERT** statements (unit: μs)
max_insert_elapse	bigint	Maximum response time of **INSERT** statements (unit: μs)
min_insert_elapse	bigint	Minimum response time of **INSERT** statements (unit: μs)
total_delete_elapse	bigint	Total response time of **DELETE** statements (unit: μs)
avg_delete_elapse	bigint	Average response time of **DELETE** statements (unit: μs)
max_delete_elapse	bigint	Maximum response time of **DELETE** statements (unit: μs)
min_delete_elapse	bigint	Minimum response time of **DELETE** statements (unit: μs)

16.2.9.4 GLOBAL_STATEMENT_COUNT

GLOBAL_STATEMENT_COUNT displays statistics about four types of running statements (**SELECT**, **INSERT**, **UPDATE**, **DELETE**, and **MERGE INTO**) as well as DDL, DML, and DCL statements on each node of the database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-108 GLOBAL_STATEMENT_COUNT columns

Name	Type	Description
node_name	text	Node name
user_name	text	Username
select_count	bigint	Statistical result of the **SELECT** statement
update_count	bigint	Statistical result of the **UPDATE** statement
insert_count	bigint	Statistical result of the **INSERT** statement
delete_count	bigint	Statistical result of the **DELETE** statement
mergeinto_count	bigint	Statistical result of the **MERGE INTO** statement
ddl_count	bigint	Number of DDL statements
dml_count	bigint	Number of DML statements
dcl_count	bigint	Number of DCL statements
total_select_elapse	bigint	Total response time of **SELECT** statements (unit: μs)
avg_select_elapse	bigint	Average response time of **SELECT** statements (unit: μs)
max_select_elapse	bigint	Maximum response time of **SELECT** statements (unit: μs)
min_select_elapse	bigint	Minimum response time of **SELECT** statements (unit: μs)
total_update_elapse	bigint	Total response time of **UPDATE** statements (unit: μs)
avg_update_elapse	bigint	Average response time of **UPDATE** statements (unit: μs)
max_update_elapse	bigint	Maximum response time of **UPDATE** statements (unit: μs)
min_update_elapse	bigint	Minimum response time of **UPDATE** statements (unit: μs)
total_insert_elapse	bigint	Total response time of **INSERT** statements (unit: μs)
avg_insert_elapse	bigint	Average response time of **INSERT** statements (unit: μs)
max_insert_elapse	bigint	Maximum response time of **INSERT** statements (unit: μs)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
min_insert_elapse	bigint	Minimum response time of **INSERT** statements (unit: μs)
total_delete_elapse	bigint	Total response time of **DELETE** statements (unit: μs)
avg_delete_elapse	bigint	Average response time of **DELETE** statements (unit: μs)
max_delete_elapse	bigint	Maximum response time of **DELETE** statements (unit: μs)
min_delete_elapse	bigint	Minimum response time of **DELETE** statements (unit: μs)

16.2.9.5 SUMMARY_STATEMENT_COUNT

SUMMARY_STATEMENT_COUNT displays statistics about four types of running statements (**SELECT**, **INSERT**, **UPDATE**, **DELETE**, and **MERGE INTO**) as well as DDL, DML, and DCL statements on all nodes (CNs and DNs) of the database.

Table 16-109 SUMMARY_STATEMENT_COUNT columns

Name	Type	Description
user_name	text	Username
select_count	numeric	Statistical result of the **SELECT** statement
update_count	numeric	Statistical result of the **UPDATE** statement
insert_count	numeric	Statistical result of the **INSERT** statement
delete_count	numeric	Statistical result of the **DELETE** statement
mergeinto_count	numeric	Statistical result of the **MERGE INTO** statement
ddl_count	numeric	Number of DDL statements
dml_count	numeric	Number of DML statements
dcl_count	numeric	Number of DCL statements
total_select_elapse	numeric	Total response time of **SELECT** statements (unit: μs)
avg_select_elapse	bigint	Average response time of **SELECT** statements (unit: μs)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
max_select_elapse	bigint	Maximum response time of **SELECT** statements (unit: μs)
min_select_elapse	bigint	Minimum response time of **SELECT** statements (unit: μs)
total_update_elapse	numeric	Total response time of **UPDATE** statements (unit: μs)
avg_update_elapse	bigint	Average response time of **UPDATE** statements (unit: μs)
max_update_elapse	bigint	Maximum response time of **UPDATE** statements (unit: μs)
min_update_elapse	bigint	Minimum response time of **UPDATE** statements (unit: μs)
total_insert_elapse	numeric	Total response time of **INSERT** statements (unit: μs)
avg_insert_elapse	bigint	Average response time of **INSERT** statements (unit: μs)
max_insert_elapse	bigint	Maximum response time of **INSERT** statements (unit: μs)
min_insert_elapse	bigint	Minimum response time of **INSERT** statements (unit: μs)
total_delete_elapse	numeric	Total response time of **DELETE** statements (unit: μs)
avg_delete_elapse	bigint	Average response time of **DELETE** statements (unit: μs)
max_delete_elapse	bigint	Maximum response time of **DELETE** statements (unit: μs)
min_delete_elapse	bigint	Minimum response time of **DELETE** statements (unit: μs)

16.2.9.6 GLOBAL_STATEMENT_COMPLEX_HISTORY

GLOBAL_STATEMENT_COMPLEX_HISTORY_TABLE displays load management information about completed jobs executed on each node. (The current feature is a lab feature. Contact Huawei technical support before using it.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-110 GLOBAL_STATEMENT_COMPLEX_HISTORY columns

Name	Type	Description
datid	oid	OID of the database that this backend is connected to
dbname	text	Name of the database that the backend is connected to
schemaname	text	Schema name
nodename	text	Name of the CN where the statement is executed
username	text	Username used for connecting to the backend
application_name	text	Name of the application connected to the backend
client_addr	inet	IP address of the client connected to the backend. If this column is null, it indicates either the client is connected via a Unix socket on the server or this is an internal process, such as autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with this backend (**-1** if a Unix socket is used)
query_band	text	Job type, which is specified by the GUC parameter **query_band**. The default value is a null string.
block_time	bigint	Duration that the statement is blocked before being executed, including the statement parsing and optimization duration (unit: ms)
start_time	timestamp with time zone	Time when the statement starts to be executed
finish_time	timestamp with time zone	Time when the statement execution ends
duration	bigint	Execution time of the statement (unit: ms)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
estimate_total_time	bigint	Estimated execution time of the statement (unit: ms)
status	text	Final statement execution status. The value can be **finished** (normal) or **aborted** (abnormal).
abort_info	text	Exception information displayed if the final statement execution status is **aborted**
resource_pool	text	Resource pool used by the user
control_group	text	Cgroup used by the statement
estimate_memory	integer	Estimated memory used by the statement (unit: MB)
min_peak_memory	integer	Minimum peak memory of the statement across all DNs (unit: MB)
max_peak_memory	integer	Maximum peak memory of the statement across all DNs (unit: MB)
average_peak_memory	integer	Average memory usage during statement execution (unit: MB)
memory_skew_percent	integer	Memory usage skew of the statement among DNs
spill_info	text	Statement spill information on all DNs. • **None**: No data is spilled to disks. • **All**: Data is spilled to disks on all DNs. • **[*a*:*b*]**: The statement has been spilled to disks on *a* of *b* DNs.
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
spill_skew_percent	integer	DN spill skew when a spill occurs
min_dn_time	bigint	Minimum execution time of the statement across all DNs (unit: ms)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
max_dn_time	bigint	Maximum execution time of the statement across all DNs (unit: ms)
average_dn_time	bigint	Average execution time of the statement across all DNs (unit: ms)
dntime_skew_percent	integer	Execution time skew of the statement among DNs
min_cpu_time	bigint	Minimum CPU time of the statement across all DNs (unit: ms)
max_cpu_time	bigint	Maximum CPU time of the statement across all DNs (unit: ms)
total_cpu_time	bigint	Total CPU time of the statement across all DNs (unit: ms)
cpu_skew_percent	integer	CPU time skew of the statement among DNs
min_peak_iops	integer	Minimum peak IOPS of the statement across all DNs. It is counted by ones in a column-store table and by ten thousands in a row-store table.
max_peak_iops	integer	Maximum peak IOPS of the statement across all DNs. It is counted by ones in a column-store table and by ten thousands in a row-store table.
average_peak_iops	integer	Average peak IOPS of the statement across all DNs. It is counted by ones in a column-store table and by ten thousands in a row-store table.
iops_skew_percent	integer	I/O skew of the statement among DNs
warning	text	Warning. The following warnings and warnings related to **Optimizing SQL Self-Diagnosis** are displayed: • Spill file size large than 256MB • Broadcast size large than 100MB • Early spill • Spill times is greater than 3 • Spill on memory adaptive • Hash table conflict
queryid	bigint	Internal query ID used for statement execution
query	text	Statement executed

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
query_plan	text	Execution plan of the statement
node_group	text	Logical cluster of the user running the statement. (The current feature is a lab feature. Contact Huawei technical support before using it.)
cpu_top1_node_name	text	Name of the node with the 1st CPU usage
cpu_top2_node_name	text	Name of the node with the 2nd CPU usage
cpu_top3_node_name	text	Name of the node with the 3rd CPU usage
cpu_top4_node_name	text	Name of the node with the 4th CPU usage
cpu_top5_node_name	text	Name of the node with the 5th CPU usage
mem_top1_node_name	text	Name of the node with the 1st memory usage
mem_top2_node_name	text	Name of the node with the 2nd memory usage
mem_top3_node_name	text	Name of the node with the 3rd memory usage
mem_top4_node_name	text	Name of the node with the 4th memory usage
mem_top5_node_name	text	Name of the node with the 5th memory usage
cpu_top1_value	bigint	1st CPU usage
cpu_top2_value	bigint	2nd CPU usage
cpu_top3_value	bigint	3rd CPU usage
cpu_top4_value	bigint	4th CPU usage
cpu_top5_value	bigint	5th CPU usage
mem_top1_value	bigint	1st memory usage
mem_top2_value	bigint	2nd memory usage
mem_top3_value	bigint	3rd memory usage
mem_top4_value	bigint	4th memory usage
mem_top5_value	bigint	5th memory usage

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
top_mem_dn	text	Top N memory usage
top_cpu_dn	text	Top N CPU usage

16.2.9.7 GLOBAL_STATEMENT_COMPLEX_HISTORY_TABLE

GLOBAL_STATEMENT_COMPLEX_HISTORY_TABLE displays load management information about completed jobs executed on each node. (The current feature is a lab feature. Contact Huawei technical support before using it.) Data is dumped from the kernel to this system catalog. If **enable_resource_record** is set to **on**, the system imports records from **GLOBAL_STATEMENT_COMPLEX_HISTORY** to this system catalog every 3 minutes. You are not advised to enable this function, because it occupies storage space and affects performance. Columns in this catalog are the same as those in **GLOBAL_STATEMENT_COMPLEX_HISTORY**.

16.2.9.8 GLOBAL_STATEMENT_COMPLEX_RUNTIME

GLOBAL_STATEMENT_COMPLEX_RUNTIME displays load management records of jobs that are being executed by the current user on each node. (The current feature is a lab feature. Contact Huawei technical support before using it.)

Table 16-111 GLOBAL_STATEMENT_COMPLEX_RUNTIME columns

Name	Type	Description
datid	oid	OID of the database that this backend is connected to
dbname	name	Name of the database that the backend is connected to
schemaname	text	Schema name
nodename	text	Name of the CN where the statement is executed.
username	name	Username used for connecting to the backend.
application_name	text	Name of the application connected to the backend.
client_addr	inet	IP address of the client connected to the backend. If this column is null, it indicates either the client is connected via a Unix socket on the server or this is an internal process, such as autovacuum.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with this backend (**-1** if a Unix socket is used)
query_band	text	Job type, which is specified by the GUC parameter **query_band**. The default value is a null string.
pid	bigint	Backend thread ID
block_time	bigint	Block time before the statement is executed (unit: ms)
start_time	timestamp with time zone	Time when the statement starts to be executed
duration	bigint	For how long the statement has been executing (unit: ms)
estimate_total_time	bigint	Estimated execution time of the statement (unit: ms)
estimate_left_time	bigint	Estimated remaining time of statement execution (unit: ms)
enqueue	text	Resource status in workload management. (The current feature is a lab feature. Contact Huawei technical support before using it.)
resource_pool	name	Resource pool used by the user
control_group	text	Cgroup used by the statement
estimate_memory	integer	Estimated memory used by the statement (unit: MB). This parameter takes effect only when **enable_dynamic_workload** is set to **on**.
min_peak_memory	integer	Minimum peak memory of the statement across all DNs (unit: MB)
max_peak_memory	integer	Maximum peak memory of the statement across all DNs (unit: MB)
average_peak_memory	integer	Average memory usage during statement execution (unit: MB)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
memory_skew_percent	integer	Memory usage skew of the statement among DNs
spill_info	text	Statement spill information on all DNs. • **None**: No data is spilled to disks on all DNs. • **All**: Data is spilled to disks on all DNs. • **[*a*:*b*]**: The statement has been spilled to disks on *a* of *b* DNs.
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
spill_skew_percent	integer	DN spill skew when a spill occurs
min_dn_time	bigint	Minimum execution time of the statement across all DNs (unit: ms)
max_dn_time	bigint	Maximum execution time of the statement across all DNs (unit: ms)
average_dn_time	bigint	Average execution time of the statement across all DNs (unit: ms)
dntime_skew_percent	integer	Execution time skew of the statement among DNs
min_cpu_time	bigint	Minimum CPU time of the statement across all DNs (unit: ms)
max_cpu_time	bigint	Maximum CPU time of the statement across all DNs (unit: ms)
total_cpu_time	bigint	Total CPU time of the statement across all DNs (unit: ms)
cpu_skew_percent	integer	CPU time skew of the statement among DNs
min_peak_iops	integer	Minimum peak IOPS of the statement across all DNs. It is counted by ones in a column-store table and by ten thousands in a row-store table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
max_peak_iops	integer	Maximum peak IOPS of the statement across all DNs. It is counted by ones in a column-store table and by ten thousands in a row-store table.
average_peak_iops	integer	Average peak IOPS of the statement across all DNs. It is counted by ones in a column-store table and by ten thousands in a row-store table.
iops_skew_percent	integer	I/O skew of the statement among DNs
warning	text	Warning. The following warnings and warnings related to **Optimizing SQL Self-Diagnosis** are displayed: • Spill file size large than 256MB • Broadcast size large than 100MB • Early spill • Spill times is greater than 3 • Spill on memory adaptive • Hash table conflict
queryid	bigint	Internal query ID used for statement execution
query	text	Statement being executed
query_plan	text	Execution plan of the statement
node_group	text	Logical cluster of the user running the statement. (The current feature is a lab feature. Contact Huawei technical support before using it.)
top_cpu_dn	text	Top N CPU usage
top_mem_dn	text	Top N memory usage

16.2.9.9 STATEMENT_RESPONSETIME_PERCENTILE

STATEMENT_RESPONSETIME_PERCENTILE obtains the response times of 80% and 95% SQL statements in the cluster.

Table 16-112 STATEMENT_RESPONSETIME_PERCENTILE columns

Name	Type	Description
p80	bigint	Response time of 80% SQL statements in the cluster (unit: μs)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
p95	bigint	Response time of 95% SQL statements in the cluster (unit: μs)

16.2.9.10 STATEMENT_COMPLEX_RUNTIME

STATEMENT_COMPLEX_RUNTIME displays load management information about jobs being executed by the current user on the current CN. (The current feature is a lab feature. Contact Huawei technical support before using it.)

Table 16-113 STATEMENT_COMPLEX_RUNTIME columns

Name	Type	Description
datid	oid	OID of the database that this backend is connected to
dbname	name	Name of the database that the backend is connected to
schemaname	text	Schema name
nodename	text	Name of the CN where the statement is executed.
username	name	Username used for connecting to the backend
application_name	text	Name of the application connected to the backend
client_addr	inet	IP address of the client connected to the backend. If this column is null, it indicates either the client is connected via a Unix socket on the server or this is an internal process, such as autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with this backend (**-1** if a Unix socket is used)
query_band	text	Job type, which is specified by the GUC parameter **query_band**. The default value is a null string.
pid	bigint	Backend thread ID

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
block_time	bigint	Block time before the statement is executed (unit: ms)
start_time	timestamp with time zone	Time when the statement starts to be executed
duration	bigint	For how long the statement has been executing (unit: ms)
estimate_total_time	bigint	Estimated execution time of the statement (unit: ms)
estimate_left_time	bigint	Estimated remaining time of statement execution (unit: ms)
enqueue	text	Resource status in workload management. (The current feature is a lab feature. Contact Huawei technical support before using it.)
resource_pool	name	Resource pool used by the user
control_group	text	Cgroup used by the statement
estimate_memory	integer	Estimated memory used by the statement (unit: MB). This parameter takes effect only when **enable_dynamic_workload** is set to **on**.
min_peak_memory	integer	Minimum peak memory of the statement across all DNs (unit: MB)
max_peak_memory	integer	Maximum peak memory of the statement across all DNs (unit: MB)
average_peak_memory	integer	Average memory usage during statement execution (unit: MB)
memory_skew_percent	integer	Memory usage skew of the statement among DNs
spill_info	text	Statement spill information on all DNs. • **None**: No data is spilled to disks. • **All**: Data is spilled to disks on all DNs. • **[*a*:*b*]**: The statement has been spilled to disks on *a* of *b* DNs.
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
spill_skew_percent	integer	DN spill skew when a spill occurs
min_dn_time	bigint	Minimum execution time of the statement across all DNs (unit: ms)
max_dn_time	bigint	Maximum execution time of the statement across all DNs (unit: ms)
average_dn_time	bigint	Average execution time of the statement across all DNs (unit: ms)
dntime_skew_percent	integer	Execution time skew of the statement among DNs
min_cpu_time	bigint	Minimum CPU time of the statement across all DNs (unit: ms)
max_cpu_time	bigint	Maximum CPU time of the statement across all DNs (unit: ms)
total_cpu_time	bigint	Total CPU time of the statement across all DNs (unit: ms)
cpu_skew_percent	integer	CPU time skew of the statement among DNs
min_peak_iops	integer	Minimum peak IOPS of the statement across all DNs. It is counted by ones in a column-store table and by ten thousands in a row-store table.
max_peak_iops	integer	Maximum peak IOPS of the statement across all DNs. It is counted by ones in a column-store table and by ten thousands in a row-store table.
average_peak_iops	integer	Average peak IOPS of the statement across all DNs. It is counted by ones in a column-store table and by ten thousands in a row-store table.
iops_skew_percent	integer	I/O skew of the statement among DNs

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
warning	text	Warning. The following warnings and warnings related to **Optimizing SQL Self-Diagnosis** are displayed: • Spill file size large than 256MB • Broadcast size large than 100MB • Early spill • Spill times is greater than 3 • Spill on memory adaptive • Hash table conflict
queryid	bigint	Internal query ID used for statement execution
query	text	Statement being executed
query_plan	text	Execution plan of the statement
node_group	text	Logical cluster of the user running the statement. (The current feature is a lab feature. Contact Huawei technical support before using it.)
top_cpu_dn	text	Top N CPU usage
top_mem_dn	text	Top N memory usage

16.2.9.11 STATEMENT_COMPLEX_HISTORY_TABLE

STATEMENT_COMPLEX_HISTORY_TABLE displays load management information about completed jobs executed on the current CN. (The current feature is a lab feature. Contact Huawei technical support before using it.) Data is dumped from the kernel to this system catalog. If **enable_resource_record** is set to **on**, the system imports records from **GS_WLM_SESSION_HISTORY** to this system catalog every 3 minutes. You are not advised to enable this function, because it occupies storage space and affects performance. Columns in this catalog are the same as those in **Table 15-190**.

16.2.9.12 STATEMENT_COMPLEX_HISTORY

STATEMENT_COMPLEX_HISTORY displays load management information about completed jobs executed on all CNs. (The current feature is a lab feature. Contact Huawei technical support before using it.) The data in this view is obtained from **GS_WLM_SESSION_QUERY_INFO_ALL**. Columns in this view are the same as those in **Table 15-190**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

16.2.9.13 STATEMENT_WLMSTAT_COMPLEX_RUNTIME

STATEMENT_WLMSTAT_COMPLEX_RUNTIME displays load management information about ongoing jobs executed by the current user. (The current feature is a lab feature. Contact Huawei technical support before using it.)

Table 16-114 STATEMENT_WLMSTAT_COMPLEX_RUNTIME columns

Name	Type	Description
datid	oid	OID of the database that this backend is connected to
datname	name	Name of the database that the backend is connected to
threadid	bigint	Backend thread ID
processid	integer	PID of the backend thread
usesysid	oid	User OID for logging in to the backend
appname	text	Name of the application connected to the backend
username	name	Name of the user logged in to the backend
priority	bigint	Priority of Cgroup where the statement is located
attribute	text	Attributes of the statement: • **Ordinary**: default attribute of a statement before it is parsed by the database • **Simple**: simple statements • **Complicated**: complicated statements • **Internal**: internal statement of the database
block_time	bigint	Pending duration of the statement by now, in seconds
elapsed_time	bigint	Actual execution duration of the statement by now, in seconds
total_cpu_time	bigint	Total CPU usage duration of the statement on the DN in the last period, in seconds
cpu_skew_percent	integer	CPU usage skew percentage of the statement on the DN in the last period
statement_mem	integer	**statement_mem** used for executing the statement (reserved column)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
active_points	integer	Number of concurrently active points occupied by the statement in the resource pool
dop_value	integer	DOP value obtained by the statement from the resource pool
control_group	text	Cgroup currently used by the statement
status	text	Status of the statement, including: • **pending**: waiting to be executed • **running**: being executed • **finished**: finished normally (If **enqueue** is set to **StoredProc** or **Transaction**, this state indicates that only a part of jobs in the statement has been executed. This state persists until the finish of this statement.) • **aborted**: terminated unexpectedly • **active**: normal status except for those above • **unknown**: unknown status
enqueue	text	Queuing status of the statement, including: • **Global**: queuing in the global queue • **Respool**: queuing in the resource pool queue • **CentralQueue**: queuing on the CCN • **Transaction**: being in a transaction block • **StoredProc**: being in a stored procedure • **None**: not in the queue • **Forced None**: being forcibly executed (transaction block statement or stored procedure statement are) because the statement waiting time exceeds the specified value
resource_pool	name	Current resource pool where the statements are located

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
query	text	Latest query at the backend. If **state** is **active**, this column shows the executing query. In all other states, it shows the last query that was executed.
is_plana	boolean	Whether a statement occupies the resources of other logical clusters in logical cluster mode. (The current feature is a lab feature. Contact Huawei technical support before using it.) The default value is **f** (does not occupy).
node_group	text	Logical cluster of the user running the statement. (The current feature is a lab feature. Contact Huawei technical support before using it.)

16.2.9.14 GS_SLOW_QUERY_INFO (Discarded)

GS_SLOW_QUERY_INFO displays the slow query information that has been dumped on the current node. Data is dumped from the kernel to this system catalog. If **enable_resource_record** is set to **on**, the system imports the query information from the kernel to **GS_WLM_SESSION_QUERY_INFO_ALL** every 3 minutes. This operation occupies storage space and affects performance. You can check **GS_SLOW_QUERY_INFO** to view the slow query information that has been dumped. This view has been discarded in this version.

Table 16-115 GS_SLOW_QUERY_INFO columns

Name	Type	Description
dbname	text	Database name
schemaname	text	Schema name
nodename	text	Node name
username	text	Username
queryid	bigint	Normalization ID
query	text	Query statement
start_time	timestamp with time zone	Execution start time
finish_time	timestamp with time zone	Execution end time
duration	bigint	Execution duration (unit: ms)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
query_plan	text	Plan inforation
n_returned_rows	bigint	Number of rows in the result set returned by the **SELECT** statement
n_tuples_fetched	bigint	Number of rows randomly scanned
n_tuples_returned	bigint	Number of rows sequentially scanned
n_tuples_inserted	bigint	Number of rows inserted
n_tuples_updated	bigint	Number of rows updated
n_tuples_deleted	bigint	Number of rows deleted
n_blocks_fetched	bigint	Number of cache loading times
n_blocks_hit	bigint	Cache hits
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: μs)
cpu_time	bigint	CPU time (unit: μs)
execution_time	bigint	Execution time in the executor (unit: μs)
parse_time	bigint	SQL parsing time (unit: μs)
plan_time	bigint	SQL plan generation time (unit: μs)
rewrite_time	bigint	SQL rewriting time (unit: μs)
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: μs)
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: μs)
net_send_time	bigint	Network time (unit: μs)
data_io_time	bigint	I/O time (unit: μs)

16.2.9.15 GS_SLOW_QUERY_HISTORY (Discarded)

GS_SLOW_QUERY_HISTORY displays the slow query information that is not dumped on the current node. For details, see **18.9.15 GS_SLOW_QUERY_INFO**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Only the **system admin** and **monitor admin** users have the permission to query this view. This view is discarded in this version.

16.2.9.16 GLOBAL_SLOW_QUERY_HISTORY (Discarded)

GS_SLOW_QUERY_HISTORY displays the slow query information that is not dumped on all nodes. This view is discarded in this version. For details, see **18.9.15 GS_SLOW_QUERY_INFO**.

16.2.9.17 GLOBAL_SLOW_QUERY_INFO (Discarded)

GS_SLOW_QUERY_HISTORY displays the slow query information that has been dumped on all nodes. This view is discarded in this version. For details, see **18.9.15 GS_SLOW_QUERY_INFO**.

16.2.9.18 STATEMENT_HISTORY

STATEMENT_HISTORY displays information about execution statements on the current node. To query a view, you must have the **sysadmin** or **monitor admin** permission. The result can be queried only in the system database but cannot be queried in the user database.

Table 16-116 STATEMENT_HISTORY columns

Name	Type	Description
dbname	name	Database name.
schemaname	name	Schema name.
origin_node	integer	Node name.
user_name	name	Username.
application_name	text	Name of the application that sends a request.
client_addr	text	IP address of the client that sends a request.
client_port	integer	Port number of the client that sends a request.
unique_query_id	bigint	ID of the normalized SQL statement.
debug_query_id	bigint	ID of the unique SQL statement.
query	text	Normalized SQL (available only on CNs).
start_time	timestamp with time zone	Time when a statement starts.
finish_time	timestamp with time zone	Time when a statement ends.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
slow_sql_threshold	bigint	Standard for slow SQL statement execution.
transaction_id	bigint	Transaction ID.
thread_id	bigint	ID of an execution thread.
session_id	bigint	Session ID of a user.
n_soft_parse	bigint	Number of soft parsing times. The value of **n_soft_parse** plus the value of **n_hard_parse** may be greater than the value of **n_calls** because the number of subqueries is not counted in the value of **n_calls**.
n_hard_parse	bigint	Number of hard parsing times. The value of **n_soft_parse** plus the value of **n_hard_parse** may be greater than the value of **n_calls** because the number of subqueries is not counted in the value of **n_calls**.
query_plan	text	Statement execution plan.
n_returned_rows	bigint	Number of rows in the result set returned by the **SELECT** statement.
n_tuples_fetched	bigint	Number of rows randomly scanned.
n_tuples_returned	bigint	Number of rows sequentially scanned.
n_tuples_inserted	bigint	Number of rows inserted.
n_tuples_updated	bigint	Number of rows updated.
n_tuples_deleted	bigint	Number of rows deleted.
n_blocks_fetched	bigint	Number of buffer block access times.
n_blocks_hit	bigint	Number of buffer block hits.
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: μs)
cpu_time	bigint	CPU time (unit: μs).
execution_time	bigint	Execution time in the executor (unit: μs).
parse_time	bigint	SQL parsing time (unit: μs)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
plan_time	bigint	SQL plan generation time (unit: μs).
rewrite_time	bigint	SQL rewriting time (unit: μs).
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: μs).
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: μs)
data_io_time	bigint	I/O time (unit: μs).
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with customer service ends, and CNs communicate with DNs through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
net_recv_info	text	Network status of messages received through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with customer service ends, and CNs communicate with DNs through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
net_stream_recv_info	text	Network status of messages received through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
lock_count	bigint	Number of locks.
lock_time	bigint	Time required for locking.
lock_wait_count	bigint	Number of lock waits.
lock_wait_time	bigint	Time required for lock waiting.
lock_max_count	bigint	Maximum number of locks.
lwlock_count	bigint	Number of lightweight locks (reserved).
lwlock_wait_count	bigint	Number of lightweight lock waits.
lwlock_time	bigint	Time required for lightweight locking (reserved).
lwlock_wait_time	bigint	Time required for lightweight lock waiting.
details	bytea	List of statement lock events, which are recorded in chronological order. The number of records is affected by the **track_stmt_details_size** parameter. This column is binary and needs to be read using the parsing function **pg_catalog.statement_detail_decode**. For details, see **Other Functions**. Events include: Start locking. Complete locking. Start lock waiting. Complete lock waiting. Start unlocking. Complete unlocking. Start lightweight lock waiting. Complete lightweight lock waiting.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
is_slow_sql	boolean	Whether the SQL statement is a slow SQL statement.
trace_id	text	Driver-specific trace ID, which is associated with an application request.
advise	text	Risks which may cause slow SQL statements. (Multiple risks may exist at the same time.) • **Cast Function Cause Index Miss.**: Index matching may fail due to implicit conversion. • **Limit too much rows.**: The SQL statement execution may slow down due to a large **limit** value. • **Proleakproof of function is false.**: The **proleakproof** of the function is set to **false**. In this case, the function does not use statistics when generating a plan due to data leakage risks. As a result, the accuracy of the generated plan is affected and the SQL statement execution may slow down.

16.2.10 Cache and I/O

16.2.10.1 STATIO_USER_TABLES

STATIO_USER_TABLES displays I/O status information about all user relationship tables in the namespace.

Table 16-117 STATIO_USER_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
idx_blks_read	bigint	Number of disk blocks read from indexes in the table
idx_blks_hit	bigint	Number of cache hits in indexes in the table
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table
tidx_blks_hit	bigint	Number of buffer hits in the TOAST table index (if any) in the table

16.2.10.2 SUMMARY_STATIO_USER_TABLES

SUMMARY_STATIO_USER_TABLES displays I/O status information about all user relationship tables in namespaces in the cluster.

Table 16-118 SUMMARY_STATIO_USER_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	numeric	Number of disk blocks read from the table
heap_blks_hit	numeric	Number of cache hits in the table
idx_blks_read	numeric	Number of disk blocks read from indexes in the table
idx_blks_hit	numeric	Number of cache hits in indexes in the table
toast_blks_read	numeric	Number of disk blocks read from TOAST tables (if any) in the table
toast_blks_hit	numeric	Number of buffer hits in TOAST tables (if any) in the table
tidx_blks_read	numeric	Number of disk blocks read from the TOAST tables index (if any) in the table
tidx_blks_hit	numeric	Number of buffer hits in the TOAST table index (if any) in the table

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

16.2.10.3 GLOBAL_STATIO_USER_TABLES

GLOBAL_STATIO_USER_TABLES displays I/O status information about all user relationship tables in namespaces on each node.

Table 16-119 GLOBAL_STATIO_USER_TABLES columns

Name	Type	Description
node_name	name	Node name
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from indexes in the table
idx_blks_hit	bigint	Number of cache hits in indexes in the table
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table
tidx_blks_hit	bigint	Number of buffer hits in the TOAST table index (if any) in the table

16.2.10.4 STATIO_USER_INDEXES

STATIO_USER_INDEXES displays I/O status information about all user relationship table indexes in namespaces on the current node.

Table 16-120 STATIO_USER_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	bigint	Number of disk blocks read from the index
idx_blks_hit	bigint	Number of cache hits in the index

16.2.10.5 SUMMARY_STATIO_USER_INDEXES

SUMMARY_STATIO_USER_INDEXES displays I/O status information about all user relationship table indexes in namespaces in the cluster.

Table 16-121 SUMMARY_STATIO_USER_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	numeric	Number of disk blocks read from the index
idx_blks_hit	numeric	Number of cache hits in the index

16.2.10.6 GLOBAL_STATIO_USER_INDEXES

GLOBAL_STATIO_USER_INDEXES displays I/O status information about all user relationship table indexes in namespaces on each node.

Table 16-122 GLOBAL_STATIO_USER_INDEXES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	numeric	Number of disk blocks read from the index
idx_blks_hit	numeric	Number of cache hits in the index

16.2.10.7 STATIO_USER_SEQUENCES

STATIO_USER_SEQUENCE displays I/O status information about all user-defined sequences in namespaces on the current node.

Table 16-123 STATIO_USER_SEQUENCE columns

Name	Type	Description
relid	oid	OID of the sequence
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Number of cache hits in the sequence

16.2.10.8 SUMMARY_STATIO_USER_SEQUENCES

SUMMARY_STATIO_USER_SEQUENCES displays I/O status information about all user-defined sequences in namespaces in the cluster.

Table 16-124 SUMMARY_STATIO_USER_SEQUENCES columns

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	numeric	Number of disk blocks read from the sequence
blks_hit	numeric	Number of cache hits in the sequence

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

16.2.10.9 GLOBAL_STATIO_USER_SEQUENCES

GLOBAL_STATIO_USER_SEQUENCES displays I/O status information about all user-defined sequences in namespaces on each node.

Table 16-125 GLOBAL_STATIO_USER_SEQUENCES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the sequence
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Number of cache hits in the sequence

16.2.10.10 STATIO_SYS_TABLES

PG_STATIO_SYS_TABLES displays I/O status information about all system catalogs in the current namespace.

Table 16-126 STATIO_SYS_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from indexes in the table
idx_blks_hit	bigint	Number of cache hits in indexes in the table
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table
tidx_blks_hit	bigint	Number of buffer hits in the TOAST table index (if any) in the table

16.2.10.11 SUMMARY_STATIO_SYS_TABLES

SUMMARY_STATIO_SYS_TABLES displays I/O status information about all system catalogs in namespaces in the cluster.

Table 16-127 SUMMARY_STATIO_SYS_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	numeric	Number of disk blocks read from the table
heap_blks_hit	numeric	Number of cache hits in the table
idx_blks_read	numeric	Number of disk blocks read from indexes in the table
idx_blks_hit	numeric	Number of cache hits in indexes in the table
toast_blks_read	numeric	Number of disk blocks read from TOAST tables (if any) in the table
toast_blks_hit	numeric	Number of buffer hits in TOAST tables (if any) in the table
tidx_blks_read	numeric	Number of disk blocks read from the TOAST tables index (if any) in the table
tidx_blks_hit	numeric	Number of buffer hits in the TOAST table index (if any) in the table

16.2.10.12 GLOBAL_STATIO_SYS_TABLES

GLOBAL_STATIO_SYS_TABLES displays I/O status information about all system catalogs in namespaces on each node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-128 GLOBAL_STATIO_SYS_TABLES columns

Name	Type	Description
node_name	name	Node name
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from indexes in the table
idx_blks_hit	bigint	Number of cache hits in indexes in the table
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table
tidx_blks_hit	bigint	Number of buffer hits in the TOAST table index (if any) in the table

16.2.10.13 STATIO_SYS_INDEXES

STATIO_SYS_INDEXES displays the I/O status information about all system catalog indexes in the current namespace.

Table 16-129 STATIO_SYS_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
idx_blks_read	bigint	Number of disk blocks read from the index
idx_blks_hit	bigint	Number of cache hits in the index

16.2.10.14 SUMMARY_STATIO_SYS_INDEXES

SUMMARY_STATIO_SYS_INDEXES displays I/O status information about all system catalog indexes in namespaces in the cluster.

Table 16-130 SUMMARY_STATIO_SYS_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	numeric	Number of disk blocks read from the index
idx_blks_hit	numeric	Number of cache hits in the index

16.2.10.15 GLOBAL_STATIO_SYS_INDEXES

GLOBAL_STATIO_SYS_INDEXES displays I/O status information about all system catalog indexes in namespaces on each node.

Table 16-131 GLOBAL_STATIO_SYS_INDEXES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	numeric	Number of disk blocks read from the index

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
idx_blks_hit	numeric	Number of cache hits in the index

16.2.10.16 STATIO_SYS_SEQUENCES

STATIO_SYS_SEQUENCES displays the I/O status information about all the system sequences in the current namespace.

Table 16-132 STATIO_SYS_SEQUENCES columns

Name	Type	Description
relid	oid	OID of the sequence
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Number of cache hits in the sequence

16.2.10.17 SUMMARY_STATIO_SYS_SEQUENCES

SUMMARY_STATIO_SYS_SEQUENCES displays I/O status information about all system sequences in namespaces in the cluster.

Table 16-133 SUMMARY_STATIO_SYS_SEQUENCES columns

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	numeric	Number of disk blocks read from the sequence
blks_hit	numeric	Number of cache hits in the sequence

16.2.10.18 GLOBAL_STATIO_SYS_SEQUENCES

GLOBAL_STATIO_SYS_SEQUENCES displays I/O status information about all system sequences in namespaces on each node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-134 GLOBAL_STATIO_SYS_SEQUENCES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the sequence
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Number of cache hits in the sequence

16.2.10.19 STATIO_ALL_TABLES

STATIO_ALL_TABLES contains I/O statistics about a row of each table (including TOAST tables) in databases.

Table 16-135 STATIO_ALL_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from indexes in the table
idx_blks_hit	bigint	Number of cache hits in indexes in the table
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table
tidx_blks_hit	bigint	Number of buffer hits in the TOAST table index (if any) in the table

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

16.2.10.20 SUMMARY_STATIO_ALL_TABLES

SUMMARY_STATIO_ALL_TABLES contains I/O statistics about each table (including TOAST tables) in databases in the cluster.

Table 16-136 SUMMARY_STATIO_ALL_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	numeric	Number of disk blocks read from the table
heap_blks_hit	numeric	Number of cache hits in the table
idx_blks_read	numeric	Number of disk blocks read from indexes in the table
idx_blks_hit	numeric	Number of cache hits in indexes in the table
toast_blks_read	numeric	Number of disk blocks read from TOAST tables (if any) in the table
toast_blks_hit	numeric	Number of buffer hits in TOAST tables (if any) in the table
tidx_blks_read	numeric	Number of disk blocks read from the TOAST tables index (if any) in the table
tidx_blks_hit	numeric	Number of buffer hits in the TOAST table index (if any) in the table

16.2.10.21 GLOBAL_STATIO_ALL_TABLES

GLOBAL_STATIO_ALL_TABLES contains I/O statistics about each table (including TOAST tables) in databases on each node.

Table 16-137 GLOBAL_STATIO_ALL_TABLES columns

Name	Type	Description
node_name	name	Node name
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from indexes in the table
idx_blks_hit	bigint	Number of cache hits in indexes in the table
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table
tidx_blks_hit	bigint	Number of buffer hits in the TOAST table index (if any) in the table

16.2.10.22 STATIO_ALL_INDEXES

STATIO_ALL_INDEXES contains one row for each index in the current database, showing I/O statistics about specific indexes.

Table 16-138 STATIO_ALL_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	bigint	Number of disk blocks read from the index
idx_blks_hit	bigint	Number of cache hits in the index

16.2.10.23 SUMMARY_STATIO_ALL_INDEXES

SUMMARY_.STATIO_ALL_INDEXES contains I/O statistics about each index row in databases in the cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-139 SUMMARY_STATIO_ALL_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	numeric	Number of disk blocks read from the index
idx_blks_hit	numeric	Number of cache hits in the index

16.2.10.24 GLOBAL_STATIO_ALL_INDEXES

GLOBAL_STATIO_ALL_INDEXES contains I/O statistics about one row of each index in databases on each node.

Table 16-140 GLOBAL_STATIO_ALL_INDEXES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	numeric	Number of disk blocks read from the index
idx_blks_hit	numeric	Number of cache hits in the index

16.2.10.25 STATIO_ALL_SEQUENCES

STATIO_ALL_SEQUENCES contains one row for each sequence in the current database, showing I/O statistics about specific sequences.

Table 16-141 STATIO_ALL_SEQUENCES columns

Name	Type	Description
relid	oid	OID of the sequence

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Number of cache hits in the sequence

16.2.10.26 SUMMARY_STATIO_ALL_SEQUENCES

SUMMARY_STATIO_ALL_SEQUENCES contains I/O statistics about one row of each sequence in databases in the cluster.

Table 16-142 SUMMARY_STATIO_ALL_SEQUENCES columns

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	numeric	Number of disk blocks read from the sequence
blks_hit	numeric	Number of cache hits in the sequence

16.2.10.27 GLOBAL_STATIO_ALL_SEQUENCES

GLOBAL_STATIO_ALL_SEQUENCES contains I/O statistics about one row of each sequence in databases on each node.

Table 16-143 GLOBAL_STATIO_ALL_SEQUENCES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the sequence
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Number of cache hits in the sequence

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

16.2.10.28 GLOBAL_STAT_DB_CU

GLOBAL_STAT_DB_CU displays CU hits on each node in each database in the cluster. You can clear it using **gs_stat_reset()**.

Table 16-144 GLOBAL_STAT_DB_CU columns

Name	Type	Description
node_name1	text	Node name
db_name	text	Database name
mem_hit	bigint	Number of memory hits
hdd_sync_read	bigint	Number of hard disk synchronous reads
hdd_asyn_read	bigint	Number of hard disk asynchronous reads

16.2.10.29 GLOBAL_STAT_SESSION_CU

GLOBAL_STAT_SESSION_CU displays CU hits of running sessions on each node in the cluster. This data about a session is cleared when you exit this session After the cluster is restarted, the statistics are also cleared.

Table 16-145 GLOBAL_STAT_SESSION_CU columns

Name	Type	Description
node_name1	text	Node name
mem_hit	integer	Number of memory hits
hdd_sync_read	integer	Number of hard disk synchronous reads
hdd_asyn_read	integer	Number of hard disk asynchronous reads

16.2.11 Communication Library

16.2.11.1 COMM_DELAY

COMM_DELAY displays the TCP proxy communications library status for a single DN.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-146 COMM_DELAY columns

Name	Type	Description
node_name	text	Node name
remote_name	text	Name of the peer node
remote_host	text	IP address of the peer node
stream_num	integer	Number of logical stream connections used by the current physical connection
min_delay	integer	Minimum delay of the current physical connection within 1 minute (unit: μs) **NOTE** A negative result is invalid. Wait until the delay status is updated and query again.
average	integer	Average delay of the current physical connection within 1 minute (unit: μs)
max_delay	integer	Maximum delay of the current physical connection within 1 minute (unit: μs)

16.2.11.2 GLOBAL_COMM_DELAY

GLOBAL_COMM_DELAY displays the TCP proxy communications library status for all the DNs.

Table 16-147 GLOBAL_COMM_DELAY columns

Name	Type	Description
node_name	text	Node name
remote_name	text	Name of the peer node
remote_host	text	IP address of the peer node
stream_num	integer	Number of logical stream connections used by the current physical connection
min_delay	integer	Minimum delay of the current physical connection within 1 minute (unit: μs) **NOTE** A negative result is invalid. Wait until the delay status is updated and query again.
average	integer	Average delay of the current physical connection within 1 minute (unit: μs)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
max_delay	integer	Maximum delay of the current physical connection within 1 minute (unit: μs)

16.2.11.3 COMM_RECV_STREAM

COMM_RECV_STREAM displays the receiving stream status of all TCP proxy communications libraries on a single DN.

Table 16-148 COMM_RECV_STREAM columns

Name	Type	Description
node_name	text	Node name
local_tid	bigint	ID of the thread using this stream
remote_name	text	Name of the peer node
remote_tid	bigint	Peer thread ID
idx	integer	Peer DN ID in the local DN
sid	integer	Stream ID in the physical connection
tcp_sock	integer	TCP socket used in the stream
state	text	Stream status
query_id	bigint	**debug_query_id** corresponding to the stream
pn_id	integer	**plan_node_id** of the query executed by the stream
send_smp	integer	**smpid** of the sender of the query executed by the stream
recv_smp	integer	**smpid** of the receiver of the query executed by the stream
recv_bytes	bigint	Total data volume received by the stream (unit: byte)
time	bigint	Current lifecycle service duration of the stream (unit: ms)
speed	bigint	Average receiving rate of the stream (unit: byte/s)
quota	bigint	Current communication quota value of the stream (unit: byte)
buff_usize	bigint	Current size of the data cache of the stream (unit: byte)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

16.2.11.4 GLOBAL_COMM_RECV_STREAM

GLOBAL_COMM_RECV_STREAM displays the receiving stream status of all TCP proxy communications libraries on all the DNs.

Table 16-149 GLOBAL_COMM_RECV_STREAM columns

Name	Type	Description
node_name	text	Node name
local_tid	bigint	ID of the thread using this stream
remote_name	text	Name of the peer node
remote_tid	bigint	Peer thread ID
idx	integer	Peer DN ID in the local DN
sid	integer	Stream ID in the physical connection
tcp_sock	integer	TCP socket used in the stream
state	text	Stream status
query_id	bigint	**debug_query_id** corresponding to the stream
pn_id	integer	**plan_node_id** of the query executed by the stream
send_smp	integer	**smpid** of the sender of the query executed by the stream
recv_smp	integer	**smpid** of the receiver of the query executed by the stream
recv_bytes	bigint	Total data volume received by the stream (unit: byte)
time	bigint	Current lifecycle service duration of the stream (unit: ms)
speed	bigint	Average receiving rate of the stream (unit: byte/s)
quota	bigint	Current communication quota value of the stream (unit: byte)
buff_usize	bigint	Current size of the data cache of the stream (unit: byte)

16.2.11.5 COMM_SEND_STREAM

COMM_SEND_STREAM displays the sending stream status of all TCP proxy communications libraries on a single DN.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-150 COMM_SEND_STREAM columns

Name	Type	Description
node_name	text	Node name
local_tid	bigint	ID of the thread using this stream
remote_name	text	Name of the peer node
remote_tid	bigint	Peer thread ID
idx	integer	Peer DN ID in the local DN
sid	integer	Stream ID in the physical connection
tcp_sock	integer	TCP socket used in the stream
state	text	Stream status
query_id	bigint	**debug_query_id** corresponding to the stream
pn_id	integer	**plan_node_id** of the query executed by the stream
send_smp	integer	**smpid** of the sender of the query executed by the stream
recv_smp	integer	**smpid** of the receiver of the query executed by the stream
send_bytes	bigint	Total data volume sent by the stream (unit: byte)
time	bigint	Current lifecycle service duration of the stream (unit: ms)
speed	bigint	Average sending rate of the stream (unit: byte/s)
quota	bigint	Current communication quota value of the stream (unit: byte)
wait_quota	bigint	Extra time generated when the stream waits for the quota value (unit: ms)

16.2.11.6 GLOBAL_COMM_SEND_STREAM

GLOBAL_COMM_SEND_STREAM displays the sending stream status of all TCP proxy communications libraries on all the DNs.

Table 16-151 GLOBAL_COMM_SEND_STREAM columns

Name	Type	Description
node_name	text	Node name
local_tid	bigint	ID of the thread using this stream

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
remote_name	text	Name of the peer node
remote_tid	bigint	Peer thread ID
idx	integer	Peer DN ID in the local DN
sid	integer	Stream ID in the physical connection
tcp_sock	integer	TCP socket used in the stream
state	text	Stream status
query_id	bigint	**debug_query_id** corresponding to the stream
pn_id	integer	**plan_node_id** of the query executed by the stream
send_smp	integer	**smpid** of the sender of the query executed by the stream
recv_smp	integer	**smpid** of the receiver of the query executed by the stream
send_bytes	bigint	Total data volume sent by the stream (unit: byte)
time	bigint	Current lifecycle service duration of the stream (unit: ms)
speed	bigint	Average sending rate of the stream (unit: byte/s)
quota	bigint	Current communication quota value of the stream (unit: byte)
wait_quota	bigint	Extra time generated when the stream waits for the quota value (unit: ms)

16.2.11.7 COMM_STATUS

COMM_STATUS displays the TCP proxy communications library status on a single DN.

Table 16-152 COMM_STATUS columns

Name	Type	Description
node_name	text	Node name
rxpck_rate	integer	Receiving rate of the communication library on the node, in byte/s
txpck_rate	integer	Sending rate of the communication library on the node, in byte/s

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
rxkbyte_rate	bigint	Receiving rate of the communication library on the node, in kbyte/s
txkbyte_rate	bigint	Sending rate of the communication library on the node, in kbyte/s
buffer	bigint	Size of the buffer of the Cmailbox
memkbyte_libcomm	bigint	Communication memory size of the **libcomm** process, in bytes
memkbyte_libpq	bigint	Communication memory size of the **libpq** process, in bytes
used_pm	integer	Real-time usage of the **postmaster** thread
used_sflow	integer	Real-time usage of the **gs_sender_flow_controller** thread
used_rflow	integer	Real-time usage of the **gs_receiver_flow_controller** thread
used_rloop	integer	Highest real-time usage among multiple **gs_receivers_loop** threads
stream	integer	Total number of used logical connections.

16.2.11.8 GLOBAL_COMM_STATUS

GLOBAL_COMM_STATUS displays the TCP proxy communications library status on all the DNs.

Table 16-153 GLOBAL_COMM_STATUS columns

Name	Type	Description
node_name	text	Node name
rxpck_rate	integer	Receiving rate of the communication library on the node, in byte/s
txpck_rate	integer	Sending rate of the communication library on the node, in byte/s
rxkbyte_rate	bigint	Receiving rate of the communication library on the node, in kbyte/s
txkbyte_rate	bigint	Sending rate of the communication library on the node, in kbyte/s
buffer	bigint	Size of the buffer of the Cmailbox

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
memkbyte_libcomm	bigint	Communication memory size of the **libcomm** process, in bytes
memkbyte_libpq	bigint	Communication memory size of the **libpq** process, in bytes
used_pm	integer	Real-time usage of the **postmaster** thread
used_sflow	integer	Real-time usage of the **gs_sender_flow_controller** thread
used_rflow	integer	Real-time usage of the **gs_receiver_flow_controller** thread
used_rloop	integer	Highest real-time usage among multiple **gs_receivers_loop** threads
stream	integer	Total number of used logical connections.

16.2.12 Utility

16.2.12.1 REPLICATION_STAT

REPLICATION_STAT describes information about log synchronization status, such as the locations where the sender sends logs and where the receiver receives logs.

Table 16-154 REPLICATION_STAT columns

Name	Type	Description
pid	bigint	Process ID of the thread
usesysid	oid	User system ID
usename	name	Username
application_name	text	Program name
client_addr	inet	Client address
client_hostname	text	Client name
client_port	integer	Port of the client
backend_start	timestamp with time zone	Start time of the program
state	text	Log replication state (catch-up or consistent streaming)
sender_sent_location	text	Location where the sender sends logs

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
receiver_write_location	text	Location where the receiver writes logs
receiver_flush_location	text	Location where the receiver flushes logs
receiver_replay_location	text	Location where the receiver replays logs
sync_priority	integer	Priority of synchronous duplication (**0** indicates asynchronization.)
sync_state	text	Synchronization status (asynchronous duplication, synchronous duplication, or potential synchronization)

16.2.12.2 GLOBAL_REPLICATION_STAT

GLOBAL_REPLICATION_STAT displays information about log synchronization status on each node, such as the locations where the sender sends logs and where the receiver receives logs.

Table 16-155 GLOBAL_REPLICATION_STAT columns

Name	Type	Description
node_name	name	Node name
pid	bigint	Process ID of the thread
usesysid	oid	User system ID
usename	name	Username
application_name	text	Program name
client_addr	inet	Client address
client_hostname	text	Client name
client_port	integer	Port of the client
backend_start	timestamp with time zone	Start time of the program
state	text	Log replication state (catch-up or consistent streaming)
sender_sent_location	text	Location where the sender sends logs
receiver_write_location	text	Location where the receiver writes logs

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
receiver_flush_location	text	Location where the receiver flushes logs
receiver_replay_location	text	Location where the receiver replays logs
sync_priority	integer	Priority of synchronous duplication (**0** indicates asynchronization.)
sync_state	text	Synchronization state: • Asynchronous replication • Synchronous replication • Potential synchronization

16.2.12.3 REPLICATION_SLOTS

REPLICATION_SLOTS displays replication slot information.

Table 16-156 REPLICATION_SLOTS columns

Name	Type	Description
slot_name	text	Replication slot name.
plugin	text	Name of the output plug-in corresponding to the logical replication slot.
slot_type	text	Replication slot type. • **physical**: physical replication slot. • **logical**: logical replication slot.
datoid	oid	OID of the database where the replication slot resides.
database	name	Name of the database where the replication slot resides.
active	boolean	Determines whether the replication slot is activated. • **t** (true): yes • **f** (false): no
xmin	xid	XID of the earliest transaction that the database must reserve for the replication slot.
catalog_xmin	xid	XID of the earliest system catalog-involved transaction that the database must reserve for the logical replication slot.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
restart_lsn	text	Physical location of the earliest Xlog required by the replication slot.
dummy_standby	boolean	Determines whether the peer end connected to the replication slot is a secondary node. • **t** (true): yes • **f** (false): no

16.2.12.4 GLOBAL_REPLICATION_SLOTS

GLOBAL_REPLICATION_SLOTS displays information about replicated slots on each node in the cluster.

Table 16-157 GLOBAL_REPLICATION_SLOTS columns

Name	Type	Description
node_name	name	Node name
slot_name	text	Replication slot name.
plugin	text	Name of the output plug-in corresponding to the logical replication slot.
slot_type	text	Replication slot type. • **physical**: physical replication slot. • **logical**: logical replication slot.
datoid	oid	OID of the database where the replication slot resides.
database	name	Name of the database where the replication slot resides.
active	boolean	Determines whether the replication slot is activated. • **t** (true): yes • **f** (false): no
x_min	xid	XID of the earliest transaction that the database must reserve for the replication slot.
catalog_xmin	xid	XID of the earliest system catalog-involved transaction that the database must reserve for the logical replication slot.
restart_lsn	text	Physical location of the earliest Xlog required by the replication slot.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
dummy_standby	boolean	Determines whether the peer end connected to the replication slot is a secondary node. • **t** (true): yes • **f** (false): no

16.2.12.5 BGWRITER_STAT

BGWRITER_STAT displays statistics about the background writer process's activities.

Table 16-158 BGWRITER_STAT columns

Name	Type	Description
checkpoints_timed	bigint	Number of scheduled checkpoints that have been performed
checkpoints_req	bigint	Number of requested checkpoints that have been performed
checkpoint_write_time	double precision	Total time that has been spent in the portion of checkpoint processing where files are written to disk (unit: ms)
checkpoint_sync_time	double precision	Total time that has been spent in the portion of checkpoint processing where files are synchronized to disk (unit: ms)
buffers_checkpoint	bigint	Number of buffers written during checkpoints
buffers_clean	bigint	Number of buffers written by the background writer
maxwritten_clean	bigint	Number of times the background writer stopped a cleaning scan because it had written too many buffers
buffers_backend	bigint	Number of buffers written directly by the backend
buffers_backend_fsync	bigint	Number of times the backend had to execute its own fsync call (normally the background writer handles those even when the backend does its own write)
buffers_alloc	bigint	Number of buffers allocated
stats_reset	timestamp with time zone	Time at which these statistics were last reset

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

16.2.12.6 GLOBAL_BGWRITER_STAT

GLOBAL_BGWRITER_STAT displays statistics about the background writer process's activities on each node.

Table 16-159 GLOBAL_BGWRITER_STAT columns

Name	Type	Description
node_name	name	Node name
checkpoints_timed	bigint	Number of scheduled checkpoints that have been performed
checkpoints_req	bigint	Number of requested checkpoints that have been performed
checkpoint_write_time	double precision	Total time that has been spent in the portion of checkpoint processing where files are written to disk (unit: ms)
checkpoint_sync_time	double precision	Total time that has been spent in the portion of checkpoint processing where files are synchronized to disk (unit: ms)
buffers_checkpoint	bigint	Number of buffers written during checkpoints
buffers_clean	bigint	Number of buffers written by the background writer
maxwritten_clean	bigint	Number of times the background writer stopped a cleaning scan because it had written too many buffers
buffers_backend	bigint	Number of buffers written directly by a backend
buffers_backend_fsync	bigint	Number of times the backend had to execute its own fsync call (normally the background writer handles those even when the backend does its own write)
buffers_alloc	bigint	Number of buffers allocated
stats_reset	timestamp with time zone	Time at which these statistics were last reset

16.2.12.7 POOLER_STATUS

POOLER_STATUS is used to query the cache connection status of the pooler module on the local CN.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-160 POOLER_STATUS columns

Name	Type	Description
database	text	Database name
user_name	text	Username
tid	bigint	In non-thread pool logic, this parameter indicates the ID of the thread connected to the CN. In thread pool logic, this parameter indicates the ID of the session connected to the CN.
node_oid	bigint	OID of the node connected
node_name	name	Name of the node connected
in_use	boolean	Whether the connection is currently used. • **t** (true): The connection is in use. • **f** (false): The connection is not in use.
node_port	integer	Port number of the node connected
fdsock	bigint	Port file descriptor
remote_pid	bigint	Thread ID of the remote node connected
session_params	text	Session parameter
used_count	bigint	Number of reuse times of a connection
idx	bigint	Logical connection ID of the connected instance node
streamid	bigint	Stream ID corresponding to each logical connection

16.2.12.8 GLOBAL_COMM_CHECK_CONNECTION_STATUS

GLOBAL_COMM_CHECK_CONNECTION_STATUS displays the connection status of all CNs and all active nodes (CNs and primary DNs). The permission control is inherited from the **DBE_PERF** schema.

Table 16-161 GLOBAL_COMM_CHECK_CONNECTION_STATUS columns

Name	Type	Description
node_name	text	Instance name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
remote_name	text	Name of the peer instance
remote_host	text	IP address of the peer instance
remote_port	integer	Port number of the peer instance
is_connected	boolean	Detection result of the connection between the current instance and the peer instance • **t** (true) indicates that the connection is normal. • **f** (false) indicates that the connection is abnormal.
no_error_occur	boolean	Pooler connection result between the current instance and the peer instance • **t** (true) indicates that the pooler connection is normal. • **f** (false) indicates that the pooler connection is abnormal.

16.2.12.9 GLOBAL_CKPT_STATUS

GLOBAL_CKPT_STATUS displays the information about checkpoints and flushing pages of all instances in the cluster.

Table 16-162 GLOBAL_CKPT_STATUS columns

Name	Type	Description
node_name	text	Instance name
ckpt_redo_point	test	Checkpoint of the current instance
ckpt_clog_flush_num	bigint	Number of Clog flushing pages from the startup time to the current time
ckpt_csnlog_flush_num	bigint	Number of CSN log flushing pages from the startup time to the current time
ckpt_multixact_flush_num	bigint	Number of MultiXact flushing pages from the startup time to the current time
ckpt_predicate_flush_num	bigint	Number of predicate flushing pages from the startup time to the current time

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
ckpt_twophase_flush_num	bigint	Number of two-phase flushing pages from the startup time to the current time

16.2.12.10 GLOBAL_DOUBLE_WRITE_STATUS

GLOBAL_DOUBLE_WRITE_STATUS displays the information about doublewrite files of all instances in the entire cluster.

Table 16-163 GLOBAL_DOUBLE_WRITE_STATUS columns

Name	Type	Description
node_name	text	Instance name
curr_dwn	bigint	Sequence number of the doublewrite file
curr_start_page	bigint	Start page for restoring the doublewrite file
file_trunc_num	bigint	Number of times that the doublewrite file is reused
file_reset_num	bigint	Number of reset times after the doublewrite file is full
total_writes	bigint	Total number of I/Os of the doublewrite file
low_threshold_writes	bigint	Number of I/Os for writing the doublewrite files with low efficiency (the number of I/O flushing pages at a time is less than 16.)
high_threshold_writes	bigint	Number of I/Os for writing the doublewrite files with high efficiency (the number of I/O flushing pages at a time is more than 421.)
total_pages	bigint	Total number of pages that are flushed to the doublewrite file area
low_threshold_pages	bigint	Number of pages that are flushed with low efficiency
high_threshold_pages	bigint	Number of pages that are flushed with high efficiency
file_id	bigint	ID of the current doublewrite file

16.2.12.11 GLOBAL_PAGEWRITER_STATUS

GLOBAL_PAGEWRITER_STATUS displays the information about checkpoints and flushing pages of all instances in the cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-164 GLOBAL_PAGEWRITER_STATUS columns

Name	Type	Description
node_name	text	Instance name
pgwr_actual_flush_total_num	bigint	Total number of dirty pages flushed from the startup time to the current time
pgwr_last_flush_num	integer	Number of dirty pages flushed in the previous batch
remain_dirty_page_num	bigint	Estimated number of dirty pages that are not flushed
queue_head_page_rec_lsn	text	**recovery_lsn** of the first dirty page in the dirty page queue of the current instance
queue_rec_lsn	text	**recovery_lsn** of the dirty page queue of the current instance
current_xlog_insert_lsn	text	Write position of Xlogs in the current instance
ckpt_redo_point	text	Checkpoint of the current instance

16.2.12.12 GLOBAL_POOLER_STATUS

GLOBAL_POOLER_STATUS is used to query the cache connection status of the pooler modules on all CNs.

Table 16-165 GLOBAL_POOLER_STATUS columns

Name	Type	Description
source_node_name	name	Source node name
database	text	Database name
user_name	text	Username
tid	bigint	In non-thread pool logic, this parameter indicates the ID of the thread connected to the CN. In thread pool logic, this parameter indicates the ID of the session connected to the CN.
node_oid	bigint	OID of the node connected
node_name	name	Name of the node connected
in_use	boolean	Whether the connection is currently used. • **t** (true): The connection is in use. • **f** (false): The connection is not in use.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
fdsock	bigint	Port file descriptor
remote_pid	bigint	Thread ID of the remote node connected
session_params	text	Session parameter

16.2.12.13 GLOBAL_RECORD_RESET_TIME

GLOBAL_RECORD_RESET_TIME is used to reset the time of restarts, switchovers, and database deletions.

Table 16-166 GLOBAL_RECORD_RESET_TIME columns

Name	Type	Description
node_name	text	Node name
reset_time	timestamp with time zone	Time to be reset

16.2.12.14 GLOBAL_REDO_STATUS

GLOBAL_REDO_STATUS displays the replaying of logs about instances in the cluster.

Table 16-167 GLOBAL_REDO_STATUS columns

Name	Type	Description
node_name	text	Instance name
redo_start_ptr	bigint	Start point for replaying the instance logs
redo_start_time	bigint	Start time (UTC) when the instance logs are replayed
redo_done_time	bigint	End time (UTC) when the instance logs are replayed
curr_time	bigint	Current time (UTC) of the instance
min_recovery_point	bigint	Position of the minimum consistency point for the instance logs
read_ptr	bigint	Position for reading the instance logs
last_replayed_read_ptr	bigint	Position for replaying the instance logs

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
recovery_done_ptr	bigint	Replay position after the instance is started
read_xlog_io_counter	bigint	Number of I/Os when the instance reads and replays logs
read_xlog_io_total_dur	bigint	Total I/O latency when the instance reads and replays logs
read_data_io_counter	bigint	Number of data page I/O reads during replay in the instance
read_data_io_total_dur	bigint	Total I/O latency of data page reads during replay in the instance
write_data_io_counter	bigint	Number of data page I/O writes during replay in the instance
write_data_io_total_dur	bigint	Total I/O latency of data page writes during replay in the instance
process_pending_counter	bigint	Number of synchronization times of log distribution threads during replay in the instance
process_pending_total_dur	bigint	Total synchronization latency of log distribution threads during replay in the instance
apply_counter	bigint	Number of synchronization times of replay threads during replay in the instance
apply_total_dur	bigint	Total synchronization latency of replay threads during replay in the instance
speed	bigint	Log replay rate of the current instance. The value is updated every time when a 256 MB log is replayed. The unit is byte/s. In a cluster environment, you are advised to run the **cm_ctl query -rv** command to obtain a more accurate replay speed of the standby node. For details about the **cm_ctl** command, see "Tools Used in the System > cm_ctl" in the *Tool Reference*.
local_max_ptr	bigint	Maximum number of replay logs received by the local host after the instance is started
primary_flush_ptr	bigint	Log point where the host flushes logs to a disk
worker_info	text	Replay thread information of the instance. If concurrent replay is not enabled, the value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

16.2.12.15 GLOBAL_RECOVERY_STATUS

GLOBAL_RECOVERY_STATUS displays log flow control information about the primary and standby nodes.

Table 16-168 GLOBAL_RECOVERY_STATUS columns

Name	Type	Description
node_name	text	Node name (including the primary and standby nodes)
standby_node_name	text	Name of the standby node
source_ip	text	IP address of the primary node
source_port	integer	Port number of the primary node
dest_ip	text	IP address of the standby node
dest_port	integer	Port number of the standby node
current_rto	bigint	Current log flow control time of the standby node (unit: s)
target_rto	bigint	Expected flow control time of the standby node specified by the corresponding GUC parameter (unit: s)
current_sleep_time	bigint	Sleep time required to achieve the expected flow control time (unit: μs)

16.2.12.16 CLASS_VITAL_INFO

CLASS_VITAL_INFO is used to check whether the OIDs of the same table or index are consistent for WDR snapshots.

Table 16-169 CLASS_VITAL_INFO columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Schema name
relname	name	Table name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relkind	"char"	Object type. Its value can be: • **r**: ordinary table • **t**: TOAST table • **i**: index

16.2.12.17 USER_LOGIN

USER_LOGIN records the number of user logins and logouts.

Table 16-170 USER_LOGIN columns

Name	Type	Description
node_name	text	Node name
user_name	text	Username
user_id	integer	User OID (Its value is the same as that of **oid** in **pg_authid**.)
login_counter	bigint	Number of logins
logout_counter	bigint	Number of logouts

16.2.12.18 SUMMARY_USER_LOGIN

SUMMARY_USER_LOGIN records information about user logins and logouts on all CNs.

Table 16-171 SUMMARY_USER_LOGIN columns

Name	Type	Description
node_name	text	Node name
user_name	text	Username
user_id	integer	User OID (Its value is the same as that of **oid** in **pg_authid**.)
login_counter	bigint	Number of logins
logout_counter	bigint	Number of logouts

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

16.2.12.19 GLOBAL_GET_BGWRITER_STATUS

GLOBAL_GET_BGWRITER_STATUS displays the information about pages flushed by the bgwriter threads of all instances in the entire cluster, number of pages in the candidate buffer chain, and buffer eviction information.

Table 16-172 GLOBAL_GET_BGWRITER_STATUS columns

Name	Type	Description
node_name	text	Instance name
bgwr_actual_flush_total_num	bigint	Total number of dirty pages flushed by the bgwriter thread from the startup time to the current time
bgwr_last_flush_num	integer	Number of dirty pages flushed by the bgwriter thread in the previous batch
candidate_slots	integer	Number of pages in the current candidate buffer chain.
get_buffer_from_list	bigint	Number of times that pages are obtained from the candidate buffer chain during buffer eviction.
get_buffer_clock_sweep	bigint	Number of times that pages are obtained from the original eviction solution during buffer eviction.

16.2.12.20 GLOBAL_SINGLE_FLUSH_DW_STATUS

The GLOBAL_SINGLE_FLUSH_DW_STATUS view displays the information about the eliminated dual-write file on a single page of all instances in the entire cluster. The information before the slash (/) is the page refresh information of the first version of the dual-write file, and that after the slash (/) is the page refresh information of the second version of the dual-write file.

Table 16-173 GLOBAL_SINGLE_FLUSH_DW_STATUS columns

Name	Type	Description
node_name	text	Instance name.
curr_dwn	text	Sequence number of the doublewrite file.
curr_start_page	text	Start position of the current doublewrite file.
total_writes	text	Total number of data write pages in the current doublewrite file.
file_trunc_num	text	Number of times that the doublewrite file is reused.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
file_reset_num	text	Number of reset times after the doublewrite file is full.

16.2.12.21 GLOBAL_CANDIDATE_STATUS

GLOBAL_CANDIDATE_STATUS displays the number of candidate buffers and buffer eviction information of all instances in the database.

Table 16-174 GLOBAL_GET_BGWRITER_STATUS columns

Name	Type	Description
node_name	text	Node name
candidate_slots	integer	Number of pages in the candidate buffer chain of the current normal buffer pool
get_buf_from_list	bigint	Number of times that pages are obtained from the candidate buffer chain during buffer eviction in the current normal buffer pool
get_buf_clock_sweep	bigint	Number of times that pages are obtained from the original eviction solution during buffer eviction in the current normal buffer pool
seg_candidate_slots	integer	Number of pages in the candidate buffer chain of the current segment buffer pool
seg_get_buf_from_list	bigint	Number of times that pages are obtained from the candidate buffer chain during buffer eviction in the current segment buffer pool
seg_get_buf_clock_sweep	bigint	Number of times that pages are obtained from the original eviction solution during buffer eviction in the current segment buffer pool

16.2.13 Lock

16.2.13.1 LOCKS

LOCKS displays information about locks held by each open transaction.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-175 LOCKS columns

Name	Type	Description
locktype	text	Type of the locked object: **relation**, **extend**, **page**, **tuple**, **transactionid**, **virtualxid**, **object**, **userlock**, or **advisory**
database	oid	OID of the database in which the locked object exists. • The OID is **0** if the object is a shared object. • The OID is **NULL** if the object is a transaction ID.
relation	oid	OID of the relationship targeted by the lock. The value is **NULL** if the object is not a relationship or part of a relationship.
page	integer	Page number targeted by the lock within the relationship. The value is **NULL** if the object is not a relationship page or row page.
tuple	smallint	Row number targeted by the lock within the page. The value is **NULL** if the object is not a row.
bucket	integer	Hash bucket number
virtualxid	text	Virtual ID of the transaction targeted by the lock. The value is **NULL** if the object is not a virtual transaction ID.
transactionid	xid	ID of the transaction targeted by the lock. The value is **NULL** if the object is not a transaction ID.
classid	oid	OID of the system catalog that contains the object. The value is **NULL** if the object is not a general database object.
objid	oid	OID of the locked object within its system catalog. The value is **NULL** if the object is not a general database object.
objsubid	smallint	Column number for a column in the table. The value is **0** if the object is some other object type. The value is **NULL** if the object is not a general database object.
virtualtransaction	text	Virtual ID of the transaction holding or awaiting this lock
pid	bigint	Logical ID of the server thread holding or awaiting this lock. The value is **NULL** if the lock is held by a prepared transaction.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sessionid	bigint	ID of the session holding or awaiting this lock The value is **NULL** if the lock is held by a prepared transaction.
mode	text	Lock mode held or desired by this thread
granted	boolean	• The value is **TRUE** if the lock is a held lock. • The value is **FALSE** if the lock is an awaited lock.
fastpath	boolean	The value is **TRUE** if the lock is obtained through **fast-path**, and is **FALSE** if the lock is obtained through the main lock table.
locktag	text	Information about the lock that the session waits for. It can be parsed using the **locktag_decode()** function.
global_sessionid	text	Global session ID

16.2.13.2 GLOBAL_LOCKS

GLOBAL_LOCKS displays information about locks held by open transactions on each node.

Table 16-176 GLOBAL_LOCKS columns

Name	Type	Description
node_name	name	Node name
locktype	text	Type of the locked object: **relation**, **extend**, **page**, **tuple**, **transactionid**, **virtualxid**, **object**, **userlock**, or **advisory**
database	oid	OID of the database in which the locked object exists. • The OID is **0** if the object is a shared object. • The OID is **NULL** if the object is a transaction ID.
relation	oid	OID of the relationship targeted by the lock. The value is **NULL** if the object is not a relationship or part of a relationship.
page	integer	Page number targeted by the lock within the relationship. The value is **NULL** if the object is not a relationship page or row page.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tuple	smallint	Row number targeted by the lock within the page. The value is **NULL** if the object is not a row.
bucket	integer	Hash bucket ID
virtualxid	text	Virtual ID of the transaction targeted by the lock. The value is **NULL** if the object is not a virtual transaction ID.
transactionid	xid	ID of the transaction targeted by the lock. The value is **NULL** if the object is not a transaction ID.
classid	oid	OID of the system catalog that contains the object. The value is **NULL** if the object is not a general database object.
objid	oid	OID of the locked object within its system catalog. The value is **NULL** if the object is not a general database object.
objsubid	smallint	Column number for a column in the table. The value is **0** if the object is some other object type. The value is **NULL** if the object is not a general database object.
virtualtransaction	text	Virtual ID of the transaction holding or awaiting this lock
pid	bigint	Logical ID of the server thread holding or awaiting this lock. The value is **NULL** if the lock is held by a prepared transaction.
sessionid	bigint	ID of the session holding or awaiting this lock The value is **NULL** if the lock is held by a prepared transaction.
global_sessionid	text	Global session ID
mode	text	Lock mode held or desired by this thread
granted	boolean	• The value is **TRUE** if the lock is a held lock. • The value is **FALSE** if the lock is an awaited lock.
fastpath	boolean	The value is **TRUE** if the lock is obtained through **fast-path**, and is **FALSE** if the lock is obtained through the main lock table.
locktag	text	Information about the lock that the session waits for. It can be parsed using the **locktag_decode()** function.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

16.2.14 Wait Event

16.2.14.1 WAIT_EVENTS

WAIT_EVENTS displays statistics about wait events on the current node. For key events in the kernel, see **Table 16-180**. Alternatively, view the list of all events in the system in the **wait_event_info** view. For details about the impact of each transaction lock on services, see **LOCK**.

Table 16-177 WAIT_EVENTS columns

Name	Type	Description
nodename	text	Node name
type	text	Event type
event	text	Event name
wait	bigint	Number of waiting times
failed_wait	bigint	Number of waiting failures
total_wait_time	bigint	Total waiting time (unit: μs)
avg_wait_time	bigint	Average waiting time (unit: μs)
max_wait_time	bigint	Maximum waiting time (unit: μs)
min_wait_time	bigint	Minimum waiting time (unit: μs)
last_updated	timestamp with time zone	Last time when the event was updated

16.2.14.2 GLOBAL_WAIT_EVENTS

GLOBAL_WAIT_EVENTS displays statistics about wait events on each node. To query a view, you must have the **sysadmin** or **monitor admin** permission.

Table 16-178 GLOBAL_WAIT_EVENTS columns

Name	Type	Description
nodename	text	Node name
type	text	Event type
event	text	Event name
wait	bigint	Number of waiting times
failed_wait	bigint	Number of waiting failures

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
total_wait_time	bigint	Total waiting time (unit: μs)
avg_wait_time	bigint	Average waiting time (unit: μs)
max_wait_time	bigint	Maximum waiting time (unit: μs)
min_wait_time	bigint	Minimum waiting time (unit: μs)
last_updated	timestamp with time zone	Last time when the event was updated

16.2.14.3 WAIT_EVENT_INFO

WAIT_EVENT_INFO displays the details about wait events.

Table 16-179 WAIT_EVENT_INFO columns

Name	Type	Description
module	text	Name of the module an event belongs to
type	text	Event type
event	text	Event name

Table 16-180 Wait event information list

Module Category	Event Category	Event	Description
Lock	Wait event	acquire lock	Waits for locking until the locking succeeds or times out.
SharedMemory	LWLock event	ShmemIndexLock	Used to protect the primary index table, a hash table, in shared memory.
Shared buffer	LWLock event	BufMappingLock	Used to protect operations on a shared-buffer mapping table.
Lmgr	LWLock event	LockMgrLock	Used to protect the information about a common lock structure.
LWLock	Wait event	acquire lwlock	Waits for a lightweight lock.
I/O	Wait event	wait io	Waits for I/O completion.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
COMM	Wait event	wait cmd	Waits for finishing reading network communication packets.
COMM	Wait event	wait pooler get conn	Waits for pooler to obtain connections.
COMM	Wait event	wait pooler abort conn	Waits for pooler to terminate connections.
COMM	Wait event	wait pooler clean conn	Waits for pooler to clear connections.
COMM	Wait event	get conn	Obtains connections to other nodes.
COMM	Wait event	set cmd	Waits for running the **SET**, **RESET**, or **TRANSACTION BLOCK LEVEL** statement on the connection.
COMM	Wait event	cancel query	Cancels the SQL statement that is being executed through a connection.
COMM	Wait event	stop query	Stops the query that is being executed through a connection.
COMM	Wait event	wait node	Waits for receiving data through the connection to a node.
COMM	Wait event	flush data	Waits for sending data to other nodes in the network.
COMM	Wait event	stream get conn	Waits for establishing connections to consumer nodes when the stream flow is initialized.
COMM	Wait event	wait producer ready	Waits for every producer to get ready when the stream flow is initialized.
Stream	Wait event	synchronize quit	Waiting for the threads in the stream thread group to quit when the stream plan ends
Stream	Wait event	wait stream group destroy	Waiting for destroying the stream node group when the stream plan ends
Transaction	Wait event	wait transaction sync	Waits for transaction synchronization.
Transaction	Wait event	wait data sync	Waits for the completion of data page synchronization to the standby node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Transaction	Wait event	wait data sync queue	Waits for putting the data pages that are in the row storage or the CU in the column storage into the synchronization queue.
Transaction	LWLock event	OidGenLock	Used to prevent different threads from generating the same OID.
Transaction	LWLock event	XidGenLock	Used to prevent two transactions from obtaining the same transaction ID.
Transaction	LWLock event	ProcArrayLock	Used to prevent concurrent access to or concurrent modification on ProcArray shared arrays.
Transaction	LWLock event	SubtransControlLock	Used to prevent concurrent access to or concurrent modification on the sub-transaction control data structure.
Transaction	LWLock event	MultiXactGenLock	Used to allocate a unique MultiXact ID in serial mode.
Transaction	LWLock event	TwoPhaseStateLock	Used to prevent concurrent access to or concurrent modification on two-phase information sharing arrays.
Transaction	LWLock event	SerializableXactHashLock	Used to prevent concurrent read/write or concurrent write/write on a sharing structure for serializable transactions.
Transaction	LWLock event	SerializableFinishedListLock	Used to prevent concurrent read/write or concurrent write/write on a shared linked list for completed serial transactions.
Transaction	LWLock event	SerializablePredicateLockListLock	Used to protect a linked list of serializable transactions that have locks.
Transaction	LWLock event	PredicateLockMgrLock	Used to protect the information about a lock structure that has serializable transactions.
Transaction	LWLock event	OldSerXid SLRU lwlock	Used to protect SLRU buffers of old transaction IDs.
Transaction	LWLock event	OldSerXidLock	Used to protect a structure that records serializable transactions that have conflicts.
Transaction	Lock event	transactionid	Adds a lock to a transaction ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Transaction	Lock event	virtualxid	Adds a lock to a virtual transaction ID.
Checkpoint	LWLock event	CheckpointLock	Used to prevent multi-checkpoint concurrent execution.
Checkpoint	LWLock event	CheckpointerCommLock	Used to send file flush requests to a checkpointer. The request structure needs to be inserted to a request queue in serial mode.
Analyze	LWLock event	AutoanalyzeLock	Used to obtain and release resources related to a task that allows for autoanalyze execution.
Vacuum	LWLock event	BtreeVacuumLock	Used to prevent **VACUUM** from clearing pages that are being used by B-tree indexes.
Vacuum	LWLock event	AutovacuumLock	Used to access the autovacuum worker array in serial mode.
Vacuum	LWLock event	AutovacuumScheduleLock	Used to distribute tables requiring **VACUUM** in serial mode.
Auto vacuum	LWLock event	AutovacuumLock	Used to protect the autovacuum shared memory structure.
Auto vacuum	LWLock event	AutovacuumScheduleLock	Used to protect the information about autovacuum workers.
Auto analyze	LWLock event	AutoanalyzeLock	Used to protect the *autoAnalyzeFreeProcess* variable and ensure that no more than 10 autoanalyze threads are running at the same time.
WAL	Wait event	wait wal sync	Waits for the completion of WAL synchronization from the specified LSN to the standby node.
WAL	I/O event	WALBootstrapSync	Flushes an initialized WAL file to a disk during database initialization.
WAL	I/O event	WALBootstrapWrite	Writes an initialized WAL file during database initialization.
WAL	I/O event	WALCopyRead	Read operation generated when an existing WAL file is read for replication after archiving and restoration.
WAL	I/O event	WALCopySync	Flushes a replicated WAL file to a disk after archiving and restoration.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
WAL	I/O event	WALCopyWrite	Write operation generated when an existing WAL file is read for replication after archiving and restoration.
WAL	I/O event	WALInitSync	Flushes a newly initialized WAL file to a disk during log reclaiming or writing.
WAL	I/O event	WALInitWrite	Initializes a newly created WAL file to **0** during log reclaiming or writing.
WAL	I/O event	WALRead	Reads data from Xlogs during redo operations on two-phase files.
WAL	I/O event	WALSyncMethodAssign	Flushes all open WAL files to a disk.
WAL	I/O event	WALWrite	Writes a WAL file.
WAL	I/O event	LOGCTRL_SLEEP	Collects statistics on the number of stream control times and the sleep time of log stream control.
WAL	LWLock event	RcvWriteLock	Used to prevent concurrent call of **WalDataRcvWrite**.
WAL	LWLock event	WALBufMappingLock	An exclusive (X) lock needs to be added when the next page of an Xlog buffer is initialized.
WAL	LWLock event	WALInsertLock	Used to prevent multiple programs from writing data to the same Xlog buffer at the same time.
WAL	LWLock event	WALWriteLock	Used to prevent concurrent WAL write.
Relation	LWLock event	SInvalReadLock	Used to prevent concurrent execution with invalid message deletion.
Relation	LWLock event	SinvalWriteLock	Used to prevent concurrent execution with invalid message write and deletion.
Relation	LWLock event	RelCacheInitLock	Used to add a lock before any operations are performed on the **init** file when messages are invalid.
Relation	LWLock event	TablespaceCreateLock	Used to check whether a tablespace already exists.
Relation	LWLock event	RelfilenodeReuseLock	Used to prevent the link to a reused column attribute file from being canceled by mistake.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Relation	Lock event	relation	Adds a lock to a table.
Relation	Lock event	extend	Adds a lock to a table being scaled out.
Relation	Lock event	partition	Adds a lock to a partitioned table.
Relation	Lock event	partition_seq	Adds a lock to a partition of a partitioned table.
WLM	Wait event	wait active statement	Waits for active statements.
WLM	Wait event	wait memory	Waits for free memory.
DDL/DCL	Wait event	create index	Waits for the completion of index creation.
DDL/DCL	Wait event	analyze	Waits for analysis completion.
DDL/DCL	Wait event	vacuum	Waits for the completion of the **VACUUM** operation.
DDL/DCL	LWLock event	DelayDDLLock	Used to prevent concurrent DDL operations.
DDL/DCL	Wait event	vacuum full	Waits for the completion of the **VACUUM FULL** operation.
Executor	Wait event	Sort	Waits for the completion of tuple sorting.
Executor	Wait event	Sort - write file	Writes sorted data to a file temporarily since the memory is limited during merge sort.
Executor	Wait event	Material	Waits for tuple materialization.
Executor	Wait event	Material - write file	Waits for writing a materialized tuple to a file.
Executor	Wait event	HashJoin - build hash	Waits until a hash table is created when a hash join is executed.
Executor	Wait event	HashJoin - write file	Waits for writing the hash result of a tuple to a disk when a hash join is executed.
Executor	Wait event	HashAgg - build hash	Waits until a hash table is created when a hash aggregate is executed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Executor	Wait event	HashAgg - write file	Waits for writing the hash result of a tuple to a disk when a hash aggregate is executed.
Executor	Wait event	HashSetop - build hash	Waits until a hash table is created when an OP operation is performed using the hash algorithm.
Executor	Wait event	HashSetop - write file	Waits for writing the hash result of a tuple to a disk when an OP operation is performed using the hash algorithm.
Executor	Wait event	wait sync consumer next step	Waits for the stream consumer to perform the next step.
Executor	Wait event	wait sync producer next step	Waits for the stream producer to perform the next step.
GTM	Wait event	gtm connect	Waits for connecting to GTM.
GTM	Wait event	gtm reset xmin	Waits for GTM to reset the minimum transaction ID.
GTM	Wait event	gtm get xmin	Waits for obtaining the minimum transaction ID from GTM.
GTM	Wait event	gtm get gxid	Waits for obtaining the global transaction ID from GTM during transaction startup.
GTM	Wait event	gtm get csn	Waits for obtaining the CSN from GTM during transaction startup.
GTM	Wait event	gtm get snapshot	Waits for obtaining snapshots from GTM during transaction startup.
GTM	Wait event	gtm begin trans	Waits for GTM to start a transaction.
GTM	Wait event	gtm commit trans	Waits for GTM to commit a transaction.
GTM	Wait event	gtm rollback trans	Waits for GTM to roll back transactions.
GTM	Wait event	gtm start preprare trans	Waits for GTM to complete the first phase during two-phase commit.
GTM	Wait event	gtm prepare trans	Waits for GTM to complete the second phase during two-phase commit.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
GTM	Wait event	gtm open sequence	Waits for GTM to create a sequence.
GTM	Wait event	gtm close sequence	Waits for GTM to complete the **ALTER SEQUENCE** operation.
GTM	Wait event	gtm set sequence val	Waits for GTM to set a sequence value.
GTM	Wait event	gtm drop sequence	Waits for GTM to delete a sequence.
GTM	Wait event	gtm rename sequence	Waits for GTM to rename a sequence.
GTM	LWLock event	GTMHostInfoLock	Used to protect GTM information.
Temp File	I/O event	BufFileRead	Reads data from a temporary file to a specified buffer.
Temp File	I/O event	BufFileWrite	Writes the content of a specified buffer to a temporary file.
Pg_control	I/O event	ControlFileRead	Reads the **pg_control** file, mainly during database startup, checkpoint execution, and primary/standby verification.
Pg_control	I/O event	ControlFileSync	Flushes the **pg_control** file to a disk, mainly during database initialization.
Pg_control	I/O event	ControlFileSyncUpdate	Flushes the **pg_control** file to a disk, mainly during database startup, checkpoint execution, and primary/standby verification.
Pg_control	I/O event	ControlFileWrite	Writes the **pg_control** file, mainly during database initialization.
Pg_control	I/O event	ControlFileWriteUpdate	Updates the **pg_control** file, mainly during database startup, checkpoint execution, and primary/standby verification.
Pg_control	LWLock event	ControlFileLock	Used to prevent concurrent read/write or concurrent write/write on the **pg_control** file.
File operation	I/O event	CopyFileRead	Reads a file during file copying.
File operation	I/O event	CopyFileWrite	Writes a file during file copying.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
File operation	I/O event	DataFileExtend	Writes a file during file extension.
Table data file	I/O event	DataFileImmediateSync	Flushes a table data file to a disk immediately.
Table data file	I/O event	DataFilePrefetch	Reads a table data file asynchronously.
Table data file	I/O event	DataFileRead	Reads a table data file synchronously.
Table data file	I/O event	DataFileSync	Synchronizes a table data file to a disk.
Table data file	I/O event	DataFileTruncate	Truncates a table data file.
Table data file	I/O event	DataFileWrite	Writes a table data file.
Table data file	LWLock event	SyncScanLock	Used to determine the start position of a **relfilenode** during heap scanning.
Table data file	LWLock event	RelationMappingLock	Used to wait for the mapping file between system catalogs and storage locations to be updated.
metadata	LWLock event	MetaCacheSweepLock	Used to add a lock when metadata is cyclically washed out.
postmaster.pid	I/O event	LockFileAddToDataDirRead	Reads the **postmaster.pid** file.
postmaster.pid	I/O event	LockFileAddToDataDirSync	Flushes the **postmaster.pid** file to a disk.
postmaster.pid	I/O event	LockFileAddToDataDirWrite	Writes PID information into the **postmaster.pid** file.
Pid File	I/O event	LockFileCreateRead	Reads the LockFile file **%s.lock**.
Pid File	I/O event	LockFileCreateSync	Flushes the LockFile file **%s.lock** to a disk.
Pid File	I/O event	LockFileCreateWRITE	Writes PID information into the LockFile file **%s.lock**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
System catalog mapping file	I/O event	RelationMapRead	Reads the mapping file between system catalogs and storage locations.
System catalog mapping file	I/O event	RelationMapSync	Flushes the mapping file between system catalogs and storage locations to a disk.
System catalog mapping file	I/O event	RelationMapWrite	Writes the mapping file between system catalogs and storage locations.
Streaming replication	I/O event	ReplicationSlotRead	Reads a stream replication slot file during a restart.
Streaming replication	I/O event	ReplicationSlotRestoreSync	Flushes a stream replication slot file to a disk.
Streaming replication	I/O event	ReplicationSlotSync	Flushes a temporary stream replication slot file to a disk during checkpoint execution.
Streaming replication	I/O event	ReplicationSlotWrite	Writes a temporary stream replication slot file during checkpoint execution.
Streaming replication	LWLock event	ReplicationSlotAllocationLock	Used to allocate a replication slot.
Streaming replication	LWLock event	ReplicationSlotControlLock	Used to detect replication slot name conflicts and identify replication slots that can be allocated.
Clog	I/O event	SLRUFlushSync	Flushes the **pg_clog** file to a disk, mainly during checkpoint execution and database shutdown.
Clog	I/O event	SLRURead	Reads the **pg_clog** file.
Clog	I/O event	SLRUSync	Writes dirty pages into the **pg_clog** file, and flushes the file to a disk, mainly during checkpoint execution and database shutdown.
Clog	I/O event	SLRUWrite	Writes the **pg_clog** file.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Clog	LWLock event	CLogControlLock	Used to prevent concurrent access to or concurrent modification on the Clog control data structure.
Clog	LWLock event	MultiXactOffsetControlLock	Used to prevent concurrent read/write or concurrent write/write on **pg_multixact/offset**.
Clog	LWLock event	MultiXactMemberControlLock	Used to prevent concurrent read/write or concurrent write/write on **pg_multixact/members**.
timelinehistory	I/O event	TimelineHistoryRead	Reads the **timelinehistory** file, during database startup.
timelinehistory	I/O event	TimelineHistorySync	Flushes the **timelinehistory** file to a disk, during database startup.
timelinehistory	I/O event	TimelineHistoryWrite	Writes the **timelinehistory** file.
pg_twophase	I/O event	TwophaseFileRead	Reads the **pg_twophase** file, mainly during two-phase transaction commit and restoration.
pg_twophase	I/O event	TwophaseFileSync	Flushes the **pg_twophase** file to a disk, mainly during two-phase transaction commit and restoration.
pg_twophase	I/O event	TwophaseFileWrite	Writes the **pg_twophase** file, mainly during two-phase transaction commit and restoration.
Cluster	LWLock event	NodeTableLock	Used to protect a shared structure that stores CNs and DNs information.
Concurrency	LWLock event	PoolerLock	Used to prevent two threads from simultaneously obtaining the same connection from a connection pool.
Concurrency	LWLock event	AsyncCtlLock	Used to prevent concurrent access to or concurrent modification on the sharing notification status.
Concurrency	LWLock event	AsyncQueueLock	Used to prevent concurrent access to or concurrent modification on the sharing notification queue.
Double write	I/O event	DoubleWriteFileWrite	Writes pages to a doublewrite file during the doublewrite process.
Double write	I/O event	DoubleWriteFileRead	Reads a doublewrite file during restoration for a halfwrite.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Statistics file	LWLock event	FileStatLock	Used to protect a data structure that stores statistics file information.
Master-slave replication	LWLock event	SyncRepLock	Used to protect Xlog synchronization information during primary/standby replication.
Master-slave replication	LWLock event	ReplicationSlotAllocationLock	Used to add a lock when a primary server allocates stream replication slots during primary/standby replication.
Master-slave replication	LWLock event	ReplicationSlotControlLock	Used to prevent concurrent update of stream replication slot status during primary/standby replication.
Master-slave replication	LWLock event	LsnXlogChkFileLock	Used to serially update the Xlog flush points for primary and standby servers recorded in a specific structure.
Master-slave replication	LWLock event	DataSyncRepLock	Used to protect data page synchronization information during primary/standby replication.
Column store	LWLock event	CStoreColspaceCacheLock	Used to add a lock when CU space is allocated for a column-store table.
Column store	LWLock event	CacheSlotMappingLock	Used to protect global CU cache information.
Column store	LWLock event	CStoreCUCacheSweepLock	Used to add a lock when CU caches used by a column-store table are cyclically washed out.
Column store	Lock event	cstore_freespace	Adds a lock to idle column-store space.
Speed up the cluster	LWLock event	dummyServerInfoCacheLock	Used to protect a global hash table where the information about cluster connections is cached. (Due to specification changes, the current version no longer supports the current feature. Do not use this feature.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Speed up the cluster	LWLock event	RPNumberLock	Used by a DN on a cluster to count the number of threads for a task where plans are being executed. (Due to specification changes, the current version no longer supports the current feature. Do not use this feature.)
Speed up the cluster	LWLock event	ClusterRPLock	Used by a cluster to control concurrent access on cluster load data maintained in a CCN of the cluster. (Due to specification changes, the current version no longer supports the current feature. Do not use this feature.)
Speed up the cluster	LWLock event	SearchServerLibLock	Used to add a lock on the file read operation when a specific dynamic library is initially loaded in GPU-accelerated scenarios.
Resource manage	LWLock event	ResourcePoolHashLock	Used to prevent concurrent access to or concurrent modification on a resource pool table, a hash table.
Resource manage	LWLock event	WorkloadStatHashLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains SQL requests from the CN side.
Resource manage	LWLock event	WorkloadIoStatHashLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains I/O information of the current DN.
Resource manage	LWLock event	WorkloadCGroupHashLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains Cgroup information.
Resource manage	LWLock event	WorkloadUserInfoLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains user information about load management. (The current feature is a lab feature. Contact Huawei technical support before using it.)
Resource manage	LWLock event	WorkloadRecordLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains requests received by CNs during adaptive memory management.
Resource manage	LWLock event	WorkloadIOUtilLock	Used to protect a structure that records **iostat** and CPU load information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Resource manage	LWLock event	WorkloadNodeGroupLock	Used to prevent concurrent access to or concurrent modification on a hash table that contains node group information in memory.
OBS	LWLock event	OBSGetPathLock	Used to prevent concurrent read/write or concurrent write/write on an OBS path.
OBS	LWLock event	OBSRuntimeLock	Used to obtain environment variables, for example, *GASSHOME*.
LLVM	LWLock event	LLVMDumpIRLock	Used to export the assembly language for dynamically generating functions. The current feature is a lab feature. Contact Huawei technical support before using it.
LLVM	LWLock event	LLVMParseIRLock	Used to compile and parse a finished IR function from the IR file at the start position of a query. The current feature is a lab feature. Contact Huawei technical support before using it.
MPP is compatible with ORACLE scheduled task function	LWLock event	JobShmemLock	Used to protect global variables in the shared memory that is periodically read during a scheduled task where MPP is compatible with Oracle.
Operator history information statistics	LWLock event	OperatorRealTLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains real-time data at the operator level.
Operator history information statistics	LWLock event	OperatorHistLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains historical data at the operator level.
query history information statistics	LWLock event	SessionRealTLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains real-time data at the query level.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
query history information statistics	LWLock event	SessionHistLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains historical data at the query level.
query history information statistics	LWLock event	WaitCountHashLock	Used to protect a shared structure in user statement counting scenarios.
barrier	LWLock event	BarrierLock	Used to ensure that only one thread is creating a barrier at a time.
CSN	LWLock event	CSNBufMappingLock	Used to protect CSN pages.
instrumentation	LWLock event	UniqueSQLMappingLock	Used to protect a unique SQL hash table.
instrumentation	LWLock event	InstrUserLock	Used to protect a user hash table.
instrumentation	LWLock event	PercentileLock	Used to protect global percentile buffers.
instrumentation	LWLock event	InstrWorkloadLock	Used to protect a workload transaction hash table.
Pgproc	LWLock event	Pgproc lwlock	Used to protect the PGPROC structure.
Async buffer	LWLock event	AsyncCtlLock	Used to protect asynchronization buffers.
MultiXact	LWLock event	MultiXactOffset lwlock	Used to protect SLRU buffers of a MultiXact offset.
MultiXact	LWLock event	MultiXactMemberlwlock	Used to protect SLRU buffer of a MultiXact member.
CBM	LWLock event	CBMParseXlogLock	Used to protect the lock used when CBM parses Xlogs.
BadBlock	LWLock event	BadBlockStatHashLock	Used to protect the hash table **global_bad_block_stat**.
Page	Lock event	page	Adds a lock to a table page.
Tuple	Lock event	tuple	Adds a lock to a tuple on a page.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
object	Lock event	object	Adds a lock to an object.
user	Lock event	userlock	Adds a lock to a user.
advisor	Lock event	advisory	Adds an advisory lock.
ODBC	LWLock event	ExtensionConnectorLibLock	Adds a lock when a specific dynamic library is loaded or uninstalled in ODBC connection initialization scenarios.

16.2.15 Configuration

16.2.15.1 CONFIG_SETTINGS

CONFIG_SETTINGS displays information about parameters of the running database.

Table 16-181 CONFIG_SETTINGS columns

Name	Type	Description
name	text	Parameter name
setting	text	Current parameter value
unit	text	Implicit unit of the parameter
category	text	Logical group of the parameter
short_desc	text	Brief description of the parameter
extra_desc	text	Detailed description of the parameter
context	text	Context required to set the parameter value, including **internal**, **postmaster**, **sighup**, **backend**, **superuser**, and **user**
vartype	text	Parameter type, including **bool**, **enum**, **integer**, **real**, or **string**
source	text	Method of assigning the parameter value
min_val	text	Maximum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
max_val	text	Minimum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.
enumvals	text[]	Valid values of an enum parameter. If the parameter type is not enum, the value of this column is **null**.
boot_val	text	Default parameter value used upon the database startup
reset_val	text	Default parameter value used upon the database reset
sourcefile	text	Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.
sourceline	integer	Row number in the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.

16.2.15.2 GLOBAL_CONFIG_SETTINGS

GLOBAL_CONFIG_SETTINGS displays information about parameters of running databases on each node.

Table 16-182 GLOBAL_CONFIG_SETTINGS columns

Name	Type	Description
node_name	text	Node name
name	text	Parameter name
setting	text	Current parameter value
unit	text	Implicit unit of the parameter
category	text	Logical group of the parameter
short_desc	text	Brief description of the parameter
extra_desc	text	Detailed description of the parameter
context	text	Context required to set the parameter value, including **internal**, **postmaster**, **sighup**, **backend**, **superuser**, and **user**
vartype	text	Parameter type, including **bool**, **enum**, **integer**, **real**, or **string**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
source	text	Method of assigning the parameter value
min_val	text	Maximum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.
max_val	text	Minimum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.
enumvals	text[]	Valid values of an enum parameter. If the parameter type is not enum, the value of this column is **null**.
boot_val	text	Default parameter value used upon the database startup
reset_val	text	Default parameter value used upon the database reset
sourcefile	text	Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.
sourceline	integer	Row number in the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.

16.2.16 Operator

16.2.16.1 OPERATOR_EC_HISTORY

OPERATOR_EC_HISTORY displays records of operators in Extension Connector jobs that have been executed by the current user on the current CN. The records in this view are cleared every 3 minutes. The current feature is a lab feature. Contact Huawei technical support before using it.

- If the GUC parameter **enable_resource_record** is set to **on**, the records in the view are dumped to the system catalog **GS_WLM_EC_OPERATOR_INFO** and deleted from the view every 3 minutes.
- If **enable_resource_record** is set to **off**, records are retained in the view for 3 minutes and then deleted. Columns in this view are the same as those in **GS_WLM_EC_OPERATOR_INFO**.

16.2.16.2 OPERATOR_EC_HISTORY_TABLE

OPERATOR_EC_HISTORY_TABLE records information about operators of Extension Connector jobs that have been executed. If **enable_resource_record** is set to **on**, the system imports records from **GS_WLM_EC_OPERATOR_HISTORY** to

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

this system catalog every 3 minutes. This operation occupies storage space and affects performance. The current feature is a lab feature. Contact Huawei technical support before using it.

Table 16-183 OPERATOR_EC_HISTORY_TABLE columns

Name	Type	Description
queryid	bigint	Internal query ID used for Extension Connector statement execution
plan_node_id	integer	Plan node ID of the execution plan of an Extension Connector operator
start_time	timestamp with time zone	Time when the Extension Connector operator starts to process the first data record
duration	bigint	Total execution time of the Extension Connector operator (unit: ms)
tuple_processed	bigint	Number of elements returned by the Extension Connector operator
min_peak_memory	integer	Minimum peak memory used by the Extension Connector operator on all DNs (unit: MB)
max_peak_memory	integer	Maximum peak memory used by the Extension Connector operator on all DNs (unit: MB)
average_peak_memory	integer	Average peak memory used by the Extension Connector operator on all DNs (unit: MB)
ec_status	text	Status of the Extension Connector job
ec_execute_datanode	text	Name of the DN executing the Extension Connector job
ec_dsn	text	DSN used by the Extension Connector job
ec_username	text	Username used by the Extension Connector job to access a remote cluster. This parameter is null if the remote cluster type is SPARK.
ec_query	text	Statement sent by the Extension Connector job to a remote cluster
ec_libodbc_type	text	Type of the unixODBC driver used by the Extension Connector job

16.2.16.3 OPERATOR_EC_RUNTIME

OPERATOR_EC_RUNTIME displays information about operators of the Extension Connector jobs that are being executed by the current user. The current feature is a lab feature. Contact Huawei technical support before using it.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-184 OPERATOR_EC_RUNTIME columns

Name	Type	Description
queryid	bigint	Internal query ID used for Extension Connector statement execution
plan_node_id	integer	Plan node ID of the execution plan of an Extension Connector operator
start_time	timestamp with time zone	Time when the Extension Connector operator starts to process the first data record
ec_status	text	Status of the Extension Connector job
ec_execute_datanode	text	Name of the DN executing the Extension Connector job
ec_dsn	text	DSN used by the Extension Connector job
ec_username	text	Username used by the Extension Connector job to access a remote cluster. This parameter is null if the remote cluster type is SPARK.
ec_query	text	Statement sent by the Extension Connector job to a remote cluster
ec_libodbc_type	text	Type of the unixODBC driver used by the Extension Connector job
ec_fetch_count	bigint	Number of data records processed by the Extension Connector job

16.2.16.4 OPERATOR_HISTORY_TABLE

OPERATOR_HISTORY_TABLE displays records about operators of completed jobs. Data is dumped from the kernel to this system catalog. If **enable_resource_record** is set to **on**, the system imports records from **GS_WLM_OPERATOR_HISTORY** to this system catalog every 3 minutes. You are not advised to enable this function, because it occupies storage space and affects performance.

Table 16-185 OPERATOR_HISTORY_TABLE columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution
pid	bigint	Backend thread ID
plan_node_id	integer	Plan node ID of the execution plan of a query
plan_node_name	text	Name of the operator corresponding to the plan node ID

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
start_time	timestamp with time zone	Time when the operator starts to process the first data record
duration	bigint	Total execution time of the operator (unit: ms)
query_dop	integer	DOP of the operator
estimated_rows	bigint	Number of rows estimated by the optimizer
tuple_processed	bigint	Number of elements returned by the operator
min_peak_memory	integer	Minimum peak memory used by the operator on all DNs (unit: MB)
max_peak_memory	integer	Maximum peak memory used by the operator on all DNs (unit: MB)
average_peak_memory	integer	Average peak memory used by the operator on all DNs (unit: MB)
memory_skew_percent	integer	Memory usage skew of the operator among DNs
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
spill_skew_percent	integer	DN spill skew when a spill occurs
min_cpu_time	bigint	Minimum execution time of the operator on all DNs (unit: ms)
max_cpu_time	bigint	Maximum execution time of the operator on all DNs (unit: ms)
total_cpu_time	bigint	Total execution time of the operator on all DNs (unit: ms)
cpu_skew_percent	integer	Skew of the execution time among DNs

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
warning	text	Warning. The following warnings are displayed: • Sort/SetOp/HashAgg/HashJoin spill • Spill file size large than 256MB • Broadcast size large than 100MB • Early spill • Spill times is greater than 3 • Spill on memory adaptive • Hash table conflict

16.2.16.5 OPERATOR_HISTORY

OPERATOR_HISTORY displays information about operators of the jobs that are executed by the current user on the current CN. Data in the kernel is cleared every 3 minutes. If the GUC parameter **enable_resource_record** is set to **on**, the records in the view are dumped to the system catalog **GS_WLM_OPERATOR_INFO** every 3 minutes and deleted from the view. If **enable_resource_record** is set to **off**, records are retained in the view for 3 minutes and then deleted. Columns in this view are the same as those in **Table 15-29**.

16.2.16.6 OPERATOR_RUNTIME

OPERATOR_RUNTIME displays information about operators of the jobs that are being executed by the current user.

Table 16-186 OPERATOR_RUNTIME columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution
pid	bigint	Backend thread ID
plan_node_id	integer	Plan node ID of the execution plan of a query
plan_node_name	text	Name of the operator corresponding to the plan node ID
start_time	timestamp with time zone	Time when the operator starts to process the first data record
duration	bigint	Total execution time of the operator (unit: ms)
status	text	Execution status of the current operator. Its value can be **finished** or **running**.
query_dop	integer	DOP of the operator

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
estimated_rows	bigint	Number of rows estimated by the optimizer
tuple_processed	bigint	Number of elements returned by the operator
min_peak_memory	integer	Minimum peak memory used by the operator on all DNs (unit: MB)
max_peak_memory	integer	Maximum peak memory used by the operator on all DNs (unit: MB)
average_peak_memory	integer	Average peak memory used by the operator on all DNs (unit: MB)
memory_skew_percent	integer	Memory usage skew of the operator among DNs
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
spill_skew_percent	integer	DN spill skew when a spill occurs
min_cpu_time	bigint	Minimum execution time of the operator on all DNs (unit: ms)
max_cpu_time	bigint	Maximum execution time of the operator on all DNs (unit: ms)
total_cpu_time	bigint	Total execution time of the operator on all DNs (unit: ms)
cpu_skew_percent	integer	Skew of the execution time among DNs
warning	text	Warning. The following warnings are displayed: ● Sort/SetOp/HashAgg/HashJoin spill ● Spill file size large than 256MB ● Broadcast size large than 100MB ● Early spill ● Spill times is greater than 3 ● Spill on memory adaptive ● Hash table conflict

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

16.2.16.7 GLOBAL_OPERATOR_EC_HISTORY

GLOBAL_OPERATOR_EC_HISTORY is used to query recorded information about operators of Extension Connector jobs that have been executed. The current feature is a lab feature. Contact Huawei technical support before using it.

Table 16-187 GLOBAL_OPERATOR_EC_HISTORY columns

Name	Type	Description
queryid	bigint	Internal query ID used for Extension Connector statement execution
plan_node_id	integer	Plan node ID of the execution plan of an Extension Connector operator
start_time	timestamp with time zone	Time when the Extension Connector operator starts to process the first data record
duration	bigint	Total execution time of the Extension Connector operator (unit: ms)
tuple_processed	bigint	Number of elements returned by the Extension Connector operator
min_peak_memory	integer	Minimum peak memory used by the Extension Connector operator on all DNs (unit: MB)
max_peak_memory	integer	Maximum peak memory used by the Extension Connector operator on all DNs (unit: MB)
average_peak_memory	integer	Average peak memory used by the Extension Connector operator on all DNs (unit: MB)
ec_status	text	Status of the Extension Connector job
ec_execute_datanode	text	Name of the DN executing the Extension Connector job
ec_dsn	text	DSN used by the Extension Connector job
ec_username	text	Username used by the Extension Connector job to access a remote cluster. This parameter is null if the remote cluster type is SPARK.
ec_query	text	Statement sent by the Extension Connector job to a remote cluster
ec_libodbc_type	text	Type of the unixODBC driver used by the Extension Connector job

16.2.16.8 GLOBAL_OPERATOR_EC_HISTORY_TABLE

GLOBAL_OPERATOR_EC_HISTORY_TABLE is used to query recorded information about operators of Extension Connector jobs that have been executed. If the GUC

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

parameter **enable_resource_record** is set to **on**, the records in **GS_WLM_EC_OPERATOR_HISTORY** are imported to the system catalog **GS_WLM_EC_OPERATOR_INFO** every 3 minutes.
GLOBAL_OPERATOR_EC_HISTORY_TABLE is an aggregation view for querying the system catalog **GS_WLM_EC_OPERATOR_INFO** among all CNs. Columns in this view are the same as those in **Table 16-187**. The current feature is a lab feature. Contact Huawei technical support before using it.

16.2.16.9 GLOBAL_OPERATOR_EC_RUNTIME

GLOBAL_OPERATOR_EC_RUNTIME displays information about operators of the Extension Connector jobs that are being globally executed by the current user. The current feature is a lab feature. Contact Huawei technical support before using it.

Table 16-188 GLOBAL_OPERATOR_EC_RUNTIME columns

Name	Type	Description
queryid	bigint	Internal query ID used for Extension Connector statement execution
plan_node_id	integer	Plan node ID of the execution plan of an Extension Connector operator
start_time	timestamp with time zone	Time when the Extension Connector operator starts to process the first data record
ec_status	text	Status of the Extension Connector job
ec_execute_datanode	text	Name of the DN executing the Extension Connector job
ec_dsn	text	DSN used by the Extension Connector job
ec_username	text	Username used by the Extension Connector job to access a remote cluster. This parameter is null if the remote cluster type is SPARK.
ec_query	text	Statement sent by the Extension Connector job to a remote cluster
ec_libodbc_type	text	Type of the unixODBC driver used by the Extension Connector job
ec_fetch_count	bigint	Number of data records processed by the Extension Connector job

16.2.16.10 GLOBAL_OPERATOR_HISTORY

GLOBAL_OPERATOR_HISTORY displays the records about operators after jobs are executed by the current user on all CNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-189 GLOBAL_OPERATOR_HISTORY columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution
pid	bigint	Backend thread ID
plan_node_id	integer	Plan node ID of the execution plan of a query
plan_node_name	text	Name of the operator corresponding to the plan node ID
start_time	timestamp with time zone	Time when the operator starts to process the first data record
duration	bigint	Total execution time of the operator (unit: ms)
query_dop	integer	DOP of the operator
estimated_rows	bigint	Number of rows estimated by the optimizer
tuple_processed	bigint	Number of elements returned by the operator
min_peak_memory	integer	Minimum peak memory used by the operator on all DNs (unit: MB)
max_peak_memory	integer	Maximum peak memory used by the operator on all DNs (unit: MB)
average_peak_memory	integer	Average peak memory used by the operator on all DNs (unit: MB)
memory_skew_percent	integer	Memory usage skew of the operator among DNs
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
spill_skew_percent	integer	DN spill skew when a spill occurs
min_cpu_time	bigint	Minimum execution time of the operator on all DNs (unit: ms)
max_cpu_time	bigint	Maximum execution time of the operator on all DNs (unit: ms)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
total_cpu_time	bigint	Total execution time of the operator on all DNs (unit: ms)
cpu_skew_percent	integer	Skew of the execution time among DNs
warning	text	Warning. The following warnings are displayed: 1. Sort/SetOp/HashAgg/HashJoin spill 2. Spill file size large than 256MB 3. Broadcast size large than 100MB 4. Early spill 5. Spill times is greater than 3 6. Spill on memory adaptive 7. Hash table conflict

16.2.16.11 GLOBAL_OPERATOR_HISTORY_TABLE

GLOBAL_OPERATOR_HISTORY_TABLE displays the records about operators of completed jobs on all CNs. Data is dumped from the kernel to the system catalog **GS_WLM_OPERATOR_INFO**. If the GUC parameter **enable_resource_record** is set to **on**, the records in **GS_WLM_OPERATOR_HISTORY** are imported to the system catalog **GS_WLM_OPERATOR_INFO** every 3 minutes. It is an aggregation view for querying the system catalog **GS_WLM_OPERATOR_INFO** on all CNs. Columns in this view are the same as those in **Table 16-189**.

16.2.16.12 GLOBAL_OPERATOR_RUNTIME

GLOBAL_OPERATOR_RUNTIME displays information about operators of the jobs that are being executed by the current user on all CNs.

Table 16-190 GLOBAL_OPERATOR_RUNTIME columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution
pid	bigint	Backend thread ID
plan_node_id	integer	Plan node ID of the execution plan of a query
plan_node_name	text	Name of the operator corresponding to the plan node ID
start_time	timestamp with time zone	Time when the operator starts to process the first data record
duration	bigint	Total execution time of the operator (unit: ms)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
status	text	Execution status of the current operator. Its value can be **finished** or **running**.
query_dop	integer	DOP of the operator
estimated_rows	bigint	Number of rows estimated by the optimizer
tuple_processed	bigint	Number of elements returned by the operator
min_peak_memory	integer	Minimum peak memory used by the operator on all DNs (unit: MB)
max_peak_memory	integer	Maximum peak memory used by the operator on all DNs (unit: MB)
average_peak_memory	integer	Average peak memory used by the operator on all DNs (unit: MB)
memory_skew_percent	integer	Memory usage skew of the operator among DNs
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: **0**)
spill_skew_percent	integer	DN spill skew when a spill occurs
min_cpu_time	bigint	Minimum execution time of the operator on all DNs (unit: ms)
max_cpu_time	bigint	Maximum execution time of the operator on all DNs (unit: ms)
total_cpu_time	bigint	Total execution time of the operator on all DNs (unit: ms)
cpu_skew_percent	integer	Skew of the execution time among DNs

 Copyright © Huawei Cloud Computing Technologies Co., Ltd. 2023

Name	Type	Description
warning	text	Warning. The following warnings are displayed: • Sort/SetOp/HashAgg/HashJoin spill • Spill file size large than 256MB • Broadcast size large than 100MB • Early spill • Spill times is greater than 3 • Spill on memory adaptive • Hash table conflict

16.2.17 Workload Manager

16.2.17.1 WLM_CGROUP_CONFIG

WLM_CGROUP_CONFIG displays information about a Cgroup for a job that is being executed.

Table 16-191 WLM_CGROUP_CONFIG columns

Name	Type	Description
cgoup_name	text	Cgroup name
priority	integer	Job priority
usage_pecent	integer	Percentage of resources used by the Cgroup
shares	bigint	CPU quota allocated to the Cgroup
cpuacct	bigint	Allocated CPU quota
cpuset	text	Allocated CPU cores
relpath	text	Relative path of the Cgroup
valid	text	Whether the Cgroup is valid
node_group	text	Logical cluster name (The current feature is a lab feature. Contact Huawei technical support before using it.)

16.2.17.2 WLM_CLUSTER_RESOURCE_RUNTIME

WLM_CLUSTER_RESOURCE_RUNTIME displays a DN resource summary.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-192 WLM_CLUSTER_RESOURCE_RUNTIME columns

Name	Type	Description
min_mem_util	integer	Minimum memory usage of a DN
max_mem_util	integer	Maximum memory usage of a DN
min_cpu_util	integer	Minimum CPU usage of a DN
max_cpu_util	integer	Maximum CPU usage of a DN
min_io_util	integer	Minimum I/O usage of a DN
max_io_util	integer	Maximum I/O usage of a DN
used_mem_rate	integer	Maximum memory usage of a physical node

16.2.17.3 WLM_CONTROLGROUP_CONFIG

WLM_CONTROLGROUP_CONFIG displays information about all Cgroups in the current database.

Table 16-193 WLM_CONTROLGROUP_CONFIG columns

Name	Type	Description
name	text	Cgroup name
type	text	Cgroup type
gid	bigint	Cgroup ID
classgid	bigint	ID of the Class Cgroup to which a Workload Cgroup belongs
class	text	Class Cgroup
workload	text	Workload Cgroup
shares	bigint	CPU quota allocated to a Cgroup
limits	bigint	Limit of CPUs allocated to a Cgroup
wdlevel	bigint	Workload Cgroup level
cpucores	text	Usage of CPU cores in a Cgroup

16.2.17.4 WLM_CONTROLGROUP_NG_CONFIG

WLM_CONTROLGROUP_NG_CONFIG displays information about Cgroups of all logical clusters in the current database. (The current feature is a lab feature. Contact Huawei technical support before using it.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-194 WLM_CONTROLGROUP_NG_CONFIG columns

Name	Type	Description
name	text	Cgroup name
type	text	Cgroup type
gid	bigint	Cgroup ID
classgid	bigint	ID of the Class Cgroup to which a Workload Cgroup belongs
class	text	Class Cgroup
workload	text	Workload Cgroup
shares	bigint	CPU quota allocated to a Cgroup
limits	bigint	Limit of CPUs allocated to a Cgroup
wdlevel	bigint	Workload Cgroup level
cpucores	text	Usage of CPU cores in a Cgroup
nodegroup	text	Name of a logical cluster
group_kind	text	Node group type. Its value can be **i**, **n**, **v**, or **e**. • **i**: installation node group • **n**: node group in a common non-logical cluster • **v**: node group in a logical cluster • **e**: elastic cluster

16.2.17.5 WLM_RESOURCEPOOL_RUNTIME

WLM_RESOURCEPOOL_RUNTIME displays statistics about a resource pool.

Table 16-195 WLM_RESOURCEPOOL_RUNTIME columns

Name	Type	Description
rpoid	oid	OID of the resource pool
respool	name	Name of the resource pool
control_group	name	Cgroup associated with the resource pool
parentid	oid	OID of the parent resource pool
ref_count	integer	Number of jobs associated with the resource pool

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
active_points	integer	Number of used points in the resource pool
running_count	integer	Number of jobs running in the resource pool
waiting_count	integer	Number of jobs queuing in the resource pool
io_limits	integer	IOPS upper limit of the resource pool
io_priority	integer	I/O priority of the resource pool

16.2.17.6 WLM_USER_RESOURCE_CONFIG

WLM_USER_RESOURCE_CONFIG displays the resource configuration information of a user.

Table 16-196 WLM_USER_RESOURCE_CONFIG columns

Name	Type	Description
userid	oid	OID of the user
username	name	Username
sysadmin	boolean	Whether the user has the **sysadmin** permission
rpoid	oid	OID of the resource pool
respool	name	Name of the resource pool
parentid	oid	OID of the parent user
totalspace	bigint	Size of the occupied space
spacelimit	bigint	Upper limit of the space size
childcount	integer	Number of child users
childlist	texto	Child user list

16.2.17.7 WLM_USER_RESOURCE_RUNTIME

WLM_USER_RESOURCE_RUNTIME displays resource usage of all users. Only administrators can query this view. This view is valid only when the GUC parameter **use_workload_manager** is set to **on**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-197 WLM_USER_RESOURCE_RUNTIME columns

Name	Type	Description
username	name	Username
used_memory	integer	Size of the memory being used (unit: MB)
total_memory	integer	Available memory (unit: MB) The value **0** indicates that the available memory is not limited and depends on the maximum memory available in the database.
used_cpu	integer	Number of CPU cores in use
total_cpu	integer	Total number of CPU cores of the Cgroup associated with the user on the node
used_space	bigint	Used storage space (unit: KB)
total_space	bigint	Available storage space (unit: KB). The value **-1** indicates that the space is not limited.
used_temp_space	bigint	Used temporary space (reserved column; unit: KB)
total_temp_space	bigint	Available temporary space (reserved column; unit: KB). The value **-1** indicates that the maximum temporary storage space is not limited.
used_spill_space	bigint	Used space for storing spilled data (reserved column; unit: KB)
total_spill_space	bigint	Available space for storing spilled data (reserved column; unit: KB). The value **-1** indicates that the maximum space for storing spilled data is not limited.

16.2.17.8 WLM_WORKLOAD_HISTORY_INFO

WLM_WORKLOAD_HISTORY_INFO displays information about workload management after a job is complete or the exception has been handled. (The current feature is a lab feature. Contact Huawei technical support before using it.)

Table 16-198 WLM_WORKLOAD_HISTORY_INFO columns

Name	Type	Description
statement	text	Statement executed for exception handling
block_time	bigint	Block time before the statement is executed

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
elapsed_time	bigint	Elapsed time when the statement is executed
total_cpu_time	bigint	Total time used by the CPU on the DN when the statement is executed for exception handling
qualification_time	bigint	Period when the statement checks the skew
cpu_skew_percent	integer	CPU usage skew on the DN when the statement is executed for exception handling
control_group	text	Cgroup used when the statement is executed for exception handling
status	text	Statement status after statement are executed for exception handling, including: • **pending**: waiting to be executed • **running**: being executed • **finished**: finished normally • **abort**: terminated unexpectedly
action	text	Actions when statements are executed for exception handling, including: • **abort**: terminating the operation. • **adjust**: executing the Cgroup adjustment operations. Currently, you can only perform the demotion operation. • **finish**: finished normally

16.2.17.9 WLM_WORKLOAD_RUNTIME

WLM_WORKLOAD_RUNTIME displays the status of job executed by the current user on CNs.

Table 16-199 WLM_WORKLOAD_RUNTIME columns

Name	Type	Description
node_name	text	Name of the CN where a job is executed
thread_id	bigint	Backend thread ID
processid	integer	PID of the backend thread

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
time_stamp	bigint	Time when the statement starts to be executed
username	name	Name of the user logged in to the backend
memory	integer	Memory required by the statement
active_points	integer	Number of resources consumed by the statement in the resource pool
max_points	integer	Number of resources consumed by the statement in the resource pool
priority	integer	Job priority
resource_pool	text	Resource pool to which the job belongs
status	text	Job execution status. Its value can be: • **pending**: blocked status • **running**: running status • **finished**: final status • **aborted**: termination status • **unknown**: unknown status
control_group	text	Cgroups used by the job
enqueue	text	Queue that the job is in. Its value can be: • **GLOBAL**: global queue • **RESPOOL**: resource pool queue • **ACTIVE**: not in a queue
query	text	Statement being executed
node_group	text	Logical cluster name (The current feature is a lab feature. Contact Huawei technical support before using it.)

16.2.17.10 GLOBAL_WLM_WORKLOAD_RUNTIME

GLOBAL_WAL_WORKLOAD_RUNTIME displays the status of jobs executed by the current user on CNs. This view is accessible only to users with system administrator permissions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-200 GLOBAL_WAL_WORKLOAD_RUNTIME columns

Name	Type	Description
node_name	text	Name of the CN where the job is executed
thread_id	bigint	Backend thread ID
processid	integer	LWP ID of the thread
time_stamp	bigint	Time when the statement starts to be executed
username	name	Name of the user logged in to the backend
memory	integer	Memory required by the statement
active_points	integer	Number of resources consumed by the statement in the resource pool
max_points	integer	Maximum number of resources in the resource pool
priority	integer	Job priority
resource_pool	text	Resource pool to which the job belongs
status	text	Job execution status. Its value can be: • **pending**: blocked status • **running**: running status • **finished**: final status • **aborted**: termination status • **unknown**: unknown status
control_group	name	Cgroups used by the job
enqueue	text	Queue that the job is in. Its value can be: • **GLOBAL**: global queue • **RESPOOL**: resource pool queue • **ACTIVE**: not in a queue
query	text	Statement being executed
node_group	text	Name of the logical cluster (The current feature is a lab feature. Contact Huawei technical support before using it.)

16.2.17.11 LOCAL_IO_WAIT_INFO

Returns the real-time statistics of I/O control on the current node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-201 LOCAL_IO_WAIT_INFO columns

Name	Type	Description
node_name	text	Node name.
device_name	text	Name of the data disk mounted to the node.
read_per_second	float	Number of read completions per second.
write_per_second	float	Number of write completions per second.
write_ratio	float	Ratio of the disk write I/Os to the total I/Os.
io_util	float	Percentage of the I/O time to the total CPU time per second.
total_io_util	integer	Level of the CPU time occupied by the last three I/Os. The value ranges from 0 to 6.
tick_count	integer	Interval for updating disk I/O information. The value is fixed to 1 second. The value is cleared each time before data is read.
io_wait_list_len	integer	Size of the I/O request thread wait queue. If the value is **0**, no I/O is under control.

16.2.17.12 GLOBAL_IO_WAIT_INFO

Returns the real-time statistics of I/O control on all nodes.

Table 16-202 GLOBAL_IO_WAIT_INFO columns

Name	Type	Description
node_name	text	Node name.
device_name	text	Name of the data disk mounted to the node.
read_per_second	float	Number of read completions per second.
write_per_second	float	Number of write completions per second.
write_ratio	float	Ratio of the disk write I/Os to the total I/Os.
io_util	float	Percentage of the I/O time to the total CPU time per second.
total_io_util	integer	Level of the CPU time occupied by the last three I/Os. The value ranges from 0 to 6.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tick_count	integer	Interval for updating disk I/O information. The value is fixed to 1 second. The value is cleared each time before data is read.
io_wait_list_len	integer	Size of the I/O request thread wait queue. If the value is **0**, no I/O is under control.

16.2.18 Global Plan Cache

16.2.18.1 LOCAL_PLANCACHE_STATUS

LOCAL_PLANCACHE_STATUS displays the status of the GPC plan cache on the current node. (The current feature is a lab feature. Contact Huawei technical support before using it.)

Table 16-203 LOCAL_PLANCACHE_STATUS columns

Name	Type	Description
nodename	text	Name of the node that the plan cache belongs to
query	text	Text of query statements
refcount	integer	Number of times that the plan cache is referenced
valid	bool	Whether the plan cache is valid
databaseid	oid	ID of the database that the plan cache belongs to
schema_name	text	Schema that the plan cache belongs to
params_num	integer	Number of parameters
func_id	oid	OID of the stored procedure where the plan cache is located. If the plancache does not belong to the stored procedure, the value is **0**.

16.2.18.2 GLOBAL_PLANCACHE_STATUS

GLOBAL_PLANCACHE_STATUS displays the status of GPC plan caches on all nodes. For details about the columns, see **LOCAL_PLANCACHE_STATUS**. (The current feature is a lab feature. Contact Huawei technical support before using it.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

16.2.18.3 LOCAL_PREPARE_STATEMENT_STATUS (Discarded)

LOCAL_PREPARE_STATEMENT_STATUS displays the information about prepare statements corresponding to the GPC plan cache on the current node. (The current feature is a lab feature. Contact Huawei technical support before using it.)

Table 16-204 LOCAL_PREPARE_STATEMENT_STATUS columns

Name	Type	Description
nodename	text	Name of the node that the statement belongs to
cn_sess_id	bigint	Session ID of the CN that the statement is sent from
cn_node_id	integer	Node ID of the CN that the statement is sent from
cn_time_line	integer	Number of restart times of the CN that the statement is sent from
statement_name	text	Statement name
refcount	integer	Number of times that the corresponding plan cache is referenced
is_shared	bool	Whether the corresponding plan cache is shared
query	text	Corresponding query statement.

16.2.18.4 GLOBAL_PREPARE_STATEMENT_STATUS (Discarded)

GLOBAL_PREPARE_STATEMENT_STATUS displays the information about prepare statements corresponding to GPC plan caches on all nodes. (The current feature is a lab feature. Contact Huawei technical support before using it.) For details about the columns, see **LOCAL_PREPARE_STATEMENT_STATUS (Discarded)**.

16.2.19 RTO & RPO

16.2.19.1 global_rto_status

Displays log flow control information about the primary and standby nodes (except the current node and DNs).

Table 16-205 global_rto_status columns

Parameter	Type	Description
node_name	text	Node name (including the primary and standby nodes)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description
rto_info	text	Flow control information, including the current log flow control time (unit: second) of the standby server, the expected flow control time (unit: second) specified by the GUC parameter, and the primary server sleep time (unit: μs) required to reach the expectation

16.2.19.2 global_streaming_hadr_rto_and_rpo_stat

global_streaming_hadr_rto_and_rpo_stat displays the log flow control information about the primary and standby clusters for streaming DR. (This view can be used only on the CN in the primary cluster and cannot obtain statistics from the DN or standby cluster.)

Table 16-206 Parameters

Parameter	Type	Description
hadr_sender_node_name	text	Name of the first standby node of the primary and standby clusters.
hadr_receiver_node_name	text	Name of the first standby node in the standby cluster.
current_rto	int	Flow control information, that is, log RTO time of the current primary and standby clusters (unit: second).
target_rto	int	Flow control information, that is, RTO time between the target primary and standby clusters (unit: second)
current_rpo	int	Flow control information, that is, log RPO time of the current primary and standby clusters (unit: second)
target_rpo	int	Flow control information, that is, RPO time between the target primary and standby clusters (unit: second).
rto_sleep_time	int	RTO flow control information, that is, expected sleep time (unit: μs) required by WAL sender on the host to reach the specified RTO
rpo_sleep_time	int	RPO flow control information, that is, expected sleep time (unit: μs) required by xlogInsert on the host to reach the specified RPO.

16.3 WDR Snapshot Schema

After the WDR snapshot function is enabled (the **enable_wdr_snapshot** parameter is set to **on**), objects are created in the snapshot schema in the **postgres** database of the **pg_default** tablespace to persist WDR snapshot data. By

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

default, the initial user or monitor administrator can access objects in the snapshot schema.

You can set the parameter **wdr_snapshot_retention_days** to automatically manage the snapshot lifecycle.

16.3.1 Original Information of WDR Snapshots

16.3.1.1 SNAPSHOT.SNAPSHOT

SNAPSHOT records the index information, start time, and end time of WDR snapshots stored in the current system. Only the initial user or monitor administrator has the permission to view the information. The result can be queried only in the system database but cannot be queried in the user database. After the WDR snapshot function is enabled (the parameter **enable_wdr_snapshot** is set to **on**), the table is created.

Table 16-207 SNAPSHOT attributes

Name	Type	Description	Example
snapshot_id	bigint	WDR snapshot ID	1
start_ts	timestamp	Start time of a WDR snapshot	2019-12-28 17:11:27.423742+08
end_ts	timestamp	End time of a WDR snapshot	2019-12-28 17:11:43.67726+08

16.3.1.2 SNAPSHOT.TABLES_SNAP_TIMESTAMP

TABLES_SNAP_TIMESTAMP records the start time and end time of data collection, as well as corresponding databases, and table objects for all stored WDR snapshots. Only the initialization user or monitor administrator has the permission to view the table. After the WDR snapshot function is enabled (the parameter **enable_wdr_snapshot** is set to **on**), the table is created.

Table 16-208 TABLES_SNAP_TIMESTAMP attributes

Name	Type	Description	Example
snapshot_id	bigint	WDR snapshot ID	1
db_name	text	Database corresponding to a WDR snapshot	tpcc1000
tablename	text	Table corresponding to a WDR snapshot	snap_xc_statio_all_indexes
start_ts	timestamp	Start time of a WDR snapshot	2019-12-28 17:11:27.425849+08

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Example
end_ts	timestamp	End time of a WDR snapshot	2019-12-28 17:11:27.707398+08

16.3.1.3 SNAP_SEQ

SNAP_SEQ is an ascending sequence, which provides IDs for WDR snapshots.

16.3.2 WDR Snapshot Data Table

The naming rule of a WDR snapshot data table is **snap_***{source data table}*.

WDR snapshot data tables come from all views in **DBE_PERF Schema**.

NOTE

The initial user or monitoring administrator has the permission to view the WDR snapshot data table.

16.3.3 Performance Report Generated Based on WDR Snapshots

Performance reports are generated based on the summary and statistics of WDR snapshot data tables. By default, the initial user or monitoring administrator can generate reports.

Prerequisites

The number of WDR snapshots is greater than or equal to 2.

Procedure

Step 1 Run the following command to create a report file:

```
touch  /home/om/wdrTestNode.html
```

Step 2 Run the following command to connect to the **postgres** database.

```
gsql -d postgres -p [Port number] -r
```

Step 3 Run the following command to query the generated snapshot and obtain **snapshot_id**:

```
select * from snapshot.snapshot;
```

Step 4 (Optional) Run the following command on the CCN to manually create a snapshot. If only one snapshot exists in the database or you want to view the monitoring data of the database in the current period, manually create a snapshot. This command is only available to users with the **sysadmin** permission.

```
select create_wdr_snapshot();
```

NOTE

Run the **cm_ctl query -Cdvi** command. In the command output, the information under **Central Coordinator State** is the CCN information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 Generate a performance report.

1. Run the following command to generate a formatted performance report file:
   ```
   \a \t \o /home/om/wdrTestNode.html
   ```
   The parameters in the preceding command are described as follows:
   - **\a**: switches the unaligned mode.
   - **\t**: switches the information and row count footer of the output column name.
   - **\o**: specifies that all the query results are sent to the server file.
   - *Server file path*: indicates the path for storing the generated performance report file. The user must have the read and write permissions on the path.
2. Run the following command to write the queried information to the performance report:
   ```
   select generate_wdr_report(begin_snap_id bigint, end_snap_id bigint, report_type cstring, report_scope cstring, node_name cstring);
   ```
   The description of the parameters in the preceding command is as follows:

Table 16-209 Parameters of the generate_wdr_report function

Parameter	Description	Value Range
begin_snap_id	ID of a snapshot when a query starts, which is specified by **snapshot_id** in the **snapshot.snaoshot** table.	-
end_snap_id	ID of a snapshot when a query ends. By default, the value of **end_snap_id** is greater than that of **begin_snap_id table** (**snapshot_id** in the **snapshot.snaoshot** table).	-
report_type	Type of the generated report. The value can be **summary**, **detail**, or **all**.	- **summary**: Summary data - **detail**: Detailed data - **all**: summary data and detailed data
report_scope	Range of the generated report. The value can be **cluster** or **node**.	- **cluster**: database-level information - **node**: node-level information

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description	Value Range
node_name	When **report_scope** is set to **node**, set this parameter to the name of the corresponding node. (You can run the **select * from pg_node_env;** command to query the node name.) If **report_scope** is set to **cluster**, this parameter can be omitted, left blank, or set to **NULL**.	– **node**: a node name in GaussDB – **cluster**: This value is omitted, left blank or set to **NULL**.

CAUTION

The two snapshots used to generate the report should meet the following conditions:

- No node is restarted between two snapshots.
- No primary/standby switchover is performed between two snapshots.
- Performance indicators cannot be reset between two snapshots.
- No drop database operation is performed between two snapshots.
- If a negative value exists in the generated WDR, it indicates that the indicator cannot reflect the performance of the database.
- The time required for generating a report depends on the amount of performance data in the performance snapshot. Generally, a report can be generated in minutes. If the report cannot be generated within 5 minutes, collect the statistics **ANALYZE | ANALYSE** about the tables in the snapshot schema (considering the **snap_global_statio_all_tables** and **snap_global_statio_all_indexes** tables first), and then generate the report again. Alternatively, set **set statement_timeout** to ***** to terminate report generation.
- When generating a report, ensure that the character set of the client is the same as that of openGauss. You can run **set client_encoding to *** to set the character set of the client.

3. Disable the output options and format the output.

```
\o \a \t
```

Step 6 **View the WDR** in **/home/om/** as required.

----End

Examples

```
-- Create a report file.
touch  /home/om/wdrTestNode.html
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Connect to the database.
gsql -d postgres -p [Port number] -r

-- Query the snapshots that have been generated.
openGauss=# select * from snapshot.snapshot;
 snapshot_id |          start_ts           |           end_ts
-------------+-----------------------------+-----------------------------
           1 | 2020-09-07 10:20:36.763244+08 | 2020-09-07 10:20:42.166511+08
           2 | 2020-09-07 10:21:13.416352+08 | 2020-09-07 10:21:19.470911+08
(2 rows)

-- Generate the formatted performance report wdrTestNode.html.
openGauss=# \a \t \o /home/om/wdrTestNode.html
Output format is unaligned.
Showing only tuples.

-- Write data into the performance report wdrTestNode.html.
openGauss=# select generate_wdr_report(1, 2, 'all', 'node', 'dn_6001_6002_6003');

-- Close the performance report wdrTestNode.html.
openGauss=# \o

-- Generate the formatted performance report wdrTestCluster.html.
openGauss=# \o /home/om/wdrTestCluster.html

-- Write data into the performance report wdrTestCluster.html.
openGauss=# select generate_wdr_report(1, 2, 'all', 'cluster');

-- Close the performance report wdrTestCluster.html.
openGauss=# \o \a \t
Output format is aligned.
Tuples only is off.
```

16.3.4 WDRs

The following table describes the main contents of WDR reports.

Table 16-210 Content of WDRs

Item	Description
Database Stat	• Database performance statistics: transactions, read and write operations, row activities, write conflicts, and deadlocks • Cluster-wide report, which can be viewed only in cluster mode
Load Profile	• Cluster performance statistics: CPU time, DB time, logical or physical read operation, I/O performance, login and logout, load strength, and load performance • Cluster-wide report, which can be viewed only in cluster mode
Instance Efficiency Percentages	• Cluster-level or node-level cache hit ratio • Cluster- or node-wide report, which can be viewed in cluster or node mode
Top 10 Events by Total Wait Time	• Most time-consuming event • Node-wide report, which can be viewed in node mode

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Item	Description
Wait Classes by Total Wait Time	• Category of the wait time that is most time-consuming • Node-wide report, which can be viewed in node mode
Host CPU	• CPU usage of the host • Node-wide report, which can be viewed in node mode
IO Profile	• I/O usage in the cluster or node dimension. • Cluster- or node-wide report, which can be viewed in cluster or node mode
Memory Statistics	• Kernel memory usage distribution • Node-wide report, which can be viewed in node mode
Time Model	• Time distribution information about the statements on a node • Node-wide report, which can be viewed in node mode
SQL Statistics	• SQL statement performance statistics: end-to-end time, row activities, cache hit, CPU consumption, and time consumption • Cluster- or node-wide report, which can be viewed in cluster or node mode
Wait Events	• Statistics on wait events at the node level • Node-wide report, which can be viewed in node mode
Cache IO Stats	• I/O statistics on user tables and indexes • Cluster- or node-wide report, which can be viewed in cluster or node mode
Utility status	• Status information about the replication slot and background checkpoint • Node-wide report, which can be viewed in node mode
Object stats	• Performance statistics in the index and table dimensions • Cluster- or node-wide report, which can be viewed in cluster or node mode
Configuration settings	• Node configuration • Node-wide report, which can be viewed in node mode
SQL Detail	• SQL statement text details • Cluster- or node-wide report, which can be viewed in cluster or node mode

16.3.4.1 Database Stat

The following table describes columns in the Database Stat report.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-211 Columns in the Database Stat report

Column	Description
DB Name	Database name
Backends	Number of backends connected to this database
Xact Commit	Number of transactions in this database that have been committed
Xact Rollback	Number of transactions in this database that have been rolled back
Blks Read	Number of disk blocks read in this database
Blks Hit	Number of times that disk blocks have been found in the cache
Tuple Returned	Number of rows sequentially scanned
Tuple Fetched	Number of rows randomly scanned
Tuple Inserted	Number of rows inserted by queries in this database
Tuple Updated	Number of rows updated by queries in this database
Tup Deleted	Number of rows deleted by queries in this database
Conflicts	Number of queries canceled due to conflicts
Temp Files	Number of temporary files created by queries in this database
Temp Bytes	Total amount of data written to temporary files by queries in this database
Deadlocks	Number of deadlocks detected in this database
Blk Read Time	Time spent reading data file blocks by backends in this database (unit: ms)
Blk Write Time	Time spent reading data file blocks by backends in this database (unit: ms)
Stats Reset	Time at which the current statistics were reset

16.3.4.2 Load Profile

The following table lists metrics in the Load Profile report.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-212 Metrics in the Load Profile report

Metric	Description
DB Time(us)	Total elapsed time of a job
CPU Time(us)	Total CPU time used for job running
Redo size(blocks)	Size of the generated WAL (blocks)
Logical read (blocks)	Number of logical reads for a table or an index (number of blocks)
Physical read (blocks)	Number of physical reads for a table or an index (number of blocks)
Physical write (blocks)	Number of physical writes (blocks) on a table or an index
Read IO requests	Number of reads for a table or an index
Write IO requests	Number of writes for a table or an index
Read IO (MB)	Size of reads for a table or an index (in MB)
Write IO (MB)	Size of writes for a table or an index (in MB)
Logons	Number of logins
Executes (SQL)	Number of times SQL statements are executed
Rollbacks	Number of rolled-back transactions
Transactions	Number of transactions
SQL response time P95(us)	Response time of 95% SQL statements
SQL response time P80(us)	Response time of 80% SQL statements

16.3.4.3 Instance Efficiency Percentages

The following table lists metrics in the Instance Efficiency Percentages report.

Table 16-213 Metrics in the Instance Efficiency Percentages report

Metric	Description
Buffer Hit %	Hit ratio of the buffer pool

16.3.4.4 Top 10 Events by Total Wait Time

The following table lists columns in the Top 10 Events by Total Wait Time report.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-214 Columns in the Top 10 Events by Total Wait Time report

Column	Description
Event	Name of a wait event
Waits	Number of wait times
Total Wait Time(us)	Total wait time, in microseconds
Avg Wait Time(us)	Average wait time, in microseconds
Tpye	Wait event type

16.3.4.5 Wait Classes by Total Wait Time

The following table lists columns in the Wait Classes by Total Wait Time report.

Table 16-215 Columns in the Wait Classes by Total Wait Time report

Column	Description
Tpye	Wait events are classified as follows: • STATUS • LWLOCK_EVENT • LOCK_EVENT • IO_EVENT
Waits	Number of wait times
Total Wait Time(us)	Total wait time, in microseconds
Avg Wait Time(us)	Average wait time, in microseconds

16.3.4.6 Host CPU

The following table describes columns in the Host CPU report.

Table 16-216 Columns in the Host CPU report

Column	Description
Cpus	Number of CPUs
Cores	Number of CPU cores
Sockets	Number of CPU sockets

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
Load Average Begin	Average load of the start snapshot
Load Average End	Average load of the end snapshot
%User	Percentage of CPU time occupied when the system is running in user mode
%System	Percentage of CPU time occupied when the system is running in kernel mode
%WIO	Percentage of CPU time occupied when the system is running in wait I/O mode
%Idle	Percentage of CPU time occupied when the system is running in idle mode

16.3.4.7 IO Profile

The following table lists metrics in the IO Profile report.

Table 16-217 Metrics in the IO Profile report

Metric	Description
Database requests	Number of database I/O times
Database (MB)	Database I/O data volume
Database (blocks)	Number of database I/O data blocks
Redo requests	Number of redo I/O times
Redo (MB)	Redo I/O data volume

16.3.4.8 Memory Statistics

The following table lists metrics in the Memory Statistics report.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 16-218 Metrics in the Memory Statistics report

Metric	Description
shared_used_memory	Size of the used shared memory, in MB
max_shared_memory	Size of the maximum shared memory, in MB
process_used_memory	Size of the used process memory, in MB
max_process_memory	Size of the maximum process memory, in MB

16.3.4.9 Time Model

The following table describes metrics in the Time Model report.

Table 16-219 Metrics in the Time Model report

Name	Description
DB_TIME	Total end-to-end wall time consumed by all threads (unit: μs)
EXECUTION_TIME	Total time consumed on the executor (unit: μs)
PL_EXECUTION_TIME	Total time consumed for executing PL/SQL statements (unit: μs)
CPU_TIME	Total CPU time consumed by all threads (unit: μs)
PLAN_TIME	Total time consumed for generating an execution plan (unit: μs)
REWRITE_TIME	Total time consumed for rewriting queries (unit: μs)
PL_COMPILATION_TIME	Total time consumed for compiling SQL statements (unit: μs)
PARSE_TIME	Total time consumed for parsing SQL statements (unit: μs)
NET_SEND_TIME	Total time consumed for sending data over the network (unit: μs)
DATA_IO_TIME	Total time consumed for reading and writing data (unit: μs)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

16.3.4.10 SQL Statistics

The following table describes columns in the SQL Statistics report.

Table 16-220 Columns in the SQL Statistics report

Column	Description
Unique SQL Id	ID of the normalized SQL statement.
Node Name	Node name.
User Name	Username.
Tuples Read	Number of tuples that are read.
Calls	Number of calls.
Min Elapse Time(us)	Minimum execution time (unit: us).
Max Elapse Time(us)	Maximum execution time (unit: us).
Total Elapse Time(us)	Total execution time (unit: us).
Avg Elapse Time(us)	Average execution time (unit: us).
Returned Rows	Number of rows returned by SELECT.
Tuples Affected	Number of rows affected by INSERT, UPDATE, and DELETE.
Logical Read	Number of logical reads on the buffer.
Physical Read	Number of physical reads on the buffer.
CPU Time(us)	CPU time (unit: us).
Data IO Time(us)	Time spent on I/O (unit: us).
Sort Count	Number of sorting execution times.
Sort Time(us)	Sorting execution time (unit: us).
Sort Mem Used(KB)	Size of work memory used during sorting (unit: KB).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
Sort Spill Count	Number of file writes when data is flushed to disks during sorting.
Sort Spill Size(KB)	File size used when data is flushed to disks during sorting (unit: KB).
Hash Count	Number of hashing execution times.
Hash Time(us)	Hashing execution time (unit: us).
Hash Mem Used(KB)	Size of work memory used during hashing (unit: KB).
Hash Spill Count	Number of file writes when data is flushed to disks during hashing.
Hash Spill Size(KB)	File size used when data is flushed to disks during hashing (unit: KB).
SQL Text	Normalized SQL character string.

16.3.4.11 Wait Events

The following table describes columns in the Wait Events report.

Table 16-221 Columns in the Wait Events report

Column	Description
Type	Wait events are classified as follows: • STATUS • LWLOCK_EVENT • LOCK_EVENT • IO_EVENT
Event	Name of a wait event
Total Wait Time (us)	Total wait time (unit: us)
Waits	Total number of wait times
Failed Waits	Number of wait failures
Avg Wait Time (us)	Average wait time (unit: us)
Max Wait Time (us)	Maximum wait time (unit: us)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

16.3.4.12 Cache IO Stats

The Cache IO Stats report consists of two tables, namely, **User table IO activity** and **User index IO activity**. Columns in the tables are described as follows:

User table IO activity

Table 16-222 Columns in the User table IO activity table

Column	Description
DB Name	Database name
Schema Name	Schema name
Table Name	Table name
%Heap Blks Hit Ratio	Buffer pool hit ratio of the table
Heap Blks Read	Number of disk blocks read from the table
Heap Blks Hit	Number of cache hits in the table
Idx Blks Read	Number of disk blocks read from all indexes in the table
Idx Blks Hit	Number of cache hits of all indexes in the table
Toast Blks Read	Number of disk blocks read from the TOAST table (if any) in the table
Toast Blks Hit	Number of buffer hits in the TOAST table (if any) in the table
Tidx Blks Read	Number of disk blocks read from the TOAST table index (if any) in the table
Tidx Blks Hit	Number of buffer hits in the TOAST table index (if any) in the table

User index IO activity

Table 16-223 Columns in the User index IO activity table

Column	Description
DB Name	Database name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
Schema Name	Schema name
Table Name	Table name
Index Name	Index name
%Idx Blks Hit Ratio	Index hit ratio
Idx Blks Read	Number of disk blocks read from all indexes
Idx Blks Hit	Number of cache hits of all indexes

16.3.4.13 Utility status

The Utility status report consists of two tables, namely, **Replication slot** and **Replication stat**. Columns in the tables are described as follows:

Replication slot

Table 16-224 Columns in the Replication slot table

Column	Description
Slot Name	Replication node name
Slot Type	Type of the replication node
DB Name	Name of the database on the replication node
Active	Replication node status
Xmin	Transaction ID of the replication node
Restart Lsn	Xlog file information on the replication node
Dummy Standby	Replication node as a dummy standby

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Replication stat

Table 16-225 Columns in the Replication stat table

Column	Description
Thread Id	PID of the thread
Usesys Id	User system ID
Usename	Username
Application Name	Application name
Client Addr	Client address
Client Hostname	Client host name
Client Port	Client port
Backend Start	Start time of an application
State	Log replication status
Sender Sent Location	Location where the sender sends logs
Receiver Write Location	Location where the receiver writes logs
Receiver Flush Location	Location where the receiver flushes logs
Receiver Replay Location	Location where the receiver replays logs
Sync Priority	Synchronization priority
Sync State	Synchronization status

16.3.4.14 Object stats

The Object stats report consists of three tables, namely, **User Tables stats**, **User index stats**, and **Bad lock stats**. Columns in the tables are described as follows:

User Tables stats

Table 16-226 Columns in the User Tables stats table

Column	Description
DB Name	Database name
Schema	Schema name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
Relname	Relation name
Seq Scan	Number of sequential scans initiated in the table
Seq Tup Read	Number of live rows fetched by sequential scans
Index Scan	Number of index scans initiated in the table
Index Tup Fetch	Number of live rows fetched by index scans
Tuple Insert	Number of rows inserted
Tuple Update	Number of rows updated
Tuple Delete	Number of rows deleted
Tuple Hot Update	Number of rows HOT updated (with no separate index updated)
Live Tuple	Estimated number of live rows
Dead Tuple	Estimated number of dead rows
Last Vacuum	Last time at which the table was manually vacuumed (not counting **VACUUM FULL**)
Last Autovacuum	Last time at which the table was vacuumed by the autovacuum daemon
Last Analyze	Last time at which the table was manually analyzed
Last Autoanalyze	Last time at which the table was analyzed by the autovacuum daemon
Vacuum Count	Number of times the table has been manually vacuumed (not counting **VACUUM FULL**)
Autovacuum Count	Number of times the table has been vacuumed by the autovacuum daemon
Analyze Count	Number of times the table has been manually analyzed
Autoanalyze Count	Number of times the table has been analyzed by the autovacuum daemon

User index stats

Table 16-227 Columns in the User index stats table

Column	Description
DB Name	Database name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
Schema	Schema name
Relname	Relation name
Index Relname	Index name
Index Scan	Number of index scans initiated on the index
Index Tuple Read	Number of index entries returned by scans on the index
Index Tuple Fetch	Number of table rows fetched by simple index scans by using the index

Bad lock stats

Table 16-228 Columns in the Bad lock stats table

Column	Description
DB Id	Database OID
Tablespace Id	Tablespace OID
Relfilenode	File object ID
Fork Number	File type
Error Count	Number of failures
First Time	First occurrence time
Last Time	Last occurrence time

16.3.4.15 Configuration settings

The following table describes columns in the Configuration settings report.

Table 16-229 Columns in the Configuration settings report

Column	Description
Name	GUC parameter name
Abstract	GUC parameter description
Type	Data type
Curent Value	Current value

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Description
Min Value	Valid minimum value
Max Value	Valid maximum value
Category	GUC parameter type
Enum Values	All enumerated values
Default Value	Default parameter value used upon the database startup
Reset Value	Default parameter value used upon the database reset

16.3.4.16 SQL Detail

The following table describes columns in the SQL Detail report.

Table 16-230 Columns in the SQL Detail report

Column	Description
Unique SQL Id	ID of the normalized SQL statement
User Name	Username
Node Name	Node name. This column is not displayed in node mode.
SQL Text	Normalized SQL text

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

17 GTM Mode

To meet different concurrency and consistency requirements, GaussDB provides GTM-Lite and GTM-Free modes. The main difference between GTM-Lite and GTM-Free lies in the pressure of the central transaction management node GTM and the transaction processing process. In GTM-Lite mode, the pressure on the central transaction processing node is reduced, the transaction processing process is further optimized, and the GTM performance and concurrency bottleneck are reduced. In this way, the transaction processing capability is improved to a great extent while ensuring consistency. In GTM-Free mode, the central transaction management node does not participate in transaction management, eliminating the single point of failure and achieving higher transaction processing performance. However, in terms of consistency, all transactions can be completed to ensure external read consistency. Strong consistency read of distributed transactions is not supported. Transaction consistency that depends on query results, such as insert into **select * from**, is not supported.

The current version does not support the switchover between the two modes. You are advised to use the default GTM mode during installation. The GTM mode can remain unchanged before and after the upgrade.

The related GUC parameters include **enable_gtm_free** and **gtm_option**. You can run the **show** statement in gsql to query the current GTM mode.

```
SHOW enable_gtm_free;
SHOW gtm_option;
```

The method of determining the mode is as follows:

- GTM-Lite mode: **enable_gtm_free=off** and **gtm_option=1**
- GTM-Free mode: **enable_gtm_free=on** or **gtm_option=2**

In GTM-Lite mode, GaussDB supports strong consistency and complete syntaxes for distributed transactions. In GTM-Free mode, eventual consistent execution and concurrency control are used for distributed transactions. Therefore, the usage scenarios and methods of some syntaxes are restricted. If the restricted syntaxes are required due to service requirements, refactoring is required based on the understanding of the eventual consistent behavior. The involved restricted syntaxes and refactoring suggestions are as follows:

1. General principle: Specify a proper distribution key (by using **DISTRIBUTE BY**) for all user tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- You are advised to distribute data evenly.
- You are advised to use the join condition in a query as the distribution key to ensure that the join query does not cause data flow between DNs.
- You are advised to select the primary key of the table as the distribution key.

2. SELECT:
   - During table query, the **WHERE** condition must contain the equivalent query condition of all distribution keys.
   - Do not use subqueries in the **SELECT** target columns. Otherwise, the plan may fail to be pushed down to DNs for execution, affecting the execution performance.
3. DML:

   By default, cross-node transactions are not supported. If the executed DML statement contains cross-node transactions, an error is reported. There are two scenarios:

   a. If a user statement is split into multiple independent statements in the database, the error message "INSERT/UPDATE/DELETE/MERGE contains multiple remote queries under GTM-free mode Unsupport DML two phase commit under gtm free mode. modify your SQL to generate light-proxy or fast-query-shipping plan" is displayed. In this case, you need to modify the statement to execute it on a single node.

      An example is as follows:

      insert into t select * from b where b.c = xx;

      Assume that the distribution keys of the **t** and **b** tables are different, and the **WHERE** condition filters out only one data record. If **enable_stream_operator** is disabled, the preceding query is split into two independent statements and executed in serial mode. First, run **select * from b where b.c = xx** to extract data from a DN to the target record. Then, run the **insert into t** statement to deliver the extracted target record to another DN to complete the insertion. In GTM-Free mode, the preceding error is reported when such a statement is executed. Similar errors may also be reported for **create table as select * from** and **DELETE**, **JOIN**, and **INSERT** statements with subqueries.

      Refactoring solution: Before statement execution, add the **set enable_stream_operator=on** command to enable the streaming operator so that service statements can be pushed down for execution.

   b. If a user statement is executed on multiple nodes in the database, the error message "Your SQL needs more than one datanode to be involved in" will be displayed. In this case, you are advised to modify the statement so that it can be executed on a single node.

      An example is as follows:

      insert into t values(3,3),(1,1);

      If (3,3) and (1,1) are distributed on different DNs, the execution of the preceding statement involves two DNs. In GTM-Free mode, the preceding error is reported when such a statement is executed.

      Refactoring method: If the preceding statement needs to be executed on multiple nodes, add a hint to the statement to prevent errors. The hint is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

insert /*+ multinode */ into t values(3,3),(1,1);

There are similar constraints on the **DELETE** and **UPDATE** statements. You are advised to add the equivalent filtering condition of the distribution key to the **WHERE** condition in the **DELETE** and **UPDATE** statements.

4. It is recommended that **application_type** be set to **perfect_sharding_type** in the JDBC connection string in the development phase. In this way, errors are reported for all SQL statements for cross-node read and write operations, prompting developers to optimize statements as soon as possible.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

18 Materialized View

A materialized view is a special physical table, which is relative to a common view. A common view is a virtual table and has many application limitations. Any query on a view is actually converted into a query on an SQL statement, and performance is not actually improved. The materialized view actually stores the results of the statements executed by the SQL statement, and is used to cache the results.

18.1 Full Materialized View

18.1.1 Overview

Full materialized views can be fully refreshed only. The syntax for creating a full materialized view is the same as the CREATE TABLE AS syntax. You cannot specify a NodeGroup to create a full materialized view.

18.1.2 Usage

Syntax

- Create a full materialized view.
  ```
  CREATE MATERIALIZED VIEW [ view_name ] AS { query_block };
  ```
- Fully refresh a materialized view.
  ```
  REFRESH MATERIALIZED VIEW [ view_name ];
  ```
- Delete a materialized view.
  ```
  DROP MATERIALIZED VIEW [ view_name ];
  ```
- Query a materialized view.
  ```
  SELECT * FROM [ view_name ];
  ```

Examples

```
-- Prepare data.
CREATE TABLE t1(c1 int, c2 int);
INSERT INTO t1 VALUES(1, 1);
INSERT INTO t1 VALUES(2, 2);

-- Create a full materialized view.
openGauss=# CREATE MATERIALIZED VIEW mv AS select count(*) from t1;
CREATE MATERIALIZED VIEW
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Query the materialized view result.
openGauss=# SELECT * FROM mv;
 count
-------
     2
(1 row)

-- Insert data into the base table in the materialized view again.
openGauss=# INSERT INTO t1 VALUES(3, 3);

-- Fully refresh a full materialized view.
openGauss=# REFRESH MATERIALIZED VIEW mv;
REFRESH MATERIALIZED VIEW

-- Query the materialized view result.
openGauss=# SELECT * FROM mv;
 count
-------
     3
(1 row)

-- Delete a materialized view.
openGauss=# DROP MATERIALIZED VIEW mv;
DROP MATERIALIZED VIEW
```

18.1.3 Support and Constraints

Supported Scenarios

- Generally, the query scope supported by full materialized views is the same as that supported by the CREATE TABLE AS statement.
- The distribution column can be specified when a full materialized view is created.
- Indexes can be created in a full materialized view.
- ANALYZE and EXPLAIN are supported.

Unsupported Scenarios

- Full materialized views do not support node groups.
- Materialized views cannot be added, deleted, or modified. Only query statements are supported.

Constraints

- The base table used to create a full materialized view must be defined on all DNs, and the node group to which the base table belongs must be an installation group.
- When a full materialized view is refreshed or deleted, a high-level lock is added to the base table. If the definition of a materialized view involves multiple tables, pay attention to the service logic to avoid deadlock.

18.2 Incremental Materialized View

18.2.1 Overview

Incremental materialized views can be incrementally refreshed. You need to manually execute statements to incrementally refresh materialized views in a

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

period of time. The difference between the incremental and the full materialized views is that the incremental materialized view supports only a small number of scenarios. Currently, only base table scanning statements or UNION ALL can be used to create materialized views.

18.2.2 Usage

Syntax

- Create a incremental materialized view.
  ```
  CREATE INCREMENTAL MATERIALIZED VIEW [ view_name ] AS { query_block };
  ```
- Fully refresh a materialized view.
  ```
  REFRESH MATERIALIZED VIEW [ view_name ];
  ```
- Incrementally refresh a materialized view.
  ```
  REFRESH INCREMENTAL MATERIALIZED VIEW [ view_name ];
  ```
- Delete a materialized view.
  ```
  DROP MATERIALIZED VIEW [ view_name ];
  ```
- Query a materialized view.
  ```
  SELECT * FROM [ view_name ];
  ```

Examples

```
-- Prepare data.
CREATE TABLE t1(c1 int, c2 int);
INSERT INTO t1 VALUES(1, 1);
INSERT INTO t1 VALUES(2, 2);

-- Create an incremental materialized view.
openGauss=# CREATE INCREMENTAL MATERIALIZED VIEW mv AS SELECT * FROM t1;
CREATE MATERIALIZED VIEW

-- Insert data.
openGauss=# INSERT INTO t1 VALUES(3, 3);
INSERT 0 1

-- Incrementally refresh a materialized view.
openGauss=# REFRESH INCREMENTAL MATERIALIZED VIEW mv;
REFRESH MATERIALIZED VIEW

-- Query the materialized view result.
openGauss=# SELECT * FROM mv;
 c1 | c2
----+----
  1 |  1
  2 |  2
  3 |  3
(3 rows)

-- Insert data.
openGauss=# INSERT INTO t1 VALUES(4, 4);
INSERT 0 1

-- Fully refresh a materialized view.
openGauss=# REFRESH MATERIALIZED VIEW mv;
REFRESH MATERIALIZED VIEW

-- Query the materialized view result.
openGauss=# select * from mv;
 c1 | c2
----+----
  1 |  1
  2 |  2
  3 |  3
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 4 |  4
(4 rows)

-- Delete a materialized view.
openGauss=# DROP MATERIALIZED VIEW mv;
DROP MATERIALIZED VIEW
```

18.2.3 Support and Constraints

Supported Scenarios

- Supports statements for querying a single table.
- Supports UNION ALL for querying multiple single tables.
- Creates an index in the materialized view.
- Performs the Analyze operation in the materialized view.
- Creates an incremental materialized view based on the node group of base tables. (Check whether the base tables are in the same node group and create the incremental materialized view based on the node group).

Unsupported Scenarios

- Materialized views do not support the Stream plan, multi-table join plan, or subquery plan.
- Except for a few ALTER operations, most DDL operations cannot be performed on base tables in materialized views.
- A distribution column of a materialized view cannot be specified when the materialized view is created.
- Materialized views cannot be added, deleted, or modified. Only query statements are supported.
- Materialized views cannot be created using the temporary table, hash bucket, unlog, or partitioned table. Only the hash distribution table is supported.
- Materialized views cannot be created in nested mode (that is, a materialized view cannot be created in another materialized view).
- The column-store tables are not supported. Only row-store tables are supported.
- Materialized views of the UNLOGGED type are not supported, and the WITH syntax is not supported.

Constraints

- If the materialized view is defined as UNION ALL, each subquery must use a different base table and the distribution column of each base table must be the same. The distribution column of the materialized view is automatically deduced and is the same as that of each base table.
- The columns defined in the materialized view must contain all distribution columns in the base table.
- When an incremental materialized view is created, fully refreshed, or deleted, a high-level lock is added to the base table. If the materialized view is defined as UNION ALL, pay attention to the service logic to avoid deadlock.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

19 GUC Parameters

19.1 GUC Parameter Usage

A database provides many operation parameters. Configurations of these parameters affect the behavior of the database system. Before modifying these parameters, learn the impact of these parameters on the database. Otherwise, unexpected results may occur.

You are advised to modify some parameters on the GaussDB console. If the parameters cannot be modified on the console, evaluate the risks and contact customer service.

Precautions

- If the value range of a parameter is a string, the string should comply with the naming conventions of the path and file name in the OS running the target database.
- If the maximum value of a parameter is *INT_MAX*, the maximum parameter value varies by OS. *INT_MAX* indicates the maximum value of the INT data type. The value is **2147483647**.
- If the maximum value of a parameter is *DBL_MAX*, the maximum parameter value varies by OS. *DBL_MAX* indicates the maximum value of the FLOAT data type.

19.2 File Location

After a database has been installed, three configuration files (**postgresql.conf**, **pg_hba.conf**, and **pg_ident.conf**) are automatically generated and saved in the data directory. You can use the methods described in this section to change the names and save paths of these configuration files.

When changing the storage directory of a configuration file, set **data_directory** in **postgresql.conf** to the actual data directory.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

If a configuration file is incorrectly modified, the database will be seriously affected. Do not modify the configuration files mentioned in this section after installation.

data_directory

Parameter description: Specifies the GaussDB **data** directory. Only the sysadmin user can access this parameter. You can set this parameter using one of the following methods:

- Set it when you install the GaussDB.
- This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string, consisting of one or more characters.

Default value: Specify this parameter during installation. If this parameter is not specified during installation, the database is not initialized by default.

config_file

Parameter description: Specifies the configuration file (**postgresql.conf**) of the primary server.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string, consisting of one or more characters.

Default value: **postgresql.conf** (The absolute directory of this file may be displayed in the actual situation.)

hba_file

Parameter description: Specifies the configuration file (**pg_hba.conf**) for host-based authentication (HBA). This parameter can be specified only in the **postgresql.conf** file and can be accessed only by the sysadmin user.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value: **pg_hba.conf** (The absolute directory of this file may be displayed in the actual situation.)

ident_file

Parameter description: Specifies the name of the configuration file (**pg_ident.conf)** for client authentication. Only the sysadmin user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string

Default value: **pg_ident.conf** (The absolute directory of this file may be displayed in the actual situation.)

external_pid_file

Parameter description: Specifies the extra PID file that can be used by the server management program. Only the sysadmin user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

This parameter takes effect only after the database restarts.

Value range: a string

Default value: empty

enable_default_cfunc_libpath

Parameter description: Specifies GaussDB whether the .so file uses the default path when the C function is created.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

on: indicates that the .so file must be placed in the specified directory ($libdir/proc_srclib) when the C function is created.

off: indicates that the .so file can be stored in any accessible directory when the C function is created.

Default value: **on**

NOTICE

If this parameter is set to **off**, the .so file can be placed in any accessible directory or the .so file provided by the system can be used, which poses security risks. Therefore, you are not advised to set this parameter to **off**.

19.3 Connection and Authentication

19.3.1 Connection Settings

This section describes parameters related to client-server connection modes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

listen_addresses

Parameter description: Specifies the TCP/IP address of the client for a server to listen on.

This parameter specifies the IP address used by the GaussDB server for listening, for example, an IPv4 address. Multiple NICs may exist on the host and each NIC can be bound to multiple IP addresses. This parameter specifies the IP addresses to which GaussDB is bound. The client can use the IP address specified by this parameter to connect to or send requests to GaussDB.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range:

- Host name or IP address. Multiple values are separated with commas (,).
- Asterisk (*) or **0.0.0.0**, indicating that all IP addresses will be listened on, which is not recommended due to potential security risks.
- If the parameter is not specified, the server does not listen on any IP address. In this case, only Unix domain sockets can be used for database connections.

Default value:

After the cluster is installed, configure different default values based on the IP addresses of different instances in the **public_cloud.conf** file. The default value of CN is **listen_addresses = 'localhost,***IP address of the mgr.net NIC,IP address of the data.net NIC,IP address of the virtual.net NIC***'**. The default value of DN is **listen_addresses ='***IP address of the data.net NIC***'**.

NOTE

localhost indicates that only local loopback is allowed.

The **public_cloud.conf** file contains the following NIC information: **mgr.net** (management NIC), **data.net** (data NIC), and **virtual.net** (virtual NIC).

local_bind_address

Parameter description: Specifies the host IP address bound to the current node for connecting to other nodes in the cluster.

This parameter is a POSTMASTER parameter.

NOTE

This parameter is specified in the configuration file during installation. Do not modify this parameter unless absolutely necessary. Otherwise, database communication will be affected.

Default value:

After the cluster is installed, configure different default values based on the IP addresses of different instances in the **public_cloud.conf** file. The default value of CN/DN is **local_bind_address ='***IP address of the data.net NIC***'**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The **public_cloud.conf** file contains the following NIC information: **mgr.net** (management NIC), **data.net** (data NIC), and **virtual.net** (virtual NIC).

port

Parameter description: Specifies the TCP port listened on by GaussDB.

NOTE

This parameter is specified in the configuration file during installation. Do not modify this parameter unless absolutely necessary. Otherwise, database communication will be affected.

Value range: an integer ranging from 1 to 65535

NOTE

- When setting the port number, ensure that the port number is not in use. When setting the port numbers of multiple instances, ensure that the port numbers do not conflict.
- Ports 1 to 1023 are reserved for the operating system. Do not use them.
- When the cluster is installed using the configuration file, pay attention to the ports reserved in the communication matrix in the configuration file. For example, the port specified by the value of **dataPortBase** plus 1 needs to be reserved for internal tools, and the port specified by the value of **dataPortBase** plus 6 needs to be reserved as the communication port of the flow engine message queue. (Due to specification changes, the current version no longer supports the current feature. Do not use this feature.) Therefore, during cluster installation, the maximum value of port is **65532** for CNs, **65529** for DNs, and **65534** for GTMs. Ensure that the port number does not conflict with each other.

Default value: **5432** (The actual value is specified in the configuration file during installation.)

max_connections

Parameter description: Specifies the maximum number of concurrent connections to the database. This parameter influences the concurrent processing capability of the cluster.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer. The minimum value is **10** (greater than **max_wal_senders**). The theoretical maximum value is **262143**. The actual maximum value is a dynamic value, which is calculated using the formula: 262143 – **job_queue_processes** – **autovacuum_max_workers** – **max_inner_tool_connections** – **AUXILIARY_BACKENDS** – **AV_LAUNCHER_PROCS** – **min(max(newValue/4,64),1024)**. The values of **job_queue_processes**, **autovacuum_max_workers**, and **max_inner_tool_connections** depend on the settings of the corresponding GUC parameters. **AUXILIARY_BACKENDS** indicates the number of reserved auxiliary threads, which is fixed to **20**. **AV_LAUNCHER_PROCS** indicates the number of reserved autovacuum launcher threads, which is fixed to **2**. In **min(max(newValue/4,64),1024)**, **newValue** indicates the new value.

Default value:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Independent deployment:

  CN: 8000 (60-core CPU/480-GB memory); 4000 (32-core CPU/256-GB memory); 2000 (16-core CPU/128-GB memory); 1000 (8-core CPU/64-GB memory); 100 (4-core CPU/32-GB memory and 4-core CPU/16-GB memory)

  DN: 24000 (60-core CPU/480-GB memory); 12000 (32-core CPU/256-GB memory); 6000 (16-core CPU/128-GB memory); 2500 (8-core CPU/64-GB memory); 100 (4-core CPU/32-GB memory and 4-core CPU/16-GB memory)

Impact of incorrect configuration:

If the value of **max_connections** exceeds the maximum dynamic value, the node fails to be started and the following error message is displayed: "invalid value for parameter "max_connections"". Alternatively, the memory fails to be allocated during the node startup and the following error message is displayed: "Cannot allocate memory".

If the value of **max_connections** is not increased based on the external egress specifications and the memory parameter is not adjusted in proportion, when the service pressure is high, the memory may be insufficient, and the error message "memory is temporarily unavailable" is displayed.

NOTE

- If the number of connections of the administrator exceeds the value of **max_connections**, the administrator can still connect to the database after the connections are used up by common users. If the number of connections exceeds the value of **sysadmin_reserved_connections**, an error is reported. That is, the maximum number of connections of the administrator is equal to the value of *max_connections* + *sysadmin_reserved_connections*.
- For common users, internal jobs use some connections. Therefore, the value of this parameter is slightly less than that of *max_connections*. The value depends on the number of internal connections.
- After the thread pool is enabled, the maximum number of stream threads is the value of **max_connections**. If the number of stream threads reaches the upper limit, the error is reported: "Exceed stream thread pool limitation...". In this case, you can increase the value of **max_connections** to increase the upper limit. This parameter is a POSTMASTER parameter. Therefore, you can estimate the number of stream threads based on service requirements. Total number of stream threads = Number of concurrent services x Number of stream threads consumed by each concurrently executed statement (which can be viewed in the execution plan).

max_inner_tool_connections

Parameter description: Specifies the maximum number of concurrent connections of a tool which is allowed to connect to the database. This parameter influences the concurrent connection capability of the GaussDB tools.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to *MIN* (which takes the smaller value between **262143** and *max_connections*). For details about how to calculate the value of *max_connections*, see the preceding description.

Default value: **50** If the default value is greater than the maximum value supported by the kernel (determined when the **gs_initdb** command is executed), an error message is displayed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestions:

You are advised to use the default value for this parameter in the primary database node.

sysadmin_reserved_connections

Parameter description: Specifies the minimum number of connections reserved for administrators. You are advised not to set this parameter to a large value. This parameter is used together with the *max_connections* parameter. The maximum number of connections of the administrator is equal to the value of *max_connections* + *sysadmin_reserved_connections*.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to *MIN* (which takes the smaller value between **262143** and *max_connections*). For details about how to calculate the value of *max_connections*, see the preceding description.

Default value: **3**

Note: When the thread pool function is enabled, if the thread pool is fully occupied, a processing bottleneck occurs. As a result, connections reserved by the administrator cannot be established. In this case, you can use gsql to establish connections through the primary port number + 1 to clear useless sessions.

unix_socket_directory

Parameter description: Specifies the Unix domain socket directory that the GaussDB server listens to for connections from the client. Only the **sysadmin** user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

The parameter length limit varies by OS. In the Linux OS, the length of a socket path name (combination of a socket directory and a socket file name) cannot exceed 107 bytes, and the length of a directory cannot exceed 92 bytes. If the upper limit is exceeded, the error "Unix-domain socket path xxx is too long" will be reported and the process cannot be started properly. You can retrieve the **system_call** log in the **cm_agent** directory to locate configuration issues.

Value range: a string

Default value: empty. The actual value is specified by **tmpMppdbPath** in the configuration file during installation.

unix_socket_group

Parameter description: Specifies the group of the Unix domain socket (the user of a socket is the user that starts the server). This parameter can work with **unix_socket_permissions** to control socket access.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string. If this parameter is set to an empty string, the default group of the current user is used.

Default value: an empty string

unix_socket_permissions

Parameter description: Specifies access permissions for the Unix domain socket.

The Unix domain socket uses the usual permission set of the Unix file system. The value of this parameter should be a number (acceptable for the **chmod** and **umask** commands). If a user-defined octal format is used, the number must start with 0.

You are advised to set it to **0770** (only allowing access from users connecting to the database and users in the same group as them) or **0700** (only allowing access from users connecting to the database).

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: 0000 to 0777

Default value: **0700**

NOTE

In the Linux OS, a document has one document attribute and nine permission attributes which consist of the read (r), write (w), and execute (x) permissions of the Owner, Group, and Others groups.

The r, w, and x permissions are represented by the following numbers:

r: 4

w: 2

x: 1

-: 0

The three attributes in a group are accumulative.

For example, **-rwxrwx---** indicates the following permissions:

owner = rwx = 4+2+1 = 7

group = rwx = 4+2+1 = 7

others = --- = 0+0+0 = 0

The permission of the file is 0770.

application_name

Parameter description: Specifies the client name used in the current connection request.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

When a standby node requests to replicate logs on the primary node, if this parameter is not an empty string, it is used as the name of the streaming replication slot of the standby node on the primary node. In this case, if the length of this parameter exceeds 61 bytes, only the first 61 bytes are used as the streaming replication slot name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string. The actual query result depends on the client used for queries or user configurations.

Default value: an empty string

connection_info

Parameter description: Specifies the database connection information, including the driver type, driver version, driver deployment path, and process owner.

This parameter is a USERSET parameter used for O&M. You are advised not to change the parameter value.

Value range: a string

Default value: empty

NOTE

- An empty string indicates that the driver connected to the database does not support automatic setting of the **connection_info** parameter or the parameter is not set by users in applications.
- The following is an example of the concatenated value of **connection_info**:
  ```
  {"driver_name":"ODBC","driver_version": "(GaussDB VxxxRxxxCxx build 290d125f) compiled at 2020-05-08 02:59:43 commit 2143 last mr 131 release","driver_path":"/usr/local/lib/psqlodbcw.so","os_user":"omm"}
  ```
  driver_name and **driver_version** are displayed by default. Whether **driver_path** and **os_user** are displayed is determined by users. For details, see **Connecting to a Database** and **Configuring a Data Source in the Linux OS**.

backend_version

Parameter description: Specifies the version number of the synchronous connection between CNs or between a CN and a DN. This parameter involves the version number and cannot be set randomly.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 100000

19.3.2 Security and Authentication (postgresql.conf)

This section describes parameters about client-to-server authentication.

authentication_timeout

Parameter description: Specifies the longest duration to wait before the client authentication times out. If a client is not authenticated by the server within the period, the server automatically disconnects from the client so that the client does not occupy connection resources.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 600. The smallest unit is s.

Default value: **1min**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

auth_iteration_count

Parameter description: Specifies the number of iterations during the generation of encryption information for authentication.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 2048 to 134217728

Default value: **10000**

NOTICE

If the number of iterations is too small, the password storage security is reduced. If the number of iterations is too large, the performance deteriorates in scenarios involving password encryption, such as authentication and user creation. Set the number of iterations based on actual hardware conditions. You are advised to retain the default value.

session_authorization

Parameter description: Specifies the user ID of the current session.

This parameter is a USERSET parameter and can be set only using the **SET SESSION AUTHORIZATION** syntax.

Value range: a string

Default value: **NULL**

session_timeout

Parameter description: Specifies the longest duration allowed when no operations are performed on a client after it is connected to the server.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 86400. The smallest unit is s. **0** indicates that the timeout is disabled.

Default value: **1800**

NOTICE

The gsql client of GaussDB has an automatic reconnection mechanism. For local connection of initialized users, the client reconnects to the server if the connection breaks after the timeout.

ssl

Parameter description: Specifies whether SSL connections are enabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that SSL connections are enabled.
- **off** indicates that SSL connections are not enabled.

NOTICE

GaussDB supports SSL when a client connects to a CN. You are advised to enable SSL connections only on CNs. The default value is **off** on DNs. To enable SSL connections, you also need to ensure that parameters such as **ssl_cert_file**, **ssl_key_file**, and **ssl_ca_file** are configured correctly. Incorrect configurations may cause startup failure of the cluster.

Default value: **on** (for CNs) or **off** (for DNs)

comm_ssl

Parameter description: Specifies whether to enable the SSL connection between primary DNs.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the SSL connection is enabled between primary DNs.
- **off** indicates that the SSL connection is disabled between primary DNs.

NOTICE

- It is recommended that this parameter be enabled only on DNs. The default value on CNs is **off**.
- To enable SSL connections, you also need to ensure that parameters such as **ssl_cert_file**, **ssl_key_file**, and **ssl_ca_file** are configured correctly. Incorrect configurations may cause startup failure of the cluster.

Default value: **off**

require_ssl

Parameter description: Specifies whether the server requires SSL connections. This parameter is valid only when **ssl** is set to **on**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the server requires SSL connections.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **off** indicates that the server does not require SSL connections.

NOTICE

GaussDB supports SSL when a client connects to a CN. It is recommended that the SSL connection be enabled only on CNs.

Default value: **off**

ssl_ciphers

Parameter description: Specifies the list of encryption algorithms supported by SSL. Only the sysadmin user can access the list.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string. Separate multiple encryption algorithms by semicolons (;).

NOTICE

If **ssl_ciphers** is set incorrectly, the cluster cannot be started properly.

Default value: **ALL**

ssl_renegotiation_limit

Parameter description: Specifies the allowed traffic volume over an SSL-encrypted channel before the session key is renegotiated. The renegotiation mechanism reduces the probability that attackers use the password analysis method to crack the key based on a huge amount of data but causes big performance losses. The traffic indicates the sum of transmitted and received traffic. The SSL renegotiation mechanism has been disabled because of potential risks. This parameter is reserved for version compatibility and does not take effect.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647. The unit is KB. **0** indicates that the renegotiation mechanism is disabled.

Default value: **0**

ssl_cert_file

Parameter description: Specifies the name of the file that contains the SSL server certificate. The relative path is relative to the data directory.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value: **server.crt**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

ssl_key_file

Parameter description: Specifies the name of the file that contains the SSL private key. The relative path is relative to the data directory.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value: **server.key**

ssl_ca_file

Parameter description: Specifies the name of the root certificate that contains CA information. Its path is relative to the data directory.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string. If it is an empty string, no CA file is loaded and client certificate verification is not performed.

Default value: **cacert.pem**

ssl_crl_file

Parameter description: Specifies the certificate revocation list (CRL). If a client certificate is in the list, the certificate is invalid. The path is relative to the data directory.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string. An empty string indicates that there is no CRL.

Default value: an empty string

ssl_cert_notify_time

Parameter description: Specifies the number of days prior to SSL server certificate expiration that a user will receive a reminder. When the SSL certificate is initialized during connection establishment, if the duration from the current time to the certificate expiration time is shorter than the specified value, an expiration notification is recorded in the log.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 7 to 180. The unit is day.

Default value: **90**

krb_server_keyfile

Parameter description: Specifies the location of the main configuration file of the Kerberos service.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

Value range: a string

Default value: empty

krb_srvname

Parameter description: Specifies the Kerberos service name.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

Value range: a string

Default value: **postgres**

krb_caseins_users

Parameter description: Specifies whether the Kerberos username is case-sensitive.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

- **on** indicates that the Kerberos username is case-insensitive.
- **off** indicates that the Kerberos username is case-sensitive.

Default value: **off**

modify_initial_password

Parameter description: After GaussDB is installed, there is only one initial user account (whose UID is 10) in the database. When a user logs in to the database using this initial account for the first time, this parameter determines whether the password of the initial account needs to be modified.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

NOTICE

If the initial user password is not specified during the installation, the initial user password is empty by default after the installation. Before performing other operations, you need to set the initial user password using the gsql client. This parameter no longer takes effect and is reserved only for compatibility with upgrade scenarios.

Value range: Boolean

- **on** indicates that the password of the initial account needs to be modified upon the first login.
- **off** indicates that the password of the initial account does not need to be modified.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **off**

password_policy

Parameter description: Specifies whether to check the password complexity when you run the **CREATE ROLE/USER** or **ALTER ROLE/USER** command to create or modify an account of GaussDB.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

For security purposes, do not disable the password complexity policy.

Value range: **0** and **1**

- **0** indicates that no password complexity policy is enabled.
- **1** indicates that the default password complexity policy is enabled.

Default value: **1**

password_reuse_time

Parameter description: Specifies whether to check the reuse interval of the new password when you run the **ALTER USER** or **ALTER ROLE** command to change a user password.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

When you change the password, the system checks the values of **password_reuse_time** and **password_reuse_max**.

- If the values of **password_reuse_time** and **password_reuse_max** are both positive numbers, an old password can be reused when it meets either of the reuse restrictions.
- If the value of **password_reuse_time** is **0**, password reuse is restricted based on the number of reuse times, and not on the reuse interval.
- If the value of **password_reuse_max** is **0**, password reuse is restricted based on the reuse interval, and not on the number of reuse times.
- If the values of both **password_reuse_time** and **password_reuse_max** are **0**, password reuse is not restricted.

Value range: a floating point number ranging from 0 to 3650. The unit is day.

- **0** indicates that the password reuse interval is not checked.
- A positive number indicates that a new password cannot be chosen from passwords in history that are newer than the specified number of days.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

password_reuse_max

Parameter description: Specifies whether to check the reuse times of the new password when you run the **ALTER USER** or **ALTER ROLE** command to change a user password. Only the sysadmin user can access the parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

When you change the password, the system checks the values of **password_reuse_time** and **password_reuse_max**.

- If the values of **password_reuse_time** and **password_reuse_max** are both positive numbers, an old password can be reused when it meets either of the reuse restrictions.
- If the value of **password_reuse_time** is **0**, password reuse is restricted based on the number of reuse times, and not on the reuse interval.
- If the value of **password_reuse_max** is **0**, password reuse is restricted based on the reuse interval, and not on the number of reuse times.
- If the values of both **password_reuse_time** and **password_reuse_max** are **0**, password reuse is not restricted.

Value range: an integer ranging from 0 to 1000

- **0** indicates that the password reuse times are not checked.
- A positive number indicates that the new password cannot be the one whose reuse times exceed the specified number.

Default value: **0**

password_lock_time

Parameter description: Specifies the duration before a locked account is automatically unlocked.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

The locking and unlocking functions take effect only when the values of **password_lock_time** and **failed_login_attempts** are positive numbers.

Value range: a floating point number ranging from 0 to 365. The unit is day. The integer part indicates the number of days, and the decimal part can be converted into hours, minutes, and seconds. For example, **password_lock_time=1.5** indicates one day and 12 hours.

- **0** indicates that an account is not automatically locked if the password verification fails.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- A positive number indicates the duration after which a locked account is automatically unlocked.

Default value: **1**

failed_login_attempts

Parameter description: Specifies the maximum number of incorrect password attempts before an account is locked. The account will be automatically unlocked after the time specified by **password_lock_time**. Only the **sysadmin** user can access the account. The automatic account locking policy applies in scenarios such as login and password modification using the **ALTER USER** command.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

The locking and unlocking functions take effect only when the values of **failed_login_attempts** and **password_lock_time** are positive numbers.

Value range: an integer ranging from 0 to 1000

- **0** indicates that the automatic locking function does not take effect.
- A positive number indicates that an account is locked when the number of incorrect password attempts reaches the value of **failed_login_attempts**.

Default value: **10**

password_encryption_type

Parameter description: Specifies the encryption type of a user password. Changing the value of this parameter does not change the password encryption type of existing users. The new encryption type is applied to passwords of new users or passwords modified after the parameter value is changed.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: 0, 1, 2, or 3

- **0** indicates that passwords are encrypted with MD5.
- **1** indicates that passwords are encrypted with SHA-256 and MD5.
- **2** indicates that passwords are encrypted with SHA-256.
- **3** indicates that the passwords are encrypted in sm3 mode.

NOTICE

The MD5 encryption algorithm is not recommended because it has lower security and poses security risks.

Default value: 2

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

password_min_length

Parameter description: Specifies the minimum length of an account password. Only the **sysadmin** user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer. A password can contain 6 to 999 characters.

Default value: **8**

password_max_length

Parameter description: Specifies the maximum length of an account password. Only the **sysadmin** user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer. A password can contain 6 to 999 characters.

Default value: **32**

password_min_uppercase

Parameter description: Specifies the minimum number of uppercase letters that an account password must contain. Only the **sysadmin** user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 999

- **0** means no limit.
- A positive integer indicates the minimum number of uppercase letters required in a password when you create an account.

Default value: **0**

password_min_lowercase

Parameter description: Specifies the minimum number of lowercase letters that an account password must contain. Only the **sysadmin** user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 999

- **0** means no limit.
- A positive integer indicates the minimum number of lowercase letters in the password specified for creating an account.

Default value: **0**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

password_min_digital

Parameter description: Specifies the minimum number of digits that an account password must contain. Only the **sysadmin** user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 999

- **0** means no limit.
- A positive integer indicates the minimum number of digits in the password specified for creating an account.

Default value: **0**

password_min_special

Parameter description: Specifies the minimum number of special characters that an account password must contain. Only the **sysadmin** user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 999

- **0** means no limit.
- A positive integer indicates the minimum number of special characters required in a password when you create an account.

Default value: **0**

password_effect_time

Parameter description: Specifies the validity period of an account password.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a floating point number ranging from 0 to 999. The unit is day.

- **0** indicates that the validity period restriction is disabled.
- A floating point number from 1 to 999 indicates the number of days for which an account password is valid. When the password is about to expire or has expired, the system prompts the user to change the password.

Default value: **0**

password_notify_time

Parameter description: Specifies how many days in advance a user is notified before a password expires.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 999. The unit is day.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **0** indicates that the reminder is disabled.
- A positive integer indicates the number of days prior to password expiration that a user will receive a reminder.

Default value: **7**

19.3.3 Communication Library Parameters

This section describes parameter settings and value ranges for communication libraries.

tcp_keepalives_idle

Parameter description: Specifies the interval for transmitting keepalive signals on an OS that supports the **TCP_KEEPIDLE** socket option. If no keepalive signal is transmitted, the connection is in idle mode.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

- If the OS does not support **TCP_KEEPIDLE**, set this parameter to **0**.
- The parameter is ignored on an OS where connections are established using the Unix domain socket.

Value range: 0 to 3600. The unit is s.

Default value: **1min**

tcp_keepalives_interval

Parameter description: Specifies the response time before retransmission on an OS that supports the **TCP_KEEPINTVL** socket option.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: 0 to 180. The unit is s.

Default value: **30**

NOTICE

- If the OS does not support **TCP_KEEPINTVL**, set this parameter to **0**.
- The parameter is ignored on an OS where connections are established using the Unix domain socket.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

tcp_keepalives_count

Parameter description: Specifies the number of keepalive signals that can be waited before the GaussDB server is disconnected from the client on an OS that supports the **TCP_KEEPCNT** socket option.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

- If the OS does not support **TCP_KEEPCNT**, set this parameter to **0**.
- The parameter is ignored on an OS where connections are established using the Unix domain socket.

Value range: 0 to 100. **0** indicates that the connection is immediately broken if GaussDB does not receive a keepalived signal from the client.

Default value: 20

tcp_user_timeout

Parameter description: Specifies the maximum duration for which the transmitted data can remain in the unacknowledged state before the TCP connection is forcibly closed when the GaussDB sends data on the OS that supports the TCP_USER_TIMEOUT socket option.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

- If the OS does not support the TCP_USER_TIMEOUT option, the value of this parameter does not take effect. The default value is **0**.
- The parameter is ignored on an OS where connections are established using the Unix domain socket.

Value Range: 0 to 3600000. The unit is ms. The value **0** indicates that the value is set based on the OS.

Default value: **0**

Note that the effective result of this parameter varies according to the OS kernel.

- For AArch64 EulerOS (Linux kernel version: 4.19), the timeout interval is the value of this parameter.
- For x86 Euler 2.5 (Linux kernel version: 3.10), the timeout interval is not the value of this parameter but the maximum value in different ranges. That is, the timeout interval is the maximum upper limit of the total Linux TCP retransmission duration to which the value of **tcp_user_timeout** belongs. For example, if **tcp_user_timeout** is set to **40000**, the total retransmission duration is 51 seconds.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 19-1 Value of tcp_user_timeout for x86 Euler 2.5 (Linux kernel version: 3.10)

Number of Linux TCP Retransmission Times	Total Linux TCP Retransmission Duration Range (s)	Example of tcp_user_timeout (ms)	Actual Linux TCP Retransmission Duration (s)
1	(0.2,0.6]	400	0.6
2	(0.6,1.4]	1000	1.4
3	(1.4,3]	2000	3
4	(3,6.2]	4000	6.2
5	(6.2,12.6]	10000	12.6
6	(12.6,25.4]	20000	25.4
7	(25.4,51]	40000	51
8	(51,102.2]	80000	102.2
9	(102.2,204.6]	150000	204.6
10	(204.6,324.6]	260000	324.6
11	(324.6,444.6]	400000	444.6

Note: The duration of each TCP retransmission increases exponentially with the number of retransmission times. When the duration of a TCP retransmission reaches 120 seconds, the duration of each subsequent retransmission does not change.

comm_tcp_mode

Parameter description: Specifies whether the communication library uses the TCP or SCTP (Due to specification changes, the current version no longer supports the current feature. Do not use this feature.) to set up a data channel. The parameter setting takes effect after you restart the cluster.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

SCTP is no longer supported. This parameter is provided for compatibility, but its value is fixed at **on**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: Boolean. If this parameter is set to **on** for CNs, the CNs connect to DNs using TCP. If this parameter is set to **on** for DNs, the DNs communicate with each other using TCP.

Default value: **on**

comm_sctp_port

Parameter description: Specifies the TCP or SCTP port used to listen on data packet channels by the TCP proxy communication library or SCTP communication library. (Due to specification changes, the current version no longer supports the current feature. Do not use this feature.)

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

This port number is automatically allocated during cluster deployment. Do not change the parameter. If the port number is incorrectly configured, the database communication fails.

Value range: an integer ranging from 0 to 65535

Default value: **25110** (The actual value is the specified value of the **port** parameter plus 2.)

comm_control_port

Parameter description: Specifies the TCP listening port used by the TCP proxy communication library or SCTP communication library. (Due to specification changes, the current version no longer supports the current feature. Do not use this feature.)

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

This port number is automatically allocated during cluster deployment. Do not change the parameter. If the port number is incorrectly configured, the database communication fails.

Value range: an integer ranging from 0 to 65535

Default value: **25111** (The actual value is the specified value of the **port** parameter plus 3.)

comm_max_datanode

Parameter description: Specifies the maximum number of DNs supported by the TCP proxy communication library.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 8192

Default value: maximum number of primary DNs supported by each node

Recommended value: **256**

comm_max_stream

Parameter description: Specifies the maximum number of concurrent data streams supported by the TCP proxy communication library. The value of this parameter must be greater than: Number of concurrent data streams x Number of operators in each stream x Square of smp.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 60000

Default value: 1024

NOTICE

- You are advised not to set this parameter to a large value because this will cause high memory usage (256 bytes x **comm_max_stream** x **comm_max_datanode**). If the number of concurrent data streams is large, the query is complex and the SMP is large, resulting in insufficient memory.
- If the process memory is sufficient, you can properly increase the value of **comm_max_stream**.

comm_max_receiver

Parameter description: Specifies the maximum number of receiver threads for the TCP proxy communication library.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 50

Default value: 4

comm_quota_size

Parameter description: Specifies the maximum size of packets that can be consecutively sent by the TCP proxy communication library. When you use a 1GE NIC, a small value ranging from 20 KB to 40 KB is recommended.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2048000. The default unit is KB.

Default value: **1 MB**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

comm_usable_memory

Parameter description: Specifies the maximum memory available for buffering on the TCP proxy communication library on a DN.

NOTICE

This parameter must be set based on environment memory and the deployment method. If it is too large, an out-of-memory (OOM) exception may occur. If it is too small, the performance of the TCP proxy communication library or SCTP communication library may deteriorate.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 100 x 1024 to 1073741823. The default unit is KB.

Default value: **4000 MB**

comm_memory_pool

Parameter description: Specifies the size of the memory pool resources that can be used by the TCP proxy communication library on a DN.

NOTICE

If the memory used by the communication library is small, set this parameter to a small value. Otherwise, set it to a large value.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 100 x 1024 to 1073741823. The default unit is KB.

Default value: **2000 MB**

comm_memory_pool_percent

Parameter description: Specifies the percentage of the memory pool resources that can be used by the TCP proxy communication library on a DN. This parameter is used to adaptively reserve memory used by the communication libraries.

NOTICE

If the memory used by the communication library is small, set this parameter to a small value. Otherwise, set it to a large value.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: an integer ranging from 0 to 100

Default value: **0**

comm_client_bind

Parameter description: Specifies whether to bind the client of the communication library to a specified IP address when the client initiates a connection.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the client is bound to a specified IP address.
- **off** indicates that the client is not bound to any IP addresses.

NOTICE

If multiple IP addresses of a node in the cluster are on the same network segment, set this parameter to **on**. In this case, the client is bound to the IP address specified by **listen_addresses**. The concurrency performance of the cluster depends on the number of random ports because a port can be used by only one client at a time.

Default value: **off**

comm_no_delay

Parameter description: Specifies whether to use the **NO_DELAY** attribute of a communication library connection.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

NOTICE

If packet loss occurs because a large number of packets are received per second, set this parameter to **off** so that small packets are combined into large packets for transmission to reduce the total number of packets.

Default value: **off**

comm_debug_mode

Parameter description: Specifies whether to enable the debug mode of the TCP proxy communication library, that is, whether to print logs about the communication layer.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

If this parameter is set to **on**, a huge number of logs will be printed, adding extra overhead and reducing database performance. Therefore, set it to **on** only in debugging scenarios.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the debug logs of the communication library are printed.
- **off** indicates that the debug logs of the communication library are not printed.

Default value: **off**

comm_ackchk_time

Parameter description: Specifies the duration after which the communication library server automatically triggers ACK when no data packet is received.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 20000. The unit is ms. **0** indicates that automatic ACK triggering is disabled.

Default value: **2000** (2s)

comm_timer_mode

Parameter description: Specifies whether to enable the timer mode of the TCP proxy communication library, that is, whether to print timer logs in each phase of the communication layer.

NOTICE

If this parameter is set to **on**, a huge number of logs will be printed, adding extra overhead and reducing database performance. Therefore, set it to **on** only in debugging scenarios.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the timer logs of the communication library are printed.
- **off** indicates that the timer logs of the communication library are not printed.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

comm_stat_mode

Parameter description: Specifies whether to enable the statistics mode of the TCP proxy communication library, that is, whether to print statistics about the communication layer.

NOTICE

If this parameter is set to **on**, a huge number of logs will be printed, adding extra overhead and reducing database performance. Therefore, set it to **on** only in debugging scenarios.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the statistics logs of the communication library are printed.
- **off** indicates that the statistics logs of the communication library are not printed.

Default value: **off**

enable_stateless_pooler_reuse

Parameter description: Specifies whether to enable the reuse of the pooler connection pool. After the parameter is enabled, existing idle TCP connections can be reused. The setting takes effect after the cluster is restarted.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** or **true** indicates that the pooler reuse mode is enabled.
- **off** or **false** indicates that the pooler reuse mode is disabled.

NOTICE

This parameter should be set to a same value on CNs and DNs. If this parameter is set to **off** for CNs and **on** for DNs, the cluster communication fails. Set this parameter to the same value for CNs and DNs. Restart the cluster for the setting to take effect.

Default value: **on**

comm_cn_dn_logic_conn

Parameter description: Specifies whether logical connections are used between CNs and DNs. The setting takes effect after the cluster is restarted.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: Boolean

- **on** or **true** indicates that the connections between CNs and DNs are logical, with the libcomm component in use.
- **off** or **false** indicates that the connections between CNs and DNs are physical, with the libpq component in use.

NOTICE

Logical connections between CNs and DNs are no longer supported. This parameter is provided for compatibility, but its value is fixed at **off**.

Default value: **off**

COMM_IPC

Parameter description: Specifies whether to print the packet sending and receiving status of each communication node.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1. **Value range**: Boolean

- **on** or **true** indicates that the function of logging packet sending and receiving status data is enabled.
- **off** or **false** indicates that the function of logging packet sending and receiving status data is disabled.

NOTICE

set logging_module='on(COMM_IPC)'; --Enabled

set logging_module='off(COMM_IPC)'; --Disabled

show logging_module; -- View the setting result.

If this parameter is set to **on**, a huge number of logs will be printed, adding extra overhead and reducing database performance. Therefore, set it to **on** only in debugging scenarios and set it to **off** after debugging.

Default value: **off**

COMM_PARAM

Parameter description: Specifies whether to print the **session** parameter settings during node communication.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

- **on** or **true** indicates that the function of logging the **session** parameter settings is enabled.
- **off** or **false** indicates that the function of logging the **session** parameter settings is disabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

set logging_module='on(COMM_PARAM)'; --Enabled

set logging_module='off(COMM_PARAM)'; --Disabled

show logging_module; -- View the setting result.

If this parameter is set to **on**, a huge number of logs will be printed, adding extra overhead and reducing database performance. Therefore, set it to **on** only in debugging scenarios and set it to **off** after debugging.

Default value: **off**

19.4 Resource Consumption

19.4.1 Memory

This section describes memory parameters.

NOTICE

These parameters, except **local_syscache_threshold**, take effect only after the database restarts.

memorypool_enable

Parameter description: Specifies whether to enable a memory pool.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the memory pool is enabled.
- **off** indicates that the memory pool is disabled.

Default value: **off**

memorypool_size

Parameter description: Specifies the memory pool size.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 128 x 1024 to 1073741823. The unit is KB.

Default value: **512 MB**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_memory_limit

Parameter description: Specifies whether to enable the logical memory management module.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the logical memory management module is enabled.
- **off** indicates that the logical memory management module is disabled.

Default value: **on**

> ⚠ CAUTION
>
> - If the value of **max_process_memory** minus **shared_buffer** minus **cstore_buffers** minus metadata size is less than 2 GB, GaussDB forcibly sets **enable_memory_limit** to **off**. Metadata is the memory used in GaussDB and is related to some concurrent parameters, such as max_connections, thread_pool_attr and max_prepared_transactions.
> - If this parameter is set to **off**, the memory used by the database is not limited. When a large number of concurrent or complex queries are performed, too much memory is used, which may cause OS OOM problems.

max_process_memory

Parameter description: Specifies the maximum physical memory of a database node.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 2097152 to 2147483647. The unit is KB.

Default value:

Independent deployment: 360 GB (60-core CPU/480 GB memory); 192 GB (32-core CPU/256 GB memory); 96 GB (16-core CPU/128 GB memory); 40 GB (8-core CPU/64 GB memory); 20 GB (4-core CPU/32 GB memory); 10 GB (4-core CPU/16 GB memory)

Setting suggestions:

On DNs, the value of this parameter is determined based on the physical system memory and the number of primary DNs deployed on a single node. Parameter value = (Physical memory – **vm.min_free_kbytes**) x 0.7/(n + Number of primary DNs). This parameter is used to prevent node OOM caused by memory usage increase, ensuring system reliability. **vm.min_free_kbytes** indicates the OS memory reserved for the kernel to receive and send data. Its value is at least 5% of the total memory. Therefore, the value of **max_process_memory** is: Physical memory x 0.665/(*n* + Number of primary DNs). When the number of nodes in the cluster is less than or equal to 256, *n* = 1. When the number of nodes in the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

cluster is greater than 256 and less than or equal to 512, *n* = 2. When the number of nodes in the cluster is greater than 512, *n* = 3.

You can set this parameter on CNs to the same value as that on DNs.

RAM is the maximum memory allocated to the cluster. It equals the physical memory of servers.

CAUTION

If this parameter is set to a value greater than the physical memory of the server, the OS OOM problem may occur.

local_syscache_threshold

Parameter description: Specifies the size of system catalog cache in a session.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

- If **enable_global_plancache** is set to **on**, **local_syscache_threshold** does not take effect when it is set to a value less than 16 MB to ensure that GPC (The current feature is a lab feature. Contact Huawei technical support before using it.) takes effect. The minimum value is 16 MB.
- If **enable_global_syscache** and **enable_thread_pool** are enabled, this parameter indicates the total cache size of the current thread and sessions bound to the current thread.

Value range: an integer ranging from 1 x 1024 to 512 x 1024. The unit is KB.

Default value:

- Independent deployment: **16 MB**

enable_memory_context_control

Parameter description: Enables the function of checking whether the amount of memory contexts exceeds the specified limit. This parameter applies only to the DEBUG version.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the function of checking the amount of memory contexts is enabled.
- **off** indicates that the function of checking the amount of memory contexts is disabled.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

uncontrolled_memory_context

Parameter description: Specifies which memory texts will not be checked when the **enable_memory_context_control** parameter is set to **on**. This parameter applies only to the DEBUG version.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

During the query, the title meaning string "MemoryContext white list:" is added to the beginning of the parameter value.

Value range: a string

Default value: empty

shared_buffers

Parameter description: Specifies the size of shared memory used by GaussDB. Increasing the value of this parameter causes GaussDB to request more System V shared memory than the default configuration allows.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 16 to 1073741823. The unit is 8 KB.

The minimum value changes according to **BLCKSZ**.

Default value:

Independent deployment:

CN: 4 GB (60-core CPU/480 GB memory); 2 GB (32-core CPU/256 GB memory, 16-core CPU/128 GB memory); 1 GB (8-core CPU/64 GB memory); 512 MB (4-core CPU/32 GB memory) 256 MB (4-core CPU/16 GB memory)

DN: 140 GB (60-core CPU/480 GB memory); 76 GB (32-core CPU/256 GB memory); 40 GB (16-core CPU/128 GB memory); 16 GB (8-core CPU/64 GB memory); 8 GB (4-core CPU/32 GB memory); 4 GB (4-core CPU/16 GB memory)

Setting suggestions:

1. Set this parameter on DNs to a value greater than that on CNs because most queries in GaussDB are pushed down.
2. Set **shared_buffers** to a value less than 40% of the memory. Set it to a large value for row-store tables and a small value for column-store tables. For column-store tables: **shared_buffers** = (Memory of a single server/Number of DNs on the single server) x 0.4 x 0.25
3. If **shared_buffers** is set to a larger value, increase the value of **checkpoint_segments** because a longer period of time is required to write a large amount of new or changed data.
4. If the process fails to be restarted after the value of **shared_buffers** is changed, perform either of the following operations based on the error information:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

a. Adjust the **kernel.shmall**, **kernel.shmmax**, and **kernel.shmmin** OS parameters. For details, see "Preparing for Installation > Modifying OS Configuration > Configuring Other OS Parameters" in *Installation Guide*.

b. Run the **free -g** command to check whether the available memory and swap space of the OS are sufficient. If the memory is insufficient, manually stop other user programs that occupy much memory.

c. Do not set **shared_buffers** to an excessively large or small value.

segment_buffers

Parameter description: Specifies the memory size of a GaussDB segment-page metadata page.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 16 to 1073741823. The unit is 8 KB.

The value of **segment_buffers** must be an integer multiple of **BLCKSZ**. Currently, **BLCKSZ** is set to **8 KB**. That is, the value of **segment_buffers** must be an integer multiple of 8 KB. The minimum value changes according to **BLCKSZ**.

Default value: **8 MB**

Setting suggestions:

- **segment_buffers** is used to cache the content of segment-paged headers, which is key metadata information. To improve performance, it is recommended that the segment headers of common tables be cached in the buffer and not be replaced. You are advised to set this parameter based on the following formula: Number of tables (including indexes and toast tables) x Number of partitions x 3 + 128. This is because each table (partition) has some extra metadata segments. Generally, a table has three segments. At last, **+128** is added because segment-page tablespace management requires a certain number of buffers.
- If this parameter is set to a small value, it takes a long time to create a segment-page table for the first time. Therefore, you are advised to set this parameter to the recommended value.

bulk_write_ring_size

Parameter description: Specifies the size of a ring buffer used for parallel data import.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 16384 to 2147483647. The unit is KB.

Default value: **2 GB**

Setting suggestions: Increase the value of this parameter on DNs if a huge amount of data will be imported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

standby_shared_buffers_fraction

Parameter description: Specifies the **shared_buffers** proportion used on the server where a standby instance is deployed.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a double-precision floating-point number ranging from 0.1 to 1.0

Default value: 1

temp_buffers

Parameter description: Specifies the maximum size of local temporary buffers used by a database session.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

This parameter can be modified only before the first use of temporary tables within each session. Subsequent attempts to change the value of this parameter will not take effect on that session.

A session allocates temporary buffers based on the value of **temp_buffers**. If a large value is set in a session that does not require many temporary buffers, only the overhead of one buffer descriptor is added. If a buffer is used, additional 8192 bytes will be consumed for it.

Value range: an integer ranging from 100 to 1073741823. The unit is 8 KB.

Default value: **1 MB**

max_prepared_transactions

Parameter description: Specifies the maximum number of transactions that can stay in the **prepared** state simultaneously. Increasing the value of this parameter causes GaussDB to request more System V shared memory than the default configuration allows.

When GaussDB is deployed as an HA system, set this parameter on standby servers to a value greater than or equal to that on primary servers. Otherwise, queries will fail on the standby servers.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 262143

Default value:

- Independent deployment:

  1200 (60-core CPU/480 GB memory and 32-core CPU/256 GB memory); 800 (16-core CPU/128 GB memory); 400 (8-core CPU/64 GB memory); 300 (4-core CPU/32 GB memory); 200 (4-core CPU/16 GB memory)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

To avoid failures in the preparation step, the value of this parameter must be greater than the number of worker threads in **thread_pool_attr** in thread pool mode. In non-thread pool mode, the value of this parameter must be greater than or equal to the value of **max_connections**.

work_mem

Parameter description: Specifies the amount of memory to be used by internal sort operations and hash tables before they write data into temporary disk files. Sort operations are required for **ORDER BY**, **DISTINCT**, and merge joins. Hash tables are used in hash joins, hash-based aggregation, and hash-based processing of **IN** subqueries.

In a complex query, several sort or hash operations may run in parallel; each operation will be allowed to use as much memory as this parameter specifies. If the memory is insufficient, data will be written into temporary files. In addition, several running sessions could be performing such operations concurrently. Therefore, the total memory used may be many times the value of **work_mem**.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 64 to 2147483647. The unit is KB.

Default value:

- Independent deployment:

  128 MB (60-core CPU/480 GB memory, 32-core CPU/256 GB memory, and 16-core CPU/128 GB memory); 64 MB (8-core CPU/64 GB memory); 32 MB (4-core CPU/32 GB memory); 16 MB (4-core CPU/16 GB memory)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

Setting suggestions:

If the physical memory specified by **work_mem** is insufficient, additional operator calculation data will be written into temporary tables based on query characteristics and the degree of parallelism. This reduces performance by five to ten times, and prolongs the query response time from seconds to minutes.

- For complex serial queries, each query requires five to ten associated operations. Set **work_mem** using the following formula: **work_mem** = 50% of the memory/10.
- For simple serial queries, each query requires two to five associated operations. Set **work_mem** using the following formula: **work_mem** = 50% of the memory/5.
- For concurrent queries, set **work_mem** using the following formula: **work_mem** = **work_mem** for serial queries/Number of concurrent SQL statements.
- BitmapScan hash tables are also restricted by **work_mem**, but will not be forcibly flushed to disks. In the case of complete lossify, every 1-MB memory occupied by the hash table corresponds to a 16 GB page of BitmapHeapScan. After the upper limit of **work_mem** is reached, the memory increases linearly with the data access traffic based on this ratio.

query_mem

Parameter description: Specifies the memory used by a query.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: 0 or an integer greater than 32 MB. The default unit is KB.

Default value: **0**

NOTICE

- If the value of **query_mem** is greater than 0, the optimizer adjusts the memory cost estimate to this value when generating an execution plan.
- If the value is set to a negative value or a positive integer less than 32 MB, the default value **0** is used. In this case, the optimizer does not adjust the estimated query memory.

query_max_mem

Parameter description: Specifies the maximum memory that can be used by a query.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: 0 or an integer greater than 32 MB. The default unit is KB.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **0**

NOTICE

- If the value of **query_max_mem** is greater than 0, an error is reported when the query memory usage exceeds the value.
- If the value is set to a negative value or a positive integer less than 32 MB, the default value **0** is used. In this case, the optimizer does not limit the query memory.

maintenance_work_mem

Parameter description: Specifies the maximum amount of memory to be used by maintenance operations, such as **VACUUM**, **CREATE INDEX**, and **ALTER TABLE ADD FOREIGN KEY**. This parameter may affect the execution efficiency of **VACUUM**, **VACUUM FULL**, **CLUSTER**, and **CREATE INDEX**.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1024 to 2147483647. The unit is KB.

Default value:

- Independent deployment:

  CN: 1 GB (60-core CPU/480 GB memory); 512 MB (32-core CPU/256 GB memory); 256 MB (16-core CPU/128 GB memory); 128 MB (8-core CPU/64 GB memory); 64 MB (4-core CPU/32 GB memory);32 MB (4-core CPU/16 GB memory)

  DN: 2 GB (60-core CPU/480 GB memory); 1 GB (32-core CPU/256 GB memory); 512 MB (16-core CPU/128 GB memory); 256 MB (8-core CPU/64 GB memory); 128 MB (4-core CPU/32 GB memory); 64 MB (4-core CPU/16 GB memory)

NOTICE

Setting suggestions:

- The value of this parameter must be greater than that of **work_mem** so that database dumps can be more quickly cleared or restored. In a database session, only one maintenance operation can be performed at a time. Maintenance is usually performed when there are not many running sessions.
- When the **Automatic Vacuuming** process is running, up to **autovacuum_max_workers** times this memory may be allocated. In this case, set **maintenance_work_mem** to a value greater than or equal to that of **work_mem**.
- If a large amount of data is to be clustered, increase the value of this parameter in the session.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

psort_work_mem

Parameter description: Specifies the memory capacity to be used for partial sorting in a column-store table before writing to temporary disk files. This parameter can be used for inserting tables having a partial cluster key or index, creating a table index, and deleting or updating a table.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

Several running sessions could be performing such operations concurrently. Therefore, the total memory used may be many times the value of **psort_work_mem**.

Value range: an integer ranging from 64 to 2147483647. The unit is KB.

Default value: **512 MB**

max_loaded_cudesc

Parameter description: Specifies the number of cudesc cached in each column when a column-store table is scanned. Increasing the value will improve query performance and increase memory usage, particularly when there are many columns in the column-store table.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

If **max_loaded_cudesc** is set to a large value, memory may be insufficient.

Value range: 100 to 1073741823

Default value: 1024

max_stack_depth

Parameter description: Specifies the maximum safe depth of the GaussDB execution stack. The safety margin is required because the stack depth is not checked in every routine in the server, but only in key potentially-recursive routines, such as expression evaluation.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 100 to 2147483647. The unit is KB.

Default value:

- If the value of **ulimit -s** minus 640 KB is greater than or equal to 2 MB, the default value of this parameter is **2 MB**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If the value of **ulimit -s** minus 640 KB is less than 2 MB, the default value of this parameter is the value of **ulimit -s** minus 640 KB.

NOTICE

When setting this parameter, comply with the following principles:

- The database needs to reserve 640 KB stack depth. Therefore, the maximum value of this parameter is the actual stack size limit enforced by the OS kernel (as set by **ulimit -s**) minus 640 KB.
- If the value of this parameter is greater than the value of **ulimit -s** minus 640 KB before the database is started, the database fails to be started. During database running, if the value of this parameter is greater than the value of **ulimit -s** minus 640 KB, this parameter does not take effect.
- If the value of **ulimit -s** minus 640 KB is less than the minimum value of this parameter, the database fails to be started.
- Setting this parameter to a value greater than the actual kernel limit means that a running recursive function may crash an individual backend process.
- Since not all OSs provide this function, you are advised to set a specific value for this parameter.
- The default value is **2 MB**, which is relatively small and does not easily cause system breakdown.

cstore_buffers

Parameter description: Specifies the shared buffer size used in column-store tables.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 16384 to 1073741823. The unit is KB.

Default value: **32 MB**

Setting suggestions:

Column-store tables use the shared buffer specified by **cstore_buffers** instead of that specified by **shared_buffers**. When column-store tables are mainly used, reduce the value of **shared_buffers** and increase that of **cstore_buffers**.

bulk_read_ring_size

Parameter description: Specifies the ring buffer size used for parallel data export.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 256 to 2147483647. The unit is KB.

Default value: **16 MB**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_early_free

Parameter description: Specifies whether the operator memory can be released in advance.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the operator memory can be released in advance.
- **off** indicates that the operator memory cannot be released in advance.

Default value: **on**

memory_trace_level

Parameter description: Specifies the control level for recording memory allocation information after the dynamic memory usage exceeds 90% of the maximum dynamic memory. This parameter takes effect only when the GUC parameters **use_workload_manager** and **enable_memory_limit** are enabled. This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: enumerated values

- **none**: indicates that memory application information is not recorded.
- **level1**: After the dynamic memory usage exceeds 90% of the maximum dynamic memory, the following information is recorded and the recorded memory information is saved in the *$GAUSSLOG*/**mem_log** directory.
  - Global memory overview.
  - Memory usage of the top 20 memory contexts of the instance, session, and thread types.
  - The **totalsize** and **freesize** columns for each memory context.
- **level2**: After the dynamic memory usage exceeds 90% of the maximum dynamic memory, the following information is recorded and the recorded memory information is saved in the *$GAUSSLOG*/**mem_log** directory.
  - Global memory overview.
  - Memory usage of the top 20 memory contexts of the instance, session, and thread types.
  - The **totalsize** and **freesize** columns for each memory context.
  - Detailed information about all memory applications in each memory context, including the file where the allocated memory is located, line number, and size.

Default value: **level1**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- If this parameter is set to **level2**, the memory allocation details (file, line, and size) of each memory context are recorded, which greatly affects the performance. Therefore, exercise caution when setting this parameter.
- The recorded memory snapshot information can be queried by using the system function **gs_get_history_memory_de...**.
- If the **use_workload_manager** parameter is disabled and the **bypass_workload_manager** parameter is enabled, this parameter also takes effect. The **bypass_workload_manager** parameter is of the SIGHUP type; therefore, after the reload mode is set, you need to restart the database for the setting to take effect.
- The recorded memory context is obtained after all memory contexts of the same type with the same name are summarized.

resilience_memory_reject_percent

Parameter description: Specifies the dynamic memory usage percentage for escape from memory overload. This parameter takes effect only when the GUC parameters **use_workload_manager** and **enable_memory_limit** are enabled. This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string, consisting of one or more characters

This parameter consists of **recover_memory_percent** and **overload_memory_percent**. The meanings of the two parts are as follows:

- **recover_memory_percent**: Percentage of the dynamic memory usage when the memory recovers from overload to the maximum dynamic memory. When the dynamic memory usage is less than the maximum dynamic memory multiplied by the value of this parameter, the overload escape function is disabled and new connections are allowed. The value ranges from 0 to 100. The value indicates a percentage.
- **overload_memory_percent**: Percentage of the dynamic memory usage to the maximum dynamic memory when the memory is overloaded. When the dynamic memory usage is greater than the maximum dynamic memory multiplied by the value of this parameter, the current memory is overloaded. In this case, the overload escape function is triggered to kill sessions and new connections are prohibited. The value ranges from 0 to 100. The value indicates a percentage.

Default value: **'0,0'**, indicating that the escape from memory overload function is disabled.

Example:

```
resilience_memory_reject_percent = '70,90'
```

When the memory usage exceeds 90% of the upper limit, new connections are forbidden and stacked sessions are killed. When the memory usage is less than 70% of the upper limit, session killing is stopped and new connections are allowed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- You can query the maximum dynamic memory and used dynamic memory in the **pv_total_memory_detail** view. **max_dynamic_memory** indicates the maximum dynamic memory, and **dynamic_used_memory** indicates the used dynamic memory.
- If this parameter is set to a small value, the escape from memory overload process is frequently triggered. As a result, ongoing sessions are forcibly logged out, and new connections fail to be connected for a short period of time. Therefore, exercise caution when setting this parameter based on the actual memory usage.
- If the **use_workload_manager** parameter is disabled and the **bypass_workload_manager** parameter is enabled, this parameter also takes effect. The **bypass_workload_manager** parameter is of the SIGHUP type; therefore, after the reload mode is set, you need to restart the database for the setting to take effect.
- The values of **recover_memory_percent** and **overload_memory_percent** can be **0** at the same time. In addition, the value of **recover_memory_percent** must be smaller than that of **overload_memory_percent**. Otherwise, the setting does not take effect.

19.4.2 Disk Space

This section describes the disk space parameters, which are used to set limits on the disk space for storing temporary files.

sql_use_spacelimit

Parameter description: Specifies the space size for files to be flushed to disks when a single SQL statement is executed on a single DN. The managed space includes the space occupied by ordinary tables, temporary tables, and intermediate result sets to be flushed to disks.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from –1 to 2147483647. The unit is KB. **–1** indicates no limit.

Default value: –1

temp_file_limit

Parameter description: Specifies the limit on the size of a temporary file spilled to disk in a session. The temporary file can be a sort or hash temporary file, or the storage file for a held cursor.

This is a session-level setting.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

This parameter does not apply to disk space used for temporary tables during the SQL query process.

Value range: an integer ranging from –1 to 2147483647. The unit is KB. **–1** indicates no limit.

Default value: **–1**

19.4.3 Kernel Resource Usage

This section describes kernel resource parameters. Whether these parameters take effect depends on OS settings.

max_files_per_process

Parameter description: Specifies the maximum number of simultaneously open files allowed by each server process. If the kernel is enforcing a proper limit, setting this parameter is not required.

However, on some platforms, such as most Berkeley Software Distribution (BSD) systems, the kernel allows individual processes to open many more files than the system can support. If the message "Too many open files" is displayed, set this parameter to a smaller value. Generally, the system must meet this requirement: Number of file descriptors >= Maximum number of concurrent statements x Number of primary DNs of the current physical machine x **max_files_per_process** x 3

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 25 to 2147483647

Default value: **1024**

shared_preload_libraries

Parameter description: Specifies one or more shared libraries to be preloaded at server start. If multiple libraries are to be loaded, separate their names using commas (,). Only the **sysadmin** user can access this parameter. For example, **$libdir/mylib** will cause **mylib.so** (or on some platforms, **mylib.sl**) to be preloaded before the loading of the standard library directory.

You can preinstall the GaussDB stored procedure library using the **$libdir/pl***XXX* syntax as described in the preceding text. *XXX* can only be **pgsql**, **perl**, **tcl**, or **python**.

By preloading a shared library and initializing it as required, the library startup time is avoided when the library is first used. However, the time to start each new server process may increase, even if that process never uses the library. Therefore, set this parameter only for libraries that will be used in most sessions.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- If a specified library is not found, the GaussDB service will fail to start.
- Each GaussDB-supported library has a special mark that is checked to guarantee compatibility. Therefore, libraries that do not support GaussDB cannot be loaded in this way.

Value range: a string

Default value: **security_plugin**

19.4.4 Cost-based Vacuum Delay

This feature allows administrators to reduce the I/O impact of the **VACUUM** and **ANALYZE** statements on concurrent database activities. It is often more important to prevent maintenance statements, such as **VACUUM** and **ANALYZE**, from affecting other database operations than to run them quickly. Cost-based vacuum delay provides a way for administrators to achieve this purpose.

NOTICE

Certain vacuum operations hold critical locks and should be complete as quickly as possible. In GaussDB, cost-based vacuum delays do not take effect during such operations. To avoid uselessly long delays in such cases, the actual delay is the larger of the two calculated values:

- **vacuum_cost_delay** x **accumulated_balance**/**vacuum_cost_limit**
- **vacuum_cost_delay** x 4

Background

During the execution of the **ANALYZE | ANALYSE** and **VACUUM** statements, the system maintains an internal counter that keeps track of the estimated cost of the various I/O operations that are performed. When the accumulated cost reaches a limit (specified by **vacuum_cost_limit**), the process performing the operation will sleep for a short period of time (specified by **vacuum_cost_delay**). Then, the counter resets and the operation continues.

By default, this feature is disabled. To enable this feature, set **vacuum_cost_delay** to a positive value.

vacuum_cost_delay

Parameter description: Specifies the length of time that a process will sleep when **vacuum_cost_limit** has been exceeded.

On many systems, the effective resolution of the sleep length is 10 milliseconds. Therefore, setting this parameter to a value that is not a multiple of 10 has the same effect as setting it to the next higher multiple of 10.

This parameter is usually set to a small value, such as 10 or 20 milliseconds. Adjusting vacuum's resource consumption is best done by changing other vacuum cost parameters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 100. A positive number enables cost-based vacuum delay and **0** disables cost-based vacuum delay.

Default value:

vacuum_cost_page_hit

Parameter description: Specifies the estimated cost for vacuuming a buffer found in the shared buffer. It represents the cost to lock the buffer pool, look up the shared hash table, and scan the content of the page.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 10000

Default value: **1**

vacuum_cost_page_miss

Parameter description: Specifies the estimated cost for vacuuming a buffer read from the disk. It represents the cost to lock the buffer pool, look up the shared hash table, read the desired block from the disk, and scan the block.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 10000

Default value: 10

vacuum_cost_page_dirty

Parameter description: Specifies the estimated cost charged when vacuum modifies a block that was previously clean. It represents the extra cost required to update the dirty block out to the disk again.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 10000

Default value: 20

vacuum_cost_limit

Parameter description: Specifies the cost limit. The vacuuming process will sleep if this limit is exceeded.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 10000

Default value: **1000**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

19.4.5 Background Writer

This section describes background writer parameters. The background writer process is used to write dirty data (new or modified data) in shared buffers to disks. This mechanism ensures that database processes seldom or never need to wait for a write action to occur when handling user queries.

It also mitigates performance deterioration caused by checkpoints because only a few of dirty pages need to be flushed to the disk when the checkpoints arrive. This mechanism, however, increases the overall net I/O load because while a repeatedly-dirtied page may otherwise be written only once per checkpoint interval, the background writer may write it several times as it is dirtied in the same interval. In most cases, continuous light loads are preferred, instead of periodical load peaks. The parameters discussed in this section can be set based on actual requirements.

bgwriter_delay

Parameter description: Specifies the interval at which the background writer writes dirty shared buffers. Each time, the backend write process initiates write operations for some dirty buffers. In full checkpoint mode, the **bgwriter_lru_maxpages** parameter is used to control the amount of data to be written each time, and the process is restarted after *bgwriter_delay* ms hibernation. In incremental checkpoint mode, the number of target idle buffer pages is calculated based on the value of **candidate_buf_percent_target**. If the number of idle buffer pages is insufficient, a batch of pages are flushed to disks every *bgwriter_delay* ms. The number of flushed pages is calculated based on the target difference percentage. The maximum number of flushed pages is limited by **max_io_capacity**.

In many systems, the effective resolution of sleep delays is 10 milliseconds. Therefore, setting this parameter to a value that is not a multiple of 10 has the same effect as setting it to the next higher multiple of 10.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 10 to 10000. The unit is millisecond.

Default value: **2s**

Setting suggestion: Reduce this value in slow data writing scenarios to reduce the checkpoint load.

candidate_buf_percent_target

Parameter description: Specifies the expected percentage of available buffers in the shared_buffer memory buffer in the candidate buffer chain when the incremental checkpoint is enabled. If the number of available buffers in the current candidate chain is less than the target value, the bgwriter thread starts flushing dirty pages that meet the requirements.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a double-precision floating point number ranging from 0.1 to 0.85

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **0.3**

bgwriter_lru_maxpages

Parameter description: Specifies the number of dirty buffers the background writer can write in each round.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 1000

NOTE

When this parameter is set to **0**, the background writer is disabled. This setting does not affect checkpoints.

Default value: **100**

bgwriter_lru_multiplier

Parameter description: Specifies the coefficient used to estimate the number of dirty buffers the background writer can write in the next round.

The number of dirty buffers written in each round depends on the number of buffers used by server processes during recent rounds. The estimated number of buffers required in the next round is calculated using the following formula: Average number of recently used buffers x **bgwriter_lru_multiplier**. The background writer writes dirty buffers until sufficient, clean and reusable buffers are available. The number of buffers the background writer writes in each round is always equal to or less than **bgwriter_lru_maxpages**.

Therefore, the value **1.0** represents a just-in-time policy of writing exactly the number of dirty buffers predicted to be required. Larger values provide some cushion against spikes in demand, whereas smaller values intentionally leave more writes to be done by server processes.

Smaller values of **bgwriter_lru_maxpages** and **bgwriter_lru_multiplier** reduce the extra I/O load caused by the background writer, but make it more likely that server processes will have to issue writes for themselves, delaying interactive queries.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a floating point number ranging from 0 to 10

Default value: 2

pagewriter_thread_num

Parameter description: Specifies the number of threads for background page flushing after the incremental checkpoint is enabled. Dirty pages are flushed in sequence to disks, promoting recovery points.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: an integer ranging from 1 to 16

Default value: **4**

dirty_page_percent_max

Parameter description: Specifies the percentage of dirty pages to **shared_buffers** after the incremental checkpoint is enabled. When the value of this parameter is reached, the background page flush thread flushes dirty pages based on the maximum value of max_io_capacity.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a floating point number ranging from 0.1 to 1

Default value: **0.9**

pagewriter_sleep

Parameter description: Specifies the interval for the pagewriter thread to flush dirty pages to disks after the incremental checkpoint is enabled. When the ratio of dirty pages to shared_buffers reaches dirty_page_percent_max, the number of pages in each batch is calculated based on the value of max_io_capacity. In other cases, the number of pages in each batch decreases proportionally.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 3600000. The unit is ms.

Default value: **2000 ms(2s)**

max_io_capacity

Parameter description: Specifies the I/O upper limit per second for the backend write process to flush pages in batches. Set this parameter based on the service scenario and the disk I/O capability. If the RTO is short or the data volume is many times that of the shared memory and the service access data volume is random, the value of this parameter cannot be too small. A small value of **max_io_capacity** reduces the number of pages flushed by the backend write process. If a large number of pages are eliminated due to service triggering, the services are affected.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 30720 to 10485760. The unit is KB.

Default value: **500 MB/s**

enable_consider_usecount

Parameter description: Specifies whether the backend thread considers the page popularity during page replacement. You are advised to enable this parameter in large-capacity scenarios.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

- **on**/**true**: The page popularity is considered.
- **off**/**false**: The page popularity is not considered.

Default value: **off**

dw_file_num

Parameter description: Specifies the number of doublewrite files to be written in batches. The value is related to **pagewriter_thread_num** and cannot be greater than the value of **pagwriter_thread_num**. If the value is too large, it will be corrected to the value of **pagewriter_thread_num**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in Table 11-1.

Value range: an integer ranging from 1 to 16

Default value: **1**

dw_file_size

Parameter description: Specifies the size of each doublewrite file.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in Table 11-1.

Value range: an integer, in the range [32,256]

Default value: **256**

19.4.6 Asynchronous I/O Operations

enable_adio_debug

Parameter description: Specifies whether O&M personnel are allowed to generate some ADIO logs to locate ADIO issues. This parameter is used only by developers. Common users are advised not to use it. Due to specification changes, the current version no longer supports the current feature. Do not use this feature.

This parameter is a SUSET parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

- **on** or **true** indicates that generation of ADIO logs is allowed.
- **off** or **false** indicates that generation of ADIO logs is disallowed.

Default value: **off**

NOTE

This parameter cannot be enabled on in the current version. Even if it is manually enabled, the system automatically disables it.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_adio_function

Parameter description: Specifies whether to enable the ADIO function. Due to specification changes, the current version no longer supports the current feature. Do not use this feature.

NOTE

The current version does not support the asynchronous I/O function. This function is disabled by default. Do not modify the setting.

Value range: Boolean

- **on** or **true** indicates that the function is enabled.
- **off** or **false** indicates that the function is disabled.

Default value: **off**

enable_fast_allocate

Parameter description: Specifies whether quick disk space allocation is enabled. Due to specification changes, the current version no longer supports the current feature. Do not use this feature.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**. This function can be enabled only in the XFS file system.

Value range: Boolean

- **on** or **true** indicates that the function is enabled.
- **off** or **false** indicates that the function is disabled.

Default value: **off**

prefetch_quantity

Parameter description: Specifies the amount of the I/O that the row-store prefetches using the ADIO. Due to specification changes, the current version no longer supports the current feature. Do not use this feature.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 128 to 131072. The unit is 8 KB.

Default value: **32 MB** (4096 x 8 KB)

backwrite_quantity

Parameter description: Specifies the amount of I/O that the row-store writes using the ADIO. Due to specification changes, the current version no longer supports the current feature. Do not use this feature.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 128 to 131072. The unit is 8 KB.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **8 MB** (1024 x 8 KB)

cstore_prefetch_quantity

Parameter description: Specifies the amount of I/O that the column-store prefetches using the ADIO. Due to specification changes, the current version no longer supports the current feature. Do not use this feature.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1024 to 1048576. The unit is KB.

Default value: **32 MB**

cstore_backwrite_quantity

Parameter description: Specifies the amount of I/O that the column-store writes using the ADIO. Due to specification changes, the current version no longer supports the current feature. Do not use this feature.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1024 to 1048576. The unit is KB.

Default value: **8 MB**

cstore_backwrite_max_threshold

Parameter description: Specifies the maximum amount of buffer I/O that the column-store writes in the database using the ADIO. Due to specification changes, the current version no longer supports the current feature. Do not use this feature.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 4096 to 1073741823. The unit is KB.

Default value: **2 GB**

fast_extend_file_size

Parameter description: Specifies the disk size that the row-store pre-scales using the ADIO. Due to specification changes, the current version no longer supports the current feature. Do not use this feature.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1024 to 1048576. The unit is KB.

Default value: **8 MB**

effective_io_concurrency

Parameter description: Specifies the number of requests that can be simultaneously processed by a disk subsystem. For the RAID array, the parameter

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

value must be the number of disk drive spindles in the array. Due to specification changes, the current version no longer supports the current feature. Do not use this feature.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 1000

Default value: **1**

checkpoint_flush_after

Parameter description: Specifies the threshold for the number of pages flushed by the checkpointer thread. If the threshold is exceeded, the operating system is instructed to flush the pages cached in the operating system asynchronously. In GaussDB, the disk page size is 8 KB.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 256. **0** indicates that the asynchronous flush function is disabled. The size of a single page is 8 KB. For example, if the value is **32**, the checkpointer thread continuously writes 32 disk pages (that is, 32 x 8 = 256 KB) before asynchronous flush.

Default value: **256KB** (32 pages)

bgwriter_flush_after

Parameter description: Specifies the threshold for the number of pages flushed by the background writer thread. If the number of pages exceeds the threshold, the background writer thread instructs the operating system to asynchronously flush the pages cached in the operating system to disks. In GaussDB, the disk page size is 8 KB.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 256. **0** indicates that the asynchronous flush function is disabled. The size of a single page is 8 KB. For example, if the value is **64**, the background writer thread continuously writes 64 disk pages (that is, 64 x 8 = 512 KB) before asynchronous flush.

Default value: **512 KB** (64 pages)

backend_flush_after

Parameter description: Specifies the threshold for the number of pages flushed by the backend thread. If the number of pages exceeds the threshold, the backend thread instructs the operating system to asynchronously flush the pages cached in the operating system to disks. In GaussDB, the disk page size is 8 KB.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 256. **0** indicates that the asynchronous flush function is disabled. For example, if the value is **64**, the backend thread

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

continuously writes 64 disk pages (that is, 64 x 8 = 512 KB) before asynchronous flush.

Default value: **0**

19.5 Parallel Data Import

GaussDB provides a parallel data import function that enables a large amount of data to be imported in a fast and efficient manner. This section describes parameters for importing data in parallel.

raise_errors_if_no_files

Parameter description: Specifies whether to distinguish between the problems "the number of imported file records is empty" and "the imported file does not exist". If this parameter is set to **on** and the problem "the imported file does not exist" occurs, GaussDB will report the error message "file does not exist".

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the messages of "the number of imported file records is empty" and "the imported file does not exist" are distinguished when files are imported.
- **off** indicates that the messages of "the number of imported file records is empty" and "the imported file does not exist" are the same when files are imported.

Default value: **off**

partition_mem_batch

Parameter description: In order to optimize the inserting of column-store partitioned tables in batches, the data is buffered during the inserting process and then written in the disk. You can specify the number of caches through **partition_mem_batch**. If the value is too large, much memory will be consumed. If it is too small, the performance of inserting column-store partitioned tables in batches will deteriorate.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: 1 to 65535

Default value: **256**

partition_max_cache_size

Parameter description: In order to optimize the inserting of column-store partitioned tables in batches, the data is buffered during the inserting process and then written in the disk. You can specify the data buffer cache size through **partition_max_cache_size**. If the value is too large, much memory will be

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

consumed. If it is too small, the performance of inserting column-store partitioned tables in batches will deteriorate.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range:

4096 to 1073741823. The unit is KB.

Default value: **2GB**

gds_debug_mod

Parameter description: Specifies whether to enable the debug function of Gauss Data Service (GDS). This parameter is used to better locate and analyze GDS faults. After the debug function is enabled, types of packets received or sent by GDS, peer end of GDS during command interaction, and other interaction information about GDS are written into the logs of corresponding nodes in the cluster. In this way, the state switching on the GaussDB state machine and the current state are recorded. If this function is enabled, additional log I/O resources will be consumed, affecting log performance and validity. You are advised to enable this function only when locating GDS faults.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range:

- **on** indicates that the GDS debug function is enabled.
- **off** indicates that the GDS debug function is disabled.

Default value: **off**

enable_delta_store

Parameter description: Specifies whether to enable delta tables for column-store tables. Delta tables will improve the performance of importing a single piece of data to a column-store table and prevent table bloating. If this parameter is set to **on**, data to be imported to a column-store table will be stored in the delta table when the data volume is less than **DELTAROW_THRESHOLD** specified in table definition and otherwise will be stored in CUs of the main table. This parameter affects all operations involving data transfer of column-store tables, including **INSERT**, **COPY**, **VACUUM**, **VACUUM FULL**, **VACUUM DELTAMERGE**, and data redistribution.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range:

- **on** indicates that delta tables are enabled.
- **off** indicates that delta tables are disabled.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

safe_data_path

Parameter description: Specifies the path prefix restriction except for the initial user. Currently, the restrictions are posed on COPY and advanced package paths. The path cannot end with a slash (/) or contain periods (..).

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string of up to 4096 characters

Default value: **NULL**

enable_copy_server_files

Parameter description: Specifies whether to enable the permission to copy server files.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the permission to copy server files is enabled.
- **off** indicates that the permission to copy server files is disabled.

Default value: **off**

NOTICE

When the **enable_copy_server_files** parameter is disabled, only the initial user is allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME** statement. When the **enable_copy_server_files** parameter is enabled, users with the **SYSADMIN** permission or users who inherit the **gs_role_copy_files** permission of the built-in role are allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME** statement.

19.6 Write Ahead Log

19.6.1 Settings

wal_level

Parameter description: Specifies the level of information to be written to the WAL. The value cannot be empty or commented out.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- To enable WAL archiving and data streaming replication between primary and standby servers, set this parameter to **archive**, **hot_standby**, or **logical**.
- If this parameter is set to **archive** or **minimal**, **hot_standby** must be set to **off**. In a distributed environment, **hot_standby** cannot be set to **off**. Therefore, you are not advised to set this parameter to **archive** or **minimal**. Otherwise, the database cannot be started.

Value range: enumerated values

- **minimal**

  Advantages: Certain bulk operations (including creating tables and indexes, executing cluster operations, and copying tables) are safely skipped in logging, which can make those operations much faster.

  Disadvantages: WALs contain only basic information required for recovery from a database server crash or an emergency shutdown. Data cannot be restored from archived WALs.

- **archive**

  Adds logging required for WAL archiving, supporting the database restoration from archives.

- **hot_standby**
  - Further adds information required to run SQL queries on a standby server and takes effect after a server restart.
  - To enable read-only queries on a standby server, the **wal_level** parameter must be set to **hot_standby** on the primary server and the same value must be set on the standby server. There are few measurable differences in performance between using **hot_standby** and **archive** levels. However, feedback is welcome if any differences in their impacts on product performance are noticeable.

- **logical**

  Only when this parameter is set to **logical**, logical logs can be parsed and the primary key information is recorded in Xlogs.

Default value: **hot_standby**

fsync

Parameter description: Specifies whether the GaussDB server uses the **fsync()** function (see **wal_sync_method**) to ensure that updates can be written to disks in a timely manner.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- Using the **fsync()** function ensures that the data can be recovered to a known state when an OS or a hardware crashes.
- Setting this parameter to **off** may result in unrecoverable data corruption in a system crash.

Value range: Boolean

- **on** indicates that the **fsync()** function is used.
- **off** indicates that the **fsync()** function is not used.

Default value: **on**

synchronous_commit

Parameter description: Specifies the synchronization mode of the current transaction.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Generally, logs generated by a transaction are synchronized in the following sequence:

1. The primary node writes the logs to the local memory.
2. The primary node writes the logs in the local memory to the local file system.
3. The primary node flushes the logs in the local file system to disks.
4. The primary node sends the logs to the standby node.
5. The standby node receives the logs and saves them to the local memory.
6. The standby node writes the logs in the local memory to the local file system.
7. The standby node flushes the logs in the local file system to disks.
8. The standby node replays the logs to complete the incremental update of data files.

Value range: enumerated values

- **on** (**true**, **yes**, **1**): The primary node waits for the standby node to flush logs to disks before committing a transaction.
- **off** (**false**, **no**, **0**): The primary node commits a transaction without waiting for the primary node to flush logs to disks. This mode is also called asynchronous commit.
- **local**: The primary node waits for the primary node to flush logs to disks before committing a transaction. This mode is also called local commit.
- **remote_write**: The primary node waits for the standby node to write logs to the file system before committing a transaction. (The logs do not need to be flushed to disks.)
- **remote_receive**: The primary node waits for the standby node to receive logs before committing a transaction. (The logs do not need to be written to the file system.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **remote_apply**: The primary node waits for the standby node to complete log replay before committing a transaction.
- **true**: same as **on**.
- **false**: same as **off**.
- **yes**: same as **on**.
- **no**: same as **off**.
- **1**: same as **on**.
- **0**: same as **off**.
- **2**: same as **remote_apply**.

Default value: **on**

wal_sync_method

Parameter description: Specifies the method used for forcing WAL updates out to disk.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

If **fsync** is set to **off**, the setting of this parameter does not take effect because WAL file updates will not be forced out to disk.

Value range: enumerated values

- **open_datasync** indicates that WAL files are opened with the **O_DSYNC** option.
- fdatasync indicates that **fdatasync()** is called at each commit. (SUSE 10 and SUSE 11 are supported.)
- **fsync_writethrough** indicates that **fsync()** is called at each commit to force data in the buffer to be written to the disk.

  NOTE

  wal_sync_method can be set to **fsync_writethrough** on a Windows platform, but this setting has the same effect as setting the parameter to **fsync**.
- **fsync** indicates that **fsync()** is invoked at each commit (SUSE 10 and SUSE 11 are supported).
- **open_sync** indicates that the **open()** with the O_SYNC option is used to write WAL files (SUSE 10 and SUSE 11 are supported).

  NOTE

  Not all platforms support the preceding parameters.

Default value: fdatasync

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

full_page_writes

Parameter description: Specifies whether the GaussDB server writes the entire content of each disk page to WALs during the first modification of that page after a checkpoint.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

- This parameter is needed because a page write that is in process during an OS crash might be only partially completed, leading to an on-disk page that contains a mix of old and new data. The row-level change data normally stored in WALs will not be enough to completely restore such a page during post-crash recovery. Storing the full page image guarantees that the page can be correctly restored, but at the price of increasing the amount of data that must be written to WALs.
- Setting this parameter to **off** might lead to unrecoverable data corruption after a system failure. It might be safe to set this parameter to **off** if you have hardware (such as a battery-backed disk controller) or file-system software (such as ReiserFS 4) that reduces the risk of partial page writes to an acceptably low level.

Value range: Boolean

- **on** indicates that this feature is enabled.
- **off** indicates that this feature is disabled.

Default value: **on**

wal_log_hints

Parameter description: Specifies whether to write an entire page to WALs during the first modification of that page after a checkpoint, even for non-critical modifications of so-called hint bits. You are advised not to modify the setting.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the entire page is written to WALs.
- **off** indicates that the entire page is not written to WALs.

Default value: **on**

wal_buffers

Parameter description: Specifies the number of **XLOG_BLCKSZ** used for storing WAL data. The size of each **XLOG_BLCKSZ** is 8 KB.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: –1 to 2^{18}. The minimum value is –1 and the maximum value is 262144. The unit is 8 KB.

- If this parameter is set to **–1**, the value of **wal_buffers** is automatically adjusted based on the value of **shared_buffers**. The default value is 1/32 of **shared_buffers**. If the value is less than 8, it will be forcibly set to **8**. If the value is greater than 2048, it will be forcibly set to **2048**.
- If this parameter is set to a value other than **–1** and smaller than **4**, the value **4** is forcibly used.
- Independent deployment: 1 GB (60-core CPU/480 GB memory and 32-core CPU/256 GB memory); 512 MB (16-core CPU/128 GB memory); 256 MB (8-core CPU/64 GB memory); 128 MB (4-core CPU/32 GB memory); 64 MB (4-core CPU/16 GB memory)

Setting suggestions: The content of the WAL buffers is written to disks at every transaction commit, so extremely large values are unlikely to provide a significant increase in system performance. However, setting this parameter to hundreds of megabytes can improve the disk write performance on a server to which a large number of transactions are committed at the same time. The default value meets user requirements in most cases.

wal_writer_delay

Parameter description: Specifies the delay between activity rounds for the WAL writer.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

A longer delay might lead to insufficient WAL buffer and a shorter delay leads to continuously writing of the WALs, thereby increasing the load of disk I/O.

Value range: an integer ranging from 1 to 10000. The unit is millisecond.

Default value: **200 ms**

commit_delay

Parameter description: Specifies the duration for committed data to be stored in the WAL buffer.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- When this parameter is set to a non-zero value, the committed transaction is stored in the WAL buffer instead of being written to the WAL immediately. Then the WAL writer process flushes the buffer out to disks periodically.
- If system load is high, other transactions are probably ready to be committed within the delay. If no other transactions are ready to be committed, the delay is a waste of time.

Value range: an integer ranging from 0 to 100000. The unit is μs. **0** indicates no delay.

Default value: **0**

commit_siblings

Parameter description: Specifies a threshold on the number of concurrent open transactions. If the number of concurrent open transactions is greater than the value of this parameter, a transaction that initiates a commit request will wait for a period of time specified by **commit_delay**. Otherwise, this transaction is written into WALs immediately.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 1000

Default value: **5**

wal_block_size

Parameter description: Specifies the size of a WAL disk block.

This parameter is a fixed INTERNAL parameter and cannot be modified.

Value range: an integer. The unit is byte.

Default value: **8192**

wal_segment_size

Parameter description: Specifies the size of a WAL segment file.

This parameter is a fixed INTERNAL parameter and cannot be modified.

Value range: an integer. The unit is 8 KB.

Default value: **16 MB** (2048 x 8 KB)

force_promote

Parameter description: Specifies whether to enable the forcible switchover function on the standby node.

When a cluster is faulty, the forcible switchover enables the cluster to recover services as soon as possible at the cost of losing some data. This is an escape

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

method used when the cluster is unavailable. You are not advised to trigger this method frequently. You are not advised not to use this function if you are not clear about the impact of data loss on services.

To use this function, you need to enable it on the DN and CM Server and restart the cluster for the setting to take effect. For details about how to enable the forcible switchover function on the standby node, see "Emergency Handling > Performing a Forcible Primary/Standby Switchover" in *Troubleshooting*.

Value range: an integer. The value can be **0** (disabled) or **1** (enabled).

Default value: **0**

wal_file_init_num

Parameter description: Specifies the number of Xlog segment files created by the WAL writer assistant thread at a time.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 0 to 1000000

Default value: **10**

wal_debug

Parameter description: Specifies whether to output WAL-related debugging information. This parameter is available only when **WAL_DEBUG** is enabled during compilation.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

Default value: **false**

walwriter_cpu_bind

Parameter description: Sets the number of CPU cores bound to the WAL writer thread.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from –1 to 2147483647

Default value: **–1**

walwriter_sleep_threshold

Parameter description: Specifies the number of times that the idle Xlog is refreshed before the Xlog refresher enters sleep.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 50000

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **500**

wal_flush_timeout

Parameter description: Specifies the timeout interval for traversing **WalInsertStatusEntryTbl**. It is the maximum wait time for the adaptive Xlog disk flushing I/O to traverse **WalInsertStatusEntryTbl**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

NOTICE

If the timeout interval is too long, the Xlog flushing frequency may decrease, reducing the Xlog processing performance.

Value range: an integer ranging from 0 to 90000000 (μs)

Default value: **2**

wal_flush_delay

Parameter description: Specifies the wait interval when an entry in the **WAL_NOT_COPIED** state is encountered during **WalInsertStatusEntryTbl** traversal.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 0 to 90000000 (μs)

Default value: **1**

19.6.2 Checkpoints

checkpoint_segments

Parameter description: Specifies the minimum number of WAL segment files in the period specified by **checkpoint_timeout**. The size of each log file is 16 MB.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 2147483646

Increasing the value of this parameter speeds up the export of a large amount of data. Set this parameter based on **checkpoint_timeout** and **shared_buffers**. This parameter affects the number of WAL segment files that can be reused. Generally, the maximum number of reused files in the **pg_xlog** folder is twice the number of **checkpoint_segments**. The reused files are not deleted and are renamed to the WAL segment files which will be later used.

Default value: **1024**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

checkpoint_timeout

Parameter description: Specifies the maximum time between automatic WAL checkpoints.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 30 to 3600. The unit is s.

If the value of **checkpoint_segments** is increased, you need to increase the value of this parameter. The increase of these two parameters further requires the increase of **shared_buffers**. Consider all these parameters during setting.

Default value: **15min**

checkpoint_completion_target

Parameter description: Specifies the target of checkpoint completion.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a double-precision floating point number ranging from 0.0 to 1.0

Default value: **0.5**

NOTE

0.5 indicates that each checkpoint should be complete within 50% of the interval between checkpoints.

checkpoint_warning

Parameter description: Specifies a time in seconds. If the checkpoint interval is close to this time due to filling of checkpoint segment files, a message is sent to the server log to suggest an increase in the **checkpoint_segments** value.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647. The unit is s. **0** indicates that the warning is disabled.

Default value: **5min**

Recommended value: **5min**

checkpoint_wait_timeout

Parameter description: Sets the longest time that the checkpoint waits for the checkpointer thread to start.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 2 to 3600. The unit is s.

Default value: **1min**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_incremental_checkpoint

Parameter description: Specifies whether to enable incremental checkpoint.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

Default value: **on**

enable_double_write

Parameter description: Specifies whether to enable the doublewrite buffer. When the incremental checkpoint is enabled, the doublewrite buffer instead of **full_page_writes** is used to prevent partial page writes.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

Default value: **on**

incremental_checkpoint_timeout

Parameter description: Specifies the maximum interval between automatic WAL checkpoints when the incremental checkpoint is enabled.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 3600. The unit is second.

Default value: **1min**

enable_xlog_prune

Parameter description: Specifies whether the primary node reclaims logs if the size of Xlogs exceeds the value of **max_size_for_xlog_prune** when any standby node is disconnected.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- If this parameter is set to **on**, the primary node reclaims logs when any standby node is disconnected.
- If this parameter is set to **off**, the primary node does not reclaim logs when any standby node is disconnected.

Default value: **on**

max_size_for_xlog_prune

Parameter description: This parameter takes effect when **enable_xlog_prune** is enabled. The working mechanism is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

1. If all standby nodes specified by the **replconninfo** series GUC parameters are connected to the primary node, this parameter does not take effect.
2. If any standby node specified by the **replconninfo** series GUC parameters is not connected to the primary node, this parameter takes effect. When the number of historical logs on the primary node is greater than the value of this parameter, the logs are forcibly recycled. Exception: In synchronous commit mode (that is, the value of **synchronous_commit** is not **local** or **off**), if there are connected standby nodes, the primary node retains the logs that meet the minimum log receiving requirements on the majority of standby nodes. In this case, the number of reserved logs may exceed the value of **max_size_for_xlog_prune**.
3. If any standby node is being built, this parameter does not take effect. All logs of the primary node are retained to prevent build failures due to log recycling.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647. The unit is KB.

Default value: **256GB**

max_redo_log_size

Parameter description: On standby DNs, this specifies the maximum size of logs between the latest checkpoint and the current log playback location. On the primary DN, this specifies the maximum size of logs between the recovery point and the latest log location. You are advised not to set this parameter to a large value if the RTO is concerned.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 163840 to 2147483647. The unit is KB.

Default value: **1048576**. The unit is KB.

19.6.3 Log Replay

recovery_time_target

Parameter description: Specifies the time for a standby server to write and replay logs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 3600. The unit is s.

0 indicates that log flow control is disabled. A value from **1** to **3600** indicates that a standby server can write and replay logs within the period specified by the value, so that the standby server can quickly assume the primary role. If this parameter is set to a small value, the performance of the primary server is affected. If it is set to a large value, the log flow is not effectively controlled.

Default value: **60**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

recovery_max_workers

Parameter description: Specifies the maximum number of concurrent replay threads.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 20

Default value: **4**

recovery_parallelism

Parameter description: Specifies the actual number of replay threads. This parameter is read-only.

This parameter is a POSTMASTER parameter and is affected by recovery_max_workers and recovery_parse_workers. If any value is greater than 0, recover_parallelism will be recalculated.

Value range: an integer ranging from 1 to 2147483647

Default value: **1**

recovery_parse_workers

Parameter description: Specifies the number of **ParseRedoRecord** threads for the ultimate RTO feature.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 16

recovery_parse_workers can be set to a value greater than 1 only when the ultimate RTO feature is enabled. In addition, it must be used together with **recovery_redo_workers**. If both **recovery_parse_workers** and **recovery_max_workers** are enabled, the setting of **recovery_parse_workers** prevails and the concurrent replay function is disabled. The ultimate RTO does not support primary/standby/secondary mode. The value of **recovery_parse_workers** can be greater than 1 only when **replication_type** is set to **1**. In addition, when ultimate RTO is enabled, ensure that the value of **wal_receiver_buffer_size** is greater than or equal to 32 MB (64 MB is recommended). This feature does not support column-store tables, either. Therefore, disable this feature in a system where column-store tables are used or are to be used.

Default value: **1**

NOTE

- After V500R001C00 is upgraded to V500R001C10 or a later version, you are advised to set this parameter to **2** and restart the DN.
- After ultimate RTO is enabled, the standby node will start more worker threads whose value is equal to the value of **recovery_parse_workers** x (the value of **recovery_redo_workers** + 2) + 5, occupying more CPU, memory, and I/O resources.
- In this version and later, the ultimate RTO does not have flow control. Flow control is controlled by the **recovery_time_target** parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

recovery_redo_workers

Parameter description: Specifies the number of **PageRedoWorker** threads corresponding to each **ParseRedoRecord** thread when the ultimate RTO feature is enabled.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 8

This parameter must be used together with **recovery_parse_workers**, and it takes effect only when **recovery_parse_workers** is set to a value greater than 1.

Default value: **1**

NOTE

After V500R001C00 is upgraded to V500R001C10 or a later version, you are advised to set parameters based on the number of CPUs in the environment and restart the DN. If the number of CPUs is less than 16, you are advised to set this parameter to **2**. If the number is greater than 16 and less than 32, you are advised to set this parameter to **4**. If the number is greater than 32, you are advised to set this parameter to **8**.

enable_page_lsn_check

Parameter description: Specifies whether to enable the data page LSN check. During replay, the current LSN of the data page is checked to see if it is the expected one.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

Default value: **on**

redo_bind_cpu_attr

Parameter description: Specifies the core binding operation of the replay thread. Only the **sysadmin** user can access this parameter. This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string, consisting of one or more characters

The available configuration modes are as follows: 1. **'nobind'**: The thread is not bound to a core. 2. **'nodebind: 1, 2'**: Use the CPU cores in NUMA groups 1 and 2 to bind threads. 3. **'cpubind: 0-30'**: Use the CPU cores 0 to 30 to bind threads. The value of this parameter is case-insensitive.

Default value: **'nobind'**

NOTE

This parameter is used for core binding in the Arm environment. You are advised to bind all replay threads to the same NUMA group for better performance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

19.6.4 Archiving

archive_mode

Parameter description: Specifies whether to archive WALs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

When **wal_level** is set to **minimal**, the **archive_mode** parameter is unavailable.

Value range: Boolean

- **on** indicates that the archiving is enabled.
- **off** indicates that the archiving is disabled.

Default value: **off**

archive_command

Parameter description: Specifies the command set by the administrator to archive WALs. You are advised to set the archive log path to an absolute path.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

- If both **archive_dest** and **archive_command** are configured, WALs are preferentially saved to the directory specified by **archive_dest**. The command configured by **archive_command** does not take effect.
- Any **%p** in the string is replaced by the absolute path of the file to archive, and any **%f** is replaced by only the file name. (The relative path is relative to the data directory.) Use **%%** to embed an actual **%** character in the command.
- This command returns zero only if it succeeds. The command example is as follows:

```
archive_command = 'cp --remove-destination %p /mnt/server/archivedir/%f'
```

- **--remove-destination** indicates that files will be overwritten during the archiving.
- If there are multiple archive commands, write them to the shell script file and set **archive_command** to the command for executing the script. Example:

```
-- Assume that multiple commands are as follows:
test ! -f dir/%f && cp %p dir/%f
-- The content of the test.sh script is as follows:
test ! -f dir/$2 && cp $1 dir/$2
-- The archive command is as follows:
archive_command='sh dir/test.sh %p %f'
```

Value range: a string

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: (disabled)

archive_dest

Parameter description: Specifies the path set by the administrator to archive WALs. You are advised to set the archive log path to an absolute path.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

- If both **archive_dest** and **archive_command** are configured, WALs are preferentially saved to the directory specified by **archive_dest**. The command configured by **archive_command** does not take effect.
- If the string is a relative path, it is relative to the data directory. Example:
  ```
  archive_dest = '/mnt/server/archivedir/'
  ```

Value range: a string

Default value: empty

archive_timeout

Parameter description: Specifies the archiving period.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

- The server is forced to switch to a new WAL segment file when the period specified by this parameter has elapsed since the last file switch.
- Archived files that are closed early due to a forced switch are still of the same length as full files. Therefore, a very short **archive_timeout** will bloat the archive storage. You are advised to set **archive_timeout** to **60s**.

Value range: an integer ranging from 0 to 1073741823. The unit is second. The value **0** indicates that the function is disabled.

Default value: **0**

archive_interval

Parameter description: Specifies the archiving interval.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- Log files are forcibly archived when the period specified by this parameter has elapsed.
- Archiving involves I/O operations. Therefore, frequent archiving is not allowed. In addition, the RPO cannot be set to a large value; otherwise, the PITR will be affected. You are advised to use the default value.

Value range: an integer ranging from 1 to 1000. The unit is second.

Default value: **1**

time_to_target_rpo

Parameter description: Specifies the maximum *time_to_target_rpo* seconds from the time when an exception occurs on the primary cluster to the time when data is archived to the OBS recovery point in dual-cluster remote DR mode.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 3600. The unit is s.

In dual-cluster remote DR mode, logs of the primary cluster are archived to OBS. **0** indicates that log flow control is disabled. 1 to 3600 indicates the maximum *time_to_target_rpo* seconds from the time when an exception occurs on the primary cluster to the time when data is archived to the recovery point of OBS. This ensures that the maximum duration of data loss is within the allowed range when the primary cluster breaks down due to a disaster. If this parameter is set to a small value, the performance of the primary server is affected. If it is set to a large value, the log flow is not effectively controlled.

Default value: **10**

19.7 HA Replication

19.7.1 Sending Server

max_wal_senders

Parameter description: Specifies the maximum number of simultaneously running WAL sender processes. The value cannot be greater than or equal to that of **max_connections**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

wal_level must be set to **archive**, **hot_standby**, or **logical** to allow the connection from standby servers.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: an integer ranging from 0 to 1024. The recommended value range is 8 to 100.

NOTE

This parameter can be set to 0 only when a single DN is used and there is no primary/standby instance.

Default value:

Setting suggestions: Each log replication connection between a standby server and a primary server occupies a WAL sender thread. Therefore, the value of this parameter must be greater than or equal to the number of DNs. Otherwise, the standby server cannot connect to the primary server. When logical replication is required, each log extraction thread occupies one WAL sender thread. If logical replication is required, set **max_wal_senders** to a value greater than the number of threads required by standby servers and logical replication extraction threads.

wal_keep_segments

Parameter description: Specifies the minimum number of transaction log files that can be retained in the **pg_xlog** directory. The standby node obtains the logs from the primary node to perform streaming replication.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 2 to *INT_MAX*

Default value: **128**

Setting suggestions:

- During WAL archiving or recovery from a checkpoint on the server, the system may retain more log files than the number specified by **wal_keep_segments**.
- If this parameter is set to an excessively small value, a transaction log may have been overwritten by a new transaction before requested by the standby server. As a result, the request fails and the connection between the primary and standby servers is terminated.
- If the HA system uses asynchronous transmission, increase the value of **wal_keep_segments** when data greater than 4 GB is continuously imported in COPY mode. Take T6000 board as an example. If the data to be imported reaches 50 GB, you are advised to set this parameter to **1000**. You can dynamically restore the setting of this parameter after data import is complete and the WAL synchronization is proper.

wal_sender_timeout

Parameter description: Specifies the maximum duration that the sending server waits for the WAL receiving in the receiver.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- If the data volume on the primary node is huge, the value of this parameter must be increased for rebuilding. For example, if the data volume on the primary node reaches 500 GB, you are advised to set this parameter to 600 seconds.
- This parameter cannot be set to a value larger than the value of **wal_receiver_timeout** or the timeout parameter for database rebuilding.

Value range: an integer ranging from 0 to 2147483647. The unit is ms.

Default value: **6s**

max_replication_slots

Parameter description: Specifies the number of log replication slots in the primary server.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 1024. The recommended value range is 8 to 100.

Default value: **20**

Setting suggestions:

NOTICE

When primary/standby replication, and backup and restoration are used, you are advised to set this parameter to: Number of current physical replication slots + Number of backup slots + Number of required logical replication slots.

If the actual value is smaller than the recommended value, these functions may be unavailable or abnormal.

Physical replication slots provide an automatic method to ensure that Xlog files are not removed from a primary DN before they are received by all the standby DNs, allowing high availability for the cluster. The number of physical replication slots required by the cluster is as follows: ratio of the number of standby DNs to the number of primary DNs in a group of DNs. For example, if the HA cluster has one primary DN and one standby DN, the number of physical replication slots required is 2. If the HA cluster has 1 primary DN and 3 standby DNs, the number of physical replication slots required is 3.

Backup slot records replication information during backup execution. Full backup and incremental backup correspond to two independent backup slots.

Plan the number of logical replication slots as follows:

- A logical replication slot can carry changes of only one database for decoding. If multiple databases are involved, create multiple logical replication slots.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If logical replication is needed by multiple target databases, create multiple logical replication slots in the source database. Each logical replication slot corresponds to one logical replication link.

max_keep_log_seg

Parameter description: Stream control parameter. In logical replication, physical logs are parsed and converted into logical logs locally on the DN. When the number of physical log files that are not parsed is greater than the value of this parameter, stream control is triggered. The value **0** indicates that the stream control function is disabled.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647

Default value: **0**

enable_wal_shipping_compression

Parameter description: Specifies whether to enable cross-cluster log compression in streaming DR mode.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

- This parameter applies only to a pair of WAL senders and WAL receivers for cross-cluster transmission in streaming DR and is configured in the primary cluster.

Value range: Boolean

- **true** indicates that cross-cluster log compression is enabled in streaming DR mode.
- **false** indicates that cross-cluster log compression is disabled in streaming DR mode.

Default value: **false**

repl_auth_mode

Parameter description: Specifies the validation mode for the primary/standby replication and standby node rebuilding.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- If UUID validation is enabled on the primary node and a non-null repl_uuid validation code is configured, UUID validation must also be enabled on the standby node and the same repl_uuid validation code must be configured on the standby node. Otherwise, requests for log replication between the primary and standby nodes and standby node rebuilding will be rejected by the primary node.
- The SIGHUP parameter can dynamically load new values. The modification does not affect the established primary/standby connection and takes effect for subsequent primary/standby replication requests and primary/standby rebuilding requests.
- It supports the standby node rebuild validation under the Quorum and DCF protocols and the primary/standby replication validation under the Quorum protocol. It does not support primary/standby replication validation under the DCF protocol.
- It does not support the authentication between the primary and standby nodes across clusters, including the primary/standby Dorado and DR clusters.
- The UUID validation function is used to prevent data crosstalk and pollution caused by incorrect connection between the primary and standby nodes. It is not used for security purposes.
- This parameter cannot be automatically synchronized between the primary and standby nodes.

Value range: enumerated values

- **off**: indicates that UUID validation is disabled.
- **default**: indicates that UUID validation is disabled.
- **uuid**: indicates that UUID validation is enabled.

Default value: **default**

repl_uuid

Parameter description: Specifies the UUID used for primary/standby UUID validation.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- If UUID validation is enabled on the primary node and a non-null repl_uuid validation code is configured, UUID validation must also be enabled on the standby node and the same repl_uuid validation code must be configured on the standby node. Otherwise, requests for log replication between the primary and standby nodes and standby node rebuilding will be rejected by the primary node.
- The SIGHUP parameter can dynamically load new values. The modification does not affect the established primary/standby connection and takes effect for subsequent primary/standby replication requests and primary/standby rebuilding requests.
- It supports the standby node rebuild validation under the Quorum and DCF protocols and the primary/standby replication validation under the Quorum protocol. It does not support primary/standby replication validation under the DCF protocol.
- It does not support the authentication between the primary and standby nodes across clusters, including the primary/standby Dorado and DR clusters.
- The UUID validation function is used to prevent data crosstalk and pollution caused by incorrect connection between the primary and standby nodes. It is not used for security purposes.
- This parameter cannot be automatically synchronized between the primary and standby nodes.

Value range: a string of 0 to 63 case-insensitive letters and digits. It is converted to lowercase letters for storage. An empty string indicates that UUID validation is disabled.

Default value: empty

replconninfo1

Parameter description: Specifies the information about the first node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string. An empty string indicates that no information about the first node is configured.

Default value: the first connection information listened on by the DN.

Example:

```
replconninfo1 = 'localhost=127.0.0.1 localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=127.0.0.1 remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX'
```

replconninfo2

Parameter description: Specifies the information about the second node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string. An empty string indicates that no information about the second node is configured.

Default value: information about the second connection listened to by the DN.

Example:

```
replconninfo2 = 'localhost=127.0.0.1 localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=127.0.0.1 remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX'
```

replconninfo3

Parameter description: Specifies the information about the third node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string. An empty string indicates that no information about the third node is configured.

Default value: information about the third connection listened to by the DN.

Example:

```
replconninfo3 = 'localhost=127.0.0.1 localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=127.0.0.1 remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX'
```

replconninfo4

Parameter description: Specifies the information about the fourth node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string. An empty string indicates that no information about the fourth node is configured.

Default value: information about the fourth connection listened to by the DN.

Example:

```
replconninfo4 = 'localhost=127.0.0.1 localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=127.0.0.1 remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX'
```

replconninfo5

Parameter description: Specifies the information about the fifth node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string An empty string indicates that no information about the fifth node is configured.

Default value: information about the fifth connection listened to by the DN.

Example:

```
replconninfo5 = 'localhost=127.0.0.1 localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=127.0.0.1 remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX'
```

replconninfo6

Parameter description: Specifies the information about the sixth node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string. An empty string indicates that no information about the sixth node is configured.

Default value: information about the sixth connection listened to by the DN.

Example:

```
replconninfo6 = 'localhost=127.0.0.1 localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=127.0.0.1 remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX'
```

replconninfo7

Parameter description: Specifies the information about the seventh node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string. An empty string indicates that no information about the seventh node is configured.

Default value: information about the seventh connection listened to by the DN.

Example:

```
replconninfo7 = 'localhost=127.0.0.1 localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=127.0.0.1 remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX'
```

19.7.2 Primary Server

synchronous_standby_names

Parameter description: Specifies a comma-separated list of names of potential standby servers that support synchronous replication.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- The current synchronous standby server is on the top of the list. If the current synchronous standby server is disconnected, it will be replaced immediately with the next-highest-priority standby server. Name of the next-highest-priority standby server is added to the list.
- The standby server name can be specified by setting the environment variable **PGAPPNAME**.

Value range: a string. If this parameter is set to *****, the name of any standby server that provides synchronous replication is matched. The value can be configured in the following format:

- ANY *num_sync* (*standby_name* [, ...])
- [FIRST] *num_sync* (*standby_name* [, ...])
- *standby_name* [, ...]

  NOTE

  - In the preceding command, *num_sync* indicates the number of standby nodes that need to wait for responses from the transaction, *standby_name* indicates the name of the standby node, and FIRST and ANY specify the policies for selecting standby nodes for synchronous replication from the listed servers.
  - **ANY N (dn_instanceId1, dn_instanceId2,...)** indicates that any *N* host names in the brackets are selected as the name list of standby nodes for synchronous replication. For example, **ANY 1(dn_instanceId1, dn_instanceId2)** indicates that any one of **dn_instanceId1** and **dn_instanceId2** is used as the standby node for synchronous replication.
  - **FIRST N (dn_instanceId1, dn_instanceId2, ...)** indicates that the first N primary node names in the brackets are selected as the standby node name list for synchronous replication based on the priority. For example, **FIRST 1 (dn_instanceId1, dn_instanceId2)** indicates that **dn_instanceId1** is selected as the standby node for synchronous replication.
  - The meanings of **dn_instanceId1, dn_instanceId2, ...** are the same as those of **FIRST 1 (dn_instanceId1, dn_instanceId2, ...)**.

If you use the gs_guc tool to set this parameter, perform the following operations:

```
gs_guc reload -Z datanode -N @NODE_NAME@ -D @DN_PATH@ -c "synchronous_standby_names='ANY NODE 1(dn_instanceId1, dn_instanceId2)'";
```

or

```
gs_guc reload -Z datanode -N @NODE_NAME@ -D @DN_PATH@ -c "synchronous_standby_names='ANY 1(AZ1, AZ2)'";
```

Default value: *****

most_available_sync

Parameter description: Specifies whether to block the primary server when the primary-standby synchronization fails.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on** indicates that the primary server is not blocked when the synchronization fails.
- **off** indicates that the primary server is blocked when the synchronization fails.

Default value: **off**

enable_stream_replication

Parameter description: Specifies whether data and logs are synchronized between primary and standby servers, and between primary and secondary servers.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

- This parameter is used for performance testing in scenarios where data synchronization to DN standby servers is enabled and where it is disabled. If this parameter is set to **off**, tests on abnormal scenarios, such as switchover and faults, cannot be performed to prevent inconsistency between the primary, standby, and secondary servers.
- This parameter is a restricted parameter, and you are advised not to set it to **off** in normal service scenarios.

Value range: Boolean

- **on** indicates that data and log synchronization is enabled.
- **off** indicates that data and log synchronization is disabled.

Default value: **on**

enable_mix_replication

Parameter description: Specifies how WAL files and data are replicated between primary and standby servers, and between primary and secondary servers.

This parameter is an INTERNAL parameter. Its default value is **off** and cannot be modified.

NOTICE

This parameter cannot be modified in normal service scenarios. That is, the WAL file and data page mixed replication mode is disabled by default.

Value range: Boolean

- **on** indicates that the WAL file and data page mixed replication mode is enabled.
- **off** indicates that the WAL file and data page mixed replication mode is disabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **off**

vacuum_defer_cleanup_age

Parameter description: Specifies the number of transactions by which **VACUUM** will defer the cleanup of invalid row-store table records, so that **VACUUM** and **VACUUM FULL** do not clean up deleted tuples immediately.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 1000000. **0** means no delay.

Default value: **0**

data_replicate_buffer_size

Parameter description: Specifies the amount of memory used by queues when the sender sends data pages to the receiver. The value of this parameter affects the buffer size used during the replication from the primary server to the standby server.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 4096 to 1072693248. The unit is KB.

Default value: **128 MB** (131072 KB)

walsender_max_send_size

Parameter description: Specifies the size of the WAL or Sender buffers on the primary server.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 8 to 1048575. The unit is KB.

Default value: **8 MB** (8192 KB)

enable_data_replicate

Parameter description: Specifies how data is synchronized between primary and standby servers when the data is imported to a row-store table.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the primary and standby servers synchronize data using data pages when the data is imported to a row-store table. When **replication_type** is set to **1**, this parameter cannot be set to **on**. If this parameter is set to **on** using the GUC tool, its value will be forcibly changed to **off**.
- **off** indicates that the primary and standby servers synchronize data using Xlogs when the data is imported to a row-store table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **off**

ha_module_debug

Parameter description: Specifies the replication status log of a specific data block during data replication.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the status of each data block is recorded in logs during data replication.
- **off** indicates that the status of each data block is not recorded in logs during data replication.

Default value: **off**

enable_incremental_catchup

Parameter description: Specifies the data catchup mode between the primary and standby servers.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the standby server uses the incremental catchup mode. That is, the standby server scans local data files on the standby server to obtain the list of differential data files between the primary and standby servers and then performs catchup between the primary and standby servers.
- **off** indicates that the standby server uses the full catchup mode. That is, the standby server scans all local data files on the primary server to obtain the list of differential data files between the primary and standby servers and then performs catchup between the primary and standby servers.

Default value: **on**

wait_dummy_time

Parameter description: Specifies the maximum duration for the primary server to wait for the standby and secondary servers to start and send the scanning lists when incremental data catchup is enabled in cluster.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 2147483647. The unit is second.

Default value: **300**

NOTE

The unit can only be second.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

catchup2normal_wait_time

Parameter description: Specifies the maximum duration that the primary server is blocked during the data catchup on the standby server in the case of a single synchronous standby server.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from –1 to 10000. The unit is ms.

- The value **–1** indicates that the primary server is blocked until the data catchup on the standby server is complete.
- The value **0** indicates that the primary server is not blocked during the data catchup on the standby server.
- Other values indicate the maximum duration that the primary server is blocked during the data catchup on the standby server. For example, if this parameter is set to **5000**, the primary server is blocked until the data catchup on the standby server is complete in 5s.

Default value: **–1**

hadr_recovery_time_target

Parameter description: Specifies whether the standby database instance completes log writing and replay in streaming DR mode.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 3600. The unit is second.

0 indicates that log flow control is disabled. A value from 1 to 3600 indicates that a standby node can write and replay logs within the period specified by **hadr_recovery_time_target**. This ensures that the logs can be written and replayed within the period specified by **hadr_recovery_time_target** and the standby database instance can be promoted to primary quickly. If this parameter is set to a small value, the performance of the primary node is affected. If it is set to a large value, the log flow is not effectively controlled.

Default value: 60 (financial edition (data computing))

hadr_recovery_point_target

Parameter description: Specifies the RPO time allowed for the standby database instance to flush logs to disks in streaming DR mode.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 3600. The unit is second.

0 indicates that log flow control is disabled. A value from 1 to 3600 indicates that the standby node can flush logs to disks within the period specified by **hadr_recovery_point_target**. This ensures that the log difference between the primary and standby database instances is controlled within the period specified by **hadr_recovery_point_target** during the switchover and the standby database

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

instance can be promoted to primary. If this parameter is set to a small value, the performance of the primary node is affected. If it is set to a large value, the log flow is not effectively controlled.

Default value: 10 (financial edition (data computing))

hadr_super_user_record_path

Parameter description: Specifies the path for storing encrypted files of the **hadr_disaster** user in the standby cluster in streaming DR mode. This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Modification suggestion: The value is automatically set by the streaming DR password transfer tool and does not need to be manually added.

Value range: a string

Default value: **NULL**

check_sync_standby

Parameter description: Specifies whether to enable the standby node check function. After the **synchronous_standby_names** parameter is correctly configured in the primary/standby scenario, if the synchronous standby node is faulty, the write service on the primary node reports a write failure. This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-2**.

Value range: on or **off**

- **on** indicates that the standby node check is enabled.
- **off** indicates that the standby node check is disabled.

Default value: **off**

NOTE

- This parameter cannot be synchronized in job work and autonomous transactions. Otherwise, the check may not take effect.
- If the standby node check is not configured for a specified user or session and the standby node is faulty when the forcible synchronization commission mode is enabled, the write operation on a table causes the query of the same table in another user or session to hang. In this case, you need to recover the standby node or manually terminate the hung client.
- The standby node check function cannot be enabled in scenarios (such as VACUUM ANALYZE and gs_clean) where non-write operations trigger log writing. If the standby node does not meet the requirements for synchronizing configurations to the standby node, services will be hung in this scenario. In this case, you need to manually terminate the services.

19.7.3 Standby Server

hot_standby

Parameter description: Specifies whether the standby server is allowed to accept connections and queries after it is restored to the minrecovery point.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

- If this parameter is set to **on**, **wal_level** must be set to **hot_standby** or higher. Otherwise, the database startup fails.
- In a distributed system, **hot_standby** cannot be set to **off**, because this setting can affect other features of the HA system.
- If the **hot_standby** parameter was disabled and the **wal_level** parameter was set to a value smaller than the value of **hot_standby**, perform the following operations to ensure that the logs to be replayed on the standby node can be queried on the standby node before enabling the **hot_standby** parameter again:
  1. Change the value of **wal_level** of the primary and standby nodes to the value of **hot_standby** or a higher value, and restart the instances for the change to take effect.
  2. Perform the checkpoint operation on the primary node and query the **pg_stat_get_wal_senders()** function to ensure that the value of **receiver_replay_location** of each standby node is the same as that of **sender_flush_location** of the primary node. Ensure that the value adjustment of **wal_level** is synchronized to the standby nodes and takes effect, and the standby nodes do not need to replay low-level logs.
  3. Set the **hot_standby** parameter of the primary and standby nodes to **on**, and restart the instances for the setting to take effect.

Value range: Boolean

- **on**: allowed.
- **off**: not allowed.

Default value: **on**

max_standby_archive_delay

Parameter description: Specifies the wait period before queries on a standby server are canceled when the queries conflict with WAL processing and archiving in hot standby mode.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

–1 indicates that the standby server waits until the conflicting queries are complete.

Value range: an integer ranging from –1 to 2147483647. The unit is ms.

Default value: **3s** (3000 ms)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

max_standby_streaming_delay

Parameter description: Specifies the wait period before queries on a standby server are canceled when the queries conflict with WAL data receiving through streaming replication in hot standby mode.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

–1 indicates that the standby server waits until the conflicting queries are complete.

Value range: an integer ranging from –1 to 2147483647. The unit is ms.

Default value: **3s** (3000 ms)

wal_receiver_status_interval

Parameter description: Specifies the maximum interval for notifying the primary server of the WAL Receiver status.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

If this parameter is set to **0**, the standby server does not send information, such as the log receiving location, to the primary server. As a result, the transaction commit on the primary server may be blocked, and the switchover may fail. In normal service scenarios, you are advised not to set this parameter to **0**.

Value range: an integer ranging from 0 to 2147483. The unit is s.

Default value: **5s**

hot_standby_feedback

Parameter description: Specifies whether a standby server is allowed to send the result of a query performed on it to the primary server, preventing a query conflict.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the standby server is allowed to send the result of a query performed on it to the primary server.
- **off** indicates that the standby server is not allowed to send the result of a query performed on it to the primary server.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **off**

wal_receiver_timeout

Parameter description: Specifies the maximum wait period for a standby server to receive data from the primary server.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647. The unit is ms.

Default value: **6s** (6000 ms)

wal_receiver_connect_timeout

Parameter description: Specifies the timeout period for a standby server to connect to the primary server.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483. The unit is s.

Default value: **2s**

wal_receiver_connect_retries

Parameter description: Specifies the maximum attempts that a standby server connects to the primary server

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 2147483647

Default value: **1**

wal_receiver_buffer_size

Parameter description: Specifies the memory buffer size for the standby and secondary servers to store the received XLOG files.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 4096 to 1047552. The unit is KB.

Default value: **64 MB** (65536 KB)

primary_slotname

Parameter description: Specifies the slot name of the primary server corresponding to a standby server. This parameter is used for the mechanisms to verify the primary-standby relationship and delete WALs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string

Default value: empty

enable_redo_atomic_operation

Parameter description: Specifies whether to use atomic operations or spinlocks to update the LSN of the current thread when parallel playback is enabled.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that atomic operations are used for update.
- **off** indicates that spinlocks are used for update.

Default value: **on**

19.8 Query Planning

This section describes the method configuration, cost constants, planning algorithm, and some configuration parameters for the optimizer.

NOTE

- Two parameters are involved in the optimizer:
  - *INT_MAX* indicates the maximum value of the INT data type. The value is **2147483647**.
  - *DBL_MAX* indicates the maximum value of the FLOAT data type.
- In addition to customer services, global query planning parameters also affect database O&M and monitoring services, such as WDR generation, scale-out, redistribution, and data import and export.

19.8.1 Optimizer Method Configuration

These configuration parameters provide a crude method of influencing the query plans chosen by the query optimizer. If the default plan chosen by the optimizer for a particular query is not optimal, a temporary solution is to use one of these configuration parameters to force the optimizer to choose a different plan. Better ways include adjusting the optimizer cost constants, manually running **ANALYZE**, increasing the value of the **default_statistics_target** configuration parameter, and increasing the amount of the statistics collected in specific columns using **ALTER TABLE SET STATISTICS**.

enable_bitmapscan

Parameter description: Controls the query optimizer's use of bitmap-scan plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on**: enabled.
- **off**: disabled.

Default value: **on**

force_bitmapand

Parameter description: Controls the query optimizer's use of BitmapAnd plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **off**

enable_hashagg

Parameter description: Controls the query optimizer's use of Hash aggregation plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **on**

enable_hashjoin

Parameter description: Controls the query optimizer's use of Hash-join plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **on**

enable_indexscan

Parameter description: Controls the query optimizer's use of index-scan plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **on**

enable_indexonlyscan

Parameter description: Controls the query optimizer's use of index-only-scan plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **on**

enable_material

Parameter description: Controls the query optimizer's use of materialization. It is impossible to suppress materialization entirely, but setting this variable to **off** prevents the optimizer from inserting materialized nodes.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **on**

enable_mergejoin

Parameter description: Controls the query optimizer's use of merge-join plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **off**

enable_nestloop

Parameter description: Controls the query optimizer's use of nested-loop join plan types to fully scan internal tables. It is impossible to suppress nested-loop

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

joins entirely, but setting this variable to **off** encourages the optimizer to choose other methods if available.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **off**

enable_index_nestloop

Parameter description: Controls the query optimizer's use of the index nested-loop join plan types to scan the parameterized indexes of internal tables.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **on**

enable_seqscan

Parameter description: Controls the query optimizer's use of sequential scan plan types. It is impossible to suppress sequential scans entirely, but setting this variable to **off** encourages the optimizer to choose other methods if available.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **on**

enable_sort

Parameter description: Controls the query optimizer's use of sort methods. It is impossible to suppress explicit sorts entirely, but setting this variable to **off** encourages the optimizer to choose other methods if available.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **on**

enable_tidscan

Parameter description: Controls the query optimizer's use of Tuple ID (TID) scan plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **on**

enable_kill_query

Parameter description: In CASCADE mode, when a user is deleted, all the objects belonging to the user are deleted. This parameter specifies whether the queries of the objects belonging to the user can be unlocked when the user is deleted.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the unlocking is allowed.
- **off** indicates that the unlocking is not allowed.

Default value: **off**

enable_stream_concurrent_update

Parameter description: Controls the use of stream in concurrent updates. This parameter is restricted by the **enable_stream_operator** parameter.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the optimizer can generate stream plans for the **UPDATE** statement.
- **off** indicates that the optimizer can generate only non-stream plans for the **UPDATE** statement.

Default value: **on**

enable_stream_operator

Parameter description: Controls the query optimizer's use of stream. When this parameter is set to **off**, a large number of logs indicating that the stream plans cannot be pushed down are recorded. If you do not need these logs, you are advised to set **enable_unshipping_log** to **off** when setting **enable_stream_operator** to **off**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value:

- Independent deployment: **off**

enable_stream_recursive

Parameter description: Specifies whether to push **WITH RECURSIVE** join queries to DNs for processing.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that **WITH RECURSIVE** join queries will be pushed down to DNs.
- **off** indicates that **WITH RECURSIVE** join queries will not be pushed down.

Default value: **on**

max_recursive_times

Parameter description: Specifies the maximum number of **WITH RECURSIVE** iterations.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647

Default value: **200**

enable_vector_engine

Parameter description: Controls the query optimizer's use of vectorized executor.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **on**

enable_broadcast

Parameter description: Controls the query optimizer's use of broadcast distribution method when it evaluates the cost of stream.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **on**

enable_change_hjcost

Parameter description: Specifies whether the optimizer excludes internal table running costs when selecting the Hash Join cost path. If it is set to **on**, tables with a few records and high running costs are more possible to be selected.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **off**

best_agg_plan

Parameter description: The query optimizer generates three plans for the aggregate operation under the stream:

1. hashagg+gather(redistribute)+hashagg
2. redistribute+hashagg(+gather)
3. hashagg+redistribute+hashagg(+gather)

This parameter is used to control the type of hashagg plans generated by the query optimizer.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 3

- **1** indicates that the first plan is forcibly generated.
- **2** indicates that the second plan is forcibly generated if the **group by** column can be redistributed. Otherwise, the first plan is generated.
- **3** indicates that the third plan is forcibly generated if the **group by** column can be redistributed. Otherwise, the first plan is generated.
- **0** indicates that the optimizer chooses an optimal plan based on the estimated costs of the three plans above.

Default value: **0**

agg_redistribute_enhancement

Parameter description: When the aggregate operation is performed, which contains multiple **group by** columns and none of the columns is the distribution

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

column, a **group by** column will be selected for redistribution. This parameter specifies the policy of selecting a redistribution column.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

- **on** indicates that the column that can be redistributed and evaluates the most distinct value is selected for redistribution.
- **off** indicates that the first column that can be redistributed is selected for redistribution.

Default value: **off**

enable_absolute_tablespace

Parameter description: Controls whether the tablespace can use an absolute path.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

- **on** indicates that an absolute path can be used.
- **off** indicates that an absolute path cannot be used.

Default value: **on**

enable_valuepartition_pruning

Parameter description: Specifies whether the DFS partitioned table is dynamically or statically optimized.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

- **on** indicates that the DFS partitioned table is dynamically or statically optimized.
- **off** indicates that the DFS partitioned table is not dynamically or statically optimized.

Default value: **on**

expected_computing_nodegroup

Parameter description: Specifies a compute node group or the way to choose such a group. The Node Group mechanism is now for internal use only. You do not need to set it.

During join or aggregation operations, a Node Group can be selected in four modes. In each mode, the specified candidate compute node groups are listed for the optimizer to select the most appropriate one for the current operator.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

- **optimal**: The list of candidate compute node groups consists of the node groups where the operator's operation objects are located and the node group that combines all DNs in the node groups on which the current user has the COMPUTE permission.
- **query**: The list of candidate compute node groups consists of the node groups where the operator's operation objects are located and the node group that combines all DNs in the node groups where base tables involved in the query are located.
- *Node group name* (when **enable_nodegroup_debug** is set to **off**): The list of candidate compute node groups consists of the node groups where the operator's operation objects are located and the specified node group.
- *Node group name* (when **enable_nodegroup_debug** is set to **on**): A specific node group is used as the compute node group.

Default value: **query**

enable_nodegroup_debug

Parameter description: Specifies whether the optimizer assigns computing workloads to a specific Node Group when multiple Node Groups exist in an environment. The Node Group mechanism is now for internal use only. You do not need to set it.

This parameter takes effect only when **expected_computing_nodegroup** is set to a specific Node Group.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that computing workloads are assigned to the Node Group specified by **expected_computing_nodegroup**.
- **off** indicates no Node Group is specified to compute.

Default value: **off**

stream_multiple

Parameter description: Specifies the weight used by the optimizer to calculate the final cost of stream operators.

The base stream cost is multiplied by this weight to obtain the final cost.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

This parameter is applicable only to Redistribute and Broadcast streams.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a floating point number ranging from 0 to *DBL_MAX*

Default value: **1**

qrw_inlist2join_optmode

Parameter description: Specifies whether to enable inlist-to-join (inlist2join) query rewriting.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

- **disable** indicates that the inlist2join query rewriting is disabled.
- **cost_base** indicates that the cost-based inlist2join query rewriting is enabled.
- **rule_base** indicates that the forcible rule-based inlist2join query rewriting is enabled.
- A positive integer indicates the threshold of inlist2join query rewriting. If the number of elements in the list is greater than the threshold, the rewriting is performed.

Default value: **cost_base**

skew_option

Parameter description: Specifies whether an optimization policy is used.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: enumerated values

- **off** indicates that the policy is disabled.
- **normal** indicates that a radical policy is used. All possible skews are optimized.
- **lazy** indicates that a conservative policy is used. Uncertain skews are ignored.

Default value: **normal**

enable_dngather

Parameter description: Specifies whether to calculate stream plans that meet the threshold on a single DN to reduce the number of planned stream nodes.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

dngather_min_rows

Parameter description: Specifies the maximum number of rows that control **dngather**. Values less than or equal to this parameter value can be calculated on a single DN. The prerequisite is that **enable_dngather** is enabled.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a floating point number ranging from –1 to DBL_MAX

Default value: **500.0**

cost_weight_index

Parameter description: Specifies the cost weight of index_scan.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a floating point number ranging from 1e-10 to 1e+10.

Default value: **1**

default_limit_rows

Parameter description: Specifies the default estimated number of limit rows for generating genericplan. If this parameter is set to a positive value, the positive value is used as the estimated number of limit rows. If this parameter is set to a negative value, the negative value is converted to a percentage and used as default estimated value, that is, -5 indicates 5%.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a floating point number ranging from –100 to DBL_MAX

Default value: **–10**

enforce_a_behavior

Parameter description: Controls the rule matching modes of regular expressions.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the A matching rule is used.
- **off** indicates that the POSIX matching rule is used.

Default value: **on**

enable_force_vector_engine

Parameter description: Specifies whether to forcibly generate vectorized execution plans for a vectorized execution operator if the operator's child node is a

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

non-vectorized operator. When this parameter is set to **on**, vectorized execution plans are forcibly generated.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that vectorized operators are forcibly generated.
- **off** indicates that the vectorized operator optimizer determines whether to perform vectorization.

Default value: **off**

try_vector_engine_strategy

Parameter description: Specifies the policy for processing row-store tables by using the vectorized executor. By setting this parameter, queries containing row-store tables can be converted to vectorized execution plans for calculation, improving the execution performance of complex queries in AP-like scenarios.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: enumerated values

- **off**: default value, which indicates that this function is disabled. That is, row-store tables will not be converted into vectorized execution plans for execution.
- **force**: Queries are forcibly converted to vectorized execution plans for execution no matter whether the base table to be queried is a row-store table, column-store table, or hybrid row-column store table, unless the query type or expression is not supported by the vectorized executor. In this case, the performance may deteriorate in different query scenarios.
- **optimal**: On the basis of **force**, the optimizer determines whether to convert a query statement into a vectorized execution plan based on the query complexity to avoid performance deterioration after the conversion.

Default value: **off**

check_implicit_conversions

Parameter description: Specifies whether to check candidate index paths generated for index columns that have implicit type conversions in a query. For details about the application scenarios of this parameter, see **Checking the Implicit Conversion Performance**.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that a check will be performed for candidate index paths generated for index columns that have implicit type conversion in a query.
- **off** indicates that a check will not be performed.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

When this parameter is set to **on**, you need to set **enable_fast_query_shipping** to **off** so that the mechanism for identifying implicit data type conversion of index columns can take effect.

19.8.2 Optimizer Cost Constants

This section describes the optimizer cost constants. The cost variables described here are measured on an arbitrary scale. Only their relative values matter, therefore scaling them all up or down by the same factor will result in no change in the optimizer's choices. By default, these cost variables are based on the cost of sequential page fetches, that is, **seq_page_cost** is conventionally set to **1.0** and the other cost variables are set with reference to the parameter. However, you can use a different scale, such as actual execution time in milliseconds.

seq_page_cost

Parameter description: Specifies the optimizer's estimated cost of a disk page fetch that is part of a series of sequential fetches.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a floating point number ranging from 0 to *DBL_MAX*

Default value: **1**

random_page_cost

Parameter description: Specifies the optimizer's estimated cost of an out-of-sequence disk page fetch.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

Although the server allows you to set **random_page_cost** to a value less than that of **seq_page_cost**, it is not physically sensitive to do so. However, setting them equal makes sense if the database is entirely cached in RAM, because in that case there is no penalty for fetching pages out of sequence. Also, in a heavily-cached database you should lower both values relative to the CPU parameters, since the cost of fetching a page already in RAM is much smaller than it would normally be.

Value range: a floating point number ranging from 0 to *DBL_MAX*

Default value: **4**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- This value can be overwritten for tables and indexes in a particular tablespace by setting the tablespace parameter of the same name.
- Reducing this value relative to **seq_page_cost** will cause the system to prefer index scans and raising it will make index scans relatively more expensive. You can increase or decrease both values together to change the disk I/O costs relative to CPU costs.

cpu_tuple_cost

Parameter description: Specifies the optimizer's estimated cost of processing each row during a query.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a floating point number ranging from 0 to *DBL_MAX*

Default value: **0.01**

cpu_index_tuple_cost

Parameter description: Specifies the optimizer's estimated cost of processing each index entry during an index scan.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a floating point number ranging from 0 to *DBL_MAX*

Default value: 0.005

cpu_operator_cost

Parameter description: Specifies the optimizer's estimated cost of processing each operator or function executed during a query.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a floating point number ranging from 0 to *DBL_MAX*

Default value: **0.0025**

effective_cache_size

Parameter description: Specifies the optimizer's assumption about the effective size of the disk cache that is available to a single query.

Set this parameter based on the following factors: the GaussDB's shared buffer space, the kernel's disk buffer space, and the estimated number of concurrent queries on different tables that share the available space.

This parameter does not affect the size of the shared memory allocated during actual GaussDB running. It is used only for estimation in the plan generation phase. The value is in the unit of disk page. Usually the size of each page is 8192 bytes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 2147483647. The unit is 8 KB.

Default value:

Independent deployment:

CN: 2 GB (60-core CPU/480 GB memory); 1 GB (32-core CPU/256 GB memory and 16-core CPU/128 GB memory); 512 MB (8-core CPU/64 GB memory); 256 MB (4-core CPU/32 GB memory); 128 MB (4-core CPU/16 GB memory)

DN: 70 GB (60-core CPU/480 GB memory); 38 GB (32-core CPU/256 GB memory); 20 GB (16-core CPU/128 GB memory); 8 GB (8-core CPU/64 GB memory); 4 GB (4-core CPU/32 GB memory); 2 GB (4-core CPU/16 GB memory)

Setting suggestions:

A larger value indicates that the optimizer prefers index scanning, and a smaller value indicates that the optimizer prefers full table scanning. Generally, the value is half of the value of **shared_buffers**. More radically, you can set the value to three fourth of the value of **shared_buffers**.

allocate_mem_cost

Parameter description: Specifies the query optimizer's estimated cost of creating a hash table for memory space using hash join. This parameter is used for optimization when the hash join estimation is inaccurate.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a floating point number ranging from 0 to *DBL_MAX*

Default value: **0**

19.8.3 Genetic Query Optimizer

This section describes parameters related to genetic query optimizer. The genetic query optimizer (GEQO) is an algorithm that plans queries by using heuristic searching. This algorithm reduces planning time for complex queries and the costs of producing plans are sometimes inferior to those found by the normal exhaustive-search algorithm.

geqo

Parameter description: Specifies whether to enable the genetic query optimization.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

It is best not to turn it off in execution. **geqo_threshold** provides more subtle control of GEQO.

If this parameter is modified by running the **gs_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **on**

geqo_threshold

Parameter description: Specifies the number of **FROM** items. Genetic query optimization is used to plan queries when the number of statements executed is greater than this value.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

- For simpler queries, it is best to use the regular, exhaustive-search planner, but for queries with many tables, it is better to use GEQO to manage the queries.
- A **FULL OUTER JOIN** construct counts as only one **FROM** item.

Value range: an integer ranging from 2 to 2147483647

Default value: **12**

geqo_effort

Parameter description: Controls the trade-off between planning time and query plan quality in GEQO.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

geqo_effort does not do anything directly. This parameter is only used to compute the default values for the other variables that influence GEQO behavior. If you prefer, you can manually set the other parameters instead.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: an integer ranging from 1 to 10

NOTICE

Larger values increase the time spent in query planning, but also increase the probability that an efficient query plan is chosen.

Default value: **5**

geqo_pool_size

Parameter description: Controls the pool size used by GEQO, that is, the number of individuals in the genetic population.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647

NOTICE

The value of this parameter must be at least **2**, and useful values are typically from **100** to **1000**. If this parameter is set to **0**, GaussDBselects a proper value based on **geqo_effort** and the number of tables.

Default value: **0**

geqo_generations

Parameter description: Specifies the number of iterations of the GEQO.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647

NOTICE

The value of this parameter must be at least **1**, and useful values are typically from **100** to **1000**. If it is set to **0**, a suitable value is chosen based on **geqo_pool_size**.

Default value: **0**

geqo_selection_bias

Parameter description: Specifies the selection bias used by GEQO. The selection bias is the selective pressure within the population.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a floating point number ranging from 1.5 to 2.0

Default value: **2**

geqo_seed

Parameter description: Specifies the initial value of the random number generator used by GEQO to select random paths through the join order search space.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a floating point number ranging from 0.0 to 1.0

NOTICE

Varying the value changes the set of join paths explored, and may result in a better or worse path being found.

Default value: **0**

19.8.4 Other Optimizer Options

enable_fast_query_shipping

Parameter description: Specifies whether to use the distributed framework for a query planner.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the distributed framework is not used. Execution plans are generated on CNs and DNs separately.
- **off** indicates that the distributed framework is used. Execution plans are generated on CNs and then sent to DNs for execution.

Default value: **on**

enable_trigger_shipping

Parameter description: Specifies whether the trigger can be pushed to DNs for execution.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the trigger can be pushed to DNs for execution.
- **off** indicates that the trigger cannot be pushed to DNs. It must be executed on CNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **on**

enable_remotejoin

Parameter description: Specifies whether JOIN operation plans can be delivered to DNs for execution.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that JOIN operation plans can be delivered to DNs for execution.
- **off** indicates that JOIN operation plans cannot be delivered to DNs for execution.

Default value: **on**

enable_remotegroup

Parameter description: Specifies whether the execution plans of **GROUP BY** and **AGGREGATE** can be delivered to DNs for execution.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the execution plans of **GROUP BY** and **AGGREGATE** can be delivered to DNs for execution.
- **off** indicates that the execution plans of **GROUP BY** and **AGGREGATE** cannot be delivered to DNs for execution.

Default value: **on**

enable_remotelimit

Parameter description: Specifies whether the execution plan specified in the **LIMIT** clause can be delivered to DNs for execution.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the execution plan specified in the **LIMIT** clause can be pushed down to DNs for execution.
- **off** indicates that the execution plan specified in the **LIMIT** clause cannot be delivered to DNs for execution.

Default value: **on**

enable_remotesort

Parameter description: Specifies whether the execution plan of the **ORDER BY** clause can be delivered to DNs for execution.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the execution plan of the **ORDER BY** clause can be delivered to DNs for execution.
- **off** indicates that the execution plan of the **ORDER BY** clause cannot be delivered to DNs for execution.

Default value: **on**

enable_csqual_pushdown

Parameter description: Specifies whether to deliver filter criteria for a rough check during query.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that a rough check is performed with filter criteria delivered during query.
- **off** indicates that a rough check is performed without filter criteria delivered during query.

Default value: **on**

explain_dna_file

Parameter description: Sets **explain_perf_mode** to **run** to export object files in CSV format.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

The value of this parameter must be an absolute path plus a file name with the extension **.csv**.

Value range: a string

Default value: empty

analysis_options

Parameter description: Specifies whether to enable function options in the corresponding options to use the corresponding location functions, including data verification and performance statistics. For details, see the options in the value range.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string

- **LLVM_COMPILE** indicates that the codegen compilation time of each thread is displayed on the explain performance page. The current feature is a lab feature. Contact Huawei technical support before using it.
- **HASH_CONFLICT** indicates that the log file in the **pg_log** directory of the DN process displays the hash table statistics, including the hash table size, hash chain length, and hash conflict information.
- **STREAM_DATA_CHECK** indicates that a CRC check is performed on data before and after network data transmission.

Default value:
ALL,on(),off(LLVM_COMPILE,HASH_CONFLICT,STREAM_DATA_CHECK), which indicates that no location function is enabled.

explain_perf_mode

Parameter description: Specifies the display format of the **explain** command.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: normal, **pretty**, **summary**, and **run**

- **normal** indicates that the default printing format is used.
- **pretty** indicates a new format improved by using GaussDB. The new format contains a plan node ID, directly and effectively analyzing performance.
- **summary** indicates that the analysis result on this information is printed in addition to the printed information specified by **pretty**.
- **run** indicates that the system exports the printed information specified by **summary** as a CSV file for further analysis.

Default value: **pretty**

NOTE

The pretty mode supports only plans that contain stream operators and does not support plans that deliver statements to DNs. Therefore, the display format is affected by the **enable_stream_operator** parameter. When **enable_stream_operator** is set to **off**, the plan containing the stream operator cannot be generated.

cost_param

Parameter description: Controls use of different estimation methods in specific customer scenarios, allowing estimated values approximating to onsite values. This parameter can control various methods simultaneously by performing AND (&) on the bit of each method. A method is selected if the result value is not **0**.

- When **cost_param & 1** is set to a value other than 0, an improved mechanism is used for connecting the selection rate of non-equi-joins. This method is more accurate for estimating the selection rate of joins between two identical tables. At present, if **cost_param & 1** is set to a value other than 0, the path is not used. That is, a better formula is selected for calculation.
- When **cost_param & 2** is set to a value other than 0, the selection rate is estimated based on multiple filter criteria. The lowest selection rate among all

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

filter criteria, but not the product of the selection rates for two tables under a specific filter criterion, is used as the total selection rate. This method is more accurate when a close correlation exists between the columns to be filtered.

- When **cost_param & 4** is not 0, the selected debugging model is not recommended when the stream node is evaluated.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647

Default value: **0**

enable_partitionwise

Parameter description: Specifies whether to select an intelligent algorithm for joining partition tables.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that an intelligent algorithm is selected.
- **off** indicates that an intelligent algorithm is not selected.

Default value: **off**

enable_fast_numeric

Parameter description: Specifies whether to enable optimization for numeric data calculation. Calculation of numeric data is time-consuming. Numeric data is converted into int64- or int128-type data to improve numeric data calculation performance.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** or **true** indicates that optimization for numeric data calculation is enabled.
- **off** or **false** indicates that optimization for numeric data calculation is disabled.

Default value: **on**

rewrite_rule

Parameter description: Specifies the rewriting rule for enabled optional queries. Some query rewrite rules are optional. Enabling them cannot always improve the query efficiency. In a specific customer scenario, you can set the query rewriting rules through this GUC parameter to achieve optimal query efficiency.

This parameter can control the combination of query rewriting rules, for example, there are multiple rewriting rules: rule1, rule2, rule3, and rule4. You can perform the following settings:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
set rewrite_rule=rule1;          -- Enable query rewriting rule1
set rewrite_rule=rule2, rule3;     -- Enable the query rewriting rules rule2 and rule3
set rewrite_rule=none;          -- Disable all optional query rewriting rules
```

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

- none: Does not use any optional query rewriting rules
- Lazyagg: Uses the Lazy Agg query rewriting rules for eliminating aggregation operations in subqueries
- **magicset**: Uses the Magic Set query rewriting rules delivered from the main query to the subquery.
- **partialpush**: Uses the Partial Push query rewriting rules. For statements that cannot be pushed down, push down some subqueries to DNs for execution and the rest to CNs for execution.
- **uniquecheck**: Uses the Unique Check query rewriting rules. Optimize the subquery statements in target columns without agg and check whether the number of returned rows is 1.
- **disablerep**: Uses the Disable Replicate query rewriting rules. The performance may deteriorate after a replication table is optimized. Therefore, after this rule is enabled, subqueries cannot be optimized.
- **intargetlist**: Uses the In Target List query rewriting rules (subquery optimization in the target column).
- **predpushnormal**: Uses the Predicate Push query rewriting rules. When predicate conditions are pushed down to subqueries, the BROADCAST operator may be added to support distributed execution.
- **predpushforce**: Uses the Predicate Push query rewriting rules. Push down predicate conditions to subqueries and use indexes as much as possible for acceleration.
- **predpush**: Selects the optimal plan based on the cost in **predpushnormal** and **predpushforce**.
- **disable_pullup_expr_sublink**: Disables optimizers to pull up expr_sublink. For details about sublink classification and pullup principles, see **Optimizing Subqueries**.

Default value: **magicset**

enable_pbe_optimization

Parameter description: Specifies whether the optimizer optimizes the query plan for statements executed in Parse Bind Execute (PBE) mode.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the optimizer optimizes the query plan.
- **off** indicates that the optimizer does not optimize the execution.

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_light_proxy

Parameter description: Specifies whether the optimizer optimizes the execution of simple queries on CNs. This parameter does not take effect if the character set of the application side does not match that of the kernel side. You are advised to set the character set to UTF8 when creating a database.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the optimizer optimizes the execution of simple queries on CNs.
- **off** indicates that the optimizer does not optimize the execution.

Default value: **on**

enable_global_plancache

Parameter description: Specifies whether to share the cache of the PBE query execution plan. If this parameter is set to **on**, the memory usage of the CNs and DNs in high concurrency scenarios can be reduced. In addition, the value of this parameter must be the same on the CN and DN. Otherwise, the packets sent from the CN to the DN do not match and an error is reported.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

When **enable_global_plancache** is enabled, to ensure that GPC takes effect, the value of **local_syscache_threshold** must be greater than or equal to 16 MB. (The current feature is a lab feature. Contact Huawei technical support before using it.) If the value of **local_syscache_threshold** is less than 16 MB, set it to **16 MB**. If the value is greater than 16 MB, do not change it.

Value range: Boolean

- **on** indicates that the execution plan of the PBE query is shared in the cache.
- **off** indicates that the execution plan of the PBE query is not shared in the cache.

Default value: **off**

gpc_clean_timeout

Parameter description: When **enable_global_plancache** is set to **on**, if a plan in the shared plan list is not used within the period specified by **gpc_clean_timeout**, the plan will be deleted. This parameter is used to control the retention period of a shared plan that is not used. The current feature is a lab feature. Contact Huawei technical support before using it.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 300 to 86400. The unit is s.

Default value: **1800**, that is, 30 minutes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_gpc_grayrelease_mode

Parameter description: Specifies whether to enable GPC in a distributed cluster. The cluster needs to be restarted to enable GPC. If you want to enable GPC without restarting the cluster, use **enable_gpc_grayrelease_mode**. The current feature is a lab feature. Contact Huawei technical support before using it.

Operations in a distributed cluster:

To enable GPC:

1. Enable **enable_gpc_grayrelease_mode** on all DNs.

2. Enable **enable_gpc_grayrelease_mode** on all CNs.

3. Enable the GPC parameter which is a POSTMASTER parameter. You need to reload the parameter and then kill the node in polling mode for GPC on the restarted node to take effect.

To disable GPC:

1. Ensure that **enable_gpc_grayrelease_mode** is set to **on**, reload and then disable the GPC parameter, and kill the node in polling mode for GPC on the restarted node to take effect.

2. Disable **enable_gpc_grayrelease_mode** on all CNs.

3. Disable **enable_gpc_grayrelease_mode** on all DNs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- on
- off

Default value: **off**

enable_opfusion

Parameter description: Specifies whether to optimize simple queries.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

This parameter is used to optimize the query performance of DNs. You can set **max_datanode_for_plan** to view the execution plan of a query DN. If the execution plan of the DN contains **[Bypass]**, the query can be optimized on the DN.

The restrictions on simple queries are as follows:

- Only indexscan and indexonlyscan are supported, and the filter criteria of all **WHERE** statements are on indexes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Only single tables can be added, deleted, modified, and queried. JOIN and USING operations are not supported.
- Only row-store tables are supported. Partitioned tables and tables with triggers are not supported.
- Information statistics features of active SQL statements and queries per second (QPS) are not supported.
- Tables that are being scaled out or in are not supported.
- System columns cannot be queried or modified.
- Only simple **SELECT** statements are supported. For example:
  ```
  SELECT c3 FROM t1 WHERE c1 = ? and c2 =10;
  ```
  Only columns in the target table can be queried. Columns **c1** and **c2** are index columns, which can be followed by constants or parameters. You can use **for update**.
- Only simple **INSERT** statements are supported. For example:
  ```
  INSERT INTO t1 VALUES (?,10,?);
  ```
  Only one **VALUES** is supported. The type in **VALUES** can be a constant or a parameter. **RETURNING** is not supported.
- Only simple **DELETE** statements are supported. For example:
  ```
  DELETE FROM t1 WHERE c1 = ? and c2 = 10;
  ```
  Columns **c1** and **c2** are index columns, which can be followed by constants or parameters.
- Only simple **UPDATE** statements are supported. For example:
  ```
  UPDATE t1 SET c3 = c3+? WHERE c1 = ? and c2 = 10;
  ```
  The values modified in column **c3** can be constants, parameters, or a simple expression. Columns **c1** and **c2** are index columns, which can be followed by constants or parameters.

Value range: Boolean

- **on** indicates that the performance logs are output.
- **off** indicates that the performance logs are not output.

Default value: **on**

enable_partition_opfusion

Parameter description: If this parameter is enabled when the **enable_opfusion** parameter is enabled, the simple query of the partitioned table can be optimized to improve the SQL execution performance. If **enable_global_plancache** is set to **on**, this parameter does not take effect.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the performance logs are output.
- **off** indicates that the performance logs are not output.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

sql_beta_feature

Parameter description: Specifies the SQL engine's optional beta features to be enabled, including optimization of row count estimation and query equivalence estimation. These optional features provide optimization for specific scenarios, but performance deterioration may occur in some scenarios for which testing is not performed. In a specific customer scenario, you can set the query rewriting rules through this GUC parameter to achieve optimal query efficiency.

This parameter determines the combination of the SQL engine's beta features, for example, feature1, feature2, feature3, and feature4. You can perform the following settings:

```
set sql_beta_feature=feature1;          --Enable the beta feature 1 of the SQL engine.
set sql_beta_feature=feature2,feature3;    --Enable the beta features 2 and 3 of the SQL engine.
set sql_beta_feature=none;          --Disable all optional SQL engine beta features.
```

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

- **none**: None of the beta optimizer features is used.
- **sel_semi_poisson**: Uses poisson distribution to calibrate the equivalent semi-join and anti-join selection rates.
- **sel_expr_instr**: Uses the matching row count estimation method to provide more accurate estimation for **instr(col, 'const') > 0, = 0, = 1**.
- **param_path_gen**: Generates more possible parameterized paths.
- **rand_cost_opt**: Optimizes the random read cost of tables that have a small amount of data.
- **param_path_opt**: Uses the bloating ratio of the table to optimize the analysis information of indexes.
- **page_est_opt**: Optimizes the **relpages** estimation for the analysis information of non-column-store table indexes.
- **no_unique_index_first**: Disables optimization of the primary key index scanning path first.
- **join_sel_with_cast_func**: Supports type conversion functions when the number of join rows is estimated.
- **canonical_pathkey**: after the regularization pathkey is generated (**pathkey**: a set of ordered key values of data).
- **index_cost_with_leaf_pages_only**: Considers index leaf nodes when the index cost is estimated.
- **partition_opfusion**: Enables partitioned table optimization.
- **a_style_coerce**: Enables the Decode type conversion rule to be compatible with O. For details, see **Type Resolution for CASE in ORA Compatibility Mode**.
- **plpgsql_stream_fetchall**: Enables the function of obtaining all tuple results when the SQL statements which use streams are executed on the for loop or cursor in a stored procedure.
- **partition_fdw_on**: SQL statements can be created for Postgres foreign tables based on partitioned tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **predpush_same_level**: Enables the **predpush** hint to control parameterized paths at the same layer.
- **disable_bitmap_cost_with_lossy_pages**: Disables the computation of the cost of lossy pages in the bitmap path cost.

Default value:
"sel_semi_poisson,sel_expr_instr,rand_cost_opt,param_path_opt,page_est_opt"

table_skewness_warning_threshold

Parameter description: Specifies the threshold for triggering a table skew alarm.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a floating point number ranging from 0 to 1

Default value: **1**

table_skewness_warning_rows

Parameter description: Specifies the minimum number of rows for triggering a table skew alarm.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647

Default value: **100000**

enable_global_stats

Parameter description: Specifies the current statistics collection mode, which can be global statistics collection or single-node statistics collection. By default, the global statistics collection mode is used. If this parameter is disabled, the statistics of the first node in the cluster are collected by default. In this case, the quality of the generated query plan may be affected. However, the information collection performance is optimal. Therefore, exercise caution when disabling this parameter.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** or **true** indicates the global statistics mode.
- **off** or **false** indicates the single-DN statistics mode.

Default value: **on**

default_statistics_target

Parameter description: Specifies the default statistics target for table columns without a column-specific target set via **ALTER TABLE SET STATISTICS**. If this parameter is set to a positive number, it indicates the number of samples of statistics information. If this parameter is set to a negative number, percentage is

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

used to set the statistic target. The negative number converts to its corresponding percentage, for example, -5 means 5%.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from –100 to 10000

NOTICE

- A larger positive number than the default value increases the time required to do **ANALYZE**, but might improve the quality of the optimizer's estimates.
- Changing settings of this parameter may result in performance deterioration. If query performance deteriorates, you can:
  1. Restore to the default statistics.
  2. Use hints to force the optimizer to use the optimal query plan. (For details, see **Hint-based Tuning**.)
- If this parameter is set to a negative value, the number of samples is greater than or equal to 2% of the total data volume, and the number of records in user tables is less than 1.6 million, the time taken by running **ANALYZE** will be longer than when this parameter uses its default value.
- If this parameter is set to a negative value, the auto-analyze function is disabled.

Default value: **100**

constraint_exclusion

Parameter description: Controls the query optimizer's use of table constraints to optimize queries.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: enumerated values

- **on**, **true**, **yes**, and **1** indicate that constraints for all tables are examined.
- **off**, **false**, **no**, and **0** indicate that no constraints are examined.
- **partition** indicates that only constraints for inheritance child tables and **UNION ALL** subqueries are examined.

NOTICE

When **constraint_exclusion** is set to **on**, the optimizer compares query conditions with the table's **CHECK** constraints, and omits scanning tables for which the conditions contradict the constraints.

Default value: **partition**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

Currently, **constraint_exclusion** is enabled by default only for cases that are often used to implement table partitioning. Turning this feature on for all tables imposes extra planning on simple queries, and provides no benefit for simple queries. If you have no partitioned tables, set it to **off**.

cursor_tuple_fraction

Parameter description: Specifies the optimizer's estimated fraction of a cursor's rows that are retrieved.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: a floating point number ranging from 0.0 to 1.0

NOTICE

Smaller values of this setting bias the optimizer towards using **fast start** plans for cursors, which will retrieve the first few rows quickly while perhaps taking a long time to fetch all rows. Larger values put more emphasis on the total estimated time. At the maximum setting of **1.0**, cursors are planned exactly like regular queries, considering only the total estimated time and how soon the first rows might be delivered.

Default value: **0.1**

from_collapse_limit

Parameter description: Specifies whether the optimizer merges sub-queries into upper queries based on the resulting FROM list. The optimizer merges sub-queries into upper queries if the resulting FROM list would have no more than this many items.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: an integer ranging from 1 to 2147483647

NOTICE

Smaller values reduce planning time but may lead to inferior execution plans.

Default value: **8**

join_collapse_limit

Parameter description: Specifies whether the optimizer rewrites **JOIN** constructs (except **FULL JOIN**) into lists of **FROM** items based on the number of the items in the result list.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: an integer ranging from 1 to 2147483647

NOTICE

- Setting this parameter to **1** prevents join reordering. As a result, the join order specified in the query will be the actual order in which the relations are joined. The query optimizer does not always choose the optimal join order. Therefore, advanced users can temporarily set this variable to **1**, and then specify the join order they desire explicitly.
- Smaller values reduce planning time but lead to inferior execution plans.

Default value: **8**

plan_mode_seed

Parameter description: This is a commissioning parameter. Currently, it supports only **OPTIMIZE_PLAN** and **RANDOM_PLAN**. The value **0** (for **OPTIMIZE_PLAN**) indicates the optimized plan using the dynamic planning algorithm. Other values are for **RANDOM_PLAN**, which indicates that the plan is randomly generated. **–1** indicates that users do not specify the value of the seed identifier. In this case, the optimizer generates a random integer from **1** to **2147483647** and a random execution plan based on the generated integer. A value from **1** to **2147483647** is regarded as the seed identifier, based on which the optimizer generates a random execution plan.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: an integer ranging from –1 to 2147483647

Default value: **0**

NOTICE

- If **plan_mode_seed** is set to **RANDOM_PLAN**, the optimizer generates a random execution plan that may not be the optimal one. Therefore, to guarantee the query performance, the default value **0** is recommended during upgrade, scale-out, scale-in, and O&M.
- If this parameter is not set to **0**, the specified hint will not be used.

enable_random_datanode

Parameter description: Specifies whether the query of the replication table is conducted on a random DN. A complete replication table is stored on each DN for random retrieval to release the pressure on nodes.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: Boolean

- **on** indicates that the random query is enabled.
- **off** indicates that the random query is disabled.

Default value: **on**

hashagg_table_size

Parameter description: Specifies the hash table size during the execution of the HASH JOIN operation.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 1073741823

Default value: **0**

enable_codegen

Parameter description: Specifies whether code optimization is enabled. Currently, the code optimization uses the LLVM optimization. The current feature is a lab feature. Contact Huawei technical support before using it.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that code optimization is enabled.
- **off** indicates that code optimization is disabled.

> **NOTICE**
>
> Currently, the LLVM optimization only supports the vectorized executor feature. You are advised to disable this parameter in other scenarios.

Default value: **off**

codegen_strategy

Parameter description: Specifies the codegen optimization strategy that is used when an expression is converted to be codegen-based. The current feature is a lab feature. Contact Huawei technical support before using it.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: enumerated values

- **partial** indicates that even if functions that are not codegen-based exist in an expression, you can still call the LLVM dynamic optimization strategy by using the entire codegen framework of the expression.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **pure** indicates that only when all functions in an expression can be codegen-based, the LLVM dynamic optimization strategy can be called.

> **NOTICE**
>
> In the scenario where query performance reduces after the codegen function is enabled, you can set this parameter to **pure**. In other scenarios, do not change the default value **partial** of this parameter.

Default value: **partial**

enable_codegen_print

Parameter description: Specifies whether the LLVM IR function can be printed in logs. The current feature is a lab feature. Contact Huawei technical support before using it.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the LLVM IR function can be printed in logs.
- **off** indicates that the LLVM IR function cannot be printed in logs.

Default value: **off**

codegen_cost_threshold

Parameter description: The LLVM compilation takes some time to generate executable machine code. Therefore, LLVM compilation is beneficial only when the actual execution cost is more than the sum of the code required for generating machine code and the optimized execution cost. This parameter specifies a threshold. If the estimated execution cost exceeds the threshold, LLVM optimization is performed. The current feature is a lab feature. Contact Huawei technical support before using it.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647

Default value: **10000**

enable_bloom_filter

Parameter description: Specifies whether the BloomFilter optimization is used. This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the BloomFilter optimization can be used.
- **off** indicates that the BloomFilter optimization cannot be used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **on**

enable_extrapolation_stats

Parameter description: Specifies whether the extrapolation logic is used for data of DATE type based on historical statistics. The logic can increase the accuracy of estimation for tables whose statistics are not collected in time, but will possibly provide an overlarge estimation due to incorrect extrapolation. Enable the logic only in scenarios where the data of DATE type is periodically inserted. This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the extrapolation logic is used for data of DATE type based on historical statistics.
- **off** indicates that the extrapolation logic is not used for data of DATE type based on historical statistics.

Default value: **off**

autoanalyze

Parameter description: Specifies whether to automatically collect statistics on tables that have no statistics when a plan is generated. **autoanalyze** cannot be used for foreign or temporary tables. To collect statistics, manually perform the ANALYZE operation. If an exception occurs in the database during the execution of autoanalyze on a table, after the database is recovered, the system may still prompt you to collect the statistics of the table when you run the statement again. In this case, manually perform the ANALYZE operation on the table to synchronize statistics. This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the table statistics are automatically collected.
- **off** indicates that the table statistics are not automatically collected.

Default value: **off**

query_dop

Parameter description: Specifies the user-defined degree of parallelism (DOP). This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from –64 to 64

A value ranging from 1 to 64 indicates that the fixed SMP is enabled and the system will use the specified DOP.

0 indicates that the SMP adaptation is enabled, and the system will dynamically select the optimal DOP based on resource usage and plan characteristics.

A value ranging from –64 to –1 indicates that the SMP adaptation is enabled, and the system limits the DOP that can be adaptively selected.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- After enabling concurrent queries, ensure you have sufficient CPU, memory, network, and I/O resources to achieve the optimal performance.
- To prevent performance deterioration caused by an overly large value of **query_dop**, the system calculates the maximum number of available CPU cores for a DN and uses the number as the upper limit for this parameter. If the value of **query_dop** is greater than 4 and also the upper limit, the system resets **query_dop** to the upper limit.

Default value: **1**

enable_analyze_check

Parameter description: Checks whether statistics were collected about tables whose **reltuples** and **relpages** are displayed as **0** in **pg_class** during plan generation.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the tables will be checked.
- **off** indicates that the tables will not be checked.

Default value: **off**

enable_sonic_hashagg

Parameter description: Specifies whether to use the hash aggregation operator designed for column-oriented hash tables when certain constraints are met.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the hash aggregation operator designed for column-oriented hash tables is used when certain constraints are met.
- **off** indicates that the hash aggregation operator designed for column-oriented hash tables is not used.

NOTE

- When the hash aggregation operator designed for column-oriented hash tables is used, the memory usage of the query can be reduced. However, in scenarios when **enable_codegen** is set to **on** and the performance is significantly improved, the performance of the operator may deteriorate.
- If **enable_sonic_hashagg** is set to **on**, when certain constraints are met, the hash aggregation operator designed for column-oriented hash tables is used and its name is displayed as **Sonic Hash Aggregation** in the output of the Explain Analyze/Performance operation. When the constraints are not met, the operator name is displayed as **Hash Aggregation**. For details, see **Description**.

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_sonic_hashjoin

Parameter description: Specifies whether to use the hash join operator designed for column-oriented hash tables when certain constraints are met.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

- **on** indicates that the hash join operator designed for column-oriented hash tables is used when certain constraints are met.
- **off** indicates that the hash join operator designed for column-oriented hash tables is not used.

NOTE

- Currently, the parameter can be used only for Inner Join.
- If **enable_sonic_hashjoin** is enabled, the memory usage of query using the Hash Inner operator can be reduced. However, in scenarios where the code generation technology can significantly improve performance, the performance of the operator may deteriorate.
- If **enable_sonic_hashjoin** is set to **on**, when certain constraints are met, the hash join operator designed for column-oriented hash tables is used and its name is displayed as **Sonic Hash Join** in the output of the Explain Analyze/Performance operation. When the constraints are not met, the operator name is displayed as **Hash Join**. For details, see Description.

Default value: **on**

enable_sonic_optspill

Parameter description: Specifies whether to optimize the number of files to be written to disks for the Hash Join operator designed for column-oriented hash tables. If this parameter is set to **on**, the number of files written to disks does not increase significantly when the Hash Join operator writes a large number of files to disks.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

- **on** indicates that the optimization is enabled.
- **off** indicates that the optimization is disabled.

Default value: **on**

log_parser_stats

Parameter description: Specifies whether the optimizer outputs the performance logs of the parser module. (The current feature is a lab feature. Contact Huawei technical support before using it.)

This parameter is a SUSET parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on** indicates that the performance logs are output.
- **off** indicates that the performance logs are not output.

Default value: **off**

log_planner_stats

Parameter description: Specifies whether the optimizer outputs the performance logs of the planner module. (The current feature is a lab feature. Contact Huawei technical support before using it.)

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the performance logs are output.
- **off** indicates that the performance logs are not output.

Default value: **off**

log_executor_stats

Parameter description: Specifies whether the optimizer outputs the performance logs of the executor module. (The current feature is a lab feature. Contact Huawei technical support before using it.)

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the performance logs are output.
- **off** indicates that the performance logs are not output.

Default value: **off**

log_statement_stats

Parameter description: Specifies whether the optimizer outputs the performance logs of a statement. (The current feature is a lab feature. Contact Huawei technical support before using it.)

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the performance logs are output.
- **off** indicates that the performance logs are not output.

Default value: **off**

plan_cache_mode

Parameter description: Specifies the policy for generating an execution plan in the **prepare** statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: enumerated values

- **auto** indicates that the **custom plan** or **generic plan** is selected by default.
- **force_generic_plan** indicates that the **generic plan** (soft parse) is forcibly used. The **generic plan** is a plan generated after you run a prepared statement. The plan policy binds parameters to the plan when you run the EXECUTE statement and execute the plan. The advantage of this plan is that repeated optimizer overheads can be avoided in each execution. The disadvantage is that the plan may not be optimal when data skew occurs for the bound parameters and may result in poor plan execution performance.
- **force_custom_plan** indicates that the **custom plan** (hard parse) is forcibly used. The **custom plan** is a plan generated after you run a prepared statement where parameters in the EXECUTE statement are embedded. The **custom plan** generates a plan based on specific parameters in the EXECUTE statement. This plan generates a preferred plan based on specific parameters each time and has good execution performance. The disadvantage is that the plan needs to be regenerated before each execution, resulting in a large amount of repeated optimizer overhead.

NOTE

This parameter is valid only for prepared statements. It is used when the parameterized field in a prepared statement has severe data skew.

Default value: **auto**

enable_router

Parameter description: Specifies whether to enable the manual node pushdown function.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

- **on** indicates that the performance logs are output.
- **off** indicates that the performance logs are not output.

Default value: **off**

router

Parameter description: Controls the detailed attributes of the router function. This parameter is valid only when **enable_router** and **enable_light_proxy** are enabled. This parameter is used to calculate the DN where the given distribution column is located based on the hash distribution column of the table. After the router is set, the supported SQL statements are pushed down to the DN for execution. If the router is incorrectly configured, data may be saved to an incorrect DN, causing unpredictable problems. Therefore, be cautious when running this command.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string

This parameter consists of two parts:
'schema_name.table_name,"distribute_keys"'. The meanings are as follows:

- **schema_name.table_name**: indicates the schema name and table name. If schema_name is not set, the default value current_schema is used.
- **distribute_keys**: Values of all distribution columns in the distribution table are separated by commas (,). The sequence of the values must be the same as that of the distribution columns in the table.

Default value: empty

enable_auto_explain

Parameter description: Specifies whether to enable the function of automatically printing execution plans. This parameter is used to locate slow stored procedures or slow queries and is valid only for the currently connected CN.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean. The value **on** indicates that the function is enabled, and the value **off** indicates that the function is disabled.

Default value: **off**

auto_explain_level

Parameter description: Specifies the log level for automatically printing execution plans.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Enumeration type. The value can be **log** or **notice**. **log** indicates that the execution plan is printed in logs. **notice** indicates that the execution plan is printed in notification mode.

Default value: **log**

auto_explain_log_min_duration

Parameter description: Specifies how long execution plans are automatically printed for. Plans can be printed only when the time required to execute the plans is greater than the value of **auto_explain_log_min_duration**.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647. The unit is ms.

- **0**: All executed plans are generated.
- **3000**: All execution plans will be generated after the execution of a statement takes more than 3000 ms.

Default value: **0**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

max_datanode_for_plan

Parameter description: Specifies the number of execution plans to be displayed on the DN when an FQS plan is generated. The number of plans that are displayed on the DN is determined by the smaller value between the number of DNs in the cluster and the value of this parameter.

For statements executed by PBE, only plans generated in kernel prepare precompilation mode can be displayed. Plans generated in JDBC precompilation mode cannot be displayed.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 8192

Default value: **0**

session_sequence_cache

Parameter description: Specifies the **sequence** value applied for one-time interaction in the current session. The unused values are automatically discarded after the session ends. When using **sequence** to import data in batches, you can increase the value of this parameter to improve the insertion speed and high concurrency performance. When a single data record is inserted concurrently, set this parameter to **1** to reduce the sequence change. If you have high requirements on continuity, you need to specify the required cache when creating a sequence. If the value of this parameter is greater than that of cache, the value automatically becomes invalid.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 2147483647

Default value: **10**

NOTE

The default value is **10**. In high-concurrency scenarios, the performance of single and batch insertion is good.

19.9 Error Reporting and Logging

19.9.1 Logging Destination

log_destination

Parameter description: GaussDB supports several methods of logging server messages. Set this parameter to a list of desired log destinations separated by commas. (For example, log_destination="stderr,csvlog")

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string

The valid values are **stderr**, **csvlog**, **syslog**, and **eventlog**.

- **stderr** indicates that logs are printed to the screen.
- **csvlog** indicates that logs are output in comma separated value (CSV) format. The prerequisite for generating logs in CSV format is that **logging_collector** must be set to **on**. For details, see **Using CSV Log Output**.
- **syslog** indicates that logs are recorded using the syslog of the OS. GaussDB can record logs using syslog from **LOCAL0** to **LOCAL7**. For details, see **syslog_facility**. To record logs using syslog, add the following information to syslog daemon's configuration file:
  local0.* */var/log/postgresql*

Default value: stderr

logging_collector

Parameter description: Specifies whether to enable the logger process to collect logs. This process captures log messages sent to **stderr** or **csvlog** and redirects them into log files.

This method is more effective than recording logs to syslog because some types of messages cannot be displayed in syslog output, such as messages indicating the loading failures of dynamic link libraries and error messages generated by scripts (for example, **archive_command**).

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

It is possible to log to **stderr** without using the logging collector and the log messages will go to where the server's **stderr** is directed. However, this method is only suitable for low log volumes due to difficulties in rotating log files.

Value range: Boolean

- **on** indicates that the log collection is enabled.
- **off** indicates that the log collection is disabled.

Default value: **on**

log_directory

Parameter description: Specifies the directory for storing log files when **logging_collector** is set to **on**. The value can be an absolute path, or relative to the data directory. The **log_directory** parameter can be dynamically modified using the **gs_guc reload** command. Only the sysadmin user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- If this parameter is set to an invalid path, the cluster cannot be started.
- If you modify the **log_directory** parameter using the **gs_guc reload** command, and the specified path is valid, the log files are output to this new path. If the specified path is invalid, the log files are output to the valid path set last time and the database operation is not affected. The invalid value is still written into the configuration file.
- In the sandbox environment, the path cannot contain /var/chroot. For example, if the absolute path of log is **/var/chroot/var/lib/log/Ruby/pg_log/cn_log**, you only need to set the path to **/var/lib/log/Ruby/pg_log/cn_log**.

NOTE

- Valid path: Users have read and write permissions on the path.
- Invalid path: Users do not have read or write permissions on an invalid path.

Value range: a string

Default value: specified during installation

log_filename

Parameter description: Specifies the names of generated log files when **logging_collector** is set to **on**. The value is treated as a strftime pattern, so %-escapes can be used to specify time-varying file names. Only the sysadmin user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

- You are advised to use %-escapes to specify the log file names for efficient management of log files.
- If **log_destination** is set to **csvlog**, log files are output in CSV format with timestamped names, for example, **server_log.1093827753.csv**.

Value range: a string

Default value: **postgresql-***%Y-%m-%d_%H%M%S*.**log**

log_file_mode

Parameter description: Specifies the permissions of log files when **logging_collector** is set to **on**. This parameter is invalid on Windows. The parameter value is usually a number in the format acceptable to the **chmod** and **umask** system calls.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- Before setting this parameter, set **log_directory** to store the logs to a directory other than the data directory.
- Do not make the log files world-readable because they might contain sensitive data.

Value range: an octal integer ranging from 0000 to 0777 (that is, 0 to 511 in the decimal format)

NOTE

- **0600** indicates that log files are readable and writable only to the server administrator.
- **0640** indicates that log files are readable and writable to members of the administrator's group.

Default value: 0600

log_truncate_on_rotation

Parameter description: Specifies the writing mode of the log files when **logging_collector** is set to **on**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

A setting example is as follows:

Assume that you want logs to be kept for 7 days, a log file generated each day to be named **server_log.Mon** on Monday, **server_log.Tue** on Tuesday, and so forth, and this week's log files to be overwritten by next week's log files. Then you can set **log_filename** to **server_log.%a**, **log_truncate_on_rotation** to **on**, and **log_rotation_age** to **1440** (indicating that the valid duration of the log file is 24 hours).

Value range: Boolean

- **on** indicates that GaussDB overwrites the existing log files of the same name on the server.
- **off** indicates that GaussDB appends the logging messages to the existing log files of the same name on the server.

Default value: **off**

log_rotation_age

Parameter description: Specifies the interval for creating a log file when **logging_collector** is set to **on**. If the duration from the time when the last log file was created to the current time is greater than the value of **log_rotation_age**, a new log file will be generated.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

Value range: an integer ranging from 0 to 35791394. The unit is min. **0** indicates that the time-based creation of new log files is disabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **1d** (1440 min)

log_rotation_size

Parameter description: Specifies the maximum size of a server log file when **logging_collector** is set to **on**. If the total size of messages in a log file exceeds the specified value, a log file will be generated.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2097151. The unit is KB.

0 indicates that the capacity-based creation of new log files is disabled.

Default value: 20 MB

syslog_facility

Parameter description: Specifies the syslog facility to be used when **log_destination** is set to **syslog**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: enumerated values. Valid values are **local0**, **local1**, **local2**, **local3**, **local4**, **local5**, **local6**, and **local7**.

Default value: local0

syslog_ident

Parameter description: Specifies the identifier of GaussDB messages in syslog logs when **log_destination** is set to **syslog**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value: **postgres**

event_source

Parameter description: Specifies the identifier of GaussDB messages in logs when **log_destination** is set to **eventlog**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value: **PostgreSQL**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

19.9.2 Logging Time

client_min_messages

Parameter description: Specifies which level of messages will be sent to the client. Each level covers all the levels following it. The lower the level is, the fewer messages are sent.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

A same value for **client_min_messages** and **log_min_messages** does not indicate the same level.

Value range: enumerated type. The valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal** and **panic**. Among them, **debug** and **debug2** are equivalent. For details about the parameters, see **Table 19-2**. If the configured level is higher than **error**, for example, **fatal** or **panic**, the system changes the level to **error** by default.

Default value: **notice**

log_min_messages

Parameter description: Specifies which level of messages will be written into the server log. Each level covers all the levels following it. The lower the level is, the fewer messages will be written into the log.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

A same value for **client_min_messages** and **log_min_messages** does not indicate the same level.

Value range: enumerated type. The valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal** and **panic**. Among them, **debug** and **debug2** are equivalent. For details about the parameters, see **Table 19-2**.

Default value: **warning**

log_min_error_statement

Parameter description: Controls which SQL statements that cause an error condition are recorded in the server log.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: enumerated values. Valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal**, and **panic**. For details about the parameters, see **Table 19-2**.

NOTE

- The default is **error**, indicating that statements causing errors, log messages, fatal errors, or panics will be logged.
- **panic** indicates that SQL statements that cause an error condition will not be logged.

Default value: **error**

log_min_duration_statement

Parameter description: Specifies the threshold for logging the duration of a completed statement. If a statement runs for a duration greater than or equal to the specified value, its duration will be logged.

Setting this parameter can be helpful in tracking down unoptimized queries. For clients using extended query protocols, the time required for parsing, binding, and executing steps are logged independently.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

When using this option together with **log_statement**, the text of statements that are logged because of **log_statement** will not be repeated in the duration log message. If you are not using **syslog**, it is recommended that you log the process ID (PID) or session ID using **log_line_prefix** so that you can link the statement message to the later duration message.

Value range: an integer ranging from –1 to 2147483647. The unit is ms.

- If this parameter is set to **250**, all SQL statements that run for 250 ms or longer will be logged.
- **0** indicates that the execution durations of all the statements are logged.
- **–1** indicates that the duration logging is disabled.

Default value: 3s (that is, 3000 ms)

backtrace_min_messages

Parameter description: Prints the function's stack information to the server's log file if the information generated is greater than or equal to the level specified by this parameter.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

This parameter is used to locate problems on-site. Frequent stack printing will affect the system's overhead and stability. Therefore, set the value of this parameter to a rank other than **fatal** or **panic** during problem location.

Value range: enumerated values

Valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal**, and **panic**. For details about the parameters, see **Table 19-2**.

Default value: **panic**

Table 19-2 explains message severities used by GaussDB. If logging output is sent to syslog or eventlog, severity is translated in GaussDB as shown in the table.

Table 19-2 Message severity levels

Severity	Description	System Log	Event Log
debug[1-5]	Provides detailed debug information.	DEBUG	INFORMATION
log	Reports information of interest to administrators, for example, checkpoint activity.	INFO	INFORMATION
info	Provides information implicitly requested by users, for example, output from **VACUUM VERBOSE**.	INFO	INFORMATION
notice	Provides information that might be helpful to users, for example, truncation of long identifiers and index created as part of the primary key.	NOTICE	INFORMATION
warning	Provides warnings of likely problems, for example, **COMMIT** outside a transaction block.	NOTICE	WARNING
error	Reports an error that causes a command to terminate.	WARNING	ERROR
fatal	Reports the reason that causes a session to terminate.	ERR	ERROR
panic	Reports an error that caused all database sessions to terminate.	CRIT	ERROR

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

plog_merge_age

Parameter description: Specifies the output period of performance log data. The current feature is a lab feature. Contact Huawei technical support before using it.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

The parameter value is in milliseconds. You are advised to set it to a multiple of 1000. That is, the value is in seconds. The performance log files controlled by this parameter are stored in the **$GAUSSLOG/gs_profile/**<*node_name*> directory in .prf format. *node_name* is the value of **pgxc_node_name** in the **postgres.conf** file.

Value range: a number ranging from 0 to 2147483647. The unit is ms.

0 indicates that the current session will not log performance data. A value other than 0 indicates that the current session will log performance data based on the period specified by this parameter.

A small value indicates that much data is logged, which seriously affects performance.

Default value: 0s

19.9.3 Logging Content

debug_print_parse

Parameter description: Specifies whether to print parsing tree results.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the printing is enabled.
- **off** indicates that the printing is disabled.

Default value: **off**

debug_print_rewritten

Parameter description: Specifies whether to print query rewriting results.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the printing is enabled.
- **off** indicates that the printing is disabled.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

debug_print_plan

Parameter description: Specifies whether to print the query execution plan to logs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the printing is enabled.
- **off** indicates that the printing is disabled.

Default value: **off**

NOTICE

- Debugging information about **debug_print_parse**, **debug_print_rewritten**, and **debug_print_plan** are printed only when the log level is set to **log** or higher. When these parameters are set to **on**, their debugging information will be recorded in server logs and will not be sent to client logs. You can change the log level by setting **client_min_messages** and **log_min_messages**.
- Do not invoke the **gs_encrypt_aes128** and **gs_decrypt_aes128** functions when **debug_print_plan** is set to **on**, preventing the risk of sensitive information disclosure. You are advised to filter parameter information of the **gs_encrypt_aes128** and **gs_decrypt_aes128** functions in the log files generated when **debug_print_plan** is set to **on** before providing the log files to external maintenance engineers for fault locating. After you finish using the logs, delete them as soon as possible.

debug_pretty_print

Parameter description: Indents the logs produced by **debug_print_parse**, **debug_print_rewritten**, and **debug_print_plan**. The output format is more readable but much longer than that generated when this parameter is set to **off**.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the indentation is enabled.
- **off** indicates that the indentation is disabled.

Default value: **on**

log_checkpoints

Parameter description: Specifies whether the statistics on checkpoints and restart points are recorded in the server logs. When this parameter is set to **on**, statistics on checkpoints and restart points are recorded in the log messages, including the number of buffers written and the time spent in writing them.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

- **on** indicates that the statistics on checkpoints and restart points are recorded in the server logs.
- **off** indicates that the statistics on checkpoints and restart points are not recorded in the server logs

Default value: **off**

log_connections

Parameter description: Specifies whether to record connection request information of the client.

This parameter is a BACKEND parameter. Set it based on instructions provided in Table 11-1.

NOTICE

Some client programs, such as gsql, attempt to connect twice while determining if a password is required. In this case, duplicate "connection receive" messages do not necessarily indicate a problem.

Value range: Boolean

- **on** indicates that the request information is recorded.
- **off** indicates that the request information is not recorded.

Default value: **off**

log_disconnections

Parameter description: Specifies whether to record disconnection request information of the client.

This parameter is a BACKEND parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

- **on** indicates that the request information is recorded.
- **off** indicates that the request information is not recorded.

Default value: **off**

log_duration

Parameter description: Specifies whether to record the duration of every completed SQL statement. For clients using extended query protocols, the time required for parsing, binding, and executing steps are logged independently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **off**: Compared with this option, **log_min_duration_statement** forcibly records the query text.
- If this parameter is set to **on** and **log_min_duration_statement** is set to a positive value, the duration of each completed statement is logged but the query text is included only for statements exceeding the threshold. This behavior can be used for gathering statistics in high-load situation.

Default value: **off**

log_error_verbosity

Parameter description: Specifies the amount of detail written in the server log for each message that is logged.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: enumerated values

- **terse** indicates that the output excludes the DETAIL, HINT, QUERY, and CONTEXT error information.
- **verbose** indicates that the output includes the SQLSTATE error code, the source code file name, function name, and number of the line in which the error occurs.
- **default** indicates that the output includes the DETAIL, HINT, QUERY, and CONTEXT error information, and excludes the SQLSTATE error code, the source code file name, function name, and number of the line in which the error occurs.

Default value: **default**

log_hostname

Parameter description: By default, connection log messages only show the IP address of the connecting host. The host name can be recorded when this parameter is set to **on**. It may take some time to parse the host name. Therefore, the database performance may be affected.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the host name is simultaneously recorded.
- **off** indicates that the host name is not simultaneously recorded.

Default value: **off**

log_line_prefix

Parameter description: Specifies the prefix format of each log information. A prefix is a printf-style string that is output at the beginning of each line of the log.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The "escape sequences" which begin with **%** are replaced with status information as listed in **Table 19-3**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Table 19-3 Escape characters

Escape Character	Effect
%a	Application name
%u	Username
%d	Database name
%r	Remote host name or IP address and remote port. If **log_hostname** is set to **off**, only the IP address and remote port are displayed.
%h	Remote host name or IP address. If **log_hostname** is set to **off**, only the IP address is displayed.
%p	Thread ID
%t	Timestamp without milliseconds (no time zone in the Windows OS)
%m	Timestamp with milliseconds
%n	Node from which an error is reported
%i	Command tag: type of command executed in the current session
%e	SQLSTATE error code
%c	Session ID: For details, see the note below the table.
%l	Number of the log line for each session, starting from 1
%s	Start time of a session
%v	Virtual transaction ID (backendID/ localXID)
%x	Transaction ID (**0** indicates that no transaction ID is assigned)
%q	Produces no output. If the current thread is a backend thread, this escape sequence is ignored and subsequent escape sequences are processed. Otherwise, this escape sequence and subsequent escape sequences are all ignored.
%S	Session ID
%T	Trace ID
%%	The character %

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The %c escape character prints a unique session ID consisting of two 4-byte hexadecimal numbers separated by a period (.). The numbers are the process startup time and the process ID. Therefore, %c can also be used as a space saving way of printing those items. For example, run the following query to generate the session ID from **pg_stat_activity**:

```
SELECT to_hex(EXTRACT(EPOCH FROM backend_start)::integer) || '.' ||
       to_hex(pid)
FROM pg_stat_activity;
```

- If you set a non-empty value for **log_line_prefix**, ensure that its last character is a space, to provide visual separation from the rest of the log line. A punctuation character can be used, too.
- Syslog generates its own timestamp and process ID information. Therefore, you do not need to include those escapes characters when you are logging in to syslog.

Value range: a string

Default value: **'%m %n %u %d %h %p %S %x %a '**

NOTE

%m %n %u %d %h %p %S %x %a indicates the session start timestamp, error reporting node, username, database name, remote host name or IP address, thread ID, session ID, transaction ID, and application name.

log_lock_waits

Parameter description: If the time for which a session waits to acquire a lock is longer than the value of **deadlock_timeout**, this parameter specifies whether to record this message in the database. This is useful in determining if lock waits are causing poor performance.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the information is recorded.
- **off** indicates that the information is not recorded.

Default value: **off**

log_statement

Parameter description: Specifies which SQL statements are recorded. For clients using extended query protocols, logging occurs when an Execute message is received, and values of the Bind parameters are included (with any embedded single quotation marks doubled).

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

Statements that contain simple syntax errors are not logged even if **log_statement** is set to **all**, because the log message is emitted only after basic parsing has been completed to determine the statement type. If an extended query protocol is used, statements that fail before the execution phase (during parse analysis or planning) are not logged, either. Set **log_min_error_statement** to **ERROR** or lower to log such statements.

Value range: enumerated values

- **none** indicates that no statement is recorded.
- **ddl** indicates that all data definition statements, such as CREATE, ALTER, and DROP, are recorded.
- **mod** indicates that all DDL statements and data modification statements, such as INSERT, UPDATE, DELETE, TRUNCATE, and COPY FROM, are recorded.
- **all** indicates that all statements, including the PREPARE, EXECUTE, and EXPLAIN ANALYZE statements, are recorded.

Default value: **none**

log_temp_files

Parameter description: Specifies whether to record the deletion information of temporary files. Temporary files can be created for sorting, hashing, and storing temporary querying results. If the recording is enabled, a log entry is generated for each temporary file when it is deleted.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from –1 to 2147483647. The unit is KB.

- A positive value indicates that the deletion information of temporary files whose size is larger than the specified value of **log_temp_files** is recorded.
- **0** indicates that the delete information of all temporary files is recorded.
- **–1** indicates that the delete information of any temporary files is not recorded.

Default value: **–1**

log_timezone

Parameter description: Specifies the time zone used for timestamps written in the server log. Different from **TimeZone**, this parameter takes effect for all sessions in the database.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string. You can obtain it by querying the **PG_TIMEZONE_NAMES** view.

Default value: Set this parameter based on the OS time zone.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The default value will be changed when **gs_initdb** is used to set system environments.

logging_module

Parameter description: Specifies whether module logs are output on the server. This parameter is a session-level parameter, and you are advised not to use the **gs_guc** tool to set it.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value: **off**. All the module logs are not output on the server. You can view the logs by running **show logging_module**.

```
ALL,on(),off(GUC,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,SSL,GDS,TBLSPC,WLM,OBS,EXECUTOR,VEC_EXECU
TOR,STREAM,LLVM,OPT,OPT_REWRITE,OPT_JOIN,OPT_AGG,OPT_SUBPLAN,OPT_SETOP,OPT_SKEW,UDF,COO
P_ANALYZE,WLMCP,ACCELERATE,PARQUET,PLANHINT,SNAPSHOT,XACT,HANDLE,CLOG,EC,REMOTE,CN_RETR
Y,PLSQL,TEXTSEARCH,SEQ,REDO,FUNCTION,PARSER,INSTR,INCRE_CKPT,DBL_WRT,RTO,HEARTBEAT,COMM_I
PC,COMM_PARAM,ENCODING_CHECK)
```

Setting method: Run **show logging_module** to view which modules are controllable. For example, the query output result is as follows:

```
openGauss=# show logging_module;
logging_module
-----------------------------------------------------------------------------------------------------------------------------------
-----------------------------------------------------------------------------------------------------------------------------------
-------------------------------------------------
ALL,on(),off(GUC,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,SSL,GDS,TBLSPC,WLM,OBS,EXECUTOR,VEC_EXECU
TOR,STREAM,LLVM,OPT,OPT_REWRITE,OPT_JOIN,OPT_AGG,OPT_SUBPLAN,OPT_SETOP,OPT_SKEW,UDF,COO
P_ANALYZE,WLMCP,ACCELERATE,PARQUET,PLANHINT,SNAPSHOT,XACT,HANDLE,CLOG,EC,REMOTE,CN_RETR
Y,PLSQL,TEXTSEARCH,SEQ,REDO,FUNCTION,PARSER,INSTR,INCRE_CKPT,DBL_WRT,RTO,HEARTBEAT,COMM_I
PC,COMM_PARAM,ENCODING_CHECK)
(1 row)
```

Controllable modules are identified by uppercase letters, and the special ID **ALL** is used for setting all module logs. You can control the output of module logs by setting **logging_module** to **on** or **off**. Enable log output for SSL:

```
openGauss=# set logging_module='on(SSL)';
SET
openGauss=# show
logging_module;
       logging_module
-----------------------------------------------------------------------------------------------------------------------------------
-----------------------------------------------------------------------------------------------------------------------------------
-------------------------------------------------
ALL,on(SSL),off(GUC,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,GDS,TBLSPC,WLM,OBS,EXECUTOR,VEC_EXECU
TOR,STREAM,LLVM,OPT,OPT_REWRITE,OPT_JOIN,OPT_AGG,OPT_SUBPLAN,OPT_SETOP,OPT_SKEW,UDF,COO
P_ANALYZE,WLMCP,ACCELERATE,PARQUET,PLANHINT,SNAPSHOT,XACT,HANDLE,CLOG,EC,REMOTE,CN_RETR
Y,PLSQL,TEXTSEARCH,SEQ,REDO,FUNCTION,PARSER,INSTR,INCRE_CKPT,DBL_WRT,RTO,HEARTBEAT,COMM_I
PC,COMM_PARAM,ENCODING_CHECK)
(1 row)
```

SSL log output is enabled.

The **ALL** identifier can be used to quickly enable or disable log output for all modules.

```
openGauss=# set logging_module='off(ALL)';
SET
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
openGauss=# show
logging_module;
          logging_module
-----------------------------------------------------------------------------------------------------------------------
-----------------------------------------------------------------------------------------------------------------------
-----------------------------------------------
ALL,on(),off(GUC,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,SSL,GDS,TBLSPC,WLM,OBS,EXECUTOR,VEC_EXECU
TOR,STREAM,LLVM,OPT,OPT_REWRITE,OPT_JOIN,OPT_AGG,OPT_SUBPLAN,OPT_SETOP,OPT_SKEW,UDF,COO
P_ANALYZE,WLMCP,ACCELERATE,PARQUET,PLANHINT,SNAPSHOT,XACT,HANDLE,CLOG,EC,REMOTE,CN_RETR
Y,PLSQL,TEXTSEARCH,SEQ,REDO,FUNCTION,PARSER,INSTR,INCRE_CKPT,DBL_WRT,RTO,HEARTBEAT,COMM_I
PC,COMM_PARAM,ENCODING_CHECK)
(1 row)

openGauss=# set logging_module='on(ALL)';
SET
openGauss=# show
logging_module;
         logging_module
-----------------------------------------------------------------------------------------------------------------------
-----------------------------------------------------------------------------------------------------------------------
-----------------------------------------------
ALL,on(GUC,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,SSL,GDS,TBLSPC,WLM,OBS,EXECUTOR,VEC_EXECUTOR,
STREAM,LLVM,OPT,OPT_REWRITE,OPT_JOIN,OPT_AGG,OPT_SUBPLAN,OPT_SETOP,OPT_SKEW,UDF,COOP_AN
ALYZE,WLMCP,ACCELERATE,PARQUET,PLANHINT,SNAPSHOT,XACT,HANDLE,CLOG,EC,REMOTE,CN_RETRY,PLS
QL,TEXTSEARCH,SEQ,REDO,FUNCTION,PARSER,INSTR,INCRE_CKPT,DBL_WRT,RTO,HEARTBEAT,COMM_IPC,C
OMM_PARAM,ENCODING_CHECK),off()
(1 row)
```

Dependency: The value of this parameter depends on the settings of **log_min_level**.

enable_unshipping_log

Parameter description: Specifies whether to log statements that are not pushed down. The logs help locate performance issues that may be caused by statements not pushed down. If **enable_stream_operator** is set to **off** and this parameter is set to **on**, a large number of logs indicating that plans cannot be pushed down are recorded. If you do not need these logs, you are advised to set both **enable_unshipping_log** and **enable_stream_operator** to **off**.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that statements not pushed down are logged.
- **off** indicates that statements not pushed down are not logged.

Default value: **off**

opfusion_debug_mode

Parameter description: Checks whether simple queries are optimized for debugging. If this parameter is set to **log**, you can view the specific reasons why queries are not optimized in the DN execution plans.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: enumerated values

- **off** indicates that reasons why queries are not optimized are not included.

- **log** indicates that reasons why queries are not optimized are included in the DN execution plan.

NOTICE

- You need to set **max_datanode_for_plan** to view the DN execution plans.
- To view the reasons why queries are not optimized in the log, set **opfusion_debug_mode** to **log**, **log_min_messages** to **debug4**, and **logging_module** to **on(OPFUSION)**. Note that a large amount of log messages may be generated. Therefore, execute only a small number of jobs during debugging.

Default value: **off**

enable_debug_vacuum

Parameter description: Specifies whether to allow output of some VACUUM-related logs for problem locating. This parameter is used only by developers. Common users are advised not to use it.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

- **on/true** indicates that output of VACUUM-related logs is allowed.
- **off/false** indicates that output of VACUUM-related logs is disallowed.

Default value: **off**

resource_track_log

Parameter description: Specifies the log level of self-diagnosis. Currently, this parameter takes effect only in multi-column statistics. (The current feature is a lab feature. Contact Huawei technical support before using it.)

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: a string

- **summary**: Brief diagnosis information is displayed.
- **detail**: Detailed diagnosis information is displayed.

Currently, the two parameter values differ only when there is an alarm about multi-column statistics not collected. If the parameter is set to **summary**, such an alarm will not be displayed. If it is set to **detail**, such an alarm will be displayed.

Default value: **summary**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

19.9.4 Using CSV Log Output

Prerequisites

- The **log_destination** parameter is set to **csvlog**.
- The **logging_collector** parameter is set to **on**.

Definition of csvlog

Log lines are emitted in comma separated values (CSV) format.

An example table definition for storing CSV-format log output is shown as follows:

```
CREATE TABLE postgres_log
(
log_time timestamp(3) with time zone,
node_name text,
user_name text,
database_name text,
process_id bigint,
connection_from text,
"session_id" text,
session_line_num bigint,
command_tag text,
session_start_time timestamp with time zone,
virtual_transaction_id text,
transaction_id bigint,
query_id bigint,
module text,
error_severity text,
sql_state_code text,
message text,
detail text,
hint text,
internal_query text,
internal_query_pos integer,
context text,
query text,
query_pos integer,
location text,
application_name text
);
```

For details, see **Table 19-4**.

Table 19-4 Meaning of each csvlog field

Field	Description	Field	Description
log_time	Timestamp in milliseconds	module	Log module
node_name	Node name	error_severity	ERRORSTATE code
user_name	Username	sql_state_code	SQLSTATE code

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Field	Description	Field	Description
database_name	Database name	message	Error message
process_id	Process ID	detail	Detailed error message
connection_from	Port number of the client host	hint	Prompt message
session_id	Session ID	internal_query	Internal query (This field is used to query the information leading to errors if any.)
session_line_num	Number of lines in each session	internal_query_pos	Pointer for an internal query
command_tag	Command tag	context	Environment
session_start_time	Start time of a session	query	Character count at the position where errors occur
virtual_transaction_id	Regular transaction	query_pos	Pointer at the position where errors occur
transaction_id	Transaction ID	location	Position where errors occur in the GaussDB source code if **log_error_verbosity** is set to **verbose**
query_id	Query ID	application_name	Application name

Run the following command to import a log file to this table:

```
COPY postgres_log FROM '/opt/data/pg_log/logfile.csv' WITH csv;
```

NOTE

The log name (**logfile.csv**) here needs to be replaced with the name of a log generated.

Simplifying Input

Simplify importing CSV log files by performing the following operations:

- Set **log_filename** and **log_rotation_age** to provide a consistent, predictable naming solution for log files. By doing this, you can predict when an individual log file is complete and ready to be imported.
- Set **log_rotation_size** to **0** to disable size-based log rollback, as it makes the log file name difficult to predict.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Set **log_truncate_on_rotation** to **on** so that old log data cannot be mixed with the new one in the same file.

19.10 Alarm Detection

During the running of the cluster, error scenarios can be detected and informed to users in a timely manner. You can view the **system_alarm** log written by the alarm in the *$GAUSSLOG*/**cm** or the *$GAUSSLOG*/**pg_log/gtm** directory.

enable_alarm

Parameter description: Specifies whether to enable the alarm detection thread to detect fault scenarios that may occur in the database.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the alarm detection thread is enabled.
- **off** indicates that the alarm detection thread is disabled.

Default value: **on**

NOTE

This parameter takes effect only on CNs and DNs.

connection_alarm_rate

Parameter description: Specifies the ratio restriction on the maximum number of allowed parallel connections to the database. The maximum number of concurrent connections to the database is **max_connections** x **connection_alarm_rate**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a floating point number ranging from 0.0 to 1.0

Default value: **0.9**

alarm_report_interval

Parameter description: specifies the interval at which an alarm is reported.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer. The unit is s.

Default value: 10

alarm_component

Parameter description: Certain alarms are suppressed during alarm reporting. That is, the same alarm will not be repeatedly reported by an instance within the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

period specified by **alarm_report_interval**. Its default value is **10s**. In this case, the parameter specifies the location of the alarm component that is used to process alarm information. Only the sysadmin user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

- If **--alarm-type** in the **gs_preinstall** script is set to **5**, no third-party component is connected and alarms are written into the **system_alarm** log. In this case, the value of **alarm_component** is **/opt/huawei/snas/bin/snas_cm_cmd**.
- If **--alarm-type** in the **gs_preinstall** script is set to **1**, a third-party component is connected. In this case, the value of **alarm_component** is the absolute path of the executable program of the third-party component.

Default value: **/opt/huawei/snas/bin/snas_cm_cmd**

19.11 Statistics During the Database Running

19.11.1 Query and Index Statistics Collector

The query and index statistics collector is used to collect statistics during database running. The statistics include the times of inserting and updating a table and index, the number of disk blocks and tuples, and the time required for the last cleanup and analysis on each table. The statistics can be viewed by querying system view **pg_stats** and **pg_statistic**. The following parameters are used to set the statistics collection feature in the server scope.

track_activities

Parameter description: Collects statistics about the commands that are being executed in session. For a stored procedure, if this parameter is enabled, you can view the PERFORM statement, stored procedure calling statement, SQL statement, and OPEN CURSOR statement that are being executed in the stored procedure in the pg_stat_activity view.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the statistics collection function is disabled.

Default value: **on**

track_counts

Parameter description: Collects statistics about database activities.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the statistics collection function is disabled.

NOTE

When the database to be cleaned up is selected from the **AutoVacuum** automatic cleanup process, the database statistics are required. In this case, the default value is set to **on**.

Default value: **on**

track_io_timing

Parameter description: Collects statistics about I/O timing in the database. The I/O timing statistics can be queried by using the **pg_stat_database** parameter.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- If this parameter is set to **on**, the collection function is enabled. In this case, the collector repeatedly queries the operating system at the current time. As a result, large number of costs may occur on some platforms. Therefore, the default value is set to **off**.
- **off** indicates that the statistics collection function is disabled.

Default value: **off**

track_functions

Parameter description: Collects statistics of the number and duration of function invocations.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

When the SQL functions are set to inline functions queried by the invoking, these SQL functions cannot be traced no matter these functions are set or not.

Value range: enumerated values

- **pl** indicates that only procedural language functions are traced.
- **all** indicates that SQL and C language functions are traced. (The current feature is a lab feature. Contact Huawei technical support before using it.)
- **none** indicates that the function tracing function is disabled.

Default value: **none**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

track_activity_query_size

Parameter description: Specifies byte counts of the current running commands used to trace each active session.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 100 to 102400

Default value: 1024

update_process_title

Parameter description: Collects statistics updated with a process name each time the server receives a new SQL statement.

The process name can be viewed on Windows task manager by running the **ps** command.

This parameter is an INTERNAL parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the statistics collection function is disabled.

Default value: **off**

stats_temp_directory

Parameter description: Specifies the directory for storing temporary statistics. Only the **sysadmin** user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

If a RAM-based file system directory is used, the actual I/O cost can be lowered and the performance can be improved.

Value range: a string

Default value: **pg_stat_tmp**

track_thread_wait_status_interval

Parameter description: Specifies the interval of collecting the thread status information.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 1440. The unit is min.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **30min**

enable_save_datachanged_timestamp

Parameter description: Specifies whether to record the time when **INSERT**, **UPDATE**, **DELETE**, or **EXCHANGE**/**TRUNCATE**/**DROP PARTITION** is performed on table data.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the time when an operation is performed on table data will be recorded.
- **off** indicates that the time when an operation is performed on table data will not be recorded.

Default value: **on**

track_sql_count

Parameter description: Collects statistics on the statements (**SELECT**, **INSERT**, **UPDATE**, **MERGE INTO**, and **DELETE**) that are being executed in a session.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU and 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 0.8% by enabling or disabling this parameter.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the auditing function is disabled.

Default value: **on**

NOTE

If **track_sql_count** is set to **off**, querying the **gs_sql_count** or **pgxc_sql_count** view returns **0**.

19.11.2 Performance Statistics

During the running of the database, the lock access, disk I/O operation, and invalid message processing are involved. All these operations are the bottleneck of the database performance. The performance statistics provided by GaussDB can facilitate the performance fault location.

Generating Performance Statistics Logs

Parameter description: For each query, the following four parameters record the performance statistics of corresponding modules in the server log:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The **log_parser_stats** parameter records the performance statistics of a parser in the server log.
- The **log_planner_stats** parameter records the performance statistics of a query optimizer in the server log.
- The **log_executor_stats** parameter records the performance statistics of an executor in the server log.
- The **log_statement_stats** parameter records the performance statistics of the whole statement in the server log.

All these parameters can only provide assistant analysis for administrators, which are similar to the getrusage() of the Linux OS.

These parameters are SUSET parameters. Set them based on instructions provided in **Table 11-1**.

NOTICE

- The **log_statement_stats** records the total statement statistics whereas other parameters record statistics only about their corresponding modules.
- The **log_statement_stats** parameter cannot be enabled together with any parameter recording statistics about a module.

Value range: Boolean

- **on** indicates that performance statistics are recorded.
- **off** indicates that performance statistics are not recorded.

Default value: **off**

19.11.3 Hotspot Key Statistics

In the distributed architecture, if applications access a node in a short period of time, the resource usage of the node is too high, affecting the normal running of the database. GaussDB provides the function of quickly detecting hotspot keys to quickly determine whether there are hotspot keys and the distribution of hotspot keys.

enable_hotkeys_collection

Parameter description: Specifies whether to automatically collect statistics on the accessed key values in the database.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

NOTE

If you set parameters using **gs_guc** set, you need to restart the database for the GUC parameters to take effect. During the restart, hotspot key information is cleared.

When the GUC parameter is disabled, the query result of the hotspot key is empty and a message is displayed indicating that the GUC parameter is disabled. However, when the function is disabled, the hotspot key clearance API can still be used.

Value range: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the auditing function is disabled.

Default value: **off**

19.12 Workload Management

The current feature is a lab feature. Contact Huawei technical support before using it.

If database resource usage is not controlled, concurrent tasks may preempt resources. As a result, the OS will be overloaded and cannot respond to user tasks; or even crash and cannot provide any services to users. The GaussDB workload management balances the database workload based on available resources to prevent database overloads.

use_workload_manager

Parameter description: Specifies whether to enable the resource management function. This parameter must be set to a same value on CNs and DNs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the resource management function is enabled.
- **off** indicates that the resource management function is disabled.

  NOTE

  - If method 2 in **Table 11-1** is used to change the parameter value, the new value takes effect only for the threads that are started after the change. In addition, the new value does not take effect for new jobs that are executed by backend threads and reused threads. You can make the new value take effect for these threads by using **kill session** or restarting the node.
  - After the value of **use_workload_manager** changes from **off** to **on**, statistics about storage resources when **use_workload_manager** was **off** are not collected. To collect statistics about such resources, run the following statement:

    ```
    select gs_wlm_readjust_user_space(0);
    ```

Default value: **on**

enable_control_group

Parameter description: Specifies whether to enable the Cgroups. This parameter must be set to a same value on CNs and DNs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the Cgroups are enabled.
- **off** indicates that the Cgroups are disabled.

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

If method 2 in **Table 11-1** is used to change the parameter value, the new value takes effect only for the threads that are started after the change. In addition, the new value does not take effect for new jobs that are executed by backend threads and reused threads. You can make the new value take effect for these threads by using **kill session** or restarting the node.

enable_backend_control

Parameter description: Specifies whether to move database permanent threads to the **DefaultBackend** control group. This parameter must be set to a same value on CNs and DNs.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that permanent threads are moved to the **DefaultBackend** control group.
- **off** indicates that permanent threads are not moved to the **DefaultBackend** control group.

Default value: **on**

enable_vacuum_control

Parameter description: Specifies whether to move the autovacuum worker thread to the **Vacuum** control group. This parameter must be set to a same value on CNs and DNs.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the autovacuum worker thread is moved to the **Vacuum** control group.
- **off** indicates that the autovacuum worker thread is not moved to the **Vacuum** control group.

Default value: **on**

enable_perm_space

Parameter description: Specifies whether to enable the perm space function. This parameter must be set to a same value on CNs and DNs.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the perm space function is enabled.
- **off** indicates that the perm space function is disabled.

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_verify_active_statements

Parameter description: Specifies whether to enable the background calibration during static self-adaptive workload balancing. This parameter must be used on CNs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the background calibration is enabled.
- **off** indicates that the background calibration is disabled.

Default value: **on**

max_active_statements

Parameter description: Specifies the maximum number of concurrent jobs in each CN. This parameter can be used in only CNs.

The database administrator should set the value of this parameter based on system resources (for example, CPU, I/O, and memory resources) to ensure that the system resources can be fully utilized and the system will not be crashed by too many concurrent jobs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from –1 to 2147483647 The values **–1** and **0** indicate that the number of concurrent jobs is not limited.

parctl_min_cost

Parameter description: Specifies the execution cost threshold of a statement. If the execution cost of a statement exceeds the specified value, the statement is subject to the concurrent limit of a resource pool. (The current feature is a lab feature. Contact Huawei technical support before using it.)

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from –1 to 2147483647

- If the value is **–1** or the cost of executing a statement is less than 10, the statement is not subject to the concurrency limit of the resource pool.
- If the value is greater than or equal to **0**, **enable_dynamic_workload** is set to **off**, and the cost of executing a statement exceeds the value and is greater than or equal to 10, the statement is subject to the concurrency limit of the resource pool.

Default value: **100000**

cgroup_name

Parameter description: Specifies the name of the Cgroup in use or changes the priority of items in the queue of the Cgroup.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If you set **cgroup_name** and then **session_respool**, the Cgroup associated with **session_respool** takes effect. If you reverse the order, the Cgroup associated with **cgroup_name** takes effect.

If the workload Cgroup level is specified during the **cgroup_name** change, the database does not check the Cgroup level. The level ranges from 1 to 10.

This parameter is a USERSET parameter. Set it based on method 3 in **Table 11-1**.

You are advised not to set **cgroup_name** and **session_respool** at the same time.

Value range: a string

Default value: **DefaultClass:Medium**

NOTE

DefaultClass:Medium indicates the **Medium** Cgroup that belongs to the **Timeshare** Cgroup under the **DefaultClass** Cgroup.

cpu_collect_timer

Parameter description: Specifies how frequently CPU data is collected during statement execution on DNs.

The database administrator should set a proper collection frequency based on system resources (for example, CPU, I/O, and memory resources). A too small value will affect the execution efficiency and a too large value will reduce the accuracy of exception handling.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 2147483647. The unit is s.

Default value: **30**

enable_cgroup_switch

Parameter description: Specifies whether a statement is automatically switched to the TopWD group when the statement is executed by control group type.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that a statement is automatically switched to the TopWD group when the statement is executed by control group type.
- **off** indicates that a statement is not automatically switched to the TopWD group when the statement is executed by control group type.

Default value: **off**

memory_tracking_mode

Parameter description: Specifies the memory information recording mode.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range:

- **none** indicates that memory statistics are not collected.
- **peak** indicates that statistics on the peak value of the query level memory are collected. The value is recorded in the database log and can also be output by using **explain analyze**.
- **normal** indicates that memory statistics are collected in real time but no file is generated.
- **executor** indicates that a statistics file is generated, containing the context information of all allocated memory used on the execution layer.
- **fullexec** indicates that a statistics file is generated, containing the information about all memory contexts requested by the execution layer.

Default value: **none**

memory_detail_tracking

Parameter description: Specifies the memory context allocation priority of a thread and the plannodeid of the query for which the current thread is running. This parameter is only suitable for the DEBUG version.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: a string

Default value: **–1** for **Memory Context Sequent Count** and **Plan Nodeid**, indicating an empty value

NOTICE

You are advised to retain the default value for this parameter.

enable_resource_track

Parameter description: Specifies whether the real-time resource monitoring is enabled. This parameter must be set to a same value on CNs and DNs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

- **on** indicates that the resource monitoring is enabled.
- **off** indicates that the resource monitoring is disabled.

Default value: **on**

enable_resource_record

Parameter description: Specifies whether resource monitoring records are archived. If this parameter is set to **on**, records in the **history** views

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

(**GS_WLM_SESSION_HISTORY** and **GS_WLM_OPERATOR_HISTORY**) are archived to the corresponding **info** views (**GS_WLM_SESSION_INFO** and **GS_WLM_OPERATOR_INFO**) at an interval of 3 minutes. After being archived, the records are deleted from the **history** views. This parameter must be set to a same value on CNs and DNs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the resource monitoring records are archived.
- **off** indicates that the resource monitoring records are not archived.

Default value: **off**

enable_logical_io_statistics

Parameter description: Specifies whether to enable the logical I/O statistics function during resource monitoring. If this function is enabled, the **read_kbytes**, **write_kbytes**, **read_counts**, **write_counts**, **read_speed**, and **write_speed** fields in the **PG_TOTAL_USER_RESOURCE_INFO** view will collect statistics on the byte count, number of times, and speed of logical read and write. Fields related to logical read and write in the system catalogs **GS_WLM_USER_RESOURCE_HISTORY** and **GS_WLM_INSTANCE_HISTORY** will collect statistics on the logical read and write of related users and instances.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

Default value: **on**

enable_user_metric_persistent

Parameter description: Specifies whether the historical monitoring data of user resources is dumped. If this parameter is set to **on**, data in the **PG_TOTAL_USER_RESOURCE_INFO** view is periodically sampled and saved to the system catalog **GS_WLM_USER_RESOURCE_HISTORY**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

on indicates that the historical monitoring data of user resources is dumped.

off indicates that the historical monitoring data of user resources is not dumped

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

user_metric_retention_time

Parameter description: Specifies the retention days of the historical monitoring data of user resources. This parameter is valid only when **enable_user_metric_persistent** is set to **on**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 3650. The unit is day.

If this parameter is set to **0**, the historical monitoring data of user resources is permanently stored.

If the value is greater than **0**, the historical monitoring data of user resources is stored for the specified number of days.

Default value: **7**

enable_instance_metric_persistent

Parameter description: Specifies whether the instance resource monitoring data is dumped. When this parameter is set to **on**, the instance monitoring data is saved to the system catalog **GS_WLM_INSTANCE_HISTORY**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the instance resource monitoring data is dumped.
- **off** indicates that the instance resource monitoring data is not dumped.

Default value: **on**

instance_metric_retention_time

Parameter description: Specifies the retention days of the historical monitoring data of instance resources. This parameter is valid only when **enable_instance_metric_persistent** is set to **on**.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 3650. The unit is day.

- If this parameter is set to **0**, the historical monitoring data of instance resources is permanently stored.
- If the value is greater than **0**, the historical monitoring data of instance resources is stored for the specified number of days.

Default value: **7**

resource_track_level

Parameter description: Specifies the resource monitoring level of the current session. This parameter is valid only when **enable_resource_track** is set to **on**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: enumerated values

- **none** indicates that resources are not monitored.
- **query** indicates that resources used at the query level are monitored.
- **operator** indicates that resources used at query and operator levels are monitored.

Default value: **query**

resource_track_cost

Parameter description: Specifies the minimum execution cost for resource monitoring on statements in the current session. This parameter is valid only when **enable_resource_track** is set to **on**.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: an integer ranging from –1 to 2147483647

- **–1** indicates that resource monitoring is disabled.
- If the value is greater than or equal to 0:
  - A value ranging from **0** to **9** indicates that statements whose execution cost is greater than or equal to 10 will be monitored.
  - A value greater than or equal to **10** indicates that statements whose execution cost exceeds this value will be monitored.

Default value: **100000**

resource_track_duration

Parameter description: Specifies the minimum statement execution time that determines whether information about jobs of a statement recorded in the real-time view will be dumped to a historical view after the statement is executed. Job information will be dumped from the real-time view (with the suffix **statistics**) to a historical view (with the suffix **history**) if the statement execution time is no less than this value. This parameter is valid only when **enable_resource_track** is set to **on**.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: an integer ranging from 0 to 2147483647. The unit is s.

- **0** indicates that historical information about all statements recorded in the real-time resource monitoring view are archived.
- If the value is greater than **0**, historical information about a statement whose execution time exceeds this value will be archived.

Default value: **1min**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

dynamic_memory_quota

Parameter description: Specifies the memory quota in adaptive workload scenarios, that is, the proportion of maximum available memory to total system memory.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 100

Default value: **80**

disable_memory_protect

Parameter description: Stops memory protection. To query system views when system memory is insufficient, set this parameter to **on** to stop memory protection. This parameter is used only to diagnose and debug the system when system memory is insufficient. Set it to **off** in other scenarios.

This parameter is a USERSET parameter and is valid only for the current session. Set this parameter following the method 3 in **Table 11-1**.

Value range: Boolean

- **on** indicates that memory protection stops.
- **off** indicates that memory is protected.

Default value: **off**

query_band

Parameter description: Specifies the job type of the current session.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value: empty

enable_bbox_dump

Parameter description: Specifies whether the black box function is enabled. The core files can be generated even when the core dump mechanism is not configured in the system. This function is valid only for CNs or DNs. For CMA, CMS, GTM, and fenced UDF, the system core mechanism must be configured to capture core files.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the black box function is enabled.
- **off** indicates that the black box function is disabled.

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

The generation of core files by the black box function depends on the open ptrace interface of the operating system. If the permission is insufficient (errno = 1), ensure that the **/proc/sys/kernel/yama/ptrace_scope** configuration is correct.

enable_ffic_log

Parameter description: Specifies whether to enable the first failure information capture (FFIC) function. This function is valid only for CNs or DNs. For CMA, CMS, GTM, and fenced UDF, the system core mechanism must be configured to capture core files.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the FFIC function is enabled.
- **off** indicates that the FFIC function is disabled.

Default value: **on**

enable_dynamic_workload

Parameter description: Specifies whether to enable the dynamic workload management function.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the dynamic workload management function is enabled.
- **off** indicates that the dynamic workload management function is disabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- If memory adaptation is enabled, you do not need to use **work_mem** to optimize the operator memory usage. The system will generate a plan for each statement based on the current workload, estimating the memory used by each operator and by the entire statement. In a concurrency scenario, statements are queued based on the system workload and their memory usage.
- In some cases, the optimizer cannot accurately estimate the number of rows and thereby underestimates or overestimates memory usage. If the memory usage is underestimated, the allocated memory will be automatically increased during statement running. If the memory usage is overestimated, system memory resources will not be fully used, and the number of statements waiting in a queue will increase, which probably results in low performance. To improve performance, identify the statements whose estimated memory usage is much greater than the peak memory of the DN and adjust the value of **query_mem** accordingly. For details, see **Configuring Key Parameters for SQL Tuning**.
- Importing column-store partitioned tables consumes many memory resources and is performance-sensitive. Dynamic workload management is not recommended for such an import.

enable_acceleration_cluster_wlm

Due to specification changes, the current version no longer supports the current feature. Do not use this feature.

Parameter description: Specifies whether to enable the dynamic workload management function to accelerate the cluster. This parameter is valid only for computing resource pools. If this parameter is set to **on** in the cluster, the related logic is not enabled.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the dynamic workload management function is enabled for the cluster.
- **off** indicates that the dynamic workload management function is disabled for the cluster.

Default value: **off**

enable_dywlm_adjust

Parameter description: Specifies whether inaccurate resource values will be dynamically adjusted. This parameter must be set to a same value on CNs and DNs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on** indicates that inaccurate resource values will be dynamically adjusted.
- **off** indicates that inaccurate resource values will not be dynamically adjusted.

Default value: **on**

enable_force_memory_control

Parameter description: Specifies whether to control simple queries based on memory usage when the concurrency control is enabled in a resource pool. (The current feature is a lab feature. Contact Huawei technical support before using it.) This parameter must be set to a same value on CNs and DNs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that simple queries are controlled.
- **off** indicates that simple queries are not controlled.

Default value: **off**

enable_reaper_backend

Parameter description: Specifies whether the signal sent by a subthread when it exits is collected by a separate thread.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the signal is collected by a separate thread.
- **off** indicates that the signal is not collected by a separate thread.

Default value: **on**

memory_fault_percent

Parameter description: Specifies the percentage of memory application failures during the memory fault test. This parameter is used only in the DEBUG version.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647

Default value: **0**

bbox_dump_count

Parameter description: Specifies the maximum number of core files that are generated by GaussDB and can be stored in the path specified by **bbox_dump_path**. If the number of core files exceeds this value, old core files will be deleted. This parameter is valid only when **enable_bbox_dump** is set to **on**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 20

Default value: **8**

NOTE

When core files are generated during concurrent SQL statement execution, the number of files may be larger than the value of **bbox_dump_count**.

bbox_dump_path

Parameter description: Specifies the path where the black box core files are generated. This parameter is valid only when **enable_bbox_dump** is set to **on**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value: empty The default path where the black box core files are generated is /**proc/sys/kernel/core_pattern**. If the path is not a directory or you do not have the write permission on the directory, black box core files will be generated under the data directory of the database.

bbox_blanklist_items

Parameter description: Specifies the anonymized data items of black box core files. This parameter is valid only when **enable_bbox_dump** is set to **on**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string of sensitive data items separated by commas (,).

Default value: empty which indicates that all supported sensitive data items of the core files generated by the black box are anonymized.

Currently, the following data items can be anonymized:

- SHARED_BUFFER: data buffer
- XLOG_BUFFER: redo log buffer
- DW_BUFFER: doublewrite data buffer
- XLOG_MESSAGE_SEND: buffer for sending primary/standby replication logs
- WALRECIVER_CTL_BLOCK: buffer for receiving primary/standby replication logs
- DATA_MESSAGE_SEND: buffer for sending primary/standby replication data
- DATA_WRITER_QUEUE: buffer for receiving primary/standby replication data

bypass_workload_manager

Parameter description: Specifies whether to enable I/O control. This parameter must be set to a same value on CNs and DNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

If **use_workload_manager** is not set to **on**, this parameter can be used to enable the I/O control independently. After the I/O control is enabled, you can set **io_limits** or **io_priority** to configure control details.

Value range: Boolean

- **on** indicates that the I/O control is enabled.
- **off** indicates that the I/O control is disabled.

io_limits

Parameter description: Specifies the upper limit of Input/output operations per second (IOPS).

This parameter is a USERSET parameter. Set it based on method 3 in **Table 11-1**.

Value range: an integer ranging from 0 to 1073741823

Default value: **0**

io_priority

Parameter description: Specifies the I/O priority for jobs that consume many I/O resources. It takes effect when the I/O usage reaches 50%.

This parameter is a USERSET parameter. Set it based on method 3 in **Table 11-1**.

Value range: enumerated values

- **None** indicates no control.
- **Low** indicates that the IOPS is reduced to 10% of the original value.
- **Medium** indicates that the IOPS is reduced to 20% of the original value.
- **High** indicates that the IOPS is reduced to 50% of the original value.

Default value: **None**

io_control_unit

Parameter description: Specifies the unit used to count the number of I/Os during I/O control in row-store scenarios. This parameter must be set to a same value on CNs and DNs.

This parameter is a SIGHUP parameter. Set it based on method 3 in **Table 11-1**.

Set a certain number of I/Os as one unit. This unit is used during the I/O control.

Value range: an integer ranging from 1000 to 1000000

Default value: **6000**

session_respool

Parameter description: Specifies the resource pool associated with the current session.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a USERSET parameter. Set it based on method 3 in **Table 11-1**.

If you set **cgroup_name** and then **session_respool**, the Cgroup associated with **session_respool** takes effect. If you reverse the order, the Cgroup associated with **cgroup_name** takes effect.

If the workload Cgroup level is specified during the **cgroup_name** change, the database does not check the Cgroup level. The level ranges from 1 to 10.

You are not advised to set **cgroup_name** and **session_respool** at the same time.

Value range: a string. This parameter can be set to the resource pool configured through **create resource pool**.

Default value: **invalid_pool**

enable_transaction_parctl

Parameter description: Specifies whether to control transaction block statements and stored procedure statements.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that transaction block statements and stored procedure statements are controlled.
- **off** indicates that transaction block statements and stored procedure statements are not controlled.

Default value: **on**

session_statistics_memory

Parameter description: Specifies the memory size of a real-time query view.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 5 x 1024 to 50% of **max_process_memory**. The unit is KB.

Default value: **5 MB**

topsql_retention_time

Parameter description: Specifies the retention period of historical TopSQL data in the **gs_wlm_session_query_info_all** and **gs_wlm_operator_info** tables.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 3650. The unit is day. If it is set to **0**, the data is stored permanently. If the value is greater than **0**, the data is stored for the specified number of days.

Default value: **0**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

session_history_memory

Parameter description: Specifies the memory size of a historical query view.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 10 x 1024 to 50% of **max_process_memory**. The unit is KB.

Default value: 10 MB

node_group_mode

Parameter description: Displays the current node group mode.

This parameter is a fixed INTERNAL parameter and cannot be modified.

Value range: a string

Default value: **"node group"**

current_logic_cluster

Parameter description: Displays the name of the current logical cluster. (The current feature is a lab feature. Contact Huawei technical support before using it.)

This parameter is a fixed INTERNAL parameter and cannot be modified.

Value range: a string

Default value: empty

transaction_pending_time

Parameter description Specifies the maximum queuing time of transaction block statements and stored procedure statements if **enable_transaction_parctl** is set to **on**.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from –1 to 1073741823. The unit is s.

- **–1** or **0** indicates that no queuing timeout is specified for transaction block statements and stored procedure statements. The statements can be executed when resources are available.
- A value greater than **0** indicates that if transaction block statements and stored procedure statements have been queued for a time longer than the specified value, they are forcibly executed regardless of the current resource situation.

Default value: **0**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

This parameter is valid only for internal statements of stored procedures and transaction blocks. That is, this parameter takes effect only for the statements whose **enqueue** value is **Transaction** or **StoredProc** in **PG_SESSION_WLMSTAT**.

19.13 Automatic Vacuuming

The **autovacuum** process automatically runs the **VACUUM** and **ANALYZE** statements to recycle the record space marked as deleted and update statistics about the table.

autovacuum

Parameter description: Specifies whether to start the **autovacuum** process in the database. Ensure that the **track_counts** parameter is set to **on** before starting the **autovacuum** process.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

NOTE

- Set the **autovacuum** parameter to **on** if you want to start the automatic cleanup of abnormal two-phase transactions when the system recovers from faults.
- If **autovacuum** is set to **on** and **autovacuum_max_workers** to **0**, the autovacuum process is started only when the system recovers from faults to clean up abnormal two-phase transactions.
- If **autovacuum** is set to **on** and **autovacuum_max_workers** to a value greater than **0**, the **autovacuum** process is started to clean up two-phase transactions and processes when the system recovers from faults.

NOTICE

Even if **autovacuum** is set to **off**, the autovacuum process will be started automatically when a transaction ID wraparound is about to occur. When a **CREATE DATABASE** or **DROP DATABASE** operation fails, it is possible that the transaction has been committed or rolled back on some nodes whereas some nodes are still in the prepared state. In this case, perform the following operations to manually restore the nodes:

1. Use the gs_clean tool (setting the **option** parameter to -N) to query the xid of the abnormal two-phase transaction and nodes in the prepared status.
2. Log in to the nodes in the prepared state. Administrators connect to an available database such as **postgres** and run the **set xc_maintenance_mode = on** statement.
3. Commit or roll back the two-phase transaction based on the global transaction status.

Value range: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on** indicates that the **autovacuum** process is started.
- **off** indicates that the **autovacuum** process is not started.

Default value: **on**

autovacuum_mode

Parameter description: Specifies whether the autoanalyze or autovacuum function is started. This parameter is valid only when **autovacuum** is set to **on**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: enumerated values

- **analyze** indicates that only autoanalyze is performed.
- **vacuum** indicates that only autovacuum is performed.
- **mix** indicates that both autoanalyze and autovacuum are performed.
- **none** indicates that neither of them is performed.

Default value: **mix**

autoanalyze_timeout

Parameter description: Specifies the timeout period of autoanalyze. If the duration of autoanalyze on a table exceeds the value of **autoanalyze_timeout**, the autoanalyze is automatically canceled.

The timeout check cannot be completely accurate. In principle, the statistics on each CN must be consistent. Therefore, the synchronization between CNs will not be interrupted even if the synchronization times out. As a result, the actual execution time may exceed the user-defined time.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 0 to 2147483, in seconds. The value **0** indicates no timeout.

Default value: **5min** (300s)

autovacuum_io_limits

Parameter description: Specifies the upper limit of I/Os triggered by the autovacuum process per second.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from –1 to 1073741823. **–1** indicates that the default cgroup is used.

Default value: **–1**

log_autovacuum_min_duration

Parameter description: Records each step performed by the autovacuum process to the server log when the execution time of the autovacuum process is greater

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

than or equal to a certain value. This parameter helps track the autovacuum behavior.

For example, set the **log_autovacuum_min_duration** parameter to **250ms** to record the information about the autovacuum commands running longer than or equal to 250 ms.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from –1 to 2147483647. The unit is ms.

- **0** indicates that all autovacuum actions are recorded in the log.
- **–1** indicates that all autovacuum actions are not recorded in the log.
- A value other than **–1** indicates that a message is recorded when an autovacuum action is skipped due to a lock conflict.

Default value: **–1**

autovacuum_max_workers

Parameter description: Specifies the maximum number of autovacuum worker threads that can run at the same time. The upper limit of this parameter is related to the values of **max_connections** and **job_queue_processes**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer. The minimum value is **0**, indicating that autovacuum is not enabled. The theoretical maximum value is **262143**, but the actual maximum value is a dynamic value calculated by the following formula: 262143 – Value of **max_inner_tool_connections** – Value of **max_connections** – Value of **job_queue_processes** – Number of auxiliary threads – Number of autovacuum launcher threads – 1. The number of auxiliary threads and the number of autovacuum launcher threads are specified by two macros. Their default values are **20** and **2** respectively.

Default value: **3**

autovacuum_naptime

Parameter description: Specifies the interval between activity rounds for the autovacuum process.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 1 to 2147483. The unit is s.

Default value: **10min** (600s)

autovacuum_vacuum_threshold

Parameter description: Specifies the threshold for triggering the **VACUUM** operation. When the number of deleted or updated records in a table exceeds the specified threshold, the **VACUUM** operation is executed on this table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 0 to 2147483647.

Default value: **50**

autovacuum_analyze_threshold

Parameter description: Specifies the threshold for triggering the **ANALYZE** operation. When the number of deleted, inserted, or updated records in a table exceeds the specified threshold, the **ANALYZE** operation is executed on this table.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 0 to 2147483647.

Default value: **50**

autovacuum_vacuum_scale_factor

Parameter description: Specifies a fraction of the table size added to the **autovacuum_vacuum_threshold** parameter when deciding whether to vacuum a table.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: a floating point number ranging from 0.0 to 100.0

Default value: **0.2**

autovacuum_analyze_scale_factor

Parameter description: Specifies a fraction of the table size added to the **autovacuum_analyze_threshold** parameter when deciding whether to analyze a table.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: a floating point number ranging from 0.0 to 100.0

Default value: **0.1**

autovacuum_freeze_max_age

Parameter description: Specifies the maximum age (in transactions) that a table's **pg_class.relfrozenxid** field can attain before a VACUUM operation is performed.

- The old files under the subdirectory of **pg_clog/** can also be deleted by the **VACUUM** operation.
- Even if the **autovacuum** process is not started, the system will invoke the process to prevent transaction ID wraparound.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 100000 to 576460752303423487

Default value: **4000000000**

autovacuum_vacuum_cost_delay

Parameter description: Specifies the value of the cost delay used in the **autovacuum** operation.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from –1 to 100. The unit is ms. **–1** indicates that the normal vacuum cost delay is used.

Default value: **20ms**

autovacuum_vacuum_cost_limit

Parameter description: sets the value of the cost limit used in the **autovacuum** operation.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from –1 to 10000 **–1** indicates that the normal vacuum cost limit is used.

Default value: **–1**

twophase_clean_workers

Parameter description: Specifies the maximum number of concurrent cleanup operations that can be performed by the gs_clean tool.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 1 to 10

Default value: **3**

defer_csn_cleanup_time

Parameter description: Specifies the interval of recycling transaction IDs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 0 to 2147483647

Default value: **5s** (5000 ms)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

19.14 Default Settings of Client Connection

19.14.1 Statement Behavior

This section describes related default parameters involved in the execution of SQL statements.

search_path

Parameter description: Specifies the order in which schemas are searched when an object is referenced with no schema specified. The value of this parameter consists of one or more schema names. Different schema names are separated by commas (,).

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

- If the schema of temporary tables exists in the current session, the scheme can be listed in **search_path** by using the alias **pg_temp**, for example, **'pg_temp,public'**. The schema of temporary tables has the highest search priority and is always searched before all the other schemas specified in **pg_catalog** and **search_path**. Therefore, do not explicitly specify **pg_temp** to be searched after other schemas in **search_path**. This setting will not take effect and an error message will be displayed. If the alias **pg_temp** is used, the temporary schema will be searched only for tables, views, and data types, and not for functions or operators.
- The system catalog schema, **pg_catalog**, has the second highest search priority and is the first to be searched among all the schemas, excluding **pg_temp**, specified in **search_path**. Therefore, do not explicitly specify **pg_catalog** to be searched after other schemas in **search_path**. This setting will not take effect and an error message will be displayed.
- When an object is created without a specific target schema, the object will be placed in the first valid schema listed in **search_path**. An error is reported if the search path is empty.
- The current effective value of the search path can be examined through the SQL function **current_schema**. This is different from examining the value of **search_path**, because the **current_schema** function displays the first valid schema name in **search_path**.

Value range: a string

NOTE

- When this parameter is set to **"$user", public**, shared use of a database (where no users have private schemas, and all share use of public), private per-user schemas and combinations of them are supported. Other effects can be obtained by modifying the default search path setting, either globally or per-user.
- When this parameter is set to a null string (''), the system automatically converts it into a pair of double quotation marks ("").
- If the content contains double quotation marks, the system considers them as insecure characters and converts each double quotation mark into a pair of double quotation marks.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **"$user",public**

NOTE

$user indicates the name of the schema with the same name as the current session user. If the schema does not exist, **$user** will be ignored.

current_schema

Parameter description: Specifies the current schema.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value: **"$user",public**

NOTE

$user indicates the name of the schema with the same name as the current session user. If the schema does not exist, **$user** will be ignored.

default_tablespace

Parameter description: Specifies the default tablespace of the created objects (tables and indexes) when a **CREATE** command does not explicitly specify a tablespace.

- The value of this parameter is either the name of a tablespace, or an empty string that indicates the use of the default tablespace of the current database. If a non-default tablespace is specified, users must have CREATE privilege for it. Otherwise, creation attempts will fail.
- This parameter is not used for temporary tables. For them, the **temp_tablespaces** is used instead.
- This parameter is not used when users create databases. By default, a new database inherits its tablespace setting from the template database.

  This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string. An empty string indicates that the default tablespace is used.

Default value: empty

default_storage_nodegroup

Parameter description: Specifies the Node Group where a table is created by default. This parameter takes effect only for ordinary tables.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

- **installation** indicates that tables will be created in the Node Group created during database installation.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- A value other than **installation** indicates that tables will be created in the Node Group specified by this parameter.

Value range: a string

Default value: **installation**

temp_tablespaces

Parameter description: Specifies one or more tablespaces to which temporary objects (temporary tables and their indexes) will be created when a CREATE command does not explicitly specify a tablespace. Temporary files for sorting large data sets are created in these tablespaces.

The value of this parameter can be a list of names of tablespaces. When there is more than one name in the list, GaussDB chooses a random tablespace from the list upon the creation of a temporary object each time. However, within a transaction, successively created temporary objects are placed in successive tablespaces in the list. If the element selected from the list is an empty string, GaussDB will automatically use the default tablespace of the current database instead.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string An empty string indicates that all temporary objects are created only in the default tablespace of the current database. For details, see **default_tablespace**.

Default value: empty

check_function_bodies

Parameter description: Specifies whether to enable validation of the function body string during the execution of **CREATE FUNCTION**. Verification is occasionally disabled to avoid problems, such as forward references when you restore function definitions from a dump. After the function is enabled, the word syntax of the PL/SQL in the stored procedure is verified, including the data type, statement, and expression. The SQL statements in the stored procedure are not checked in the Create phase. Instead, they are checked during running.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that validation of the function body string is enabled during the execution of **CREATE FUNCTION**.
- **off** indicates that validation of the function body string is disabled during the execution of **CREATE FUNCTION**.

Default value: **on**

default_transaction_isolation

Parameter description: Specifies the default isolation level of each transaction.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

NOTE

The current version does not support the setting of the default transaction isolation level. The default value is **read committed**. Do not change the value.

Value range: enumerated values

- **read uncommitted** indicates that a transaction reads the uncommitted modifications made by other transactions.
- **read committed** indicates that the data read by a transaction is committed at the moment it is read.
- **repeatable read** indicates that the data that has been read by the current transaction cannot be modified by other transactions until the current transaction completes, thereby preventing unrepeatable reads.
- **serializable**: Currently, this isolation level is not supported in GaussDB. It is equivalent to **repeatable read**.

Default value: read committed

default_transaction_read_only

Parameter description: Specifies whether each new transaction is in read-only state.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

CAUTION

If this parameter is set to **on**, the DML and write transactions cannot be executed.

Value range: Boolean

- **on** indicates that the transaction is in read-only state.
- **off** indicates that the transaction is in read/write state.

Default value: **off**

default_transaction_deferrable

Parameter description: Specifies the default deferrable status of each new transaction. It currently has no effect on read-only transactions or those running at isolation levels lower than serializable.

GaussDB does not support the serializable isolation level. Therefore, the parameter takes no effect.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on** indicates that a transaction is delayed by default.
- **off** indicates that a transaction is not delayed by default.

Default value: **off**

session_replication_role

Parameter description: Specifies the behavior of replication-related triggers and rules for the current session.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

Setting this parameter will discard all the cached execution plans.

Value range: enumerated values

- **origin** indicates that the system copies operations such as insert, delete, and update from the current session.
- **replica** indicates that the system copies operations such as insert, delete, and update from other places to the current session.
- **local** indicates that the system will detect the role that has logged in to the database when using the function to copy operations and will perform related operations.

Default value: **origin**

statement_timeout

Parameter description: If the statement execution time (starting from the time the server receives the command) is longer than the duration specified by the parameter, error information is displayed and the statement exits.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**. The default value is **0**, indicating that the parameter does not take effect.

Value range: an integer ranging from 0 to 2147483647. The unit is ms.

Default value: **0**

vacuum_freeze_min_age

Parameter description: Specifies whether VACUUM replaces the xmin column of a record with FrozenXID when scanning a table (in the same transaction).

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 576460752303423487

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

Although you can set this parameter to any value, VACUUM will limit the effective value to half the value of **autovacuum_freeze_max_age** by default.

Default value: **2000000000**

vacuum_freeze_table_age

Parameter description: Specifies when VACUUM scans the whole table and freezes old tuples. VACUUM performs a full table scan if the difference between the current transaction ID and the value of pg_class.relfrozenxid64 is greater than the specified time.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 576460752303423487

NOTE

Although you can set this parameter to any value, **VACUUM** will limit the effective value to 95% of **autovacuum_freeze_max_age** by default. Therefore, a periodic manual VACUUM has a chance to run before an anti-wraparound autovacuum is launched for the table.

Default value: **4000000000**

bytea_output

Parameter description: Specifies the output format for values of the bytea type.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: enumerated values

- **hex** indicates that the binary data is converted to hexadecimal format.
- **escape** indicates that the traditional PostgreSQL format is used. It takes the approach of representing a binary string as a sequence of ASCII characters, while converting those bytes that cannot be represented as an ASCII character into special escape sequences.

Default value: **hex**

xmlbinary

Parameter description: Specifies how binary values are to be encoded in XML.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

NOTE

Currently, this parameter does not support data of the XML type.

Value range: enumerated values

- base64

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- hex

Default value: **base64**

xmloption

Parameter description: Specifies whether DOCUMENT or CONTENT is implicit when converting between XML and string values.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

NOTE

Currently, this parameter does not support data of the XML type.

Value range: enumerated values

- **document** indicates an HTML document.
- **content** indicates a common string.

Default value: **content**

max_compile_functions

Parameter description: Specifies the maximum number of function compilation results stored in the server. Excessive functions and compilation results of stored procedures may occupy large memory space. Setting this parameter to a proper value can reduce the memory usage and improve system performance.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 2147483647

Default value: 1000

gin_pending_list_limit

Parameter description: Specifies the maximum size of the GIN pending list which is used when **fastupdate** is enabled. If the list grows larger than this maximum size, it is cleaned up by moving the entries in it to the main GIN data structure in batches. This setting can be overridden for individual GIN indexes by changing index storage parameters.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 64 to 2147483647. The unit is KB.

Default value: **4MB**

19.14.2 Locale and Formatting

This section describes parameters related to the time format setting.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

DateStyle

Parameter description: Specifies the display format for date and time values, as well as the rules for interpreting ambiguous date input values.

This variable contains two independent components: the output format specifications (ISO, Postgres, SQL, or German) and the input/output order of year/month/day (DMY, MDY, or YMD). The two components can be set separately or together. The keywords Euro and European are synonyms for DMY; the keywords US, NonEuro, and NonEuropean are synonyms for MDY.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value: **'ISO, MDY'**

NOTE

gs_initdb will initialize this parameter so that its value is the same as that of **lc_time**.

If this parameter is modified by running the **gs_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

Setting Suggestions: The ISO format is recommended. Postgres, SQL, and German use abbreviations for time zones, such as **EST**, **WST**, and **CST**. These abbreviations can be ambiguous. For example, **CST** can represent Central Standard Time (USA) UT-6:00, Central Standard Time (Australia) UT+9:30, and China Standard Time UT+8:00. This may lead to incorrect time zone conversion and cause errors.

IntervalStyle

Parameter description: Specifies the display format for interval values.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: enumerated values

- **sql_standard** indicates that output matching SQL standards will be generated.
- **postgres** indicates that output matching PostgreSQL 8.4 will be generated when the **DateStyle** parameter is set to **ISO**.
- **postgres_verbose** indicates that output matching PostgreSQL 8.4 will be generated when the **DateStyle** parameter is set to **non_ISO**.
- **iso_8601** indicates that output matching the time interval "format with designators" defined in ISO 8601 will be generated.
- **oracle** indicates that output matching the numtodsinterval function in the Oracle database will be generated. For details, see **numtodsinterval**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

The **IntervalStyle** parameter also affects the interpretation of ambiguous interval input.

If this parameter is modified by running the **gs_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

Default value: **postgres**

TimeZone

Parameter description: Specifies the time zone for displaying and interpreting timestamps.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string. You can obtain it by querying the **PG_TIMEZONE_NAMES** view.

Default value:

NOTE

gs_initdb will set a time zone value that is consistent with the system environment.

If this parameter is modified by running the **gs_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

timezone_abbreviations

Parameter description: Specifies the time zone abbreviations that will be accepted by the server.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string. You can obtain it by querying the **pg_timezone_names** view.

Default value: **Default**

NOTE

Default indicates abbreviations that work in most of the world. There are also other abbreviations, such as **Australia** and **India** that can be defined for a particular installation.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

extra_float_digits

Parameter description: Adjusts the number of digits displayed for floating-point values, including float4, float8, and geometric data types. The parameter value is added to the standard number of digits (FLT_DIG or DBL_DIG as appropriate).

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from –15 to 3

NOTE

- This parameter can be set to **3** to include partially-significant digits. It is especially useful for dumping float data that needs to be restored exactly.
- This parameter can also be set to a negative value to suppress unwanted digits.

Default value: **0**

client_encoding

Parameter description: Specifies the client-side encoding (character set).

Set this parameter based on the situation of the front-end services. Try to keep the encoding consistent on the client and server to improve efficiency.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: encoding compatible with PostgreSQL. **UTF8** indicates that the database encoding is used.

NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.
- To use consistent encoding for communication within the cluster, retain the default value of **client_encoding**. Modification to this parameter in the **postgresql.conf** file (by using the **gs_guc** tool, for example) does not take effect.

Default value: **UTF8**

Recommended value: **SQL_ASCII** or **UTF8**

lc_messages

Parameter description: Specifies the language in which messages are displayed.

- Acceptable values are system-related.
- On some systems, this locale category does not exist. Setting this variable will still work, but there will be no effect. In addition, translated messages for the desired language may not exist. In this case, you can still see the English messages.

  This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string

NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.

Default value: **C**

lc_monetary

Parameter description: Specifies the display format of monetary values. It affects the output of functions such as **to_char**. Acceptable values are system-related.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.
- If this parameter is modified by running the **gs_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

Default value: **C**

lc_numeric

Parameter description: Specifies the display format of numbers. It affects the output of functions such as **to_char**. Acceptable values are system-related.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.
- If this parameter is modified by running the **gs_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **C**

lc_time

Parameter description: Specifies the display format of time and locale. It affects the output of functions such as **to_char**. Acceptable values are system-related.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.
- If this parameter is modified by running the **gs_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

Default value: **C**

default_text_search_config

Parameter description: Specifies the text search configuration.

If the specified text search configuration does not exist, an error will be reported. If the specified text search configuration is deleted, set **default_text_search_config** again. Otherwise, an error will be reported, indicating incorrect configuration.

- The text search configuration is used by text search functions that do not have an explicit argument specifying the configuration.
- When a configuration file matching the environment is determined, **gs_initdb** will initialize the configuration file with a setting that corresponds to the environment.

  This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

NOTE

GaussDB supports the following two configurations: **pg_catalog.english** and **pg_catalog.simple**.

Default value: **pg_catalog.english**

19.14.3 Other Default Parameters

This section describes the default database loading parameters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

dynamic_library_path

Parameter description: Specifies the path that the system will search for a shared database file that is dynamically loadable. When a dynamically loadable module needs to be opened and the file name specified in the **CREATE FUNCTION** or **LOAD** command does not have a directory component, the system will search this path for the required file. Only the sysadmin user can access this parameter.

The value of **dynamic_library_path** must be a list of absolute paths separated by colons (:) or by semi-colons (;) on the Windows OS. When the name of a path starts with the special variable $libdir, the variable will be replaced with the directory in which the module provided by GaussDB is installed. For example:

```
dynamic_library_path = '/usr/local/lib/postgresql:/opt/testgs/lib:$libdir'
```

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

NOTE

If the value of this parameter is set to an empty character string, the automatic path search is turned off.

Default value: **$libdir**

gin_fuzzy_search_limit

Parameter description: Specifies the upper limit of the size of the set returned by GIN indexes.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647

Default value: **0**

local_preload_libraries

Parameter description: Specifies one or more shared libraries that are to be preloaded at connection start. If multiple libraries are to be loaded, separate their names with commas (,). All library names are converted to lower case unless double-quoted.

- Any user can change this option. Therefore, library files that can be loaded are restricted to those saved in the **plugins** subdirectory of the standard library installation directory. It is the database administrator's responsibility to ensure that libraries in this directory are all safe. Entries in **local_preload_libraries** can specify the library directory explicitly, for example, **$libdir/plugins/mylib**, or just specify the library name, for example, **mylib**. (**mylib** is equivalent to **$libdir/plugins/mylib**.)
- Unlike **shared_preload_libraries**, there are no differences in performance between loading a module at session start or doing this during the session. The intent of this feature is to allow debugging or performance-measurement libraries to be loaded into specific sessions without an explicit LOAD

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

command. For example, debugging can be enabled under a given user name by setting this parameter to **ALTER USER SET**.

- If a specified library is not found, the connection attempt will fail.
- Every GaussDB-supported library has a "magic block" that is checked to guarantee compatibility. For this reason, non-GaussDB-supported libraries cannot be loaded in this way.

This parameter is a BACKEND parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value: empty

19.15 Lock Management

In GaussDB, a deadlock may occur when concurrently executed transactions compete for resources. This section describes parameters used for managing transaction locks.

deadlock_timeout

Parameter description: Specifies the time, in milliseconds, to wait on a lock before checking whether there is a deadlock condition. When the applied lock exceeds the preset value, the system will check whether a deadlock occurs. This parameter takes effect only for common locks.

- The check for deadlock is relatively expensive. Therefore, the server does not check it when waiting for a lock every time. Deadlocks do not frequently occur when the system is running. Therefore, the system just needs to wait on the lock for a while before checking for a deadlock. Increasing this value reduces the time wasted in needless deadlock checks, but slows down reporting of real deadlock errors. On a heavily loaded server, you may need to raise it. The value you have set needs to exceed the transaction time. By doing this, the possibility that a lock will be checked for deadlocks before it is released will be reduced.
- If you want to write the lock wait time during query execution to logs by setting **log_lock_waits**, ensure that the value of **log_lock_waits** is less than the specified value (or the default value) of **deadlock_timeout**.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 2147483647. The unit is ms.

Default value: **1s**

lockwait_timeout

Parameter description: Specifies the timeout for attempts to acquire a lock. If the time spent in waiting for a lock exceeds the specified time, an error is reported. This parameter takes effect only for common locks.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: an integer ranging from 0 to 2147483647. The unit is ms.

Default value: **20min**

update_lockwait_timeout

Parameter description: Specifies the maximum duration that a lock waits for concurrent updates on a row to complete when the concurrent update feature is enabled. If the time spent in waiting for a lock exceeds the specified time, an error is reported. This parameter takes effect only for common locks.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647. The unit is ms.

Default value: **120000** (2 minutes)

max_locks_per_transaction

Parameter description: Determines the average number of object locks allocated for each transaction.

- The size of the shared lock table is calculated under the condition that a maximum of *N* independent objects need to be locked at any time. *N* = **max_locks_per_transaction** x (**max_connections** + **max_prepared_transactions**). Objects whose amount does not exceed the preset number can be locked simultaneously at any time. You may need to increase this value if many different tables are modified in a single transaction. This parameter can only be set at database start.
- Increasing the value of this parameter may cause GaussDB to request more System V-shared memory than the OS's default configuration allows.
- When running a standby server, you must set this parameter to a value that is no less than that on the primary server. Otherwise, queries will not be allowed on the standby server.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 10 to 2147483647

Default value: **256**

max_pred_locks_per_transaction

Parameter description: Specifies the average number of predicate locks allocated for each transaction.

- The size of the shared predicate lock table is calculated under the condition that a maximum of *N* independent objects need to be locked at any time. *N* = **max_pred_locks_per_transaction** x (**max_connections** + **max_prepared_transactions**). Objects whose amount does not exceed the preset number can be locked simultaneously at any time. You may need to increase this value if many different tables are modified in a single transaction. This parameter can only be set at server start.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Increasing the value of this parameter may cause GaussDB to request more System V-shared memory than the OS's default configuration allows.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 10 to 2147483647

Default value: **64**

gs_clean_timeout

Parameter description: Controls the average interval between **gs_clean** invocations by the Coordinator.

- Transactions in GaussDB are committed in two phases. An unfinished two-phase transaction may hold a table-level lock, keeping tables from being locked by other connections. In this case, the database needs to invoke the **gs_clean** tool to clean unfinished two-phase transactions. **gs_clean_timeout** is used to control the interval for the Coordinator to invoke the **gs_clean** tool.
- A larger value of this parameter indicates a low frequency of **gs_clean** invocation to clean unfinished two-phase transactions.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483. The unit is s.

Default value: **1min**

partition_lock_upgrade_timeout

Parameter description: Specifies the timeout for attempts to upgrade an exclusive lock (read allowed) to an access exclusive lock (read/write blocked) on a partitioned table during the execution of some query statements. If there are concurrent read transactions running, the lock upgrade will need to wait. This parameter sets the waiting timeout for lock upgrade attempts.

- When you do **MERGE PARTITION** and **CLUSTER PARTITION** on a partitioned table, temporary tables are used for data rearrangement and file exchange. To concurrently perform as many operations as possible on the partitions, exclusive locks are acquired for the partitions during data rearrangement and access exclusive locks are acquired during file exchange.
- Generally, a partition waits until it acquires a lock, or a timeout occurs if the partition waits for a period longer than the value specified by the **lockwait_timeout** parameter.
- When doing **MERGE PARTITION** or **CLUSTER PARTITION** on a partitioned table, an access exclusive lock needs to be acquired during file exchange. If the lock fails to be acquired, the acquisition is retried at an interval of 50 ms until timeout occurs. The **partition_lock_upgrade_timeout** parameter specifies the time to wait before the lock acquisition attempt times out.
- If this parameter is set to **–1**, the lock upgrade never times out. The lock upgrade is continuously retried until it succeeds.

  This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: an integer ranging from –1 to 3000. The unit is s.

Default value: **1800**

fault_mon_timeout

Parameter description: Specifies the period for detecting lightweight deadlocks. This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 1440. The unit is minute.

Default value: **5min**

enable_online_ddl_waitlock

Parameter description: Specifies whether to block DDL operations to wait for the release of cluster locks, such as **pg_advisory_lock** and **pgxc_lock_for_backup**. This parameter is mainly used in online OM operations and you are not advised to modify the settings.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **off**

xloginsert_locks

Parameter description: Specifies the number of locks on concurrent write-ahead logging. This parameter is used to improve the efficiency of writing write-ahead logs.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 1000

Default value: **16**

num_internal_lock_partitions

Parameter description: Specifies the number of internal lightweight lock partitions. It is mainly used for performance optimization in various scenarios. The content is organized in the KV format of keywords and numbers. Different types of locks are separated by commas (,). The sequence does not affect the setting result. For example, **CLOG_PART=256,CSNLOG_PART=512** is equivalent to **CSNLOG_PART=512,CLOG_PART=256**. If you set the same keyword multiple times, only the latest setting takes effect. For example, if you set **CLOG_PART** to **256** and **CLOG_PART** to **2**, the value of **CLOG_PART** is **2**. If no keyword is set, the default value is used. The usage description, maximum value, minimum value, and default value of each lock type are as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **CLOG_PART**: number of Clog file controllers. Increasing the value of this parameter improves the Clog writing efficiency and transaction submission performance, but increases the memory usage. Decreasing the value of this parameter reduces the memory usage, but may increase the conflict of writing Clogs and affect the performance. The value ranges from 1 to 256.
- **CSNLOG_PART**: number of CSNLOG file controllers. Increasing the value of this parameter improves the CSNLOG log writing efficiency and transaction submission performance, but increases the memory usage. Decreasing the value of this parameter reduces the memory usage, but may increase the conflict of writing CSNLOG logs and affect the performance. The value ranges from 1 to 512.
- **LOG2_LOCKTABLE_PART**: two logarithms of the number of common table lock partitions. Increasing the value can improve the concurrency of obtaining locks in the normal process, but may increase the time required for transferring and clearing locks. When waiting events occur in **LockMgrLock**, you can increase the value to improve the performance. The minimum value is 4, that is, the number of lock partitions is 16. The maximum value is 16, that is, the number of lock partitions is 65536.
- **TWOPHASE_PART**: number of partitions of the two-phase transaction lock. Increasing the value can increase the number of concurrent two-phase transaction commits. The value ranges from 1 to 64.
- **FASTPATH_PART**: maximum number of locks that each thread can obtain without using the primary lock table. Increasing the value of this parameter will consume more memory. The value ranges from 20 to 10000.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value:

- **CLOG_PART**: **256**
- **CSNLOG_PART**: **512**
- **LOG2_LOCKTABLE_PART**: **4**
- **TWOPHASE_PART**: **1**
- **FASTPATH_PART**: **20**

19.16 Version and Platform Compatibility

19.16.1 Compatibility with Earlier Versions

This section describes the parameters that control the backward compatibility and external compatibility of GaussDB. A backward compatible database supports applications of earlier versions. This section describes parameters used for controlling backward compatibility of a database.

array_nulls

Parameter description: Controls whether the array input parser recognizes unquoted NULL as a null array element.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

- **on** indicates that null values can be entered in arrays.
- **off** indicates backward compatibility with the old behavior. Arrays containing the value **NULL** can still be created when this parameter is set to **off**.

Default value: **on**

backslash_quote

Parameter description: Controls whether a single quotation mark can be represented by \' in a string text.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

NOTICE

When the string text meets the SQL standards, \ has no other meanings. This parameter only affects the handling of non-standard-conforming string texts, including escape string syntax (E'...').

Valid value: enumerated values

- **on** indicates that the use of \' is always allowed.
- **off** indicates that the use of \' is rejected.
- **safe_encoding** indicates that the use of \' is allowed only when client encoding does not allow ASCII \ within a multibyte character.

Default value: **safe_encoding**

default_with_oids

Parameter description: Specifies whether **CREATE TABLE** and **CREATE TABLE AS** include an **OID** field in newly-created tables if neither **WITH OIDS** nor **WITHOUT OIDS** is specified. It also determines whether OIDs will be included in tables created by **SELECT INTO**.

It is not recommended that OIDs be used in user tables. Therefore, this parameter is set to **off** by default. When OIDs are required for a particular table, **WITH OIDS** needs to be specified during the table creation.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

- **on** indicates that **CREATE TABLE** and **CREATE TABLE AS** can include an **OID** field in newly-created tables.
- **off** indicates that **CREATE TABLE** and **CREATE TABLE AS** cannot include any OID field in newly-created tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **off**

escape_string_warning

Parameter description: Specifies whether to issue a warning when a backslash (\) is used as an escape in an ordinary character string.

- Applications that wish to use a backslash (\) as an escape need to be modified to use escape string syntax (E'...'). This is because the default behavior of ordinary character strings treats the backslash as an ordinary character in each SQL standard.
- This variable can be enabled to help locate code lines that need to be changed.
- If E'...' is used as an escape, logs may be incomplete in some scenarios.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

Default value: **on**

lo_compat_privileges

Parameter description: Specifies whether to enable backward compatibility for the privilege check of large objects.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

on indicates that the privilege check is disabled when users read or modify large objects. This setting is compatible with versions earlier than PostgreSQL 9.0.

off indicates that privilege check is enabled for large objects.

Default value: **off**

quote_all_identifiers

Parameter description: Specifies whether to forcibly quote all identifiers even if they are not keywords when the database generates SQL. This will affect the output of **EXPLAIN** and the results of functions, such as pg_get_viewdef. For details, see the **--quote-all-identifiers** parameter of **gs_dump**.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the forcible quotation is enabled.
- **off** indicates that the forcible quotation is disabled.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

sql_inheritance

Parameter description: Controls the inheritance semantics. This parameter specifies the access policy of descendant tables. **off** indicates that subtables cannot be accessed by commands. That is, the ONLY keyword is used by default. It is set for compatibility with versions earlier than PostgreSQL 7.1.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that subtables can be accessed.
- **off** indicates that subtables cannot be accessed.

Default value: **on**

standard_conforming_strings

Parameter description: Controls whether ordinary string texts ('...') treat backslashes as ordinary texts as specified in the SQL standard.

- Applications can check this parameter to determine how string texts will be processed.
- It is recommended that characters be escaped by using the escape string syntax (E'...').

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that backslashes are treated as ordinary texts.
- **off** indicates that backslashes are not treated as ordinary texts.

Default value: **on**

synchronize_seqscans

Parameter description: Controls sequential scans of tables to synchronize with each other, so that concurrent scans read the same data block at about the same time and share the I/O workload.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that a scan may start in the middle of the table and then "wrap around" the end to cover all rows to synchronize with the activity of scans already in progress. This may result in unpredictable changes in the row ordering returned by queries that have no ORDER BY clause.
- **off** indicates that the scan always starts from the table heading.

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_beta_features

Parameter description: Specifies whether to enable some features that are not officially released and are used only for POC verification, such as GDS table join. Exercise caution when enabling these extended features because they may cause errors in some scenarios.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the features are enabled for forward compatibility. Note that enabling them may cause errors in certain scenarios.
- **off** indicates that the features are disabled.

Default value: **off**

19.16.2 Platform and Client Compatibility

Many platforms use the database system. External compatibility of the database system provides a lot of convenience for platforms.

transform_null_equals

Parameter description: Specifies whether expressions of the form expr = NULL (or NULL = expr) are treated as expr IS NULL. They return true if expr evaluates to the null value, and false otherwise.

- The correct SQL-standard-compliant behavior of expr = NULL is to always return null (unknown).
- Filtered forms in Microsoft Access generate queries that appear to use expr = NULL to test for null values. If you turn this option on, you can use this interface to access the database.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-2**.

Value range: Boolean

- **on** indicates that expressions of the form expr = NULL (or NULL = expr) are treated as expr IS NULL.
- **off** indicates that expr = NULL always returns null (unknown).

Default value: **off**

NOTE

New users are always confused about the semantics of expressions involving **NULL** values. Therefore, **off** is used as the default value.

support_extended_features

Parameter description: Specifies whether extended database features are supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-2**.

Value range: Boolean

- **on** indicates that extended database features are supported.
- **off** indicates that extended database features are not supported.

Default value: **off**

lastval_supported

Parameter description: Specifies whether the lastval function can be used.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-2**.

Value range: Boolean

- **on** indicates that the lastval function can be used and the nextval function cannot be pushed down.
- **off** indicates that the lastval function cannot be used and the nextval function can be pushed down.

Default value: **off**

sql_compatibility

Parameter description: Specifies the type of mainstream database with which the SQL syntax and statement behavior of the database is compatible. This parameter is an INTERNAL parameter. It can be viewed but cannot be modified.

Value range: enumerated values

- **ORA** indicates that the SQL syntax and statement behavior of the database is compatible with the Oracle database.
- **TD** indicates that the SQL syntax and statement behavior of the database is compatible with the Teradata database.
- **MYSQL** indicates that the SQL syntax and statement behavior of the database is compatible with the MySQL database.
- **PG** indicates that the database is compatible with the PostgreSQL database.

Default value: **MYSQL**

NOTICE

- This parameter can be set only when you run the **CREATE DATABASE** command to create a database.
- In the database, this parameter must be set to a specific value. It can be set to **ORA** or **TD** and cannot be changed randomly. Otherwise, the setting is not consistent with the database behavior.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

behavior_compat_options

Parameter description: Specifies database compatibility behavior. Multiple items are separated by commas (,).

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value: ""

NOTE

- Currently, only items in **Platform and Client Compatibility** are supported.
- Multiple items are separated by commas (,), for example, **set behavior_compat_options='end_month_calculate,display_leading_zero';**.

Table 19-5 Compatibility configuration items

Compatibility Configuration Item	Behavior
display_leading_zero	Specifies how floating point numbers are displayed. • If this item is not specified, for a decimal number between –1 and 1, the 0 before the decimal point is not displayed. For example, 0.25 is displayed as **.25**. • If this item is specified, for a decimal number between –1 and 1, the 0 before the decimal point is displayed. For example, 0.25 is displayed as **0.25**.

end_month_calculate	Specifies the calculation logic of the **add_months** function.
	Assume that the two parameters of the add_months function are **param1** and **param2**, and that the month of **param1** and **param2** is **result**.
	• If this item is not specified, and the **Day** of **param1** indicates the last day of a month shorter than **result**, the **Day** in the calculation result will equal that in **param1**. For example:
	`openGauss=# select add_months('2018-02-28',3) from sys_dummy;`
	`add_months`
	`---------------------`
	`2018-05-28 00:00:00`
	`(1 row)`
	• If this item is specified, and the **Day** of **param1** indicates the last day of a month shorter than **result**, the **Day** in the calculation result will equal that in **result**. For example:
	`openGauss=# select add_months('2018-02-28',3) from sys_dummy;`
	`add_months`
	`---------------------`
	`2018-05-31 00:00:00`
	`(1 row)`

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Compatibility Configuration Item	Behavior
compat_analyze_sample	Specifies the sampling behavior of the ANALYZE operation. If this item is specified, the sample collected by the ANALYZE operation will be limited to around 30,000 records, controlling CN memory consumption and maintaining the stability of ANALYZE.
bind_schema_tablespace	Binds a schema with the tablespace with the same name. If a tablespace name is the same as *sche_name*, **default_tablespace** will also be set to *sche_name* if **search_path** is set to *sche_name*.
bind_procedure_searchpath	Specifies the search path of the database object for which no schema name is specified. If no schema name is specified for a stored procedure, the search is performed in the schema to which the stored procedure belongs. If the stored procedure is not found, the following operations are performed: ● If this item is not specified, the system reports an error and exits. ● If this item is specified, the search continues based on the settings of **search_path**. If the issue persists, the system reports an error and exits.
correct_to_number	Controls the compatibility of the **to_number()** result. If this item is specified, the value of **to_number()** is the same as that of **pg11**. Otherwise, the value is the same as that of Oracle.
unbind_divide_bound	Controls the range check on the result of integer division. If this item is specified, you do not need to check the range of the division result. For example, the result of INT_MIN/(-1) can be *INT_MAX*+1. If this item is not specified, an out-of-bounds error is reported because the result is greater than *INT_MAX*.
convert_string_digit_to_numeric	Determines whether to convert columns of the character string type to those of the numeric type before columns of these two types are compared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Compatibility Configuration Item	Behavior

return_null_string	Specifies how to display the empty result (empty string '') of the lpad() and rpad() functions.
	• If this item is not specified, the empty string is displayed as **NULL**.
	`openGauss=# select length(lpad('123',0,'*')) from sys_dummy;`
	`length`
	`--------`
	`(1 row)`
	• If this item is specified, the empty string is displayed as single quotation marks (''').
	`openGauss=# select length(lpad('123',0,'*')) from sys_dummy;`
	`length`
	`--------`
	`0`
	`(1 row)`

compat_concat_variadic	Specifies the compatibility of variadic results of the **concat()** and **concat_ws()** functions. If this item is specified and a **concat** function has a parameter of the variadic type, different result formats in Oracle and Teradata are retained. If this item is not specified and a **concat** function has a parameter of the variadic type, the result format of Oracle is retained for both Oracle and Teradata. This option has no effect on MySQL because MySQL has no variadic type.
merge_update_multi	When MERGE INTO... WHEN MATCHED THEN UPDATE (see **MERGE INTO**) and INSERT... ON DUPLICATE KEY UPDATE (see **INSERT**) are used, control the UPDATE behavior if a piece of target data in the target table conflicts with multiple pieces of source data. If this item is specified and the preceding scenario exists, the system performs multiple UPDATE operations on the conflicting row. If this item is not specified and the preceding scenario exists, an error is reported, that is, the MERGE or INSERT operation fails.
plstmt_implicit_savepoint	Determines whether the execution of an UPDATE statement in a stored procedure has an independent subtransaction. If this parameter is set, the implicit savepoint is enabled before executing each UPDATE statement in the stored procedure, and the subtransaction is rolled backed to the latest savepoint in the EXCEPTION block by default, ensuring that only the modification of failed statements is rolled back. This option is used to be compatible with the **EXCEPTION** behavior of the O database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Compatibility Configuration Item	Behavior

hide_tailing_zero	Configuration item for numeric display. If this parameter is not set, numeric values are displayed based on the specified precision. If this parameter is set, all numeric values are output with trailing zeros (after a decimal point) hidden, including the to_char(numeric, format) scenario.
	For example:
	`set behavior_compat_options='hide_tailing_zero';`
	`select cast(123.123 as numeric(15,10));`
	`numeric`
	`---------`
	`123.123`
	`(1 row)`

plsql_security_definer	After this parameter is enabled, the definer permission is used by default when a stored procedure is created.
char_coerce_compat	Specifies the behavior when the char(n) type is converted to other variable-length string types. By default, spaces at the end are omitted when the char(n) type is converted to other variable-length string types. After this parameter is enabled, spaces at the end are not omitted during conversion. In addition, if the length of the char(n) type exceeds the length of other variable-length string types, an error is reported. This parameter is valid only when the **sql_compatibility** parameter is set to **ORA**. After this parameter is enabled, spaces at the end are not omitted in implicit conversion, explicit conversion, or conversion by calling the **text(bpchar)** function.
truncate_numeric_tail_zero	Configuration item for numeric display. If this parameter is not set, numeric values are displayed based on the default precision. If this parameter is set, all numeric values are output with trailing zeros (after a decimal point) hidden, except for to_char(numeric, format).
array_count_compat	Controls the array.count function. If the parameter is enabled, the function returns **0**. Otherwise, the function returns null.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Compatibility Configuration Item	Behavior
aformat_regexp_match	Determines the matching behavior of regular expression functions. When this parameter is set and **sql_compatibility** is set to **A** or **B**, the options supported by the **flags** parameter of the regular expression are changed as follows: 1. . By default, the character '\n' cannot be matched. 2. When **flags** contains the **n** option, the character '\n' can be matched. 3. The **regexp_replace(source, pattern replacement)** function replaces all matching substrings. 4. **regexp_replace(source, pattern, replacement, flags)** returns null when the value of **flags** is **''** or null. Otherwise, the meanings of the options supported by the **flags** parameter of the regular expression are as follows: 1. . By default, the character '\n' can be matched. 2. The **n** option in **flags** indicates that the multi-line matching mode is used. 3. The **regexp_replace(source, pattern replacement)** function replaces only the first matched substring. 4. If the value of **flags** is **''** or null, the return value of **regexp_replace(source, pattern, replacement, flags)** is the character string after replacement.
disable_emptystr2null	Disables the function of converting an empty string to null by default for the text, clob, blob, and raw character string types.

a_format_version

Parameter description: Specifies the database platform compatibility configuration item. The value of this parameter is an enumerated string.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-2**.

Value range: a string

Default value: **""**

NOTE

Set a character string for the compatibility configuration item, for example, **set a_format_version='10c'**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 19-6 Compatibility configuration items

Compatibility Configuration Item	Compatibility Behavior Control
10c	Compatible version of platform A

a_format_dev_version

Parameter description: Specifies the database platform minor version compatibility configuration item. The value of this parameter is an enumerated string.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-2.

Value range: a string

Default value: ""

NOTE

Set a character string for the compatibility configuration item, for example, **set a_format_dev_version='s1'**.

Table 19-7 Compatibility configuration items

Compatibility Configuration Item	Compatibility Behavior Control
s1	• Compatible minor version of platform A, which affects functions TRUNC(date, fmt), ROUND(date, fmt), NVL2, LPAD, RPAD, ADD_MONTHS, MONTHS_BETWEEN, REGEXP_REPLACE, REGEXP_COUNT, TREAT, EMPTY_CLOB, and INSTRB. • After this parameter is enabled, the int casted from text can be rounded off.

plpgsql.variable_conflict

Parameter description: Sets the priority of using stored procedure variables and table columns with the same name.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-2.

Value range: a string

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **error** indicates that a compilation error is reported when the name of a stored procedure variable is the same as that of a table column.
- **use_variable** indicates that if the name of a stored procedure variable is the same as that of a table column, the variable is used preferentially.
- **use_column** indicates that if the name of a stored procedure variable is the same as that of a table column, the column name is used preferentially.

Default value: **error**

td_compatible_truncation

Parameter description: Specifies whether to enable features compatible with a Teradata database. You can set this parameter to **on** when connecting to a database compatible with the Teradata database, so that when you perform the INSERT operation, overlong strings are truncated based on the allowed maximum length before being inserted into char- and varchar-type columns in the target table. This ensures all data is inserted into the target table without errors reported.

NOTE

The string truncation function cannot be used if the INSERT statement includes a foreign table.

If inserting multi-byte character data (such as Chinese characters) to database with the character set byte encoding (such as SQL_ASCII or LATIN1), and the character data crosses the truncation position, the string is truncated based on its bytes instead of characters. Unexpected result will occur in tail after the truncation. If you want correct truncation result, you are advised to adopt encoding set such as UTF8, which has no character data crossing the truncation position.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-2**.

Value range: Boolean

- **on** indicates that overlong strings are truncated.
- **off** indicates that overlong strings are not truncated.

Default value: **off**

nls_timestamp_format

Parameter description: Specifies the default timestamp format.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value: **DD-Mon-YYYY HH:MI:SS.FF AM**

max_function_args

Parameter description: Specifies the maximum number of parameters allowed for a function.

This parameter is a fixed INTERNAL parameter and cannot be modified.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: an integer.

Default value: **8192**

convert_string_to_digit

Parameter description: Specifies the implicit conversion priority, which determines whether to preferentially convert strings into numbers.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

- **on** indicates that strings are preferentially converted into numbers.
- **off** indicates that strings are not preferentially converted into numbers.

Default value: **on**

NOTICE

Adjusting this parameter will change the internal data type conversion rule and cause unexpected behavior. Exercise caution when performing this operation.

19.17 Fault Tolerance

This section describes parameters used for controlling how the server processes an error occurring in the database system.

exit_on_error

Parameter description: If this function is enabled, errors of the ERROR level will be upgraded to PANIC errors, and core stacks will be generated. It is mainly used to locate problems and test services.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-2.

Value range: Boolean

- **on** indicates that errors of the ERROR level will be upgraded to PANIC errors.
- **off** indicates that errors of the ERROR level will not be upgraded.

Default value: **off**

restart_after_crash

Parameter description: If this parameter is set to **on** and a backend process crashes, GaussDB automatically reinitializes the backend process.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-2.

Value range: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on** maximizes the availability of the database.

  In some circumstances (for example, when a management tool, such as xCAT, is used to manage GaussDB), setting this parameter to **on** maximizes the availability of the database.
- **off** indicates that a management tool is enabled to obtain control permission and take proper measures when a backend process crashes.

Default value: **on**

omit_encoding_error

Parameter description: If this parameter is set to **on** and the client character set of the database is encoded in UTF-8 format, character encoding conversion errors will be recorded in logs. Additionally, converted characters that have conversion errors will be ignored and replaced with question marks (?).

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-2**.

Value range: Boolean

- **on** indicates that characters that have conversion errors will be ignored and replaced with question marks (?), and error information will be recorded in logs.
- **off** indicates that characters that have conversion errors cannot be converted and error information will be directly displayed.

Default value: **off**

NOTE

If this parameter is modified by running the **gs_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

max_query_retry_times

The current feature is a lab feature. Contact Huawei technical support before using it.

Parameter description: Specifies the maximum number of retry attempts when an SQL statement error occurs. Currently, the error types that support retries are **Connection reset by peer**, **Lock wait timeout**, and **Connection timed out**. For details about complete error types, see "Cluster HA > Automatic Retry upon SQL Statement Execution Errors" in the *GaussDB Kernel Troubleshooting*. If it is set to **0**, the retry function is disabled.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 0 to 20

Default value: **0**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

cn_send_buffer_size

Parameter description: Specifies the size of the data buffer used for data transmission on data on CNs.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 8 to 128. The unit is KB.

Default value: **8KB**

max_cn_temp_file_size

Parameter description: Specifies the maximum number of temporary files that can be used by the CN during automatic SQL statement retries. The value **0** indicates that no temporary file is used.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 0 to 10485760. The unit is KB.

Default value: **5GB**

retry_ecode_list

Parameter description: Specifies the list of SQL error types that support automatic retries.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-2**.

Value range: a string

Default value: **YY001 YY002 YY003 YY004 YY005 YY006 YY007 YY008 YY009 YY010 YY011 YY012 YY013 YY014 YY015 53200 08006 08000 57P01 XX003 XX009 YY016**

data_sync_retry

Parameter description: Specifies whether to keep running the database when updated data fails to be written into disks by using the **fsync** function. In some OSs, no error is reported even if **fsync** fails after the second attempt. As a result, data is lost.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-2**.

Value range: Boolean

- **on** indicates that the database keeps running and **fsync** is executed again after **fsync** fails.
- **off** indicates that a PANIC-level error is reported and the database is stopped after **fsync** fails.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

remote_read_mode

Parameter description: Specifies whether to enable the remote read function. This function allows pages on the standby server to be read when reading pages on the primary server fails.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: enumerated values

- **off** indicates that the remote read function is disabled.
- **non_authentication** indicates that the remote read function is enabled but certificate authentication is not required.
- **authentication** indicates that the remote read function is enabled and certificate authentication is required.

Default value: **authentication**

19.18 Connection Pool Parameters

When a connection pool is used to access the database, database connections are established and then stored in the memory as objects during system running. When you need to access the database, no new connection is established. Instead, an existing idle connection is selected from the connection pool. After you finish accessing the database, the database does not disable the connection but puts it back into the connection pool. The connection can be used for the next access request.

pooler_port

Parameter description: Specifies the O&M management port of internal tools, such as cm_agent and cm_ctl. This port is used by the initial user or system administrator to connect to the database through the client.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-2**.

Value range: the value of the GUC parameter **port** of a CN or DN plus 1

Default value: the default value of the GUC parameter **port** of a CN or DN plus 1. The default value of this parameter is **8001** for CNs and **40001** for DNs.

pooler_maximum_idle_time

Parameter description: Specifies the maximum amount of time that the connections can remain idle in a pool before being removed. After that, the automatic connection clearing mechanism is triggered to reduce the number of connections on each node to the value of **minimum_pool_size**.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 0 to 2147483647. The smallest unit is s.

Default value: **10min** (600 seconds)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

minimum_pool_size

Parameter description: Specifies the minimum number of remaining connections in the pool on each node after the automatic connection clearing is triggered. If this parameter is set to **0**, the automatic connection clearing is disabled.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 1 to 65535

Default value: **50**

max_pool_size

Parameter description: Specifies the maximum number of connections between a CN's connection pool and another CN/DN.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 1 to 65535

Default value:

- Independent deployment:

  32768 (60-core CPU/480 GB memory); 16384 (32-core CPU/256 GB memory); 8192 (16-core CPU/128 GB memory); 4096 (8-core CPU/64 GB memory); 2048 (4-core CPU/32 GB memory); 1000 (4-core CPU/16 GB memory)

persistent_datanode_connections

Parameter description: Specifies whether to release the connection for the current session.

This parameter is a BACKEND parameter. Set it based on instructions provided in **Table 11-2**.

Value range: Boolean

- **off** indicates that the connection for the current session will be released.
- **on** indicates that the connection for the current session will not be released.

> **NOTICE**
>
> After this parameter is set to **on**, a session may hold a connection but does not run a query. As a result, other query requests fail to be connected. To fix this problem, the number of sessions must be less than or equal to **max_active_statements**.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

max_coordinators

Parameter description: Specifies the maximum number of CNs in a cluster. If scale-out is required, ensure that the value of this parameter is greater than the number of CNs in the target cluster. Otherwise, the scale-out will fail.

This parameter is a POSTMASTER parameter. You are not advised to modify it. If you need to modify it, set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 2 to 1024. The minimum value cannot be less than the actual number of CNs in the cluster.

Default value: **128**

max_datanodes

Parameter description: Specifies the maximum number of DNs in a cluster. If scale-out is required, ensure that the value of this parameter is greater than the total number of DNs in the target cluster. Otherwise, the scale-out will fail.

This parameter is a POSTMASTER parameter. You are not advised to modify it. If you need to modify it, set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 2 to 65535. The minimum value cannot be less than the actual number of DNs in the cluster.

Default value: **256**

cache_connection

Parameter description: Specifies whether to reclaim the connections of a connection pool.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: Boolean

- **on** indicates that the connections of a connection pool will be reclaimed.
- **off** indicates that the connections of a connection pool will not be reclaimed.

Default value: **on**

enable_force_reuse_connections

Parameter description: Specifies whether a session forcibly reuses a new connection.

This parameter is a BACKEND parameter. Set it based on instructions provided in **Table 11-2**.

Value range: Boolean

- **on** indicates that the new connection is forcibly used.
- **off** indicates that the current connection is used.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pooler_connect_max_loops

Parameter description: Specifies whether to enable the connection retries to enhance stability of setting up connections in primary/standby switchover scenarios. If a service fails to connect to the primary server, it will retry by attempting to connect to the standby server. If the standby server is successfully promoted to primary, the retry attempt will succeed. This parameter specifies the total number of retry attempts. If this parameter is set to **0**, retries are disabled. The service only establishes a connection to the primary server.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 0 to 20

Default value: **1**

pooler_connect_interval_time

Parameter description: Specifies the interval between retries when **pooler_connect_max_loops** is set to a value greater than 1. You are advised to set this parameter to a value slightly greater than the time required for primary/standby switchover in the current cluster.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 0 to 7200. The smallest unit is s.

Default value: **15s**

pooler_timeout

Parameter description: Specifies the timeout period of communication between each connection in a CN's connection pool and another CN/DN.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 0 to 7200. The smallest unit is s.

Default value: **10min**

pooler_connect_timeout

Parameter description: Specifies the timeout period of connecting a CN's connection pool to another CN/DN in the same cluster.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 0 to 7200. The smallest unit is s.

Default value: **1min**

pooler_cancel_timeout

Parameter description: Specifies the timeout period of canceling a connection by a CN's connection pool during error processing. If similar timeout occurs when an

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

exception of the subtransaction or stored procedure is captured, the transaction containing the subtransaction or the stored procedure rolls back. If the source data from the COPY FROM operation is not consistent with that of the table structure in the target table, and the parameter value is not **0**, an error is reported.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 0 to 7200. The smallest unit is s. **0** (not recommended) indicates that the timeout is disabled.

Default value: **15s**

19.19 Cluster Transaction Parameters

This section describes the settings and value ranges of transaction parameters for the cluster.

transaction_isolation

Parameter description: specifies the isolation level of the current transaction.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-2**.

Value range: a string of case-sensitive characters. The values include:

- **serializable**: This value is equivalent to REPEATABLE READ in GaussDB.
- **read committed** indicates that only the data in committed transactions will be read.
- **repeatable read** indicates that only the data committed before transaction start is read. Uncommitted data or data committed in other concurrent transactions cannot be read.
- **read uncommitted** indicates that data is readable at any time.
- **default**: The value is the same as that of **default_transaction_isolation**.

Default value: read committed

transaction_read_only

Parameter description: Specifies whether the current transaction is a read-only transaction.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-2**.

Value range: Boolean

- **on** indicates that the current transaction is a read-only transaction.
- **off** indicates that the current transaction can be a read/write transaction.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

xc_maintenance_mode

Parameter description: Specifies whether the system is in maintenance mode.

This parameter is a SUSET parameter. Set it based on method 3 in **Table 11-2**.

Value range: Boolean

- **on** indicates that the system is in maintenance mode.
- **off** indicates that the system is not in maintenance mode.

NOTICE

Exercise caution when setting this parameter to **on** to avoid data inconsistencies in the cluster.

Default value: **off**

allow_concurrent_tuple_update

Parameter description: Specifies whether to allow concurrent update.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-2**.

Value range: Boolean

- **on** indicates that concurrent update is allowed.
- **off** indicates that concurrent update is disallowed.

Default value: **on**

gtm_host

Parameter description: Specifies the IP address of the primary GTM process. This parameter is visible only to the sysadmin user.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: a string

Default value: IP address of the primary GTM

gtm_port

Parameter description: Specifies the listening port of the primary GTM process. This parameter is visible only to the sysadmin user.

This parameter is a POSTMASTER parameter.

NOTE

This parameter is specified in the configuration file during installation. Do not modify this parameter unless absolutely necessary. Otherwise, database communication will be affected.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: an integer ranging from 1 to 65535

Default value: specified during installation

gtm_host1

Parameter description: Specifies the IP address of the standby GTM process. This parameter is visible only to the sysadmin user.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: a string

Default value: IP address of the standby GTM

gtm_port1

Parameter description: Specifies the listening port of the standby GTM process. This parameter is visible only to the sysadmin user.

This parameter is a POSTMASTER parameter.

NOTE

This parameter is specified in the configuration file during installation. Do not modify this parameter unless absolutely necessary. Otherwise, database communication will be affected.

Value range: an integer ranging from 1 to 65535

Default value: The value is specified during installation if the standby GTM 1 is deployed. Otherwise, the value is **6665**.

pgxc_node_name

Parameter description: Specifies the name of a node.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-2**.

When a standby node requests to replicate logs on the primary node, if the **application_name** parameter is not set, the **pgxc_node_name** parameter is used as the name of the streaming replication slot of the standby node on the primary node. The streaming replication slot is named in the following format: Value of this parameter_IP address of the standby node_Port number of the standby node. The IP address and port number of the standby node are obtained from the IP address and port number of the standby node specified by the **replconninfo** parameter. The maximum length of a streaming replication slot name is 61 characters. If the length of the concatenated string exceeds 61 characters, the truncated **pgxc_node_name** will be used for concatenation to ensure that the length of the streaming replication slot name is less than or equal to 61 characters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **CAUTION**
>
> After this parameter is modified, the cluster will fail to be connected. You are advised not to modify this parameter.

Value range: a string

Default value: current node name

gtm_backup_barrier

Parameter description: Specifies whether to create a restoration point for the GTM starting point.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-2**.

Value range: Boolean

- **on** indicates that a restoration point will be created for the GTM starting point.
- **off** indicates that a restoration point will not be created for the GTM starting point.

Default value: **off**

gtm_conn_check_interval

Parameter description: Sets the intervals between two consecutive performed checks performed by the CN on the connections between local threads and the primary GTM.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 0 to 2147483. The unit is s.

Default value: **10s**

transaction_deferrable

Parameter description: Specifies whether to delay the execution of a read-only serial transaction without incurring an execution failure. Assume this parameter is set to **on**. When the server detects that the tuples read by a read-only transaction are being modified by other transactions, it delays the execution of the read-only transaction until the other transactions finish modifying the tuples. This parameter is reserved and does not take effect in this version. Similar to this parameter, the **default_transaction_deferrable** parameter is used to specify whether to allow delayed execution of a transaction.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-2**.

Value range: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on** indicates that the execution of a read-only serial transaction can be delayed.
- **off** indicates that the execution of a read-only serial transaction cannot be delayed.

Default value: **off**

enable_show_any_tuples

Parameter description: This parameter is available only in a read-only transaction and is used for analysis. When this parameter is set to **on** or **true**, all versions of tuples in the table are displayed.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-2**.

Value range: Boolean

- **on** or **true** indicates that all versions of tuples in the table are displayed.
- **off** or **false** indicates that no versions of tuples in the table are displayed.

Default value: **off**

gtm_connect_timeout

Parameter description: Specifies the GTM connection timeout. If the connection time of the GTM exceeds its value, the connection times out and exits.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 1 to 2147483647. The unit is s.

Default value: **2s**

gtm_connect_retries

Parameter description: Specifies the number of GTM reconnection attempts.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 2147483647

Default value: **30**

gtm_rw_timeout

Parameter description: Specifies the GTM response timeout. If the time spent waiting for GTM responses exceeds its value, the operation times out and exits.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 1 to 2147483647. The unit is s.

Default value: **1min**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_redistribute

Parameter description: Specifies whether unmatched nodes are redistributed.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-2**.

Value range: Boolean

- **on** indicates that unmatched nodes are redistributed.
- **off** indicates that unmatched nodes are not redistributed.

Default value: **off**

replication_type

Parameter description: Specifies whether the current HA mode is primary/standby/secondary, one primary multiple standbys, or single primary.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-2**.

This parameter is used for CM deployment. Do not set it.

Value range: 0 to 2

- **0**: indicates that the HA nodes consist of a primary, a standby, and a secondary node.
- **1** Indicates that the one-primary-multiple-standby mode is used, covering all scenarios. This mode is recommended.
- **2** Indicates the single primary mode. In this mode, the standby node cannot be expanded.

Default value: **1**

enable_gtm_free

Parameter description: Specifies whether the GTM-Free mode is enabled. In large concurrency scenarios, the snapshots delivered by the GTM increase in number and size. The network between the GTM and the CN becomes the performance bottleneck. The GTM-Free mode is used to eliminate the bottleneck. In this mode, the CN communicates with DNs instead of the GTM. The CN sends queries to each DN, which locally generates snapshots and xids, ensuring external write consistency but not external read consistency.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-2**.

CAUTION

When the GTM-Free mode is used, you are advised to set **application_type** to **perfect_sharding_type** so that you can find SQL statements that may cause data inconsistency. Otherwise, the system does not intercept statements that may cause data inconsistency.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: Boolean

- **on** indicates that the GTM-FREE mode is enabled and the cluster ensures eventual read consistency.
- **off** indicates that the GTM-FREE mode is disabled.

Default value: **off**

enable_twophase_commit

Parameter description: Specifies whether to enable distributed two-phase commit in the GTM-Free mode adopted to address the replacement issues of SDS in the cloud database. This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-2**.

Value range: Boolean

- **on** indicates that distributed two-phase commit is allowed in the GTM-Free mode.
- **off** indicates that distributed two-phase commit is not allowed in the GTM-Free mode.

Default value: **on**

application_type

Parameter description: valid only when **enable_gtm_free** is set to **on**. This parameter specifies the service type of a user. This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-2**. This parameter cannot be set using **gs_guc**. Only the following ways are allowed:

1. Use the **gsql** client to perform session-level configuration.
2. When JDBC is used to connect to the database, set the **ApplicationType** parameter for the connection string.

Value range: enumerated values

- **not_perfect_sharding_type** indicates a service across nodes. If this value is used, statements across nodes can be executed.
- **perfect_sharding_type** indicates a service on a single node. If this value is used and the SQL statement involves multiple nodes, an error is reported. The corresponding SQL statement is recorded in the system log.
  - If this value is used, you can run the **/*+ multinode */ hint** command to allow SQL statements to be executed on multiple nodes. The multinode hint can be added after the select, insert, update, delete, and merge keywords.

gtm_host2

Parameter description: Specifies the host name or IP address of the standby GTM 2 if the standby GTM 2 is deployed. This parameter is visible only to the sysadmin user.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string

Default value: the IP address of the standby GTM 2 if the standby GTM 2 is deployed. Otherwise, the value is **""**.

gtm_host3

Parameter description: Specifies the host name or IP address of the standby GTM 3 if the standby GTM 3 is deployed. This parameter is visible only to the sysadmin user.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: a string

Default value: the IP address of the standby GTM 3 if the standby GTM 3 is deployed. Otherwise, the value is **""**.

gtm_host4

Parameter description: Specifies the host name or IP address of the standby GTM 4 if the standby GTM 4 is deployed. This parameter is visible only to the sysadmin user.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: a string

Default value: the IP address of the standby GTM 4 if the standby GTM 4 is deployed. Otherwise, the value is **""**.

gtm_host5

Parameter description: Specifies the host name or IP address of the standby GTM 5 if the standby GTM 5 is deployed. This parameter is visible only to the sysadmin user.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: a string

Default value: the IP address of the standby GTM 5 if the standby GTM 5 is deployed. Otherwise, the value is **""**.

gtm_host6

Parameter description: Specifies the host name or IP address of the standby GTM 6 if the standby GTM 6 is deployed. This parameter is visible only to the sysadmin user.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: a string

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: the IP address of the standby GTM 6 if the standby GTM 6 is deployed. Otherwise, the value is **""**.

gtm_host7

Parameter description: Specifies the host name or IP address of the standby GTM 7 if the standby GTM 7 is deployed. This parameter is visible only to the sysadmin user.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: a string

Default value: the IP address of the standby GTM 7 if the standby GTM 7 is deployed. Otherwise, the value is **""**.

gtm_port2

Parameter description: Specifies the listening port of the standby GTM 2 if the standby GTM 2 is deployed. This parameter is visible only to the sysadmin user.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 1 to 65535

Default value: The value is specified during installation if the standby GTM 2 is deployed. Otherwise, the value is **6666**.

gtm_port3

Parameter description: Specifies the listening port of the standby GTM 3 if the standby GTM 3 is deployed. This parameter is visible only to the sysadmin user.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 1 to 65535

Default value: The value is specified during installation if the standby GTM 3 is deployed. Otherwise, the value is **6666**.

gtm_port4

Parameter description: Specifies the listening port of the standby GTM 4 if the standby GTM 4 is deployed. This parameter is visible only to the sysadmin user.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 1 to 65535

Default value: The value is specified during installation if the standby GTM 4 is deployed. Otherwise, the value is **6666**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gtm_port5

Parameter description: Specifies the listening port of the standby GTM 5 if the standby GTM 5 is deployed. This parameter is visible only to the sysadmin user.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 1 to 65535

Default value: The value is specified during installation if the standby GTM 5 is deployed. Otherwise, the value is **6666**.

gtm_port6

Parameter description: Specifies the listening port of the standby GTM 6 if the standby GTM 6 is deployed. This parameter is visible only to the sysadmin user.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 1 to 65535

Default value: The value is specified during installation if the standby GTM 6 is deployed. Otherwise, the value is **6666**.

gtm_port7

Parameter description: Specifies the listening port of the standby GTM 7 if the standby GTM 7 is deployed. This parameter is visible only to the **sysadmin** user.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 1 to 65535

Default value: The value is specified during installation if the standby GTM 7 is deployed. Otherwise, the value is **6666**.

enable_defer_calculate_snapshot

Parameter description: Specifies the delay in calculating **xmin** and **oldestxmin**. Calculation is triggered only when 1000 transactions are executed or the interval is 1s. If this parameter is set to **on**, the overhead of calculating snapshots can be reduced in heavy-load scenarios, but the progress of **oldestxmin** is slow, affecting tuple recycling. If this parameter is set to **off**, **xmin** and **oldestxmin** can be calculated in real time, but the overhead for calculating snapshots increases.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Value range: Boolean

- **on** indicates that snapshots **xmin** and **oldestxmin** are calculated with a delay.
- **off** indicates that snapshots **xmin** and **oldestxmin** are calculated in real time.

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

19.20 Dual-Cluster Replication Parameters

enable_roach_standby_cluster

Parameter description: Sets the instances of the standby cluster to read-only in dual-cluster mode. Only the sysadmin user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-2**.

Value range: Boolean

- **on** indicates that the read-only mode is enabled for the standby cluster.
- **off** indicates that the read-only mode is disabled for the standby cluster. In this case, the standby cluster can be read and written.

Default value: **off**

enable_slot_log

Parameter description: Determines whether to enable primary/standby synchronization for logical replication slots.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-2**.

Value range: Boolean

- **on** indicates that primary/standby synchronization is enabled for logical replication slots.
- **off** indicates that primary/standby synchronization is disabled for logical replication slots.

Default value: **on**

max_changes_in_memory

Parameter description: Specifies the maximum number of DML statements cached in memory for a single transaction during logical decoding.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-2**.

Value range: an integer ranging from 1 to 2147483647

Default value: **4096**

max_cached_tuplebufs

Parameter description: Specifies the upper limit of the total tuple information cached in the memory during logical decoding. You are advised to set this parameter to a value greater than or equal to twice of **max_changes_in_memory**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-2**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: an integer ranging from 1 to 2147483647

Default value: **8192**

logical_decode_options_default

Parameter description: Specifies the global default value for unspecified decoding options when logical decoding starts.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Currently, the following logical decoding options are supported: **parallel-decode-num**, **parallel-queue-size**, **max-txn-in-memory**, **max-reorderbuffer-in-memory**, and **exclude-users**. For the meanings of the options, see **Example: Logic Replication Code**.

Value range: a string of key=value characters separated by commas (,), for example, **'parallel-decode-num=4,parallel-queue-size=128,exclude-users=userA'**. An empty string indicates that the default value hardcoded by the program is used.

Default value: **""**

NOTICE

The SIGHUP parameter does not affect the started logic decoding process. The options specified by this parameter are used as the default settings for subsequent logic decoding startup, and the settings specified in the startup command are preferentially used.

The **exclude-users** option is different from the logic decoding startup option. You are not allowed to specify multiple blacklisted users.

logical_sender_timeout

Parameter description: Specifies the maximum waiting time for the sender to wait for the receiver to receive logical logs.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647. The unit is ms.

Default value: **30s**

RepOriginId

Parameter description: This parameter is a session-level GUC parameter. In bidirectional logical replication, set it to a non-zero value to avoid infinite data replication.

This parameter is a USERSET parameter. Set it based on **Method 3** provided in **Table 11-2**.

Value range: an integer ranging from 0 to 2147483647

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **0**

hadr_max_size_for_xlog_receiver

Parameter description: Specifies the maximum difference between the OBS logs obtained by instances in the DR cluster and the local playback logs. If the difference is greater than the value of this parameter, the instances stop obtaining OBS logs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

Handling suggestion: The value of this parameter is related to the local disk size. You are advised to set this parameter to 50% of the local disk size.

Value range: an integer ranging from 0 to 2147483647

Default value: **256GB**

auto_csn_barrier

Parameter description: Specifies whether the barrier logging function is enabled for the primary cluster for streaming DR.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on**: enabled.
- **off**: disabled.

Default value: **off**

stream_cluster_run_mode

Parameter description: Specifies whether a CN or DN belongs to the primary or standby cluster in a dual-cluster streaming DR scenario. In a single-cluster scenario, the primary cluster is selected by default.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: enumerated values

- **cluster_primary** indicates that the node is in the primary cluster.
- **cluster_standby** indicates that the node is in the standby cluster.

Default value: **cluster_primary**

19.21 Developer Options

allow_system_table_mods

Parameter description: Specifies whether the structure of a system catalog or the name of a system schema can be modified.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the structure of the system catalog or the name of the system schema can be modified.
- **off** indicates that the structure of the system catalog or the name of the system schema cannot be modified.

Default value: **off**

CAUTION

You are not advised to change the default value of this parameter. If this parameter is set to **on**, system tables may be damaged and the database may fail to be started.

allow_create_sysobject

Parameter description: Specifies whether objects such as functions, stored procedures, and synonyms can be created or modified in the system schema. The system schema refers to the schema provided by the database after initialization, excluding the public schema. The OID of the system schema is usually smaller than 16384.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that initial users and system administrators can create or modify objects such as functions, stored procedures, and synonyms in the system schema. For details about whether other users are allowed to create these objects, see the permission requirements of the corresponding schema.
- **off** indicates that all users are not allowed to create or modify objects such as functions, stored procedures, and synonyms in the system schema.

Default value: **on**

debug_assertions

Parameter description: Specifies whether to enable various assertion checks. This parameter assists in debugging. If you are experiencing strange problems or crashes, set this parameter to **on** to identify programming defects. To use this parameter, the macro USE_ASSERT_CHECKING must be defined (through the configure option **--enable-cassert**) during the GaussDB compilation.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that various assertion checks are enabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **off** indicates that various assertion checks are disabled.

NOTE

If you compile GaussDB with the assertion check enabled, this parameter is set to **on** by default.

Default value: **off**

ignore_checksum_failure

Parameter description: Specifies whether to ignore check failures (but still generate an alarm) and continue reading data. Continuing reading data may result in breakdown, damaged data being transferred or stored, failure of data recovery from remote nodes, or other serious problems. You are not advised to modify the settings.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that data check errors are ignored.
- **off** indicates that data check errors are reported.

Default value: **off**

ignore_system_indexes

Parameter description: Specifies whether to ignore system indexes when reading system tables (but still update the indexes when modifying the tables).

This parameter is a BACKEND parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

This parameter is useful for recovering data from tables whose system indexes are damaged.

Value range: Boolean

- **on** indicates that system indexes are ignored.
- **off** indicates that system indexes are not ignored.

Default value: **off**

post_auth_delay

Parameter description: Specifies the delay in the connection to the server after a successful authentication. Developers can attach a debugger to the server startup process.

This parameter is a BACKEND parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: an integer ranging from 0 to 2147. The unit is s.

Default value: **0**

NOTE

This parameter is used only for commissioning and fault locating. To prevent impact on service running, ensure that the default value **0** is used in the production environment. If this parameter is set to a value other than 0, the cluster status may be abnormal due to a long authentication delay.

pre_auth_delay

Parameter description: Specifies the period of delaying authentication after the connection to the server is started. Developers can attach a debugger to the authentication procedure.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 60. The unit is s.

Default value: **0**

NOTE

This parameter is used only for commissioning and fault locating. To prevent impact on service running, ensure that the default value **0** is used in the production environment. If this parameter is set to a value other than 0, the cluster status may be abnormal due to a long authentication delay.

trace_notify

Parameter description: Specifies whether to enable the function of generating debugging output for the **LISTEN** and **NOTIFY** commands. The level of **client_min_messages** or **log_min_messages** must be **debug1** or lower so that debugging output can be recorded in the client or server logs, respectively.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

Default value: **off**

trace_recovery_messages

Parameter description: Specifies whether to enable logging of recovery-related debugging output. This parameter allows users to overwrite the normal setting of **log_min_messages**, but only for specific messages. This is intended for the use in debugging the standby server.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: enumerated values. Valid values include **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, and **log**. For details about the parameter values, see **log_min_messages**.

Default value: **log**

NOTE

- **log** indicates that recovery-related debugging information will not be logged.
- Except the default value **log**, each of the other values indicates that recovery-related debugging information at the specified level will also be logged. Common settings of **log_min_messages** enables logs to be unconditionally recorded into server logs.

trace_sort

Parameter description: Specifies whether to print information about resource usage during sorting operations. This parameter is available only when the macro TRACE_SORT is defined during the GaussDB compilation. However, TRACE_SORT is currently defined by default.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

Default value: **off**

zero_damaged_pages

Parameter description: Specifies whether to detect a damaged page header that causes GaussDB to report an error, aborting the current transaction.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- Setting this parameter to **on** causes the system to report a warning, zero out the damaged page, and continue processing. This behavior will destroy data, including all the rows on the damaged page. However, it allows you to bypass the error and retrieve rows from any undamaged pages that may be present in the table. Therefore, it is useful for restoring data if corruption has occurred due to a hardware or software error. In most cases, you are advised not to set this parameter to **on** if you want to restore data from damaged pages.
- If this parameter is set to **off**, the system does not fill zeros in damaged pages.

Default value: **off**

string_hash_compatible

Parameter description: Specifies whether to use the same method to calculate char-type hash values and varchar- or text-type hash values. Based on the setting

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

of this parameter, you can determine whether a redistribution is required when a distribution column is converted from a char-type data distribution into a varchar- or text-type data distribution.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the same calculation method is used and a redistribution is not required.
- **off** indicates that different calculation methods are used and a redistribution is required.

NOTE

Calculation methods differ in the length of input strings used for calculating hash values. (For a char-type hash value, spaces following a string are not counted as the length. For a text- or varchar-type hash value, the spaces are counted.) The hash value affects the calculation result of queries. To avoid query errors, do not modify this parameter during database running once it is set.

Default value: **off**

remotetype

Parameter description: Specifies the remote connection type.

This parameter is a BACKEND parameter. Set it based on instructions provided in **Table 11-1**.

Value range: enumerated values. Valid values are **application**, **coordinator**, **datanode**, **gtm**, **gtmproxy**, **internaltool**, and **gtmtool**.

Default value: **application**

max_user_defined_exception

Parameter description: Specifies the maximum number of exceptions.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer. Currently, only the fixed value **1000** is supported.

Default value: **1000**

enable_compress_spill

Parameter description: Specifies whether to enable the compression function of writing data to disk.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** or **true** indicates that optimization for writing data to disk is enabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **off** or **false** indicates that optimization for writing data to a disk is disabled.

Default value: **on**

enable_parallel_ddl

Parameter description: Specifies whether multiple CNs can concurrently perform DDL operations on the same database object.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on**: DDL operations can be concurrently performed without distributed deadlocks.
- **off**: DDL operations cannot be concurrently performed as distributed deadlocks may occur.

Default value: **on**

support_batch_bind

Parameter description: Specifies whether to batch bind and execute PBE statements through interfaces such as JDBC, ODBC, and libpq.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that batch binding and execution are used.
- **off** indicates that batch binding and execution are not used.

Default value: **on**

numa_distribute_mode

Parameter description: Specifies the distribution of some shared data and threads among NUMA nodes. This parameter is used to optimize the performance of large-scale ARM servers with multiple NUMA nodes. Generally, you do not need to set this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string. The valid values are **none** and **all**.

- **none** indicates that this function is disabled.
- **all** indicates that some shared data and threads are distributed to different NUMA nodes to reduce the number of remote access times and improve performance. Currently, this function applies only to ARM servers with multiple NUMA nodes. All NUMA nodes must be available for database processes. You cannot select only some NUMA nodes.

NOTE

In the current version, **numa_distribute_mode** cannot be set to **all** on the x86 architecture.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **none**

log_pagewriter

Parameter description: Specifies whether to display the page refresh information of a thread and details about an incremental check point after the incremental check point is enabled. You are not advised to set this parameter to **true** because a large amount of information will be generated.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

Default value: **off**

advance_xlog_file_num

Parameter description: Specifies the number of Xlog files that are periodically initialized in advance in the background. This parameter is used to prevent the Xlog file initialization from affecting the performance during transaction submission. However, such a fault may occur only when the system is overloaded. Therefore, you do not need to set this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 1000000. The value **0** indicates that initialization is not performed in advance. For example, the value **10** indicates that the backend thread periodically initializes 10 Xlog files in advance based on the write location of the current xlog.

Default value: **0**

comm_sender_buffer_size

Parameter description: Specifies the size of the buffer for each interaction between CNs and DNs and between DNs in the stream plan. In some cases, different values affect the stream performance. After the value is reset, the cluster needs to be restarted for the reset to take effect. The unit is KB.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 1024

Default value: **8**

default_index_kind

Parameter description: Controls the default behavior of creating indexes.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer. Currently, only the fixed values **0**, **1**, and **2** are supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **0**: The global partition index function is disabled for distributed deployment.
- **1**: A local index is created by default.
- **2**: A global index is created by default.

Default value: **2**

> **CAUTION**
>
> You are advised not to change the default value of this parameter. Otherwise, the index validity may be affected.

19.22 Auditing

19.22.1 Audit Switch

audit_enabled

Parameter description: Specifies whether to enable or disable the audit process. After the audit process is enabled, the auditing information written by the background process can be read from the pipe and written into audit files.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the auditing function is enabled.
- **off** indicates that the auditing function is disabled.

Default value: **on**

audit_directory

Parameter description: Specifies the storage directory of audit files. A path relative to the **data** directory. Only the **sysadmin** user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value: pg_audit If **om** is used for cluster deployment, audit logs are stored in *$GAUSSLOG*/**pg_audit/***Instance name*.

> **NOTICE**
>
> - You need to set different audit file directories for different CNs or DNs. Otherwise, audit logs will be abnormal.
> - If the value of **audit_directory** in the configuration file is an invalid path, the audit function cannot be used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- Valid path: Users have read and write permissions on the path.
- Invalid path: Users do not have read or write permissions on an invalid path.

audit_data_format

Parameter description: Audits the format of log files. Currently, only the binary format is supported. Only the **sysadmin** user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value: **binary**

audit_rotation_interval

Parameter description: Specifies the interval of creating an audit log file. If the difference between the current time and the time when the previous audit log file is created is greater than the value of **audit_rotation_interval**, a new audit log file will be generated.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 35791394. The unit is min.

Default value: 1d

NOTICE

Adjust this parameter only when required. Otherwise, **audit_resource_policy** may fail to take effect. To control the storage space and time of audit logs, set the **audit_resource_policy**, **audit_space_limit**, and **audit_file_remain_time** parameters.

audit_rotation_size

Parameter description: Specifies the maximum capacity of an audit log file. If the total number of messages in an audit log exceeds the value of **audit_rotation_size**, the server will generate a new audit log file.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1024 to 1048576. The unit is KB.

Default value: **10 MB**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- Do not adjust this parameter unless necessary. Otherwise, **audit_resource_policy** may fail to take effect. To control the storage space and time of audit logs, set the **audit_resource_policy**, **audit_space_limit**, and **audit_file_remain_time** parameters.
- If the space occupied by a single record in an audit log file exceeds the value of this parameter, the log file is regarded as an invalid log file.

audit_resource_policy

Parameter description: Specifies the policy for determining whether audit logs are preferentially stored by space or time.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that audit logs are preferentially stored by space. A maximum of **audit_space_limit** logs can be stored.
- **off** indicates that audit logs are preferentially stored by time. A minimum duration of **audit_file_remain_time** logs must be stored.

Default value: **on**

audit_file_remain_time

Parameter description: Specifies the minimum duration required for recording audit logs. This parameter is valid only when **audit_resource_policy** is set to **off**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 730. The unit is day. **0** indicates that the storage duration is not limited.

Default value: **90**

audit_space_limit

Parameter description: Specifies the total disk space occupied by audit files.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1024 KB to 1024 GB. The unit is KB.

Default value: **1 GB**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- This parameter takes effect only for a single process instance folder in the **pg_audit** directory. By default, the total disk space occupied by audit files on each CN or DN is 1 GB.
- In the multi-audit thread scenario, the minimum disk space occupied by audit files is the product of values of **audit_thread_num** and **audit_rotation_size**. If the value of this parameter is too small, the disk space occupied by audit files may exceed the value of this parameter.

audit_file_remain_threshold

Parameter description: Specifies the maximum number of audit files in the audit directory.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 100 to 1048576

Default value: **1048576**

NOTICE

- Ensure that this parameter is set to **1048576**. Do not adjust this parameter unless necessary. Otherwise, **audit_resource_policy** may fail to take effect. To control the storage space and time of audit logs, set the **audit_resource_policy**, **audit_space_limit**, and **audit_file_remain_time** parameters.
- In the multi-audit thread scenario, do not adjust this parameter unless necessary. Ensure that the value of this parameter is greater than or equal to the value of **audit_thread_num**. Otherwise, the audit function cannot be used and the database is abnormal.

audit_thread_num

Parameter description: Specifies the number of audit threads.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 48

Default value: **1**

NOTICE

When **audit_dml_state** is enabled and high performance is required, you are advised to increase the value of this parameter to ensure that audit messages can be processed and recorded in a timely manner.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

19.22.2 User and Permission Audit

audit_login_logout

Parameter description: Specifies whether to audit the GaussDB user's login (including login success and failure) and logout.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 7

- **0** indicates that the function of auditing users' logins and logouts is disabled.
- **1** indicates that only successful user logins are audited.
- **2** indicates that only failed user logins are audited.
- **3** indicates that successful and failed user logins are audited.
- **4** indicates that only user logouts are audited.
- **5** indicates that successful user logouts and logins are audited.
- **6** indicates that failed user logouts and logins are audited.
- **7** indicates that successful user logins, failed user logins, and logouts are audited.

Default value: **7**

audit_database_process

Parameter description: Specifies whether to audit the GaussDB user's login (including login success and failure) and logout.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: 0 or **1**

- **0** indicates that the function of auditing GaussDB start, stop, recovery, and switchover operations of a database is disabled.
- **1** indicates that the function of auditing GaussDB start, stop, recovery, and switchover operations of a database is enabled.

Default value: **1**

audit_user_locked

Parameter description: Specifies whether to audit the GaussDB user's locking and unlocking.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: 0 or **1**

- **0** indicates that the function of auditing user's locking and unlocking is disabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **1** indicates that the function of auditing user's locking and unlocking is enabled.

Default value: **1**

audit_user_violation

Parameter description: Specifies whether to audit the access violation operations of a user.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: 0 or **1**

- **0** indicates that the function of auditing the access violation operations of a user is disabled.
- **1** indicates that the function of auditing the access violation operations of a user is enabled.

Default value: **0**

audit_grant_revoke

Parameter description: Specifies whether to audit the granting and reclaiming of the GaussDB user's permission.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: 0 or **1**

- **0** indicates that the function of auditing the granting and reclaiming of a user's permission is disabled.
- **1** indicates that the function of auditing the granting and reclaiming of a user's permission is enabled.

Default value: **1**

19.22.3 Operation Auditing

audit_system_object

Parameter description: Specifies whether to audit the CREATE, DROP, and ALTER operations on the GaussDB database object. The GaussDB database objects include databases, users, schemas, and tables. You can change the value of this parameter to audit only the operations on required database objects. In the scenario where the leader node is forcibly selected, you are advised to set **audit_system_object** to the maximum value and audit all DDL objects.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 134217727

- **0** indicates that the function of auditing the CREATE, DROP, and ALTER operations on the GaussDB database object is disabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Other values indicate that the CREATE, DROP, and ALTER operations on a certain or some GaussDB database objects are audited.

Value description:

The value of this parameter is calculated by 27 binary bits. The 27 binary bits represent 27 types of GaussDB objects. If the corresponding binary bit is set to **0**, the CREATE, DROP, and ALTER operations on corresponding database objects are not audited. If it is set to **1**, the CREATE, DROP, and ALTER operations are audited. For details about the audit contents represented by these 27 binary bits, see **Table 19-8**.

Default value: **67121159**, indicating that DDL operations on databases, schemas, users, data sources, and node groups are audited.

Table 19-8 audit_system_object parameter description

Binary Bit	Description	Value Range
Bit 0	Whether to audit the CREATE, DROP, and ALTER operations on databases.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 1	Whether to audit the CREATE, DROP, and ALTER operations on schemas.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 2	Whether to audit the CREATE, DROP, and ALTER operations on users and user mappings.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 3	Whether to audit the CREATE, DROP, ALTER, and TRUNCATE operations on tables.	• **0** indicates that the CREATE, DROP, ALTER, and TRUNCATE operations on these objects are not audited. • **1** indicates that the CREATE, DROP, ALTER, and TRUNCATE operations on these objects are audited.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Binary Bit	Description	Value Range
Bit 4	Whether to audit the CREATE, DROP, and ALTER operations on indexes.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 5	Whether to audit the CREATE and DROP operations on views and materialized views.	• **0** indicates that the CREATE and DROP operations on these objects are not audited. • **1** indicates that the CREATE and DROP operations on these objects are audited.
Bit 6	Whether to audit the CREATE, DROP, and ALTER operations on triggers.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 7	Whether to audit the CREATE, DROP, and ALTER operations on procedures and functions.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 8	Whether to audit the CREATE, DROP, and ALTER operations on tablespaces.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 9	Whether to audit the CREATE, DROP, and ALTER operations on resource pools.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 10	Whether to audit the CREATE, DROP, and ALTER operations on workloads.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 11	Reserved	-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Binary Bit	Description	Value Range
Bit 12	Whether to audit the CREATE, DROP, and ALTER operations on data sources.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 13	Whether to audit the CREATE and DROP operations on node groups.	• **0** indicates that the CREATE and DROP operations on these objects are not audited. • **1** indicates that the CREATE and DROP operations on these objects are audited.
Bit 14	Whether to audit the CREATE, DROP, and ALTER operations on row-level security objects.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 15	Whether to audit the CREATE, DROP, and ALTER operations on types.	• **0** indicates that the CREATE, DROP, and ALTER operations on types are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on types are audited.
Bit 16	Whether to audit the CREATE, DROP, and ALTER operations on text search objects (CONFIGURATION and DICTIONARY).	• **0** indicates that the CREATE, DROP, and ALTER operations on text search objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on text search objects are audited.
Bit 17	Whether to audit the CREATE, DROP, and ALTER operations on directories.	• **0** indicates that the CREATE, DROP, and ALTER operations on directories are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on directories are audited.
Bit 18	Whether to audit the CREATE, DROP, and ALTER operations on synonyms.	• **0** indicates that the CREATE, DROP, and ALTER operations on synonyms are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on synonyms are audited.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Binary Bit	Description	Value Range
Bit 19	Whether to audit the CREATE, DROP, and ALTER operations on sequences.	• **0** indicates that the CREATE, DROP, and ALTER operations on sequences are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on sequences are audited.
Bit 20	Whether to audit the CREATE and DROP operations on CMKs and CEKs.	• **0** indicates that the CREATE and DROP operations on CMKs and CEKs are not audited. • **1** indicates that the CREATE and DROP operations on CMKs and CEKs are audited.
Bit 21	Whether to audit the CREATE, DROP, and ALTER operations on packages. (Currently, the operations on packages can be audited only in the centralized deployment scenario.)	• **0** indicates that the CREATE, DROP, and ALTER operations on packages are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on packages are audited.
Bit 22	Reserved	-
Bit 23	Reserved	-
Bit 24	Whether to audit the ALTER and DROP operations on the **gs_global_config** objects.	• **0** indicates that the ALTER and DROP operations on the **gs_global_config** objects are not audited. • **1** indicates that the ALTER and DROP operations on the **gs_global_config** objects are audited.
Bit 25	Reserved	-
Bit 26	Reserved	-

audit_dml_state

Parameter description: Specifies whether to audit the INSERT, UPDATE, and DELETE operations on a specific table.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer, **0** or **1**

- **0** indicates that the function of auditing the DML operations (except SELECT) is disabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **1** indicates that the function of auditing the DML operations (except SELECT) is enabled.

Default value: **0**

audit_dml_state_select

Parameter description: Specifies whether to audit the SELECT operation.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer, **0** or **1**

- **0** indicates that auditing the SELECT operation is disabled.
- **1** indicates that auditing the SELECT operation is enabled.

Default value: **0**

audit_function_exec

Parameter description: Specifies whether to record the audit information during the execution of the stored procedures, anonymous blocks, or user-defined functions (excluding system functions).

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer, **0** or **1**

- **0** indicates that auditing the stored procedure or function execution is disabled.
- **1** indicates that auditing the stored procedure or function execution is enabled.

Default value: **0**

audit_copy_exec

Parameter description: Specifies whether to audit the COPY operation.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer, **0** or **1**

- **0** indicates that auditing the COPY operation is disabled.
- **1** indicates that auditing the COPY operation is enabled.

Default value: **1**

audit_set_parameter

Parameter description: Specifies whether to audit the SET operation.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: an integer, **0** or **1**

- **0** indicates that auditing the SET operation is disabled.
- **1** indicates that auditing the SET operation is enabled.

Default value: **0**

audit_xid_info

Parameter description: Specifies whether to record the transaction ID of the SQL statement in the **detail_info** column of the audit log.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer, **0** or **1**

- **0** indicates that the function of recording transaction IDs in the audit log is disabled.
- **1** indicates that the function of recording transaction IDs in the audit log is enabled.

Default value: **0**

NOTICE

If this function is enabled, the **detail_info** information in the audit log starts with *xid*. For example:

```
detail_info: xid=14619 , create table t1(id int);
```

If transaction IDs do not exist, *xid* is recorded as **NA** in the audit log.

enableSeparationOfDuty

Parameter description: Specifies whether the separation of duties is enabled.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the separation of duties is enabled.
- **off** indicates that the separation of duties is disabled.

Default value: **off**

enable_nonsysadmin_execute_direct

Parameter description: Specifies whether non-system administrator and non-monitor administrator users are allowed to execute the EXECUTE DIRECT ON statement.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on** indicates that any user is allowed to execute the EXECUTE DIRECT ON statement.
- **off** indicates that only the system administrator and monitor administrator are allowed to execute the EXECUTE DIRECT ON statement.

Default value: **off**

enable_access_server_directory

Parameter description: Specifies whether to allow non-initial users to create, modify, and delete directories.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

- **on** indicates that non-initial users have the permission to create, modify, and delete directories.
- **off** indicates that non-initial users do not have the permission to create, modify, and delete directories.

Default value: **off**

NOTICE

To use the advanced package UTL_FILE to access files on the server, you must have the permissions on the specified directory.

For security purposes, only the initial user can create, modify, and delete directories by default.

If **enable_access_server_directory** is enabled, users with the **SYSADMIN** permission and users who inherit the **gs_role_directory_create** permission of the built-in role can create directories. A user with the **SYSADMIN** permission, the owner of a directory, a user who is granted with the **DROP** permission for the directory, or a user who inherits the **gs_role_directory_drop** permission of the built-in role can delete the directory. A user with the **SYSADMIN** permission and the owner of a directory object can change the owner of the directory, and the user must be a member of the new owning role.

19.23 Transaction Monitoring

The automatic rollback transaction can be monitored and its statement problems can be located by setting the transaction timeout warning. In addition, the statements with long execution time can also be monitored.

transaction_sync_naptime

Parameter description: For data consistency, when the local transaction's status differs from that in the snapshot of GTM, other transactions will be blocked. You need to wait for a few minutes until the transaction status of the local host is consistent with that of the GTM. The gs_clean tool is automatically triggered for

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

cleansing when the waiting period on the CN exceeds that of **transaction_sync_naptime**. The tool will shorten the blocking time after it completes the cleansing.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483. The unit is s.

Default value: **30s**

NOTE

If the value of this parameter is set to **0**, gs_clean will not be automatically invoked for the cleansing before the blocking arrives the duration. Instead, the gs_clean tool is invoked by **gs_clean_timeout**. The default value is 5 minutes.

transaction_sync_timeout

Parameter description: For data consistency, when the local transaction's status differs from that in the snapshot of GTM, other transactions will be blocked. You need to wait for a few minutes until the transaction status of the local host is consistent with that of the GTM. An exception is reported when the waiting duration on the CN exceeds the value of **transaction_sync_timeout**. Roll back the transaction to avoid system blocking due to long time of process response failures (for example, sync lock).

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483. The unit is s.

Default value: **10min**

NOTE

- If the value is **0**, no error is reported when the blocking times out or the transaction is rolled back.
- The value of this parameter must be greater than **gs_clean_timeout**. Otherwise, unnecessary transaction rollback will probably occur due to a block timeout caused by residual transactions that have not been deleted by gs_clean on the DN.

19.24 CM Parameters

Modifying CM parameters affects the running mechanism of GaussDB. You are advised to ask GaussDB engineers to do it for you. For details about how to modify the CM parameters, see method 1 in **Table 11-2**.

You can view CM Agent parameters in the **cm_agent.conf** file in the CM Agent data directory and CM Server parameters in the **cm_server.conf** file in the CM Server data directory.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

19.24.1 CM Agent Parameters

log_dir

Parameter description: Specifies the directory where CM Agent logs are stored. The value can be an absolute path, or relative to the CM Agent data directory.

Value range: a string. Any modification of this parameter takes effect only after CM Agent is restarted. For details about how to modify this parameter, see **Table 11-2**.

Default value: **"log"**, indicating that CM Agent logs are generated in the CM Agent data directory.

log_file_size

Parameter description: Specifies the size of a log file. If a log file exceeds the specified size, a new one is created to record log information.

Value range: an integer ranging from 0 to 2047. The unit is MB. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 11-2**.

Default value: **16MB**

log_min_messages

Parameter description: Specifies which message levels are written to the CM Agent log. A higher level covers the messages of all the lower levels. The lower the level is, the fewer messages will be written into the log.

Value range: enumerated type. Valid values are **debug5**, **debug1**, **log**, **warning**, **error**, and **fatal**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 11-2**.

Default value: **warning**

incremental_build

Parameter description: Specifies whether a standby DN is incrementally built. If this parameter is enabled, a standby DN is incrementally built.

Value range: Boolean. The value can be **on** or **off**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 11-2**.

Default value: **on**

alarm_component

Parameter description: Specifies the location of the alarm component that processes alarms.

Value range: a string The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see **Table 11-2**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If **--alarm-type** in the **gs_preinstall** script is set to **5**, no third-party component is connected and alarms are written into the **system_alarm** log. In this case, the value of **alarm_component** is **/opt/huawei/snas/bin/snas_cm_cmd**.
- If **--alarm-type** in the **gs_preinstall** script is set to **1**, a third-party component is connected. In this case, the value of **alarm_component** is the absolute path of the executable program of the third-party component.

Default value: **/opt/huawei/snas/bin/snas_cm_cmd**

alarm_report_interval

Parameter description: Specifies the interval at which an alarm is reported. For details about how to modify this parameter, see **Table 11-2**.

Value range: a non-negative integer (unit: s)

Default value: **1**

alarm_report_max_count

Parameter description: Specifies the maximum number of times an alarm is reported. For details about how to modify this parameter, see **Table 11-2**.

Value range: a non-negative integer

Default value: **1**

agent_report_interval

Parameter description: Specifies the interval at which CM Agent reports the instance status.

Value range: an integer. The unit is s. For details about how to modify this parameter, see **Table 11-2**.

Default value: **1**

agent_phony_dead_check_interval

Parameter description: Specifies the interval at which CM Agent checks whether the CN, DN, or GTM process is suspended.

Value range: an integer. The unit is s. For details about how to modify this parameter, see **Table 11-2**.

Default value: 10

agent_check_interval

Parameter description: Specifies the interval at which the CM Agent queries the status of instances, such as the DNs, CN, and GTM.

Value range: an integer. The unit is s. For details about how to modify this parameter, see **Table 11-2**.

Default value: 2

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

agent_heartbeat_timeout

Parameter description: Specifies the heartbeat timeout interval for CM Agent to connect to CM Server.

Value range: an integer ranging from 2 to 2^{31} – 1. The unit is second. For details about how to modify this parameter, see **Table 11-2**.

Default value: **8**

agent_connect_timeout

Parameter description: Specifies the time to wait before the attempt of CM Agent to connect to CM Server times out.

Value range: an integer. The unit is s. For details about how to modify this parameter, see **Table 11-2**.

Default value: **1**

agent_connect_retries

Parameter description: Specifies the number of times CM Agent tries to connect to the CM Server.

Value range: an integer. For details about how to modify this parameter, see **Table 11-2**.

Default value: **15**

agent_kill_instance_timeout

Parameter description: Specifies the interval from the time when CM Agent fails to connect to the primary CM Server to the time when CM Agent kills all instances on the node.

Value range: an integer. For details about how to modify this parameter, see **Table 11-2**.

Default value: **0**, indicating that the operation of killing all instances on the node is not initiated.

enable_gtm_phony_dead_check

Parameter description: Specifies whether to enable the GTM zombie check function.

Value range: an integer. The value **1** indicates that the zombie check is enabled, and the value **0** indicates that the zombie check is disabled. For details about how to modify this parameter, see **Table 11-2**.

Default value: **1**

security_mode

Parameter description: Specifies whether CNs and DNs are started in secure mode. If this parameter is set to **on**, CNs and DNs are started in secure mode.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: Boolean. The value can be **on** or **off**. For details about how to modify this parameter, see **Table 11-2**.

Default value: **off**

upgrade_from

Parameter description: Specifies the internal version number of the cluster before an in-place upgrade. Do not modify the value of this parameter.

Value range: a non-negative integer For details about how to modify this parameter, see **Table 11-2**.

The recommended value range is [0,*Version number of the installation package*].

Default value: **0**

process_cpu_affinity

Parameter description: Specifies whether to bind a primary DN process to a CPU core before starting the process. If this parameter is set to **0**, core binding will not be performed. If it is set to another value, core binding will be performed, and the number of physical CPU cores is 2^n. Any modification of this parameter takes effect only after the cluster and CM Agent are restarted. Only Arm is supported. For details about how to modify this parameter, see **Table 11-2**.

Value range: an integer ranging from 0 to 2

Default value: **0**

enable_xc_maintenance_mode

Parameter description: Specifies whether the **pgxc_node** system catalog can be modified when the cluster is in read-only mode.

Value range: Boolean Any modification of this parameter takes effect only after CM Agent is restarted. For details about how to modify this parameter, see **Table 11-2**.

- **on** indicates that the **pgxc_node** system catalog can be modified.
- **off** indicates that the **pgxc_node** system catalog cannot be modified.

Default value: **on**

log_threshold_check_interval

Parameter description: Specifies the interval for compressing and clearing logs.

Value range: an integer ranging from 0 to 2^{31} – 1. The unit is second. For details about how to modify this parameter, see **Table 11-2**.

Default value: **1800**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

dilatation_shard_count_for_disk_capacity_alarm

Parameter description: Specifies the number of shards to be added in the scale-out scenario. This parameter is used to calculate the threshold for reporting a disk capacity alarm.

NOTE

The parameter value must be the same as the actual number of shards to be added.

Value range: an integer ranging from 0 to 2^{31} – 1. If this parameter is set to **0**, the disk scale-out alarm is not reported. If this parameter is set to a value greater than **0**, the disk scale-out alarm is reported and the threshold is calculated based on the number of shards specified by this parameter. For details about how to modify this parameter, see **Table 11-2**.

Default value: **1**

log_max_size

Parameter description: Specifies the maximum size of a log file.

Value range: an integer ranging from 0 to 2^{31} – 1. The unit is MB. For details about how to modify this parameter, see **Table 11-2**.

Default value: **10240**

log_max_count

Parameter description: Specifies the maximum number of logs that can be stored on hard disks.

Value range: an integer ranging from 0 to 10000. For details about how to modify this parameter, see **Table 11-2**.

Default value: **10000**

log_saved_days

Parameter description: Specifies the number of days for storing logs.

Value range: an integer ranging from 0 to 1000. The unit is day. For details about how to modify this parameter, see **Table 11-2**.

Default value: **90**

enable_log_compress

Parameter description: Specifies whether to enable log compression.

Value range: Boolean For details about how to modify this parameter, see **Table 11-2**.

- **on** indicates that log compression is enabled.
- **off** indicates that log compression is disabled.

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_cn_auto_repair

Parameter description: Specifies whether to enable automatic CN recovery.

Value range: Boolean For details about how to modify this parameter, see **Table 11-2**.

- **on** indicates that the automatic CN recovery is enabled. That is, after a CN is removed, the agent automatically attempts to recover the CN and add the CN back.
- **off** indicates that automatic CN recovery is disabled.

Default value: **on**

agent_backup_open

Parameter description: Specifies whether to enable the DR cluster. After the DR cluster is enabled, the CM runs in DR cluster mode.

Value range: an integer ranging from 0 to 1 Any modification of this parameter takes effect only after CM Agent is restarted. For details about how to modify this parameter, see **Table 11-2**.

- **0**: disabled.
- **1**: enabled.

Default value: **0**

enable_e2e_rto

Parameter description: Specifies whether to enable the E2E RTO function. After this function is enabled, the hang-up detection period and network detection timeout time are shortened. The CM can reach the E2E RTO indicator (RTO for a single instance ≤ 10s; RTO for combined faults ≤ 30s).

Value range: an integer, **0** or **1** The value **1** indicates enabled, while the value **0** indicates disabled. For details about how to modify this parameter, see **Table 11-2**.

Default value:

Independent deployment: **1**

enable_dcf

Parameter description: Specifies the status of the DCF mode.

Value range: Boolean Any modification of this parameter takes effect only after CM Agent is restarted. For details about how to modify this parameter, see **Table 11-2**.

- **0**: disabled.
- **1**: enabled.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

unix_socket_directory

Parameter description: Specifies the directory location of the Unix socket.

Value range: a string For details about how to modify this parameter, see **Table 11-2**.

Default value: ''

disaster_recovery_type

Parameter description: Specifies the type of the DR relationship between primary and standby clusters.

Value range: an integer ranging from 0 to 2 For details about how to modify this parameter, see **Table 11-2**.

- **0** indicates that no DR relationship is established.
- **1** indicates that the OBS DR relationship is established.
- **2** indicates that the streaming DR relationship is established.

Default value: **0**

environment_threshold

Parameter description: Specifies the thresholds for the physical environment and node status monitored by the agent. If the thresholds are exceeded, logs will be printed. The thresholds include the memory usage threshold, CPU usage threshold, disk usage threshold, instance memory usage threshold, and instance thread pool usage threshold.

Value range: a string, in the format of (*0*, *0*, *0*, *0*). The value range for each number is [0,100]. The unit is %. Value **0** indicates that the detection is disabled. For details about how to modify this parameter, see **Table 11-2**.

Default value: **(0,0,0,0,0)**

19.24.2 CM Server Parameters

log_dir

Parameter description: Specifies the directory where CM Server logs are stored. The value can be an absolute path, or relative to the CM Server data directory.

Value range: a string Any modification of this parameter takes effect only after the CM Server is restarted. For details about how to modify this parameter, see **Table 11-2**.

Default value: **"log"**, indicating that CM Server logs are generated in the CM Server data directory.

log_file_size

Parameter description: Specifies the size of a log file. If a log file exceeds the specified size, a new one is created to record log information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: an integer ranging from 0 to 2047. The unit is MB. For details about how to modify this parameter, see **Table 11-2**.

Default value: **16MB**

log_min_messages

Parameter description: Specifies the level of messages to be written to the CM Server log. A higher level covers the messages of all the lower levels. The lower the level is, the fewer messages will be written into the log.

Value range: enumerated type. Valid values are **debug5**, **debug1**, **log**, **warning**, **error**, and **fatal**. For details about how to modify this parameter, see **Table 11-2**.

Default value: **warning**

thread_count

Parameter description: Specifies the number of threads in the CM Server thread pool. If the value is greater than the sum of the number of cluster nodes and the number of threads for processing cm_ctl requests (if the number of cluster nodes is less than 32, one thread is used by default; otherwise, four threads are used), the value that takes effect is the sum of the number of cluster nodes and the number of threads for processing cm_ctl requests.

Value range: an integer ranging from 2 to 1000. Any modification of this parameter takes effect only after the CM Server is restarted. For details about how to modify this parameter, see **Table 11-2**.

Default value: 1000

alarm_component

Parameter description: Specifies the location of the alarm component that processes alarms.

Value range: a string For details about how to modify this parameter, see **Table 11-2**.

- If **--alarm-type** in the **gs_preinstall** script is set to **5**, no third-party component is connected and alarms are written into the **system_alarm** log. In this case, the value of **alarm_component** is **/opt/huawei/snas/bin/snas_cm_cmd**.
- If **--alarm-type** in the **gs_preinstall** script is set to **1**, a third-party component is connected. In this case, the value of **alarm_component** is the absolute path of the executable program of the third-party component.

Default value: **/opt/huawei/snas/bin/snas_cm_cmd**

instance_failover_delay_timeout

Parameter description: Specifies the delay in the CM Server failover when the primary CM Server breakdown is detected.

Value range: an integer. The unit is s. For details about how to modify this parameter, see **Table 11-2**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **0**

instance_heartbeat_timeout

Parameter description: Specifies the time to wait before the instance heartbeat times out.

Value range: an integer. The unit is s. For details about how to modify this parameter, see **Table 11-2**.

Default value: **6**

coordinator_heartbeat_timeout

Parameter description: Specifies the heartbeat timeout that triggers the automatic removal of faulty CNs. The setting of this parameter takes effect immediately, and you do not need to restart CM Server. If this parameter is set to **0**, faulty CNs are not automatically removed.

Value range: an integer. The unit is s. For details about how to modify this parameter, see **Table 11-2**.

Default value: 25

cmserver_ha_connect_timeout

Parameter description: Specifies the time to wait before the connection between the primary and standby CM Servers times out.

Value range: an integer. The unit is s. For details about how to modify this parameter, see **Table 11-2**.

Default value: **2**

cmserver_ha_heartbeat_timeout

Parameter description: Specifies the time to wait before the heartbeat between the primary and standby CM Servers times out.

Value range: an integer. The unit is s. For details about how to modify this parameter, see **Table 11-2**.

Default value: **6**

phony_dead_effective_time

Parameter description: Specifies the maximum number of times CN, DN, or GTM processes are detected as zombie. If the number of times a process is detected as zombie is greater than the specified value, the process is considered as a zombie process and will be restarted.

Value range: an integer. For details about how to modify this parameter, see **Table 11-2**.

Default value: **5**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_transaction_read_only

Parameter description: Specifies whether to enable the automatic threshold detection function of the CM Server disk. After this function is enabled, CM Server automatically sets the database to read-only when the disk usage is greater than the value of **datastorage_threshold_value_check**.

Value range: Boolean values **on**, **off**, **true**, **false**, **yes**, **no**, **1**, and **0** For details about how to modify this parameter, see **Table 11-2**.

Default value: **on**

datastorage_threshold_check_interval

Parameter description: Specifies the interval for checking the disk usage. The system checks the disk usage at the interval specified by the user.

Value range: an integer. The unit is s. For details about how to modify this parameter, see **Table 11-2**.

Default value: **10**

datastorage_threshold_value_check

Parameter description: Specifies the usage threshold of a read-only disk in a database. When the disk usage of the data directory exceeds the specified value, the database is automatically set to read-only.

Value range: an integer ranging from 1 to 99, in percentage. For details about how to modify this parameter, see **Table 11-2**.

Default value: **85**

max_datastorage_threshold_check

Parameter description: Specifies the maximum interval for checking the disk usage. After you modify the **enable_transaction_read_only** parameter, the system automatically checks whether the disk usage reaches the threshold at the specified interval.

Value range: an integer. The unit is s. For details about how to modify this parameter, see **Table 11-2**.

Default value: **43200**

cmserver_ha_status_interval

Parameter description: Specifies the interval between synchronizations of primary and standby CM Server status.

Value range: an integer. The unit is s. For details about how to modify this parameter, see **Table 11-2**.

Default value: **1**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

cmserver_self_vote_timeout

Parameter description: Specifies the time to wait before the CM Server self-voting times out.

Value range: an integer. The unit is s. For details about how to modify this parameter, see **Table 11-2**.

Default value: **6**

alarm_report_interval

Parameter description: Specifies the interval at which an alarm is reported.

Value range: a non-negative integer (unit: s) For details about how to modify this parameter, see **Table 11-2**.

Default value: **3**

alarm_report_max_count

Parameter description: Specifies the maximum number of times an alarm is reported.

Value range: a non-negative integer For details about how to modify this parameter, see **Table 11-2**.

Default value: **1**

enable_az_auto_switchover

Parameter description: Specifies whether to enable automatic AZ switchover. If it is set to **1**, CM Server automatically switches over services among AZs. Otherwise, when a DN is faulty, services will not be automatically switched to another AZ even if the current AZ is unavailable. You can run the switchover command to manually switch services to another AZ.

Value range: a non-negative integer. The value **0** indicates that automatic AZ switchover is disabled, and the value **1** indicates that automatic AZ switchover is enabled. For details about how to modify this parameter, see **Table 11-2**.

Default value: **1**

instance_keep_heartbeat_timeout

Parameter description: The CM Agent periodically checks the instance status and reports the status to the CM Server. If the instance status cannot be detected for a long time and the accumulated number of times exceeds the value of this parameter, the CM Server delivers a command to the CM Agent to restart the instance.

Value range: an integer. The unit is s. For details about how to modify this parameter, see **Table 11-2**.

Default value: **40**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

az_switchover_threshold

Parameter description: If the failure rate of a DN shard in an AZ (Number of faulty DN shards/Total number of DN shards x 100%) exceeds the specified value, automatic AZ switchover is triggered.

Value range: an integer ranging from 0 to 100 For details about how to modify this parameter, see **Table 11-2**.

Default value: **100**

az_check_and_arbitrate_interval

Parameter description: Specifies the interval for checking the AZ status. If the status of an AZ is abnormal, automatic AZ switchover is triggered.

Value range: an integer. The unit is s. For details about how to modify this parameter, see **Table 11-2**.

Default value: **2**

az_connect_check_interval

Parameter description: Specifies the interval at which the network connection between AZs is checked.

Value range: an integer. The unit is s. For details about how to modify this parameter, see **Table 11-2**.

Default value: **60**

az_connect_check_delay_time

Parameter description: Specifies the delay between two retries to check the network connection between AZs.

Value range: an integer. The unit is s. For details about how to modify this parameter, see **Table 11-2**.

Default value: **150**

cmserver_demote_delay_on_etcd_fault

Parameter description: Specifies the interval at which CM Server switches from the primary state to the standby state due to unhealthy etcd.

Value range: an integer. The unit is s. For details about how to modify this parameter, see **Table 11-2**.

Default value: **8**

instance_phony_dead_restart_interval

Parameter description: Specifies the interval at which the CM Agent process restarts and kills a zombie CN, DN, or GTM instance. The interval between two consecutive kill operations cannot be less than the value of this parameter. Otherwise, the CM Agent process does not deliver commands.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: an integer ranging from 1800 to 2^{31} – 1. The unit is second. For details about how to modify this parameter, see **Table 11-2**.

Default value: 21600

cm_auth_method

Parameter description: Specifies the port authentication mode of the CM. **trust** indicates that port authentication is not configured. **gss** indicates that Kerberos port authentication is used. Note that you can change the value to **gss** only after the Kerberos server and client are successfully installed. Otherwise, the CM cannot communicate properly, affecting the cluster status.

Value range: **gss** or **trust**. For details about how to modify this parameter, see **Table 11-2**.

Default value: **trust**

cm_krb_server_keyfile

Parameter description: Specifies the location of the key file on the Kerberos server. The value must be an absolute path. The file is usually stored in the *${GAUSSHOME}*/**kerberos** directory and ends with keytab. The file name is the same as the name of the user who runs the cluster. This parameter is used together with **cm_auth_method**. If the **cm_auth_method** parameter is changed to **gss**, **cm_krb_server_keyfile** must also be configured as the correct path. Otherwise, the cluster status will be affected.

Value range: a string. For details about how to modify the parameter, see **Table 11-2**.

Default value: *${GAUSSHOME}*/**kerberos/***{Username}*.**keytab**. The default value cannot take effect and is used only as a prompt.

cm_server_arbitrate_delay_base_time_out

Parameter description: Specifies the basic delay duration for CM Server arbitration. If the primary CM Server is disconnected, the arbitration starts to be timed. If the disconnection duration exceeds the arbitration delay duration, a new primary CM Server will be selected. The arbitration delay duration is determined by the basic delay duration, the node index (server ID), and the incremental delay duration. The formula is as follows: Arbitration delay duration = Basic delay duration + Node index x Incremental delay duration

Value range: an integer. The unit is s. The index should be larger than 0. For details about how to modify this parameter, see **Table 11-2**.

Default value: **10**

cm_server_arbitrate_delay_incrememtal_time_out

Parameter description: Specifies the incremental delay duration for CM Server arbitration. If the primary CM Server is disconnected, the arbitration starts to be timed. If the disconnection duration exceeds the arbitration delay duration, a new primary CM Server will be selected. The arbitration delay duration is determined by the basic delay duration, the node index (server ID), and the incremental delay

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

duration. The formula is as follows: Arbitration delay duration = Basic delay duration + Node index x Incremental delay duration

Value range: an integer. The unit is s. The index should be larger than 0. For details about how to modify this parameter, see **Table 11-2**.

Default value: **3**

force_promote

Parameter description: Specifies whether CM Server enables the forcible startup logic (that is, when the cluster status is unknown, ensure that the basic functions of the cluster are available at the cost of partial data loss). The value **0** indicates that forcible startup is disabled, and the value **1** indicates that forcible startup is enabled. This parameter applies to CNs and DNs.

Value range: 0 or **1**. For details about how to modify this parameter, see **Table 11-2**.

Default value: **0**

switch_rto

Parameter description: Specifies the delay for the forcible startup of CM Server. When **force_promote** is set to **1** and a shard in the cluster does not have primary CM Server, the system starts timing. After the delay, the forcible startup logic starts to be executed.

Value range: an integer ranging from 0 to 2147483647. The unit is second. The minimum value that takes effect is 60. If this parameter is set to a value less than 60, 60s is used. For details about how to modify this parameter, see **Table 11-2**.

Default value: **600**

backup_open

Parameter description: Specifies whether to enable the DR cluster. After the DR cluster is enabled, the CM runs in DR cluster mode.

Value range: an integer, **0** or **1**. Any modification of this parameter takes effect only after the CM Server is restarted. This parameter cannot be enabled for non-DR clusters. For details about how to modify this parameter, see **Table 11-2**.

- **0**: disabled.
- **1**: enabled.

Default value: **0**

enable_e2e_rto

Parameter description: Specifies whether to enable the E2E RTO function. After this function is enabled, the hang-up detection period and network detection timeout time are shortened. The CM can reach the E2E RTO indicator (RTO for a single instance ≤ 10s; RTO for combined faults ≤ 30s).

Value range: an integer, **0** or **1**. The value **1** indicates enabled, while the value **0** indicates disabled. For details about how to modify this parameter, see **Table 11-2**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value:

Independent deployment: **1**

cluster_starting_aribt_delay

Parameter description: Specifies the time that CM Server waits for the static primary DN to be promoted to primary during cluster startup.

Value range: an integer. The unit is s. For details about how to modify this parameter, see **Table 11-2**.

Default value: **180**

enable_dcf

Parameter description: Specifies the status of the DCF mode.

Value range: Boolean Any modification of this parameter takes effect only after the CM Server is restarted. For details about how to modify this parameter, see **Table 11-2**.

- **0**: disabled.
- **1**: enabled.

Default value: **off**

ddb_type

Parameter description: Specifies whether to switch between ETCD and DCC modes.

Value range: an integer. **0**: ETCD; **1**: DCC. Any modification of this parameter takes effect only after the CM Server is restarted. For details about how to modify this parameter, see **Table 11-2**.

Default value: **0**

enable_ssl

Parameter description: Specifies whether to enable SSL.

Value range: Boolean After this function is enabled, the SSL certificate is used to encrypt communication. Any modification of this parameter takes effect only after a restart. For details about how to modify this parameter, see **Table 11-2**.

Default value:

- **on** indicates that SSL is enabled.
- **off** indicates that SSL is disabled.
- **Default value**: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

To ensure security, you are not advised to disable it. After this function is disabled, the CM does not use encrypted communication and all information is transmitted in plaintext, which may bring security risks such as eavesdropping, tampering, and spoofing.

ssl_cert_expire_alert_threshold

Parameter description: Specifies the SSL certificate expiration alerting time.

Value range: an integer. The unit is day. If the certificate expiration time is less than the value of this parameter, an alarm indicating that the certificate is about to expire is reported. Any modification of this parameter takes effect only after a restart. For details about how to modify this parameter, see **Table 11-2**.

Default value: **90**

ssl_cert_expire_check_interval

Parameter description: Specifies the period for checking whether the SSL certificate expires.

Value range: an integer. The unit is s. Any modification of this parameter takes effect only after a restart. For details about how to modify this parameter, see **Table 11-2**.

Default value: **86400**

ddb_log_level

Parameter description: Sets the DDB log level.

To disable the log function, set this parameter to **NONE**, which cannot be used together with the following log levels:

To enable the log function, set this parameter to one or a combination of the following log levels: **RUN_ERR|RUN_WAR|RUN_INF|DEBUG_ERR|DEBUG_WAR|DEBUG_INF|TRACE|PROFILE|OPER**. If two or more log levels are used together, separate them with vertical bars (|). The log level cannot be set to an empty string.

Value range: a string containing one or a combination of the following log levels: **RUN_ERR|RUN_WAR|RUN_INF|DEBUG_ERR|DEBUG_WAR|DEBUG_INF|TRACE|PROFILE|OPER**. For details about how to modify this parameter, see **Table 11-2**.

Default value: **RUN_ERR|RUN_WAR|DEBUG_ERR|OPER|RUN_INF|PROFILE**

ddb_log_backup_file_count

Parameter description: Specifies the maximum number of log files that can be saved.

Value range: an integer, in the range [1,100]. For details about how to modify this parameter, see **Table 11-2**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **10**

ddb_max_log_file_size

Parameter description: Specifies the maximum number of bytes in a log.

Value range: a string, in the range [1MB,1000MB]. For details about how to modify this parameter, see **Table 11-2**.

Default value: **10MB**

ddb_log_suppress_enable

Parameter description: Specifies whether to enable the log suppression function.

Value range: an integer. **0**: disabled; **1**: enabled. For details about how to modify this parameter, see **Table 11-2**.

Default value: **1**

ddb_election_timeout

Parameter description: Specifies the DCC election timeout period.

Value range: an integer, in the range [1,600], in seconds. For details about how to modify this parameter, see **Table 11-2**.

Default value: **3**

delay_arbitrate_timeout

Parameter description: Specifies the waiting time for a node in the same AZ as the primary DN to be promoted to primary after redo replay.

Value range: an integer, in the range [0,21474836] (unit: second). For details about how to modify this parameter, see **Table 11-2**.

Default value: **0**

install_type

Parameter description: Specifies the settings related to the DR cluster to distinguish the cluster type.

Value range: an integer ranging from 0 to 2 Any modification of this parameter takes effect only after the CM Server is restarted. This parameter cannot be enabled for non-DR clusters. For details about how to modify this parameter, see **Table 11-1**.

Default value: **0**

- **0** indicates the cluster for which no DR relationship is established.
- **1** indicates a Dorado-based cluster.
- **2** indicates a streaming-based cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

19.25 GTM Parameters

GTM parameters can be set in the **gtm.conf** file or using gs_guc.

nodename

Parameter description: Specifies the name of the primary or standby GTM.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string, which complies with the identifier naming convention

Default value: **NULL**

port

Parameter description: Specifies the host port number listened by the primary or standby GTM.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647. The recommended value range is 1024 to 65535.

Default value: **6666**

log_file

Parameter description: Specifies a log file name.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string, which complies with the identifier naming convention

Default value: **gtm-***%Y-%m-%d_%H%M%S*.**log**

active_host

Parameter description: Specifies the IP address of a target GTM. For the primary GTM, it is the IP address of the standby GTM; for the standby GTM, it is the IP address of the primary GTM.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string, which complies with the identifier naming convention

Default value: **NULL**

local_host

Parameter description: Specifies the HA local address. Set this parameter based on the cluster configuration file. You do not need to manually set this parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string, which complies with the identifier naming convention.

Default value: **NULL**

active_port

Parameter description: Specifies the port number of the target GTM server.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647. The recommended value range is 1024 to 65535.

NOTE

This parameter is specified in the configuration file during installation. Do not modify this parameter unless absolutely necessary. Otherwise, database communication will be affected.

Default value: **0**

local_port

Parameter description: Specifies the local port for HA.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647. The recommended value range is 1024 to 65535.

NOTE

This parameter is specified in the configuration file during installation. Do not modify this parameter unless absolutely necessary. Otherwise, database communication will be affected.

Default value: **0**

standby_connection_timeout

Parameter description: Specifies the timeout interval between the primary and standby GTMs. A larger value enhances the fault tolerance capability of the network between the primary and standby GTMs, but increases the duration for reporting disconnection between them.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 5 to 2147483647. The unit is s.

Default value: **5**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

keepalives_count

Parameter description: Specifies the number of keepalived signals that can be waited before the GTM server is disconnected from the client if the OS supports the **TCP_KEEPCNT** socket parameter. This parameter takes effect only on the standby GTM.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647

Default value: **0**, indicating that the connection is immediately broken if no keepalived signal from the client is received by the GTM.

keepalives_idle

Parameter description: Specifies the interval for sending keepalived signals.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647. The unit is s.

Default value: **0**

keepalives_interval

Parameter description: Specifies the response time before retransmission on an OS that supports the **TCP_KEEPINTVL** socket option.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647. The unit is s.

Default value: **0**

synchronous_backup

Parameter description: Specifies whether to enable synchronization for backing up data to the standby GTM.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: **off**, **on**, or **auto**

- **on**: Synchronization is enabled.
- **off**: Synchronization is disabled.
- **auto**: Automatic synchronization is enabled.

Default value: **auto**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

query_memory_limit

Parameter description: Specifies the limit of memory available for queries. This parameter applies only to the default resource group. For other resource groups, the memory available for queries is not limited.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a floating point number ranging from **0.0** to **1.0**

Default value: **0.25**

wlm_max_mem

Parameter description: Specifies the maximum memory for GTM execution.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 512 to 2147483647. The unit is MB.

Default value: **2048**

config_file

Parameter description: Specifies the name of a GTM configuration file. Only the sysadmin user can access this parameter.

Value range: a string Set it based on instructions provided in **Table 11-1**.

Default value: **gtm.conf**

data_dir

Parameter description: Specifies the GTM data file directory.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value: **NULL**

listen_addresses

Parameter description: Specifies the TCP/IP address of the client for a server to listen on.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range:

- Host name or IP address. Multiple values are separated with commas (,).
- An asterisk (*), indicating all IP addresses.
- If the parameter is not specified, the server does not listen on any IP address. In this case, only Unix domain sockets can be used for database connections.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: *

log_directory

Parameter description: Specifies the directory for storing log files when **logging_collector** is set to **on**. The value can be an absolute path, or relative to the data directory.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

- If the value of **log_directory** in the configuration file is an invalid path (that is, the user does not have the permission to read or write this path), the cluster cannot be restarted.
- If the value of **log_directory** is changed to a valid path (that is, the user has the permission to read and write this path), logs are generated in the new path. If the specified path is invalid, log files are generated in the last valid path and the database running is not affected. The invalid value is still written into the configuration file.

Value range: a string

Default value: **gtm_log**, indicating that server logs will be generated in the **gtm_log/** directory under the data directory.

log_min_messages

Parameter description: Specifies which level of messages will be written into server logs. Each level covers all the levels following it. The lower the level is, the fewer messages will be written into the log.

NOTICE

If the values of **client_min_messages** and **log_min_messages** are the same, they indicate different levels.

Valid values: enumerated values. Valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal**, and **panic**. For details about the parameters, see **Table 19-2**.

Default value: **warning**

alarm_component

Parameter description: Certain alarms are suppressed during alarm reporting. That is, the same alarm will not be repeatedly reported by an instance within the period specified by **alarm_report_interval**. Its default value is **10s**. In this case, the parameter specifies the location of the alarm component that is used to process alarm information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

- If **--alarm-type** in the **gs_preinstall** script is set to **5**, no third-party component is connected and alarms are written into the **system_alarm** log. In this case, the value of **alarm_component** is **/opt/huawei/snas/bin/snas_cm_cmd**.
- If **--alarm-type** in the **gs_preinstall** script is set to **1**, a third-party component is connected. In this case, the value of **alarm_component** is the absolute path of the executable program of the third-party component.

Default value: **/opt/huawei/snas/bin/snas_cm_cmd**

alarm_report_interval

Parameter description: Specifies the interval at which an alarm is reported.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a non-negative integer (unit: s)

Default value: 10

standby_only

Parameter description: Specifies whether to forcibly synchronize information to standby nodes. In one primary+multiple standbys mode, information is only forcibly synchronized to the ETCD.

Value range: **0** or **1**. Set this parameter based on instructions provided in **Table 11-1**.

- **0**: Information is not forcibly synchronized to standby nodes.
- **1**: Information is forcibly synchronized to standby nodes.

Default value: **0**

gtm_max_trans

Parameter description: Specifies the maximum number of connections accepted by the GTM. You are not advised to change the value. If you have to, set this parameter to a value no less than the maximum number of connections plus 100.

Value range: an integer ranging from 256 to 200000. Set it based on instructions provided in **Table 11-1**.

Default value: **8192**

enable_connect_control

Parameter description: Specifies whether the GTM verifies that a connection IP address is within the cluster.

Value range: Boolean. Set it based on instructions provided in **Table 11-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **true**: The GTM checks whether a connection IP address is within the cluster. If it is not, the access is rejected.
- **false**: The GTM does not check whether a connection IP address is within the cluster.

Default value: **true**

gtm_authentication_type

Parameter description: Specifies the port authentication mode of the GTM. **trust** indicates that port authentication is not configured. **gss** indicates that Kerberos port authentication is used. Note that you can change the value to **gss** only after the Kerberos server and client are successfully installed. Otherwise, the GTM cannot communicate properly, affecting the cluster status.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: **gss** or **trust**.

Default value: **trust**

gtm_krb_server_keyfile

Parameter description: Specifies the location of the key file on the Kerberos server. The value must be an absolute path. The file is usually stored in the *${GAUSSHOME}*/**kerberos** directory and ends with keytab. The file name is the same as the name of the user who runs the cluster. This parameter is used together with **gtm_authentication_type**. If **gtm_authentication_type** is changed to **gss**, **gtm_krb_server_keyfile** must be configured as the correct path. Otherwise, the cluster status will be affected.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value: **''**

gtm_option

Parameter description: Specifies the GTM mode, which must be set to the same value on all GTMs, CNs, and DNs. There are three GTM modes: GTM, GTM-Lite, and GTM-FREE. For details, see **GTM Modes**. The GTM and GTM-Lite modes take effect only when the **enable_gtm_free** parameter is set to **off**. The current version does not support switching between different GTM modes for installed clusters.

Value range: an integer ranging from 0 to 2. The value **0** indicates the GTM mode, the value **1** indicates the GTM-Lite mode, and the value **2** indicates the GTM-FREE mode. Set it based on instructions provided in **Table 11-1**.

Default value: **1**

csn_sync_interval

Parameter description: Specifies the interval for synchronizing CSN between the primary and standby GTMs, in unit of s.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: an integer ranging from 1 to 2147483647. Set it based on instructions provided in **Table 11-1**.

Default value: **1**

restore_duration

Parameter description: Specifies the pre-allocation interval of XID or CSN on the GTM.

Value range: an integer ranging from 1000000 to 2147483647. Set it based on instructions provided in **Table 11-1**.

Default value: **1000000**

gtm_enable_threadpool

Parameter description: Specifies whether to enable the GTM thread pool function. The setting takes effect only after the GTM is restarted.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

Default value: **true**

gtm_num_threads

Parameter description: Specifies the number of work threads in the thread pool when the thread pool function **gtm_enable_threadpool** is enabled.

The value is related to the size of **gtm_max_trans** and cannot exceed the result of (Value of **gtm_max_trans** – 1 – Number of auxiliary threads). The number of auxiliary threads is **2** in the current version.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 16384

Default value: **1024**

19.26 Upgrade Parameters

IsInplaceUpgrade

Parameter description: Specifies whether an upgrade is ongoing. This parameter is an upgrade parameter and cannot be modified. Only the sysadmin user can access the parameter.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on** indicates an upgrade is ongoing.
- **off** indicates no upgrade is ongoing.

Default value: **off**

inplace_upgrade_next_system_object_oids

Parameter description: Indicates the OID of a new system object during the in-place upgrade. This parameter is used for upgrade and cannot be modified by users.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value: empty

upgrade_mode

Parameter description: Specifies the upgrade mode. This parameter is used for upgrade. You are advised not to modify it.

This parameter is a fixed INTERNAL parameter and cannot be modified.

Value range: an integer ranging from 0 to 2147483647

- **0**: indicates that the local upgrade and the minor version gray upgrade are not in progress.
- **1**: indicates that the upgrade is in progress. The upgrade command is executed and takes effect after the check is completed.
- **2**: indicates that the major version gray upgrade is in progress. The upgrade command is executed and takes effect after the check is completed.

Default value: **0**

NOTE

Execute the precommand on new packages, switch to the cluster user, and use the **source** command to invalidate environment variables. Run the **gs_upgradectl -t chose-strategy** command to check whether the upgrade is a major version upgrade or minor version upgrade.

If "Upgrade strategy: large-binary-upgrade" is returned, the major version is upgraded.

If "Upgrade strategy: small-binary-upgrade" is returned, the minor version is upgraded.

19.27 Miscellaneous Parameters

server_version

Parameter description: Specifies the server version number.

This parameter is a fixed INTERNAL parameter and cannot be modified. This parameter is inherited from the PostgreSQL kernel, indicating that the current database kernel is compatible with PostgreSQL's **server_version**. This parameter is reserved to ensure the ecosystem compatibility of the northbound external tool

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

APIs (which will be queried when the tool is connected). This parameter is not recommended. You can use the **opengauss_version()** function to obtain the kernel version.

Value range: a string

Default value: **9.2.4**

server_version_num

Parameter description: Specifies the server version number.

This parameter is a fixed INTERNAL parameter and cannot be modified. This parameter is inherited from the PostgreSQL kernel, indicating that the current database kernel is compatible with PostgreSQL's **server_version_num**. This parameter is reserved to ensure the ecosystem compatibility of the northbound external tool APIs (which will be queried when the tool is connected).

Value range: an integer

Default value: **90204**

block_size

Parameter description: Specifies the block size of the current database.

This parameter is a fixed INTERNAL parameter and cannot be modified. This parameter is inherited from the PostgreSQL kernel, indicating that the current database kernel is compatible with PostgreSQL's **server_version_num**. This parameter is reserved to ensure the ecosystem compatibility of the northbound external tool APIs.

Default value: **8192**

segment_size

Parameter description: Specifies the segment file size of the current database.

This parameter is a fixed INTERNAL parameter and cannot be modified.

Default value: **1 GB**

max_index_keys

Parameter description: Specifies the maximum number of index keys supported by the current database.

This parameter is a fixed INTERNAL parameter and cannot be modified.

Default value: **32**

integer_datetimes

Parameter description: Specifies whether the date and time are in the 64-bit integer format.

This parameter is a fixed INTERNAL parameter and cannot be modified.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: Boolean

- **on** indicates that the 64-bit integer format is used.
- **off** indicates that the 64-bit integer format is not used.

Default value: **on**

enable_cluster_resize

Parameter description: If an SQL statement involves tables belonging to different groups, you can enable this parameter to push the execution plan of the statement to improve performance.

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the execution plan of the statement can be pushed.
- **off** indicates that the execution plan of the statement cannot be pushed.

Default value: **off**

NOTE

This parameter is used for internal O&M. Do not set it to **on** unless absolutely necessary.

lc_collate

Parameter description: Specifies the locale in which sorting of textual data is done.

This parameter is a fixed INTERNAL parameter and cannot be modified.

Default value: Determined by the configuration set during the cluster installation and deployment.

lc_ctype

Parameter description: Specifies the locale that determines character classifications. For example, it specifies what a letter and its upper-case equivalent are.

This parameter is a fixed INTERNAL parameter and cannot be modified.

Default value: Determined by the configuration set during the cluster installation and deployment.

max_identifier_length

Parameter description: Specifies the maximum identifier length.

This parameter is a fixed INTERNAL parameter and cannot be modified.

Value range: an integer

Default value: **63**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

server_encoding

Parameter description: Specifies the database encoding (character set).

This parameter is a fixed INTERNAL parameter and cannot be modified.

Default value: Determined when the database is created.

enable_upgrade_merge_lock_mode

Parameter description: If this parameter is set to **on**, the delta merge operation internally increases the lock level, and errors can be prevented when update and delete operations are performed at the same time.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- If this parameter is set to **on**, the delta merge operation internally increases the lock level. In this way, when the **DELTAMERGE** operation is concurrently performed with the **UPDATE** or **DELETE** operation, one operation can be performed only after the previous one is complete.
- If this parameter is set to **off** and the **DELTAMERGE** operation is concurrently performed with the **UPDATE** or **DELETE** operation to the data in a row in the delta table of the table, errors will be reported during the later operation, and the operation will stop.

Default value: **off**

transparent_encrypted_string

Parameter description: Specifies a sample string that is transparently encrypted. Its value is generated by encrypting **TRANS_ENCRYPT_SAMPLE_STRING** using a database secret key. The ciphertext is used to check whether the DEK obtained during secondary startup is correct. If the DEK is incorrect, CNs and DNs reject the startup. This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**. This parameter applies only to the DWS scenario in the current version.

Value range: a string. An empty string indicates that the entire cluster is encrypted.

Default value: empty

NOTE

Do not set this parameter manually. Otherwise, the cluster may become faulty.

transparent_encrypt_kms_url

Parameter description: Specifies the URL for obtaining the database secret key to be transparently encrypted. It must contain only the characters specified in RFC3986, and the maximum length is 2047 bytes. The format is **kms://** *Protocol*@*KMS host name 1*;*KMS host name 2*:*KMS port number*/**kms**, for example, **kms://https@linux175:29800/**. This parameter applies only to the DWS scenario in the current version.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value: empty

transparent_encrypt_kms_region

Parameter description: Specifies the deployment region of the entire cluster. It must contain only the characters specified in RFC 3986, and the maximum length is 2,047 bytes. This parameter applies only to the DWS scenario in the current version.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value: empty

datanode_heartbeat_interval

Parameter description: Specifies the interval at which heartbeat messages are sent between heartbeat threads. You are advised to set this parameter to a value no more than wal_receiver_timeout/2.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1000 to 60000. The unit is ms.

Default value: **1s**

dfs_partition_directory_length

Parameter description: Specifies the maximum directory name length for the partition directory of a table partitioned by VALUE in the HDFS.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: 92 to 7999

Default value: **512**

max_concurrent_autonomous_transactions

Parameter description: Specifies the maximum number of autonomous transaction connections, that is, the maximum number of concurrent autonomous transactions executed at the same time. If this parameter is set to **0**, autonomous transactions cannot be executed.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: 0–1024

Default value: 10

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

mot_config_file

This parameter is unavailable in a distributed system.

19.28 Wait Event

enable_instr_track_wait

Parameter description: Specifies whether to enable real-time collection of wait event information.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the function of collecting wait event information is enabled.
- **off** indicates that the function of collecting wait event information is disabled.

Default value: **on**

19.29 Query

instr_unique_sql_count

Parameter description: Specifies the maximum number of unique SQL records to be collected. The value **0** indicates that the function of collecting Unique SQL information is disabled.

If the value is changed from a larger one to a smaller one, unique SQL statistics will be reset and re-collected (the standby node does not support this function). There is no impact if the value is changed from a smaller one to a larger one.

When the number of unique SQL records generated in the system is greater than the value of **instr_unique_sql_count**, the extra unique SQL records are not collected.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32U 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 3% by enabling or disabling this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647

Default value: **200000**

instr_unique_sql_track_type

Parameter description: Specifies which SQL statements are recorded in unique SQL.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is an INTERNAL parameter. Set it based on instructions provided in Table 11-1.

Value range: enumerated values

top: Only top-level SQL statements are recorded.

Default value: **top**

unique_sql_retention_time

Parameter description: Specifies the memory cleanup interval for the unique SQL hash table. The default value is 30 minutes.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

Value range: an integer ranging from 1 to 3650

Default value: **30min**

enable_instr_rt_percentile

Parameter description: Specifies whether to enable the function of calculating the response time of 80% and 95% SQL statements in the system.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

- **on** indicates that the function of calculating the response time of 80% and 95% SQL statements is enabled.
- **off** indicates that the function of calculating the response time of 80% and 95% SQL statements is disabled.

Default value: **on**

percentile

Parameter description: Specifies the percentage of SQL statements whose response time is to be calculated by the background calculation thread.

This parameter is an INTERNAL parameter. Set it based on instructions provided in Table 11-1.

Value range: a string

Default value: **"80,95"**

instr_rt_percentile_interval

Parameter description: Specifies the interval at which the background calculation thread calculates the SQL response time.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

Value range: an integer ranging from 0 to 3600. The unit is s.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **10s**

enable_instr_cpu_timer

Parameter description: Specifies whether to capture the CPU time consumed during SQL statement execution.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32U 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 3.5% by enabling or disabling this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the CPU time consumed during SQL statement execution is captured.
- **off** indicates that the CPU time consumed during SQL statement execution is not captured.

Default value: **on**

enable_slow_query_log (Discarded)

Parameter description: Specifies whether to write the slow query information to the log file. This parameter is discarded in this version.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on**: indicates that slow query information needs to be written into log files.
- **off**: indicates that slow query information does not need to be written into log files.

Default value: **on**

query_log_file (Discarded)

Parameter description: Specifies the name of a slow query log file on the server. If **enable_slow_query_log** is set to **ON**, slow query records are written into log files. Only the **sysadmin** user can access this parameter. Generally, log file names are generated in strftime mode. Therefore, the system time can be used to define log file names, which are implemented using the escape character %. This function has been discarded in this version.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

You are advised to use escape character % to specify the log file names for efficient management of log files.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string

Default value: slow_query_log-%Y-%m-%d_%H%M%S.log

query_log_directory (Discarded)

Parameter description: Specifies the directory for storing low query log files when **enable_slow_query_log** is set to **on**. Only the **sysadmin** user can access this parameter. It can be an absolute path or a relative path (relative to the data directory), which has been discarded in this version.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

If this parameter is set to an invalid path, the cluster cannot be started.

NOTE

Valid path: You have read and write permissions on the path.

Invalid path: You do not have read or write permission on the path.

Value range: a string

Default value: specified during installation

asp_log_directory

Parameter description: Specifies the directory for storing ASP log files on the server when **asp_flush_mode** is set to **all** or **file**. The value can be an absolute path, or relative to the data directory. Only the **sysadmin** user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

NOTICE

If this parameter is set to an invalid path, the cluster cannot be started.

NOTE

- Valid path: Users have read and write permissions on the path.
- Invalid path: Users do not have read or write permissions on an invalid path.

Value range: a string

Default value: specified during installation

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

perf_directory

Parameter description: Specifies the directory of the output file of the performance view dotting task. Only the **sysadmin** user can access this parameter. The value can be an absolute path, or relative to the data directory.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

NOTE

- Valid path: Users have read and write permissions on the path.
- Invalid path: Users do not have read or write permissions on an invalid path.

Value range: a string

Default value: specified during installation

enable_stmt_track

Parameter description: Specifies whether to enable the full/slow SQL statement feature.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32U 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 1.2% by enabling or disabling this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on**: Full/Slow SQL capture is enabled.
- **off**: Full/Slow SQL capture is disabled.

Default value: **on**

track_stmt_parameter

Parameter description: After **track_stmt_parameter** is enabled, the executed statements recorded in **statement_history** are not normalized. The complete SQL statement information can be displayed to help the database administrator locate faults. For a simple query, the complete statement information is displayed. For a PBE statement, the complete statement information and information about each variable value are displayed. The format is query string; parameters: $1=value1,$2=value2, ... This parameter is used to display full SQL information for users and is not controlled by the **track_activity_query_size** parameter. When the SQL bypass logic is used for PBE statements, parameters are directly delivered to DNs. Therefore, the number of complete statements cannot be obtained by querying **statement_history** on CNs. In addition, DNs do not have query character strings. Therefore, complete statement information cannot be obtained by querying **statement_history** on DNs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-2**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: Boolean

- **on**: The function of displaying complete SQL statement information is enabled.
- **off**: The function of displaying complete SQL statement information is disabled.

Default value: **off**

track_stmt_session_slot

Parameter description: Specifies the maximum number of full/slow SQL statements that can be cached in a session. If the number of full/slow SQL statements exceeds this value, new statements will not be traced until the flush thread flushes the cached statements to the disk to reserve free space.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 2147483647

Default value: 1000

track_stmt_details_size

Parameter description: Specifies the maximum size (in bytes) of execution events that can be collected by a single statement.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 100000000

Default value: **4096**

track_stmt_retention_time

Parameter description: Specifies the retention period of full/slow SQL statement records. This parameter is a combination of parameters. This parameter is read every 60 seconds and records older than the retention period are deleted. Only the **sysadmin** user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

This parameter consists of two parts in the format of 'full sql retention time, slow sql retention time'.

- **full sql retention time** indicates the retention period of full SQL statements. The value ranges from 0 to 86400.
- **slow sql retention time** indicates the retention period of slow SQL statements. The value ranges from 0 to 604800.

Default value: **3600,604800**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

track_stmt_stat_level

Parameter description: Controls the level of statement execution tracing.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1. Letters are case insensitive. If the full SQL function is enabled, the performance will be affected and a large amount of disk space may be occupied.

Value range: a string

This parameter consists of two parts in the format of 'full sql stat level, slow sql stat level'.

- The first part indicates the tracing level of full SQL statements. The value can be **OFF**, **L0**, **L1**, or **L2**.
- The second part indicates the tracing level of slow SQL statements. The value can be **OFF**, **L0**, **L1**, or **L2**.

  NOTE

  If the tracing level of full SQL statements is not **OFF**, the current SQL statement tracing level is the higher level (L2 > L1 > L0) of the full SQL statements and slow SQL statements. For details about the levels, see Table 15-109.

Default value: **OFF,L0**

19.30 System Performance Snapshot

enable_wdr_snapshot

Parameter description: Specifies whether to enable the database monitoring snapshot function.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

- **on** indicates that the database monitoring snapshot function is enabled.
- **off** indicates that the database monitoring snapshot function is disabled.

Default value: **on**

wdr_snapshot_retention_days

Parameter description: Specifies the number of days database monitoring snapshots are retained. If the number of days that the snapshots are retained exceeds the value of this parameter, the system deletes the snapshots with the smallest ID at an interval specified by **wdr_snapshot_interval**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

Value range: an integer ranging from 1 to 8. The unit is day.

Default value: **8**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wdr_snapshot_query_timeout

Parameter description: Specifies the execution timeout for the SQL statements associated with database monitoring snapshot operations. If the SQL statement execution is not complete and a result is not returned within the specified time, the snapshot operation fails.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 100 to 2147483647. The unit is s.

Default value: **100s**

wdr_snapshot_interval

Parameter description: Specifies the interval at which the backend thread Snapshot automatically performs snapshot operations on the database monitoring data.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 10 to 60. The unit is min.

Default value: **1h**

enable_asp

Parameter description: Specifies whether to enable the active session profile function.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on**: The function is enabled.
- **off**: The function is disabled.

Default value: **on**

asp_sample_num

Parameter description: Specifies the maximum number of samples allowed in the LOCAL_ACTIVE_SESSION view. Only the sysadmin user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 10000 to 100000

Default value: **100000**

asp_sample_interval

Parameter description: Specifies the sampling interval.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

Value range: an integer ranging from 1 to 10. The unit is s.

Default value: **1s**

asp_flush_rate

Parameter description: When the number of samples reaches the value of **asp_sample_num**, the samples in the memory are updated to the disk based on a certain proportion. **asp_flush_rate** indicates the update proportion. If this parameter is set to **10**, it indicates that the update ratio is 10:1.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

Value range: an integer ranging from 1 to 10

Default value: **10**

asp_flush_mode

Parameter description: Specifies the mode for the ASP to update data to the disk. The value can be **file** (default value), **table** (system catalog), or **all** (system catalog and file). Only the sysadmin user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

Value range: a string, which can be **table**, **file**, or **all**

Default value: **table**

asp_retention_days

Parameter description: Specifies the maximum number of days for reserving ASP samples when they are written to the system catalog.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

Value range: an integer ranging from 1 to 7. The unit is day.

Default value: **2**

asp_log_filename

Parameter description: Specifies the file name format when writing files using ASP. Only the sysadmin user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

Value range: a string

Default value: **asp-%Y-%m-%d_%H%M%S.log**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

19.31 Security Configuration

enable_security_policy

Parameter description: Specifies whether the unified audit and dynamic data masking policies take effect.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

on: The security policy is enabled.

off: The security policy is disabled.

Default value: **off**

use_elastic_search

Parameter description: Specifies whether to send unified audit logs to Elasticsearch. If **enable_security_policy** and this parameter are enabled, unified audit logs are sent to Elasticsearch through HTTP or HTTPS (used by default). After this parameter is enabled, ensure that the Elasticsearch service corresponding to **elastic_search_ip_addr** can be properly connected. Otherwise, the process fails to be started.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

on: Unified audit logs are sent to Elasticsearch.

off: Unified audit logs are not sent to Elasticsearch.

Default value: **off**

elastic_search_ip_addr

Parameter description: Specifies the IP address of the Elasticsearch system.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value: **'https:127.0.0.1'**

is_sysadmin

Parameter description: Specifies whether the current user is an initial user.

This parameter is a fixed INTERNAL parameter and cannot be modified.

Value range: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

on indicates that the user is an initial user.

off indicates that the user is not an initial user.

Default value: **off**

enable_tde

Parameter description: Specifies whether to enable the TDE function. Set this parameter to **on** before creating an encrypted table. If this parameter is set to **off**, new encrypted tables cannot be created. The created encrypted table is decrypted only when data is read and is not encrypted when the data is written.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

on: The TDE function is enabled.

off: The TDE function is disabled.

Default value: **off**

tde_cmk_id

Parameter description: Specifies the CMK ID of the cluster used by the TDE function. The ID is generated by KMS. The CMK of the cluster is used to encrypt the DEK. When the DEK needs to be decrypted, a request packet needs to be sent to KMS. The DEK ciphertext and the ID of the corresponding CMK are sent to KMS.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string

Default value: **""**

19.32 HyperLogLog

hll_default_log2m

Parameter description: Specifies the number of buckets for HLL data. The number of buckets affects the precision of distinct values calculated by HLL. The more buckets there are, the smaller the deviation is. The deviation range is as follows: $[-1.04/2^{log2m*1/2}, +1.04/2^{log2m*1/2}]$

This parameter is a **USERSET** parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 10 to 16

Default value: **14**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

hll_default_log2explicit

Parameter description: Specifies the default threshold for switching from the explicit mode to the sparse mode.

This parameter is a **USERSET** parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 12 The value **0** indicates that the explicit mode is skipped. The value 1 to 12 indicates that the mode is switched when the number of distinct values reaches $2^{hll\_default\_log2explicit}$.

Default value: **10**

hll_default_log2sparse

Parameter description: Specifies the default threshold for switching from the **sparse** mode to the **full** mode.

This parameter is a **USERSET** parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 to 14 The value **0** indicates that the explicit mode is skipped. The value 1 to 14 indicates that the mode is switched when the number of distinct values reaches $2^{hll\_default\_log2sparse}$.

Default value: **12**

hll_duplicate_check

Parameter description: Specifies whether duplicatecheck is enabled by default.

This parameter is a **USERSET** parameter. Set it based on instructions provided in **Table 11-1**.

Value range: **0** or **1** **0**: disabled; **1**: enabled

Default value: **0**

hll_default_regwidth (Discarded)

Parameter description: Specifies the number of bits in each bucket for HLL data. A larger value indicates more memory occupied by HLL. **hll_default_regwidth** and **hll_default_log2m** determine the maximum number of distinct values that can be calculated by HLL. Currently, **regwidth** is set to a fixed value and is no longer used.

This parameter is a **USERSET** parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 1 to 5

Default value: **5**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

hll_default_expthresh (Discarded)

Parameter description: Specifies the default threshold for switching from the **explicit** mode to the **sparse** mode. Currently, the **hll_default_log2explicit** parameter is used to replace the similar function.

This parameter is a **USERSET** parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from –1 to 7 **–1** indicates the auto mode; **0** indicates that the **explicit** mode is skipped; a value from 1 to 7 indicates that the mode is switched when the number of distinct values reaches $2^{hll\_default\_expthresh}$.

Default value: **–1**

hll_default_sparseon (Discarded)

Parameter description: Specifies whether to enable the **sparse** mode by default. Currently, the **hll_default_log2sparse** parameter is used to replace the similar function. When **hll_default_log2sparse** is set to **0**, the **sparse** mode is disabled.

This parameter is a **USERSET** parameter. Set it based on instructions provided in **Table 11-1**.

Value range: **0** or **1** **0** indicates that the **sparse** mode is disabled by default. **1** indicates that the **sparse** mode is enabled by default.

Default value: **1**

hll_max_sparse (Discarded)

Parameter description: Specifies the size of **max_sparse**. Currently, the **hll_default_log2sparse** parameter is used to replace the similar function.

This parameter is a **USERSET** parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from –1 to 2147483647

Default value: **–1**

enable_compress_hll (Discarded)

Parameter description: Specifies whether to enable memory optimization for HLL. Currently, the HLL memory has been optimized, and this parameter is no longer used.

This parameter is a **USERSET** parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** or **true** indicates that memory optimization is enabled.
- **off** or **false** indicates that memory optimization is disabled.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

19.33 User-defined Functions

udf_memory_limit

Parameter description: Specifies the maximum physical memory that can be used when CNs and DNs execute UDFs. This parameter does not take effect in the current version. Use **FencedUDFMemoryLimit** and **UDFWorkerMemHardLimit** to control virtual memory used by fenced udf worker.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 200 x 1024 to 2147483647. The unit is KB.

Default value: **200 MB**

FencedUDFMemoryLimit

Parameter description: Specifies the virtual memory used by each fenced udf worker process.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0 KB to 2147483647 KB. The unit can also be MB or GB. **0** indicates that the memory is not limited.

Default value: **0**

UDFWorkerMemHardLimit

Parameter description: Specifies the maximum value of **fencedUDFMemoryLimit**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: an integer ranging from 0KB to 2147483647KB. The unit can also be MB or GB.

Default value: **1GB**

pljava_vmoptions

Parameter description: Specifies the startup parameters for JVMs used by the PL/Java function. Only the sysadmin user can access this parameter. (The current feature is a lab feature. Contact Huawei technical support before using it.)

This parameter is a SUSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string, supporting:

- JDK8 JVM startup parameters. For details, see JDK **official** descriptions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- JDK8 JVM system attributes (starting with **–D**, for example, **–Djava.ext.dirs**). For details, see JDK **official** descriptions.
- User-defined parameters (starting with **–D**, for example, **–Duser.defined.option**).

NOTICE

If **pljava_vmoptions** is set to a value beyond the value range, an error will be reported when PL/Java functions are used.

Default value: empty

19.34 Collaborative Analysis

Due to specification changes, the current version no longer supports the current feature. Do not use this feature.

enable_agg_pushdown_for_ca

Parameter description: In collaborative analysis, this parameter specifies whether to convert the Agg operator above the ForeignScan operator into a remote SQL statement and send it to a remote cluster.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the Agg operator above ForeignScan is converted into a remote SQL statement.
- **off** indicates that only the ForeignScan operator is converted to a remote SQL statement.

Default value: **on**

19.35 Acceleration Cluster

Due to specification changes, the current version no longer supports the current feature. Do not use this feature.

show_acce_estimate_detail

Parameter description: When the cluster is accelerated (**acceleration_with_compute_pool** is set to **on**), this parameter specifies whether the **EXPLAIN** statement displays the evaluation information about execution plan pushed down to the accelerated cluster. (Due to specification changes, the current version no longer supports the current feature. Do not use this feature.) The evaluation information is generally used by O&M personnel during maintenance, and it may affect the output display of the **EXPLAIN** statement. Therefore, this parameter is disabled by default. The evaluation information is displayed only if the **verbose** option of the **EXPLAIN** statement is enabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the evaluation information is displayed in the output of the **EXPLAIN** statement.
- **off** indicates that the evaluation information is not displayed in the output of the **EXPLAIN** statement.

Default value: **off**

acceleration_with_compute_pool

Parameter description: Specifies whether to use the computing resource pool for acceleration when an OBS is queried. (Due to specification changes, the current version no longer supports the current feature. Do not use this feature.)

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the query covering OBS is accelerated based on the cost when the computing resource pool is available.
- **off** indicates that no query is accelerated using the computing resource pool.

Default value: **off**

max_resource_package

Parameter description: Specifies the upper limit of the concurrent task threads for accelerating each cluster each DN.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: 0 to 2147483647

Default value: **0**

19.36 Scheduled Task

job_queue_processes

Parameter description: Specifies the number of jobs that can be concurrently executed. This parameter is a POSTMASTER parameter. You can set it using **gs_guc**, and you need to restart **gaussdb** to make the setting take effect.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: 0 to 1000

Function:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Setting **job_queue_processes** to **0** indicates that the scheduled job function is disabled and that no job will be executed. (Enabling scheduled jobs may affect the system performance. At sites where this function is not required, you are advised to disable it.)
- Setting **job_queue_processes** to a value that is greater than **0** indicates that the scheduled job function is enabled and this value is the maximum number of jobs that can be concurrently processed.

After the scheduled job function is enabled, the job_scheduler thread polls the **pg_job** system catalog at a scheduled interval. The scheduled job check is performed every second by default.

Too many concurrent jobs consume many system resources, so you need to set the number of concurrent jobs to be processed. If the current number of concurrent jobs reaches the value of **job_queue_processes** and some of them expire, these jobs will be postponed to the next polling period. Therefore, you are advised to set the polling interval (the **Interval** parameter of the **submit** interface) based on the execution duration of each job to avoid the problem that jobs in the next polling period cannot be properly processed because of overlong job execution time.

Note: If the number of concurrent jobs is large and the value is too small, these jobs will wait in queues. However, a large parameter value leads to large resource consumption. You are advised to set this parameter to **100** and change it based on the system resource condition.

Default value: **10**

enable_prevent_job_task_startup

Parameter description: Specifies whether to start the job thread.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the job thread is not started.
- **off** indicates that the job thread is started.

Default value: **off**

19.37 Thread Pool

The current feature is a lab feature. Contact Huawei technical support before using it.

enable_thread_pool

Parameter description: Specifies whether to enable the thread pool function. This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the thread pool function is enabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **off** indicates that the thread pool function is disabled.

Default value: **on**

thread_pool_attr

Parameter description: Specifies the detailed attributes of the thread pool function. This parameter is valid only when **enable_thread_pool** is set to **on**. Only the sysadmin user can access this parameter. This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string, consisting of one or more characters.

This parameter consists of three parts: thread_num, group_num, and cpubind_info. The meanings of the three parts are as follows:

- **thread_num** indicates the total number of threads in the thread pool. The value ranges from 0 to 4096. The value **0** indicates that the database automatically configures the number of threads in the thread pool based on the number of CPU cores. If the value is greater than **0**, the number of threads in the thread pool is the same as the value of **thread_num**. You are advised to set the thread pool size based on the hardware configuration. The formula is as follows: Value of **thread_num** = Number of CPU cores x 3–5. The maximum value of **thread_num** is **4096**.
- **group_num** indicates the number of thread groups in the thread pool. The value ranges from 0 to 64. The value **0** indicates that the database automatically configures the number of thread groups in the thread pool based on the number of NUMA groups. If the value is greater than **0**, the number of thread groups in the thread pool is the same as the value of **group_num**.
- **cpubind_info** indicates whether the thread pool is bound to a core. The available configuration modes are as follows: 1. '(nobind)': The thread is not bound to a core. 2. '(allbind)': Use all CPU cores that can be queried in the current system to bind threads. 3. **'(nodebind: 1, 2)'**: Use the CPU cores in NUMA groups 1 and 2 to bind threads. 4. **'(cpubind: 0-30)'**: Use CPU cores 0 to 30 to bind threads. 5. **'(numabind: 0-30)'**: Use CPU cores 0 to 30 in the NUMA group to bind threads. This parameter is case-insensitive.

Default value:

- Independent deployment: '1024,2,(nobind)' (60-core CPU/480 GB memory and 32-core CPU/256 GB memory); '512,2,(nobind)' (16-core CPU/128 GB memory); '256,2,(nobind)'(8-core CPU/64 GB memory); '128,2,(nobind)' (4-core CPU/32 GB memory); '64,2,(nobind)' (4-core CPU/16 GB memory)

thread_pool_stream_attr

Parameter description: Specifies the detailed attributes of the stream thread pool function. This parameter is valid only when **enable_thread_pool** is set to **on** and only takes effect on DNs. Only the **sysadmin** user can access this parameter. This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string, consisting of one or more characters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter consists of four parts: 'stream_thread_num, stream_proc_ratio ,group_num ,cpubind_info'. The meanings of the four parts are as follows:

- **stream_thread_num** indicates the total number of threads in the stream thread pool. The value ranges from 0 to 4096. The value **0** indicates that the database automatically configures the number of threads in the thread pool based on the number of CPU cores. If the value is greater than **0**, the number of threads in the thread pool is the same as the value of **stream_thread_num**. You are advised to set the thread pool size based on the hardware configuration. The formula is as follows: Value of **stream_thread_num** = Number of CPU cores x 3–5. The maximum value of **stream_thread_num** is **4096**.
- **stream_proc_ratio** indicates the ratio of proc resources reserved for stream threads. The value is a floating point number. The default value is **0.2**. The reserved proc resources are calculated as follows: Value of **stream_proc_ratio** x Value of **stream_thread_num**.
- **group_num** indicates the number of thread groups in the thread pool. The value ranges from 0 to 64. The value **0** indicates that the database automatically configures the number of thread groups in the thread pool based on the number of NUMA groups. If the value is greater than **0**, the number of thread groups in the thread pool is the same as the value of **group_num**. The value of **group_num** in **thread_pool_stream_attr** must be the same as that in **thread_pool_attr**. If they are set to different values, the value of **group_num** in **thread_pool_attr** is used.
- **cpubind_info** indicates whether the thread pool is bound to a core. The available configuration modes are as follows: 1. '(nobind)': The thread is not bound to a core. 2. '(allbind)': Use all CPU cores that can be queried in the current system to bind threads. 3. **'(nodebind: 1, 2)'**: Use the CPU cores in NUMA groups 1 and 2 to bind threads. 4. **'(cpubind: 0-30)'**: Use CPU cores 0 to 30 to bind threads. 5. **'(numabind: 0-30)'**: Use CPU cores 0 to 30 in the NUMA group to bind threads. This parameter is case-insensitive. The value of **cpubind_info** in **thread_pool_stream_attr** must be the same as that in **thread_pool_attr**. If they are set to different values, the value of **cpubind_info** in **thread_pool_attr** is used.

Default value:

stream_thread_num: **16**

stream_proc_ratio: **0.2**

group_num and **cpubind_info**: For details, see **thread_pool_attr**.

resilience_threadpool_reject_cond

Parameter description: Specifies the percentage of accumulated sessions in the thread pool for escape from overload. This parameter takes effect only when the GUC parameters **enable_thread_pool** and **use_workload_manager** are enabled. This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: a string, consisting of one or more characters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter consists of **recover_threadpool_percent** and **overload_threadpool_percent**. The meanings of the two parts are as follows:

- **recover_threadpool_percent**: Percentage of the number of sessions that are recovered to the normal state in the initial number of threads in the thread pool. When the number of accessed sessions is less than the initial number of threads in the thread pool multiplied by the value of this parameter, the escape from overload function is disabled and new connections are allowed. The value ranges from 0 to **INT_MAX**. The value indicates a percentage.
- **overload_threadpool_percent**: Percentage of the number of accessed sessions to the initial number of threads in the thread pool when the thread pool is overloaded. If the number of accessed sessions is greater than the initial number of threads in the thread pool multiplied by the value of this parameter, the current thread pool is overloaded. In this case, the escape from overload function is enabled to kill sessions and forbid new connections to access the thread pool. The value ranges from 0 to **INT_MAX**. The value indicates a percentage.

Default value: **'0,0'**, indicating that the thread pool escape function is disabled.

Example:

```
resilience_threadpool_reject_cond = '100,200'
```

When the number of stacked sessions exceeds 200% of the initial number of threads in the thread pool, new connections are forbidden and stacked sessions are killed. When the number of stacked sessions is less than 100% of the initial number of threads in the thread pool, new connections are allowed.

NOTICE

- The number of stacked sessions can be obtained by querying the number of data records in the **pg_stat_activity** view. A few backend threads need to be filtered out. The initial number of threads in the thread pool can be obtained by querying the **thread_pool_attr** parameter.
- If this parameter is set to a small value, the thread pool escape from overload process is frequently triggered. As a result, ongoing sessions are forcibly logged out, and new connections fail to be connected for a short period of time. Therefore, exercise caution when setting this parameter based on the actual thread pool usage.
- If the **use_workload_manager** parameter is disabled and the **bypass_workload_manager** parameter is enabled, this parameter also takes effect. The **bypass_workload_manager** parameter is of the SIGHUP type; therefore, after the reload mode is set, you need to restart the database for the setting to take effect.
- The values of **recover_threadpool_percent** and **overload_threadpool_percent** can be **0** at the same time. In addition, the value of **recover_threadpool_percent** must be smaller than that of **overload_threadpool_percent**. Otherwise, the setting does not take effect.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

19.38 Full Text Search

ngram_gram_size

Parameter description: Specifies the length of the ngram parser segmentation.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: an integer ranging from 1 to 4

Default value: **2**

ngram_grapsymbol_ignore

Parameter description: Specifies whether the ngram parser ignores graphical characters.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

- **on**: The ngram parser ignores graphical characters.
- **off**: The ngram parser does not ignore graphical characters.

Default value: **off**

ngram_punctuation_ignore

Parameter description: Specifies whether the ngram parser ignores punctuations.

This parameter is a USERSET parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

- **on**: The ngram parser ignores punctuations.
- **off**: The ngram parser does not ignore punctuations.

Default value: **on**

19.39 Backup and Restoration

operation_mode

Parameter description: Specifies whether the system enters the backup and restoration mode.

This parameter is a SIGHUP parameter. Set it based on instructions provided in Table 11-1.

Value range: Boolean

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on** indicates that the system is in the backup and restoration mode.
- **off** indicates that the system is not in the backup and restoration mode.

Default value: **off**

enable_cbm_tracking

Parameter description: Specifies whether to enable cbm tracking. To perform full or incremental backup for the cluster by using Roach, set this parameter to **on**. Otherwise, the backup will fail.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on**: The cbm tracking is enabled.
- **off**: The cbm tracking is disabled.

Default value: **off**

19.40 AI Features

enable_hypo_index

Parameter description: Specifies whether the database optimizer considers the created virtual index when executing the **EXPLAIN** statement. By executing **EXPLAIN** on a specific query statement, you can evaluate whether the index can improve the execution efficiency of the query statement based on the execution plan provided by the optimizer.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 11-2**.

Value range: Boolean

- **on** indicates that a virtual index is created during **EXPLAIN** execution.
- **off** indicates that no virtual index is created during **EXPLAIN** execution.

Default value: **off**

19.41 Global SysCache Parameters

enable_global_syscache

Parameter description: Specifies whether to enable the global system cache function. This parameter is a POSTMASTER parameter. Set it based on instructions provided in **Table 11-1**.

Value range: Boolean

- **on** indicates that the global system cache function is enabled.
- **off** indicates that the global system cache function is disabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **on**

You are advised to use this parameter together with the thread pool parameter. After this parameter is enabled, you are advised to set **wal_level** of the standby node to **hot_standby** or higher if you need to access the standby node.

global_syscache_threshold

Parameter description: Specifies the maximum memory usage of the global system cache.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 11-1**.

The **enable_global_syscache** parameter must be enabled.

Value range: an integer ranging from 16384 to 1073741824. The unit is KB.

Default value: **163840**

Recommended calculation formula: The smaller value of the number of hot databases and the number of threads x Memory size allocated to each database, that is, **global_syscache_threshold** = **min(count(hot dbs)**,**count(threads))** x **memofdb**.

The number of hot databases refers to the number of frequently accessed databases. In thread pool mode, the number of threads is the sum of the number of threads in the thread pool and the number of background threads. In non-thread pool mode, the number of hot databases is used.

memofdb indicates the average memory allocated to each database. The background noise memory of each database is 2 MB. Each time a table or index is added, 11 KB memory is added.

If this parameter is set to a small value, memory is frequently evicted, and a large number of memory fragments cannot be recycled. As a result, memory control fails.

19.42 Reserved Parameters

NOTE

The following parameters are reserved and do not take effect in this version.

acce_min_datasize_per_thread

cstore_insert_mode

dfs_partition_directory_length

21 API Reference

21.1 JDBC Interface Reference

The JDBC interface is a set of API methods provided to users. This chapter describes its common interfaces. For other interfaces, see information in JDK1.6 (software package) and JDBC4.0.

21.1.1 java.sql.Connection

This section describes **java.sql.Connection**, the interface for connecting to a database.

Table 21-1 Support status for java.sql.Connection

Method Name	Return Type	Support JDBC 4
abort(Executor executor)	void	Yes
clearWarnings()	void	Yes
close()	void	Yes
commit()	void	Yes
createArrayOf(String typeName, Object[] elements)	Array	Yes
createBlob()	Blob	Yes
createClob()	Clob	Yes
createSQLXML()	SQLXML	Yes
createStatement()	Statement	Yes
createStatement(int resultSetType, int resultSetConcurrency)	Statement	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Method Name	Return Type	Support JDBC 4
createStatement(int resultSetType, int resultSetConcurrency, int resultSetHoldability)	Statement	Yes
getAutoCommit()	Boolean	Yes
getCatalog()	String	Yes
getClientInfo()	Properties	Yes
getClientInfo(String name)	String	Yes
getHoldability()	int	Yes
getMetaData()	DatabaseMetaData	Yes
getNetworkTimeout()	int	Yes
getSchema()	String	Yes
getTransactionIsolation()	int	Yes
getTypeMap()	Map<String,Class<?>>	Yes
getWarnings()	SQLWarning	Yes
isClosed()	Boolean	Yes
isReadOnly()	Boolean	Yes
isValid(int timeout)	boolean	Yes
nativeSQL(String sql)	String	Yes
prepareCall(String sql)	CallableStatement	Yes
prepareCall(String sql, int resultSetType, int resultSetConcurrency)	CallableStatement	Yes
prepareCall(String sql, int resultSetType, int resultSetConcurrency, int resultSetHoldability)	CallableStatement	Yes
prepareStatement(String sql)	PreparedStatement	Yes
prepareStatement(String sql, int autoGeneratedKeys)	PreparedStatement	Yes
prepareStatement(String sql, int[] columnIndexes)	PreparedStatement	Yes
prepareStatement(String sql, int resultSetType, int resultSetConcurrency)	PreparedStatement	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Method Name	Return Type	Support JDBC 4
prepareStatement(String sql, int resultSetType, int resultSetConcurrency, int resultSetHoldability)	PreparedStatement	Yes
prepareStatement(String sql, String[] columnNames)	PreparedStatement	Yes
releaseSavepoint(Savepoint savepoint)	void	Yes
rollback()	void	Yes
rollback(Savepoint savepoint)	void	Yes
setAutoCommit(boolean autoCommit)	void	Yes
setClientInfo(Properties properties)	void	Yes
setClientInfo(String name,String value)	void	Yes
setHoldability(int holdability)	void	Yes
setNetworkTimeout(Executor executor, int milliseconds)	void	Yes
setReadOnly(boolean readOnly)	void	Yes
setSavepoint()	Savepoint	Yes
setSavepoint(String name)	Savepoint	Yes
setSchema(String schema)	void	Yes
setTransactionIsolation(int level)	void	Yes
setTypeMap(Map<String,Class<?>> map)	void	Yes

NOTICE

The AutoCommit mode is used by default within the interface. If you disable it by running **setAutoCommit(false)**, all the statements executed later will be packaged in explicit transactions, and you cannot execute statements that cannot be executed within transactions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

21.1.2 java.sql.CallableStatement

This section describes **java.sql.CallableStatement**, the interface for executing the stored procedure.

Table 21-2 Support status for java.sql.CallableStatement

Method Name	Return Type	Support JDBC 4
getArray(int parameterIndex)	Array	Yes
getBigDecimal(int parameterIndex)	BigDecimal	Yes
getBlob(int parameterIndex)	Blob	Yes
getBoolean(int parameterIndex)	boolean	Yes
getByte(int parameterIndex)	byte	Yes
getBytes(int parameterIndex)	byte[]	Yes
getClob(int parameterIndex)	Clob	Yes
getDate(int parameterIndex)	Date	Yes
getDate(int parameterIndex, Calendar cal)	Date	Yes
getDouble(int parameterIndex)	double	Yes
getFloat(int parameterIndex)	float	Yes
getInt(int parameterIndex)	int	Yes
getLong(int parameterIndex)	long	Yes
getObject(int parameterIndex)	Object	Yes
getObject(int parameterIndex, Class<T> type)	Object	Yes
getShort(int parameterIndex)	short	Yes
getSQLXML(int parameterIndex)	SQLXML	Yes
getString(int parameterIndex)	String	Yes
getNString(int parameterIndex)	String	Yes
getTime(int parameterIndex)	Time	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Method Name	Return Type	Support JDBC 4
getTime(int parameterIndex, Calendar cal)	Time	Yes
getTimestamp(int parameterIndex)	Timestamp	Yes
getTimestamp(int parameterIndex, Calendar cal)	Timestamp	Yes
registerOutParameter(int parameterIndex, int type)	void	Yes
registerOutParameter(int parameterIndex, int sqlType, int type)	void	Yes
wasNull()	Boolean	Yes

NOTE

- The batch operation of statements containing OUT parameter is not allowed.
- The following methods are inherited from java.sql.Statement: close, execute, executeQuery, executeUpdate, getConnection, getResultSet, getUpdateCount, isClosed, setMaxRows, and setFetchSize.
- The following methods are inherited from java.sql.PreparedStatement: addBatch, clearParameters, execute, executeQuery, executeUpdate, getMetaData, setBigDecimal, setBoolean, setByte, setBytes, setDate, setDouble, setFloat, setInt, setLong, setNull, setObject, setString, setTime, and setTimestamp.
- The **registerOutParameter(int parameterIndex, int sqlType, int type)** method is used only to register the composite data type.

21.1.3 java.sql.DatabaseMetaData

This section describes **java.sql.DatabaseMetaData**, the interface for defining database objects.

Table 21-3 Support status for java.sql.DatabaseMetaData

Method Name	Return Type	Support JDBC 4
allProceduresAreCallable()	boolean	Yes
allTablesAreSelectable()	boolean	Yes
autoCommitFailureClosesAll-ResultSets()	boolean	Yes
dataDefinitionCausesTran-sactionCommit()	boolean	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Method Name	Return Type	Support JDBC 4
dataDefinitionIgnoredIn-Transactions()	boolean	Yes
deletesAreDetected(int type)	boolean	Yes
doesMaxRowSizeInclude-Blobs()	boolean	Yes
generatedKeyAlwaysRe-turned()	boolean	Yes
getBestRowIdentifier(String catalog, String schema, String table, int scope, boolean nullable)	ResultSet	Yes
getCatalogs()	ResultSet	Yes
getCatalogSeparator()	String	Yes
getCatalogTerm()	String	Yes
getClientInfoProperties()	ResultSet	Yes
getColumnPrivileges(String catalog, String schema, String table, String columnNamePattern)	ResultSet	Yes
getConnection()	Connection	Yes
getCrossReference(String parentCatalog, String parentSchema, String parentTable, String foreignCatalog, String foreignSchema, String foreignTable)	ResultSet	Yes
getDefaultTransactionIsola-tion()	int	Yes
getExportedKeys(String catalog, String schema, String table)	ResultSet	Yes
getExtraNameCharacters()	String	Yes
getFunctionColumns(String catalog, String schemaPattern, String functionNamePattern, String columnNamePattern)	ResultSet	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Method Name	Return Type	Support JDBC 4
getFunctions(String catalog, String schemaPattern, String functionNamePattern)	ResultSet	Yes
getIdentifierQuoteString()	String	Yes
getImportedKeys(String catalog, String schema, String table)	ResultSet	Yes
getIndexInfo(String catalog, String schema, String table, boolean unique, boolean approximate)	ResultSet	Yes
getMaxBinaryLiteralLength()	int	Yes
getMaxCatalogName-Length()	int	Yes
getMaxCharLiteralLength()	int	Yes
getMaxColumnName-Length()	int	Yes
getMaxColumnsInGroupBy()	int	Yes
getMaxColumnsInIndex()	int	Yes
getMaxColumnsInOrderBy()	int	Yes
getMaxColumnsInSelect()	int	Yes
getMaxColumnsInTable()	int	Yes
getMaxConnections()	int	Yes
getMaxCursorNameLength()	int	Yes
getMaxIndexLength()	int	Yes
getMaxLogicalLobSize()	default long	Yes
getMaxProcedureName-Length()	int	Yes
getMaxRowSize()	int	Yes
getMaxSchemaName-Length()	int	Yes
getMaxStatementLength()	int	Yes
getMaxStatements()	int	Yes
getMaxTableNameLength()	int	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Method Name	Return Type	Support JDBC 4
getMaxTablesInSelect()	int	Yes
getMaxUserNameLength()	int	Yes
getNumericFunctions()	String	Yes
getPrimaryKeys(String catalog, String schema, String table)	ResultSet	Yes
getPartitionTablePrimary-Keys(String catalog, String schema, String table)	ResultSet	Yes
getProcedureColumns(String catalog, String schemaPattern, String procedureNamePattern, String columnNamePattern)	ResultSet	Yes
getProcedures(String catalog, String schemaPattern, String procedureNamePattern)	ResultSet	Yes
getProcedureTerm()	String	Yes
getSchemas()	ResultSet	Yes
getSchemas(String catalog, String schemaPattern)	ResultSet	Yes
getSchemaTerm()	String	Yes
getSearchStringEscape()	String	Yes
getSQLKeywords()	String	Yes
getSQLStateType()	int	Yes
getStringFunctions()	String	Yes
getSystemFunctions()	String	Yes
getTablePrivileges(String catalog, String schemaPattern, String tableNamePattern)	ResultSet	Yes
getTimeDateFunctions()	String	Yes
getTypeInfo()	ResultSet	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Method Name	Return Type	Support JDBC 4
getUDTs(String catalog, String schemaPattern, String typeNamePattern, int[] types)	ResultSet	Yes
getURL()	String	Yes
getVersionColumns(String catalog, String schema, String table)	ResultSet	Yes
insertsAreDetected(int type)	boolean	Yes
locatorsUpdateCopy()	boolean	Yes
othersDeletesAreVisible(int type)	boolean	Yes
othersInsertsAreVisible(int type)	boolean	Yes
othersUpdatesAreVisible(int type)	boolean	Yes
ownDeletesAreVisible(int type)	boolean	Yes
ownInsertsAreVisible(int type)	boolean	Yes
ownUpdatesAreVisible(int type)	boolean	Yes
storesLowerCaseIdentifiers()	Boolean	Yes
storesMixedCaseIdentifiers()	boolean	Yes
storesUpperCaseIdentifiers()	Boolean	Yes
supportsBatchUpdates()	boolean	Yes
supportsCatalogsInDataManipulation()	boolean	Yes
supportsCatalogsInIndexDefinitions()	boolean	Yes
supportsCatalogsInPrivilegeDefinitions()	boolean	Yes
supportsCatalogsInProcedureCalls()	boolean	Yes
supportsCatalogsInTableDefinitions()	boolean	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Method Name	Return Type	Support JDBC 4
supportsCorrelatedSubqueries()	boolean	Yes
supportsDataDefinitionAndDataManipulationTransactions()	boolean	Yes
supportsDataManipulationTransactionsOnly()	boolean	Yes
supportsGetGeneratedKeys()	boolean	Yes
supportsMixedCaseIdentifiers()	Boolean	Yes
supportsMultipleOpenResults()	boolean	Yes
supportsNamedParameters()	boolean	Yes
supportsOpenCursorsAcrossCommit()	boolean	Yes
supportsOpenCursorsAcrossRollback()	boolean	Yes
supportsOpenStatementsAcrossCommit()	boolean	Yes
supportsOpenStatementsAcrossRollback()	boolean	Yes
supportsPositionedDelete()	boolean	Yes
supportsPositionedUpdate()	boolean	Yes
supportsRefCursors()	boolean	Yes
supportsResultSetConcurrency(int type, int concurrency)	boolean	Yes
supportsResultSetType(int type)	boolean	Yes
supportsSchemasInIndexDefinitions()	boolean	Yes
supportsSchemasInPrivilegeDefinitions()	boolean	Yes
supportsSchemasInProcedureCalls()	boolean	Yes
supportsSchemasInTableDefinitions()	boolean	Yes
supportsSelectForUpdate()	boolean	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Method Name	Return Type	Support JDBC 4
supportsStatementPooling()	boolean	Yes
supportsStoredFunctionsUsingCallSyntax()	boolean	Yes
supportsStoredProcedures()	boolean	Yes
supportsSubqueriesInComparisons()	boolean	Yes
supportsSubqueriesInExists()	boolean	Yes
supportsSubqueriesInIns()	boolean	Yes
supportsSubqueriesInQuantifieds()	boolean	Yes
supportsTransactionIsolationLevel(int level)	boolean	Yes
supportsTransactions()	boolean	Yes
supportsUnion()	boolean	Yes
supportsUnionAll()	boolean	Yes
updatesAreDetected(int type)	boolean	Yes
getTables(String catalog, String schemaPattern, String tableNamePattern, String[] types)	ResultSet	Yes
getColumns(String catalog, String schemaPattern, String tableNamePattern, String columnNamePattern)	ResultSet	Yes
getTableTypes()	ResultSet	Yes
getUserName()	String	Yes
isReadOnly()	Boolean	Yes
nullsAreSortedHigh()	Boolean	Yes
nullsAreSortedLow()	Boolean	Yes
nullsAreSortedAtStart()	Boolean	Yes
nullsAreSortedAtEnd()	Boolean	Yes
getDatabaseProductName()	String	Yes
getDatabaseProductVersion()	String	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Method Name	Return Type	Support JDBC 4
getDriverName()	String	Yes
getDriverVersion()	String	Yes
getDriverMajorVersion()	int	Yes
getDriverMinorVersion()	int	Yes
usesLocalFiles()	Boolean	Yes
usesLocalFilePerTable()	Boolean	Yes
supportsMixedCaseIdentifiers()	Boolean	Yes
storesUpperCaseIdentifiers()	Boolean	Yes
storesLowerCaseIdentifiers()	Boolean	Yes
supportsMixedCaseQuotedIdentifiers()	Boolean	Yes
storesUpperCaseQuotedIdentifiers()	Boolean	Yes
storesLowerCaseQuotedIdentifiers()	Boolean	Yes
storesMixedCaseQuotedIdentifiers()	Boolean	Yes
supportsAlterTableWithAddColumn()	Boolean	Yes
supportsAlterTableWithDropColumn()	Boolean	Yes
supportsColumnAliasing()	Boolean	Yes
nullPlusNonNullIsNull()	Boolean	Yes
supportsConvert()	Boolean	Yes
supportsConvert(int fromType, int toType)	Boolean	Yes
supportsTableCorrelationNames()	Boolean	Yes
supportsDifferentTableCorrelationNames()	Boolean	Yes
supportsExpressionsInOrderBy()	Boolean	Yes
supportsOrderByUnrelated()	Boolean	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Method Name	Return Type	Support JDBC 4
supportsGroupBy()	Boolean	Yes
supportsGroupByUnrelated()	Boolean	Yes
supportsGroupByBeyondSelect()	Boolean	Yes
supportsLikeEscapeClause()	Boolean	Yes
supportsMultipleResultSets()	Boolean	Yes
supportsMultipleTransactions()	Boolean	Yes
supportsNonNullableColumns()	Boolean	Yes
supportsMinimumSQLGrammar()	Boolean	Yes
supportsCoreSQLGrammar()	Boolean	Yes
supportsExtendedSQLGrammar()	Boolean	Yes
supportsANSI92EntryLevelSQL()	Boolean	Yes
supportsANSI92IntermediateSQL()	Boolean	Yes
supportsANSI92FullSQL()	Boolean	Yes
supportsIntegrityEnhancementFacility()	Boolean	Yes
supportsOuterJoins()	Boolean	Yes
supportsFullOuterJoins()	Boolean	Yes
supportsLimitedOuterJoins()	Boolean	Yes
isCatalogAtStart()	Boolean	Yes
supportsSchemasInDataManipulation()	Boolean	Yes
supportsSavepoints()	Boolean	Yes
supportsResultSetHoldability(int holdability)	Boolean	Yes
getResultSetHoldability()	int	Yes
getDatabaseMajorVersion()	int	Yes
getDatabaseMinorVersion()	int	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Method Name	Return Type	Support JDBC 4
getJDBCMajorVersion()	int	Yes
getJDBCMinorVersion()	int	Yes

NOTE

The **getPartitionTablePrimaryKeys(String catalog, String schema, String table)** API is used to obtain the primary key column of a partitioned table that contains global indexes. An example is as follows:

```
PgDatabaseMetaData dbmd = (PgDatabaseMetaData)conn.getMetaData();
dbmd.getPartitionTablePrimaryKeys("catalogName", "schemaName", "tableName");
```

21.1.4 java.sql.Driver

This section describes **java.sql.Driver**, the database driver interface.

Table 21-4 Support status for java.sql.Driver

Method Name	Return Type	Support JDBC 4
acceptsURL(String url)	Boolean	Yes
connect(String url, Properties info)	Connection	Yes
jdbcCompliant()	Boolean	Yes
getMajorVersion()	int	Yes
getMinorVersion()	int	Yes
getParentLogger()	Logger	Yes
getPropertyInfo(String url, Properties info)	DriverPropertyInfo[]	Yes

21.1.5 java.sql.PreparedStatement

This section describes **java.sql.PreparedStatement**, the interface for preparing statements.

Table 21-5 Support status for java.sql.PreparedStatement

Method Name	Return Type	Support JDBC 4
clearParameters()	void	Yes
execute()	Boolean	Yes
executeQuery()	ResultSet	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Method Name	Return Type	Support JDBC 4
excuteUpdate()	int	Yes
executeLargeUpdate()	long	No
getMetaData()	ResultSetMetaData	Yes
getParameterMetaData()	ParameterMetaData	Yes
setArray(int parameterIndex, Array x)	void	Yes
setAsciiStream(int parameterIndex, InputStream x, int length)	void	Yes
setBinaryStream(int parameterIndex, InputStream x)	void	Yes
setBinaryStream(int parameterIndex, InputStream x, int length)	void	Yes
setBinaryStream(int parameterIndex, InputStream x, long length)	void	Yes
setBlob(int parameterIndex, InputStream inputStream)	void	Yes
setBlob(int parameterIndex, InputStream inputStream, long length)	void	Yes
setBlob(int parameterIndex, Blob x)	void	Yes
setCharacterStream(int parameterIndex, Reader reader)	void	Yes
setCharacterStream(int parameterIndex, Reader reader, int length)	void	Yes
setClob(int parameterIndex, Reader reader)	void	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Method Name	Return Type	Support JDBC 4
setClob(int parameterIndex, Reader reader, long length)	void	Yes
setClob(int parameterIndex, Clob x)	void	Yes
setDate(int parameterIndex, Date x, Calendar cal)	void	Yes
setNull(int parameterIndex, int sqlType)	void	Yes
setNull(int parameterIndex, int sqlType, String typeName)	void	Yes
setObject(int parameterIndex, Object x)	void	Yes
setObject(int parameterIndex, Object x, int targetSqlType)	void	Yes
setObject(int parameterIndex, Object x, int targetSqlType, int scaleOrLength)	void	Yes
setSQLXML(int parameterIndex, SQLXML xmlObject)	void	Yes
setTime(int parameterIndex, Time x)	void	Yes
setTime(int parameterIndex, Time x, Calendar cal)	void	Yes
setTimestamp(int parameterIndex, Timestamp x)	void	Yes
setTimestamp(int parameterIndex, Timestamp x, Calendar cal)	void	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Method Name	Return Type	Support JDBC 4
setUnicodeStream(int parameterIndex, InputStream x, int length)	void	Yes
setURL(int parameterIndex, URL x)	void	Yes
setBoolean(int parameterIndex, boolean x)	void	Yes
setBigDecimal(int parameterIndex, BigDecimal x)	void	Yes
setByte(int parameterIndex, byte x)	void	Yes
setBytes(int parameterIndex, byte[] x)	void	Yes
setDate(int parameterIndex, Date x)	void	Yes
setDouble(int parameterIndex, double x)	void	Yes
setFloat(int parameterIndex, float x)	void	Yes
setInt(int parameterIndex, int x)	void	Yes
setLong(int parameterIndex, long x)	void	Yes
setShort(int parameterIndex, short x)	void	Yes
setString(int parameterIndex, String x)	void	Yes
setNString(int parameterIndex, String x)	void	Yes
addBatch()	void	Yes
executeBatch()	int[]	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- Execute **addBatch()** and **execute()** only after running **clearBatch()**.
- Batch is not cleared by calling **executeBatch()**. Clear batch by explicitly calling **clearBatch()**.
- After bounded variables of a batch are added, if you want to reuse these values, you do not need to use **set*()** again. Instead, add a batch.
- The following methods are inherited from **java.sql.Statement**: **close**, **execute**, **executeQuery**, **executeUpdate**, **getConnection**, **getResultSet**, **getUpdateCount**, **isClosed**, **setMaxRows**, and **setFetchSize**.
- The **executeLargeUpdate()** method can only be used in JDBC 4.2 or later.

21.1.6 java.sql.ResultSet

This section describes **java.sql.ResultSet**, the interface for execution result sets.

Table 21-6 Support status for java.sql.ResultSet

Method Name	Return Type	Support JDBC 4
absolute(int row)	Boolean	Yes
afterLast()	void	Yes
beforeFirst()	void	Yes
cancelRowUpdates()	void	Yes
clearWarnings()	void	Yes
close()	void	Yes
deleteRow()	void	Yes
findColumn(String columnLabel)	int	Yes
first()	Boolean	Yes
getArray(int columnIndex)	Array	Yes
getArray(String columnLabel)	Array	Yes
getAsciiStream(int columnIndex)	InputStream	Yes
getAsciiStream(String columnLabel)	InputStream	Yes
getBigDecimal(int columnIndex)	BigDecimal	Yes
getBigDecimal(String columnLabel)	BigDecimal	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Method Name	Return Type	Support JDBC 4
getBinaryStream(int columnIndex)	InputStream	Yes
getBinaryStream(String columnLabel)	InputStream	Yes
getBlob(int columnIndex)	Blob	Yes
getBlob(String columnLabel)	Blob	Yes
getBoolean(int columnIndex)	Boolean	Yes
getBoolean(String columnLabel)	Boolean	Yes
getByte(int columnIndex)	byte	Yes
getBytes(int columnIndex)	byte[]	Yes
getByte(String columnLabel)	byte	Yes
getBytes(String columnLabel)	byte[]	Yes
getCharacterStream(int columnIndex)	Reader	Yes
getCharacterStream(String columnLabel)	Reader	Yes
getClob(int columnIndex)	Clob	Yes
getClob(String columnLabel)	Clob	Yes
getConcurrency()	int	Yes
getCursorName()	String	Yes
getDate(int columnIndex)	Date	Yes
getDate(int columnIndex, Calendar cal)	Date	Yes
getDate(String columnLabel)	Date	Yes
getDate(String columnLabel, Calendar cal)	Date	Yes

Method Name	Return Type	Support JDBC 4
updateLong(int columnIndex, long x)	void	Yes
updateLong(String columnLabel, long x)	void	Yes
updateNull(int columnIndex)	void	Yes
updateNull(String columnLabel)	void	Yes
updateObject(int columnIndex, Object x)	void	Yes
updateObject(int columnIndex, Object x, int scaleOrLength)	void	Yes
updateObject(String columnLabel, Object x)	void	Yes
updateObject(String columnLabel, Object x, int scaleOrLength)	void	Yes
updateRow()	void	Yes
updateShort(int columnIndex, short x)	void	Yes
updateShort(String columnLabel, short x)	void	Yes
updateSQLXML(int columnIndex, SQLXML xmlObject)	void	Yes
updateSQLXML(String columnLabel, SQLXML xmlObject)	void	Yes
updateString(int columnIndex, String x)	void	Yes
updateString(String columnLabel, String x)	void	Yes
updateTime(int columnIndex, Time x)	void	Yes
updateTime(String columnLabel, Time x)	void	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Method Name	Return Type	Support JDBC 4
updateTimestamp(int columnIndex, Timestamp x)	void	Yes
updateTimestamp(String columnLabel, Timestamp x)	void	Yes
wasNull()	Boolean	Yes

NOTE

- One Statement cannot have multiple open ResultSets.
- The cursor that is used for traversing the ResultSet cannot be open after being committed.

21.1.7 java.sql.ResultSetMetaData

This section describes **java.sql.ResultSetMetaData**, which provides details about ResultSet object information.

Table 21-7 Support status for java.sql.ResultSetMetaData

Method Name	Return Type	Support JDBC 4
getCatalogName(int column)	String	Yes
getColumnClassName(int column)	String	Yes
getColumnCount()	int	Yes
getColumnDisplaySize(int column)	int	Yes
getColumnLabel(int column)	String	Yes
getColumnName(int column)	String	Yes
getColumnType(int column)	int	Yes
getColumnTypeName(int column)	String	Yes
getPrecision(int column)	int	Yes
getScale(int column)	int	Yes
getSchemaName(int column)	String	Yes
getTableName(int column)	String	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Method Name	Return Type	Support JDBC 4
isAutoIncrement(int column)	boolean	Yes
isCaseSensitive(int column)	boolean	Yes
isCurrency(int column)	boolean	Yes
isDefinitelyWritable(int column)	boolean	Yes
isNullable(int column)	int	Yes
isReadOnly(int column)	boolean	Yes
isSearchable(int column)	boolean	Yes
isSigned(int column)	boolean	Yes
isWritable(int column)	boolean	Yes

21.1.8 java.sql.Statement

This section describes **java.sql.Statement**, the interface for executing SQL statements.

Table 21-8 Support status for java.sql.Statement

Method Name	Return Type	Support JDBC 4
addBatch(String sql)	void	Yes
clearBatch()	void	Yes
clearWarnings()	void	Yes
close()	void	Yes
closeOnCompletion()	void	Yes
execute(String sql)	Boolean	Yes
execute(String sql, int autoGeneratedKeys)	Boolean	Yes
execute(String sql, int[] columnIndexes)	Boolean	Yes
execute(String sql, String[] columnNames)	Boolean	Yes
executeBatch()	Boolean	Yes
executeQuery(String sql)	ResultSet	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Method Name	Return Type	Support JDBC 4
executeUpdate(String sql)	int	Yes
executeUpdate(String sql, int autoGeneratedKeys)	int	Yes
executeUpdate(String sql, int[] columnIndexes)	int	Yes
executeUpdate(String sql, String[] columnNames)	int	Yes
getConnection()	Connection	Yes
getFetchDirection()	int	Yes
getFetchSize()	int	Yes
getGeneratedKeys()	ResultSet	Yes
getMaxFieldSize()	int	Yes
getMaxRows()	int	Yes
getMoreResults()	boolean	Yes
getMoreResults(int current)	boolean	Yes
getResultSet()	ResultSet	Yes
getResultSetConcurrency()	int	Yes
getResultSetHoldability()	int	Yes
getResultSetType()	int	Yes
getQueryTimeout()	int	Yes
getUpdateCount()	int	Yes
getWarnings()	SQLWarning	Yes
isClosed()	Boolean	Yes
isCloseOnCompletion()	Boolean	Yes
isPoolable()	Boolean	Yes
setCursorName(String name)	void	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Method Name	Return Type	Support JDBC 4
setEscapeProcess-ing(boolean enable)	void	Yes
setFetchDirection(int direction)	void	Yes
setMaxFieldSize(int max)	void	Yes
setMaxRows(int max)	void	Yes
setPoolable(boolean poolable)	void	Yes
setQueryTimeout(int seconds)	void	Yes
setFetchSize(int rows)	void	Yes
cancel()	void	Yes
executeLargeUpdate(String sql)	long	No
getLargeUpdateCount()	long	No
executeLargeBatch()	long	No
executeLargeUpdate(String sql, int autoGeneratedKeys)	long	No
executeLargeUpdate(String sql, int[] columnIndexes)	long	No
executeLargeUpdate(String sql, String[] columnNames)	long	No

NOTE

- Using setFetchSize can reduce the memory occupied by result sets on the client. Result sets are packaged into cursors and segmented for processing, which will increase the communication traffic between the database and the client, affecting performance.
- Database cursors are valid only within their transactions. If **setFetchSize** is set, set **setAutoCommit(false)** and commit transactions on the connection to flush service data to a database.
- **LargeUpdate** methods can only be used in JDBC 4.2 or later.

21.1.9 javax.sql.ConnectionPoolDataSource

This section describes **javax.sql.ConnectionPoolDataSource**, the interface for data source connection pools.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 21-9 Support status for javax.sql.ConnectionPoolDataSource

Method Name	Return Type	Support JDBC 4
getPooledConnection()	PooledConnection	Yes
getPooledConnection(String user,String password)	PooledConnection	Yes

21.1.10 javax.sql.DataSource

This section describes **javax.sql.DataSource**, the interface for data sources.

Table 21-10 Support status for javax.sql.DataSource

Method Name	Return Type	Support JDBC 4
getConneciton()	Connection	Yes
getConnection(String username,String password)	Connection	Yes
getLoginTimeout()	int	Yes
getLogWriter()	PrintWriter	Yes
setLoginTimeout(int seconds)	void	Yes
setLogWriter(PrintWriter out)	void	Yes

21.1.11 javax.sql.PooledConnection

This section describes **javax.sql.PooledConnection**, the connection interface created by a connection pool.

Table 21-11 Support status for javax.sql.PooledConnection

Method Name	Return Type	Support JDBC 4
addConnectionEventListener (ConnectionEventListener listener)	void	Yes
close()	void	Yes
getConnection()	Connection	Yes
removeConnectionEventListener (ConnectionEventListener listener)	void	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

21.1.12 javax.naming.Context

This section describes **javax.naming.Context**, the context interface for connection configuration.

Table 21-12 Support status for javax.naming.Context

Method Name	Return Type	Support JDBC 4
bind(Name name, Object obj)	void	Yes
bind(String name, Object obj)	void	Yes
lookup(Name name)	Object	Yes
lookup(String name)	Object	Yes
rebind(Name name, Object obj)	void	Yes
rebind(String name, Object obj)	void	Yes
rename(Name oldName, Name newName)	void	Yes
rename(String oldName, String newName)	void	Yes
unbind(Name name)	void	Yes
unbind(String name)	void	Yes

21.1.13 javax.naming.spi.InitialContextFactory

This section describes **javax.naming.spi.InitialContextFactory**, the initial context factory interface.

Table 21-13 Support status for javax.naming.spi.InitialContextFactory

Method Name	Return Type	Support JDBC 4
getInitialContext(Hashtable<?,?> environment)	Context	Yes

21.1.14 CopyManager

CopyManager is an API class provided by the JDBC driver in GaussDB. It is used to import data to GaussDB clusters in batches.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Inheritance Relationship of CopyManager

The CopyManager class is in the **org.postgresql.copy** package and inherits the java.lang.Object class. The declaration of the class is as follows:

```
public class CopyManager
extends Object
```

Constructor Method

public CopyManager(BaseConnection connection)

throws SQLException

Common Methods

Table 21-14 Common methods of CopyManager

Return Value	Method	Description	throws
CopyIn	copyIn(String sql)	-	SQLException
long	copyIn(String sql, InputStream from)	Uses **COPY FROM STDIN** to quickly load data to tables in the database from InputStream.	SQLException,IOException
long	copyIn(String sql, InputStream from, int bufferSize)	Uses **COPY FROM STDIN** to quickly load data to tables in the database from InputStream.	SQLException,IOException
long	copyIn(String sql, Reader from)	Uses **COPY FROM STDIN** to quickly load data to tables in the database from Reader.	SQLException,IOException
long	copyIn(String sql, Reader from, int bufferSize)	Uses **COPY FROM STDIN** to quickly load data to tables in the database from Reader.	SQLException,IOException
CopyOut	copyOut(String sql)	-	SQLException

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return Value	Method	Description	throws
long	copyOut(String sql, OutputStream to)	Sends the result set of **COPY TO STDOUT** from the database to the OutputStream class.	SQLException,IOException
long	copyOut(String sql, Writer to)	Sends the result set of **COPY TO STDOUT** from the database to the Writer class.	SQLException,IOException

21.1.15 PGReplicationConnection

PGReplicationConnection is an API class provided by the JDBC driver in GaussDB. It is used to implement functions related to logical replication.

Inheritance Relationship of PGReplicationConnection

PGReplicationConnection is a logical replication interface. Its implementation class is PGReplicationConnectionImpl, which is in the **org.postgresql.replication** package. The declaration of the class is as follows:

```
public class PGReplicationConnection implements PGReplicationConnection
```

Constructor Method

public PGReplicationConnection(BaseConnection connection)

Common Methods

Table 21-15 Common methods of PGReplicationConnection

Return Value	Method	Description	throws
ChainedCreateReplicationSlotBuilder	createReplication-Slot()	Creates a logical replication slot.	-
void	dropReplication-Slot(String slotName)	Deletes a logical replication slot.	SQLException,IOException
ChainedStreamBuilder	replicationStream()	Logical replication is enabled.	-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

21.1.16 PGReplicationStream

PGReplicationStream is an API class provided by the GaussDB JDBC driver. It is used to operate logical replication streams.

Inheritance Relationship of PGReplicationStream

PGReplicationStream is a logical replication API. Its implementation class is V3PGReplicationStream, which is in the **org.postgresql.core.v3.replication** package. The declaration of the class is as follows:

```
public class V3PGReplicationStream implements PGReplicationStream
```

Constructor

public V3PGReplicationStream(CopyDual copyDual, LogSequenceNumber startLSN, long updateIntervalMs, ReplicationType replicationType)

Common Methods

Table 21-16 Common methods of PGReplicationConnection

Return Value	Method	Description	throws
void	close()	Ends the logical replication and releases resources.	SQLException
void	forceUpdateStatus()	Forcibly sends the LSN status received, refreshed, and applied last time to the backend.	SQLException
LogSequenceNumber	getLastAppliedLSN()	Obtains the LSN when the primary node replays logs last time.	-
LogSequenceNumber	getLastFlushedLSN()	Obtains the LSN flushed by the primary node last time, that is, the LSN pushed by the current logic decoding.	-
LogSequenceNumber	getLastReceiveLSN()	Obtains the LSN received last time.	-
boolean	isClosed()	Determines whether the replication stream is disabled.	-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return Value	Method	Description	throws
ByteBuffer	read()	Reads the next WAL record from the backend. If the data cannot be read, this method blocks the I/O read.	SQLException
ByteBuffer	readPending()	Reads the next WAL record from the backend. If the data cannot be read, this method does not block the I/O read.	SQLException
void	setAppliedLSN(LogSequenceNumber applied)	Sets the applied LSN.	-
void	setFlushedLSN(LogSequenceNumber flushed)	Sets the flushed LSN, which is sent to the backend at the next update to push the LSN on the server.	-

21.1.17 ChainedStreamBuilder

ChainedStreamBuilder is an API class provided by the GaussDB JDBC driver. It is used to build replication streams.

Inheritance Relationship of ChainedStreamBuilder

ChainedStreamBuilder is a logical replication API. Its implementation class is ReplicationStreamBuilder, which is in the **org.postgresql.replication.fluent** package. The declaration of the class is as follows:

```
public class ReplicationStreamBuilder implements ChainedStreamBuilder
```

Constructor

public ReplicationStreamBuilder(final BaseConnection connection)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Common Methods

Table 21-17 Common methods of ReplicationStreamBuilder

Return Value	Method	Description	throws
ChainedLogicalStreamBuilder	logical()	Creates a logical replication stream.	-
ChainedPhysicalStreamBuilder	physical()	Creates a physical replication stream.	-

21.1.18 ChainedCommonStreamBuilder

ChainedCommonStreamBuilder is an API class provided by the GaussDB JDBC driver. It is used to specify common parameters for logical and physical replication.

Inheritance Relationship of ChainedCommonStreamBuilder

ChainedCommonStreamBuilder is an API for logical replication. The implementation abstract class is AbstractCreateSlotBuilder. The inheritance class is LogicalCreateSlotBuilder which is in the **org.postgresql.replication.fluent.logical** package. The declaration of this class is as follows:

```
public class LogicalCreateSlotBuilder
    extends AbstractCreateSlotBuilder<ChainedLogicalCreateSlotBuilder>
    implements ChainedLogicalCreateSlotBuilder
```

Constructor

public LogicalCreateSlotBuilder(BaseConnection connection)

Common Methods

Table 21-18 Common methods of LogicalCreateSlotBuilder

Return Value	Method	Description	throws
T	withSlotName(String slotName)	Specifies the name of a replication slot.	-
ChainedLogicalCreateSlotBuilder	withOutputPlugin(String outputPlugin)	Plug-in name. Currently, mppdb_decoding is supported.	-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return Value	Method	Description	throws
void	make()	Creates a slot with the specified parameters in the database.	SQLException
ChainedLogicalCreateSlotBuilder	self()	-	-

21.2 ODBC Interface Reference

The ODBC interface is a set of API functions provided to users. This chapter describes its common interfaces. For details on other interfaces, see "ODBC Programmer's Reference" at MSDN (https://msdn.microsoft.com/en-us/library/windows/desktop/ms714177(v=vs.85).aspx).

21.2.1 SQLAllocEnv

In ODBC 3.x, SQLAllocEnv (an ODBC 2.x function) was deprecated and replaced by SQLAllocHandle. For details, see **SQLAllocHandle**.

21.2.2 SQLAllocConnect

In ODBC 3.x, SQLAllocConnect (an ODBC 2.x function) was deprecated and replaced by SQLAllocHandle. For details, see **SQLAllocHandle**.

21.2.3 SQLAllocHandle

Function

SQLAllocHandle is used to allocate environment, connection, statement, or descriptor handles. This function replaces the deprecated ODBC 2.x functions SQLAllocEnv, SQLAllocConnect, and SQLAllocStmt.

Prototype

```
SQLRETURN SQLAllocHandle(SQLSMALLINT   HandleType,
                         SQLHANDLE     InputHandle,
                         SQLHANDLE     *OutputHandlePtr);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter

Table 21-19 SQLAllocHandle parameters

Keyword	Parameter Description
HandleType	Type of handle to be allocated by SQLAllocHandle. The value must be one of the following: • SQL_HANDLE_ENV (environment handle) • SQL_HANDLE_DBC (connection handle) • SQL_HANDLE_STMT (statement handle) • SQL_HANDLE_DESC (descriptor handle) The handle application sequence is: **SQL_HANDLE_ENV** > **SQL_HANDLE_DBC** > **SQL_HANDLE_STMT**. The handle applied later depends on the handle applied prior to it.
InputHandle	Existing handle to use as a context for the new handle being allocated. • If **HandleType** is **SQL_HANDLE_ENV**, this parameter is set to **SQL_NULL_HANDLE**. • If **HandleType** is **SQL_HANDLE_DBC**, this parameter value must be an environment handle. • If **HandleType** is **SQL_HANDLE_STMT** or **SQL_HANDLE_DESC**, this parameter value must be a connection handle.
OutputHandlePtr	**Output parameter**: Pointer to a buffer that stores the returned handle in the newly allocated data structure.

Return Value

- **SQL_SUCCESS** indicates that the call succeeded.
- **SQL_SUCCESS_WITH_INFO** indicates that some warning information is displayed.
- **SQL_ERROR** indicates major errors, such as memory allocation and connection failures.
- **SQL_INVALID_HANDLE** indicates that invalid handles were called. This value may also be returned by other APIs.

Precautions

If SQLAllocHandle returns **SQL_ERROR** when it is used to allocate a non-environment handle, it sets **OutputHandlePtr** to **SQL_NULL_HDBC**, **SQL_NULL_HSTMT**, or **SQL_NULL_HDESC**. The application can then call **SQLGetDiagRec**, with **HandleType** and **Handle** set to the value of **IntputHandle**, to obtain the **SQLSTATE** value. The **SQLSTATE** value provides the detailed function calling information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example

See **Examples**.

21.2.4 SQLAllocStmt

In ODBC 3.x, SQLAllocStmt was deprecated and replaced by SQLAllocHandle. For details, see **SQLAllocHandle**.

21.2.5 SQLBindCol

Function

SQLBindCol is used to bind columns in a result set to an application data buffer.

Prototype

```
SQLRETURN SQLBindCol(SQLHSTMT       StatementHandle,
                     SQLUSMALLINT   ColumnNumber,
                     SQLSMALLINT    TargetType,
                     SQLPOINTER     TargetValuePtr,
                     SQLINTEGER     BufferLength,
                     SQLINTEGER     *StrLen_or_IndPtr);
```

Parameter

Table 21-20 SQLBindCol parameters

Keyword	Parameter Description
StatementHandle	Statement handle.
ColumnNumber	Number of the column to be bound. The column number starts with 0 and increases in ascending order. Column 0 is the bookmark column. If no bookmark column is set, column numbers start with 1.
TargetType	C data type in the buffer.
TargetValuePtr	**Output parameter**: pointer to the buffer bound with the column. The SQLFetch function returns data in the buffer. If **TargetValuePtr** is null, **StrLen_or_IndPtr** is a valid value.
BufferLength	Size of the **TargetValuePtr** buffer in bytes.
StrLen_or_IndPtr	**Output parameter**: pointer to the length or indicator of the buffer. If **StrLen_or_IndPtr** is null, no length or indicator is used.

Return Value

- **SQL_SUCCESS** indicates that the call succeeded.
- **SQL_SUCCESS_WITH_INFO** indicates that some warning information is displayed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **SQL_ERROR** indicates major errors, such as memory allocation and connection failures.
- **SQL_INVALID_HANDLE** indicates that invalid handles were called. This value may also be returned by other APIs.

Precautions

If SQLBindCol returns **SQL_ERROR** or **SQL_SUCCESS_WITH_INFO**, the application can call **SQLGetDiagRec**, with **HandleType** and **Handle** set to **SQL_HANDLE_STMT** and **StatementHandle**, respectively, to obtain the **SQLSTATE** value. The **SQLSTATE** value provides the detailed function calling information.

Example

See **Examples**.

21.2.6 SQLBindParameter

Function

SQLBindParameter is used to bind parameter markers in an SQL statement to a buffer.

Prototype

```
SQLRETURN SQLBindParameter(SQLHSTMT       StatementHandle,
                           SQLUSMALLINT   ParameterNumber,
                           SQLSMALLINT    InputOutputType,
                           SQLSMALLINT    ValuetType,
                           SQLSMALLINT    ParameterType,
                           SQLSMALLINT    ColumnSize,
                           SQLSMALLINT    DecimalDigits,
                           SQLPOINTER     ParameterValuePtr,
                           SQLINTEGER     BufferLength,
                           SQLINTEGER     *StrLen_or_IndPtr);
```

Parameter

Table 21-21 SQLBindParameter parameters

Keyword	Parameter Description
StatementHandle	Statement handle.
ParameterNumber	Parameter marker number, starting with 1 and increasing in ascending order.
InputOutputType	Input/output type of the parameter.
ValueType	C data type of the parameter.
ParameterType	SQL data type of the parameter.
ColumnSize	Size of the column or expression of the corresponding parameter marker.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Keyword	Parameter Description
DecimalDigits	Digital number of the column or expression of the corresponding parameter marker.
ParameterValuePtr	Pointer to the storage parameter buffer.
BufferLength	Size of the ParameterValuePtr buffer in bytes.
StrLen_or_IndPtr	Pointer to the length or indicator of the buffer. If **StrLen_or_IndPtr** is null, no length or indicator is used.

Return Value

- **SQL_SUCCESS** indicates that the call succeeded.
- **SQL_SUCCESS_WITH_INFO** indicates that some warning information is displayed.
- **SQL_ERROR** indicates major errors, such as memory allocation and connection failures.
- **SQL_INVALID_HANDLE** indicates that invalid handles were called. This value may also be returned by other APIs.

Precautions

If SQLBindParameter returns **SQL_ERROR** or **SQL_SUCCESS_WITH_INFO**, the application can call **SQLGetDiagRec**, with **HandleType** and **Handle** set to **SQL_HANDLE_STMT** and **StatementHandle**, respectively, to obtain the **SQLSTATE** value. The **SQLSTATE** value provides the detailed function calling information.

Example

See **Examples**.

21.2.7 SQLColAttribute

Function

SQLColAttribute is used to return the descriptor information about a column in the result set.

Prototype

```
SQLRETURN SQLColAttibute(SQLHSTMT        StatementHandle,
                         SQLUSMALLINT    ColumnNumber,
                         SQLUSMALLINT    FieldIdentifier,
                         SQLPOINTER      CharacterAtrributePtr,
                         SQLSMALLINT     BufferLength,
                         SQLSMALLINT     *StringLengthPtr,
                         SQLPOINTE       NumericAttributePtr);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter

Table 21-22 SQLColAttribute parameters

Keyword	Parameter Description
StatementHandle	Statement handle.
ColumnNumber	Column number of the field to be queried, starting with 1 and increasing in ascending order.
FieldIdentifier	Field identifier of **ColumnNumber** in IRD.
CharacterAttributePtr	**Output parameter**: pointer to the buffer that returns the **FieldIdentifier** value.
BufferLength	• **BufferLength** indicates the length of the buffer if **FieldIdentifier** is an ODBC-defined field and **CharacterAttributePtr** points to a character string or a binary buffer. • Ignore this parameter if **FieldIdentifier** is an ODBC-defined field and **CharacterAttributePtr** points to an integer.
StringLengthPtr	**Output parameter**: pointer to a buffer in which the total number of valid bytes (for string data) is stored in ***CharacterAttributePtr**. Ignore the value of **BufferLength** if the data is not a string.
NumericAttributePtr	**Output parameter**: pointer to an integer buffer in which the value of the **FieldIdentifier** field in the **ColumnNumber** row of the IRD is returned.

Return Value

- **SQL_SUCCESS** indicates that the call succeeded.
- **SQL_SUCCESS_WITH_INFO** indicates that some warning information is displayed.
- **SQL_ERROR** indicates major errors, such as memory allocation and connection failures.
- **SQL_INVALID_HANDLE** indicates that invalid handles were called. This value may also be returned by other APIs.

Precautions

If SQLColAttribute returns **SQL_ERROR** or **SQL_SUCCESS_WITH_INFO**, the application can call **SQLGetDiagRec**, with **HandleType** and **Handle** set to **SQL_HANDLE_STMT** and **StatementHandle**, respectively, to obtain the **SQLSTATE** value. The **SQLSTATE** value provides the detailed function calling information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example

See **Examples**.

21.2.8 SQLConnect

Function

SQLConnect is used to establish a connection between a driver and a data source. After the connection is established, the connection handle can be used to access all information about the data source, including its application operating status, transaction processing status, and error information.

Prototype

```
SQLRETURN  SQLConnect(SQLHDBC        ConnectionHandle,
                      SQLCHAR        *ServerName,
                      SQLSMALLINT    NameLength1,
                      SQLCHAR        *UserName,
                      SQLSMALLINT    NameLength2,
                      SQLCHAR        *Authentication,
                      SQLSMALLINT    NameLength3);
```

Parameter

Table 21-23 SQLConnect parameters

Keyword	Parameter Description
ConnectionHandle	Connection handle, obtained from SQLAllocHandle.
ServerName	Name of the data source to connect.
NameLength1	Length of **ServerName**.
UserName	Username of the database in the data source.
NameLength2	Length of **UserName**.
Authentication	User password of the database in the data source.
NameLength3	Length of **Authentication**.

Return Value

- **SQL_SUCCESS** indicates that the call succeeded.
- **SQL_SUCCESS_WITH_INFO** indicates that some warning information is displayed.
- **SQL_ERROR** indicates major errors, such as memory allocation and connection failures.
- **SQL_INVALID_HANDLE** indicates that invalid handles were called. This value may also be returned by other APIs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **SQL_STILL_EXECUTING** indicates that the statement is being executed.

Precautions

If SQLConnect returns **SQL_ERROR** or **SQL_SUCCESS_WITH_INFO**, the application can call **SQLGetDiagRec**, with **HandleType** and **Handle** set to **SQL_HANDLE_DBC** and **ConnectionHandle**, respectively, to obtain the **SQLSTATE** value. The **SQLSTATE** value provides the detailed function calling information.

Example

See **Examples**.

21.2.9 SQLDisconnect

Function

SQLDisconnect is used to close the connection associated with a database connection handle.

Prototype

```
SQLRETURN SQLDisconnect(SQLHDBC     ConnectionHandle);
```

Parameter

Table 21-24 SQLDisconnect parameters

Keyword	Parameter Description
ConnectionHandle	Connection handle, obtained from SQLAllocHandle.

Return Value

- **SQL_SUCCESS** indicates that the call succeeded.
- **SQL_SUCCESS_WITH_INFO** indicates that some warning information is displayed.
- **SQL_ERROR** indicates major errors, such as memory allocation and connection failures.
- **SQL_INVALID_HANDLE** indicates that invalid handles were called. This value may also be returned by other APIs.

Precautions

If SQLDisconnect returns **SQL_ERROR** or **SQL_SUCCESS_WITH_INFO**, the application can call **SQLGetDiagRec**, with **HandleType** and **Handle** set to **SQL_HANDLE_DBC** and **ConnectionHandle**, respectively, to obtain the **SQLSTATE** value. The **SQLSTATE** value provides the detailed function calling information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example

See **Examples**.

21.2.10 SQLExecDirect

Function

SQLExecDirect is used to execute a prepared SQL statement specified in this parameter. This is the fastest method for executing only one SQL statement at a time.

Prototype

```
SQLRETURN SQLExecDirect(SQLHSTMT         StatementHandle,
                        SQLCHAR          *StatementText,
                        SQLINTEGER       TextLength);
```

Parameter

Table 21-25 SQLExecDirect parameters

Keyword	Parameter Description
StatementHandle	Statement handle, obtained from SQLAllocHandle.
StatementText	SQL statement to be executed. One SQL statement can be executed at a time.
TextLength	Length of **StatementText**.

Return Value

- **SQL_SUCCESS** indicates that the call succeeded.
- **SQL_SUCCESS_WITH_INFO** indicates that some warning information is displayed.
- **SQL_NEED_DATA** indicates that parameters provided before executing the SQL statement are insufficient.
- **SQL_ERROR** indicates major errors, such as memory allocation and connection failures.
- **SQL_INVALID_HANDLE** indicates that invalid handles were called. This value may also be returned by other APIs.
- **SQL_STILL_EXECUTING** indicates that the statement is being executed.
- **SQL_NO_DATA** indicates that the SQL statement does not return a result set.

Precautions

If SQLExecDirect returns **SQL_ERROR** or **SQL_SUCCESS_WITH_INFO**, the application can call **SQLGetDiagRec**, with **HandleType** and **Handle** set to **SQL_HANDLE_STMT** and **StatementHandle**, respectively, to obtain the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

SQLSTATE value. The **SQLSTATE** value provides the detailed function calling information.

Example

See **Examples**.

21.2.11 SQLExecute

Function

SQLExecute is used to execute a prepared SQL statement using SQLPrepare. The statement is executed using the current value of any application variables that were bound to parameter markers by SQLBindParameter.

Prototype

```
SQLRETURN SQLExecute(SQLHSTMT    StatementHandle);
```

Parameter

Table 21-26 SQLExecute parameters

Keyword	Parameter Description
StatementHandle	Statement handle to be executed.

Return Value

- **SQL_SUCCESS** indicates that the call succeeded.
- **SQL_SUCCESS_WITH_INFO** indicates that some warning information is displayed.
- **SQL_NEED_DATA** indicates that parameters provided before executing the SQL statement are insufficient.
- **SQL_ERROR** indicates major errors, such as memory allocation and connection failures.
- **SQL_NO_DATA** indicates that the SQL statement does not return a result set.
- **SQL_INVALID_HANDLE** indicates that invalid handles were called. This value may also be returned by other APIs.
- **SQL_STILL_EXECUTING** indicates that the statement is being executed.

Precautions

If SQLExecute returns **SQL_ERROR** or **SQL_SUCCESS_WITH_INFO**, the application can call **SQLGetDiagRec**, with **HandleType** and **Handle** set to **SQL_HANDLE_STMT** and **StatementHandle**, respectively, to obtain the **SQLSTATE** value. The **SQLSTATE** value provides the detailed function calling information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example

See **Examples**.

21.2.12 SQLFetch

Function

SQLFetch is used to advance the cursor to the next row of the result set and retrieve any bound columns.

Prototype

```
SQLRETURN SQLFetch(SQLHSTMT    StatementHandle);
```

Parameter

Table 21-27 SQLFetch parameters

Keyword	Parameter Description
StatementHandle	Statement handle, obtained from SQLAllocHandle.

Return Value

- **SQL_SUCCESS** indicates that the call succeeded.
- **SQL_SUCCESS_WITH_INFO** indicates that some warning information is displayed.
- **SQL_ERROR** indicates major errors, such as memory allocation and connection failures.
- **SQL_NO_DATA** indicates that the SQL statement does not return a result set.
- **SQL_INVALID_HANDLE** indicates that invalid handles were called. This value may also be returned by other APIs.
- **SQL_STILL_EXECUTING** indicates that the statement is being executed.

Precautions

If SQLFetch returns **SQL_ERROR** or **SQL_SUCCESS_WITH_INFO**, the application can call **SQLGetDiagRec**, with **HandleType** and **Handle** set to **SQL_HANDLE_STMT** and **StatementHandle**, respectively, to obtain the **SQLSTATE** value. The **SQLSTATE** value provides the detailed function calling information.

Example

See **Examples**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

21.2.13 SQLFreeStmt

In ODBC 3.x, SQLFreeStmt (an ODBC 2.x function) was deprecated and replaced by SQLFreeHandle. For details, see **SQLFreeHandle**.

21.2.14 SQLFreeConnect

In ODBC 3.x, SQLFreeConnect (an ODBC 2.x function) was deprecated and replaced by SQLFreeHandle. For details, see **SQLFreeHandle**.

21.2.15 SQLFreeHandle

Function

SQLFreeHandle is used to release resources associated with a specific environment, connection, or statement handle. It replaces the ODBC 2.x functions: SQLFreeEnv, SQLFreeConnect, and SQLFreeStmt.

Prototype

```
SQLRETURN SQLFreeHandle(SQLSMALLINT   HandleType,
                        SQLHANDLE     Handle);
```

Parameter

Table 21-28 SQLFreeHandle parameters

Keyword	Parameter Description
HandleType	Type of handle to be freed by SQLFreeHandle. The value must be one of the following: • SQL_HANDLE_ENV • SQL_HANDLE_DBC • SQL_HANDLE_STMT • SQL_HANDLE_DESC If **HandleType** is not one of the preceding values, SQLFreeHandle returns **SQL_INVALID_HANDLE**.
Handle	Name of the handle to be freed.

Return Value

- **SQL_SUCCESS** indicates that the call succeeded.
- **SQL_SUCCESS_WITH_INFO** indicates that some warning information is displayed.
- **SQL_ERROR** indicates major errors, such as memory allocation and connection failures.
- **SQL_INVALID_HANDLE** indicates that invalid handles were called. This value may also be returned by other APIs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

If SQLFreeHandle returns **SQL_ERROR**, the handle is still valid.

Example

See **Examples**.

21.2.16 SQLFreeEnv

In ODBC 3.x, SQLFreeEnv (an ODBC 2.x function) was deprecated and replaced by SQLFreeHandle. For details, see **SQLFreeHandle**.

21.2.17 SQLPrepare

Function

SQLPrepare is used to prepare an SQL statement to be executed.

Note that the prepared statements sent by ODBC do not support the kernel reuse plan. As a result, a new plan needs to be generated for each execution, causing high CPU usage. If services have requirements on plan reuse, you are advised to use the JDBC client.

Prototype

```
SQLRETURN SQLPrepare(SQLHSTMT      StatementHandle,
                     SQLCHAR       *StatementText,
                     SQLINTEGER    TextLength);
```

Parameter

Table 21-29 SQLPrepare parameters

Keyword	Parameter Description
StatementHandle	Statement handle.
StatementText	SQL text string.
TextLength	Length of **StatementText**.

Return Value

- **SQL_SUCCESS** indicates that the call succeeded.
- **SQL_SUCCESS_WITH_INFO** indicates that some warning information is displayed.
- **SQL_ERROR** indicates major errors, such as memory allocation and connection failures.
- **SQL_INVALID_HANDLE** indicates that invalid handles were called. This value may also be returned by other APIs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **SQL_STILL_EXECUTING** indicates that the statement is being executed.

Precautions

If SQLPrepare returns **SQL_ERROR** or **SQL_SUCCESS_WITH_INFO**, the application can call **SQLGetDiagRec**, with **HandleType** and **Handle** set to **SQL_HANDLE_STMT** and **StatementHandle**, respectively, to obtain the **SQLSTATE** value. The **SQLSTATE** value provides the detailed function calling information.

Example

See **Examples**.

21.2.18 SQLGetData

Function

SQLGetData is used to retrieve data for a single column in the result set. It can be called for many times to retrieve data of variable lengths.

Prototype

```
SQLRETURN SQLGetData(SQLHSTMT        StatementHandle,
                     SQLUSMALLINT    Col_or_Param_Num,
                     SQLSMALLINT     TargetType,
                     SQLPOINTER      TargetValuePtr,
                     SQLLEN          BufferLength,
                     SQLLEN          *StrLen_or_IndPtr);
```

Parameter

Table 21-30 SQLGetData parameters

Keyword	Parameter Description
StatementHandle	Statement handle, obtained from SQLAllocHandle.
Col_or_Param_Num	Column number for which the data retrieval is requested. The column number starts with 1 and increases in ascending order. The number of the bookmark column is 0.
TargetType	C data type in the TargetValuePtr buffer. If **TargetType** is **SQL_ARD_TYPE**, the driver uses the data type of the **SQL_DESC_CONCISE_TYPE** field in ARD. If **TargetType** is **SQL_C_DEFAULT**, the driver selects a default data type according to the source SQL data type.
TargetValuePtr	**Output parameter**: pointer to the pointer that points to the buffer where the data is located.
BufferLength	Size of the **TargetValuePtr** buffer.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Keyword	Parameter Description
StrLen_or_IndPtr	**Output parameter**: pointer to the buffer where the length or identifier value is returned.

Return Value

- **SQL_SUCCESS** indicates that the call succeeded.
- **SQL_SUCCESS_WITH_INFO** indicates that some warning information is displayed.
- **SQL_ERROR** indicates major errors, such as memory allocation and connection failures.
- **SQL_NO_DATA** indicates that the SQL statement does not return a result set.
- **SQL_INVALID_HANDLE** indicates that invalid handles were called. This value may also be returned by other APIs.
- **SQL_STILL_EXECUTING** indicates that the statement is being executed.

Precautions

If SQLGetData returns **SQL_ERROR** or **SQL_SUCCESS_WITH_INFO**, the application can call **SQLGetDiagRec**, with **HandleType** and **Handle** set to **SQL_HANDLE_STMT** and **StatementHandle**, respectively, to obtain the **SQLSTATE** value. The **SQLSTATE** value provides the detailed function calling information.

Example

See **Examples**.

21.2.19 SQLGetDiagRec

Function

SQLGetDiagRec is used to return the current values of multiple fields in a diagnostic record that contains error, warning, and status information.

Prototype

```
SQLRETURN  SQLGetDiagRec(SQLSMALLINT    HandleType
                         SQLHANDLE      Handle,
                         SQLSMALLINT    RecNumber,
                         SQLCHAR        *SQLState,
                         SQLINTEGER     *NativeErrorPtr,
                         SQLCHAR        *MessageText,
                         SQLSMALLINT    BufferLength
                         SQLSMALLINT    *TextLengthPtr);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter

Table 21-31 SQLGetDiagRec parameters

Keyword	Parameter Description
HandleType	A handle-type identifier that describes the type of handle for which diagnostics are desired. The value must be one of the following: • SQL_HANDLE_ENV • SQL_HANDLE_DBC • SQL_HANDLE_STMT • SQL_HANDLE_DESC
Handle	A handle for the diagnostic data structure. Its type is indicated by **HandleType**. If **HandleType** is **SQL_HANDLE_ENV**, **Handle** may be a shared or non-shared environment handle.
RecNumber	Status record from which the application seeks information. **RecNumber** starts with 1.
SQLState	**Output parameter**: pointer to a buffer that saves the 5-character **SQLSTATE** code pertaining to **RecNumber**.
NativeErrorPtr	**Output parameter**: pointer to a buffer that saves the native error code.
MessageText	Pointer to a buffer that saves text strings of diagnostic information.
BufferLength	Length of **MessageText**.
TextLengthPtr	**Output parameter**: pointer to the buffer, the total number of bytes in the returned **MessageText**. If the number of bytes available to return is greater than **BufferLength**, then the diagnostics information text in **MessageText** is truncated to **BufferLength** minus the length of the null termination character.

Return Value

- **SQL_SUCCESS** indicates that the call succeeded.
- **SQL_SUCCESS_WITH_INFO** indicates that some warning information is displayed.
- **SQL_ERROR** indicates major errors, such as memory allocation and connection failures.
- **SQL_INVALID_HANDLE** indicates that invalid handles were called. This value may also be returned by other APIs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

SQLGetDiagRec does not release diagnostic records for itself. It uses the following return values to report execution results:

- **SQL_SUCCESS** indicates that the function successfully returns diagnostic information.
- **SQL_SUCCESS_WITH_INFO** indicates that the ***MessageText** buffer is too small to hold the requested diagnostic information. No diagnostic records are generated.
- **SQL_INVALID_HANDLE** indicates that the handle indicated by **HandType** and **Handle** is an invalid handle.
- **SQL_ERROR** indicates that **RecNumber** is less than or equal to 0 or that **BufferLength** is smaller than 0.

If an ODBC function returns **SQL_ERROR** or **SQL_SUCCESS_WITH_INFO**, the application can call SQLGetDiagRec to obtain the **SQLSTATE** value. The possible **SQLSTATE** values are listed as follows:

Table 21-32 SQLSTATE values

SQLSATATE	Error	Description
HY000	General error.	An error occurred for which there is no specific SQLSTATE.
HY001	Memory allocation error.	The driver is unable to allocate memory required to support execution or completion of the function.
HY008	Operation canceled.	SQLCancel is called to terminate the statement execution, but the StatementHandle function is still called.
HY010	Function sequence error.	The function is called prior to sending data to data parameters or columns being executed.
HY013	Memory management error.	The function fails to be called. The error may be caused by low memory conditions.
HYT01	Connection timeout.	The timeout period expired before the application was able to connect to the data source.
IM001	Function not supported by the driver.	The called function is not supported by the StatementHandle driver.

Example

See **Examples**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

21.2.20 SQLSetConnectAttr

Function

SQLSetConnectAttr is used to set connection attributes.

Prototype

```
SQLRETURN SQLSetConnectAttr(SQLHDBC      ConnectionHandle
                            SQLINTEGER   Attribute,
                            SQLPOINTER   ValuePtr,
                            SQLINTEGER   StringLength);
```

Parameter

Table 21-33 SQLSetConnectAttr parameters

Keyword	Parameter Description
ConnectionHandle	Connection handle.
Attribute	Attribute to set.
ValuePtr	Pointer to the **Attribute** value. **ValuePtr** depends on the **Attribute** value, and can be a 32-bit unsigned integer value or a null-terminated string. If the **ValuePtr** parameter is a driver-specific value, it may be a signed integer.
StringLength	If **ValuePtr** points to a string or a binary buffer, **StringLength** is the length of ***ValuePtr**. If **ValuePtr** points to an integer, **StringLength** is ignored.

Return Value

- **SQL_SUCCESS** indicates that the call succeeded.
- **SQL_SUCCESS_WITH_INFO** indicates that some warning information is displayed.
- **SQL_ERROR** indicates major errors, such as memory allocation and connection failures.
- **SQL_INVALID_HANDLE** indicates that invalid handles were called. This value may also be returned by other APIs.

Precautions

If SQLSetConnectAttr returns **SQL_ERROR** or **SQL_SUCCESS_WITH_INFO**, the application can call **SQLGetDiagRec**, with **HandleType** and **Handle** set to **SQL_HANDLE_DBC** and **ConnectionHandle**, respectively, to obtain the **SQLSTATE** value. The **SQLSTATE** value provides the detailed function calling information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example

See **Examples**.

21.2.21 SQLSetEnvAttr

Function

SQLSetEnvAttr is used to set environment attributes.

Prototype

```
SQLRETURN SQLSetEnvAttr(SQLHENV      EnvironmentHandle
                        SQLINTEGER   Attribute,
                        SQLPOINTER   ValuePtr,
                        SQLINTEGER   StringLength);
```

Parameter

Table 21-34 SQLSetEnvAttr parameters

Keyword	Parameter Description
EnvironmentHandle	Environment handle.
Attribute	Environment attribute to be set. The value must be one of the following: • **SQL_ATTR_ODBC_VERSION**: ODBC version • **SQL_CONNECTION_POOLING**: connection pool attribute • **SQL_OUTPUT_NTS**: string type returned by the driver
ValuePtr	Pointer to the **Attribute** value. **ValuePtr** depends on the **Attribute** value, and can be a 32-bit integer value or a null-terminated string.
StringLength	If **ValuePtr** points to a string or a binary buffer, **StringLength** is the length of ***ValuePtr**. If **ValuePtr** points to an integer, **StringLength** is ignored.

Return Value

- **SQL_SUCCESS** indicates that the call succeeded.
- **SQL_SUCCESS_WITH_INFO** indicates that some warning information is displayed.
- **SQL_ERROR** indicates major errors, such as memory allocation and connection failures.
- **SQL_INVALID_HANDLE** indicates that invalid handles were called. This value may also be returned by other APIs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

If SQLSetEnvAttr returns **SQL_ERROR** or **SQL_SUCCESS_WITH_INFO**, the application can call **SQLGetDiagRec**, set **HandleType** and **Handle** to **SQL_HANDLE_ENV** and **EnvironmentHandle**, and obtain the **SQLSTATE** value. The **SQLSTATE** value provides the detailed function calling information.

Example

See **Examples**.

21.2.22 SQLSetStmtAttr

Function

SQLSetStmtAttr is used to set attributes related to a statement.

Prototype

```
SQLRETURN SQLSetStmtAttr(SQLHSTMT      StatementHandle
                         SQLINTEGER    Attribute,
                         SQLPOINTER    ValuePtr,
                         SQLINTEGER    StringLength);
```

Parameter

Table 21-35 SQLSetStmtAttr parameters

Keyword	Parameter Description
StatementHandle	Statement handle.
Attribute	Attribute to set.
ValuePtr	Pointer to the **Attribute** value. **ValuePtr** depends on the **Attribute** value, and can be a 32-bit unsigned integer value or a pointer to a null-terminated string, a binary buffer, or a driver-specified value. If the **ValuePtr** parameter is a driver-specific value, it may be a signed integer.
StringLength	If **ValuePtr** points to a string or a binary buffer, **StringLength** is the length of ***ValuePtr**. If **ValuePtr** points to an integer, **StringLength** is ignored.

Return Value

- **SQL_SUCCESS** indicates that the call succeeded.
- **SQL_SUCCESS_WITH_INFO** indicates that some warning information is displayed.
- **SQL_ERROR** indicates major errors, such as memory allocation and connection failures.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **SQL_INVALID_HANDLE** indicates that invalid handles were called. This value may also be returned by other APIs.

Precautions

If SQLSetStmtAttr returns **SQL_ERROR** or **SQL_SUCCESS_WITH_INFO**, the application can call **SQLGetDiagRec**, with **HandleType** and **Handle** set to **SQL_HANDLE_STMT** and **StatementHandle**, respectively, to obtain the **SQLSTATE** value. The **SQLSTATE** value provides the detailed function calling information.

Example

See **Examples**.

21.3 libpq Interface Reference

21.3.1 Database Connection Control Functions

Database connection control functions control the connections to GaussDB servers. An application can connect to multiple servers at a time. For example, a client connects to multiple databases. Each connection is represented by a PGconn object, which is obtained from the function PQconnectdb, PQconnectdbParams, or PQsetdbLogin. Note that these functions will always return a non-null object pointer, unless there is too little memory to allocate the PGconn object. The interface for establishing a connection is stored in the PGconn object. The PQstatus function can be called to check the return value for a successful connection.

21.3.1.1 PQconnectdbParams

Function

PQconnectdbParams is used to establish a new connection with the database server.

Prototype

```
PGconn *PQconnectdbParams(const char * const *keywords,
                          const char * const *values,
                          int expand_dbname);
```

Parameter

Table 21-36 PQconnectdbParams parameters

Keyword	Parameter Description
keywords	An array of strings, each of which is a keyword.
values	Value assigned to each keyword.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Keyword	Parameter Description
expand_dbname	When **expand_dbname** is non-zero, the **dbname** keyword value can be recognized as a connection string. Only **dbname** that first appears is expanded in this way, and any subsequent **dbname** value is treated as a database name.

Return Value

PGconn * points to the object pointer that contains a connection. The memory is applied for by the function internally.

Precautions

This function establishes a new database connection using the parameters taken from two NULL-terminated arrays. Unlike PQsetdbLogin, the parameter set can be extended without changing the function signature. Therefore, use of this function (or its non-blocking analogs PQconnectStartParams and PQconnectPoll) is preferred for new application programming.

Example

For details, see **Example**.

21.3.1.2 PQconnectdb

Function

PQconnectdb is used to establish a new connection with the database server.

Prototype

```
PGconn *PQconnectdb(const char *conninfo);
```

Parameter

Table 21-37 PQconnectdb parameter

Keyword	Parameter Description
conninfo	Connection string. For details about the fields in the string, see **Connection Strings**.

Return Value

PGconn * points to the object pointer that contains a connection. The memory is applied for by the function internally.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- This function establishes a new database connection using the parameters taken from the string **conninfo**.
- The input parameter can be empty, indicating that all default parameters can be used. It can also contain one or more parameters separated by spaces or it can contain a URL.

Example

For details, see **Example**.

21.3.1.3 PQbackendPID

Supplementary Explanation

After GaussDB is multi-thread refactored based on PostgreSQL, the semantic of PQbackendPID is different from that in the native PostgreSQL libpq. In GaussDB, the return value of the PQbackendPID function indicates the slot ID of the background thread, not the backend PID of the background thread. Due to the preceding difference, you are not advised to execute this function by following the PostgreSQL semantics. To obtain the backend PID of the connection, you can use the pg_backend_pid system function. In addition, other driver APIs which depend on libpq and have the same names as PostgreSQL's APIs (such as the get_backend_pid function of the Python connection driver psycopg2) also comply with the preceding rule.

21.3.1.4 PQsetdbLogin

Function

PQsetdbLogin is used to establish a new connection with the database server.

Prototype

```
PGconn *PQsetdbLogin(const char *pghost,
                     const char *pgport,
                     const char *pgoptions,
                     const char *pgtty,
                     const char *dbName,
                     const char *login,
                     const char *pwd);
```

Parameter

Table 21-38 PQsetdbLogin parameters

Keyword	Parameter Description
pghost	Name of the host to be connected. For details, see the **host** field described in **Link Parameters**.
pgport	Port number of the host server. For details, see the **port** field described in **Link Parameters**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Keyword	Parameter Description
pgoptions	Command-line options to be sent to the server during running. For details, see the **options** field described in **Link Parameters**.
pgtty	This field can be ignored. (Previously, this field declares the output direction of server logs.)
dbName	Name of the database to be connected. For details, see the **dbname** field described in **Link Parameters**.
login	Username for connection. For details, see the **user** field described in **Link Parameters**.
pwd	Password used for authentication during connection. For details, see the **password** field described in **Link Parameters**.

Return Value

PGconn * points to the object pointer that contains a connection. The memory is applied for by the function internally.

Precautions

- This function is the predecessor of PQconnectdb with a fixed set of parameters. When an undefined parameter is called, its default value is used. Write NULL or an empty string for any one of the fixed parameters that is to be defaulted.
- If the **dbName** value contains an = sign or a valid prefix in the connection URL, it is taken as a conninfo string and passed to PQconnectdb, and the remaining parameters are consistent with PQconnectdbParams parameters.

Example

For details, see **Example**.

21.3.1.5 PQfinish

Function

PQfinish is used to close the connection to the server and release the memory used by the PGconn object.

Prototype

```
void PQfinish(PGconn *conn);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter

Table 21-39 PQfinish parameter

Keyword	Parameter Description
conn	Points to the object pointer that contains the connection information.

Precautions

If the server connection attempt fails (as indicated by PQstatus), the application should call PQfinish to release the memory used by the PGconn object. The PGconn pointer must not be used again after PQfinish has been called.

Example

For details, see **Example**.

21.3.1.6 PQreset

Function

PQreset is used to reset the communication port to the server.

Prototype

```
void PQreset(PGconn *conn);
```

Parameter

Table 21-40 PQreset parameter

Keyword	Parameter Description
conn	Points to the object pointer that contains the connection information.

Precautions

This function will close the connection to the server and attempt to establish a new connection to the same server by using all the parameters previously used. This function is applicable to fault recovery after a connection exception occurs.

Example

For details, see **Example**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

21.3.1.7 PQstatus

Function

PQstatus is used to return the connection status.

Prototype

```
ConnStatusType PQstatus(const PGconn *conn);
```

Parameter

Table 21-41 PQ status parameter

Keyword	Parameter Description
conn	Points to the object pointer that contains the connection information.

Return Value

ConnStatusType indicates the connection status. The enumerated values are as follows:

```
CONNECTION_STARTED
Waiting for the connection to be established.

CONNECTION_MADE
Connection succeeded; waiting to send

CONNECTION_AWAITING_RESPONSE
Waiting for a response from the server.

CONNECTION_AUTH_OK
Authentication received; waiting for backend startup to complete.

CONNECTION_SSL_STARTUP
Negotiating SSL encryption.

CONNECTION_SETENV
Negotiating environment-driven parameter settings.

CONNECTION_OK
Normal connection.

CONNECTION_BAD
Failed connection.
```

Precautions

The connection status can be one of the preceding values. After the asynchronous connection procedure is complete, only two of them, **CONNECTION_OK** and **CONNECTION_BAD**, can return. **CONNECTION_OK** indicates that the connection to the database is normal. **CONNECTION_BAD** indicates that the connection attempt fails. Generally, the **CONNECTION_OK** state remains until PQfinish is called. However, a communication failure may cause the connection status to become to **CONNECTION_BAD** before the connection procedure is complete. In

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

this case, the application can attempt to call PQreset to restore the communication.

Example

For details, see **Example**.

21.3.2 Database Statement Execution Functions

After the connection to the database server is successfully established, you can use the functions described in this section to execute SQL queries and commands.

21.3.2.1 PQexec

Function

PQexec is used to submit a command to the server and wait for the result.

Prototype

```
PGresult *PQexec(PGconn *conn, const char *command);
```

Parameter

Table 21-42 PQexec parameters

Keyword	Parameter Description
conn	Points to the object pointer that contains the connection information.
command	Query string to be executed.

Return Value

PGresult indicates the object pointer that contains the query result.

Precautions

The PQresultStatus function should be called to check the return value for any errors (including the value of a null pointer, in which **PGRES_FATAL_ERROR** will be returned). The PQerrorMessage function can be called to obtain more information about such errors.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

The command string can contain multiple SQL commands separated by semicolons (;). Multiple queries sent in a PQexec call are processed in one transaction, unless there are specific BEGIN/COMMIT commands in the query string to divide the string into multiple transactions. Note that the returned PGresult structure describes only the result of the last command executed from the string. If a command fails, the string processing stops and the returned PGresult describes the error condition.

Example

For details, see **Example**.

21.3.2.2 PQprepare

Function

PQprepare is used to submit a request to create a prepared statement with given parameters and wait for completion.

Prototype

```
PGresult *PQprepare(PGconn *conn,
                    const char *stmtName,
                    const char *query,
                    int nParams,
                    const Oid *paramTypes);
```

Parameter

Table 21-43 PQprepare parameters

Keyword	Parameter Description
conn	Points to the object pointer that contains the connection information.
stmtName	Prepared statement to be executed.
query	Query string to be executed.
nParams	Parameter quantity.
paramTypes	Array of the parameter type.

Return Value

PGresult indicates the object pointer that contains the query result.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- PQprepare creates a prepared statement for later execution with PQexecPrepared. This function allows commands to be repeatedly executed, without being parsed and planned each time they are executed. PQprepare is supported only in protocol 3.0 or later. It will fail when protocol 2.0 is used.
- This function creates a prepared statement named **stmtName** from the query string, which must contain an SQL command. **stmtName** can be **""** to create an unnamed statement. In this case, any pre-existing unnamed statement will be automatically replaced. Otherwise, this is an error if the statement name has been defined in the current session. If any parameters are used, they are referred to in the query as $1, $2, and so on. **nParams** is the number of parameters for which types are pre-specified in the array paramTypes[]. (The array pointer can be NULL when **nParams** is **0**.) paramTypes[] specifies the data types to be assigned to the parameter symbols by OID. If **paramTypes** is NULL, or any element in the array is **0**, the server assigns a data type to the parameter symbol in the same way as it does for an untyped literal string. In addition, the query can use parameter symbols whose numbers are greater than **nParams**. Data types of these symbols will also be inferred.

NOTICE

You can also execute the SQLPREPARE statement to create a prepared statement that is used with PQexecPrepared. Although there is no libpq function of deleting a prepared statement, the SQL DEALLOCATE statement can be used for this purpose.

Example

For details, see **Example**.

21.3.2.3 PQresultStatus

Function

PQresultStatus is used to return the result status of a command.

Prototype

```
ExecStatusType PQresultStatus(const PGresult *res);
```

Parameter

Table 21-44 PQresultStatus parameter

Keyword	Parameter Description
res	Object pointer that contains the query result.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return Value

PQresultStatus indicates the command execution status. The enumerated values are as follows:

```
PQresultStatus can return one of the following values:
PGRES_EMPTY_QUERY
The string sent to the server was empty.

PGRES_COMMAND_OK
A command that does not return data was successfully executed.

PGRES_TUPLES_OK
A query (such as SELECT or SHOW) that returns data was successfully executed.

PGRES_COPY_OUT
Copy Out (from the server) data transfer started.

PGRES_COPY_IN
Copy In (to the server) data transfer started.

PGRES_BAD_RESPONSE
The response from the server cannot be understood.

PGRES_NONFATAL_ERROR
A non-fatal error (notification or warning) occurred.

PGRES_FATAL_ERROR
A fatal error occurred.

PGRES_COPY_BOTH
Copy In/Out (to and from the server) data transfer started. This state occurs only in streaming replication.

PGRES_SINGLE_TUPLE
PGresult contains a result tuple from the current command. This state occurs in a single-row query.
```

Precautions

- Note that the SELECT command that happens to retrieve zero rows still returns **PGRES_TUPLES_OK**. **PGRES_COMMAND_OK** is used for commands that can never return rows (such as INSERT or UPDATE, without return clauses). The result status **PGRES_EMPTY_QUERY** might indicate a bug in the client software.
- The result status P**GRES_NONFATAL_ERROR** will never be returned directly by PQexec or other query execution functions. Instead, such results will be passed to the notice processor.

Example

For details, see **Example**.

21.3.2.4 PQclear

Function

PQclear is used to release the storage associated with PGresult. Any query result should be released by PQclear when it is no longer needed.

Prototype

```
void PQclear(PGresult *res);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter

Table 21-45 PQclear parameter

Keyword	Parameter Description
res	Object pointer that contains the query result.

Precautions

PGresult is not automatically released. That is, it does not disappear when a new query is submitted or even if you close the connection. To delete it, you must call PQclear. Otherwise, memory leakage occurs.

Example

For details, see **Example**.

21.3.3 Functions for Asynchronous Command Processing

The PQexec function is adequate for committing commands in common, synchronous applications. However, it has several defects, which may be important to some users:

- PQexec waits for the end of the command, but the application may have other work to do (for example, maintaining a user interface). In this case, PQexec would not want to be blocked to wait for the response.
- As the client application is suspended while waiting for the result, it is difficult for the application to determine whether to cancel the ongoing command.
- PQexec can return only one PGresult structure. If the committed command string contains multiple SQL commands, all the PGresult structures except the last PGresult are discarded by PQexec.
- PQexec always collects the entire result of the command and caches it in a PGresult. Although this mode simplifies the error handling logic for applications, it is impractical for results that contain multiple rows.

Applications that do not want to be restricted by these limitations can use the following functions built from PQexec: PQsendQuery and PQgetResult. The functions PQsendQueryParams, PQsendPrepare, and PQsendQueryPrepared can also be used with PQgetResult.

21.3.3.1 PQsendQuery

Function

PQsendQuery is used to submit a command to the server without waiting for the result. If the query is successful, **1** is returned. Otherwise, **0** is returned.

Prototype

```
int PQsendQuery(PGconn *conn, const char *command);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter

Table 21-46 PQsendQuery parameters

Keyword	Parameter Description
conn	Points to the object pointer that contains the connection information.
command	Query string to be executed.

Return Value

int indicates the execution result. **1** indicates successful execution and **0** indicates an execution failure. The failure cause is stored in **conn->errorMessage**.

Precautions

After PQsendQuery is successfully called, call PQgetResult one or more times to obtain the results. PQsendQuery cannot be called again (on the same connection) until PQgetResult returns a null pointer, indicating that the command execution is complete.

Example

For details, see **Example**.

21.3.3.2 PQsendQueryParams

Function

PQsendQueryParams is used to submit a command and separate parameters to the server without waiting for the result.

Prototype

```
int PQsendQueryParams(PGconn *conn,
                      const char *command,
                      int nParams,
                      const Oid *paramTypes,
                      const char * const *paramValues,
                      const int *paramLengths,
                      const int *paramFormats,
                      int resultFormat);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter

Table 21-47 PQsendQueryParams parameters

Keyword	Parameter Description
conn	Points to the object pointer that contains the connection information.
command	Query string to be executed.
nParams	Parameter quantity.
paramTypes	Parameter type.
paramValues	Parameter value.
paramLengths	Parameter length.
paramFormats	Parameter format.
resultFormat	Result format.

Return Value

int indicates the execution result. **1** indicates successful execution and **0** indicates an execution failure. The failure cause is stored in **conn->errorMessage**.

Precautions

PQsendQueryParams is equivalent to PQsendQuery. The only difference is that query parameters can be specified separately from the query string. PQsendQueryParams parameters are handled in the same way as PQexecParams parameters. Like PQexecParams, PQsendQueryParams cannot work on connections using protocol v2.0 and it allows only one command in the query string.

Example

For details, see **Example**.

21.3.3.3 PQsendPrepare

Function

PQsendPrepare is used to send a request to create a prepared statement with given parameters, without waiting for completion.

Prototype

```
int PQsendPrepare(PGconn *conn,
                  const char *stmtName,
                  const char *query,
                  int nParams,
                  const Oid *paramTypes);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter

Table 21-48 PQsendPrepare parameters

Keyword	Parameter Description
conn	Points to the object pointer that contains the connection information.
stmtName	Prepared statement to be executed.
query	Query string to be executed.
nParams	Parameter quantity.
paramTypes	Array of the parameter type.

Return Value

int indicates the execution result. **1** indicates successful execution and **0** indicates an execution failure. The failure cause is stored in **conn->errorMessage**.

Precautions

PQsendPrepare is an asynchronous version of PQprepare. If it can dispatch a request, **1** is returned. Otherwise, **0** is returned. After a successful calling of PQsendPrepare, call PQgetResult to check whether the server successfully created the prepared statement. PQsendPrepare parameters are handled in the same way as PQprepare parameters. Like PQprepare, PQsendPrepare cannot work on connections using protocol v2.0.

Example

For details, see **Example**.

21.3.3.4 PQsendQueryPrepared

Function

PQsendQueryPrepared is used to send a request to execute a prepared statement with given parameters, without waiting for the result.

Prototype

```
int PQsendQueryPrepared(PGconn *conn,
                        const char *stmtName,
                        int nParams,
                        const char * const *paramValues,
                        const int *paramLengths,
                        const int *paramFormats,
                        int resultFormat);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter

Table 21-49 PQsendQueryPrepared parameters

Keyword	Parameter Description
conn	Points to the object pointer that contains the connection information.
stmtName	Prepared statement to be executed.
nParams	Parameter type.
paramValues	Parameter value.
paramLengths	Parameter length.
paramFormats	Parameter format.
resultFormat	Result format.

Return Value

int indicates the execution result. **1** indicates successful execution and **0** indicates an execution failure. The failure cause is stored in **conn->errorMessage**.

Precautions

PQsendQueryPrepared is similar to PQsendQueryParams, but the command to be executed is specified by naming a previously-prepared statement, instead of providing a query string. PQsendQueryPrepared parameters are handled in the same way as PQexecPrepared parameters. Like PQexecPrepared, PQsendQueryPrepared cannot work on connections using protocol v2.0.

Example

For details, see **Example**.

21.3.3.5 PQflush

Function

PQflush is used to try to flush any queued output data to the server.

Prototype

```
int PQflush(PGconn *conn);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter

Table 21-50 PQflush parameter

Keyword	Parameter Description
conn	Points to the object pointer that contains the connection information.

Return Value

int indicates the operation result. If the operation is successful (or the send queue is empty), **0** is returned. If the operation fails, **-1** is returned. If all data in the send queue fails to be sent, **1** is returned. (This case occurs only when the connection is non-blocking.) The failure cause is stored in **conn->error_message**.

Precautions

Call PQflush after sending any command or data over a non-blocking connection. If **1** is returned, wait for the socket to become read- or write-ready. If the socket becomes write-ready, call PQflush again. If the socket becomes read-ready, call PQconsumeInput and then call PQflush again. Repeat the operation until the value **0** is returned for PQflush. (It is necessary to check for read-ready and drain the input using PQconsumeInput. This is because the server can block trying to send us data, for example, notification messages, and will not read our data until we read it.) Once PQflush returns **0**, wait for the socket to be read-ready and then read the response as described above.

Example

For details, see **Example**.

21.3.4 Functions for Canceling Queries in Progress

A client application can use the functions described in this section to cancel a command that is still being processed by the server.

21.3.4.1 PQgetCancel

Function

PQgetCancel is used to create a data structure that contains the information required to cancel a command issued through a specific database connection.

Prototype

```
PGcancel *PQgetCancel(PGconn *conn);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter

Table 21-51 PQgetCancel parameter

Keyword	Parameter Description
conn	Points to the object pointer that contains the connection information.

Return Value

PGcancel points to the object pointer that contains the cancel information.

Precautions

PQgetCancel creates a PGcancel object for a given PGconn connection object. If the given connection object (**conn**) is NULL or an invalid connection, PQgetCancel will return NULL. The PGcancel object is an opaque structure that cannot be directly accessed by applications. It can be transferred only to PQcancel or PQfreeCancel.

Example

For details, see **Example**.

21.3.4.2 PQfreeCancel

Function

PQfreeCancel is used to release the data structure created by PQgetCancel.

Prototype

```
void PQfreeCancel(PGcancel *cancel);
```

Parameter

Table 21-52 PQfreeCancel parameter

Keyword	Parameter Description
cancel	Points to the object pointer that contains the cancel information.

Precautions

PQfreeCancel releases a data object previously created by PQgetCancel.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example

For details, see **Example**.

21.3.4.3 PQcancel

Function

PQcancel is used to request the server to abandon processing of the current command.

Prototype

```
int PQcancel(PGcancel *cancel, char *errbuf, int errbufsize);
```

Parameter

Table 21-53 PQcancel parameters

Keyword	Parameter Description
cancel	Points to the object pointer that contains the cancel information.
errbuf	Buffer for storing error information.
errbufsize	Size of the buffer for storing error information.

Return Value

int indicates the execution result. **1** indicates successful execution and **0** indicates an execution failure. The failure cause is stored in **errbuf**.

Precautions

- Successful sending does not guarantee that the request will have any effect. If the cancellation is valid, the current command is terminated early and an error is returned. If the cancellation fails (for example, because the server has processed the command), no result is returned.
- If **errbuf** is a local variable in a signal handler, you can safely call PQcancel from the signal handler. For PQcancel, the PGcancel object is read-only, so it can also be called from a thread that is separate from the thread that is operating the PGconn object.

Example

For details, see **Example**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

21.4 Psycopg API Reference

Psycopg APIs are a set of methods provided for users. This section describes some common APIs.

21.4.1 psycopg2.connect()

Function

This method creates a database session and returns a new connection object.

Prototype

```
import os
conn=psycopg2.connect(dbname="test",user=os.getenv('user'),password=os.getenv('password'),host="127.0.0.1",port="5432")
```

Parameter

Table 21-54 psycopg2.connect parameters

Keyword	Description
dbname	Database name.
user	Username.
password	Password.
host	Database IP address. The default type is UNIX socket.
port	Connection port number. The default value is **5432**.
sslmode	SSL mode, which is used for SSL connection.
sslcert	Path of the client certificate, which is used for SSL connection.
sslkey	Path of the client key, which is used for SSL connection.
sslrootcert	Path of the root certificate, which is used for SSL connection.
hostaddr	IP address of the database
connect_timeout	Client connection timeout interval
client_encoding	Encoding format of the client
application_name	Value of **application_name**.
fallback_application_name	Rollback value of **application_name**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Keyword	Description
keepalives	Determines whether to enable the TCP connection on the client. The default value is **1**, indicating that the TCP connection is enabled. The value **0** indicates that the TCP connection is disabled. If the UNIX domain socket connection is used, ignore this parameter.
options	Specifies the command line options sent to the server when the connection starts.
keepalives_idle	Describes inactivity before keepalive messages are sent to the server. If **keepalive** is disabled, ignore this parameter.
keepalives_interval	Determines whether keepalive messages that are not confirmed by the server need to be resent. If **keepalive** is disabled, ignore this parameter.
keepalives_count	Specifies the number of TCP connections that may be lost before the client is disconnected from the server.
replication	Ensures that the connection uses the replication protocol instead of the common protocol.
requiressl	Supports the SSL mode.
sslcompression	Specifies the SSL compression. If this parameter is set to **1**, the data sent through the SSL connection is compressed. If this parameter is set to **0**, the compression is disabled. If no SSL connection is established, ignore this parameter.
sslcrl	Specifies the path of the certificate revocation list (CRL), which is used to check whether the SSL server certificate is available.
requirepeer	Specifies the OS username of the server.

Return Value

Connection object (for connecting to the PostgreSQL DB instance).

Example

For details, see **Example: Common Operations**.

21.4.2 connection.cursor()

Function

This method returns a new cursor object.

Prototype

```
cursor(name=None, cursor_factory=None, scrollable=None, withhold=False)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter

Table 21-55 connection.cursor parameters

Keyword	Description
name	Cursor name. The default value is **None**.
cursor_factory	Creates a non-standard cursor. The default value is **None**.
scrollable	Sets the SCROLL option. The default value is **None**.
withhold	Sets the HOLD option. The default value is **False**.

Return Value

Cursor object (used for cusors that are programmed using Python in the entire database)

Example

For details, see **Example: Common Operations**.

21.4.3 cursor.execute(query,vars_list)

Function

This method executes the parameterized SQL statements (that is, placeholders instead of SQL literals). The psycopg2 module supports placeholders marked with **%s**.

Prototype

```
cursor.execute(query,vars_list)
```

Parameter

Table 21-56 cursor.execute parameters

Keyword	Description
query	SQL statement to be executed.
vars_list	Variable list, which matches the **%s** placeholder in the query.

Return Value

None

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example

For details, see **Example: Common Operations**.

21.4.4 cursor.executemany(query,vars_list)

Function

This method executes an SQL command against all parameter sequences or mappings found in the sequence SQL.

Prototype

```
cursor.executemany(query,vars_list)
```

Parameter

Table 21-57 cursor.executemany parameters

Keyword	Description
query	SQL statement that you want to execute.
vars_list	Variable list, which matches the **%s** placeholder in the query.

Return Value

None

Example

For details, see **Example: Common Operations**.

21.4.5 connection.commit()

Function

This method commits the currently pending transaction to the database.

CAUTION

By default, Psycopg opens a transaction before executing the first command. If **commit()** is not called, the effect of any data operation will be lost.

Prototype

```
connection.commit()
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter

None

Return Value

None

Example

For details, see **Example: Common Operations**.

21.4.6 connection.rollback()

Function

This method rolls back the current pending transaction.

> **CAUTION**
>
> If you close the connection using **close()** but do not commit the change using **commit()**, an implicit rollback will be performed.

Prototype

```
connection.rollback()
```

Parameter

None

Return Value

None

Example

For details, see **Example: Common Operations**.

21.4.7 cursor.fetchone()

Function

This method extracts the next row of the query result set and returns a tuple.

Prototype

```
cursor.fetchone()
```

Parameter

None

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return Value

A single tuple is the first result in the result set. If no more data is available, **None** is returned.

Example

For details, see **Example: Common Operations**.

21.4.8 cursor.fetchall()

Function

This method gets all the (remaining) rows of the query result and returns them as a list of tuples.

Prototype

```
cursor.fetchall()
```

Parameter

None

Return Value

Tuple list, which contains all results of the result set. An empty list is returned when no rows are available.

Example

For details, see **Example: Common Operations**.

21.4.9 cursor.close()

Function

This method closes the cursor of the current connection.

Prototype

```
cursor.close()
```

Parameter

None

Return Value

None

Example

For details, see **Example: Common Operations**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

21.4.10 connection.close()

Function

This method closes the database connection.

> **CAUTION**
>
> This method closes the database connection and does not automatically call **commit()**. If you just close the database connection without calling **commit()** first, changes will be lost.

Prototype

```
connection.close()
```

Parameter

None

Return Value

None

Example

For details, see **Example: Common Operations**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.
