The following table lists the functions used by GaussDB to implement internal system functions. You are advised not to use these functions. If you need to use them, contact Huawei technical support.

- **smgreq(a smgr, b smgr)**
Description: Compares two smgrs to check whether they are the same.
Parameter: smgr, smgr
Return type: Boolean
- **smgrne(a smgr, b smgr)**
Description: Checks whether the two smgrs are different.

Parameter: smgr, smgr

Return type: Boolean

- spread_collect

Description: Calculates the difference between the maximum and minimum values in a certain period of time. This function is used for data collection of aggregate functions.

Parameters: s real[], v real[]

Return type: real[]

- spread_final

Description: Calculates the difference between the maximum and minimum values in a certain period of time. This function is used for the final data processing of the aggregate function.

Parameter: s real[]

Return type: real

- spread_internal

Description: Calculates the difference between the maximum and minimum values in a certain period of time. This function is used for the process of aggregate functions.

Parameters: s real[], v real

Return type: real[]

- xidin4

Description: Inputs a 4-byte xid.

Parameter:cstring

Return type: xid32

- set_hashbucket_info

Description: Sets hash bucket information.

Parameter: text

Return type: Boolean

- gap_fill_internal

Description: Returns the first non-NULL value in the parameter list.

Parameter: s anyelement, v anyelement

Return type: anyelement

- int1send

Description: Packs unsigned 1-byte integers into the internal data buffer stream.

Parameter: tinyint

Return type: bytea

- is_contain_namespace

Description: Searches for the table name and namespace split location. If no namespace exists, 0 is returned.

Parameter: relationname name

Return type: integer

- `is_oid_in_group_members`
Description: Not supported
Parameter: `node_oid oid`, `group_members oidvector_extend`
Return type: Boolean
- `isubmit_on_nodes_internal`
Description: Not supported
Parameter: `job bigint`, `node_name name`, `database name`, `what text`, `next_date timestamp without time zone`, `job_interval text`
Return type: integer
- `listagg`
Description: Specifies aggregate functions of the list type.
Parameter: `smallint`, `text`
Return type: text
- `log_fdw_validator`
Description: Specifies validation functions.
Parameter: `text[]`, `oid`
Return type: void
- `nvarchar2typmodin`
Description: Obtains the typmod information of the varchar type.
Parameter: `cstring[]`
Return type: integer
- `nvarchar2typmodout`
Description: Obtains the typmod information of the varchar type, constructs a character string, and returns the character string.
Parameter: `integer`
Return type: `cstring`
- `pg_nodes_memmon`
Description: Not supported
Parameter: `nan`
Return type: `innernname text`, `innerusedmem bigint`, `innertopctxt bigint`, `nname text`, `usedmem text`, `sharedbuffercache text`, `topcontext text`
- `read_disable_conn_file`
Description: Reads forbidden connection files.
Parameter: `nan`
Return type: `disconn_mode text`, `disconn_host text`, `disconn_port text`, `local_host text`, `local_port text`, `redo_finished text`
- `regex_like_m`
Description: Specifies the regular expression match, which is used to determine whether a character string complies with a specified regular expression.
Parameter: `text`, `text`
Return type: Boolean

- `update_pgjob`
Description: Updates a job.
Parameter: bigint, "char", bigint, timestamp without time zone, timestamp without time zone, timestamp without time zone, timestamp without time zone, timestamp without time zone, smallint, text
Return type: void
- `enum_cmp`
Description: Specifies the enumeration comparison function, which is used to determine whether two enumeration classes are equal and determine their relative sizes.
Parameter: anyenum, anyenum
Return type: integer
- `enum_eq`
Description: Specifies the enumeration comparison function, which is used to implement the equal sign (=).
Parameter: anyenum, anyenum
Return type: Boolean
- `enum_first`
Description: Returns the first element in the enumeration class.
Parameter: anyenum
Return type: anyenum
- `enum_ge`
Description: Specifies the enumeration comparison function, which is used to implement the greater-than sign (>) and equal sign (=).
Parameter: anyenum, anyenum
Return type: Boolean
- `enum_gt`
Description: Specifies the enumeration comparison function, which is used to implement the greater-than sign (>).
Parameter: anyenum, anyenum
Return type: Boolean
- `enum_in`
Description: Specifies the enumeration comparison function, which is used to determine whether an element is in an enumeration class.
Parameter: cstring, oid
Return type: anyenum
- `enum_larger`
Description: Specifies the enumeration comparison function, which is used to implement the greater-than sign (>).
Parameter: anyenum, anyenum
Return type: anyenum
- `enum_last`
Description: Returns the last element in the enumeration class.

Parameter: anyenum

Return type: anyenum

- enum_le

Description: Specifies the enumeration comparison function, which is used to implement the less-than sign (<) and equal sign (=).

Parameter: anyenum, anyenum

Return type: Boolean

- enum_lt

Description: Specifies the enumeration comparison function, which is used to implement the less-than sign (<).

Parameter: anyenum, anyenum

Return type: Boolean

- enum_smaller

Description: Specifies the enumeration comparison function, which is used to implement the less-than sign (<).

Parameter: anyenum, anyenum

Return type: Boolean

- node_oid_name

Description: Not supported

Parameter: oid

Return type: cstring

- pg_buffercache_pages

Description: Reads data from the shared buffer.

Parameter: nan

Return type: bufferid integer, relfilenode oid, bucketid smallint, storage_type oid, reltablespace oid, reldatabase oid, relforknumber smallint, relblocknumber bigint, isdirty boolean, and usage_count smallint

- pg_check_xidlimit

Description: Checks whether nextxid is greater than or equal to xidwarnlimit.

Parameter: nan

Return type: Boolean

- pg_comm_delay

Description: Displays the delay status of the communications library of a single DN.

Parameter: nan

Return type: text, text, integer, integer, integer, integer

- pg_comm_rcv_stream

Description: Displays the receiving stream status of all communication libraries on a single DN.

Parameter: nan

Return type: text, bigint, text, bigint, integer, integer, integer, text, bigint, integer, integer, integer, bigint, bigint, bigint, bigint

- `pg_comm_send_stream`
Description: Displays the sending stream status of all communication libraries on a single DN.
Parameter: nan
Return type: text, bigint, text, bigint, integer, integer, integer, text, bigint, integer, integer, integer, bigint, bigint, bigint, bigint
- `pg_comm_status`
Description: Displays the communication status of a single DN.
Parameter: nan
Return type: text, integer, integer, bigint, bigint, bigint, bigint, bigint, integer, integer, integer, integer
- `pg_log_comm_status`
Description: Prints some logs on the DN.
Parameter: nan
Return type: Boolean
- `pg_parse_clog`
Description: Parses clog to obtain the status of xid.
Parameter: nan
Return type: xid xid, status text
- `pg_pool_ping`
Description: Sets PoolerPing.
Parameter: Boolean
Return type: SETOF boolean
- `pg_pool_validate`
Description: Compares fields in the **pgxc_node** system catalog to check whether a connection is available.
Parameter: clear boolean, co_node_name cstring
Return type: pid bigint, node_name text
- `pg_resume_bkp_flag`
Description: Obtains the delay xlong flag for backup and restoration.
Parameter: slot_name name
Return type: start_backup_flag boolean, to_delay boolean, ddl_delay_recycle_ptr text, rewind_time text
- `pg_stat_get_pooler_status`
Description: Queries the cache connection status in the pooler.
Parameter: nan
Return type: text, text, bigint, text, bigint, boolean, text, bigint, bigint, bigint, bigint, bigint

Table 7-128 PG_STAT_GET_POOLER_STATUS columns

Name	Type	Description
database_name	text	Database name
user_name	text	Username
tid	bigint	In non-thread pool logic, this parameter indicates the ID of the thread connected to the CN. In thread pool logic, this parameter indicates the ID of the session connected to the CN.
pgoptions	text	Database connection option. For details, see the options column in Connection Parameters .
node_oid	bigint	OID of the node connected
in_use	boolean	Specifies whether the connection is currently used. <ul style="list-style-type: none">• t (true): The connection is in use.• f (false): The connection is not in use.
session_params	text	GUC session parameter delivered by the connection
fdsock	bigint	Local socket
remote_pid	bigint	Peer thread ID
used_count	bigint	Number of reuse times of a connection
idx	bigint	Peer DN ID in the local CN
streamid	bigint	Stream ID in the physical connection

- `gs_validate_ext_listen_ip`

Description: Connects to DNs, queries invalid service threads on DNs connected to the original extended IP address, and clears the threads.

Parameter: For details, see [Table 7-129](#).

Return value: `bigint pid`, `text node_name`

Note: This function is used only when old connections still exist on the original extended IP address after the extended IP address is reloaded. This function clears the threads where the original IP connections are located. Executing this function will clear communication listening on the extended IP address. Exercise caution when performing O&M operations. Currently, this command can be executed only by connecting to DNs and delivered by the administrator.

Table 7-129 GS_VALIDATE_EXT_LISTEN_IP columns

Name	Type	Description
clear	IN cstring	Specifies whether to clear data. The options are as follows: on : clear; off : not clear.
validate_node_name	IN cstring	Name of the DN where the extended IP address connections to be cleared are located.
validate_ip	IN cstring	Extended IP address whose connections are to be cleared.
pid	OUT bigint	ID of the service thread where the extended IP address connections to be cleared are located.
node_name	OUT text	Name of the instance to which the extended IP address connections to be cleared belong.

- gs_comm_listen_address_ext_info

Description: Displays the DFX information about the extended IP address configured for **listen_address_ext** connected to the current instance.

Parameter: nan

Return type: text node_name, text app, bigint tid, integer lwtid, bigint query_id, integer socket, text remote_ip, text remote_port, text local_ip or text local_port

Table 7-130 GS_COMM_LISTEN_ADDRESS_EXT_INFO columns

Name	Type	Description
node_name	text	Name of the current instance.
app	text	Client connected to the DN.
tid	bigint	Thread ID of the current thread.
lwtid	integer	Lightweight thread ID of the current thread.
query_id	bigint	Query ID of the current thread.
socket	integer	Socket FD of the current physical connection.
remote_ip	text	Peer IP address of the current connection.
remote_port	text	Peer port of the current connection.

Name	Type	Description
local_ip	text	Local IP address of the current connection.
local_port	text	Local port of the current connection.

- `gs_get_global_listen_address_ext_info()`
 Description: Queries the global extended IP address configuration on the CN.
 Parameter: For details, see [Table 7-131](#).
 Return type: text node_name, text host, text port, text ext_listen_ip
 Note: If the input parameter of the function is **all**, the function depends on the **ext_ip_info** static configuration file. If the file is abnormal, use the CM/OM tool to rectify the fault. In this case, the configuration cannot be updated in real time. You can set the input parameter to **primary** to obtain the configuration information about all primary DNs.

Table 7-131 GS_GET_GLOBAL_LISTEN_ADDRESS_EXT_INFO columns

Name	Type	Description
dn_mode	IN cstring	Specifies the range of DNs to be displayed. If this parameter is set to null , all DNs are queried by default.
node_name	OUT text	DN name.
host	OUT text	Listening IP address of the DN.
port	OUT text	Listening port of the DN.
ext_listen_ip	OUT text	Extended listening IP address of the DN.

- `gs_get_listen_address_ext_info()`
 Description: Queries the extended IP address configuration of the current instance.
 Parameter: nan
 Return type: text node_name, text host, text port, text ext_listen_ip

Table 7-132 GS_GET_LISTEN_ADDRESS_EXT_INFO

Name	Type	Description
node_name	OUT text	DN name.
host	OUT text	Listening IP address of the DN.
port	OUT text	Listening port of the DN.

Name	Type	Description
ext_listen_ip	OUT text	Extended listening IP address of the DN.

- **psortoptions**
Description: Returns the psort attribute.
Parameter: text[], boolean
Return type: bytea
- **remove_job_class_depend**
Description: Removes the job dependency.
Parameter: oid
Return type: void
- **xideq4**
Description: Compares two xids to check whether they are the same.
Parameter: xid32, xid32
Return type: Boolean
- **xideqint8**
Description: Compares two xids to check whether they are the same.
Parameter: xid, bigint
Return type: Boolean
- **xidlt**
Description: Returns whether xid1 < xid2 is true.
Parameter: xid, xid
Return type: Boolean
- **xidlt4**
Description: Returns whether xid1 < xid2 is true.
Parameter: xid32, xid32
Return type: Boolean
- **get_local_cont_query_stat**
Description: Obtains the statistics of a specified continuous computing view on the local node.
Parameter: cq_id oid
Return type: cq oid, w_in_rows int8, w_in_bytes int8, w_out_rows int8, w_out_bytes int8, w_pendings int8, w_errors int8, r_in_rows int8, r_in_bytes int8, r_out_rows int8, r_out_bytes int8, r_errors int8, c_in_rows int8, c_in_bytes int8, c_out_rows int8, c_out_bytes int8, c_pendings int8, c_errors int8
- **get_local_cont_query_stats**
Description: Obtains all continuous computing view statistics of the local node.
Parameter: nan
Return type: cq oid, w_in_rows int8, w_in_bytes int8, w_out_rows int8, w_out_bytes int8, w_pendings int8, w_errors int8, r_in_rows int8, r_in_bytes

int8, r_out_rows int8, r_out_bytes int8, r_errors int8, c_in_rows int8, c_in_bytes int8, c_out_rows int8, c_out_bytes int8, c_pendings int8, c_errors int8

- `get_cont_query_stats`

Description: Obtains statistics about all continuous computing views on each DN.

Parameter: nan

Return type: node name, cq oid, w_in_rows int8, w_in_bytes int8, w_out_rows int8, w_out_bytes int8, w_pendings int8, w_errors int8, r_in_rows int8, r_in_bytes int8, r_out_rows int8, r_out_bytes int8, r_errors int8, c_in_rows int8, c_in_bytes int8, c_out_rows int8, c_out_bytes int8, c_pendings int8, c_errors int8

- `reset_local_cont_query_stat`

Description: Resets the statistics of a specified continuous computation view on the local node.

Parameter: cq_id oid

Return type: Boolean

- `reset_local_cont_query_stats`

Description: Resets association statistics on the specified continuous computation view of the local node.

Parameter: cq_id oid

Return type: Boolean

- `reset_cont_query_stats`

Description: Resets the continuous computation view statistics corresponding to the STREAM object on each DN.

Parameter: stream_id oid

Return type: Boolean

- `check_cont_query_schema_changed`

Description: Determines the schema change status of a specified continuous computation view.

Parameter: cq_id oid

Return type: Boolean

- `gs_get_standby_cluster_barrier_status`

Description: Queries the barrier log replay information of the standby CN or DN, including the latest received barrier, LSN of the latest received barrier, barrier played back last time, and target barrier to be played back.

Parameter: nan

Return type: barrier_id text, barrier_lsn text, recovery_id text, target_id text

Note: To call this function, the user must have the SYSADMIN or OPRADMIN permission, and **operate_mode** must be enabled for the O&M administrator role.

- `gs_set_standby_cluster_target_barrier_id`

Description: Sets the target barrier to be played back.

Parameter: barrier_id

Return type: target_id text

Note: To call this function, the user must have the SYSADMIN or OPRADMIN permission, and **operate_mode** must be enabled for the O&M administrator role.

- `gs_query_standby_cluster_barrier_id_exist`

Description: Queries whether the specified barrier is received by the standby node.

Parameter: `barrier_id`

Return type: Boolean

Note: To call this function, the user must have the SYSADMIN or OPRADMIN permission, and **operate_mode** must be enabled for the O&M administrator role.

- `standby_read_status`

Description: Obtains the CSN snapshot information of all DNs in a cluster, the difference between the primary and standby DNs, and the CSN snapshot information used for the last read query on the standby node.

Parameter: `nan`

Return type: `text, text, text, integer, bigint, bigint, bigint`

Table 7-133 `standby_read_status` columns

Name	Type	Description
<code>name</code>	<code>text</code>	DN name
<code>type</code>	<code>text</code>	DN type (primary for the primary node and standby for the standby node)
<code>host</code>	<code>text</code>	IP address used by the DN
<code>port</code>	<code>integer</code>	Port used by the DN
<code>collected_csn</code>	<code>bigint</code>	CSN snapshot information of the DN (For the primary node, the value is 0 . For the standby node, the value is the collected CSN.)
<code>delay</code>	<code>bigint</code>	Difference between the primary and standby DNs. The unit is ms.
<code>visited_csn</code>	<code>bigint</code>	CSN information used for the last read query on the standby node. (This parameter is valid only for the standby node where the last query is executed.)

- `gs_shutdown_cross_region_walsenders`

Description: Interrupts cross-cluster streaming replication.

Parameter: `nan`

Return type: `void`

Note: To call this function, the user must have the SYSADMIN or OPRADMIN permission, and **operate_mode** must be enabled for the O&M administrator role.

The following stream functions exist but are not supported. You are advised not to use them.

streaming_int8_avg_gather, streaming_numeric_avg_gather, streaming_float8_avg_gather, streaming_interval_avg_gather, streaming_int8_sum_gather, and streaming_int2_int4_sum_gather

- **is_dblink_in_transaction**
Description: Checks whether a database link corresponding to an OID is used in the current transaction.
Parameter: oid
Return type: Boolean
- **dblink_has_updatasent**
Description: Checks whether DML statements are sent using a database link corresponding to an OID in the current transaction and are not committed.
Parameter: oid
Return type: Boolean
- **get_last_xmin_by_oid**
Description: Obtains the maximum **xmin** value of all columns in a table based on the table OID.
Parameter: oid
Return type: xid
- **get_relid_by_relname**
Description: Obtains the OID of a table based on the table name and relnamespace.
Parameter: cstring, oid
Return type: oid

7.5.34 Internal Functions

The following functions of GaussDB use internal data types, which cannot be directly called by users.

- Selectivity calculation functions

areajoin el	areasel	arraycon tjoin sel	arraycon tsel	contjoin el	contsel	eqjoin sel

----------------------------	------------------------	----------------------------	-----------------------------

- Functions for reading data remotely

gs_read_block_from_remote is used to read the pages of a table file. By default, only the initial user can view the data. Other users can use the data only after being granted with permissions.

- Function for reading files remotely

gs_read_file_size_from_remote is used to read the size of a specified file. Before using the gs_repair_file function to repair a file, you need to obtain the size of the file from the remote end to verify the missing file information and repair the missing files one by one. By default, only the initial user can view the data. Other users can use the data only after being granted with permissions.

gs_read_file_from_remote is used to read a specified file. After obtaining the file size by using the gs_read_file_size_from_remote function, gs_repair_file reads the remote file segment by segment using this function. By default, only the initial user can view the data. Other users can use the data only after being granted with permissions.

- Auxiliary functions for incrementally rebuilding other standby or cascaded standby DNs using the standby DN.

gs_standby_incremental_filemap_create is used to create a temporary filemap file for incremental rebuilding on the standby DN. The filemap file is used to store the path and size of the data to be transferred during the incremental rebuilding. This API can be invoked only when the initial user is used and **application** is **gs_rewind**.

`gs_standby_incremental_filemap_insert` is used to insert file information into a specified temporary filemap file. The file information includes the file path, transfer start point, length of data to be transferred at a time, and rebuild flag bit. This API can be invoked only when the initial user is used and **application** is `gs_rewind`.

`gs_standby_incremental_filemap_execute` is used to obtain file information stored in a specified temporary filemap file and delete the specified filemap file for data transmission during incremental standby DN rebuilding. This API can be invoked only when the initial user is used and **application** is `gs_rewind`.

- View-related reference functions
 - `adm_hist_sqlstat_func`
 - `adm_hist_sqlstat_idlog_func`
 - `adm_hist_sqltext_func`
- `gs_txn_snapshot` system catalog maintenance function
 - `gs_insert_delete_txn_snapshot` is used to maintain the `gs_txn_snapshot` system catalog of each node in distributed GTM-Lite mode. Only the system administrator can invoke `gs_insert_delete_txn_snapshot`.
- XMLType functions
 - `isschemavalid` (unavailable)

7.5.35 AI Feature Functions

- `gs_index_advise(text)`
 - Description: Recommends an index for a single query statement.
 - Parameter: SQL statement string
 - Return type: record
 - For details, see section "Index-advisor: Index Recommendation > Single-Query Index Recommendation" in *Feature Guide*.
- `hypopg_create_index(text, [text])`
 - Description: Creates a virtual index.
 - Parameter: character string of the statement for creating an index, level of the created virtual index (optional)
 - Return type: record
 - For details, see section "Index-advisor: Index Recommendation > Virtual Index" in *Feature Guide*.
- `hypopg_display_index([text])`
 - Description: Displays information about all created virtual indexes.
 - Parameter: level of the virtual index to be displayed (optional)
 - Return type: record
 - For details, see section "Index-advisor: Index Recommendation > Virtual Index" in *Feature Guide*.
- `hypopg_drop_index(oid)`
 - Description: Deletes a specified virtual index.
 - Parameter: OID of the index

Return type: Boolean

For details, see section "Index-advisor: Index Recommendation > Virtual Index" in *Feature Guide*.

- `hypopg_reset_index([text])`

Description: Clears all virtual indexes.

Parameter: level of the virtual index to be cleared (optional)

Return type: none

For details, see section "Index-advisor: Index Recommendation > Virtual Index" in *Feature Guide*.

- `hypopg_estimate_size(oid)`

Description: Estimates the space required for creating a specified index.

Parameter: OID of the index

Return type: int8

For details, see section "Index-advisor: Index Recommendation > Virtual Index" in *Feature Guide*.

- `db4ai_predict_by_bool (text, VARIADIC "any")`

Description: Obtains a model whose return value is of the Boolean type for model inference. This function is an internal function. You are advised to use the **PREDICT BY** syntax for inference.

Parameter: model name and input column name of the inference task

Return type: Boolean

- `db4ai_predict_by_float4(text, VARIADIC "any")`

Description: Obtains a model whose return value is of the float4 type for model inference. This function is an internal function. You are advised to use the **PREDICT BY** syntax for inference.

Parameter: model name and input column name of the inference task

Return type: float

- `db4ai_predict_by_float8(text, VARIADIC "any")`

Description: Obtains a model whose return value is of the float8 type for model inference. This function is an internal function. You are advised to use the **PREDICT BY** syntax for inference.

Parameter: model name and input column name of the inference task

Return type: float

- `db4ai_predict_by_int32(text, VARIADIC "any")`

Description: Obtains a model whose return value is of the int32 type for model inference. This function is an internal function. You are advised to use the **PREDICT BY** syntax for inference.

Parameter: model name and input column name of the inference task

Return type: int

- `db4ai_predict_by_int64(text, VARIADIC "any")`

Description: Obtains a model whose return value is of the int64 type for model inference. This function is an internal function. You are advised to use the **PREDICT BY** syntax for inference.

Parameter: model name and input column name of the inference task

Return type: int

- `db4ai_predict_by_numeric(text, VARIADIC "any")`

Description: Obtains a model whose return value is of the numeric type for model inference. This function is an internal function. You are advised to use the **PREDICT BY** syntax for inference.

Parameter: model name and input column name of the inference task

Return type: numeric

- `db4ai_predict_by_text(text, VARIADIC "any")`

Description: Obtains a model whose return value is of the character type for model inference. This function is an internal function. You are advised to use the **PREDICT BY** syntax for inference.

Parameter: model name and input column name of the inference task

Return type: text

- `db4ai_predict_by_float8_array(text, VARIADIC "any")`

Description: Obtains a model whose return value is of the character type for model inference. This function is an internal function. You are advised to use the **PREDICT BY** syntax for inference.

Parameter: model name and input column name of the inference task

Return type: text

- `gs_explain_model(text)`

Description: Obtains the model whose return value is of the character type for text-based model parsing.

Parameter: model name

Return type: text

- `gs_ai_stats_explain(text, text[])`

Description: Prints the intelligent statistics of multiple columns in the corresponding table and columns on the current node.

Parameters: table name and column name collection.

Return type: text

- `ai_watchdog_detection_warnings()`

Description: Obtains the risk alarm information of the AI watchdog.

Parameter: none

Return type: record

- `ai_watchdog_monitor_status(int)`

Description: Obtains the monitoring information of the AI watchdog.

Parameter: Returns the upper limit of the length of the monitored sequence.

Return type: record

- `ai_watchdog_parameters()`

Description: Obtains the internal parameters or status information of the AI watchdog.

Parameter: none

Return type: record

7.5.36 Dynamic Data Masking Functions

NOTE

This function is an internal function. For details, see "Database Security > Dynamic Data Anonymization" in *Feature Description*.

- `creditcardmasking(col text, letter char default 'x')`

Description: Replaces the digits before the last four bits following the col string with letters.

Parameter: Character string to be replaced or character string used for replacement

Return type: text
- `basicmailmasking(col text, letter char default 'x')`

Description: Replaces the characters before the first at sign (@) in the col string with letters.

Parameter: Character string to be replaced or character string used for replacement

Return type: text
- `fullmailmasking(col text, letter char default 'x')`

Description: Replaces the characters (except @) before the last period (.) in the col string with letters.

Parameter: Character string to be replaced or character string used for replacement

Return type: text
- `alldigitsmasking(col text, letter char default '0')`

Description: Replaces the digits in the col string with letters.

Parameter: Character string to be replaced or character string used for replacement

Return type: text
- `shufflemasking(col text)`

Description: Sorts the characters in the col string out of order.

Parameter: Character string to be replaced or character string used for replacement

Return type: text
- `randommasking(col text)`

Description: Randomizes the characters in the col string.

Parameter: Character string to be replaced or character string used for replacement

Return type: text
- `regexprmasking(col text, reg text, replace_text text, pos INTEGER default 0, reg_len INTEGER default -1)`

Description: Replaces the col string with a regular expression.

Parameters: Character string to be replaced, regular expression, replacement start position, and replacement length.

Return type: text

7.5.37 Hotkey Feature Functions

- `gs_stat_get_hotkeys_info()`
Description: Obtains hotkey information queried on the local node.

Return type: Tuple

Example:

```
gaussdb=# select * from gs_stat_get_hotkeys_info() order by count, hash_value;
database_name | schema_name | table_name | key_value | hash_value | count
-----+-----+-----+-----+-----+-----
regression   | public     | hotkey_single_col | {22}      | 1858004829 | 2
regression   | public     | hotkey_single_col | {11}      | 2011968649 | 2
(2 rows)
```

- `gs_stat_clean_hotkeys()`
Description: Clears hotkey cache and resets hotkey status information.

Return type: bool, and the return value is always **true**.

Example:

```
gaussdb=# select * from gs_stat_clean_hotkeys();
gs_stat_clean_hotkeys
-----
t
(1 row)
```

7.5.38 Global SysCache Functions

- `gs_gsc_table_detail(database_id default NULL, rel_id default NULL)`

Description: Queries the table metadata in the global system cache in a database. The user who calls this function must have the **SYSADMIN** permission.

Parameter: Specifies the database and table to be queried in the global system cache. The default value **NULL** or value **-1** of **database_id** indicates all databases. The value **0** indicates a shared table. Other values indicate a specified database and a shared table. **rel_id** indicates the OID of a specified table. The default value **NULL** or value **-1** indicates all tables. Other values indicate a specified table. If **database_id** does not exist, an error is reported. If **rel_id** does not exist, the query result is empty.

Return type: tuple

```
select * from gs_gsc_table_detail(-1) limit 1;
database_oid | database_name | reloid | relname | relnamespace | reltype | reloftype |
relowner | relam | relfilenode | reltablespace | relhasindex | relisshared | relkind | relnatts | relhasoids |
relhaspkey | parttype | tdhasuids | attnames | extinfo
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
0 | 1664 | f | t | i | 1 | f | f | n | f | 'rolname' | 0
(1 row)
```

- `gs_gsc_catalog_detail(database_id default NULL, rel_id default NULL)`

Description: Queries the system catalog row information in the global system cache in a database. The user who calls this function must have the **SYSADMIN** permission.

Parameter: Specifies the database and table to be queried in the global system cache. The default value **NULL** or value **-1** of **database_id** indicates

all databases. The value **0** indicates a shared table. Other values indicate a specified database and a shared table. **rel_id** indicates the ID of a specified table, including all system catalogs in the system cache. The default value **NULL** or value **-1** indicates all tables. Other values indicate a specified table. If **database_id** does not exist, an error is reported. If **rel_id** does not exist, the result is empty.

Return type: tuple

Example:

```
gaussdb=# select * from gs_gsc_catalog_detail(16574, 1260);
 database_id | database_name | rel_id | rel_name | cache_id | self | ctid | infomask | infomask2 |
 hash_value | refcount
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
10          |              | 1260 | pg_authid | 10 | (0, 9) | (0, 9) | 10507 | 26 | 531311568 |
10          |              | 0 | pg_authid | 11 | (0, 4) | (0, 4) | 2313 | 26 | 365368336 | 1
10          |              | 0 | pg_authid | 11 | (0, 9) | (0, 9) | 10507 | 26 | 3911517328 |
10          |              | 0 | pg_authid | 11 | (0, 7) | (0, 7) | 2313 | 26 | 1317799983 |
1           |              | 0 | pg_authid | 11 | (0, 5) | (0, 5) | 2313 | 26 | 3664347448 |
1           |              | 0 | pg_authid | 11 | (0, 1) | (0, 1) | 2313 | 26 | 276477273 | 1
1           |              | 0 | pg_authid | 11 | (0, 3) | (0, 3) | 2313 | 26 | 2465837659 |
1           |              | 0 | pg_authid | 11 | (0, 8) | (0, 8) | 2313 | 26 | 3205288035 |
1           |              | 0 | pg_authid | 11 | (0, 6) | (0, 6) | 2313 | 26 | 131811687 | 1
1           |              | 0 | pg_authid | 11 | (0, 2) | (0, 2) | 2313 | 26 | 1226484587 |
(10 rows)
```

- **gs_gsc_clean(database_id default NULL)**

Description: Clears the global system cache. Note that data in use will not be cleared. The user who calls this function must have the **SYSADMIN** permission.

Parameter: Specifies the database whose global system cache needs to be cleared. The default value **NULL** or value **-1** indicates that the global system cache of all databases is forcibly cleared. The value **0** indicates that the global system cache of only the shared table is cleared. Other values indicate that the global system cache of a specified database and a specified shared table is cleared. If **database_id** does not exist, an error is reported.

Return type: Boolean

Example:

```
gaussdb=# select * from gs_gsc_clean();
 gs_gsc_clean
-----
t
(1 row)
```

- **gs_gsc_dbstat_info(database_id default NULL)**

Description: Obtains GSC memory statistics on the local node, including cache query, hit, loading, expiration, and occupied space information of tuples, relations, and partitions, database-level eviction information, thread reference information, and memory usage information. This parameter can be used to locate performance problems. For example, if the value of the hits or searches array is far less than 1, the value of **global_syscache_threshold** may be too

and users with the O&M administrator permission in the O&M mode can view the information. Other users can view the information only after being granted with permissions.

The returned result is as follows:

- **rel_oid** and **rel_name** indicate the table OID and table name of the corresponding file, and **miss_file_path** indicates the relative path of the lost file.

Parameter description:

- **verify_segment**
Specifies the range of files to be checked.
The value can be **true** or **false** (default value). **true** is a reserved parameter and is not supported currently.

Return type: record

Example (The abnormal line is displayed only when an exception is detected. Otherwise, no line is displayed.):

```
gaussdb=# select * from gs_verify_data_file();
node_name | rel_oid | rel_name | miss_file_path
-----+-----+-----+-----
dn_6001_6002_6003 | 16554 | test | base/16552/24745
```

- **gs_repair_file**(tableoid Oid, path text, timeout int)

Description: Repairs the file based on the input parameters. Only the primary DN with normal primary/standby connection is supported. The parameter is set based on the OID and path returned by the `gs_verify_data_file` function. If the repair is successful, **true** is returned. If the repair fails, the failure cause is displayed. By default, only initial users, users with the sysadmin permission, and users with the O&M administrator permission in the O&M mode on the primary DN can view the information. Other users can view the information only after being granted with permissions.

⚠ CAUTION

1. If a file on a DN is damaged, a verification error at the PANIC level is reported when the DN is promoted to primary. The DN cannot be promoted to primary, which is normal.
2. If a file exists but its size is 0, the file will not be repaired. To repair the file, you need to delete the file whose size is 0 and then repair it.
3. You can delete a file only after the file descriptor is automatically closed. You can manually restart the process or perform a primary/standby switchover.

Parameter description:

- **tableoid**
OID of the table corresponding to the file to be repaired. Set this parameter based on the **rel_oid** column in the list returned by the **gs_verify_data_file** function.
Value range: OID ranging from 0 to 4294967295. Note: A negative value will be forcibly converted to a non-negative integer.

- path
Path of the file to be repaired. Set this parameter based on the **miss_file_path** column in the list returned by the **gs_verify_data_file** function.
Value range: a string
- timeout
Specifies the duration for waiting for the standby DN to replay. The repair file needs to wait for the standby DN to be put back to the corresponding location on the current primary DN. Set this parameter based on the replay duration of the standby DN.
Value range: 60s to 3600s.

Return type: Boolean

Example (Set **tablespace** and **path** based on the output of **gs_verify_data_file**):

```
gaussdb=# select * from gs_repair_file(16554,'base/16552/24745',360);
gs_repair_file
-----
t
```

- **local_bad_block_info()**

Description: Displays the page damage of the instance. You can read the page from the disk and record the page CRC failure. By default, only initial users, users with the sysadmin permission, users with the monitor administrator permission, users with the O&M administrator permission in the O&M mode, and monitor users can view the information. Other users can view the information only after being granted with permissions. **file_path** indicates the relative path of the damaged file. **block_num** indicates the number of the page where the file is damaged. The page number starts from 0. **check_time** indicates the time when the page damage is detected. **repair_time** indicates the time when the page is repaired.

Return type: record

Example (Related entries are displayed only when there are damaged records. Otherwise, no log is displayed.):

```
gaussdb=# select * from local_bad_block_info();
node_name | spc_node | db_node | rel_node | bucket_node | fork_num | block_num | file_path |
check_time | repair_time
-----+-----+-----+-----+-----+-----+-----+-----+
dn_6001_6002_6003| 1663 | 16552 | 24745 | -1 | 0 | 0 | base/16552/24745 |
2022-01-13 20:19:08.385004+08 | 2022-01-13 20:19:08.407314+08
```

- **remote_bad_block_info()**

Description: Queries the page damage of other instances except the current instance when a query is performed on the CN. The recorded data is the same as that of the **local_bad_block_info** function executed on other instances. The execution result on the DN is empty. By default, only initial users, users with the sysadmin permission, users with the monitor administrator permission, users with the O&M administrator permission in the O&M mode, and monitor users can view the information. Other users can view the information only after being granted with permissions.

Return type: record

- **local_clear_bad_block_info()**

Description: Deletes data of repaired pages from **local_bad_block_info**, that is, information whose **repair_time** is not empty. By default, only initial users, users with the sysadmin permission, users with the O&M administrator permission in the O&M mode, and monitor users can view the information. Other users can view the information only after being granted with permissions.

Return type: bool

Example:

```
gaussdb=# select * from local_clear_bad_block_info();
result
-----
t
```

- **remote_clear_bad_block_info()**

Description: Clears the data of the repaired pages of other instances except the current instance when this function is executed on the CN, that is, information whose **repair_time** is not empty. The execution result on the DN is empty. By default, only initial users, users with the sysadmin permission, users with the O&M administrator permission in the O&M mode, and monitor users can view the information. Other users can view the information only after being granted with permissions.

Return type: record

- **gs_verify_and_tryrepair_page** (path text, blocknum Oid, verify_mem bool, is_segment bool)

Description: Verifies the page specified by the instance. By default, only initial users, users with the sysadmin permission, and users with the O&M administrator permission in the O&M mode on the primary DN can view the information. Other users can view the information only after being granted with permissions. In the command output, **disk_page_res** indicates the verification result of the page on the disk, **mem_page_res** indicates the verification result of the page in the memory, and **is_repair** specifies whether the repair function is triggered during the verification. **t** indicates that the page is repaired, and **f** indicates that the page is not repaired.

Note:

- a. If a page on a DN is damaged, a verification error at the PANIC level is reported when the DN is promoted to primary. The DN cannot be promoted to primary, which is normal. Damaged pages of hash bucket tables cannot be repaired.
- b. The repair triggered by this function can only repair pages in the memory. The repair takes effect only after the memory pages are flushed to disks.

Parameter description:

- path

Path of the damaged file. Set this parameter based on the **file_path** column in **local_bad_block_info**. To verify the undo pages of the Ustore table, enter the path of the undo pages to be verified.

Value range: a string

- blocknum

Page number of the damaged file. Set this parameter based on the **block_num** column in **local_bad_block_info**. To verify the undo pages of the Ustore table, enter the path of the undo pages to be verified.

Value range: OID ranging from 0 to 4294967295. Note: A negative value will be forcibly converted to a non-negative integer.

– verify_mem

Specifies whether to verify a specified page in the memory. If this parameter is set to **false**, only pages on the disk are verified. If this parameter is set to **true**, pages in the memory and on the disk are verified. If a page on the disk is damaged, the system verifies the basic information of the page in the memory and flushes the page to the disk to restore the page. If a page is not found in the memory during memory page verification, the page on the disk is read through the memory API. During this process, if the disk page is faulty, the remote read automatic repair function is triggered.

Value range: The value is of a Boolean type and can be **true** or **false**.

– is_segment

Determines whether the table is a segment-page table. **false** indicates that the table is not a segment-page table. **true** indicates a reserved parameter value, which is not supported currently.

Value range: The value is of a Boolean type and can be **true** or **false**.

Return type: record

Examples (Transfer parameters based on the output of `local_bad_block_info`. Otherwise, an error is reported.):

```
gaussdb=# select * from gs_verify_and_tryrepair_page('base/16552/24745',0,false,false);
node_name | path | blocknum | disk_page_res | mem_page_res | is_repair
-----+-----+-----+-----+-----+-----
dn_6001_6002_6003 | base/16552/24745 | 0 | page verification succeeded. | | f
```

• `gs_repair_page(path text, blocknum oid is_segment bool, timeout int)`

Description: Restores the specified page of the instance. This function can be used only by the primary DN that is properly connected to the primary and standby DNs. By default, only initial users, users with the `sysadmin` permission, and users with the O&M administrator permission in the O&M mode on the primary DN can view the information. Other users can view the information only after being granted with permissions.

Note: If a page on a DN is damaged, a verification error at the PANIC level is reported when the DN is promoted to primary. The DN cannot be promoted to primary, which is normal. Damaged pages of hash bucket tables cannot be repaired.

Parameter description:

– path

Path of the damaged page. Set this parameter based on the **file_path** column in **local_bad_block_info** or the **path** column in the **gs_verify_and_tryrepair_page** function.

Value range: a string

– blocknum

Number of the damaged page. Set this parameter based on the **block_num** column in **local_bad_block_info** or the **blocknum** column in the **gs_verify_and_tryrepair_page** function.

Value range: OID ranging from 0 to 4294967295. Note: A negative value will be forcibly converted to a non-negative integer.

- **is_segment**
Determines whether the table is a segment-page table. **false** indicates that the table is not a segment-page table. **true** indicates a reserved parameter value, which is not supported currently.
Value range: The value is of a Boolean type and can be **true** or **false**.
- **timeout**
Duration of waiting for standby DN replay. The page to be repaired needs to wait for the standby DN to be played back to the location of the current primary DN. Set this parameter based on the replay duration of the standby DN.
Value range: 60s to 3600s.

Return type: Boolean

Examples (Transfer parameters based on the output of `local_bad_block_info`. Otherwise, an error is reported.):

```
gaussdb=# select * from gs_repair_page('base/16552/24745',0,false,60);
result
-----
t
```

- **gs_edit_page_bypath**(path text, blocknum int64, offset int, data text, data_size int, read_backup bool, storage_type text)

Description: Transfers the path, block number, offset, target data to be modified, and length of the target table file, and modifies the target data to the corresponding fields on the page. The **read_backup** column determines the file reading mode, and the **storage_type** column indicates the file storage mode (for example, page storage). To prevent incorrect modification, this function does not directly modify the original page but modifies the copied page and flushes the modified page to the specified path. Only the system administrator or O&M administrator in O&M mode can execute this function. In a distributed environment, this function must be executed on DNs.

Return type: text.

Table 7-134 gs_edit_page_bypath parameters

Category	Parameter	Type	Description
Input parameter	path	text	<p>Physical file path of the file to be modified, which is related to the read_backup field. The value can be the relative path of the file in the database directory or the absolute path of files such as the backup file. If the target file does not exist or fails to be read, an error message is displayed.</p> <ul style="list-style-type: none"> If read_backup is false, the path format is <i>tablespace name/database oid/table relfilenode (physical file name)</i>. For example, base/16603/16394. If read_backup is true, path is a valid path. In this case, because other information about the input file cannot be obtained, you need to ensure that the input data is correct. <p>Note: Only U-page and UB-tree data pages can be edited and modified in page mode. Tables with tablespaces are not supported. Other information about the input file cannot be obtained. Therefore, you need to ensure that the input data type is correct.</p>
Input parameter	blocknum	bigint	<p>Block number of the page to be repaired. Value range: 0 to <i>MaxBlockNumber</i>.</p> <p>Reads the page corresponding to the specified physical or logical block number based on the read_backup field. If the specified block number is out of range, an error message is returned.</p>
Input parameter	offset	int	<p>In-page offset of the field to be modified. Value range: 0 to <i>BLCKSZ</i>.</p> <p>If the specified value is less than 0 or greater than that of BLCKSZ, the system view is used to return the corresponding error information.</p>
Input parameter	data	text	<p>Type of the target value to be modified. Type:</p> <ul style="list-style-type: none"> '0x': hexadecimal. '0b': binary. '0s': character string. <p>Others: If the value of the data parameter is not one of the preceding types, the data is a decimal character string.</p>

Category	Parameter	Type	Description
Input parameter	data_size	int	Length of the written data, in bytes. Value range: 1 to 8. If the specified write length is less than 1 byte or greater than 8 bytes, or the sum of offset and data_size is greater than the value of BLCKSZ , the system view is used to return the corresponding error information.
Input parameter	read_backup	bool	Specifies whether to read pages from the backup directory. If this parameter is set to false , the target page is read based on the logical block number. Otherwise, the page is read based on the physical block number.
Input parameter	storage_type	text	File storage mode. Currently, only the page storage mode is supported. This parameter is optional. <ul style="list-style-type: none"> 'page': page mode. 'segment': segment-page mode. This parameter is reserved and is not supported currently.
Output parameter	output_msg	text	If the modification is successful, the absolute path of the modified file is returned. The modified file is stored in the pg_log/dump directory. If the modification fails, a failure message is returned.

Note: In the example, transfer parameters based on the parameter description and use the actual physical path.

Example 1: Overwrite the data whose value is **0X1FFF** at the offset of 16 bytes on page 0 in the **base/15808/25075** table.

```
gaussdb=# select gs_edit_page_bypath('base/15808/25075',0,16,'0x1FFF', 2, false, 'page');
gs_edit_page_bypath
-----
/pg_log_dir/dump/1663_15808_25075_0.editpage
(1 rows)
```

Example 2: If the input parameter does not comply with the specifications, an error message is returned.

```
gaussdb=# select gs_edit_page_bypath('base/15808/25075', 0,16,'@1231!', 8, false, 'page');
gs_edit_page_bypath
-----
Error: the parameter 'data' decode failed.
(1 row)
```

Example 3: When the data to be written is the same as the original value, an alarm is returned.

```
gaussdb=# select gs_edit_page_bypath('/pg_log_dir/dump/1663_15808_25075_0.editpage',
0,16,'0x1FFF', 2, true, 'page');
gs_edit_page_bypath
-----
```

Warning: source buffer is consistent with target buffer.
(1 row)

- `gs_repair_page_bypath(src_path text, src_blkno int64, dest_path text, dest_blkno int64, storage_type text)`

Description: Transfers the path and page number of the source file, and writes the page to the specified page number of the target file. You can repair the pages of the primary node through the standby node. In addition, you can initialize bad blocks in this view. In a distributed environment, this function must be executed on DNs.

- a. The target page is overwritten and synchronized to the standby node. The page-based modification object supports the U-heap and UB-tree pages. The Undo Record page, Undo Slot page, compressed table, and Astore page will be supported later. System catalog files and data sections cannot be modified.
- b. With this function, you can overwrite target pages during the write operation. Before overwriting, the target page is backed up and flushed to a specified directory. The backup page can be rewritten back to the target page. If an ordinary table is modified on the primary node, a new WAL is generated and synchronized to the standby node. If an ordinary table is modified on the standby node, no WAL is recorded.
- c. The repair view applies only to the primary node in a centralized or distributed system or the standby node when the read function is enabled on the standby node. Only the system administrator or O&M administrator in O&M mode can use this function. All modifications will be recorded in database logs. In addition, you are advised to enable the audit logging function of system functions before using this function to record audit information.
- d. The LSNs of the source and target pages must be the same. Otherwise, the repair fails.

Return type: text.

 **CAUTION**

Invoking this system function is a high-risk operation. Exercise caution when performing this operation.

Category	Parameter	Type	Description
Input parameter	src_path	text	Path of the source file. The following types of paths are supported: <ul style="list-style-type: none">• Data files and index files: pg_log/dump/1663_15808_25075_0.editpage.• src_path is set to 'standby' on the primary node. That is, pages are read from the standby node to repair the primary node.• src_path is set to init_block on the primary node to allow skipping bad blocks in extreme scenarios.
Input parameter	src_blkno	bigint	Physical block number of the source page. Value range: 0 to <i>MaxBlockNumber</i> .
Input parameter	dest_path	text	Relative path of the target file. For example, base/15808/25075 .
Input parameter	dest_blkno	bigint	Logical block number of the target page. Value range: 0 to <i>MaxBlockNumber</i> .
Input parameter	storage_type	text	Storage mode of the target file. Currently, only the page storage mode is supported. This parameter is optional. <ul style="list-style-type: none">• 'page': page mode.• 'segment': segment-page. This parameter is reserved and is not supported currently.
Output parameter	output_msg	text	If the write overwrite operation is successful, the backup path of the target page is returned. If the write overwrite operation fails, an error message is returned. The format of the flushed file name is <i>relfilepath_blocknum_timestamp.repairpage</i> .

Note: Transfer parameters based on the preceding table and ensure that the physical file exists. If the input parameter is abnormal or the restoration fails, an error is reported.

Example 1: Enter a file in a specified path to overwrite the target file.

```
gaussdb=# select * from gs_repair_page_bypath('pg_log/dump/1663_15991_16767_0.editpage', 0,
'base/15991/16767', 0, 'page');
          output_msg
-----
/pg_log_dir/dump/1663_15991_16767_0_738039702421788.repairpage
(1 row)
```

Example 2: Read pages from the standby node to repair the primary node.

```
gaussdb=# select * from gs_repair_page_bypath('standby', 0, 'base/15990/16768', 0, 'page');
          output_msg
-----
/pg_log_dir/dump/1663_15990_16768_0_738040397197907.repairpage
(1 row)
```

Example 3: Initialize the target page and skip bad blocks.

```
gaussdb=# select * from gs_repair_page_bypath('init_block', 0, 'base/15990/16768', 0, 'page');
          output_msg
-----
/pg_log_dir/dump/1663_15990_16768_0_738040768010281.repairpage
(1 row)
```

- `gs_repair_undo_byzone(zone_id int)`

Description: Transfers the ID of the undo zone to be repaired, repairs the metadata of the target undo zone, and returns the repair result details. If the undo zone is not repaired, no information is output.

Return type: record

Note: Currently, the function can be invoked only on the primary node. After the repair is successful, the repair will be synchronized to the standby node by recording Xlogs. The invoker must be a system administrator or an O&M administrator in O&M mode. You are advised to enable the audit logging function before using the function to record audit information.

CAUTION

Invoking this system function is a high-risk operation. Exercise caution when performing this operation.

Table 7-135 `gs_repair_undo_byzone` parameters

Category	Parameter	Type	Description
Input parameter	zone_id	int	Undo zone ID: <ul style="list-style-type: none"> • -1: repairs the metadata of all undo zones. • 0 to 1048575: repairs the metadata of the undo zone corresponding to the zone ID.
Output parameter	zone_id	int	Undo zone ID.

Category	Parameter	Type	Description
Output parameter	repair_detail	text	Repair result of the undo zone metadata corresponding to the zone ID. If the repair is successful, "rebuild undo meta succeed." is displayed. If the repair fails, "rebuild undo meta failed." as well as the failure cause is displayed.

Note: The output is one of the three cases based on the repair result.

Example 1: If the undo zone meta information corresponding to the entered **zone_id** is not damaged, no output is expected.

```
gaussdb=# select * from gs_repair_undo_byzone(4);
zone_id | repair_detail
-----+-----
(0 rows)
```

Example 2: If the undo zone metadata corresponding to the entered **zone_id** is successfully restored, the system displays a message indicating that the restoration is successful.

```
gaussdb=# select * from gs_repair_undo_byzone(78);
zone_id | repair_detail
-----+-----
    78 | rebuild undo meta succeed.
(1 row)
```

Example 3: If the undo zone metadata corresponding to the entered zone ID fails to be repaired, the detailed information about the repair failure is displayed.

```
gaussdb=# select * from gs_repair_undo_byzone(0);
zone_id | repair_detail
-----+-----
    0 | rebuild undo meta failed. try lock undo zone_id failed.
(1 row)
```

NOTE

If the undo zone to be repaired is damaged and the zone ID is occupied by another active thread, invoking this repair function will end the thread that occupies the zone ID and forcibly repair the damaged undo zone metadata.

- `gs_verify_urq(index_oid oid, partindex_oid oid, blocknum bigint, queue_type text)`

Description: Verifies the correctness of the index recycling queue (potential queue/available queue/single page).

Parameter description: See [Table 7-136](#).

Return type: record

Table 7-136 gs_verify_urq parameters

Category	Parameter	Type	Description
Input parameter	index_oid	oid	UB-tree index OID. <ul style="list-style-type: none"> Common index: index OID. Global index: GPI OID. Local index: OID of the primary index.
Input parameter	partindex_oid	oid	UB-Tree partitioned index OID: <ul style="list-style-type: none"> Common index: 0. Global index: 0. Local index: OID of the partitioned index (primary or secondary).
Input parameter	blocknum	bigint	Specifies the page number: <ul style="list-style-type: none"> If the queue type is single page, the correctness of all tuples of blocknum on a single page is verified. The value range is [0, <i>Queue file size</i>/8192). If the queue is empty or free, blocknum is an invalid value.
Input parameter	queue_type	text	Specifies the queue type: <ul style="list-style-type: none"> empty queue: potential queue free queue: available queue single page: single-page queue
Output parameter	error_code	text	Error code
Output parameter	detail	text	Detailed error information and other key information.

Example 1: When using the example, transfer parameters based on the parameter description and use the actual OID and **blocknum**. Otherwise, an error is reported.

```
gaussdb=# select * from gs_verify_urq(16387, 0, 1, 'free queue');
error_code | detail
-----+-----
(0 rows)
```

Example 2: When using the example, transfer parameters based on the parameter description and use the actual OID and **blocknum**. Otherwise, an error is reported.

```
gaussdb=# select * from gs_verify_urq(16387, 0, 1, 'empty queue');
error_code |
```

```

detail
-----
+-----+
VERIFY_URQ_PAGE_ERROR | invalid urq meta: oid 16387, blkno 1, head_blkno = 1, tail_blkno = 3,
nblocks_upper = 4294967295, nblocks_lower = 1; urq_blocks = 6, index_blocks = 12
(1 row)
    
```

 **NOTE**

Currently, this interface supports only Ustore index tables. If the verification of the index recycling queue is normal, the view does not display the error code and error details. Otherwise, the view displays the error code and error details. The error codes include "VERIFY_URQ_PAGE_ERROR", "VERIFY_URQ_LINK_ERROR", "VERIFY_URQ_HEAD_MISSED_ERROR", and "VERIFY_URQ_TAIL_MISSED_ERROR". If any of the preceding error codes is displayed, contact Huawei engineers to locate the fault.

- `gs_urq_dump_stat(index_oid oid, partindex_oid oid)`

Description: Queries information about a specified index recycling queue.

In the return result, **recentGlobalDataXmin** and **globalFrozenXid** are two oldestxmins used by the recycling queue to determine whether the index page can be recycled, **next_xid** is the XID of the next latest transaction, **urq_blocks** indicates the total number of pages in the recycling queue and information about valid pages in the free queue (available queue) and empty queue (potential queue).

Parameter description: See [Table 7-137](#).

Table 7-137 `gs_urq_dump_stat` parameters

Category	Parameter	Type	Description
Input parameter	<code>index_oid</code>	oid	UB-tree index OID. <ul style="list-style-type: none"> • Common index: index OID. • Global index: GPI OID. • Local index: OID of the primary index.
Input parameter	<code>partindex_oid</code>	oid	UB-Tree partitioned index OID: <ul style="list-style-type: none"> • Common index: 0. • Global index: 0. • Local index: OID of the partitioned index (primary or secondary).
Output parameter	<code>result</code>	text	Detailed statistics about the index recycling queue.

Note: When using the example, transfer parameters based on the parameter description and use the actual OID. Otherwise, an error is reported.

Example:

```

gaussdb=# select * from gs_urq_dump_stat(16387, 0);
          result
-----
    
```

```

-----
urq stat info: recentGlobalDataXmin = 213156, globalFrozenXid = 213156, next_xid = 214157,
urq_blocks = 6,
free queue: head page blkno = 0 min_xid = 211187 max_xid = 214157, tail page blkno = 0
min_xid = 211187 max_xid = 214157,+
middle page min_xid = 1152921504606846975 max_xid = 0, valid_pages = 1, valid_items =
6, can_use_item = 3
empty queue: head page blkno = 1 min_xid = 212160 max_xid = 213160, tail page blkno = 3
min_xid = 213162 max_xid = 214156,+
middle page min_xid = 1152921504606846975 max_xid = 0, valid_pages = 2, valid_items =
999, can_use_item = 498
(1 row)

```

 **NOTE**

Currently, this interface supports only Ustore index tables.

- `gs_repair_urq(index_oid oid, partindex_oid oid)`

Description: Repairs (with loss) index recycling queues (potential and available queues). The recycling queue file of the current index is deleted and an empty recycling queue file is created. If the repair is successful, **reinitial the recycle queue of index relation successfully** is displayed.

Parameter description: See [Table 7-138](#).

Note: The current function can be invoked only on the primary node.

Table 7-138 `gs_repair_urq` parameters

Category	Parameter	Type	Description
Input parameter	<code>index_oid</code>	oid	UB-tree index OID. <ul style="list-style-type: none"> • Common index: index OID. • Global index: GPI OID. • Local index: OID of the primary index.
Input parameter	<code>partindex_oid</code>	oid	UB-Tree partitioned index OID: <ul style="list-style-type: none"> • Common index: 0. • Global index: 0. • Local index: OID of the partitioned index (primary or secondary).
Output parameter	<code>result</code>	text	If the repair is successful, reinitial the recycle queue of index relation successfully is displayed.

Example: When using the example, transfer parameters based on the parameter description and use the actual OID and **blocknum**. Otherwise, an error is reported.

```

gaussdb=# select * from gs_repair_urq(16387, 0);
result
-----

```

reinitial the recycle queue of index relation successfully.
(1 row)

 **NOTE**

Currently, this interface supports only Ustore index tables.

- `gs_get_standby_bad_block_info()`

Description: Displays the pages that have been detected on the standby node but have not been repaired. By default, only initial users, users with the sysadmin permission, users with the O&M administrator permission in the O&M mode, and users with the monitor administrator permission on the standby DN can view the information. Other users can view the information only after being granted with permissions. There are four return values in the **invalid_type** column: **NOT_PRESENT** (the page does not exist), **NOT_INITIALIZED** (the page initialization fails), **LSN_CHECK_ERROR** (the LSN check fails), and **CRC_CHECK_ERROR** (the CRC check fails).

Return type: record.

Example: If no page is detected but not repaired, no line is displayed.

```
gaussdb=# select * from gs_get_standby_bad_block_info();
 spc_node | db_node | rel_node | bucket_node | fork_num | block_num | invalid_type |
master_page_lsn
-----+-----+-----+-----+-----+-----+-----+-----
 1663 | 16552 | 24745 | -1 | 0 | 0 | CRC_CHECK_ERROR | 0/B2009E8
(1 rows)
```

7.5.40 Functions of the XML Type

- `xmlparse ({ DOCUMENT | CONTENT } value [wellformed])`

Description: Generates XML values from character data.

Parameter: data of the TEXT type.

Return type: XML

Example:

```
gaussdb=# SELECT XMLPARSE (DOCUMENT '<?xml version="1.0"?><book><title>Manual</title><chapter>...</chapter></book>');
 xmlparse
-----
<book><title>Manual</title><chapter>...</chapter></book>
(1 row)
gaussdb=# SELECT XMLPARSE (CONTENT 'abc<foo>bar</foo><bar>foo</bar>');
 xmlparse
-----
abc<foo>bar</foo><bar>foo</bar>
(1 row)
gaussdb=# SELECT XMLPARSE (CONTENT 'abc<foo>bar</foo>' wellformed);
 xmlparse
-----
abc<foo>bar</foo>
(1 row)
```

- `xmlconcat(xml[, ...])`

Description: Concatenates a list of single XML values into a single value that contains an XML content fragment. Null values are ignored, and the result is null only when all parameters are null. In ORA-compatible mode, you can set **a_format_version** to **10c** and **a_format_dev_version** to **s2** to check whether the input segment is well-formed XML text.

Parameter: data of the XML type.

Return type: XML

Note: Example 2 is a syntax example compatible with the ORA database.

Example 1:

```
gaussdb=# set xmloption=content;
SET
gaussdb=# select XMLCONCAT(('<?xml version="1.0" encoding="GB2312" standalone="no"?
><bar>foo</bar>'),('<?xml version="1.0" encoding="GB2312" standalone="no" ?><bar>foo</bar>'));
          xmlconcat
-----
<?xml version="1.0" standalone="no"?><bar>foo</bar><bar>foo</bar>
(1 row)
gaussdb=# select XMLCONCAT('abc');
          xmlconcat
-----
abc>
(1 row)
```

Example 2:

```
gaussdb=# set a_format_version='10c';
SET
gaussdb=# set a_format_dev_version=s2;
SET
gaussdb=# set xmloption=content;
SET
gaussdb=# select XMLCONCAT(('<?xml version="1.0" encoding="GB2312" standalone="no"?
><bar>foo</bar>'),('<?xml version="1.0" encoding="GB2312" standalone="no" ?><bar>foo</bar>'));
          xmlconcat
-----
<?xml version="1.0" standalone="no"?><bar>foo</bar><bar>foo</bar>
(1 row)
gaussdb=# select XMLCONCAT('abc');
ERROR: invalid XML document
LINE 1: SELECT XMLCONCAT('abc');
DETAIL: line 1: Start tag expected, '<' not found
CONTEXT: referenced column: xmlconcat
```

- `xmllagg(xml [order_by_clause])`

Description: Concatenates the input values called by the aggregate function. Cross-line concatenation is supported. For details about **order_by_clause**, see [SELECT](#). In ORA-compatible database mode, you can set **a_format_version** to **10c** and **a_format_dev_version** to **s2**. The **xmloption** parameter of the database is set to **content** by default. When **xmloption** is set to **document**, newline characters are used to concatenate multiple XML lines. If the encoding attribute value in the XML declaration is not the default UTF-8, the aggregation result contains the XML declaration.

Parameter: XML

Return type: XML

Note: Example 2 is a syntax example compatible with the ORA database.

Example 1:

```
gaussdb=# CREATE TABLE xmltest (
          id int,
          data xml
        );
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'id' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
gaussdb=# INSERT INTO xmltest VALUES (1, '<value>one</value>');
INSERT 0 1
gaussdb=# INSERT INTO xmltest VALUES (2, '<value>two</value>');
INSERT 0 1
gaussdb=# SELECT xmllagg(data) FROM xmltest;
          xmllagg
-----
<value>one</value><value>two</value>
(1 row)
```

Example 2:

```

gaussdb=# set xmloption=document;
SET
gaussdb=# SELECT xmlagg(data) FROM xmltest;
      xmlagg
-----
<value>one</value>+
<value>two</value>
(1 row)
gaussdb=# DELETE FROM XMLTEST;
DELETE 2
gaussdb=# INSERT INTO xmltest VALUES (1, '<?xml version="1.0" encoding="GBK"?><value>one</value>');
INSERT 0 1
gaussdb=# INSERT INTO xmltest VALUES (2, '<?xml version="1.0" encoding="GBK"?><value>two</value>');
INSERT 0 1
gaussdb=# SELECT xmlagg(data) FROM xmltest;
      xmlagg
-----
<?xml version="1.0" encoding="GBK"?><value>one</value>+
<value>two</value>
(1 row)
gaussdb=# SELECT xmlagg(data order by id desc) FROM xmltest;
      xmlagg
-----
<?xml version="1.0" encoding="GBK"?><value>two</value>+
<value>one</value>
(1 row)

```

- xmlelement**([ENTITYESCAPING | NOENTITYESCAPING] { [NAME] element_name | EVALNAME element_name } [, xmlattributes([ENTITYESCAPING | NOENTITYESCAPING] value [[AS] attname | AS EVALNAME attname] [, ...])] [, content [[AS] alias] [, ...]])

Description: Generates an XML element with the given name, attribute, and content.

Return type: XML

Example:

```

gaussdb=# SELECT xmlelement(name foo);
xmlelement
-----
<foo/>

```

In compatible mode ORA:

- If the keyword ENTITYESCAPING is not set in XMLElement by default or is set, the reserved characters in the content of XMLElement are escaped.

```

SELECT xmlelement('entityescaping<>', 'a$<&"b');
      xmlelement
-----
<entityescaping<>>a$&gt;&lt;&amp;&quot;b</entityescaping<>>
(1 row)

```

```

SELECT xmlelement(entityescaping "entityescaping<>", 'a$<&"b');
      xmlelement
-----
<entityescaping<>>a$&gt;&lt;&amp;&quot;b</entityescaping<>>
(1 row)

```
- When the keyword NOENTITYESCAPING is set in XMLElement, the reserved characters in the content of XMLElement will not be escaped.

```

SELECT xmlelement(noentityescaping "entityescaping<>", 'a$<&"b');
      xmlelement
-----
<entityescaping<>>a$<&"b</entityescaping<>>

```

(1 row)

3. When [AS] alias is used to declare an alias for the content in XMLElement, the content value type must be XML.

```
SELECT xmlelement("entityescaping<>", '<abc/>' b);
ERROR: argument of XMLELEMENT must be type xml, not type unknown
LINE 1: SELECT xmlelement("entityescaping<>", '<abc/>' b);
                ^
```

CONTEXT: referenced column: xmlelement

```
SELECT xmlelement("entityescaping<>", '<abc/>' as b);
ERROR: argument of XMLELEMENT must be type xml, not type unknown
LINE 1: SELECT xmlelement("entityescaping<>", '<abc/>' as b);
                ^
```

CONTEXT: referenced column: xmlelement

```
SELECT xmlelement("entityescaping<>", xml('<abc/>') b);
                xmlelement
```

<entityescaping<>><abc/></entityescaping<>>

(1 row)

```
SELECT xmlelement("entityescaping<>", xml('<abc/>') as b);
                xmlelement
```

<entityescaping<>><abc/></entityescaping<>>

(1 row)

4. If the keyword ENTITYESCAPING is not set in XMLAttributes by default or is set, the reserved characters in XMLAttributes are escaped.

```
SELECT xmlelement("entityescaping<>", xmlattributes('entityescaping<>' "entityescaping<>"));
                xmlelement
```

<entityescaping<> entityescaping<>="entityescaping<&t;&t;"/>

(1 row)

```
SELECT xmlelement(name "entityescaping<>", xmlattributes(entityescaping 'entityescaping<>'
"entityescaping<>"));
                xmlelement
```

<entityescaping<> entityescaping<>="entityescaping<&t;&t;"/>

(1 row)

5. When the NOENTITYESCAPING keyword is set in XMLAttributes, the reserved characters in XMLAttributes will not be escaped.

```
SELECT xmlelement("entityescaping<>", xmlattributes(noentityescaping 'entityescaping<>'
"entityescaping<>"));
                xmlelement
```

<entityescaping<> entityescaping<>="entityescaping<>"/>

(1 row)

NOTE

1. For **xmlelement** and **xmlattributes**, when the value of **name** is **NULL**, the database behavior is different from that of the O database. When the **name** field of **xmlelement** is set to **NULL**, the name information is empty and the attribute information is not displayed. When the **name** field of **xmlattributes** is set to **NULL**, the attribute information is not displayed.
2. After the following two parameters are set, the content escape rule of **xmlelement** is ORA compatible. If the two parameters are not set, the content escape rule of **xmlelement** is PG compatible.

```
set a_format_version='10c';
set a_format_dev_version=s2;
```

7.5.41 Functions of the XMLType Type

- `createxml(vvarchar2[,vvarchar2,numeric ,numeric])`

Description: Statically creates the XMLType type. The input parameters are of the `vvarchar2` type.

Parameters: The first parameter is the character string to be converted to XMLType (mandatory field). The second parameter is the optional schema URL used to make the input comply with the specified schema (optional field, which is empty by default and does not take effect currently). The third parameter is the flag indicating whether the instance is valid according to the given XML schema (optional field, which is **0** by default and does not take effect currently). The fourth parameter is the flag indicating whether the instance is well-formed (optional field, which is **0** by default and does not take effect currently).

Return type: XMLType

Example:

```
gaussdb=# SELECT createxml('<a>123</a>');
createxml
-----
<a>123</a>
(1 row)
```

 NOTE

- Different from that in database A, in PL/SQL, createxml allows input parameters to be empty strings and returns **NULL**.
- For character encoding, only UTF-8, GBK, and LATIN1 to LATIN10 are supported, and the **version** field can only be set to **1.x**.
- The createxml function can be invoked using the xmltype.createxml() syntax.

Example:

```
gaussdb=# SELECT xmltype.createxml('<a>123</a>');
createxml
-----
<a>123</a>
(1 row)
```

- In this chapter, the function whose input parameter is xmltype() can be invoked in xmltype().func() mode. The XMLType type returned by a function is transferred to the next function as the input parameter. This syntax supports multi-layer nesting. (If the input parameter is defined as XMLType by a user, this syntax is not supported.)

Example:

```
gaussdb=# select xmltype('<a>123<b>456</b></a>').extract('/a/b').getstringval();
xmltypefunc
-----
<b>456</b>
(1 row)
```

The actual effect of the preceding example is the same as that of the following function nesting:

```
gaussdb=# select getstringval(extractxml(xmltype('<a>123<b>456</b></a>'),'a/b'));
getstringval
-----
<b>456</b>
(1 row)
```

- In a stored procedure, variables of the XMLType type can invoke functions in a.func() mode. This syntax supports one-layer nesting.

Example:

```
gaussdb=# declare
a xmltype;
b varchar2;
begin
a:=xmltype('<a>123<b>456</b></a>');
b:=a.getstringval();
RAISE NOTICE 'xmltype_str is : %',b;
end;
/
NOTICE: xmltype_str is : <a>123<b>456</b></a>
```

- createxml(clob [,varchar2,numeric ,numeric])

Description: Statically creates the XMLType type. The input parameters are of the CLOB type.

Parameters: The first parameter is the CLOB to be converted to XMLType (mandatory field). The second parameter is the optional schema URL used to make the input comply with the specified schema (optional field, which is empty by default and does not take effect currently). The third parameter is the flag indicating whether the instance is valid according to the given XML schema (optional field, which is **0** by default and does not take effect currently). The fourth parameter is the flag indicating whether the instance is well-formed (optional field, which is **0** by default and does not take effect currently).

Return type: XMLType

Example:

```
gaussdb=# declare
xmltype_clob clob;
xmltype_obj xmltype;
xmltype_str varchar2(1000);
begin
xmltype_clob := '<a>123</a>';
xmltype_obj := createxml(xmltype_clob);
xmltype_str := xmltype_obj.getstringval();
RAISE NOTICE 'xmltype_str is : %',xmltype_str;
end;
/
NOTICE: xmltype_str is : <a>123</a>
```

 **NOTE**

The maximum size of the input parameter of the CLOB type is 1 GB minus 1 byte.

- `createxml(blob, numeric [,varchar2,numeric ,numeric])`

Description: Statically creates the XMLType type. The input parameters are of the BLOB type.

Parameters: The first parameter is the BLOB to be converted to XMLType (mandatory field). The second parameter is the character set ID of the input XML data. The third parameter is the optional schema URL used to make the input comply with the specified schema (optional field, which is empty by default and does not take effect currently). The fourth parameter is the flag indicating whether the instance is valid according to the given XML schema (optional field, which is **0** by default and does not take effect currently). The fifth parameter is the flag indicating whether the instance is well-formed (optional field, which is **0** by default and does not take effect currently).

Return type: XMLType

Example:

```
gaussdb=# declare
xmltype_blob blob;
xmltype_obj xmltype;
xmltype_str varchar2(1000);
begin
xmltype_blob := xmltype('<a>123</a>').getblobval(7);
xmltype_obj := createxml(xmltype_blob,7);
xmltype_str := xmltype_obj.getstringval();
RAISE NOTICE 'xmltype_str is : %',xmltype_str;
end;
/
NOTICE: xmltype_str is : <?xml version="1.0" encoding="UTF8"?>
<a>123</a>
```

 **NOTE**

1. The maximum size of input parameters of the BLOB type is 256 MB minus 1 byte.
2. The character set ID ranges from 1 to 41.

- `getblobval(xmltype, numeric)`

Description: Converts the XMLType type to the BLOB type. The `xmltype().func()` method can be invoked.

Parameters: The first parameter is of the XMLType type, and the second parameter is the ID of the target character set to be converted.

Return type: BLOB

Example:

```
gaussdb=# SELECT getblobval(xmltype('<asd/>'),7);
getblobval
```

```
-----  
3C3F786D6C2076657273696F6E3D22312E302220656E636F64696E673D2255544638223F3E0A3C6173  
642F3E  
(1 row)
```

```
xmltype ().func ():  
gaussdb=# select xmltype('<asd/>').getblobVal(7);  
xmltypefunc  
-----
```

```
3C3F786D6C2076657273696F6E3D22312E302220656E636F64696E673D2255544638223F3E0A3C6173  
642F3E  
(1 row)
```

NOTE

The maximum length of the input parameter of the XMLType type is 256 MB minus 1 byte.

- **getclobval(xmltype)**

Description: Converts the XMLType type to the CLOB type. The xmltype().func() method can be invoked.

Parameter: The input parameter is of the XMLType type.

Return type: CLOB

Example:

```
gaussdb=# SELECT getclobval(xmltype('<a>123</a>'));  
getclobval  
-----  
<a>123</a>  
(1 row)
```

```
xmltype ().func ():  
gaussdb=# SELECT xmltype('<a>123</a>').getclobval();  
xmltypefunc  
-----  
<a>123</a>  
(1 row)
```

- **getnumberval(xmltype)**

Description: Converts the XMLType type to the numeric type. The xmltype().func() method can be invoked.

Parameter: The input parameter is of the XMLType type.

Return type: numeric

Example:

```
gaussdb=# SELECT getnumberval(xmltype('<a>123</a>').extract('/a/text()'));  
getnumberval  
-----  
123  
(1 row)
```

```
xmltype ().func ():  
gaussdb=# SELECT xmltype('<a>123</a>').extract('/a/text()').getnumberval();  
xmltypefunc  
-----  
123  
(1 row)
```

- **isfragment(xmltype)**

Description: Returns a result indicating whether the XMLType type is fragment (1) or document (0). The xmltype().func() method can be invoked.

Parameter: The input parameter is of the XMLType type.

Return type: numeric

Example:

```
gaussdb=# SELECT isfragment(xmltype('<a>123</a>'));
isfragment
-----
         0
(1 row)
```

xmltype ().func ():

```
gaussdb=# SELECT xmltype('<a>123</a>').isfragment();
xmltypefunc
-----
         0
(1 row)
```

- xmltype(varchar2[,varchar2,numeric ,numeric])

Description: Creates the XMLType type from the varchar2 type.

Parameters: The first parameter is the character string to be converted to XMLType (mandatory field). The second parameter is the optional schema URL used to make the input comply with the specified schema (optional field, which is empty by default and does not take effect currently). The third parameter is the flag indicating whether the instance is valid according to the given XML schema (optional field, which is **0** by default and does not take effect currently). The fourth parameter is the flag indicating whether the instance is well-formed (optional field, which is **0** by default and does not take effect currently).

Return type: XMLType

Example:

```
gaussdb=# SELECT xmltype('<a>123</a>');
xmltype
-----
<a>123</a>
(1 row)
```

NOTE

- Different from that in database A, in PL/SQL, XMLType allows input parameters to be empty strings and returns **NULL**.
 - For character encoding, only UTF-8, GBK, and LATIN1 to LATIN10 are supported, and the **version** field can only be set to **1.x**.
- xmltype(clob [,varchar2,numeric ,numeric])

Description: Creates the XMLType type from the CLOB type.

Parameters: The first parameter is the CLOB to be converted to XMLType (mandatory field). The second parameter is the optional schema URL used to make the input comply with the specified schema (optional field, which is empty by default and does not take effect currently). The third parameter is the flag indicating whether the instance is valid according to the given XML schema (optional field, which is **0** by default and does not take effect currently). The fourth parameter is the flag indicating whether the instance is well-formed (optional field, which is **0** by default and does not take effect currently).

Return type: XMLType

Example:

```
gaussdb=# declare
xmltype_clob clob;
xmltype_obj xmltype;
xmltype_str varchar2(1000);
```

```
begin
xmltype_clob := '<a>123</a>';
xmltype_obj := xmltype(xmltype_clob);
xmltype_str := xmltype_obj.getstringval();
RAISE NOTICE 'xmltype_str is : %',xmltype_str;
end;
/
NOTICE: xmltype_str is : <a>123</a>
```

NOTE

The maximum size of the input parameter of the CLOB type is 1 GB minus 1 byte.

- `xmltype(blob, numeric [,varchar2,numeric ,numeric])`

Description: Creates the XMLType type from the BLOB type.

Parameters: The first parameter is the BLOB to be converted to XMLType (mandatory field). The second parameter is the character set ID of the input XML data. The third parameter is the optional schema URL used to make the input comply with the specified schema (optional field, which is empty by default and does not take effect currently). The fourth parameter is the flag indicating whether the instance is valid according to the given XML schema (optional field, which is **0** by default and does not take effect currently). The fifth parameter is the flag indicating whether the instance is well-formed (optional field, which is **0** by default and does not take effect currently).

Return type: XMLType

Example:

```
gaussdb=# declare
xmltype_blob blob;
xmltype_obj xmltype;
xmltype_str varchar2(1000);
begin
xmltype_blob := getblobval(createxml('<a>123</a>'),7);
xmltype_obj := xmltype(xmltype_blob,7);
xmltype_str := xmltype_obj.getstringval();
RAISE NOTICE 'xmltype_str is : %',xmltype_str;
end;
/
NOTICE: xmltype_str is : <?xml version="1.0" encoding="UTF8"?>
<a>123</a>
```

NOTE

1. The maximum size of input parameters of the BLOB type is 256 MB minus 1 byte.
2. The character set ID ranges from 1 to 41.

- `getstringval(xmltype)`

Description: Converts the XMLType to a string.

Parameter: XMLType to be converted.

Return type: varchar2

The `getstringval` function can be invoked in two modes. The invoking mode in example 2 is compatible with the ORA syntax.

Example 1:

```
gaussdb=# select getstringval('<a>123<b>456</b></a>');
getstringval
-----
<a>123<b>456</b></a>
(1 row)
```

Example 2:

```
gaussdb=# select xmltype('<a>123<b>456</b></a>').getstringval();
xmltypefunc
-----
<a>123<b>456</b></a>
(1 row)
```

- `getrootelement(xmltype)`

Description: Gets the root element of the XMLType type.

Parameter: XMLType whose root element is to be obtained.

Return type: `varchar2`

The `getrootelement` function can be invoked in two modes. The invoking mode in example 2 is compatible with the ORA syntax.

Example 1:

```
gaussdb=# select getrootelement('<a>123<b>456</b></a>');
getrootelement
-----
a
(1 row)
```

Example 2:

```
gaussdb=# select xmltype('<a>123<b>456</b></a>').getrootelement();
xmltypefunc
-----
a
(1 row)
```

- `getnamespace(xmltype)`

Description: Gets the namespace of the XMLType top-level element.

Parameter: XMLType whose namespace is to be obtained.

Return type: `varchar2`

The `getnamespace` function can be invoked in two modes. The invoking mode in example 2 is compatible with the ORA syntax.

Example 1:

```
gaussdb=# select getnamespace('<c:a xmlns:c="asd">123<d:b xmlns:d="qwe">456</d:b></c:a>');
getnamespace
-----
asd
(1 row)
```

Example 2:

```
gaussdb=# select xmltype('<c:a xmlns:c="asd">123<d:b xmlns:d="qwe">456</d:b></c:a>').getnamespace();
xmltypefunc
-----
asd
(1 row)
```

- `existsnode(xmltype, varchar2[, varchar2])`

Description: Determines whether the XML node exists in XMLType based on the XPath expression. If the XML node exists, **1** is returned. Otherwise, **0** is returned.

Parameters: XMLType to be queried, path of the XPath node to be queried, and namespace of the XPath path (If the input parameter has a namespace, aliases must be defined for both the XPath and namespace, as shown in example 3.)

Return type: `numeric`

The `existsnode` function can be invoked in two modes. The invoking modes in examples 2 and 4 are compatible with the syntax of database ORA.

Example 1:

```
gaussdb=# select existsnode('<a>123<b>456</b></a>', '/a/b');
existsnode
-----
         1
(1 row)
```

Example 2:

```
gaussdb=# select xmltype('<a>123<b>456</b></a>').existsnode('/a/b');
xmltypefunc
-----
         1
(1 row)
```

Example 3

```
gaussdb=# select existsnode('<a:b xmlns:a="asd">123<c>456</c></a:b>', '/a:b/c', 'xmlns:a="asd"');
existsnode
-----
         1
(1 row)
```

Example 4:

```
gaussdb=# select xmltype('<a:b xmlns:a="asd">123<c>456</c></a:b>').existsnode('/a:b/c', 'xmlns:a="asd"');
xmltypefunc
-----
         1
(1 row)
```

- `extractxml(xmltype, varchar2[, varchar2])`

Description: Checks whether an XML node exists in the given XMLType based on the XPath expression. If yes, the XMLType containing the node is returned. If no, **NULL** is returned. The return value can be inserted into a table of the XMLType type.

Parameters: XMLType to be queried, path of the XPath node to be queried, and namespace of the XPath path (If the input parameter has a namespace, aliases must be defined for both the XPath and namespace, as shown in example 3.)

Return type: XMLType

The `extractxml` function can be invoked in two modes. The invoking modes in examples 2 and 4 are compatible with the syntax of database ORA.

Example 1:

```
gaussdb=# select extractxml('<a>123<b>456</b></a>', '/a/b');
extractxml
-----
<b>456</b>
(1 row)
```

Example 2:

```
gaussdb=# select xmltype('<a>123<b>456</b></a>').extract('/a/b');
xmltypefunc
-----
<b>456</b>
(1 row)

gaussdb=# select xmltype('<a>123<b>456</b></a>').extractxml('/a/b');
xmltypefunc
-----
<b>456</b>
(1 row)
```

Example 3

```
gaussdb=# select extractxml('<a:b xmlns:a="asd">123<c>456</c></a:b>', '/a:b', 'xmlns:a="asd"');
extractxml
```

```
-----
<a:b xmlns:a="asd">123<c>456</c></a:b>
(1 row)
```

Example 4:

```
gaussdb=# select xmltype('<a:b xmlns:a="asd">123<c>456</c></a:b>').extract('/a:b', 'xmlns:a="asd"');
xmltypefunc
```

```
-----
<a:b xmlns:a="asd">123<c>456</c></a:b>
(1 row)
```

```
gaussdb=# select xmltype('<a:b xmlns:a="asd">123<c>456</c></a:b>').extractxml('/
a:b', 'xmlns:a="asd"');
xmltypefunc
```

```
-----
<a:b xmlns:a="asd">123<c>456</c></a:b>
(1 row)
```

7.5.42 Functions Used by a Ledger Database (Lab Feature)

This is a lab feature. Contact Huawei technical support before using it.

- `get_dn_hist_relhash(text, text)`
Description: Returns the hash value of table-level data in a specified tamper-proof user table. This function can be invoked only between distributed nodes. A message indicating insufficient permission is displayed when all users invoke this function.
Parameter type: text
Return type: hash16
- `ledger_hist_check(text, text)`
Description: Verifies the consistency between the hash value of table-level data in a specified tamper-proof user table and that in the corresponding history table.
Parameter type: text
Return type: Boolean
- `ledger_hist_repair(text, text)`
Description: Restores the hash value of the history table corresponding to the specified tamper-proof user table to be the same as that of the user table, and returns the hash difference.
Parameter type: text
Return type: hash16
- `ledger_hist_archive(text, text)`
Description: Archives the history table corresponding to a specified tamper-proof user table to the **hist_back** folder in the audit log directory.
Parameter type: text
Return type: Boolean
- `ledger_gchain_check(text, text)`
Description: Verifies the consistency between the history table hash corresponding to the specified tamper-proof user table and the **relhash** corresponding to the global history table.
Parameter type: text

- Return type: Boolean
- `ledger_gchain_repair(text, text)`
Description: Restores **relhash** of a specified tamper-proof user table in the global history table so that the hash is the same as that in the history table, and returns the total hash value of the specified table.
Parameter type: text
Return type: hash16
 - `ledger_gchain_archive(void)`
Description: Archives global history tables to the **hist_back** folder in the audit log directory.
Parameter type: void
Return type: Boolean
 - `hash16in(cstring)`
Description: Converts the input hexadecimal string into the internal hash16 format.
Parameter type: cstring
Return type: hash16
 - `hash16out(uint64)`
Description: Converts internal hash16 data to hexadecimal cstring data.
Parameter type: hash16
Return type: cstring
 - `hash32in(cstring)`
Description: Converts the input hexadecimal string (32 characters) into the internal type hash32.
Parameter type: cstring
Return type: hash32
 - `hash32out(hash32)`
Description: Converts internal hash32 data to hexadecimal cstring data.
Parameter type: cstring
Return type: hash32

7.5.43 Obsolete Functions

The following functions in GaussDB have been discarded in the latest version:

`gs_wlm_get_session_info`, `gs_wlm_get_user_session_info`, `check_engine_status`, `encode_plan_node`, `model_train_opt`, `gs_stat_get_wlm_plan_operator_info`, `track_model_train_opt`, `array_extend`, `dbe_perf.global_slow_query_info`, `dbe_perf.global_slow_query_info_bytime`, `dbe_perf.global_slow_query_history`, `pg_reload_conf`, `pg_rotate_logfile`, `gs_stat_ustore`, `pv_compute_pool_workload()`, and `pgxc_log_comm_status(void)`

7.6 Expressions

7.6.1 Simple Expressions

Logical Expressions

[Logical Operators](#) lists the operators and calculation rules of logical expressions.

Comparative Expressions

[Comparison Operators](#) lists the common comparative operators.

In addition to comparative operators, you can also use the following sentence structure:

- BETWEEN operator
a **BETWEEN x AND y** is equivalent to **a >= x AND a <= y**.
a **NOT BETWEEN x AND y** is equivalent to **a < x OR a > y**.
- To check whether a value is null, use:
expression IS NULL
expression IS NOT NULL
or an equivalent (non-standard) sentence structure:
expression ISNULL
expression NOTNULL

NOTICE

- Do not write **expression=NULL** or **expression<>(=)NULL**, because **NULL** represents an unknown value, and these expressions cannot determine whether two unknown values are equal.
 - Only the comparative expressions IS NULL and IS NOT NULL support data of XML type.
-
- is distinct from/is not distinct from
 - is distinct from
If the data types and values of A and B are different, the value is **true**.
If the data types and values of A and B are the same, the value is **false**.
Empty values are considered the same.
 - is not distinct from
If the data types and values of A and B are different, the value is **false**.
If the data types and values of A and B are the same, the value is **true**.
Empty values are considered the same.
 - <=> NULL-safe equal operator
The comparison of NULL values is added on the basis of the comparison of '='. If neither the left nor right value of the operator is NULL, the result is the same as that of '='.
If the data types and values of A and B are different, the value is **false**.

If the data types and values of A and B are the same, the value is **true**.
Empty values are considered the same.

 **NOTE**

- The usage of the <=> operator is the same as that of IS NOT DISTINCT FROM.
- This operator is valid only when the database is compatible with the MySQL type (that is, **sql_compatibility** is set to 'MYSQL'). Other types do not support this operator.

Examples

```
gaussdb=# SELECT 2 BETWEEN 1 AND 3 AS RESULT;
result
-----
t
(1 row)

gaussdb=# SELECT 2 >= 1 AND 2 <= 3 AS RESULT;
result
-----
t
(1 row)

gaussdb=# SELECT 2 NOT BETWEEN 1 AND 3 AS RESULT;
result
-----
f
(1 row)

gaussdb=# SELECT 2 < 1 OR 2 > 3 AS RESULT;
result
-----
f
(1 row)

gaussdb=# SELECT 2+2 IS NULL AS RESULT;
result
-----
f
(1 row)

gaussdb=# SELECT 2+2 IS NOT NULL AS RESULT;
result
-----
t
(1 row)

gaussdb=# SELECT 2+2 ISNULL AS RESULT;
result
-----
f
(1 row)

gaussdb=# SELECT 2+2 NOTNULL AS RESULT;
result
-----
t
(1 row)

gaussdb=# SELECT 2+2 IS DISTINCT FROM NULL AS RESULT;
result
-----
t
(1 row)

gaussdb=# SELECT 2+2 IS NOT DISTINCT FROM NULL AS RESULT;
```

```

result
-----
f
(1 row)

gaussdb=# select 1 <=> 1 AS RESULT;
result
-----
t
(1 row)

gaussdb=# select NULL <=> 1 AS RESULT;
result
-----
f
(1 row)

gaussdb=# select NULL <=> NULL AS RESULT;
result
-----
t
(1 row)

```

7.6.2 Condition Expressions

Data that meets the requirements specified by conditional expressions are filtered during SQL statement execution.

Conditional expressions include the following types:

- **CASE**
CASE expressions are similar to the **CASE** statements in other coding languages.

Figure 7-1 shows the syntax of a **CASE** expression.

Figure 7-1 case::=

A **CASE** clause can be used in a valid expression. **condition** is an expression that returns a value of Boolean type.

- If the result is **true**, the result of the **CASE** expression is the required result.
- If the result is false, the following **WHEN** or **ELSE** clauses are processed in the same way.
- If every **WHEN condition** is false, the result of the expression is the result of the **ELSE** clause. If the **ELSE** clause is omitted and has no match condition, the result is NULL.
- Operations on XML data are supported.

For example:

```
gaussdb=# CREATE TABLE tpcds.case_when_t1(CW_COL1 INT) DISTRIBUTE BY HASH (CW_COL1);
```

```
gaussdb=# INSERT INTO tpcds.case_when_t1 VALUES (1), (2), (3);

gaussdb=# SELECT * FROM tpcds.case_when_t1;
 a
---
 1
 2
 3
(3 rows)

gaussdb=# SELECT CW_COL1, CASE WHEN CW_COL1=1 THEN 'one' WHEN CW_COL1=2 THEN 'two'
ELSE 'other' END FROM tpcds.case_when_t1 ORDER BY 1;
 cw_col1 | case
-----+-----
       1 | one
       2 | two
       3 | other
(3 rows)

gaussdb=# DROP TABLE tpcds.case_when_t1;
```

- DECODE

Figure 7-2 shows the syntax of a **DECODE** expression.

Figure 7-2 decode::=

Compare each following **compare(n)** with **base_expr**, **value(n)** is returned if a **compare(n)** matches the **base_expr** expression. If **base_expr** does not match each **compare(n)**, the default value is returned.

Operations on XML data are supported.

Conditional Expression Functions describes the examples.

```
gaussdb=# SELECT DECODE('A','A',1,'B',2,0);
 case
-----
      1
(1 row)
```

- COALESCE

Figure 7-3 shows the syntax of a **COALESCE** expression.

Figure 7-3 coalesce::=

COALESCE returns its first not-**NULL** value. If all the parameters are **NULL**, **COALESCE** will return **NULL**. This value is replaced by the default value when data is displayed. Like a **CASE** expression, **COALESCE** only evaluates the parameters that are needed to determine the result. That is, parameters to the right of the first not-**NULL** parameter are not evaluated.

Operations on XML data are supported.

Example

```
gaussdb=# CREATE TABLE tpcds.c_tabl(description varchar(10), short_description varchar(10),
last_value varchar(10))
DISTRIBUTE BY HASH (last_value);

gaussdb=# INSERT INTO tpcds.c_tabl VALUES('abc', 'efg', '123');
gaussdb=# INSERT INTO tpcds.c_tabl VALUES(NULL, 'efg', '123');

gaussdb=# INSERT INTO tpcds.c_tabl VALUES(NULL, NULL, '123');

gaussdb=# SELECT description, short_description, last_value, COALESCE(description, short_description,
last_value) FROM tpcds.c_tabl ORDER BY 1, 2, 3, 4;
description | short_description | last_value | coalesce
-----+-----+-----+-----
abc        | efg              | 123       | abc
          | efg              | 123       | efg
          |                  | 123       | 123
(3 rows)

gaussdb=# DROP TABLE tpcds.c_tabl;
```

If **description** is not **NULL**, the value of **description** is returned. Otherwise, parameter **short_description** is calculated. If **short_description** is not **NULL**, the value of **short_description** is returned. Otherwise, parameter **last_value** is calculated. If **last_value** is not **NULL**, the value of **last_value** is returned. Otherwise, **none** is returned.

```
gaussdb=# SELECT COALESCE(NULL,'Hello World');
coalesce
-----
Hello World
(1 row)
```

- **NULLIF**

Figure 7-4 shows the syntax of a **NULLIF** expression.

Figure 7-4 nullif::=

Only if **value1** is equal to **value2** can **NULLIF** return the **NULL** value. Otherwise, **value1** is returned. Operations on XML data are supported.

Example

```
gaussdb=# CREATE TABLE tpcds.null_if_t1 (
NI_VALUE1 VARCHAR(10),
NI_VALUE2 VARCHAR(10)
)DISTRIBUTE BY HASH (NI_VALUE1);

gaussdb=# INSERT INTO tpcds.null_if_t1 VALUES('abc', 'abc');
gaussdb=# INSERT INTO tpcds.null_if_t1 VALUES('abc', 'efg');

gaussdb=# SELECT NI_VALUE1, NI_VALUE2, NULLIF(NI_VALUE1, NI_VALUE2) FROM tpcds.null_if_t1
ORDER BY 1, 2, 3;

ni_value1 | ni_value2 | nullif
-----+-----+-----
abc       | abc       |
abc       | efg       | abc
(2 rows)

gaussdb=# DROP TABLE tpcds.null_if_t1;
```

If **value1** is equal to **value2**, **NULL** is returned. Otherwise, **value1** is returned.

```
gaussdb=# SELECT NULLIF('Hello','Hello World');
nullif
-----
Hello
(1 row)
```

- GREATEST (maximum value) and LEAST (minimum value)

Figure 7-5 shows the syntax of a **GREATEST** expression.

Figure 7-5 greatest::=

You can select the maximum value from any numerical expression list. Operations on XML data are supported.

```
gaussdb=# SELECT greatest(9000,15555,2.01);
greatest
-----
15555
(1 row)
```

Figure 7-6 shows the syntax of a **LEAST** expression.

Figure 7-6 least::=

You can select the minimum value from any numerical expression list. Each of the preceding numeric expressions can be converted into a common data type, which will be the data type of the result.

The NULL values in the list will be ignored. The result is **NULL** only if the results of all expressions are **NULL**.

Operations on XML data are supported.

```
gaussdb=# SELECT least(9000,2);
least
-----
2
(1 row)
```

Conditional Expression Functions describes the examples.

- NVL

Figure 7-7 shows the syntax of an **NVL** expression.

Figure 7-7 nvl::=

If the value of **value1** is **NULL**, **value2** is returned. Otherwise, **value1** is returned. Operations on XML data are supported.

For example:

```
gaussdb=# SELECT nvl(null,1);
NVL
-----
1
(1 row)
gaussdb=# SELECT nvl ('Hello World' ,1);
      nvl
-----
Hello World
(1 row)
```

7.6.3 Subquery Expressions

Subquery expressions include the following types:

- EXISTS/NOT EXISTS

Figure 7-8 shows the syntax of an **EXISTS/NOT EXISTS** expression.

Figure 7-8 EXISTS/NOT EXISTS::=

The parameter of an **EXISTS** expression is an arbitrary **SELECT** statement, or subquery. The subquery is evaluated to determine whether it returns any rows. If it returns at least one row, the result of **EXISTS** is true. If the subquery returns no rows, the result of **EXISTS** is false.

The subquery will generally only be executed long enough to determine whether at least one row is returned, not all the way to completion.

Operations on XML data are not supported.

For example:

```
gaussdb=# CREATE TABLE exists_t1(a int, b int);
gaussdb=# INSERT INTO exists_t1 VALUES(1, 2),(2, 3),(3, 4),(4, 5);

gaussdb=# CREATE TABLE exists_t2(a int, c int);
gaussdb=# INSERT INTO exists_t2 VALUES(3, 4),(4, 5),(5, 6),(6, 7);

gaussdb=# SELECT * FROM exists_t1 t1 WHERE EXISTS (SELECT * FROM exists_t2 t2 WHERE t2.a =
t1.a);
 a | b
---+---
 3 | 4
 4 | 5
(2 rows)

gaussdb=# DROP TABLE exists_t1, exists_t2;
```

- IN/NOT IN

Figure 7-9 shows the syntax of an **IN/NOT IN** expression.

Figure 7-9 IN/NOT IN::=

The right-hand side is a parenthesized subquery, which must return exactly one column. The left-hand expression is evaluated and compared to each row of the subquery result. The result of **IN** is true if any equal subquery row is found. The result is false if no equal row is found (including the case where the subquery returns no rows).

This is in accordance with SQL normal rules for Boolean combinations of null values. If the columns corresponding to two rows equal and are not empty, the two rows are equal to each other. If any columns corresponding to the two rows do not equal and are not empty, the two rows are not equal to each other. Otherwise, the result is **NULL**. If there are no equal right-hand values and at least one right-hand row yields null, the result of **IN** will be null, not false.

Operations on XML data are not supported.

For example:

```

gaussdb=# CREATE TABLE in_t1(a int, b int);
gaussdb=# INSERT INTO in_t1 VALUES(1, 2),(2, 3),(3, 4),(4, 5);

gaussdb=# CREATE TABLE in_t2(a int, c int);
gaussdb=# INSERT INTO in_t2 VALUES(3, 4),(4, 5),(5, 6),(6, 7);

gaussdb=# SELECT * FROM in_t1 t1 WHERE t1.a IN (SELECT t2.a FROM in_t2 t2);
 a | b
----+----
 3 | 4
 4 | 5
(2 rows)

gaussdb=# DROP TABLE in_t1, in_t2;
  
```

- **ANY/SOME**

Figure 7-10 shows the syntax of an **ANY/SOME** expression.

Figure 7-10 any/some::=

The right-hand side is a parenthesized subquery, which must return exactly one column. The left-hand expression is evaluated and compared to each row of the subquery result using the given operator, which must yield a Boolean result. The result of **ANY** is "true" if any true result is obtained. The result is "false" if no true result is found (including the case where the subquery returns no rows). **SOME** is a synonym of **ANY**. **IN** can be equivalently replaced with **ANY**.

Operations on XML data are not supported.

For example:

```
gaussdb=# CREATE TABLE any_t1(a int, b int);
gaussdb=# INSERT INTO any_t1 VALUES(1, 2),(2, 3),(3, 4),(4, 5);

gaussdb=# CREATE TABLE any_t2(a int, c int);
gaussdb=# INSERT INTO any_t2 VALUES(3, 4),(4, 5),(5, 6),(6, 7);

gaussdb=# SELECT * FROM any_t1 t1 WHERE t1.a < ANY(SELECT t2.a FROM any_t2 t2 where t2.a = 3
or t2.a = 4);
 a | b
----+----
 1 | 2
 2 | 3
 3 | 4
(3 rows)

gaussdb=# DROP TABLE any_t1, any_t2;
```

- ALL

Figure 7-11 shows the syntax of an **ALL** expression.

Figure 7-11 all::=

The right-hand side is a parenthesized subquery, which must return exactly one column. The left-hand expression is evaluated and compared to each row of the subquery result using the given operator, which must yield a Boolean result. The result of ALL is true if all values are true (including the case where the subquery returns no rows). The result is false if any false result is found.

Operations on XML data are not supported.

Example:

```
gaussdb=# CREATE TABLE all_t1(a int, b int);
gaussdb=# INSERT INTO all_t1 VALUES(1, 2),(2, 3),(3, 4),(4, 5);

gaussdb=# CREATE TABLE all_t2(a int, c int);
gaussdb=# INSERT INTO all_t2 VALUES(3, 4),(4, 5),(5, 6),(6, 7);

gaussdb=# SELECT * FROM all_t1 t1 WHERE t1.a < ALL(SELECT t2.a FROM all_t2 t2 where t2.a = 3 or
t2.a = 4);
 a | b
----+----
 1 | 2
 2 | 3
(2 rows)

gaussdb=# DROP TABLE all_t1, all_t2;
```

7.6.4 Array Expressions

IN

expression **IN** (*value* [, ...])

The parentheses on the right contain an expression list. The expression result on the left is compared with the content in the expression list. If the content in the list meets the expression result on the left, the result of **IN** is **true**. If no result meets the requirements, the result of **IN** is **false**.

For example:

```
gaussdb=# SELECT 8000+500 IN (10000, 9000) AS RESULT;  
result  
-----  
f  
(1 row)
```

NOTE

- If the expression result is null or the expression list does not meet the expression conditions and at least one empty value is returned for the expression list on the right, the result of **IN** is **null** rather than **false**. This method is consistent with the Boolean rules used when SQL statements return empty values.
- Operations on XML data are not supported.

NOT IN

expression **NOT IN** (*value* [, ...])

The parentheses on the right contain an expression list. The expression result on the left is compared with the content in the expression list. If the content in the list does not meet the expression result on the left, the result of **NOT IN** is **true**. If any content meets the expression result, the result of **NOT IN** is **false**.

For example:

```
gaussdb=# SELECT 8000+500 NOT IN (10000, 9000) AS RESULT;  
result  
-----  
t  
(1 row)
```

NOTE

- If the query statement result is null or the expression list does not meet the expression conditions and at least one empty value is returned for the expression list on the right, the result of **NOT IN** is null rather than false. This method is consistent with the Boolean rules used when SQL statements return empty values.
- In all situations, X **NOT IN** Y equals to **NOT**(X **IN** Y).
- Operations on XML data are not supported.

ANY/SOME (array)

expression operator **ANY** (*array expression*)

expression operator **SOME** (*array expression*)

The right side is a parenthesized expression, which must yield an array value. The result of the expression on the left uses operators to compute and compare the results in each row of the array expression. The comparison result must be a Boolean value.

Example:

```
gaussdb=# SELECT 8000+500 < SOME (array[10000,9000]) AS RESULT;  
result  
-----  
t  
(1 row)  
gaussdb=# SELECT 8000+500 < ANY (array[10000,9000]) AS RESULT;  
result
```

```
-----  
t  
(1 row)
```

NOTE

- If at least one comparison result is true, the result of ANY is true.
- If no comparison result is true, the result of ANY is false.
- If no comparison result is true and the array expression generates at least one null value, the value of **ANY** is **NULL** rather than **false**. This method is consistent with the Boolean rules used when SQL statements return empty values.
- SOME is a synonym of ANY.
- Operations on XML data are not supported.

ALL (array)

expression operator ALL (array expression)

The right-hand side is a parenthesized expression, which must yield an array value. The result of the expression on the left uses operators to compute and compare the results in each row of the array expression. The comparison result must be a Boolean value.

- The result of **ALL** is **true** if all comparisons yield **true** (including the case where the array has zero elements).
- If one or more comparison results are false, the result of **ALL** is false.
- If the array expression yields a null array, the result of ALL will be null. If the expression on the left yields NULL, the result of ALL is generally NULL (though a non-strict comparison operator could possibly yield a different result). Also, if the array on the right contains any null elements and no false comparison result is found, the result of ALL is NULL, not true (again, assuming a strict comparison operator). This method is consistent with the Boolean rules used when SQL statements return empty values.
- Operations on XML data are not supported.

```
gaussdb=# SELECT 8000+500 < ALL (array[10000,9000]) AS RESULT;  
result  
-----  
t  
(1 row)
```

7.6.5 Row Expressions

Syntax:

row_constructor operator row_constructor

Both sides of the row expression are row constructors. The values of both rows must have the same number of columns and they are compared with each other. The row comparison allows operators including =, <>, <, <=, and >= or a similar operator.

For operators <, <=, >, and >=, the columns in rows are compared from left to right until a pair of columns that are not equal or are empty are detected. If the pair of columns contains at least one null value, the comparison result is null. Otherwise, the comparison result of this pair of columns is the final result. If no unequal or empty column is found, the values in the two rows are equal. The final result is determined based on the operator meaning.

Operations on XML data are not supported.

For example:

```
gaussdb=# SELECT ROW(1,2,NULL) < ROW(1,3,0) AS RESULT;
result
-----
t
(1 row)

gaussdb=# select (4,5,6) > (3,2,1) as result;
result
-----
t
(1 row)

gaussdb=# select (4,1,1) > (3,2,1) as result;
result
-----
t
(1 row)

gaussdb=# select ('test','data') > ('data','data') as result;
result
-----
t
(1 row)

gaussdb=# select (4,1,1) > (3,2,null) as result;
result
-----
t
(1 row)

gaussdb=# select (null,1,1) > (3,2,1) as result;
result
-----

(1 row)

gaussdb=# select (null,5,6) > (null,5,6) as result;
result
-----

(1 row)

gaussdb=# select (4,5,6) > (4,5,6) as result;
result
-----
f
(1 row)

gaussdb=# select (2,2,5) >= (2,2,3) as result;
result
-----
t
(1 row)

gaussdb=# select (2,2,1) <= (2,2,3) as result;
result
-----
t
(1 row)
```

The use of operators = and <> is slightly different from other operators. If all columns in the two rows are not empty and meet the operator condition, the two rows meet the operator condition. If any column in the two rows is not empty and

does not meet the operator condition, the two rows do not meet the operator condition. If any column in the two rows is empty, the comparison result is null.

For example:

```
gaussdb=# select (1,2,3) = (1,2,3) as result;
result
-----
t
(1 row)

gaussdb=# select (1,2,3) <> (2,2,3) as result;
result
-----
t
(1 row)

gaussdb=# select (2,2,3) <> (2,2,null) as result;
result
-----

(1 row)

gaussdb=# select (null,5,6) <> (null,5,6) as result;
result
-----

(1 row)
```

7.7 Pseudocolumn

ROWNUM is a pseudocolumn that returns a number indicating the row number of the obtained query result. The value of **ROWNUM** in the first row is **1**, the value of **ROWNUM** in the second row is **2**, and so on.

ROWNUM can be used to limit the number of rows returned by a query, as shown in the following example:

```
gaussdb=# CREATE TABLE Students (name varchar(20), id int) with (STORAGE_TYPE = USTORE);
gaussdb=# INSERT INTO Students VALUES ('Jack', 35);
gaussdb=# INSERT INTO Students VALUES ('Leon', 15);
gaussdb=# INSERT INTO Students VALUES ('James', 24);
gaussdb=# INSERT INTO Students VALUES ('Taker', 81);
gaussdb=# INSERT INTO Students VALUES ('Mary', 25);
gaussdb=# INSERT INTO Students VALUES ('Rose', 64);
gaussdb=# INSERT INTO Students VALUES ('Perl', 18);
gaussdb=# INSERT INTO Students VALUES ('Under', 57);
gaussdb=# INSERT INTO Students VALUES ('Angel', 101);
gaussdb=# INSERT INTO Students VALUES ('Frank', 20);
gaussdb=# INSERT INTO Students VALUES ('charlie', 40);
gaussdb=# SELECT * FROM Students WHERE rownum <= 10; -- Output the first 10 rows of data records in
the Students table.
name | id
-----+-----
Jack | 35
Leon | 15
James | 24
Taker | 81
Mary | 25
Rose | 64
Perl | 18
Under | 57
Angel | 101
Frank | 20
(10 rows)
```

If the statement has a clause, the output rows are reordered according to the clause.

```
gaussdb=# SELECT * FROM Students WHERE rownum < 5 order by 1;
name | id
-----+-----
Jack | 35
James | 24
Leon | 15
Taker | 81
(4 rows)
```

If a subquery has a clause but the condition is placed in the top-level query, you can use the **ROWNUM** condition after sorting.

```
gaussdb=# SELECT rownum, * FROM (SELECT * FROM Students order by 1) WHERE rownum <= 2;
rownum | name | id
-----+-----+-----
1 | Angel | 101
2 | charlie | 40
(2 rows)
```

As long as **ROWNUM** is greater than a specific positive integer, the condition is always false. As shown in the following example, the statement does not return any result in the table.

```
gaussdb=# SELECT * FROM Students WHERE rownum > 1;
name | id
-----+-----
(0 rows)
```

Use **ROWNUM** to assign a value to each row within a certain range of the table.

```
gaussdb=# SELECT * FROM Students;
name | id
-----+-----
Jack | 35
Leon | 15
James | 24
Taker | 81
Mary | 25
Rose | 64
Perl | 18
Under | 57
Angel | 101
Frank | 20
charlie | 40
(11 rows)

gaussdb=# update Students set id = id + 5 WHERE rownum < 4;
UPDATE 3
gaussdb=# SELECT * FROM Students;
name | id
-----+-----
Jack | 40
Leon | 20
James | 29
Taker | 81
Mary | 25
Rose | 64
Perl | 18
Under | 57
Angel | 101
Frank | 20
charlie | 40
(11 rows)

gaussdb=# DROP TABLE Students;
DROP TABLE
```

The restrictions on using **ROWNUM** are as follows:

- Do not use ROWNUM as an alias to avoid ambiguity in SQL statements.
- Do not use ROWNUM when creating an index.
- Do not use ROWNUM as the default value when creating a table.
- Do not use ROWNUM as an alias in the WHERE clause.
- Do not use ROWNUM when inserting data.
- Do not use ROWNUM in a tableless query.
- Do not use ROWNUM in the LIMIT clause.
- Do not use ROWNUM as a parameter of the EXECUTE statement.
- Do not use ROWNUM to update a clause in the UPSERT statement.
- Do not use ROWNUM as a projection column or WHERE condition in the SELECT ... FOR UPDATE statement.

- If the HAVING clause contains ROWNUM (not in an aggregate function), the GROUP BY clause must also contain ROWNUM (not in an aggregate function), unless the GROUP BY clause contains an expression, for example, **SELECT a + a FROM t group by a + a having rownum < 5.**

- If the ROWNUM condition exists in the HAVING clause, the HAVING clause cannot be pushed down to any scan node.

```
gaussdb=# CREATE TABLE test (a int, b int);
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'a' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
```

```
CREATE TABLE
gaussdb=# INSERT INTO test SELECT generate_series, generate_series FROM generate_series(1, 10);
INSERT 0 10
```

```
gaussdb=# EXPLAIN SELECT a,rownum FROM test group by a,rownum having rownum < 5; -- The
ROWNUM condition cannot be pushed down to Seq Scan.
```

```
QUERY PLAN
```

```
-----
HashAggregate (cost=3.45..3.49 rows=3 width=4)
  Group By Key: a, ROWNUM
  Filter: ((ROWNUM) < 5::numeric)
  -> Rownum (cost=0.19..3.40 rows=10 width=4)
     -> Streaming (type: GATHER) (cost=0.19..3.40 rows=10 width=4)
        Node/s: All datanodes
     -> Seq Scan on test (cost=0.00..3.03 rows=10 width=4)
(7 rows)
```

- If a subquery contains the ROWNUM condition, the predicate cannot be pushed down to any scan node.

```
gaussdb=# EXPLAIN SELECT * FROM (SELECT * FROM test WHERE rownum < 5) WHERE b < 5; -- The
b<5 WHERE clause cannot be pushed down to Seq Scan.
```

```
QUERY PLAN
```

```
-----
Streaming (type: GATHER) (cost=0.06..0.76 rows=2 width=8)
  Node/s: All datanodes
  -> Subquery Scan on __unnamed_subquery__ (cost=0.00..0.63 rows=2 width=8)
     Filter: (__unnamed_subquery__.b < 5)
     -> Rownum (cost=0.00..0.57 rows=5 width=8)
        StopKey: (ROWNUM < 5::numeric)
     -> Streaming(type: BROADCAST) (cost=0.00..1.71 rows=15 width=8)
        Spawn on: All datanodes
     -> Rownum (cost=0.00..1.68 rows=5 width=8)
        StopKey: (ROWNUM < 5::numeric)
     -> Seq Scan on test (cost=0.00..3.03 rows=10 width=8)
(11 rows)
```

```
gaussdb=# DROP TABLE test;
DROP TABLE
```

CAUTION

- The query result of **ROWNUM** may be unstable due to the sequence in which the CN receives DN data.

```
gaussdb=# CREATE TABLE test(a int, b int);
gaussdb=# INSERT INTO test VALUES(generate_series(1,10),generate_series(1,10));
gaussdb=# SELECT rownum,* FROM test; -- The CN receives data from DN1 and then from DN2.
```

```
rownum | a | b
-----+---+---
1 | 1 | 1
2 | 2 | 2
3 | 5 | 5
4 | 6 | 6
5 | 8 | 8
6 | 9 | 9
7 | 3 | 3
8 | 4 | 4
9 | 7 | 7
10 | 10 | 10
```

(10 rows)

```
gaussdb=# SELECT rownum,* FROM test; -- The CN receives data from DN2 and then from DN1.
```

```
rownum | a | b
-----+---+---
1 | 3 | 3
2 | 4 | 4
3 | 7 | 7
4 | 10 | 10
5 | 1 | 1
6 | 2 | 2
7 | 5 | 5
8 | 6 | 6
9 | 8 | 8
10 | 9 | 9
```

(10 rows)

- It is not recommended that the **ROWNUM** condition be used in the **JOIN ON** clause. In GaussDB, when the **ROWNUM** condition is used in the **JOIN ON** clause, the behavior in the **LEFT JOIN**, **RIGHT JOIN**, **FULL JOIN**, and **MERGE INTO** scenarios is different from that in other databases, causing risks in service migration.

7.8 Type Conversion

7.8.1 Overview

Background

SQL is a typed language. That is, every data item has an associated data type which determines its behavior and allowed usage. GaussDB has an extensible type system that is more general and flexible than other SQL implementations. Hence, most type conversion behaviors in GaussDB are governed by general rules. This allows the use of mixed-type expressions.

The GaussDB scanner/parser divides lexical elements into five fundamental categories: integers, floating-point numbers, strings, identifiers, and keywords. Constants of most non-numeric types are first classified as strings. The SQL language definition allows specifying type names with constant strings. For example, the query:

```
gaussdb=# SELECT text 'Origin' AS "label", point '(0,0)' AS "value";
label | value
-----+-----
Origin | (0,0)
(1 row)
```

has two literal constants, of type **text** and **point**. If a type is not specified for a string literal, then the placeholder type **unknown** is assigned initially.

There are four fundamental SQL constructs requiring distinct type conversion rules in GaussDB parser:

- **Function calls**
Much of the SQL type system is built around a rich set of functions. Functions can have one or more arguments. Since SQL permits function overloading, the function name alone does not uniquely identify the function to be called. The parser must select the right function based on the data types of the supplied arguments.
- **Operators**
SQL allows expressions with prefix and postfix unary (one-argument) operators, as well as binary (two-argument) operators. Like functions, operators can be overloaded, so the same problem of selecting the right operator exists.
- **Value storage**
SQL **INSERT** and **UPDATE** statements place the results of expressions into a table. The expressions in the statement must be matched up with, and perhaps converted to, the types of the target columns.
- **UNION, CASE, and Related Constructs**
Since all query results from a unionized **SELECT** statement must appear in a single set of columns, the types of the results of each **SELECT** clause must be matched up and converted to a uniform set. Similarly, the result expressions of a **CASE** construct must be converted to a common type so that the **CASE** expression as a whole has a known output type. The same holds for **ARRAY** constructs, and for the **GREATEST** and **LEAST** functions.

The system catalog `pg_cast` stores information about which conversions, or casts, exist between which data types, and how to perform those conversions. For details, see [PG_CAST](#).

The return type and conversion behavior of an expression are determined during semantic analysis. Data types are divided into several basic type categories, including **Boolean**, **numeric**, **string**, **bitstring**, **datetime**, **timespan**, **geometric**, and **network**. Within each category there can be one or more preferred types, which are preferred when there is a choice of possible types. With careful selection of preferred types and available implicit casts, it is possible to ensure that ambiguous expressions (those with multiple candidate parsing solutions) can be resolved in a useful way.

All type conversion rules are designed based on the following principles:

- Implicit conversions should never have surprising or unpredictable outcomes.
- There should be no extra overhead in the parser or executor if a query does not need implicit type conversion. That is, if a query is well-formed and the types already match, then the query should execute without spending extra

time in the parser and without introducing unnecessary implicit conversion calls in the query.

- Additionally, if a query usually requires an implicit conversion for a function, and if then the user defines a new function with the correct argument types, the parser should use this new function.
- XML data does not support implicit type conversion, including implicit conversion between strings and XML types.

7.8.2 Operators

Operator Type Resolution

1. Select the operators to be considered from the **pg_operator** system catalog. Considered operators are those with the matching name and argument count. If the search path finds multiple available operators, only the most suitable one is considered.
2. Look for the best match.
 - a. Discard candidate operators for which the input types do not match and cannot be converted (using an implicit conversion) to match. **unknown** literals are assumed to be convertible to anything for this purpose. If only one candidate remains, use it; else continue to the next step.
 - b. Run through all candidates and keep those with the most exact matches on input types. Domains are considered the same as their base type for this purpose. Keep all candidates if none survives these tests. If only one candidate remains, use it; else continue to the next step.
 - c. Run through all candidates and keep those that accept preferred types (of the input data type's type category) at the most positions where type conversion will be required. Keep all candidates if none accepts preferred types. If only one candidate remains, use it; else continue to the next step.
 - d. If any input arguments are of **unknown** types, check the type categories accepted at those argument positions by the remaining candidates. At each position, select the string category if any candidate accepts that category. (This bias towards string is appropriate since an unknown-type literal looks like a string.) Otherwise, if all the remaining candidates accept the same type category, select that category; otherwise fail because the correct choice cannot be deduced without more clues. Now discard candidates that do not accept the selected type category. Furthermore, if any candidate accepts a preferred type in that category, discard candidates that accept non-preferred types for that argument. Keep all candidates if none survives these tests. If only one candidate remains, use it; else continue to the next step.
 - e. If there are both **unknown** and known-type arguments, and all the known-type arguments have the same type, assume that the **unknown** arguments are also of that type, and check which candidates can accept that type at the unknown-argument positions. If exactly one candidate passes this test, use it. Otherwise, fail.

Examples

Example 1: Use factorial operator type resolution. There is only one factorial operator (postfix !) defined in the system catalog, and it takes an argument of

type **bigint**. The scanner assigns an initial type of **bigint** to the argument in this query expression:

```
gaussdb=# SELECT 40 ! AS "40 factorial";
         40 factorial
-----
815915283247897734345611269596115894272000000000
(1 row)
```

So the parser does a type conversion on the operand and the query is equivalent to:

```
gaussdb=# SELECT CAST(40 AS bigint) ! AS "40 factorial";
```

Example 2: String concatenation operator type resolution. A string-like syntax is used for working with string types and for working with complex extension types. Strings with unspecified type are matched with likely operator candidates. An example with one unspecified argument:

```
gaussdb=# SELECT text 'abc' || 'def' AS "text and unknown";
text and unknown
-----
abcdef
(1 row)
```

In this example, the parser looks for an operator whose parameters are of the text type. Such an operator is found.

Here is a concatenation of two values of unspecified types:

```
gaussdb=# SELECT 'abc' || 'def' AS "unspecified";
unspecified
-----
abcdef
(1 row)
```

NOTE

In this case there is no initial hint for which type to use, since no types are specified in the query. So, the parser looks for all candidate operators and finds that there are candidates accepting both string-category and bit-string-category inputs. Since string category is preferred when available, that category is selected, and then the preferred type for strings, **text**, is used as the specific type to resolve the unknown-type literals as.

Example 3: Absolute-value and negation operator type resolution. The GaussDB operator catalog has several entries for the prefix operator @. All the entries implement absolute-value operations for various numeric data types. One of these entries is for type **float8**, which is the preferred type in the numeric category. Therefore, GaussDB will use that entry when faced with an unknown input:

```
gaussdb=# SELECT @ '-4.5' AS "abs";
abs
----
4.5
(1 row)
```

Here the system has implicitly resolved the unknown-type literal as type **float8** before applying the chosen operator.

Example 4: Use the array inclusion operator type resolution as an example. Here is another example of resolving an operator with one known and one unknown input:

```
gaussdb=# SELECT array[1,2] <@ '{1,2,3}' as "is subset";
is subset
```

```
-----  
t  
(1 row)
```

NOTE

The GaussDB operator catalog has several entries for the infix operator `<@`, but the only two that could possibly accept an integer array on the left side are array inclusion (`anyarray <@ anyarray`) and range inclusion (`anyelement <@ anyrange`). Since none of these polymorphic pseudo-types (see section [Pseudo-Types](#)) is considered preferred, the parser cannot resolve the ambiguity on that basis. However, the last resolution rule tells it to assume that the unknown-type literal is of the same type as the other input, that is, integer array. Now only one of the two operators can match, so array inclusion is selected. (Had range inclusion been selected, we would have gotten an error, because the string does not have the right format to be a range literal.)

7.8.3 Functions

Function Type Resolution

1. Select the functions to be considered from the `pg_proc` system catalog. If a non-schema-qualified function name was used, the functions in the current search path are considered. If a qualified function name was given, only functions in the specified schema are considered.
If the search path finds multiple functions of different argument types, a proper function in the path is considered.
2. Check for a function accepting exactly the input argument types. If the function exists, use it. Cases involving **unknown** will never find a match at this step.
3. If no exact match is found, see if the function call appears to be a special type conversion request.
4. Look for the best match.
 - a. Discard candidate functions for which the input types do not match and cannot be converted (using an implicit conversion) to match. **unknown** literals are assumed to be convertible to anything for this purpose. If only one candidate remains, use it; else continue to the next step.
 - b. Run through all candidates and keep those with the most exact matches on input types. Domains are considered the same as their base type for this purpose. Keep all candidates if none has exact matches. If only one candidate remains, use it; else continue to the next step.
 - c. Run through all candidates and keep those that accept preferred types at the most positions where type conversion will be required. Keep all candidates if none accepts preferred types. If only one candidate remains, use it; else continue to the next step.
 - d. If any input arguments are of **unknown** types, check the type categories accepted at those argument positions by the remaining candidates. At each position, select the string category if any candidate accepts that category. (This bias towards string is appropriate since an unknown-type literal looks like a string.) Otherwise, if all the remaining candidates accept the same type category, select that category; otherwise fail because the correct choice cannot be deduced without more clues. Now discard candidates that do not accept the selected type category. Furthermore, if any candidate accepts a preferred type in that category,

discard candidates that accept non-preferred types for that argument. Keep all candidates if none survives these tests. If only one candidate remains, use it; else continue to the next step.

- e. If there are both **unknown** and known-type arguments, and all the known-type arguments have the same type, assume that the **unknown** arguments are also of that type, and check which candidates can accept that type at the **unknown**-argument positions. If exactly one candidate passes this test, use it. Otherwise, fail.

Examples

Example 1: Use the rounding function argument type resolution as the first example. There is only one **round** function that takes two arguments; it takes a first argument of type **numeric** and a second argument of type **integer**. So the following query automatically converts the first argument of type **integer** to **numeric**:

```
gaussdb=# SELECT round(4, 4);
round
-----
4.0000
(1 row)
```

That query is actually transformed by the parser to:

```
gaussdb=# SELECT round(CAST (4 AS numeric), 4);
```

Since numeric constants with decimal points are initially assigned the type **numeric**, the following query will require no type conversion and therefore might be slightly more efficient:

```
gaussdb=# SELECT round(4.0, 4);
```

Example 2: Use the substring function type resolution as the second example. There are several **substr** functions, one of which takes types **text** and **integer**. If the function is called with a string constant of unspecified type, the system chooses the candidate function that accepts an argument of the preferred category **string** (namely of type **text**).

```
gaussdb=# SELECT substr('1234', 3);
substr
-----
34
(1 row)
```

If the string is declared to be of type **varchar**, as might be the case if it comes from a table, then the parser will try to convert it to become **text**:

```
gaussdb=# SELECT substr(varchar '1234', 3);
substr
-----
34
(1 row)
```

This is transformed by the parser to effectively become:

```
gaussdb=# SELECT substr(CAST (varchar '1234' AS text), 3);
```

NOTE

The parser learns from the **pg_cast** catalog that **text** and **varchar** are binary-compatible, meaning that one can be passed to a function that accepts the other without doing any physical conversion. Therefore, no type conversion is really inserted in this case.

And, if the function is called with an argument of type **integer**, the parser will try to convert that to **text**:

```
gaussdb=# SELECT substr(1234, 3);
substr
-----
34
(1 row)
```

This is transformed by the parser to effectively become:

```
gaussdb=# SELECT substr(CAST (1234 AS text), 3);
substr
-----
34
(1 row)
```

7.8.4 Value Storage

Value Storage Type Resolution

1. Search for an exact match with the target column.
2. Try to convert the expression to the target type. This will succeed if there is a registered cast between the two types. If the expression is an unknown-type literal, the content of the literal string will be fed to the input conversion routine for the target type.
3. Check to see if there is a sizing cast for the target type. A sizing cast is a cast from that type to itself. If one is found in the **pg_cast** catalog, apply it to the expression before storing into the destination column. The implementation function for such a cast always takes an extra parameter of type **integer**. The parameter receives the destination column's **atttypmod** value (typically its declared length, although the interpretation of **atttypmod** varies for different data types), and may take a third Boolean parameter that says whether the cast is explicit or implicit. The cast function is responsible for applying any length-dependent semantics such as size checking or truncation.

Examples

Use the **character** storage type conversion as an example. For a target column declared as **character(20)**, the following statement shows that the stored value is sized correctly:

```
gaussdb=# CREATE TABLE tpcds.value_storage_t1 (
VS_COL1 CHARACTER(20)
)DISTRIBUTE BY HASH (VS_COL1);
gaussdb=# INSERT INTO tpcds.value_storage_t1 VALUES('abcdef');
gaussdb=# SELECT VS_COL1, octet_length(VS_COL1) FROM tpcds.value_storage_t1;
vs_col1 | octet_length
-----+-----
abcdef | 20
(1 row)
)
gaussdb=# DROP TABLE tpcds.value_storage_t1;
```

 NOTE

What has happened here is that the two unknown literals are resolved to **text** by default, allowing the || operator to be resolved as **text** concatenation. Then the **text** result of the operator is converted to **bpchar** ("blank-padded char", the internal name of the **character** data type) to match the target column type. Since the conversion from **text** to **bpchar** is binary-coercible, this conversion does not insert any real function call. Finally, the sizing function **bpchar(bpchar, integer, Boolean)** is found in the system catalog and used for the operator's result and the stored column length. This type-specific function performs the required length check and addition of padding spaces.

7.8.5 UNION, CASE, and Related Constructs

SQL UNION constructs must match up possibly dissimilar types to become a single result set. The resolution algorithm is applied separately to each output column of a union query. INTERSECT and EXCEPT constructs resolve dissimilar types in the same way as UNION. The CASE, ARRAY, VALUES, GREATEST and LEAST constructs use the identical algorithm to match up their component expressions and select a result data type.

Type Resolution for UNION, CASE, and Related Constructs

- If all inputs are of the same type and are not unknown, resolve them as the unknown type.
- If all inputs are of the unknown type, resolve them as the text type (the preferred type of the string category). Otherwise, unknown inputs are ignored. (Exception: The UNION operation resolves a group of two unknown types into the text type, and then continues to match the type with other groups.)
- If the inputs are not all of the same type category, a failure will be resulted. (The unknown type is not included in this case.)
- If the inputs are all of the same type category, choose the top preferred type in that category. (Exception: The UNION operation regards the type of the first branch as the selected type.)

 NOTE

- typcategory** in the **pg_type** system catalog indicates the data type category.
typispreferred indicates whether a type is preferred in **typcategory**.
- Convert all inputs to the selected type. (Retain the original lengths of strings). Fail if there is not an implicit conversion from a given input to the selected type.
 - If the input contains the json, txid_snapshot, sys_refcursor, or geometry type, UNION cannot be performed.

Type Resolution for CASE and COALESCE in TD Compatibility Type

- If all inputs are of the same type and are not unknown, resolve them as the unknown type.
- If all inputs are of the unknown type, resolve them as the text type.
- If inputs are of the string type (including unknown which is resolved as text) and digit type, resolve them as the string type. If the inputs are not of the two types, an error will be reported.

- If the inputs are all of the same type category, choose the top preferred type in that category.
- Convert all inputs to the selected type. Fail if there is not an implicit conversion from a given input to the selected type.

Type Resolution for CASE in ORA Compatibility Mode

decode(expr, search1, result1, search2, result2, ..., defresult): When the **sql_beta_feature** is set to **a_style_coerce**, the final return value type of the expression is set to the data type of result1 or a higher-precision data type in the same type as result1, as that in ORA-compatible mode. (For example, numeric and int are both numeric data types, but numeric has higher precision and priority than int.) For CASE WHEN, the behavior is the same as the default behavior in ORA-compatible mode.

- If all inputs are of the same type and are not unknown, resolve them as the unknown type. Otherwise, proceed to the next step.
- Set the data type of result1 to the final return value type **preferType**, which belongs to **preferCategory**.
- Consider the data types of result2, result3, and defresult in sequence. If the type category is also **preferCategory**, which is the same as that of result1, check whether the precision (priority) is higher than that of **preferType**. If it is, update **preferType** to a data type with higher precision. If the type category is not **preferCategory**, check whether the category can be implicitly converted to **preferType**. If it cannot, an error is reported.
- Uses the data type recorded by **preferType** as the return value type of the expression. The expression result is implicitly converted to this data type.

Note 1:

There is a special case where the character type of a super-large number is converted to the numeric type, for example, **select decode(1, 2, 2, '53465465676465454657567678676')**, in which the large number exceeds the range of the bigint and double types. If result1 is of the numeric type and does not meet the condition that all inputs are of the same type, the type of the return value is set to numeric to be compatible with this special case.

Note 2:

Priority of the numeric types: numeric > float8 > float4 > int8 > int4 > int2 > int1

Priority of the character types: text > varchar (nvarchar2) > bpchar > char

Priority of date types: timestamptz > timestamp > smalldatetime > date > abstime > timetz > time

Priority of date span types: interval > tinterval > reltime

Note 3:

The following figure shows the supported implicit type conversion when **set sql_beta_feature** is set to **'a_style_coerce'** in ORA compatibility mode. \ indicates that conversion is not required, **yes** indicates that conversion is supported, and the blank value indicates that conversion is not supported.

	bool	int1	int2	int4	int8	float4	float8	numeric	money	char	bpchar	varchar2	nvarchar2	text/clob	raw	blob	date	time	timetz	timestamp	timestampz	smalldatetime	interval	reftime	abstime
bool	\																								
int1		\	yes	yes	yes	yes	yes	yes		yes	yes	yes	yes	yes											
int2		yes	\	yes	yes	yes	yes	yes		yes	yes	yes	yes	yes											
int4		yes	yes	\	yes	yes	yes	yes		yes	yes	yes	yes	yes											
int8		yes	yes	yes	\	yes	yes	yes		yes	yes	yes	yes	yes											
float4		yes	yes	yes	yes	\	yes	yes		yes	yes	yes	yes	yes											
float8		yes	yes	yes	yes	yes	\	yes		yes	yes	yes	yes	yes											
numeric		yes	yes	yes	yes	yes	yes	\		yes	yes	yes	yes	yes											
money									\																
char		yes	yes	yes	yes	yes	yes	yes		\	yes	yes	yes	yes											
bpchar		yes	yes	yes	yes	yes	yes	yes		yes	\	yes	yes	yes											
varchar2		yes	yes	yes	yes	yes	yes	yes		yes	yes	\	yes	yes	yes										
nvarchar2		yes	yes	yes	yes	yes	yes	yes		yes	yes	yes	\	yes											
text/clob		yes	yes	yes	yes	yes	yes	yes		yes	yes	yes	yes	\											
raw												yes		yes	\	yes									
blob															yes	\									
date											yes	yes	yes	yes			\			yes	yes	yes			yes
time														yes			\	yes							
timetz														yes			yes	\							
timestamp											yes	yes	yes	yes			yes		\		yes	yes			yes
timestampz														yes			yes	\		yes	\	yes			yes
smalldatetime												yes		yes			yes			yes	yes	\			yes
interval												yes	yes	yes									\	yes	
reftime														yes									yes	\	
abstime														yes			yes			yes	yes	yes			\

Examples

Example 1: Use type resolution with underspecified types in a union as the first example. Here, the unknown-type literal 'b' will be resolved to the text type.

```
gaussdb=# SELECT text 'a' AS "text" UNION SELECT 'b';
text
-----
a
b
(2 rows)
```

Example 2: Use type resolution in a simple union as the second example. The literal 1.2 is of numeric type, and the integer value 1 can be cast implicitly to numeric type, so that type is used.

```
gaussdb=# SELECT 1.2 AS "numeric" UNION SELECT 1;
numeric
-----
1
1.2
(2 rows)
```

Example 3: Use type resolution in a transposed union as the third example. Since the real type cannot be implicitly cast to integer, but integer can be implicitly cast to real, the union result type is resolved as real.

```
gaussdb=# SELECT 1 AS "real" UNION SELECT CAST('2.2' AS REAL);
real
-----
1
2.2
(2 rows)
```

Example 4: In the TD type, if input parameters for COALESCE are of int and varchar types, resolve them as the varchar type. In ORA mode, an error is reported.

```
-- In Oracle mode, create the oracle_1 database compatible with Oracle.
gaussdb=# CREATE DATABASE oracle_1 dbcompatibility = 'ORA';
```

```
-- Switch to the oracle_1 database.
gaussdb=# \c oracle_1

-- Create the t1 table.
oracle_1=# CREATE TABLE t1(a int, b varchar(10));

-- Show the execution plan of a statement for querying the types int and varchar of input parameters for COALESCE:
a_1 # EXPLAIN SELECT coalesce(a, b) FROM t1;
ERROR: COALESCE types integer and character varying cannot be matched
LINE 1: EXPLAIN SELECT coalesce(a, b) FROM t1;
          ^
CONTEXT: referenced column: coalesce
```

```
-- Delete the table.
oracle_1=# DROP TABLE t1;

-- Switch to the testdb database.
oracle_1=# \c testdb

-- In TD mode, create the td_1 database compatible with Teradata.
gaussdb=# CREATE DATABASE td_1 dbcompatibility = 'TD';

-- Switch to the td_1 database.
gaussdb=# \c td_1

-- Create the t2 table.
td_1=# CREATE TABLE t2(a int, b varchar(10));

-- View the execution plan of the query statement whose coalesce parameter is of the int or varchar type.
td_1=# EXPLAIN VERBOSE select coalesce(a, b) from t2;
          QUERY PLAN
-----
Data Node Scan (cost=0.00..0.00 rows=0 width=0)
Output: (COALESCE((t2.a)::character varying, t2.b))
Node/s: All DNs
Remote query: SELECT COALESCE(a::character varying, b) AS "coalesce" FROM public.t2
(4 rows)

-- Delete the table.
td_1=# DROP TABLE t2;

-- Switch to the testdb database.
td_1=# \c testdb

-- Delete databases in Oracle and TD mode.
gaussdb=# DROP DATABASE oracle_1;
gaussdb=# DROP DATABASE td_1;
```

Example 5: In **ORA** mode, set the final return value type of the expression to the data type of result1 or a higher-precision data type whose category is the same as that of the data type of result1.

```
-- In ORA mode, create the ora_1 database compatible with ORA.
gaussdb=# CREATE DATABASE ora_1 dbcompatibility = 'A';

-- Switch to the ora_1 database.
gaussdb=# \c ora_1

-- Enable the decode compatibility parameters.
set sql_beta_feature='a_style_coerce';

-- Create the t1 table.
ora_1=# CREATE TABLE t1(c_int int, c_float8 float8, c_char char(10), c_text text, c_date date);

-- Insert data.
ora_1=# INSERT INTO t1 VALUES(1, 2, '3', '4', date '12-10-2010');

-- The data type of result1 is char and that of defresult is text. The precision of text is higher, and the type
```

```
of the return value is changed to text from char.
ora_1=# SELECT decode(1, 2, c_char, c_text) AS result, pg_typeof(result) FROM t1;
result | pg_typeof
-----+-----
4      | text
(1 row)

-- The data type of result1 is int, which is a numeric type. The type of the return value is set to numeric.
ora_1=# SELECT decode(1, 2, c_int, c_float8) AS result, pg_typeof(result) FROM t1;
result | pg_typeof
-----+-----
2      | numeric
(1 row)

-- The implicit conversion from the data type of defresult to that of result1 does not exist. If it is performed,
an error is reported.
ora_1=# SELECT decode(1, 2, c_int, c_date) FROM t1;
ERROR: CASE types integer and timestamp without time zone cannot be matched
LINE 1: SELECT decode(1, 2, c_int, c_date) FROM t1;
                        ^
CONTEXT:  referenced column: c_date

-- Disable the decode compatibility parameters.
set sql_beta_feature='none';

-- Delete the table.
ora_1=# DROP TABLE t1;
DROP TABLE

-- Switch to the testdb database.
ora_1=# \c testdb

-- Delete the database in ORA mode.
gaussdb=# DROP DATABASE ora_1;
DROP DATABASE
```

Example 6: The UNION operation resolves a group of two unknown types into the text type, and then continues to match the type with other groups.

```
-- Resolve the first two NULL values of the unknown type as the text type. Then, match the text type with
the third element of the varchar2 type, and select the text type.
gaussdb=# SELECT "text", pg_typeof("text") as type from (SELECT NULL AS "text" UNION ALL SELECT
NULL AS "text" UNION ALL SELECT 'a'::varchar2 as "text");
text | type
-----+-----
| text
| text
a    | text
(3 rows)
```

7.9 Full Text Search

Full text search (or just text search) provides the capability to identify natural-language documents that satisfy a query, and optionally to sort them by relevance to the query. The most common type of search is to find all documents containing given query terms and return them in order of their similarity to the query.

This is a lab feature. Contact Huawei technical support before using it.

7.9.1 Introduction

7.9.1.1 Full-Text Retrieval

Textual search operators have been used in databases for years. GaussDB has `~`, `~*`, `LIKE`, and `ILIKE` operators for textual data types, but they lack many essential properties required by modern information systems. They can be supplemented by indexes and dictionaries.

Text search lacks the following essential properties required by information systems:

- There is no linguistic support, even for English.
Regular expressions are not sufficient because they cannot easily handle derived words. For example, you might miss documents that contain **satisfies**, although you probably would like to find them when searching for **satisfy**. It is possible to use **OR** to search for multiple derived forms, but this is tedious and error-prone, because some words can have several thousand derivatives.
- They provide no ordering (ranking) of search results, which makes them ineffective when thousands of matching documents are found.
- They tend to be slow because there is no index support, so they must process all documents for every search.

Full text indexing allows documents to be preprocessed and an index is saved for later rapid searching. Preprocessing includes:

- Parsing documents into tokens
It is useful to identify various classes of tokens, for example, numbers, words, complex words, and email addresses, so that they can be processed differently. In principle, token classes depend on the specific application, but for most purposes it is adequate to use a predefined set of classes.
- Converting tokens into lexemes
A lexeme is a string, just like a token, but it has been normalized so that different forms of the same word are made alike. For example, normalization almost always includes folding upper-case letters to lower-case, and often involves removal of suffixes (such as **s** or **es** in English). This allows searches to find variant forms of the same word, without tediously entering all the possible variants. Also, this step typically eliminates stop words, which are words that are so common that they are useless for searching. (In short, tokens are raw fragments of the document text, while lexemes are words that are believed useful for indexing and searching.) GaussDB uses dictionaries to perform this step and provides various standard dictionaries.
- Storing preprocessed documents optimized for searching
For example, each document can be represented as a sorted array of normalized lexemes. Along with the lexemes, it is often desirable to store positional information for proximity ranking. Therefore, a document that contains a more "dense" region of query words is assigned with a higher rank than the one with scattered query words.

Dictionaries allow fine-grained control over how tokens are normalized. With appropriate dictionaries, you can define stop words that should not be indexed.

A data type **tsvector** is provided for storing preprocessed documents, along with a type **tsquery** for storing query conditions. For details, see [Text Search Types](#). For details about the functions and operators available for these data types, see [Text Search Functions and Operators](#). The match operator `@@`, which is the most

important among those functions and operators, is introduced in [Basic Text Matching](#).

7.9.1.2 What Is a Document?

A document is the unit of searching in a full text search system; for example, a magazine article or email message. The text search engine must be able to parse documents and store associations of lexemes (keywords) with their parent document. Later, these associations are used to search for documents that contain query words.

For searches within GaussDB, a document is normally a textual column within a row of a database table, or possibly a combination (concatenation) of such columns, perhaps stored in several tables or obtained dynamically. In other words, a document can be constructed from different parts for indexing and it might not be stored anywhere as a whole. For example:

```
gaussdb=# SELECT d_dow || '-' || d_dom || '-' || d_fy_week_seq AS identify_serials FROM tpceds.date_dim
WHERE d_fy_week_seq = 1;
identify_serials
-----
5-6-1
0-8-1
2-3-1
3-4-1
4-5-1
1-2-1
6-7-1
(7 rows)
```

NOTICE

Actually, in these example queries, **coalesce** should be used to prevent a single **NULL** attribute from causing a **NULL** result for the whole document.

Another possibility is to store the documents as simple text files in the file system. In this case, the database can be used to store the full text index and to execute searches, and some unique identifier can be used to retrieve the document from the file system. However, retrieving files from outside the database requires system administrator permissions or special function support, so this is usually less convenient than keeping all the data inside the database. Also, keeping everything inside the database allows easy access to document metadata to assist in indexing and display.

For text search purposes, each document must be reduced to the preprocessed **tsvector** format. Searching and relevance-based ranking are performed entirely on the **tsvector** representation of a document. The original text is retrieved only when the document has been selected for display to a user. We therefore often speak of the **tsvector** as being the document, but it is only a compact representation of the full document.

7.9.1.3 Basic Text Matching

Full text search in GaussDB is based on the match operator **@@**, which returns **true** if a **tsvector** (document) matches a **tsquery** (query). It does not matter which data type is written first:

```
gaussdb=# SELECT 'a fat cat sat on a mat and ate a fat rat'::tsvector @@ 'cat & rat'::tsquery AS RESULT;
result
-----
t
(1 row)
gaussdb=# SELECT 'fat & cow'::tsquery @@ 'a fat cat sat on a mat and ate a fat rat'::tsvector AS RESULT;
result
-----
f
(1 row)
```

As the above example suggests, a **tsquery** is not raw text, any more than a **tsvector** is. A **tsquery** contains search terms, which must be already-normalized lexemes, and may combine multiple terms using **AND**, **OR**, and **NOT** operators. For details, see [Text Search Types](#). There are functions **to_tsquery** and **plainto_tsquery** that are helpful in converting user-written text into a proper **tsquery**, for example by normalizing words appearing in the text. Similarly, **to_tsvector** is used to parse and normalize a document string. So in practice a text search match would look more like this:

```
gaussdb=# SELECT to_tsvector('fat cats ate fat rats') @@ to_tsquery('fat & rat') AS RESULT;
result
-----
t
(1 row)
```

Observe that this match would not succeed if written as follows:

```
gaussdb=# SELECT 'fat cats ate fat rats'::tsvector @@ to_tsquery('fat & rat')AS RESULT;
result
-----
f
(1 row)
```

In the preceding match, no normalization of the word **rats** will occur. Therefore, **rats** does not match **rat**.

The @@ operator also supports text input, allowing explicit conversion of a text string to **tsvector** or **tsquery** to be skipped in simple cases. The variants available are:

```
tsvector @@ tsquery
tsquery  @@ tsvector
text     @@ tsquery
text     @@ text
```

We already saw the first two of these. The form **text @@ tsquery** is equivalent to **to_tsvector(text) @@ tsquery**. The form **text @@ text** is equivalent to **to_tsvector(text) @@ plainto_tsquery(text)**.

7.9.1.4 Configurations

Full text search functionality includes the ability to do many more things: skip indexing certain words (stop words), process synonyms, and use sophisticated parsing, for example, parse based on more than just white space. This functionality is controlled by text search configurations. GaussDB comes with predefined configurations for many languages, and you can easily create your own configurations. (The **\dF** command of **gsq** shows all available configurations.)

During installation an appropriate configuration is selected and **default_text_search_config** is set accordingly in **postgresql.conf**. If you are using the same text search configuration for the entire cluster you can use the value in

postgresql.conf. To use different configurations throughout the cluster but the same configuration within any one database, use **ALTER DATABASE ... SET**. Otherwise, you can set **default_text_search_config** in each session.

Each text search function that depends on a configuration has an optional argument, so that the configuration to use can be specified explicitly.

default_text_search_config is used only when this argument is omitted.

To make it easier to build custom text search configurations, a configuration is built up from simpler database objects. GaussDB's text search facility provides the following types of configuration-related database objects:

- Text search parsers break documents into tokens and classify each token (for example, as words or numbers).
- Text search dictionaries convert tokens to normalized form and reject stop words.
- Text search templates provide the functions underlying dictionaries. (A dictionary simply specifies a template and a set of parameters for the template.)
- Text search configurations select a parser and a set of dictionaries to use to normalize the tokens produced by the parser.

7.9.2 Tables and Indexes

7.9.2.1 Searching a Table

It is possible to do a full text search without an index.

- A simple query to print each row that contains the word **america** in its **body** column is as follows:

```
gaussdb=# DROP SCHEMA IF EXISTS tsearch CASCADE;

gaussdb=# CREATE SCHEMA tsearch;

gaussdb=# CREATE TABLE tsearch.pgweb(id int, body text, title text, last_mod_date date);

gaussdb=# INSERT INTO tsearch.pgweb VALUES(1, 'China, officially the People's Republic of China (PRC), located in Asia, is the world's most populous state.', 'China', '2010-1-1');

gaussdb=# INSERT INTO tsearch.pgweb VALUES(2, 'America is a rock band, formed in England in 1970 by multi-instrumentalists Dewey Bunnell, Dan Peek, and Gerry Beckley.', 'America', '2010-1-1');

gaussdb=# INSERT INTO tsearch.pgweb VALUES(3, 'England is a country that is part of the United Kingdom. It shares land borders with Scotland to the north and Wales to the west.', 'England', '2010-1-1');

gaussdb=# INSERT INTO tsearch.pgweb VALUES(4, 'Australia, officially the Commonwealth of Australia, is a country comprising the mainland of the Australian continent, the island of Tasmania, and numerous smaller islands.', 'Australia', '2010-1-1');

gaussdb=# INSERT INTO tsearch.pgweb VALUES(6, 'Japan is an island country in East Asia.', 'Japan', '2010-1-1');

gaussdb=# INSERT INTO tsearch.pgweb VALUES(7, 'Germany, officially the Federal Republic of Germany, is a sovereign state and federal parliamentary republic in central-western Europe.', 'Germany', '2010-1-1');

gaussdb=# INSERT INTO tsearch.pgweb VALUES(8, 'France, is a sovereign state comprising territory in western Europe and several overseas regions and territories.', 'France', '2010-1-1');
```

```

gaussdb=# INSERT INTO tsearch.pgweb VALUES(9, 'Italy officially the Italian Republic, is a unitary
parliamentary republic in Europe.', 'Italy', '2010-1-1');

gaussdb=# INSERT INTO tsearch.pgweb VALUES(10, 'India, officially the Republic of India, is a country
in South Asia.', 'India', '2010-1-1');

gaussdb=# INSERT INTO tsearch.pgweb VALUES(11, 'Brazil, officially the Federative Republic of Brazil,
is the largest country in both South America and Latin America.', 'Brazil', '2010-1-1');

gaussdb=# INSERT INTO tsearch.pgweb VALUES(12, 'Canada is a country in the northern half of
North America.', 'Canada', '2010-1-1');

gaussdb=# INSERT INTO tsearch.pgweb VALUES(13, 'Mexico, officially the United Mexican States, is a
federal republic in the southern part of North America.', 'Mexico', '2010-1-1');

gaussdb=# SELECT id, body, title FROM tsearch.pgweb WHERE to_tsvector('english', body) @@
to_tsquery('english', 'america');
 id |                               body                               | title
----+-----
-----+-----
  2 | America is a rock band, formed in England in 1970 by multi-instrumentalists Dewey Bunnell, Dan
    | Peek, and Gerry Beckley. | America
 12 | Canada is a country in the northern half of North
    | America.                  | Canada
 13 | Mexico, officially the United Mexican States, is a federal republic in the southern part of North
    | America.                  | Mexico
 11 | Brazil, officially the Federative Republic of Brazil, is the largest country in both South America
    | and Latin America.       | Brazil
(4 rows)

```

This will also find related words, such as **America**, since all these are reduced to the same normalized lexeme.

The query above specifies that the **english** configuration is to be used to parse and normalize the strings. Alternatively we could omit the configuration parameters, and use the configuration set by **default_text_search_config**.

```

gaussdb=# SHOW default_text_search_config;
 default_text_search_config
-----
 pg_catalog.english
(1 row)

gaussdb=# SELECT id, body, title FROM tsearch.pgweb WHERE to_tsvector(body) @@
to_tsquery('america');
 id |                               body                               | title
----+-----
-----+-----
 11 | Brazil, officially the Federative Republic of Brazil, is the largest country in both South America
    | and Latin America.       | Brazil
  2 | America is a rock band, formed in England in 1970 by multi-instrumentalists Dewey Bunnell, Dan
    | Peek, and Gerry Beckley. | America
 12 | Canada is a country in the northern half of North
    | America.                  | Canada
 13 | Mexico, officially the United Mexican States, is a federal republic in the southern part of North
    | America.                  | Mexico
(4 rows)

```

- A more complex example to select the ten most recent documents that contain **north** and **america** in the **title** or **body** column is as follows:

```

gaussdb=# SELECT title FROM tsearch.pgweb WHERE to_tsvector(title || ' ' || body) @@
to_tsquery('north & america') ORDER BY last_mod_date DESC LIMIT 10;
 title
-----
 Mexico
 Canada
(2 rows)

```

For clarity we omitted the **coalesce** function calls which would be needed to find rows that contain **NULL** in one of the two columns.

The preceding examples show queries without using indexes. Most applications will find this approach too slow. Therefore, practical use of text searching usually requires creating an index, except perhaps for occasional ad-hoc searches.

7.9.2.2 Creating an Index

You can create a **GIN** index to speed up text searches:

```
gaussdb=# CREATE INDEX pgweb_idx_1 ON tsearch.pgweb USING gin(to_tsvector('english', body));
```

The **to_tsvector** function comes in two versions: the 1-argument version and the 2-argument version. When the 1-argument version is used, the system uses the configuration specified by **default_text_search_config** by default.

Notice that the 2-argument version of **to_tsvector** is used for index creation. Only text search functions that specify a configuration name can be used in expression indexes. This is because the index contents must be unaffected by **default_text_search_config**, whose value can be changed at any time. If they were affected, the index contents might be inconsistent, because different entries could contain **tsvectors** that were created with different text search configurations, and there would be no way to guess which was which. It would be impossible to dump and restore such an index correctly.

Because the two-argument version of **to_tsvector** was used in the index above, only a query reference that uses the 2-argument version of **to_tsvector** with the same configuration name will use that index. That is, **WHERE to_tsvector('english', body) @@ 'a & b'** can use the index, but **WHERE to_tsvector(body) @@ 'a & b'** cannot. This ensures that an index will be used only with the same configuration used to create the index entries.

It is possible to set up more complex expression indexes wherein the configuration name is specified by another column. For example:

```
gaussdb=# CREATE INDEX pgweb_idx_2 ON tsearch.pgweb USING gin(to_tsvector('ngram', body));
```

Where, **body** is a column in the **pgweb** table. This allows mixed configurations in the same index while recording which configuration was used for each index entry. This would be useful, for example, if the document collection contained documents in different languages. Again, queries that are meant to use the index must be phrased to match, for example, **WHERE to_tsvector(config_name, body) @@ 'a & b'** must match **to_tsvector** in the index.

Indexes can even concatenate columns:

```
gaussdb=# CREATE INDEX pgweb_idx_3 ON tsearch.pgweb USING gin(to_tsvector('english', title || ' ' || body));
```

Another approach is to create a separate **tsvector** column to hold the output of **to_tsvector**. This example is a concatenation of **title** and **body**, using **coalesce** to ensure that one column will still be indexed when the other is **NULL**:

```
gaussdb=# ALTER TABLE tsearch.pgweb ADD COLUMN textsearchable_index_col tsvector;  
gaussdb=# UPDATE tsearch.pgweb SET textsearchable_index_col = to_tsvector('english', coalesce(title, '')) || ' ' || coalesce(body, ''));
```

Then, create a GIN index to speed up the search:

```
gaussdb=# CREATE INDEX textsearch_idx_4 ON tsearch.pgweb USING gin(textsearchable_index_col);
```

Now you are ready to perform a fast full text search:

```
gaussdb=# SELECT title
FROM tsearch.pgweb
WHERE textsearchable_index_col @@ to_tsquery('north & america')
ORDER BY last_mod_date DESC
LIMIT 10;

title
-----
Canada
Mexico
(2 rows)
```

One advantage of the separate-column approach over an expression index is that it is unnecessary to explicitly specify the text search configuration in queries in order to use the index. As shown in the preceding example, the query can depend on **default_text_search_config**. Another advantage is that searches will be faster, since it will not be necessary to redo the **to_tsvector** calls to verify index matches. The expression-index approach is simpler to set up, however, and it requires less disk space since the **tsvector** representation is not stored explicitly.

7.9.2.3 Constraints on Index Use

The following is an example of index use:

```
gaussdb=# create table table1 (c_int int,c_bigint bigint,c_varchar varchar,c_text text) with(orientation=row);
gaussdb=# create text search configuration ts_conf_1(parser=POUND);
gaussdb=# create text search configuration ts_conf_2(parser=POUND) with(split_flag='%');
gaussdb=# set default_text_search_config='ts_conf_1';
gaussdb=# create index idx1 on table1 using gin(to_tsvector(c_text));
gaussdb=# set default_text_search_config='ts_conf_2';
gaussdb=# create index idx2 on tscp_u_m_005_tbl using gin(to_tsvector(c_text));
gaussdb=# select c_varchar,to_tsvector(c_varchar) from table1 where to_tsvector(c_text) @@
plainto_tsquery('¥#@.....&**') and to_tsvector(c_text) @@ plainto_tsquery('Company') and c_varchar is
not null order by 1 desc limit 3;
```

In this example, **table1** has two GIN indexes created on the same column **c_text**, **idx1** and **idx2**, but these two indexes are created under different settings of the GUC parameter **default_text_search_config**. Differences between this example and the scenario where one table has common indexes created on the same column are as follows:

- GIN indexes use different parsers (that is, different delimiters). In this case, the index data of **idx1** is different from that of **idx2**.
- In the specified scenario, the index data of multiple common indexes created on the same column is the same.

As a result, using **idx1** and **idx2** for the same query returns different results.

Constraints

Still use the above example. When:

- Multiple GIN indexes are created on the same column of the same table.

- The GIN indexes use different parsers (that is, different delimiters).
- The column is used in a query, and an index scan is used in the execution plan.

To avoid different query results caused by different GIN indexes, ensure that only one GIN index is available on a column of the physical table.

- The Ustore storage engine supports only UB-tree indexes and does not support GIN indexes.

7.9.3 Controlling Text Search

To implement full text searching there must be a function to create a **tsvector** from a document and a **tsquery** from a user query. Also, we need to return results in a useful order, so we need a function that compares documents with respect to their relevance to the query. It is also important to be able to display the results nicely. GaussDB supports all these functions.

7.9.3.1 Parsing Documents

GaussDB provides function **to_tsvector** for converting a document to the **tsvector** data type.

```
to_tsvector([ config regconfig, ] document text) returns tsvector
```

to_tsvector parses a textual document into tokens, reduces the tokens to lexemes, and returns a **tsvector**, which lists the lexemes together with their positions in the document. The document is processed according to the specified or default text search configuration. Here is a simple example:

```
gaussdb=# SELECT to_tsvector('english', 'a fat cat sat on a mat - it ate a fat rats');
to_tsvector
-----
'ate':9 'cat':3 'fat':2,11 'mat':7 'rat':12 'sat':4
```

In the preceding example we see that the resulting **tsvector** does not contain the words **a**, **on**, or **it**, the word **rats** became **rat**, and the punctuation sign (-) was ignored.

The **to_tsvector** function internally calls a parser which breaks the document text into tokens and assigns a type to each token. For each token, a list of dictionaries is consulted. where the list can vary depending on the token type. The first dictionary that recognizes the token emits one or more normalized lexemes to represent the token. For example:

- **rats** became **rat** because one of the dictionaries recognized that the word **rats** is a plural form of **rat**.
- Some words are recognized as stop words (see [Stop Words](#)), which causes them to be ignored since they occur too frequently to be useful in searching. In our example these are **a**, **on**, and **it**.
- If no dictionary in the list recognizes the token then it is also ignored. In this example that happened to the punctuation sign (-) because there are no dictionaries assigned for its token type (**Space symbols**), meaning space tokens will never be indexed.

The choices of parser, dictionaries and which types of tokens to index are determined by the selected text search configuration. It is possible to have many

different configurations in the same database, and predefined configurations are available for various languages. In our example we used the default configuration **english** for the English language.

The function **setweight** can be used to label the entries of a **tsvector** with a given weight, where a weight is one of the letters **A**, **B**, **C**, or **D**. This is typically used to mark entries coming from different parts of a document, such as title versus body. Later, this information can be used for ranking of search results.

Because **to_tsvector(NULL)** will return **NULL**, you are advised to use **coalesce** whenever a column might be null. Here is the recommended method for creating a **tsvector** from a structured document:

```
gaussdb=# CREATE TABLE tsearch.tt (id int, title text, keyword text, abstract text, body text, ti tsvector);

gaussdb=# INSERT INTO tsearch.tt(id, title, keyword, abstract, body) VALUES (1, 'China', 'Beijing',
'China','China, officially the People's Republic of China (PRC), located in Asia, is the world's most populous
state.');
```

```
gaussdb=# UPDATE tsearch.tt SET ti =
  setweight(to_tsvector(coalesce(title,'')), 'A') ||
  setweight(to_tsvector(coalesce(keyword,'')), 'B') ||
  setweight(to_tsvector(coalesce(abstract,'')), 'C') ||
  setweight(to_tsvector(coalesce(body,'')), 'D');
```

```
gaussdb=# DROP TABLE tsearch.tt;
```

In this example, **setweight** is used to label the source of each lexeme in the finished **tsvector**, and then the labeled **tsvector** values are merged using the **tsvector** concatenation operator **||**. For details about these operations, see [Manipulating tsvector](#).

7.9.3.2 Parsing Queries

GaussDB provides functions **to_tsquery** and **plainto_tsquery** for converting a query to the **tsquery** data type. **to_tsquery** offers access to more features than **plainto_tsquery**, but is less forgiving about its input.

```
to_tsquery([ config regconfig, ] querytext text) returns tsquery
```

to_tsquery creates a **tsquery** value from **querytext**, which must consist of single tokens separated by the Boolean operators **&** (AND), **|** (OR), and **!** (NOT). These operators can be grouped using parentheses. In other words, the input to **to_tsquery** must follow the general rules for **tsquery** input, as described in [Text Search Types](#). The difference is that while basic **tsquery** input takes the tokens at face value, **to_tsquery** normalizes each token to a lexeme using the specified or default configuration, and discards any tokens that are stop words according to the configuration. For example:

```
gaussdb=# SELECT to_tsquery('english', 'The & Fat & Rats');
 to_tsquery
-----
'fat' & 'rat'
(1 row)
```

As in basic **tsquery** input, **weight(s)** can be attached to each lexeme to restrict it to match only **tsvector** lexemes of those **weight(s)**. For example:

```
gaussdb=# SELECT to_tsquery('english', 'Fat | Rats:AB');
 to_tsquery
-----
'fat' | 'rat':AB
(1 row)
```

Also, the asterisk (*) can be attached to a lexeme to specify prefix matching:

```
gaussdb=# SELECT to_tsquery('supern:*A & star:A*B');
to_tsquery
-----
'supern':*A & 'star':*AB
(1 row)
```

Such a lexeme will match any word having the specified string and weight in a **tsquery**.

plainto_tsquery([config regconfig,] querytext text) returns tsquery

plainto_tsquery transforms unformatted text **querytext** to **tsquery**. The text is parsed and normalized much as for **to_tsvector**, then the **&** (AND) Boolean operator is inserted between surviving words.

For example:

```
gaussdb=# SELECT plainto_tsquery('english', 'The Fat Rats');
plainto_tsquery
-----
'fat' & 'rat'
(1 row)
```

Note that **plainto_tsquery** cannot recognize Boolean operators, weight labels, or prefix-match labels in its input:

```
gaussdb=# SELECT plainto_tsquery('english', 'The Fat & Rats:C');
plainto_tsquery
-----
'fat' & 'rat' & 'c'
(1 row)
```

Here, all the input punctuation was discarded as being space symbols.

7.9.3.3 Ranking Search Results

Ranking attempts to measure how relevant documents are to a particular query, so that when there are many matches the most relevant ones can be shown first. GaussDB provides two predefined ranking functions, which take into account lexical, proximity, and structural information; that is, they consider how often the query terms appear in the document, how close together the terms are in the document, and how important is the part of the document where they occur. However, the concept of relevancy is vague and application-specific. Different applications might require additional information for ranking, for example, document modification time. The built-in ranking functions are only examples. You can write your own ranking functions and/or combine their results with additional factors to fit your specific needs.

The two ranking functions currently available are:

ts_rank([weights float4[],] vector tsvector, query tsquery [, normalization integer]) returns float4

Ranks vectors based on the frequency of their matching lexemes.

ts_rank_cd([weights float4[],] vector tsvector, query tsquery [, normalization integer]) returns float4

This function requires positional information in its input. Therefore, it will not work on "stripped" **tsvector** values. It will always return zero.

For both these functions, the optional **weights** argument offers the ability to weigh word instances more or less heavily depending on how they are labeled.

The weight arrays specify how heavily to weigh each category of words, in the order:

```
{D-weight, C-weight, B-weight, A-weight}
```

If no **weights** are provided, then these defaults are used: {0.1, 0.2, 0.4, 1.0}

Typically weights are used to mark words from special areas of the document, like the title or an initial abstract, so they can be treated with more or less importance than words in the document body.

Since a longer document has a greater chance of containing a query term, it is reasonable to take into account document size. For example, a hundred-word document with five instances of a search word is probably more relevant than a thousand-word document with five instances. Both ranking functions take an integer **normalization** option that specifies whether and how a document's length should impact its rank. The integer option controls several behaviors, so it is a bit mask: you can specify one or more behaviors using a vertical bar (|) (for example, 2|4).

- **0** (default) ignores the document length.
- **1** divides the rank by (1 + logarithm of the document length).
- **2** divides the rank by the document length.
- **4** divides the rank by the mean harmonic distance between extents. This is implemented only by **ts_rank_cd**.
- **8** divides the rank by the number of unique words in document.
- **16** divides the rank by (1 + Logarithm of the number of unique words in document).
- **32** divides the rank by (itself + 1).

If more than one flag bit is specified, the transformations are applied in the order listed.

It is important to note that the ranking functions do not use any global information, so it is impossible to produce a fair normalization to 1% or 100% as sometimes desired. Normalization option 32 (**rank/(rank+1)**) can be applied to scale all ranks into the range zero to one, but of course this is just a cosmetic change; it will not affect the ordering of the search results.

Here is an example that selects only the ten highest-ranked matches:

```
gaussdb=# SELECT id, title, ts_rank_cd(to_tsvector(body), query) AS rank
FROM tsearch.pgweb, to_tsquery('america') query
WHERE query @@ to_tsvector(body)
ORDER BY rank DESC
LIMIT 10;
 id | title | rank
-----+-----+-----
 11 | Brazil | .2
   2 | America | .1
 12 | Canada | .1
 13 | Mexico | .1
(4 rows)
```

This is the same example using normalized ranking:

```
gaussdb=# SELECT id, title, ts_rank_cd(to_tsvector(body), query, 32 /* rank/(rank+1) */) AS rank
FROM tsearch.pgweb, to_tsquery('america') query
WHERE query @@ to_tsvector(body)
```

```
ORDER BY rank DESC
LIMIT 10;
id | title | rank
-----+-----+-----
11 | Brazil | .166667
 2 | America | .0909091
12 | Canada | .0909091
13 | Mexico | .0909091
(4 rows)
```

Ranking can be expensive since it requires consulting the **tsvector** of each matching document, which can be I/O bound and therefore slow. Unfortunately, it is almost impossible to avoid since practical queries often result in large numbers of matches.

7.9.3.4 Highlighting Results

To present search results it is ideal to show a part of each document and how it is related to the query. Usually, search engines show fragments of the document with marked search terms. GaussDB provides a function **ts_headline** that implements this functionality.

```
ts_headline([ config regconfig, ] document text, query tsquery [, options text ]) returns text
```

ts_headline accepts a document along with a query, and returns an excerpt from the document in which terms from the query are highlighted. The configuration to be used to parse the document can be specified by **config**. If **config** is omitted, the **default_text_search_config** configuration is used.

If an options string is specified it must consist of a comma-separated list of one or more **option=value** pairs. The available options are:

- **StartSel, StopSel**: The strings with which to delimit query words appearing in the document, to distinguish them from other excerpted words. You must double-quote these strings if they contain spaces or commas.
- **MaxWords, MinWords**: These numbers determine the longest and shortest headlines to output.
- **ShortWord**: Words of this length or less will be dropped at the start and end of a headline. The default value of three eliminates common English articles.
- **HighlightAll**: Boolean flag. If **true** the whole document will be used as the headline, ignoring the preceding three parameters.
- **MaxFragments**: Maximum number of text excerpts or fragments to display. The default value of zero selects a non-fragment-oriented headline generation method. A value greater than zero selects fragment-based headline generation. This method finds text fragments with as many query words as possible and stretches those fragments around the query words. As a result query words are close to the middle of each fragment and have words on each side. Each fragment will be of at most **MaxWords** and words of length **ShortWord** or less are dropped at the start and end of each fragment. If not all query words are found in the document, then a single fragment of the first **MinWords** in the document will be displayed.
- **FragmentDelimiter**: When more than one fragment is displayed, the fragments will be separated by this string.

Any unspecified options receive these defaults:

```
StartSel=<b>, StopSel=</b>,  
MaxWords=35, MinWords=15, ShortWord=3, HighlightAll=FALSE,  
MaxFragments=0, FragmentDelimiter=" ... "
```

For example:

```
gaussdb=# SELECT ts_headline('english',  
'The most common type of search  
is to find all documents containing given query terms  
and return them in order of their similarity to the  
query.',  
to_tsquery('english', 'query & similarity'));  
          ts_headline  
-----  
containing given <b>query</b> terms  
and return them in order of their <b>similarity</b> to the  
<b>query</b>.  
(1 row)
```

```
gaussdb=# SELECT ts_headline('english',  
'The most common type of search  
is to find all documents containing given query terms  
and return them in order of their similarity to the  
query.',  
to_tsquery('english', 'query & similarity'),  
'StartSel = <, StopSel = >');  
          ts_headline  
-----  
containing given <query> terms  
and return them in order of their <similarity> to the  
<query>.  
(1 row)
```

ts_headline uses the original document, not a **tsvector** summary, so it can be slow and should be used with care.

7.9.4 Additional Features

7.9.4.1 Manipulating tsvector

GaussDB provides functions and operators that can be used to manipulate documents that are already in **tsvector** type.

- **tsvector || tsvector**

The **tsvector** concatenation operator returns a new **tsvector** which combines the lexemes and positional information of the two **tsvectors** given as arguments. Positions and weight labels are retained during the concatenation. Positions appearing in the right-hand **tsvector** are offset by the largest position mentioned in the left-hand **tsvector**, so that the result is nearly equivalent to the result of performing **to_tsvector** on the concatenation of the two original document strings. (The equivalence is not exact, because any stop-words removed from the end of the left-hand argument will not affect the result, whereas they would have affected the positions of the lexemes in the right-hand argument if textual concatenation were used.)

One advantage of using concatenation in the **tsvector** form, rather than concatenating text before applying **to_tsvector**, is that you can use different configurations to parse different sections of the document. Also, because the **setweight** function marks all lexemes of the given **tsvector** the same way, it is necessary to parse the text and do **setweight** before concatenating if you want to label different parts of the document with different weights.

- `setweight(vector tsvector, weight "char")` returns `tsvector`
setweight returns a copy of the input `tsvector` in which every position has been labeled with the given weight, either **A**, **B**, **C**, or **D**. (**D** is the default for new `tsvectors` and as such is not displayed on output.) These labels are retained when `tsvectors` are concatenated, allowing words from different parts of a document to be weighted differently by ranking functions.

NOTICE

Note that weight labels apply to positions, not lexemes. If the input `tsvector` has been stripped of positions then **setweight** does nothing.

- `length(vector tsvector)` returns integer
Returns the number of lexemes stored in the `tsvector`.
- `strip(vector tsvector)` returns `tsvector`
Returns a `tsvector` which lists the same lexemes as the given `tsvector`, but which lacks any position or weight information. While the returned `tsvector` is much less useful than an unstripped `tsvector` for relevance ranking, it will usually be much smaller.

7.9.4.2 Manipulating Queries

GaussDB provides functions and operators that can be used to manipulate queries that are already in **tsquery** type.

- `tsquery && tsquery`
Returns the AND-combination of the two given queries.
- `tsquery || tsquery`
Returns the OR-combination of the two given queries.
- `!! tsquery`
Returns the negation (NOT) of the given query.
- `numnode(query tsquery)` returns integer
Returns the number of nodes (lexemes plus operators) in a **tsquery**. This function is useful to determine if the query is meaningful (returns > 0), or contains only stop words (returns 0). For example:

```
gaussdb=# SELECT numnode(plainto_tsquery('the any'));
NOTICE: text-search query contains only stop words or doesn't contain lexemes, ignored
CONTEXT: referenced column: numnode
 numnode
-----
      0

gaussdb=# SELECT numnode('foo & bar'::tsquery);
 numnode
-----
      3
```
- `querytree(query tsquery)` returns text
Returns the portion of a **tsquery** that can be used for searching an index. This function is useful for detecting unindexable queries, for example those containing only stop words or only negated terms. For example:

```
gaussdb=# SELECT querytree(to_tsquery('!defined'));
querytree
-----
T
(1 row)
```

7.9.4.3 Rewriting Queries

The **ts_rewrite** family of functions searches a given **tsquery** for occurrences of a target subquery, and replace each occurrence with a substitute subquery. In essence this operation is a **tsquery** specific version of substring replacement. A target and substitute combination can be thought of as a query rewrite rule. A collection of such rewrite rules can be a powerful search aid. For example, you can expand the search using synonyms (that is, new york, big apple, nyc, gotham) or narrow the search to direct the user to some hot topic.

- **ts_rewrite** (query tsquery, target tsquery, substitute tsquery) returns tsquery
This form of **ts_rewrite** simply applies a single rewrite rule: **target** is replaced by **substitute** wherever it appears in query. For example:

```
gaussdb=# SELECT ts_rewrite('a & b':tsquery, 'a':tsquery, 'c':tsquery);
ts_rewrite
-----
'b' & 'c'
```

- **ts_rewrite** (query tsquery, select text) returns tsquery
This form of **ts_rewrite** accepts a starting query and a SQL select command, which is given as a text string. The **select** must yield two columns of **tsquery** type. For each row of the select result, occurrences of the first column value (the target) are replaced by the second column value (the substitute) within the current **query** value.

NOTE

Note that when multiple rewrite rules are applied in this way, the order of application can be important; so in practice you will want the source query to **ORDER BY** some ordering key.

Consider a real-life astronomical example. We will expand query supernovae using table-driven rewriting rules:

```
gaussdb=# CREATE TABLE tsearch.aliases (id int, t tsquery, s tsquery);

gaussdb=# INSERT INTO tsearch.aliases VALUES(1, to_tsquery('supernovae'), to_tsquery('supernovae|sn'));

gaussdb=# SELECT ts_rewrite(to_tsquery('supernovae & crab'), 'SELECT t, s FROM tsearch.aliases');

ts_rewrite
-----
'crab' & ( 'supernova' | 'sn' )
```

We can change the rewriting rules just by updating the table:

```
gaussdb=# UPDATE tsearch.aliases
SET s = to_tsquery('supernovae|sn & !nebulae')
WHERE t = to_tsquery('supernovae');

gaussdb=# SELECT ts_rewrite(to_tsquery('supernovae & crab'), 'SELECT t, s FROM tsearch.aliases');

ts_rewrite
-----
'crab' & ( 'supernova' | 'sn' & '!nebula' )
```

Rewriting can be slow when there are many rewriting rules, since it checks every rule for a possible match. To filter out obvious non-candidate rules we

can use the containment operators for the **tsquery** type. In the example below, we select only those rules which might match the original query:

```
gaussdb=# SELECT ts_rewrite('a & b'::tsquery, 'SELECT t,s FROM tsearch.aliases WHERE "a & b"::tsquery @> t');
 ts_rewrite
-----
'b' & 'a'
(1 row)
gaussdb=# DROP TABLE tsearch.aliases;
```

7.9.4.4 Gathering Document Statistics

The function **ts_stat** is useful for checking your configuration and for finding stop-word candidates.

```
ts_stat(sqlquery text, [ weights text, ]
OUT word text, OUT ndoc integer,
OUT nentry integer) returns setof record
```

sqlquery is a text value containing an SQL query which must return a single **tsvector** column. **ts_stat** executes the query and returns statistics about each distinct lexeme (word) contained in the **tsvector** data. The columns returned are:

- **word text**: the value of a lexeme
- **ndoc integer**: number of documents (**tsvectors**) the word occurred in
- **nentry integer**: total number of occurrences of the word

If **weights** are supplied, only occurrences having one of those weights are counted. For example, to find the ten most frequent words in a document collection:

```
gaussdb=# SELECT * FROM ts_stat('SELECT to_tsvector("english", sr_reason_sk) FROM tpccs.store_returns WHERE sr_customer_sk < 10') ORDER BY nentry DESC, ndoc DESC, word LIMIT 10;
 word | ndoc | nentry
-----+-----+-----
 32  |    2 |      2
 33  |    2 |      2
  1  |    1 |      1
 10  |    1 |      1
 13  |    1 |      1
 14  |    1 |      1
 15  |    1 |      1
 17  |    1 |      1
 20  |    1 |      1
 22  |    1 |      1
(10 rows)
```

The same, but counting only word occurrences with weight **A** or **B**:

```
gaussdb=# SELECT * FROM ts_stat('SELECT to_tsvector("english", sr_reason_sk) FROM tpccs.store_returns WHERE sr_customer_sk < 10', 'a') ORDER BY nentry DESC, ndoc DESC, word LIMIT 10;
 word | ndoc | nentry
-----+-----+-----
(0 rows)
```

7.9.5 Parser

Text search parsers are responsible for splitting raw document text into tokens and identifying each token's type, where the set of types is defined by the parser itself. Note that a parser does not modify the text at all — it simply identifies plausible word boundaries. Because of this limited scope, there is less need for application-specific custom parsers than there is for custom dictionaries.

Currently, GaussDB provides the following built-in parsers: `pg_catalog.default` for English configuration, and `pg_catalog.ngram` and `pg_catalog.pound` for full text search in texts containing Chinese, or both Chinese and English.

The built-in parser is named **`pg_catalog.default`**. It recognizes 23 token types, shown in [Table 7-139](#).

Table 7-139 Default parser's token types

Alias	Description	Example
<code>asciiword</code>	Word, all ASCII letters	elephant
<code>word</code>	Word, all letters	mañana
<code>numword</code>	Word, letters and digits	beta1
<code>asciihword</code>	Hyphenated word, all ASCII	up-to-date
<code>hword</code>	Hyphenated word, all letters	lógico-matemática
<code>numhword</code>	Hyphenated word, letters and digits	test-beta1
<code>hword_ascii</code>	Hyphenated word part, all ASCII	test in the context test-beta1
<code>hword_part</code>	Hyphenated word part, all letters	lógico or matemática in the context lógico-matemática
<code>hword_num</code>	Hyphenated word part, letters and digits	beta1 in the context test-beta1
<code>email</code>	Email address	foo@example.com
<code>protocol</code>	Protocol head	http://
<code>url</code>	URL	example.com/stuff/index.html
<code>host</code>	Host	example.com
<code>url_path</code>	URL path	/stuff/index.html, in the context of a URL
<code>file</code>	File or path name	/usr/local/foo.txt, if not within a URL
<code>sfloat</code>	Scientific notation	-1.23E+56
<code>float</code>	Decimal notation	-1.234
<code>int</code>	Signed integer	-1234
<code>uint</code>	Unsigned integer	1234
<code>version</code>	Version number	8.3.0
<code>tag</code>	XML tag	

Alias	Description	Example
entity	XML entity	&
blank	Space symbols	(any whitespace or punctuation not otherwise recognized)

Note: The parser's notion of a "letter" is determined by the database's locale setting, specifically **lc_ctype**. Words containing only the basic ASCII letters are reported as a separate token type, since it is sometimes useful to distinguish them. In most European languages, token types `word` and `asciiword` should be treated alike.

email does not support all valid email characters as defined by RFC 5322. Specifically, the only non-alphanumeric characters supported for email usernames are period, dash, and underscore.

It is possible for the parser to identify overlapping tokens in the same piece of text. As an example, a hyphenated word will be reported both as the entire word and as each component:

```
gaussdb=# SELECT alias, description, token FROM ts_debug('english','foo-bar-beta1');
 alias | description | token
-----+-----+-----
numhword | Hyphenated word, letters and digits | foo-bar-beta1
hword_asciipart | Hyphenated word part, all ASCII | foo
blank | Space symbols | -
hword_asciipart | Hyphenated word part, all ASCII | bar
blank | Space symbols | -
hword_numpart | Hyphenated word part, letters and digits | beta1
```

This behavior is desirable since it allows searches to work for both the whole compound word and for components. Here is another instructive example:

```
gaussdb=# SELECT alias, description, token FROM ts_debug('english','http://example.com/stuff/index.html');
 alias | description | token
-----+-----+-----
protocol | Protocol head | http://
url | URL | example.com/stuff/index.html
host | Host | example.com
url_path | URL path | /stuff/index.html
```

N-gram is a mechanical word segmentation method, and applies to no semantic Chinese segmentation scenarios. The N-gram segmentation method ensures the completeness of the segmentation. However, to cover all the possibilities, it but adds unnecessary words to the index, resulting in a large number of index items. N-gram supports Chinese coding, including GBK and UTF-8. Six built-in token types are shown in [Table 7-140](#).

Table 7-140 Token types

Alias	Description
zh_words	chinese words
en_word	english word

Alias	Description
numeric	numeric data
alnum	alnum string
grapsymbol	graphic symbol
multisymbol	multiple symbol

Pound segments words in a fixed format. It is used to segment to-be-parsed nonsense Chinese and English words that are separated by fixed separators. It supports Chinese encoding (including GBK and UTF8) and English encoding (including ASCII). Pound has six pre-configured token types (as listed in [Table 7-141](#)) and supports five separators (as listed in [Table 7-142](#)). The default, the separator is #. Pound The maximum length of a token is 256 characters.

Table 7-141 Token types

Alias	Description
zh_words	chinese words
en_word	english word
numeric	numeric data
alnum	alnum string
grapsymbol	graphic symbol
multisymbol	multiple symbol

Table 7-142 Separator types

Separator	Description
@	Special character
#	Special character
\$	Special character
%	Special character
/	Special character

7.9.6 Dictionaries

7.9.6.1 Overview

A dictionary is used to define stop words, that is, words to be ignored in full-text retrieval.

A dictionary can also be used to normalize words so that different derived forms of the same word will match. A normalized word is called a lexeme.

In addition to improving retrieval quality, normalization and removal of stop words can reduce the size of the **tsvector** representation of a document, thereby improving performance. Normalization and removal of stop words do not always have linguistic meaning. Users can define normalization and removal rules in dictionary definition files based on application environments.

A dictionary is a program that receives a token as input and returns:

- An array of lexemes if the input token is known to the dictionary (note that one token can produce more than one lexeme).
- A single lexeme with the **TSL_FILTER** flag set (which is automatically set in a filtering dictionary and is not perceived by users), to replace the original token with a new token to be passed to subsequent dictionaries (a dictionary that does this is called a filtering dictionary).
- An empty array if the input token is known to the dictionary but is a stop word.
- **NULL** if the dictionary does not recognize the token.

GaussDB provides predefined dictionaries for many languages and also provides five predefined dictionary templates, **Simple**, **Synonym**, **Thesaurus**, **Ispell**, and **Snowball**. These templates can be used to create new dictionaries with custom parameters.

When using full-text retrieval, you are advised to:

- In the text search configuration, configure a parser together with a set of dictionaries to process the parser's output tokens. For each token type that the parser can return, a separate list of dictionaries is specified by the configuration. When a token of that type is found by the parser, each dictionary in the list is consulted in turn, until a dictionary recognizes it as a known word. If it is identified as a stop word, or no dictionary recognizes the token, it will be discarded and not indexed or searched for. Generally, the first dictionary that returns a non-**NULL** output determines the result, and any remaining dictionaries are not consulted. However, a filtering dictionary can replace the input token with a modified one, which is then passed to subsequent dictionaries.
- The general rule for configuring a list of dictionaries is to place first the most narrow, most specific dictionary, then the more general dictionaries, finishing with a very general dictionary, like a **Snowball** stemmer dictionary or a **Simple** dictionary, which recognizes everything. In the following example, for an astronomy-specific search (**astro_en** configuration), you can configure the token type **asciiword** (ASCII word) with a **Synonym** dictionary of astronomical terms, a general English **Ispell** dictionary, and a **Snowball** English stemmer dictionary:

```
gaussdb=# ALTER TEXT SEARCH CONFIGURATION astro_en  
ADD MAPPING FOR asciiword WITH astro_syn, english_ispell, english_stem;
```

A filtering dictionary can be placed anywhere in the list, except at the end where it would be useless. Filtering dictionaries are useful to partially normalize words to simplify the task of later dictionaries.

7.9.6.2 Stop Words

Stop words are words that are very common, appear in almost every document, and have no discrimination value. Therefore, they can be ignored in the context of full text searching. Each type of dictionaries treats stop words in different ways. For example, **Ispell** dictionaries first normalize words and then check the list of stop words, while **Snowball** dictionaries first check the list of stop words.

For example, every English text contains words like **a** and **the**, so it is useless to store them in an index. However, stop words affect the positions in **tsvector**, which in turn affect ranking.

```
gaussdb=# SELECT to_tsvector('english','in the list of stop words');
to_tsvector
-----
'list':3 'stop':5 'word':6
```

The missing positions 1, 2, and 4 are because of stop words. Ranks calculated for documents with and without stop words are quite different:

```
gaussdb=# SELECT ts_rank_cd (to_tsvector('english','in the list of stop words'), to_tsquery('list & stop'));
ts_rank_cd
-----
.05

gaussdb=# SELECT ts_rank_cd (to_tsvector('english','list stop words'), to_tsquery('list & stop'));
ts_rank_cd
-----
.1
```

7.9.6.3 Simple Dictionary

A **Simple** dictionary operates by converting the input token to lower case and checking it against a list of stop words. If the token is found in the list, an empty array will be returned, causing the token to be discarded. If it is not found, the lower-cased form of the word is returned as the normalized lexeme. In addition, you can set **Accept to false** for **Simple** dictionaries (default: **true**) to report non-stop-words as unrecognized, allowing them to be passed on to the next dictionary in the list.

Precautions

- Most types of dictionaries rely on dictionary configuration files. The name of a configuration file can only be lowercase letters, digits, and underscores (_).
- A dictionary cannot be created in **pg_temp** mode.
- Dictionary configuration files must be stored in UTF-8 encoding. They will be translated to the actual database encoding, if that is different, when they are read into the server.
- Generally, a session will read a dictionary configuration file only once, when it is first used within the session. To modify a configuration file, run the **ALTER TEXT SEARCH DICTIONARY** statement to update and reload the file.

Procedure

Step 1 Create a **Simple** dictionary.

```
gaussdb=# CREATE TEXT SEARCH DICTIONARY public.simple_dict (
    TEMPLATE = pg_catalog.simple,
    STOPWORDS = english
);
```

english.stop is the full name of a file of stop words. For details about the syntax and parameters for creating a **Simple** dictionary, see [CREATE TEXT SEARCH DICTIONARY](#).

Step 2 Use the **Simple** dictionary.

```
gaussdb=# SELECT ts_lexize('public.simple_dict','Yes');
ts_lexize
-----
{yes}
(1 row)

gaussdb=# SELECT ts_lexize('public.simple_dict','The');
ts_lexize
-----
{}
(1 row)
```

Step 3 Set **Accept=false** so that the **Simple** dictionary returns **NULL** instead of a lower-cased non-stop word.

```
gaussdb=# ALTER TEXT SEARCH DICTIONARY public.simple_dict ( Accept = false );
ALTER TEXT SEARCH DICTIONARY
gaussdb=# SELECT ts_lexize('public.simple_dict','Yes');
ts_lexize
-----
(1 row)

gaussdb=# SELECT ts_lexize('public.simple_dict','The');
ts_lexize
-----
{}
(1 row)
```

----End

7.9.6.4 Synonym Dictionary

A **Synonym** dictionary is used to define, identify, and convert synonyms of a token. Phrases are not supported. Synonyms of phrases can be defined in a **Thesaurus** dictionary. For details, see [Thesaurus Dictionary](#).

Examples

- A **Synonym** dictionary can be used to overcome linguistic problems. For example, to prevent an English stemmer dictionary from reducing the word 'Paris' to 'pari', define a **Paris paris** line in the **Synonym** dictionary and put it before the **english_stem** dictionary.

```
gaussdb=# SELECT * FROM ts_debug('english', 'Paris');
 alias | description | token | dictionaries | dictionary | lexemes
-----+-----+-----+-----+-----+-----
asciword | Word, all ASCII | Paris | {english_stem} | english_stem | {pari}
(1 row)

gaussdb=# CREATE TEXT SEARCH DICTIONARY my_synonym (
    TEMPLATE = synonym,
```

```

SYNONYMS = my_synonyms,
FILEPATH = 'file:///home/dicts/'
);

gaussdb=# ALTER TEXT SEARCH CONFIGURATION english
ALTER MAPPING FOR asciiword
WITH my_synonym, english_stem;

gaussdb=# SELECT * FROM ts_debug('english', 'Paris');
 alias | description | token | dictionaries | dictionary | lexemes
-----+-----+-----+-----+-----+-----
asciiword | Word, all ASCII | Paris | {my_synonym,english_stem} | my_synonym | {paris}
(1 row)

gaussdb=# SELECT * FROM ts_debug('english', 'paris');
 alias | description | token | dictionaries | dictionary | lexemes
-----+-----+-----+-----+-----+-----
asciiword | Word, all ASCII | Paris | {my_synonym,english_stem} | my_synonym | {paris}
(1 row)

gaussdb=# ALTER TEXT SEARCH DICTIONARY my_synonym ( CASESENSITIVE=true);

gaussdb=# SELECT * FROM ts_debug('english', 'Paris');
 alias | description | token | dictionaries | dictionary | lexemes
-----+-----+-----+-----+-----+-----
asciiword | Word, all ASCII | Paris | {my_synonym,english_stem} | my_synonym | {paris}
(1 row)

gaussdb=# SELECT * FROM ts_debug('english', 'paris');
 alias | description | token | dictionaries | dictionary | lexemes
-----+-----+-----+-----+-----+-----
asciiword | Word, all ASCII | Paris | {my_synonym,english_stem} | my_synonym | {pari}
(1 row)

```

The full name of the **Synonym** dictionary file is **my_synonyms.syn**, and the dictionary is stored in the *Connected CN/home/dicts/* directory. For details about the syntax and parameters for creating a **Synonym** dictionary, see [CREATE TEXT SEARCH DICTIONARY](#).

- An asterisk (*) can be placed at the end of a synonym in the configuration file. This indicates that the synonym is a prefix. The asterisk is ignored when the entry is used in `to_tsvector()`, but when it is used in `to_tsquery()`, the result will be a query item with the prefix match marker (see [Manipulating Queries](#)).

Assume that the content in the dictionary file **synonym_sample.syn** is as follows:

```

gogle googl
indices index*

```

Create and use a dictionary.

```

gaussdb=# CREATE TEXT SEARCH DICTIONARY syn (
TEMPLATE = synonym,
SYNONYMS = synonym_sample
);

gaussdb=# SELECT ts_lexize('syn','indices');
 ts_lexize
-----
{index}
(1 row)

gaussdb=# CREATE TEXT SEARCH CONFIGURATION tst (copy=simple);

gaussdb=# ALTER TEXT SEARCH CONFIGURATION tst ALTER MAPPING FOR asciiword WITH syn;

gaussdb=# SELECT to_tsvector('tst','indices');
 to_tsvector

```

```

-----
'index':1
(1 row)

gaussdb=# SELECT to_tsquery('tst','indices');
to_tsquery
-----
'index':*
(1 row)

gaussdb=# SELECT 'indexes are very useful':tsvector;
tsvector
-----
'are' 'indexes' 'useful' 'very'
(1 row)

gaussdb=# SELECT 'indexes are very useful':tsvector @@ to_tsquery('tst','indices');
?column?
-----
t
(1 row)

```

7.9.6.5 Thesaurus Dictionary

A **Thesaurus** dictionary (sometimes abbreviated as TZ) is a collection of relationships between words and phrases, such as broader terms (BT), narrower terms (NT), preferred terms, non-preferred terms, and related terms. Based on definitions in the dictionary file, a TZ replaces all non-preferred terms by one preferred term and, optionally, preserves the original terms for indexing as well. A TZ is an extension of a **Synonym** dictionary with added phrase support.

Precautions

- A TZ has the capability to recognize phrases and therefore it must remember its state and interact with the parser to determine whether to handle the next token or stop accumulation. A TZ must be configured carefully. For example, if an AZ is configured to handle only **asciiword** tokens, a TZ definition like **one 7** will not work because the token type **uint** is not assigned to the TZ.
- TZs are used during indexing, so any change in the TZ's parameters requires reindexing. For most other dictionary types, small changes such as adding or removing stop words does not force reindexing.

Procedure

Step 1 Create a TZ named **thesaurus_astro**.

thesaurus_astro is a simple astronomical TZ that defines two astronomical word combinations (word+synonym).

```
supernovae stars : sn
crab nebulae : crab
```

Run the following statement to create the TZ:

```
gaussdb=# CREATE TEXT SEARCH DICTIONARY thesaurus_astro (
    TEMPLATE = thesaurus,
    DictFile = thesaurus_astro,
    Dictionary = pg_catalog.english_stem,
    FILEPATH = 'file:///home/dicts/'
);
```

The full name of the TZ file is **thesaurus_astro.ths**, and the TZ is stored in the *Connected CN/home/dicts/* directory. **pg_catalog.english_stem** is the

subdictionary (a **Snowball** English stemmer) used for input normalization. The subdictionary has its own configuration (for example, stop words), which is not shown here. For details about the syntax and parameters for creating a **Thesaurus** dictionary, see [CREATE TEXT SEARCH DICTIONARY](#).

Step 2 Bind the TZ to the desired token types in the text search configuration.

```
gaussdb=# ALTER TEXT SEARCH CONFIGURATION russian
ALTER MAPPING FOR asciiword, asciihword, hword_asciipart
WITH thesaurus_astro, english_stem;
```

Step 3 Use the TZ.

- Test the TZ.

The **ts_lexize** function is not very useful for testing the TZ because the function processes its input as a single token. Instead, you can use the **plainto_tsquery**, **to_tsvector**, or **to_tsquery** function which will break their input strings into multiple tokens. Enclose the argument with single quotation marks (') if you use the **to_tsquery** function.

```
gaussdb=# SELECT plainto_tsquery('russian','supernova star');
plainto_tsquery
-----
'sn'
(1 row)

gaussdb=# SELECT to_tsvector('russian','supernova star');
to_tsvector
-----
'sn':1
(1 row)

gaussdb=# SELECT to_tsquery('russian','"supernova star"');
to_tsquery
-----
'sn'
(1 row)
```

supernova star matches **supernovae stars** in **thesaurus_astro** because the **english_stem** stemmer is specified in the **thesaurus_astro** definition. The stemmer removed **e** and **s**.

- To index the original phrase, include it in the right-hand part of the definition.

```
gaussdb=# ALTER TEXT SEARCH DICTIONARY thesaurus_astro (
DictFile = thesaurus_astro,
FILEPATH = 'file:///home/dicts/');

gaussdb=# SELECT plainto_tsquery('russian','supernova star');
plainto_tsquery
-----
'sn' & 'supernova' & 'star'
(1 row)
```

----End

7.9.6.6 Ispell Dictionary

An **Ispell** dictionary is a morphological dictionary, which can normalize different linguistic forms of a word into the same lexeme. For example, an English **Ispell** dictionary can match all declensions and conjugations of the search term **bank**, such as, **banking**, **banked**, **banks**, **banks'**, and **bank's**.

GaussDB does not provide any predefined **Ispell** dictionaries or dictionary files. The .dict files and .affix files support multiple open-source dictionary formats, including **Ispell**, **MySpell**, and **Hunspell**.

Procedure

Step 1 Obtain the dictionary definition file (.dict) and affix file (.affix).

You can use an open-source dictionary (available on OpenOffice). The name extensions of the open-source dictionary may be .aff and .dic. In this case, you need to change them to .affix and .dict. In addition, for some dictionary files (for example, Norwegian dictionary files), you need to run the following commands to convert the character encoding to UTF-8:

```
iconv -f ISO_8859-1 -t UTF-8 -o nn_no.affix nn_NO.aff  
iconv -f ISO_8859-1 -t UTF-8 -o nn_no.dict nn_NO.dic
```

Step 2 Create an **Ispell** dictionary.

```
gaussdb=# CREATE TEXT SEARCH DICTIONARY norwegian_ispell (  
    TEMPLATE = ispell,  
    DictFile = nn_no,  
    AffFile = nn_no,  
    FilePath = 'file:///home/dicts'  
);
```

The full names of the **Ispell** dictionary files are **nn_no.dict** and **nn_no.affix**, and the dictionary is stored in the *Connected CN/home/dicts/* directory. For details about the syntax and parameters for creating an **Ispell** dictionary, see [CREATE TEXT SEARCH DICTIONARY](#).

Step 3 Use the **Ispell** dictionary to split compound words.

```
gaussdb=# SELECT ts_lexize('norwegian_ispell', 'sjokoladefabrikk');  
    ts_lexize  
-----  
{sjokolade,fabrikk}  
(1 row)
```

MySpell does not support compound words. **Hunspell** supports compound words. GaussDB supports only the basic compound word operations of **Hunspell**. Generally, **Ispell** dictionaries recognize a limited set of words, so they should be followed by another broader dictionary, for example, a **Snowball** dictionary, which recognizes everything.

----End

7.9.6.7 Snowball Dictionary

A **Snowball** dictionary is based on a project by Martin Porter and is used for stem analysis, providing stemming algorithms for many languages. GaussDB provides predefined **Snowball** dictionaries of many languages. You can query the [PG_TS_DICT](#) system catalog to view the predefined **Snowball** dictionaries and supported stemming algorithms.

A **Snowball** dictionary recognizes everything, no matter whether it is able to simplify the word. Therefore, it should be placed at the end of the dictionary list. It is useless to place it before any other dictionary because a token will never pass it through to the next dictionary.

For details about the syntax of **Snowball** dictionaries, see [CREATE TEXT SEARCH DICTIONARY](#).

7.9.7 Configuration Examples

Text search configuration specifies the following components required for converting a document into a **tsvector**:

- A parser, decomposes a text into tokens.
- Dictionary list, converts each token into a lexeme.

Each time when the **to_tsvector** or **to_tsquery** function is invoked, a text search configuration is required to specify a processing procedure. The GUC parameter **default_text_search_config** specifies the default text search configuration, which will be used if the text search function does not explicitly specify a text search configuration.

GaussDB provides some predefined text search configurations. You can also create user-defined text search configurations. In addition, to facilitate the management of text search objects, multiple **gsql** meta-commands are provided to display information about text search objects. For details, see "Client Tool > Meta-Command Reference" in *Tool Reference*.

Procedure

- Step 1** Create a text search configuration **ts_conf** by copying the predefined text search configuration **english**.

```
gaussdb=# CREATE TEXT SEARCH CONFIGURATION ts_conf ( COPY = pg_catalog.english );
CREATE TEXT SEARCH CONFIGURATION
```

- Step 2** Create a **Synonym** dictionary.

Assume that the definition file **gs_dict.syn** of the **Synonym** dictionary contains the following contents:

```
gaussdb gs
gauss gs
```

Run the following statement to create the **Synonym** dictionary:

```
gaussdb=# CREATE TEXT SEARCH DICTIONARY gs_dict (
    TEMPLATE = synonym,
    SYNONYMS = gs_dict,
    FILEPATH = 'file:///home/dicts'
);
```

- Step 3** Create an **Ispell** dictionary **english_ispell** (the dictionary definition file is from the open source dictionary).

```
gaussdb=# CREATE TEXT SEARCH DICTIONARY english_ispell (
    TEMPLATE = ispell,
    DictFile = english,
    AffFile = english,
    StopWords = english,
    FILEPATH = 'file:///home/dicts'
);
```

- Step 4** Modify the text search configuration **ts_conf** and change the dictionary list for tokens of certain types. For details about token types, see [Parser](#).

```
gaussdb=# ALTER TEXT SEARCH CONFIGURATION ts_conf
    ALTER MAPPING FOR asciiword, asciihword, hword_asciipart,
        word, hword, hword_part
    WITH gs_dict, english_ispell, english_stem;
```

Step 5 In the text search configuration, set non-index or set the search for tokens of certain types.

```
gaussdb=# ALTER TEXT SEARCH CONFIGURATION ts_conf
DROP MAPPING FOR email, url, url_path, sfloat, float;
```

Step 6 Use the text retrieval commissioning function `ts_debug()` to test the text search configuration `ts_conf`.

```
gaussdb=# SELECT * FROM ts_debug('ts_conf', '
GaussDB, the highly scalable, SQL compliant, open source object-relational
database management system, is now undergoing beta testing of the next
version of our software.
');
```

Step 7 You can set the default text search configuration of the current session to `ts_conf`. This setting is valid only for the current session.

```
gaussdb=# \dF+ ts_conf
Text search configuration "public.ts_conf"
Parser: "pg_catalog.default"
Token | Dictionaries
-----+-----
asciihword | gs_dict,english_ispell,english_stem
asciword | gs_dict,english_ispell,english_stem
file | simple
host | simple
hword | gs_dict,english_ispell,english_stem
hword_asciipart | gs_dict,english_ispell,english_stem
hword_numpart | simple
hword_part | gs_dict,english_ispell,english_stem
int | simple
numhword | simple
numword | simple
uint | simple
version | simple
word | gs_dict,english_ispell,english_stem

gaussdb=# SET default_text_search_config = 'public.ts_conf';
SET
gaussdb=# SHOW default_text_search_config;
default_text_search_config
-----
public.ts_conf
(1 row)
```

----End

7.9.8 Testing and Debugging Text Search

The behavior of a custom text search configuration can easily become confusing. The functions described in this section are useful for testing text search objects. You can test a complete configuration, or test parsers and dictionaries separately.

7.9.8.1 Testing a Configuration

The function `ts_debug` allows easy testing of a text search configuration.

```
ts_debug([ config regconfig, ] document text,
OUT alias text,
OUT description text,
OUT token text,
OUT dictionaries regdictionary[],
OUT dictionary regdictionary,
OUT lexemes text[])
returns setof record
```

ts_debug displays information about every token of document as produced by the parser and processed by the configured dictionaries. It uses the configuration specified by **config**, or **default_text_search_config** if that argument is omitted.

ts_debug returns one row for each token identified in the text by the parser. The columns returned are:

- **alias text**: short name of the token type
- **description text**: description of the token type
- **token text**: text of the token
- **dictionaries regdictionary[]**: dictionaries selected by the configuration for this token type
- **dictionary regdictionary**: dictionary that recognized the token, or NULL if none did
- **lexemes text[]**: lexeme produced by the dictionary that recognized the token, or NULL if none did; an empty array ({}) means the token was recognized as a stop word

Here is a simple example:

```
gaussdb=# SELECT * FROM ts_debug('english','a fat cat sat on a mat - it ate a fat rats');
 alias | description | token | dictionaries | dictionary | lexemes
-----+-----+-----+-----+-----+-----
asciiword | Word, all ASCII | a | {english_stem} | english_stem | {}
blank | Space symbols | | {} | | 
asciiword | Word, all ASCII | fat | {english_stem} | english_stem | {fat}
blank | Space symbols | | {} | | 
asciiword | Word, all ASCII | cat | {english_stem} | english_stem | {cat}
blank | Space symbols | | {} | | 
asciiword | Word, all ASCII | sat | {english_stem} | english_stem | {sat}
blank | Space symbols | | {} | | 
asciiword | Word, all ASCII | on | {english_stem} | english_stem | {}
blank | Space symbols | | {} | | 
asciiword | Word, all ASCII | a | {english_stem} | english_stem | {}
blank | Space symbols | | {} | | 
asciiword | Word, all ASCII | mat | {english_stem} | english_stem | {mat}
blank | Space symbols | | {} | | 
blank | Space symbols | - | {} | | 
asciiword | Word, all ASCII | it | {english_stem} | english_stem | {}
blank | Space symbols | | {} | | 
asciiword | Word, all ASCII | ate | {english_stem} | english_stem | {ate}
blank | Space symbols | | {} | | 
asciiword | Word, all ASCII | a | {english_stem} | english_stem | {}
blank | Space symbols | | {} | | 
asciiword | Word, all ASCII | fat | {english_stem} | english_stem | {fat}
blank | Space symbols | | {} | | 
asciiword | Word, all ASCII | rats | {english_stem} | english_stem | {rat}
(24 rows)
```

7.9.8.2 Testing an Age Parser

The **ts_parse** function allows direct testing of a text search parser.

```
ts_parse(parser_name text, document text,
         OUT tokid integer, OUT token text) returns setof record
```

ts_parse parses the given **document** and returns a series of records, one for each token produced by parsing. Each record includes a **tokid** showing the assigned token type and a **token** which is the text of the token. For example:

```
gaussdb=# SELECT * FROM ts_parse('default', '123 - a number');
 tokid | token
```

```

-----+-----
22 | 123
12 |
12 | -
1 | a
12 |
1 | number
(6 rows)

```

The **ts_token_type** function returns the token type and description of the specified parser.

```
ts_token_type(parser_name text, OUT tokid integer,
              OUT alias text, OUT description text) returns setof record
```

ts_token_type returns a table which describes each type of token the specified parser can recognize. For each token type, the table gives the integer **tokid** that the parser uses to label a token of that type, the **alias** that names the token type in configuration commands, and a short description. For example:

```

gaussdb=# SELECT * FROM ts_token_type('default');
tokid | alias | description
-----+-----
1 | asciiword | Word, all ASCII
2 | word | Word, all letters
3 | numword | Word, letters and digits
4 | email | Email address
5 | url | URL
6 | host | Host
7 | sfloat | Scientific notation
8 | version | Version number
9 | hword_numpart | Hyphenated word part, letters and digits
10 | hword_part | Hyphenated word part, all letters
11 | hword_asciipart | Hyphenated word part, all ASCII
12 | blank | Space symbols
13 | tag | XML tag
14 | protocol | Protocol head
15 | numhword | Hyphenated word, letters and digits
16 | asciihword | Hyphenated word, all ASCII
17 | hword | Hyphenated word, all letters
18 | url_path | URL path
19 | file | File or path name
20 | float | Decimal notation
21 | int | Signed integer
22 | uint | Unsigned integer
23 | entity | XML entity
(23 rows)

```

7.9.8.3 Testing a Dictionary

The **ts_lexize** function facilitates dictionary testing.

ts_lexize(dict regdictionary, token text) returns text[] **ts_lexize** returns an array of lexemes if the input **token** is known to the dictionary, or an empty array if the token is known to the dictionary but it is a stop word, or **NULL** if it is an unknown word.

For example:

```

gaussdb=# SELECT ts_lexize('english_stem', 'stars');
ts_lexize
-----
{star}

gaussdb=# SELECT ts_lexize('english_stem', 'a');
ts_lexize

```

```
-----  
{
```

NOTICE

The `ts_lexize` function expects a single **token**, not text.

7.9.9 Limitations

The current limitations of GaussDB's text search features are:

- The length of each lexeme must be less than 2K bytes.
- The length of a **tsvector** (lexemes + positions) must be less than 1 megabyte.
- Position values in **tsvector** must be greater than 0 and no more than 16383.
- No more than 256 positions per lexeme. Excessive positions, if any, will be discarded.
- The number of nodes (lexemes + operators) in a tsquery must be less than 32768.

7.10 System Operation

GaussDB text runs SQL statements to perform different system operations, such as setting variables, displaying the execution plan, and collecting garbage data.

Setting Variables

For details about how to set various parameters for a session or transaction, see [SET](#).

Displaying the Execution Plan

For details about how to display the execution plan that GaussDB makes for SQL statements, see [EXPLAIN](#).

Specifying a Checkpoint in Transaction Logs

By default, WALs periodically specify checkpoints in a transaction log. **CHECKPOINT** forces an immediate checkpoint when the related command is issued, without waiting for a regular checkpoint scheduled by the system. For details, see [CHECKPOINT](#).

Collecting Unnecessary Data

For details about how to collect garbage data and analyze a database as required, For details, see [VACUUM](#).

Collecting Statistics

For details about how to collect statistics on tables in databases, see [ANALYZE | ANALYZE](#).

Setting the Constraint Check Mode for the Current Transaction

For details about how to set the constraint check mode for the current transaction, see [SET CONSTRAINTS](#).

7.11 Controlling Transactions

A transaction is a user-defined sequence of database operations, which form an integral unit of work.

Starting a Transaction

GaussDB starts a transaction using **START TRANSACTION** and **BEGIN**. For details, see [START TRANSACTION](#) and [BEGIN](#).

Setting a Transaction

GaussDB sets a transaction using **SET TRANSACTION** or **SET LOCAL TRANSACTION**. For details, see [SET TRANSACTION](#).

Committing a Transaction

GaussDB commits all operations of a transaction using **COMMIT** or **END**. For details, see [COMMIT | END](#).

Rolling Back a Transaction

If a fault occurs during a transaction and the transaction cannot proceed, the system performs rollback to cancel all the completed database operations related to the transaction. For details, see [ROLLBACK](#).

NOTE

If an execution request (not in a transaction block) received in the database contains multiple statements, the request is packed into a transaction. If one of the statements fails, the entire request will be rolled back.

7.12 DDL Syntax Overview

Data definition language (DDL) is used to define or modify an object in a database, such as a table, an index, or a view.

NOTE

GaussDB does not support DDL if its CN is unavailable. For example, if a CN in cluster is faulty, creating a database or a table will fail.

Defining a CMK

Client master keys (CMKs) are used to encrypt column encryption keys (CEKs) for the encrypted database feature. CMK definition includes creating and deleting a CMK. For details about related SQL statements, see [Table 7-143](#).

Table 7-143 SQL statements for defining a CMK

Function	SQL Statement
Creating a CMK	CREATE CLIENT MASTER KEY
Deleting a CMK	DROP CLIENT MASTER KEY

Defining a CEK

CEKs are used to encrypt data for the encrypted database feature. You can create a CEK, change the client master key specified by a CEK, and delete a CEK. For details about related SQL statements, see [Table 7-143](#).

Table 7-144 SQL statements for defining a CEK

Function	SQL Statement
Creating a CEK	CREATE COLUMN ENCRYPTION KEY
Changing the client master key specified by a CEK	7.14.173-ALTER COLUMN ENCRYPTION KEY
Deleting a CEK	DROP COLUMN ENCRYPTION KEY

Defining a Database

A database is the warehouse for organizing, storing, and managing data. Defining a database includes: creating a database, altering the database attributes, and dropping the database. For details about related SQL statements, see [Table 7-145](#).

Table 7-145 SQL statements for defining a database

Function	SQL Statement
Creating a database	CREATE DATABASE
Altering database attributes	ALTER DATABASE
Dropping a Database	DROP DATABASE

Defining a Schema

A schema is the set of a group of database objects and is used to control the access to the database objects. For details about related SQL statements, see [Table 7-146](#).

Table 7-146 SQL statements for defining a schema

Function	SQL Statement
Creating a schema	CREATE SCHEMA
Altering schema attributes	ALTER SCHEMA
Dropping a schema	DROP SCHEMA

Defining a Tablespace

A tablespace is used to manage data objects and corresponds to a catalog on a disk. For details about related SQL statements, see [Table 7-147](#).

Table 7-147 SQL statements for defining a tablespace

Function	SQL Statement
Creating a tablespace	CREATE TABLESPACE
Altering tablespace attributes	ALTER TABLESPACE
Dropping a tablespace	DROP TABLESPACE

Defining a Table

A table is a special data structure in a database and is used to store data objects and relationship between data objects. For details about related SQL statements, see [Table 7-148](#).

Table 7-148 SQL statements for defining a table

Function	SQL Statement
Creating a table	CREATE TABLE
Altering table attributes	ALTER TABLE
Dropping a table	DROP TABLE

Defining a Partitioned Table

A partitioned table is a logical table used to improve query performance and does not store data (data is stored in common tables). For details about related SQL statements, see [Table 7-149](#).

Table 7-149 SQL statements for defining a partitioned table

Function	SQL Statement
Creating a partitioned table	CREATE TABLE PARTITION
Create a partition	ALTER TABLE PARTITION
Altering partitioned table attributes	ALTER TABLE PARTITION
Deleting a partition	ALTER TABLE PARTITION
Dropping a partitioned table	DROP TABLE

Defining an Index

An index indicates the sequence of values in one or more columns in a database table. It is a data structure that improves the speed of data access to specific information in a database table. For details about related SQL statements, see [Table 7-150](#).

Table 7-150 SQL statements for defining an index

Function	SQL Statement
Creating an index	CREATE INDEX
Altering index attributes	ALTER INDEX
Dropping an index	DROP INDEX
Rebuilding an index	REINDEX

Defining a Stored Procedure

A stored procedure is a set of SQL statements for achieving specific functions and is stored in the database after compiling. Users can specify a name and provide parameters (if necessary) to execute the stored procedure. For details about related SQL statements, see [Table 7-151](#).

Table 7-151 SQL statements for defining a stored procedure

Function	SQL Statement
Creating a stored procedure	CREATE PROCEDURE
Dropping a stored procedure	DROP PROCEDURE

Defining a Function

In GaussDB, a function is similar to a stored procedure, which is a set of SQL statements. The function and stored procedure are used the same. For details about related SQL statements, see [Table 7-152](#).

Table 7-152 SQL statements for defining a function

Function	SQL Statement
Creating a function	CREATE FUNCTION
Modifying attributes of a function or recompiling the function	ALTER FUNCTION
Dropping a function	DROP FUNCTION

Defining a View

A view is a virtual table exported from one or more basic tables. It is used to control data accesses of users. [Table 7-153](#) lists the related SQL statements.

Table 7-153 SQL statements for defining a view

Function	SQL Statement
Creating a view	CREATE VIEW
Dropping a view	DROP VIEW

Defining a Cursor

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers to context regions. With a cursor, the stored procedure can control alterations in context areas. For details, see [Table 7-154](#).

Table 7-154 SQL statements for defining a cursor

Function	SQL Statement
Creating a cursor	CURSOR
Moving a cursor	MOVE
Fetching data from a cursor	FETCH
Closing a cursor	CLOSE

Defining a Database Link

A database link can be used to remotely operate a database object. For details about corresponding SQL statements, see [Table 7-155](#).

Table 7-155 Database link-related SQL statements

Function	SQL Statement
Creating a database link	CREATE DATABASE LINK
Modifying a database link	ALTER DATABASE LINK
Deleting a database link	DROP DATABASE LINK

7.13 DML Syntax Overview

Data manipulation language (DML) is used to perform operations on data in database tables, such as inserting, updating, querying, or deleting data.

Inserting Data

Inserting data refers to adding one or multiple records to a database table. For details, see [INSERT](#).

Updating Data

Updating data refers to modifying one or multiple records in a database table. For details, see [UPDATE](#).

Querying Data

The database query statement **SELECT** is used to search required information in a database. For details, see [SELECT](#).

Deleting Data

GaussDB provides two statements for deleting data from database tables. To delete data meeting specified conditions from a database table, see [DELETE](#). To delete all data from a database table, see [TRUNCATE](#).

TRUNCATE can quickly delete all data from a database table, which achieves the effect same as that running **DELETE** to delete data without specifying conditions from each table. Deletion efficiency using **TRUNCATE** is faster because **TRUNCATE** does not scan tables. Therefore, **TRUNCATE** is useful in large tables.

Copying Data

GaussDB provides a statement for copying data between tables and files. For details, see [COPY](#).

Locking a Table

GaussDB provides multiple lock modes to control concurrent accesses to table data. For details, see [LOCK](#).

Calling a Function

GaussDB provides three statements for calling functions. These statements are the same in the syntax structure. For details, see [CALL](#).

Session Management

A session is a connection established between the user and the database. [Table 7-156](#) lists the related SQL statements.

Table 7-156 SQL statements related to sessions

Function	SQL Statement
Altering a session	ALTER SESSION
Killing a session	ALTER SYSTEM KILL SESSION

7.14 DCL Syntax Overview

Data control language (DCL) is used to create users and roles and set or modify database users or role rights.

Defining a Role

A role is used to manage permissions. For database security, management and operation permissions can be granted to different roles. For details about related SQL statements, see [Table 7-157](#).

Table 7-157 SQL statements for defining a role

Function	SQL Statement
Creating a role	CREATE ROLE
Altering role attributes	ALTER ROLE
Dropping a role	DROP ROLE

Defining a User

A user is used to log in to a database. Different permissions can be granted to users for managing data accesses and operations of the users. For details about related SQL statements, see [Table 7-158](#).

Table 7-158 SQL statements for defining a user

Function	SQL Statement
Creating a user	CREATE USER
Altering user attributes	ALTER USER
Dropping a user	DROP USER

Granting Rights

GaussDB provides a statement for granting rights to data objects and roles. For details, see [GRANT](#).

Revoking Rights

GaussDB provides a statement for revoking rights. For details, see [REVOKE](#).

Setting Default Rights

GaussDB allows users to set rights for objects that will be created in the future. For details, see [ALTER DEFAULT PRIVILEGES](#).

7.15 SQL Syntax

7.15.1 SQL Syntax

Table 7-159 SQL syntax

Format	Description
[]	The part enclosed in brackets ([]) is optional.
...	Preceding elements can appear repeatedly.
[x y ...]	One item is selected from two or more options or no item is selected.
{ x y ... }	One item is selected from two or more options.
[x y ...] [...]	Multiple parameters or no parameter can be selected. If multiple parameters are selected, separate them with spaces.
[x y ...] [, ...]	Multiple parameters or no parameter can be selected. If multiple parameters are selected, separate them with commas (,).
{ x y ... } [...]	At least one parameter can be selected. If multiple parameters are selected, separate them with spaces.

Format	Description
{ x y ... } [,...]	At least one parameter can be selected. If multiple parameters are selected, separate them with commas (,).

7.15.2 ABORT

Description

Rolls back the current transaction and cancels the changes in the transaction.

It is equivalent to **ROLLBACK**, and is present only for historical reasons. Now ROLLBACK is recommended.

Precautions

ABORT has no impact outside a transaction, but will provoke a warning.

Syntax

```
ABORT [ WORK | TRANSACTION ] ;
```

Parameters

WORK | TRANSACTION

Optional keyword has no effect except increasing readability.

Examples

```
-- Create the customer_demographics_t1 table.
gaussdb=# CREATE TABLE customer_demographics_t1
(
  CD_DEMO_SK          INTEGER          NOT NULL,
  CD_GENDER           CHAR(1)         ,
  CD_MARITAL_STATUS  CHAR(1)         ,
  CD_EDUCATION_STATUS CHAR(20)       ,
  CD_PURCHASE_ESTIMATE INTEGER        ,
  CD_CREDIT_RATING   CHAR(10)        ,
  CD_DEP_COUNT        INTEGER         ,
  CD_DEP_EMPLOYED_COUNT INTEGER       ,
  CD_DEP_COLLEGE_COUNT INTEGER
)
DISTRIBUTE BY HASH (CD_DEMO_SK);

-- Insert data.
gaussdb=# INSERT INTO customer_demographics_t1 VALUES(1920801,'M', 'U', 'DOCTOR DEGREE', 200,
'GOOD', 1, 0,0);

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Update the column.
gaussdb=# UPDATE customer_demographics_t1 SET cd_education_status= 'Unknown';

-- Abort the transaction. All updates are rolled back.
gaussdb=# ABORT;

-- Query data.
```

```
gaussdb=# SELECT * FROM customer_demographics_t1 WHERE cd_demo_sk = 1920801;
cd_demo_sk | cd_gender | cd_marital_status | cd_education_status | cd_purchase_estimate | cd_credit_rating
| cd_dep_count | cd_dep_employed_count | cd_dep_college_count
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
| 1920801 | M       | U               | DOCTOR DEGREE      | 200 | GOOD      |
|          | 0      | 0               |                    |     |          |
(1 row)

-- Delete the table.
gaussdb=# DROP TABLE customer_demographics_t1;
```

Helpful Links

[SET TRANSACTION](#), [COMMIT | END](#), and [ROLLBACK](#)

7.15.3 ALTER APP WORKLOAD GROUP MAPPING

Description

Modifies the workload group associated with an application mapping group. Only users who have the ALTER permission on the current database can modify application mapping group.

Precautions

None

Syntax

```
ALTER APP WORKLOAD GROUP MAPPING app_name
WITH ( WORKLOAD_GPNAME = wg_name );
```

Parameters

- **app_name**
Specifies the name of an application mapping group. The name of an application mapping group must be unique in the current database.
Value range: a string. It must comply with the [naming convention](#).
- **wg_name**
Specifies a Workload Cgroup name.
Value range: a string, which indicates the created workload group.

Examples

```
-- Create a workload group.
gaussdb=# CREATE WORKLOAD GROUP wg_hr1;

-- Create a default application mapping group and associate it with the default workload group.
gaussdb=# CREATE APP WORKLOAD GROUP MAPPING app_wg_map1;

-- Change the name of the workload group associated with an application mapping group.
gaussdb=# ALTER APP WORKLOAD GROUP MAPPING app_wg_map1 WITH(WORKLOAD_GPNAME=wg_hr1);

-- Delete the application mapping group.
gaussdb=# DROP APP WORKLOAD GROUP MAPPING app_wg_map1;
```

```
-- Delete the workload group.  
gaussdb=# DROP WORKLOAD GROUP wg_hr1;
```

Helpful Links

[CREATE APP WORKLOAD GROUP MAPPING](#) and [DROP APP WORKLOAD GROUP MAPPING](#)

7.15.4 ALTER AUDIT POLICY

Description

Modifies the unified audit policy.

Precautions

- Only users with the poladmin or sysadmin permission, or the initial user can perform this operation.
- The unified audit policy takes effect only after **enable_security_policy** is set to **on**.

Syntax

Add or delete an operation type in the audit policy.

```
ALTER AUDIT POLICY [ IF EXISTS ] policy_name { ADD | REMOVE } { privilege_audit_clause |  
access_audit_clause };
```

Modify the filter criteria in the audit policy.

```
ALTER AUDIT POLICY [ IF EXISTS ] policy_name MODIFY ( filter_group_clause );
```

Delete the filter criteria from the audit policy.

```
ALTER AUDIT POLICY [ IF EXISTS ] policy_name DROP FILTER;
```

Modify the description of the audit policy.

```
ALTER AUDIT POLICY [ IF EXISTS ] policy_name COMMENTS policy_comments;
```

Enable or disable the audit policy.

```
ALTER AUDIT POLICY [ IF EXISTS ] policy_name { ENABLE | DISABLE };
```

- **privilege_audit_clause**
DDL operation type and target resource label in the audit policy.
PRIVILEGES ({ DDL | ALL } [ON LABEL (resource_label_name [, ...])])
- **access_audit_clause**
DML operation type and target resource label in the audit policy.
ACCESS ({ DML | ALL } [ON LABEL (resource_label_name [, ...])])
- **filter_group_clause**
Filter criteria in the audit policy.
FILTER ON { filter_type (filter_value [, ...]) } [, ...]

Parameters

- **policy_name**
Specifies the audit policy name, which must be unique.

Value range: a string. It must comply with the [naming convention](#).

- **DDL**
Specifies the operations that will be audited within the database: ALTER, ANALYZE, COMMENT, CREATE, DROP, GRANT, REVOKE, SET, and SHOW.
- **ALL**
Indicates all operations supported by the specified DDL statements in the database.
- **DML**
Specifies the operations that are audited within the database: COPY, DEALLOCATE, DELETE_P, EXECUTE, REINDEX, INSERT, PREPARE, SELECT, TRUNCATE, and UPDATE.
- **FILTER_TYPE**
Specifies a type of information to be filtered by the audit policy. The value can be **IP**, **ROLES**, or **APP**.
- **filter_value**
Indicates the detailed information to be filtered.
- **policy_comments**
Records description information of audit policies.
- **ENABLE|DISABLE**
Enables or disables the unified audit policy.

Examples

See [Examples](#) in section "CREATE AUDIT POLICY."

Helpful Links

[CREATE AUDIT POLICY](#) and [DROP AUDIT POLICY](#)

7.15.5 ALTER COLUMN ENCRYPTION KEY

Function

ALTER COLUMN ENCRYPTION KEY encrypts the CMKs of CEKs in round robin (RR) mode and encrypts the plaintext of CEKs.

Precautions

- This syntax is specific to the fully-encrypted database. When connecting to the database server, enable the fully-encrypted database before using this syntax.
- This syntax takes effect on CMKs only. Encrypting the plaintext of CEKs does not change the ciphertext of the encrypted columns.

Syntax

```
ALTER COLUMN ENCRYPTION KEY column_encryption_key_name WITH VALUES ( CLIENT_MASTER_KEY = client_master_key_name );
```

Parameter Description

- **column_encryption_key_name**
Specifies the key name. In the same namespace, the value of this parameter must be unique.
Value range: a string. It must comply with the [naming convention](#).
- **client_master_key_name**
Specifies the CMK used to encrypt the CEK. The value is the CMK name, which is created using the CREATE CLIENT MASTER KEY syntax. The encrypted CMKs are different from those specified before RR encryption.

NOTICE

The constraints of using Chinese cryptographic algorithms are as follows: SM2, SM3, and SM4 are Chinese cryptographic algorithms. To avoid legal risks, these algorithms must be used together. The Chinese cryptographic algorithms used for the RR encryption must be the same as those used before RR encryption.

Examples

For details, see [7.15.58-Examples](#) in section "CREATE COLUMN ENCRYPTION KEY."

7.15.6 ALTER COORDINATOR

Function

ALTER COORDINATOR changes the value of **nodeis_active** on a specified node in the **pgxc_node** system catalog. This operation can be performed on any normal CN in the cluster and also specifies the node on which the system catalog is to be modified.

Precautions

- ALTER COORDINATOR is a statement used to modify the system catalog. Only the administrator and users in internal maintenance mode (for example, CM) can execute this statement. This statement is dedicated for the CN removal feature and must be used together with other operations. You are advised not to run it by yourself.
- After this statement is executed, **select reload_active_coordinator()** needs to be called to update the connection pool information of the node on which the system catalog is modified.

Syntax

```
ALTER COORDINATOR nodename SET status  
WITH (nodename1[, nodename2, nodename3 ...]);
```

Parameter Description

- **nodename**

Specifies the node name corresponding to a row of records in the **pgxc_node** system catalog. After the node name is specified, the value of **nodeis_active** in the record is changed.

Value range: a string. Only CNs are supported. Ensure that the node name has a corresponding record in the **pgxc_node** system catalog.
- **status**

Specifies the updated value of **nodeis_active** in the **pgxc_node** system catalog.

Value range:

 - FALSE
 - TRUE
- **nodename1[, nodename2, nodename3 ...]**

Specifies the range of nodes on which the SQL statement is executed. When **ALTER COORDINATOR** is executed, the SQL statement is automatically delivered to all nodes in the range. The current execution node must be included.

Value range: a string. Only CNs are supported. Ensure that the node name has a corresponding record in the **pgxc_node** system catalog and the node state is normal. Otherwise, the SQL statement fails to be executed.

Examples

The cluster has three CNs, namely, cn_5001, cn_5002, and cn_5003, which are running properly.

If cn_5001 is faulty and needs to be removed from the cluster within the specified time, run the following SQL statement on cn_5002 and cn_5003 to change the value of **nodeis_active** corresponding to cn_5001 in the **pgxc_node** system catalog to **false**:

```
ALTER COORDINATOR cn_5001 SET False WITH (cn_5002,cn_5003);
```

After cn_5001 is recovered, run the following SQL statement on cn_5002 and cn_5003 to change the value of **nodeis_active** corresponding to cn_5001 in the **pgxc_node** system catalog to **true**:

```
ALTER COORDINATOR cn_5001 SET True WITH (cn_5002,cn_5003);
```

7.15.7 ALTER DATABASE

Description

Modifies a database, including its name, owner, connection limitation, and object isolation.

Precautions

- Only the database owner or a user granted with the ALTER permission can run the **ALTER DATABASE** command. The system administrator has this

permission by default. The following are permission constraints depending on attributes to be modified:

- To modify the database name, you must have the CREATEDB permission.
 - To modify a database owner, you must be a database owner or system administrator and a member of the new owner role, with the CREATEDB permission.
 - To modify the default tablespace of the database, the user must have the CREATE permission on the tablespace. This statement physically migrates tables and indexes in a default tablespace to a new tablespace. Note that tables and indexes outside the default tablespace are not affected.
- You are not allowed to rename a database in use. To rename it, connect to another database.

Syntax

- Modify the maximum number of connections to the database.

```
ALTER DATABASE database_name  
[ [ WITH ] CONNECTION LIMIT connlimit ];
```

- Rename the database.

```
ALTER DATABASE database_name  
RENAME TO new_name;
```

- Change the database owner.

```
ALTER DATABASE database_name  
OWNER TO new_owner;
```

- Modify the object isolation attribute of the database.

```
ALTER DATABASE database_name [ WITH ] { ENABLE | DISABLE } PRIVATE OBJECT;
```

NOTE

- To modify the object isolation attribute of a database, the database must be connected. Otherwise, the modification will fail.
 - For a new database, the object isolation attribute is disabled by default. After the database object isolation attribute is enabled, the database automatically adds row-level security policies to the system catalogs PG_CLASS, PG_ATTRIBUTE, PG_PROC, PG_NAMESPACE, PGXC_SLICE, and PG_PARTITION. Common users can only view the objects (tables, functions, views, and columns) that they have the permission to access. This attribute does not take effect for administrators. After this attribute is enabled, administrators can still view all database objects.
- Change the database time zone.

```
ALTER DATABASE database_name SET DBTIMEZONE = time_zone;
```

- Change the default tablespace of the database.

```
ALTER DATABASE database_name  
SET TABLESPACE new_tablespace;
```

NOTE

If some tables or objects in the database have been created in `new_tablespace`, the default tablespace of the database cannot be changed to **new_tablespace**. An error will be reported during the execution.

- Modify the session parameter value of the database.

```
ALTER DATABASE database_name  
SET configuration_parameter { { TO | = } { value | DEFAULT } | FROM CURRENT };
```

- Reset the database configuration parameter.

```
ALTER DATABASE database_name RESET  
{ configuration_parameter | ALL };
```

Parameters

- **database_name**
Specifies the name of the database whose attributes are to be modified.
Value range: a string. It must comply with the [naming convention](#).
- **connlimit**
Specifies the maximum number of concurrent connections that can be made to this database (excluding administrators' connections).
Value range: an integer ranging from -1 to $2^{31} - 1$. You are advised to set this parameter to an integer ranging from 1 to 50. The default value -1 indicates that there is no restriction on the number of concurrent connections.
- **new_name**
Specifies the new name of a database.
Value range: a string. It must comply with the [naming convention](#).
- **new_owner**
Specifies the new owner of a database.
Value range: a string. It must be a valid username.
- **new_tablespace**
Specifies the new default tablespace of a database. The tablespace exists in the database. The default tablespace is **pg_default**.
Value range: a string. It must be a valid tablespace name.
- **configuration_parameter value**
Sets a specified database session parameter to a specified value. If the value is **DEFAULT** or **RESET**, the default setting is used in the new session. **OFF** closes the setting.

NOTICE

The current version does not support setting database-level parameters.

Value range: a string

- **DEFAULT**
- **OFF**
- **RESET**

- **time_zone**
Sets the time zone of the database specified by **database_name**. You must have the permission on the corresponding database.
Value range: a string
 - Time zones supported by the system and their abbreviations
 - From - 15:59 to + 15:00
- **FROM CURRENT**
Sets the value of the database based on the current connected session.

- **RESET configuration_parameter**
Resets the specified database session parameter.

NOTICE

The current version does not support resetting database-level parameters.

- **RESET ALL**
Resets all database session parameters.

NOTICE

The current version does not support resetting database-level parameters.

 **NOTE**

- Modify the default tablespace of a database by moving the table or index in the old tablespace into the new tablespace. This operation does not affect the tables or indexes in other non-default tablespaces.
- The modified database session parameter values will take effect in the next session.
- After setting the parameters, you need to manually run the **CLEAN CONNECTION** command to clear the old connections. Otherwise, the parameter values between cluster nodes may be inconsistent.

Examples

See [Examples](#) in section "CREATE DATABASE."

Helpful Links

[CREATE DATABASE](#) and [DROP DATABASE](#)

7.15.8 ALTER DATABASE LINK

7.15.9 ALTER DATA SOURCE

Description

Modifies the attributes and content of the data source.

The attributes include the name and owner. The content includes the type, version, and connection options.

Precautions

- Only the initial user, system administrator, and owner have the permission to modify data sources.
- To change the owner, the new owner must be the initial user or a system administrator.

- If the **password** option is displayed, ensure that the **datasource.key.cipher** and **datasource.key.rand** files exist in the *\$GAUSSHOME/bin* directory of each node in the cluster. If the two files do not exist, use the `gs_guc` tool to generate them and use the `gs_ssh` tool to release them to the *\$GAUSSHOME/bin* directory on each node in the cluster.

Syntax

- Set the version, type, and connection options of a data source object.

```
ALTER DATA SOURCE src_name
  [TYPE 'type_str']
  [VERSION {'version_str' | NULL}]
  [OPTIONS ( { [ ADD | SET | DROP ] optname ['optvalue'] } [, ...] )];
```

- Update the name of the data source object.

```
ALTER DATA SOURCE src_name RENAME TO src_new_name;
```

- Update the owner of the data source object.

```
ALTER DATA SOURCE src_name OWNER TO new_owner;
```

Parameters

- **src_name**
Specifies the data source name to be modified.
Value range: a string. It must comply with the [naming convention](#).
- **TYPE**
Changes the original **TYPE** value of the data source to the specified value.
Value range: an empty string or a non-empty string
- **VERSION**
Changes the original **VERSION** value of the data source to the specified value.
Value range: an empty string, a non-empty string, or null
- **OPTIONS**
Specifies the column to be added, modified, or deleted. The value of `optname` should be unique. Comply with the following rules to set this parameter:
To add a column, you can omit **ADD** and simply specify the column name, which cannot be an existing column name.
To modify a column, specify **SET** and an existing column name.
To delete a column, specify **DROP** and an existing column name. Do not set **optvalue**.
- **src_new_name**
Specifies the new data source name.
Value range: a string. It must comply with the [naming convention](#).
- **new_user**
Specifies the new owner of an object.
Value range: a string. It must be a valid username.

Examples

```
-- Create an empty data source object.
gaussdb=# CREATE DATA SOURCE ds_test1;
-- Rename the data source.
```

```
gaussdb=# ALTER DATA SOURCE ds_test1 RENAME TO ds_test;

-- Change the owner.
gaussdb=# CREATE USER user_test1 IDENTIFIED BY '*****';
gaussdb=# ALTER USER user_test1 WITH SYSADMIN;
gaussdb=# ALTER DATA SOURCE ds_test OWNER TO user_test1;

-- Modify TYPE and VERSION.
gaussdb=# ALTER DATA SOURCE ds_test TYPE 'MPPDB_TYPE' VERSION 'XXX';

-- Add a column.
gaussdb=# ALTER DATA SOURCE ds_test OPTIONS (add dsn 'mppdb', username 'test_user');

-- Modify a column.
gaussdb=# ALTER DATA SOURCE ds_test OPTIONS (set dsn 'unknown');

-- Delete a column.
gaussdb=# ALTER DATA SOURCE ds_test OPTIONS (drop username);

-- Delete the data source and user objects.
gaussdb=# DROP DATA SOURCE ds_test;
gaussdb=# DROP USER user_test1;
```

[CREATE DATA SOURCE](#) and [DROP DATA SOURCE](#)

7.15.10 ALTER DEFAULT PRIVILEGES

Function

Allows you to set the permissions that will be applied to objects created in the future. (It does not affect permissions granted to existing objects.)

Precautions

Currently, you can change only the permissions for tables (including views), sequences, functions, client master keys of encrypted databases, column encryption keys, and types.

Syntax

```
ALTER DEFAULT PRIVILEGES
[ FOR { ROLE | USER } target_role [, ...] ]
[ IN SCHEMA schema_name [, ...] ]
abbreviated_grant_or_revoke;
```

- **abbreviated_grant_or_revoke** grants or revokes permissions on some objects.

```
grant_on_tables_clause
| grant_on_sequences_clause
| grant_on_functions_clause
| grant_on_types_clause
| grant_on_client_master_keys_clause
| grant_on_column_encryption_keys_clause
| revoke_on_tables_clause
| revoke_on_sequences_clause
| revoke_on_functions_clause
| revoke_on_types_clause
| revoke_on_client_master_keys_clause
| revoke_on_column_encryption_keys_clause
```

- **grant_on_tables_clause** grants permissions on tables.

```
GRANT { { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | ALTER | DROP |
COMMENT | INDEX | VACUUM }
```

```
[, ...] | ALL [ PRIVILEGES ] }  
ON TABLES  
TO { [ GROUP ] role_name | PUBLIC } [, ...]  
[ WITH GRANT OPTION ]
```

- **grant_on_sequences_clause** grants permissions on sequences.

```
GRANT { { SELECT | UPDATE | USAGE | ALTER | DROP | COMMENT }  
[, ...] | ALL [ PRIVILEGES ] }  
ON SEQUENCES  
TO { [ GROUP ] role_name | PUBLIC } [, ...]  
[ WITH GRANT OPTION ]
```

- **grant_on_functions_clause** grants permissions on functions.

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }  
ON FUNCTIONS  
TO { [ GROUP ] role_name | PUBLIC } [, ...]  
[ WITH GRANT OPTION ]
```

- **grant_on_types_clause** grants permissions on types.

```
GRANT { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }  
ON TYPES  
TO { [ GROUP ] role_name | PUBLIC } [, ...]  
[ WITH GRANT OPTION ]
```

- **grant_on_client_master_keys_clause** grants permissions on CMKs.

```
GRANT { { USAGE | DROP } [, ...] | ALL [ PRIVILEGES ] }  
ON CLIENT_MASTER_KEYS  
TO { [ GROUP ] role_name | PUBLIC } [, ...]  
[ WITH GRANT OPTION ]
```

- **grant_on_column_encryption_keys_clause** grants permissions on column encryption keys.

```
GRANT { { USAGE | DROP } [, ...] | ALL [ PRIVILEGES ] }  
ON COLUMN_ENCRYPTION_KEYS  
TO { [ GROUP ] role_name | PUBLIC } [, ...]  
[ WITH GRANT OPTION ]
```

- **revoke_on_tables_clause** revokes permissions on tables.

```
REVOKE [ GRANT OPTION FOR ]  
{ { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | ALTER | DROP | COMMENT |  
INDEX | VACUUM }  
[, ...] | ALL [ PRIVILEGES ] }  
ON TABLES  
FROM { [ GROUP ] role_name | PUBLIC } [, ...]  
[ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```

- **revoke_on_sequences_clause** revokes permissions on sequences.

```
REVOKE [ GRANT OPTION FOR ]  
{ { SELECT | UPDATE | USAGE | ALTER | DROP | COMMENT }  
[, ...] | ALL [ PRIVILEGES ] }  
ON SEQUENCES  
FROM { [ GROUP ] role_name | PUBLIC } [, ...]  
[ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```

- **revoke_on_functions_clause** revokes permissions on functions.

```
REVOKE [ GRANT OPTION FOR ]  
{ { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }  
ON FUNCTIONS  
FROM { [ GROUP ] role_name | PUBLIC } [, ...]  
[ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```

- **revoke_on_types_clause** revokes permissions on types.

```
REVOKE [ GRANT OPTION FOR ]  
{ { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }  
ON TYPES  
FROM { [ GROUP ] role_name | PUBLIC } [, ...]  
[ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```

- **revoke_on_client_master_keys_clause** revokes permissions on CMKs.

```
REVOKE [ GRANT OPTION FOR ]  
{ { USAGE | DROP } [, ...] | ALL [ PRIVILEGES ] }  
ON CLIENT_MASTER_KEYS
```

```
FROM { [ GROUP ] role_name | PUBLIC } [, ...]  
[ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```

- **revoke_on_column_encryption_keys_clause** revokes permissions on CEKs.

```
REVOKE [ GRANT OPTION FOR ]  
{ { USAGE | DROP } [, ...] | ALL [ PRIVILEGES ] }  
ON COLUMN_ENCRYPTION_KEYS  
FROM { [ GROUP ] role_name | PUBLIC } [, ...]  
[ CASCADE | RESTRICT | CASCADE CONSTRAINTS ]
```

Parameter Description

- **target_role**
Specifies the name of an existing role. If **FOR ROLE/USER** is omitted, the current role is assumed.
Value range: an existing role name
- **schema_name**
Specifies the name of an existing schema.
target_role must have the **CREATE** permission for **schema_name**.
Value range: an existing schema name
- **role_name**
Specifies the name of an existing role to grant or revoke permissions for.
Value range: an existing role name

NOTICE

To drop a role for which the default permissions have been granted, reverse the changes in its default permissions or use **DROP OWNED BY** to get rid of the default permission entry for the role.

Examples

```
-- Grant the SELECT permission on all the tables (and views) in tpcds to every user.  
gaussdb=# ALTER DEFAULT PRIVILEGES IN SCHEMA tpcds GRANT SELECT ON TABLES TO PUBLIC;  
  
-- Create a common user jack.  
gaussdb=# CREATE USER jack PASSWORD '*****';  
  
-- Grant the INSERT permission on all the tables in tpcds to the user jack.  
gaussdb=# ALTER DEFAULT PRIVILEGES IN SCHEMA tpcds GRANT INSERT ON TABLES TO jack;  
  
-- Revoke the preceding permissions.  
gaussdb=# ALTER DEFAULT PRIVILEGES IN SCHEMA tpcds REVOKE SELECT ON TABLES FROM PUBLIC;  
gaussdb=# ALTER DEFAULT PRIVILEGES IN SCHEMA tpcds REVOKE INSERT ON TABLES FROM jack;  
  
-- Delete user jack.  
gaussdb=# DROP USER jack;
```

Helpful Links

[GRANT](#) and [REVOKE](#)

7.15.11 ALTER DIRECTORY

Function

ALTER DIRECTORY modifies a directory.

Precautions

- Currently, only the directory owner can be changed.
- When **enable_access_server_directory** is set to **off**, only the initial user is allowed to change the directory owner. When **enable_access_server_directory** is set to **on**, users with the **SYSADMIN** permission and the directory object owner can change the directory object owner, and the user who changes the owner is required to be a member of the new owner.

Syntax

```
ALTER DIRECTORY directory_name  
OWNER TO new_owner;
```

Parameter Description

directory_name

Specifies the name of a directory to be modified. The value must be an existing directory name.

Examples

```
-- Create a directory.  
gaussdb=# CREATE OR REPLACE DIRECTORY dir as '/tmp/';  
  
-- Change the owner of the directory.  
gaussdb=# ALTER DIRECTORY dir OWNER TO system;  
  
-- Delete the foreign table.  
gaussdb=# DROP DIRECTORY dir;
```

Helpful Links

[CREATE DIRECTORY](#) and [DROP DIRECTORY](#)

7.15.12 ALTER FOREIGN TABLE (for Import and Export)

Description

Modifies a foreign table.

Precautions

When multi-layer quotation marks are used for sensitive columns (such as **password** and **secret_access_key**) in **OPTIONS**, the semantics is different from that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.

Syntax

- Set the attributes of a foreign table.
`ALTER FOREIGN TABLE [IF EXISTS] table_name
OPTIONS ({[ADD | SET | DROP] option ['value']}, ...);`
- Set a new owner.
`ALTER FOREIGN TABLE [IF EXISTS] tablename
OWNER TO new_owner;`
- Set foreign table column options.
`ALTER FOREIGN TABLE [IF EXISTS] table_name
ALTER column_name OPTIONS;`

Parameters

- **table_name**
Specifies the name of an existing foreign table to be modified.
Value range: an existing table name
- **OPTIONS**
Specifies the options column of a foreign table. By default, the value is **SET** in range [**ADD** | **SET** | **DROP**].
- **option**
Specifies the name of the option to be modified.
Value range: See [Parameters](#) in section "CREATE FOREIGN TABLE."
- **value**
Specifies the new value of **option**.

Examples

```
-- Create a foreign table.
gaussdb=# CREATE SCHEMA tpcds;
gaussdb=# CREATE FOREIGN TABLE tpcds.customer_ft
(
  c_customer_sk      integer      ,
  c_customer_id     char(16)     ,
  c_current_demo_sk integer      ,
  c_current_hdemo_sk integer     ,
  c_current_addr_sk integer     ,
  c_first_shipto_date_sk integer  ,
  c_first_sales_date_sk integer  ,
  c_salutation      char(10)    ,
  c_first_name      char(20)    ,
  c_last_name       char(30)    ,
  c_preferred_cust_flag char(1) ,
  c_birth_day       integer     ,
  c_birth_month     integer     ,
  c_birth_year      integer     ,
  c_birth_country   varchar(20) ,
  c_login           char(13)    ,
  c_email_address   char(50)    ,
  c_last_review_date char(10)   )
SERVER gsmpp_server
OPTIONS
(
  location 'gsfs://10.185.179.143:5000/customer1*.dat',
  FORMAT 'TEXT' ,
  DELIMITER '|',
  encoding 'utf8',
  mode 'Normal')
```

```
READ ONLY;
-- Modify foreign table attributes and delete the mode option.
gaussdb=# ALTER FOREIGN TABLE tpceds.customer_ft options(drop mode);

-- Delete the foreign table.
gaussdb=# DROP FOREIGN TABLE tpceds.customer_ft;
gaussdb=# DROP SCHEMA tpceds CASCADE;
```

Helpful Links

[CREATE FOREIGN TABLE \(for Import and Export\)](#) and [DROP FOREIGN TABLE](#)

7.15.13 ALTER FUNCTION

Function

ALTER FUNCTION modifies the attributes of a user-defined function or recompiles a function.

Precautions

- Only the function owner or a user granted with the **ALTER** permission can run the **ALTER FUNCTION** command. The system administrator has this permission by default. The following is permission constraints depending on attributes to be modified:
 - If a function involves operations on temporary tables, **ALTER FUNCTION** cannot be used.
 - To modify the owner or schema of a function, you must be a function owner or system administrator and a member of the new owner role.
 - Only the system administrator and initial user can change the schema of a function to public.
- The **plpgsql_dependency** parameter must be set for function recompilation.
- When separation-of-duties is enabled, to modify the owner of a function, users must have the user group permission, even a system administrator.
- Only the initial user can change the owner of a function to the initial user.

Syntax

- Modify the additional parameters of the customized function.
`ALTER FUNCTION function_name ([{ [argname] [argmode] argtype} [, ...]])
action [...] [RESTRICT];`

The syntax of the **action** clause is as follows:

```
{CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT}
| {IMMUTABLE | STABLE | VOLATILE}
| {SHIPPABLE | NOT SHIPPABLE}
| {NOT FENCED | FENCED}
| [ NOT ] LEAKPROOF
| [ [ EXTERNAL ] SECURITY INVOKER | [ EXTERNAL ] SECURITY DEFINER ]
| AUTHID { DEFINER | CURRENT_USER }
| COST execution_cost
| ROWS result_rows
| SET configuration_parameter { { TO | = } { value | DEFAULT } } FROM CURRENT}
| RESET {configuration_parameter | ALL}
```

- Rename the customized function.

```
ALTER FUNCTION funname ( [ { [ argname ] [ argmode ] argtype} [, ...] ] )  
    RENAME TO new_name;
```

- Change the owner of the customized function.

```
ALTER FUNCTION funname ( [ { [ argname ] [ argmode ] argtype} [, ...] ] )  
    OWNER TO new_owner;
```
- Modify the schema of the customized function.

```
ALTER FUNCTION funname ( [ { [ argname ] [ argmode ] argtype} [, ...] ] )  
    SET SCHEMA new_schema;
```
- Recompile the function.

```
ALTER FUNCTION function_name COMPILE;
```

Parameter Description

- **function_name**
Specifies the name of the function to be modified.
Value range: an existing function name
- **argmode**
Specifies whether a parameter is an input or output parameter.
Value range: **IN**, **OUT**, and **IN OUT**
- **argname**
Parameter name.
Value range: a string. It must comply with the [naming convention](#).
- **argtype**
Specifies the parameter type.
Value range: a valid type. For details, see [Data Type](#).
- **CALLED ON NULL INPUT**
Declares that some parameters of the function can be invoked in normal mode if the parameter values are null. Omitting this parameter is the same as specifying it.
- **RETURNS NULL ON NULL INPUT**
STRICT
Specifies that the function always returns **NULL** whenever any of its parameters is **NULL**. If **STRICT** is specified, the function will not be executed when there are null parameters; instead a null result is assumed automatically.
RETURNS NULL ON NULL INPUT and **STRICT** have the same functions.
- **IMMUTABLE**
Specifies that the function always returns the same result if the parameter values are the same.
- **STABLE**
Specifies that the function cannot modify the database, and that within a single table scan it will consistently return the same result for the same parameter value, but its result varies by SQL statements.
- **VOLATILE**
Specifies that the function value can change in a single table scan and no optimization is performed.

- **SHIPPABLE**
- **NOT SHIPPABLE**

Specifies whether the function can be pushed down to DN for execution.
Functions of the **IMMUTABLE** type can always be pushed down to DN.
Functions of the **STABLE** or **VOLATILE** type can be pushed down to DN only if their attribute is **SHIPPABLE**.
- **LEAKPROOF**

Specifies that the function has no side effect and the parameter contains only the return value. **LEAKPROOF** can be set only by the system administrator.
- **EXTERNAL**

(Optional) The purpose is to be compatible with SQL. This feature applies to all functions, not only external functions.
- **SECURITY INVOKER**

AUTHID CURREN_USER
Specifies that the function will be executed with the permissions of the user who invokes it. Omitting this parameter is the same as specifying it.
SECURITY INVOKER and **AUTHID CURREN_USER** have the same functions.
- **SECURITY DEFINER**

AUTHID DEFINER
Specifies that the function will be executed with the permissions of the user who created it.
AUTHID DEFINER and **SECURITY DEFINER** have the same functions.
- **COST execution_cost**

Estimates the execution cost of a function.
The unit of **execution_cost** is **cpu_operator_cost**.
Value range: a positive integer
- **ROWS result_rows**

Estimates the number of rows returned by the function. This is only allowed when the function is declared to return a set.
Value range: a positive number. The default value is **1000**.
- **configuration_parameter**
 - **value**

Sets a specified database session parameter to a specified value. If the value is **DEFAULT** or **RESET**, the default setting is used in the new session. **OFF** closes the setting.
Value range: a string

 - **DEFAULT**
 - **OFF**
 - **RESET**

Specifies the default value.
 - **from current**

Uses the value of **configuration_parameter** of the current session.

- **new_name**
Specifies the new name of a function. To change the schema of a function, you must have the **CREATE** permission on the new schema.
Value range: a string. It must comply with the [naming convention](#).
- **new_owner**
Specifies the new owner of a function. To change the owner of a function, the new owner must have the **CREATE** permission on the schema to which the function belongs. Note that only the initial user can set the function owner to another initial user.
Value range: an existing user role
- **new_schema**
Specifies the new schema of a function.
Value range: an existing schema

Examples

See [Examples](#) in section "CREATE FUNCTION."

Recompilation examples:

```
-- Enable the dependency function.
set behavior_compat_options='plpgsql_dependency';
-- Create a function.
create or replace function test_func(a int) return int
is
    proc_var int;
begin
    proc_var := a;
    return 1;
end;
/
-- Recompile the function with a function name.
alter procedure test_func compile;
-- Recompile the stored procedure with a signed int type function.
alter procedure test_func(int) compile;
```

Helpful Links

[CREATE FUNCTION](#) and [DROP FUNCTION](#)

7.15.14 ALTER GLOBAL CONFIGURATION

Description

Adds or modifies the key-value of the `gs_global_config` system catalog. You can modify an existing parameter or add a new one.

Precautions

- Only the initial database user can run this command.
- The keyword cannot be changed to **weak_password**.

Syntax

```
ALTER GLOBAL CONFIGURATION with(paraname=value, paraname=value...);
```

Parameters

- **name**
Parameter name, which is of the text type. The value cannot be **weak_password** or **undostoragetype**.
- **value**
Parameter value, which is of the text type.

Examples

```
-- Insert.
gaussdb=# ALTER GLOBAL CONFIGURATION with(redis_is_ok = true);
-- Query.
gaussdb=# SELECT * FROM gs_global_config;
   name   | value
-----+-----
 buckets_len | 16384
 undostoragetype | page
 redis_is_ok  | true
(3 rows)

-- Modify.
gaussdb=# ALTER GLOBAL CONFIGURATION with(redis_is_ok = false);
-- Query.
gaussdb=# SELECT * FROM gs_global_config;
   name   | value
-----+-----
 buckets_len | 16384
 undostoragetype | page
 redis_is_ok  | false
(3 rows)

-- Delete.
gaussdb=# DROP GLOBAL CONFIGURATION redis_is_ok;
-- Query.
gaussdb=# SELECT * FROM gs_global_config;
   name   | value
-----+-----
 buckets_len | 16384
 undostoragetype | page
(2 rows)
```

Helpful Links

[DROP GLOBAL CONFIGURATION](#)

7.15.15 ALTER GROUP

Function

ALTER GROUP modifies the attributes of a user group.

Precautions

ALTER GROUP is an alias for **ALTER ROLE**, and it is not a standard SQL syntax and not recommended. Users can use **ALTER ROLE** directly.

Syntax

- Add users to a group.

```
ALTER GROUP group_name  
  ADD USER user_name [, ... ];
```

- Remove users from a group.

```
ALTER GROUP group_name  
  DROP USER user_name [, ... ];
```

- Change the name of the group.

```
ALTER GROUP group_name  
  RENAME TO new_name;
```

Parameter Description

See [Parameters](#) in section "ALTER ROLE."

Examples

```
-- Create a user group.  
gaussdb=# CREATE GROUP super_users WITH PASSWORD "*****";  
  
-- Create a user.  
gaussdb=# CREATE ROLE lche WITH PASSWORD "*****";  
  
-- Create a user.  
gaussdb=# CREATE ROLE jim WITH PASSWORD "*****";  
  
-- Add users to a user group.  
gaussdb=# ALTER GROUP super_users ADD USER lche, jim;  
  
-- Remove users from a user group.  
gaussdb=# ALTER GROUP super_users DROP USER jim;  
  
-- Change the name of a user group.  
gaussdb=# ALTER GROUP super_users RENAME TO normal_users;  
  
-- Delete the user.  
gaussdb=# DROP ROLE lche, jim;  
  
-- Delete the user group.  
gaussdb=# DROP GROUP normal_users;
```

Helpful Links

[CREATE GROUP](#), [DROP GROUP](#), and [ALTER ROLE](#)

7.15.16 ALTER INDEX

Description

ALTER INDEX modifies the definition of an existing index.

It has the following forms:

- IF EXISTS
Sends a notice instead of an error if the specified index does not exist.
- RENAME TO
Changes only the name of the index. The stored data is not affected.
- SET TABLESPACE
Changes the index tablespace to the specified tablespace and moves index-related data files to the new tablespace.

- **SET ({ STORAGE_PARAMETER = value } [, ...])**
Changes one or more index-method-specific storage parameters of an index. Note that the index content will not be modified immediately by this statement. You may need to use REINDEX to rebuild the index based on different parameters to achieve the expected effect.
- **RESET ({ storage_parameter } [, ...])**
Resets one or more index-method-specific storage parameters of an index to the default value. Similar to the SET statement, REINDEX may be used to completely update the index.
- **[MODIFY PARTITION index_partition_name] UNUSABLE**
Sets the indexes on a table or index partition to be unavailable.
- **REBUILD [PARTITION index_partition_name]**
Rebuilds indexes on a table or an index partition.
- **RENAME PARTITION**
Renames an index partition.
- **MOVE PARTITION**
Modifies the tablespace to which an index partition belongs.

Precautions

Only the index owner, a user who has the INDEX permission on the table where the index resides, or a user who has the ALTER ANY INDEX permission can run the **ALTER INDEX** command. The system administrator has this permission by default.

Syntax

- **Rename a table index.**

```
ALTER INDEX [ IF EXISTS ] index_name  
  RENAME TO new_name;
```
- **Change the tablespace to which a table index belongs.**

```
ALTER INDEX [ IF EXISTS ] index_name  
  SET TABLESPACE tablespace_name;
```
- **Modify the storage parameter of a table index.**

```
ALTER INDEX [ IF EXISTS ] index_name  
  SET ( {storage_parameter = value} [, ...] );
```
- **Reset the storage parameter of a table index.**

```
ALTER INDEX [ IF EXISTS ] index_name  
  RESET ( storage_parameter [, ...] );
```
- **Set a table index or an index partition to be unavailable.**

```
ALTER INDEX [ IF EXISTS ] index_name  
  [ MODIFY PARTITION index_partition_name ] UNUSABLE;
```
- **Rebuild a table index or index partition.**

```
ALTER INDEX index_name  
  REBUILD [ PARTITION index_partition_name ];
```
- **Rename an index partition.**

```
ALTER INDEX [ IF EXISTS ] index_name  
  RENAME PARTITION index_partition_name TO new_index_partition_name;
```
- **Modify the tablespace to which an index partition belongs.**

```
ALTER INDEX [ IF EXISTS ] index_name  
  MOVE PARTITION index_partition_name TABLESPACE new_tablespace;
```

Parameters

- **index_name**
Specifies the index name to be modified.
- **new_name**
Specifies the new name of the index.
Value range: a string. It must comply with the [naming convention](#).
- **tablespace_name**
Specifies the tablespace name.
Value range: an existing tablespace name.
- **storage_parameter**
Specifies the name of an index-method-specific parameter. **ACTIVE_PAGES** indicates the number of index pages, which may be less than the actual number of physical file pages and can be used for optimization. Currently, this parameter is valid only for the local index of the Ustore partitioned table and will be updated by VACUUM and ANALYZE (including AUTOVACUUM). You are not advised to manually set this parameter because it is invalid in distributed mode.
- **value**
Specifies the new value for an index-method-specific storage parameter. This might be a number or a word depending on the parameter.
- **new_index_partition_name**
Specifies the new name of the index partition.
- **index_partition_name**
Specifies the name of an index partition.
- **new_tablespace**
Specifies a new tablespace.

Examples

See [Examples](#) in section "CREATE INDEX."

Helpful Links

[CREATE INDEX](#), [DROP INDEX](#), and [REINDEX](#)

7.15.17 ALTER LANGUAGE

This version does not support this syntax.

7.15.18 ALTER LARGE OBJECT

Description

ALTER LARGE OBJECT changes the owner of a large object.

Precautions

Only a system administrator or the owner of the to-be-modified large object can run **ALTER LARGE OBJECT**.

Syntax

```
ALTER LARGE OBJECT large_object_oid  
OWNER TO new_owner;
```

Parameters

- **large_object_oid**
Specifies the OID of the large object to be modified.
Value range: an existing large object name
- **OWNER TO new_owner**
Specifies the new owner of the object.
Value range: an existing username/role name

Examples

None

7.15.19 ALTER MASKING POLICY

Function

Modifies a masking policy.

Precautions

- Only user **poladmin**, user **sysadmin**, or the initial user can perform this operation.
- The masking policy takes effect only after **enable_security_policy** is set to **on**.

Syntax

- Modify the policy description.

```
ALTER MASKING POLICY policy_name COMMENTS policy_comments;
```
- Modify the masking method.

```
ALTER MASKING POLICY policy_name [ADD | REMOVE | MODIFY] masking_actions[, ...];
```

The syntax of **masking_action**.

```
masking_function ON LABEL(label_name[, ...])
```
- Modify the scenarios where the masking policies take effect.

```
ALTER MASKING POLICY policy_name MODIFY(FILTER ON FILTER_TYPE(filter_value[, ...])[, ...]);
```
- Remove the filters of the masking policies.

```
ALTER MASKING POLICY policy_name DROP FILTER;
```
- Enable or disable the masking policies.

```
ALTER MASKING POLICY policy_name [ENABLE | DISABLE];
```

Parameter Description

- **policy_name**

Specifies the masking policy name, which must be unique.

Value range: a string. It must comply with the [naming convention](#).

- **policy_comments**

Adds or modifies description of masking policies.

- **masking_function**

Specifies eight preset masking methods or user-defined functions. Schema is supported.

maskall is not a preset function. It is hard-coded and cannot be displayed by running `\df`.

The preset masking methods are as follows:

```
maskall | randommasking | creditcardmasking | basicemailmasking | fullemailmasking |  
shufflemasking | alldigitsmasking | regepmasking
```

- **label_name**

Specifies the resource label name.

- **FILTER_TYPE**

Specifies the types of information to be filtered by the policies: **IP**, **ROLES**, and **APP**.

- **filter_value**

Indicates the detailed information to be filtered, such as the IP address, app name, and username.

- **ENABLE|DISABLE**

Enables or disables the masking policy. If **ENABLE|DISABLE** is not specified, **ENABLE** is used by default.

Examples

```
-- Create users dev_mask and bob_mask.  
gaussdb=# CREATE USER dev_mask PASSWORD '*****';  
gaussdb=# CREATE USER bob_mask PASSWORD '*****';  
  
-- Create table tb_for_masking.  
gaussdb=# CREATE TABLE tb_for_masking(col1 text, col2 text, col3 text);  
  
-- Create a resource label for sensitive column col1.  
gaussdb=# CREATE RESOURCE LABEL mask_lb1 ADD COLUMN(tb_for_masking.col1);  
  
-- Create a resource label for sensitive column col2.  
gaussdb=# CREATE RESOURCE LABEL mask_lb2 ADD COLUMN(tb_for_masking.col2);  
  
-- Create a masking policy for the operation of accessing sensitive column col1.  
gaussdb=# CREATE MASKING POLICY maskpol1 maskall ON LABEL(mask_lb1);  
  
-- Add description for masking policy maskpol1.  
gaussdb=# ALTER MASKING POLICY maskpol1 COMMENTS 'masking policy for tb_for_masking.col1';  
  
-- Modify masking policy maskpol1 to add a masking method.  
gaussdb=# ALTER MASKING POLICY maskpol1 ADD randommasking ON LABEL(mask_lb2);  
  
-- Modify masking policy maskpol1 to remove a masking method.  
gaussdb=# ALTER MASKING POLICY maskpol1 REMOVE randommasking ON LABEL(mask_lb2);  
  
-- Modify masking policy maskpol1 to modify a masking method.  
gaussdb=# ALTER MASKING POLICY maskpol1 MODIFY randommasking ON LABEL(mask_lb1);  
  
-- Modify masking policy maskpol1 so that it takes effect only for scenarios where users are dev_mask and bob_mask, the client tool is gsq, and the IP addresses are 10.20.30.40 and 127.0.0.24.
```

```
gaussdb=# ALTER MASKING POLICY maskpol1 MODIFY (FILTER ON ROLES(dev_mask, bob_mask),
APP(gsql), IP('10.20.30.40', '127.0.0.0/24'));

-- Modify masking policy maskpol1 so that it takes effect for all user scenarios.
gaussdb=# ALTER MASKING POLICY maskpol1 DROP FILTER;

-- Disable masking policy maskpol1.
gaussdb=# ALTER MASKING POLICY maskpol1 DISABLE;

-- Delete a masking policy.
gaussdb=# DROP MASKING POLICY maskpol1;

-- Delete the resource label.
gaussdb=# DROP RESOURCE LABEL mask_lb1, mask_lb2;

-- Delete the tb_for_masking table.
gaussdb=# DROP TABLE tb_for_masking;

-- Delete the dev_mask and bob_mask users.
gaussdb=# DROP USER dev_mask, bob_mask;
```

7.15.20 ALTER MATERIALIZED VIEW

Function

ALTER MATERIALIZED VIEW changes multiple auxiliary attributes of an existing materialized view.

Statements and actions that can be used for **ALTER MATERIALIZED VIEW** are a subset of **ALTER TABLE** and have the same meaning when used for materialized views. For details, see [ALTER TABLE](#).

Precautions

- Only the owner of a materialized view or a system administrator has the **ALTER TMATERIALIZED VIEW** permission.
- The materialized view structure cannot be modified.

Syntax

- Change the owner of a materialized view.
ALTER MATERIALIZED VIEW [IF EXISTS] mv_name
OWNER TO new_owner;
- Modify the column of a materialized view.
ALTER MATERIALIZED VIEW [IF EXISTS] mv_name
RENAME [COLUMN] column_name TO new_column_name;
- Rename a materialized view.
ALTER MATERIALIZED VIEW [IF EXISTS] mv_name
RENAME TO new_name;

Parameter Description

- **mv_name**

Specifies the name of an existing materialized view, which can be schema-qualified.

Value range: a string. It must comply with the [naming convention](#).

- **column_name**

Specifies the name of a new or existing column.

Value range: a string. It must comply with the [naming convention](#).

- **new_column_name**

Specifies the new name of an existing column.

- **new_owner**

Specifies the username of the new owner of a materialized view.

- **new_name**

Specifies the new name of a materialized view.

Examples

```
-- Create a table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int) WITH(STORAGE_TYPE=ASTORE);

-- Create a complete-refresh materialized view.
gaussdb=# CREATE MATERIALIZED VIEW foo AS SELECT * FROM my_table;

-- Rename the materialized view foo to bar.
gaussdb=# ALTER MATERIALIZED VIEW foo RENAME TO bar;

-- Delete a complete-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW bar;

-- Delete the my_table table.
gaussdb=# DROP TABLE my_table;
```

Helpful Links

[CREATE INCREMENTAL MATERIALIZED VIEW](#), [CREATE MATERIALIZED VIEW](#), [DROP MATERIALIZED VIEW](#), [REFRESH INCREMENTAL MATERIALIZED VIEW](#), and [REFRESH MATERIALIZED VIEW](#)

7.15.21 ALTER NODE

Function

ALTER NODE modifies the definition of an existing node.

Precautions

ALTER NODE is an interface of the cluster management tool and is used to manage clusters. Only administrators have the permission to use this interface. You are not advised to use this interface, because doing so affects the cluster.

Syntax

```
ALTER NODE nodename WITH
(
  [ TYPE = nodetype,]
  [ HOST = hostname,]
  [ PORT = portnum,]
```

```
[ HOST1 = 'hostname',]  
[ PORT1 = portnum,]  
[ HOSTPRIMARY [ = boolean ],]  
[ PRIMARY [ = boolean ],]  
[ PREFERRED [ = boolean ],]  
[ SCTP_PORT = portnum,]  
[ CONTROL_PORT = portnum,]  
[ SCTP_PORT1 = portnum,]  
[ CONTROL_PORT1 = portnum, ]  
[ NODEIS_CENTRAL [ = boolean ]]  
);
```

NOTE

The port whose number is specified by **PORT** is used for internal communications between nodes. Unlike the port connecting to an external client, it can be queried in the **pgxc_node** table.

Parameter Description

See [Parameters](#) in **CREATE NODE**.

Helpful Links

[CREATE NODE](#) and [DROP NODE](#)

7.15.22 ALTER NODE GROUP

Description

Modifies information about a node group.

Precautions

- Only the system administrator or a user who has the ALTER permission of a node group can modify the information about the node group.
- Node group modification is an internal operation of the system. Except SET DEFAULT, other operations must be performed in maintenance mode (by invoking **set xc_maintenance_mode=on**).
- ALTER NODE GROUP can be used only within a database. To avoid data inconsistency in DBMS, do not manually run this SQL statement.

Syntax

```
ALTER NODE GROUP groupname  
| SET DEFAULT  
| RENAME TO new_group_name  
| SET VCGROUP RENAME TO new_group_name  
| SET NOT VCGROUP  
| SET TABLE GROUP new_group_name  
| COPY BUCKETS FROM src_group_name  
| ADD NODE ( nodename [ , ... ] )  
| DELETE NODE ( nodename [ , ... ] )  
| RESIZE TO dest_group_name  
| SET VCGROUP WITH GROUP new_group_name
```

Parameters

- **groupname**

Specifies the name of the node group to be modified.

Value range: a string. It must comply with the [naming convention](#).

- **SET DEFAULT**
Sets **in_redistribution** to 'y' for all node groups excluding the one specified by **groupname**. To be compatible with earlier versions, this syntax is retained and does not need to be executed in maintenance mode.
- **RENAME TO new_group_name**
Renames the node group specified by **groupname** to **new_group_name**.
- **SET TABLE GROUP new_group_name**
Changes all the **group_names** in the **pggroup** columns of the **pgxc_class** tables on all CNs to **new_group_name**.
- **COPY BUCKETS FROM src_group_name**
Copies values in the **group_members** and **group_buckets** columns from the node group specified by **src_group_name** to the node group specified by **groupname**.
- **ADD NODE (nodename [, ...])**
Adds nodes from the node group specified by **groupname**. After the statement execution, the new nodes are registered with the **PGXC_NODE** system catalog. This statement only modifies the system catalog and does not add nodes or redistribute data. Do not invoke this statement.
- **DELETE NODE (nodename [, ...])**
Deletes nodes from the node group specified by **groupname**. The deleted nodes still exist in the **PGXC_NODE** system catalog. This statement only modifies the system catalog and does not delete nodes or redistribute data. Do not invoke this statement.
- **RESIZE TO dest_group_name**
Specifies a resize flag for the cluster. Set **groupname** to the source node group before data redistribution and **is_installation** of the node group to **FALSE**. Set **desst_group_name** to the destination node group and **is_installation** of the node group to **TRUE**.

7.15.23 ALTER PACKAGE

Description

Modifies the attributes of a package or recompiles a package.

Precautions

- Currently, only users with the ALTER PACKAGE OWNER permission can run this command. By default, system administrators have the permission. The restrictions are as follows:
 - The current user must be the owner of the package or the system administrator and a member of the new owner role.
- The **plpgsql_dependency** parameter must be set for package recompilation.
- When separation-of-duties is enabled, to modify the owner of a package, users must have the user group permission, even a system administrator.

- Only the initial user can change the owner of a package to the initial user.
- In separation-of-duties mode, the owner of a package of the DEFINER type cannot be changed. In non-separation-of-duties mode, only the system administrator or user with a higher permission can change the owner of a package.
- The system administrator is not allowed to change the owner of a package of the DEFINER type to the initial user or O&M administrator.

Syntax

- Change the owner of a package.
`ALTER PACKAGE package_name OWNER TO new_owner;`
- Recompile the package.
`ALTER PACKAGE package_name COMPILE [PACKAGE | BODY | SPECIFICATION];`

Parameters

- **package_name**
Specifies the name of the package to be modified.
Value range: an existing package name. Only one package can be modified at a time.
- **new_owner**
Specifies the new owner of a package. To change the owner of a package, the new owner must have the CREATE permission on the schema to which the package belongs.
Value range: an existing user role

Example

For details, see [CREATE PACKAGE](#).

Recompilation examples:

```
-- Enable the dependency function.
SET behavior_compat_options = 'plpgsql_dependency';
-- Create a function.
CREATE OR REPLACE PACKAGE TEST_PKG
AS
    pkg_var int := 1;
    PROCEDURE test_pkg_proc(var int);
END TEST_PKG;
/
CREATE OR REPLACE PACKAGE BODY TEST_PKG
AS
    PROCEDURE test_pkg_proc(var int)
IS
BEGIN
    pkg_var := 1;
END;
END TEST_PKG;
/
-- Recompile the package.
ALTER PACKAGE TEST_PKG COMPILE;

-- Delete the package.
DROP PACKAGE TEST_PKG;

-- Disable the dependent function.
SET behavior_compat_options = '';
```

Helpful Links

[CREATE PACKAGE](#) and [DROP PACKAGE](#)

7.15.24 ALTER RESOURCE LABEL

Function

ALTER RESOURCE LABEL modifies resource labels.

Precautions

Only user **poladmin**, user **sysadmin**, or the initial user can perform this operation.

Syntax

```
ALTER RESOURCE LABEL label_name (ADD|REMOVE)  
label_item_list[, ...];
```

- **label_item_list**
resource_type(resource_path[, ...])
- **resource_type**
TABLE | COLUMN | SCHEMA | VIEW | FUNCTION

Parameter Description

- **label_name**
Specifies the resource label name.
Value range: a string. It must comply with the [naming convention](#).
- **resource_type**
Specifies the type of database resources to be labeled.
- **resource_path**
Specifies the path of database resources.

Examples

```
-- Create basic table table_for_label.  
gaussdb=# CREATE TABLE table_for_label(col1 int, col2 text);  
  
-- Create resource label table_label.  
gaussdb=# CREATE RESOURCE LABEL table_label ADD COLUMN(table_for_label.col1);  
  
-- Attach resource label table_label to col2.  
gaussdb=# ALTER RESOURCE LABEL table_label ADD COLUMN(table_for_label.col2)  
  
-- Remove an item from table_label.  
gaussdb=# ALTER RESOURCE LABEL table_label REMOVE COLUMN(table_for_label.col1);  
  
-- Delete the resource label table_label.  
gaussdb=# DROP RESOURCE LABEL table_label;  
  
-- Delete the base table table_for_label.  
gaussdb=# DROP TABLE table_for_label;
```

Helpful Links

[5.1.13.14.61-CREATE RESOURCE LABEL](#) and [5.1.13.14.102-DROP RESOURCE LABEL](#)

7.15.25 ALTER ROLE

Description

Modifies role attributes.

Precautions

None

Syntax

- Modify the permissions of a role.

```
ALTER ROLE role_name [ [ WITH ] option [ ... ] ];
```

The option clause for granting permissions is as follows:

```
{CREATEDB | NOCREATEDB}
| {CREATEROLE | NOCREATEROLE}
| {INHERIT | NOINHERIT}
| {AUDITADMIN | NOAUDITADMIN}
| {SYSADMIN | NOSYSADMIN}
| {MONADMIN | NOMONADMIN}
| {OPRADMIN | NOOPRADMIN}
| {POLADMIN | NOPOLADMIN}
| {USEFT | NOUSEFT}
| {LOGIN | NOLOGIN}
| {REPLICATION | NOREPLICATION}
| {VCADMIN | NOVCADMIN}
| {PERSISTENCE | NOPERSISTENCE}
| CONNECTION LIMIT connlimit
| [ ENCRYPTED | UNENCRYPTED ] PASSWORD 'password'[EXPIRED]
| [ ENCRYPTED | UNENCRYPTED ] IDENTIFIED BY 'password' [ REPLACE 'old_password' | EXPIRED ]
| [ ENCRYPTED | UNENCRYPTED ] PASSWORD { 'password' | DISABLE | EXPIRED }
| [ ENCRYPTED | UNENCRYPTED ] IDENTIFIED BY { 'password' [ REPLACE 'old_password' ] |
DISABLE }
| VALID BEGIN 'timestamp'
| VALID UNTIL 'timestamp'

| USER GROUP 'groupuser'
| PERM SPACE 'spacelimit'
| TEMP SPACE 'tmpspacelimit'
| SPILL SPACE 'spillspacelimit'
| NODE GROUP logic_cluster_name
| PGUSER
```

- Rename a role.

```
ALTER ROLE role_name
  RENAME TO new_name;
```

- Lock or unlock.

```
ALTER ROLE role_name
  ACCOUNT { LOCK | UNLOCK };
```

- Set parameters for a role.

```
ALTER ROLE role_name [ IN DATABASE database_name ]
  SET configuration_parameter {{ TO | = } { value | DEFAULT } | FROM CURRENT};
```

- Reset parameters for a role.

```
ALTER ROLE role_name
  [ IN DATABASE database_name ] RESET {configuration_parameter|ALL};
```

Parameters

- role_name**

Specifies a role name.

Value range: an existing role name. If a role name contains uppercase letters, enclose the name with double quotation marks ("").

- **IN DATABASE database_name**
Modifies the parameters of a role in a specified database.
- **SET configuration_parameter**
Sets parameters for a role. Session parameters modified by ALTER ROLE apply to a specified role and take effect in the next session triggered by the role.

NOTICE

The current version does not support setting user-level parameters.

Value range:

For details about the values of **configuration_parameter** and **value**, see [SET](#).

DEFAULT: clears the value of **configuration_parameter**.

configuration_parameter will inherit the default value of the new session generated for the role.

FROM CURRENT: uses the value of **configuration_parameter** of the current session.

- **RESET configuration_parameter/ALL**
Clears the value of **configuration_parameter**. The statement has the same effect as that of **SET configuration_parameter TO DEFAULT**.

NOTICE

The current version does not support the resetting of user-level parameters.

Value range: **ALL** indicates that the values of all parameters are cleared.

- **ACCOUNT LOCK | ACCOUNT UNLOCK**
 - **ACCOUNT LOCK:** locks an account to forbid login to databases.
 - **ACCOUNT UNLOCK:** unlocks an account to allow login to databases.
- **PGUSER**
In the current version, the PGUSER permission of a role cannot be modified.
- **PASSWORD/IDENTIFIED BY 'password'**
Resets or changes the user password. Except the initial user, other administrators and common users need to enter the correct old password when changing their own passwords. Only the initial user, the system administrator (**sysadmin**), or users who have the permission to create users (CREATEROLE) can reset the password of a common user without entering the old password. The initial user can reset passwords of system administrators. System administrators cannot reset passwords of other system administrators.
- **EXPIRED**
Invalidates the password. Only initial users, system administrators (**sysadmin**), and users who have the permission to create users

(CREATEROLE) can invalidate user passwords. System administrators can invalidate their own passwords or the passwords of other system administrators. The password of the initial user cannot be invalidated.

The user whose password is invalid can log in to the database but cannot perform the query operation. The query operation can be performed only after the password is changed or the administrator resets the password.

For details about other parameters, see [Parameters](#) in section "CREATE ROLE."

Examples

See [Examples](#) in section "CREATE ROLE."

Helpful Links

[CREATE ROLE](#), [DROP ROLE](#), and [SET](#)

7.15.26 ALTER ROW LEVEL SECURITY POLICY

Function

ALTER ROW LEVEL SECURITY POLICY modifies an existing row-level access control policy, including the policy name and the users and expressions affected by the policy.

Precautions

Only the table owner or a system administrator can perform this operation.

Syntax

Change the name of an existing row-level security policy.

```
ALTER [ ROW LEVEL SECURITY ] POLICY policy_name ON table_name RENAME TO new_policy_name;
```

Change the specified user and policy expression of an existing row-level security policy.

```
ALTER [ ROW LEVEL SECURITY ] POLICY policy_name ON table_name  
[ TO { role_name | PUBLIC } [, ...] ]  
[ USING ( using_expression ) ];
```

Parameter Description

- **policy_name**
Specifies the name of a row-level access control policy.
- **table_name**
Specifies the name of a table to which a row-level access control policy is applied.
- **new_policy_name**
Specifies the new name of a row-level access control policy.
- **role_name**
Specifies names of users affected by a row-level access control policy. PUBLIC indicates that the row-level access control policy will affect all users.

- `using_expression`
Specifies a row-level security policy, which is similar to a Boolean expression in the WHERE clause.

Examples

```
-- Create the data table all_data.
gaussdb=# CREATE TABLE all_data(id int, role varchar(100), data varchar(100));

-- Create a row-level security policy to specify that the current user can view only their own data.
gaussdb=# CREATE ROW LEVEL SECURITY POLICY all_data_rls ON all_data USING(role = CURRENT_USER);
gaussdb=# \d+ all_data
          Table "public.all_data"
Column |      Type      | Modifiers | Storage | Stats target | Description
-----+-----+-----+-----+-----+-----
id     | integer        |           |         |              |
role   | character varying(100) |         | extended |              |
data   | character varying(100) |         | extended |              |
Row Level Security Policies:
  POLICY "all_data_rls" FOR ALL
    TO public
    USING (((role)::name = "current_user"()))
Has OIDs: no
Distribute By: HASH(id)
Location Nodes: ALL DATANODES
Options: orientation=row, compression=no

-- Create users alice and bob.
gaussdb=# CREATE ROLE alice WITH PASSWORD "*****";
gaussdb=# CREATE ROLE bob WITH PASSWORD "*****";

-- Change the name of the all_data_rls policy.
gaussdb=# ALTER ROW LEVEL SECURITY POLICY all_data_rls ON all_data RENAME TO all_data_new_rls;

-- Change the users affected by the row-level security policy.
gaussdb=# ALTER ROW LEVEL SECURITY POLICY all_data_new_rls ON all_data TO alice, bob;
gaussdb=# \d+ all_data
          Table "public.all_data"
Column |      Type      | Modifiers | Storage | Stats target | Description
-----+-----+-----+-----+-----+-----
id     | integer        |           |         |              |
role   | character varying(100) |         | extended |              |
data   | character varying(100) |         | extended |              |
Row Level Security Policies:
  POLICY "all_data_new_rls" FOR ALL
    TO alice,bob
    USING (((role)::name = "current_user"()))
Has OIDs: no
Distribute By: HASH(id)
Location Nodes: ALL DATANODES
Options: orientation=row, compression=no, enable_rowsecurity=true

-- Modify the expression defined for the row-level security policy.
gaussdb=# ALTER ROW LEVEL SECURITY POLICY all_data_new_rls ON all_data USING (id > 100 AND role =
current_user);
gaussdb=# \d+ all_data
          Table "public.all_data"
Column |      Type      | Modifiers | Storage | Stats target | Description
-----+-----+-----+-----+-----+-----
id     | integer        |           |         |              |
role   | character varying(100) |         | extended |              |
data   | character varying(100) |         | extended |              |
Row Level Security Policies:
  POLICY "all_data_new_rls" FOR ALL
    TO alice,bob
    USING (((id > 100) AND ((role)::name = "current_user"()))))
Has OIDs: no
Distribute By: HASH(id)
```

```
Location Nodes: ALL DATANODES
Options: orientation=row, compression=no, enable_rowsecurity=true

-- Delete users alice and bob.
gaussdb=# DROP ROLE alice, bob;

-- Delete the policy.
gaussdb=# DROP ROW LEVEL SECURITY POLICY all_data_new_rls ON all_data;

-- Delete the all_data table.
gaussdb=# DROP TABLE all_data;
```

Helpful Links

[CREATE ROW LEVEL SECURITY POLICY](#) and [DROP ROW LEVEL SECURITY POLICY](#)

7.15.27 ALTER SCHEMA

Description

Modifies schema attributes.

Precautions

- Only the owner of a schema or users granted with the ALTER permission on the schema can run the **ALTER SCHEMA** command. The system administrator has this permission by default. To change the owner of a schema, you must be the owner of the schema or system administrator and a member of the new owner role.
- For system schemas other than public, such as pg_catalog and sys, only the initial user is allowed to change the owner of a schema. Changing the names of the built-in system schemas may make some functions unavailable or even affect the normal running of the database. By default, the names of the built-in system schemas cannot be changed. To ensure forward compatibility, you can change the names of the built-in system schemas only when the system is being started or upgraded or when **allow_system_table_mods** is set to **on**.
- Only the initial user can change the owner of a schema to an O&M administrator. Other users cannot change the owner of a schema to an O&M administrator.

Syntax

- Alter the tamper-proof attribute of a schema.
ALTER SCHEMA schema_name { WITH | WITHOUT } BLOCKCHAIN
- Rename a schema.
ALTER SCHEMA schema_name
RENAME TO new_name;
- Change the owner of a schema.
ALTER SCHEMA schema_name
OWNER TO new_owner;

Parameters

- **schema_name**
Specifies the name of an existing schema.

Value range: an existing schema name.

- **RENAME TO new_name**

Rename a schema.

new_name: new name of the schema.

NOTICE

- The schema name must be unique in the current database.
- The schema name cannot be the same as the initial username of the current database.
- The schema name cannot start with pg_.
- The schema name cannot start with gs_role_.

Value range: a string. It must comply with the [naming convention](#).

- **OWNER TO new_owner**

Change the owner of a schema. To do this as a non-administrator, you must be a direct or indirect member of the new owner role, and that role must have the CREATE permission on the database.

new_owner: new owner of the schema.

Value range: an existing username or role name.

- **{ WITH | WITHOUT } BLOCKCHAIN**

Alters the tamper-proof attribute of a schema. Common row-store tables with the tamper-proof attribute are tamper-proof history tables, excluding foreign tables, temporary tables, and system catalogs. The tamper-proof attribute can be altered only when no table is contained in the schema. The tamper-proof attribute of the temporary table schema, the TOAST table schema, db_perf schema, and blockchain schema cannot be modified. This syntax can be used to convert between normal and tamper-proof modes only if the schema does not contain any tables.

Examples

```
-- Create the ds schema.
gaussdb=# CREATE SCHEMA ds;

-- Rename the current schema ds to ds_new.
gaussdb=# ALTER SCHEMA ds RENAME TO ds_new;

-- Create user jack.
gaussdb=# CREATE USER jack PASSWORD '*****';

-- Change the owner of ds_new to jack.
gaussdb=# ALTER SCHEMA ds_new OWNER TO jack;

-- Modify the tamper-proof attribute of ds_new.
gaussdb=# ALTER SCHEMA ds_new WITH BLOCKCHAIN;

-- Delete user jack and schema ds_new.
gaussdb=# DROP SCHEMA ds_new;
gaussdb=# DROP USER jack;
```

Helpful Links

[CREATE SCHEMA](#) and [DROP SCHEMA](#)

7.15.28 ALTER SEQUENCE

Function

ALTER SEQUENCE modifies the parameters of an existing sequence.

Precautions

- Only the owner of a sequence, a user granted the ALTER permission on a sequence, or a user granted the ALTER ANY SEQUENCE permission on a sequence can run the **ALTER SEQUENCE** command. The system administrator has this permission by default. To modify a sequence owner, you must be the sequence owner or system administrator and a member of the new owner role.
- In the current version, you can modify only the owner, owning column, and maximum value. To modify other parameters, delete the sequence and create it again. Then, use the **Setval** function to restore parameter values.
- **ALTER SEQUENCE MAXVALUE** cannot be used in transactions, functions, and stored procedures.
- After the maximum value of a sequence is changed, the cache of the sequence in all sessions is cleared.
- The **ALTER SEQUENCE** statement blocks the invoking of **nextval**, **setval**, **currval**, and **lastval**.

Syntax

Change the owning column of a sequence.

```
ALTER SEQUENCE [ IF EXISTS ] name  
  [MAXVALUE maxvalue | NO MAXVALUE | NOMAXVALUE]  
  [ OWNED BY { table_name.column_name | NONE } ] ;
```

Change the owner of a sequence.

```
ALTER SEQUENCE [ IF EXISTS ] name OWNER TO new_owner;
```

Parameter Description

- name
Specifies the name of the sequence to be modified.
- IF EXISTS
Sends a notice instead of an error when you are modifying a nonexisting sequence.
- OWNED BY
Associates a sequence with a specified column included in a table. In this way, the sequence will be deleted when you delete its associated column or the table where the column belongs to.
If the sequence has been associated with another table before you use this option, the new association will overwrite the old one.

The associated table and sequence must be owned by the same user and in the same schema.

If **OWNED BY NONE** is used, all existing associations will be deleted.

- **new_owner**

Specifies the username of the new owner of the sequence. To change the owner, you must also be a direct or indirect member of the new role, and this role must have **CREATE** permission on the sequence's schema.

Examples

```
-- Create an ascending sequence named serial, which starts from 101.
gaussdb=# CREATE SEQUENCE serial START 101;

-- Create a table and specify default values for the sequence.
gaussdb=# CREATE TABLE T1(C1 bigint default nextval('serial'));

-- Change the owning column of serial to T1.C1.
gaussdb=# ALTER SEQUENCE serial OWNED BY T1.C1;

-- Delete the sequence.
gaussdb=# DROP SEQUENCE serial cascade;
gaussdb=# DROP TABLE T1;
```

Helpful Links

[CREATE SEQUENCE](#) and [DROP SEQUENCE](#)

7.15.29 ALTER SERVER

Function

ALTER SERVER adds, modifies, or deletes the parameters of an existing server. You can query existing servers from the `pg_foreign_server` system catalog.

Precautions

Only the server owner or a user granted with the ALTER permission can run the **ALTER SERVER** command. The system administrator has this permission by default. To change the owner of a server, the current user must be the owner of the server or the system administrator, and the user must be a member of the new owner role.

When multi-layer quotation marks are used for sensitive columns (such as **password** and **secret_access_key**) in **OPTIONS**, the semantics is different from that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.

Syntax

- Change the parameters for a foreign server.

```
ALTER SERVER server_name [ VERSION 'new_version' ]
[ OPTIONS ( {[ ADD | SET | DROP ] option ['value']} [, ... ] ) ] ;
```

In **OPTIONS**, **ADD**, **SET**, and **DROP** are operations to be performed. If these operations are not specified, **ADD** operations will be performed by default. **option** and **value** are the parameters of the corresponding operation.

- Change the owner of a foreign server.

```
ALTER SERVER server_name  
OWNER TO new_owner;
```

- Change the name of a foreign server.

```
ALTER SERVER server_name  
RENAME TO new_name;
```

Parameter Description

The parameters for modifying the server are as follows:

- **server_name**
Specifies the name of the server to be modified.
- **new_version**
Specifies the new version of the server.
- The server parameters in **OPTIONS** are as follows:
 - **encrypt**
Specifies whether to encrypt data. This parameter can be set only when **type** is set to **OBS**. The default value is **off**.
Value range:
 - **on** indicates that data is encrypted.
 - **off** indicates that data is not encrypted.
 - **access_key**
Specifies the access key (AK) (obtained by users from the OBS console) used for the OBS access protocol. When you create a foreign table, the AK value is encrypted and saved to the metadata table of the database. This parameter is available only when **type** is set to **OBS**.
 - **secret_access_key**
Specifies the SK value (obtained by users from the OBS console) used for the OBS access protocol. When you create a foreign table, the SK value is encrypted and saved to the metadata table of the database. This parameter is available only when **type** is set to **OBS**.
- **new_owner**
Specifies the new owner of the server. To change the owner, you must be the owner of the foreign server and a direct or indirect member of the new owner role, and must have the **USAGE** permission on the encapsulator of the foreign server.
- **new_name**
Specifies the new name of the server.

Examples

```
-- Create my_server.  
gaussdb=# CREATE SERVER my_server FOREIGN DATA WRAPPER log_fdw;  
  
-- Change the name of an external service.  
gaussdb=# ALTER SERVER my_server  
RENAME TO my_server_1;
```

```
-- Delete my_server_1.  
gaussdb=# DROP SERVER my_server_1;
```

7.15.30 ALTER SESSION

Description

ALTER SESSION defines or modifies the conditions or parameters that affect the current session. Modified session parameters are kept until the current session is disconnected.

Precautions

- If the **START TRANSACTION** statement is not executed before the **SET TRANSACTION** statement, the transaction is ended instantly and the statement does not take effect.
- You can use the **transaction_mode(s)** method declared in the **START TRANSACTION** statement to avoid using the **SET TRANSACTION** statement.

Syntax

- Set transaction parameters of a session.

```
ALTER SESSION SET [ SESSION CHARACTERISTICS AS ] TRANSACTION  
{ ISOLATION LEVEL { READ COMMITTED } | { READ ONLY | READ WRITE } } [, ...] ;
```
- Set other GUC parameters of a session.

```
ALTER SESSION SET  
{{config_parameter { { TO | = } { value | DEFAULT }  
| FROM CURRENT }} | CURRENT_SCHEMA [ TO | = ] { schema | DEFAULT }  
| TIME_ZONE time_zone  
| SCHEMA schema  
| NAMES encoding_name  
| ROLE role_name PASSWORD 'password'  
| SESSION AUTHORIZATION { role_name PASSWORD 'password' | DEFAULT }  
| XML OPTION { DOCUMENT | CONTENT }  
};
```

Parameters

For details about the parameters involved in modifying a session, see [Parameter Description](#) of the SET syntax.

Examples

```
-- Create the ds schema.  
gaussdb=# CREATE SCHEMA ds;  
  
-- Set the search path of a schema.  
gaussdb=# SET SEARCH_PATH TO ds, public;  
  
-- Set the time/date type to the traditional postgres format (date before month).  
gaussdb=# SET DATESTYLE TO postgres, dmy;  
  
-- Set the character code of the current session to UTF8.  
gaussdb=# ALTER SESSION SET NAMES 'UTF8';
```

```
-- Set the time zone to Berkeley of California.
gaussdb=# SET TIME ZONE 'PST8PDT';

-- Set the time zone to Italy.
gaussdb=# SET TIME ZONE 'Europe/Rome';

-- Set the current schema.
gaussdb=# ALTER SESSION SET CURRENT_SCHEMA TO tpceds;

-- Set XML OPTION to DOCUMENT.
gaussdb=# ALTER SESSION SET XML OPTION DOCUMENT;

-- Create the role joe, and set the session role to joe.
gaussdb=# CREATE ROLE joe WITH PASSWORD '*****';
gaussdb=# ALTER SESSION SET SESSION AUTHORIZATION joe PASSWORD '*****';

-- Switch to the default user.
gaussdb=> ALTER SESSION SET SESSION AUTHORIZATION default;

-- Delete the ds schema.
gaussdb=# DROP SCHEMA ds;

-- Delete the role joe.
gaussdb=# DROP ROLE joe;
```

[SET](#)

7.15.31 ALTER SYNONYM

Description

Modifies the attributes of the SYNONYM object.

Precautions

- Currently, only the owner of the SYNONYM object can be changed.
- Only the system administrator has the permission to modify the owner of the SYNONYM object.
- The new owner must have the CREATE permission on the schema where the SYNONYM object resides.

Syntax

```
ALTER SYNONYM synonym_name
    OWNER TO new_owner;
```

Parameters

- **synonym**
Specifies the name of the synonym to be modified, which can contain the schema name.
Value range: a string. It must comply with the [naming convention](#).
- **new_owner**
Specifies the new owner of the SYNONYM object.
Value range: a string. It must be a valid username.

Examples

```
-- Create a system administrator.
gaussdb=# CREATE USER sysadmin WITH SYSADMIN PASSWORD '*****!';

-- Switch the system administrator.
gaussdb=# \c - sysadmin

-- Create synonym t1.
gaussdb=# CREATE OR REPLACE SYNONYM t1 FOR ot.t1;

-- Create user u1.
gaussdb=# CREATE USER u1 PASSWORD '*****!';

-- Assign permissions to the new system administrator.
gaussdb=# GRANT ALL ON SCHEMA sysadmin TO u1;

-- Change the owner of synonym t1 to u1.
gaussdb=# ALTER SYNONYM t1 OWNER TO u1;

-- Delete synonym t1.
gaussdb=# DROP SYNONYM t1;

-- Revoke permissions from user u1.
gaussdb=# REVOKE ALL ON SCHEMA sysadmin FROM u1;

-- Delete user u1.
gaussdb=# DROP USER u1;

-- Switch to the initial user init_user. Replace init_user with the actual initial user name.
gaussdb=# \c - init_user

-- Delete user sysadmin.
gaussdb=# DROP USER sysadmin;
```

Helpful Links

[CREATE SYNONYM](#) and [DROP SYNONYM](#)

7.15.32 ALTER SYSTEM KILL SESSION

Description

ALTER SYSTEM KILL SESSION ends a session.

Precautions

None

Syntax

```
ALTER SYSTEM KILL SESSION 'session_sid, serial' [ IMMEDIATE ];
```

Parameters

- **session_sid, serial**

Specifies **SID** and **SERIAL** of a session (see examples for format). You can use the `pg_stat_activity` system catalog to query the current active threads (see the examples). However, when you run the **ALTER SYSTEM KILL SESSION** command, the threads may have ended.

Value range: SIDs and SERIALS of all sessions that can be queried from the system catalog **dv_sessions**

- **IMMEDIATE**

Specifies that a session will be ended instantly after the statement is executed.

Examples

```
-- Query session information.
gaussdb=# SELECT sid,serial#,username FROM dv_sessions;
```

sid	serial#	username
140131075880720	0	omm
140131025549072	0	omm
140131073779472	0	omm
140131071678224	0	omm
140131125774096	0	
140131127875344	0	
140131113629456	0	
140131094742800	0	

```
(8 rows)

-- End the session whose SID is 140131075880720.
gaussdb=# ALTER SYSTEM KILL SESSION '140131075880720,0' IMMEDIATE;
```

7.15.33 ALTER TABLE

Description

Modifies tables, including modifying table definitions, renaming tables, renaming specified columns in tables, renaming table constraints, setting table schemas, enabling or disabling row-level security policies, and adding or updating multiple columns.

Precautions

- If the base table is a hash-distributed table, to create a primary key or unique index that does not contain the distribution key of the base table, use a GSI (by specifying the **BY GLOBAL INDEX** column); to create a primary key or unique index that contains the distribution key of the base table, use a common index (without specifying the **BY GLOBAL INDEX** column). In single-DN deployment mode, both the GSI and common index can be successfully created. If the base table is a non-hash-distributed table, you can only create the primary key or unique index as a common index. That is, the index key must contain the distribution key of the base table.
- The owner of a table, users granted with the ALTER permission on the table, or users granted with the ALTER ANY TABLE permission can run the **ALTER TABLE** command. The system administrator has the permission to run the command by default. To modify the owner or schema of a table, you must be the table owner or system administrator and a member of the new owner role.
- The tablespace of a partitioned table cannot be modified, but the tablespace of the partition can be modified.
- The storage parameter **ORIENTATION** cannot be modified.

- Currently, SET SCHEMA can only set schemas to user schemas. It cannot set a schema to a system internal schema.
- The distribution key (or column) of a table cannot be modified.
- Auto-increment columns cannot be added, or a column whose **DEFAULT** value contains the nextval() expression cannot be added.
- Row-level security cannot be enabled for foreign tables and temporary tables.
- When you delete a PRIMARY KEY constraint by constraint name, the NOT NULL constraint is not deleted. If necessary, manually delete the NOT NULL constraint.
- When JDBC is used, the **DEFAULT** value can be set through PreparedStatement.
- If you add a column using **ADD COLUMN**, all existing rows in the table are initialized to the column's default value (**NULL** if no DEFAULT clause is specified).

If no **DEFAULT** value is specified for the new column, **NULL** is used, and no full table update is triggered.

If the new column has the **DEFAULT** value, the column must meet all the following requirements. Otherwise, the entire table is updated, leading to additional overheads and affecting online services.

1. The data type is BOOL, BYTEA, SMALLINT, BIGINT, SMALLINT, INTEGER, NUMERIC, FLOAT, DOUBLE PRECISION, CHAR, VARCHAR, TEXT, TIMESTAMPTZ, TIMESTAMP, DATE, TIME, TIMETZ, or INTERVAL.

2. The length of the **DEFAULT** value of the added column cannot exceed 128 bytes.

3. The **DEFAULT** value of the added column does not contain the volatile function.

4. The **DEFAULT** value is required and cannot be **NULL**.

If you are not sure whether condition 3 is met, check whether the **provolatile** attribute of the function in the PG_RPOC system catalog is 'v'.

- The number of table constraints cannot exceed 32,767.

Syntax

- Modify the definition of a table.

```
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name ) }  
action [, ... ];
```

There are several clauses of **action**:

```
column_clause  
| ADD table_constraint [ NOT VALID ]  
| ADD table_constraint_using_index  
| VALIDATE CONSTRAINT constraint_name  
| DROP CONSTRAINT [ IF EXISTS ] constraint_name [ RESTRICT | CASCADE ]  
| CLUSTER ON index_name  
| SET WITHOUT CLUSTER  
| SET ( {storage_parameter = value} [, ... ] )  
| RESET ( storage_parameter [, ... ] )  
| OWNER TO new_owner  
| SET TABLESPACE new_tablespace  
| SET {COMPRESS|NOCOMPRESS}  
| TO { GROUP groupname | NODE ( nodename [, ... ] ) }  
| ADD NODE ( nodename [, ... ] )  
| DELETE NODE ( nodename [, ... ] )  
| UPDATE SLICE LIKE table_name  
| DISABLE TRIGGER [ trigger_name | ALL | USER ]
```

```
| ENABLE TRIGGER [ trigger_name | ALL | USER ]  
| ENABLE REPLICA TRIGGER trigger_name  
| ENABLE ALWAYS TRIGGER trigger_name  
| DISABLE/ENABLE [ REPLICAS | ALWAYS ] RULE  
| DISABLE ROW LEVEL SECURITY  
| ENABLE ROW LEVEL SECURITY  
| FORCE ROW LEVEL SECURITY  
| NO FORCE ROW LEVEL SECURITY  
| ENCRYPTION KEY ROTATION  
| INHERIT parent_table  
| NO INHERIT parent_table  
  
| NOT OF  
| REPLICAS IDENTITY { DEFAULT | USING INDEX index_name | FULL | NOTHING }
```

 NOTE

- **ADD table_constraint [NOT VALID]**
Adds a table constraint.
- **ADD table_constraint_using_index**
Adds a primary key constraint or unique constraint to a table based on the existing unique index. If the specified index is a GSI, an error is reported. In this case, you need to use the BY GLOBAL INDEX syntax to add a GSI index constraint.
- **VALIDATE CONSTRAINT constraint_name**
Validates a check-class constraint created with the **NOT VALID** option, and scans the entire table to ensure that all rows meet the constraint. Nothing happens if the constraint is already marked valid.
- **DROP CONSTRAINT [IF EXISTS] constraint_name [RESTRICT | CASCADE]**
Deletes a table constraint.
- **CLUSTER ON index_name**
Selects the default index for future CLUSTER operations. Actually, the table is not re-clustered.
- **SET WITHOUT CLUSTER**
Deletes the most recently used CLUSTER index from the table. Deletes the most recently used CLUSTER index from the table.
- **SET ({storage_parameter = value} [, ...])**
Changes one or more storage parameters for the table. If the value of **table_name** is an index name, **ACTIVE_PAGES** specifies the number of index pages, which may be less than the actual number of physical file pages and can be used for optimizer optimization. Currently, this parameter is valid only for the local index of the Ustore partitioned table and will be updated by VACUUM and ANALYZE (including AUTOVACUUM). You are advised not to manually set this parameter because it is invalid in distributed mode.
- **RESET (storage_parameter [, ...])**
Resets one or more storage parameters to their defaults. As with SET, a table rewrite might be needed to update the table entirely.
- **OWNER TO new_owner**
Changes the owner of a table, sequence, or view to the specified user.
- **SET TABLESPACE new_tablespace**
Changes the table's tablespace to the specified tablespace and moves the data files associated with the table to the new tablespace. Indexes on the table, if any, are not moved; but they can be moved separately with additional **SET TABLESPACE** option in ALTER INDEX.
- **SET {COMPRESS|NOCOMPRESS}**
Sets the compression feature of a table. The table compression feature affects only the storage mode of data inserted in a batch subsequently and does not affect storage of existing data. Setting the table compression feature will result in the fact that there are both compressed and uncompressed data in the table. Row-store tables do not support compression.
- **TO { GROUP groupname | NODE (nodename [, ...]) }**
The syntax is only available in extended mode (when GUC parameter **support_extended_features** is on). Exercise caution when enabling the mode. It is mainly used for tools like internal dilatation tools. Common users should not use the mode. This command only modifies the logical mapping relationship of the table distribution nodes and does not migrate the table's metadata and data on the DN.
- **ADD NODE (nodename [, ...])**

It is only available for internal scale-out tools. Common users should not use the syntax.

- **DELETE NODE (nodename [, ...])**

It is only available for internal scale-in tools. Common users should not use the syntax.

- **UPDATE SLICE LIKE table_name**

This syntax is used by internal scaling tools and cannot be used by common users.

- **DISABLE TRIGGER [trigger_name | ALL | USER]**

Disables a single trigger specified by **trigger_name**, disables all triggers, or disables only user triggers (excluding internally generated constraint triggers, for example, deferrable unique constraint triggers and exclusion constraints triggers).

Exercise caution when using this function because data integrity cannot be ensured as expected if the triggers are not executed.

- **| ENABLE TRIGGER [trigger_name | ALL | USER]**

Enables a single trigger specified by **trigger_name**, enables all triggers, or enables only user triggers.

- **| ENABLE REPLICA TRIGGER trigger_name**

Determines that the trigger firing mechanism is affected by the configuration variable *session_replication_role*. When the replication role is **origin** (default value) or **local**, a simple trigger is fired.

When **ENABLE REPLICA** is configured for a trigger, it is triggered only when the session is in replica mode.

- **| ENABLE ALWAYS TRIGGER trigger_name**

Determines that all triggers are fired regardless of the current replica mode.

- **| DISABLE/ENABLE [REPLICA | ALWAYS] RULE**

Enables or disables a rule for tables. Disabled rules are still visible in the system, but are not applied during query rewriting. The ON SELECT rule cannot be disabled because it is related to the view implementation. Rules configured as **ENABLE REPLICA** are enabled only when the session is in replica mode, while those configured as **ENABLE ALWAYS** can be enabled regardless of the replica mode. Rule triggering is also affected by configuration variable *session_replication_role*, which is similar to the preceding trigger setting.

- **| DISABLE/ENABLE ROW LEVEL SECURITY**

Enables or disables row-level security for a table.

If row-level security is enabled for a data table but no row-level security policy is defined, the row-level access to the data table is not affected. If row-level security for a table is disabled, the row-level access to the table is not affected even if a row-level security policy has been defined. For details, see [CREATE ROW LEVEL SECURITY POLICY](#).

- **| NO FORCE/FORCE ROW LEVEL SECURITY**

Forcibly enables or disables row-level security for a table.

By default, the table owner is not affected by the row-level security feature. However, if row-level security is forcibly enabled, the table owner (excluding system administrators) will be affected. System administrators are not affected by any row-level security policies.

- **| ENCRYPTION KEY ROTATION**

Rotation of the transparent data encryption key.

The data encryption key rotation of a table can be performed only when the TDE function is enabled for the database and **enable_tde** of the table is set to **on**. After the key rotation operation is performed, the system automatically applies for a new KMS key. After the key rotation, the data encrypted using the old key is decrypted using the old key, and the newly written data is encrypted using the new key. To ensure the security of encrypted data, you can periodically update the key

based on the amount of new data in the encrypted table. It is recommended that the key be updated every two to three years.

- **INHERIT parent_table**

Adds the target data table to a specified parent data table as a new child data table. After that, the query for the parent data table will contain the data in the target data table. Before being added as a child data table, the target data table must contain all the columns in the parent data table. These columns must have matching data categories, and if they have NOT NULL constraints in the parent data table, they must also have NOT NULL constraints in the child data table. For all CHECK constraints in the parent data table, there must be corresponding constraints in the child data table, unless the parent data table is marked as non-inheritable.

- **NO INHERIT parent_table**

Generates the target data table from the child data table of a specified parent data table. Queries for the parent data table will no longer contain records generated from the target data table.

- **NOT OF**

Removes the join relationship between a table and a type.

- **REPLICA IDENTITY { DEFAULT | USING INDEX index_name | FULL | NOTHING }**

Specifies the record level of old tuples in UPDATE and DELETE statements on a table in logical replication scenarios.

- **DEFAULT** records the old value of the primary key column. If there is no primary key, **DEFAULT** does not record the old value.
- **USING INDEX** records the old values of columns covered by the named indexes. These values must be unique, non-local, and non-deferrable, and contain the values of columns marked **NOT NULL**.
- **FULL** records the old values of all columns in the row.
- **NOTHING** does not record information in old rows.

In logical replication scenarios, when the UPDATE and DELETE statements of a table are parsed, the parsed old tuples consist of the information recorded in this method. For tables with primary keys, this option can be set to **DEFAULT** or **FULL**. For a table without a primary key, set this parameter to **FULL**. Otherwise, the old tuple will be parsed as empty during decoding. You are advised not to set this parameter to **NOTHING** in common scenarios because old tuples are always parsed as empty.

- The **column_clause** can be one of the following clauses:

```
ADD [ COLUMN ] column_name data_type [ compress_mode ] [ COLLATE collation ]
[ column_constraint [ ... ] ]
| MODIFY column_name data_type
| MODIFY column_name [ CONSTRAINT constraint_name ] NOT NULL [ ENABLE ]
| MODIFY column_name [ CONSTRAINT constraint_name ] NULL
| DROP [ COLUMN ] [ IF EXISTS ] column_name [ RESTRICT | CASCADE ]
| ALTER [ COLUMN ] column_name [ SET DATA ] TYPE data_type [ COLLATE collation ] [ USING
expression ]
| ALTER [ COLUMN ] column_name { SET DEFAULT expression | DROP DEFAULT }
| ALTER [ COLUMN ] column_name { SET | DROP } NOT NULL
| ALTER [ COLUMN ] column_name SET STATISTICS [PERCENT] integer
| ADD STATISTICS (( column_1_name, column_2_name [, ... ] ))
| DELETE STATISTICS (( column_1_name, column_2_name [, ... ] ))
| ENABLE/DISABLE STATISTICS (( column_1_name, column_2_name [, ... ] ))
| ALTER [ COLUMN ] column_name SET ( {attribute_option = value} [, ... ] )
| ALTER [ COLUMN ] column_name RESET ( attribute_option [, ... ] )
| ALTER [ COLUMN ] column_name SET STORAGE { PLAIN | EXTERNAL | EXTENDED | MAIN }
```

 NOTE

- **ADD [COLUMN] column_name data_type [compress_mode] [COLLATE collation] [column_constraint [...]]**

Adds a column to a table. If a column is added using ADD COLUMN, all existing rows in the table are initialized with the column's default value (NULL if no DEFAULT clause is specified).

- **ADD ({ column_name data_type [compress_mode] } [, ...])**

Adds columns in the table.

- **MODIFY ({ column_name data_type | column_name [CONSTRAINT constraint_name] NOT NULL [ENABLE] | column_name [CONSTRAINT constraint_name] NULL } [, ...])**

Modifies the data type of an existing column in the table. Running this command will clear the statistics of this column. You are advised to collect the statistics of this column again after the modification.

- **DROP [COLUMN] [IF EXISTS] column_name [RESTRICT | CASCADE]**

Drops a column from a table. Indexes and constraints related to the column are automatically dropped. If an object not belonging to the table depends on the column (for example, view), CASCADE must be specified.

The DROP COLUMN statement does not physically remove the column, but simply makes it invisible to SQL operations. Subsequent INSERT and UPDATE operations in the table will store a **NULL** value for the column. Therefore, column deletion takes a short period of time but does not immediately release the tablespace on the disks, because the space occupied by the deleted column is not recycled. The space will be recycled when VACUUM is executed.

- **ALTER [COLUMN] column_name [SET DATA] TYPE data_type [COLLATE collation] [USING expression]**

Modifies the type of a column in a table. Indexes and simple table constraints on the column will automatically use the new data type by reparsing the originally supplied expression.

If the original data type of a column and the modified data type are binary compatible, you do not need to rewrite the entire table when running this statement. In other scenarios, the entire table is rewritten. You can check whether the original type and target type are binary compatible in the PG_CAST system catalog. If **castmethod** is 'b', they are binary compatible. For example, if the data type of the source table is text and is converted to int, table rewriting is triggered. If it is converted to clob, table rewriting is not triggered. If table rewriting is triggered, the deleted space on the table is recycled immediately.

Running this command will clear the statistics of this column. You are advised to collect the statistics of this column again after the modification.

- **ALTER [COLUMN] column_name { SET DEFAULT expression | DROP DEFAULT }**

Sets or removes the default value for a column. The default values only apply to subsequent INSERT operations; they do not cause rows already in the table to change. Defaults can also be created for views, in which case they are inserted into INSERT statements on the view before the view's ON INSERT rule is applied.

- **ALTER [COLUMN] column_name { SET | DROP } NOT NULL**

Changes whether a column is marked to allow null values or to reject null values. You can only use SET NOT NULL when the column contains no null values.

- **ALTER [COLUMN] column_name SET STATISTICS [PERCENT] integer**

Specifies the per-column statistics-gathering target for subsequent ANALYZE operations. The target can be set in the range from 0 to 10000. Set it to **-1** to revert to using the default system statistics target.

- **{ADD | DELETE} STATISTICS ((column_1_name, column_2_name [, ...]))**

Adds or deletes the declaration of collecting multi-column statistics to collect multi-column statistics as needed when ANALYZE is performed for a table or a database. The statistics about a maximum of 32 columns can be collected at a time. You are not allowed to add or delete such declaration for system catalogs or foreign tables.

- **{ENABLE | DISABLE } STATISTICS ((column_1_name, column_2_name [, ...]))**

Enables or disables multi-column statistics. When automatic statistics creation is enabled (the GUC parameter **auto_statistic_ext_columns** is required), you can disable specific multi-column combinations to prevent them from being automatically created and used.

- **ALTER [COLUMN] column_name SET ({attribute_option = value} [, ...])**
ALTER [COLUMN] column_name RESET (attribute_option [, ...])

Sets or resets per-attribute options.

Currently, the only defined per-attribute options are **n_distinct** and **n_distinct_inherited**. **n_distinct** affects statistics of a table, while **n_distinct_inherited** affects the statistics of the table and its subtables. Currently, only **SET/RESET n_distinct** is supported, and **SET/RESET n_distinct_inherited** is forbidden.

- **ALTER [COLUMN] column_name SET STORAGE { PLAIN | EXTERNAL | EXTENDED | MAIN }**

Sets the storage mode for a column. It specifies whether this column is held inline or in an attached table, and whether the data should be compressed. **SET STORAGE** does not change a table. It only specifies the recommended strategy for future table updates.

- **column_constraint** is as follows:

```
[ CONSTRAINT constraint_name ]
{ NOT NULL |
  NULL |
  CHECK ( expression ) |
  DEFAULT default_expr |
  UNIQUE [KEY] index_parameters |
  PRIMARY KEY index_parameters |
  ENCRYPTED WITH ( COLUMN_ENCRYPTION_KEY = column_encryption_key,
  ENCRYPTION_TYPE = encryption_type_value ) |
  REFERENCES reftable [ ( refcolumn ) ] [ MATCH FULL | MATCH PARTIAL | MATCH
SIMPLE ]
  [ ON DELETE action ] [ ON UPDATE action ] }
[ DEFERRABLE | NOT DEFERRABLE ][ INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
```

- **index_parameters** is as follows:

```
[ WITH ( {storage_parameter = value} [, ... ] ) ]
[ USING INDEX TABLESPACE tablespace_name ]
```

- **compress_mode** of a column is as follows:

```
{ DELTA | PREFIX | DICTIONARY | NUMSTR | NOCOMPRESS }
```

- **table_constraint_using_index** used to add the primary key constraint or unique constraint based on the unique index is as follows:

```
[ CONSTRAINT constraint_name ]
{ UNIQUE | PRIMARY KEY } USING INDEX index_name
[ DEFERRABLE | NOT DEFERRABLE ][ INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
```

- **table_constraint** is as follows:

```
[ CONSTRAINT constraint_name ]
{ CHECK ( expression ) |
  UNIQUE ( column_name [, ... ] ) index_parameters |
```

```
PRIMARY KEY ( column_name [, ... ] ) index_parameters
}
[ DEFERRABLE | NOT DEFERRABLE ][ INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
```

index_parameters is as follows:

```
[ WITH ( {storage_parameter = value} [, ... ] ) ]
[ USING INDEX TABLESPACE tablespace_name ][BY GLOBAL INDEX]
```

NOTE

If **index_parameters** is set to **BY GLOBAL INDEX**, the global secondary index is used to create constraints.

- Rename a table. The renaming does not affect stored data.

```
ALTER TABLE [ IF EXISTS ] table_name
RENAME TO new_table_name;
```

- Rename the specified column in the table.

```
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name ) }
RENAME [ COLUMN ] column_name TO new_column_name;
```

- Rename the constraint of the table.

```
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name ) }
RENAME CONSTRAINT constraint_name TO new_constraint_name;
```

- Set the schema of the table.

```
ALTER TABLE [ IF EXISTS ] table_name
SET SCHEMA new_schema;
```

NOTE

- The schema setting moves the table into another schema. Associated indexes and constraints owned by table columns are migrated as well. Currently, the schema for sequences cannot be changed. If the table has sequences, delete the sequences, and create them again or delete the ownership between the table and sequences. In this way, the table schema can be changed.
- To change the schema of a table, you must also have the CREATE permission on the new schema. To add the table as a new child of a parent table, you must own the parent table as well. To alter the owner, you must also be a direct or indirect member of the new owning role, and that role must have the CREATE permission on the table's schema. These restrictions enforce that the user can only re-create and delete the table. However, a system administrator can alter the ownership of any table anyway.
- All the actions except for RENAME and SET SCHEMA can be combined into a list of multiple alterations to apply in parallel. For example, it is possible to add several columns or alter the type of several columns in a single statement. This is useful with large tables, since only one pass over the tables need be made.
- Adding a CHECK or NOT NULL constraint will scan the table to validate that existing rows meet the constraint.
- Adding a column with a non-NULL default or changing the type of an existing column will rewrite the entire table. Rewriting a large table may take much time and temporarily needs doubled disk space.
- Add columns.

```
ALTER TABLE [ IF EXISTS ] table_name
ADD ( { column_name data_type [ compress_mode ] [ COLLATE collation ] [ column_constraint [ ... ] ] } [, ... ] );
```
- Update columns.

```
ALTER TABLE [ IF EXISTS ] table_name
MODIFY ( { column_name data_type | column_name [ CONSTRAINT constraint_name ] NOT NULL [ ENABLE ] | column_name [ CONSTRAINT constraint_name ] NULL } [, ... ] );
```

Parameters

- **IF EXISTS**

Sends a notice instead of an error if no tables have identical names. The notice prompts that the table you are querying does not exist.

- **table_name [*] | ONLY table_name | ONLY (table_name)**

table_name is the name of the table that you need to modify.

If **ONLY** is specified, only the table is modified. If **ONLY** is not specified, the table and all subtables are modified. You can add the asterisk (*) option following the table name to specify that all subtables are scanned, which is the default operation.

- **constraint_name**

Specifies the name of an existing constraint to drop.

- **index_name**

Specifies the index name.

- **storage_parameter**

Specifies the name of a storage parameter.

The following options are added for online scaling (This is a lab feature. Contact Huawei technical support before using it.):

- **append_mode** (enumerated type)

Scales a table online (This is a lab feature. Contact Huawei technical support before using it.) or offline, or stops scaling it. You can modify certain content in the table during online scaling but cannot do so during offline scaling.

To modify a table that is being scaled, append new data so that they can be recorded as incremental data.

- **on**: scales a table online (This is a lab feature. Contact Huawei technical support before using it.). New data will be appended.

- **off**: stops scaling. New data will be written in normal mode, and options for online scaling will not be displayed in **pg_class.reloptions**.

- **read_only**: scales a table offline, during which no other operations can be performed on the table.

- **end_catchup**: reports errors for the write service in the last round of data increment. The read service is executed normally.

- **rel_cn_oid** (OID type)

Records the OID of tables on the current CN to generate **delete_delta** on the DNs.

If **append_mode** is set to **on**, **rel_cn_oid** must be specified.

The **append_mode** and **rel_cn_oid** options are used only for online scaling tools (This is a lab feature. Contact Huawei technical support before using it.).

- **exec_step** (integer)

Records resumable transmission steps in **relOptions** of the temporary table.

Value range: [1,4]

It can be used only for data redistribution.

- **create_time** (long integer)

Records the time when the temporary table is created during resumable transmission in **relOptions** of the temporary table.

Only the data redistribution tool is supported.

- **wait_clean_cbi** (string type)

Specifies whether the current global index contains the residual tuple generated during bucket migration for scaling. After scaling, **wait_clean_cbi** is set to **y**. After the residual tuple is cleared in the vacuum process, **wait_clean_cbi** is set to **n**.

This option is used only in scaling tools.

The following option is added for creating an index:

- **parallel_workers** (int type)

Number of bgworker threads started when an index is created. For example, value **2** indicates that two bgworker threads are started to create indexes concurrently.

Value range: [0,32]. The value 0 indicates that concurrent index creation is disabled.

Default value: If this parameter is not set, the concurrent index creation function is disabled.

The following option is added to the replication table:

- **primarynode** (Boolean type)

Default value: **off**

When **primarynode** is set to **on**, the primary node is selected for the replication table. Generally, the primary node is the first node recorded in the **nodeoids** column in the **pgxc_class** table. When the IUD operation is performed on the replication table, the operation is delivered to the primary node first. After the result is received, the operation is delivered to other DNs.

- **logical_repl_node** (string type)

Name of the DN that returns logical logs to the CN during logical decoding of a distributed replication table. For the replication table, if this parameter is not specified, the first node in the node group where the current table is located is used by default. When the RESET operation is performed on this option, **logical_repl_node** is reset to the first node of current table.

Value range: a string

Default value: For the non-replication table, this parameter is empty by default. For the replication table, this parameter is set to the name of the first node by default.

TDE options:

- **enable_tde** (bool type)

Specifies whether transparent data encryption is enabled for a table.

Before enabling this function, ensure that the GUC parameter **enable_tde** has been enabled, the KMS has been enabled, and the cluster master key ID in the GUC parameter **tde_cmk_id** has been correctly configured.

This parameter does not support temporary tables. The Ustore storage engine is not supported. The Ustore storage engine is not supported. This parameter can be modified only when **enable_tde** is specified during table creation. Switching the encryption switch status does not change the encryption algorithm and key information.

Value range: **on** and **off**. **on** indicates that transparent data encryption is enabled. After the value is switched from **off** to **on**, new data is automatically encrypted when being written to the data page, and old data is automatically encrypted when the data page is updated. **off** indicates that transparent data encryption is disabled. After the value is switched from **on** to **off**, newly written data is not encrypted, old encrypted data can be automatically decrypted when being read, and data is not encrypted when being written back to the data page.

Default value: **off**

- **hasuids** (Boolean type)

Default value: **off**

If this parameter is set to **on**, a unique table-level ID is allocated to a tuple when the tuple is updated.

- **new_owner**
Specifies the name of the new table owner.
- **new_tablespace**
Specifies the new name of the tablespace to which the table belongs.
- **column_name, column_1_name, column_2_name**
Specifies the name of a new or existing column.
- **data_type**
Specifies the type of a new column or a new type of an existing column.
- **compress_mode**
Specifies whether to compress a table column. The clause specifies the compression algorithm preferentially used by the column. Row-store tables do not support compression.
- **collation**
Specifies the collation rule name of a column. The optional COLLATE clause specifies a collation for the new column; if omitted, the collation is the default for the new column. You can run the **select * from pg_collation** command to query collation rules from the **pg_collation** system catalog. The default collation rule is the row starting with **default** in the query result.
- **USING expression**
Specifies how to compute the new column value from the old; if omitted, the default conversion is an assignment cast from old data type to new. A USING clause must be provided if there is no implicit or assignment cast from the old to new type.

 **NOTE**

USING in ALTER TYPE can specify any expression involving the old values of the row; that is, it can refer to any columns other than the one being cast. This allows general casting to be done with the ALTER TYPE syntax. Because of this flexibility, the USING expression is not applied to the column's default value (if any); the result might not be a constant expression as required for a default. This means that when there is no implicit or assignment cast from old to new type, ALTER TYPE might fail to convert the default even though a USING clause is supplied. In such cases, drop the default with DROP DEFAULT, perform ALTER TYPE, and then use SET DEFAULT to add a suitable new default. Similar considerations apply to indexes and constraints involving the column.

- **NOT NULL | NULL**

Sets whether the column allows null values.

- **ENABLE**

Specifies that the constraint is enabled. By default, the constraint is enabled.

- **integer**

Specifies the constant value of a signed integer. When using **PERCENT**, the range of **integer** is from 0 to 100.

- **attribute_option**

Specifies an attribute option.

- **PLAIN | EXTERNAL | EXTENDED | MAIN**

Specifies a column-store mode.

- **PLAIN** must be used for fixed-length values (such as integers). It must be inline and uncompressed.
- **MAIN** is for inline, compressible data.
- **EXTERNAL** is for external, uncompressed data. Use of **EXTERNAL** will make substring operations on **text** and **bytea** values run faster, at the penalty of increased storage space.
- **EXTENDED** is for external, compressed data. **EXTENDED** is the default for most data types that support non-**PLAIN** storage.

- **CHECK (expression)**

New rows or rows to be updated must satisfy for an expression to be true. If any row produces a false result, an error is raised and the database is not modified.

A check constraint specified as a column constraint should reference only the column's values, while an expression in a table constraint can reference multiple columns.

Currently, **CHECK (expression)** does not include subqueries and cannot use variables apart from the current column.

- **DEFAULT default_expr**

Assigns a default data value to a column.

The data type of the default expression must match the data type of the column.

The default expression will be used in any insert operation that does not specify a value for the column. If there is no default value for a column, then the default value is **NULL**.

- **COLUMN_ENCRYPTION_KEY = column_encryption_key**
Specifies the name of the column encryption key in the ENCRYPTED WITH constraint.
Value range: a string. It must comply with the naming convention.
- **ENCRYPTION_TYPE = encryption_type_value**
For the encryption type in the ENCRYPTED WITH constraint, the value of **encryption_type_value** is **DETERMINISTIC** or **RANDOMIZED**.
- **UNIQUE [KEY] index_parameters**
UNIQUE (column_name [, ...]) index_parameters
UNIQUE specifies that a group of one or more columns of a table can contain only unique values.
UNIQUE KEY can be used only when **sql_compatibility** is set to 'MYSQL', which has the same semantics as UNIQUE.
- **PRIMARY KEY index_parameters**
PRIMARY KEY (column_name [, ...]) index_parameters
Specifies that a column or columns of a table can contain only unique (non-duplicate) and non-null values.
- **DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE**
Sets whether the constraint can be deferrable.
 - **DEFERRABLE**: deferrable to the end of the transaction and checked using **SET CONSTRAINTS**.
 - **NOT DEFERRABLE**: checks immediately after the execution of each command.
 - **INITIALLY IMMEDIATE**: checks immediately after the execution of each statement.
 - **INITIALLY DEFERRED**: checks when the transaction ends.
- **WITH ({storage_parameter = value} [, ...])**
Specifies an optional storage parameter for a table or an index.
- **tablespace_name**
Specifies the name of the tablespace where the index locates.
- **COMPRESS|NOCOMPRESS**
 - **NOCOMPRESS**: If the **NOCOMPRESS** keyword is specified, the existing compression feature of the table will not be changed.
 - **COMPRESS**: If the **COMPRESS** keyword is specified, the table compression feature will be triggered by batch tuple insertion. Row-store tables do not support compression.
- **new_table_name**
Specifies the new table name.
- **new_column_name**
Specifies the new name of a specific column in a table.
- **new_constraint_name**
Specifies the new name of a table constraint.

- **new_schema**
Specifies the new schema name.
- **CASCADE**
Automatically drops objects that depend on the dropped column or constraint (for example, views referencing the column).
- **RESTRICT**
Refuses to drop the column if the column is referenced by other columns or constraints. **RESTRICT** is the default option. If **CASCADE** is not specified, the value is **RESTRICT**. An example of the statement is as follows:

```
alter table <Table name>[drop [column] <Column name> [cascade | restrict]];
```
- **schema_name**
Specifies the schema name of a table.

Examples of Modifying a Table

- Rename a table.

```
gaussdb=# CREATE TABLE aa(c1 int, c2 int);
gaussdb=# ALTER TABLE IF EXISTS aa RENAME TO test_alt1;
```
- Modify the schema of a table.
-- Create the **test_schema** schema.

```
gaussdb=# CREATE SCHEMA test_schema;
```

-- Change the schema of the **test_alt1** table to **test_schema**.

```
gaussdb=# ALTER TABLE test_alt1 SET SCHEMA test_schema;
```

-- Query table information.

```
gaussdb=# SELECT schemaname,tablename FROM pg_tables WHERE tablename = 'test_alt1';
schemaname | tablename
-----+-----
test_schema | test_alt1
(1 row)
```
- Change the owner of a table.
-- Create user **test_user**.

```
gaussdb=# CREATE USER test_user PASSWORD 'XXXXXXXXXX';
```

-- Change the owner of the **test_alt1** table to **test_user**.

```
gaussdb=# ALTER TABLE IF EXISTS test_schema.test_alt1 OWNER TO test_user;
```

-- Query.

```
gaussdb=# SELECT tablename, schemaname, tableowner FROM pg_tables WHERE tablename = 'test_alt1';
tablename | schemaname | tableowner
-----+-----+-----
test_alt1 | test_schema | test_user
(1 row)
```
- Modify the tablespace of a table.
-- Create the **tbs_data1** tablespace.

```
gaussdb=# CREATE TABLESPACE tbs_data1 RELATIVE LOCATION 'tablespace1/tbs_data1';
```

-- Change the tablespace of the **test_alt1** table to **tbs_data1**.

```
gaussdb=# ALTER TABLE test_schema.test_alt1 SET TABLESPACE tbs_data1;
```

-- Query.

```
gaussdb=# SELECT tablename, tablespace FROM pg_tables WHERE tablename = 'test_alt1';
tablename | tablespace
-----+-----
test_alt1 | tbs_data1
(1 row)
```

-- Delete.

```
gaussdb=# DROP TABLE test_schema.test_alt1;
gaussdb=# DROP TABLESPACE tbs_data1;
gaussdb=# DROP SCHEMA test_schema;
gaussdb=# DROP USER test_user;
```

Examples of Modifying a Column

- Change column names.

```
-- Create a table.
gaussdb=# CREATE TABLE test_alt2(c1 INT,c2 INT);
-- Change column names.
gaussdb=# ALTER TABLE test_alt2 RENAME c1 TO id;
gaussdb=# ALTER TABLE test_alt2 RENAME COLUMN c2 to areaid;
-- Query.
\d test_alt1
Table "public.test_alt1"
Column | Type | Modifiers
-----+-----+-----
id | integer |
areaid | integer |
```

- Add columns.

```
-- Add a column to the test_alt1 table.
gaussdb=# ALTER TABLE IF EXISTS test_alt2 ADD COLUMN name VARCHAR(20);
-- Query.
gaussdb=# \d test_alt2
Table "public.test_alt1"
Column | Type | Modifiers
-----+-----+-----
id | integer |
areacode | integer |
name | character varying(20) |
```

- Modify the data type of a column.

```
-- Change the type of the name column in the test_alt1 table.
gaussdb=# ALTER TABLE test_alt1 MODIFY name VARCHAR(50);
-- Query.
gaussdb=# \d test_alt1
Table "public.test_alt2"
Column | Type | Modifiers
-----+-----+-----
id | integer |
areaid | integer |
name | character varying(50) |
-- Change the type of the name column in the test_alt1 table.
gaussdb=# ALTER TABLE test_alt2 ALTER COLUMN name TYPE VARCHAR(25);
-- Query.
gaussdb=# \d test_alt2
Table "public.test_alt2"
Column | Type | Modifiers
-----+-----+-----
id | integer |
areaid | integer |
name | character varying(25) |
```

- Delete a column.

```
-- Delete the areaid column from test_alt1.
gaussdb=# ALTER TABLE test_alt2 DROP COLUMN areaid;
-- Query.
gaussdb=# \d test_alt2
Table "public.test_alt2"
Column | Type | Modifiers
-----+-----+-----
id | integer |
name | character varying(25) |
```

- Modify the column storage mode.

```
-- View table details.
gaussdb=# \d+ test_alt2
Table "public.test_alt2"
Column | Type | Modifiers | Storage | Stats target | Description
-----+-----+-----+-----+-----+-----
id | integer | | plain | |
name | character varying(25) | | extended | |
Has OIDs: no
Options: orientation=row, compression=no, storage_type=USTORE
```

```
-- Change the storage mode of the name column in the test_alt2 table.
gaussdb=# ALTER TABLE test_alt2 ALTER COLUMN name SET STORAGE PLAIN;

-- Query.
gaussdb=# \d+ test_alt2
          Table "public.test_alt2"
Column |      Type      | Modifiers | Storage | Stats target | Description
-----+-----+-----+-----+-----+-----
id     | integer        |           | plain   |              |
name   | character varying(25) |         | plain   |              |
Has OIDs: no
Options: orientation=row, compression=no, storage_type=USTORE

-- Delete.
gaussdb=# DROP TABLE test_alt2;
```

Examples of Modifying a Constraint

- Add a not-null constraint to a column.

```
-- Create a table.
gaussdb=# CREATE TABLE test_alt3(pid INT, areaid CHAR(5), name VARCHAR(20));
Add a not-null constraint to pid.
gaussdb=# ALTER TABLE test_alt3 MODIFY pid NOT NULL;
-- Query.
gaussdb=# \d test_alt3
          Table "public.test_alt3"
Column |      Type      | Modifiers
-----+-----+-----
pid    | integer        | not null
areaid | character(5)   |
name   | character varying(20) |
```

- Cancel the not-null constraint on a column.

```
gaussdb=# ALTER TABLE test_alt3 MODIFY pid NULL;
-- Query.
gaussdb=# \d test_alt3
          Table "public.test_alt3"
Column |      Type      | Modifiers
-----+-----+-----
pid    | integer        |
areaid | character(5)   |
name   | character varying(20) |
```

- Modify the default value of a column.

```
-- Modify the default value of id in the test_alt1 table.
gaussdb=# ALTER TABLE test_alt3 ALTER COLUMN areaid SET DEFAULT '00000';
-- Query.
gaussdb=# \d test_alt3
          Table "public.test_alt3"
Column |      Type      | Modifiers
-----+-----+-----
pid    | integer        |
areaid | character(5)   | default '00000'::bpchar
name   | character varying(20) |
-- Delete the default value of id.
gaussdb=# ALTER TABLE test_alt3 ALTER COLUMN areaid DROP DEFAULT;
-- Query.
gaussdb=# \d test_alt3
          Table "public.test_alt3"
Column |      Type      | Modifiers
-----+-----+-----
pid    | integer        |
areaid | character(5)   |
name   | character varying(20) |
```

- Add a table-level constraint.
 - Directly add a constraint.

- ```
-- Add a primary key constraint to the table.
gaussdb=# ALTER TABLE test_alt3 ADD CONSTRAINT pk_test3_pid PRIMARY KEY (pid);
-- Query.
gaussdb=# \d test_alt3
 Table "public.test_alt3"
 Column | Type | Modifiers
-----+-----+-----
 pid | integer | not null
 areaid | integer |
 name | character varying(20) |
Indexes:
 "pk_test3_pid" PRIMARY KEY, btree (pid) TABLESPACE pg_default
```
- Create an index and then add constraints.

```
-- Create a table.
gaussdb=# CREATE TABLE test_alt4(c1 INT, c2 INT);
-- Create an index.
gaussdb=# CREATE UNIQUE INDEX pk_test4_c1 ON test_alt4(c1);
-- Associate the created index when adding a constraint.
gaussdb=# ALTER TABLE test_alt4 ADD CONSTRAINT pk_test4_c1 PRIMARY KEY USING INDEX
pk_test4_c1;
-- Query.
gaussdb=# \d test_alt4
 Table "public.test_alt4"
 Column | Type | Modifiers
-----+-----+-----
 c1 | integer | not null
 c2 | integer |
Indexes:
 "pk_test4_c1" PRIMARY KEY, btree (c1) TABLESPACE pg_default
-- Delete.
gaussdb=# DROP TABLE test_alt4;
```
  - Delete a table-level constraint.

```
-- Delete a constraint.
gaussdb=# ALTER TABLE test_alt3 DROP CONSTRAINT IF EXISTS pk_test3_pid;
-- Query.
gaussdb=# \d test_alt3
 Table "public.test_alt3"
 Column | Type | Modifiers
-----+-----+-----
 pid | integer | not null
 areaid | integer |
 name | character varying(20) |
Indexes:
 "pk_test3_pid" PRIMARY KEY, btree (pid) TABLESPACE pg_default
-- Delete.
gaussdb=# DROP TABLE test_alt3;
```

## Helpful Links

[CREATE TABLE](#) and [DROP TABLE](#)

## 7.15.34 ALTER TABLE PARTITION

### Description

Modifies table partitions, including adding, deleting, splitting, merging, clearing, swapping, and renaming partitions, moving partition tablespaces, and modifying partition attributes.

### Precautions

- The tablespace of the added partition cannot be PG\_GLOBAL.
- The name of the added partition must be different from names of existing partitions in the partitioned table.

- The key value of the added partition must be consistent with the type of partition keys in the partitioned table.
- If a range partition is added, the key value of the added partition must be greater than the upper limit of the last range partition in the partitioned table.
- If a list partition is added, the key value of the added partition cannot be the same as that of an existing partition.
- Hash partitions cannot be added.
- If the number of partitions in the target partitioned table has reached the maximum (**1048575**), partitions cannot be added.
- If a partitioned table has only one partition, the partition cannot be deleted.
- Use `PARTITION FOR()` to choose partitions. The number of specified values in the brackets should be the same as the column number in customized partition, and they must be consistent.
- The **Value** partitioned table does not support the `ALTER PARTITION` operation.
- Hash partitioned tables do not support splitting, combination, addition, and deletion of partitions.
- Only the partitioned table owner or a user granted with the `ALTER` permission can run the **ALTER TABLE PARTITION** command. The system administrator has this permission by default.
- Deleting, splitting, merging, clearing, and exchanging partitions will invalidate global indexes. The `UPDATE GLOBAL INDEX` clause can be used to update the indexes synchronously.
- If the `UPDATE GLOBAL INDEX` clause is not used when you delete, split, merge, clear, or exchange partitions, concurrent DML services may report errors due to invalidated indexes.
- Deleting, splitting, merging, clearing, and exchanging partitions will invalidate global secondary indexes in partitioned tables. For exchanging partitions, all global secondary indexes in ordinary tables will also become invalid. Concurrent DML services may report errors due to unavailable indexes.
- If **enable\_gpi\_auto\_update** is set to **on**, the global index is automatically updated even if the `UPDATE GLOBAL INDEX` clause is not declared.

## Syntax

Modifying a partition in a partitioned table includes modifying the table partition itself and the table partition name, and resetting the partition ID.

- Modify the syntax of the table partition.

```
ALTER TABLE [IF EXISTS] { table_name [*] | ONLY table_name | ONLY (table_name) }
action [, ...];
```

**action** indicates the following clauses for maintaining partitions. For the partition continuity when multiple clauses are used for partition maintenance, GaussDB executes `DROP PARTITION` and `ADD PARTITION` first, and then the rest clauses in sequence.

```
move_clause |
exchange_clause |
row_clause |
merge_clause |
modify_clause |
```

```
split_clause |
add_clause |
drop_clause
```

- The `move_clause` syntax is used to move the partition to a new tablespace.

```
MOVE PARTITION { partition_name | FOR (partition_value [, ...]) } TABLESPACE tablespacename
```

- The `exchange_clause` syntax is used to move the data from an ordinary table to a specified partition.

```
EXCHANGE PARTITION { (partition_name) | FOR (partition_value [, ...]) }
WITH TABLE {[ONLY] ordinary_table_name | ordinary_table_name * | ONLY
(ordinary_table_name)}
[{ WITH | WITHOUT } VALIDATION] [VERBOSE] [UPDATE GLOBAL INDEX]
```

The ordinary table and partition whose data is to be exchanged must meet the following requirements:

- The number of columns of the ordinary table is the same as that of the partition, and their information should be consistent, including: column name, data type, constraint, collation information, storage parameter, and compression information.
- The compression information of the ordinary table and partition should be consistent.
- The distribution key information of the ordinary table and partition should be consistent.
- The number of ordinary table indexes is the same as that of local indexes of the partition, and the index information is the same.
- The number and information of constraints of the ordinary table and partition should be consistent.
- The ordinary table cannot be a temporary table.
- When the built-in security policy is enabled, an ordinary table cannot contain columns bound to a dynamic data anonymization policy.

---

#### NOTICE

- When the exchange is done, the data and tablespace of the ordinary table and partition are exchanged. The statistics of the ordinary table and partition are no longer inaccurate after the exchange, and they should be analyzed again.
- A non-partition key cannot be used to create a local unique index. Therefore, if an ordinary table contains a unique index, data cannot be exchanged.

To exchange data, you can create an intermediate table, insert partition data into the intermediate table, truncate partitions, insert ordinary table data into the partitioned table, drop the ordinary table, and rename the intermediate table.

- If the `DROP COLUMN` operation is performed on an ordinary or partitioned table, the deleted column still exists physically. Therefore, you need to ensure that the deleted column of the ordinary table is strictly aligned with that of the partition.
-

- The `row_clause` syntax is used to set row movement of a partitioned table.  
`{ ENABLE | DISABLE } ROW MOVEMENT`
- The `merge_clause` syntax is used to merge partitions into one. The maximum number of source partitions that can be merged in a command is 300.  
`MERGE PARTITIONS { partition_name } [, ...] INTO PARTITION partition_name  
[ TABLESPACE tablespacename ] [ UPDATE GLOBAL INDEX ]`

---

**NOTICE**

For range partitioning and interval partitioning, the ranges of the source partitions must increase continuously, and the partition name after MERGE can be the same as the name of the last source partition. For list partitioning, there is no such range requirement on the source partitions, and the partition name after MERGE can be the same as that of any source partition. If the partition name after MERGE is the same as that of a source partition, they are considered as the same partition.

---

**CAUTION**

Ustore tables do not support ALTER TABLE MERGE PARTITIONS in transaction blocks and stored procedures.

- The `modify_clause` syntax is used to set whether a partitioned index is usable.  
`MODIFY PARTITION partition_name { UNUSABLE LOCAL INDEXES | REBUILD UNUSABLE LOCAL INDEXES }`
- The `split_clause` syntax is used to split one partition into partitions.  
`SPLIT PARTITION { partition_name | FOR ( partition_value [, ...] ) } { split_point_clause | no_split_point_clause } [ UPDATE GLOBAL INDEX ]`

---

**NOTICE**

- The partition name after SPLIT can be the same as the source partition name, but they are regarded as different partitions.
- The `split_point_clause` syntax for specifying the split point for a range partitioned table is as follows:  
`AT ( partition_value ) INTO ( PARTITION partition_name [ TABLESPACE tablespacename ] , PARTITION partition_name [ TABLESPACE tablespacename ] )`

---

**NOTICE**

The size of the split point should be in the range of partition keys of the partition of to be split. The split point can only split one partition into two new partitions.

- The `no_split_point_clause` syntax without specifying a split point for a range partitioned table is as follows:  
`INTO ( ( partition_less_than_item [, ...] ) | ( partition_start_end_item [, ...] ) )`

---

**NOTICE**

- The first new partition key specified by **partition\_less\_than\_item** should be greater than that of the previously split partition (if any), and the last partition key specified by **partition\_less\_than\_item** should equal that of the partition being split.
- The first new partition key specified by **partition\_start\_end\_item** should equal that of the former partition (if any), and the last partition key specified by **partition\_start\_end\_item** should equal that of the partition being split.
- **partition\_less\_than\_item** supports a maximum of 16 partition keys, while **partition\_start\_end\_item** supports only one partition key. For details about the supported data types, see [PARTITION BY RANGE\(part...](#)
- **partition\_less\_than\_item** and **partition\_start\_end\_item** cannot be used in the same statement. There is no restriction on different SPLIT statements.

- 
- The `partition_less_than_item` syntax is as follows:  
`PARTITION partition_name VALUES LESS THAN ( { partition_value | MAXVALUE } [, ...] ) [ TABLESPACE tablespacename ]`

- The `partition_start_end_item` syntax is as follows. For details about the constraints, see [START END](#).

```
PARTITION partition_name {
 {START(partition_value) END (partition_value) EVERY (interval_value)} |
 {START(partition_value) END ({partition_value | MAXVALUE})} |
 {START(partition_value)} |
 {END({partition_value | MAXVALUE})}
} [TABLESPACE tablespacename]
```

- The syntax for specifying the split point for a list partitioned table is as follows:

```
VALUES (partition_value_list) INTO (PARTITION partition_name [TABLESPACE tablespacename] , PARTITION partition_name [TABLESPACE tablespacename])
```

---

**NOTICE**

The split point must be a non-empty true subset of the source partition. Specifying a split point can only split one partition into two partitions.

- 
- The syntax for not specifying the split point for a list partitioned table is as follows:

```
INTO (PARTITION partition_name VALUES (partition_value_list) [TABLESPACE tablespacename] [, ...])
```

**NOTICE**

- The range of the last partition is not defined, that is, the VALUES (partition\_value\_list) part is not defined; the partition range is equal to the remaining set of the source partition excluding other level-2 partitions.
- If no split point is specified, each new partition must be a non-empty true subset of the source partition and does not overlap with each other.

- The add\_clause syntax is used to add one or more partitions to a specified partitioned table.

```
ADD {partition_less_than_item | partition_start_end_item}
```

The partition\_list\_item syntax is as follows:

```
PARTITION partition_name VALUES (list_values_clause)
[TABLESPACE tablespacename]
```

**NOTICE**

- **partition\_list\_item** supports a maximum of 16 partition keys. For details about the supported data types, see [PARTITION BY LIST \[COLU...](#)
- Partitions cannot be added to a hash partitioned table.

- The drop\_clause syntax is used to remove a partition from a specified partitioned table.

```
DROP PARTITION { partition_name | FOR (partition_value [, ...]) } [UPDATE GLOBAL INDEX]
```

**NOTICE**

- Hash partitioned table does not support partition deletion.
- If a partitioned table has only one partition, the partition cannot be deleted.

- The truncate\_clause syntax is used to remove a specified partition from a partitioned table.

```
TRUNCATE PARTITION { partition_name | FOR (partition_value [, ...]) } [UPDATE GLOBAL INDEX]
```

- The syntax for modifying the name of a partition is as follows:  

```
ALTER TABLE [IF EXISTS] { table_name [*] | ONLY table_name | ONLY (table_name) }
RENAME PARTITION { partion_name | FOR (partition_value [, ...]) } TO partition_new_name;
```
- Reset a partition ID.  

```
ALTER TABLE [IF EXISTS] { table_name [*] | ONLY table_name | ONLY (table_name) } RESET PARTITION;
```

## Parameters

- **table\_name**  
Specifies the name of a partitioned table.  
Value range: an existing table name

- **partition\_name**  
Specifies the name of a partition.  
Value range: an existing partition name
- **tablespacename**  
Specifies which tablespace the partition moves to.  
Value range: an existing tablespace name
- **partition\_value**  
Specifies the key value of a partition.  
The value specified by **PARTITION FOR ( partition\_value [, ...] )** can uniquely identify a partition.  
Value range: partition keys for the partition to be operated.
- **UNUSABLE LOCAL INDEXES**  
Sets all the indexes unusable in the partition.
- **REBUILD UNUSABLE LOCAL INDEXES**  
Rebuilds all the indexes in the partition.
- **ENABLE/DISABLE ROW MOVEMENT**  
Sets row movement.  
If the tuple value is updated on the partition key during the **UPDATE** action, the partition where the tuple is located is altered. Setting this parameter enables error messages to be reported or movement of the tuple between partitions.  
Value range:
  - **ENABLE**: Row movement is enabled.
  - **DISABLE**: Row movement is disabled.By default, this parameter is disabled.
- **ordinary\_table\_name**  
Specifies the name of the ordinary table whose data is to be migrated.  
Value range: an existing table name
- **{ WITH | WITHOUT } VALIDATION**  
Checks whether the ordinary table data meets the specified partition key range of the partition to be migrated.  
Value range:
  - **WITH**: checks whether the ordinary table data meets the partition key range of the partition to be migrated. If any data does not meet the required range, an error is reported.
  - **WITHOUT**: does not check whether the ordinary table data meets the partition key range of the partition to be migrated.The default value is **WITH**.  
The check is time consuming, especially when the data volume is large. Therefore, use **WITHOUT** when you are sure that the current ordinary table data meets the partition key range of the partition to be migrated.
- **VERBOSE**

When **VALIDATION** is **WITH**, if the ordinary table contains data that is out of the partition key range, insert the data to the correct partition. If there is no correct partition where the data can be inserted to, an error is reported.

---

**NOTICE**

Only when **VALIDATION** is **WITH**, **VERBOSE** can be specified.

---

- **partition\_new\_name**  
Specifies the new name of a partition.  
Value range: a string. It must comply with the [naming convention](#).
- **UPDATE GLOBAL INDEX**  
If this parameter is used, all global indexes in a partitioned table are updated to ensure that correct data can be queried using global indexes.  
If this parameter is not used, all global indexes in a partitioned table will become invalid.

## Examples

See [Examples](#) in section "CREATE TABLE PARTITION."

## Helpful Links

[CREATE TABLE PARTITION](#) and [DROP TABLE](#)

## 7.15.35 ALTER TABLESPACE

### Description

Modifies the attributes of a tablespace.

### Precautions

- The ALTER TABLESPACE syntax cannot be used in the current version.
- Only the tablespace owner or a user granted with the ALTER permission can run the **ALTER TABLESPACE** command. The system administrator has this permission by default. To modify a tablespace owner, you must be the tablespace owner or system administrator and a member of the new owner role.
- The ALTER TABLESPACE operation on a row-store table cannot be performed in a transaction block.
- To change the owner, you must also be a direct or indirect member of the new owning role.

 **NOTE**

If **new\_owner** is the same as **old\_owner**, the current user will not be verified. A message indicating successful ALTER execution is displayed.

## Syntax

- The syntax of renaming a tablespace is as follows:  

```
ALTER TABLESPACE tablespace_name
 RENAME TO new_tablespace_name;
```
- The syntax of setting the owner of a tablespace is as follows:  

```
ALTER TABLESPACE tablespace_name
 OWNER TO new_owner;
```
- The syntax of setting the attributes of a tablespace is as follows:  

```
ALTER TABLESPACE tablespace_name
 SET ({tablespace_option = value} [, ...]);
```
- The syntax of resetting the attributes of a tablespace is as follows:  

```
ALTER TABLESPACE tablespace_name
 RESET ({ tablespace_option } [, ...]);
```
- The syntax of setting the quota of a tablespace is as follows:  

```
ALTER TABLESPACE tablespace_name
 RESIZE MAXSIZE { UNLIMITED | 'space_size'};
```

## Parameters

- **tablespace\_name**  
Specifies the tablespace to be modified.  
Value range: an existing table name
- **new\_tablespace\_name**  
Specifies the new name of a tablespace.  
The new name cannot start with PG\_.  
Value range: a string. It must comply with the [naming convention](#).
- **new\_owner**  
Specifies the new owner of the tablespace.  
Value range: an existing username
- **tablespace\_option**  
Sets or resets the parameters of a tablespace.  
Value range:
  - **seq\_page\_cost**: sets the optimizer to calculate the cost of obtaining disk pages in sequence. The default value is **1.0**.
  - **random\_page\_cost**: sets the optimizer to calculate the cost of obtaining disk pages in a non-sequential manner. The default value is **4.0**.

### NOTE

- The value of **random\_page\_cost** is relative to that of **seq\_page\_cost**. It is meaningless when the value is equal to or less than the value of **seq\_page\_cost**.
- The prerequisite for the default value **4.0** is that the optimizer uses indexes to scan table data and the hit ratio of table data in the cache is about 90%.
- If the size of the table data space is smaller than that of the physical memory, decrease the value to a proper level. On the contrary, if the hit ratio of table data in the cache is lower than 90%, increase the value.
- If random-access memory like SSD is adopted, the value can be decreased to a certain degree to reflect the cost of true random scan.

Value range: a positive floating-point number

- **RESIZE MAXSIZE**

Resets the maximum size of tablespace.

Value range:

- **UNLIMITED**: No limit is set for the tablespace.
- Determined by **space\_size**. For details about the format, see [CREATE TABLESPACE](#).

 **NOTE**

- If the adjusted quota is smaller than the current tablespace usage, the adjustment is successful. You need to decrease the tablespace usage to a value less than the new quota before writing data to the tablespace.
- You can also use the following statement to change the value of **MAXSIZE**:

```
ALTER TABLESPACE tablespace_name RESIZE MAXSIZE
{'UNLIMITED' | 'space_size'};
```

## Examples

See [Examples](#) in section "CREATE TABLESPACE."

## Helpful Links

[CREATE TABLESPACE](#) and [DROP TABLESPACE](#)

## 7.15.36 ALTER TEXT SEARCH CONFIGURATION

### Description

Modifies the definition of a text search configuration. You can modify its mappings from token types to dictionaries, change the configuration's name or owner, or modify the parameters.

The **ADD MAPPING FOR** form installs a list of dictionaries to be consulted for the specified token types; an error will be generated if there is already a mapping for any of the token types.

The **ALTER MAPPING FOR** form removes existing mapping for those token types and then adds specified mappings.

The **ALTER MAPPING REPLACE ... WITH ...** and **ALTER MAPPING FOR ... REPLACE ... WITH ...** options replace **old\_dictionary** with **new\_dictionary**. Note that only when **pg\_ts\_config\_map** has tuples corresponding to **maptokentype** and **old\_dictionary**, the update will succeed. If the update fails, no messages are returned.

The **DROP MAPPING FOR** form deletes all dictionaries for the specified token types in the text search configuration. If **IF EXISTS** is not specified and the string type mapping specified by **DROP MAPPING FOR** does not exist in text search configuration, an error will occur in the database.

This is a lab feature. Contact Huawei technical support before using it.

## Precautions

- If a search configuration is referenced (to create indexes), users are not allowed to modify the text search configuration.
- To use ALTER TEXT SEARCH CONFIGURATION, you must be the owner of the configuration.

## Syntax

- Add text search configuration string mapping.

```
ALTER TEXT SEARCH CONFIGURATION name
 ADD MAPPING FOR { token_type } [, ...] WITH { dictionary_name } [, ...];
```

- Modify the text search configuration dictionary syntax.

```
ALTER TEXT SEARCH CONFIGURATION name
 ALTER MAPPING FOR { token_type } [, ...] REPLACE old_dictionary WITH new_dictionary;
```

- Modify the text search configuration string.

```
ALTER TEXT SEARCH CONFIGURATION name
 ALTER MAPPING FOR { token_type } [, ...] WITH { dictionary_name } [, ...];
```

- Change the text search configuration dictionary.

```
ALTER TEXT SEARCH CONFIGURATION name
 ALTER MAPPING REPLACE old_dictionary WITH new_dictionary;
```

- Remove text search configuration string mapping.

```
ALTER TEXT SEARCH CONFIGURATION name
 DROP MAPPING [IF EXISTS] FOR { token_type } [, ...];
```

- Rename the owner of text search configuration.

```
ALTER TEXT SEARCH CONFIGURATION name OWNER TO new_owner;
```

- Rename the text search configuration.

```
ALTER TEXT SEARCH CONFIGURATION name RENAME TO new_name;
```

- Rename the namespace of text search configuration.

```
ALTER TEXT SEARCH CONFIGURATION name SET SCHEMA new_schema;
```

- Modify the attributes of the text search configuration.

```
ALTER TEXT SEARCH CONFIGURATION name SET ({ configuration_option = value } [, ...]);
```

- Reset the attributes of text search configuration.

```
ALTER TEXT SEARCH CONFIGURATION name RESET ({configuration_option} [, ...]);
```

## Parameters

- **name**  
Specifies the name (optionally schema-qualified) of an existing text search configuration.
- **token\_type**  
Specifies the name of a token type that is emitted by the configuration's parser. For details, see [Parser](#).
- **dictionary\_name**  
Specifies the name of a text search dictionary. If multiple dictionaries are listed, they are searched in the specified order.
- **old\_dictionary**  
Specifies the name of a text search dictionary to be replaced in the mapping.

- **new\_dictionary**  
Specifies the name of a text search dictionary to be substituted for **old\_dictionary**.
- **new\_owner**  
Specifies the new owner of the text search configuration.
- **new\_name**  
Specifies the new name of the text search configuration.
- **new\_schema**  
Specifies the new schema for the text search configuration.
- **configuration\_option**  
Specifies the text search configuration option. For details, see [CREATE TEXT SEARCH CONFIGURATION](#).
- **value**  
Specifies the value of text search configuration option.

## Examples

```
-- Create a text search configuration.
gaussdb=# CREATE TEXT SEARCH CONFIGURATION english_1 (parser=default);
CREATE TEXT SEARCH CONFIGURATION

-- Add text search configuration string mapping.
gaussdb=# ALTER TEXT SEARCH CONFIGURATION english_1 ADD MAPPING FOR word WITH
simple,english_stem;
ALTER TEXT SEARCH CONFIGURATION

-- Add text search configuration string mapping.
gaussdb=# ALTER TEXT SEARCH CONFIGURATION english_1 ADD MAPPING FOR email WITH english_stem,
french_stem;
ALTER TEXT SEARCH CONFIGURATION

-- Query information about the text search configuration.
gaussdb=# SELECT b.cfgrname,a.maptokentype,a.mapseqno,a.mapdict,c.dictname FROM pg_ts_config_map
a,pg_ts_config b, pg_ts_dict c WHERE a.mapcfg=b.oid AND a.mapdict=c.oid AND b.cfgrname='english_1'
ORDER BY 1,2,3,4,5;
 cfgrname | maptokentype | mapseqno | mapdict | dictname
-----+-----+-----+-----+-----
english_1 | 2 | 1 | 3765 | simple
english_1 | 2 | 2 | 12960 | english_stem
english_1 | 4 | 1 | 12960 | english_stem
english_1 | 4 | 2 | 12964 | french_stem
(4 rows)

-- Add text search configuration string mapping.
gaussdb=# ALTER TEXT SEARCH CONFIGURATION english_1 ALTER MAPPING REPLACE french_stem with
german_stem;
ALTER TEXT SEARCH CONFIGURATION

-- Query information about the text search configuration.
gaussdb=# SELECT b.cfgrname,a.maptokentype,a.mapseqno,a.mapdict,c.dictname FROM pg_ts_config_map
a,pg_ts_config b, pg_ts_dict c WHERE a.mapcfg=b.oid AND a.mapdict=c.oid AND b.cfgrname='english_1'
ORDER BY 1,2,3,4,5;
 cfgrname | maptokentype | mapseqno | mapdict | dictname
-----+-----+-----+-----+-----
english_1 | 2 | 1 | 3765 | simple
english_1 | 2 | 2 | 12960 | english_stem
english_1 | 4 | 1 | 12960 | english_stem
english_1 | 4 | 2 | 12966 | german_stem
(4 rows)
```

```
-- Delete a text search configuration.
gaussdb=# DROP TEXT SEARCH CONFIGURATION english_1;
```

See [Examples](#) in section "CREATE TEXT SEARCH CONFIGURATION."

## Helpful Links

[CREATE TEXT SEARCH CONFIGURATION](#) and [DROP TEXT SEARCH CONFIGURATION](#)

## 7.15.37 ALTER TEXT SEARCH DICTIONARY

### Description

Modifies the definition of a full-text search dictionary, including its parameters, name, owner, and schema.

This is a lab feature. Contact Huawei technical support before using it.

### Precautions

- Predefined dictionaries do not support the ALTER operations.
- Only the owner of a dictionary or a system administrator can perform the ALTER operations.
- After a dictionary is created or modified, any modification to the customized dictionary definition file in the **filepath** directory does not affect the dictionary in the database. To use these modifications in the database, run the **ALTER TEXT SEARCH DICTIONARY** statement to update the definition file of the corresponding dictionary.

### Syntax

- Modify the dictionary definition.  

```
ALTER TEXT SEARCH DICTIONARY name (
 option [= value] [, ...]
);
```
- Rename a dictionary.  

```
ALTER TEXT SEARCH DICTIONARY name RENAME TO new_name;
```
- Set the schema of the dictionary.  

```
ALTER TEXT SEARCH DICTIONARY name SET SCHEMA new_schema;
```
- Change the owner of the dictionary.  

```
ALTER TEXT SEARCH DICTIONARY name OWNER TO new_owner;
```

### Parameters

- **name**  
Specifies the name of an existing dictionary. (If you do not specify a schema name, the dictionary in the current schema will be used.)  
Value range: an existing dictionary name
- **option**  
Specifies the name of a parameter to be modified. Each type of dictionaries has a template containing their custom parameters. Parameters function in a way irrelevant to their setting sequence. For details about the parameters, see [option](#).

 NOTE

- The value of **TEMPLATE** in the dictionary cannot be changed.
  - To specify a dictionary, specify both the dictionary definition file path (**FILEPATH**) and the file name.
  - The name of a dictionary definition file can contain only lowercase letters, digits, and underscores (\_).
- **value**  
Specifies the new value of a parameter. If the equal sign (=) and *value* are omitted, the previous settings of the option are deleted and the default value is used.  
Value range: valid values defined by **option**.
  - **new\_name**  
Specifies the new name of a dictionary.  
Value range: a string, which complies with the **naming convention**. A value can contain a maximum of 63 characters.
  - **new\_owner**  
Specifies the new owner of a dictionary.  
Value range: an existing username
  - **new\_schema**  
Specifies the new schema of a dictionary.  
Value range: an existing schema

## Examples

```
-- Create the dictionary my_dict.
gaussdb=# CREATE TEXT SEARCH DICTIONARY my_dict (TEMPLATE = Simple);

-- Modify the dictionary of the simple type, set non-stop words as recognized, and retain the values of
other parameters.
gaussdb=# ALTER TEXT SEARCH DICTIONARY my_dict (Accept = true);

-- Modify the dictionary of the simple type and reset the Accept parameter.
gaussdb=# ALTER TEXT SEARCH DICTIONARY my_dict (Accept);

-- Update the dictionary definition and do not change any other content.
gaussdb=# ALTER TEXT SEARCH DICTIONARY my_dict (dummy);

-- Delete the dictionary my_dict.
gaussdb=# DROP TEXT SEARCH DICTIONARY my_dict;
```

## Helpful Links

[CREATE TEXT SEARCH DICTIONARY](#) and [DROP TEXT SEARCH DICTIONARY](#)

## 7.15.38 ALTER TRIGGER

### Description

Renames a trigger.

 NOTE

Currently, only the name can be modified.

## Precautions

The owner of the table where a trigger resides or a user granted the ALTER ANY TRIGGER permission can perform the ALTER TRIGGER operation. A system administrator has this permission by default.

## Syntax

```
ALTER TRIGGER trigger_name ON table_name RENAME TO new_name;
```

## Parameters

- **trigger\_name**  
Specifies the name of the trigger to be modified.  
Value range: an existing trigger
- **table\_name**  
Specifies the name of the table where the trigger to be modified is located.  
Value range: an existing table having a trigger
- **new\_name**  
Specifies the new name after modification.  
Value range: a string, which complies with the [naming convention](#). A value contains a maximum of 63 characters and cannot be the same as other triggers on the same table.

## Examples

For details, see [CREATE TRIGGER](#).

## Helpful Links

[CREATE TRIGGER](#), [DROP TRIGGER](#), and [ALTER TABLE](#)

## 7.15.39 ALTER TYPE

### Description

Modifies the definition of a type.

### Precautions

Only the owner of a type, a user granted the ALTER permission on a type, or a user granted the ALTER ANY TYPE permission on a sequence can run the **ALTER TYPE** command. The system administrator has this permission by default. To modify the owner or schema of a type, you must be a type owner or system administrator and a member of the new owner role.

### Syntax

- Modify a type.  
ALTER TYPE name action [, ... ]  
ALTER TYPE name OWNER TO { new\_owner | CURRENT\_USER | SESSION\_USER }  
ALTER TYPE name RENAME ATTRIBUTE attribute\_name TO new\_attribute\_name [ CASCADE ]

```
RESTRICT]
ALTER TYPE name RENAME TO new_name
ALTER TYPE name SET SCHEMA new_schema
ALTER TYPE name ADD VALUE [IF NOT EXISTS] new_enum_value [{ BEFORE | AFTER }
neighbor_enum_value]
ALTER TYPE name RENAME VALUE existing_enum_value TO new_enum_value
```

where action is one of:

```
ADD ATTRIBUTE attribute_name data_type [COLLATE collation] [CASCADE | RESTRICT]
DROP ATTRIBUTE [IF EXISTS] attribute_name [CASCADE | RESTRICT]
ALTER ATTRIBUTE attribute_name [SET DATA] TYPE data_type [COLLATE collation] [CASCADE |
RESTRICT]
```

- **Change the owner of a type.**  
ALTER TYPE name OWNER TO { new\_owner | CURRENT\_USER | SESSION\_USER }
- **Change the name of a type.**  
ALTER TYPE name RENAME TO new\_name  
ALTER TYPE name RENAME ATTRIBUTE attribute\_name TO new\_attribute\_name [ CASCADE | RESTRICT ]
- **Move a type to a new schema.**  
ALTER TYPE name SET SCHEMA new\_schema
- **Add a new value to an enumerated type.**  
ALTER TYPE name ADD VALUE [ IF NOT EXISTS ] new\_enum\_value [ { BEFORE | AFTER } neighbor\_enum\_value ]
- **Change an enumerated value in the value list.**  
ALTER TYPE name RENAME VALUE existing\_enum\_value TO new\_enum\_value

## Parameters

- **name**  
Specifies the name of an existing type that needs to be modified (optionally schema-qualified).
- **new\_name**  
Specifies the new name of the type.
- **new\_owner**  
Specifies the new owner of the type.
- **new\_schema**  
Specifies the new schema of the type.
- **attribute\_name**  
Specifies the name of the attribute to be added, modified, or deleted.
- **new\_attribute\_name**  
Specifies the new name of the attribute to be renamed.
- **data\_type**  
Specifies the data type of the attribute to be added, or the new type of the attribute to be modified.
- **new\_enum\_value**  
Specifies a new enumerated value. It is a non-null string with a maximum length of 64 bytes.
- **neighbor\_enum\_value**  
Specifies an existing enumerated value before or after which a new enumerated value will be added.

- **existing\_enum\_value**  
Specifies an enumerated value to be changed. It is a non-null string with a maximum length of 64 bytes.
- **CASCADE**  
Determines that the type to be modified, its associated records, and subtables that inherit the type will all be updated.
- **RESTRICT**  
Refuses to update the associated records of the modified type. This is the default action.

---

**NOTICE**

- **ADD ATTRIBUTE, DROP ATTRIBUTE, and ALTER ATTRIBUTE** can be combined for processing. For example, it is possible to add several attributes or change the types of several attributes at the same time in one command.
- To modify a schema of a type, you must have the **CREATE** permission on the new schema. To alter the owner, you must be a direct or indirect member of the new owner role, and that member must have **CREATE** permission on the schema of this type (these restrictions enforce that the alter owner will not do anything that cannot be done by deleting and rebuilding the type). However, the system administrator can modify the rights of any type in any way. To add an attribute or modify the type of an attribute, you must also have the **USAGE** permission of this type.

- 
- **CURRENT\_USER**  
Specifies the current user.
  - **SESSION\_USER**  
Specifies the current system user.
  - **COLLATE collation**  
Assigns a collation to the column, which must be a sortable data type. If the collation is not specified, the default collation for the column's data type is used.

## Examples

See [Examples](#) in section "CREATE TYPE."

## Helpful Links

[CREATE TYPE](#) and [DROP TYPE](#)

## 7.15.40 ALTER USER

### Description

Modifies the attributes of a database user.

## Precautions

Session parameters modified by ALTER USER apply to a specified user and take effect in the next session.

## Syntax

- Modify user permissions or other information.

```
ALTER USER user_name [[WITH] option [...]];
```

The **option** clause is as follows:

```
{ CREATEDB | NOCREATEDB }
| { CREATEROLE | NOCREATEROLE }
| { INHERIT | NOINHERIT }
| { AUDITADMIN | NOAUDITADMIN }
| { SYSADMIN | NOSYSADMIN }
| { MONADMIN | NOMONADMIN }
| { OPRADMIN | NOOPRADMIN }
| { POLADMIN | NOPOLADMIN }
| { USEFT | NOUSEFT }
| { LOGIN | NOLOGIN }
| { REPLICATION | NOREPLICATION }
| { VCADMIN | NOVCADMIN }
| { PERSISTENCE | NOPERSISTENCE }
| CONNECTION LIMIT connlimit
| [ENCRYPTED | UNENCRYPTED] PASSWORD { 'password' [EXPIRED] | DISABLE | EXPIRED }
| [ENCRYPTED | UNENCRYPTED] IDENTIFIED BY { 'password' [REPLACE 'old_password' |
EXPIRED] | DISABLE }
| VALID BEGIN 'timestamp'
| VALID UNTIL 'timestamp'

| USER GROUP 'groupuser'
| PERM SPACE 'spacelimit'
| TEMP SPACE 'tmpspacelimit'
| SPILL SPACE 'spillspacelimit'
| NODE GROUP logic_cluster_name
| PGUSER
```

- Change the username.

```
ALTER USER user_name
 RENAME TO new_name;
```

- Lock or unlock.

```
ALTER USER user_name
 ACCOUNT { LOCK | UNLOCK };
```

## Parameters

- **user\_name**

Specifies the current username.

Value range: an existing username. If a username contains uppercase letters, enclose the name with double quotation marks ("").

- **new\_password**

Specifies a new password.

The new password must:

- Differ from the old password.
- Contain at least eight characters. This is the default length.
- Differ from the username or the username spelled backward.
- Contain at least three types of the following four types of characters: uppercase characters (A to Z), lowercase characters (a to z), digits (0 to

9), and special characters, including: ~!@#%&^&\*()-\_+=+\\[{}];,;<.>/? If the password contains characters other than the preceding characters, an error will be reported during statement execution.

Value range: a string

- **old\_password**  
Specifies the old password.
- **ACCOUNT LOCK | ACCOUNT UNLOCK**
  - **ACCOUNT LOCK**: locks an account to forbid login to databases.
  - **ACCOUNT UNLOCK**: unlocks an account to allow login to databases.
- **PGUSER**  
In the current version, the **PGUSER** attribute of a user cannot be modified.

For details about other parameters, see "Parameters" in [CREATE ROLE](#) and [ALTER ROLE](#).

---

**NOTICE**

The current version does not support the setting of user-level parameters.

---

## Examples

See [Examples](#) in section "CREATE USER."

## Helpful Links

[CREATE ROLE](#), [CREATE USER](#), and [DROP USER](#)

## 7.15.41 ALTER VIEW

### Function

**ALTER VIEW** modifies all auxiliary attributes of a view. (To modify the query definition of a view, use **CREATE OR REPLACE VIEW**.)

### Precautions

Only the view owner or a user granted with the ALTER permission can run the **ALTER VIEW** command. The system administrator has this permission by default. The following is permission constraints depending on attributes to be modified:

- To modify the schema of a view, you must be the owner of the view or system administrator and have the CREATE permission on the new schema.
- To modify the owner of a view, you must be the owner of the view or system administrator and a member of the new owner role, with the CREATE permission on the schema of the view.
- Do not change the type of a column in a view.

## Syntax

- Set the default value of a view column.  

```
ALTER VIEW [IF EXISTS] view_name
ALTER [COLUMN] column_name SET DEFAULT expression;
```
- Remove the default value of a view column.  

```
ALTER VIEW [IF EXISTS] view_name
ALTER [COLUMN] column_name DROP DEFAULT;
```
- Change the owner of a view.  

```
ALTER VIEW [IF EXISTS] view_name
OWNER TO new_owner;
```
- Rename a view.  

```
ALTER VIEW [IF EXISTS] view_name
RENAME TO new_name;
```
- Set the schema of a view.  

```
ALTER VIEW [IF EXISTS] view_name
SET SCHEMA new_schema;
```
- Set the options of a view.  

```
ALTER VIEW [IF EXISTS] view_name
SET ({ view_option_name [= view_option_value] } [, ...]);
```
- Reset the options of a view.  

```
ALTER VIEW [IF EXISTS] view_name
RESET (view_option_name [, ...]);
```

## Parameter Description

- **IF EXISTS**  
If this option is used, no error is generated when the view does not exist, and only a message is displayed.
- **view\_name**  
Specifies the view name, which can be schema-qualified.  
Value range: a string. It must comply with the [naming convention](#).
- **column\_name**  
Specifies an optional list of names to be used for columns of the view. If not given, the column names are deduced from the query.  
Value range: a string. It must comply with the [naming convention](#).
- **SET/DROP DEFAULT**  
Sets or deletes the default value of a column. This parameter does not take effect.
- **new\_owner**  
Specifies the new owner of a view.
- **new\_name**  
Specifies the new view name.
- **new\_schema**  
Specifies the new schema of the view.
- **view\_option\_name [ = view\_option\_value ]**  
Specifies an optional parameter for a view.
  - **security\_barrier**: specifies whether the view provides row-level security. The value is of the Boolean type. The default value is **true**.

- **expression**  
Specifies constants, functions, or SQL expressions.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer table.
gaussdb=# CREATE TABLE tpcds.customer
(
 c_customer_sk INTEGER NOT NULL,
 c_customer_id CHARACTER(16) NOT NULL
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.customer VALUES (1, 'AAAAAAAAABAAAAAAA'),(100,
'AAAAAAAAACAAAAAAA'),(150, 'AAAAAADAAAAAAA');

-- Create a view consisting of rows with c_customer_sk less than 150.
gaussdb=# CREATE VIEW tpcds.customer_details_view_v1 AS
 SELECT * FROM tpcds.customer
 WHERE c_customer_sk < 150;

-- Rename a view.
gaussdb=# ALTER VIEW tpcds.customer_details_view_v1 RENAME TO customer_details_view_v2;

-- Change the schema of a view.
gaussdb=# ALTER VIEW tpcds.customer_details_view_v2 SET schema public;

-- Delete a view.
gaussdb=# DROP VIEW public.customer_details_view_v2;

-- Delete the tpcds.customer table.
gaussdb=# DROP TABLE tpcds.customer;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## Helpful Links

[CREATE VIEW](#) and [DROP VIEW](#)

## 7.15.42 ALTER WORKLOAD GROUP

### Description

Modifies a workload group and sets the number of concurrent SQL statements.

### Precautions

- Only a user with the ALTER permission on the current database can perform this operation.
- If **ACT\_STATEMENTS** is not specified, the number of concurrent tasks in the resource pool to which the workload group belongs is not limited.

### Syntax

```
ALTER WORKLOAD GROUP wg_name
 USING RESOURCE POOL pool_name [WITH (ACT_STATEMENTS = count)];
```

## Parameters

- **wg\_name**

Specifies the workload group name.

 **NOTE**

The workload group must be unique in a database.

Value range: a string. It must comply with the [naming convention](#).

- **pool\_name**

Specifies the name of a resource pool.

Value range: a string that indicates an existing resource pool

- **counts**

Specifies the number of concurrent SQL statements in the resource pool that the workload group belongs to.

Value range: an integer ranging from -1 to 2147483647. The default value is -1. The value -1 indicates no limit.

## Examples

```
-- Create a workload group named group1.
gaussdb=# CREATE WORKLOAD GROUP group1;

-- Change the maximum number of concurrent SQL statements in workload group group1 to 10.
gaussdb=# ALTER WORKLOAD GROUP group1 WITH (ACT_STATEMENTS=10);

-- Delete workload group group1.
gaussdb=# DROP WORKLOAD GROUP group1;
```

## 7.15.43 ANALYZE | ANALYSE

### Description

ANALYZE collects statistics about ordinary tables in a database and stores the results in the PG\_STATISTIC and PG\_STATISTIC\_EXT system catalogs. After you run the **ANALYZE** command, you can query the collected statistics in the preceding system catalogs or system views PG\_STATS and PG\_EXT\_STATS. The execution plan generator uses these statistics to generate the most effective execution plan.

If no parameters are specified, ANALYZE analyzes each table and partitioned table in the database. You can also specify the **table\_name**, **column**, and **partition\_name** parameters to restrict the analysis to a specific table, column, or partitioned table.

ANALYZE | ANALYSE VERIFY checks whether data files of ordinary tables in a database are damaged.

## Precautions

Non-temporary tables cannot be analyzed in an anonymous block, transaction block, function, or stored procedure. Temporary tables in a stored procedure can be analyzed but their statistics updates cannot be rolled back.

Remote read is not involved in the ANALYZE VERIFY scenario. Therefore, the remote read parameter does not take effect. If the system detects that a page is damaged due to an error in a key system table, the system directly reports an error and does not continue the detection.

With no table specified, ANALYZE processes all the tables that the current user has permission to analyze in the current database. With a table specified, ANALYZE processes only that table.

To perform ANALYZE operation to a table, you must be a table owner or a user granted the VACUUM permission on the table. By default, the system administrator has this permission. However, database owners are allowed to analyze all tables in their databases, except shared catalogs. (The restriction for shared catalogs means that a true database-wide analyze operation can only be executed by the system administrator). ANALYZE skips tables on which users do not have permissions.

ANALYZE does not collect columns for which comparison or equivalent operations cannot be performed, for example, columns of the cursor type.

## Syntax

- Collect statistics information about a table.  

```
{ ANALYZE | ANALYSE } [VERBOSE]
 [table_name [(column_name [, ...])]] ;
```

- Collect partition statistics on a partitioned table. This syntax is not supported currently.

```
{ ANALYZE | ANALYSE } [VERBOSE]
 table_name [(column_name [, ...])] PARTITION (partition_name) ;
```

### NOTE

An ordinary partitioned table supports the syntax but not the function of collecting statistics about specified partitions.

- Collect statistics about global secondary indexes.  

```
{ ANALYZE | ANALYSE } GLOBAL INDEX index_name FOR TABLE table_name;
```

### NOTE

- Before performing ANALYZE on the global secondary index, you need to perform ANALYZE on the base table to ensure the accuracy of global secondary indexes.
- After performing the REINDEX/REBUILD operation on the global secondary indexes, you need to perform ANALYZE on the base table first before the global secondary indexes to ensure the accuracy of global secondary indexes.
- To collect statistics from global secondary indexes, you must specify **index\_name** and **table\_name**, and **index\_name** must be the name of a global secondary index.
- The global secondary indexes include only the statistics (reltuple and relpages) in the pg\_class system catalog.
- Collect statistics about multiple columns manually.  

```
{ ANALYZE | ANALYSE } [VERBOSE]
 table_name ((column_1_name, column_2_name [, ...]));
```

 NOTE

- The statistics about a maximum of 32 columns can be collected at a time.
- You are not allowed to collect statistics about multiple columns in system catalogs.
- Collect statistics about multiple columns automatically.

After the **auto\_statistic\_ext\_columns** parameter is enabled and analyzed, multi-column statistics are automatically created based on the index prefix of the table. The number of columns in the multi-column statistics cannot exceed the value of **auto\_statistic\_ext\_columns**.

For example, if index (a, b, c, d) exists in table **t** and **auto\_statistic\_ext\_columns** is set to **4**, multi-column statistics about (a, b), (a, b, c), and (a, b, c, d) are created after table **t** is analyzed.

```
{ ANALYZE | ANALYSE } [VERBOSE] table_name;
```

- Check the data files in the current database.

```
{ ANALYZE | ANALYSE } VERIFY { FAST | COMPLETE };
```

 NOTE

- In fast mode, DML operations need to be performed on the tables to be verified concurrently. As a result, an error is reported during the verification. In the current fast mode, data is directly read from the disk. When other threads modify files concurrently, the obtained data is incorrect. Therefore, you are advised to perform the verification offline.
- You can perform operations on the entire database. Because a large number of tables are involved, you are advised to save the results in redirection mode.  

```
gsql -d database -p port -f sqlfile> sqllog.txt 2>&1
```
- Temporary tables and unlogged tables are not supported.
- NOTICE is used to check only tables that are visible to external systems. The detection of internal tables is included in the external tables on which NOTICE depends and is not displayed externally.
- This statement can be executed with error tolerance.
- If a key system table is damaged during a full database operation, an error is reported and the operation stops.
- Check data files of tables and indexes.

```
{ ANALYZE | ANALYSE } VERIFY { FAST | COMPLETE } { table_name | index_name } [CASCADE];
```

 NOTE

- Operations on ordinary tables and index tables are supported, but CASCADE operations on indexes of index tables are not supported. The CASCADE mode is used to process all index tables of the main table. When the index tables are checked separately, the CASCADE mode is not required.
- Temporary tables and unlogged tables are not supported.
- When the main table is checked, the internal tables of the main table, such as the toast table, are also checked.
- When the system displays a message indicating that the index table is damaged, you are advised to run the **reindex** command to re-create the index.
- Check the data files of the table partition.

```
{ ANALYZE | ANALYSE } VERIFY { FAST | COMPLETE } table_name PARTITION (partition_name) [CASCADE];
```

 NOTE

- You can check a single partition of a table, but cannot perform the CASCADE operation on the indexes of an index table.
- Temporary tables and unlogged tables are not supported.

## Parameters

- **VERBOSE**

Enables the display of progress messages.

 NOTE

If **VERBOSE** is specified, ANALYZE displays the progress information, indicating the table that is being processed. Statistics about tables are also displayed.

- **table\_name**

Specifies the name (possibly schema-qualified) of a specific table to analyze. If omitted, all regular tables (but not foreign tables) in the current database are analyzed.

Currently, you can use ANALYZE to collect statistics on foreign tables of column-store tables.

Value range: an existing table name.

- **column\_name**, **column\_1\_name**, **column\_2\_name**

Specifies the name of a specific column to analyze. All columns are analyzed by default.

Value range: an existing column name

- **partition\_name**

Assumes the table is a partitioned table. You can specify **partition\_name** following the keyword **PARTITION** to analyze the statistics of this table. Currently, ANALYZE can be performed on partitioned tables, but statistics of specified partitions cannot be analyzed.

Value range: a partition name of a table

- **index\_name**

Specifies the name of the specific index table to be analyzed (possibly schema-qualified).

Value range: an existing table name

- **FAST|COMPLETE**

The **FAST** mode verifies the CRC and page header of the table. If the verification fails, an alarm is generated. In **COMPLETE** mode, the pointer and tuple of the table are parsed and verified.

- **CASCADE**

In **CASCADE** mode, all indexes of the current table are verified.

## Examples

-- Create a table.

```
gaussdb=# CREATE TABLE customer_info
(
 WR_RETURNED_DATE_SK INTEGER
```

```
WR_RETURNED_TIME_SK INTEGER ,
WR_ITEM_SK INTEGER NOT NULL,
WR_REFUNDED_CUSTOMER_SK INTEGER
)
DISTRIBUTE BY HASH (WR_ITEM_SK);
```

-- Create a partitioned table.

```
gaussdb=# CREATE TABLE customer_par
(
WR_RETURNED_DATE_SK INTEGER ,
WR_RETURNED_TIME_SK INTEGER ,
WR_ITEM_SK INTEGER NOT NULL,
WR_REFUNDED_CUSTOMER_SK INTEGER
)
DISTRIBUTE BY HASH (WR_ITEM_SK)
PARTITION BY RANGE(WR_RETURNED_DATE_SK)
(
PARTITION P1 VALUES LESS THAN(2452275),
PARTITION P2 VALUES LESS THAN(2452640),
PARTITION P3 VALUES LESS THAN(2453000),
PARTITION P4 VALUES LESS THAN(MAXVALUE)
)
ENABLE ROW MOVEMENT;
```

-- Run **ANALYZE** to update statistics.

```
gaussdb=# ANALYZE customer_info;
```

-- Run the **ANALYZE VERBOSE** statement to update statistics and display table information.

```
gaussdb=# ANALYZE VERBOSE customer_info;
INFO: analyzing "public.customer_info"(cn_5002 pid=53078)
INFO: analyzing "public.customer_info" inheritance tree(cn_5002 pid=53078)
ANALYZE
```

#### NOTE

If any environment-related fault occurs, check the logs of CN.

-- Delete the table.

```
gaussdb=# DROP TABLE customer_info;
gaussdb=# DROP TABLE customer_par;
```

## 7.15.44 BEGIN

### Description

BEGIN may be used to initiate an anonymous block or a single transaction. This section describes the syntax of BEGIN used to initiate an anonymous block. For details about the BEGIN syntax that initiates transactions, see [START TRANSACTION](#).

An anonymous block is a structure that can dynamically create and execute stored procedure code instead of permanently storing code as a database object in the database.

### Precautions

None

## Syntax

- Enable an anonymous block.  

```
[DECLARE [declare_statements]]
BEGIN
execution_statements
END;
/
```
- Start a transaction.  

```
BEGIN [WORK | TRANSACTION]
[
 {
 ISOLATION LEVEL { READ COMMITTED | SERIALIZABLE | REPEATABLE READ }
 | { READ WRITE | READ ONLY }
 } [, ...]
];
```

## Parameters

- **declare\_statements**  
Declares a variable, including its name and type, for example, **sales\_cnt int**.
- **execution\_statements**  
Specifies the statement to be executed in an anonymous block.  
Value range: an existing function name

## Examples

```
-- Generate a string using an anonymous block.
gaussdb=# BEGIN
dbe_output.print_line('Hello');
END;
/
```

## Helpful Links

[START TRANSACTION](#)

## 7.15.45 CALL

### Description

Calls defined functions and stored procedures.

### Precautions

The owner of a function or stored procedure, users granted with the EXECUTE permission on the function or stored procedure, or users granted with the EXECUTE ANY FUNCTION permission can call the function or stored procedure. The system administrator has the permission to call the function or stored procedure by default.

### Syntax

```
CALL [schema.|package.] { func_name | procedure_name } (param_expr);
```

## Parameters

- **schema**  
Specifies the name of the schema where a function or stored procedure is located.
- **package**  
Specifies the name of the package where a function or stored procedure is located.
- **func\_name**  
Specifies the name of the function or stored procedure to be called.  
Value range: an existing function name

### NOTE

You can use database links to perform operations on remote functions or stored procedures. For details, see [DATABASE LINK](#).

- **param\_expr**  
Specifies a list of parameters in the function. Use := or => to separate a parameter name and its value. This method allows parameters to be placed in any order. If only parameter values are in the list, the value order must be the same as that defined in the function or stored procedure.

Value range: an existing function parameter name or stored procedure parameter name

### NOTE

- The parameters include input parameters (whose name and type are separated by **IN**) and output parameters (whose name and type are separated by **OUT**). When you run the **CALL** command to call a function or stored procedure, the parameter list must contain an output parameter for non-overloaded functions. You can set the output parameter to a variable or any constant. For details, see [Examples](#). If an output parameter is contained, it must be a constant.

## Examples

```
-- Create a function func_add_sql, calculate the sum of two integers, and return the result.
gaussdb=# CREATE FUNCTION func_add_sql(num1 integer, num2 integer) RETURN integer
AS
BEGIN
RETURN num1 + num2;
END;
/

-- Transfer by parameter value.
gaussdb=# CALL func_add_sql(1, 3);

-- Transfer by naming tag method.
gaussdb=# CALL func_add_sql(num1 => 1,num2 => 3);
gaussdb=# CALL func_add_sql(num2 := 2, num1 := 3);

-- Delete the function.
gaussdb=# DROP FUNCTION func_add_sql;

-- Create a function with output parameters.
gaussdb=# CREATE FUNCTION func_increment_sql(num1 IN integer, num2 IN integer, res OUT integer)
RETURN integer
AS
BEGIN
res := num1 + num2;
```

```
END;
/

-- Transfer a constant as an output parameter.
gaussdb=# CALL func_increment_sql(1,2,1);

-- Transfer a variable as an output parameter.
gaussdb=# DECLARE
res int;
BEGIN
func_increment_sql(1, 2, res);
dbe_output.print_line(res);
END;
/

-- Create an overloaded function.
gaussdb=# create or replace procedure package_func_overload(col int, col2 out int) package
as
declare
col_type text;
begin
col := 122;
dbe_output.print_line('two out parameters ' || col2);
end;
/

gaussdb=# create or replace procedure package_func_overload(col int, col2 out varchar)
package
as
declare
col_type text;
begin
col2 := '122';
dbe_output.print_line('two varchar parameters ' || col2);
end;
/

-- Call the function.
gaussdb=# call package_func_overload(1, 'test');
gaussdb=# call package_func_overload(1, 1);

-- Delete the function.
gaussdb=# DROP FUNCTION func_increment_sql;
```

## 7.15.46 CHECKPOINT

### Function

A checkpoint is a point in the transaction log sequence at which all data files have been updated to reflect the information in the log. All data files will be flushed to a disk.

**CHECKPOINT** forces a transaction log checkpoint. By default, WALs periodically specify checkpoints in a transaction log. You may use **gs\_guc** to specify run-time parameters **checkpoint\_segments**, **checkpoint\_timeout**, and **incremental\_checkpoint\_timeout** to adjust the atomized checkpoint intervals.

### Precautions

- Only the system administrator and O&M administrator can invoke **CHECKPOINT**.
- **CHECKPOINT** forces an immediate checkpoint when the related command is issued, without waiting for a regular checkpoint scheduled by the system.

## Syntax

```
CHECKPOINT;
```

## Parameter Description

None

## Examples

```
-- Set a checkpoint.
gaussdb=# CHECKPOINT;
```

## 7.15.47 CLEAN CONNECTION

### Function

Clear idle or invalid network connections between the current CN and other specified CNs or DNs. This statement is used to clear the specified database and idle or invalid connections of a specified user cached in the current CN on a specified CN.

### Precautions

1. In non-force mode, this function only clears connections between database cluster nodes (CNs/DNs) and does not affect client connections.
2. This function clears only idle and invalid connections cached on the CN. Normal connections that are being used are not cleared.
3. This function takes effect only on CNs and does not take effect on DNs.
4. You can query the **PG\_STAT\_GET\_POOLER\_STATUS()** function to check the cache connection and verify the clearing effect.
5. You are advised to perform this operation only when the network connection of the database is abnormal.

### Syntax

```
CLEAN CONNECTION
TO { COORDINATOR (nodename [, ...]) | NODE (nodename [, ...]) | ALL [CHECK] [FORCE] }
{ FOR DATABASE dbname | TO USER username | FOR DATABASE dbname TO USER username };
```

### Parameter Description

- **CHECK**  
This parameter can be specified only when the node list is specified as **TO ALL**. Setting this parameter will check whether a database is accessed by other sessions before its connections are cleared. If any sessions are detected before **DROP DATABASE** is executed, an error will be reported and the database will not be deleted.
- **FORCE**  
This parameter can be specified only when the node list is **TO ALL**. If this parameter is specified, all threads related to the specified dbname and username in the current CN receive the SIGTERM signal, the corresponding session is forcibly closed, the transaction is terminated, and the network connection is cleared.

- **COORDINATOR ( nodename ,nodename ... } ) | NODE ( nodename , nodename ... ) | ALL**

This command is used to delete the idle or invalid connections between the current CN node and a specified node. There are three scenarios:

- **COORDINATOR:** Delete the idle or invalid connections from the current CN to a specified CN.
- **NODE:** Delete the idle or invalid connections from the current CN to a specified DN.
- **ALL:** Delete the idle or invalid connections from the current CN to all nodes, including CNs and DNs.

Value range: **nodename** is an existing node name.

- **dbname**

Deletes connections to a specified database from the current CN. If this parameter is not specified, connections to all databases will be deleted.

Value range: an existing database name

- **username**

Deletes connections to a specified user from the current CN. If this parameter is not specified, connections of all users will be deleted.

Value range: an existing username

## Examples

```
-- Create user jack.
gaussdb=# CREATE USER jack PASSWORD '*****';

-- Delete the idle and invalid connections between the current CN and dn1 and dn2 in the template1
database.
gaussdb=# CLEAN CONNECTION TO NODE (dn_6001_6002,dn_6003_6004) FOR DATABASE template1;

-- Delete the idle and invalid connections between the current CN and dn1 that are related to user jack.
gaussdb=# CLEAN CONNECTION TO NODE (dn_6001_6002) TO USER jack;

-- Delete the connections between the current CN and all nodes related to the testdb database.
gaussdb=# CLEAN CONNECTION TO ALL FORCE FOR DATABASE testdb;

-- Delete user jack.
gaussdb=# DROP USER jack;
```

## 7.15.48 CLOSE

### Function

**CLOSE** frees the resources associated with an open cursor.

### Precautions

- After a cursor is closed, no subsequent operations are allowed on it.
- A cursor should be closed when it is no longer needed.
- Every non-holdable open cursor is implicitly closed when a transaction is terminated by **COMMIT** or **ROLLBACK**.
- A holdable cursor is implicitly closed if the transaction that created it aborts by **ROLLBACK**.

- If the cursor creation transaction is successfully committed, the holdable cursor remains open until an explicit **CLOSE** operation is executed, or the client disconnects.
- GaussDB does not have an explicit **OPEN** cursor statement. A cursor is considered open when it is declared. You can view all available cursors by querying the **pg\_cursors** system view.

## Syntax

```
CLOSE { cursor_name | ALL } ;
```

## Parameter Description

- **cursor\_name**  
Specifies the name of a cursor to be closed.
- **ALL**  
Closes all open cursors.

## Examples

See [Examples](#) in **FETCH**.

## Helpful Links

[FETCH](#) and [MOVE](#)

## 7.15.49 CLUSTER

### Description

Clusters a table based on an index.

CLUSTER instructs GaussDB to cluster the table specified by **table\_name** based on the index specified by **index\_name**. The index must have been defined by **table\_name**.

When a table is clustered, it is physically reordered based on the index information. Clustering is a one-time operation. When the table is subsequently updated, the changes are not clustered. That is, no attempt is made to store new or updated rows according to their index order.

When a table is clustered, GaussDB records which index the table was clustered by. CLUSTER table\_name reclusters the clustered index that was previously recorded in the table. You can also use ALTER TABLE table\_name CLUSTER on index\_name to set the index of a specified table for subsequent cluster operations, or use ALTER TABLE table\_name SET WITHOUT CLUSTER to clear the previously clustered index of a specified table.

If CLUSTER does not contain parameters, all tables that have been clustered in the database owned by the current user will be reprocessed. If a system administrator uses this command, all clustered tables are reclustered.

When a table is being clustered, an ACCESS EXCLUSIVE lock is acquired on it. This prevents any other database operations (both read and write) from being performed on the table until the CLUSTER operation is finished.

## Precautions

- Only row-store B-tree indexes support CLUSTER.
- In the case where you are accessing single rows randomly within a table, the actual order of the data in the table is unimportant. Only row-store B-tree indexes support CLUSTER. If you are requesting a range of indexed values from a table, or a single indexed value that has multiple rows that match, CLUSTER will help because once the index identifies the table page for the first row that matches, all other rows that match are probably already on the same table page, and so you save disk accesses and speed up the query.
- When an index scan is used, a temporary copy of the table is created that contains the table data in the index order. Temporary copies of each index on the table are created as well. Therefore, you need free space on disk at least equal to the sum of the table size and the total index size.
- Because CLUSTER remembers which indexes are clustered, one can cluster the tables manually the first time, then set up a time like VACUUM without any parameters, so that the desired tables are periodically reclustered.
- Because the optimizer records statistics about the ordering of tables, it is advisable to run **ANALYZE** on the newly clustered table. Otherwise, the optimizer might make poor choices of query plans.
- CLUSTER cannot be executed in transactions.
- If the **xc\_maintenance\_mode** parameter is not enabled, CLUSTER skips all system catalogs.

## Syntax

- Cluster a table.  
`CLUSTER [ VERBOSE ] table_name [ USING index_name ];`
- Cluster a partition.  
`CLUSTER [ VERBOSE ] table_name PARTITION ( partition_name ) [ USING index_name ];`
- Recluster a table.  
`CLUSTER [ VERBOSE ];`

## Parameters

- **VERBOSE**  
Enables the display of progress messages.
- **table\_name**  
Specifies the table name.  
Value range: an existing table name
- **index\_name**  
Specifies the index name.  
Value range: an existing index name
- **partition\_name**  
Specifies the partition name.  
Value range: an existing partition name

## Examples

```
-- Create a partitioned table.
gaussdb=# CREATE TABLE tpcds.inventory_p1
```

```
(
 INV_DATE_SK INTEGER NOT NULL,
 INV_ITEM_SK INTEGER NOT NULL,
 INV_WAREHOUSE_SK INTEGER NOT NULL,
 INV_QUANTITY_ON_HAND INTEGER
)
DISTRIBUTE BY HASH(INV_ITEM_SK)
PARTITION BY RANGE(INV_DATE_SK)
(
 PARTITION P1 VALUES LESS THAN(2451179),
 PARTITION P2 VALUES LESS THAN(2451544),
 PARTITION P3 VALUES LESS THAN(2451910),
 PARTITION P4 VALUES LESS THAN(2452275),
 PARTITION P5 VALUES LESS THAN(2452640),
 PARTITION P6 VALUES LESS THAN(2453005),
 PARTITION P7 VALUES LESS THAN(MAXVALUE)
);

-- Create an index named ds_inventory_p1_index1.
gaussdb=# CREATE INDEX ds_inventory_p1_index1 ON tpcds.inventory_p1 (INV_ITEM_SK) LOCAL;

-- Cluster the tpcds.inventory_p1 table.
gaussdb=# CLUSTER tpcds.inventory_p1 USING ds_inventory_p1_index1;

-- Cluster the p3 partition.
gaussdb=# CLUSTER tpcds.inventory_p1 PARTITION (p3) USING ds_inventory_p1_index1;

-- Cluster the tables that can be clustered in the database.
gaussdb=# CLUSTER;

-- Delete the index.
gaussdb=# DROP INDEX tpcds.ds_inventory_p1_index1;

-- Drop the partitioned table.
gaussdb=# DROP TABLE tpcds.inventory_p1;
```

## 7.15.50 COMMENT

### Description

Defines or changes the comment of an object.

### Precautions

- Each object stores only one comment. Therefore, you need to modify a comment and issue a new **COMMENT** command to the same object. To delete the comment, write **NULL** at the position of the text string. When an object is deleted, the comment is automatically deleted.
- Currently, there is no security protection for viewing comments. Any user connected to a database can view all the comments for objects in the database. For shared objects such as databases, roles, and tablespaces, comments are stored globally so any user connected to any database in the cluster can see all the comments for shared objects. Therefore, do not put security-critical information in comments.
- To comment objects, you must be an object owner or user granted the **COMMENT** permission. The system administrator has this permission by default.
- Roles do not have owners, so the rule for **COMMENT ON ROLE** is that you must be an administrator to comment on an administrator role, or have the **CREATEROLE** permission to comment on non-administrator roles. A system administrator can comment on all objects.

## Syntax

```
COMMENT ON
{
 AGGREGATE agg_name (agg_type [, ...]) |
 CAST (source_type AS target_type) |
 COLLATION object_name |
 COLUMN { table_name.column_name | view_name.column_name } |
 CONSTRAINT constraint_name ON table_name |
 CONVERSION object_name |
 DATABASE object_name |
 DOMAIN object_name |

 FOREIGN DATA WRAPPER object_name |

 FUNCTION function_name ([[argname] [argmode] argtype] [, ...]) |
 INDEX object_name |
 LARGE OBJECT large_object_oid |
 OPERATOR operator_name (left_type, right_type) |
 OPERATOR CLASS object_name USING index_method |
 OPERATOR FAMILY object_name USING index_method |
 [PROCEDURAL] LANGUAGE object_name |
 ROLE object_name |
 SCHEMA object_name |
 SERVER object_name |
 TABLE object_name |
 TABLESPACE object_name |
 TEXT SEARCH CONFIGURATION object_name |
 TEXT SEARCH DICTIONARY object_name |
 TEXT SEARCH PARSER object_name |
 TEXT SEARCH TEMPLATE object_name |
 TYPE object_name |
 VIEW object_name |
 TRIGGER trigger_name ON table_name
}
IS 'text';
```

## Parameters

- **agg\_name**  
Specifies the new name of an aggregation function.
- **agg\_type**  
Specifies the data type of the aggregation function parameters.
- **source\_type**  
Specifies the source data type of the cast.
- **target\_type**  
Specifies the target data type of the cast.
- **object\_name**  
Specifies the name of an object.
- **table\_name.column\_name**  
**view\_name.column\_name**  
Specifies the column whose comment is defined or modified. You can add the table name or view name as the prefix.
- **constraint\_name**  
Specifies the table constraint whose comment is defined or modified.
- **table\_name**  
Specifies the name of a table.

- **function\_name**  
Specifies the function whose comment is defined or modified.
- **argmode,argname,argtype**  
Specifies the schema, name, and type of the function parameters.
- **large\_object\_oid**  
Specifies the OID of the large object whose comment is defined or modified.
- **operator\_name**  
Specifies the name of the operator.
- **left\_type,right\_type**  
Specifies the data type of the operator parameters (optionally schema-qualified). If the prefix or suffix operator does not exist, the **NONE** option can be added.
- **text**  
Specifies the comment content.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer table.
gaussdb=# CREATE TABLE tpcds.customer
(
 c_customer_sk INTEGER NOT NULL,
 c_customer_id CHAR(16) NOT NULL
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.customer VALUES (50, 'AAAAAAAAABAAAAAAA'),(100,
'AAAAAAAAACAAAAAAA'),(150, 'AAAAAAAADAAAAAAA');

gaussdb=# CREATE TABLE tpcds.customer_demographics_t2.
(
 CD_DEMO_SK INTEGER NOT NULL,
 CD_GENDER CHAR(1) ,
 CD_MARITAL_STATUS CHAR(1) ,
 CD_EDUCATION_STATUS CHAR(20) ,
 CD_PURCHASE_ESTIMATE INTEGER ,
 CD_CREDIT_RATING CHAR(10) ,
 CD_DEP_COUNT INTEGER ,
 CD_DEP_EMPLOYED_COUNT INTEGER ,
 CD_DEP_COLLEGE_COUNT INTEGER
)
DISTRIBUTE BY HASH (CD_DEMO_SK);

-- Comment out the tpcds.customer_demographics_t2.cd_demo_sk column.
gaussdb=# COMMENT ON COLUMN tpcds.customer_demographics_t2.cd_demo_sk IS 'Primary key of
customer demographics table.';

-- Create a view consisting of rows with c_customer_sk less than 150.
gaussdb=# CREATE VIEW tpcds.customer_details_view_v2 AS
SELECT *
FROM tpcds.customer
WHERE c_customer_sk < 150;

-- Comment out the tpcds.customer_details_view_v2 view.
gaussdb=# COMMENT ON VIEW tpcds.customer_details_view_v2 IS 'View of customer detail';

-- Delete the view.
gaussdb=# DROP VIEW tpcds.customer_details_view_v2;
```

```
-- Delete tpcds.customer_demographics_t2.
gaussdb=# DROP TABLE tpcds.customer_demographics_t2;

-- Delete the tpcds.customer table.
gaussdb=# DROP TABLE tpcds.customer;

-- Delete the schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## 7.15.51 COMMIT | END

### Description

COMMIT or END commits all operations of a transaction.

### Precautions

Only the creator of a transaction or a system administrator can run the **COMMIT** command. The creation and commit operations must be in different sessions.

### Syntax

```
{ COMMIT | END } [WORK | TRANSACTION] ;
```

### Parameters

- **COMMIT | END**  
Commits the current transaction and makes all changes made by the transaction become visible to others.
- **WORK | TRANSACTION**  
Specifies an optional keyword, which has no effect except increasing readability.

### Examples

```
-- Create a table.
gaussdb=# CREATE TABLE tpcds.customer_demographics_t2
(
 CD_DEMO_SK INTEGER NOT NULL,
 CD_GENDER CHAR(1) ,
 CD_MARITAL_STATUS CHAR(1) ,
 CD_EDUCATION_STATUS CHAR(20) ,
 CD_PURCHASE_ESTIMATE INTEGER ,
 CD_CREDIT_RATING CHAR(10) ,
 CD_DEP_COUNT INTEGER ,
 CD_DEP_EMPLOYED_COUNT INTEGER ,
 CD_DEP_COLLEGE_COUNT INTEGER
)
DISTRIBUTE BY HASH (CD_DEMO_SK);

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Insert data.
gaussdb=# INSERT INTO tpcds.customer_demographics_t2 VALUES(1,'M', 'U', 'DOCTOR DEGREE', 1200,
'GOOD', 1, 0, 0);
gaussdb=# INSERT INTO tpcds.customer_demographics_t2 VALUES(2,'F', 'U', 'MASTER DEGREE', 300, 'BAD',
1, 0, 0);

-- Commit the transaction to make all changes permanent.
```

```
gaussdb=# COMMIT;

-- Query data.
gaussdb=# SELECT * FROM tpcds.customer_demographics_t2;

-- Delete the tpcds.customer_demographics_t2 table.
gaussdb=# DROP TABLE tpcds.customer_demographics_t2;
```

## 7.15.52 COMMIT PREPARED

### Description

Commits a prepared two-phase transaction. This function is for internal use only. You are advised not to use it.

### Precautions

- The function is only available in maintenance mode (when GUC parameter **xc\_maintenance\_mode** is **on**). Exercise caution when enabling the mode. It is used by maintenance engineers for troubleshooting. Common users should not use the mode.
- Only the transaction creators or system administrators can run the **COMMIT PREPARED** command. The creation and commit operations must be in different sessions.
- The transaction function is maintained automatically by the database, and should be not visible to users.

### Syntax

```
COMMIT PREPARED transaction_id [WITH commit_sequence_number];
```

### Parameters

- **transaction\_id**  
Specifies the identifier of the transaction to be committed. The identifier must be different from those for current prepared transactions.
- **commit\_sequence\_number**  
Specifies the sequence number of the transaction to be committed. It is a 64-bit, incremental, unsigned number.

### Examples

```
-- Start.
gaussdb=# BEGIN;

-- Prepare a transaction whose identifier is trans_test.
gaussdb=# PREPARE TRANSACTION 'trans_test';

-- Create a table.
gaussdb=# CREATE TABLE item1(id int);

--Commit the transaction whose identifier is trans_test.
gaussdb=# COMMIT PREPARED 'trans_test';
```

```
-- Delete the table.
gaussdb=# DROP TABLE item1;
```

## 7.15.53 COPY

### Description

Copies data between tables and files.

**COPY FROM** copies data from a file to a table, and **COPY TO** copies data from a table to a file.

### Precautions

- When the **enable\_copy\_server\_files** parameter is disabled, only the initial user is allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME** statement. When the **enable\_copy\_server\_files** parameter is enabled, users with the **SYSADMIN** permission or users who inherit the built-in role permission **gs\_role\_copy\_files** are allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME** statement. By default, database configuration files and key files are not allowed, and you can run **COPY FROM FILENAME** or **COPY TO FILENAME** for certificate files and audit logs to prevent unauthorized users from viewing or modifying sensitive files. When **enable\_copy\_server\_files** is enabled, the administrator can use the GUC parameter **safe\_data\_path** to set the path for common users to import and export to the subpath of the set path. If this GUC parameter is not set (by default), the path used by common users is not blocked. This parameter reports an error for ... in the path of the **COPY** statement.
- **COPY** applies only to tables but not views.
- **COPY TO** requires the select permission on the table to be read, and **COPY FROM** requires the insert permission on the table to be inserted.
- If a list of columns is specified, **COPY** copies only the data of the specified columns between the file and the table. If a table has any columns that are not in the column list, **COPY FROM** inserts default values for those columns.
- If a data source file is specified, the server must be able to access the file. If **STDIN** is specified, data flows between the client and the server. When entering data, use the **TAB** key to separate the columns of the table and use a backslash and a period (\.) in a new row to indicate the end of the input.
- **COPY FROM** throws an error if any row in the data file contains more or fewer columns than expected.
- The end of the data can be represented by a line that contains only backslashes and periods (\.). If data is read from a file, the end flag is unnecessary. If data is copied between client applications, an end tag must be provided.
- In **COPY FROM**, **\N** is an empty string. To enter the actual value **\N**, use **\\N**.
- **COPY FROM** does not support data preprocessing during data import, such as expression operation and default value filling. If you need to preprocess data

during the import, you need to import the data to a temporary table and then run SQL statements to insert the data to the table through operations. However, this method causes I/O expansion and reduces the import performance.

- When a data format error occurs during COPY FROM execution, the transaction is rolled back. However, the error information is insufficient, making it difficult to locate the error data from a large amount of raw data.
- COPY FROM and COPY TO apply to low concurrency and local import and export of a small amount of data.
- When COPY is used in binary format, transcoding in distributed mode is not supported.
- **COPY** is a server command and its execution environment is the same as that of the database server process. **\COPY** is a client meta-command and its execution environment is the same as that of gsql on the client. Note that when the database and gsql are used in the sandbox environment, the **COPY** and **\COPY** commands both use the paths in the sandbox. When the database is used in the sandbox environment and gsql is used outside the sandbox, the **COPY** command uses the path inside the sandbox, and the **\COPY** command uses the path outside the sandbox.
- During the export using COPY TO, if the column data in the table contains the '\0' character, the column data will be truncated during the export. Only the data before '\0' will be exported.

## Syntax

- Copy data from a file to a table.

```
COPY table_name [(column_name [, ...])]
FROM { 'filename' | STDIN }
[[USING] DELIMITERS 'delimiters']
[WITHOUT ESCAPING]
[LOG ERRORS]
[LOG ERRORS DATA]
[REJECT LIMIT 'limit']
[[WITH] (option [, ...])]
| copy_option
| [TRANSFORM ({ column_name [data_type] [AS transform_expr] }, ...)]
| [FIXED FORMATTER ({ column_name(offset, length) }, ...) [(option [, ...]) | copy_option
[...]]];
```

### NOTE

The fixed formatter syntax is compatible with copy\_option but incompatible with option. copy\_option is incompatible with option. transform is compatible with copy\_option and fixed formatter.

- Copy data from a table to a file.

```
COPY table_name [(column_name [, ...])]
TO { 'filename' | STDOUT }
[[USING] DELIMITERS 'delimiters']
[WITHOUT ESCAPING]
[[WITH] (option [, ...])]
| copy_option
| [FIXED FORMATTER ({ column_name(offset, length) }, ...) [(option [, ...]) | copy_option
[...]]];
```

```
COPY query
TO { 'filename' | STDOUT }
[WITHOUT ESCAPING]
[[WITH] (option [, ...])]
| copy_option
```

```
| [FIXED FORMATTER ({ column_name(offset, length) } [, ...]) [(option [, ...]) | copy_option
[...]]];
```

### NOTE

1. The syntax constraints of COPY TO are as follows:  
(query) is incompatible with [USING] DELIMITERS. If the data comes from a query result, COPY TO cannot specify [USING] DELIMITERS.
2. Use spaces to separate **copy\_option** following FIXED FORMATTER.
3. **copy\_option** is the native parameter, while **option** is the parameter imported by a compatible foreign table.

The syntax of the optional parameter **option** is as follows:

```
FORMAT 'format_name'
| FORMAT binary
| OIDS [boolean]
| DELIMITER 'delimiter_character'
| NULL 'null_string'
| HEADER [boolean]
| USEEOF [boolean]
| FILEHEADER 'header_file_string'
| FREEZE [boolean]
| QUOTE 'quote_character'
| ESCAPE 'escape_character'
| EOL 'newline_character'
| NOESCAPING [boolean]
| FORCE_QUOTE { (column_name [, ...]) | * }
| FORCE_NOT_NULL (column_name [, ...])
| ENCODING 'encoding_name'
| IGNORE_EXTRA_DATA [boolean]
| FILL_MISSING_FIELDS [boolean]
| COMPATIBLE_ILLEGAL_CHARS [boolean]
| DATE_FORMAT 'date_format_string'
| TIME_FORMAT 'time_format_string'
| TIMESTAMP_FORMAT 'timestamp_format_string'
| SMALLDATETIME_FORMAT 'smalldatetime_format_string'
```

The syntax of the optional parameter **copy\_option** is as follows:

```
OIDS
| NULL 'null_string'
| HEADER
| USEEOF
| FILEHEADER 'header_file_string'
| FREEZE
| FORCE_NOT_NULL column_name [, ...]
| FORCE_QUOTE { column_name [, ...] | * }
| BINARY
| CSV
| QUOTE [AS] 'quote_character'
| ESCAPE [AS] 'escape_character'
| EOL 'newline_character'
| ENCODING 'encoding_name'
| IGNORE_EXTRA_DATA
| FILL_MISSING_FIELDS
| COMPATIBLE_ILLEGAL_CHARS
| DATE_FORMAT 'date_format_string'
| TIME_FORMAT 'time_format_string'
| TIMESTAMP_FORMAT 'timestamp_format_string'
| SMALLDATETIME_FORMAT 'smalldatetime_format_string'
```

## Parameters

- **query**  
Specifies that the results are to be copied.  
Valid value: a **SELECT** or **VALUES** command in parentheses

- **table\_name**  
Specifies the name (possibly schema-qualified) of an existing table.  
Value range: an existing table name
- **column\_name**  
Specifies an optional list of columns to be copied.  
Value range: any columns. All columns will be copied if no column list is specified.
- **STDIN**  
Specifies that input comes from the standard input.
- **STDOUT**  
Specifies that output goes to the standard output.
- **FIXED**  
Fixes column length. When the column length is fixed, **DELIMITER**, **NULL**, and **CSV** cannot be specified. When **FIXED** is specified, **BINARY**, **CSV**, and **TEXT** cannot be specified by **option** or **copy\_option**.

 **NOTE**

The definition of fixed length is as follows:

1. The column length of each record is the same.
2. Spaces are used for column padding. Columns of the numeric type are left-aligned and columns of the string type are right-aligned.
3. No delimiters are used between columns.

- **[USING] DELIMITERS 'delimiters'**

String that separates columns within each row (line) of the file. It cannot be larger than 10 bytes.

Value range: The delimiter in text format cannot include any of the following characters: \.abcdefghijklmnopqrstuvwxyz0123456789, but has no restriction for the CSV format.

Value range: The default value is a tab character in text format and a comma in CSV format.

 **NOTE**

Both **DELIMITER** and **DELIMITERS** can specify separators. However, **DELIMITERS** can be followed by syntax with bracket, but **DELIMITER** cannot be directly followed by bracket. Otherwise, a syntax error is reported.

- **WITHOUT ESCAPING**

Specifies, in the **TEXT** format, whether to escape the backslash (\) and its following characters.

Value range: text only

- **LOG ERRORS**

If this parameter is specified, the error tolerance mechanism for data type errors in the **COPY FROM** statement is enabled. Row errors are recorded in the **public.pgxc\_copy\_error\_log** table in the database for future reference.

Value range: a value set while data is imported using **COPY FROM**.

 NOTE

The restrictions of this error tolerance parameter are as follows:

- This error tolerance mechanism captures only the data type errors (**DATA\_EXCEPTION**) that occur during data parsing of **COPY FROM** on a CN. Other errors, such as network errors between CNs and DN or expression conversion errors on DNs, are not captured.
  - Before enabling error tolerance for **COPY FROM** for the first time in a database, check whether the **public.pgxc\_copy\_error\_log** table exists. If it does not, call the `copy_error_log_create()` function to create it. If it does, copy its data elsewhere, delete it, and call the `copy_error_log_create()` function to create the table. For details about columns in the **public.pgxc\_copy\_error\_log** table, see [Table 7-86](#).
  - While a **COPY FROM** statement with specified **LOG ERRORS** is being executed, if **public.pgxc\_copy\_error\_log** does not exist or does not have the table definitions compliant with those predefined in `copy_error_log_create()`, an error will be reported. Ensure that the error table is created using the `copy_error_log_create()` function. Otherwise, **COPY FROM** statements with error tolerance may fail to be run.
  - If existing error tolerance parameters (for example, **IGNORE\_EXTRA\_DATA**) of the **COPY** statement are enabled, the error of the corresponding type will be processed as specified by the parameters and no error will be reported. Therefore, the error table does not contain such error data.
- **LOG ERRORS DATA**

The differences between **LOG ERRORS DATA** and **LOG ERRORS** are as follows:

- a. **LOG ERRORS DATA** fills the **rawrecord** column in the error tolerance table.
- b. Only users with the **super** permission can use the **LOG ERRORS DATA** parameter.

---

 CAUTION

- If error content is too complex, it may fail to be written to the error tolerance table by using **LOG ERRORS DATA**, causing the task failure.
- For errors that cannot be read in certain code, the error codes are `ERRCODE_CHARACTER_NOT_IN_REPERTOIRE` and `ERRCODE_UNTRANSLATABLE_CHARACTER`. The **rawrecord** column is not recorded.

- **REJECT LIMIT 'limit'**

Used with the **LOG ERROR** parameter to set the upper limit of the tolerated errors in the **COPY FROM** statement. If the number of errors exceeds the limit, later errors will be reported based on the original mechanism.

Value range: a positive integer (1 to 2147483647) or **unlimited**

Default value: If **LOG ERRORS** is not specified, an error will be reported. If **LOG ERRORS** is specified, the default value is **0**.

 NOTE

Different from the GDS error tolerance mechanism, in the error tolerance mechanism described in **LOG ERRORS**, the count of **REJECT LIMIT** is calculated based on the number of data parsing errors on the CN where the **COPY FROM** statement is run, not based on the number of errors on each DN.

- **FORMATTER**

Defines the place of each column in the data file in fixed length mode.  
Defines the place of each column in the data file in the **column(offset,length)** format.

Value range:

- The value of **offset** must be larger than 0. The unit is byte.
- The value of **length** must be larger than 0. The unit is byte.

The total length of all columns must be less than 1 GB.

Replace columns that are not in the file with null.

- **OPTION { option\_name ' value ' }**

Specifies all types of parameters of a compatible foreign table.

- **FORMAT**

Specifies the format of the source data file in the foreign table.

Value range: **CSV**, **TEXT**, **FIXED**, and **BINARY**

- The CSV file can process newline characters efficiently, but cannot process certain special characters well.
- The TEXT file can process certain special characters efficiently, but cannot process newline characters well.
- In FIXED files, the column length of each record is the same. Spaces are used for padding, and the excessive part will be truncated.
- All data in the BINARY file is stored/read as binary format rather than as text. It is faster than the text and CSV formats, but a binary-format file is less portable.

Default value: **TEXT**

- **OIDS**

Specifies the internal OID to be copied for each row.

 **NOTE**

An error is raised if OIDs are specified for a table that does not have OIDs, or in the case of copying a query.

Value range: **true/on** and **false/off**.

Default value: **false**

- **DELIMITER**

Specifies the character that separates columns within each row (line) of the file.

 NOTE

- The value of **delimiter** cannot be `\r` or `\n`.
- A delimiter cannot be the same as the null value. The delimiter for the CSV format cannot be same as the **quote** value.
- The delimiter for the TEXT format data cannot contain lowercase letters, digits, or special characters (`.\|`).
- The data length of a single row should be less than 1 GB. A row that has many columns using long delimiters cannot contain much valid data.
- You are advised to use multi-character delimiters or invisible delimiters. For example, you can use multi-characters (such as `$^&`) and invisible characters (such as `0x07`, `0x08`, and `0x1b`).
- To use a tab to isolate CSV data, set **delimiter** to `E'\t'`.

Value range: a multi-character delimiter within 10 bytes

Default value:

- A tab character in text format
- A comma (,) in CSV format
- No delimiter in FIXED format

## - NULL

Specifies the string that represents a null value.

Value range:

- A null value cannot be `\r` or `\n`. The maximum length is 100 characters.
- A null value cannot be the same as the **delimiter** or **quote** value.

Default value:

- The default value for the CSV format is an empty string without quotation marks.
- The default value for the TEXT format is `\N`.

## - HEADER

Specifies whether a file contains a header with the names of each column in the file. **header** is available only for CSV and FIXED files.

When data is imported, if **header** is **on**, the first row of the data file will be identified as the header and ignored. If **header** is **off**, the first row will be identified as a data row.

When data is exported, if header is **on**, **fileheader** must be specified. If **header** is **off**, an exported file does not contain a header.

Value range: **true/on** and **false/off**.

Default value: **false**

## - USEEOF

The system does not report an error for `\".` in the imported data.

Value range: **true/on** and **false/off**.

Default value: **false**

## - QUOTE

Specifies a quoted character string for a CSV file.

Default value: double quotation marks (""")

 NOTE

- The value of **quote** cannot be the same as that of the **delimiter** or **null** parameter.
- The value of **quote** must be a single-byte character.
- You are advised to set **quote** to an invisible character, such as **0x07**, **0x08**, or **0x1b**.

## - ESCAPE

Specifies an escape character for a CSV file. The value must be a single-byte character.

Default value: quotation mark ("). If the value is the same as that of **quote**, it will be replaced by '\0'.

## - EOL 'newline\_character'

Specifies the newline character style of the imported or exported data file.

Value range: multi-character newline characters within 10 bytes.

Common newline characters include `\r` (0x0D), `\n` (0x0A), and `\r\n` (0x0D0A). Special newline characters include `$` and `#`.

 NOTE

- The EOL parameter supports only the TEXT format for data import and export and does not support the CSV or FIXED format for data import. For forward compatibility, the EOL parameter can be set to **0x0D** or **0x0D0A** for data export in the CSV or FIXED format.
- The value of **EOL** cannot be the same as that of the **delimiter** or **null** parameter.
- The EOL parameter value cannot contain the following characters: .abcdefghijklmnopqrstuvwxyz0123456789.

## - FORCE\_QUOTE { ( column\_name [, ...] ) | \* }

In **CSV COPY TO** mode, forces quotation marks to be used for all non-null values in each specified column. Null values are not quoted.

Value range: an existing column name

## - FORCE\_NOT\_NULL ( column\_name [, ...] )

Assigns a value to a specified column in **CSV COPY FROM** mode.

Value range: an existing column name

## - ENCODING

Specifies the encoding format of a data file. The default value is the current database encoding format.

 CAUTION

When COPY FROM is executed, **ENCODING** in the control file must be the same as the encoding format of the file. Otherwise, an error is reported or garbled characters are displayed in the imported data.

- IGNORE\_EXTRA\_DATA  
Specifies whether to ignore excessive columns when the number of data source files exceeds the number of foreign table columns. This parameter is used only during data import.  
Value range: **true/on** or **false/off**
  - **true/on**: If the number of columns in a data source file is greater than that defined by the foreign table, the extra columns at the end of a row are ignored.
  - **false/off**: If the number of columns in a data source file is greater than that defined by the foreign table, the following error message is reported:  
extra data after last expected columnDefault value: **false**

---

**NOTICE**

If a newline character at the end of a row is missing and the row and another row are integrated into one, data in another row is ignored after the parameter is set to **true**.

- COMPATIBLE\_ILLEGAL\_CHARS  
Specifies whether to tolerate invalid characters during data import. The parameter is valid only for data import using **COPY FROM**.  
Value range: **true/on** and **false/off**.
  - **true/on**: No error message is reported and data import is not interrupted when there are invalid characters. Invalid characters are converted into valid ones, and then imported to the database.
  - **false/off**: An error occurs when there are invalid characters, and the import stops.Default value: **false/off**

**NOTE**

The rules for converting invalid characters are as follows:

1. '\0' is converted to a space.
2. Other invalid characters are converted to question marks.
3. When **compatible\_illegal\_chars** is set to **true/on**, after invalid characters such as **NULL**, **DELIMITER**, **QUOTE**, and **ESCAPE** are converted to spaces or question marks, an error message stating "illegal chars conversion may confuse COPY escape 0x20" will be displayed to remind you of possible parameter confusion caused by the conversion.

- FILL\_MISSING\_FIELDS  
Specifies how to handle the problem that the last column of a row in a source data file is lost during data import.  
Value range: **true/on** and **false/off**.  
Default value: **false/off**

- **DATE\_FORMAT**

Specifies the DATE format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.

Value range: a valid DATE value. For details, see [Date and Time Processing Functions and Operators](#).

 **NOTE**

If Oracle is specified as the compatible database, the DATE format is **TIMESTAMP**. For details, see **timestamp\_format** below.
- **TIME\_FORMAT**

Specifies the TIME format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.

Value range: a valid TIME value. Time zones cannot be used. For details, see [Date and Time Processing Functions and Operators](#).
- **TIMESTAMP\_FORMAT**

Specifies the TIMESTAMP format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.

Value range: a valid TIMESTAMP value. Time zones cannot be used. For details, see [Date and Time Processing Functions and Operators](#).
- **SMALLDATETIME\_FORMAT**

Specifies the SMALLDATETIME format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.

Value range: a valid SMALLDATETIME value. For details, see [Date and Time Processing Functions and Operators](#).
- **COPY\_OPTION { option\_name ' value ' }**

Specifies all types of native parameters of **COPY**.

  - **OIDS**

Specifies the internal OID to be copied for each row.

 **NOTE**

An error is raised if OIDs are specified for a table that does not have OIDs, or in the case of copying a query.
  - **NULL null\_string**

Specifies the string that represents a null value.

---

**NOTICE**

When using **COPY FROM**, any data item that matches this string will be stored as a null value, so make sure that you use the same string as you used with **COPY TO**.

---

Value range:

- A null value cannot be `\r` or `\n`. The maximum length is 100 characters.
- A null value cannot be the same as the **delimiter** or **quote** value.

Default value:

- The default value for the TEXT format is `\N`.
- The default value for the CSV format is an empty string without quotation marks.

– **HEADER**

Specifies whether a file contains a header with the names of each column in the file. **header** is available only for CSV and FIXED files.

When data is imported, if **header** is **on**, the first row of the data file will be identified as the header and ignored. If **header** is **off**, the first row will be identified as a data row.

When data is exported, if header is **on**, **fileheader** must be specified. If **header** is **off**, an exported file does not contain a header.

– **USEEOF**

The system does not report an error for `"\"` in the imported data.

– **FILEHEADER**

Specifies a file that defines the content in the header for exported data. The file contains data description of each column.

---

**NOTICE**

- This parameter is available only when **header** is **on** or **true**.
- **fileheader** specifies an absolute path.
- The file can contain only one row of header information, and ends with a newline character. Excess rows will be discarded. (Header information cannot contain newline characters.)
- The length of the file including the newline character cannot exceed 1 MB.

---

– **FREEZE**

Sets the **COPY** loaded data row as **frozen**, like these data have executed **VACUUM FREEZE**.

This is a performance option of initial data loading. The data will be frozen only when the following three requirements are met:

- The table being loaded has been created or truncated in the same transaction before copying.
- There are no cursors open in the current transaction.
- There are no original snapshots in the current transaction.

 **NOTE**

When **COPY** is completed, all the other sessions will see the data immediately. However, this violates the general principle of MVCC visibility, and users should understand that this may cause potential risks.

- **FORCE NOT NULL** column\_name [, ...]  
Assigns a value to a specified column in **CSV COPY FROM** mode.  
Value range: an existing column
  - **FORCE QUOTE** { column\_name [, ...] | \* }  
In **CSV COPY TO** mode, forces quotation marks to be used for all non-null values in each specified column. Null values are not quoted.  
Value range: an existing column name
  - **BINARY**  
Specifies that data is stored and read in binary mode instead of text mode. In binary mode, you cannot declare **DELIMITER**, **NULL**, or **CSV**. When **BINARY** is specified, **CSV**, **FIXED**, and **TEXT** cannot be specified through **option** or **copy\_option**.
  - **CSV**  
Enables the CSV mode. When **CSV** is specified, **BINARY**, **FIXED**, and **TEXT** cannot be specified through **option** or **copy\_option**.
  - **QUOTE** [AS] 'quote\_character'  
Specifies a quoted character string for a CSV file.  
Default value: quotation mark (").
-  **NOTE**
- The value of **quote** cannot be the same as that of the **delimiter** or **null** parameter.
  - The value of **quote** must be a single-byte character.
  - You are advised to set **quote** to an invisible character, such as **0x07**, **0x08**, or **0x1b**.
- **ESCAPE** [AS] 'escape\_character'  
Specifies an escape character for a CSV file. The value must be a single-byte character.  
Default value: quotation mark ("). If the value is the same as that of **quote**, it will be replaced by '\0'.
  - **EOL** 'newline\_character'  
Specifies the newline character style of the imported or exported data file.  
Value range: multi-character newline characters within 10 bytes. Common newline characters include **\r** (0x0D), **\n** (0x0A), and **\r\n** (0x0D0A). Special newline characters include **\$** and **#**.

 NOTE

- The **EOL** parameter supports only the TEXT format for data import and export and does not support the CSV or FIXED format. For forward compatibility, the **EOL** parameter can be set to **0x0D** or **0x0D0A** for data export in the CSV or FIXED format.
  - The value of **EOL** cannot be the same as that of the **delimiter** or **null** parameter.
  - The EOL parameter value cannot contain the following characters: .abcdefghijklmnopqrstuvwxyz0123456789.
- ENCODING 'encoding\_name'  
Specifies the name of a file encoding format.  
Value range: a valid encoding format  
Default value: current encoding format

---

 CAUTION

When COPY FROM is executed, **ENCODING** in the control file must be the same as the encoding format of the file. Otherwise, an error is reported or garbled characters are displayed in the imported data.

---

- IGNORE\_EXTRA\_DATA  
Specifies that when the number of data source files exceeds the number of foreign table columns, excess columns at the end of the row are ignored. This parameter is used only during data import.  
If this parameter is not used and the number of columns in the data source file is greater than that defined in the foreign table, the following error information is displayed:  
extra data after last expected column
- COMPATIBLE\_ILLEGAL\_CHARS  
Specifies that invalid characters are tolerated during data import. Invalid characters are converted and then imported to the database. No error is reported and the import is not interrupted. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.  
If this parameter is not used, an error is reported when invalid characters are encountered during the import, and the import is interrupted.

 NOTE

The rules for converting invalid characters are as follows:

1. '\0' is converted to a space.
  2. Other invalid characters are converted to question marks.
  3. When **compatible\_illegal\_chars** is set to **true/on**, after invalid characters such as **NULL**, **DELIMITER**, **QUOTE**, and **ESCAPE** are converted to spaces or question marks, an error message stating "illegal chars conversion may confuse COPY escape 0x20" will be displayed to remind you of possible parameter confusion caused by the conversion.
- FILL\_MISSING\_FIELDS

Specifies how to handle the problem that the last column of a row in a source data file is lost during data import.

Value range: **true/on** and **false/off**.

Default value: **false** or **off**

---

**NOTICE**

Do not specify this option. Currently, it does not enable error tolerance, but will make the parser ignore the said errors during data parsing on the CN. Such errors will not be recorded in the **COPY** error table (enabled using **LOG ERRORS REJECT LIMIT**) but will be reported later by DNs. Therefore, do not specify this option.

- 
- **DATE\_FORMAT** 'date\_format\_string'  
Specifies the DATE format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.  
Value range: a valid DATE value For details, see [Date and Time Processing Functions and Operators](#).

 **NOTE**

If Oracle is specified as the compatible database, the DATE format is **TIMESTAMP**. For details, see **timestamp\_format** below.

- **TIME\_FORMAT** 'time\_format\_string'  
Specifies the TIME format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.  
Value range: a valid TIME value. Time zones cannot be used. For details, see [Date and Time Processing Functions and Operators](#).
- **TIMESTAMP\_FORMAT** 'timestamp\_format\_string'  
Specifies the **TIMESTAMP** format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.  
Value range: a valid **TIMESTAMP** value. Time zones cannot be used. For details, see [Date and Time Processing Functions and Operators](#).
- **SMALLDATETIME\_FORMAT** 'smalldatetime\_format\_string'  
Specifies the **SMALLDATETIME** format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.  
Value range: a valid **SMALLDATETIME** value. For details, see [Date and Time Processing Functions and Operators](#).
- **TRANSFORM** ( { column\_name [ data\_type ] [ AS transform\_expr ] } [, ...] )

Specify the conversion expression of each column in the table. **data\_type** specifies the data type of the column in the expression parameter. **transform\_expr** is the target expression that returns the result value whose data type is the same as that of the target column in the table. For details about the expression, see [Expressions](#).

#### NOTE

**COPY FROM** does not support expression conversion for distribution columns. The following special backslash sequences are recognized by **COPY FROM**:

- **\b**: Backslash (ASCII 8)
- **\f**: Form feed (ASCII 12)
- **\n**: Newline character (ASCII 10)
- **\r**: Carriage return character (ASCII 13)
- **\t**: Tab (ASCII 9)
- **\v**: Vertical tab (ASCII 11)
- **\digits**: Backslash followed by one to three octal digits specifies that the ASCII value is the character with that numeric code.
- **\xdigits**: Backslash followed by an x and one or two hex digits specifies the character with that numeric code.

## Permission Control Examples

```
gaussdb=> copy t1 from '/home/xy/t1.csv';
ERROR: COPY to or from a file is prohibited for security concerns
HINT: Anyone can COPY to stdout or from stdin. gsql's \copy command also works for anyone.
gaussdb=> grant gs_role_copy_files to xxx;
```

This error occurs because a non-initial user does not have the COPY permission. To solve this problem, enable the **enable\_copy\_server\_files** parameter. Then, the administrator can use the COPY function, and common users need to join the **gs\_role\_copy\_files** group.

## Examples

```
-- Copy the data from tpcds.ship_mode to the /home/omm/ds_ship_mode.dat file:
gaussdb=# COPY tpcds.ship_mode TO '/home/omm/ds_ship_mode.dat';

-- Output tpcds.ship_mode to stdout.
gaussdb=# COPY tpcds.ship_mode TO stdout;

-- Create the tpcds.ship_mode_t1 table.
gaussdb=# CREATE TABLE tpcds.ship_mode_t1
(
 SM_SHIP_MODE_SK INTEGER NOT NULL,
 SM_SHIP_MODE_ID CHAR(16) NOT NULL,
 SM_TYPE CHAR(30) ,
 SM_CODE CHAR(10) ,
 SM_CARRIER CHAR(20) ,
 SM_CONTRACT CHAR(20)
)
DISTRIBUTE BY HASH(SM_SHIP_MODE_SK);

-- Copy data from stdin to the tpcds.ship_mode_t1.
gaussdb=# COPY tpcds.ship_mode_t1 FROM stdin;

-- Copy data from the /home/omm/ds_ship_mode.dat file to the tpcds.ship_mode_t1 table.
gaussdb=# COPY tpcds.ship_mode_t1 FROM '/home/omm/ds_ship_mode.dat';
```

```
-- Copy data from the /home/omm/ds_ship_mode.dat file to the tpcds.ship_mode_t1 table, convert the
data using the TRANSFORM expression, and insert the 10 characters on the left of the SM_TYPE column
into the table.
gaussdb=# COPY tpcds.ship_mode_t1 FROM '/home/omm/ds_ship_mode.dat' TRANSFORM (SM_TYPE AS
LEFT(SM_TYPE, 10));

-- Copy data from the /home/omm/ds_ship_mode.dat file to the tpcds.ship_mode_t1 table, with the
import format set to TEXT (format 'text'), the delimiter set to \t' (delimiter E'\t'), excessive columns
ignored (ignore_extra_data 'true'), and characters not escaped (noescaping 'true').
gaussdb=# COPY tpcds.ship_mode_t1 FROM '/home/omm/ds_ship_mode.dat' WITH(format 'text', delimiter
E'\t', ignore_extra_data 'true', noescaping 'true');

-- Copy data from the /home/omm/ds_ship_mode.dat file to the tpcds.ship_mode_t1 table, with the
import format set to FIXED, fixed-length format specified (FORMATTER(SM_SHIP_MODE_SK(0, 2),
SM_SHIP_MODE_ID(2,16), SM_TYPE(18,30), SM_CODE(50,10), SM_CARRIER(61,20),
SM_CONTRACT(82,20))), excessive columns ignored (ignore_extra_data), and headers included (header).
gaussdb=# COPY tpcds.ship_mode_t1 FROM '/home/omm/ds_ship_mode.dat' FIXED
FORMATTER(SM_SHIP_MODE_SK(0, 2), SM_SHIP_MODE_ID(2,16), SM_TYPE(18,30), SM_CODE(50,10),
SM_CARRIER(61,20), SM_CONTRACT(82,20)) header ignore_extra_data;

-- Delete tpcds.ship_mode_t1.
gaussdb=# DROP TABLE tpcds.ship_mode_t1;
```

## 7.15.54 CREATE APP WORKLOAD GROUP MAPPING

### Description

Creates an application mapping group and associates it with an existing workload group.

### Precautions

Only a user with the CREATE permission on the current database can perform this operation.

### Syntax

```
CREATE APP WORKLOAD GROUP MAPPING app_name
[WITH (WORKLOAD_GPNAME = workload_gpname)];
```

### Parameters

- **app\_name**  
Specifies the name of an application mapping group. The name of an application mapping group must be unique in the current database.  
Value range: a string. It must comply with the [naming convention](#).
- **workload\_gpname**  
Specifies the workload group name.  
Value range: a string, which indicates the created workload group.

### Examples

```
-- Create a workload group.
gaussdb=# CREATE WORKLOAD GROUP group1;

-- Create an application mapping group and associate it with the created workload group.
gaussdb=# CREATE APP WORKLOAD GROUP MAPPING app_wg_map1 WITH
(WORKLOAD_GPNAME=group1);
```

```
-- Create a default application mapping group and associate it with the default workload group.
gaussdb=# CREATE APP WORKLOAD GROUP MAPPING app_wg_map2;

-- Delete the application mapping group.
gaussdb=# DROP APP WORKLOAD GROUP MAPPING app_wg_map1;
gaussdb=# DROP APP WORKLOAD GROUP MAPPING app_wg_map2;

-- Delete the workload group.
gaussdb=# DROP WORKLOAD GROUP group1;
```

## Helpful Links

[ALTER APP WORKLOAD GROUP MAPPING](#) and [DROP APP WORKLOAD GROUP MAPPING](#)

## 7.15.55 CREATE AUDIT POLICY

### Description

Creates a unified audit policy.

### Precautions

Only users with the poladmin or sysadmin permission, or the initial user can perform this operation.

The masking policy takes effect only after the security policy is enabled, that is, **enable\_security\_policy** is set to **on**.

---

#### CAUTION

When you use database links to perform operations on remote objects, the client initiates a database link request. The actual sender is the server, and the attributes such as the IP address of the sender are the values of the server. For details, see [DATABASE LINK](#).

---

### Syntax

```
CREATE AUDIT POLICY [IF NOT EXISTS] policy_name { { privilege_audit_clause | access_audit_clause }
[filter_group_clause] [ENABLE | DISABLE] };
```

- **privilege\_audit\_clause**  
PRIVILEGES { DDL | ALL } [ ON LABEL ( resource\_label\_name [, ... ] ) ]
- **access\_audit\_clause**  
ACCESS { DML | ALL } [ ON LABEL ( resource\_label\_name [, ... ] ) ]
- **filter\_group\_clause**  
FILTER ON { FILTER\_TYPE ( filter\_value [, ... ] ) } [, ... ]

### Parameters

- **policy\_name**  
Specifies the audit policy name, which must be unique.  
Value range: a string. It must comply with the [naming convention](#).

- **DDL**  
Specifies the operations that are audited in the database: **CREATE**, **ALTER**, **DROP**, **ANALYZE**, **COMMENT**, **GRANT**, **REVOKE**, **SET**, and **SHOW**.  
If this parameter is set to **ANALYZE**, both **ANALYZE** and **VACUUM** operations are audited.
- **ALL**  
Indicates all operations supported by the specified DDL statements in the database.
- **resource\_label\_name**  
Specifies the resource label name.
- **DML**  
Specifies the operations that are audited within the database: **SELECT**, **COPY**, **DEALLOCATE**, **DELETE**, **EXECUTE**, **INSERT**, **PREPARE**, **REINDEX**, **TRUNCATE**, and **UPDATE**.
- **FILTER\_TYPE**  
Specifies the types of information to be filtered by the policy, including **APP**, **ROLES**, and **IP**.
- **filter\_value**  
Indicates the detailed information to be filtered.
- **ENABLE|DISABLE**  
Enables or disables the unified audit policy. If **ENABLE|DISABLE** is not specified, **ENABLE** is used by default.

## Examples

```
-- Create users dev_audit and bob_audit.
gaussdb=# CREATE USER dev_audit PASSWORD '*****';
gaussdb=# CREATE USER bob_audit password '*****';

-- Create table tb_for_audit.
gaussdb=# CREATE TABLE tb_for_audit(col1 text, col2 text, col3 text);

-- Create a resource label.
gaussdb=# CREATE RESOURCE LABEL adt_lb0 add TABLE(tb_for_audit);

-- Perform the CREATE operation on the database to create an audit policy.
gaussdb=# CREATE AUDIT POLICY adt1 PRIVILEGES CREATE;

-- Perform the SELECT operation on the database to create an audit policy.
gaussdb=# CREATE AUDIT POLICY adt2 ACCESS SELECT;

-- Create an audit policy to audit only the CREATE operations performed on the adt_lb0 resource by users dev_audit and bob_audit.
gaussdb=# CREATE AUDIT POLICY adt3 PRIVILEGES CREATE ON LABEL(adt_lb0) FILTER ON ROLES(dev_audit, bob_audit);

-- Create an audit policy to audit only the SELECT, INSERT, and DELETE operations performed on the adt_lb0 resource by users dev_audit and bob_audit using client tool gsql on the servers whose IP addresses are 10.20.30.40 and 127.0.0.0/24.
gaussdb=# CREATE AUDIT POLICY adt4 ACCESS SELECT ON LABEL(adt_lb0), INSERT ON LABEL(adt_lb0), DELETE FILTER ON ROLES(dev_audit, bob_audit), APP(gsql), IP('10.20.30.40', '127.0.0.0/24');

-- Delete the audit policy.
gaussdb=# DROP AUDIT POLICY adt1, adt2, adt3, adt4;

-- Delete the resource label.
gaussdb=# DROP RESOURCE LABEL adt_lb0;
```

```
-- Delete the tb_for_audit table.
gaussdb=# DROP TABLE tb_for_audit;

-- Delete the dev_audit and bob_audit users.
gaussdb=# DROP USER dev_audit, bob_audit;
```

## Helpful Links

[ALTER AUDIT POLICY](#) and [DROP AUDIT POLICY](#)

## 7.15.56 CREATE BARRIER

### Description

Creates a barrier for cluster nodes. The barrier can be used for data restoration. This function is for internal use only. You are advised not to use it.

### Precautions

Generally, CREATE BARRIER is used only for backup and restoration. Therefore, CREATE BARRIER can be executed only in the following scenarios:

- The database initial user can run this command.
- If the backup and restoration mode is enabled on the CN, that is, the GUC parameter **operation\_mode** is set to **on**, users with the OPRADMIN permission can run this command.

### Syntax

```
CREATE BARRIER [barrier_name] ;
```

### Parameters

#### **barrier\_name**

(Optional) Specifies the name of a barrier.

Value range: a string. It must comply with the [naming convention](#).

### Examples

```
-- Specify the barrier name.
gaussdb=# CREATE BARRIER 'barrier1';
```

## 7.15.57 CREATE CLIENT MASTER KEY

### Description

The encrypted equality query feature adopts a multi-level encryption model. The master key encrypts the column key, and the column key encrypts data. This syntax is used to create a master key object.

### Precautions

- This syntax is specific to a fully-encrypted database.

- When connecting to the database, you need to enable the connection parameters of the encrypted equality query feature on the database driver side before running this syntax.
- The master key is provided by an external key manager. This syntax processes only information such as the key source and key ID. The following external key managers are supported:
  - a. Huawei Cloud KMS huawei\_kms
- Before using this syntax, set environment variables for the external key manager on the database driver side. For details, see section "Setting Encrypted Equality Query" in *Feature Guide*.

## Syntax

```
CREATE CLIENT MASTER KEY client_master_key_name WITH (KEY_STORE = key_store_name, KEY_PATH = "key_path_value", ALGORITHM = algorithm_type);
```

## Parameters

- **client\_master\_key\_name**

This parameter is used as the name of a key object. In the same namespace, the value of this parameter must be unique.

Value range: a string. It must comply with the [naming convention](#).
- **KEY\_STORE**

External key manager. For details about the value, see [Table 7-160](#).
- **KEY\_PATH**

Each key is managed by an external key manager and the key path format varies depending on the key manager. The value is a character string. For details, see [Table 7-160](#). A character string is enclosed in single or double quotation marks. If the length of a character string exceeds 64 characters, only single quotation marks can be used.
- **ALGORITHM**

Encryption algorithm used by the key. For details about the value, see [Table 7-160](#).

**Table 7-160** Parameter values for different key managers

| KEY_STORE  | KEY_PATH                                                                                                                                                                                                                                                    | ALGORITHM |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|
| huawei_kms | Format: '{KmsApiUrl}/{Key ID}'<br>Reference: 'https://kms.{Project}.myhuaweicloud.com/v1.0/{Project ID}/kms/{Key ID}'<br>Example: 'https://kms.cn-north-4.myhuaweicloud.com/v1.0/00000000000000000000000000000000/kms/00000000-0000-0000-0000-000000000000' | AES_256   |

### Example (Using gsql to Connect to the Database Server)

Before using this syntax, you need to enable KMS and configure parameters for accessing KMS. For details, see "Setting Encrypted Equality Queries" in *Feature Guide*.

## 7.15.58 CREATE COLUMN ENCRYPTION KEY

### Description

Creates a CEK that can be used to encrypt a specified column in a table.

### Precautions

This syntax is specific to a fully-encrypted database.

When using **gsql** to connect to a database server, you need to use the **-C** parameter to enable the fully-encrypted database.

The CEK object created using this syntax can be used for column-level encryption. When defining a column in a table, you can specify a CEK object to encrypt the column.

### Syntax

```
CREATE COLUMN ENCRYPTION KEY column_encryption_key_name WITH VALUES(CLIENT_MASTER_KEY = client_master_key_name, ALGORITHM = algorithm_type, ENCRYPTED_VALUE = encrypted_value);
```

### Parameters

- column\_encryption\_key\_name**  
 This parameter is used as the name of a key object. In the same namespace, the value of this parameter must be unique.  
 Value range: a string. It must comply with the [naming convention](#).

- **CLIENT\_MASTER\_KEY**  
Specifies the CMK used to encrypt the CEK. The value is the CMK object name, which is created using the CREATE CLIENT MASTER KEY syntax.
- **ALGORITHM**  
Encryption algorithm to be used by the CEK. The value can be **AEAD\_AES\_256\_CBC\_HMAC\_SHA256**, **AEAD\_AES\_128\_CBC\_HMAC\_SHA256**, **AEAD\_AES\_256\_CTR\_HMAC\_SHA256**, **AES\_256\_GCM**, or **SM4\_SM3**.  
The data expansion rates of different encryption algorithms are sorted as follows: **AEAD\_AES\_256\_CTR\_HMAC\_SHA256** < **AES\_256\_GCM** < **AEAD\_AES\_256\_CBC\_HMAC\_SHA256** = **AEAD\_AES\_128\_CBC\_HMAC\_SHA256** = **SM4\_SM3**. The **AEAD\_AES\_256\_CTR\_HMAC\_SHA256** and **AES\_256\_GCM** encryption algorithms are recommended.
- **ENCRYPTED\_VALUE (optional)**  
Specifies the key password defined by the user. The key password contains 28 to 256 characters. The security strength of a key containing 28 characters complies with AES128. If AES256 is used, the key password must contain 39 characters. If this parameter is not specified, a 256-bit key is automatically generated.

---

**NOTICE**

- SM algorithm constraints: SM2, SM3, and SM4 are Chinese national cryptography standards. To avoid legal risks, these algorithms must be used together. If you specify the SM4 algorithm to encrypt CEKs when creating a CMK, you must specify the SM3 and SM4 algorithms (**SM4\_SM3**) to encrypt data when creating CEKs.
  - Constraints on the **ENCRYPTED\_VALUE** column: If the CMK generated by Huawei KMS is used to encrypt the CEK and the **ENCRYPTED\_VALUE** column is used to transfer the key in the **CREATE COLUMN ENCRYPTION KEY** syntax, the length of the input key must be an integer multiple of 16 bytes.
- 

## Example (Using gsql to Connect to the Database Server)

Before using this syntax, you need to enable KMS and configure parameters for accessing KMS. For details, see "Setting Encrypted Equality Queries" in *Feature Guide*.

## 7.15.59 CREATE CONVERSION

### Description

Defines a new conversion between two character set encodings. This function is for internal use only. You are advised not to use it.

### Precautions

- The **DEFAULT** parameter indicates that the conversion between the source encoding and the target encoding is executed by default between the client

and the server. To support this usage, bidirectional conversion must be defined, that is, both conversion from A to B and conversion from B to A are supported.

- To perform conversion, you must have the EXECUTE permission on function and the CREATE permission on the target schema.
- SQL\_ASCII cannot be used for either source encoding or target encoding because the server behavior is hardwired when SQL\_ASCII "encoding" is involved.
- You can remove user-defined conversions using DROP CONVERSION.

## Syntax

```
CREATE [DEFAULT] CONVERSION name
FOR 'source_encoding' TO 'dest_encoding' FROM function_name
```

## Parameters

- **DEFAULT**  
Specifies that the conversion is the default conversion from the source encoding to the target encoding. There should be only one default conversion for each encoding pair in a schema.
- **name**  
Specifies the name of the conversion, which can be restricted by the schema. If not restricted by a schema, the conversion is defined in the current schema. The conversion name must be unique in a schema.
- **source\_encoding**  
Source encoding name.
- **dest\_encoding**  
Target encoding name.
- **function\_name**  
Function used for conversion. A function name can be restricted by a schema. If not, the function is found in the path.

The function must be in the following format:

```
conv_proc(
 integer, -- Source encoding ID
 integer, -- Target encoding ID
 cstring, -- Source character string (C character string ending with a null value)
 internal, -- Target (filled with a null-terminated C character string)
 integer -- Length of the source string
) RETURNS void;
```

---

### CAUTION

Currently, only internal creation is supported.

---

## 7.15.60 CREATE DATABASE

### Function

Creates a database. By default, the new database will be created only by cloning the standard system database **template0**.

### Precautions

- A user that has the CREATEDB permission or a system administrator can create a database.
- It cannot be executed inside a transaction block.
- If an error message similar to "could not initialize database directory" is displayed during database creation, the possible cause is that the permission on the data directory in the file system is insufficient or the disk is full.

### Syntax

```
CREATE DATABASE database_name
 [[WITH] { [OWNER [=] user_name] |
 [TEMPLATE [=] template] |
 [ENCODING [=] 'encoding'] |
 [LC_COLLATE [=] 'lc_collate'] |
 [LC_CTYPE [=] 'lc_ctype'] |
 [DBCOMPATIBILITY [=] 'compatibility_type'] |
 [TABLESPACE [=] tablespace_name] |
 [CONNECTION LIMIT [=] conlimit] |
 [DBTIMEZONE [=] 'time_zone'] }[...]];
```

### Parameter Description

- **database\_name**  
Specifies the database name.  
Value range: a string. It must comply with the [naming convention](#).
- **OWNER [= ] user\_name**  
Specifies the owner of the new database. If omitted, the default owner is the current user.  
Value range: an existing username
- **TEMPLATE [= ] template**  
Specifies a template name. That is, the template from which the database is created. GaussDB creates a database by copying data from a template database. GaussDB has two default template databases **template0** and **template1** and a default user database **postgres**.  
Value range: **template0**
- **ENCODING [= ] 'encoding'**  
Specifies the character encoding used by the database. The value can be a string (for example, **SQL\_ASCII**) or an integer.  
If this parameter is not specified, the encoding of the template database is used by default. By default, the codes of the template databases **template0** and **template1** are related to the operating system environment. The character encoding of **template1** cannot be changed. To change the encoding, use **template0** to create a database.

Common values are **GBK**, **UTF8**, **Latin1**, and **GB18030**. The supported character sets are as follows:

**Table 7-161** Supported character sets

| Name         | Description                       | Language            | Server-side Encoding | ICU Support | Number of Bytes/Characters | Alias              |
|--------------|-----------------------------------|---------------------|----------------------|-------------|----------------------------|--------------------|
| BIG5         | Big Five                          | Traditional Chinese | No                   | No          | 1-2                        | WIN950, Windows950 |
| EUC_CN       | Extended Unix Code-CN             | Simplified Chinese  | Yes                  | Yes         | 1-3                        | -                  |
| EUC_JP       | Extended Unix Code-JP             | Japanese            | Yes                  | Yes         | 1-3                        | -                  |
| EUC_JIS_2004 | Extended Unix Code-JP, JIS X 0213 | Japanese            | Yes                  | No          | 1-3                        | -                  |
| EUC_KR       | Extended Unix Code-KR             | Korean              | Yes                  | Yes         | 1-3                        | -                  |
| EUC_TW       | Extended Unix Code-Taiwan, China  | Traditional Chinese | Yes                  | Yes         | 1-3                        | -                  |
| GB18030      | National standards                | Chinese             | Yes                  | No          | 1-4                        | -                  |
| GB18030_2022 | National standards                | Chinese             | Yes                  | No          | 1-4                        | -                  |
| GBK          | Extended national standards       | Simplified Chinese  | Yes                  | No          | 1-2                        | WIN936, Windows936 |

| Name       | Description          | Language                   | Server-side Encoding | ICU Support | Number of Bytes/Characters | Alias    |
|------------|----------------------|----------------------------|----------------------|-------------|----------------------------|----------|

 **CAUTION**

- Note that not all client APIs support the preceding character sets.
- The SQL\_ASCII setting performs quite differently from other settings. If the character set of the server is SQL\_ASCII, the server interprets the byte values 0 to 127 according to the ASCII standard. The byte values 128 to 255 are regarded as the characters that cannot be parsed. If this parameter is set to SQL\_ASCII, no code conversion occurs. Therefore, this setting is not basically used to declare the specified encoding used, because this declaration ignores the encoding. In most cases, if you use any non-ASCII data, it is unwise to use the SQL\_ASCII setting because the database will not be able to help you convert or verify non-ASCII characters.

**NOTICE**

- The character set encoding of the new database must be compatible with the local settings (**LC\_COLLATE** and **LC\_CTYPE**).
  - When the specified character encoding set is **GBK**, some uncommon Chinese characters cannot be directly used as object names. This is because the byte encoding overlaps with the ASCII characters `@A-Z[\]^_`a-z{}` when the second byte of the GBK ranges from 0x40 to 0x7E. `@[\]^_`{}` is an operator in the database. If it is directly used as an object name, a syntax error will be reported. For example, the GBK hexadecimal code is **0x8240**, and the second byte is **0x40**, which is the same as the ASCII character `@`. Therefore, the character cannot be used as an object name. If you need to use this function, you can add double quotation marks ("" ) to avoid this problem when creating and accessing objects.
  - If the client code is A and the server code is B, the conversion between encoding formats A and B must exist in the database. For details about encoding format conversion supported by the database, see the system catalog **PG\_CONVERSION**. (If the encoding format cannot be converted, it is recommended that the encoding format on the client be the same as that on the server. You can change the encoding format on the client by setting the **client\_encoding** parameter.)
  - If you want to set the database character set encoding to **GB18030\_2022** and the client encoding to **GB18030**, ensure that the client OS supports **GB18030\_2022**. If the **GB18030** character set versions are incompatible with each other, data inconsistency may occur. In addition, if historical data needs to be switched to the **GB18030\_2022** database, follow the database switching process to migrate data.
- 
- **LC\_COLLATE [ = ] 'lc\_collate'**  
Specifies the character set used by the new database. For example, set this parameter by using **lc\_collate = 'zh\_CN.gbk'**.  
The use of this parameter affects the sort order of strings (for example, the order of using **ORDER BY** for execution and the order of using indexes on text columns). By default, the sorting order of the template database is used.  
Value range: character sets supported by the OS.
  - **LC\_CTYPE [ = ] 'lc\_ctype'**  
Specifies the character class used by the new database. For example, set this parameter by using **lc\_ctype = 'zh\_CN.gbk'**. The use of this parameter affects the classification of characters, such as uppercase letters, lowercase letters, and digits. By default, the character classification of the template database is used.  
Value range: character classes supported by the OS.

 **NOTE**

- The value ranges of **lc\_collate** and **lc\_ctype** depend on the character sets supported by the local environment. For example, in the Linux operating system, you can run the **locale -a** command to obtain the list of character sets supported by the operating system. When using the **lc\_collate** and **lc\_ctype** parameters, you can select the required character sets and character classes.
- If the specified character encoding set is **GB18030\_2022**, the value ranges of **LC\_COLLATE** and **LC\_CTYPE** are the same as those of **GB18030**.

- **DBCOMPATIBILITY [ = ] 'compatibility\_type'**

Specifies the compatible database type. The default value is **MySQL**.

Value range: **MYSQL**, **TD**, **ORA**, and **PG**. MySQL, Teradata, Oracle and PostgreSQL are compatible, respectively.

 **NOTE**

- For ORA compatibility, the database treats empty strings as **NULL** and replaces **DATE** with **TIMESTAMP(0) WITHOUT TIME ZONE**.
  - When a character string is converted to an integer, if the input is invalid, the input will be converted to 0 due to MySQL compatibility, and an error will be reported due to other compatibility issues.
  - For PG compatibility, CHAR and VARCHAR are counted by character. For other compatibility types, they are counted by byte. For example, for the UTF-8 character set, CHAR(3) can store three Chinese characters in PG compatibility scenarios, but can store only one Chinese character in other compatibility scenarios.
  - If an error is reported during statement execution, A-format or B-format is displayed in some error information. A-format indicates ORA-format, and B-format indicates MySQL-format.
- **TABLESPACE [ = ] tablespace\_name**  
Specifies the tablespace of the database.  
Value range: an existing tablespace name
  - **CONNECTION LIMIT [ = ] connlimit**  
Specifies the maximum number of concurrent connections that can be made to the new database.

---

**NOTICE**

- The system administrator is not restricted by this parameter.
- **connlimit** is calculated for each each CN. The number of connections in a cluster is calculated using the following formula: Number of connections in a cluster = **connlimit** x Number of normal CNs.

---

Value range: an integer in the range  $[-1, 2^{31} - 1]$ . The default value is **-1**, indicating that there is no limit.

The restrictions on character encoding are as follows:

- If the locale is set to **C** (or **POSIX**), all encoding types are allowed. For other locale settings, the character encoding must be the same as that of the locale.
- The encoding and region settings must match the template database, except that **template0** is used as a template. This is because other databases may contain data that does not match the specified encoding, or may contain indexes whose sorting order is affected by **LC\_COLLATE** and **LC\_CTYPE**. Copying this data will invalidate the indexes in the new database. **template0** does not contain any data or indexes that may be affected.
- **DBTIMEZONE [ = ] 'time\_zone'**  
Specifies the time zone of the new database. For example, you can set this parameter by setting **DBTIMEZONE** to **'+00:00'**. This parameter affects the time zone of the new database. The PRC is used by default.

Value range: name and abbreviation of the time zone supported by the OS, or the timestamp ranges from -15:59 to +15:00.

## Examples

```
-- Create users jim and tom.
gaussdb=# CREATE USER jim PASSWORD '*****';
gaussdb=# CREATE USER tom PASSWORD '*****';

-- Create database music using GBK (the local encoding type is also GBK).
gaussdb=# CREATE DATABASE music ENCODING 'GBK' template = template0;

-- Create database music2 and specify user jim as its owner.
gaussdb=# CREATE DATABASE music2 OWNER jim;

-- Create database music3 using template template0 and specify user jim as its owner.
gaussdb=# CREATE DATABASE music3 OWNER jim TEMPLATE template0;

-- Set the maximum number of connections to database music to 10.
gaussdb=# ALTER DATABASE music CONNECTION LIMIT= 10;

-- Rename database music to music4.
gaussdb=# ALTER DATABASE music RENAME TO music4;

-- Change the owner of database music2 to user tom.
gaussdb=# ALTER DATABASE music2 OWNER TO tom;

-- Delete the database.
gaussdb=# DROP DATABASE music2;
gaussdb=# DROP DATABASE music3;
gaussdb=# DROP DATABASE music4;

-- Delete the jim and tom users.
gaussdb=# DROP USER jim;
gaussdb=# DROP USER tom;

-- Create a database compatible with the TD format.
gaussdb=# CREATE DATABASE td_compatible_db DBCOMPATIBILITY 'TD';

-- Create a database compatible with the ORA format.
gaussdb=# CREATE DATABASE ora_compatible_db DBCOMPATIBILITY 'ORA';

-- Delete the databases that are compatible with the TD and ORA formats.
gaussdb=# DROP DATABASE td_compatible_db;
gaussdb=# DROP DATABASE ora_compatible_db;
```

## Helpful Links

[ALTER DATABASE](#) and [DROP DATABASE](#)

## Suggestions

- **create database**  
Database cannot be created in a transaction.
- **ENCODING**  
If the new database Encoding does not match the template database (SQL\_ASCII) ('GBK', 'UTF8', 'LATIN1', 'GB18030', or 'GB18030\_2022'), **template [=] template0** must be specified.

## 7.15.61 CREATE DATABASE LINK

### Function

Creates a database link object. For details about database links, see [DATABASE LINK](#).

### Syntax

```
CREATE [PUBLIC] DATABASE LINK dblink
[CONNECT TO { CURRENT_USER | user IDENTIFIED BY password }] [USING (option 'value' [...])];
```

### Parameter Description

- **PUBLIC**  
Creates a public database link visible to all users. If this clause is omitted, the database link is private and available only to the current user.
- **dblink**  
Indicates the name of the database link to be created.
- **user**  
Indicates the name of the user for connecting to the remote end of the created database link.
- **password**  
Indicates the password of the user for connecting to the remote end of the created database link.
- **CURRENT\_USER**  
Uses the initial username and empty password of the current database for connection.
- **USING ( option 'value' [, ... ] )**  
Specifies parameters such as the IP address, port number, and remote database name of the database to be connected. The supported options are as follows:
  - **host**: specifies the IP addresses to be connected. IPv6 addresses are not supported. Multiple IP addresses can be specified using character strings separated by commas (.). Currently, encrypted databases, SSL settings, and certificate authentication are not supported. If no IP address is specified, this parameter is left empty by default.
  - **port**: specifies the port number for connection. If this parameter is not specified, the default value **5432** is used.
  - **dbname**: specifies the name of the database to be connected. If this parameter is not specified, the username used for connecting to the remote end is used by default.
  - **fetch\_size**: specifies the amount of data obtained from the remote end each time. The value of **fetch\_size** ranges from 0 to 2147483647. The default value is **100**.

**NOTICE**

- You can write only part of the preceding options in the brackets after USING.
- If the keyword USING is not written, the content in the brackets is not written as well.
- When a database link is created, the system does not check whether the connection is successful. If related keywords are missing, an error may be reported.

**Example**

```
-- Create a user with the system administrator permission.
gaussdb=# CREATE USER user01 WITH SYSADMIN PASSWORD '*****';
gaussdb=# SET ROLE user01 PASSWORD '*****';

-- Create a private database link.
gaussdb=# CREATE DATABASE LINK private_dblink CONNECT TO 'user1' IDENTIFIED BY '*****' USING
(host '192.168.11.11',port '54399',dbname 'db01');

-- Delete the private database link.
gaussdb=# DROP DATABASE LINK private_dblink;

-- Create a public database link.
gaussdb=# CREATE PUBLIC DATABASE LINK public_dblink CONNECT TO 'user1' IDENTIFIED BY '*****'
USING (host '192.168.11.11',port '54399',dbname 'db01');

-- Delete the public database link.
gaussdb=# DROP PUBLIC DATABASE LINK public_dblink;

-- Delete the created user.
gaussdb=# RESET ROLE;
gaussdb=# DROP USER user01 CASCADE;
```

**NOTICE**

- Do not use database links to connect to the initial user.
- Initial users are not allowed to create, modify, or delete database links.
- If the upgrade is not committed, the database link cannot be created.
- Do not use 127.0.0.1 or local host for the **host** parameter. Otherwise, the connection fails.
- If the CURRENT\_USER is used or the CONNECT TO connection string is omitted, the initial username and empty password of the current database are used for connection, resulting in connection failure.

## 7.15.62 CREATE DATA SOURCE

**Function**

Creates an external data source, which defines the information about the database that GaussDB will connect to.

## Precautions

- The data source name must be unique in the database and comply with the identifier naming rules. Its length cannot exceed 63 bytes. Otherwise, it will be truncated.
- Only the system administrator or initial user has the permission to create data sources. The user who creates the object is the default owner of the object.
- If the **password** option is displayed, ensure that the **datasource.key.cipher** and **datasource.key.rand** files exist in the *\$GAUSSHOME/bin* directory of each node in the cluster. If the two files do not exist, use the **gs\_guc** tool to generate them and use the **gs\_ssh** tool to release them to the *\$GAUSSHOME/bin* directory on each node in the cluster.

## Syntax

```
CREATE DATA SOURCE src_name
 [TYPE 'type_str']
 [VERSION {'version_str' | NULL}]
 [OPTIONS (optname 'optvalue' [, ...]);
```

## Parameter Description

- **src\_name**  
Specifies the name of the new data source, which must be unique in the database.  
Value range: a string. It must comply with the naming convention.
- **TYPE**  
Specifies the type of the data source. This parameter can be left empty, and its default value will be used.  
Value range: an empty string or a non-empty string
- **VERSION**  
Specifies the version number of the new data source. This parameter can be left empty or set to null.  
Value range: an empty string, a non-empty string, or null
- **OPTIONS**  
Specifies the options of the data source. This parameter can be left empty or specified using the following keywords:
  - **optname**  
Specifies the option name.  
Value range: **dsn**, **username**, **password**, and **encoding**. The value is case-insensitive.
    - **dsn** corresponds to the DSN in the ODBC configuration file.
    - **username/password** indicates the username and password for connecting to the destination database.  
The username and password entered by the user are encrypted in the GaussDB background to ensure security. The key file required for encryption must be generated using the **gs\_guc** tool and released to the *\$GAUSSHOME/bin* directory of each node in the cluster using the **gs\_ssh** tool. **username** and **password** shall not contain the prefix

**encryptOpt**. Otherwise, the values of **username** and **password** will be considered as encrypted ciphertext.

- **encoding** indicates the character string encoding mode used for interaction with the destination database (including the sent SQL statements and returned data of the character type). Its validity is not checked during object creation. Whether data can be encoded and decoded depends on whether the encoding you specified can be used in the database.
- **optvalue**  
Specifies the option value.  
Value range: an empty string or a non-empty string

## Examples

```
-- Create an empty data source that does not contain any information.
gaussdb=# CREATE DATA SOURCE ds_test1;

-- Create a data source with TYPE information and VERSION being null.
gaussdb=# CREATE DATA SOURCE ds_test2 TYPE 'MPPDB' VERSION NULL;

-- Create a data source that contains only OPTIONS.
gaussdb=# CREATE DATA SOURCE ds_test3 OPTIONS (dsn 'GaussDB', encoding 'utf8');

-- Create a data source that contains TYPE, VERSION, and OPTIONS.
gaussdb=# CREATE DATA SOURCE ds_test4 TYPE 'unknown' VERSION '11.2.3' OPTIONS (dsn 'GaussDB',
username 'userid', password '*****', encoding '');

-- Delete the data source.
gaussdb=# DROP DATA SOURCE ds_test1;
gaussdb=# DROP DATA SOURCE ds_test2;
gaussdb=# DROP DATA SOURCE ds_test3;
gaussdb=# DROP DATA SOURCE ds_test4;
```

## 7.15.63 CREATE DIRECTORY

### Function

**CREATE DIRECTORY** creates a directory. The directory defines an alias for a path in the server file system and is used to store data files used by users. Users can read and write these files through the **db\_file** advanced package.

The read and write permissions for the directory can be granted to specified users to provide permission control for **db\_file**.

### Precautions

- When **enable\_access\_server\_directory** is set to **off**, only the initial user is allowed to create directory objects. When **enable\_access\_server\_directory** is set to **on**, the user with the SYSADMIN permission and the user who inherits the **gs\_role\_directory\_create** permission of the built-in role can create directory objects.
- By default, the user who creates a directory has the read and write permissions on the directory.

- The default owner of a directory is the user who creates the directory.
- A directory cannot be created for the following paths:
  - The path contains special characters.
  - The path is a relative path.
- The following validity check is performed during directory creation:
  - Check whether the path exists in the OS. If it does not exist, a message is displayed, indicating the potential risks.
  - Check whether the database initial user **omm** has the read, write, and execution permissions on the created directory. If the user does not have all the permissions, a message is displayed, indicating the potential risks.
- In a cluster, ensure that the path is the same on all the nodes. Otherwise, the path may fail to be found on some nodes when the directory is used.

## Syntax

```
CREATE [OR REPLACE] DIRECTORY directory_name
AS 'path_name';
```

## Parameter Description

- **directory\_name**  
Specifies name of a directory.  
Value range: a string. It must comply with the naming convention.
- **path\_name**  
Specifies the OS path for which a directory is to be created.  
Value range: a valid OS path

## Examples

```
-- Create a directory.
gaussdb=# CREATE OR REPLACE DIRECTORY dir AS '/tmp/';

-- Delete the directory.
gaussdb=# DROP DIRECTORY dir;
```

[ALTER DIRECTORY](#) and [DROP DIRECTORY](#)

## 7.15.64 CREATE FOREIGN TABLE (for Import and Export)

Creates a GDS foreign table.

## Description

Creates a GDS foreign table in the current database for concurrent data import and export. The GDS foreign table can be read-only or write-only, used for concurrent data import and export, respectively. The OBS foreign table is read-only by default.

## Precautions

- The foreign table is owned by the user who runs the statement.
- The distribution mode of a GDS foreign table does not need to be explicitly specified. The default mode is **ROUNDROBIN**.
- All constraints (including column and row constraints) are invalid to the GDS foreign table.
- When multi-layer quotation marks are used for sensitive columns (such as **password** and **secret\_access\_key**) in **OPTIONS**, the semantics is different from that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.

## Syntax

```
CREATE FOREIGN TABLE [IF NOT EXISTS] table_name
([{ column_name type_name POSITION (offset, length) | LIKE source_table } [, ...]])
SERVER server_name
OPTIONS ({ option_name 'value' } [, ...])
[WRITE ONLY | READ ONLY]
[WITH error_table_name | LOG INTO error_table_name]
[REMOTE LOG 'name']
[PER NODE REJECT LIMIT 'value']
[TO { GROUP groupname | NODE (nodename [, ...]) }];
```

## Parameter Overview

The syntax for creating a foreign table provides multiple parameters. Common parameters are classified as follows:

- Mandatory parameters
  - **table\_name**
  - **column\_name**
  - **type\_name**
  - **POSITION(offset,length)**
  - **LIKE source\_table**
  - **SERVER server\_name**
  - **OPTIONS**
- Optional parameters
  - Data source location parameter in foreign tables: **location**
  - Data format parameters
    - **format**
    - **header** (only for CSV and FIXED source data files)
    - **fileheader** (only for CSV and FIXED source data files)
    - **out\_filename\_prefix**
    - **delimiter**
    - **quote** (only for CSV source data files)

- **escape** (only for CSV source data files)
- **null**
- **noescaping** (only for TEXT source data files)
- **encoding**
- **eol**
- Error-tolerance parameters
  - **fill\_missing\_fields**
  - **ignore\_extra\_data**
  - **reject\_limit**
  - **compatible\_illegal\_chars**
  - **WITH error\_table\_name**
  - **LOG INTO error\_table\_nam...**
  - **REMOTE LOG 'name'**
  - **PER NODE REJECT LIMIT 'v...**

## Parameters

- **IF NOT EXISTS**  
Sends a notice, but does not throw an error, if a table with the same name exists.
- **table\_name**  
Specifies the name of a foreign table.  
Value range: a string. It must comply with the **naming convention**.
- **column\_name**  
Specifies the name of a column in the foreign table.  
Value range: a string. It must comply with the **naming convention**.
- **type\_name**  
Specifies the data type of the column.
- **POSITION(offset,length)**  
Defines the place of each column in the data file in fixed length mode.  
 **NOTE**  
**offset** is the start of the column in the source file, and **length** is the length of the column.  
Value range: **offset** must be greater than 0, and its unit is byte.  
The length of each record must be less than or equal to 1 GB. By default, columns not in the file are replaced with null.
- **LIKE source\_table**

Specifies a foreign table. A new foreign table automatically inherits all column names and their data types from this foreign table.

- **SERVER server\_name**

Specifies the server name of the foreign table. For the GDS foreign table, its server is created by the initial database, which is **gsmpp\_server**.

 **NOTE**

The name of the foreign-data wrapper corresponding to the server cannot be **file\_fdw**.

- **OPTIONS ( { option\_name ' value ' } [, ...] )**

Specifies all types of parameters of foreign table data.

- location

Specifies the data source location of the foreign table, which can be expressed through URLs or in local files. Separate URLs and local files with vertical bars (|).

 **NOTE**

- For a read-only foreign table imported by GDS from a remote server in parallel, its URL must end with its corresponding schema or file name. (Read-only is the default file attribute.)

For example: **gsfs://192.168.0.90:5000/\***, **file:///data/data.txt**, or **gsfs://192.168.0.90:5000/\* | gsfs://192.168.0.91:5000/\***.

- For a writable foreign table exported by GDS to a remote server in parallel, its URL does not need to contain a file name. If the data source is local, for example, **file:///data/**, only one data source in the foreign table can be specified, and the hosting directory must be created in advance on each node. If the exported data file is stored in a remote URL, for example, **gsfs://192.168.0.90:5000/**, you can specify multiple data source locations. In this case, if the number of storage locations of exported data files is less than or equal to the number of DNs, a foreign table is used to execute the export task. The system traverses the nodes and allocates storage locations for exported data files one by one. After a round of allocation is complete, the system performs the next round of allocation from the beginning. Therefore, the more the nodes, the more evenly the allocation. If the number of storage locations is greater than the number of DNs, an export task is executed. Data is evenly allocated to the data source locations whose number is equal to the number of data nodes from the beginning of the location list. Data files are still created in the remaining data source locations, but the files do not contain any data.
- For a read-only foreign table imported by GDS from a remote server in parallel, the number of URLs must be less than the number of DNs, and URLs in the same location cannot be used.
- If the URL begins with **gsfss://**, data is imported and exported in encryption mode, and DOP cannot exceed 10.
- If SSL is used for encrypted transmission and the certificate is replaced, GDS must be restarted.

- format

Specifies the format of the data source file in a foreign table.

Value range: **CSV**, **TEXT**, and **FIXED**. The default value is **TEXT**.

- In CSV files, escape sequences are processed as common strings. Therefore, newline characters are processed as data.

- In TEXT files, escape sequences are processed as they are. Therefore, newline characters are not processed as data.
- In FIXED files, the column length of each record is the same and spaces are used for padding.

**NOTE**

- An escape sequence is a string starting with a backslash (\), including **\b** (backspace), **\f** (form feed), **\n** (new line), **\r** (carriage return), **\t** (horizontal tab), **\v** (vertical tab), **\digit** (octal number), and **\xdigit** (hexadecimal number). In TEXT files, strings are processed as they are. In files of other formats, strings are processed as data.
- **FIXED** is defined as follows (**POSITION** must be specified for each column when **FIXED** is used.):
  1. The column length of each record is the same.
  2. Spaces are used for column padding. Columns of the numeric type are left-aligned and columns of the string type are right-aligned.
  3. No delimiters are used between columns.

– **header**

Specifies whether a file contains a header with the names of each column in the file. **header** is available only for CSV and FIXED files.

When data is imported, if **header** is **on**, the first row of the data file will be identified as the header and ignored. If **header** is **off**, the first row will be identified as a data row.

When data is exported, if header is **on**, **fileheader** must be specified. **fileheader** is used to specify the export header file format. If **header** is **off**, an exported file does not contain a header.

Value range: **true/on** and **false/off**. The default value is **false/off**.

– **fileheader**

Specifies a file that defines the content in the header for exported data. The file contains one row of data description of each column.

For example, to add a header in a file containing product information, define the file as follows:

```
The information of products.\n
```

---

**NOTICE**

- This parameter is available only when **header** is **on** or **true**. The file must be prepared in advance.
- In **Remote** mode, the definition file must be put to the working directory of the GDS (the **-d** directory specified when the GDS is started).
- In **Local** mode, the definition file must be put to the same path of each node, and **fileheader** specifies the absolute path.
- The file can contain only one row of header information, and end with a newline character. Excess rows will be discarded. (Header information cannot contain newline characters).
- The length of the file including the newline character cannot exceed 1 MB.

---

**out\_filename\_prefix**

Specifies the name prefix of the data file exported using GDS from a write-only foreign table.

---

**NOTICE**

- The file name prefix must be valid and compliant with the restrictions of the file system in the physical environment where the GDS is deployed. Otherwise, the file will fail to be created.
  - The prefix of the specified export file name does not contain invalid characters, including but not limited to: '/', '?', '\*', ':', '|', '\\', '<', '>', '@', '#', '\$', '&', '(', ')', '+', '-'. The allowed characters are [a-z]\*[A-Z]\*[0-9]\* and '\_'.
  - The file name prefix cannot contain feature columns reserved for the Windows and Linux OS, including but not limited to:  
"con", "aux", "nul", "prn", "com0", "com1", "com2", "com3", "com4", "com5", "com6", "com7", "com8", "com9", "lpt0", "lpt1", "lpt2", "lpt3", "lpt4", "lpt5", "lpt6", "lpt7", "lpt8", and "lpt9".
  - The total length of the absolute path consisting of the exported file prefix, the path specified by **gds -d**, and **.dat.x** should be as required by the file system where GDS is deployed.
  - It is required that the prefix can be correctly parsed and identified by the receiver (including but not limited to the original database where it was exported) of the data file. Identify and modify the option that causes the file name resolution problem (if any).
- To concurrently perform export jobs, do not use the same file name prefix for them. Otherwise, the exported files may overwrite each other or be lost in the OS or file system.

---

**delimiter**

Specifies the column delimiter of data. Use the default delimiter if it is not set. The default delimiter in the TEXT format is a tab and that in the CSV format is a comma (,). No delimiter is used in the FIXED format.

 NOTE

- The value of **delimiter** cannot be `\r` or `\n`.
- A delimiter cannot be the same as the null value. The delimiter for the CSV format cannot be same as the **quote** value.
- The delimiter of TEXT data cannot contain any of the following characters: `\.abcdefghijklmnopqrstuvwxyz0123456789`.
- The data length of a single row should be less than 1 GB. A row that has many columns using long delimiters cannot contain much valid data.
- You are advised to use a multi-character, such as the combination of the dollar sign (\$), caret (^), and ampersand (&), or invisible characters, such as `0x07`, `0x08`, and `0x1b` as the delimiter.

Value range:

The value of **delimiter** can be a multi-character delimiter whose length is less than or equal to 10 bytes.

## - quote

Specifies which characters in a CSV source data file will be quoted. The default value is single quotation marks (").

 NOTE

- The value of **quote** cannot be the same as that of the **delimiter** or **null** parameter.
- The value of **quote** must be a single-byte character.
- Invisible characters are recommended, such as `0x07`, `0x08`, and `0x1b`.

## - escape

Specifies which characters in a CSV source data file are escape characters. Escape characters can only be single-byte characters.

The default value is single quotation marks ("). If the value is the same as that of **quote**, it will be replaced by `\0`.

## - null

Specifies the string that represents a null value.

 NOTE

- A null value cannot be `\r` or `\n`. The maximum length is 100 characters.
- A null value cannot be the same as the **delimiter** or **quote** value.

Value range:

- The default value is `\n` for the TEXT format.
- The default value for the CSV format is an empty string without quotation marks.

## - noescaping

Specifies, in the TEXT format, whether to escape the backslash (\) and its following characters.

 NOTE

**noescaping** is available only for TEXT source data files.

Value range: **true/on** and **false/off**. The default value is **false/off**.

- encoding  
Specifies the encoding of a data file, that is, the encoding used to parse, check, and generate a data file. Its default value is the default **client\_encoding** value of the current database. For details about the value range of the character encoding, see [ENCODING \[ = \] 'encoding'](#) in section "CREATE DATABASE."

Before you import foreign tables, it is recommended that you set **client\_encoding** to the file encoding format, or a format matching the character set of the file. Otherwise, parsing and check errors may occur, leading to import errors, rollback, or even invalid data import. In a foreign table used for export, you are also advised to set this parameter because the export result using the default character set may not be what you expected.

If this parameter is not specified when you create a foreign table, a warning message will be displayed on the client.

#### NOTE

Currently, GDS foreign tables cannot parse data files using multiple encoding formats during data import and cannot write such data files during data export.

- fill\_missing\_fields  
Specifies how to handle the problem that the last column of a row in a source data file is lost during data import.  
Value range: **true/on** and **false/off**. The default value is **false/off**.
  - **true/on**: If the last column in a row of a data source file is missing during data loading, the column is set to null and no import error message is reported.
  - **false/off**: If the last column in a row of a data source file is missing during data import, the following error message is reported:  
missing data for column "tt"
- ignore\_extra\_data  
Specifies whether to ignore excessive columns when the number of data source files exceeds the number of foreign table columns. This parameter is used only during data import.  
Value range: **true/on** and **false/off**. The default value is **false/off**.
  - **true/on**: If the number of columns in a data source file is greater than that defined by the foreign table, the extra columns at the end of a row are ignored.
  - **false/off**: If the number of columns in a data source file is greater than that defined by the foreign table, the following error message is reported:  
extra data after last expected column

---

#### NOTICE

If a newline character at the end of a row is missing and the row and another row are integrated into one, data in another row is ignored after the parameter is set to **true**.

---

- **reject\_limit**  
Specifies the maximum number of data format errors allowed during a data import task. If the number of errors does not reach the maximum number, the data import task can still be executed.

---

**NOTICE**

You are advised to replace this syntax with **PER NODE REJECT LIMIT 'value'**.

Data format errors include the following: a column is lost, an extra column exists, a data type is incorrect, and encoding is incorrect. Once a non-data-format error occurs, the whole data import process is stopped.

---

Value range: a positive integer or **unlimited**

The default value is **0**, indicating that error information is returned immediately.

**NOTE**

Enclose positive integer values with single quotation marks (').

- **mode**  
Specifies the data import policy during a specific data import process.  
Value range:
  - **Normal** (default): supports all file types (CSV, TEXT, FIXED). Enable GDS to help data import.
  - **Shared**: supports the TEXT format. It does not need assistance from GDS, but requires that all the user data be mounted to the same path of the same nodes through NFS.
  - **Private**: User data has been stored in the same local directories of DNs.
- **eol**  
Specifies the newline character style of the imported or exported data file.  
Value range: multi-character newline characters within 10 bytes. Common newline characters include `\r` (0x0D), `\n` (0x0A), and `\r\n` (0x0D0A). Special newline characters include `$` and `#`.  
**NOTE**
  - The **eol** parameter supports only the TEXT format for data import and export and does not support the CSV or FIXED format for data import. For forward compatibility, the **EOL** parameter can be set to **0x0D** or **0x0D0A** for data export in the CSV or FIXED format.
  - The value of **EOL** cannot be the same as that of the **delimiter** or **null** parameter.
  - The **EOL** parameter value cannot contain the following characters: .abcdefghijklmnopqrstuvwxyz0123456789.
- **fix**

Specifies the length of fixed-length data. The unit is byte. This syntax is available only for READ ONLY foreign tables.

Value range: less than 1 GB, and greater than or equal to the total length specified by **POSITION** (The total length is the sum of **offset** and **length** in the last column of the table definition.)

– out\_fix\_alignment

Specifies how the columns of the types BYTEA OID, CHAROID, NAMEOID, TEXTOID, BPCHAROID, VARCHAROID, NVARCHAR2OID, and CSTRINGOID are aligned during fixed-length export.

Value range: **align\_left** and **align\_right**

Default value: **align\_right**

---

**NOTICE**

The bytea data type must be in hexadecimal format (for example, \XXXX) or octal format (for example, \XXX\XXX\XXX). The data to be imported must be left-aligned (that is, the column data starts with either of the two formats instead of spaces). Therefore, if the exported file needs to be imported using a GDS foreign table and the file data length is less than that specified by the foreign table formatter, the exported file must be left aligned. Otherwise, an error is reported during the import.

---

– date\_format

Specifies the DATE format for data import. This syntax is available only for READ ONLY foreign tables.

Value range: a valid DATE value For details, see [Date and Time Processing Functions and Operators](#).

 NOTE

If Oracle is specified as the compatible database, the DATE format is **TIMESTAMP**. For details, see **timestamp\_format** below.

– time\_format

Specifies the TIME format for data import. This syntax is available only for READ ONLY foreign tables.

Value range: a valid TIME value. Time zones are not supported. For details, see [Date and Time Processing Functions and Operators](#).

– timestamp\_format

Specifies the TIMESTAMP format for data import. This syntax is available only for READ ONLY foreign tables.

Value range: a valid TIMESTAMP value. Time zones cannot be used. For details, see [Date and Time Processing Functions and Operators](#).

– smalldatetime\_format

Specifies the SMALLDATETIME format for data import. This syntax is available only for READ ONLY foreign tables.

Value range: a valid SMALLDATETIME value For details, see [Date and Time Processing Functions and Operators](#).

- **compatible\_illegal\_chars**  
Specifies whether to tolerate invalid characters during data import. This syntax is available only for READ ONLY foreign tables.  
Value range: **true/on** and **false/off**. The default value is **false/off**.
  - **true/on**: No error message is reported and data import is not interrupted when there are invalid characters. Invalid characters are converted into valid ones, and then imported to the database.
  - **false/off**: An error occurs when there are invalid characters, and the import stops.

 **NOTE**

The rules for converting invalid characters are as follows:

1. **\0** is converted to a space.
2. Other invalid characters are converted to question marks.
3. When **compatible\_illegal\_chars** is set to **true/on**, after invalid characters such as **NULL**, **DELIMITER**, **QUOTE**, and **ESCAPE** are converted to spaces or question marks, an error message stating "illegal chars conversion may confuse COPY escape 0x20" will be displayed to remind you of possible parameter confusion caused by the conversion.

- **READ ONLY**

Specifies whether a foreign table is read-only. This parameter is available only for data import.

- **WRITE ONLY**

Specifies whether a foreign table is write-only. This parameter is available only for data import.

- **WITH error\_table\_name**

Specifies the table where data format errors generated during parallel data import are recorded. You can query the error information table after data is imported to obtain error details. This parameter is available only after **reject\_limit** is set.

 **NOTE**

To be compatible with PostgreSQL open source interfaces, you are advised to replace this syntax with **LOG INTO**.

Value range: a string. It must comply with the [naming convention](#).

- **LOG INTO error\_table\_name**

Specifies the table where data format errors generated during parallel data import are recorded. You can query the error information table after data is imported to obtain error details.

 **NOTE**

This parameter is available only after **PER NODE REJECT LIMIT** is set.

Value range: a string. It must comply with the [naming convention](#).

- **REMOTE LOG 'name'**

Specifies that the data format error information is saved as files in GDS. **name** is the prefix of the error data file.

- **PER NODE REJECT LIMIT 'value'**

Specifies the maximum number of data format errors allowed on each DN during data import. If the number of errors exceeds the specified value on any DN, data import fails, an error is reported, and the system exits data import.

---

**NOTICE**

This syntax specifies the error tolerance of a single node.

Data format errors include the following: a column is lost, an extra column exists, a data type is incorrect, and encoding is incorrect. Once a non-data-format error occurs, the whole data import process is stopped.

---

Value range: an integer or **unlimited**. The default value is 0, indicating that error information is returned immediately.

- **TO { GROUP groupname | NODE ( nodename [, ... ] ) }**

Currently, **TO GROUP** is not supported. **TO NODE** is used for internal scale-out tools.

## Examples

```
-- Create a foreign table to import data from GDS servers 192.168.0.90 and 192.168.0.91 in text format.
Record errors that occur during data import to the err_HR_staffs table.
gaussdb=# CREATE FOREIGN TABLE foreign_HR_staffs
(
 staff_ID NUMBER(6) ,

```

## Helpful Links

[ALTER FOREIGN TABLE \(for Import and Export\)](#) and [DROP FOREIGN TABLE](#)

## Suggestions

- delimiter
  - A delimiter cannot be `\r` or `\n`, or the same as the null value. The delimiter of CSV data cannot be same as the **quote** value.
  - The data length of a single row should be less than 1 GB. A row that has many columns using long delimiters cannot contain much valid data.
  - You are advised to use a multi-character, such as the combination of the dollar sign (\$), caret (^), and ampersand (&), or invisible characters, such as 0x07, 0x08, and 0x1b as the delimiter.
- quote
  - The value of **quote** cannot be the same as that of the **delimiter** or null parameter. The value must be a single-byte character.
  - Invisible characters are recommended, such as 0x07, 0x08, and 0x1b.
- mode Normal
  - Supports all file types (including CSV, TEXT, and FIXED). To import data, you need to enable GDS on the data server.
- mode Shared

- Supports the TEXT format. It does not need assistance from GDS, but requires that all the user data be mounted to the same path of the same nodes through NFS.
- mode Private
  - This mode is used when user data has been stored in the same local directories of DNs.

## 7.15.65 CREATE FUNCTION

### Description

Creates a function.

### Precautions

- If the parameters or return values of a function have precision, the precision is not checked.
- When creating a function, you are advised to explicitly specify the schemas of tables in the function definition. Otherwise, the function may fail to be executed.
- **current\_schema** and **search\_path** specified by SET during function creation are invalid. **search\_path** and **current\_schema** before and after function execution should be the same.
- If a function has output parameters, the GUC parameter **set behavior\_compat\_options** must be set to '**proc\_outparam\_override**' for the output parameters to take effect. When the function is invoked using SELECT or CALL, an actual parameter must be provided in the position of the output parameter. Otherwise, the function fails to be invoked, and the actual parameter is meaningless.
- After **REPLACE** is specified, a new function is created instead of replacing a function if the number of parameters, parameter type, or return value is different.
- You cannot create overloaded functions with different formal parameter names (the function name and parameter list type are the same).
- You cannot create a function that has the same name and parameter list as a stored procedure.
- Formal parameters cannot be overloaded if only the custom ref cursor type is different from the sys\_refcursor type.
- Function overloading is not supported if only the returned data types are different.
- Function overloading is not supported if only the default values are different.
- When an overloaded function is invoked, the variable type must be specified.
- If an undeclared variable is used in a function, an error is reported when the function is invoked.
- You can use the SELECT statement to specify different parameters using identical functions.
- When you create a function, you cannot insert other agg functions out of the avg function or other functions.

- In non-logical cluster mode, return values, parameters, and variables cannot be set to the tables of the node groups that are not installed in the system by default. The internal statements of SQL functions cannot be executed on such tables.
- By default, the permissions to execute new functions are granted to PUBLIC users. For details, see [GRANT](#). By default, a user inherits the permissions of the PUBLIC role. Therefore, the user has the permission to execute a function and view the definition of the function. In addition, to execute the function, the user must have the USAGE permission on the schema to which the function locates. You can revoke the default execution permissions from the PUBLIC role when creating a function and grant the function execution permission to users as needed. To avoid the time window during which new functions can be accessed by all users, create functions and set function execution permissions in a transaction. After the database object isolation attribute is enabled, common users can view only the definitions of functions that they have permission to execute.
- If a function is defined as **IMMUTABLE** or **SHIPPABLE**, avoid **INSERT**, **UPDATE**, **DELETE**, **MERGE**, and **DDL** operations in the function because the CN needs to determine the execution node for these operations. Otherwise, an error may occur. If DDL operations are performed on a function of the IMMUTABLE or SHIPPABLE type, database objects on each node may be inconsistent. To resolve this problem, create the VOLATILE PL/SQL function on the CN, run the EXECUTE statement in the function definition to dynamically execute the DDL operation for repairing system objects, and then use the EXECUTE DIRECT ON syntax to call the repair function on the specified DN.
- When functions without parameters are invoked inside another function, you can omit brackets and call functions using their names directly.
- If the parameter **set behavior\_compat\_options** is not set to **proc\_outparam\_override**, the **OUT** output parameter of the function is directly invoked by an anonymous block or stored procedure, and the return value is used as the first value of the **OUT** output parameter. As a result, the invoking fails. To correctly use the **OUT** and **IN OUT** output parameters, set the parameter **set behavior\_compat\_options** to **proc\_outparam\_override**. For details, see the example.
- When other functions with output parameters are invoked in a function and an assignment expression, set the GUC parameter **set behavior\_compat\_options** to **'proc\_outparam\_override'**, define variables of the same type as the output parameters in advance, and use the variables as output parameters to invoke other functions with output parameters for the output parameters to take effect. Otherwise, the output parameters of the invoked functions will be ignored.
- After the GUC parameter **behavior\_compat\_options** is set to **'proc\_outparam\_override'**, if the return type of the function is setof, the output parameter will not take effect.
- Oracle-compatible functions support viewing, exporting, and importing parameter comments.
- Oracle-compatible functions support viewing, exporting, and importing comments between IS/AS and plsql\_body.
- Users granted with the CREATE ANY FUNCTION permission can create or replace functions in the user schemas.

- The default permission on a function is SECURITY INVOKER. To change the permission to SECURITY DEFINER, set the GUC parameter **behavior\_compat\_options** to **'plsql\_security\_definer'**.
- When a function is created, it depends on an undefined object. If **behavior\_compat\_options** is set to **'plpgsql\_dependency'**, the creation can be executed and a warning message is displayed. If **behavior\_compat\_options** is not set to **'plpgsql\_dependency'**, the creation cannot be executed.
- When **behavior\_compat\_options** is set to **'plpgsql\_dependency'**, if function A is invoked in the function and function B is contained in the input and output parameters of function A, function B will not establish a dependency. For example, **functionA(functionB())**. **gs\_dependencies** only creates dependency with function A.
- If a view directly depends on an O-style function and the **behavior\_compat\_options** parameter is set to **'plpgsql\_dependency'**, the view can be accessed when the function is created again. However, if the **behavior\_compat\_options** parameter is not set to **'plpgsql\_dependency'**, the view cannot be accessed.
- When creating a function, you cannot use the function itself as the default value of input parameter.
- The function with **OUT** parameter cannot be called by SQL statement.
- The function with **OUT** parameter cannot be called by SELECT INTO syntax.
- Functions with **OUT** parameters cannot be called in nested mode.

Example:

```
b := func(a,func(c,1));
```

Should be changed to:

```
tmp := func(c,1); b := func(a,tmp);
```

- When a function is created, the type of the return value of the function is not checked.
- If a function with the definer specified is created in a schema of another user, the function will be executed by another user, which may cause unauthorized operations. Therefore, exercise caution when performing this operation.
- In the schema of the O&M administrator, only the initial user and schema owner can create objects. The schema that does not allow other users to create and modify objects is the schema of the O&M administrator.
- If the **out** parameter is used as the output parameter in an expression, the expression does not take effect in the following scenarios: (a) The execute immediate sqlv using func syntax is used to execute a function. (b) The select func into syntax is used to execute a function. (c) DML statements such as INSERT and UPDATE are used to execute a function. (d) The select where a=func() statement is used. (e) When a function with the **out** output parameter is used as an input parameter, that is, **fun (func (out b), a)**, the **out b** parameter does not take effect.
- When a stored procedure with the out parameter is called, you can set the GUC parameter **set behavior\_compat\_options** to **'proc\_outparam\_transfer\_length'** to transfer the parameter length. The specifications and constraints are as follows:

- a. The following types are supported: CHAR(n), CHARACTER(n), NCHAR(n), VARCHAR(n), VARYING(n), VARCHAR2(n), and NVARCHAR2(n).
- b. If the out parameter does not take effect (for example, **perform**), the length does not need to be transferred.
- c. The following types do not support precision transfer: NUMERIC, DECIMAL, NUMBER, FLOAT, DEC, INTEGER, TIME, TIMESTAMP, INTERVAL, TIME WITH TIME ZONE, TIMESTAMP WITH TIME ZONE, TIME WITHOUT TIME ZONE, and TIMESTAMP WITHOUT TIME ZONE.
- d. The parameter length can be transferred regardless of whether the GUC parameter **set behavior\_compat\_options** is set to **proc\_outparam\_override**.

## Syntax

- Syntax (compatible with PostgreSQL) for creating a user-defined function:

```
CREATE [OR REPLACE] FUNCTION function_name
([{ argname [argmode] argtype [{ DEFAULT | := | = } expression] } [, ...]])
[RETURNS rettype [DETERMINISTIC] | RETURNS TABLE ({ column_name column_type }
[, ...])]
LANGUAGE lang_name
[
 {IMMUTABLE | STABLE | VOLATILE }
 | {SHIPPABLE | NOT SHIPPABLE}
 | WINDOW
 | [NOT] LEAKPROOF
 | {CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }
 | [{ EXTERNAL] SECURITY INVOKER | [EXTERNAL] SECURITY DEFINER | AUTHID DEFINER |
AUTHID CURRENT_USER}
 | {fenced | not fenced}
 | {PACKAGE}

 | COST execution_cost
 | ROWS result_rows
 | SET configuration_parameter { {TO | =} value | FROM CURRENT }
][...]
{
 AS 'definition'
 | AS 'obj_file', 'link_symbol'
};
```

- ORA-compatible syntax for creating a user-defined function:

```
CREATE [OR REPLACE] FUNCTION function_name
([{ argname [argmode] argtype [{ DEFAULT | := | = } expression] } [, ...]])
RETURN rettype [DETERMINISTIC]
[
 {IMMUTABLE | STABLE | VOLATILE }
 | {SHIPPABLE | NOT SHIPPABLE}
 | {PACKAGE}
 | {FENCED | NOT FENCED}
 | [NOT] LEAKPROOF
 | {CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }
 | [{ EXTERNAL] SECURITY INVOKER | [EXTERNAL] SECURITY DEFINER |
AUTHID DEFINER | AUTHID CURRENT_USER
}
]
| COST execution_cost
| ROWS result_rows
| SET configuration_parameter { {TO | =} value | FROM CURRENT
| LANGUAGE lang_name
][...]
{
 IS | AS
} plsql_body
/
```

## Parameters

- **function\_name**

Specifies the name of the function to be created (optionally schema-qualified).

Value range: a string. It must comply with the [naming convention](#). The value contains a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the function name.

- **argname**

Specifies the parameter name of the function.

Value range: a string. It must comply with the [naming convention](#). The value contains a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the function parameter name.

- **argmode**

Specifies the parameter mode of the function.

Value range: **IN**, **OUT**, **INOUT**, and **VARIADIC**. The default value is **IN**. Only the parameter of the **OUT** mode can be followed by **VARIADIC**. The parameters of **OUT** and **INOUT** cannot be used in the function definition of RETURNS TABLE.

 **NOTE**

**VARIADIC** specifies parameters of the array type.

- **argtype**

Specifies the data type of a function parameter. You can use **%ROWTYPE** to indirectly reference the type of a table. For details, see [Variable Definition Statements](#).

- **expression**

Specifies the default expression of a parameter.

 **NOTE**

- If **a\_format\_version** is set to **10c** and **a\_format\_dev\_version** is set to **s2**, the default expression is not supported when the parameter is in INOUT mode.
  - It is recommended that you define all default parameters after all non-default parameters.
  - If a function with default parameters is invoked, input parameters are added to the function from left to right. If inputs of non-default parameters are missing, an error is reported.
  - If **proc\_uncheck\_default\_param** is enabled and a function with default parameters is invoked, input parameters are added to the function from left to right. The number of defaulted inputs depends on the number of default parameters. If an input of a non-default parameter is missing, the previous default value is used to fill this parameter.
  - When **a\_format\_version** is set to **10c**, **a\_format\_dev\_version** is set to **s1**, **proc\_outparam\_override** is disabled, and the function parameters include the output parameter **out** and **default**, the default value cannot be used.
- **rettype**
- Specifies the return data type. Same as **argtype**, **%TYPE** or **%ROWTYPE** can also be used to indirectly reference types.

When there is **OUT** or **IN OUT** parameter, the **RETURNS** clause can be omitted. If the clause is not omitted, the result type of the clause must be the same as that of the output parameter. The result type of the clause is the same as that of a single output parameter.

The **SETOF** modifier indicates that the function will return a set of items, rather than a single item.

- **column\_name**  
Specifies the column name.
- **column\_type**  
Specifies the column type.
- **definition**  
Specifies a string constant defining a function. Its meaning depends on the language. It can be an internal function name, a path pointing to a target file, a SQL query, or text in a procedural language.
- **DETERMINISTIC**  
Specifies an interface compatible with the SQL syntax. You are advised not to use it.
- **LANGUAGE lang\_name**  
Specifies the name of the language that is used to implement the function. It can be **SQL**, **C**, **internal**, or the name of a customized process language. To ensure downward compatibility, the name can use single quotation marks. Contents in single quotation marks must be capitalized.  
Due to compatibility issues, no matter which language is specified when an ORA-style database is created, the language used is `plpgsql`.

#### NOTE

- When an internal function is defined, if **AS** specifies the function as an internal system function, the parameter type, number of parameters, and return value type of the new function must be the same as those of the internal system function, and the user who creates the internal function must have the permission to execute the internal system function.
- Only users with the `sysadmin` permission can create internal functions.
- **WINDOW**  
Specifies that the function is a window function. This is currently only useful for functions written in C. The **WINDOW** attribute cannot be changed when replacing an existing function definition.

---

#### NOTICE

For a customized window function, the value of **LANGUAGE** can only be **internal**, and the referenced internal function must be a window function.

---

- **IMMUTABLE**  
Specifies that the function always returns the same result if the parameter values are the same.
- **STABLE**

Specifies that the function cannot modify the database, and that within a single table scan it will consistently return the same result for the same parameter value, but its result varies by SQL statements.

- **VOLATILE**

Specifies that the function value can change in a single table scan and no optimization is performed.

- **SHIPPABLE**

**NOT SHIPPABLE**

Specifies whether the function can be pushed down to DN for execution.

- Functions of the IMMUTABLE type can always be pushed down to DN.
- Functions of the STABLE or VOLATILE type can be pushed down to DN only if their attribute is **SHIPPABLE**.

---

**NOTICE**

The function or stored procedure of the SHIPPABLE/IMMUTABLE type cannot contain EXCEPTION or invoke functions or stored procedures that contain EXCEPTION.

- **LEAKPROOF**

Specifies that the function has no side effects. **LEAKPROOF** can be set only by the system administrator.

- **CALLED ON NULL INPUT**

Declares that some parameters of the function can be invoked in normal mode if the parameter values are null. This parameter can be omitted.

- **RETURNS NULL ON NULL INPUT**

**STRICT**

Specifies that the function always returns null whenever any of its parameters is null. If this parameter is specified, the function is not executed when there are null parameters; instead a null result is returned automatically.

**RETURNS NULL ON NULL INPUT** and **STRICT** have the same functions.

- **EXTERNAL**

The purpose is to be compatible with SQL statements and it is optional. This feature applies to all functions, not only external functions.

- **SECURITY INVOKER**

**AUTHID CURRENT\_USER**

Specifies that the function will be executed with the permissions of the user who invokes it. This parameter can be omitted.

**SECURITY INVOKER** and **AUTHID CURRENT\_USER** have the same functions.

- **SECURITY DEFINER**

**AUTHID DEFINER**

Specifies that the function will be executed with the permissions of the user who created it.

**AUTHID DEFINER** and **SECURITY DEFINER** have the same functions.

- **FENCED**  
**NOT FENCED**  
Specifies whether the function is executed in fenced mode or not fenced mode. In **NOT FENCED** mode, a function is executed in a CN or DN process. In **FENCED** mode, a function is executed in a new fork process, which does not affect CN or DN processes.  
Application scenarios:
  - Develop or debug a function in **FENCED** mode and execute it in **NOT FENCED** mode. This reduces the overhead of the fork process and communication.
  - Perform complex OS operations, such as opening a file, and processing signals and threads in **FENCED** mode; otherwise, the GaussDB database execution may be affected.
  - Customize PL/SQL functions. If this parameter is not specified, the default value **NOT FENCED** is used and the **FENCED** execution mode is not supported.
- **COST execution\_cost**  
Estimates the execution cost of a function.  
The unit of **execution\_cost** is **cpu\_operator\_cost**.  
Value range:  $\geq 0$
- **ROWS result\_rows**  
Estimates the number of rows returned by the function. This is only allowed when the function is declared to return a set.  
Value range:  $\geq 0$ . The default value is **1000**.
- **configuration\_parameter**
  - **value**  
Sets a specified database session parameter to a specified value. If the value is **DEFAULT** or **RESET**, the default setting is used in the new session. **OFF** disables the setting.  
Value range: a string
    - **DEFAULT**
    - **OFF**
    - **RESET**Specifies the default value.
  - **from current**  
Uses the value of **configuration\_parameter** of the current session.
- **obj\_file, link\_symbol**  
(Used for C functions) Specifies the absolute path of the dynamic library using *obj\_file* and the link symbol (function name in C programming language) of the function using *link\_symbol*. (This is a lab feature. Contact Huawei technical support before using it.)
- **plsql\_body**  
Specifies the PL/SQL stored procedure body.

**NOTICE**

When you perform password-related operations, such as user creation, password change, and encryption/decryption, in a function body, the password will be recorded in the system catalogs and logs in plaintext. To prevent sensitive information leakage, you are advised not to perform operations on the function body related to sensitive information, such as passwords or keys.

**Examples**

```
-- Create an ORA-compatible database.
CREATE DATABASE ora_compatible_db DBCOMPATIBILITY 'ORA';
CREATE DATABASE
-- Switch to another database.
\c ora_compatible_db
-- Define a function as SQL query.
CREATE FUNCTION func_add_sql(integer, integer) RETURNS integer
 AS 'select $1 + $2;'
 LANGUAGE SQL
 IMMUTABLE
 RETURNS NULL ON NULL INPUT;

-- Add an integer by parameter name using PL/pgSQL.
CREATE OR REPLACE FUNCTION func_increment_plsql(i integer) RETURNS integer AS $$
 BEGIN
 RETURN i + 1;
 END;
$$ LANGUAGE plpgsql;

-- Return a record containing multiple output parameters.
CREATE FUNCTION func_dup_sql(in int, out f1 int, out f2 text)
 AS $$ SELECT $1, CAST($1 AS text) || ' is text' $$
 LANGUAGE SQL;

SELECT * FROM func_dup_sql(42);

-- Compute the sum of two integers and returning the result (if the input is null, the returned result is null):
CREATE FUNCTION func_add_sql2(num1 integer, num2 integer) RETURN integer
AS
BEGIN
RETURN num1 + num2;
END;
/

-- Create an overloaded function with the PACKAGE attribute.
create or replace function package_func_overload(col int, col2 int)
return integer package
as
declare
 col_type text;
begin
 col := 122;
 db_output.print_line('two int parameters ' || col2);
 return 0;
end;
/

-- Create an overloaded function whose second formal parameter type is different from that of the
package_func_overload function.
create or replace function package_func_overload(col int, col2 smallint)
return integer package
as
declare
 col_type text;
```

```
begin
 col := 122;
 dbe_output.print_line('two smallint parameters ' || col2);
 return 0;
end;
/

-- Alter the execution rule of function add to IMMUTABLE (that is, the same result is returned if the
parameter remains unchanged).
ALTER FUNCTION func_add_sql2(INTEGER, INTEGER) IMMUTABLE;

-- Alter the name of function add to add_two_number.
ALTER FUNCTION func_add_sql2(INTEGER, INTEGER) RENAME TO add_two_number;

-- Change the owner of function add to omm.
ALTER FUNCTION add_two_number(INTEGER, INTEGER) OWNER TO omm;

-- Delete the function.
DROP FUNCTION add_two_number;
DROP FUNCTION func_increment_sql;
DROP FUNCTION func_dup_sql;
DROP FUNCTION func_increment_plsql;
DROP FUNCTION package_func_overload(col int, col2 int);
DROP FUNCTION package_func_overload(col int, col2 smallint);
DROP FUNCTION func_add_sql;

-- If the parameter set behavior_compat_options is not set to proc_outparam_override, the OUT output
parameter of the function is directly invoked by an anonymous block or stored procedure, and the return
value is used as the first value of the OUT output parameter. As a result, the invoking fails.
create type rec as(c1 int, c2 int);
create or replace function func(a in out rec, b in out int) return int
as
begin
 a.c1:=100;
 a.c2:=200;
 b:=300;
 return 1;
end;

[ALTER FUNCTION](#) and [DROP FUNCTION](#)

## Suggestions

- analyse | analyze
  - Do not run **ANALYZE** in a transaction or anonymous block.
  - Do not run **ANALYZE** in a function or stored procedure.

## 7.15.66 CREATE GLOBAL INDEX

### Description

Creates a global secondary index (GSI) on a specified table.

The GSIs allow users to define indexes that are inconsistent with the distribution of base tables. In this way, single-node plans for querying non-distributed columns of base tables and unique/primary key constraints on non-distributed columns of base tables are achieved.

 NOTE

1. GSI creation is not allowed during the upgrade uncommitted observation.
2. You are advised to create a NOT NULL constraint on the index key of at least one column of GSI to improve IUD performance.
3. You are advised to create common indexes in the GSI base table to improve IUD execution efficiency.
4. The execution plan generated when a GSI is created is to pull the base table data back to the CN and then deliver the data to the DN where the GSI is located. Therefore, the performance of a large-scale cluster with a large amount of data is much worse than that of using a common index. For example, it may take about one hour to create a GSI with tens of millions of data records on six SSDs. The GSI creation mechanism will be optimized in later versions and the current single point will be changed to parallel DNs to improve the creation efficiency.

## Precautions

- Similar to the base table constraints, the distribution keys of GSIs do not support the UPDATE operation.
- The GSI can be created only in GTM-LITE mode. If a GSI is created in other GTM modes, an error is reported.
- Common UB-tree indexes can be created. Expression indexes and some other indexes are not supported. Astore does not support UB-tree indexes other than GSIs and does not support partition creation for GSIs.
- The GSI whose distribution is the same as that of the base table cannot be created. Otherwise, an error will be reported during the execution.
- Online GSI creation or rebuild is not supported and a syntax error will be reported. PARALLEL is not supported, and **parallel\_workers** will be set to **0** on the DN.
- Hash-distributed GSIs can be created for row-store Astore tables and partitioned tables whose base tables are hash-distributed. The base tables cannot be replicate, hash bucket, list/range distribution, or Ustore table. GSIs of these tables do not support distribution other than hash distribution.
- If the base table is a partitioned table, the GSI supports a maximum of 27 columns. If the base table is not a partitioned table, the GSI supports a maximum of 28 columns (including the index key and distribution key).
- UPSERT, IUD returning on base tables with GSIs, TABLE ACCESS BY INDEX ROWID, MERGE INTO, CLUSTER, and SQL PATCH are not supported.
- Operations that will invalidate the GSIs in the current version:
  - VACUUM FULL
    - VACUUM FULL on a single table: All GSIs on the table are invalidated.
    - VACUUM FULL on a database: All GSIs in the database are invalidated.
  - REINDEX
    - REINDEX on a single table (offline): All GSIs on the table are invalidated.
    - REINDEX on a database (offline): All GSIs in the database are invalidated.

- CLUSTER
  - CLUSTER on a single table using a common index: All GSIs on the table are invalidated.
  - CLUSTER on a single table: All GSIs on the table are invalidated.
  - CLUSTER on a database: All GSIs on the tables that have been clustered in the database are invalidated.
- COPY/GDS  
All GSIs on the table are invalidated.
- PARTITION  
MERGE PARTITION, EXCHANGE PARTITION, TRUNCATE PARTITION, DROP PARTITION and SPLIT PARTITION invalidate all GSIs on a partitioned table. EXCHANGE PARTITION invalidates all GSIs on an ordinary table.
- For batch scenarios such as INSERT INTO SELECT and UPDATE/DELETE, the execution plan goes back to the CN, and the performance is poor (similar to the performance of GSI creation).
- For INSERT, UPDATE, and DELETE, distributed execution plans are used, which may cause performance loss.
- If `_new$$` or `_NEW$$` is added to a column name or `ctid`, `xc_node_hash`, `xmin`, `xmax` or `tableoid` (when the base table is a partitioned table), a GSI fails to be created for the base table whose column names are repeated.
- If the VACUUM FULL, CLUSTER, or REINDEX operation on a table is interrupted, the GSI on the table may turn to the **UNUSABLE** state. In this case, an error will be reported when the GSI is queried. You are advised to run **REINDEX INDEX** to rebuild the GSI.

## Syntax

```
CREATE GLOBAL [UNIQUE] INDEX [[schema_name.]index_name] ON table_name [USING method]
({ column_name [COLLATE collation] [opclass] [ASC | DESC] [NULLS { FIRST | LAST }] }, ...)
[CONTAINING (containing_colname)] [DISTRIBUTE BY hash(dist_colnames)]
[TABLESPACE tablespace_name];
```

## Parameters

- **UNIQUE**  
Creates a unique index. In this way, the system checks whether new values are unique in the index column. If the inserted or updated value causes duplicate records, an error is reported.
- **schema\_name**  
Specifies the schema name.  
Value range: an existing schema name
- **index\_name**  
Specifies the name of the index to be created. No schema name can be included here; the index is always created in the same schema as its parent table.  
Value range: a string. It must comply with the [naming convention](#).

- **table\_name**  
Specifies the name of the table to be indexed (optionally schema-qualified).  
Value range: an existing table name
- **USING method**  
Specifies the name of the index method to be used.  
Value range: UB-tree. The multi-version B-tree index is provided. The index page contains transaction information.
- **column\_name**  
Specifies the name of the column on which an index is to be created.  
If the index mode supports multi-column indexes, multiple columns can be declared. A maximum of 28 columns can be declared for a non-partitioned base table, and a maximum of 27 columns can be declared for a partitioned base table.
- **COLLATE collation**  
Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **select \* from pg\_collation** command to query collation rules from the **pg\_collation** system catalog. The default collation rule is the row starting with **default** in the query result.
- **opclass**  
Specifies the name of an operator class. An operator class can be specified for each column of an index. The operator class identifies the operators to be used by the index for that column.
- **ASC**  
Specifies an ascending (default) sort order.
- **DESC**  
Specifies a descending sort order.
- **NULLS FIRST**  
Specifies that null values appear before non-null values in the sort ordering. This is the default when **DESC** is specified.
- **NULLS LAST**  
Specifies that null values appear after non-null values in the sort ordering. This is the default when **DESC** is not specified.
- **CONTAINING**  
Specifies the base table attributes other than index keys contained in the GSI.
- **containing\_colname**  
Specifies the base table attributes other than the index keys contained in the GSI.
- **DISTRIBUTE BY**  
Specifies the distribution key of the GSI, which is different from that of the base table, and only the hash distribution can be used.
- **dist\_colnames**  
Specifies the distribution key of the GSI.  
It must be contained in **column\_name**.

- **TABLESPACE tablespace\_name**  
Specifies the tablespace for an index. If no tablespace is specified, the default tablespace is used.  
Value range: an existing table name

## Example

```
-- Create a base table test that contains three columns.
gaussdb=# CREATE TABLE test(c1 int, c2 int, c3 int);

-- Create a GSI on the c2 column of the test table containing the c3 column based on the hash distribution
of c2 column.
gaussdb=# CREATE GLOBAL INDEX idx_gsi_1 ON test(c2) CONTAINING(c3) DISTRIBUTE BY HASH(c2);

-- Create a base table test2 that contains three columns.
gaussdb=# CREATE TABLE test2(c1 int, c2 int, c3 int);

-- Create a GSI on the c2 column of the test2 table containing the c3 column based on the hash
distribution of c2 column.
gaussdb=# CREATE GLOBAL INDEX idx_gsi_2 ON test2(c2) CONTAINING(c3) ;

-- Create a base table test3 that contains three columns.
gaussdb=# CREATE TABLE test3(c1 int, c2 int, c3 int);

-- Create a GSI in UNIQUE form on the c2 column of the test3 table, which is based on the hash
distribution of the c2 column by default.
gaussdb=# CREATE GLOBAL UNIQUE INDEX idx_gsi_3 ON test3(c2) DISTRIBUTE BY HASH(c2);
```

## 7.15.67 CREATE GROUP

### Description

Creates a user group.

### Precautions

CREATE GROUP is an alias for CREATE ROLE, and it is not a standard SQL syntax and not recommended. Users can use CREATE ROLE directly.

### Syntax

```
CREATE GROUP group_name [[WITH] option [...]]
 [ENCRYPTED | UNENCRYPTED] { PASSWORD | IDENTIFIED BY } { 'password' [EXPIRED] | DISABLE };
```

The syntax of the optional action clause is as follows:

```
where option can be:
{SYSADMIN | NOSYSADMIN}
| {MONADMIN | NOMONADMIN}
| {OPRADMIN | NOOPRADMIN}
| {POLADMIN | NOPOLADMIN}
| {AUDITADMIN | NOAUDITADMIN}
| {CREATEDB | NOCREATEDB}
| {USEFT | NOUSEFT}
| {CREATEROLE | NOCREATEROLE}
| {INHERIT | NOINHERIT}
| {LOGIN | NOLOGIN}
| {REPLICATION | NOREPLICATION}
| {VCADMIN | NOVCADMIN}
| {PERSISTENCE | NOPERSISTENCE}
| CONNECTION LIMIT connlimit
| VALID BEGIN 'timestamp'
| VALID UNTIL 'timestamp'
```

```
| USER GROUP 'groupuser'
| PERM SPACE 'spacelimit'
| NODE GROUP logic_group_name
| IN ROLE role_name [, ...]
| IN GROUP role_name [, ...]
| ROLE role_name [, ...]
| ADMIN role_name [, ...]
| USER role_name [, ...]
| SYSID uid
| DEFAULT TABLESPACE tablespace_name
| PROFILE DEFAULT
| PROFILE profile_name
| PGUSER
```

## Parameters

See [Parameters](#) in section "CREATE ROLE."

## Examples

```
-- Create group my_group.
gaussdb=# CREATE GROUP my_group PASSWORD '*****';

-- Delete the group.
gaussdb=# DROP GROUP my_group;
```

## 7.15.68 CREATE INCREMENTAL MATERIALIZED VIEW

### Function

**CREATE INCREMENTAL MATERIALIZED VIEW** creates a fast-refresh materialized view, and you can refresh the data of the materialized view by using **REFRESH MATERIALIZED VIEW** (complete-refresh) and **REFRESH INCREMENTAL MATERIALIZED VIEW** (fast-refresh).

**CREATE INCREMENTAL MATERIALIZED VIEW** is similar to **CREATE TABLE AS**, but it remembers the query used to initialize the view, so it can refresh data later. A materialized view has many attributes that are the same as those of a table, but does not support temporary materialized views.

### Precautions

- Incremental materialized views cannot be created on database link tables, temporary tables, or global temporary tables.
- Fast-refresh materialized views support only simple filter queries and UNION ALL queries of base tables.
- The distribution column cannot be specified when a fast-refresh materialized view is created.
- After a fast-refresh materialized view is created, most DDL operations in the base table are no longer supported.
- The IUD operation cannot be performed on fast-refresh materialized views.

- After a fast-refresh materialized view is created, you need to run the **REFRESH** command to synchronize the materialized view with the base table when the base table data changes.

## Syntax

```
CREATE INCREMENTAL MATERIALIZED VIEW mv_name
 [(column_name [, ...])]
 [TABLESPACE tablespace_name]
 AS query;
```

## Parameter Description

- **mv\_name**  
Name (optionally schema-qualified) of the materialized view to be created.  
Value range: a string. It must comply with the [naming convention](#).
- **column\_name**  
Column name in the new materialized view. The materialized view supports specified columns. The number of specified columns must be the same as the number of columns in the result of the subsequent query statement. If no column name is provided, the column name is obtained from the output column name of the query.  
Value range: a string. It must comply with the [naming convention](#).
- **TABLESPACE tablespace\_name**  
Tablespace to which the new materialized view belongs. If the tablespace is not specified, the default tablespace is used.
- **AS query**  
**SELECT** or **TABLE** command. This query will be run in a security-constrained operation.

## Examples

```
-- Create an ordinary table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int);

-- Create a fast-refresh materialized view.
gaussdb=# CREATE INCREMENTAL MATERIALIZED VIEW my_imv AS SELECT * FROM my_table;

-- Write data to the base table.
gaussdb=# INSERT INTO my_table VALUES(1,1),(2,2);

-- Fast refresh the fast-refresh materialized view my_imv.
gaussdb=# REFRESH INCREMENTAL MATERIALIZED VIEW my_imv;

-- Delete a fast-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_imv;

-- Delete the ordinary table my_table.
gaussdb=# DROP TABLE my_table;
```

## Helpful Links

[ALTER MATERIALIZED VIEW](#), [CREATE MATERIALIZED VIEW](#), [CREATE TABLE](#), [DROP MATERIALIZED VIEW](#), [REFRESH INCREMENTAL MATERIALIZED VIEW](#), and [REFRESH MATERIALIZED VIEW](#)

## 7.15.69 CREATE INDEX

### Description

Defines a new index.

Indexes are primarily used to enhance database performance (though inappropriate use can result in database performance deterioration). You are advised to create indexes on:

- Columns that are often queried
- Join conditions. For a query on joined columns, you are advised to create a composite index on the columns. For example, for **select \* from t1 join t2 on t1.a=t2.a and t1.b=t2.b**, you can create a composite index on columns **a** and **b** in table **t1**.
- Columns having filter criteria (especially scope criteria) of a **where** clause
- Columns that appear after **order by**, **group by**, and **distinct**

Partitioned tables do not support partial index creation (when indexes contain the GLOBAL or LOCAL keyword or the created index is a GLOBAL index).

### Precautions

- If the base table is a hash-distributed table, to create a primary key or unique index that does not contain the distribution key of the base table, use a GSI (using CREATE GLOBAL INDEX); to create a primary key or unique index that contains the distribution key of the base table, use a common index (using CREATE INDEX). In single-DN deployment mode, both the GSI and common index can be successfully created. If the base table is a non-hash-distributed table, you can only create the primary key or unique index as a common index (using CREATE INDEX). That is, the index key must contain the distribution key of the base table.
- Indexes consume storage and computing resources. Creating too many indexes has negative impact on database performance (especially the performance of data import. Therefore, you are advised to import the data before creating indexes). Therefore, create indexes only when they are necessary.
- All functions and operators used in an index definition must be immutable, that is, their results must depend only on their parameters and never on any outside influence (such as the contents of another table or the current time). This restriction ensures that the behavior of the index is well-defined. To use a user-defined function in an index or WHERE clause, mark it as an immutable function.
- A user granted with the CREATE ANY INDEX permission can create indexes in both the public and user schemas.
- If a user-defined function is called in the expression index, the expression index function is executed based on the permission of the function creator.
- Data of the XML type cannot be used as common indexes, unique indexes, global indexes, local indexes, or partial indexes.
- Only B-tree and UB-tree indexes can be created online. GiST and GIN indexes are not supported. Only common indexes of non-partitioned tables, as well as

global and local indexes of partitioned tables can be created. Online index column addition, deletion, and modification, PCR UB-tree indexes, level-2 partitions, and GSIs are not supported. Online concurrent index creation supports only Astore common indexes, global indexes, and local indexes. Ustore indexes are not supported.

- GiST indexes (This is a lab feature. Contact Huawei technical support before using it.) support only the Astore storage engine. Ustore, hash bucket, TDE, materialized view, parallel index creation, online index creation scenarios are not supported.

## Syntax

- **Create an index on a table.**

```
CREATE [UNIQUE] INDEX [CONCURRENTLY] [[schema_name.] index_name] ON table_name
[USING method]
 ({ { column_name | (expression) } [COLLATE collation] [opclass] [ASC | DESC] [NULLS
{ FIRST | LAST }] } [, ...])
 [INCLUDE (column_name [, ...])]
 [WITH ({storage_parameter = value} [, ...])]
 [TABLESPACE tablespace_name]
 [WHERE predicate];
```
- **Create an index on a partitioned table.**

```
CREATE [UNIQUE] INDEX [CONCURRENTLY] [[schema_name.] index_name] ON table_name
[USING method]
 ({ { column_name | (expression) } [COLLATE collation] [opclass] [ASC | DESC] [NULLS
LAST] } [, ...])
 [LOCAL [({ PARTITION index_partition_name [TABLESPACE index_partition_tablespace] }
[, ...])) | GLOBAL]
 [INCLUDE (column_name [, ...])]
 [WITH ({ storage_parameter = value } [, ...])]
 [TABLESPACE tablespace_name];
```

## Parameters

- **UNIQUE**

Creates a unique index. In this way, the system checks whether new values are unique in the index column. Attempts to insert or update data which would result in duplicate entries will generate an error.

Currently, only B-tree indexes and UB-tree indexes in row-store tables support unique indexes.
- **CONCURRENTLY**

Creates an index (with ShareUpdateExclusiveLock) in a mode that does not block DML statements. When an index is created, other statements cannot access the table on which the index depends. If this keyword is specified, DML is not blocked during the creation.

  - This option can only specify a name of one index.
  - The CREATE INDEX statement can be run within a transaction, but CREATE INDEX CONCURRENTLY cannot.
  - For temporary tables, you can use CONCURRENTLY to create indexes. However, indexes are created in blocking mode because no other sessions concurrently access the temporary tables and the blocking mode is more cost-effective.

 NOTE

- This keyword is specified when an index is created. The entire table needs to be scanned twice and built. When the table is scanned for the first time, an index is created and the read and write operations are not blocked. During the second scan, changes that have occurred since the first scan are merged and updated.
- The table needs to be scanned and built twice, and all existing transactions that may modify the table must be completed. This means that the creation of the index takes a longer time than normal. In addition, the CPU and I/O consumption also affects other services.
- If an index build fails, it leaves an "unusable" index. This index is ignored by queries, but it still consumes the update overhead. In this case, you are advised to run the **DROP INDEX IF EXISTS** statement to delete the index and run the **CONCURRENTLY** statement to create the index again. Note that when indexes are rebuilt by using **CLUSTER**, **TRUNCATE**, **VACUUM FULL**, or **REINDEX TABLE**, the residual "unusable" indexes are skipped. If **ALTER TABLE** involves table and index rebuild, residual "unusable" indexes will be automatically cleared.
- After the second scan, index creation must wait for any transaction that holds a snapshot earlier than the snapshot taken by the second scan to terminate. In addition, the **ShareUpdateExclusiveLock** (level 4) added during index creation conflicts with a lock whose level is greater than or equal to 4. Therefore, when such an index is created, the system is prone to hang or deadlock. Example:
  - If two sessions create an index by using **CONCURRENTLY** for the same table, a deadlock occurs.
  - If a session creates an index by using **CONCURRENTLY** for a table and another session drops a table, a deadlock occurs.
  - There are three sessions. Session 1 locks table **a** and does not commit it. Session 2 creates an index by using **CONCURRENTLY** for table **b**. Session 3 writes data to table **a**. Before the transaction of session 1 is committed, session 2 is blocked.
  - When an index is created by using **CONCURRENTLY** for a table concurrently with the **TRUNCATE** operation on the same table, a deadlock occurs.
  - The transaction isolation level is set to repeatable read (read committed by default). Two sessions are started. Session 1 writes data to table **a** and does not commit it. Session 2 creates an index by using **CONCURRENTLY** for table **b**. Before the transaction of session 1 is committed, session 2 is blocked.
- When an index is being created or fails to be created, you need to check the index progress or status. You can query the **gs\_get\_index\_status('schema\_name', 'index\_name')** function to check the index status on all nodes. The input parameters **schema\_name** and **index\_name** are used to specify the index schema name and index name, respectively. The return values are **node\_name**, **indisready**, and **indisvalid**, indicating the node name, whether the index can be inserted on the node, and whether the index is available on the node. The index is available only when **indisready** and **indisvalid** on all nodes are set to **true**; otherwise, wait until the index creation is complete. If the index fails to be created, delete the index and create it again.
- When the I/O and CPU resources are not limited, the service performance deterioration caused by online index creation can be controlled within 10%. However, in special scenarios, the service performance deterioration may exceed 10%. This is because online index creation is a long transaction that consumes a large number of I/O and CPU resources. It consumes more resources than offline index creation. The longer the online index creation transaction lasts, the greater the impact on service performance. The time for creating indexes online is positively correlated with the data volume of base tables and the data volume generated by concurrent DMLs. When the I/O and CPU resources are not limited, the time for creating indexes online is about two to six times that for creating indexes offline. However, when the number of concurrent transactions is large (> 10000 TPS) or resource contention occurs, the time may be even longer. In Astore

mode, you can create indexes in parallel to shorten the index creation time. The performance of online parallel index creation increases to a certain value and becomes stable as the number of parallel worker threads increases. Compared with the performance of creating indexes in serial mode, the performance of creating indexes in parallel online is improved by about 30%. You are advised to create indexes online during off-peak hours to avoid great impact on services. Although online index creation provides the capability of uninterrupted services to some extent, it still needs to be implemented with caution.

- **schema\_name**  
Specifies the schema name.  
Value range: an existing schema name
- **index\_name**  
Specifies the name of the index to be created. No schema name can be included here; the index is always created in the same schema as its parent table.  
Value range: a string. It must comply with the [naming convention](#).
- **table\_name**  
Specifies the name of the table to be indexed (optionally schema-qualified).  
Value range: an existing table name
- **USING method**  
Specifies the name of the index method to be used.  
Value range:
  - **btree**: B-tree indexes store key values of data in a B+ tree structure. This structure helps users to quickly search for indexes. B-tree supports comparison query and query range. When an index is created in a Ustore table, the index is automatically changed to UB-tree.
  - **gin**: GIN indexes are reverse indexes and can process values that contain multiple keys (for example, arrays).
  - **gist**: GiST indexes are suitable for the set data type and multidimensional data types, such as geometric and geographic data types.
  - **ubtree**: Multi-version B-tree index used only for Ustore tables. The index page contains transaction information and can be recycled. By default, the INSERTPT function is enabled for UB-tree indexes.

Row-store tables support the following index types: **ubtree** (default), **gin**, and **gist**. Row-store tables (Ustore storage engine) support the following index type: UB-tree. Column-store tables support the following index types: **Psort** (default), **btree**, and **gin**. Global temporary tables do not support GIN and GiST indexes.
- **column\_name**  
Specifies the name of the column on which an index is to be created.  
Multiple columns can be specified if the index method supports multi-column indexes. A global index supports a maximum of 31 columns, and other indexes support a maximum of 32 columns.
- **expression**  
Specifies an expression based on one or more columns of the table. The expression usually must be written with surrounding parentheses, as shown in the syntax. However, the parentheses can be omitted if the expression has the form of a function call.

Expression can be used to obtain fast access to data based on some transformation of the basic data. For example, an index computed on **upper(col)** would allow the clause **WHERE upper(col) = 'JIM'** to use an index.

If an expression contains **IS NULL**, the index for this expression is invalid. In this case, you are advised to create a partial index.

- **COLLATE collation**

Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **select \* from pg\_collation** command to query collation rules from the pg\_collation system catalog. The default collation rule is the row starting with **default** in the query result.

- **opclass**

Specifies the name of an operator class. An operator class can be specified for each column of an index. The operator class identifies the operators to be used by the index for that column. For example, a B-tree index on the type int4 would use the **int4\_ops** class; this operator class includes comparison functions for values of type int4. In practice, the default operator class for the column's data type is sufficient. The operator class applies to data with multiple sorts. For example, users might want to sort a complex-number data type either by absolute value or by real part. They could do this by defining two operator classes for the data type and then selecting the proper class when making an index.

- **ASC**

Specifies an ascending (default) sort order.

- **DESC**

Specifies a descending sort order.

- **NULLS FIRST**

Specifies that null values appear before non-null values in the sort ordering. This is the default when **DESC** is specified.

- **NULLS LAST**

Specifies that null values appear after non-null values in the sort ordering. This is the default when **DESC** is not specified.

- **WITH ( {storage\_parameter = value} [, ... ] )**

Specifies the storage parameter used for an index.

Value range:

Only index GIN supports parameters **FASTUPDATE** and **GIN\_PENDING\_LIST\_LIMIT**. Indexes other than GIN and psort support the **FILLFACTOR** parameter. Only non-partitioned B-tree indexes support the **DEDUPLICATION** parameter.

- **FILLFACTOR**

The fill factor of an index is a percentage from 10 to 100. In the scenario where a large number of concurrent insertions are performed and the key value range is dense, select a smaller fill factor when the contention of the same index page is high during the insertion.

Value range: 10–100

- **FASTUPDATE**  
Specifies whether fast update is enabled for the GIN index.  
Value range: **ON** and **OFF**  
Default value: **ON**
- **GIN\_PENDING\_LIST\_LIMIT**  
Specifies the maximum capacity of the pending list of the GIN index when fast update is enabled for the GIN index.  
Value range: 64–2147483647. The unit is KB.  
Default value: The default value of **gin\_pending\_list\_limit** depends on **gin\_pending\_list\_limit** specified in GUC parameters. By default, the value is **4**.
- **CROSSBUCKET**  
Specifies whether cross-hash bucket indexes are used. Only B-tree indexes are supported. The current feature is a lab feature. Contact Huawei technical support before using it.  
Value range: **ON** and **OFF**  
Default: **ON**
- **ACTIVE\_PAGES**  
Specifies the number of index pages, which may be less than the actual number of physical file pages and can be used for optimization. Currently, this parameter is valid only for the local index of the Ustore partitioned table and will be updated by VACUUM and ANALYZE (including AUTOVACUUM). You are not advised to manually set this parameter because it is invalid in distributed mode.
- **DEDUPLICATION**  
Specifies whether to deduplicate and compress tuples with duplicate key values. This is an index parameter. When there are a large number of indexes with duplicate key values, enabling this parameter can effectively reduce the space occupied by indexes. This parameter does not take effect for primary key indexes and unique indexes. If non-unique indexes are used and the index key value duplication rate is low or the index key values are unique, enabling this parameter will slightly deteriorate the index insertion performance. Currently, local and global indexes of partitioned tables are not supported.  
Value range: Boolean value. The default value is the value of the **enable\_default\_index\_deduplication** GUC parameter (the default value is **off**).
- **TABLESPACE tablespace\_name**  
Specifies the tablespace for an index. If no tablespace is specified, the default tablespace is used.  
Value range: an existing table name
- **WHERE predicate**  
Creates a partial index. A partial index is an index that contains entries for only a portion of a table, usually a portion that is more useful for indexing than the rest of the table. For example, if you have a table that contains both billed and unbilled orders where the unbilled orders take up a small fraction of the total table and yet that is an often used portion, you can improve

performance by creating an index on just that portion. In addition, **WHERE** with **UNIQUE** can be used to enforce uniqueness over a subset for a table.

**Value range:** The predicate expression can only refer to columns of the underlying table, but it can use all columns, not just the ones being indexed. Currently, subqueries and aggregate expressions are forbidden in **WHERE**. You are advised not to use numeric types such as `int` for predicate, because such types can be implicitly converted to `bool` values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

For a partitioned table index, if the created index contains the `GLOBAL` or `LOCAL` keyword or the created index is a `GLOBAL` index, the `WHERE` clause cannot be used to create an index.

- **PARTITION index\_partition\_name**

Specifies the name of an index partition.

**Value range:** a string. It must comply with the [naming convention](#).

- **TABLESPACE index\_partition\_tablespace**

Specifies the tablespace of an index partition.

**Value range:** If this parameter is not specified, the value of `index_tablespace` is used.

## Examples

```
-- Create the tpcds.ship_mode_t1 table.
gaussdb=# create schema tpcds;
gaussdb=# CREATE TABLE tpcds.ship_mode_t1
(
 SM_SHIP_MODE_SK INTEGER NOT NULL,
 SM_SHIP_MODE_ID CHAR(16) NOT NULL,
 SM_TYPE CHAR(30)
 SM_CODE CHAR(10)
 SM_CARRIER CHAR(20)
 SM_CONTRACT CHAR(20)
)
DISTRIBUTE BY HASH(SM_SHIP_MODE_SK);

-- Create a common unique index on the SM_SHIP_MODE_SK column in the tpcds.ship_mode_t1 table.
gaussdb=# CREATE UNIQUE INDEX ds_ship_mode_t1_index1 ON tpcds.ship_mode_t1(SM_SHIP_MODE_SK);

-- Create a B-tree index on the SM_SHIP_MODE_SK column in the tpcds.ship_mode_t1 table.
gaussdb=# CREATE INDEX ds_ship_mode_t1_index4 ON tpcds.ship_mode_t1 USING
btree(SM_SHIP_MODE_SK);

-- Create an expression index on the SM_CODE column in the tpcds.ship_mode_t1 table:
gaussdb=# CREATE INDEX ds_ship_mode_t1_index2 ON tpcds.ship_mode_t1(SUBSTR(SM_CODE,1,4));

-- Create a partial index on the SM_SHIP_MODE_SK column where SM_SHIP_MODE_SK is greater than 10
in the tpcds.ship_mode_t1 table.
gaussdb=# CREATE UNIQUE INDEX ds_ship_mode_t1_index3 ON tpcds.ship_mode_t1(SM_SHIP_MODE_SK)
WHERE SM_SHIP_MODE_SK>10;

-- Create an index on the SM_SHIP_MODE_SK column of table tpcds.ship_mode_t1 in a mode that does
not block DML.
gaussdb=# CREATE INDEX CONCURRENTLY ds_ship_mode_t1_index4 ON
tpcds.ship_mode_t1(SM_SHIP_MODE_SK);

-- Rename an existing index.
gaussdb=# ALTER INDEX tpcds.ds_ship_mode_t1_index1 RENAME TO ds_ship_mode_t1_index5;

-- Set the index as unusable.
gaussdb=# ALTER INDEX tpcds.ds_ship_mode_t1_index2 UNUSABLE;
```

```
-- Rebuild an index.
gaussdb=# ALTER INDEX tpcds.ds_ship_mode_t1_index2 REBUILD;

-- Delete an existing index.
gaussdb=# DROP INDEX tpcds.ds_ship_mode_t1_index2;

-- Delete the table.
gaussdb=# DROP TABLE tpcds.ship_mode_t1;

-- Create a tablespace.
gaussdb=# CREATE TABLESPACE example1 RELATIVE LOCATION 'tablespace1/tablespace_1';
gaussdb=# CREATE TABLESPACE example2 RELATIVE LOCATION 'tablespace2/tablespace_2';
gaussdb=# CREATE TABLESPACE example3 RELATIVE LOCATION 'tablespace3/tablespace_3';
gaussdb=# CREATE TABLESPACE example4 RELATIVE LOCATION 'tablespace4/tablespace_4';
-- Create the tpcds.customer_address_p1 table.
gaussdb=# CREATE TABLE tpcds.customer_address_p1
(
 CA_ADDRESS_SK INTEGER NOT NULL,
 CA_ADDRESS_ID CHAR(16) NOT NULL,
 CA_STREET_NUMBER CHAR(10) ,
 CA_STREET_NAME VARCHAR(60) ,
 CA_STREET_TYPE CHAR(15) ,
 CA_SUITE_NUMBER CHAR(10) ,
 CA_CITY VARCHAR(60) ,
 CA_COUNTY VARCHAR(30) ,
 CA_STATE CHAR(2) ,
 CA_ZIP CHAR(10) ,
 CA_COUNTRY VARCHAR(20) ,
 CA_GMT_OFFSET DECIMAL(5,2) ,
 CA_LOCATION_TYPE CHAR(20)
)
TABLESPACE example1
DISTRIBUTE BY HASH(CA_ADDRESS_SK)
PARTITION BY RANGE(CA_ADDRESS_SK)
(
 PARTITION p1 VALUES LESS THAN (3000),
 PARTITION p2 VALUES LESS THAN (5000) TABLESPACE example1,
 PARTITION p3 VALUES LESS THAN (MAXVALUE) TABLESPACE example2
)
ENABLE ROW MOVEMENT;
-- Create the partitioned table index ds_customer_address_p1_index1 without specifying the index
partition name.
gaussdb=# CREATE INDEX ds_customer_address_p1_index1 ON
tpcds.customer_address_p1(CA_ADDRESS_SK) LOCAL;
-- Create the partitioned table index ds_customer_address_p1_index2 with the name of the index partition
specified.
gaussdb=# CREATE INDEX ds_customer_address_p1_index2 ON
tpcds.customer_address_p1(CA_ADDRESS_SK) LOCAL
(
 PARTITION CA_ADDRESS_SK_index1,
 PARTITION CA_ADDRESS_SK_index2 TABLESPACE example3,
 PARTITION CA_ADDRESS_SK_index3 TABLESPACE example4
)
TABLESPACE example2;

-- Create the partitioned table index ds_customer_address_p1_index3 online without specifying the index
partition name.
gaussdb=# CREATE INDEX CONCURRENTLY ds_customer_address_p1_index3 ON
tpcds.customer_address_p1(CA_ADDRESS_SK) LOCAL;

-- Create the global partitioned index ds_customer_address_p1_index4 online.
gaussdb=# CREATE INDEX CONCURRENTLY ds_customer_address_p1_index4 ON
tpcds.customer_address_p1(CA_ADDRESS_ID) GLOBAL;

-- Change the tablespace of the partitioned table index CA_ADDRESS_SK_index2 to example1.
gaussdb=# ALTER INDEX tpcds.ds_customer_address_p1_index2 MOVE PARTITION CA_ADDRESS_SK_index2
TABLESPACE example1;
```

```
-- Change the tablespace of the partitioned table index CA_ADDRESS_SK_index3 to example2.
gaussdb=# ALTER INDEX tpcds.ds_customer_address_p1_index2 MOVE PARTITION CA_ADDRESS_SK_index3
TABLESPACE example2;

-- Rename a partitioned table index.
gaussdb=# ALTER INDEX tpcds.ds_customer_address_p1_index2 RENAME PARTITION
CA_ADDRESS_SK_index1 TO CA_ADDRESS_SK_index4;

-- Delete the created indexes and the partitioned table.
gaussdb=# DROP INDEX tpcds.ds_customer_address_p1_index1;
gaussdb=# DROP INDEX tpcds.ds_customer_address_p1_index2;
gaussdb=# DROP TABLE tpcds.customer_address_p1;
-- Delete the tablespace.
gaussdb=# DROP TABLESPACE example1;
gaussdb=# DROP TABLESPACE example2;
gaussdb=# DROP TABLESPACE example3;
gaussdb=# DROP TABLESPACE example4;
```

## Helpful Links

[ALTER INDEX](#) and [DROP INDEX](#)

## Suggestions

- create index

You are advised to create indexes on:

- Columns that are often queried
- Join conditions. For a query on joined columns, you are advised to create a composite index on the columns. For example, for **select \* from t1 join t2 on t1.a=t2.a and t1.b=t2.b**, you can create a composite index on columns **a** and **b** in table **t1**.
- Columns having filter criteria (especially scope criteria) of a **where** clause
- Columns that appear after **order by**, **group by**, and **distinct**

Constraints:

- An index of an ordinary table supports a maximum of 32 columns. A GLOBAL index of a partitioned table supports a maximum of 31 columns.
- The size of a single index cannot exceed the size of the index page (8 KB). The size of a B-tree, UB-tree, or GIN index cannot exceed one third of the page size.
- Partial indexes cannot be created in a partitioned table.

## 7.15.70 CREATE LANGUAGE

This version does not support this syntax.

## 7.15.71 CREATE MASKING POLICY

### Description

Creates a masking policy.

### Precautions

Only users with the poladmin or sysadmin permission, or the initial user can perform this operation.

The masking policy takes effect only after the security policy is enabled, that is, **enable\_security\_policy** is set to **on**.

---

**CAUTION**

When you use database links to perform operations on remote objects, the client initiates a database link request. The actual sender is the server, and the attributes such as the IP address of the sender are the values of the server. For details, see [DATABASE LINK](#).

---

## Syntax

```
CREATE MASKING POLICY policy_name masking_clause[, ...] [policy_filter_clause] [ENABLE | DISABLE];
```

- **masking\_clause**  
masking\_function ON LABEL(label\_name[, ...])
- **masking\_function**  
**maskall** is not a preset function. It is hard-coded and cannot be displayed by running **\df**.  
Eight preset masking methods or user-defined functions  
{ maskall | randommasking | creditcardmasking | basicemailmasking | fullemailmasking | shufflemasking | alldigitmasking | regexmasking }
- **policy\_filter\_clause**:  
FILTER ON { FILTER\_TYPE ( filter\_value [, ...] ) } [, ...]
- **FILTER\_TYPE**:  
IP | APP | ROLES

## Parameters

- **policy\_name**  
Specifies the audit policy name, which must be unique.  
Value range: a string. It must comply with the [naming convention](#).
- **label\_name**  
Specifies the resource label name.
- **masking\_clause**  
Specifies the masking function to be used to anonymize database resources labeled by **label\_name**. **schema.function** can be used to specify the masking function.
- **policy\_filter**  
Specifies the users for which the masking policy takes effect. If this parameter is left empty, the masking policy takes effect for all users.
- **FILTER\_TYPE**  
Specifies the types of information to be filtered by the policy, including **IP**, **APP**, and **ROLES**.
- **filter\_value**  
Indicates the detailed information to be filtered, such as the IP address, app name, and username.
- **ENABLE|DISABLE**

Enables or disables the masking policy. If **ENABLE|DISABLE** is not specified, **ENABLE** is used by default.

## Examples

```
-- Create users dev_mask and bob_mask.
gaussdb=# CREATE USER dev_mask PASSWORD '*****';
gaussdb=# CREATE USER bob_mask PASSWORD '*****';

-- Create table tb_for_masking.
gaussdb=# CREATE TABLE tb_for_masking(idx int, col1 text, col2 text, col3 text, col4 text, col5 text, col6
text, col7 text,col8 text);
gaussdb=# INSERT INTO tb_for_masking VALUES(1, '9876543210', 'usr321usr', 'abc@huawei.com',
'abc@huawei.com', '1234-4567-7890-0123', 'abcdef 123456 ui 323 jsfd321 j3k2l3', '4880-9898-4545-2525',
'this is a llt case');
gaussdb=# INSERT INTO tb_for_masking VALUES(2, '0123456789', 'lltc123llt', 'abc@gmail.com',

## 7.15.72 CREATE MATERIALIZED VIEW

**CREATE MATERIALIZED VIEW** creates a complete-refresh materialized view, and you can use **REFRESH MATERIALIZED VIEW** (full refresh) to refresh the data in the materialized view.

**CREATE MATERIALIZED VIEW** is similar to **CREATE TABLE AS**, but it remembers the query used to initialize the view, so it can refresh data later. A materialized view has many attributes that are the same as those of a table, but does not support temporary materialized views.

## Precautions

- Complete-refresh materialized views cannot be created in temporary tables or global temporary tables.
- Complete-refresh materialized views do not support NodeGroups.
- After a complete-refresh materialized view is created, most DDL operations in the base table are no longer supported.
- IUD operations cannot be performed on complete-refresh materialized views.
- After a complete-refresh materialized view is created, if the base table data changes, you need to run the refresh command to synchronize the materialized view with the base table.
- The Ustore engine does not support the creation and use of materialized views.

## Syntax

```
CREATE MATERIALIZED VIEW mv_name
[(column_name [, ...])]
[WITH ({storage_parameter = value} [, ...])]
[TABLESPACE tablespace_name]
AS query;
```

## Parameter Description

- **mv\_name**  
Name (optionally schema-qualified) of the materialized view to be created.

Value range: a string. It must comply with the [naming convention](#).

- **column\_name**

Column name in the new materialized view. The materialized view supports specified columns. The number of specified columns must be the same as the number of columns in the result of the subsequent query statement. If no column name is provided, the column name is obtained from the output column name of the query.

Value range: a string. It must comply with the [naming convention](#).

- **WITH ( storage\_parameter [= value] [, ... ] )**

Specifies an optional storage parameter for a table or an index. For details, see [CREATE TABLE](#).

- **TABLESPACE tablespace\_name**

Tablespace to which the new materialized view belongs. If the tablespace is not specified, the default tablespace is used.

- **AS query**

**SELECT**, **TABLE**, or **VALUES** command This query will be run in a security-constrained operation.

## Examples

```
-- Create an ordinary table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int);

-- Create a complete-refresh materialized view.
gaussdb=# CREATE MATERIALIZED VIEW my_mv AS SELECT * FROM my_table;

-- Write data to the base table.
gaussdb=# INSERT INTO my_table VALUES(1,1),(2,2);

-- Completely refresh the complete-refresh materialized view my_mv.
gaussdb=# REFRESH MATERIALIZED VIEW my_mv;

-- Delete a complete-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_mv;

-- Delete the ordinary table my_table.
gaussdb=# DROP TABLE my_table;
```

## 7.15.73 CREATE MODEL

This syntax is not supported in distributed scenarios.

## 7.15.74 CREATE NODE

### Description

Creates a cluster node.

## Precautions

CREATE NODE is an interface of the cluster management tool. You are not advised to use this interface, because doing so affects the cluster. Only the administrator has the permission to use this interface.

## Syntax

```
CREATE NODE nodename WITH
(
 [TYPE = nodetype,]
 [HOST = hostname,]
 [PORT = portnum,]
 [HOST1 = 'hostname',]
 [PORT1 = portnum,]
 [HOSTPRIMARY [= boolean],]
 [PRIMARY [= boolean],]
 [PREFERRED [= boolean],]
 [SCTP_PORT = portnum,]
 [CONTROL_PORT = portnum,]
 [SCTP_PORT1 = portnum,]
 [CONTROL_PORT1 = portnum]
);
```

## Parameters

- **nodename**  
Specifies the node name.  
Value range: a string. It must comply with the [naming convention](#).
- **TYPE = nodetype**  
Specifies the type of a node.  
Value range:
  - 'coordinator'
  - 'datanode'
- **HOST = hostname**  
Specifies the primary server name or IP address of a node.
- **PORT = portnum**  
Specifies the primary server port to which a node is bound.
- **HOST1 = hostname**  
Specifies the name or IP address of the standby server of a node.
- **PORT1 = portnum**  
Specifies the port number of the standby server to which a node is bound.
- **HOSTPRIMARY**
- **PRIMARY = boolean**  
Specifies whether the node is a primary node or not. A primary node allows read/write operations. A non-primary node allows only read operations.  
Value range:
  - **true**
  - **false** (default value)
- **PREFERRED = boolean**

Specifies whether the node is a preferred node for read operations.

Value range:

- **true**
- **false** (default value)

- **SCTP\_PORT = portnum**

Specifies the port used by the TCP proxy communications library of the primary node to listen on the data transmission channel. TCP is used to listen on connections.

- **CONTROL\_PORT = portnum**

Specifies the port used by the TCP proxy communications library of the primary server to listen on the control channel. It may be a TCP port.

- **SCTP\_PORT1 = portnum**

Specifies the port used by the TCP proxy communications library of the standby node to listen on the data transmission channel. TCP is used to listen on connections.

- **CONTROL\_PORT 1= portnum**

Specifies the port used by the TCP proxy communications library of the standby server to listen on the control channel. It is a TCP port.

## Helpful Links

[ALTER NODE](#) and [DROP NODE](#)

## 7.15.75 CREATE NODE GROUP

### Description

Creates a cluster node group.

### Precautions

- CREATE NODE GROUP is an interface of the cluster management tool.
- Only a system administrator has the permission.

### Syntax

```
CREATE NODE GROUP groupname
 WITH (nodename [, ...]) [bucketcnt bucket_cnt]
 [BUCKETS [(bucketnumber [, ...])]] [VCGROUP] [DISTRIBUTE FROM src_group_name] [groupparent
parent_group_name];
```

### Parameters

- **groupname**

Specifies the name of a node group.

Value range: a string. It must comply with the [naming convention](#). A value can contain a maximum of 63 characters.

 NOTE

A node group name supports all ASCII characters, but you are advised to name a node group according to the naming convention.

- **nodename**  
Specifies the node name.  
Value range: a string. It must comply with the [naming convention](#). A value can contain a maximum of 63 characters.  
If this parameter is not specified, the value of **bucketcnt** must be specified, indicating that child node groups belonging to the installation node group will be created.
- bucketcnt bucket\_cnt  
**bucket\_cnt** indicates the number of buckets.  
The value range is [32,16384) and the value must be a power of 2.  
If this parameter is not specified, the value of **WITH** must be specified.
- **BUCKETS [ ( bucketnumber [, ... ] ) ]**  
Designed for internal use of the cluster management tool. You are advised not to use it directly. Otherwise, the cluster may be affected.
- groupparent parent\_group\_name  
**parent\_group\_name** indicates the name of the parent node group to which the current child node group belongs.

## Helpful Links

[DROP NODE GROUP](#)

## 7.15.76 CREATE PACKAGE

### Description

Creates a package.

### Precautions

- In distributed mode, PACKAGE can be used only in an ORA-compatible database.
- The functions or stored procedures declared in the package specification must be defined in the package body.
- During instantiation, the stored procedure with **commit** or **rollback** cannot be invoked.
- Package functions cannot be invoked in triggers.
- Variables in a package cannot be directly used in external SQL statements.
- Private variables and stored procedures in a package cannot be invoked outside the package.
- Usage that other stored procedures do not support are not supported. For example, if **commit** or **rollback** cannot be invoked in a function, **commit** or **rollback** cannot be invoked in the function of a package.

- The name of a schema cannot be the same as that of a package.
- Only A-style stored procedures and function definitions are supported.
- Variables with the same name in a package, including parameters with the same name in a package, are not supported.
- The global variables in a package are shared at the session level. The variables in packages cannot be shared among different sessions.
- When a function of an autonomous transaction is called in a package, the cursor variables in the package and recursive functions that use the cursor variables in the package are not allowed.
- A package does not declare ref cursor variables.
- The default permission on a package is **SECURITY INVOKER**. To change the default permission to **SECURITY DEFINER**, set the GUC parameter **behavior\_compat\_options** to **'plsql\_security\_definer'**.
- A user granted with the CREATE ANY PACKAGE permission can create packages in the public and user schemas.
- If the name of a package to be created contains special characters, spaces cannot be contained between special characters. You are advised to set the GUC parameter **behavior\_compat\_options** to **"skip\_insert\_gs\_source"**. Otherwise, an error may occur.
- When a package is created, it depends on an undefined object. If **behavior\_compat\_options** is set to **'plpgsql\_dependency'**, the creation can be executed and a warning message is displayed. If **behavior\_compat\_options** is not set to **'plpgsql\_dependency'**, the creation cannot be executed.
- If a view directly depends on an O-style function in a package and the **behavior\_compat\_options** parameter is set to **'plpgsql\_dependency'**, the view can be accessed if the package is created again. However, if the **behavior\_compat\_options** parameter is not set to **'plpgsql\_dependency'**, the view cannot be accessed.
- When you create a package function, the default parameter value cannot contain variables.
- The package specification in PG\_OBJECT is set to **'S'**, and the package body in PG\_OBJECT is set to **'B'**. When a created package object becomes invalid, you can use the **VALID** column in PG\_OBJECT to search for the OID of the invalid package object and run **ALTER PACKAGE PKG\_NAME COMPILE**; to recompile the package to make it valid.
- When creating a function in a package, if the function name is in the schema.func or package.func format, only the func name is obtained. The schema declaration or package declaration is invalid. To disable this behavior by default, set the GUC parameter **behavior\_compat\_options** to **'forbid\_package\_function\_with\_prefix'**.

## Syntax

- **CREATE PACKAGE SPECIFICATION**

```
CREATE [OR REPLACE] PACKAGE [schema] package_name
[invoker_rights_clause] { IS | AS } item_list_1 END package_name;
```

**invoker\_rights\_clause** can be declared as **AUTHID DEFINER** or **AUTHID CURRENT\_USER**, which indicate the definer permission and invoker permission, respectively.

**item\_list\_1** can be a declared variable, stored procedure, or function.

The package specification (header) declares public variables, functions, and exceptions in a package, which can be called by external functions or stored procedures. It can only declare stored procedures and functions but cannot define them.

- **CREATE PACKAGE BODY**

```
CREATE [OR REPLACE] PACKAGE BODY [schema] package_name
 { IS | AS } declare_section [initialize_section] END package_name;
```

The package body defines private variables and functions in a package. If a variable or function is not declared by the package specification, it is a private variable or function.

The package body also has an instantiation part to initialize the package. For details, see the example.

## Example

- Create an ORA-compatible database.

```
CREATE DATABASE ora_compat_db DBCOMPATIBILITY 'ORA';
\c ora_compat_db;
```

- Example of CREATE PACKAGE SPECIFICATION

```
CREATE OR REPLACE PACKAGE emp_bonus IS
 var1 int:=1;-- Public variable
 var2 int:=2;
 PROCEDURE testpro1(var3 int);-- Public stored procedure, which can be called by external systems.
END emp_bonus;
/
```

- Example of CREATE PACKAGE BODY

```
drop table if exists test1;
create or replace package body emp_bonus is
 var3 int:=3;
 var4 int:=4;
 procedure testpro1(var3 int)
 is
 begin
 create table if not exists test1(col1 int);
 insert into test1 values(var1);
 insert into test1 values(var4);
 end;
 begin: -- The instantiation starts.
 var4:=9;
 testpro1(var4);
end emp_bonus;
/
```

- Example of ALTER PACKAGE OWNER

```
ALTER PACKAGE emp_bonus OWNER TO omm;
-- Change the owner of PACKAGE emp_bonus to omm.
```

- Example of calling a package

```
call emp_bonus.testpro1(1); -- Use call to call the stored procedure of a package.
select emp_bonus.testpro1(1); -- Use select to call the stored procedure of a package.
-- Call the stored procedure of a package in an anonymous block.
begin
 emp_bonus.testpro1(1);
end;
/
```

## 7.15.77 CREATE PROCEDURE

### Description

Creates a stored procedure.

## Precautions

- If the parameters or return values of a stored procedure have precision, the precision is not checked.
- When creating a stored procedure, you are advised to explicitly specify the schemas of all operations on table objects in the stored procedure definition. Otherwise, the stored procedure may fail to be executed.
- **current\_schema** and **search\_path** specified by **SET** during stored procedure creation are invalid. **search\_path** and **current\_schema** before and after function execution should be the same.
- When the function is invoked by **SELECT** or **CALL**, an argument must be provided in the output parameter. The argument does not take effect.
- A stored procedure with the **PACKAGE** attribute can use overloaded functions.
- Do not create an overloaded stored procedure with different parameter names but same stored procedure name and parameter list type.
- Do not create a stored procedure that has the same name and parameter list as the function.
- Do not overload stored procedures with different default values.
- Only the **IN**, **OUT**, and **INOUT** parameters of the stored procedure cannot be reloaded after the GUC parameter **behavior\_compat\_options** is set to '**proc\_outparam\_override**'. They can be reloaded after the parameter is disabled.
- When an overloaded stored procedure is invoked, the variable type must be specified.
- If an undeclared variable is used in a stored procedure, an error is reported when the stored procedure is invoked.
- When you create a procedure, you cannot insert aggregate functions or other functions out of the average function.
- If a function is defined as **IMMUTABLE** or **SHIPPABLE**, avoid **INSERT**, **UPDATE**, **DELETE**, **MERGE**, and **DDL** operations in the function because the CN needs to determine the execution node for these operations. Otherwise, an error may occur.
- The stored procedure does not support operations that will return a set.
- When stored procedures without parameters are called in another stored procedure, you can omit brackets and call stored procedures using their names directly.
- When other functions with output parameters are invoked in a stored procedure and an assignment expression, set the GUC parameter **set behavior\_compat\_options** to '**proc\_outparam\_override**', define variables of the same type as the output parameters in advance, and use the variables as output parameters to invoke other functions with output parameters for the output parameters to take effect. Otherwise, the output parameters of the invoked function will be ignored.
- The stored procedure supports viewing, exporting, and importing parameter comments.
- The stored procedure supports viewing, exporting, and importing parameter comments between **IS/AS** and **plsql\_body**.
- Users granted with the **CREATE ANY FUNCTION** permission can create or replace stored procedures in the user schemas.

- The default permission on a stored procedure is **SECURITY INVOKER**. To change the default permission to **SECURITY DEFINER**, set the GUC parameter **behavior\_compat\_options** to '**plsql\_security\_definer**'.
- When a stored procedure is created, it depends on an undefined object. If **behavior\_compat\_options** is set to '**plpgsql\_dependency**', the creation can be executed, and a warning message is displayed. If **behavior\_compat\_options** is not set to '**plpgsql\_dependency**', the creation cannot be executed.
- When separation of duties is enabled, stored procedures with the definer specified can be rebuilt only by the current user. Only the initial user can alter the stored procedures to other users.
- If a stored procedure with the definer specified is created in a schema of another user, the stored procedure will be executed by another user, which may cause unauthorized operations. Therefore, exercise caution when performing this operation.
- If the **out** parameter is used as the output parameter in an expression, the expression does not take effect in the following scenarios: (a) The **execute immediate sqlv using func** syntax is used to execute a function. (b) The **select func into** syntax is used to execute a function. (c) DML statements such as INSERT and UPDATE are used to execute a function. (d) The **select where a=func()** statement is used. (e) When a function with the **out** output parameter is used as an input parameter, that is, **fun (func (out b), a)**, the **out b** parameter does not take effect.
- When a stored procedure with the out parameter is called, you can set the GUC parameter **set behavior\_compat\_options** to '**proc\_outparam\_transfer\_length**' to transfer the parameter length. The specifications and constraints are as follows:
  - a. The following types are supported: CHAR(n), CHARACTER(n), NCHAR(n), VARCHAR(n), VARYING(n), VARCHAR2(n), and NVARCHAR2(n).
  - b. If the out parameter does not take effect (for example, **perform**), the length does not need to be transferred.
  - c. The following types do not support precision transfer: NUMERIC, DECIMAL, NUMBER, FLOAT, DEC, INTEGER, TIME, TIMESTAMP, INTERVAL, TIME WITH TIME ZONE, TIMESTAMP WITH TIME ZONE, TIME WITHOUT TIME ZONE, and TIMESTAMP WITHOUT TIME ZONE.
  - d. The parameter length can be transferred regardless of whether the GUC parameter **set behavior\_compat\_options** is set to **proc\_outparam\_override**.

## Syntax

```
gaussdb=# CREATE [OR REPLACE] PROCEDURE procedure_name
 [(([argname] [argmode] argtype [{ DEFAULT | := | = } expression]) [...])]
 [
 { IMMUTABLE | STABLE | VOLATILE }
 | { SHIPPABLE | NOT SHIPPABLE }
 | { PACKAGE }
 | [NOT] LEAKPROOF
 | { CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }
 | [[EXTERNAL] SECURITY INVOKER | [EXTERNAL] SECURITY DEFINER | AUTHID DEFINER | AUTHID
CURRENT_USER]
 | COST execution_cost
 | SET configuration_parameter { [TO | =] value | FROM CURRENT }
] [...]
```

```
{ IS | AS }
plsql_body
/
```

## Parameters

- **OR REPLACE**  
Replaces the original definition when two stored procedures are with the same name.
- **procedure\_name**  
Specifies the name of the stored procedure that is created (optionally with schema names).  
Value range: a string. It must comply with the [naming convention](#).
- **argmode**  
Specifies the mode of an argument.

---

### NOTICE

**VARIADIC** specifies parameters of the array type.

---

Value range: **IN**, **OUT**, **INOUT**, and **VARIADIC**. The default value is **IN**. Only the parameter of the **OUT** mode can be followed by **VARIADIC**. The parameters of **OUT** and **INOUT** cannot be used in procedure definition of **RETURNS TABLE**.

- **argname**  
Specifies the argument name.  
Value range: a string. It must comply with the [naming convention](#).
- **argtype**  
Specifies the type of an argument. You can use **%ROWTYPE** to indirectly reference the type of a table.  
Value range: a valid data type
- **expression**  
Specifies the default expression of a parameter.

 NOTE

- If **a\_format\_version** is set to **10c** and **a\_format\_dev\_version** is set to **s2**, the default expression is not supported when the parameter is in INOUT mode.
  - It is recommended that you define all default parameters after all non-default parameters.
  - If a function with default parameters is invoked, input parameters are added to the function from left to right. If inputs of non-default parameters are missing, an error is reported.
  - If **proc\_uncheck\_default\_param** is enabled and a function with default parameters is invoked, input parameters are added to the function from left to right. The number of defaulted inputs depends on the number of default parameters. If an input of a non-default parameter is missing, the previous default value is used to fill this parameter.
  - When **a\_format\_version** is set to **10c**, **a\_format\_dev\_version** is set to **s1**, **proc\_outparam\_override** is disabled, and the function parameters include the output parameter **out** and **default**, the default value cannot be used.
- **IMMUTABLE, STABLE,...**  
Specifies a constraint. The function of each parameter is similar to that of CREATE FUNCTION. For details, see [CREATE FUNCTION](#).
  - **plsql\_body**  
Specifies the PL/SQL stored procedure body.

---

**NOTICE**

When you perform password-related operations, such as user creation, password change, and encryption/decryption, in a stored procedure, the password will be recorded in the system catalogs and logs in plaintext. To prevent sensitive information leakage, you are not advised to perform password-related operations in a stored procedure.

---

 NOTE

No specific order is applied to **argname** and **argname**. The following order is advised: **argname**, **argmode**, and **argtype**.

## Examples

```
-- Create a stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE prc_add
(
 param1 IN INTEGER,
 param2 IN OUT INTEGER
)
AS
BEGIN
 param2:= param1 + param2;
 db_output.print_line('result is: '||to_char(param2));
END;
/

-- Call the stored procedure.
gaussdb=# SELECT prc_add(2,3);

-- Create a stored procedure whose parameter type is VARIADIC.
gaussdb=# CREATE OR REPLACE PROCEDURE pro_variadic (var1 VARCHAR2(10) DEFAULT 'hello!',var4
VARIADIC int4[])
```

```
AS
BEGIN
 dbe_output.print_line(var1);
END;
/

-- Execute the stored procedure.
gaussdb=# SELECT pro_variadic(var1=>'hello', VARIADIC var4=> array[1,2,3,4]);

-- Create a stored procedure with the permission of the user who calls it.
gaussdb=# CREATE TABLE tb1(a integer);
gaussdb=# CREATE PROCEDURE insert_data(v integer)
SECURITY INVOKER
AS
BEGIN
 INSERT INTO tb1 VALUES(v);
END;
/

-- Call the stored procedure.

## Suggestions

- analyse | analyze
  - Do not run **ANALYZE** in a transaction or anonymous block.
  - Do not run **ANALYZE** in a function or stored procedure.

## 7.15.78 CREATE RESOURCE LABEL

### Function

**CREATE RESOURCE LABEL** creates a resource label.

### Precautions

Only user **poladmin**, user **sysadmin**, or the initial user can perform this operation.

### Syntax

```
CREATE RESOURCE LABEL [IF NOT EXISTS] label_name ADD label_item_list[, ...];
```

- **label\_item\_list**  
resource\_type(resource\_path[, ...])
- **resource\_type**  
{ TABLE | COLUMN | SCHEMA | VIEW | FUNCTION }

## Parameter Description

- **IF NOT EXISTS**  
If a resource label with the same name already exists, no error is generated. Instead, a message is displayed, indicating that the resource label already exists.
- **label\_name**  
Specifies the resource label name, which must be unique.  
Value range: a string. It must comply with the [naming convention](#).
- **resource\_type**  
Specifies the type of database resources to be labeled.  
Value range: **TABLE**, **COLUMN**, **SCHEMA**, **VIEW**, and **FUNCTION**.
- **resource\_path**  
Specifies the path of database resources.

## Examples

```
-- Create table tb_for_label.
gaussdb=# CREATE TABLE tb_for_label(col1 text, col2 text, col3 text);

-- Create schema schema_for_label.
gaussdb=# CREATE SCHEMA schema_for_label;

-- Create view view_for_label.
gaussdb=# CREATE VIEW view_for_label AS SELECT 1;

-- Create function func_for_label.
gaussdb=# CREATE FUNCTION func_for_label RETURNS TEXT AS $$ SELECT col1 FROM tb_for_label; $$
LANGUAGE SQL;

-- Create a resource label based on a table.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS table_label add TABLE(public.tb_for_label);

-- Create a resource label based on columns.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS column_label add COLUMN(public.tb_for_label.col1);

-- Create a resource label based on a schema.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS schema_label add SCHEMA(schema_for_label);

-- Create a resource label based on a view.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS view_label add VIEW(view_for_label);

-- Create a resource label based on a function.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS func_label add FUNCTION(func_for_label);

-- Delete a resource label.
gaussdb=# DROP RESOURCE LABEL func_label, view_label, schema_label, column_label, table_label;

-- Delete the func_for_label function.
gaussdb=# DROP FUNCTION func_for_label;

-- Delete the view_for_label view.
gaussdb=# DROP VIEW view_for_label;

-- Delete the schema_for_label schema.
```

```
gaussdb=# DROP SCHEMA schema_for_label;
-- Delete the tb_for_label table.
gaussdb=# DROP TABLE tb_for_label;
```

## 7.15.79 CREATE ROLE

### Description

Creates a role.

A role is an entity that owns database objects and permissions. In different environments, a role can be considered a user, a group, or both.

### Precautions

- If a role is added to the database, the role does not have the login permission.
- Only the user who has the CREATE ROLE permission or a system administrator is allowed to create roles.

### Syntax

```
CREATE ROLE role_name [[WITH] option [...]] [ENCRYPTED | UNENCRYPTED] { PASSWORD | IDENTIFIED BY } { 'password' [EXPIRED] | DISABLE };
```

The syntax of role information configuration clause option is as follows:

```
{SYSADMIN | NOSYSADMIN}
| {MONADMIN | NOMONADMIN}
| {OPRADMIN | NOOPRADMIN}
| {POLADMIN | NOPOLADMIN}
| {AUDITADMIN | NOAUDITADMIN}
| {CREATEDB | NOCREATEDB}
| {USEFT | NOUSEFT}
| {CREATEROLE | NOCREATEROLE}
| {INHERIT | NOINHERIT}
| {LOGIN | NOLOGIN}
| {REPLICATION | NOREPLICATION}
| {VCADMIN | NOVCADMIN}
| {PERSISTENCE | NOPERSISTENCE}
| CONNECTION LIMIT connlimit
| VALID BEGIN 'timestamp'
| VALID UNTIL 'timestamp'

| USER GROUP 'groupuser'
| PERM SPACE 'spacelimit'
| TEMP SPACE 'tmpspacelimit'
| SPILL SPACE 'spillspacelimit'
| NODE GROUP logic_cluster_name
| IN ROLE role_name [, ...]
| IN GROUP role_name [, ...]
| ROLE role_name [, ...]
| ADMIN rol e_name [, ...]
| USER role_name [, ...]
| SYSID uid
| DEFAULT TABLESPACE tablespace_name
| PROFILE DEFAULT
| PROFILE profile_name
| PGUSER
```

## Parameters

- **role\_name**

Specifies the name of a role.

Value range: a string. It must comply with the [naming convention](#). A value can contain a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the role name. If a role name contains uppercase letters, the database automatically converts the uppercase letters into lowercase letters. To create a role name that contains uppercase letters, enclose the role name with double quotation marks ("").
- **password**

Specifies the login password.

A new password must:

  - Contain at least eight characters. This is the default length.
  - Differ from the role name or the role name spelled backward.
  - Contain at least three of the following character types: uppercase characters, lowercase characters, digits, and special characters (limited to ~!@#\$ %^&\*()-\_+=\|[{]};,;<.>/?). If the password contains characters other than the preceding characters, an error will be reported during statement execution.
  - The password can also be a ciphertext character string that meets the format requirements. This mode is mainly used to import user data. You are advised not to use it directly. If a ciphertext password is used, the user must know the plaintext corresponding to the ciphertext password and ensure that the plaintext password meets the complexity requirements. The database does not verify the complexity of the ciphertext password. Instead, the security of the ciphertext password is ensured by the user.
  - Be enclosed by single quotation marks when a role is created.

Value range: a character string that cannot be empty.
- **EXPIRED**

When creating a user, you can select **EXPIRED**. That is, you can create a user whose password is invalid. The user cannot perform simple query or extended query. The statement can be executed only after the password is changed.
- **DISABLE**

By default, you can change your password unless it is disabled. To disable the password of a user, use this parameter. After the password of a user is disabled, the password will be deleted from the system. The user can connect to the database only through external authentication, for example, Kerberos authentication. Only administrators can enable or disable a password. Common users cannot disable the password of an initial user. To enable a password, run **ALTER USER** and specify the password.
- **ENCRYPTED | UNENCRYPTED**

Controls whether the password is stored encrypted in the system catalogs. According to product security requirement, the password must be stored encrypted. Therefore, **UNENCRYPTED** is forbidden in GaussDB. If the password string has already been encrypted in the SHA256 format, it is stored encrypted as it was, regardless of whether **ENCRYPTED** or **UNENCRYPTED** is

specified (since the system cannot decrypt the specified encrypted password string). This allows reloading of encrypted passwords during dump/restore.

- **SYSADMIN | NOSYSADMIN**

Specifies whether a new role is a system administrator. Roles with the SYSADMIN attribute have the highest permission.

Value range: If not specified, **NOSYSADMIN** is the default.

When separation of duties is enabled, users with the SYSADMIN permission do not have the permission to create users.

- **MONADMIN | NOMONADMIN**

Specifies whether a role is a monitor administrator.

Value range: If not specified, **NOMONADMIN** is the default.

- **OPRADMIN | NOOPRADMIN**

Specifies whether a role is an O&M administrator.

Value range: If not specified, **NOOPRADMIN** is the default.

- **POLADMIN | NOPOLADMIN**

Specifies whether a role is a security policy administrator.

Value range: If not specified, **NOPOLADMIN** is the default.

- **AUDITADMIN | NOAUDITADMIN**

Specifies whether a role has the audit and management attributes.

If not specified, **NOAUDITADMIN** is the default.

- **CREATEDB | NOCREATEDB**

Specifies a role's permission to create databases.

A new role does not have the permission to create databases.

Value range: If not specified, **NOCREATEDB** is the default.

- **USEFT | NOUSEFT**

This parameter is reserved and not used in this version.

- **CREATEROLE | NOCREATEROLE**

Specifies whether a role will be permitted to create new roles (that is, execute **CREATE ROLE** and **CREATE USER**). A role with the CREATEROLE permission can also modify and delete other roles.

Value range: If not specified, **NOCREATEROLE** is the default.

- When separation of duties is disabled, users with the CREATEROLE permission can create users with the CREATEROLE, AUDITADMIN, MONADMIN, POLADMIN, or CREATEDB permission and common users.

- When separation of duties is enabled, users with the CREATEROLE permission can create users with the CREATEROLE, MONADMIN, POLADMIN, or CREATEDB permission and common users.

- **INHERIT | NOINHERIT**

Specifies whether a role "inherits" the permissions of roles in the same group. It is not recommended.

- **LOGIN | NOLOGIN**

Specifies whether a role is allowed to log in to a database. A role having the **LOGIN** attribute can be considered as a user.

Value range: If not specified, **NOLOGIN** is the default.

- **REPLICATION | NOREPLICATION**

Specifies whether a role is allowed to initiate streaming replication or put the system in and out of backup mode. A role having the **REPLICATION** attribute is specific to replication.

If not specified, **NOREPLICATION** is the default.

- **PERSISTENCE | NOPERSISTENCE**

Defines a permanent user. Only the initial user is allowed to create, modify, and delete permanent users with the **PERSISTENCE** attribute.

- **CONNECTION LIMIT**

Specifies how many concurrent connections the role can make.

---

**NOTICE**

- The system administrator is not restricted by this parameter.
- **connlimit** is calculated for each CN. The number of connections in a cluster is calculated using the following formula: Number of connections in a cluster = **connlimit** x Number of normal CNs.

---

Value range: an integer in the range  $[-1, 2^{31} - 1]$ . The default value is **-1**, which means unlimited.

- **VALID BEGIN**

Sets the timestamp when a role takes effect. If this clause is omitted, the role has no valid start time. **timestamp** indicates the start time. The format is 'YYYY-MM-DD HH:mm:ss'.

- **VALID UNTIL**

Sets a date and time after which the role's password is no longer valid. If this clause is omitted, the role has no valid end time. **timestamp** indicates the end time. The format is 'YYYY-MM-DD HH:mm:ss'.

- **RESOURCE POOL**

Sets the name of resource pool used by the role. The name belongs to the system catalog **pg\_resource\_pool**.

- **USER GROUP 'groupuser'**

Creates a sub-user.

- **PERM SPACE**

Sets the space available for a user.

- **TEMP SPACE**

Sets the space allocated to the temporary table of a user.

- **SPILL SPACE**

Sets the operator disk flushing space of a user.

- **IN ROLE**

Lists one or more existing roles to which the new role will be immediately added as a new member. It is not recommended.

- **IN GROUP**  
Specifies an obsolete spelling of **IN ROLE**. It is not recommended.
- **ROLE**  
Lists one or more existing roles which are automatically added as members of the new role.
- **ADMIN**  
Similar to **ROLE**. However, **ADMIN** grants permissions of new roles to other roles.
- **USER**  
Specifies an obsolete spelling of the **ROLE** clause.
- **SYSID**  
The **SYSID** clause is ignored.
- **DEFAULT TABLESPACE**  
The **DEFAULT TABLESPACE** clause is ignored.
- **PROFILE**  
The **PROFILE** clause is ignored.
- **PGUSER**  
In the current version, this attribute is reserved only for forward compatibility.

## Examples

```
-- Create a role manager whose password is *****.
gaussdb=# CREATE ROLE manager IDENTIFIED BY '*****';

-- Create a role with its validity from January 1, 2015 to January 1, 2026.
gaussdb=# CREATE ROLE miriam WITH LOGIN PASSWORD '*****' VALID BEGIN '2015-01-01' VALID UNTIL
'2026-01-01';

-- Change the password of role manager to *****.
gaussdb=# ALTER ROLE manager IDENTIFIED BY '*****' REPLACE '*****';

-- Change role manager to the system administrator.
gaussdb=# ALTER ROLE manager SYSADMIN;

-- Delete role manager.
gaussdb=# DROP ROLE manager;

-- Delete role miriam.
gaussdb=# DROP ROLE miriam;
```

## 7.15.80 CREATE ROW LEVEL SECURITY POLICY

### Description

Creates a row-level security policy for a table.

The policy takes effect only after row-level security is enabled (by running **ALTER TABLE... ENABLE ROW LEVEL SECURITY**). Otherwise, this statement does not take effect.

Currently, row-level security affects the read (**SELECT**, **UPDATE**, **DELETE**) of data tables and does not affect the write (**INSERT** and **MERGE INTO**) of data tables. The table owner or system administrators can create an expression in the **USING** clause. When the client reads the data table, the database server combines the expressions that meet the condition and applies it to the execution plan in the statement rewriting phase of a query. For each tuple in a data table, if the expression returns **TRUE**, the tuple is visible to the current user; if the expression returns **FALSE** or **NULL**, the tuple is invisible to the current user.

A row-level security policy name is specific to a table. A data table cannot have row-level security policies with the same name. Different data tables can have the same row-level security policy.

Row-level security policies can be applied to specified operations (**SELECT**, **UPDATE**, **DELETE**, and **ALL**). **ALL** indicates that **SELECT**, **UPDATE**, and **DELETE** will be affected. For a new row-level security policy, the default value **ALL** will be used if you do not specify the operations that will be affected.

Row-level security policies can be applied to a specified user (role) or to all users (**PUBLIC**). For a new row-level security policy, the default value **PUBLIC** will be used if you do not specify the user that will be affected.

## Precautions

- Row-level security policies can be defined for row-store tables, row-store partitioned tables, replication tables, unlogged tables, and hash tables.
- Row-level security policies cannot be defined for foreign tables and temporary tables.
- Row-level security policies cannot be defined for views.
- A maximum of 100 row-level security policies can be defined for a table.
- System administrators are not affected by row-level security policies and can view all data in a table.
- Tables queried by using SQL statements, views, functions, and stored procedures are affected by row-level security policies.
- The data type of a table column to which a row-level security policy has been added cannot be changed.

## Syntax

```
CREATE [ROW LEVEL SECURITY] POLICY policy_name ON table_name
 [AS { PERMISSIVE | RESTRICTIVE }]
 [FOR { ALL | SELECT | UPDATE | DELETE }]
 [TO { role_name | PUBLIC | CURRENT_USER | SESSION_USER } [, ...]]
 USING (using_expression)
```

## Parameters

- **policy\_name**  
Specifies the name of a row-level security policy to be created. The names of row-level security policies for a table must be unique.
- **table\_name**  
Specifies the name of a table to which a row-level security policy is applied.
- **PERMISSIVE | RESTRICTIVE**

**PERMISSIVE** enables the permissive row-level security policy. The conditions of the permissive policy are joined through the OR expression. **RESTRICTIVE** enables the restrictive row-level security policy. The conditions of the restrictive policy are joined through the AND expression. The join methods are as follows:

(using\_expression\_permissive\_1 OR using\_expression\_permissive\_2 ...) AND  
(using\_expression\_restrictive\_1 AND using\_expression\_restrictive\_2 ...)

The default value is **PERMISSIVE**.

- **command**

Specifies the SQL operations affected by a row-level security policy, including **ALL**, **SELECT**, **UPDATE**, and **DELETE**. If this parameter is not specified, the default value **ALL** will be used, covering **SELECT**, **UPDATE**, and **DELETE**.

If **command** is set to **SELECT**, only tuple data that meets the condition (the return value of **using\_expression** is **TRUE**) can be queried. The operations that are affected include **SELECT**, **SELECT FOR UPDATE/SHARE**, **UPDATE ... RETURNING**, and **DELETE ... RETURNING**.

If **command** is set to **UPDATE**, only tuple data that meets the condition (the return value of **using\_expression** is **TRUE**) can be updated. The operations that are affected include **UPDATE**, **UPDATE ... RETURNING**, and **SELECT ... FOR UPDATE/SHARE**.

If **command** is set to **DELETE**, only tuple data that meets the condition (the return value of **using\_expression** is **TRUE**) can be deleted. The operations that are affected include **DELETE** and **DELETE ... RETURNING**.

The following table describes the relationship between row-level security policies and SQL statements.

**Table 7-162** Relationship between row-level security policies and SQL statements.

| Command                        | SELECT/ALL Policy | UPDATE/ALL Policy | DELETE/ALL Policy |
|--------------------------------|-------------------|-------------------|-------------------|
| <b>SELECT</b>                  | Existing row      | No                | No                |
| <b>SELECT FOR UPDATE/SHARE</b> | Existing row      | Existing row      | No                |
| <b>UPDATE</b>                  | No                | Existing row      | No                |
| <b>UPDATE RETURNING</b>        | Existing row      | Existing row      | No                |
| <b>DELETE</b>                  | No                | No                | Existing row      |
| <b>DELETE RETURNING</b>        | Existing row      | No                | Existing row      |

- **role\_name**

Specifies database users affected by a row-level security policy.

**CURRENT\_USER** indicates the username in the current execution environment. **SESSION\_USER** indicates the session username. If this

parameter is not specified, the default value **PUBLIC** is used, indicating that all database users are affected. You can specify multiple affected database users.

### NOTICE

System administrators are not affected by row access control.

- **using\_expression**

Specifies an expression defined for a row-level security policy (return type: Boolean).

The expression cannot contain aggregate functions or window functions. In the statement rewriting phase of a query, if row-level security for a data table is enabled, the expressions that meet the specified conditions will be added to the plan tree. The expression is calculated for each tuple in the data table. For **SELECT**, **UPDATE**, and **DELETE**, row data is visible to the current user only when the return value of the expression is **TRUE**. If the expression returns **FALSE**, the tuple is invisible to the current user. In this case, the user cannot view the tuple through the **SELECT** statement, update the tuple through the **UPDATE** statement, or delete the tuple through the **DELETE** statement.

## Examples

```
-- Create user alice.
gaussdb=# CREATE USER alice PASSWORD '*****';

-- Create user bob.
gaussdb=# CREATE USER bob PASSWORD '*****';

-- Create data table all_data.
gaussdb=# CREATE TABLE public.all_data(id int, role varchar(100), data varchar(100));

-- Insert data into the data table.
gaussdb=# INSERT INTO all_data VALUES(1, 'alice', 'alice data');
gaussdb=# INSERT INTO all_data VALUES(2, 'bob', 'bob data');
gaussdb=# INSERT INTO all_data VALUES(3, 'peter', 'peter data');

-- Grant the read permission on the all_data table to users alice and bob.
gaussdb=# GRANT SELECT ON all_data TO alice, bob;

-- Enable the row-level security policy.
gaussdb=# ALTER TABLE all_data ENABLE ROW LEVEL SECURITY;

-- Create a row-level security policy to specify that the current user can view only their own data.
gaussdb=# CREATE ROW LEVEL SECURITY POLICY all_data_rls ON all_data USING(role = CURRENT_USER);

-- View information about the all_data table.
gaussdb=# \d+ all_data
 Table "public.all_data"
Column | Type | Modifiers | Storage | Stats target | Description
-----+-----+-----+-----+-----+-----
id | integer | | plain | |
role | character varying(100) | | extended | |
data | character varying(100) | | extended | |
Row Level Security Policies:
 POLICY "all_data_rls" FOR ALL
 TO public
 USING (((role)::name = "current_user"()))
Has OIDs: no
Distribute By: HASH(id)
```

```
Location Nodes: ALL DATANODES
Options: orientation=row, compression=no, enable_rowsecurity=true

-- Run SELECT.
gaussdb=# SELECT * FROM all_data;
 id | role | data
-----+-----
 1 | alice | alice data
 2 | bob | bob data
 3 | peter | peter data
(3 rows)

-- Grant the login permission to the user.
gaussdb=# ALTER USER alice LOGIN;

gaussdb=# EXPLAIN(COSTS OFF) SELECT * FROM all_data;
 QUERY PLAN

Streaming (type: GATHER)
 Node/s: All datanodes
-> Seq Scan on all_data
(3 rows)

-- Switch to user alice and run SELECT.
gaussdb=# SELECT * FROM all_data;
 id | role | data
-----+-----
 1 | alice | alice data
(1 row)

gaussdb=# EXPLAIN(COSTS OFF) SELECT * FROM all_data;
 QUERY PLAN

Streaming (type: GATHER)
 Node/s: All datanodes
-> Seq Scan on all_data
 Filter: ((role)::name = 'alice'::name)
Notice: This query is influenced by row level security feature
(5 rows)

-- Delete the row-level security policy.
gaussdb=# DROP ROW LEVEL SECURITY POLICY all_data_rls ON all_data;

-- Delete the all_data table.
gaussdb=# DROP TABLE public.all_data;

-- Delete users alice and bob.
gaussdb=# DROP USER alice, bob;
```

## Helpful Links

[DROP ROW LEVEL SECURITY POLICY](#)

## 7.15.81 CREATE SCHEMA

### Description

Creates a schema.

Named objects are accessed either by "qualifying" their names with the schema name as a prefix, or by setting a search path that includes the desired schema. When creating named objects, you can also use the schema name as a prefix.

Optionally, CREATE SCHEMA can include sub-commands to create objects within the new schema. The sub-commands are treated essentially the same as separate

commands issued after creating the schema. If the `AUTHORIZATION` clause is used, all the created objects are owned by this user.

## Precautions

- Only a user with the `CREATE` permission on the current database can perform this operation.
- The owner of an object created by a system administrator in a schema with the same name as a common user is the common user, not the system administrator.

## Syntax

- Create a schema based on a specified name.  

```
CREATE SCHEMA schema_name
[AUTHORIZATION user_name] [WITH BLOCKCHAIN] [schema_element [...]];
```
- Create a schema based on a username.  

```
CREATE SCHEMA AUTHORIZATION user_name [schema_element [...]];
```

## Parameters

- **schema\_name**  
Specifies the schema name.

---

### NOTICE

- The schema name must be unique in the current database.
- The schema name cannot be the same as the initial username of the current database.
- The schema name cannot start with `pg_`.
- The schema name cannot start with `gs_role_`.

---

Value range: a string. It must comply with the [naming convention](#).

- **AUTHORIZATION user\_name**  
Specifies the owner of a schema. If **schema\_name** is not specified, **user\_name** will be used as the schema name. In this case, **user\_name** can only be a role name.  
Value range: an existing username or role name
- **WITH BLOCKCHAIN**  
Specifies the tamper-proof attribute of a schema. A common row-store table in tamper-proof mode is a tamper-proof user table.
- **schema\_element**  
Specifies an SQL statement defining an object to be created within the schema. Currently, only `CREATE TABLE`, `CREATE VIEW`, `CREATE INDEX`, `CREATE PARTITION`, and `GRANT` are supported.  
Objects created by sub-commands are owned by the user specified by `AUTHORIZATION`.

 NOTE

If objects in the schema on the current search path are with the same name, specify the schemas for different objects. You can run **SHOW SEARCH\_PATH** to check the schemas on the current search path.

## Examples

```
-- Create the role1 role.
gaussdb=# CREATE ROLE role1 IDENTIFIED BY '*****';

-- Create a schema named role1 for the role1 role. The owner of the films and winners tables created by
the clause is role1.
gaussdb=# CREATE SCHEMA AUTHORIZATION role1
CREATE TABLE films (title text, release date, awards text[])
CREATE VIEW winners AS
SELECT title, release FROM films WHERE awards IS NOT NULL;

-- Delete the schema.
gaussdb=# DROP SCHEMA role1 CASCADE;
-- Delete the user.
gaussdb=# DROP USER role1 CASCADE;
```

## Helpful Links

[ALTER SCHEMA](#) and [DROP SCHEMA](#)

## 7.15.82 CREATE SEQUENCE

### Function

**CREATE SEQUENCE** adds a sequence to the current database. The owner of a sequence is the user who creates the sequence.

### Precautions

- A sequence is a special table that stores arithmetic columns. Such a table is controlled by DBMS. It has no actual meaning and is usually used to generate unique identifiers for rows or tables.
- If a schema name is given, the sequence is created in the specified schema; otherwise, it is created in the current schema. The sequence name must be different from the names of other sequences, tables, indexes, views in the same schema.
- After the sequence is created, functions **nextval()** and **generate\_series(1,N)** insert data to the table. Make sure that the number of times for invoking **nextval** is greater than or equal to N+1. Otherwise, errors will be reported because the number of times for invoking function **generate\_series()** is N+1.
- A user granted with the CREATE ANY SEQUENCE permission can create sequences in the public and user schemas.

### Syntax

```
CREATE SEQUENCE name [INCREMENT [BY] increment]
[MINVALUE minvalue | NO MINVALUE | NOMINVALUE] [MAXVALUE maxvalue | NO MAXVALUE |
NOMAXVALUE]
[START [WITH] start] [CACHE cache] [[NO] CYCLE | NOCYCLE]
[OWNED BY { table_name.column_name | NONE }];
```

## Parameter Description

- **name**  
Specifies the name of a sequence to be created.  
Value range: a string containing only lowercase letters, uppercase letters, special characters #\_\$, and digits
- **increment**  
Specifies the step for a sequence. A positive number generates an ascending sequence, and a negative number generates a decreasing sequence.  
The default value is **1**.  
  
 **NOTE**  
In MySQL compatibility mode, if the step is a floating point number, the value is automatically converted to an integer. In other modes, this parameter cannot be set to a floating point number.
- **MINVALUE minvalue | NO MINVALUE| NOMINVALUE**  
Specifies the minimum value of the sequence. If **MINVALUE** is not declared, or **NO MINVALUE** is declared, the default value of the ascending sequence is **1**, and that of the descending sequence is **-2<sup>63</sup>-1**. **NOMINVALUE** is equivalent to **NO MINVALUE**.
- **MAXVALUE maxvalue | NO MAXVALUE| NOMAXVALUE**  
Specifies the maximum value of the sequence. If **MAXVALUE** is not declared, or **NO MAXVALUE** is declared, the default value of the ascending sequence is **2<sup>63</sup>-1**, and that of the descending sequence is **-1**. **NOMAXVALUE** is equivalent to **NO MAXVALUE**.
- **start**  
Specifies the start value of the sequence. The default value for an ascending sequence is **minvalue** and that for a descending sequence is **maxvalue**.
- **cache**  
Specifies the number of sequences stored in the memory for quick access purposes.  
Default value **1** indicates that one sequence can be generated each time.  
  
 **NOTE**
  - It is not recommended that you define **cache** and **maxvalue** or **minvalue** at the same time. The continuity of sequences cannot be ensured after **cache** is defined because unacknowledged sequences may be generated, causing waste of sequences. If there are requirements on the concurrency performance, see the **session\_sequence\_cache** parameter.
  - **cache** specifies the value that a single CN/DN applies for from the GTM at a time. **session\_sequence\_cache** specifies the value of the cache that a single session applies for from the CN/DN at a time. The value is automatically discarded after the session ends.
- **CYCLE**  
Recycles sequences after the number of sequences reaches **maxvalue** or **minvalue**.  
If **NO CYCLE** is specified, any invocation of **nextval** would return an error after the number of sequences reaches **maxvalue** or **minvalue**.  
**NOCYCLE** is equivalent to **NO CYCLE**.

The default value is **NO CYCLE**.

If **CYCLE** is specified, the sequence uniqueness cannot be ensured.

- **OWNED BY-**

Associates a sequence with a specified column included in a table. In this way, the sequence will be deleted when you delete its associated column or the table where the column belongs to. The associated table and sequence must be owned by the same user and in the same schema. **OWNED BY** only establishes the association between a table column and the sequence. Sequences on the column do not increase automatically when data is inserted.

The default value **OWNED BY NONE** indicates that such association does not exist.

---

**NOTICE**

You are not advised to use the sequence created using **OWNED BY** in other tables. If multiple tables need to share a sequence, the sequence must not belong to a specific table.

---

## Examples

Create an ascending sequence named **serial**, which starts from 101.

```
gaussdb=# CREATE SEQUENCE serial
START 101
CACHE 20;
```

Select the next number from the sequence.

```
gaussdb=# SELECT nextval('serial');
nextval

101
```

Select the next number from the sequence.

```
gaussdb=# SELECT nextval('serial');
nextval

102
```

Create a sequence associated with the table.

```
gaussdb=# CREATE TABLE customer_address
(
 ca_address_sk integer not null,
 ca_address_id char(16) not null,
 ca_street_number char(10)
 ca_street_name varchar(60)
 ca_street_type char(15)
 ca_suite_number char(10)
 ca_city varchar(60)
 ca_county varchar(30)
 ca_state char(2)
 ca_zip char(10)
 ca_country varchar(20)
 ca_gmt_offset decimal(5,2)
 ca_location_type char(20)
);
```

```
gaussdb=# CREATE SEQUENCE serial1
START 101
CACHE 20
OWNED BY customer_address.ca_address_sk;
-- Delete the sequence.
gaussdb=# DROP TABLE customer_address;
gaussdb=# DROP SEQUENCE serial cascade;
gaussdb=# DROP SEQUENCE serial1 cascade;
```

## 7.15.83 CREATE SERVER

### Function

**CREATE SERVER** creates a foreign server.

A foreign server stores OBS server information or other homogeneous cluster information.

### Precautions

Only a system administrator and users with permission to use a specified **FOREIGN DATA WRAPPER** can create a foreign server. The authorization syntax is as follows:

```
GRANT USAGE ON FOREIGN DATA WRAPPER fdw_name TO username
```

**fdw\_name** is the name of the **FOREIGN DATA WRAPPER**, and **username** is the name of the user creating a foreign server.

When multi-layer quotation marks are used for sensitive columns (such as **password** and **secret\_access\_key**) in **OPTIONS**, the semantics is different from that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.

### Syntax

```
CREATE SERVER server_name
FOREIGN DATA WRAPPER fdw_name
OPTIONS ({ option_name ' value ' } [, ...]);
```

### Parameter Description

- **server\_name**  
Specifies the server name.  
Value range: a string containing no more than 63 characters
- **FOREIGN DATA WRAPPER fdw\_name**  
Specifies the name of the foreign data wrapper.  
Value range: **fdw\_name** is the data wrapper created by the system during database initialization. Currently, **fdw\_name** can only be **gc\_fdw** for other homogeneous clusters. You can also create **dist\_fdw**, **file\_fdw**, and **log\_fdw**. **log\_fdw** is used only for syntax compatibility and can be used to create

foreign tables, but it is meaningless. **dist\_fdw** is used to import GDS data. You do not need to manually create a server using **dist\_fdw** because **gsmpp\_server** is already built in.

- **OPTIONS ( { option\_name ' value ' } [, ...] )**

Specifies the parameters for the foreign server. The detailed parameter description is as follows:

- **encrypt**

Specifies whether data is encrypted. This parameter is available only when **type** is **OBS**. The default value is **on**.

Value range:

- **on** indicates that data is encrypted and HTTPS is used for communication.
- **off** indicates that data is not encrypted and HTTP is used for communication.

- **access\_key**

Specifies the access key (AK) (obtained by users from the OBS console) used for the OBS access protocol. When you create a foreign table, the AK value is encrypted and saved to the metadata table of the database. This parameter is available only when **type** is set to **OBS**.

- **secret\_access\_key**

Specifies the secret key (SK) value (obtained by users from the OBS console) used for the OBS access protocol. When you create a foreign table, the SK value is encrypted and saved to the metadata table of the database. This parameter is available only when **type** is set to **OBS**.

## Examples

Create **my\_server**, in which **dfs\_fdw** is the built-in foreign data wrapper.

```
-- Create my_server.
gaussdb=# CREATE SERVER my_server FOREIGN DATA WRAPPER file_fdw;

-- Delete my_server.
gaussdb=# DROP SERVER my_server;
```

You are advised to create another server in the homogeneous cluster, where **gc\_fdw** is the foreign data wrapper in the database.

```
-- Create a server.
gaussdb=# CREATE SERVER server_remote FOREIGN DATA WRAPPER GC_FDW OPTIONS
(address '10.146.187.231:8000,10.180.157.130:8000' ,
 dbname 'test',
 username 'test',
 password '*****'
);

-- Delete the server.
gaussdb=# DROP SERVER server_remote;
```

## 7.15.84 CREATE SYNONYM

### Description

Creates a synonym object. A synonym is an alias of a database object and is used to record the mapping between database object names. You can use synonyms to access associated database objects.

### Precautions

- The user of a synonym should be its owner.
- If the schema name is specified, create a synonym in the specified schema. Otherwise create a synonym in the current schema.
- Database objects that can be accessed using synonyms include tables, views, types, packages, functions, and stored procedures.
- To use synonyms, you must have the required permissions on associated objects.
- The following DML statements support synonyms: **SELECT**, **INSERT**, **UPDATE**, **DELETE**, **EXPLAIN**, and **CALL**.
- The **CREATE SYNONYM** statement of an associated function or stored procedure cannot be used in a stored procedure. You are advised to use synonyms existing in the **pg\_synonym** system catalog in the stored procedure.
- You are not advised to create synonyms for temporary tables. To create a synonym, you need to specify the schema name of the target temporary table. Otherwise, the synonym cannot be used normally. In addition, you need to run the **DROP SYNONYM** command before the current session ends.
- After an original object is deleted, the synonym associated with the object will not be deleted in cascading mode. If you continue to access the synonym, for tables, a message is displayed indicating that the synonyms has expired; for functions, stored procedures, and packages, a message is displayed indicating that the objects do not exist.
- Users granted the CREATE ANY SYNONYM permission can create synonyms in user schemas.
- Synonyms cannot be created for encrypted tables that contain encrypted columns and views, functions, and stored procedures based on encrypted tables.
- If the schema of a synonym is the schema to which the user belongs, the owner of the synonym is also the owner of the schema. In other scenarios, the owner of the synonym is the creator of the synonym by default.
- If **SEARCH\_PATH** is set and no synonym schema is specified, for stored procedures and functions, the PG\_PROC table is preferentially searched by name. If no function with the same name exists, synonyms are searched based on **SEARCH\_PATH**. For other objects, **SEARCH\_PATH** is preferentially searched, if their schemas are the same as that of synonyms, the objects are accessed prior to synonyms.
- Objects associated with synonyms cannot be accessed using DDL statements, such as CREATE, DROP, and ALTER.

## Syntax

```
CREATE [OR REPLACE] SYNONYM synonym_name
FOR object_name;
```

## Parameters

- **synonym**  
Specifies the name of the synonym to be created, which can contain the schema name.  
Value range: a string. It must comply with the [naming convention](#).
- **object\_name**  
Specifies the name of an object that is associated (optionally with schema names).  
Value range: a string. It must comply with the [naming convention](#).

### NOTE

- **object\_name** can be the name of an object that does not exist.
- **object\_name** can be the name of a remote object accessed by using a database link. For details about how to use database links, see [DATABASE LINK](#).

---

### CAUTION

Do not create aliases for functions that contain passwords and other sensitive information, such as the encryption function `gs_encrypt` and the decryption function `gs_decrypt` or use aliases to call the functions to prevent sensitive information leakage.

---

## Examples

```
-- Create schema ot.
gaussdb=# CREATE SCHEMA ot;

-- Create table ot.t1 and its synonym t1.
gaussdb=# CREATE TABLE ot.t1(id int, name varchar2(10)) DISTRIBUTE BY hash(id);
gaussdb=# CREATE OR REPLACE SYNONYM t1 FOR ot.t1;

-- Use synonym t1.
gaussdb=# SELECT * FROM t1;
gaussdb=# INSERT INTO t1 VALUES (1, 'ada'), (2, 'bob');
gaussdb=# UPDATE t1 SET t1.name = 'cici' WHERE t1.id = 2;

-- Create synonym v1 and its associated view ot.v_t1.
gaussdb=# CREATE SYNONYM v1 FOR ot.v_t1;
gaussdb=# CREATE VIEW ot.v_t1 AS SELECT * FROM ot.t1;

-- Use synonym v1.
gaussdb=# SELECT * FROM v1;

-- Create overloaded function ot.add and its synonym add.
gaussdb=# CREATE OR REPLACE FUNCTION ot.add(a integer, b integer) RETURNS integer AS
$$
SELECT $1 + $2
$$
LANGUAGE sql;

gaussdb=# CREATE OR REPLACE FUNCTION ot.add(a decimal(5,2), b decimal(5,2)) RETURNS decimal(5,2)
AS
```

```
$$
SELECT $1 + $2
$$
LANGUAGE sql;

gaussdb=# CREATE OR REPLACE SYNONYM add FOR ot.add;

-- Use synonym add.
gaussdb=# SELECT add(1,2);
gaussdb=# SELECT add(1.2,2.3);

-- Create stored procedure ot.register and its synonym register.
gaussdb=# CREATE PROCEDURE ot.register(n_id integer, n_name varchar2(10))
SECURITY INVOKER
AS
BEGIN
 INSERT INTO ot.t1 VALUES(n_id, n_name);
END;
/

gaussdb=# CREATE OR REPLACE SYNONYM register FOR ot.register;

-- Use synonym register to invoke the stored procedure.
gaussdb=# CALL register(3,'mia');

-- Delete the synonym.
gaussdb=# DROP SYNONYM t1;
gaussdb=# DROP SYNONYM IF EXISTS v1;
gaussdb=# DROP SYNONYM IF EXISTS add;
gaussdb=# DROP SYNONYM register;
gaussdb=# DROP SCHEMA ot CASCADE;
```

## Helpful Links

[ALTER SYNONYM](#) and [DROP SYNONYM](#)

## 7.15.85 CREATE TABLE

### Description

Creates an initially empty table in the current database. The table will be owned by the creator.

### Precautions

- If a primary key constraint or unique constraint is added to a non-distribution key, a global secondary index is created by default.
- By default, **HASH(column\_name)** is used in a distributed system. **column\_name** is the primary key column or unique constraint column (if any) of the table, or the first column of a data type that can be used as the distribution key. The priority is as follows: primary key column > unique constraint column > first column of a data type that can be used as the distribution key. If a primary key column and multiple unique constraint columns exist and the distribution mode of the table is not specified, GSIs are created for other unique constraint columns by default after the distribution key of the table is determined based on the priority.
- Distribution columns do not support the UPDATE operation.
- If an error occurs during table creation, after it is fixed, the system may fail to delete the empty disk files created before the last automatic clearance. This problem seldom occurs and does not affect system running of the database.

- When JDBC is used, the **DEFAULT** value can be set through **PrepareStatement**.
- Row-store tables do not support foreign key as the table-level constraint.
- A user granted with the CREATE ANY TABLE permission can create tables in the public and user schemas. To create a table that contains serial columns, you must also obtain the CREATE ANY SEQUENCE permission to create sequences.
- The XML type cannot be used as a primary key or foreign key.

### NOTICE

If GaussDB creates unlimited tables, CNs may be affected as follows:

- Resource exhaustion: Each table occupies certain disk space. Unlimited table creation will occupy a large amount of memory and disk space, which may exhaust CN resources. As a result, the system breaks down or becomes unstable.
- Performance deterioration: Unlimited table creation causes a large number of I/O operations and CPU computing, and the metadata information of the database becomes large, which may deteriorate the CN performance, including operations such as insert, query, update, and deletion. As a result, the system responds slowly or cannot meet service requirements.
- Security issues: Excessive tables make database management and maintenance difficult. Creating unlimited tables may cause security issues such as data leakage or data loss. Database stability decreases, causing immeasurable loss to enterprises.

Therefore, plan the number and size of GaussDB databases properly to avoid unlimited table creation and ensure system stability, reliability, and security.

- The number of table constraints cannot exceed 32,767.

## Syntax

- Create a table.

```
CREATE [[GLOBAL | LOCAL] { TEMPORARY | TEMP } | UNLOGGED] TABLE [IF NOT EXISTS]
table_name
 ({ column_name data_type [CHARACTER SET | CHARSET charset]
 [compress_mode] [COLLATE collation] [column_constraint [...]]
 | table_constraint
 | LIKE source_table [like_option [...]] }
 [, ...])
[WITH ({ storage_parameter = value } [, ...])]
[ON COMMIT { PRESERVE ROWS | DELETE ROWS }]
[COMPRESS | NOCOMPRESS]
[TABLESPACE tablespace_name]
[DISTRIBUTE BY { REPLICATION | HASH (column_name [, ...]) }
| RANGE (column_name [, ...]) { SLICE REFERENCES tablename | (slice_less_than_item [, ...])
| (slice_start_end_item [, ...]) }
| LIST (column_name [, ...]) { SLICE REFERENCES tablename | (slice_values_item [, ...]) }
]]
[TO { GROUP groupname | NODE (nodename [, ...]) }];
```

- **column\_constraint** is as follows:

```
[CONSTRAINT constraint_name]
{ NOT NULL |
 NULL |
 CHECK (expression) |
```

```

DEFAULT default_expr |
GENERATED ALWAYS AS (generation_expr) [STORED] |
AUTO_INCREMENT |
UNIQUE [KEY] [index_parameters] |
PRIMARY KEY [index_parameters] |
ENCRYPTED WITH (COLUMN_ENCRYPTION_KEY = column_encryption_key,
ENCRYPTION_TYPE = encryption_type_value) }
REFERENCES reftable [(refcolumn)] [MATCH FULL | MATCH PARTIAL | MATCH SIMPLE]
[ON DELETE action] [ON UPDATE action] }
[DEFERRABLE | NOT DEFERRABLE] [INITIALLY DEFERRED | INITIALLY IMMEDIATE]

```

- **table\_constraint** is as follows:

```

[CONSTRAINT constraint_name]
{ CHECK (expression) |
 UNIQUE (column_name [, ...]) [index_parameters] |
 PRIMARY KEY (column_name [, ...]) [index_parameters]
}
[DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE]

```

- **like\_option** is as follows:

```

{ INCLUDING | EXCLUDING } { DEFAULTS | GENERATED | CONSTRAINTS | INDEXES | STORAGE |
COMMENTS | PARTITION | REOPTIONS | DISTRIBUTION | ALL }

```

- **Range distribution rules**

For **slice\_less\_than\_item**:

```

SLICE slice_name VALUES LESS THAN ({ expression | MAXVALUE } [, ...]) [DATANODE
datanode_name | (datanode_name_list)]

```

For **slice\_start\_end\_item**:

```

SLICE name {
{ START (expression) END (expression) EVERY (expression) } |
{ START (literal) END ({ literal | MAXVALUE }) } |
{ START (literal) } |
{ END ({ literal | MAXVALUE }) }
}

```

- The LIST distribution rule **slice\_values\_item** is as follows:

```

SLICE name VALUES (expression [, ...]) [DATANODE datanode_name | (datanode_name_list)] |
SLICE name VALUES (DEFAULT) [DATANODE datanode_name | (datanode_name_list)]

```

**index\_parameters** is as follows:

```

[WITH ({storage_parameter = value} [, ...])]
[USING INDEX TABLESPACE tablespace_name]

```

## Parameters

- **UNLOGGED**

If this keyword is specified, the created table is an unlogged table. Data written to unlogged tables is not written to the WALs, which makes them considerably faster than ordinary tables. However, an unlogged table is automatically truncated after conflicts, OS restart, database restart, switchover, power-off, or abnormal shutdown, incurring data loss risks. Contents of an unlogged table are also not replicated to standby nodes. Any indexes created on an unlogged table are not automatically logged as well.

Usage scenario: Unlogged tables do not ensure data security. Users can back up data before using unlogged tables; for example, users should back up the data before a system upgrade.

Troubleshooting: If data is missing in the indexes of unlogged tables due to some unexpected operations such as an unclean shutdown, users should re-create the indexes with errors.

- **GLOBAL | LOCAL**

When creating a temporary table, you can specify the **GLOBAL** or **LOCAL** keyword before **TEMP** or **TEMPORARY**. Currently, the two keywords are used

to be compatible with the SQL standard. A local temporary table will be created by the GaussDB regardless of whether **GLOBAL** or **LOCAL** is specified.

- **TEMPORARY | TEMP**

If **TEMP** or **TEMPORARY** is specified, the created table is a temporary table. A temporary table is automatically dropped at the end of the current session. Therefore, you can create and use temporary tables in the current session as long as the connected CN in the session is normal. Temporary tables are created only in the current session. If a DDL statement involves operations on temporary tables, a DDL error will be generated. Therefore, you are advised not to perform operations on temporary tables in DDL statements. **TEMP** is equivalent to **TEMPORARY**.

---

**NOTICE**

- Temporary tables are visible to the current session through the schema starting with **pg\_temp** start. Users should not delete schema started with **pg\_temp** or **pg\_toast\_temp**.
- If **TEMPORARY** or **TEMP** is not specified when you create a table but its schema is set to that starting with **pg\_temp\_** in the current session, the table will be created as a temporary table.
- A temporary table is visible only to the current session. Therefore, it cannot be used together with **\parallel on**.
- Temporary tables do not support DN faults or primary/standby switchovers.

---

- **IF NOT EXISTS**

Sends a notice, but does not throw an error, if a table with the same name exists.

- **table\_name**

Specifies the name of the table to be created.

---

**NOTICE**

Some processing logic of materialized views determines whether a table is the log table of a materialized view or a table associated with a materialized view based on the table name prefix. Therefore, do not create a table whose name prefix is **mlog\_** or **matviewmap\_**. Otherwise, some functions of the table are affected.

---

- **column\_name**

Specifies the name of a column to be created in the new table.

- **data\_type**

Specifies the data type of the column.

- **compress\_mode**

Specifies whether to compress a table column. The option specifies the algorithm preferentially used by table columns. Row-store tables do not support compression.

Value range: **DELTA**, **PREFIX**, **DICTIONARY**, **NUMSTR**, and **NOCOMPRESS**

- **COLLATE collation**

Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **select \* from pg\_collation** command to query collation rules from the **pg\_collation** system catalog. The default collation rule is the row starting with **default** in the query result.

- **LIKE source\_table [ like\_option ... ]**

Specifies a table from which the new table automatically inherits all column names, their data types, and their not-null constraints, as well as the default expression declared as serial.

The new table and the original table are decoupled after creation is complete. Changes to the original table will not be applied to the new table, and it is not possible to include data of the new table in scans of the original table.

Columns and constraints copied by **LIKE** are not merged with the same name. If the same name is specified explicitly or in another **LIKE** clause, an error is reported.

- The default expressions are copied from the original table to the new table only if **INCLUDING DEFAULTS** is specified. The **serial** column is not copied. The default behavior is to exclude default expressions, resulting in the copied columns in the new table having default values **NULL**.
- The **CHECK** constraints are copied from the original table to the new table only when **INCLUDING CONSTRAINTS** is specified. Other types of constraints are never copied to the new table. Not-null constraints are always copied to the new table. These rules also apply to column constraints and table constraints.
- Any indexes on the original table will not be created on the new table, unless the **INCLUDING INDEXES** clause is specified.
- **STORAGE** settings for the source column definitions are copied only if **INCLUDING STORAGE** is specified. The default behavior is to exclude **STORAGE** settings.
- If **INCLUDING COMMENTS** is specified, comments for the copied columns, constraints, and indexes are copied. The default behavior is to exclude comments.
- If **INCLUDING PARTITION** is specified, the partition definitions of the source table are copied to the new table, and the new table no longer uses the **PARTITION BY** clause. The default behavior is to exclude partition definition of the original table.
- If **INCLUDING REOPTIONS** is specified, the new table will copy the storage parameter (that is, **WITH** clause) of the source table. The default behavior is to exclude partition definition of the storage parameter of the original table.
- If **INCLUDING DISTRIBUTION** is specified, the distribution information of the original table is copied to the new table, including distribution type and key, and the new table no longer use the **DISTRIBUTE BY** clause. The default behavior is to exclude distribution information of the original table.
- **INCLUDING ALL** contains the meaning of **INCLUDING DEFAULTS**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING**

**STORAGE, INCLUDING COMMENTS, INCLUDING PARTITION, INCLUDING REOPTIONS, and INCLUDING DISTRIBUTION.****NOTICE**

- If the original table contains a sequence with the SERIAL, BIGSERIAL, or SMALLSERIAL data type, or a column in the original table is a sequence by default and the sequence is created for this table (created by using **CREATE SEQUENCE ... OWNED BY**), these sequences will not be copied to the new table, and another sequence specific to the new table will be created. This is different from earlier versions. To share a sequence between the source table and new table, create a shared sequence (do not use **OWNED BY**) and set a column in the source table to this sequence.
  - You are advised not to set a column in the source table to the sequence specific to another table especially when the table is distributed in specific node groups, because doing so may result in CREATE TABLE ... LIKE execution failures. In addition, doing so may cause the sequence to become invalid in the source sequence because the sequence will also be deleted from the source table when it is deleted from the table that the sequence is specific to. To share a sequence among multiple tables, you are advised to create a shared sequence for them.
- 
- **WITH ( { storage\_parameter = value } [, ... ] )**  
Specifies an optional storage parameter for a table or an index. The WITH clause used for tables can also contain **OIDS=FALSE** to specify that rows of the new table should not contain OIDs.

 **NOTE**

When using **Numeric** of any precision to define a column, specify precision **p** and scale **s**. When precision and scale are not specified, the input will be displayed.

The description of parameters is as follows:

– **FILLFACTOR**

The fill factor of a table is a percentage from 10 to 100. **100** (complete filling) is the default value. If the Ustore storage engine is used, the default value is **92**. When a smaller fill factor is specified, **INSERT** operations fill table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives **UPDATE** a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate.

Value range: 10–100

– **ORIENTATION**

Specifies the storage mode of table data. This parameter can be set only once.

Value range:

- **ROW** indicates that table data is stored in rows.

**ROW** applies to the OLTP service, which has many interactive transactions. An interaction involves many columns in the table. Using ROW can improve the efficiency.

Default value:

If an ordinary tablespace is specified, the default is **ROW**.

- STORAGE\_TYPE

Specifies the storage engine type. This parameter cannot be modified once it is set.

Value range:

- **USTORE** indicates that tables support the inplace-update storage engine. Note that the **track\_counts** and **track\_activities** parameters must be enabled when the Ustore table is used. Otherwise, space bloating may occur.
- **ASTORE** indicates that tables support the append-only storage engine.

Default value:

If no table is specified, data is stored in Append-Only mode by default.

- INIT\_TD

Specifies the number of TDs to be initialized when an Ustore table is created. This parameter can be modified by running the **ALTER TABLE** command. Note that this parameter affects the maximum size of a single tuple stored on the data page. The conversion method is  $MAX\_TUPLE\_SIZE = BLCKSZ - INIT\_TD * TD\_SIZE$ . For example, if you change the number of INIT\_TD from 4 to 8, the maximum size of a single tuple decreases by 4 x INIT\_TD.

Value ranges: 2-128. The default value is **4**.

- Specifies the compression level of table data. It determines the compression ratio and time. Generally, the higher the level of compression, the higher the ratio, the longer the time; and the lower the level of compression, the lower the ratio, the shorter the time. The actual compression ratio depends on the distribution mode of table data loaded. Row-store tables do not support compression.

Value range:

The default value for row-store tables is **NO**.

- Specifies the table data compression ratio and duration at the same compression level. This divides a compression level into sublevels, providing more choices for compression ratio and duration. As the value becomes greater, the compression ratio becomes higher and duration longer at the same compression level.

Value range: 0 to 3. The default value is **0**.

- segment

This parameter is reserved and is not supported currently.

- hashbucket

This parameter is reserved and is not supported currently.

- bucketcnt

Specifies the number of buckets of a bucket table when the table is created. (This is a lab feature. Contact Huawei technical support before using it.) The value of this parameter must correspond to a child node group.

The value ranges from 32 to 16384 and must be an integer power of 2.

Default value: **16384**.

– `enable_tde`

Creates a TDE table. Before enabling this function, ensure that the GUC parameter **enable\_tde** has been enabled, the KMS service has been enabled, and the cluster master key ID in the GUC parameter **tde\_cmk\_id** has been correctly configured. This parameter supports only row-store tables. Temporary tables are not supported. The Ustore storage engine is not supported.

Value range: **on** and **off**. If this parameter is set to **on**, transparent data encryption is enabled. If this parameter is set to **off**, transparent data encryption is disabled but the encryption function will be enabled later. When a table is created, a data encryption key will be applied from KMS.

Default value: **off**

– `encrypt_algo`

Specifies the transparent data encryption algorithm. Before enabling this function, ensure that **enable\_tde** must be set for a table. The encryption algorithm can be specified only when a table is created. Different tables support different encryption algorithms. After the table is created, the encryption algorithm cannot be changed.

Value range: a string. The value can be **AES\_128\_CTR** or **SM4\_CTR**.

If **enable\_tde** is not set, the default value is null. If **enable\_tde** is set to **on** or **off** and **encrypt\_algo** is not set, the value is **AES\_128\_CTR**.

– `parallel_workers`

Number of bgworker threads started when an index is created. For example, value **2** indicates that two bgworker threads are started to create indexes concurrently.

Value range: [0,32], int type. If this parameter is not set, concurrent index creation is disabled.

Default value: If this parameter is not set, the concurrent index creation function is disabled.

– `dek_cipher`

Ciphertext of the key used for transparent data encryption. When **enable\_tde** is enabled, the system automatically applies for ciphertext creation. You cannot specify the ciphertext. The key rotation function can be used to update the key.

Value range: a string.

If encryption is disabled, the default value is null by default.

– `cmk_id`

ID of the cluster master key used for transparent data encryption. When **enable\_tde** is enabled, the value is obtained from the GUC parameter **tde\_cmk\_id** and cannot be specified or modified by users.

Value range: a string.

If encryption is disabled, the default value is null by default.

- **hasuids**

If this parameter is set to **on**, a unique table-level ID is allocated to a tuple when the tuple is updated.

Value range: **on** and **off**

Default value: **off**

- **logical\_repl\_node**

Name of the DN that returns logical logs to the CN during logical decoding of a distributed replication table. For the replication table, if this parameter is not specified, the first node in the node group where the current table is located is used by default. When the RESET operation is performed on this option, **logical\_repl\_node** is reset to the first node of current table.

Value range: a string.

Default value: For the non-replication table, this parameter is empty by default. For the replication table, this parameter is set to the name of the first node by default.

- **WITHOUT OIDS**

It is equivalent to **WITH(OIDS=FALSE)**.

- **ON COMMIT { PRESERVE ROWS | DELETE ROWS }**

**ON COMMIT** determines what to do when you commit a temporary table creation operation. Currently, the **PRESERVE ROWS** and **DELETE ROWS** options are supported.

- **PRESERVE ROWS** (default): No special action is taken at the ends of transactions. The temporary table and its table data are unchanged.
- **DELETE ROWS**: All rows in the temporary table will be deleted at the end of each transaction block.

- **COMPRESS | NOCOMPRESS**

If you specify **COMPRESS** in the **CREATE TABLE** statement, the compression feature is triggered in case of a bulk **INSERT** operation. If this feature is enabled, a scan is performed for all tuple data within the page to generate a dictionary and then the tuple data is compressed and stored. If **NOCOMPRESS** is specified, the table is not compressed. Row-store tables do not support compression.

Default value: **NOCOMPRESS**, that is, tuple data is not compressed before storage.

- **TABLESPACE tablespace\_name**

Specifies the tablespace where the new table is created. If not specified, the default tablespace is used.

- **DISTRIBUTE BY**

Specifies how the table is distributed or replicated between DNs.

Value range:

- **REPLICATION**: Each row in the table exists on all DNs, that is, each DN has complete table data.
- **HASH (column\_name)**: Each row of the table will be placed into specified DNs based on the hash value of the specified column.

- **RANGE(column\_name)**: maps a specified column based on the range and distributes data to the corresponding DNs.
- **LIST(column\_name)**: maps a specified column based on a specific value and distributes data to the corresponding DNs.

**NOTE**

- For HASH distribution, the maximum number of distribution keys is the same as that of columns. A maximum of 1600 distribution keys are supported. For RANGE (VALUE LESS THAN) and LIST distributions, a maximum of four distribution key columns are supported. For RANGE (START END) distribution, only one distribution key column is supported.
- For a RANGE distribution policy using the VALUE LESS THAN clause, a maximum of four distribution key columns are supported. The distribution rules are as follows:
  1. The comparison starts from the first column of values to be inserted.
  2. If the value of the inserted first column is smaller than the boundary value of the current column in the local slice, the values are directly inserted.
  3. If the value of the inserted first column is equal to the boundary value of the current column in the local slice, compare the value of the inserted second column with the boundary value of the next column in the local slice. If the value of the inserted second column is smaller than the boundary value of the next column in the local slice, the values are directly inserted. If they are equal, the comparison of the next columns between the source and target continues.
  4. If the value of the inserted first column is greater than the boundary value of the current column in the local slice, compare the value with that in the next slice.
- If the shard of the RANGE distribution table corresponds to multiple DNs, the hash value of the distribution key is calculated to perform modulo operation on the number of DN and map a new DN. For details, see the example.
- If the shard of the list distribution table corresponds to multiple DNs, the hash value of the distribution key is calculated for the default shards. Then, use the calculated hash value to perform modulo operation on the number of DN and map a new DN. For non-default shards, the round robin method is used to map values in the values list to DNs. For details, see the example.
- The RANGE/LIST distribution tables support only scale-out but not scale-in. For details about the slice scale-out rule, contact the administrator.

For the hash distribution, **column\_name** supports the following data types:

- Integer types: **TINYINT**, **SMALLINT**, **INT**, **BIGINT**, and **NUMERIC/DECIMAL**
- Character types: **CHAR**, **BPCHAR**, **VARCHAR**, **VARCHAR2**, **NVARCHAR2**, and **TEXT**
- Date/time types: **DATE**, **TIME**, **TIMETZ**, **TIMESTAMP**, **TIMESTAMPTZ**, **INTERVAL**, and **SMALLDATETIME**

For the range (value less than) or list distribution, **column\_name** supports the following data types:

- Integer types: **SMALLINT**, **INT**, **BIGINT**, **NUMERIC/DECIMAL**
- Character types: **CHAR**, **BPCHAR**, **VARCHAR**, **VARCHAR2**, **NVARCHAR2**, and **TEXT**
- Date/Time types: **DATE**, **TIMESTAMP**, **TIMESTAMPTZ**

For the range (start end) distribution, the data type of **column\_name** must be one of the following:

- Integer types: **SMALLINT, INT, BIGINT, NUMERIC/DECIMAL, FLOAT4/REAL, FLOAT8/DOUBLE**
- Date/Time types: **DATE, TIMESTAMP, TIMESTAMPTZ**

 **NOTE**

When you create a table, the choices of distribution keys and partition keys have major impact on SQL query performance. Therefore, select appropriate distribution keys and partition keys with strategies.

- Select appropriate distribution keys.

A hash table's distribution key should evenly distribute data on each DN to prevent skewing the data or distributing it unevenly across DNs. Determine appropriate distribution keys based on the following principles:

1. Determine whether data is skewed.

Connect to the database and run the following statement to check the number of tuples on each DN. Replace *tablename* with the actual name of the table to be analyzed.

```
gaussdb=# SELECT a.count,b.node_name FROM (SELECT count(*) AS
count,xc_node_id FROM tablename GROUP BY xc_node_id) a, pgxc_node b WHERE
a.xc_node_id=b.node_id ORDER BY a.count DESC;
```

If tuple numbers vary greatly (several times or tenfold) on each DN, a data skew occurs. Change the data distribution key based on the following principles:

2. Recreate a table to change its distribution keys. **ALTER TABLE** cannot change distribution keys. Therefore, you need to re-create a table when changing its distribution keys.

Principles for selecting distribution keys are as follows:

The value of the distribution key should be discrete so that data can be evenly distributed on each DN. You can select the primary key of the table as the distribution key. For example, for a person information table, choose the ID card number column as the distribution key.

With the above principles are met, you can select join conditions as distribution keys so that join tasks can be pushed down to DNs, reducing the amount of data transferred between the DNs.

- Select appropriate partition keys.

In range partitioning, a table is partitioned based on ranges defined by one or more columns, with no overlap between the ranges of values assigned to different partitions. Each range has a dedicated partition for data storage.

Modify partition keys to make the query result stored in the same or least partitions (partition pruning). Obtain consecutive I/O to improve the query performance.

In actual services, time is used to filter query objects. Therefore, you can use time as a partition key, and change the key value based on the total data volume and data volume of a single query.

- RANGE/LIST distribution

If no DN is specified for the shards of a RANGE/LIST distribution table, the database uses the Round Robin algorithm to allocate DNs to the shards. In addition, if RANGE/LIST distribution is used, you are advised to define as many shards as possible when creating a table for future capacity expansion. If the defined number of shards is less than the number of DNs before scale-out, data redistribution cannot be performed on new DNs. Note that the sharding rules are designed by users. In some extreme cases, scale-out may not solve the problem of insufficient storage space.

- **TO { GROUP groupname | NODE ( nodename [, ... ] ) }**

**TO GROUP** specifies the node group to which the table to be created belongs.  
**TO NODE** is used for internal scale-out tools.

- **CONSTRAINT constraint\_name**

Specifies the name of a column or table constraint. The optional constraint clauses specify constraints that new or updated rows must satisfy for an INSERT or UPDATE operation to succeed.

There are two ways to define constraints:

- A column constraint is defined as part of a column definition, and it is bound to a particular column.
- A table constraint is not bound to a particular column but can apply to more than one column.

- **NOT NULL**

The column is not allowed to contain null values.

- **NULL**

The column is allowed to contain null values. This is the default setting.

This clause is only provided for compatibility with non-standard SQL databases. It is not recommended.

- **CHECK ( expression )**

Specifies an expression producing a Boolean result where the INSERT or UPDATE operation of new or updated rows can succeed only when the expression result is **TRUE** or **UNKNOWN**; otherwise, an error is thrown and the database is not altered.

A CHECK constraint specified as a column constraint should reference only the column's value, while an expression in a table constraint can reference multiple columns.

 **NOTE**

<>NULL and !=NULL are invalid in an expression. Change them to **IS NOT NULL**.

- **DEFAULT default\_expr**

Assigns a default data value to a column. The value can be any variable-free expressions. (Subqueries and cross-references to other columns in the current table are not allowed.) The data type of the default expression must match the data type of the column.

The default expression will be used in any insert operation that does not specify a value for the column. If there is no default value for a column, then the default value is null.

- **UNIQUE [KEY] index\_parameters**

**UNIQUE ( column\_name [, ... ] ) index\_parameters**

Specifies that a group of one or more columns of a table can contain only unique values.

For the purpose of a unique constraint, null is not considered equal.

UNIQUE KEY can be used only when **sql\_compatibility** is set to 'MYSQL', which has the same semantics as UNIQUE.

- **PRIMARY KEY index\_parameters**

**PRIMARY KEY ( column\_name [, ... ] ) index\_parameters**

Specifies that a column or columns of a table can contain only unique (non-duplicate) and non-null values.

Only one primary key can be specified for a table.

- **REFERENCES**

The distributed database of the current version does not support the REFERENCES clause.

- **DEFERRABLE | NOT DEFERRABLE**

Controls whether the constraint can be deferred. A constraint that is not deferrable will be checked immediately after every command. Checking of constraints that are deferrable can be postponed until the end of the transaction using the **SET CONSTRAINTS** command. **NOT DEFERRABLE** is the default value. Currently, only **UNIQUE** and **PRIMARY KEY** constraints accept this clause. All the other constraints are not deferrable.

- **INITIALLY IMMEDIATE | INITIALLY DEFERRED**

If a constraint is deferrable, this clause specifies the default time to check the constraint.

- If the constraint is **INITIALLY IMMEDIATE** (default value), it is checked after each statement.
- If the constraint is **INITIALLY DEFERRED**, it is checked only at the end of the transaction.

The constraint check time can be altered using the **SET CONSTRAINTS** statement.

- **USING INDEX TABLESPACE tablespace\_name**

Allows selection of the tablespace in which the index associated with a **UNIQUE** or **PRIMARY KEY** constraint will be created. If not specified, the index is created in **default\_tablespace**. If **default\_tablespace** is empty, the default tablespace of the database is used.

- **ENCRYPTION\_TYPE = encryption\_type\_value**

For the encryption type in the ENCRYPTED WITH constraint, the value of **encryption\_type\_value** is **DETERMINISTIC** or **RANDOMIZED**.

## Examples

```
-- Create a simple table.
gaussdb=# CREATE TABLE tpcds.warehouse_t1
(
 W_WAREHOUSE_SK INTEGER NOT NULL,
 W_WAREHOUSE_ID CHAR(16) NOT NULL,
 W_WAREHOUSE_NAME VARCHAR(20)

## Helpful Links

[ALTER TABLE](#), [DROP TABLE](#), and [CREATE TABLESPACE](#)

## Suggestions

- UNLOGGED
  - The unlogged table and its indexes do not use the WAL log mechanism during data writing. Their write speed is much higher than that of ordinary tables. Therefore, they can be used for storing intermediate result sets of complex queries to improve query performance.
  - The unlogged table has no primary/standby mechanism. In case of system faults or abnormal breakpoints, data loss may occur. Therefore, the unlogged table cannot be used to store basic data.
- TEMPORARY | TEMP
  - A temporary table is automatically dropped at the end of a session.
  - The temporary table is visible only to the current CN.
- LIKE
  - The new table automatically inherits all column names, data types, and not-null constraints from this table. The new table is irrelevant to the original table after the creation.
- LIKE INCLUDING DEFAULTS
  - The default expressions are copied from the original table to the new table only if **INCLUDING DEFAULTS** is specified. The default behavior is to exclude default expressions, resulting in the copied columns in the new table having default values **NULL**.
- LIKE INCLUDING CONSTRAINTS
  - The **CHECK** constraints are copied from the original table to the new table only when **INCLUDING CONSTRAINTS** is specified. Other types of constraints are never copied to the new table. Not-null constraints are always copied to the new table. These rules also apply to column constraints and table constraints.

- LIKE INCLUDING INDEXES
  - Any indexes on the original table will not be created on the new table, unless the **INCLUDING INDEXES** clause is specified.
- LIKE INCLUDING STORAGE
  - **STORAGE** settings for the copied column definitions are copied only if **INCLUDING STORAGE** is specified. The default behavior is to exclude **STORAGE** settings.
- LIKE INCLUDING COMMENTS
  - If **INCLUDING COMMENTS** is specified, comments for the copied columns, constraints, and indexes are copied. The default behavior is to exclude comments.
- LIKE INCLUDING PARTITION
  - If **INCLUDING PARTITION** is specified, the partition definitions of the source table are copied to the new table, and the new table no longer uses the **PARTITION BY** clause. The default behavior is to exclude partition definition of the original table.
- LIKE INCLUDING REOPTIONS
  - If **INCLUDING REOPTIONS** is specified, the new table will copy the storage parameter (that is, **WITH** clause) of the source table. The default behavior is to exclude partition definition of the storage parameter of the original table.
- LIKE INCLUDING DISTRIBUTION
  - If **INCLUDING DISTRIBUTION** is specified, the distribution information of the original table is copied to the new table, including distribution type and key, and the new table no longer use the **DISTRIBUTE BY** clause. The default behavior is to exclude distribution information of the original table.
- LIKE INCLUDING ALL
  - **INCLUDING ALL** contains the meaning of **INCLUDING DEFAULTS**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING STORAGE**, **INCLUDING COMMENTS**, **INCLUDING PARTITION**, **INCLUDING REOPTIONS**, and **INCLUDING DISTRIBUTION**.
- ORIENTATION ROW
  - Creates a row-store table. Row-store applies to the OLTP service, which has many interactive transactions. An interaction involves many columns in the table. Using row-store can improve the efficiency.
- DISTRIBUTE BY
  - It is recommended that a fact table or dimension table containing a large amount of data be created as a distribution table. Each row of the table will be placed into specified DNs based on the hash value of the specified column. The syntax is **distribute by hash (column\_name)**.
  - It is recommended that a dimension table containing a small amount of data be created as a replication table. Each row in the table exists on all DNs. That is, each DN has complete table data. The syntax is **distribute by replication**.

## 7.15.86 CREATE TABLESPACE

### Description

Creates a tablespace in a database.

### Precautions

- The system administrator or a user who inherits the `gs_role_tablespace` permission of the built-in role can create a tablespace.
- Do not run **CREATE TABLESPACE** in a transaction block.
- If executing **CREATE TABLESPACE** fails but the internal directory (or file) has been created, the directory (or file) will remain. You need to manually clear it before creating the tablespace again. If there are residual files of soft links for the tablespace in the data directory, delete the residual files, and then perform O&M operations.
- **CREATE TABLESPACE** cannot be used for two-phase transactions. If it fails on some nodes, the execution cannot be rolled back.
- For details about how to prepare for creating tablespaces, see the description of parameters below.
- You are advised not to use user-defined tablespaces in scenarios such as Huawei Cloud.

This is because user-defined tablespaces are usually used with storage media other than the main storage (storage device where the default tablespace is located, such as a disk) to isolate I/O resources that can be used by different services. Storage devices use standard configurations and do not have other available storage media in scenarios such as Huawei Cloud. If the user-defined tablespace is not properly used, the system cannot run stably for a long time and the overall performance is affected. Therefore, you are advised to use the default tablespace.

### Syntax

```
CREATE TABLESPACE tablespace_name
[OWNER user_name] [RELATIVE] LOCATION 'directory' [MAXSIZE 'space_size']
[with_option_clause];
```

The **with\_option\_clause** syntax for creating a general tablespace is as follows:

```
WITH ({filesystem= { 'general'| "general" | general} |
random_page_cost = { 'value ' | value } |
seq_page_cost = { 'value ' | value }}[,...])
```

### Parameters

- **tablespace\_name**  
Specifies name of a tablespace to be created.  
The tablespace name must be distinct from the name of any existing tablespace in the cluster and cannot start with "pg", which are reserved for system catalog spaces.  
Value range: a string. It must comply with the [naming convention](#).
- **OWNER user\_name**

Specifies the name of the user who will own the tablespace. If omitted, the default owner is the current user.

Only system administrators can create tablespaces, but they can use the **OWNER** clause to assign ownership of tablespaces to non-**Sysadmin** administrators.

Value range: a string. It must be an existing user.

- **RELATIVE**

If this parameter is specified, a relative path is used. The location directory is relative to each CN/DN data directory.

Directory hierarchy: relative path of the CNs and DNs directory **/pg\_location/**. A relative path contains a maximum of two levels.

If this parameter is not specified, the absolute tablespace path is used. The location directory must be an absolute path.

- **LOCATION directory**

Specifies the directory for the table space. When creating an absolute tablespace path, ensure that the directory meets the following requirements:

- The GaussDB system user must have the read and write permissions on the directory, and the directory must be empty. If the directory does not exist, the system automatically creates it.
- The directory must be an absolute path, and does not contain special characters, such as dollar sign (\$) and greater-than sign (>).
- The directory cannot be specified under the database data directory.
- The directory must be a local path.

Value range: a string. It must be a valid directory.

- **MAXSIZE 'space\_size'**

Specifies the maximum value of the tablespace in a single DN.

Value range: a string consisting of a positive integer and unit. The unit can be KB, MB, GB, TB, or PB currently. The unit of parsed value is KB and cannot exceed the range that can be expressed in 64 bits, which is 1 KB to 9007199254740991 KB.

- **random\_page\_cost**

Specifies the cost of randomly reading the page overhead.

Value range: 0 to 1.79769e+308

Default value: value of the GUC parameter **random\_page\_cost**

- **seq\_page\_cost**

Specifies the cost of reading the page overhead in specified order.

Value range: 0 to 1.79769e+308

Default value: value of GUC parameter **seq\_page\_cost**

## Examples

```
-- Create a tablespace.
gaussdb=# CREATE TABLESPACE ds_location1 RELATIVE LOCATION 'test_tablespace/test_tablespace_1';

-- Create user joe.
gaussdb=# CREATE ROLE joe IDENTIFIED BY '*****!';

-- Create user jay.
```

```
gaussdb=# CREATE ROLE jay IDENTIFIED BY '*****';
-- Create a tablespace and set its owner to user joe.
gaussdb=# CREATE TABLESPACE ds_location2 OWNER joe RELATIVE LOCATION 'test_tablespace/
test_tablespace_2';
-- Rename the ds_location1 tablespace to ds_location3.
gaussdb=# ALTER TABLESPACE ds_location1 RENAME TO ds_location3;
-- Change the owner of the ds_location2 tablespace.
gaussdb=# ALTER TABLESPACE ds_location2 OWNER TO jay;
-- Delete the tablespace.
gaussdb=# DROP TABLESPACE ds_location2;
gaussdb=# DROP TABLESPACE ds_location3;
-- Delete users.
gaussdb=# DROP ROLE joe;
gaussdb=# DROP ROLE jay;
```

## Helpful Links

[CREATE DATABASE](#), [CREATE TABLE](#), [CREATE INDEX](#), [DROP TABLESPACE](#), and [ALTER TABLESPACE](#)

## Suggestions

- create tablespace  
You are not advised to create tablespaces in a transaction.

## 7.15.87 CREATE TABLE AS

### Description

Creates a table from the results of a query.

It creates a table and fills it with data obtained using **SELECT**. The table columns have the names and data types associated with the output columns of **SELECT** (except that you can override the **SELECT** output column names by giving an explicit list of new column names).

**CREATE TABLE AS** queries a source table once and writes the data in a new table. The result in the query view changes with the source table. In contrast, the view re-computes and defines its **SELECT** statement at each query.

### Precautions

- This statement cannot be used to create a partitioned table.
- If an error occurs during table creation, after it is fixed, the system may fail to delete the disk files that are created before the last automatic clearance and whose size is not 0. This problem seldom occurs and does not affect system running of the database.

### Syntax

```
CREATE [[GLOBAL | LOCAL] [TEMPORARY | TEMP] | UNLOGGED] TABLE [IF NOT EXISTS] table_name
[(column_name [, ...])]
[WITH ({storage_parameter = value} [, ...])]
[COMPRESS | NOCOMPRESS]
```

```
[TABLESPACE tablespace_name]
[DISTRIBUTE BY { REPLICATION | HASH (column_name [, ...])
| RANGE (column_name [, ...]) { SLICE REFERENCES tablename | (slice_less_than_item [, ...])
| (slice_start_end_item [, ...]) }
| LIST (column_name [, ...]) { SLICE REFERENCES tablename | (slice_values_item [, ...]) }
}]
[TO { GROUP groupname | NODE (nodename [, ...]) }]
AS query
[WITH [NO] DATA];
```

For details about each field, see [Syntax](#).

## Parameters

- **UNLOGGED**

Specifies that the table is created as an unlogged table. Data written to unlogged tables is not written to the WALs, which makes them considerably faster than ordinary tables. However, they are not crash-safe. An unlogged table is automatically truncated after a crash or unclean shutdown. The contents of an unlogged table are also not replicated to standby servers. Any indexes created on an unlogged table are automatically unlogged as well.

- Usage scenario: Unlogged tables do not ensure data security. Users can back up data before using unlogged tables; for example, users should back up the data before a system upgrade.
- Troubleshooting: If data is missing in the indexes of unlogged tables due to some unexpected operations such as an unclean shutdown, users should rebuild the indexes with errors.

- **GLOBAL | LOCAL**

When creating a temporary table, you can specify the **GLOBAL** or **LOCAL** keyword before **TEMP** or **TEMPORARY**. Currently, the two keywords are used to be compatible with the SQL standard. A local temporary table will be created by the GaussDB regardless of whether **GLOBAL** or **LOCAL** is specified.

- **TEMPORARY | TEMP**

If **TEMP** or **TEMPORARY** is specified, the created table is a temporary table. A temporary table is automatically dropped at the end of the current session. Therefore, you can create and use temporary tables in the current session as long as the connected CN in the session is normal. Temporary tables are created only in the current session. If a DDL statement involves operations on temporary tables, a DDL error will be generated. Therefore, you are advised not to perform operations on temporary tables in DDL statements. **TEMP** is equivalent to **TEMPORARY**.

**NOTICE**

- Temporary tables are visible to the current session through the schema starting with **pg\_temp** start. Users should not delete schema started with **pg\_temp** or **pg\_toast\_temp**.
- If **TEMPORARY** or **TEMP** is not specified when you create a table but its schema is set to that starting with **pg\_temp\_** in the current session, the table will be created as a temporary table.
- A temporary table is visible only to the current session. Therefore, it cannot be used together with **\parallel on**.
- Temporary tables do not support DN faults or primary/standby switchovers.

- **table\_name**  
Specifies the name of the table to be created.  
Value range: a string. It must comply with the [naming convention](#).
- **column\_name**  
Specifies the name of a column to be created in the new table.  
Value range: a string. It must comply with the [naming convention](#).
- **WITH ( storage\_parameter [= value] [, ... ] )**  
Specifies an optional storage parameter for a table or an index. See details of parameters below.
  - **FILLFACTOR**  
The fill factor of a table is a percentage from 10 to 100. **100** (complete filling) is the default value. If the Ustore storage engine is used, the default value is **92**. When a smaller fill factor is specified, INSERT operations fill table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives **UPDATE** a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate.  
Value range: 10–100
  - **ORIENTATION**  
Value range:  
**ROW** (default value): The data will be stored in rows.
  - **COMPRESSION**  
Specifies the compression level of table data. It determines the compression ratio and time. Generally, the higher the level of compression, the higher the ratio, the longer the time; and the lower the level of compression, the lower the ratio, the shorter the time. The actual compression ratio depends on the distribution mode of table data loaded.  
Value range:  
Row-store tables do not support compression.
  - **hashbucket**

Creates a hash table that uses buckets. This parameter supports only row-store tables, including row-store range tables.

Value range: **on** and **off**

Default value: **off**

#### NOTICE

This is a lab feature. Contact Huawei engineers for technical support when using this feature. In current version, DDL operations on hash bucket tables are affected. Therefore, you are advised not to frequently perform DDL operations on hash bucket tables.

- **COMPRESS / NOCOMPRESS**

Specifies keyword **COMPRESS** during the creation of a table, so that the compression feature is triggered in case of bulk **INSERT** operations. If this feature is enabled, a scan is performed for all tuple data within the page to generate a dictionary and then the tuple data is compressed and stored. If **NOCOMPRESS** is specified, the table is not compressed. Row-store tables do not support compression.

Default value: **NOCOMPRESS**, that is, tuple data is not compressed before storage.

- **TABLESPACE tablespace\_name**

Specifies that the new table will be created in the **tablespace\_name** tablespace. If not specified, the default tablespace is used.

- **DISTRIBUTE BY**

For details, see [DISTRIBUTE BY](#).

- **TO { GROUP groupname | NODE ( nodename [, ... ] ) }**

**TO GROUP** specifies the node group to which the table to be created belongs. **TO NODE** is used for internal scale-out tools.

- **AS query**

Specifies a **SELECT** or **VALUES** command, or an **EXECUTE** command that runs a prepared **SELECT** or **VALUES** query.

- **[ WITH [ NO ] DATA ]**

Specifies whether the data produced by the query should be copied to the new table. By default, the data will be copied. If the value **NO** is used, only the table structure will be copied.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.store_returns table.
gaussdb=# CREATE TABLE tpcds.store_returns
(
 W_WAREHOUSE_SK INTEGER NOT NULL,
 W_WAREHOUSE_ID CHAR(16) NOT NULL,
 sr_item_sk VARCHAR(20) ,
 W_WAREHOUSE_SQ_FT INTEGER
);
```

```
-- Insert a record into a table:
gaussdb=# INSERT INTO tpcds.store_returns(W_WAREHOUSE_SK, W_WAREHOUSE_ID, sr_item_sk,
W_WAREHOUSE_SQ_FT) VALUES (1, 'AAAAAAAAABAAAAAAA', '4800', '20');

-- Create the tpcds.store_returns_t1 table and insert numbers that are greater than 4795 in the sr_item_sk
column of the tpcds.store_returns table.
gaussdb=# CREATE TABLE tpcds.store_returns_t1 AS SELECT * FROM tpcds.store_returns WHERE sr_item_sk
> '4795';

-- Copy tpcds.store_returns to create the tpcds.store_returns_t2 table.
gaussdb=# CREATE TABLE tpcds.store_returns_t2 AS table tpcds.store_returns;

-- Delete the table.
gaussdb=# DROP TABLE tpcds.store_returns_t1 ;
gaussdb=# DROP TABLE tpcds.store_returns_t2 ;
gaussdb=# DROP TABLE tpcds.store_returns;

-- Delete the schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

[CREATE TABLE](#) and [SELECT](#)

## 7.15.88 CREATE TABLE PARTITION

### Description

Creates a partitioned table. Partitioning refers to splitting what is logically one large table into smaller physical pieces based on specific schemes. The table based on the logic is called a partitioned table, and each physical piece is called a partition. Data is stored on these physical partitions, instead of the logical partitioned table.

The common forms of partitioning include range partitioning, interval partitioning, hash partitioning, list partitioning, and value partitioning. Currently, row-store tables support range partitioning, hash partitioning, list partitioning.

In range partitioning, a table is partitioned based on ranges defined by one or more columns, with no overlap between the ranges of values assigned to different partitions. Each range has a dedicated partition for data storage.

The partitioning policy for range partitioning refers to how data is inserted into partitions.

In range partitioning, a table is partitioned based on partition key values. If a record can be mapped to a partition, it is inserted into the partition; if it cannot, an error message is returned. Range partitioning is the most commonly used partitioning policy.

In hash partitioning, a modulus and a remainder are specified for each partition based on a column in the table, and records to be inserted into the table are allocated to the corresponding partition, the rows in each partition must meet the following condition: The value of the partition key divided by the specified modulus generates the remainder specified for the partition key.

In hash partitioning, table is partitioned based on partition key values. If a record can be mapped to a partition, it is inserted into the partition; if it cannot, an error message is returned.

List partitioning is to allocate the records to be inserted into a table to the corresponding partition based on the key values in each partition. The key values do not overlap in different partitions. Create a partition for each group of key values to store corresponding data.

In list partitioning, table is partitioned based on partition key values. If a record can be mapped to a partition, it is inserted into the partition; if it cannot, an error message is returned.

Partitioning can provide several benefits:

- Query performance can be improved drastically in certain situations, particularly when most of the heavily accessed rows of the table are in a single partition or a small number of partitions. Partitioning narrows the range of data search and improves data access efficiency.
- In the case of an INSERT or UPDATE operation on most portions of a single partition, performance can be improved by taking advantage of continuous scan of that partition instead of partitions scattered across the whole table.
- Frequent loading or deletion operations on records in a separate partition can be accomplished by reading or removing that partition. It also avoids the VACUUM overload caused by bulk DELETE operations.

## Precautions

- If the constraint key of the unique constraint and primary key constraint contains all partition keys, a local index is created for the constraints. Otherwise, a global index is created.
- Currently, hash partitioning supports only single-column partition keys, and does not support multi-column partition keys.
- In the PARTITION FOR (values) syntax for partitioned tables, values can only be constants.
- In the PARTITION FOR (values) syntax for partitioned tables, if data type conversion is required for values, you are advised to use forcible type conversion to prevent the implicit type conversion result from being inconsistent with the expected result.
- The maximum number of partitions is 1048575. Generally, it is impossible to create so many partitions, because too many partitions may cause insufficient memory. Create partitions based on the value of **local\_syscache\_threshold**. The memory used by the partitioned tables is about (number of partitions x 3/1024) MB. Theoretically, the memory occupied by the partitions cannot be greater than the value of **local\_syscache\_threshold**. In addition, some space must be reserved for other functions.
- If the memory is insufficient due to too many partitions, the performance deteriorates sharply.
- Currently, the statement specifying a partition cannot perform global index scan.
- Data of the XML type cannot be used as partition keys or level-2 partition keys.

## Syntax

```
CREATE TABLE [IF NOT EXISTS] partition_table_name
([
```

```

{ column_name data_type [COLLATE collation] [column_constraint [...]]
| table_constraint
| LIKE source_table [like_option [...]] }
[, ...]
)
[WITH ({storage_parameter = value} [, ...])]
[COMPRESS | NOCOMPRESS]
[TABLESPACE tablespace_name]
[DISTRIBUTE BY { REPLICATION | HASH (column_name [, ...])
| RANGE (column_name [, ...]) { SLICE REFERENCES tablename | (slice_less_than_item [, ...])
| (slice_start_end_item [, ...]) }
| LIST (column_name [, ...]) { SLICE REFERENCES tablename | (slice_values_item [, ...]) }
}]
]
] TO { GROUP groupname | NODE (nodename [, ...]) }]
PARTITION BY {
{RANGE [COLUMNS] (partition_key) [PARTITIONS integer] (partition_less_than_item [, ...])} |
{RANGE [COLUMNS] (partition_key) [PARTITIONS integer] (partition_start_end_item [, ...])} |
{LIST [COLUMNS] (partition_key) [PARTITIONS integer] (PARTITION partition_name VALUES [IN]
(list_values) [TABLESPACE [=] tablespace_name][, ...])} |
{ HASH (partition_key) [PARTITIONS integer] (PARTITION partition_name [TABLESPACE [=]
tablespace_name][, ...])}
} [{ ENABLE | DISABLE } ROW MOVEMENT];

```

- **column\_constraint** is as follows:

```

[CONSTRAINT constraint_name]
{ NOT NULL |
NULL |
CHECK (expression) |
DEFAULT default_expr |
UNIQUE [KEY] [index_parameters] |
PRIMARY KEY [index_parameters] }
[DEFERRABLE | NOT DEFERRABLE][INITIALLY DEFERRED | INITIALLY IMMEDIATE]

```

- **table\_constraint** is as follows:

```

[CONSTRAINT constraint_name]
{ CHECK (expression) |
UNIQUE (column_name [, ...]) [index_parameters] |
PRIMARY KEY (column_name [, ...]) [index_parameters] }
[DEFERRABLE | NOT DEFERRABLE][INITIALLY DEFERRED | INITIALLY IMMEDIATE]

```

- **like\_option** is as follows:

```

{ INCLUDING | EXCLUDING } { DEFAULTS | CONSTRAINTS | INDEXES | STORAGE | COMMENTS |
RELOPTIONS | DISTRIBUTION | ALL }

```

- **index\_parameters** is as follows:

```

[WITH ({storage_parameter = value} [, ...])]
[USING INDEX TABLESPACE tablespace_name]

```

- **partition\_less\_than\_item:**

```

PARTITION partition_name VALUES LESS THAN ({ partition_value | MAXVALUE }) [TABLESPACE
tablespace_name]

```

- **partition\_start\_end\_item:**

```

PARTITION partition_name {
{START(partition_value) END (partition_value) EVERY (interval_value)} |
{START(partition_value) END ({partition_value | MAXVALUE})} |
{START(partition_value)} |
{END({partition_value | MAXVALUE})}
} [TABLESPACE tablespace_name]

```

## Parameters

- **IF NOT EXISTS**

Sends a notice, but does not throw an error, if a table with the same name exists.

- **partition\_table\_name**

Specifies the name of a partitioned table.

Value range: a string. It must comply with the [naming convention](#).

- **column\_name**

Specifies the name of a column to be created in the new table.

Value range: a string. It must comply with the [naming convention](#).

- **data\_type**

Specifies the data type of the column.

- **COLLATE collation**

Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used.

- **CONSTRAINT constraint\_name**

Specifies the name of a column or table constraint. The optional constraint clauses specify constraints that new or updated rows must satisfy for an INSERT or UPDATE operation to succeed. You can run the **select \* from pg\_collation** command to query collation rules from the **pg\_collation** system catalog. The default collation rule is the row starting with **default** in the query result.

There are two ways to define constraints:

- A column constraint is defined as part of a column definition, and it is bound to a particular column.
- A table constraint is not bound to a particular column but can apply to more than one column.

- **LIKE source\_table [ like\_option ... ]**

Specifies a table from which the new table automatically copies all column names, their data types, and their not-null constraints.

Unlike **INHERITS**, the new table and original table are decoupled after creation is complete. Changes to the original table will not be applied to the new table, and it is not possible to include data of the new table in scans of the original table.

Default expressions for the copied column definitions will be copied only if **INCLUDING DEFAULTS** is specified. The default behavior is to exclude default expressions, resulting in the copied columns in the new table having default values **NULL**.

Not-null constraints are always copied to the new table. **CHECK** constraints will only be copied if **INCLUDING CONSTRAINTS** is specified; other types of constraints will never be copied. These rules also apply to column constraints and table constraints.

Unlike those of **INHERITS**, columns and constraints copied by **LIKE** are not merged with similarly named columns and constraints. If the same name is specified explicitly or in another **LIKE** clause, an error is reported.

- Any indexes on the original table will not be created on the new table, unless the **INCLUDING INDEXES** clause is specified.
- **STORAGE** settings for the source columns are copied only if **INCLUDING STORAGE** is specified. The default behavior is to exclude **STORAGE** settings.
- If **INCLUDING COMMENTS** is specified, comments for the copied columns, constraints, and indexes are copied. The default behavior is to exclude comments.

- If **INCLUDING REOPTIONS** is specified, the new table will copy the storage parameter (that is, **WITH** clause) of the source table. The default behavior is to exclude partition definition of the storage parameter of the original table.
- If **INCLUDING DISTRIBUTION** is specified, the new table will copy the distribution information of the source table, including distribution type and key, and the new table cannot use **DISTRIBUTE BY** clause. The default behavior is to exclude distribution information of the original table.
- **INCLUDING ALL** contains the meaning of **INCLUDING DEFAULTS**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING STORAGE**, **INCLUDING COMMENTS**, **INCLUDING REOPTIONS**, and **INCLUDING DISTRIBUTION**.
- **WITH ( storage\_parameter [= value] [, ... ] )**

Specifies an optional storage parameter for a table or an index. Optional parameters are as follows:

  - **FILLFACTOR**

The fill factor of a table is a percentage from 10 to 100. **100** (complete filling) is the default value. When a smaller fill factor is specified, **INSERT** operations pack table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives **UPDATE** a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate.

Value range: 10–100
  - **ORIENTATION**

Determines the data storage mode of the table.

Value range:

    - **ROW** (default value): The data will be stored in rows.

---

**NOTICE**

**orientation** cannot be modified.

---

  - **COMPRESSION**
    - Row-store tables do not support compression.
  - **hashbucket**

Creates a hash table that uses buckets. This parameter supports only row-store tables, including row-store range tables.

Value range: **on** and **off**

Default value: **off**

---

**NOTICE**

This is a lab feature. Contact Huawei engineers for technical support when using this feature. In current version, DDL operations on hash bucket tables are affected. Therefore, you are advised not to frequently perform DDL operations on hash bucket tables.

---

- **COMPRESS / NOCOMPRESS**

Specifies keyword **COMPRESS** during the creation of a table, so that the compression feature is triggered in case of **BULK INSERT** operations. If this feature is enabled, a scan is performed for all tuple data within the page to generate a dictionary and then the tuple data is compressed and stored. If **NOCOMPRESS** is specified, the table is not compressed.

Default value: **NOCOMPRESS**, that is, tuple data is not compressed before storage. Row-store tables do not support compression.

- **TABLESPACE tablespace\_name**

Specifies that the new table will be created in the **tablespace\_name** tablespace. If not specified, the default tablespace is used.

- **DISTRIBUTE BY**

Specifies how the table is distributed or replicated between nodes.

For the value range and details, see [DISTRIBUTE BY](#).

- **TO { GROUP groupname | NODE ( nodename [, ... ] ) }**

**TO GROUP** specifies the node group to which the table to be created belongs. **TO NODE** is used for internal scale-out tools.

- **PARTITION BY RANGE(partition\_key)**

Creates a range partition. **partition\_key** is the name of the partition key.

(1) Assume that the **VALUES LESS THAN** syntax is used.

---

**NOTICE**

If the **VALUE LESS THAN** clause is used, a range partitioning policy supports a partition key with up to 16 columns.

---

Data types supported by the partition keys are as follows: **SMALLINT**, **INTEGER**, **BIGINT**, **DECIMAL**, **NUMERIC**, **REAL**, **FLOAT4**, **FLOAT8**, **DOUBLE PRECISION**, **CHARACTER VARYING(*n*)**, **VARCHAR(*n*)**, **CHARACTER(*n*)**, **CHAR(*n*)**, **CHARACTER**, **CHAR**, **TEXT**, **NVARCHAR2**, **NAME**, **TIMESTAMP[(*p*)] [WITHOUT TIME ZONE]**, **TIMESTAMP[(*p*)] [WITH TIME ZONE]**, and **DATE**.

(2) Assume that the **START END** syntax is used.

---

**NOTICE**

In this case, only one partition key is supported.

---

Data types supported by the partition key are as follows: **SMALLINT**, **INTEGER**, **BIGINT**, **DECIMAL**, **NUMERIC**, **REAL**, **FLOAT4**, **FLOAT8**, **DOUBLE**

**PRECISION, TIMESTAMP[(p)] [WITHOUT TIME ZONE], TIMESTAMP[(p)] [WITH TIME ZONE], and DATE.**

- **PARTITION partition\_name VALUES LESS THAN ( { partition\_value | MAXVALUE } )**

Specifies the information of partitions. **partition\_name** is the name of a range partition. **partition\_value** is the upper limit of a range partition, and the value depends on the type of **partition\_key**. *MAXVALUE* usually specifies the upper limit of the last range partition.

---

**NOTICE**

- Each partition requires an upper limit.
- The data type of the upper limit must be the same as that of the partition key.
- In a partition list, partitions are arranged in ascending order of upper limits. A partition with a smaller upper limit value is placed before another partition with a larger one.

- 
- **PARTITION partition\_name {START (partition\_value) END (partition\_value) EVERY (interval\_value)} | {START (partition\_value) END (partition\_value|MAXVALUE)} | {START(partition\_value)} | {END (partition\_value | MAXVALUE)}**

Specifies the information of partitions.

- **partition\_name**: name or name prefix of a range partition. It is the name prefix only in the following cases (assuming that **partition\_name** is **p1**):
  - If **START+END+EVERY** is used, the names of partitions will be defined as **p1\_1**, **p1\_2**, and the like. For example, if **PARTITION p1 START(1) END(4) EVERY(1)** is defined, the generated partitions are [1, 2), [2, 3), and [3, 4), and their names are **p1\_1**, **p1\_2**, and **p1\_3**. In this case, **p1** is a name prefix.
  - If the defined statement is in the first place and has **START** specified, the range (*MINVALUE*, **START**) will be automatically used as the first actual partition, and its name will be **p1\_0**. The other partitions are then named **p1\_1**, **p1\_2**, and the like. For example, if **PARTITION p1 START(1), PARTITION p2 START(2)** is defined, generated partitions are (*MINVALUE*, 1), [1, 2), and [2, *MAXVALUE*), and their names will be **p1\_0**, **p1\_1**, and **p2**. In this case, **p1** is a name prefix and **p2** is a partition name. *MINVALUE* means the minimum value.
- **partition\_value**: start value or end value of a range partition. The value depends on **partition\_key** and cannot be *MAXVALUE*.
- **interval\_value**: width of each partition for dividing the [**START**, **END**) range. It cannot be *MAXVALUE*. If the value of (**END** - **START**) divided by **EVERY** has a remainder, the width of only the last partition is less than the value of **EVERY**.
- *MAXVALUE* usually specifies the upper limit of the last range partition.

**NOTICE**

1. If the defined statement is in the first place and has **START** specified, the range (*MINVALUE*, **START**) will be automatically used as the first actual partition.
2. The **START END** syntax must comply with the following rules:
  - The value of **START** (if any, same for the following situations) in each **partition\_start\_end\_item** must be smaller than that of **END**.
  - In two adjacent **partition\_start\_end\_item** statements, the value of the first **END** must be equal to that of the second **START**.
  - The value of **EVERY** in each **partition\_start\_end\_item** must be a positive number (in ascending order) and must be smaller than **END** minus **START**.
  - Each partition includes the start value (unless it is *MINVALUE*) and excludes the end value. The format is as follows: [**START**, **END**).
  - Partitions created by the same **partition\_start\_end\_item** belong to the same tablespace.
  - If **partition\_name** is a name prefix of a partition, the length must not exceed 57 bytes. If there are more than 57 bytes, the prefix will be automatically truncated.
  - When creating or modifying a partitioned table, ensure that the total number of partitions in the table does not exceed the maximum value **1048575**.
3. In statements for creating partitioned tables, **START END** and **LESS THAN** cannot be used together.
4. The **START END** syntax in a partitioned table creation SQL statement will be replaced by the **VALUES LESS THAN** syntax when **gs\_dump** is executed.

---

- **PARTITION BY LIST [COLUMNS] (partition\_key)**

Creates a list partition. **partition\_key** is the name of the partition key.

The **COLUMNS** keyword can be used only when **sql\_compatibility** is set to '**MYSQL**'. The semantics of **PARTITION BY LIST COLUMNS** is the same as that of **PARTITION BY LIST**.

- A list partitioning policy supports a partition key with up to 16 columns.
- For the clause syntax **VALUES [IN] (list\_values)**, if **list\_values** contains the key values of the corresponding partition, it is recommended that the number of key values of each partition be less than or equal to 64.

Partition keys support the following data types: **INT1**, **INT2**, **INT4**, **INT8**, **NUMERIC**, **VARCHAR(*n*)**, **CHAR**, **BPCHAR**, **NVARCHAR2**, **TIMESTAMP[(*p*)] [WITHOUT TIME ZONE]**, **TIMESTAMP[(*p*)] [WITH TIME ZONE]** and **DATE**. The number of partitions cannot exceed 1048575.

- **PARTITION BY HASH(partition\_key)**

Create a hash partition. **partition\_key** is the name of the partition key.

For **partition\_key**, the hash partitioning policy supports only one column of partition keys.

Partition keys support the following data types: **INT1**, **INT2**, **INT4**, **INT8**, **NUMERIC**, **VARCHAR(*n*)**, **CHAR**, **BPCHAR**, **TEXT**, **NVARCHAR2**,

TIMESTAMP[(p)] [WITHOUT TIME ZONE], TIMESTAMP[(p)] [WITH TIME ZONE], and DATE. The number of partitions cannot exceed 1048575.

- **PARTITIONS integer**

Specifies the number of partitions.

**integer** indicates the number of partitions. The value must be an integer greater than 0 and cannot be greater than 1048575.

- When this clause is specified after the range and list partitions, each partition must be explicitly defined, and the number of defined partitions must be equal to the integer value. This clause can be specified after the range and list partitions only when **sql\_compatibility** is set to 'MYSQL'.
- When this clause is specified after the hash and key partitions, if the definition of each partition is not listed, an *integer* number of partitions are automatically generated. The automatically generated partition name is "p+number", and the number ranges from 0 to *integer* minus 1. The tablespace of the partition is the tablespace of the table by default. If each partition definition is explicitly defined, the number of defined partitions must be the same as the value of *integer*. If neither the partition definition nor the number of partitions is specified, a unique partition is created.

- **{ ENABLE | DISABLE } ROW MOVEMENT**

Sets row movement.

If the tuple value is updated on the partition key during the UPDATE operation, the partition where the tuple is located is altered. Setting this parameter enables error messages to be reported or movement of the tuple between partitions.

Value range:

- **ENABLE**: Row movement is enabled.
- **DISABLE** (default value): Row movement is disabled.

If the row movement is enabled, an error may be reported when update and delete operations are performed concurrently. The causes are as follows:

The old data is marked as deleted under the update and delete operations. If the row movement is enabled, the cross-partition update occurs when the partition key is updated. The kernel marks the old data in the old partition as deleted and adds a data to the new partition. As a result, the new data cannot be found by querying the old data.

If data in the same row is concurrently operated, the cross-partition and non-cross-partition data results have different behaviors in the following three concurrency scenarios: update and update concurrency, delete and delete concurrency, update and delete concurrency.

- a. For non-cross-partition data, no error is reported for the second operation after the first operation is performed.
  - If the first operation is update, the latest data can be found and operated after the second operation is performed.
  - If the first operation is delete, the second operation is terminated when the current data is deleted and the latest data cannot be found.
- b. For the cross-partition data result, an error is reported for the second operation after the first operation is performed.

If the first operation is update, the second operation cannot find the latest data because the new data is in the new partition. The operation fails and an error is reported.

If the first operation is delete, performing the second operation can find that the current data is deleted and the latest data cannot be found, but cannot determine whether the operation of deleting the old data is update or delete. If the operation is update, an error is reported. If the operation is delete, the second operation is terminated. To ensure the data correctness, an error is reported.

If the update and update concurrency, and update and delete concurrency are performed, the error can be solved only when the operations are performed serially. If the delete and delete concurrency are performed, the error can be solved by disabling the row movement.

- **NOT NULL**

The column is not allowed to contain null values. **ENABLE** can be omitted.

- **NULL**

Specifies that the column is allowed to contain null values. This is the default setting.

This clause is only provided for compatibility with non-standard SQL databases. It is not recommended.

- **CHECK (condition) [ NO INHERIT ]**

Specifies an expression producing a Boolean result where the INSERT or UPDATE operation of new or updated rows can succeed only when the expression result is **TRUE** or **UNKNOWN**; otherwise, an error is thrown and the database is not altered.

A check constraint specified as a column constraint should reference only the column's values, while an expression in a table constraint can reference multiple columns.

A constraint marked with **NO INHERIT** will not propagate to child tables.

**ENABLE** can be omitted.

- **DEFAULT default\_expr**

Assigns a default data value to a column. The value can be any variable-free expressions. (Subqueries and cross-references to other columns in the current table are not allowed.) The data type of the default expression must match the data type of the column.

The default expression will be used in any insert operation that does not specify a value for the column. If there is no default value for a column, then the default value is null.

- **UNIQUE [KEY] index\_parameters**

**UNIQUE ( column\_name [, ... ] ) index\_parameters**

Specifies that a group of one or more columns of a table can contain only unique values.

For the purpose of a unique constraint, null is not considered equal.

UNIQUE KEY can be used only when **sql\_compatibility** is set to 'MYSQL', which has the same semantics as UNIQUE.

- **PRIMARY KEY index\_parameters**

**PRIMARY KEY ( column\_name [, ... ] ) index\_parameters**

Specifies that a column or columns of a table can contain only unique (non-duplicate) and non-null values.

Only one primary key can be specified for a table.

- **DEFERRABLE | NOT DEFERRABLE**

Controls whether the constraint can be deferred. A constraint that is not deferrable will be checked immediately after every command. Checking of constraints that are deferrable can be postponed until the end of the transaction using the **SET CONSTRAINTS** command. **NOT DEFERRABLE** is the default value. Currently, only **UNIQUE** and **PRIMARY KEY** constraints accept this clause. All the other constraints are not deferrable.

- **INITIALLY IMMEDIATE | INITIALLY DEFERRED**

If a constraint is deferrable, this clause specifies the default time to check the constraint.

- If the constraint is **INITIALLY IMMEDIATE** (default value), it is checked after each statement.
- If the constraint is **INITIALLY DEFERRED**, it is checked only at the end of the transaction.

The constraint check time can be altered using the **SET CONSTRAINTS** statement.

- **USING INDEX TABLESPACE tablespace\_name**

Allows selection of the tablespace in which the index associated with a **UNIQUE** or **PRIMARY KEY** constraint will be created. If not specified, the index is created in **default\_tablespace**. If **default\_tablespace** is empty, the default tablespace of the database is used.

## Examples

- Example 1: Create a range-partitioned table **tpcds.web\_returns\_p1**. The table has eight partitions and their partition keys are of the integer type. The ranges of the partitions are:  $wr\_returned\_date\_sk < 2450815$ ,  $2450815 \leq wr\_returned\_date\_sk < 2451179$ ,  $2451179 \leq wr\_returned\_date\_sk < 2451544$ ,  $2451544 \leq wr\_returned\_date\_sk < 2451910$ ,  $2451910 \leq wr\_returned\_date\_sk < 2452275$ ,  $2452275 \leq wr\_returned\_date\_sk < 2452640$ ,  $2452640 \leq wr\_returned\_date\_sk < 2453005$ , and  $wr\_returned\_date\_sk \geq 2453005$ .

```
-- Create a temporary schema.
gaussdb=# CREATE SCHEMA tpcds;
gaussdb=# SET CURRENT_SCHEMA TO tpcds;

-- Create the tpcds.web_returns table.
gaussdb=# CREATE TABLE tpcds.web_returns
(

gaussdb=# DROP TABLE tpcds.web_returns;

-- Delete the schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

- Example 2: Create a range-partitioned table **tpcds.web\_returns\_p2**. The table has eight partitions and their partition keys are of the integer type. The upper limit of the eighth partition is *MAXVALUE*.

The ranges of the partitions are: `wr_returned_date_sk < 2450815`, `2450815 ≤ wr_returned_date_sk < 2451179`, `2451179 ≤ wr_returned_date_sk < 2451544`, `2451544 ≤ wr_returned_date_sk < 2451910`, `2451910 ≤ wr_returned_date_sk < 2452275`, `2452275 ≤ wr_returned_date_sk < 2452640`, `2452640 ≤ wr_returned_date_sk < 2453005`, and `wr_returned_date_sk ≥ 2453005`.

The tablespace of the **tpcds.web\_returns\_p2** partitioned table is **example1**. Partitions **P1** to **P7** have no specified tablespaces, and use the **example1** tablespace of the **tpcds.web\_returns\_p2** partitioned table. The tablespace of the **P8** partitioned table is **example2**.

Assume that *CN and DN data directory/pg\_location/mount1/path1*, *CN and DN data directory/pg\_location/mount2/path2*, *CN and DN data directory/pg\_location/mount3/path3*, and *CN and DN data directory/pg\_location/mount4/path4* are empty directories for which user **dwsadmin** has read and write permissions.

```
gaussdb=# CREATE TABLESPACE example1 RELATIVE LOCATION 'tablespace1/tablespace_1';
gaussdb=# CREATE TABLESPACE example2 RELATIVE LOCATION 'tablespace2/tablespace_2';
gaussdb=# CREATE TABLESPACE example3 RELATIVE LOCATION 'tablespace3/tablespace_3';
gaussdb=# CREATE TABLESPACE example4 RELATIVE LOCATION 'tablespace4/tablespace_4';

-- Create a temporary schema.
gaussdb=# CREATE SCHEMA tpcds;
gaussdb=# SET CURRENT_SCHEMA TO tpcds;

gaussdb=# CREATE TABLE tpcds.web_returns_p2
(
 WR_RETURNED_DATE_SK INTEGER ,
 WR_RETURNED_TIME_SK INTEGER ,
 WR_ITEM_SK INTEGER NOT NULL,
 WR_REFUNDED_CUSTOMER_SK INTEGER ,
 WR_REFUNDED_CDEMO_SK INTEGER ,

## 7.15.89 CREATE TEXT SEARCH CONFIGURATION

### Description

Creates a text search configuration. A text search configuration specifies a text search parser that can divide a string into tokens, plus dictionaries that can be used to determine which tokens are of interest for searching.

This is a lab feature. Contact Huawei technical support before using it.

### Precautions

- If only the parser is specified, the new text search configuration initially has no mapping from token types to dictionaries, and therefore will ignore all words. Subsequently, **ALTER TEXT SEARCH CONFIGURATION** must be used

to create mapping to make the configuration useful. If **COPY** is specified, the parser, mapping and parameters of the text search configuration is copied automatically.

- If the schema name is given, the text search configuration will be created in the specified schema. Otherwise, the configuration will be created in the current schema.
- The user who defines a text search configuration becomes its owner.
- **PARSER** and **COPY** options are mutually exclusive, because when an existing configuration is copied, its parser selection is copied too.
- If only the parser is specified, the new text search configuration initially has no mapping from token types to dictionaries, and therefore will ignore all words.

## Syntax

```
CREATE TEXT SEARCH CONFIGURATION name
 (PARSER = parser_name | COPY = source_config)
 [WITH ({configuration_option = value} [, ...])];
```

## Parameters

- **name**  
Specifies the name of the text search configuration to be created. The name can be schema-qualified.
- **parser\_name**  
Specifies the name of the text search parser to use for this configuration.
- **source\_config**  
Specifies the name of an existing text search configuration to copy.
- **configuration\_option**  
Specifies parameters for the text search configuration, particularly for the parser executed by **parser\_name** or contained by **source\_config**.  
Value range: The default and **ngram** parsers are supported. The parser of default type has no corresponding **configuration\_option**. [Table 7-163](#) lists **configuration\_option** for **ngram** parsers.

**Table 7-163** Configuration parameters for **ngram** parsers

| Parser | Parameter          | Description                    | Value Range                                                                                                                                                |
|--------|--------------------|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ngram  | gram_size          | Length of word segmentation    | Integer, 1 to 4<br>Default value: 2                                                                                                                        |
|        | punctuation_ignore | Whether to ignore punctuations | <ul style="list-style-type: none"> <li>• <b>true</b> (default value): Ignore punctuations.</li> <li>• <b>false</b>: Do not ignore punctuations.</li> </ul> |

| Parser | Parameter         | Description                            | Value Range                                                                                                                                                             |
|--------|-------------------|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|        | grapsymbol_ignore | Whether to ignore graphical characters | <ul style="list-style-type: none"><li>• <b>true</b>: Ignore graphical characters.</li><li>• <b>false</b> (default value): Do not ignore graphical characters.</li></ul> |

## Examples

```
-- Create a text search configuration.
gaussdb=# CREATE TEXT SEARCH CONFIGURATION ngram2 (parser=ngram) WITH (gram_size = 2,
grapsymbol_ignore = false);

-- Create a text search configuration.
gaussdb=# CREATE TEXT SEARCH CONFIGURATION ngram3 (copy=ngram2) WITH (gram_size = 2,
grapsymbol_ignore = false);

-- Add type mapping.
gaussdb=# ALTER TEXT SEARCH CONFIGURATION ngram2 ADD MAPPING FOR multisymbol WITH simple;

-- Create user joe.
gaussdb=# CREATE USER joe IDENTIFIED BY '*****!';

-- Change the owner of the text search configuration.
gaussdb=# ALTER TEXT SEARCH CONFIGURATION ngram2 OWNER TO joe;

-- Change the schema of the text search configuration.
gaussdb=# ALTER TEXT SEARCH CONFIGURATION ngram2 SET SCHEMA joe;

-- Rename the text search configuration.
gaussdb=# ALTER TEXT SEARCH CONFIGURATION joe.ngram2 RENAME TO ngram_2;

-- Delete the type mapping.
gaussdb=# ALTER TEXT SEARCH CONFIGURATION joe.ngram_2 DROP MAPPING IF EXISTS FOR
multisymbol;

-- Delete the text search configuration.
gaussdb=# DROP TEXT SEARCH CONFIGURATION joe.ngram_2;
gaussdb=# DROP TEXT SEARCH CONFIGURATION ngram3;

-- Delete the schema and user joe.
gaussdb=# DROP SCHEMA IF EXISTS joe CASCADE;
gaussdb=# DROP ROLE IF EXISTS joe;
```

## 7.15.90 CREATE TEXT SEARCH DICTIONARY

### Description

Creates a full-text retrieval dictionary. A dictionary is used to identify and process particular words during full-text retrieval.

Dictionaries are created by using predefined templates (defined in the [PG\\_TS\\_TEMPLATE](#) system catalog). Five types of dictionaries can be created,

**Simple, Ispell, Synonym, Thesaurus, and Snowball.** These dictionaries are used to handle different types of tasks.

This is a lab feature. Contact Huawei technical support before using it.

## Precautions

- A user with the **SYSADMIN** permission can create a dictionary. Then, the user automatically becomes the owner of the dictionary.
- A dictionary cannot be created in **pg\_temp** mode.
- After a dictionary is created or modified, any modification to the customized dictionary definition file will not affect the dictionary in the database. To make such modifications take effect in the dictionary in the database, run the **ALTER** statement to update the definition file of the dictionary.

## Syntax

```
CREATE TEXT SEARCH DICTIONARY name (
 TEMPLATE = template
 [, option = value [, ...]]
);
```

## Parameters

- **name**  
Specifies the name of a dictionary to be created. (If you do not specify a schema name, the dictionary will be created in the current schema.)  
Value range: a string, which complies with the **naming convention**. A value can contain a maximum of 63 characters.
- **template**  
Specifies a template name.  
Value range: templates (**Simple, Synonym, Thesaurus, Ispell, and Snowball**) defined in the **PG\_TS\_TEMPLATE** system catalog
- **option**  
Specifies a parameter name. Each type of dictionaries has a template containing their custom parameters. Parameters function in a way irrelevant to their setting sequence.
  - Parameters for a **Simple** dictionary
    - **STOPWORDS**  
Specifies the name of a file listing stop words. The default file name extension is **.stop**. In the file, each line defines a stop word. Dictionaries will ignore blank lines and spaces in the file and convert stop-word phrases into lowercase.
    - **ACCEPT**  
Specifies whether to accept a non-stop word as recognized. Default value: **true**  
If **ACCEPT** is set to **true** for a **Simple** dictionary, no token will be passed to subsequent dictionaries. In this case, you are advised to place the **Simple** dictionary at the end of the dictionary list. If

**ACCEPT** is set to **false**, you are advised to place the **Simple** dictionary before at least one dictionary in the list.

- **FILEPATH**

Specifies the directory for storing dictionary files. The directory can be a local directory or an OBS directory. (The OBS directory can be specified only in security mode. You can add the **securitymode** option during startup to enter the security mode.) The local directory format is **file://absolute\_path**. The OBS directory format is **obs://bucket\_name/path accesskey=ak secretkey=sk region=rg**. The default value is the directory where predefined dictionary files are located. If any of the **FILEPATH** and **STOPWORDS** parameters is specified, the other one must also be specified.

- Parameters for a **Synonym** dictionary

- **SYNONYM**

Specifies the name of the definition file for a **Synonym** dictionary. The default file name extension is **.syn**.

The file is a list of synonyms. Each line is in the format of *token synonym*, that is, token and its synonym separated by a space.

- **CASESENSITIVE**

Specifies whether tokens and their synonyms are case sensitive. The default value is **false**, indicating that tokens and synonyms in dictionary files will be converted into lowercase. If this parameter is set to **true**, they will not be converted into lowercase.

- **FILEPATH**

Specifies the directory for storing **Synonym** dictionary files. The directory can be a local directory or an OBS directory. (The OBS directory can be specified only in security mode. You can add the **securitymode** option during startup to enter the security mode.) The local directory format is **file://absolute\_path**. The OBS directory format is **obs://bucket\_name/path accesskey=ak secretkey=sk region=rg**. The default value is the directory where predefined dictionary files are located.

- Parameters for a **Thesaurus** dictionary

- **DICTFILE**

Specifies the name of a dictionary definition file. The default file name extension is **.ths**.

The file is a list of synonyms. Each line is in the format of *sample words : indexed words*. The colon (:) is used as a separator between a phrase and its substitute word. If multiple sample words are matched, the TZ selects the longest one.

- **DICTIONARY**

Specifies the name of a subdictionary used for word normalization. This parameter is mandatory and only one subdictionary name can be specified. The specified subdictionary must exist. It is used to identify and normalize input text before phrase matching.

If an input word cannot be recognized by the subdictionary, an error will be reported. In this case, remove the word or update the subdictionary to make the word recognizable. In addition, an asterisk (\*) can be placed at the beginning of an indexed word to skip the application of a subdictionary on it, but all sample words must be recognizable by the subdictionary.

If the sample words defined in the dictionary file contain stop words defined in the subdictionary, use question marks (?) to replace them. Assume that **a** and **the** are stop words defined in the subdictionary.

```
? one ? two : ssws
```

**a one the two** and **the one a two** will be matched and output as **ssws**.

- **FILEPATH**

Specifies the directory for storing dictionary definition files. The directory can be a local directory or an OBS directory. (The OBS directory can be specified only in security mode. You can add the **securitymode** option during startup to enter the security mode.) The local directory format is **file://absolute\_path**. The OBS directory format is **obs://bucket\_name/path accesskey=ak secretkey=sk region=rg**. The default value is the directory where predefined dictionary files are located.

- Parameters for an **Ispell** dictionary

- **DICTFILE**

Specifies the name of a dictionary definition file. The default file name extension is **.dict**.

- **AFFFILE**

Specifies the name of an affix file. The default file name extension is **.affix**.

- **STOPWORDS**

Specifies the name of a file listing stop words. The default file name extension is **.stop**. The file content format is the same as that of the file for a **Simple** dictionary.

- **FILEPATH**

Specifies the directory for storing dictionary files. The directory can be a local directory or an OBS directory. (The OBS directory can be specified only in security mode. You can add the **securitymode** option during startup to enter the security mode.) The local directory format is **file://absolute\_path**. The OBS directory format is **obs://bucket\_name/path accesskey=ak secretkey=sk region=rg**. The default value is the directory where predefined dictionary files are located.

- Parameters for a **Snowball** dictionary

- **LANGUAGE**

Specifies the name of a language whose stemming algorithm will be used. According to spelling rules in the language, the algorithm normalizes the variants of an input word into a basic word or a stem.

- **STOPWORDS**

Specifies the name of a file listing stop words. The default file name extension is .stop. The file content format is the same as that of the file for a **Simple** dictionary.

- **FILEPATH**

Specifies the directory for storing dictionary definition files. You can specify a local directory or an OBS directory. (The OBS directory can be specified only in security mode. You can enter the security mode by adding the **securitymode** option during startup.) The local directory format is **file://absolute\_path**. The OBS directory format is **obs://bucket\_name/path accesskey=ak secretkey=sk region=rg**. The default value is the directory where predefined dictionary files are located. If any of the **FILEPATH** and **STOPWORDS** parameters is specified, the other one must also be specified.

 **NOTE**

The name of a dictionary definition file can contain only lowercase letters, digits, and underscores (\_).

- **value**

Specifies a parameter value. If the value is not an identifier or a number, enclose it with single quotation marks ("). You can also enclose identifiers and numbers.

## 7.15.91 CREATE TRIGGER

### Description

Creates a trigger. The trigger will be associated with the specified table or view, and will execute the specified function operations are performed.

### Precautions

- Currently, triggers can be created only on ordinary row-store tables, instead of on temporary tables or unlogged tables.
- If multiple triggers of the same kind are defined for the same event, they will be fired in alphabetical order by name.
- Triggers are usually used for data association and synchronization between multiple tables. SQL execution performance is greatly affected. Therefore, you are advised not to use this statement when a large amount of data needs to be synchronized and performance requirements are high.

- When a trigger meets the following conditions, the trigger statement and trigger itself can be pushed together down to a DN for execution, improving the trigger execution performance:
  - The GUC parameters **enable\_trigger\_shipping** and **enable\_fast\_query\_shipping** are enabled.
  - The trigger function used by the source table is a PL/pgSQL function (recommended).
  - The source and target tables have the same type and number of distribution keys, are both row-store tables, and belong to the same node group.
  - The **INSERT**, **UPDATE**, or **DELETE** statement on the source table contains an expression about equality comparison between all the distribution keys and the *NEW* or *OLD* variable.
  - The **INSERT**, **UPDATE**, or **DELETE** statement on the source table can be pushed down without a trigger.
  - There are only six types of triggers (**INSERT BEFORE FOR EACH ROW**, **INSERT AFTER FOR EACH ROW**, **UPDATE BEFORE FOR EACH ROW**, **UPDATE AFTER FOR EACH ROW**, **DELETE BEFORE FOR EACH ROW**, and **DELETE AFTER FOR EACH ROW**) on the source table, and all the triggers can be pushed down.
- The **INSERT ON DUPLICATE KEY UPDATE** statement cannot fire a trigger.
- When a trigger statement is executed, the permission is determined by the trigger creator.
- To create a trigger, you must have the TRIGGER permission on the specified table or have the CREATE ANY TRIGGER permission.

## Syntax

```
CREATE [CONSTRAINT] TRIGGER name { BEFORE | AFTER | INSTEAD OF } { event [OR ...] }
ON table_name
[FROM referenced_table_name]
{ NOT DEFERRABLE | [DEFERRABLE] { INITIALLY IMMEDIATE | INITIALLY DEFERRED } }
[FOR [EACH] { ROW | STATEMENT }]
[WHEN (condition)]
EXECUTE PROCEDURE function_name (arguments);
```

Events include:

```
INSERT
UPDATE [OF column_name [, ...]]
DELETE
TRUNCATE
```

## Parameters

- **CONSTRAINT**  
(Optional) Creates a constraint trigger. That is, the trigger is used as a constraint. This is the same as a regular trigger except that the timing of the trigger firing can be adjusted using **SET CONSTRAINTS**. Constraint triggers must be AFTER ROW triggers.
- **name**  
Specifies the name of the trigger to be created. This must be distinct from the name of any other trigger for the same table. The name cannot be schema-

qualified — the trigger inherits the schema of its table. For a constraint trigger, this is also the name to use when modifying the trigger's behavior using [SET CONSTRAINTS](#).

Value range: a string, which complies with the [naming convention](#). A value can contain a maximum of 63 characters.

- **BEFORE**

Specifies that the function is called before the event.

- **AFTER**

Specifies that the function is called after the event. A constraint trigger can only be specified as **AFTER**.

- **INSTEAD OF**

Specifies that the function is called instead of the event.

- **event**

Specifies the event that will fire the trigger. Values are **INSERT**, **UPDATE**, **DELETE**, and **TRUNCATE**. Multiple events can be specified using **OR**.

For **UPDATE** events, it is possible to specify a list of columns using this syntax:

```
UPDATE OF column_name1 [, column_name2 ...]
```

The trigger will only fire if at least one of the listed columns is mentioned as a target of the **UPDATE** statement. **INSTEAD OF UPDATE** events do not allow a list of columns.

- **table\_name**

Specifies the name of the table for which the trigger is created.

Value range: name of an existing table in the database

- **referenced\_table\_name**

Specifies the name of another table referenced by the constraint. This option is used for foreign-key constraints. It can only be specified for constraint triggers. Because foreign keys are not supported currently, this option is not recommended for general use.

Value range: name of an existing table in the database

- **DEFERRABLE | NOT DEFERRABLE**

Specifies the start time of the trigger. It can only be specified for constraint triggers. They determine whether the constraint is deferrable.

For details, see [CREATE TABLE](#).

- **INITIALLY IMMEDIATE | INITIALLY DEFERRED**

If the constraint is deferrable, the two clauses specify the default time to check the constraint. It can only be specified for constraint triggers.

For details, see [CREATE TABLE](#).

- **FOR EACH ROW | FOR EACH STATEMENT**

Specifies the frequency of firing the trigger.

- **FOR EACH ROW** indicates that the trigger should be fired once for every row affected by the trigger event.
- **FOR EACH STATEMENT** indicates that the trigger should be fired just once per SQL statement.

If neither is specified, the default is **FOR EACH STATEMENT**. Constraint triggers can only be marked as **FOR EACH ROW**.

- **condition**

Specifies whether the trigger function will actually be executed. If **WHEN** is specified, the function will be called only when **condition** returns **true**.

In **FOR EACH ROW** triggers, the **WHEN** condition can refer to columns of the old and/or new row values by writing **OLD.column name** or **NEW.column name** respectively. In addition, **INSERT** triggers cannot refer to **OLD**, and **DELETE** triggers cannot refer to **NEW**.

**INSTEAD OF** triggers do not support **WHEN** conditions.

Currently, **WHEN** expressions cannot contain subqueries.

Note that for constraint triggers, evaluation of the **WHEN** condition is not deferred, but occurs immediately after the row update operation is performed. If the condition does not evaluate to **true**, then the trigger is not queued for deferred execution.

- **function\_name**

Specifies a user-defined function, which must be declared as taking no parameters and returning type trigger. This is executed when a trigger fires.

- **arguments**

Specifies an optional comma-separated list of parameters to be provided to the function when the trigger is executed. The parameters are literal string constants. Simple names and numeric constants can also be written here, but they will all be converted to strings. Check the description of the implementation language of the trigger function to find out how these parameters can be accessed within the function.

 **NOTE**

The following details trigger types:

- **INSTEAD OF** triggers must be marked as **FOR EACH ROW** and can be defined only on views.
- **BEFORE** and **AFTER** triggers on a view must be marked as **FOR EACH STATEMENT**.
- **TRUNCATE** triggers must be marked as **FOR EACH STATEMENT**.

**Table 7-164** Types of triggers supported on tables and views

| When       | Event                | Row-Level      | Statement-Level  |
|------------|----------------------|----------------|------------------|
| BEFORE     | INSERT/UPDATE/DELETE | Tables         | Tables and views |
|            | TRUNCATE             | Not supported. | Tables           |
| AFTER      | INSERT/UPDATE/DELETE | Tables         | Tables and views |
|            | TRUNCATE             | Not supported. | Tables           |
| INSTEAD OF | INSERT/UPDATE/DELETE | Views          | Not supported.   |
|            | TRUNCATE             | Not supported. | Not supported.   |

**Table 7-165** Special variables of PL/pgSQL trigger functions

| Variable        | Description                                                                                                          |
|-----------------|----------------------------------------------------------------------------------------------------------------------|
| NEW             | New tuple for <b>INSERT</b> and <b>UPDATE</b> operations. This variable is <b>NULL</b> for <b>DELETE</b> operations. |
| OLD             | Old tuple for <b>UPDATE</b> and <b>DELETE</b> operations. This variable is <b>NULL</b> for <b>INSERT</b> operations. |
| TG_NAME         | Trigger name.                                                                                                        |
| TG_WHEN         | Trigger timing ( <b>BEFORE</b> , <b>AFTER</b> , or <b>INSTEAD OF</b> ).                                              |
| TG_LEVEL        | Trigger frequency ( <b>ROW</b> or <b>STATEMENT</b> ).                                                                |
| TG_OP           | Trigger event ( <b>INSERT</b> , <b>UPDATE</b> , <b>DELETE</b> , or <b>TRUNCATE</b> ).                                |
| TG_RELID        | OID of the table where the trigger resides.                                                                          |
| TG_RELNAME      | Name of the table where the trigger resides. (This variable has been replaced by <b>TG_TABLE_NAME</b> .)             |
| TG_TABLE_NAME   | Name of the table where the trigger resides.                                                                         |
| TG_TABLE_SCHEMA | Schema of the table where the trigger resides.                                                                       |
| TG_NARGS        | Number of parameters for the trigger function.                                                                       |
| TG_ARGV[]       | List of parameters for the trigger function.                                                                         |

## Examples

```
-- Create a source table and a target table.
gaussdb=# CREATE TABLE test_trigger_src_tbl(id1 INT, id2 INT, id3 INT);
gaussdb=# CREATE TABLE test_trigger_des_tbl(id1 INT, id2 INT, id3 INT);

-- Create a trigger function.
gaussdb=# CREATE OR REPLACE FUNCTION tri_insert_func() RETURNS TRIGGER AS
$$
DECLARE
BEGIN
 INSERT INTO test_trigger_des_tbl VALUES(NEW.id1, NEW.id2, NEW.id3);
 RETURN NEW;
END
$$ LANGUAGE plpgsql;
```

```
gaussdb=# CREATE OR REPLACE FUNCTION tri_update_func() RETURNS TRIGGER AS
$$
DECLARE
BEGIN
 UPDATE test_trigger_des_tbl SET id3 = NEW.id3 WHERE id1=OLD.id1;
 RETURN OLD;
END
$$ LANGUAGE plpgsql;

gaussdb=# CREATE OR REPLACE FUNCTION TRI_DELETE_FUNC() RETURNS TRIGGER AS
$$
DECLARE
BEGIN
 DELETE FROM test_trigger_des_tbl WHERE id1=OLD.id1;
 RETURN OLD;
END
$$ LANGUAGE plpgsql;

-- Create an INSERT trigger.
gaussdb=# CREATE TRIGGER insert_trigger
BEFORE INSERT ON test_trigger_src_tbl
FOR EACH ROW
EXECUTE PROCEDURE tri_insert_func();

-- Create an UPDATE trigger.
gaussdb=# CREATE TRIGGER update_trigger
AFTER UPDATE ON test_trigger_src_tbl
FOR EACH ROW
EXECUTE PROCEDURE tri_update_func();

-- Create a DELETE trigger.
gaussdb=# CREATE TRIGGER delete_trigger
BEFORE DELETE ON test_trigger_src_tbl
FOR EACH ROW
EXECUTE PROCEDURE tri_delete_func();

-- Execute the INSERT event and check the trigger results.
gaussdb=# INSERT INTO test_trigger_src_tbl VALUES(100,200,300);
gaussdb=# SELECT * FROM test_trigger_src_tbl;
gaussdb=# SELECT * FROM test_trigger_des_tbl; // Check whether the trigger operation takes effect.

-- Execute the UPDATE event and check the trigger results.
gaussdb=# UPDATE test_trigger_src_tbl SET id3=400 WHERE id1=100;
gaussdb=# SELECT * FROM test_trigger_src_tbl;
gaussdb=# SELECT * FROM test_trigger_des_tbl; // Check whether the trigger operation takes effect.

-- Execute the DELETE event and check the trigger results.
gaussdb=# DELETE FROM test_trigger_src_tbl WHERE id1=100;
gaussdb=# SELECT * FROM test_trigger_src_tbl;
gaussdb=# SELECT * FROM test_trigger_des_tbl; // Check whether the trigger operation takes effect.

-- Modify a trigger.
gaussdb=# ALTER TRIGGER delete_trigger ON test_trigger_src_tbl RENAME TO delete_trigger_renamed;

-- Disable insert_trigger.
gaussdb=# ALTER TABLE test_trigger_src_tbl DISABLE TRIGGER insert_trigger;

-- Disable all triggers on the current table.
gaussdb=# ALTER TABLE test_trigger_src_tbl DISABLE TRIGGER ALL;

-- Delete triggers.
gaussdb=# DROP TRIGGER insert_trigger ON test_trigger_src_tbl;
gaussdb=# DROP TRIGGER update_trigger ON test_trigger_src_tbl;
gaussdb=# DROP TRIGGER delete_trigger_renamed ON test_trigger_src_tbl;
```

## 7.15.92 CREATE TYPE

### Description

Defines a new data type for use in the current database. The user who defines a type becomes its owner. Types are designed only for row-store tables.

The following data types can be created: base type, shell type, enumerated type, and set type.

- **Base type**  
You can create a base type (scalar type). Generally, the functions required by a base type have to be coded in C or another low-level language.
- **Shell type**  
A shell type is simply a placeholder for a type to be defined later; it is created by issuing CREATE TYPE with no parameters except for the type name. Shell types are needed as forward references when base types are created.
- **Enumerated type**  
An enumerated type is a list of one or more quoted labels, each of which must be 1 to 64 bytes long.
- A user granted with the CREATE ANY TYPE permission can create types in the public and user schemas.

### Precautions

- If a schema name is given then the type is created in the specified schema. Otherwise, it is created in the current schema. The type name must be distinct from the name of any existing type or domain in the same schema. (Because tables have associated data types, the type name must also be distinct from the name of any existing table in the same schema.)
- When creating a non-system type by associating a function, the user needs to understand the definition of the type and the function associated with the type. If this function is not properly used, permissions may be exploited due to the associated function.

### Syntax

```
CREATE TYPE name AS
 ([attribute_name data_type [COLLATE collation] [, ...]]);
```

```
CREATE TYPE name (
 INPUT = input_function,
 OUTPUT = output_function
 [, RECEIVE = receive_function]
 [, SEND = send_function]
 [, TYPMOD_IN = type_modifier_input_function]
 [, TYPMOD_OUT = type_modifier_output_function]
 [, ANALYZE = analyze_function]
 [, INTERNALLENGTH = { internallength | VARIABLE }]
 [, PASSEDBYVALUE]
 [, ALIGNMENT = alignment]
 [, STORAGE = storage]
 [, LIKE = like_type]
 [, CATEGORY = category]
 [, PREFERRED = preferred]
 [, DEFAULT = default]
```

```
[, ELEMENT = element]
[, DELIMITER = delimiter]
[, COLLATABLE = collatable]
);

CREATE TYPE name;

CREATE TYPE name AS ENUM
(['label' [, ...]]);
```

## Parameters

### Base type

When creating a base type, you can place parameters in any order. The **input\_function** and **output\_function** parameters are mandatory, and other parameters are optional.

- **input\_function**

Specifies the name of a function that converts data from the type's external textual form to its internal form.

The input function may be declared as taking one parameter of type `cstring` or taking three parameters of types `cstring`, `oid`, and `integer`.

- The `cstring`-type parameter is the input text as a C string.
- the second parameter is the type's own `OID`.
- The `integer`-type parameter is `typmod` of the destination column, if known (`-1` will be passed if not known).

The input function must return a value of the data type itself. Usually, an input function should be declared as **STRICT**. Otherwise, when a **NULL** input value is read and the input function is called, the first parameter is **NULL**. The function must still return **NULL** in this case, unless it raises an error. (This case is mainly meant to support domain input functions, which might need to reject **NULL** inputs.)

#### NOTE

- The input and output functions can be declared to have results or parameters of the new type, when they have to be created before the new type can be created. The type should first be defined as a shell type, which is a placeholder type that has no attributes except a name and an owner. This is done by issuing the **CREATE TYPE name** statement, with no additional parameters. Then the I/O functions can be defined referencing the shell type. Finally, **CREATE TYPE** with a full definition replaces the shell entry with a complete, valid type definition, after which the new type can be used normally.
  - If the input and output functions are internal functions and are specified as internal system functions, the parameter types of the input and output functions must be the same, and the parameter types of **INTERNALLENGTH** and **PASSEDBYVALUE** of the new type must be the same as those of the input and output functions.
- **output\_function**

Specifies the name of a function that converts data from the type's internal form to its external textual form.

The output function must be declared as taking one parameter of the new data type. The output function must return type `cstring`. Output functions are not invoked for **NULL** values.

- **receive\_function**

(Optional) Specifies the name of a function that converts data from the type's external binary form to its internal form.

If this function is not supplied, the type cannot participate in binary input. The binary representation should be chosen to be cheap to convert to internal form, while being reasonably portable. (For example, the standard integer data types use network byte order as the external binary representation, while the internal representation is in the machine's native byte order.) The receive function should perform adequate checking to ensure that the value is valid.

The receive function may be declared as taking one parameter of type internal or taking three parameters of types internal, oid, integer.

- The first parameter is a pointer to a StringInfo buffer holding the received byte string;
- the latter two are the same as for the text input function.

The receive function must return a value of the data type itself. Usually, a receive function should be declared **STRICT**; if it is not, it will be called with a **NULL** first parameter when reading a **NULL** input value. The function must still return **NULL** in this case, unless it raises an error. (This case is mainly meant to support domain receive functions, which might need to reject **NULL** inputs.)

- **send\_function**

(Optional) Specifies the name of a function that converts data from the type's internal form to its external binary form.

If this function is not supplied, the type cannot participate in binary output. The send function must be declared as taking one parameter of the new data type. The send function must return type bytea. Send functions are not invoked for **NULL** values.

- **type\_modifier\_input\_function**

(Optional) Specifies the name of a function that converts an array of modifiers for a type to its internal format.

- **type\_modifier\_output\_function**

(Optional) Specifies the name of a function that converts the internal format of modifiers for a type to its external text format.

 **NOTE**

**type\_modifier\_input\_function** and **type\_modifier\_output\_function** are needed if the type supports modifiers, that is optional constraints attached to a type declaration, such as `char(5)` or `numeric(30,2)`. GaussDB allows user-defined types to take one or more simple constants or identifiers as modifiers. However, this information must be capable of being packed into a single non-negative integer value for storage in the system catalogs. Declared modifiers are passed to **type\_modifier\_input\_function** in the cstring array format. It must check the values for validity (throwing an error if they are wrong), and if they are correct, return a single non-negative integer value that will be stored as the column "typmod". Type modifiers will be rejected if the type does not have a **type\_modifier\_input\_function**. The **type\_modifier\_output\_function** converts the internal integer typmod value back to the correct form for user display. It must return a cstring value that is the exact string to append to the type name; for example numeric's function might return (30,2). It is allowed to omit the **type\_modifier\_output\_function**, in which case the default display format is just the stored typmod integer value enclosed in parentheses.

- **analyze\_function**

(Optional) Specifies the name of a function that performs statistical analysis for the data type.

By default, **ANALYZE** will attempt to gather statistics using the type's "equals" and "less-than" operators, if there is a default B-tree operator class for the type. For non-scalar types, this behavior is likely to be unsuitable, so it can be overridden by specifying a custom analysis function. The analysis function must be declared to take one parameter of type internal and return a boolean result.
- **internallength**

(Optional) Specifies the length in bytes of the new type's internal representation. The default assumption is that it is variable-length.

While the details of the new type's internal representation are only known to the I/O functions and other functions you create to work with the type, there are several attributes of the internal representation that must be declared to GaussDB. Foremost of these is **internallength**. Base data types can be fixed-length, in which case **internallength** is a positive integer, or variable length, indicated by setting **internallength** to **VARIABLE**. (Internally, this is represented by setting **typlen** to -1.) The internal representation of all variable-length types must start with a 4-byte integer giving the total length of this value of the type.
- **PASSEDBYVALUE**

(Optional) Indicates that values of this data type are passed by value, rather than by reference. You cannot pass by value types whose internal representation is larger than the size of the Datum type (4 bytes on most machines, 8 bytes on a few).
- **alignment**

(Optional) Specifies the storage alignment requirement of the data type. If specified, it must be **char**, **int2**, **int4**, or **double**; the default is **int4**.

The allowed values equate to alignment on 1, 2, 4, or 8 byte boundaries. Note that variable-length types must have an alignment of at least 4, since they necessarily contain an int4 as their first component.
- **storage**

(Optional) Specifies the storage strategy for the data type.

If specified, it must be **plain**, **external**, **extended**, or **main**; the default is **plain**.

  - **plain** specifies that data of the type will always be stored in-line and not compressed. (Only **plain** is allowed for fixed-length types.)
  - **extended** specifies that the system will first try to compress a long data value, and will move the value out of the main table row if it is still too long.
  - **external** allows the value to be moved out of the main table, but the system will not try to compress it.
  - **main** allows compression, but discourages moving the value out of the main table. (Data items with this storage strategy might still be moved out of the main table if there is no other way to make a row fit, but they will be kept in the main table preferentially over **extended** and **external** items.)

All **storage** values other than **plain** imply that the functions of the data type can handle values that have been toasted. The specific other value given merely determines the default **TOAST** storage strategy for columns of a toastable data type; users can pick other strategies for individual columns using **ALTER TABLE SET STORAGE**.

- **like\_type**

(Optional) Specifies the name of an existing data type that the new type will have the same representation as. The values of **internallength**, **passedbyvalue**, **alignment**, and **storage** are copied from that type, unless overridden by explicit specification elsewhere in this **CREATE TYPE** statement. Specifying representation in this way is especially useful when the low-level implementation of a new type references an existing type.

- **category**

(Optional) Specifies the category code (a single ASCII character) for this type. The default is **U** for a user-defined type. You may also choose other ASCII characters to create custom categories.

- **preferred**

(Optional) Specifies whether a type is preferred within its type category. If it is, the value will be **TRUE**, else **FALSE**. The default is **FALSE**. Be very careful about creating a preferred type within an existing type category, as this could cause surprising changes in behavior.

 **NOTE**

The **category** and **preferred** parameters can be used to help control which implicit cast will be applied in ambiguous situations. Each data type belongs to a category named by a single ASCII character, and each type is either preferred or not within its category. The parser will prefer casting to preferred types (but only from other types within the same category) when this rule is helpful in resolving overloaded functions or operators. For types that have no implicit casts to or from any other types, it is sufficient to leave these settings at the defaults. However, for a group of related types that have implicit casts, it is often helpful to mark them all as belonging to a category and select one or two of the most general types as being preferred within the category. The **category** parameter is especially useful when adding a user-defined type to an existing built-in category, such as the numeric or string types. However, it is also possible to create entirely-user-defined type categories. Select any ASCII character other than an uppercase letter to name such a category.

- **default**

(Optional) Specifies the default value for the data type. If this is omitted, the default is null.

A default value can be specified, in case a user wants columns of the data type to default to something other than the null value. Specify the default with the **DEFAULT** keyword. (Such a default can be overridden by an explicit **DEFAULT** clause attached to a particular column.)

- **element**

(Optional) Specifies the type of array elements when an array type is created. For example, to define an array of 4-byte integers (**int4**), specify **ELEMENT = int4**.

- **delimiter**

(Optional) Specifies the delimiter character to be used between values in arrays made of this type.

**delimiter** can be set to a specific character. The default delimiter is the comma (,).

- **collatable**

(Optional) Specifies whether this type's operations can use collation information. If they can, the value will be **TRUE**, else **FALSE** (default).

If **collatable** is **TRUE**, column definitions and expressions of the type may carry collation information through use of the **COLLATE** clause. It is up to the implementations of the functions operating on the type to actually make use of the collation information; this does not happen automatically merely by marking the type collatable.

- **label**

(Optional) Represents the textual label associated with one value of an enumerated type. It is a string of 1 to 63 characters.

## Examples

```
gaussdb=# CREATE TABLE t1_compfoo(a int, b compfoo);
gaussdb=# CREATE TABLE t2_compfoo(a int, b compfoo);

-- Change the owner of the user-defined type compfoo1 to usr1.
gaussdb=# CREATE USER usr1 PASSWORD '*****';

Delete related tables and users.
gaussdb=# DROP TABLE t1_compfoo;
gaussdb=# DROP TABLE t2_compfoo;
gaussdb=# DROP SCHEMA usr1;
gaussdb=# DROP USER usr1;

-- Create an enumerated type.
gaussdb=# CREATE TYPE bugstatus AS ENUM ('create', 'modify', 'closed');

-- Add a label.
gaussdb=# ALTER TYPE bugstatus ADD VALUE IF NOT EXISTS 'regress' BEFORE 'closed';

-- Rename the label.
gaussdb=# ALTER TYPE bugstatus RENAME VALUE 'create' TO 'new';

-- Compile the .so file and create a shell type.
gaussdb=# CREATE TYPE complex;
-- This statement creates a placeholder for the type to be defined so that the type can be referenced when
its I/O functions are defined. Then, you can define I/O functions. Note that the functions must be declared
to take the NOT FENCED mode during creation.
gaussdb=# CREATE FUNCTION
complex_in(cstring)
 RETURNS complex
 AS 'filename'
 LANGUAGE C IMMUTABLE STRICT not fenced;

gaussdb=# CREATE FUNCTION
complex_out(complex)
 RETURNS cstring
 AS 'filename'
 LANGUAGE C IMMUTABLE STRICT not fenced;

gaussdb=# CREATE FUNCTION
complex_rcv(internal)

RETURNS complex

AS 'filename'
```

```
LANGUAGE C IMMUTABLE STRICT not fenced;

gaussdb=# CREATE FUNCTION
complex_send(complex)

RETURNS bytea

AS 'filename'

LANGUAGE C IMMUTABLE STRICT not fenced;
-- Finally, provide a complete definition of the data type.
gaussdb=# CREATE TYPE complex (

internallength = 16,

input = complex_in,

output = complex_out,

receive = complex_rcv,

send = complex_send,

alignment = double
);
```

The C functions corresponding to the input, output, receive, and send functions are defined as follows:

```
-- Define a structure body Complex.
typedef struct Complex {
 double x;
 double y;
} Complex;

-- Define an input function.
PG_FUNCTION_INFO_V1(complex_in);

Datum
complex_in(PG_FUNCTION_ARGS)
{
 char *str = PG_GETARG_CSTRING(0);
 double x,
 y;
 Complex *result;

 if (sscanf(str, " (%lf , %lf)", &x, &y) != 2)
 ereport(ERROR,
 (errmsg("invalid input syntax for complex: \"%s\"",
 str)));

 result = (Complex *) palloc(sizeof(Complex));
 result->x = x;
 result->y = y;
 PG_RETURN_POINTER(result);
}

-- Define an output function.
PG_FUNCTION_INFO_V1(complex_out);

Datum
complex_out(PG_FUNCTION_ARGS)
{
 Complex *complex = (Complex *) PG_GETARG_POINTER(0);
 char *result;

 result = (char *) palloc(100);
 snprintf(result, 100, "(%g,%g)", complex->x, complex->y);
 PG_RETURN_CSTRING(result);
}
```

```
}

-- Define a receive function.
PG_FUNCTION_INFO_V1(complex_rcv);

Datum
complex_rcv(PG_FUNCTION_ARGS)
{
 StringInfo buf = (StringInfo) PG_GETARG_POINTER(0);
 Complex *result;

 result = (Complex *) palloc(sizeof(Complex));
 result->x = pq_getmsgfloat8(buf);
 result->y = pq_getmsgfloat8(buf);
 PG_RETURN_POINTER(result);
}

-- Define a send function.
PG_FUNCTION_INFO_V1(complex_send);

Datum
complex_send(PG_FUNCTION_ARGS)
{
 Complex *complex = (Complex *) PG_GETARG_POINTER(0);
 StringInfoData buf;

 pq_begintypsend(&buf);
 pq_sendfloat8(&buf, complex->x);
 pq_sendfloat8(&buf, complex->y);
 PG_RETURN_BYTEA_P(pq_endtypsend(&buf));
}
```

## Helpful Links

[ALTER TYPE](#) and [DROP TYPE](#)

## 7.15.93 CREATE USER

### Description

Creates a user.

### Precautions

- A user created using the CREATE USER statement has the LOGIN permission by default.
- When you run the **CREATE USER** command to create a user, the system creates a schema with the same name as the user in the database where the command is executed.
- The owner of an object created by a system administrator in a schema with the same name as a common user is the common user, not the system administrator.

### Syntax

```
CREATE USER user_name [[WITH] option [...]] [ENCRYPTED | UNENCRYPTED] { PASSWORD | IDENTIFIED BY } { 'password' [EXPIRED] | DISABLE };
```

The **option** clause is used to configure information, including permissions and properties.

```
{SYSADMIN | NOSYSADMIN}
| {MONADMIN | NOMONADMIN}
| {OPRADMIN | NOOPRADMIN}
| {POLADMIN | NOPOLADMIN}
| {AUDITADMIN | NOAUDITADMIN}
| {CREATEDB | NOCREATEDB}
| {USEFT | NOUSEFT}
| {CREATEROLE | NOCREATEROLE}
| {INHERIT | NOINHERIT}
| {LOGIN | NOLOGIN}
| {REPLICATION | NOREPLICATION}
| {VCADMIN | NOVADMIN}
| {PERSISTENCE | NOPERSISTENCE}
| CONNECTION LIMIT connlimit
| VALID BEGIN 'timestamp'
| VALID UNTIL 'timestamp'

| USER GROUP 'groupuser'
| PERM SPACE 'spacelimit'
| TEMP SPACE 'tmpspacelimit'
| SPILL SPACE 'spillspacelimit'
| NODE GROUP logic_cluster_name
| IN ROLE role_name [, ...]
| IN GROUP role_name [, ...]
| ROLE role_name [, ...]
| ADMIN role_name [, ...]
| USER role_name [, ...]
| SYSID uid
| DEFAULT TABLESPACE tablespace_name
| PROFILE DEFAULT
| PROFILE profile_name
| PGUSER
```

## Parameters

- **user\_name**  
Username.  
Value range: a string. It must comply with the [naming convention](#). A value can contain a maximum of 63 characters. If a username contains uppercase letters, the database automatically converts the uppercase letters into lowercase letters. To create a username that contains uppercase letters, enclose the username with double quotation marks ("").
- **password**  
Specifies the login password.  
The new password must:
  - Contain at least eight characters. This is the default length.
  - Differ from the username or the username spelled backward.
  - Contain at least three of the following character types: uppercase characters, lowercase characters, digits, and special characters (limited to ~!@#\$%^&\*()-\_+=\|[]{};:;<.>/?). If the password contains characters other than the preceding characters, an error will be reported during statement execution.
  - The password can also be a ciphertext character string that meets the format requirements. This mode is mainly used to import user data. You are advised not to use it directly. If a ciphertext password is used, the user must know the plaintext corresponding to the ciphertext password and ensure that the plaintext password meets the complexity requirements. The database does not verify the complexity of the ciphertext password. Instead, the security of the ciphertext password is ensured by the user.

- Be enclosed by single quotation marks when a user is created.

Value range: a string

For details about other parameters, see [Parameter Description](#) in "CREATE ROLE."

## Examples

```
-- Create user jim whose login password is *****.
gaussdb=# CREATE USER jim PASSWORD '*****';

-- Alternatively, you can run the following statement:
gaussdb=# CREATE USER kim IDENTIFIED BY '*****';

-- To create a user with the CREATEDB permission, add the CREATEDB keyword.
gaussdb=# CREATE USER dim CREATEDB PASSWORD '*****';

-- Change the login password of user jim from ***** to *****.
gaussdb=# ALTER USER jim IDENTIFIED BY '*****' REPLACE '*****';

-- Add the CREATEROLE permission to jim.
gaussdb=# ALTER USER jim CREATEROLE;

-- Lock jim.
gaussdb=# ALTER USER jim ACCOUNT LOCK;

-- Delete users.
gaussdb=# DROP USER kim CASCADE;
gaussdb=# DROP USER jim CASCADE;
gaussdb=# DROP USER dim CASCADE;
```

## Helpful Links

[ALTER USER](#), [CREATE ROLE](#), and [DROP USER](#)

## 7.15.94 CREATE VIEW

### Description

**CREATE VIEW** creates a view. A view is a virtual table, not a base table. Only view definition is stored in the database and view data is not. The data is stored in a base table. If data in the base table changes, the data in the view changes accordingly. In this sense, a view is like a window through which users can know their interested data and data changes in the database.

### Precautions

A user granted with the **CREATE ANY TABLE** permission can create views in the public and user schemas.

### Syntax

```
CREATE [OR REPLACE] [TEMP | TEMPORARY] VIEW view_name [(column_name [, ...])]
[WITH ({view_option_name [= view_option_value]} [, ...])]
AS query;
```

 NOTE

You can use **WITH(security\_barrier)** to create a relatively secure view. This prevents attackers from printing base table data by using the **RAISE** statement of low-cost functions. After a view is created, you are not allowed to use **REPLACE** to modify column names in the view or delete the columns.

## Parameters

- **OR REPLACE**  
Redefines the view if it already exists.
- **TEMP | TEMPORARY**  
Creates a temporary view.
- **view\_name**  
Specifies the name (optionally schema-qualified) of the view to be created.  
Value range: a string. It must comply with the [naming convention](#).
- **column\_name**  
Specifies an optional list of names to be used for columns of the view. If not given, the column names are deduced from the query.  
Value range: a string. It must comply with the [naming convention](#).
- **view\_option\_name [= view\_option\_value]**  
Specifies an optional parameter for a view.  
Currently, **view\_option\_name** supports only the **security\_barrier** parameter. This parameter is used when the view attempts to provide row-level security.  
Value range: **TRUE** or **FALSE**
- **query**  
Specifies a **SELECT** or **VALUES** statement that will provide the columns and rows of the view.

---

**NOTICE**

If **query** contains a clause specifying the partition of a partitioned table, the OID of the specified partition is hardcoded to the system catalog when the view is created. If the partition DDL syntax that causes the change in the OID of the specified partition is used, for example, **DROP**, **SPLIT**, or **MERGE**, the view is unavailable. In this case, you need to create a view.

---

## Examples

```
-- Create a view consisting of columns whose spcname is pg_default.
gaussdb=# CREATE VIEW myView AS
 SELECT * FROM pg_tablespace WHERE spcname = 'pg_default';

-- Query the view.
gaussdb=# SELECT * FROM myView ;

-- Delete the view.
gaussdb=# DROP VIEW myView;
```

## Helpful Links

[ALTER VIEW](#) and [DROP VIEW](#)

# 7.15.95 CREATE WORKLOAD GROUP

## Description

Creates a workload group, associates it with a resource pool, and specifies the number of concurrent SQL statements in the resource pool.

## Precautions

Only a user with the CREATE permission on the current database can perform this operation.

## Syntax

```
CREATE WORKLOAD GROUP wg_name
[USING RESOURCE POOL pool_name [WITH (ACT_STATEMENTS = counts)]];
```

## Parameters

- **wg\_name**  
Specifies the workload group name.  
 **NOTE**  
The workload group must be unique in a database.  
Value range: a string. It must comply with the [naming convention](#).
- **pool\_name**  
Specifies the name of a resource pool.  
Value range: a string. It must comply with the [naming convention](#).
- **counts**  
Specifies the number of concurrent SQL statements in the resource pool that the workload group belongs to.  
Value range: an integer ranging from -1 to 2147483647

## Examples

```
-- Create a default workload group in the default resource pool.
gaussdb=# CREATE WORKLOAD GROUP wg_name1;

-- Create a workload group.
gaussdb=# CREATE WORKLOAD GROUP wg_name2;

-- Create a workload group, associate it with pool1, and set the number of concurrent SQL statements to 10.
gaussdb=# CREATE WORKLOAD GROUP wg_name3 USING RESOURCE POOL pool1 WITH
(ACT_STATEMENTS=10);

-- Delete the created workload groups.
gaussdb=# DROP WORKLOAD GROUP wg_name1;
gaussdb=# DROP WORKLOAD GROUP wg_name2;
gaussdb=# DROP WORKLOAD GROUP wg_name3;
```

## Helpful Links

[ALTER WORKLOAD GROUP](#) and [DROP WORKLOAD GROUP](#)

## 7.15.96 CREATE WEAK PASSWORD DICTIONARY

### Function

**CREATE WEAK PASSWORD DICTIONARY** inserts one or more weak passwords into the **gs\_global\_config** table.

### Precautions

- Only the initial user, system administrator, and security administrator have the permission to execute this syntax.
- Passwords in the weak password dictionary are stored in the **gs\_global\_config** system catalog.
- The weak password dictionary is empty by default. You can use this syntax to add one or more weak passwords.
- When a user attempts to execute this syntax to insert a weak password that already exists in the **gs\_global\_config** table, only one weak password is retained in the table.

### Syntax

```
CREATE WEAK PASSWORD DICTIONARY
[WITH VALUES] ({'weak_password'} [, ...]);
```

### Parameter Description

weak\_password

Weak password

Value range: a character string.

### Example

```
-- Insert a single weak password into the gs_global_config system catalog.
gaussdb=# CREATE WEAK PASSWORD DICTIONARY WITH VALUES ('password1');

-- Insert multiple weak passwords into the gs_global_config system catalog.
gaussdb=# CREATE WEAK PASSWORD DICTIONARY WITH VALUES ('password2'),('password3');

-- Clear all weak passwords in the gs_global_config system catalog.
gaussdb=# DROP WEAK PASSWORD DICTIONARY;

-- View existing weak passwords.
gaussdb=# SELECT * FROM gs_global_config WHERE NAME LIKE 'weak_password';
```

## Helpful Links

[13.14.119-DROP WEAK PASSWORD DICTIONARY](#)

## 7.15.97 CURSOR

### Function

**CURSOR** defines a cursor to retrieve a small number of rows at a time out of a larger query.

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers pointing to context regions. With cursors, stored procedures can control alterations in context regions.

### Precautions

- **CURSOR** is used only in transaction blocks.
- Generally, **CURSOR** and **SELECT** both have text returns. Since data is stored in binary format in the system, the system needs to convert the data from the binary format to the text format. If data is returned in text format, client applications need to convert the data back to the binary format for processing. **FETCH** implements conversion between binary data and text data.
- Binary cursors should be used carefully. Text usually occupies larger space than binary data. A binary cursor returns internal binary data, which is easier to operate. A text cursor returns text, which is easier to retrieve and therefore reduces workload on the client. As an example, if a query returns a value of one from an integer column, you would get a string of 1 with a default cursor, whereas with a binary cursor you would get a 4-byte field containing the internal representation of the value (in big-endian byte order).

### Syntax

```
CURSOR cursor_name
[BINARY] [NO SCROLL] [{ WITH | WITHOUT } HOLD]
FOR query ;
```

### Parameter Description

- **cursor\_name**  
Specifies the name of the cursor to be created.  
Value range: a string. It must comply with the naming convention.
- **BINARY**  
Causes the cursor to return data in binary rather than in text format.
- **NO SCROLL**  
Specifies how the cursor retrieves rows.
  - **NO SCROLL**: specifies that the cursor cannot be used to retrieve rows in a nonsequential fashion.
  - Unspecified: Based on the query's execution plan, the system automatically determines whether the cursor can be used to retrieve rows in a nonsequential fashion.
- **WITH HOLD | WITHOUT HOLD**  
Specifies whether the cursor can continue to be used after the transaction that created it successfully commits.

- **WITH HOLD**: The cursor can continue to be used after the transaction that created it successfully commits.
- **WITHOUT HOLD**: The cursor cannot be used outside of the transaction that created it.
- If neither **WITH HOLD** nor **WITHOUT HOLD** is specified, the default is **WITHOUT HOLD**.
- Cross-node transactions (for example, DDL-contained transactions created in a coordinator cluster) do not support **WITH HOLD**.
- **query**  
Uses a **SELECT** or **VALUES** clause to specify the rows to be returned by the cursor.  
Value range: **SELECT** or **VALUES** clause

## Examples

See [Examples](#) in **FETCH**.

## Helpful Links

[FETCH](#)

# 7.15.98 DEALLOCATE

## Function

**DEALLOCATE** deallocates a previously prepared statement. If you do not explicitly deallocate a prepared statement, it is deallocated when the session ends.

The **PREPARE** keyword is always ignored.

## Precautions

None

## Syntax

```
DEALLOCATE [PREPARE] { name | ALL };
```

## Parameter Description

- **name**  
Specifies the name of the prepared statement to be deallocated.
- **ALL**  
Deallocates all prepared statements.

## Examples

None

## 7.15.99 DECLARE

### Function

**DECLARE** defines a cursor to retrieve a small number of rows at a time out of a larger query and can be the start of an anonymous block.

This section describes usage of cursors. The usage of anonymous blocks is available in [BEGIN](#).

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers pointing to context regions. With cursors, stored procedures can control alterations in context regions.

Generally, **CURSOR** and **SELECT** both have text returns. Since data is stored in binary format in the system, the system needs to convert the data from the binary format to the text format. If data is returned in text format, client applications need to convert the data back to the binary format for processing. **FETCH** implements conversion between binary data and text data.

### Precautions

- **CURSOR** is used only in transaction blocks.
- Binary cursors should be used carefully. Text usually occupies larger space than binary data. A binary cursor returns internal binary data, which is easier to operate. A text cursor returns text, which is easier to retrieve and therefore reduces workload on the client. As an example, if a query returns a value of one from an integer column, you would get a string of 1 with a default cursor, whereas with a binary cursor you would get a 4-byte field containing the internal representation of the value (in big-endian byte order).

### Syntax

- Define a cursor.

```
DECLARE cursor_name [BINARY] [NO SCROLL]
 CURSOR [{ WITH | WITHOUT } HOLD] FOR query ;
```
- Enable an anonymous block.

```
[DECLARE [declare_statements]]
BEGIN
execution_statements
END;
/
```

### Parameter Description

- **cursor\_name**  
Specifies the name of the cursor to be created.  
Value range: a string. It must comply with the naming convention.
- **BINARY**  
Causes the cursor to return data in binary rather than in text format.
- **NO SCROLL**  
Specifies how the cursor retrieves rows.

- **NO SCROLL**: specifies that the cursor cannot be used to retrieve rows in a nonsequential fashion.
- Unspecified: Based on the query's execution plan, the system automatically determines whether the cursor can be used to retrieve rows in a nonsequential fashion.
- **WITH HOLD**  
**WITHOUT HOLD**  
Specifies whether the cursor can continue to be used after the transaction that created it successfully commits.
  - **WITH HOLD**: The cursor can continue to be used after the transaction that created it successfully commits.
  - **WITHOUT HOLD**: The cursor cannot be used outside of the transaction that created it.
  - If neither **WITH HOLD** nor **WITHOUT HOLD** is specified, the default is **WITHOUT HOLD**.

---

**NOTICE**

- For a cursor declared as **WITH HOLD**, all data of the cursor is cached when a transaction ends. If the cursor has a large amount of data, this process may take a long time.
- 
- **query**  
Uses a **SELECT** or **VALUES** clause to specify the rows to be returned by the cursor.  
Value range: **SELECT** or **VALUES** clause
  - **declare\_statements**  
Declares a variable, including its name and type, for example, **sales\_cnt int**.
  - **execution\_statements**  
Specifies the statement to be executed in an anonymous block.  
Value range: an existing function name

## Examples

For details about how to start a transaction, see [Examples](#) in section "BEGIN".

For details about how to define a cursor, see [Examples](#) in section "FETCH."

## Helpful Links

[BEGIN](#) and [FETCH](#)

## 7.15.100 DELETE

### Description

Deletes rows that satisfy the WHERE clause from the specified table. If the WHERE clause is absent, the effect is to delete all rows in the table. The result is a valid, but an empty table.

### Precautions

- The owner of a table, users granted with the DELETE permission on the table, or users granted with the DELETE ANY TABLE permission can delete data from the table. The system administrator has the permission to delete data from the table by default, as well as the SELECT permission on any table in the USING clause or whose values are read in **condition**.
- For row-store tables, DELETE can be used if the tables have primary key constraints or the execution plan can be pushed down.
- For the DELETE statement whose subquery is a stream plan, the same deleted row cannot be concurrently updated.

### Syntax

```
[WITH [RECURSIVE] with_query [, ...]]
DELETE [/*+ plan_hint */] [FROM] [ONLY] table_name [*] [[AS] alias]
 [USING using_list]
 [WHERE condition | WHERE CURRENT OF cursor_name]
 [ORDER BY {expression [[ASC | DESC | USING operator]] }]
 [RETURNING { * | { output_expr [[AS] output_name] } [, ...] }];
```

Format of **with\_query**:

```
with_query_name [(column_name [, ...])] AS [[NOT] MATERIALIZED]
({select | values | insert | update | delete})
```

### Parameters

- **WITH [ RECURSIVE ] with\_query [, ...]**  
Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table.  
If RECURSIVE is specified, it allows a SELECT subquery to reference itself by name.
  - **with\_query\_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.
  - **column\_name** specifies the column name displayed in the subquery result set.
  - Each subquery can be a **SELECT**, **VALUES**, **INSERT**, **UPDATE** or **DELETE** statement.
  - You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE.
  - If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery cannot be jointly optimized with the **SELECT** statement trunk (for example, predicate

pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.

- If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the trunk statement to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.

- **plan\_hint**

Follows the **DELETE** keyword in the */\*+ \*/* format. It is used to optimize the plan of a **DELETE** statement block. For details, see [Hint-based Tuning](#). In each statement, only the first */\*+ plan\_hint\*/* comment block takes effect as a hint. Multiple hints can be written.

- **ONLY**

If **ONLY** is specified before the table name, matching rows are deleted from the named table only. If **ONLY** is not specified, matching rows are also deleted from any tables inheriting from the named table.

- **table\_name**

Specifies the name (optionally schema-qualified) of the table to delete rows from.

Value range: an existing table name

 **NOTE**

You can use database links to perform operations on remote tables. For details, see [DATABASE LINK](#).

- **alias**

Specifies a substitute name for the target table.

Value range: a string. It must comply with the [naming convention](#).

- **using\_list**

Specifies the **USING** clause.

- **condition**

Specifies an expression that returns a value of type Boolean. Only rows for which this expression returns **true** will be deleted. You are advised not to use numeric types such as int as conditions, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and 0 is implicitly converted to **false**), which may cause unexpected results.

- **WHERE CURRENT OF cursor\_name**

When the cursor points to a row in a table, you can use this syntax to delete the row. For details about the restrictions, see [UPDATE](#).

- **ORDER BY**

For details about the keywords, see [SELECT](#).

- **output\_expr**

Specifies an expression to be computed and returned by the **DELETE** statement after each row is deleted. The expression can use any column names of the table. Write \* to return all columns.

- **output\_name**

Specifies a name to use for a returned column.

Value range: a string. It must comply with the [naming convention](#).

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer_address table.
gaussdb=# CREATE TABLE tpcds.customer_address
(
ca_address_sk INTEGER NOT NULL,
ca_address_id CHARACTER(16) NOT NULL,
ca_street_number INTEGER ,
ca_street_name CHARACTER (20)
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.customer_address VALUES (1, 'AAAAAAAAABAAAAAAA', '18', 'Jackson'),
(10000, 'AAAAAAAACAAAAAAA', '362', 'Washington 6th'),(15000, 'AAAAAAAADAAAAAAA', '585', 'Dogwood
Washington');

-- Create the tpcds.customer_address_bak table.
gaussdb=# CREATE TABLE tpcds.customer_address_bak AS TABLE tpcds.customer_address;

-- Delete employees whose ca_address_sk is smaller than 14888 from the tpcds.customer_address_bak
table.
gaussdb=# DELETE FROM tpcds.customer_address_bak WHERE ca_address_sk < 14888;

-- Delete all data from the tpcds.customer_address_bak table.
gaussdb=# DELETE FROM tpcds.customer_address_bak;

-- Delete the tpcds.customer_address_bak table.
gaussdb=# DROP TABLE tpcds.customer_address_bak;

-- Delete the tpcds.customer_address table.
gaussdb=# DROP TABLE tpcds.customer_address;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## Suggestions

- delete  
To delete all records in a table, use the TRUNCATE syntax.

## 7.15.101 DO

### Function

Executes an anonymous code block.

The code block is treated as though it were the body of a function with no parameters, returning **void**. It is parsed and executed a single time.

### Precautions

- The procedural language to be used must already have been installed into the current database by means of **CREATE LANGUAGE**. **plpgsql** is installed by default, but other languages are not.
- The user must have the **USAGE** permission on the procedural language, or must be a system administrator if the language is untrusted.

## Syntax

```
DO [LANGUAGE lang_name] code;
```

## Parameter Description

- **lang\_name**  
Specifies the name of the procedural language the code is written in. If omitted, the default is **plpgsql**.
- **code**  
Specifies the procedural language code to be executed. This must be specified as a string literal.

## Examples

```
-- Create the webuser user.
gaussdb=# CREATE USER webuser PASSWORD '*****';

-- Grant all permissions on all views in the tpcds schema to the webuser user.
gaussdb=# DO $$DECLARE r record;
BEGIN
 FOR r IN SELECT c.relname,n.nspname FROM pg_class c,pg_namespace n
 WHERE c.relnamespace = n.oid AND n.nspname = 'tpcds' AND relkind IN ('r','v')
 LOOP
 EXECUTE 'GRANT ALL ON ' || quote_ident(r.table_schema) || '.' || quote_ident(r.table_name) || ' TO
webuser';
 END LOOP;
END$$;

-- Delete the webuser user.
gaussdb=# DROP USER webuser CASCADE;
```

## 7.15.102 DROP APP WORKLOAD GROUP MAPPING

### Description

Deletes an app workload group mapping.

### Precautions

Only a user with the DROP permission on the current database can perform this operation.

### Syntax

```
DROP APP WORKLOAD GROUP MAPPING [IF EXISTS] app_name;
```

### Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified app workload group mapping does not exist.
- **app\_name**  
Specifies the name of the app workload group mapping to be deleted. The name was specified during **CREATE APP WORKLOAD GROUP MAPPING**.  
Value range: a string. It must comply with the [naming convention](#).

## Examples

See [Examples](#) in section "CREATE APP WORKLOAD GROUP MAPPING."

## Helpful Links

[ALTER APP WORKLOAD GROUP MAPPING](#) and [CREATE APP WORKLOAD GROUP MAPPING](#)

## 7.15.103 DROP AUDIT POLICY

### Description

Deletes an audit policy.

### Precautions

Only users with the poladmin or sysadmin permission, or the initial user can perform this operation.

### Syntax

```
DROP AUDIT POLICY [IF EXISTS] policy_name;
```

### Parameters

#### **policy\_name**

Specifies the audit policy name, which must be unique.

Value range: a string. It must comply with the [naming convention](#).

## Examples

See [Examples](#) in section "CREATE AUDIT POLICY."

## Helpful Links

[CREATE AUDIT POLICY](#) and [ALTER AUDIT POLICY](#)

## 7.15.104 DROP CLIENT MASTER KEY

### Function

**DROP CLIENT MASTER KEY** deletes a CMK.

### Precautions

- Only the CMK owner or a user who has been granted the DROP permission can run this command. By default, the system administrator has this permission.
- This command can only be used to delete the metadata information recorded in the system catalog of the database, but cannot be used to delete the CMK file. You need to use KeyTool to delete the CMK file.

## Syntax

```
DROP CLIENT MASTER KEY [IF EXISTS] client_master_key_name [, ...] [CASCADE | RESTRICT];
```

## Parameter Description

- **IF EXISTS**  
If a specified CMK does not exist, a notice rather than an error is issued.
- **client\_master\_key\_name**  
Name of a CMK to be deleted.  
Value range: a string. It is the name of an existing CMK.
- **CASCADE | RESTRICT**  
Allows/Restricts to delete objects that depend on the CMK.

## Examples

```
-- Delete a CMK object.
gaussdb=> DROP CLIENT MASTER KEY imgCMK CASCADE;
NOTICE: drop cascades to column setting: imgcek
DROP GLOBAL SETTING
```

## 7.15.105 DROP COLUMN ENCRYPTION KEY

### Function

**CREATE COLUMN ENCRYPTION KEY** deletes a column encryption key (CEK).

### Precautions

Only the CEK owner or a user who has been granted the DROP permission can run this command. By default, the system administrator has this permission.

### Syntax

```
DROP COLUMN ENCRYPTION KEY [IF EXISTS] column_encryption_key_name [, ...] [CASCADE | RESTRICT];
```

## Parameter Description

- **IF EXISTS**  
If a specified CEK does not exist, a notice rather than an error is issued.
- **column\_encryption\_key\_name**  
Name of a CEK to be deleted.  
Value range: a string. It is the name of an existing CEK.
- **CASCADE | RESTRICT**  
For fully-encrypted databases, this syntax is high-risk operation. Actually, encrypted columns that depend on CEKs cannot be deleted.

## Examples

```
-- Delete a CEK object.
gaussdb=# DROP COLUMN ENCRYPTION KEY imgCEK CASCADE;
ERROR: cannot drop column setting: imgcek cascadelly because encrypted column depend on it.
HINT: we have to drop encrypted column: name, ... before drop column setting: imgcek cascadelly.
```

## 7.15.106 DROP DATABASE

### Function

**DROP DATABASE** deletes a database.

### Precautions

- Only the database owner or a user granted with the DROP permission can run the **DROP DATABASE** command. The system administrator has this permission by default.
- The preinstalled POSTGRES, TEMPLATE0, and TEMPLATE1 databases are protected and therefore cannot be deleted. To check databases in the current service, run the gsql statement `\l`.
- If any users are connected to the database, the database cannot be deleted. To check the current database connections, open the **dv\_sessions** view.
- **DROP DATABASE** cannot be executed within a transaction block.
- Before deleting a database, run the **CLEAN CONNECTION TO ALL FORCE FOR DATABASE XXXX** command to forcibly stop the existing user connections and backend threads, preventing database deletion failures caused by running backend threads. Forcibly stopping backend threads may cause data inconsistency in the current database. Therefore, execute this command only when you are sure to delete the database.
- If **DROP DATABASE** fails and is rolled back, run **DROP DATABASE IF EXISTS** again.

---

#### NOTICE

**DROP DATABASE** cannot be undone.

---

### Syntax

```
DROP DATABASE [IF EXISTS] database_name ;
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified database does not exist.
- **database\_name**  
Specifies the name of the database to be deleted.  
Value range: an existing database name

### Examples

See [Examples](#) in **CREATE DATABASE**.

### Helpful Links

[CREATE DATABASE](#)

## Suggestions

- drop database  
Do not delete databases during transactions.

## 7.15.107 DROP DATABASE LINK

## 7.15.108 DROP DATA SOURCE

### Description

Deletes a data source.

### Precautions

Only an owner, system administrator, or initial user can delete a data source.

### Syntax

```
DROP DATA SOURCE [IF EXISTS] src_name [CASCADE | RESTRICT];
```

### Parameters

- **src\_name**  
Specifies the name of the data source to be deleted.  
Value range: a string. It must comply with the [naming convention](#).
- **IF EXISTS**  
Reports a notice instead of an error if the specified data source does not exist.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the data source.
  - **RESTRICT**: refuses to delete the data source if any objects depend on it. This is the default action.

Currently, no objects depend on data sources. Therefore, **CASCADE** is equivalent to **RESTRICT**, and they are reserved to ensure backward compatibility.

### Examples

```
-- Create a data source.
gaussdb=# CREATE DATA SOURCE ds_tst1;

-- Delete the data source.
gaussdb=# DROP DATA SOURCE ds_tst1 CASCADE;
gaussdb=# DROP DATA SOURCE IF EXISTS ds_tst1 RESTRICT;
```

### Helpful Links

[CREATE DATA SOURCE](#) and [ALTER DATA SOURCE](#)

## 7.15.109 DROP DIRECTORY

### Function

**DROP DIRECTORY** deletes a directory.

### Precautions

When **enable\_access\_server\_directory** is set to **off**, only the initial user is allowed to delete directory objects. When **enable\_access\_server\_directory** is set to **on**, a user with the SYSADMIN permission, the owner of the directory object, a user who is granted with the DROP permission of the directory, or a user who inherits the **gs\_role\_directory\_drop** permission of the built-in role can delete directory objects.

### Syntax

```
DROP DIRECTORY [IF EXISTS] directory_name;
```

### Parameter Description

- **directory\_name**  
Specifies the name of the directory to be deleted.  
Value range: an existing directory name

### Examples

```
-- Create a directory.
gaussdb=# CREATE OR REPLACE DIRECTORY dir as '/tmp/';

-- Delete a foreign table.
gaussdb=# DROP DIRECTORY dir;
```

### Helpful Links

[CREATE DIRECTORY](#) and [ALTER DIRECTORY](#)

## 7.15.110 DROP FOREIGN TABLE

### Function

**DROP FOREIGN TABLE** deletes a foreign table.

### Precautions

**DROP FOREIGN TABLE** forcibly deletes the specified table and the indexes depending on the table. After the table is deleted, the functions and stored procedures that need to use this table cannot be executed.

### Syntax

```
DROP FOREIGN TABLE [IF EXISTS]
table_name [, ...] [CASCADE | RESTRICT];
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified table does not exist.
- **table\_name**  
Specifies the name of the table to be deleted.  
Value range: an existing table name
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects (such as views) that depend on the table.
  - **RESTRICT**: refuses to delete the table if any objects depend on it. This is the default action.

## Examples

See [Examples](#) in **CREATE FOREIGN TABLE**.

## Helpful Links

[ALTER FOREIGN TABLE \(for Import and Export\)](#) and [CREATE FOREIGN TABLE \(for Import and Export\)](#)

## 7.15.111 DROP FUNCTION

### Function

**DROP FUNCTION** deletes a function.

### Precautions

If a function involves operations on temporary tables, **DROP FUNCTION** cannot be used.

Only the function owner or a user granted with the DROP permission can run the **DROP FUNCTION** command. The system administrator has this permission by default.

### Syntax

```
DROP FUNCTION [IF EXISTS] function_name
[([{ [argname] [argmode] argtype } [, ...]]) [CASCADE | RESTRICT]] ;
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified function does not exist.
- **function\_name**  
Specifies the name of the function to be deleted.  
Value range: an existing function name
- **argmode**  
Specifies the parameter mode of the function.

- **argname**  
Specifies the parameter name of the function.
- **argtype**  
Specifies the parameter type of the function.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects (such as operators) that depend on the function.
  - **RESTRICT**: refuses to delete the function if any objects depend on it. This is the default action.

## Examples

See [Examples](#) in **CREATE FUNCTION**.

## Helpful Links

[ALTER FUNCTION](#) and [CREATE FUNCTION](#)

# 7.15.112 DROP GLOBAL CONFIGURATION

## Function

**DROP GLOBAL CONFIGURATION** deletes parameter values from the **gs\_global\_config** system catalog.

## Precautions

Only the initial database user can run this command.

The **weak\_password** keyword cannot be deleted.

## Syntax

```
DROP GLOBAL CONFIGURATION Parameter name, Parameter name...
```

## Parameter Description

The parameter is a parameter that already exists in the **gs\_global\_config** system catalog. If you delete a parameter that does not exist, an error will be reported.

# 7.15.113 DROP GROUP

## Function

**DROP GROUP** deletes a user group. **DROP GROUP** is an alias for **DROP ROLE**.

## Precautions

**DROP GROUP** is available only to users with the **CREATE ROLE** permission granted by the administrator.

## Syntax

```
DROP GROUP [IF EXISTS] group_name [, ...];
```

## Parameter Description

See [Parameter Description](#) in **DROP ROLE**.

## Helpful Links

- [CREATE GROUP](#)
- [ALTER GROUP](#)
- [DROP ROLE](#)

## 7.15.114 DROP INDEX

### Function

**DROP INDEX** deletes an index.

### Precautions

Only the index owner, owner of the schema where the index resides, a user who has the INDEX permission on the table where the index resides, or a user who has the DROP ANY INDEX permission can run the **DROP INDEX** command. The system administrator has this permission by default.

## Syntax

```
DROP INDEX [IF EXISTS]
index_name [, ...] [CASCADE | RESTRICT];
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified index does not exist.
- **index\_name**  
Specifies the name of the index to be deleted.  
Value range: an existing index
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the index.
  - **RESTRICT**: refuses to delete the index if any objects depend on it. This is the default action.

## Examples

See [Examples](#) in **CREATE INDEX**.

## Helpful Links

[ALTER INDEX](#) and [CREATE INDEX](#)

## 7.15.115 DROP LANGUAGE

This version does not support this syntax.

## 7.15.116 DROP MASKING POLICY

### Description

Deletes a masking policy.

### Precautions

Only users with the poladmin or sysadmin permission, or the initial user can perform this operation.

### Syntax

```
DROP MASKING POLICY [IF EXISTS] policy_name;
```

### Parameters

#### **policy\_name**

Specifies the audit policy name, which must be unique.

Value range: a string. It must comply with the [naming convention](#).

### Examples

```
-- Delete a masking policy.
gaussdb=# DROP MASKING POLICY IF EXISTS maskpol1;

-- Delete a group of anonymization policies.
gaussdb=# DROP MASKING POLICY IF EXISTS maskpol1, maskpol2, maskpol3;
```

### Helpful Links

[5.1.13.14.14-ALTER MASKING POLICY](#) and [5.13.14.59-CREATE MASKING POLICY](#)

## 7.15.117 DROP MATERIALIZED VIEW

### Function

**DROP MATERIALIZED VIEW** deletes an existing materialized view from the database.

### Precautions

The owner of a materialized view, owner of the schema of the materialized view, users granted with the DROP permission on the materialized view, or users granted with the DROP ANY TABLE permission can run the **DROP MATERIALIZED VIEW** command. By default, the system administrator has the permission to run the command.

## Syntax

```
DROP MATERIALIZED VIEW [IF EXISTS] mv_name [, ...] [CASCADE | RESTRICT];
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified materialized view does not exist.
- **mv\_name**  
Name of the materialized view to be deleted.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on a materialized view.
  - **RESTRICT**: refuses to delete a materialized view if any objects depend on it. This is the default value.

## Examples

```
-- Create a table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int) WITH(STORAGE_TYPE=ASTORE);

-- Create a materialized view named my_mv.
gaussdb=# CREATE MATERIALIZED VIEW my_mv AS SELECT * FROM my_table;

-- Delete the materialized view named my_mv.
gaussdb=# DROP MATERIALIZED VIEW my_mv;

-- Delete the table.
gaussdb=# DROP TABLE my_table;
```

## Helpful Links

[ALTER MATERIALIZED VIEW](#), [CREATE INCREMENTAL MATERIALIZED VIEW](#), [CREATE MATERIALIZED VIEW](#), [CREATE TABLE](#), [REFRESH INCREMENTAL MATERIALIZED VIEW](#), and [REFRESH MATERIALIZED VIEW](#)

## 7.15.118 DROP MODEL

This syntax is not supported in distributed scenarios.

## 7.15.119 DROP NODE

### Function

**DROP NODE** deletes a node.

### Precautions

**CREATE NODE GROUP** is an interface of the cluster management tool. You are not advised to use this interface, because doing so affects the cluster. Only the administrator has the permission to use this interface.

## Syntax

```
DROP NODE [IF EXISTS] nodename [WITH (cnodename [, ...])];
```

## Parameter Description

### IF EXISTS

Reports a notice instead of an error if the specified node does not exist.

### nodename

Specifies the name of the node to be deleted.

Value range: an existing node name

### cnnodename

Specifies the CN name. If it is specified, **DROP NODE** will be executed on both the connected CN and the specified CN. If it is not specified, DN deletion must be performed on all CNs, and CN deletion must be performed on all CNs except the CN to be deleted.

Value range: an existing CN name

## Helpful Links

- [CREATE NODE](#)
- [ALTER NODE](#)

## 7.15.120 DROP NODE GROUP

### Description

Deletes a node group.

### Precautions

- DROP NODE GROUP is an interface of the cluster management tool.
- Only the system administrator or a user who has the DROP permission can perform this operation.

### Syntax

```
DROP NODE GROUP groupname [DISTRIBUTE FROM src_group_name];
```

### Parameters

#### groupname

Specifies the name of the node group to be deleted.

Value range: an existing node group name

## Helpful Links

[CREATE NODE GROUP](#)

## 7.15.121 DROP OWNED

### Function

**DROP OWNED** deletes the database objects owned by a database role.

### Precautions

- This interface will revoke the role's permissions on all objects in the current database and shared objects (databases and tablespaces).
- **DROP OWNED** is often used to prepare for removing one or more roles. Because **DROP OWNED** affects only the objects in the current database, you need to run this statement in each database that contains the objects owned by the role to be removed.
- Using the **CASCADE** option may cause this statement to recursively remove objects owned by other users.
- The databases and tablespaces owned by the role will not be removed.

### Syntax

```
DROP OWNED BY name [, ...] [CASCADE | RESTRICT];
```

### Parameter Description

- **name**  
Specifies the role name.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the objects to be deleted.
  - **RESTRICT**: refuses to delete the objects if other objects depend on them. This is the default action.

### Helpful Links

[REASSIGN OWNED](#) and [DROP ROLE](#)

## 7.15.122 DROP PACKAGE

### Function

**DROP PACKAGE** deletes an existing package or package body.

### Precautions

After the package body is deleted, the stored procedures and functions in the package become invalid.

### Syntax

```
DROP PACKAGE [IF EXISTS] package_name;
DROP PACKAGE BODY [IF EXISTS] package_name;
```

## 7.15.123 DROP PROCEDURE

### Function

**DROP PROCEDURE** deletes a stored procedure.

### Precautions

None

### Syntax

```
DROP PROCEDURE [IF EXISTS] procedure_name ;
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified stored procedure does not exist.
- **procedure\_name**  
Specifies the name of the stored procedure to be deleted.  
Value range: an existing stored procedure name

### Examples

See [Examples](#) in **CREATE PROCEDURE**.

### Helpful Links

[CREATE PROCEDURE](#)

## 7.15.124 DROP RESOURCE LABEL

### Function

**DROP RESOURCE LABEL** deletes a resource label.

### Precautions

Only user **poladmin**, user **sysadmin**, or the initial user can perform this operation.

### Syntax

```
DROP RESOURCE LABEL [IF EXISTS] label_name[, ...];
```

### Parameter Description

- label\_name**  
Specifies the resource label name.  
Value range: a string. It must comply with the [naming convention](#).

## Examples

```
-- Delete a resource label.
gaussdb=# DROP RESOURCE LABEL IF EXISTS res_label1;

-- Delete a group of resource labels.
gaussdb=# DROP RESOURCE LABEL IF EXISTS res_label1, res_label2, res_label3;
```

## Helpful Links

[5.1.13.14.17-ALTER RESOURCE LABEL](#) and [5.1.13.14.64-CREATE RESOURCE LABEL](#)

## 7.15.125 DROP ROLE

### Function

**DROP ROLE** deletes a role.

### Precautions

None

### Syntax

```
DROP ROLE [IF EXISTS] role_name [, ...];
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified role does not exist.
- **role\_name**  
Specifies the name of the role to be deleted.  
Value range: an existing role name

## Examples

See [Examples](#) in **CREATE ROLE**.

## Helpful Links

[CREATE ROLE](#), [ALTER ROLE](#), and [SET ROLE](#)

## 7.15.126 DROP ROW LEVEL SECURITY POLICY

### Function

**DROP ROW LEVEL SECURITY POLICY** deletes a row-level access control policy from a table.

### Precautions

Only the owner of a table or a system administrator has the **DROP ROW LEVEL SECURITY POLICY** permission.

## Syntax

```
DROP [ROW LEVEL SECURITY] POLICY [IF EXISTS] policy_name ON table_name [CASCADE | RESTRICT]
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified row-level access control policy does not exist.
- **policy\_name**  
Specifies the name of a row-level access control policy to be deleted.
  - **table\_name**  
Specifies the name of the table containing the row-level access control policy.
  - **CASCADE/RESTRICT**  
Currently, no objects depend on row-level access control policies. Therefore, **CASCADE** is equivalent to **RESTRICT**, and they are reserved to ensure backward compatibility.

## Examples

```
-- Create the data table all_data.
gaussdb=# CREATE TABLE all_data(id int, role varchar(100), data varchar(100));

-- Create a row-level security policy.
gaussdb=# CREATE ROW LEVEL SECURITY POLICY all_data_rls ON all_data USING(role = CURRENT_USER);

-- Delete the row-level security policy.
gaussdb=# DROP ROW LEVEL SECURITY POLICY all_data_rls ON all_data;

-- Delete the all_data table.
gaussdb=# DROP TABLE all_data;
```

## Helpful Links

[ALTER ROW LEVEL SECURITY POLICY](#) and [CREATE ROW LEVEL SECURITY POLICY](#)

## 7.15.127 DROP SCHEMA

### Function

Deletes a schema from the current database.

### Precautions

- Only the schema owner or a user granted with the DROP permission can run the **DROP SCHEMA** command. The system administrator has this permission by default.
- Only initial users and O&M administrators can run the **DROP SCHEMA** command for O&M administrators. Other users cannot run **DROP SCHEMA** for O&M administrators.

## Syntax

```
DROP SCHEMA [IF EXISTS] schema_name [, ...] [CASCADE | RESTRICT];
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified schema does not exist.
- **schema\_name**  
Specifies the name of the schema to be deleted.  
Value range: an existing schema name
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes all the objects contained in the schema.
  - **RESTRICT**: refuses to delete the schema if the schema contains objects. This is the default action.

### NOTICE

Schemas beginning with **pg\_temp** or **pg\_toast\_temp** are for internal use. Do not delete them. Otherwise, unexpected consequences may be incurred.

### NOTE

The schema currently being used cannot be deleted. To delete it, switch to another schema first.

## Examples

See [Examples](#) in **CREATE SCHEMA**.

## Helpful Links

[ALTER SCHEMA](#) and [CREATE SCHEMA](#).

## 7.15.128 DROP SEQUENCE

### Function

**DROP SEQUENCE** deletes a sequence from the current database.

### Precautions

Only the owner of a sequence, the owner of the schema to which the sequence belongs, or a user granted the DROP permission on a sequence or a user granted the DROP ANY SEQUENCE permission can delete a sequence. The system administrator has this permission by default.

## Syntax

```
DROP SEQUENCE [IF EXISTS] { [schema.] sequence_name } [, ...] [CASCADE | RESTRICT];
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified sequence does not exist.
- **name**  
Specifies the name of the sequence to be deleted.
- **CASCADE**  
Automatically deletes the objects that depend on the sequence.
- **RESTRICT**  
Refuses to delete the sequence if any objects depend on it. This is the default action.

## Examples

```
-- Create an ascending sequence named serial, starting from 101.
gaussdb=# CREATE SEQUENCE serial START 101;

-- Delete a sequence.
gaussdb=# DROP SEQUENCE serial;
```

## Helpful Links

[ALTER SEQUENCE](#) and [DROP SEQUENCE](#)

## 7.15.129 DROP SERVER

### Description

Deletes an existing data server.

### Precautions

Only the server owner or a user granted with the DROP permission can run the **DROP SERVER** command. The system administrator has this permission by default.

### Syntax

```
DROP SERVER [IF EXISTS] server_name [{ CASCADE | RESTRICT }] ;
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified data server does not exist.
- **server\_name**  
Specifies the name of the data server to be deleted.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the data server.
  - **RESTRICT**: refuses to delete the server if any objects depend on it. This is the default action.

## Examples

See [Examples](#) in section "CREATE SERVER."

## Helpful Links

[ALTER SERVER](#) and [CREATE SERVER](#)

## 7.15.130 DROP SYNONYM

### Function

**DROP SYNONYM** deletes a synonym.

### Precautions

Only the synonym owner or a user granted with the DROP ANY SYNONYM permission can run the **DROP SYNONYM** command. The system administrator has this permission by default.

### Syntax

```
DROP SYNONYM [IF EXISTS] synonym_name [CASCADE | RESTRICT];
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified synonym does not exist.
- **synonym\_name**  
Specifies the name (optionally schema-qualified) of the synonym to be deleted.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects (such as views) that depend on the synonym.
  - **RESTRICT**: refuses to delete the synonym if any objects depend on it. This is the default action.

## Examples

See [Examples](#) in **CREATE SYNONYM**.

## Helpful Links

[ALTER SYNONYM](#) and [CREATE SYNONYM](#)

## 7.15.131 DROP TABLE

### Function

**DROP TABLE** deletes a table.

## Precautions

**DROP TABLE** forcibly deletes the specified table and the indexes depending on the table. After the table is deleted, the functions and stored procedures that need to use this table cannot be executed. Deleting a partitioned table also deletes all partitions in the table.

The owner of a table, the owner of the schema of the table, users granted with the DROP permission on the table, or users granted with the DROP ANY TABLE permission can delete the specified table. The system administrator has the permission to delete the specified table by default.

## Syntax

```
DROP TABLE [IF EXISTS]
{ [schema.]table_name } [, ...] [CASCADE | RESTRICT] [PURGE];
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified table does not exist.
- **schema**  
Specifies the schema name.
- **table\_name**  
Specifies the table name.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects (such as views) that depend on the table.
  - **RESTRICT**: refuses to delete the table if any objects depend on it. This is the default action.
- **PURGE**  
Specifies that even if the recycle bin function is enabled, the table is physically dropped instead of being moved to the recycle bin.

## Examples

See [Examples](#) in **CREATE TABLE**.

## Helpful Links

[ALTER TABLE](#) and [CREATE TABLE](#)

## 7.15.132 DROP TABLESPACE

### Function

**DROP TABLESPACE** deletes a tablespace.

## Precautions

- Only the tablespace owner or a user granted with the DROP permission can run the **DROP TABLESPACE** command. The system administrator has this permission by default.
- The tablespace to be deleted should not contain any database objects. Otherwise, an error will be reported.
- **DROP TABLESPACE** cannot be rolled back and therefore cannot be run in transaction blocks.
- During execution of **DROP TABLESPACE**, database queries by other sessions using `\db` may fail and need to be reattempted.
- If **DROP TABLESPACE** fails to be executed, run **DROP TABLESPACE IF EXISTS**.

## Syntax

```
DROP TABLESPACE [IF EXISTS] tablespace_name;
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified tablespace does not exist.
- **tablespace\_name**  
Specifies the name of the tablespace to be deleted.  
Value range: an existing tablespace name

## Examples

See [Examples](#) in **CREATE TABLESPACE**.

## Helpful Links

[ALTER TABLESPACE](#) and [CREATE TABLESPACE](#)

## Suggestions

- drop tablespace  
Do not delete tablespaces during transactions.

## 7.15.133 DROP TEXT SEARCH CONFIGURATION

### Description

Deletes a text search configuration.

This is a lab feature. Contact Huawei technical support before using it.

### Precautions

Only the owner of a text search configuration has the permission to run the command.

## Syntax

```
DROP TEXT SEARCH CONFIGURATION [IF EXISTS] name [CASCADE | RESTRICT];
```

## Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified text search configuration does not exist.
- **name**  
Specifies the name (optionally schema-qualified) of the text search configuration to be deleted.
- **CASCADE**  
Automatically deletes the objects that depend on the text search configuration.
- **RESTRICT**  
Refuses to delete the text search configuration if any objects depend on it. This is the default action.

## Examples

See [Examples](#) in section "CREATE TEXT SEARCH CONFIGURATION."

## Helpful Links

[ALTER TEXT SEARCH CONFIGURATION](#) and [CREATE TEXT SEARCH CONFIGURATION](#)

## 7.15.134 DROP TEXT SEARCH DICTIONARY

### Description

Deletes a full-text search dictionary.

This is a lab feature. Contact Huawei technical support before using it.

### Precautions

- Predefined dictionaries do not support the DROP operation.
- Only the owner of a dictionary or a system administrator has the permission to perform the DROP operation.
- Execute DROP...CASCADE only when necessary because this operation will delete the text search configurations that use this dictionary.

### Syntax

```
DROP TEXT SEARCH DICTIONARY [IF EXISTS] name [CASCADE | RESTRICT]
```

### Parameters

- **IF EXISTS**

Reports a notice instead of an error if the specified full-text retrieval dictionary does not exist.

- **name**

Specifies the name (optionally schema-qualified) of the full-text retrieval dictionary to be deleted. (If you do not specify a schema name, the dictionary will be deleted in the current schema by default.)

Value range: an existing dictionary name

- **CASCADE**

Automatically deletes the objects that depend on the full-text retrieval dictionary and other objects that depend on these objects.

If any text search configuration uses the dictionary, the **DROP** statement will fail. You can add **CASCADE** to delete all text search configurations and dictionaries that use this dictionary.

- **RESTRICT**

Refuses to delete the full-text retrieval dictionary if any object depends on it. This is the default action.

## Examples

```
-- Create the dictionary english.
gaussdb=# CREATE TEXT SEARCH DICTIONARY english (
 TEMPLATE = simple
);

-- Delete the english dictionary.
gaussdb=# DROP TEXT SEARCH DICTIONARY english;
```

## Helpful Links

[ALTER TEXT SEARCH DICTIONARY](#) and [CREATE TEXT SEARCH DICTIONARY](#)

## 7.15.135 DROP TRIGGER

### Function

**DROP TRIGGER** deletes a trigger.

### Precautions

Only the trigger owner or a user granted with the DROP ANY TRIGGER permission can run the **DROP TRIGGER** command. The system administrator has this permission by default.

### Syntax

```
DROP TRIGGER [IF EXISTS] trigger_name ON table_name [CASCADE | RESTRICT];
```

### Parameter Description

- **IF EXISTS**

Reports a notice instead of an error if the specified trigger does not exist.

- **trigger\_name**

Specifies the name of the trigger to be deleted.

Value range: an existing trigger name

- **table\_name**

Specifies the name of the table containing the trigger.

Value range: name of the table containing the trigger

- **CASCADE | RESTRICT**

- **CASCADE**: automatically deletes the objects that depend on the trigger.

- **RESTRICT**: refuses to delete the trigger if any objects depend on it. This is the default action.

## Examples

For details, see [Examples](#) in [CREATE TRIGGER](#).

## Helpful Links

[CREATE TRIGGER](#), [ALTER TRIGGER](#), and [ALTER TABLE](#)

## 7.15.136 DROP TYPE

### Function

**DROP TYPE** deletes a user-defined data type.

### Precautions

Only the owner of a type, a user granted the DROP permission on a type, or a user granted the DROP ANY TYPE permission on a sequence can run the **DROP TYPE** command. The system administrator has this permission by default.

### Syntax

```
DROP TYPE [IF EXISTS] name [, ...] [CASCADE | RESTRICT]
```

### Parameter Description

- **IF EXISTS**

Reports a notice instead of an error if the specified type does not exist.

- **name**

Specifies the name (optionally schema-qualified) of the type to be deleted.

- **CASCADE**

Automatically deletes the objects (such as fields, functions, and operators) that depend on the type.

- **RESTRICT**

Refuses to delete the type if any objects depend on it. This is the default action.

## Examples

See [Examples](#) in `CREATE TYPE`.

## Helpful Links

[CREATE TYPE](#) and [ALTER TYPE](#)

# 7.15.137 DROP USER

## Description

Deletes a user and the schema with the same name as the user.

## Precautions

- **CASCADE** is used to delete the objects (excluding databases) that depend on the user. **CASCADE** cannot delete locked objects unless the objects are unlocked or the processes locking the objects are killed.
- In GaussDB, the `postgresql.conf` file contains the `enable_kill_query` parameter. This parameter affects **CASCADE**.
  - If `enable_kill_query` is **on** and **CASCADE** is used, the statement automatically kills the processes locking dependent objects and then deletes the specified user.
  - If `enable_kill_query` is **off** and **CASCADE** is used, the statement waits until the processes locking dependent objects stop and then deletes the specified user.
- If the dependent objects are other databases or reside in other databases, manually delete them before deleting the user from the current database. **DROP USER** cannot delete objects across databases.
- Before deleting a user, you need to delete all the objects owned by the user and revoke the user's permissions on other objects. Alternatively, you can specify **CASCADE** to delete the objects owned by the user and the granted permissions.
- If the user has an error table specified when the GDS foreign table is created, the user cannot be deleted by specifying the **CASCADE** keyword in the **DROP USER** statement.

## Syntax

```
DROP USER [IF EXISTS] user_name [, ...] [CASCADE | RESTRICT];
```

## Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified user does not exist.
- **user\_name**  
Specifies the name of the user to be deleted.  
Value range: an existing username
- **CASCADE | RESTRICT**

- **CASCADE**: automatically deletes objects that depend on the user and revokes the permissions granted to the user.
- **RESTRICT**: refuses to delete a user if the user has any dependent objects or has been granted permissions on other objects. This is the default value.

#### NOTE

In GaussDB, the `postgresql.conf` file contains the `enable_kill_query` parameter. This parameter affects **CASCADE**.

- If `enable_kill_query` is **on** and **CASCADE** is used, the statement automatically kills the processes locking dependent objects and then deletes the specified user.
- If `enable_kill_query` is **off** and **CASCADE** is used, the statement waits until the processes locking dependent objects stop and then deletes the specified user.

## Examples

See [Examples](#) in section "CREATE USER."

## Helpful Links

[ALTER USER](#) and [CREATE USER](#)

## 7.15.138 DROP VIEW

### Function

**DROP VIEW** forcibly deletes a view from the database.

### Precautions

The owner of a view, owner of the schema of the view, users granted with the DROP permission on the view, or users granted with the DROP ANY TABLE permission can run the **DROP VIEW** command. By default, the system administrator has the permission to run the command.

### Syntax

```
DROP VIEW [IF EXISTS] view_name [, ...] [CASCADE | RESTRICT];
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified view does not exist.
- **view\_name**  
Specifies the name of the view to be deleted.  
Value range: an existing view name
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects (such as other views) that depend on the view.

- **RESTRICT**: refuses to delete the view if any objects depend on it. This is the default action.

## Examples

See [Examples](#) in **CREATE VIEW**.

## Helpful Links

[ALTER VIEW](#) and [CREATE VIEW](#)

## 7.15.139 DROP WORKLOAD GROUP

### Function

**DROP WORKLOAD GROUP** deletes a workload group.

### Precautions

Only a user with the **DROP** permission on the current database can perform this operation.

### Syntax

```
DROP WORKLOAD GROUP [IF EXISTS] wg_name;
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified workload group does not exist.
- **wg\_name**  
Specifies the name of the workload group to be deleted. The workload group must be unique in a database.  
Value range: an existing workload group name

## Examples

See [Examples](#) in **CREATE WORKLOAD GROUP**.

## Helpful Links

[ALTER WORKLOAD GROUP](#) and [CREATE WORKLOAD GROUP](#)

## 7.15.140 DROP WEAK PASSWORD DICTIONARY

### Function

**DROP WEAK PASSWORD DICTIONARY** clears all weak passwords in `gs_global_config`.

## Precautions

Only the initial user, system administrator, and security administrator have the permission to execute this syntax.

## Syntax

```
DROP WEAK PASSWORD DICTIONARY;
```

## Description

None.

## Example

See [CREATE WEAK PASSWORD DICTIONARY](#).

## Helpful Links

[13.14.82-CREATE WEAK PASSWORD DICTIONARY](#)

# 7.15.141 EXECUTE

## Function

**EXECUTE** executes a prepared statement. Because a prepared statement exists only in the lifetime of the session, the prepared statement must be created earlier in the current session by using the **PREPARE** statement.

## Precautions

If the **PREPARE** statement creating the prepared statement declares some parameters, the parameter set passed to the **EXECUTE** statement must be compatible. Otherwise, an error will occur.

## Syntax

```
EXECUTE name [(parameter [, ...])];
```

## Parameter Description

- **name**  
Specifies the name of the prepared statement to be executed.
- **parameter**  
Specifies a parameter of the prepared statement. It must be an expression that generates a value compatible with the data type of the parameter specified when the prepared statement was created. **ROWNUM** cannot be used as a parameter.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;
```

```
-- Create the reason table.
gaussdb=# CREATE TABLE tpcds.reason (
 CD_DEMO_SK INTEGER NOT NULL,
 CD_GENDER character(16) ,
 CD_MARITAL_STATUS character(100)
);

-- Insert data.
gaussdb=# INSERT INTO tpcds.reason VALUES(51, 'AAAAAAAADDAAAAAA', 'reason 51');

-- Create the reason_t1 table.
gaussdb=# CREATE TABLE tpcds.reason_t1 AS TABLE tpcds.reason;

-- Create a prepared statement for an INSERT statement and execute the prepared statement.
gaussdb=# PREPARE insert_reason(integer,character(16),character(100)) AS INSERT INTO tpcds.reason_t1
VALUES($1,$2,$3);

gaussdb=# EXECUTE insert_reason(52, 'AAAAAAAADDAAAAAA', 'reason 52');

-- Delete the reason and reason_t1 tables.
gaussdb=# DROP TABLE tpcds.reason;
gaussdb=# DROP TABLE tpcds.reason_t1;

-- Delete the schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## 7.15.142 EXECUTE DIRECT

### Description

Executes an SQL statement on a specified node. Generally, the execution of SQL statements is automatically allocated to proper nodes by the cluster load. EXECUTE DIRECT is mainly used for database maintenance and testing.

### Precautions

- When **enable\_nonsysadmin\_execute\_direct** is **off**, only a system administrator has the EXECUTE DIRECT permission.
- To ensure data consistency across nodes, only the SELECT statement can be used. Transaction statements, DDL, and DML cannot be used.
- When the stddev aggregation calculation is performed on the specified DN using such statements, the result set is returned in triplet. For example, {3, 8, 30} indicates that the count result is 3, the sum result is 8, and the sum of squares is 30. When the AVG aggregation calculation is performed on the specified DN using such statements, the result set is returned in a binary tuple, for example, {4,2}. The result of count is 4, and that of sum is 2.
- When multiple nodes are specified, aggregate functions are not supported. If the query contains an aggregate function, the message "EXECUTE DIRECT on multinode not support agg functions." is returned.
- CN nodes do not store user table data. Therefore, do not execute SELECT for querying user tables on a CN.
- If the SQL statement to be executed is also EXECUTE DIRECT, do not nest it into EXECUTE DIRECT; instead, directly execute the inner EXECUTE DIRECT.
- The query result of the **agg** function is inconsistent with that on the CN. Multiple pieces of information are returned. The **array\_avg** function is not supported.

- If the **nodeoid** or **nodeoid list** parameter is specified, this parameter takes effect only when the **enable\_direct\_standby\_datanodes** parameter is successfully set in distributed mode. To query data on a specified DN, invalid or duplicate **nodeoid** values are not supported, and **nodeoid** and **nodename** cannot be used together.

## Syntax

```
EXECUTE DIRECT ON (nodename [, ...]) query ;
EXECUTE DIRECT ON (nodeoid [, ...]) query;
EXECUTE DIRECT ON { COORDINATORS | DATANODES | ALL } query;
```

## Parameters

- **nodename**  
Specifies the node name.  
Value range: an existing node name
- **nodeoid**  
Node OID.  
Value range: an existing DN OID, which can be obtained from the [PGXC\\_NODE](#) system catalog.
- **query**  
Specifies the SQL statement to be executed.
- **COORDINATORS**  
Run the query statement on all CNs.
- **DATANODES**  
Run the query statement on all DNs.
- **ALL**  
Run the query statement on all CNs and DNs.

## Examples

```
-- Query the node distribution status of the current cluster.
gaussdb=# SELECT * FROM pgxc_node;
 node_name | node_type | node_port | node_host | node_port1 | node_host1 | hostis_primary |
 nodeis_primary | nodeis_preferred | node_id | sctp_port | control_port | sctp_port1 | control_port1

-- Query records in the tpcds.customer_address table on dn_6001_6002.
gaussdb=# EXECUTE DIRECT ON(dn_6001_6002) 'select count(*) from tpcds.customer_address';
count

16922
```

```
(1 row)
-- Query records in the tpcds.customer_address table.
gaussdb=# SELECT count(*) FROM tpcds.customer_address;
count

50000
(1 row)
```

## 7.15.143 EXPDP DATABASE

### Function

**EXPDP DATABASE** exports all physical files in a database.

### Syntax

```
EXPDP DATABASE db_name LOCATION = 'directory';
```

### Parameter Description

- **db\_name**: name of the database to be exported.
- **directory**: directory for storing exported files.

### Example

```
expdp database test location = '/data1/expdp/database';
```

## 7.15.144 EXPDP TABLE

### Function

**EXPDP TABLE** exports all table-related index, sequence, partition, toast, and toast index files.

### Syntax

```
EXPDP TABLE table_name LOCATION = 'directory';
```

### Parameter Description

- **table\_name**: name of the table to be exported.
- **directory**: directory for storing exported files.

### Example

```
expdp table test_t location = '/data1/expdp/table0';
```

## 7.15.145 EXPLAIN

### Function

Shows the execution plan of an SQL statement.

The execution plan shows how the tables referenced by the statement will be scanned - by plain sequential scan, index scan, etc. - and if multiple tables are

referenced, what join algorithms will be used to bring together the required rows from each input table.

The most critical part of the display is the estimated statement execution cost, which is the planner's guess at how long it will take to run the statement.

The **ANALYZE** option causes the statement to be actually executed, not only planned. The total elapsed time expended within each plan node (in milliseconds) and total number of rows it actually returned are added to the display. This is useful for seeing whether the planner's estimates are close to reality.

## Precautions

The statement is actually executed when ANALYZE is used. If you want to use EXPLAIN ANALYZE on an INSERT, UPDATE, DELETE, CREATE TABLE AS, or EXECUTE statement without letting the statement affect your data, use this approach:

```
START TRANSACTION;
EXPLAIN ANALYZE ...;
ROLLBACK;
```

## Syntax

- Display the execution plan of an SQL statement, which supports multiple options and has no requirements for the order of options.

```
EXPLAIN [(option [, ...])] statement;
```

The syntax of the **option** clause is as follows:

```
ANALYZE [boolean] |
ANALYSE [boolean] |
VERBOSE [boolean] |
COSTS [boolean] |
CPU [boolean] |
DETAIL [boolean] |
NODES [boolean] |
NUM_NODES [boolean] |
BUFFERS [boolean] |
TIMING [boolean] |
PLAN [boolean] |
BLOCKNAME [boolean] |
FORMAT { TEXT | XML | JSON | YAML }
```

- Display the execution plan of an SQL statement, where options are in order.  
EXPLAIN { [ { ANALYZE | ANALYSE } ] [ VERBOSE ] | PERFORMANCE } statement;

## Parameter Description

- **statement**  
Specifies the SQL statement to explain.
- **ANALYZE boolean | ANALYSE boolean**  
Specifies whether to display actual run times and other statistics.  
Value range:
  - **TRUE** (default): displays them.
  - **FALSE**: does not display them.
- **VERBOSE boolean**  
Specifies whether to display additional information regarding the plan.  
Value range:

- **TRUE** (default): displays it.
- **FALSE**: does not display it.
- **COSTS boolean**

Specifies whether to display the estimated total cost of each plan node, estimated number of rows, estimated width of each row.

Value range:

  - **TRUE** (default): displays them.
  - **FALSE**: does not display them.
- **CPU boolean**

Specifies whether to display CPU usage. It should be used together with the ANALYZE option.

Value range:

  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **DETAIL boolean**

Specifies whether to display DN information. It should be used together with the ANALYZE option.

Value range:

  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **NODES boolean**

Specifies whether to display information about the nodes executed by query.

Value range:

  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **NUM\_NODES boolean**

Specifies whether to display the number of executing nodes.

Value range:

  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **BUFFERS boolean**

Specifies whether to display buffer usage. It should be used together with the ANALYZE option.

Value range:

  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **TIMING boolean**

Specifies whether to display the actual startup time and time spent on the output node. It should be used together with the ANALYZE option.

Value range:

  - **TRUE** (default): displays them.

- **FALSE**: does not display them.
- **PLAN** boolean  
Specifies whether to store the execution plan in **PLAN\_TABLE**. If this parameter is set to **on**, the execution plan is stored in **PLAN\_TABLE** and not displayed on the screen. Therefore, this parameter cannot be used together with other parameters when it is set to **on**.  
Value range:
  - **TRUE** (default): The execution plan is stored in **PLAN\_TABLE** and not displayed on the screen. If the plan is stored successfully, "EXPLAIN SUCCESS" is returned.
  - **FALSE**: The execution plan is not stored in **PLAN\_TABLE** but is displayed on the screen.
- **BLOCKNAME** boolean  
Specifies whether to display the query block where each operation of the plan is located. When this option is enabled, the name of the query block where each operation is performed is displayed in the **Query Block** column. This helps users obtain the query block name and use hints to modify the execution plan.
  - **TRUE** (default value): When the plan is displayed, the name of the query block where each operation is located is displayed in the **Query Block** column. This option must be used in the pretty mode. For details, see [Hint Specifying the Query Block Where the Hint Is Located](#).
  - **FALSE**: The plan display is not affected.
- **FORMAT**  
Specifies the output format.  
Value range: **TEXT**, **XML**, **JSON**, and **YAML**  
Default value: **TEXT**
- **PERFORMANCE**  
Prints all relevant information in execution. Some information is described as follows:
  - **ex c/r**: indicates the average number of CPU cycles used by each row, which is equal to **(ex cyc) / (ex row)**.
  - **ex row**: indicates the number of executed rows.
  - **ex cyc**: indicates the number of used CPU cycles.
  - **inc cyc**: indicates the total number of CPU cycles used by subnodes.
  - **shared hit**: indicates the shared buffer hits of the operator.
  - **loops**: indicates the number of operator loop execution times.
  - **total\_calls**: indicates the total number of generated elements.
  - **remote query poll time stream gather**: indicates the operator used to listen to the network poll time when data on each DN reaches the CN.
  - **deserialize time**: indicates the time required for deserialization.
  - **estimated time**: indicates the estimated time.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;
```

```
-- Create the tpcds.customer_address table.
gaussdb=# CREATE TABLE tpcds.customer_address(
ca_address_sk INTEGER NOT NULL,
ca_address_id CHARACTER(16) NOT NULL
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.customer_address VALUES (5000, 'AAAAAAAAABAAAAAAA'),(10000,
'AAAAAAAAACAAAAAAA');

-- Create the tpcds.customer_address_p1 table.
gaussdb=# CREATE TABLE tpcds.customer_address_p1 AS TABLE tpcds.customer_address;

-- Change the value of explain_perf_mode to normal.
gaussdb=# SET explain_perf_mode=normal;

-- Display an execution plan for simple queries in the table.
gaussdb=# EXPLAIN SELECT * FROM tpcds.customer_address_p1;
QUERY PLAN

Data Node Scan (cost=0.00..0.00 rows=0 width=0)
Node/s: All DNs
(2 rows)

-- Generate an execution plan in JSON format (with explain_perf_mode being normal).
gaussdb=# EXPLAIN(FORMAT JSON) SELECT * FROM tpcds.customer_address_p1;
QUERY PLAN

[
 {
 "Plan": {
 "Node Type": "Data Node Scan",+
 "Startup Cost": 0.00, +
 "Total Cost": 0.00, +

gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## Helpful Links

[ANALYZE](#) | [ANALYSE](#)

## 7.15.146 EXPLAIN PLAN

### Function

**EXPLAIN PLAN** saves information about an execution plan into the **PLAN\_TABLE** table. Different from the **EXPLAIN** statement, **EXPLAIN PLAN** only saves plan information; it does not print information on the screen.

### Syntax

```
EXPLAIN PLAN
[SET STATEMENT_ID = string]
FOR statement ;
```

### Parameter Description

- **PLAN**: saves plan information into **PLAN\_TABLE**. If information is stored successfully, "EXPLAIN SUCCESS" is returned.
- **STATEMENT\_ID**: tags each query. The tag information will be stored in **PLAN\_TABLE**.

#### NOTE

If **SET STATEMENT\_ID** is not specified when the **EXPLAIN PLAN** statement is executed, **STATEMENT\_ID** is left empty by default. In addition, the value of **STATEMENT\_ID** cannot exceed 30 bytes. Otherwise, an error will be reported.

## Precautions

- **EXPLAIN PLAN** cannot be executed on DNs.
- Plan information cannot be collected for SQL statements that failed to be executed.
- Data in **PLAN\_TABLE** is in a session-level lifecycle. Sessions are isolated from users, and therefore users can only view the data of the current session and current user.
- **PLAN\_TABLE** cannot be joined with GDS foreign tables.
- For a query that cannot be pushed down, object information cannot be collected and only such information as **REMOTE\_QUERY** and **CTE** can be collected. For details, see [Example 2](#).

## Example 1

You can perform the following steps to collect execution plans of SQL statements by running **EXPLAIN PLAN**:

### Step 1 Run the **EXPLAIN PLAN** statement.

#### NOTE

After the **EXPLAIN PLAN** statement is executed, plan information is automatically stored in **PLAN\_TABLE**. **INSERT**, **UPDATE**, and **ANALYZE** cannot be performed on **PLAN\_TABLE**.

For details about **PLAN\_TABLE**, see [PLAN\\_TABLE](#).

```
explain plan set statement_id='TPCH-Q4' for
select
o_orderpriority,
count(*) as order_count
from
orders
where
o_orderdate >= '1993-07-01'::date
and o_orderdate < '1993-07-01'::date + interval '3 month'
and exists (
select
*
from
lineitem
where
l_orderkey = o_orderkey
and l_commitdate < l_receiptdate
)
group by
o_orderpriority
order by
o_orderpriority;
```

### Step 2 Query **PLAN\_TABLE**.

```
SELECT * FROM PLAN_TABLE;
```

| statement_id | plan_id  | id | operation           | options     | object_name | object_type | object_owner | projection                                    |
|--------------|----------|----|---------------------|-------------|-------------|-------------|--------------|-----------------------------------------------|
| TPCH-Q4      | 16781167 | 1  | ROW ADAPTER         |             |             |             |              | ORDERS.O_ORDERPRIORITY, (PG_CATALOG.COUNT(*)) |
| TPCH-Q4      | 16781167 | 2  | VECTOR SORT         |             |             |             |              | ORDERS.O_ORDERPRIORITY, (PG_CATALOG.COUNT(*)) |
| TPCH-Q4      | 16781167 | 3  | VECTOR AGGREGATE    | HASHED      |             |             |              | ORDERS.O_ORDERPRIORITY, PG_CATALOG.COUNT(*)   |
| TPCH-Q4      | 16781167 | 4  | VECTOR STREAMING    | GATHER      |             |             |              | ORDERS.O_ORDERPRIORITY, (COUNT(*))            |
| TPCH-Q4      | 16781167 | 5  | VECTOR AGGREGATE    | HASHED      |             |             |              | ORDERS.O_ORDERPRIORITY, COUNT(*)              |
| TPCH-Q4      | 16781167 | 6  | VECTOR NESTED LOOPS | SEMI        |             |             |              | ORDERS.O_ORDERPRIORITY                        |
| TPCH-Q4      | 16781167 | 7  | TABLE ACCESS        | CSTORE SCAN | ORDERS      | TABLE       | TPCH         | ORDERS.O_ORDERPRIORITY, ORDERS.O_ORDERKEY     |
| TPCH-Q4      | 16781167 | 8  | VECTOR MATERIALIZE  |             |             |             |              | LINEITEM.L_ORDERKEY                           |
| TPCH-Q4      | 16781167 | 9  | TABLE ACCESS        | CSTORE SCAN | LINEITEM    | TABLE       | TPCH         | LINEITEM.L_ORDERKEY                           |

### Step 3 Delete data from **PLAN\_TABLE**.

```
DELETE FROM PLAN_TABLE WHERE xxx;
```

----End

## Example 2

For a query that cannot be pushed down, only such information as **REMOTE\_QUERY** and **CTE** can be collected from **PLAN\_TABLE** after **EXPLAIN PLAN** is executed.

Scenario 1: The optimizer generates a plan for pushing down statements. In this case, only **REMOTE\_QUERY** can be collected.

```
explain plan set statement_id = 'test remote query' for
select
current_user
from
customer;
```

Query **PLAN\_TABLE**.

```
SELECT * FROM PLAN_TABLE;
```

| statement_id      | plan_id  | id | operation      | options   | object_name      | object_type  | object_owner | projection    |
|-------------------|----------|----|----------------|-----------|------------------|--------------|--------------|---------------|
| test remote query | 29360133 | 1  | NESTED LOOPS   | CARTESIAN |                  |              |              | 'apple'::name |
| test remote query | 29360133 | 2  | DATA NODE SCAN |           | customer         | REMOTE_QUERY |              |               |
| test remote query | 29360133 | 3  | DATA NODE SCAN |           | customer_address | REMOTE_QUERY |              |               |

(3 rows)

Scenario 2: For a query with **WITH RECURSIVE** that cannot be pushed down, only **CTE** can be collected.

Disable **enable\_stream\_recursive** so that the query cannot be pushed down.  
set enable\_stream\_recursive = off;

Run the **EXPLAIN PLAN** statement.

```
explain plan set statement_id = 'cte can not be push down'
for
with recursive rq as
(
select id, name from chinamap where id = 11
union all

## 7.15.147 FETCH

### Description

FETCH retrieves rows using a previously created cursor.

A cursor has an associated position, which is used by FETCH. The cursor position can be before the first row of the query result, on any particular row of the result, or after the last row of the result.

- When created, a cursor is positioned before the first row.

- After fetching some rows, the cursor is positioned on the row most recently retrieved.
- If **FETCH** runs off the end of the available rows then the cursor is left positioned after the last row, or before the first row if fetching backward.
- **FETCH ALL** or **FETCH BACKWARD ALL** will always leave the cursor positioned after the last row or before the first row.

## Precautions

- If the cursor is declared with **NO SCROLL**, backward fetches like **FETCH BACKWARD** are not allowed.
- The forms **NEXT**, **PRIOR**, **FIRST**, **LAST**, **ABSOLUTE**, and **RELATIVE** fetch a single row after moving the cursor appropriately. If there is no such row, an empty result is returned, and the cursor is left positioned before the first row (backward fetch) or after the last row (forward fetch) as appropriate.
- The forms using **FORWARD** and **BACKWARD** retrieve the indicated number of rows moving in the forward or backward direction, leaving the cursor positioned on the last-returned row or after (backward fetch)/before (forward fetch) all rows if the **count** exceeds the number of rows available.
- **RELATIVE 0**, **FORWARD 0**, and **BACKWARD 0** all request fetching the current row without moving the cursor, that is, re-fetching the most recently fetched row. This will succeed unless the cursor is positioned before the first row or after the last row; in which case, no row is returned.
- If the cursor of **FETCH** involves a non-system catalog, backward fetches like **BACKWARD**, **PRIOR**, and **FIRST** are not allowed.

## Syntax

```
FETCH [direction { FROM | IN }] cursor_name;
```

The **direction** clause specifies optional parameters.

```
NEXT
| PRIOR
| FIRST
| LAST
| ABSOLUTE count
| RELATIVE count
| count
| ALL
| FORWARD
| FORWARD count
| FORWARD ALL
| BACKWARD
| BACKWARD count
| BACKWARD ALL
```

## Parameters

- **direction\_clause**  
Defines the fetch direction.  
Value range:
  - **NEXT** (default value)  
Fetches the next row.

- **PRIOR**  
Fetches the prior row.
- **FIRST**  
Fetches the first row of the query (same as **ABSOLUTE 1**).
- **LAST**  
Fetches the last row of the query (same as **ABSOLUTE -1**).
- **ABSOLUTE** *count*  
Fetches the *count*th row of the query.  
**ABSOLUTE** fetches are not any faster than navigating to the desired row with a relative move: the underlying implementation must traverse all the intermediate rows anyway.  
Value range: a possibly-signed integer
  - If *count* is positive, the *count*th row of the query will be fetched. If *count* is less than the current cursor position, rewind is required, which is currently not supported.
  - If *count* is negative or 0, backward scanning is required, which is currently not supported.
- **RELATIVE** *count*  
Fetches the *count*th succeeding row or the *count*th prior row if count is negative.  
Value range: a possibly-signed integer
  - If *count* is positive, the *count*th succeeding row will be fetched.
  - If *count* is negative or 0, backward scanning is required, which is currently not supported.
  - If the current row contains no data, **RELATIVE 0** returns null.
- **count**  
Fetches the next *count* rows (same as **FORWARD** *count*).
- **ALL**  
Fetches all remaining rows (same as **FORWARD ALL**).
- **FORWARD**  
Fetches the next row (same as **NEXT**).
- **FORWARD** *count*  
Fetches the next or prior *count* rows (same as **RELATIVE** *count*).
- **FORWARD ALL**  
Fetches all remaining rows.
- **BACKWARD**  
Fetches the prior row (same as **PRIOR**).
- **BACKWARD** *count*  
Fetches the prior *count* rows (scanning backwards).  
Value range: a possibly-signed integer

- If *count* is positive, *count* prior rows will be fetched.
- If *count* is a negative, *count* succeeding rows will be fetched.
- **BACKWARD 0** re-fetches the current row, if any.
- **BACKWARD ALL**  
Fetches all prior rows (scanning backwards).
- **{ FROM | IN } cursor\_name**  
Specifies the cursor name using the keyword **FROM** or **IN**.  
Value range: an existing cursor name

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer_address table.
gaussdb=# CREATE TABLE tpcds.customer_address
(
ca_address_sk INTEGER NOT NULL,
ca_address_id CHARACTER(16) NOT NULL,
ca_street_number INTEGER
,
ca_street_name CHARACTER (20)
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.customer_address VALUES (1, 'AAAAAAAABAAAAAAA', '18', 'Jackson'),(2,
'AAAAAAAACAAAAAAA', '362', 'Washington 6th'),(3, 'AAAAAAAADAAAAAAA', '585', 'Dogwood Washington');

-- (For the SELECT statement, traverse a table using a cursor.) Start a transaction.
gaussdb=# START TRANSACTION;

-- Set up cursor1.
gaussdb=# CURSOR cursor1 FOR SELECT * FROM tpcds.customer_address ORDER BY 1;

-- Fetch the first three rows in cursor1.
gaussdb=# FETCH FORWARD 3 FROM cursor1;
ca_address_sk | ca_address_id | ca_street_number | ca_street_name
-----+-----+-----+-----
 1 | AAAAAAABAAAAAAA | 18 | Jackson
 2 | AAAAAAACAAAAAAA | 362 | Washington 6th
 3 | AAAAAAADAAAAAAA | 585 | Dogwood Washington
(3 rows)

-- Close the cursor and commit the transaction.
gaussdb=# CLOSE cursor1;

-- End the transaction.
gaussdb=# END;

-- (For the VALUES clause, traverse the clause using a cursor.) Start a transaction.
gaussdb=# START TRANSACTION;

-- Set up cursor2.
gaussdb=# CURSOR cursor2 FOR VALUES(1,2),(0,3) ORDER BY 1;

-- Fetch the first two rows in cursor2.
gaussdb=# FETCH FORWARD 2 FROM cursor2;
column1 | column2
-----+-----
0 | 3
1 | 2
(2 rows)
```

```
-- Close the cursor and commit the transaction.
gaussdb=# CLOSE cursor2;

-- End the transaction.
gaussdb=# END;

-- (WITH HOLD cursor) Start a transaction.
gaussdb=# START TRANSACTION;

-- Set up a WITH HOLD cursor.
gaussdb=# DECLARE cursor1 CURSOR WITH HOLD FOR SELECT * FROM tpcds.customer_address ORDER BY
1;

-- Fetch the first two rows in cursor1.
gaussdb=# FETCH FORWARD 2 FROM cursor1;
 ca_address_sk | ca_address_id | ca_street_number | ca_street_name
-----+-----+-----+-----
 1 | AAAAAAAAAABAAAAAA | 18 | Jackson
 2 | AAAAAAAACAAAAAA | 362 | Washington 6th
(2 rows)

-- End the transaction.
gaussdb=# END;

-- Fetch the next row in cursor1.
gaussdb=# FETCH FORWARD 1 FROM cursor1;
 ca_address_sk | ca_address_id | ca_street_number | ca_street_name
-----+-----+-----+-----
 3 | AAAAAAADAAAAAA | 585 | Dogwood Washington
(1 row)

-- Close the cursor.
gaussdb=# CLOSE cursor1;

-- Delete the tpcds.customer_address table.
gaussdb=# DROP TABLE tpcds.customer_address;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## 7.15.148 GRANT

### Description

Grants permissions to roles and users.

**GRANT** is used in the following scenarios:

- **Granting system permissions to roles or users**

System permissions are also called user attributes, including **SYSADMIN**, **CREATEDB**, **CREATEROLE**, **AUDITADMIN**, **MONADMIN**, **OPRADMIN**, **POLADMIN**, **INHERIT**, **REPLICATION**, **VCADMIN**, and **LOGIN**.

They can be specified only by the **CREATE ROLE** or **ALTER ROLE** statement. The **SYSADMIN** permissions can be granted and revoked using **GRANT ALL PRIVILEGE** and **REVOKE ALL PRIVILEGE**, respectively. System permissions cannot be inherited by a user from a role, and cannot be granted using **PUBLIC**.

- **Granting database object permissions to roles or users**

Grant permissions on a database object (table, view, column, database, function, schema, or tablespace) to a role or user.

**GRANT** gives specific permissions on a database object to one or more roles. These permissions are added to those already granted, if any.

The keyword **PUBLIC** indicates that the permissions are to be granted to all roles, including those that might be created later. **PUBLIC** can be thought of as an implicitly defined group that always includes all roles. Any particular role will have the sum of permissions granted directly to it, permissions granted to any role it is presently a member of, and permissions granted to **PUBLIC**.

If **WITH GRANT OPTION** is specified, the recipient of the permission can in turn grant it to others. Without a grant option, the recipient cannot do that. This option cannot be granted to **PUBLIC**, which is a unique GaussDB attribute.

GaussDB grants the permissions on certain types of objects to **PUBLIC**. By default, permissions on tables, columns, sequences, foreign data sources, foreign servers, schemas, and tablespaces are not granted to **PUBLIC**, but the following permissions are granted to **PUBLIC**: **CONNECT** and **CREATE TEMP TABLE** permissions on databases, **EXECUTE** permission on functions, and **USAGE** permission on languages and data types (including domains). An object owner can revoke the default permissions granted to **PUBLIC** and grant permissions to other users as needed. For security purposes, you are advised to create an object and set its permissions in the same transaction so that other users do not have time windows to use the object. These default permissions can be modified using the **ALTER DEFAULT PRIVILEGES** command.

By default, an object owner has all permissions on the object. For security purposes, the owner can discard some permissions. However, the **ALTER**, **DROP**, **COMMENT**, **INDEX**, **VACUUM**, and re-grantable permissions of the object are inherent permissions implicitly owned by the owner.

- **Granting the permissions of one role or user to others**

Grant the permissions of one role or user to others. In this case, every role or user can be regarded as a set of one or more database permissions.

If **WITH ADMIN OPTION** is specified, the recipients can in turn grant the permissions to other roles or users or revoke the permissions they have granted to other roles or users. If recipients' permissions are changed or revoked later, the grantees' permissions will also change.

Database administrators can grant or revoke permissions for any roles or users. Roles with the **CREATEROLE** permission can grant or revoke permissions for non-admin roles.

- **Granting ANY permissions to roles or users**

Grant ANY permissions to a specified role or user. For details about the value range of the ANY permissions, see the syntax. If **WITH ADMIN OPTION** is specified, the grantee can grant the ANY permissions to or revoke them from other roles or users. The ANY permissions can be inherited by a role but cannot be granted to **PUBLIC**. An initial user and the system administrator when separation of duties is disabled can grant the ANY permissions to or revoke them from any role or user.

Currently, the following ANY permissions are supported: CREATE ANY TABLE, ALTER ANY TABLE, DROP ANY TABLE, SELECT ANY TABLE, INSERT ANY TABLE, UPDATE ANY TABLE, DELETE ANY TABLE, CREATE ANY SEQUENCE, CREATE ANY INDEX, CREATE ANY FUNCTION, EXECUTE ANY FUNCTION, CREATE ANY PACKAGE, EXECUTE ANY PACKAGE, CREATE ANY TYPE, ALTER ANY TYPE, DROP ANY TYPE, ALTER ANY SEQUENCE, DROP ANY SEQUENCE, SELECT ANY SEQUENCE, ALTER ANY INDEX, DROP ANY INDEX, CREATE ANY SYNONYM, DROP ANY SYNONYM, CREATE ANY TRIGGER, ALTER ANY TRIGGER, and DROP ANY TRIGGER. For details about the ANY permission scope, see [Table 7-166](#).

## Precautions

- It is not allowed to grant the ANY permissions to **PUBLIC** or revoke the ANY permissions from **PUBLIC**.
- The ANY permissions are database permissions and are valid only for database objects that are granted with the permissions. For example, **SELECT ANY TABLE** only allows a user to view all user table data in the current database, but the user does not have the permission to view user tables in other databases.
- The ANY permissions and the original permissions do not affect each other.
- If a user is granted with the **CREATE ANY TABLE** permission, the owner of a table created in a schema with the same name as the user is the creator of the schema. When the user performs other operations on the table, the user needs to be granted with the corresponding operation permission. Similarly, if a user is granted with the CREATE ANY FUNCTION, CREATE ANY PACKAGE, CREATE ANY TYPE, CREATE ANY SEQUENCE, or CREATE ANY INDEX permission, the owner of an object created in a schema with the same name is the owner of the schema. If a user is granted with the CREATE ANY TRIGGER or CREATE ANY SYNONYM permission, the owner of an object created in a schema with the same name is the creator.
- Exercise caution when granting the CREATE ANY FUNCTION or CREATE ANY PACKAGE permission to users to prevent other users from using DEFINER functions or PACKAGE for privilege escalation.
- When GRANT is used to grant the permission to use a table, if the permission is not properly used, ALTER may be used to add expressions to the default values and constraints of the table, or indexes may be created to add expressions to INDEX. In this case, the permission may be exploited.
- When GRANT is used to grant the TRIGGER permission, if the permission is not properly used, the WHEN condition may be used to create expressions. When the trigger is triggered, the permission may be exploited.

## Syntax

- Grant the table or view access permission to a user or role.

```
GRANT { { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | TRIGGER | ALTER | DROP
| COMMENT | INDEX | VACUUM } [, ...]
| ALL [PRIVILEGES] }
ON { [TABLE] table_name [, ...]
| ALL TABLES IN SCHEMA schema_name [, ...] }
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```
- Grant the column access permission to a user or role.

```
GRANT { { SELECT | INSERT | UPDATE | REFERENCES | COMMENT } (column_name [, ...]) } [, ...]
 | ALL [PRIVILEGES] (column_name [, ...]) }
 ON [TABLE] table_name [, ...]
 TO { [GROUP] role_name | PUBLIC } [, ...]
 [WITH GRANT OPTION];
```

- Grant the sequence access permission to a specified user or role.

```
GRANT { { SELECT | UPDATE | USAGE | ALTER | DROP | COMMENT } [, ...]
 | ALL [PRIVILEGES] }
 ON { [SEQUENCE] sequence_name [, ...]
 | ALL SEQUENCES IN SCHEMA schema_name [, ...] }
 TO { [GROUP] role_name | PUBLIC } [, ...]
 [WITH GRANT OPTION];
```

- Grant the database access permission to a user or role.

```
GRANT { { CREATE | CONNECT | TEMPORARY | TEMP | ALTER | DROP | COMMENT } [, ...]
 | ALL [PRIVILEGES] }
 ON DATABASE database_name [, ...]
 TO { [GROUP] role_name | PUBLIC } [, ...]
 [WITH GRANT OPTION];
```

- Grant the domain access permission to a user or role.

```
GRANT { USAGE | ALL [PRIVILEGES] }
 ON DOMAIN domain_name [, ...]
 TO { [GROUP] role_name | PUBLIC } [, ...]
 [WITH GRANT OPTION];
```

#### NOTE

In the current version, the domain access permission cannot be granted.

- Grant the CMK access permission to a specified user or role.

```
GRANT { { USAGE | DROP } [, ...] | ALL [PRIVILEGES] }
 ON { CLIENT_MASTER_KEY client_master_key
 TO { [GROUP] role_name | PUBLIC } [, ...]
 [WITH GRANT OPTION];
```

- Grant the column encryption key (CEK) access permission to a specified user or role.

```
GRANT { { USAGE | DROP } [, ...] | ALL [PRIVILEGES] }
 ON { COLUMN_ENCRYPTION_KEY column_encryption_key
 TO { [GROUP] role_name | PUBLIC } [, ...]
 [WITH GRANT OPTION];
```

- Grant the foreign data source access permission to a user or role.

```
GRANT { USAGE | ALL [PRIVILEGES] }
 ON FOREIGN DATA WRAPPER fdw_name [, ...]
 TO { [GROUP] role_name | PUBLIC } [, ...]
 [WITH GRANT OPTION];
```

- Grant the foreign server access permission to a user or role.

```
GRANT { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
 ON FOREIGN SERVER server_name [, ...]
 TO { [GROUP] role_name | PUBLIC } [, ...]
 [WITH GRANT OPTION];
```

- Grant the function access permission to a user or role.

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
 ON { FUNCTION {function_name ([{[argmode] [arg_name] arg_type} [, ...]) } } [, ...]
 | ALL FUNCTIONS IN SCHEMA schema_name [, ...] }
 TO { [GROUP] role_name | PUBLIC } [, ...]
 [WITH GRANT OPTION];
```

- Grant the procedural procedure access permission to a user or role.

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
 ON { PROCEDURE {proc_name ([{[argmode] [arg_name] arg_type} [, ...]) } } [, ...]
 TO { [GROUP] role_name | PUBLIC } [, ...]
 [WITH GRANT OPTION];
```

- Grant the sub-cluster access permission to a user or role.

```
GRANT { { CREATE | USAGE | COMPUTE | ALTER | DROP } [, ...] | ALL [PRIVILEGES] }
 ON NODE GROUP group_name [, ...]
```

```
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```

**NOTE**

When the **create** permission of a sub-cluster is granted to a specified user or role, the **usage** and **compute** permissions are granted to the specified user or role by default.

- Grant the schema access permission to a user or role.

```
GRANT { { CREATE | USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON SCHEMA schema_name [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```

**NOTE**

When you grant table or view permissions to other users, you also need to grant the **USAGE** permission on the schema that the tables and views belong to. Without the **USAGE** permission, the users with table or view permissions can only see the object names, but cannot access them.

- Grant the large object access permission to a specified user or role.

```
GRANT { { SELECT | UPDATE } [, ...] | ALL [PRIVILEGES] }
ON LARGE OBJECT loid [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```

**NOTE**

In the current version, the large object access permission cannot be granted.

- Grant the tablespace access permission to a user or role.

```
GRANT { { CREATE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON TABLESPACE tablespace_name [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```

- Grant the type access permission to a user or role.

```
GRANT { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON TYPE type_name [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```

**NOTE**

In the current version, the type access permission cannot be granted.

- Grant the directory permission to a role.

```
GRANT { { READ | WRITE | ALTER | DROP } [, ...] | ALL [PRIVILEGES] }
ON DIRECTORY directory_name [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```

- Grant the package permission to a role.

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON PACKAGE package_name [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```

- Grant a role's permissions to another user or role.

```
GRANT role_name [, ...]
TO role_name [, ...]
[WITH ADMIN OPTION];
```

- Grant the **sysadmin** permission to a role.

```
GRANT ALL { PRIVILEGES | PRIVILEGE }
TO role_name;
```

- Grant the ANY permissions to another user or role.

```
GRANT { CREATE ANY TABLE | ALTER ANY TABLE | DROP ANY TABLE | SELECT ANY TABLE |
INSERT ANY TABLE | UPDATE ANY TABLE | DELETE ANY TABLE | CREATE ANY SEQUENCE |
```

```
CREATE ANY INDEX | CREATE ANY FUNCTION | EXECUTE ANY FUNCTION | CREATE ANY PACKAGE |
EXECUTE ANY PACKAGE | CREATE ANY TYPE | ALTER ANY TYPE | DROP ANY TYPE |
ALTER ANY SEQUENCE | DROP ANY SEQUENCE | SELECT ANY SEQUENCE | ALTER ANY INDEX |
DROP ANY INDEX | CREATE ANY SYNONYM | DROP ANY SYNONYM | CREATE ANY TRIGGER | ALTER
ANY TRIGGER |
DROP ANY TRIGGER } [, ...]
TO [GROUP] role_name [, ...]
[WITH ADMIN OPTION];
```

- Grant the database link object permission to a specified user.

```
GRANT { CREATE | ALTER | DROP } [PUBLIC] DATABASE LINK TO role_name;
```

#### NOTE

- **PUBLIC:** creates a public database link visible to all users. If this clause is omitted, the database link is private and used only as a compatible API. The data that can be accessed on the remote database depends on the identity used by the database link during connection.
- When the permission to create a database link is granted to a user, the user can remotely access a database by using the IP address of the remote database. Exercise caution when granting this permission to users.
- In addition to the statement for directly granting the database link permission, you can also obtain the database link permission by inheriting permission and granting permission to an administrator.
- For details about database links, see [DATABASE LINK](#).

## Parameters

The possible permissions are:

- **SELECT**  
Allows **SELECT** from any table, view, or sequence.
- **INSERT**  
Allows **INSERT** of a new row into a table.
- **UPDATE**  
Allows **UPDATE** of any column of a table. **SELECT ... FOR UPDATE** and **SELECT ... FOR SHARE** also require this permission on at least one column, in addition to the **SELECT** permission.
- **DELETE**  
Allows **DELETE** of a row from a table.
- **TRUNCATE**  
Allows **TRUNCATE** on a table.
- **REFERENCES**  
Allows to create a foreign key constraint referencing a table. This permission is required on both referencing and referenced tables. This function is not supported in distributed mode.
- **TRIGGER**  
Allows the creation of a trigger on the specified table.
- **CREATE**
  - For databases, allows new schemas to be created within the database.
  - For schemas, allows new objects to be created within the schema. To rename an existing object, you must own the object and have the **CREATE** permission on the schema of the object.

- For tablespaces, allows tables to be created within the tablespace, and allows databases and schemas to be created that have the tablespace as their default tablespace.
- For sub-clusters, allows tables to be created within the sub-cluster.
- **CONNECT**  
Allows the grantee to connect to the database.
- **EXECUTE**  
Allows calling a function, including use of any operators that are implemented on top of the function.
- **USAGE**
  - For procedural languages, allows use of the language for the creation of functions in that language.
  - For schemas, allows access to objects contained in the schema. Without this permission, it is still possible to see the object names.
  - For sequences, allows use of the **nextval** function.
  - For sub-clusters, allows users who can access objects contained in the schema to access tables in the sub-cluster.
  - For a key object, **USAGE** is the permission to use the key.
- **COMPUTE**  
For computing sub-clusters, allows users to perform elastic computing in the sub-cluster that they have the compute permission on.
- **ALTER**  
Allows users to modify the attributes of a specified object, excluding the owner and schema of the object.
- **DROP**  
Allows users to delete specified objects.
- **COMMENT**  
Allows users to define or modify comments of a specified object.
- **INDEX**  
Allows users to create indexes on specified tables, manage indexes on the tables, and perform REINDEX and CLUSTER operations on the tables.
- **VACUUM**  
Allows users to perform ANALYZE and VACUUM operations on specified tables.
- **ALL PRIVILEGES**  
Grants all available permissions to a user or role at a time. Only a system administrator has the **GRANT ALL PRIVILEGES** permission.

**GRANT** parameters are as follows:

- **role\_name**  
Specifies the username.
- **table\_name**  
Specifies the table name.

- **column\_name**  
Specifies the column name.
- **schema\_name**  
Specifies the schema name.
- **database\_name**  
Specifies the database name.
- **function\_name**  
Specifies the function name.
- **sequence\_name**  
Specifies the sequence name.
- **domain\_name**  
Specifies the domain type name.
- **fdw\_name**  
Specifies the foreign data wrapper name.
- **lang\_name**  
Specifies the language name.
- **type\_name**  
Specifies the type name.
- **group\_name**  
Specifies the sub-cluster name.
- **argmode**  
Specifies the parameter mode.  
Value range: a string. It must comply with the [naming convention](#).
- **arg\_name**  
Specifies the parameter name.  
Value range: a string. It must comply with the [naming convention](#).
- **arg\_type**  
Specifies the parameter type.  
Value range: a string. It must comply with the [naming convention](#).
- **loid**  
Specifies the identifier of the large object that includes this page.  
Value range: a string. It must comply with the [naming convention](#).
- **tablespace\_name**  
Specifies the tablespace name.
- **client\_master\_key**  
Name of the CMK.  
Value range: a string. It must comply with the [naming convention](#).
- **column\_encryption\_key**  
Name of the column encryption key.  
Value range: a string. It must comply with the [naming convention](#).

- **directory\_name**  
Specifies the directory name.  
Value range: a string. It must comply with the [naming convention](#).
- **WITH GRANT OPTION**  
If **WITH GRANT OPTION** is specified, the recipient of the permission can in turn grant it to others. Without a grant option, the recipient cannot do that. Grant options cannot be granted to **PUBLIC**.

When a non-owner of an object attempts to grant permissions on the object:

- The statement will fail outright if the user has no permissions whatsoever on the object.
- As long as some permission is available, the statement will proceed, but it will grant only those permissions for which the user has grant options.
- The **GRANT ALL PRIVILEGES** forms will issue a warning message if no grant options are held, while the other forms will issue a warning if grant options for any of the permissions specifically named in the statement are not held.

#### NOTE

Database administrators can access all objects, regardless of object permission settings. It is unwise to operate as a system administrator except when necessary.

- **WITH ADMIN OPTION**  
If **WITH ADMIN OPTION** is specified for a role, the grantee can grant the role to other roles or users or revoke the role from other roles or users.  
For the ANY permissions, if **WITH ADMIN OPTION** is specified, the grantee can grant the ANY permissions to or revoke them from other roles or users.

**Table 7-166** ANY permissions

| Permission       | Description                                                                                                                                                                                                                                                                    |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CREATE ANY TABLE | Users can create tables or views in the public and user schemas. The users must be granted with the permission to create sequences to create a table that contains serial columns.                                                                                             |
| ALTER ANY TABLE  | Users' <b>ALTER</b> permission on tables or views in the public and user schemas. If the users want to modify the unique index of a table to add a primary key constraint or unique constraint to the table, the users must be granted with the index permission on the table. |
| DROP ANY TABLE   | Users' <b>DROP</b> permission on tables or views in the public and user schemas.                                                                                                                                                                                               |
| SELECT ANY TABLE | Users' <b>SELECT</b> permission on tables or views in the public and user schemas, which is still subject to row-level security.                                                                                                                                               |
| UPDATE ANY TABLE | Users' <b>UPDATE</b> permission on tables or views in the public and user schemas, which is still subject to row-level security.                                                                                                                                               |

| Permission           | Description                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INSERT ANY TABLE     | Users' <b>INSERT</b> permission on tables or views in the public and user schemas.                                                                                                                                                                                                                                                                                                               |
| DELETE ANY TABLE     | Users' <b>DELETE</b> permission on tables or views in the public and user schemas, which is still subject to row-level security.                                                                                                                                                                                                                                                                 |
| CREATE ANY FUNCTION  | Users can create functions or stored procedures in the user schemas.                                                                                                                                                                                                                                                                                                                             |
| EXECUTE ANY FUNCTION | Users' <b>EXECUTE</b> permission on functions or stored procedures in the public and user schemas.                                                                                                                                                                                                                                                                                               |
| CREATE ANY TYPE      | Users can create types in the public and user schemas.                                                                                                                                                                                                                                                                                                                                           |
| CREATE ANY SEQUENCE  | Users can create sequences in the public and user schemas.                                                                                                                                                                                                                                                                                                                                       |
| CREATE ANY INDEX     | Users can create indexes in the public and user schemas. The users must be granted with the permission to create tablespaces to create a partitioned table index in a tablespace.                                                                                                                                                                                                                |
| ALTER ANY TYPE       | Users have the ALTER permission on types in public and user schemas, excluding modifying the owner of a type or modifying the schema of a type.                                                                                                                                                                                                                                                  |
| DROP ANY TYPE        | Users' <b>DROP</b> permission on types in the public and user schemas.                                                                                                                                                                                                                                                                                                                           |
| ALTER ANY SEQUENCE   | Users have the ALTER permission on sequences in public and user schemas, excluding modifying the owner of a sequence.                                                                                                                                                                                                                                                                            |
| DROP ANY SEQUENCE    | Users' <b>DROP</b> permission on sequences in the public and user schemas.                                                                                                                                                                                                                                                                                                                       |
| SELECT ANY SEQUENCE  | Users' SELECT, USAGE, and UPDATE permissions on sequences in the public and user schemas.                                                                                                                                                                                                                                                                                                        |
| ALTER ANY INDEX      | Users' <b>ALTER</b> permission on indexes in the public and user schemas. To rename an index, users also need the permission to create objects in the schema where the index is located. If tablespace operations are involved, users need to have the corresponding operation permission on the tablespace. To set an index to <b>UNUSABLE</b> , users must have the DROP ANY INDEX permission. |
| DROP ANY INDEX       | Users' <b>DROP</b> permission on indexes in the public and user schemas.                                                                                                                                                                                                                                                                                                                         |
| CREATE ANY TRIGGER   | Users can create triggers in the public and user schemas.                                                                                                                                                                                                                                                                                                                                        |
| ALTER ANY TRIGGER    | Users' <b>ALTER</b> permission on triggers in the public and user schemas.                                                                                                                                                                                                                                                                                                                       |

| Permission         | Description                                                               |
|--------------------|---------------------------------------------------------------------------|
| DROP ANY TRIGGER   | Users' <b>DROP</b> permission on triggers in the public and user schemas. |
| CREATE ANY SYNONYM | Users can create synonyms in user schema.                                 |
| DROP ANY SYNONYM   | Users' <b>DROP</b> permission on synonyms in the public and user schemas. |

 **NOTE**

If a user is granted with any ANY permission, the user has the USAGE permission on the public and user schemas but does not have the USAGE permission on the system schemas except **public** listed in [Table 13-1](#).

## Examples

### Example: Granting system permissions to a user or role

Create the **joe** user and grant the **sysadmin** permission to it.

```
gaussdb=# CREATE USER joe PASSWORD '*****';
gaussdb=# GRANT ALL PRIVILEGES TO joe;
```

Then **joe** has the **sysadmin** permission.

### Example: Granting object permissions to a user or role

1. Revoke the **sysadmin** permission from the **joe** user. Grant the usage permission of the **tpcds** schema and all permissions on the **tpcds.reason** table to **joe**.

```
gaussdb=# CREATE SCHEMA tpcds;
gaussdb=# CREATE TABLE tpcds.reason(
 r_reason_sk INTEGER NOT NULL,
 r_reason_id CHAR(16) NOT NULL,
 r_reason_desc VARCHAR(20)
);
gaussdb=# REVOKE ALL PRIVILEGES FROM joe;
gaussdb=# GRANT USAGE ON SCHEMA tpcds TO joe;
gaussdb=# GRANT ALL PRIVILEGES ON tpcds.reason TO joe;
```

Then **joe** has all permissions on the **tpcds.reason** table, including create, retrieve, update, and delete.

2. Grant the retrieve permission of **r\_reason\_sk**, **r\_reason\_id**, and **r\_reason\_desc** columns and the update permission of the **r\_reason\_desc** column in the **tpcds.reason** table to **joe**.

```
gaussdb=# GRANT select (r_reason_sk,r_reason_id,r_reason_desc),update (r_reason_desc) ON
tpcds.reason TO joe;
```

Then **joe** has the retrieve permission of **r\_reason\_sk** and **r\_reason\_id** columns in the **tpcds.reason** table. To enable **joe** to grant these permissions to other users, execute the following statement:

```
gaussdb=# GRANT select (r_reason_sk, r_reason_id) ON tpcds.reason TO joe WITH GRANT OPTION;
```

Grant the connection and schema creation permissions of the **testdb** database to **joe**, and allow **joe** to grant these permissions to other users.

```
gaussdb=# GRANT create,connect on database testdb TO joe WITH GRANT OPTION;
```

Create the **tpcds\_manager** role, grant the access and object creation permissions of the **tpcds** schema to **tpcds\_manager**, but do not allow **tpcds\_manager** to grant these permissions to others.

```
gaussdb=# CREATE ROLE tpcds_manager PASSWORD '*****';
gaussdb=# GRANT USAGE,CREATE ON SCHEMA tpcds TO tpcds_manager;
```

Grant all permissions on the **tpcds\_tbspc** tablespace to **joe**, but do not allow **joe** to grant these permissions to others.

```
gaussdb=# CREATE TABLESPACE tpcds_tbspc RELATIVE LOCATION 'tablespace/tablespace_1';
gaussdb=# GRANT ALL ON TABLESPACE tpcds_tbspc TO joe;
```

### Example: Granting the permissions of one user or role to others

1. Create the **manager** role, grant **joe**'s permissions to **manager**, and allow **manager** to grant these permissions to others.

```
gaussdb=# CREATE ROLE manager PASSWORD '*****';
gaussdb=# GRANT joe TO manager WITH ADMIN OPTION;
```

2. Create the **senior\_manager** user and grant **manager**'s permissions to it.

```
gaussdb=# CREATE ROLE senior_manager PASSWORD '*****';
gaussdb=# GRANT manager TO senior_manager;
```

3. Revoke permissions and delete users.

```
gaussdb=# REVOKE manager FROM joe;
gaussdb=# REVOKE senior_manager FROM manager;
gaussdb=# DROP USER manager;
```

### Example: Granting the CMK or CEK permission to other user or role

1. Connect to an encrypted database.

Prerequisites: You have set the parameters and used the CREATE CLIENT MASTER KEY syntax to create a master key named **MyCMK1** by referring to "Setting Encrypted Equality Queries" in *Feature Guide*.

```
gaussdb=# CREATE COLUMN ENCRYPTION KEY MyCEK1 WITH VALUES (CLIENT_MASTER_KEY =
MyCMK1, ALGORITHM = AEAD_AES_256_CBC_HMAC_SHA256);
CREATE COLUMN ENCRYPTION KEY
```

2. Create a role **newuser** and grant the key permission to **newuser**.

```
gaussdb=# CREATE USER newuser PASSWORD '*****';
CREATE ROLE
gaussdb=# GRANT ALL ON SCHEMA public TO newuser;
GRANT
gaussdb=# GRANT USAGE ON COLUMN_ENCRYPTION_KEY MyCEK1 to newuser;
GRANT
gaussdb=# GRANT USAGE ON CLIENT_MASTER_KEY MyCMK1 to newuser;
GRANT
```

3. Set the user to connect to a database and use a CEK to create an encrypted table.

```
gaussdb=# SET SESSION AUTHORIZATION newuser PASSWORD '*****';
gaussdb=> CREATE TABLE acltest1 (x int, x2 varchar(50) ENCRYPTED WITH
(COLUMN_ENCRYPTION_KEY = MyCEK1, ENCRYPTION_TYPE = DETERMINISTIC));
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'x' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
```

```
gaussdb=> SELECT has_cek_privilege('newuser', 'MyCEK1', 'USAGE');
has_cek_privilege
```

```

t
(1 row)
```

4. Revoke permissions and delete users.

```
gaussdb=# REVOKE USAGE ON COLUMN_ENCRYPTION_KEY MyCEK1 FROM newuser;
gaussdb=# REVOKE USAGE ON CLIENT_MASTER_KEY MyCMK1 FROM newuser;
gaussdb=# DROP TABLE newuser.acltest1;
gaussdb=# DROP COLUMN ENCRYPTION KEY MyCEK1;
gaussdb=# DROP CLIENT MASTER KEY MyCMK1;
```

```
gaussdb=# DROP SCHEMA IF EXISTS newuser CASCADE;
gaussdb=# REVOKE ALL ON SCHEMA public FROM newuser;
gaussdb=# DROP ROLE IF EXISTS newuser;
```

### Example: Revoking permissions and deleting roles and users

```
gaussdb=# REVOKE ALL PRIVILEGES ON tpcds.reason FROM joe;
gaussdb=# REVOKE ALL PRIVILEGES ON SCHEMA tpcds FROM joe;
gaussdb=# REVOKE ALL ON TABLESPACE tpcds_tbsp FROM joe;
gaussdb=# DROP TABLESPACE tpcds_tbsp;
gaussdb=# REVOKE USAGE,CREATE ON SCHEMA tpcds FROM tpcds_manager;
gaussdb=# DROP ROLE tpcds_manager;
gaussdb=# DROP ROLE senior_manager;
gaussdb=# DROP USER joe CASCADE;
gaussdb=# DROP TABLE tpcds.reason;
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## 7.15.149 IMPDP DATABASE CREATE

### Function

**IMPDP DATABASE CREATE** specifies the preparation phase for importing a database.

### Syntax

```
IMPDP DATABASE [db_name] CREATE SOURCE = 'directory' OWNER = user [LOCAL];
```

### Parameter Description

- **db\_name**: name of the new database after the import. If this parameter is not specified, the original database name is retained after the import.
- **directory**: data source directory of the imported database.
- **user**: owner of the imported database.
- **LOCAL**: If this field is specified, data is imported to the original cluster. If this field is not specified, data is imported to a new cluster.

### Example

```
impdp database test create source = '/data1/impdp/database' owner=admin;
```

## 7.15.150 IMPDP RECOVER

### Function

**IMPDP RECOVER** specifies the execution phase of importing a database.

### Syntax

```
IMPDP DATABASE RECOVER SOURCE = 'directory' OWNER = user [LOCAL];
```

## Parameter Description

- **directory**: data source directory of the imported database.
- **user**: owner of the imported database.
- **LOCAL**: If this field is specified, data is imported to the original cluster. If this field is not specified, data is imported to a new cluster.

## Example

```
impdp database recover source = '/data1/impdp/database' owner=admin;
```

## 7.15.151 INSERT

### Description

**INSERT** inserts new rows into a table.

### Precautions

- The owner of a table, users granted with the **INSERT** permission on the table, or users granted with the **INSERT ANY TABLE** permission can insert data into the table. The system administrator has the permission to insert data into the table by default.
- Use of the **RETURNING** clause requires the **SELECT** permission on all columns mentioned in **RETURNING**.
- If **ON DUPLICATE KEY UPDATE** is used, you must have the **SELECT** and **UPDATE** permissions on the table and the **SELECT** permission on the unique constraint (primary key or unique index).
- If you use the **query** clause to insert rows from a query, you need to have the **SELECT** permission on any table or column used in the query.
- If you use the query clause to insert data from the dynamic data anonymization column, the inserted result is the anonymized value and cannot be restored.
- When you connect to a database compatible to Teradata and **td\_compatible\_truncation** is **on**, a long string will be automatically truncated. If later **INSERT** statements (not involving foreign tables) insert long strings to columns of char- and varchar-typed columns in the target table, the system will truncate the long strings to ensure no strings exceed the maximum length defined in the target table.

#### NOTE

If inserting multi-byte character data (such as Chinese characters) to a database with the character set byte encoding (SQL\_ASCII, LATIN1), and the character data crosses the truncation position, the string is truncated based on its bytes instead of characters. Unexpected result will occur in tail after the truncation. If you want correct truncation result, you are advised to adopt encoding set such as UTF8, which has no character data crossing the truncation position.

### Syntax

```
[WITH [RECURSIVE] with_query [, ...]]
INSERT [/*+ plan_hint */] INTO table_name [AS alias] [(column_name [, ...])]
{ DEFAULT VALUES
```

```
| VALUES {{ { expression | DEFAULT } [, ...] } [, ...]
| query }
[ON DUPLICATE KEY UPDATE { NOTHING | { column_name = { expression | DEFAULT } } [, ...] [WHERE
condition] }]
[RETURNING { * | {output_expression [[AS] output_name] } [, ...] }];
```

## Parameters

- **WITH [ RECURSIVE ] with\_query [, ...]**

Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table.

If **RECURSIVE** is specified, it allows a **SELECT** subquery to reference itself by name.

Format of **with\_query**:

```
with_query_name [(column_name [, ...])] AS [[NOT] MATERIALIZED]
({select | values | insert | update | delete})
```

- **with\_query\_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.

- **column\_name** specifies the column name displayed in the subquery result set.

Each subquery can be a **SELECT**, **VALUES**, **INSERT**, **UPDATE** or **DELETE** statement.

- You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE.
- If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery cannot be jointly optimized with the SELECT statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.
- If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the trunk statement to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.

### NOTE

- **INSERT ON DUPLICATE KEY UPDATE** does not support the WITH or WITH RECURSIVE clauses.
- The output of the INSERT statement displays only the number of tuples inserted into the outermost query block. For example:  

```
with cte as (insert into t1 values(1) returning *) insert into t1 select * from cte;
```

Only one tuple is displayed, but two tuples are actually inserted.
- **plan\_hint** clause  

Follows the **INSERT** keyword in the **/+ \* /** format. It is used to optimize the plan of an **INSERT** statement block. For details, see [Hint-based Tuning](#). In each statement, only the first **/+ plan\_hint \*/** comment block takes effect as a hint. Multiple hints can be written.
- **table\_name**  

Specifies the name of the target table where data will be inserted.

Value range: an existing table name

 **NOTE**

You can use database links to perform operations on remote tables. For details, see [DATABASE LINK](#).

- **column\_name**

Specifies the name of a column in a table.

- The column name can be qualified with a subcolumn name or array subscript, if needed.
- Each column not present in the explicit or implicit column list will be filled with a default value, either its declared default value or **NULL** if there is none.
- The target column names **column\_name** can be listed in any order. If no list of column names is given at all, the default is all the columns of the table in their declared order.
- The target columns are the first *N* column names, if there are only *N* columns supplied by the **VALUE** clause or query.
- The values provided by the **VALUE** clause and query are associated with the corresponding columns from left to right in the table.

Value range: an existing column

- **expression**

Specifies an expression or a value to assign to the corresponding column.

- In the **INSERT ON DUPLICATE KEY UPDATE** statement, expression can be **VALUES(column\_name)** or **EXCLUDED.column\_name**, indicating that the value of **column\_name** corresponding to the conflict row is referenced. Note that **VALUES(column\_name)** cannot be nested in an expression (for example, **VALUES(column\_name)+1**). **EXCLUDED** is not subject to this restriction.
- If single-quotation marks are inserted in a column, the single-quotation marks need to be used for escape.
- If the expression for any column is not of the correct data type, automatic type conversion will be attempted. If the attempt fails, data insertion fails, and the system returns an error message.

- **DEFAULT**

Specifies the default value of a column. The value is **NULL** if no default value is assigned to it.

- **query**

Specifies a query statement (**SELECT** statement) that uses the query result as the inserted data.

- **RETURNING**

Returns the inserted rows. The syntax of the **RETURNING** list is identical to that of the output list of **SELECT**. Note that **INSERT ON DUPLICATE KEY UPDATE** does not support the **RETURNING** clause.

- **output\_expression**

Specifies an expression used to calculate the output result of the **INSERT** statement after each row is inserted.

Value range: The expression can use any column in the table. You can use the asterisk (\*) to return all columns of the inserted row.

- **output\_name**

Specifies a name to use for a returned column.

Value range: a string. It must comply with the [naming convention](#).

- **ON DUPLICATE KEY UPDATE**

For a table with a unique constraint (**UNIQUE INDEX** or **PRIMARY KEY**), if the inserted data violates the unique constraint, the **UPDATE** clause is executed to update the conflicting rows. If the clause of **UPDATE** is **NOTHING**, no operation will be performed.

For a table without a unique constraint, only insert is performed.

- Triggers are supported. The execution sequence of triggers is determined by the actual execution process.
  - Run the **INSERT** command to trigger the **before insert** and **after insert** triggers.
  - Executing **UPDATE** will trigger the **BEFORE INSERT**, **BEFORE UPDATE**, and **AFTER UPDATE**.
  - Executing **UPDATE NOTHING** will trigger the **BEFORE INSERT**.
- The unique constraint or primary key of **DEFERRABLE** is not supported.
- If a table has multiple unique constraints and the inserted data violates multiple unique constraints, only the first row that has a conflict is updated. (The check sequence is closely related to index maintenance. Generally, the conflict check is performed on the index that is created first.)
- Distribution columns and unique index columns cannot be updated.
- The **WHERE** clause of **UPDATE** does not contain sublinks.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
);

-- Insert a record into a table:
gaussdb=# INSERT INTO tpcds.reason(r_reason_sk, r_reason_id, r_reason_desc) VALUES (0,
'AAAAAAAAAAAAAAAAAAAA', 'reason0');

-- Create the tpcds.reason_t2 table:
gaussdb=# CREATE TABLE tpcds.reason_t2
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
);

-- Insert a record into a table:
gaussdb=# INSERT INTO tpcds.reason_t2(r_reason_sk, r_reason_id, r_reason_desc) VALUES (1,
'AAAAAAAABAAAAAAA', 'reason1');
```

```
-- Insert a record into the table, which is equivalent to the previous syntax:
gaussdb=# INSERT INTO tpced.reason_t2 VALUES (2, 'AAAAAAAABAAAAAA', 'reason2');

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpced.reason_t2 VALUES (3, 'AAAAAAAACAAAAAA', 'reason3'),(4,
'AAAAAAAADAAAAAA', 'reason4'),(5, 'AAAAAAAEEAAAAAA', 'reason5');

-- Insert records whose r_reason_sk in the tpced.reason table is less than 5:
gaussdb=# INSERT INTO tpced.reason_t2 SELECT * FROM tpced.reason WHERE r_reason_sk <5;

-- Create a unique index for the table:
gaussdb=# CREATE UNIQUE INDEX reason_t2_u_index ON tpced.reason_t2(r_reason_sk);

-- Insert multiple records into the table. If the records conflict, update the r_reason_id column in the
conflict data row to BBBB BBBB CAAAAAA.
gaussdb=# INSERT INTO tpced.reason_t2 VALUES (5, 'BBBBBBB CAAAAAA', 'reason5'),(6,
'AAAAAAAADAAAAAA', 'reason6') ON DUPLICATE KEY UPDATE r_reason_id = 'BBBBBBB CAAAAAA';

-- Delete the tpced.reason_t2 table.
gaussdb=# DROP TABLE tpced.reason_t2;

-- Delete the tpced.reason table.
gaussdb=# DROP TABLE tpced.reason;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpced CASCADE;
```

## Suggestions

### VALUES

When you run the **INSERT** statement to insert data in batches, you are advised to combine multiple records into one statement to improve data loading performance. Example: **INSERT INTO sections VALUES (30, 'Administration', 31, 1900), (40, 'Development', 35, 2000), (50, 'Development', 60, 2001);**

If values of an insert statement are distributed on a DN, GaussDB can push the statement down to the corresponding DN for execution. Currently, only constants, simple expressions, and pushdown functions (**provolatile** in `pg_proc` is set to 'i') are supported. If a column in the table has a default value, the value must be a constant or a simple expression. Neither a single-value statement nor a multi-value statement can be pushed down to a single DN.

## 7.15.152 IMPDP TABLE

### Function

**IMPDP TABLE** specifies the execution phase of importing a table.

### Syntax

```
IMPDP TABLE [AS table_name] SOURCE = 'directory' OWNER = user;
```

### Parameter Description

- **table\_name**: name of the new table after the import. If this parameter is not specified, the original table name is retained after the import.
- **directory**: data source directory of the imported table.
- **user**: owner of the imported table.

## Example

```
impdp table source = '/data1/impdp/table0' owner=admin;
```

## 7.15.153 IMPDP TABLE PREPARE

### Function

**IMPDP TABLE PREPARE** specifies the preparation phase for importing a table.

### Syntax

```
IMPDP TABLE PREPARE SOURCE = 'directory' OWNER = user;
```

### Parameter Description

- **directory**: data source directory of the imported table.
- **user**: owner of the imported table.

## Example

```
impdp table prepare source = '/data1/impdp/table0' owner=admin;
```

## 7.15.154 LOCK

### Function

**LOCK TABLE** obtains a table-level lock.

GaussDB always tries to select the lock mode with minimum constraints when automatically requesting a lock for a statement referenced by a table. Use **LOCK** if users need a more strict lock mode. For example, suppose an application runs a transaction at the Read Committed isolation level and needs to ensure that data in a table remains stable in the duration of the transaction. To achieve this, you could obtain **SHARE** lock mode over the table before the query. This will prevent concurrent data changes and ensure subsequent reads of the table see a stable view of committed data. It is because the **SHARE** lock mode conflicts with the **ROW EXCLUSIVE** lock acquired by writers, and your **LOCK TABLE name IN SHARE MODE** statement will wait until any concurrent holders of **ROW EXCLUSIVE** mode locks commit or roll back. Therefore, once you obtain the lock, there are no uncommitted writes outstanding; furthermore none can begin until you release the lock.

The kernel can automatically cancel services when the scale-out redistribution tool waits for a lock.

### Precautions

- **LOCK TABLE** is useless outside a transaction block: the lock would remain held only to the completion of the statement. If **LOCK TABLE** is out of any transaction block, an error is reported.
- If no lock mode is specified, then **ACCESS EXCLUSIVE**, the most restrictive mode, is used.

- LOCK TABLE ... **IN ACCESS SHARE MODE** requires the **SELECT** permission on the target table. All other forms of **LOCK** require table-level **UPDATE** and/or the **DELETE** permission.
- There is no **UNLOCK TABLE** statement. Locks are always released at transaction end.
- **LOCK TABLE** only deals with table-level locks, and so the mode names involving **ROW** are all misnomers. These mode names should generally be read as indicating the intention of the user to acquire row-level locks within the locked table. Also, **ROW EXCLUSIVE** mode is a shareable table lock. Note that all lock modes have the same semantics as long as LOCK TABLE is involved. The only difference lies in whether locks conflict with each other. For details about the rules, see [Table 7-167](#).
- If the xc\_maintenance\_mode parameter is not enabled, an error is reported when an ACCESS EXCLUSIVE lock is applied for a system catalog.
- Only the redistribution tool can use the automatic CANCEL service interface.

## Syntax

```
LOCK [TABLE] {[ONLY] name [, ...]} {name [*]} [, ...]
 [IN {ACCESS SHARE | ROW SHARE | ROW EXCLUSIVE | SHARE UPDATE EXCLUSIVE | SHARE | SHARE
ROW EXCLUSIVE | EXCLUSIVE | ACCESS EXCLUSIVE} MODE]
 [NOWAIT][CANCELABLE];
```

## Parameter Description

Table 7-167 Lock mode conflicts

| Requested Lock Mode/<br>Current Lock Mode | ACCESS SHARE | ROW SHARE | ROW EXCLUSIVE | SHARE UPDATE EXCLUSIVE | SHARE | SHARE ROW EXCLUSIVE | EXCLUSIVE | ACCESS EXCLUSIVE |
|-------------------------------------------|--------------|-----------|---------------|------------------------|-------|---------------------|-----------|------------------|
| ACCESS SHARE                              | -            | -         | -             | -                      | -     | -                   | -         | X                |
| ROW SHARE                                 | -            | -         | -             | -                      | -     | -                   | X         | X                |
| ROW EXCLUSIVE                             | -            | -         | -             | -                      | X     | X                   | X         | X                |
| SHARE UPDATE EXCLUSIVE                    | -            | -         | -             | X                      | X     | X                   | X         | X                |
| SHARE                                     | -            | -         | X             | X                      | -     | X                   | X         | X                |

| Requested Lock Mode/<br>Current Lock Mode | ACCESS SHARE | ROW SHARE | ROW EXCLUSIVE | SHARE UPDATE EXCLUSIVE | SHARE | SHARE ROW EXCLUSIVE | EXCLUSIVE | ACCESS EXCLUSIVE |
|-------------------------------------------|--------------|-----------|---------------|------------------------|-------|---------------------|-----------|------------------|
| SHARE ROW EXCLUSIVE                       | -            | -         | X             | X                      | X     | X                   | X         | X                |
| EXCLUSIVE                                 | -            | X         | X             | X                      | X     | X                   | X         | X                |
| ACCESS EXCLUSIVE                          | X            | X         | X             | X                      | X     | X                   | X         | X                |

**LOCK** parameters are as follows:

- **name**

Specifies the name (optionally schema-qualified) of an existing table to lock.

Tables are locked one-by-one in the order specified in the **LOCK TABLE** statement.

Value range: an existing table name

 **NOTE**

You can use database links to perform operations on remote tables. For details, see [DATABASE LINK](#).

- **ONLY**

If **ONLY** is specified, only that table is locked. If **ONLY** is not specified, the table and all its sub-tables are locked.

- **ACCESS SHARE**

Allows only read operations on a table. In general, any SQL statements that only read a table and do not modify it will acquire this lock mode. The **SELECT** statement acquires a lock of this mode on referenced tables.

- **ROW SHARE**

Allows concurrent read of a table but does not allow any other operations on the table.

**SELECT FOR UPDATE** and **SELECT FOR SHARE** automatically acquire the **ROW SHARE** lock on the target table and add the **ACCESS SHARE** lock to other referenced tables except **FOR SHARE** and **FOR UPDATE**.

For a partitioned table, **SELECT FOR SHARE** obtains the **ROW EXCLUSIVE** lock of the partition object on the DN for concurrency control.

- **ROW EXCLUSIVE**  
Allows concurrent read of a table but does not allow modification of data in the table like **ROW SHARE**. **UPDATE**, **DELETE**, and **INSERT** automatically acquire the **ROW SHARE** lock on the target table and add the **ACCESS SHARE** lock to other referenced tables. Generally, all statements that modify table data acquire the **ROW EXCLUSIVE** lock for tables.
- **SHARE UPDATE EXCLUSIVE**  
Protects a table against concurrent schema changes and **VACUUM** runs. The **VACUUM** (without **FULL**), **ANALYZE**, and **CREATE INDEX CONCURRENTLY** statements automatically request this lock.
- **SHARE**  
Allows concurrent queries of a table but does not allow modification of the table.  
The **CREATE INDEX** (without **CONCURRENTLY**) statement automatically requests this lock.
- **SHARE ROW EXCLUSIVE**  
Protects a table against concurrent data changes, and is self-exclusive so that only one session can hold it at a time.  
No SQL statements automatically acquire this lock mode.
- **EXCLUSIVE**  
Allows concurrent queries of the target table but does not allow any other operations.  
This mode allows only concurrent **ACCESS SHARE** locks; that is, only reads from the table can proceed in parallel with a transaction holding this lock mode.  
No SQL statements automatically acquire this lock mode on user tables. However, it will be acquired on some system catalogs in case of some operations.
- **ACCESS EXCLUSIVE**  
Guarantees that the holder is the only transaction accessing the table in any way.  
Acquired by the **ALTER TABLE**, **DROP TABLE**, **TRUNCATE**, **REINDEX**, **CLUSTER**, and **VACUUM FULL** statements.  
This is also the default lock mode for **LOCK TABLE** statements that do not specify a mode explicitly.
- **NOWAIT**  
Specifies that **LOCK TABLE** does not wait for any conflicting locks to be released. If the lock cannot be obtained immediately, the command exits and an error message is displayed.  
If **NOWAIT** is not specified, **LOCK TABLE** obtains a table-level lock, waiting if necessary for any conflicting locks to be released.
- **CANCELABLE**  
Allows the waiting thread to send **CANCEL** signals to the holding threads and waiting threads.  
Only the redistribution tool can use this parameter. An error message is displayed when the parameter is used by users.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason(
r_reason_sk INTEGER NOT NULL,
r_reason_id CHAR(16) NOT NULL,
r_reason_desc INTEGER
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.reason VALUES (1, 'AAAAAAAAABAAAAAAA', '18'),(5, 'AAAAAAAACAAAAAAA',
'362'),(7, 'AAAAAAAADAAAAAAA', '585');

-- Obtain a SHARE ROW EXCLUSIVE lock on a primary key table when going to perform a delete operation.
gaussdb=# CREATE TABLE tpcds.reason_t1 AS TABLE tpcds.reason;

gaussdb=# START TRANSACTION;

gaussdb=# LOCK TABLE tpcds.reason_t1 IN SHARE ROW EXCLUSIVE MODE;

gaussdb=# DELETE FROM tpcds.reason_t1 WHERE r_reason_desc IN(SELECT r_reason_desc FROM
tpcds.reason_t1 WHERE r_reason_sk < 6);

gaussdb=# DELETE FROM tpcds.reason_t1 WHERE r_reason_sk = 7;

gaussdb=# COMMIT;

-- Delete the tpcds.reason_t1 table.
gaussdb=# DROP TABLE tpcds.reason_t1;

-- Delete the table.
gaussdb=# DROP TABLE tpcds.reason;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## 7.15.155 MOVE

### Function

Repositions a cursor without retrieving any data. MOVE works exactly like the [FETCH](#) statement, except it only repositions the cursor and does not return rows.

### Precautions

None

### Syntax

```
MOVE [direction [FROM | IN]] cursor_name;
```

The **direction** clause specifies optional parameters.

```
NEXT
| PRIOR
| FIRST
| LAST
| ABSOLUTE count
| RELATIVE count
| count
| ALL
| FORWARD
```

```
| FORWARD count
| FORWARD ALL
| BACKWARD
| BACKWARD count
| BACKWARD ALL
```

## Parameter Description

The MOVE statement parameters are the same as FETCH statement parameters. For details, see [Parameters](#) in section "FETCH."

### NOTE

On successful completion, a **MOVE** statement returns a tag of the form **MOVE count**. The **count** is the number of rows that a **FETCH** statement with the same parameters would have returned (possibly zero).

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason(
r_reason_sk INTEGER NOT NULL,
r_reason_id CHAR(16) NOT NULL,
r_reason_desc VARCHAR(40)
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.reason VALUES (1, 'AAAAAAAABAAAAAAA', 'XXXXXXXX'),(2,
'AAAAAAAACAAAAAAA', 'XXXXXXXX'),(3, 'AAAAAAAADAAAAAAA', 'XXXXXXXX'),(4, 'AAAAAAAEEAAAAAAA',
'Not the product that was ordered'),(5, 'AAAAAAAFAAAAAAAA', 'Parts missing'),(6, 'AAAAAAAAGAAAAAAA',
'Does not work with a product that I have'),(7, 'AAAAAAAHAAAAAAA', 'Gift exchange');

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Define a cursor named cursor1.
gaussdb=# CURSOR cursor1 FOR SELECT * FROM tpcds.reason;

-- Skip the first three rows of cursor1:
gaussdb=# MOVE FORWARD 3 FROM cursor1;

-- Fetch the first four rows from cursor1:
gaussdb=# FETCH 4 FROM cursor1;
r_reason_sk | r_reason_id | r_reason_desc
-----+-----
+-----+-----
4 | AAAAAAAEEAAAAAAA | Not the product that was
ordred
5 | AAAAAAAFAAAAAAAA | Parts missing
6 | AAAAAAAGAAAAAAA | Does not work with a product that I
have
7 | AAAAAAAHAAAAAAA | Gift
exchange
(4 rows)

-- Close the cursor.
gaussdb=# CLOSE cursor1;

-- End the transaction.
gaussdb=# END;

-- Delete the table.
gaussdb=# DROP TABLE tpcds.reason;
```

```
-- Delete a schema.
gaussdb=# DROP SCHEMA tpccs CASCADE;
```

[CLOSE](#) and [FETCH](#)

## 7.15.156 MERGE INTO

### Description

**MERGE INTO** conditionally matches data in a target table with that in a source table. If data matches, **UPDATE** is executed on the target table; if data does not match, **INSERT** is executed. You can use this syntax to run **UPDATE** and **INSERT** at a time for convenience

### Precautions

- You have the **INSERT** and **UPDATE** permissions for the target table and the **SELECT** permission for the source table.
- **MERGE INTO** cannot be executed during redistribution.
- If the source table of the **MERGE INTO** operation contains data columns that are dynamically anonymized, the result of inserting data to or updating data in the target table is the anonymized value and cannot be restored.

### Syntax

```
MERGE [/*+ plan_hint */] INTO table_name [[AS] alias]
USING { { table_name | view_name } | subquery } [[AS] alias]
ON (condition)
[
 WHEN MATCHED THEN
 UPDATE SET { column_name = { expression | subquery | DEFAULT } |
 (column_name [, ...]) = ({ expression | subquery | DEFAULT } [, ...]) } [, ...]
 [WHERE condition]
]
[
 WHEN NOT MATCHED THEN
 INSERT { DEFAULT VALUES |
 [(column_name [, ...])] VALUES ({ expression | subquery | DEFAULT } [, ...]) [, ...] [WHERE condition] }
];
NOTICE: 'subquery' in the UPDATE and INSERT clauses are only available in CENTRALIZED mode!
```

### Parameters

- **plan\_hint** clause  
Follows the **MERGE** keyword in the */\*+ \*/* format. It is used to optimize the plan of a **MERGE** statement block. For details, see [Hint-based Tuning](#). In each statement, only the first */\*+ plan\_hint \*/* comment block takes effect as a hint. Multiple hints can be written.
- **INTO** clause  
Specifies the target table that is being updated or has data being inserted. If the target table is a replication table, the default value of a column (such as auto-increment column) in the target table cannot be the volatile function. If **enable\_stream\_operator** is set to **off**, the target table must contain a primary key or **UNIQUE** and **NOT NULL** constraints.

- **table\_name**  
Specifies the name of the target table.
- **alias**  
Specifies the alias of the target table.  
Value range: a string. It must comply with the [naming convention](#).
- USING clause  
Specifies the source table, which can be a table, view, or subquery. If the target table is a replication table, the USING clause cannot contain non-replication tables.
- ON clause  
Specifies the condition used to match data between the source and target tables. Columns in the condition cannot be updated.
- WHEN MATCHED clause  
Performs UPDATE if data in the source table matches that in the target table based on the condition.  
Distribution keys cannot be updated. System catalogs and system columns cannot be updated.
- WHEN NOT MATCHED clause  
Performs INSERT if data in the source table does not match that in the target table based on the condition.  
An INSERT clause cannot contain multiple VALUES.  
The order of WHEN MATCHED and WHEN NOT MATCHED clauses can be reversed. One of them can be used by default, but they cannot be both used at one time. Two WHEN MATCHED or WHEN NOT MATCHED clauses cannot be specified at the same time.
- **DEFAULT**  
Specifies the default value of a column.  
The value is **NULL** if no default value is assigned to it.
- WHERE condition  
Specifies the conditions for the UPDATE and INSERT clauses. The two clauses will be executed only when the conditions are met. The default value can be used. System columns cannot be referenced in WHERE condition. You are advised not to use numeric types such as int as conditions, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

## Examples

```
-- Create the target table products and source table newproducts, and insert data to them.
gaussdb=# CREATE TABLE products
(
 product_id INTEGER,
 product_name VARCHAR2(60),
 category VARCHAR2(60)
);

gaussdb=# INSERT INTO products VALUES (1501, 'vivitar 35mm', 'electrnics');
gaussdb=# INSERT INTO products VALUES (1502, 'olympus is50', 'electrnics');
gaussdb=# INSERT INTO products VALUES (1600, 'play gym', 'toys');
```

```
gaussdb=# INSERT INTO products VALUES (1601, 'lamaze', 'toys');
gaussdb=# INSERT INTO products VALUES (1666, 'harry potter', 'dvd');

gaussdb=# CREATE TABLE newproducts
(
product_id INTEGER,
product_name VARCHAR2(60),
category VARCHAR2(60)
);

gaussdb=# INSERT INTO newproducts VALUES (1502, 'olympus camera', 'electrnics');
gaussdb=# INSERT INTO newproducts VALUES (1601, 'lamaze', 'toys');
gaussdb=# INSERT INTO newproducts VALUES (1666, 'harry potter', 'toys');
gaussdb=# INSERT INTO newproducts VALUES (1700, 'wait interface', 'books');

-- Run MERGE INTO.
gaussdb=# MERGE INTO products p
USING newproducts np
ON (p.product_id = np.product_id)
WHEN MATCHED THEN
 UPDATE SET p.product_name = np.product_name, p.category = np.category WHERE p.product_name !=
'play gym'
WHEN NOT MATCHED THEN
 INSERT VALUES (np.product_id, np.product_name, np.category) WHERE np.category = 'books';
MERGE 4

-- Query updates.
gaussdb=# SELECT * FROM products ORDER BY product_id;
product_id | product_name | category
-----+-----+-----
1501 | vivitar 35mm | electrncs
1502 | olympus camera | electrncs
1600 | play gym | toys
1601 | lamaze | toys
1666 | harry potter | toys
1700 | wait interface | books
(6 rows)

-- Delete the table.
gaussdb=# DROP TABLE products;
gaussdb=# DROP TABLE newproducts;
```

## 7.15.157 PREDICT BY

This syntax is not supported in distributed scenarios.

## 7.15.158 PREPARE

### Function

**PREPARE** creates a prepared statement.

A prepared statement is a performance optimizing object on the server. When the **PREPARE** statement is executed, the specified query is parsed, analyzed, and rewritten. When **EXECUTE** is executed, the prepared statement is planned and executed. This avoids repetitive parsing and analysis. After the **PREPARE** statement is created, it exists throughout the database session. Once it is created (even if in a transaction block), it will not be deleted when a transaction is rolled back. It can only be deleted by explicitly invoking **DEALLOCATE** or automatically deleted when the session ends.

### Precautions

None

## Syntax

```
PREPARE name [(data_type [, ...])] AS statement;
```

## Parameter Description

- **name**  
Specifies the name of a prepared statement. It must be unique in the session.
- **data\_type**  
Specifies the type of an argument.
- **statement**  
Specifies a **SELECT**, **INSERT**, **UPDATE**, **DELETE**, **MERGE INTO**, or **VALUES** statement.

## Examples

See [Examples](#) in **EXECUTE**.

## Helpful Links

[DEALLOCATE](#)

# 7.15.159 PREPARE TRANSACTION

## Function

Prepares the current transaction for two-phase commit.

After this statement, the transaction is no longer associated with the current session; instead, its state is fully stored on disk, and there is a high probability that it can be committed successfully, even if a database crash occurs before the commit is requested.

Once prepared, a transaction can later be committed or rolled back with **COMMIT PREPARED** or **ROLLBACK PREPARED**, respectively. Those statements can be issued from any session, not only the one that executed the original transaction.

From the point of view of the issuing session, **PREPARE TRANSACTION** is not unlike a **ROLLBACK** statement: after executing it, there is no active current transaction, and the effects of the prepared transaction are no longer visible. (The effects will become visible again if the transaction is committed.)

If the **PREPARE TRANSACTION** statement fails for any reason, it becomes a **ROLLBACK** and the current transaction is canceled.

## Precautions

- The transaction function is maintained automatically by the database, and should be not visible to users.
- The distributed system does not allow users to call the customized **PREPARE TRANSACTION** operation.
- When running the **PREPARE TRANSACTION** statement, increase the value of **max\_prepared\_transactions** in configuration file **postgres.conf**. You are

advised to set **max\_prepared\_transactions** to a value not less than that of **max\_connections** so that one pending prepared transaction is available for each session.

## Syntax

```
PREPARE TRANSACTION transaction_id;
```

## Parameter Description

### transaction\_id

Specifies an arbitrary identifier that later identifies this transaction for **COMMIT PREPARED** or **ROLLBACK PREPARED**. The identifier must be different from those for current prepared transactions.

Value range: The identifier must be written as a string literal, and must be less than 200 bytes long.

## Helpful Links

[COMMIT PREPARED](#) and [ROLLBACK PREPARED](#)

## 7.15.160 PURGE

### Description

The **PURGE** statement can be used to:

- Clear tables or indexes from the recycle bin and release all space related to the objects.
- Clear the recycle bin.
- Clear the objects of a specified tablespace in the recycle bin.

### Precautions

- The **PURGE** operation supports tables (**PURGE TABLE**), indexes (**PURGE INDEX**), and recycle bins (**PURGE RECYCLEBIN**).
- The permission requirements for performing the **PURGE** operation are as follows:
  - **PURGE TABLE**: The user must be the owner of the table and must have the **USAGE** permission on the schema to which the table belongs. By default, the system administrator has this permission.
  - **PURGE INDEX**: The user must be the owner of the index and have the **USAGE** permission on the schema to which the index belongs. By default, the system administrator has this permission.
  - **PURGE RECYCLEBIN**: Common users can clear only the objects owned by themselves in the recycle bin. In addition, the user must have the **USAGE** permission of the schema to which the objects belong. By default, the system administrator can clear all objects in the recycle bin.

## Prerequisites

- The **enable\_recyclebin** parameter has been enabled to enable the recycle bin. Contact the administrator for details about how to use the parameter.
- The **recyclebin\_retention\_time** parameter has been set for specifying the retention period of objects in the recycle bin. The objects will be automatically deleted after the retention period expires. Contact the administrator for details about how to use the parameter.

## Syntax

```
PURGE { TABLE [schema_name.]table_name
 | INDEX index_name
 | RECYCLEBIN
 }
```

## Parameters

- [*schema\_name*. ]  
Schema name.
- TABLE [*schema\_name*. ] *table\_name*  
Clears a specified table in the recycle bin.
- INDEX *index\_name*  
Clears a specified index in the recycle bin.
- RECYCLEBIN  
Clears the objects in the recycle bin.

## Examples

```
-- Create the tpcds role.
gaussdb=# CREATE ROLE tpcds IDENTIFIED BY '*****';

-- Create the reason_table_space tablespace.
gaussdb=# CREATE TABLESPACE REASON_TABLE_SPACE1 owner tpcds RELATIVE location 'tablespace/
tsp_reason1';

-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason_t1 table in the tablespace.
gaussdb=# CREATE TABLE tpcds.reason_t1
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
) with(storage_type=ustore) tablespace reason_table_space1;
-- Create the tpcds.reason_t2 table in the tablespace.
gaussdb=# CREATE TABLE tpcds.reason_t2
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
) with(storage_type=ustore) tablespace reason_table_space1;
-- Create the tpcds.reason_t3 table in the tablespace.
gaussdb=# CREATE TABLE tpcds.reason_t3
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
) with(storage_type=ustore) tablespace reason_table_space1;
```

```

-- Create an index on the tpcds.reason_t1 table.
gaussdb=# CREATE INDEX index_t1 on tpcds.reason_t1(r_reason_id);
gaussdb=# DROP TABLE tpcds.reason_t1;
gaussdb=# DROP TABLE tpcds.reason_t2;
gaussdb=# DROP TABLE tpcds.reason_t3;
-- View the recycle bin.
gaussdb=# SELECT rcyname,rcyoriginname,rcytablespace FROM GS_RECYCLEBIN;
 rcyname | rcyoriginname | rcytablespace
-----+-----+-----
BIN$16409$2CEE988==$0 | reason_t1 | 16408
BIN$16412$2CF2188==$0 | reason_t2 | 16408

BIN$16418$2CF3EC8==$0 | index_t1 | 0
(4 rows)
-- Purge the table.
gaussdb=# PURGE TABLE tpcds.reason_t3;
gaussdb=# SELECT rcyname,rcyoriginname,rcytablespace FROM GS_RECYCLEBIN;
 rcyname | rcyoriginname | rcytablespace
-----+-----+-----
BIN$16409$2CEE988==$0 | reason_t1 | 16408
BIN$16412$2CF2188==$0 | reason_t2 | 16408
BIN$16418$2CF3EC8==$0 | index_t1 | 0
(3 rows)
-- Purge the index.
gaussdb=# PURGE INDEX tpcds.index_t1;
gaussdb=# SELECT rcyname,rcyoriginname,rcytablespace FROM GS_RECYCLEBIN;
 rcyname | rcyoriginname | rcytablespace
-----+-----+-----
BIN$16409$2CEE988==$0 | reason_t1 | 16408
BIN$16412$2CF2188==$0 | reason_t2 | 16408
(2 rows)
-- Purge all objects in the recycle bin.
gaussdb=# PURGE recyclebin;
gaussdb=# SELECT rcyname,rcyoriginname,rcytablespace FROM GS_RECYCLEBIN;
 rcyname | rcyoriginname | rcytablespace
-----+-----+-----
(0 rows)

-- Delete the schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;

```

## 7.15.161 REASSIGN OWNED

### Function

Changes the owner of the database object.

**REASSIGN OWNED** requires that the system change owners of all the database objects owned by **old\_roles** to **new\_role**.

### Precautions

- **REASSIGN OWNED** is often executed before role deletion.
- To run the **REASSIGN OWNED** statement, you must have the permissions of the original and target roles.

### Syntax

```
REASSIGN OWNED BY old_role [, ...] TO new_role;
```

### Parameter Description

- **old\_role**

Specifies the role name of the old owner.

- **new\_role**

Specifies the role name of the new owner. Note: Only the initial user can use the REASSIGN OWNED syntax to change the owner to the initial user.

## Examples

None

## 7.15.162 REINDEX

### Description

Rebuilds an index using the data stored in the index's table, replacing the old copy of the index.

There are several scenarios in which **REINDEX** can be used:

- An index has become corrupted, and no longer contains valid data.
- An index has become "bloated", that is, it contains many empty or nearly-empty pages.
- You have altered a storage parameter (such as a fill factor) for an index, and wish that the change takes full effect.

### Precautions

- **REINDEX DATABASE** and **REINDEX SYSTEM** type cannot be performed in transaction blocks.
- GIST indexes (This is a lab feature. Contact Huawei technical support before using it.) cannot be rebuilt online or concurrently.

### Syntax

- Rebuild a general index.  
`REINDEX { INDEX | TABLE | DATABASE | SYSTEM } [CONCURRENTLY] name [ FORCE ];`
- Rebuild an index partition.  
`REINDEX { INDEX | TABLE } name  
PARTITION partition_name [ FORCE ];`

### Parameters

- **INDEX**  
Rebuilds the specified index.
- **TABLE**  
Recreates all indexes of a specified table. If a table has a TOAST table, the table will also be reindexed. If an index on the table has been invalidated by running **alter unusable**, the index cannot be rebuilt. Indexes in the TOAST table cannot be recreated when specifying the **CONCURRENTLY** option.
- **DATABASE**  
Rebuilds all indexes within the current database. Indexes in the TOAST table within the current database cannot be recreated when specifying the **CONCURRENTLY** option.

- **SYSTEM**  
Rebuilds all indexes on system catalogs within the current database. Indexes on user tables are not processed.
- **CONCURRENTLY**  
Rebuilds an index (with ShareUpdateExclusiveLock) in non-blocking DML mode. When an index is rebuilt, other statements cannot access the table on which the index depends. If this keyword is specified, DML is not blocked during the recreation. Indexes in system catalogs cannot be rebuilt online. REINDEX INTERNAL TABLE CONCURRENTLY and REINDEX SYSTEM CONCURRENTLY are not supported. When REINDEX DATABASE CONCURRENTLY is executed, all indexes on user tables in the current database are rebuilt online (indexes on system catalogs are not processed). REINDEX CONCURRENTLY cannot be executed within a transaction. Only B-tree and UB-tree indexes can be created online and only common, global, and local indexes are supported. Online concurrent index rebuilding supports only Astore common indexes, global indexes, and local indexes. Ustore indexes are not supported. If online index recreating fails, invalid new indexes may be left. If the system cannot automatically clear the invalid indexes (for example, the database is shut down), you need to manually clear the invalid indexes (using the DROP INDEX statement) as soon as possible to prevent more resources from being occupied. Generally, the extension of an invalid index name is **\_ccnew**. The execution of REINDEX INDEX CONCURRENTLY adds a four-level session lock to the table and its first several phases are similar to those of CREATE INDEX CONCURRENTLY. Therefore, the execution may be suspended or deadlocked, which is similar to that of CREATE INDEX CONCURRENTLY. For example, if two sessions perform the REINDEX CONCURRENTLY operation on the same index or table at the same time, a deadlock occurs. For details, see [CONCURRENTLY](#).
- **name**  
Specifies the name of the index, table, or database whose index needs to be rebuilt. Tables and indexes can be schema-qualified.  
  
 **NOTE**  
  
REINDEX DATABASE and SYSTEM can create indexes for only the current database. Therefore, **name** must be the same as the current database name.
- **FORCE**  
Discarded parameter. It is currently reserved for compatibility with earlier versions.
- **partition\_name**  
Specifies the name of the partition or index partition to be rebuilt.  
Value range:
  - If REINDEX INDEX is used, specify the name of an index partition.
  - If it is REINDEX TABLE, specify the name of a partition.

---

**NOTICE**

REINDEX DATABASE and REINDEX SYSTEM cannot be performed in transaction blocks.

---

 CAUTION

REINDEX and REINDEX CONCURRENTLY do not support separate operations on TOAST tables or TOAST indexes.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer table.
gaussdb=# CREATE TABLE tpcds.customer(
c_customer_sk INTEGER NOT NULL,
c_customer_id CHAR(16) NOT NULL
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.customer VALUES (1, 'AAAAAAAAABAAAAAAA'),(5, 'AAAAAAAACAAAAAAA'),
(10, 'AAAAAAAADAAAAAAA');

-- Create a row-store table tpcds.customer_t1 and create an index on the c_customer_sk column in the
table.
gaussdb=# CREATE TABLE tpcds.customer_t1
(
 c_customer_sk integer not null,
 c_customer_id char(16) not null,
 c_current_demo_sk integer ,
 c_current_hdemo_sk integer ,
 c_current_addr_sk integer ,
 c_first_shipto_date_sk integer ,
 c_first_sales_date_sk integer ,
 c_salutation char(10) ,
 c_first_name char(20) ,
 c_last_name char(30) ,
 c_preferred_cust_flag char(1) ,
 c_birth_day integer ,
 c_birth_month integer ,
 c_birth_year integer ,
 c_birth_country varchar(20) ,
 c_login char(13) ,
 c_email_address char(50) ,
 c_last_review_date char(10)
)
WITH (orientation = row);

gaussdb=# CREATE INDEX tpcds_customer_index1 ON tpcds.customer_t1 (c_customer_sk);

gaussdb=# INSERT INTO tpcds.customer_t1 SELECT * FROM tpcds.customer WHERE c_customer_sk < 10;

-- Rebuild a single index.
gaussdb=# REINDEX INDEX tpcds.tpcds_customer_index1;

-- Rebuild a single index online.
gaussdb=# REINDEX INDEX CONCURRENTLY tpcds.tpcds_customer_index1;

-- Rebuild all indexes in the tpcds.customer_t1 table:
gaussdb=# REINDEX TABLE tpcds.customer_t1;

-- Rebuild all indexes in the tpcds.customer_t1 table online.
gaussdb=# REINDEX TABLE CONCURRENTLY tpcds.customer_t1;

-- Delete the tpcds.customer_t1 table:
gaussdb=# DROP TABLE tpcds.customer_t1;

-- Delete the tpcds.customer table.
gaussdb=# DROP TABLE tpcds.customer;
```

```
-- Delete a schema.
gaussdb=# DROP SCHEMA tpceds CASCADE;
```

## Suggestions

- **DATABASE**  
You are advised not to reindex a database in a transaction.
- **SYSTEM**  
You are advised not to reindex system catalogs in transactions.

## 7.15.163 REFRESH INCREMENTAL MATERIALIZED VIEW

### Function

**REFRESH INCREMENTAL MATERIALIZED VIEW** refreshes a materialized view in materialized mode.

### Precautions

- Incremental refresh supports only incremental materialized views.
- To refresh a materialized view, you must have the SELECT permission on the base table.

### Syntax

```
REFRESH INCREMENTAL MATERIALIZED VIEW mv_name;
```

### Parameter Description

- **mv\_name**  
Name of the materialized view to be refreshed.

### Examples

```
-- Create an ordinary table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int);

-- Create a fast-refresh materialized view.
gaussdb=# CREATE INCREMENTAL MATERIALIZED VIEW my_imv AS SELECT * FROM my_table;

-- Write data to the base table.
gaussdb=# INSERT INTO my_table VALUES(1,1),(2,2);

-- Fast refresh the fast-refresh materialized view my_imv.
gaussdb=# REFRESH INCREMENTAL MATERIALIZED VIEW my_imv;

-- Delete the fast-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_imv;

-- Delete the my_table table.
gaussdb=# DROP TABLE my_table;
```

### Helpful Links

## 7.15.164 REFRESH MATERIALIZED VIEW

### Function

**REFRESH MATERIALIZED VIEW** refreshes materialized views in full refresh mode.

### Precautions

- Full refreshing can be performed on both full and incremental materialized views.
- To refresh a materialized view, you must have the SELECT permission on the base table.

### Syntax

```
REFRESH MATERIALIZED VIEW mv_name;
```

### Parameter Description

- **mv\_name**  
Name of the materialized view to be refreshed.

### Examples

```
-- Create an ordinary table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int);

-- Create a complete-refresh materialized view.
gaussdb=# CREATE MATERIALIZED VIEW my_mv AS SELECT * FROM my_table;

-- Create a fast-refresh materialized view.
gaussdb=# CREATE INCREMENTAL MATERIALIZED VIEW my_imv AS SELECT * FROM my_table;

-- Write data to the base table.
gaussdb=# INSERT INTO my_table VALUES(1,1),(2,2);

-- Completely refresh the complete-refresh materialized view my_mv.
gaussdb=# REFRESH MATERIALIZED VIEW my_mv;

-- Completely refresh the fast-refresh materialized view my_imv.
gaussdb=# REFRESH MATERIALIZED VIEW my_imv;

-- Delete a fast-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_imv;

-- Delete a complete-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_mv;

-- Delete the my_table table.
gaussdb=# DROP TABLE my_table;
```

### Helpful Links

## 7.15.165 RELEASE SAVEPOINT

### Function

Destroys a savepoint previously defined in the current transaction.

Destroying a savepoint makes it unavailable as a rollback point, but it has no other user visible behavior. It does not undo the effects of statements executed after the savepoint was established. To do that, use **ROLLBACK TO SAVEPOINT**. Destroying a savepoint when it is no longer needed allows the system to reclaim some resources earlier than transaction end.

**RELEASE SAVEPOINT** also destroys all savepoints that were established after the named savepoint was established.

### Precautions

- Specifying a savepoint name that was not previously defined causes an error.
- It is not possible to release a savepoint when the transaction is in an aborted state.
- If multiple savepoints have the same name, only the one that was most recently defined is released.

### Syntax

```
RELEASE [SAVEPOINT] savepoint_name;
```

### Parameter Description

#### **savepoint\_name**

Specifies the name of the savepoint you want to destroy.

### Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create a table.
gaussdb=# CREATE TABLE tpcds.table1(a int);

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Insert data.
gaussdb=# INSERT INTO tpcds.table1 VALUES (3);

-- Establish a savepoint.
gaussdb=# SAVEPOINT my_savepoint;

-- Insert data.
gaussdb=# INSERT INTO tpcds.table1 VALUES (4);

-- Delete the savepoint.
gaussdb=# RELEASE SAVEPOINT my_savepoint;

-- Commit the transaction.
gaussdb=# COMMIT;

-- Query the table content, which should contain both 3 and 4.
```

```
gaussdb=# SELECT * FROM tpcds.table1;
-- Delete the table.
gaussdb=# DROP TABLE tpcds.table1;
-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## Helpful Links

[SAVEPOINT](#) and [ROLLBACK TO SAVEPOINT](#)

## 7.15.166 RESET

### Description

Restores GUC parameters to their default values. The default values are parameter default values compiled in the **postgresql.conf** configuration file.

**RESET** is an alternative spelling for:

```
SET configuration_parameter TO DEFAULT;
```

### Precautions

**RESET** and **SET** have the same transaction behavior. Their impact will be rolled back.

### Syntax

```
RESET {configuration_parameter | CURRENT_SCHEMA | TIME_ZONE | TRANSACTION ISOLATION LEVEL | SESSION AUTHORIZATION | ALL };
```

### Parameters

- **configuration\_parameter**  
Specifies the name of a settable GUC parameter.  
Value range: GUC parameters. You can view them by running the **SHOW ALL** statement.  
 **NOTE**  
Some parameters that viewed by **SHOW ALL** cannot be set by **SET**. For example, **max\_datanodes**.
- **CURRENT\_SCHEMA**  
Specifies the current schema.
- **TIME\_ZONE**  
Specifies the time zone.
- **TRANSACTION ISOLATION LEVEL**  
Specifies the transaction isolation level.
- **SESSION AUTHORIZATION**  
Specifies the current user identifier of the current session.
- **ALL**  
Resets all settable GUC parameters to default values.

## Examples

```
-- Reset timezone to the default value.
gaussdb=# RESET timezone;

-- Set all parameters to their default values.
gaussdb=# RESET ALL;
```

## Helpful Links

[SET](#) and [SHOW](#)

## 7.15.167 REVOKE

### Description

Revokes permissions from one or more roles.

### Precautions

If a non-owner user of an object attempts to the REVOKE permission on the object, the statement is executed based on the following rules:

- If the user has no permissions whatsoever on the object, the statement will fail outright.
- If an authorized user has some permissions, only the permissions with authorization options are revoked.
- If the authorized user does not have the authorization option, the **REVOKE ALL PRIVILEGES** form will issue an error message. For other forms of statements, if the permission specified in the statement does not have the corresponding authorization option, the statement will issue a warning.

### Syntax

- Revoke the permission on a specified table or view.

```
REVOKE [GRANT OPTION FOR]
 { { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | ALTER | DROP | COMMENT |
 INDEX | VACUUM }, ... }
 | ALL [PRIVILEGES] }
 ON { [TABLE] table_name [, ...]
 | ALL TABLES IN SCHEMA schema_name [, ...] }
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```
- Revoke the permission on a specified field in a table.

```
REVOKE [GRANT OPTION FOR]
 { { { SELECT | INSERT | UPDATE | REFERENCES | COMMENT } (column_name [, ...]) }, ... }
 | ALL [PRIVILEGES] (column_name [, ...]) }
 ON [TABLE] table_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```
- Revoke the permission on a specified sequence.

```
REVOKE [GRANT OPTION FOR]
 { { SELECT | UPDATE | ALTER | DROP | COMMENT }, ... }
 | ALL [PRIVILEGES] }
 ON { [SEQUENCE] sequence_name [, ...]
 | ALL SEQUENCES IN SCHEMA schema_name [, ...] }
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```

- **Revoke the permission on a specified database.**

```
REVOKE [GRANT OPTION FOR]
 { { CREATE | CONNECT | TEMPORARY | TEMP | ALTER | DROP | COMMENT } [, ...]
 | ALL [PRIVILEGES] }
 ON DATABASE database_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```
- **Revoke the permission on a specified domain.**

```
REVOKE [GRANT OPTION FOR]
 { USAGE | ALL [PRIVILEGES] }
 ON DOMAIN domain_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```
- **Revoke the specified CMK permission.**

```
REVOKE [GRANT OPTION FOR]
 { { USAGE | DROP } [, ...] | ALL [PRIVILEGES] }
 ON CLIENT_MASTER_KEYS client_master_keys_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```
- **Revoke the specified CEK permission.**

```
REVOKE [GRANT OPTION FOR]
 { { USAGE | DROP } [, ...] | ALL [PRIVILEGES]}
 ON COLUMN_ENCRYPTION_KEYS column_encryption_keys_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```
- **Revoke the permission on a specified directory.**

```
REVOKE [GRANT OPTION FOR]
 { { READ | WRITE | ALTER | DROP } [, ...] | ALL [PRIVILEGES] }
 ON DIRECTORY directory_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```
- **Revoke the permission on a specified external data source.**

```
REVOKE [GRANT OPTION FOR]
 { USAGE | ALL [PRIVILEGES] }
 ON FOREIGN_DATA_WRAPPER fdw_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```
- **Revoke the permission on a specified external server.**

```
REVOKE [GRANT OPTION FOR]
 { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
 ON FOREIGN_SERVER server_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```
- **Revoke the permission on a specified function.**

```
REVOKE [GRANT OPTION FOR]
 { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
 ON { FUNCTION {function_name ([{ [argmode] [arg_name] arg_type } [, ...]) } } [, ...]
 | ALL FUNCTIONS IN SCHEMA schema_name [, ...] }
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```
- **Revoke the permission on a specified stored procedure.**

```
REVOKE [GRANT OPTION FOR]
 { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
 ON { PROCEDURE {proc_name ([{ [argmode] [arg_name] arg_type } [, ...]) } } [, ...]
 | ALL PROCEDURE IN SCHEMA schema_name [, ...] }
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```
- **Revoke the permission on a specified procedural language.**

```
REVOKE [GRANT OPTION FOR]
 { USAGE | ALL [PRIVILEGES] }
 ON LANGUAGE lang_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```

- Revoke the permission on a specified large object.

```
REVOKE [GRANT OPTION FOR]
 { { SELECT | UPDATE } [, ...] | ALL [PRIVILEGES] }
 ON LARGE OBJECT loid [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```

- Revoke the permission on a specified schema.

```
REVOKE [GRANT OPTION FOR]
 { { CREATE | USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
 ON SCHEMA schema_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```

- Revoke the permission on a specified tablespace.

```
REVOKE [GRANT OPTION FOR]
 { { CREATE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
 ON TABLESPACE tablespace_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```

- Revoke the permission on a specified type.

```
REVOKE [GRANT OPTION FOR]
 { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
 ON TYPE type_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```

- Revoke the permission on a specified sub-cluster.

```
REVOKE [GRANT OPTION FOR]
 { { CREATE | USAGE | COMPUTE | ALTER | DROP } [, ...] | ALL [PRIVILEGES] }
 ON NODE GROUP group_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```

#### NOTE

When the **create** permission on a sub-cluster is revoked, the **usage** and **compute** permissions are revoked by default.

- Revoke the permission on a directory object.

```
REVOKE [GRANT OPTION FOR]
 { { READ | WRITE } [, ...] | ALL [PRIVILEGES] }
 ON DIRECTORY directory_name [, ...]
 FROM {[GROUP] role_name | PUBLIC} [, ...]
 [CASCADE | RESTRICT];
```

- Revoke permissions from a role.

```
REVOKE [ADMIN OPTION FOR]
 role_name [, ...] FROM role_name [, ...]
 [CASCADE | RESTRICT];
```

- Revoke the sysadmin permission from a role.

```
REVOKE ALL { PRIVILEGES | PRIVILEGE } FROM role_name;
```

- Revoke the ANY permissions.

```
REVOKE [ADMIN OPTION FOR]
 { CREATE ANY TABLE | ALTER ANY TABLE | DROP ANY TABLE | SELECT ANY TABLE | INSERT ANY
 TABLE | UPDATE ANY TABLE |
 DELETE ANY TABLE | CREATE ANY SEQUENCE | CREATE ANY INDEX | CREATE ANY FUNCTION |
 EXECUTE ANY FUNCTION |
 CREATE ANY PACKAGE | EXECUTE ANY PACKAGE | CREATE ANY TYPE | ALTER ANY TYPE | DROP ANY
 TYPE | ALTER ANY SEQUENCE | DROP ANY SEQUENCE |
 SELECT ANY SEQUENCE | ALTER ANY INDEX | DROP ANY INDEX | CREATE ANY SYNONYM | DROP
 ANY SYNONYM | CREATE ANY TRIGGER | ALTER ANY TRIGGER |
 DROP ANY TRIGGER
 } [, ...]
 FROM [GROUP] role_name [, ...];
```

- Revoke the permission on database links.

```
REVOKE { CREATE | ALTER | DROP } [PUBLIC] DATABASE LINK FROM role_name;
```

 NOTE

For details about database links, see [DATABASE LINK](#).

## Parameters

The keyword **PUBLIC** indicates an implicitly defined group that has all roles.

For details about permission types and parameters, see section "GRANT".

Permissions of a role include the permissions directly granted to the role, permissions inherited from the parent role, and permissions granted to **PUBLIC**. Therefore, revoking the **SELECT** permission for an object from **PUBLIC** does not necessarily mean that the **SELECT** permission for the object has been revoked from all roles, because the **SELECT** permission directly granted to roles and inherited from parent roles remains. Similarly, if the **SELECT** permission is revoked from a user but is not revoked from **PUBLIC**, the user can still run the **SELECT** statement.

If **GRANT OPTION FOR** is specified, the permission cannot be granted to others, but permission itself is not revoked.

If user A holds the **UPDATE** permissions on a table and the **WITH GRANT OPTION** and has granted them to user B, the permissions that user B holds are called dependent permissions. If the permissions or the grant option held by user A is revoked, the dependent permissions still exist. Those dependent permissions are also revoked if **CASCADE** is specified.

A user can only revoke permissions that were granted directly by that user. For example, if user A has granted permission with grant option (**WITH ADMIN OPTION**) to user B, and user B has in turn granted it to user C, then user A cannot revoke the permission directly from C. However, user A can revoke the grant option held by user B and use **CASCADE**. In this way, the permission of user C is automatically revoked. For another example, if both user A and user B have granted the same permission to C, A can revoke his own grant but not B's grant, so C will still effectively have the permission.

If the role executing **REVOKE** holds permissions indirectly via more than one role membership path, it is unspecified which containing role will be used to execute the statement. In such cases, you are advised to use **SET ROLE** to become the specific role you want to do the **REVOKE** as, and then execute **REVOKE**. Failure to do so may lead to deleting permissions not intended to delete, or not deleting any permissions at all.

## Examples

See [Examples](#) in section "GRANT."

## Helpful Links

[GRANT](#)

## 7.15.168 ROLLBACK

### Function

**ROLLBACK** rolls back the current transaction and backs out all updates in the transaction.

**ROLLBACK** backs out of all changes that a transaction makes to a database if the transaction fails to be executed due to a fault.

### Precautions

If a **ROLLBACK** statement is executed out of a transaction, no error occurs, but a notice is displayed.

### Syntax

```
ROLLBACK [WORK | TRANSACTION];
```

### Parameter Description

**WORK | TRANSACTION**

Specifies the optional keyword that more clearly illustrates the syntax.

### Examples

```
-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Roll back all changes.
gaussdb=# ROLLBACK;
```

### Helpful Links

[COMMIT | END](#)

## 7.15.169 ROLLBACK PREPARED

### Function

Cancels a transaction ready for two-phase committing.

### Precautions

- The function is only available in maintenance mode (when GUC parameter **xc\_maintenance\_mode** is **on**). Exercise caution when enabling the mode. It is used by maintenance engineers for troubleshooting. Common users should not use the mode.
- Only the user that initiates a transaction or the system administrator can roll back the transaction.
- The transaction function is maintained automatically by the database, and should be not visible to users.

## Syntax

```
ROLLBACK PREPARED transaction_id ;
```

## Parameter Description

**transaction\_id**

Specifies the identifier of the transaction to be committed. The identifier must be different from those for current prepared transactions.

## Helpful Links

[COMMIT PREPARED](#) and [PREPARE TRANSACTION](#)

## 7.15.170 ROLLBACK TO SAVEPOINT

### Function

Rolls back to a savepoint. It implicitly destroys all savepoints that were established after the named savepoint.

Rolls back all statements that were executed after the savepoint was established. The savepoint remains valid and can be rolled back to again later, if needed.

### Precautions

- Specifying a savepoint name that has not been established is an error.
- Cursors have somewhat non-transactional behavior with respect to savepoints. Any cursor that is opened inside a savepoint will be closed when the savepoint is rolled back. If a previously opened cursor is affected by a **FETCH** or **MOVE** statement inside a savepoint that is later rolled back, the cursor remains at the position that **FETCH** left it pointing to (that is, the cursor motion caused by **FETCH** is not rolled back). Closing a cursor is not undone by rolling back, either. A cursor whose execution causes a transaction to abort is put in a cannot-execute state, so while the transaction can be restored using **ROLLBACK TO SAVEPOINT**, the cursor can no longer be used.
- Use **ROLLBACK TO SAVEPOINT** to roll back to a savepoint. Use **RELEASE SAVEPOINT** to destroy a savepoint but keep the effects of the statements executed after the savepoint was established.

## Syntax

```
ROLLBACK [WORK | TRANSACTION] TO [SAVEPOINT] savepoint_name;
```

## Parameter Description

**savepoint\_name**

Rolls back to a savepoint.

## Examples

```
-- Undo the effects of the statements executed after my_savepoint was established:
gaussdb=# START TRANSACTION;
```

```
gaussdb=# SAVEPOINT my_savepoint;
gaussdb=# ROLLBACK TO SAVEPOINT my_savepoint;
-- Cursor positions are not affected by savepoint rollback.
gaussdb=# DECLARE foo CURSOR FOR SELECT 1 UNION SELECT 2;
gaussdb=# SAVEPOINT foo;
gaussdb=# FETCH 1 FROM foo;
?column?

1
gaussdb=# ROLLBACK TO SAVEPOINT foo;
gaussdb=# FETCH 1 FROM foo;
?column?

2
gaussdb=# RELEASE SAVEPOINT my_savepoint;
gaussdb=# COMMIT;
```

## Helpful Links

[SAVEPOINT](#) and [RELEASE SAVEPOINT](#)

## 7.15.171 SAVEPOINT

### Function

**SAVEPOINT** establishes a new savepoint within the current transaction.

A savepoint is a special mark inside a transaction. It allows all statements that are executed after it was established to be rolled back, restoring the transaction state to what it was at the time of the savepoint.

### Precautions

- Use **ROLLBACK TO SAVEPOINT** to roll back to a savepoint. Use **RELEASE SAVEPOINT** to destroy a savepoint but keep the effects of the statements executed after the savepoint was established.
- Savepoints can only be established when inside a transaction block. Multiple savepoints can be defined in a transaction.
- In the case of an unexpected termination of a distributed thread or process caused by a node or connection failure, or of an error caused by the inconsistency between source and destination table structures in a COPY FROM operation, the transaction cannot be rolled back to the established savepoint. Instead, the entire transaction will be rolled back.
- According to the SQL standard, when a savepoint with the same name is created, the previous savepoint with the same name is automatically deleted. In GaussDB, the old savepoint is retained, but only the latest one is used during rollback or release. Releasing the newer savepoint with **RELEASE SAVEPOINT** will cause the older one to again become accessible to **ROLLBACK TO SAVEPOINT** and **RELEASE SAVEPOINT**. In addition, **SAVEPOINT** fully complies with the SQL standard.

### Syntax

```
SAVEPOINT savepoint_name;
```

## Parameter Description

savepoint\_name

Specifies the name of the new savepoint.

## Examples

```
-- Create a table.
gaussdb=# CREATE TABLE table1(a int);

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Insert data.
gaussdb=# INSERT INTO table1 VALUES (1);

-- Create a savepoint.
gaussdb=# SAVEPOINT my_savepoint;

-- Insert data.
gaussdb=# INSERT INTO table1 VALUES (2);

-- Roll back the savepoint.
gaussdb=# ROLLBACK TO SAVEPOINT my_savepoint;

-- Insert data.
gaussdb=# INSERT INTO table1 VALUES (3);

-- Commit the transaction.
gaussdb=# COMMIT;

-- Query the content of the table. You can see 1 and 3 at the same time, but cannot see 2 because 2 is
rolled back.
gaussdb=# SELECT * FROM table1;

-- Delete the table.
gaussdb=# DROP TABLE table1;

-- Create a table.
gaussdb=# CREATE TABLE table2(a int);

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Insert data.
gaussdb=# INSERT INTO table2 VALUES (3);

-- Create a savepoint.
gaussdb=# SAVEPOINT my_savepoint;

-- Insert data.
gaussdb=# INSERT INTO table2 VALUES (4);

-- Roll back the savepoint.
gaussdb=# RELEASE SAVEPOINT my_savepoint;

-- Commit the transaction.
gaussdb=# COMMIT;

-- Query the table content. You can see 3 and 4 at the same time.
gaussdb=# SELECT * FROM table2;

-- Delete the table.
gaussdb=# DROP TABLE table2;
```

## Helpful Links

[RELEASE SAVEPOINT](#) and [ROLLBACK TO SAVEPOINT](#)

## 7.15.172 SELECT

### Description

SELECT retrieves data from tables or views.

Serving as an overlaid filter on database tables, the SELECT statement uses SQL keywords to filter data tables and extract the required data.

### Precautions

- The owner of a table, users granted with the SELECT permission on the table, or users granted with the SELECT ANY TABLE permission can read data in the table or view. The system administrator has the permission to read data in the table or view by default.
- Using SELECT can join ordinary tables, but cannot join ordinary and GDS foreign tables. That is, the SELECT statement cannot contain both an ordinary table and a GDS foreign table.
- You must have the SELECT permission on each field used in the SELECT statement.
- UPDATE permission is required when FOR UPDATE or FOR SHARE is used.

### Syntax

- Query data.

```
[WITH [RECURSIVE] with_query [, ...]]
SELECT [/*+ plan_hint */] [ALL | DISTINCT [ON (expression [, ...])]]
 { * | {expression [[AS] output_name]} [, ...] }
 [FROM from_item [, ...]]
 [WHERE condition]
 [GROUP BY grouping_element [, ...]]
 [HAVING condition [, ...]]
 [WINDOW {window_name AS (window_definition)} [, ...]]
 [{ UNION | INTERSECT | EXCEPT | MINUS } [ALL | DISTINCT] select]
 [ORDER BY {expression [[ASC | DESC | USING operator] | nlssort_expression_clause] [NULLS { FIRST |
LAST } }] [, ...]]
 [LIMIT { [offset,] count | ALL }]
 [OFFSET start [ROW | ROWS]]
 [FETCH { FIRST | NEXT } [count] { ROW | ROWS } ONLY]
 [{FOR { UPDATE | SHARE } [OF table_name [, ...]] [NOWAIT | WAIT N]} [...]]
TABLE { ONLY { (table_name) | table_name } | table_name [*]};
```

 NOTE

In condition and expression, you can use the aliases of expressions in **targetlist** in compliance with the following rules:

- Reference only within the same level.
- Reference only the aliases in the target list.
- Reference a prior expression in a subsequent expression.
- Volatile functions cannot be used.
- Window functions cannot be used.
- Aliases cannot be referenced in the condition of JOIN ON.
- An error is reported if the target list contains multiple aliases to be referenced.
- The subquery **with\_query** is as follows:  
with\_query\_name [ ( column\_name [, ...] ) ]  
AS [ [ NOT ] MATERIALIZED ] ( {select | values | insert | update | delete} )
- The specified query source **from\_item** is as follows:  
{ [ ONLY ] table\_name [ \* ] [ partition\_clause ] [ [ AS ] alias [ ( column\_alias [, ...] ) ] ]  
[ TABLESAMPLE sampling\_method ( argument [, ...] ) [ REPEATABLE ( seed ) ] ]  
[ ( select ) [ AS ] alias [ ( column\_alias [, ...] ) ] ]  
[with\_query\_name [ [ AS ] alias [ ( column\_alias [, ...] ) ] ] ]  
[function\_name ( [ argument [, ...] ] ) [ AS ] alias [ ( column\_alias [, ...] | column\_definition [, ...] ) ]  
[function\_name ( [ argument [, ...] ] ) AS ( column\_definition [, ...] ) ]  
[from\_item unpivot\_clause  
[from\_item pivot\_clause  
[from\_item [ NATURAL ] join\_type from\_item [ ON join\_condition | USING ( join\_column [, ...] ) ] ] }
- The GROUP clause is as follows:  
( )  
| expression  
| ( expression [, ...] )  
| ROLLUP ( { expression | ( expression [, ...] ) } [, ...] )  
| CUBE ( { expression | ( expression [, ...] ) } [, ...] )  
| GROUPING SETS ( grouping\_element [, ...] )
- The specified partition **partition\_clause** is as follows:  
PARTITION { ( partition\_name ) |  
FOR ( partition\_value [, ...] ) }

 NOTE

The specified partition applies only to ordinary tables.

- The sorting order **nlssort\_expression\_clause** is as follows:  
NLSSORT ( column\_name, ' NLS\_SORT = { SCHINESE\_PINYIN\_M | generic\_m\_ci } ' )  
The second parameter can be **generic\_m\_ci**, which supports only the case-insensitive order for English characters.
- Simplified query syntax, equivalent to **select \* from table\_name**.  
TABLE { ONLY {(table\_name)| table\_name} | table\_name [ \* ]};

## Parameters

- **WITH [ RECURSIVE ] with\_query [, ...]**  
Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table. This subquery statement structure is called the common table expression (CTE) structure. When this structure is used, the execution plan contains the CTE SCAN content.  
If **RECURSIVE** is specified, it allows a **SELECT** subquery to reference itself by name.

The detailed format of **with\_query** is as follows: **with\_query\_name** [ ( **column\_name** [, ...] ) ] **AS** [ [ **NOT** ] **MATERIALIZED** ] ( {**select** | **values** | **insert** | **update** | **delete**} )

- **with\_query\_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.
- **column\_name** specifies the column name displayed in the subquery result set.
- Each subquery can be a **SELECT**, **VALUES**, **INSERT**, **UPDATE** or **DELETE** statement.
- **RECURSIVE** can appear only after **WITH**. In the case of multiple CTEs, you only need to declare **RECURSIVE** at the first CTE.
- You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE. Currently, only inline execution is supported for stream plans. In this case, this syntax does not take effect.
  - If **MATERIALIZED** is specified, the **WITH** query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the **WITH** subquery cannot be jointly optimized with the **SELECT** statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the **WITH** query can be executed as a subquery inline, the preceding optimization can be performed.
  - If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the **SELECT** statement trunk to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.
- **plan\_hint** clause

Follows the **SELECT** keyword in the */\*+<Plan hint> \*/* format. It is used to optimize the plan of a **SELECT** statement block. For details, see [Hint-based Tuning](#). In each statement, only the first */\*+ plan\_hint \*/* comment block takes effect as a hint. Multiple hints can be written.
- **ALL**

Specifies that all rows that meet the conditions are returned. This is the default behavior and can be omitted.
- **DISTINCT [ ON ( expression [, ...] ) ]**

Removes all duplicate rows from the **SELECT** result set so one row is kept from each group of duplicates.

Retains only the first row in the set of rows that have the same result calculated on the given expression.

**NOTICE**

**DISTINCT ON** expression is explained with the same rule of **ORDER BY**. Unless you use **ORDER BY** to ensure that the required row appears first, you cannot know what the first row is.

- **SELECT list**

Specifies the name of a column in the table to be queried. The value can be a part of the column name or all of the column names. The wildcard (\*) is used to represent the column name.

You may use the **AS output\_name** clause to give an alias for an output column. The alias is used for the displaying of the output column. The name, value, and type keywords can be used as column aliases.

Column names can be expressed in the following formats:

- Manually input column names which are spaced using commas (,).
- Columns computed in the **FROM** clause.

- **FROM clause**

Specifies one or more source tables for **SELECT**.

The **FROM** clause can contain the following elements:

- table\_name

Specifies the name of a table or view. The schema name can be added before the table name or view name, for example, schema\_name.table\_name.

 **NOTE**

You can use database link to perform operations on remote tables and synonyms. For details, see [DATABASE LINK](#).

- alias

Gives a temporary alias to a table to facilitate the quotation by other queries.

An alias is used for brevity or to eliminate ambiguity for self-joins. If an alias is provided, it completely replaces the actual name of the table.

**NOTICE**

If an alias is specified for the table created by **joined\_table** and **joined\_table** is wrapped, that is, (**joined\_table**), non-reserved keywords UNPIVOT and PIVOT cannot be used as aliases.

- TABLESAMPLE *sampling\_method* ( *argument* [, ...] ) [ REPEATABLE ( *seed* ) ]

The **TABLESAMPLE** clause following *table\_name* specifies that the specified *sampling\_method* should be used to retrieve the subset of rows in the table.

The optional **REPEATABLE** clause specifies the number of seeds used to generate random numbers in the sampling method. The seed value can be any non-null constant value. If the table was not changed during the

query, the two queries having the same seed and *argument* values will select the same sampling in this table. However, different seed values usually generate different samples. If **REPEATABLE** is not specified, a new random sample will be selected for each query based on the seed generated by the system.

- TIMECAPSULE { TIMESTAMP | CSN } expression

Queries the table data of a specified CSN or at a specified time point.

Currently, the following tables do not support flashback query: system catalogs, DFS tables, global temporary tables, local temporary tables, unlogged tables, views, sequence tables, hash bucket tables, shared tables, and inherited tables.

- TIMECAPSULE TIMESTAMP

Searches for the result set of a specified time point based on the date as the flashback query flag. *date* must be a valid past timestamp

- TIMECAPSULE CSN

Searches for the result set of a specified CSN point based on the CSN flashback of the table as the flashback query flag. The CSN can be obtained from **snpcsn** recorded in **gs\_txn\_snapshot**.

#### NOTE

- A flashback query cannot span statements that affect the table structure or physical storage. Otherwise, an error is reported. Between the flashback point and the current point, if a statement (TRUNCATE, DDL, DCL, or VACUUM FULL) has been executed to modify the table structure or affect physical storage, the flashback fails.
- Flashback query does not support index query. Flashback query supports only seqScan for full table scanning.
- When the flashback point is too old, the old version cannot be obtained because the flashback version is recycled. As a result, the flashback fails and the error message "Restore point too old" is displayed.
- The flashback point is specified by time. The maximum difference between the flashback point and the actual time is 3 seconds.
- After truncating a table, perform a flashback query or flashback on the table. The error message "Snapshot too old" is displayed when a flashback is performed at a specified time point. Data cannot be found or the error message "Snapshot too old" is reported during the CSN-based flashback.
- In the GTM-Free scenario, each node uses the local CSN and does not have a globally unified CSN. Therefore, flashback in CSN mode is not supported.

- column\_alias

Specifies the column alias.

- PARTITION

Queries data in the specified partition in a partitioned table.

- partition\_name

Specifies the name of a partition.

- partition\_value

Specifies the value of the specified partition key. If there are many partition keys, use the **PARTITION FOR** clause to specify the value of the only partition key you want to use.

- subquery

Performs a subquery in the **FROM** clause. A temporary table is created to save subquery results.

- with\_query\_name

Specifies that the **WITH** clause can also be used as the source of the **FROM** clause and can be referenced by the name of the **WITH** query.

- function\_name

Function name. Function calls can appear in the **FROM** clause.

- join\_type

The options are as follows:

- [ INNER ] JOIN

A **JOIN** clause combines two **FROM** items. You can use parentheses to determine the order of nesting. In the absence of parentheses, **JOIN** nests left-to-right.

In any case, **JOIN** binds more tightly than the commas separating **FROM** items.

- LEFT [ OUTER ] JOIN

Returns all rows that meet join conditions in the Cartesian product, plus those rows that do not match the right table rows in the left table by join conditions. This left-hand row is extended to the full width of the joined table by inserting **NULL** values for the right-hand columns. Note that only the **JOIN** clause's own condition is considered while the system decides which rows have matches. Outer conditions are applied afterward.

- RIGHT [ OUTER ] JOIN

Returns all the joined rows, plus one row for each unmatched right-hand row (extended with **NULL** on the left).

This is just a notational convenience, since you could convert it to a **LEFT OUTER JOIN** by switching the left and right inputs.

- FULL [ OUTER ] JOIN

Returns all the joined rows, plus one row for each unmatched left-hand row (extended with **NULL** on the right), and plus one row for each unmatched right-hand row (extended with **NULL** on the left).

- CROSS JOIN

Is equivalent to **INNER JOIN ON (TRUE)**, which means no rows are removed by qualification. These join types are just a notational convenience, since they do nothing you could not do with plain **FROM** and **WHERE**.

 NOTE

For the **INNER** and **OUTER** join types, a join condition must be specified, namely exactly one of **NATURAL ON**, **join\_condition**, or **USING (join\_column [, ...])**. For **CROSS JOIN**, none of these clauses can appear.

**CROSS JOIN** and **INNER JOIN** produce a simple Cartesian product, the same result as you get from listing the two items at the top level of **FROM**.

- ON join\_condition

Defines which rows have matches in joins. Example: ON left\_table.a = right\_table.a You are advised not to use numeric types such as int for **join\_condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

- USING(join\_column[, ...])

ON left\_table.a = right\_table.a AND left\_table.b = right\_table.b ... abbreviation. Corresponding columns must have the same name.

- NATURAL

Is a shorthand for a **USING** list that mentions all columns in the two tables that have the same names.

- from item

Specifies the name of the query source object connected.

- unpivot\_clause

Converts a column to a row. The syntax format is as follows:

```
UNPIVOT [{INCLUDE | EXCLUDE} NULLS]
(
 unpivot_col_clause
 unpivot_for_clause
 unpivot_in_clause
)
```

- {INCLUDE | EXCLUDE} NULLS

Controls whether the converted result contains NULL rows. **INCLUDE NULLS** indicates that the converted results contain NULL rows.

**EXCLUDE NULLS** indicates that the converted results do not contain NULL rows. If this clause is ignored, the unpivot operation removes NULL rows from the converted results by default.

- unpivot\_col\_clause

```
unpivot_col_element
```

**unpivot\_col\_element** specifies the output column names. These columns store the values to be converted.

- unpivot\_col\_element

```
{ column | (column [, column]...) }
```

unpivot\_col\_element has two forms: column and ( column [, column]... ).

- unpivot\_for\_clause

```
FOR { unpivot_col_element }
```

**unpivot\_col\_element** contained in the **unpivot\_for\_clause** is used to specify the output column names. These columns store the alias and names of the column to be converted.

- **unpivot\_in\_clause**  
IN ( unpivot\_in\_element [,unpivot\_in\_element...])  
**unpivot\_in\_clause** specifies the columns to be converted. The column names and column values are saved in the previously specified output columns.
  - unpivot\_in\_element  
{ unpivot\_col\_element }[ AS { unpivot\_alias\_element } ]  
**unpivot\_col\_element** specifies the column to be converted. If ( column [, column]...) is used to specify the column to be converted, the *column* names are connected by underscores ( \_ ) and saved in the output columns. For example, IN ((col1, col2)) generates the column name "col1\_col2" and saves it in the output column specified by **unpivot\_for\_clause**. In addition, the AS keyword can be used to specify an alias for the column to be converted. Once an alias is specified, the alias is saved in the output column instead of the name of column to be converted.
- unpivot\_alias\_element  
{ alias | ( alias [, alias]... ) }  
Similar to **unpivot\_col\_element**, **unpivot\_alias\_element** has two forms. **alias** indicates the specified alias.

---

**NOTICE**

Currently, **unpivot\_clause** has the following restrictions:

- This parameter can be used only in ORA compatibility mode.
- The **unpivot\_clause** clause cannot be used with hints.
- For **unpivot\_col\_clause**, the number of output columns specified by **unpivot\_col\_element** must be the same as that of **unpivot\_col\_element** contained in **unpivot\_in\_clause**.
- For **unpivot\_for\_clause**, the number of output columns specified by **unpivot\_col\_element** must be the same as the number of aliases specified by **unpivot\_alias\_element** contained in **unpivot\_in\_clause**.
- For **unpivot\_in\_clause**, the alias must be a constant or an expression that can be converted to a constant.
- For **unpivot\_in\_clause**, constant expressions support only IMMUTABLE functions.
- For all **unpivot\_col\_element** parameters contained in **unpivot\_in\_clause**, if the column types in the same position of these **unpivot\_col\_element** parameters are different, UNPIVOT attempts to convert the column types in order to convert the values of columns to be converted to a public type. Similarly, for all **unpivot\_alias\_element** parameters, if the alias types of these **unpivot\_alias\_element** parameters in the same position are different, UNPIVOT attempts to do the similar type conversion.

For example, assume that there is an **unpivot\_in\_clause** in the form of IN (col1, col2), where col1 is of the int type and col2 is of the float type, UNPIVOT attempts to convert the column value of col1 to the public type float during the calculation.

## - pivot\_clause

Converts a row into column. The syntax format is as follows:

```
PIVOT [XML]
(aggregate_function (expr) [[AS] alias]
 [, aggregate_function (expr) [[AS] alias]]...
 pivot_for_clause
 pivot_in_clause
)
```

## ▪ aggregate\_function ( expr ) [[AS] alias ]

Aggregates calculation on a given expression. The calculation result is saved in the output column specified by **pivot\_in\_clause**. [AS] alias (The AS keyword can be omitted.) can be used to specify an alias for **aggregate\_function**. The alias is appended to the output column name specified by **pivot\_in\_clause** in the format of "\_alias".

## ▪ pivot\_for\_clause

```
FOR { column
 | (column [, column]...)
}
```

Specifies the row to be converted. The **column** indicates a column of the row to be converted.

## ▪ pivot\_in\_clause

```
IN ({ { { expr
 | (expr [, expr]...)
 } [[AS] alias]
 }...
}
```

Specifies the name of the output column. The column name can consist of one or more expressions, for example, (expr1, expr2). When a column name consists of multiple expressions, these expressions are connected by underscores (\_) in sequence. That is, the output column name corresponding to (expr1, expr2) is "expr1\_expr2". These expressions not only generate output column names, but also determine the time when the aggregation function is triggered. If the values of row to be converted is the same as the value of these expressions, the results calculated by **aggregate\_function** are saved in the output column names that consist of these expressions. Assume that expr1 is "1" and expr2 is "2". For row "1 2", **aggregate\_function** is used for calculation. For row "1 1", the calculation is not triggered.

**NOTICE**

Currently, **pivot\_clause** has the following restrictions:

- This parameter can be used only in ORA compatibility mode.
- The **pivot\_clause** clause cannot be used with hints.
- If more than one **aggregate\_function** is specified, at most one **aggregate\_function** is allowed to have no alias, the rest of the **aggregate\_function** functions are required to specify an alias.
- XML supports only syntax but does not support functions.
- The expression in **pivot\_in\_clause** can be a constant or an expression that can be converted to a constant. If the expression is not a unary expression, specify an alias for the expression.
- For **pivot\_in\_clause**, constant expressions support only IMMUTABLE functions.
- For the expression in **pivot\_in\_clause**, when the keyword AS is used to specify an alias for the expression, only the non-reserved keywords can be used as aliases.
- If the length of an output column name exceeds 63 characters, subsequent characters will not be printed.

- **WHERE clause**

Forms an expression for row selection to narrow down the query range of **SELECT**. **condition** indicates any expression that returns a value of Boolean type. Rows that do not meet this condition will not be retrieved. You are advised not to use numeric types such as int for **condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

In the **WHERE** clause, you can use the operator (+) to convert a table join to an outer join. However, this method is not recommended because it is not the standard SQL syntax and may raise syntax compatibility issues during platform migration. There are many restrictions on using the operator (+):

- a. It can appear only in the **WHERE** clause.
- b. If a table join has been specified in the **FROM** clause, the operator (+) cannot be used in the **WHERE** clause.
- c. The operator (+) can work only on columns of tables or views, instead of on expressions.
- d. If table A and table B have multiple join conditions, the operator (+) must be specified in all the conditions. Otherwise, the operator (+) will not take effect, and the table join will be converted into an inner join without any prompt information.
- e. Tables specified in a join condition where the operator (+) works cannot cross queries or subqueries. If tables where the operator (+) works are not in the **FROM** clause of the current query or subquery, an error will be reported. If a peer table for the operator (+) does not exist, no error will be reported and the table join will be converted into an inner join.
- f. Expressions where the operator (+) is used cannot be directly connected through **OR**.

- g. If a column where the operator (+) works is compared with a constant, the expression becomes a part of the join condition.
- h. A table cannot have multiple foreign tables.
- i. The operator (+) can appear only in the following expressions: comparison, NOT, ANY, ALL, IN, NULLIF, IS DISTINCT FROM, and IS OF. It is not allowed in other types of expressions. In addition, these expressions cannot be connected through **AND** or **OR**.
- j. The operator (+) can be used to convert a table join only to a left or right outer join, instead of a full join. That is, the operator (+) cannot be specified on both tables of an expression.

---

**NOTICE**

For the **WHERE** clause, if special character %, \_, or \ is queried in **LIKE**, add the slash \ before each character.

---

**GROUP BY clause**

Condenses query results into a single row all selected rows that share the same values for the grouped expressions.

- CUBE ( { expression | ( expression [, ...] ) } [, ...] )

A CUBE grouping is an extension to the **GROUP BY** clause that creates subtotals for all of the possible combinations of the given list of grouping columns (or expressions). In terms of multidimensional analysis, CUBE generates all the subtotals that could be calculated for a data cube with the specified dimensions. For example, given three expressions ( $n=3$ ) in the CUBE clause, the operation results in  $2^n = 2^3 = 8$  groupings. Rows grouped on the values of  $n$  expressions are called regular rows, and the rest are called superaggregate rows.

- GROUPING SETS ( grouping\_element [, ...] )

Another extension to the **GROUP BY** clause. It allows users to specify multiple **GROUP BY** clauses. This improves efficiency by trimming away unnecessary data. After you specify the set of groups that you want to create using a **GROUPING SETS** expression within a **GROUP BY** clause, the database does not need to compute a whole **ROLLUP** or **CUBE**.

---

**NOTICE**

- If a SELECT list expression references ungrouped columns and no aggregate function is used, an error is reported. This is because multiple values may be returned for ungrouped columns.
- If a SELECT list expression references a constant, the GROUP BY clause does not need to group the constant. Otherwise, an error is reported.

---

**HAVING clause**

Selects special groups by working with the **GROUP BY** clause. The **HAVING** clause compares some attributes of groups with a constant. Only groups that matching the logical expression in the **HAVING** clause are extracted.

- **WINDOW clause**

The general format is **WINDOW window\_name AS ( window\_definition ) [ , ... ]**. **window\_name** is a name can be referenced by **window\_definition**. **window\_definition** can be expressed in the following forms:

[ existing\_window\_name ]

[ PARTITION BY expression [ , ... ] ]

[ ORDER BY expression [ ASC | DESC | USING operator ] [ NULLS { FIRST | LAST } ] [ , ... ] ]

[ frame\_clause ]

**frame\_clause** defines a **window frame** for the window function. The window function (not all window functions) depends on **window frame** and **window frame** is a set of relevant rows of the current query row. **frame\_clause** can be expressed in the following forms:

[ RANGE | ROWS ] frame\_start

[ RANGE | ROWS ] BETWEEN frame\_start AND frame\_end

**frame\_start** and **frame\_end** can be expressed in the following forms:

UNBOUNDED PRECEDING

value PRECEDING

CURRENT ROW

value FOLLOWING

UNBOUNDED FOLLOWING

- **UNION clause**

Computes the set union of the rows returned by the involved **SELECT** statements.

The **UNION** clause has the following constraints:

- By default, the result of **UNION** does not contain any duplicate rows unless the **ALL** clause is declared.
- Multiple **UNION** operators in the same **SELECT** statement are evaluated left to right, unless otherwise specified by parentheses.
- **FOR UPDATE** cannot be specified either for a **UNION** result or for any input of a **UNION**.

General expression:

select\_statement UNION [ALL] select\_statement

- **select\_statement** can be any **SELECT** statement without an **ORDER BY**, **LIMIT**, or **FOR UPDATE** statement.
- **ORDER BY** and **LIMIT** can be attached to the subexpression if it is enclosed in parentheses.

- **INTERSECT clause**

Computes the set intersection of rows returned by the involved **SELECT** statements. The result of **INTERSECT** does not contain any duplicate rows.

The **INTERSECT** clause has the following constraints:

- Multiple **INTERSECT** operators in the same **SELECT** statement are evaluated left to right, unless otherwise specified by parentheses.
- Processing **INTERSECT** preferentially when **UNION** and **INTERSECT** operations are executed for results of multiple **SELECT** statements.

General format:

```
select_statement INTERSECT select_statement
```

**select\_statement** can be any **SELECT** statement without a **FOR UPDATE** clause.

- **EXCEPT clause**

Has the following common form:

```
select_statement EXCEPT [ALL] select_statement
```

**select\_statement** can be any **SELECT** statement without a **FOR UPDATE** clause.

The **EXCEPT** operator computes the set of rows that are in the result of the left **SELECT** statement but not in the result of the right one.

The result of **EXCEPT** does not contain any duplicate rows unless the **ALL** clause is declared. To execute **ALL**, a row that has  $m$  duplicates in the left table and  $n$  duplicates in the right table will appear  $\text{MAX}(m-n, 0)$  times in the result set.

Multiple **EXCEPT** operators in the same **SELECT** statement are evaluated left to right, unless parentheses dictate otherwise. **EXCEPT** binds at the same level as **UNION**.

Currently, **FOR UPDATE** cannot be specified either for an **EXCEPT** result or for any input of an **EXCEPT**.

- **MINUS clause**

Has the same function and syntax as **EXCEPT** clause.

- **ORDER BY clause**

Sorts data retrieved by **SELECT** in descending or ascending order. If the **ORDER BY** expression contains multiple columns:

- If two columns are equal according to the leftmost expression, they are compared according to the next expression and so on.
- If they are equal according to all specified expressions, they are returned in an implementation-dependent order.
- When used with the **DISTINCT** keyword, the columns to be sorted in **ORDER BY** must be included in the columns of the result set retrieved by the **SELECT** statement.
- When used with the **GROUP BY** clause, the columns to be sorted in **ORDER BY** must be included in the columns of the result set retrieved by the **SELECT** statement.

---

**NOTICE**

To support Chinese pinyin order, set the encoding format to **UTF-8**, **GB18030**, **GB18030\_2022**, or **GBK** when initializing the database. The statements are as follows:

```
initdb -E UTF8 -D ../data -locale=zh_CN.UTF-8, initdb -E GB18030 -D ../data -locale=zh_CN.GB18030, initdb -E GB18030_2022 -D ../data -locale=zh_CN.GB18030, or initdb -E GBK -D ../data -locale=zh_CN.GBK.
```

- **LIMIT clause**

Consists of two independent sub-clauses:

LIMIT { count | ALL }

**OFFSET start count** specifies the maximum number of rows to return, while **start** specifies the number of rows to skip before starting to return rows. When both are specified, **start** rows are skipped before starting to count the **count** rows to be returned.

ROWNUM cannot be used as count or offset in the LIMIT clause.

- **OFFSET clause**

The SQL: 2008 standard has introduced a different clause:

OFFSET start { ROW | ROWS }

**start** specifies the number of rows to skip before starting to return rows.

- **FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY**

If **count** is omitted in a **FETCH** clause, it defaults to 1.

- **FOR UPDATE clause**

The **FOR UPDATE** clause locks the rows retrieved by **SELECT**. This ensures that the rows cannot be modified or deleted by other transactions until the current transaction ends. That is, other transactions that attempt **UPDATE**, **DELETE**, or **SELECT FOR UPDATE** of these rows will be blocked until the current transaction ends.

To prevent the operation from waiting for the commit of other transactions, you can use **NOWAIT**. If the selected row cannot be locked immediately, an error is reported immediately when you execute **SELECT FOR UPDATE NOWAIT**. If you use **WAIT N** and the selected row cannot be locked immediately, the operation needs to wait for *N* seconds (the value of *N* is of the int type with a range of  $0 \leq N \leq 2147483$ ). If the lock is obtained within *N* seconds, the operation is performed normally. Otherwise, an error is reported.

**FOR SHARE** behaves similarly, except that it acquires a shared rather than exclusive lock on each retrieved row. A share lock blocks other transaction from performing **UPDATE**, **DELETE**, or **SELECT FOR UPDATE** on these rows, but it does not prevent them from performing **SELECT FOR SHARE**.

If specified tables are named in **FOR UPDATE** or **FOR SHARE**, then only rows coming from those tables are locked. Any other tables used in **SELECT** are simply read as usual. Otherwise, locking all tables in the statement.

If **FOR UPDATE** or **FOR SHARE** is applied to a view or sub-query, it affects all tables used in the view or sub-query.

Multiple **FOR UPDATE** and **FOR SHARE** clauses can be written if it is necessary to specify different locking behaviors for different tables.

If the same table is mentioned (or implicitly affected) by both **FOR UPDATE** and **FOR SHARE** clauses, it is processed as **FOR UPDATE**. Similarly, a table is processed as **NOWAIT** if that is specified in any of the clauses affecting it.

**NOTICE**

- For SQL statements containing **FOR UPDATE** or **FOR SHARE**, their execution plans will be pushed down to DNs. If the pushdown fails, an error will be reported.
- The query of row number contained in the projection column or WHERE conditions does not support **for update/share**.
- For the FOR UPDATE/SHARE statements whose subquery is a stream plan, the same locked row cannot be concurrently updated.
- For the ORDER BY FOR UPDATE/SHARE statement, the execution sequence of the SORT and LOCKROW operators in the stream plan is different from that in other plans. In the stream plan, LOCK is executed before SORT. In other plans, SORT is executed before LOCK. The reason is that if the data in the stream plan is not on the current DN, the data needs to be redistributed and locked on the original DN. After redistribution, data becomes disordered. Therefore, the SORT operator needs to be added. If SORT is performed before LOCK, the original ordered data becomes disordered again. In this case, the SORT operator is meaningless and can be eliminated. The final plan execution sequence is changed from **sort > lock > sort** to **lock > sort**.
- In scenarios where FOR UPDATE/SHARE statements are concurrently executed, ORDER BY is used to sort data to avoid deadlocks. This method is not feasible for distributed systems because the DN lock sequence cannot be ensured by ORDER BY. In addition, adding ORDER BY causes performance overhead. Therefore, you are advised not to add ORDER BY to solve the deadlock problem.

**NLS\_SORT**

Specifies that a field is sorted in a special order. Currently, only Chinese Pinyin and case-insensitive sorting are supported. To support this sorting mode, you need to set the encoding format to UTF8, GB18030, GB18030\_2022, or GBK when creating a database. If you set the encoding format to another format, for example, SQL\_ASCII, an error may be reported or the sorting mode may be invalid.

Value range:

- **SCHINESE\_PINYIN\_M**, sorted by Pinyin order.
- **generic\_m\_ci**: sorted in case-insensitive order (optional; only English characters are supported in the case-insensitive order.)

**PARTITION clause**

Queries data in the specified partition in a partitioned table.

**Examples**

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
);
```

```
-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.reason values(3,'AAAAAAAABAAAAAAAA','reason 1'),
(10,'AAAAAAAABAAAAAAAA','reason 2'),(4,'AAAAAAAABAAAAAAAA','reason 3'),
(10,'AAAAAAAABAAAAAAAA','reason 4'),(10,'AAAAAAAABAAAAAAAA','reason 5'),
(20,'AAAAAAACAAAAAA','N%reason 6'),(30,'AAAAAAACAAAAAA','W%reason 7');

-- Obtain the temp_t temporary table by a subquery and query all records in this table.
gaussdb=# WITH temp_t(name,isdba) AS (SELECT username,usesuper FROM pg_user) SELECT * FROM
temp_t;

-- Query all r_reason_sk records in the tpcds.reason table and delete duplicate records:
gaussdb=# SELECT DISTINCT(r_reason_sk) FROM tpcds.reason;

-- Example of a LIMIT clause: Obtain a record from the table.
gaussdb=# SELECT * FROM tpcds.reason LIMIT 1;

-- Query all records and sort them in alphabetic order.
gaussdb=# SELECT r_reason_desc FROM tpcds.reason ORDER BY r_reason_desc;

-- Use table aliases to obtain data from the pg_user and pg_user_status tables:
gaussdb=# SELECT a.username,b.locktime FROM pg_user a,pg_user_status b WHERE a.usesysid=b.rolid;

-- Example of the FULL JOIN clause: Join data in the pg_user and pg_user_status tables.
gaussdb=# SELECT a.username,b.locktime,a.usesuper FROM pg_user a FULL JOIN pg_user_status b on
a.usesysid=b.rolid;

-- Example of the GROUP BY clause: Filter data based on query conditions, and group the results.
gaussdb=# SELECT r_reason_id, AVG(r_reason_sk) FROM tpcds.reason GROUP BY r_reason_id HAVING
AVG(r_reason_sk) > 25;

-- Example of the GROUP BY CUBE clause: Filter data based on query conditions, and group the results.
gaussdb=# SELECT r_reason_id,AVG(r_reason_sk) FROM tpcds.reason GROUP BY
CUBE(r_reason_id,r_reason_sk);

-- Example of the GROUP BY GROUPING SETS clause: Filter data based on query conditions, and group the
results.
gaussdb=# SELECT r_reason_id,AVG(r_reason_sk) FROM tpcds.reason GROUP BY GROUPING
SETS((r_reason_id,r_reason_sk),r_reason_sk);

-- Example of the UNION clause: Merge the names started with W and N in the r_reason_desc column in
the tpcds.reason table.
gaussdb=# SELECT r_reason_sk, tpcds.reason.r_reason_desc
FROM tpcds.reason
WHERE tpcds.reason.r_reason_desc LIKE 'W%'
UNION
SELECT r_reason_sk, tpcds.reason.r_reason_desc
FROM tpcds.reason
WHERE tpcds.reason.r_reason_desc LIKE 'N%';

-- Example of the NLS_SORT clause: Sort by Chinese Pinyin.
gaussdb=# SELECT * FROM tpcds.reason ORDER BY NLSSORT(r_reason_desc, 'NLS_SORT =
SCHINESE_PINYIN_M');

-- sorting by case-insensitive order (optional; only English characters are supported in the case-insensitive
order.)
gaussdb=# SELECT * FROM tpcds.reason ORDER BY NLSSORT(r_reason_desc, 'NLS_SORT = generic_m_ci');

-- Create a partitioned table tpcds.reason_p:
gaussdb=# CREATE TABLE tpcds.reason_p
(
r_reason_sk integer,
r_reason_id character(16),
r_reason_desc character(100)
)
PARTITION BY RANGE (r_reason_sk)
(
partition P_05_BEFORE values less than (05),
```

```
partition P_15 values less than (15),
partition P_25 values less than (25),
partition P_35 values less than (35),
partition P_45_AFTER values less than (MAXVALUE)
)
;

-- Insert data.
gaussdb=# INSERT INTO tpcds.reason_p values(3,'AAAAAAAABAAAAAAAA','reason 1'),
(10,'AAAAAAAABAAAAAAAA','reason 2'),(4,'AAAAAAAABAAAAAAAA','reason 3'),
(10,'AAAAAAAABAAAAAAAA','reason 4'),(10,'AAAAAAAABAAAAAAAA','reason 5'),
(20,'AAAAAAAACAAAAAAAAA','reason 6'),(30,'AAAAAAAACAAAAAAAAA','reason 7');

-- Example of the PARTITION clause: Obtain data from the P_05_BEFORE partition in the tpcds.reason_p
table.
gaussdb=# SELECT * FROM tpcds.reason_p PARTITION (P_05_BEFORE);
 r_reason_sk | r_reason_id | r_reason_desc
-----+-----+-----
 3 | AAAAAAAAABAAAAAAAA | reason 1
 4 | AAAAAAAAABAAAAAAAA | reason 3
(2 rows)

-- Example of the GROUP BY clause: Group records in the tpcds.reason_p table by r_reason_id, and count
the number of records in each group.
gaussdb=# SELECT COUNT(*),r_reason_id FROM tpcds.reason_p GROUP BY r_reason_id;
 count | r_reason_id
-----+-----
 2 | AAAAAAAAACAAAAAAAAA
 5 | AAAAAAAAABAAAAAAAA
(2 rows)

-- Example of the GROUP BY CUBE clause: Filter data based on query conditions, and group the results.
gaussdb=# SELECT * FROM tpcds.reason GROUP BY CUBE (r_reason_id,r_reason_sk,r_reason_desc);

-- Example of the GROUP BY GROUPING SETS clause: Filter data based on query conditions, and group the
results.
gaussdb=# SELECT * FROM tpcds.reason GROUP BY GROUPING SETS
((r_reason_id,r_reason_sk),r_reason_desc);

-- Example of the HAVING clause: Group records in the tpcds.reason_p table by r_reason_id, count the
number of records in each group, and display only values whose number of r_reason_id is greater than 2.
gaussdb=# SELECT COUNT(*) c,r_reason_id FROM tpcds.reason_p GROUP BY r_reason_id HAVING c>2;
 c | r_reason_id
---+-----
 5 | AAAAAAAAABAAAAAAAA
(1 row)

-- Example of the IN clause: Group records in the tpcds.reason_p table by r_reason_id, count the number
of records in each group, and display only the numbers of records whose r_reason_id is
AAAAAAAAABAAAAAAAA or AAAAAAAAADAAAAAAAA.
gaussdb=# SELECT COUNT(*),r_reason_id FROM tpcds.reason_p GROUP BY r_reason_id HAVING r_reason_id
IN('AAAAAAAAABAAAAAAAA','AAAAAAAAADAAAAAAAA');
 count | r_reason_id
-----+-----
 5 | AAAAAAAAABAAAAAAAA
(1 row)

-- Example of the INTERSECT clause: Query records whose r_reason_id is AAAAAAAAABAAAAAAAA and
whose r_reason_sk is smaller than 5.
gaussdb=# SELECT * FROM tpcds.reason_p WHERE r_reason_id='AAAAAAAAABAAAAAAAA' INTERSECT SELECT
* FROM tpcds.reason_p WHERE r_reason_sk<5;
 r_reason_sk | r_reason_id | r_reason_desc
-----+-----+-----
 4 | AAAAAAAAABAAAAAAAA | reason 3
 3 | AAAAAAAAABAAAAAAAA | reason 1
(2 rows)

-- Example of the EXCEPT clause: Query records whose r_reason_id is AAAAAAAAABAAAAAAAA and whose
r_reason_sk is greater than or equal to 4.
```

```
gaussdb=# SELECT * FROM tpcds.reason_p WHERE r_reason_id='AAAAAAAAABAAAAAAA' EXCEPT SELECT *
FROM tpcds.reason_p WHERE r_reason_sk<4;
r_reason_sk | r_reason_id | r_reason_desc
-----+-----+-----

## 7.15.173 SELECT INTO

### Function

Defines a new table based on a query result and inserts data obtained by query to the new table.

Different from **SELECT**, data found by **SELECT INTO** is not returned to the client. The table columns have the same names and data types as the output columns of the **SELECT**.

## Precautions

**CREATE TABLE AS** provides functions similar to **SELECT INTO** in functions and provides a superset of functions provided by **SELECT INTO**. You are advised to use **CREATE TABLE AS**, because **SELECT INTO** cannot be used in a stored procedure.

## Syntax

```
[WITH [RECURSIVE] with_query [, ...]]
SELECT [ALL | DISTINCT [ON (expression [, ...])]]
 { * | {expression [[AS] output_name]} [, ...] }
INTO [UNLOGGED] [TABLE] new_table
 [FROM from_item [, ...]]
 [WHERE condition]
 [GROUP BY expression [, ...]]
 [HAVING condition [, ...]]
 [WINDOW {window_name AS (window_definition)} [, ...]]
 [{ UNION | INTERSECT | EXCEPT | MINUS } [ALL | DISTINCT] select]
 [ORDER BY {expression [[ASC | DESC | USING operator] | nlssort_expression_clause] [NULLS { FIRST |
LAST }]} [, ...]]
 [LIMIT { count | ALL }]
 [OFFSET start [ROW | ROWS]]
 [FETCH { FIRST | NEXT } [count] { ROW | ROWS } ONLY]
 [{FOR { UPDATE | SHARE } [OF table_name [, ...]] [NOWAIT | WAIT N]} [...]];
```

## Parameter Description

### INTO [ UNLOGGED ] [ TABLE ] new\_table

Specifies that the table is created as an unlogged table. Data written to unlogged tables is not written to the WALs, which makes them considerably faster than ordinary tables. However, they are not crash-safe: an unlogged table is automatically truncated after a crash or unclean shutdown. The contents of an unlogged table are also not replicated to standby servers. Any indexes created on an unlogged table are automatically unlogged as well.

**new\_table** specifies the name of the new table.

#### NOTE

For details about other parameters of **SELECT INTO**, see [Parameters](#) in "SELECT."

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.reason values(1,'AAAAAAAABAAAAAAAA','reason 1'),
(2,'AAAAAAAAABAAAAAAAA','reason 2'),(3,'AAAAAAAAABAAAAAAAA','reason 3'),
(4,'AAAAAAAABAAAAAAAA','reason 4'),(4,'AAAAAAAABAAAAAAAA','reason 5');
```

```
(4,'AAAAAAACAAAAAA','reason 6'),(5,'AAAAAAACAAAAAA','reason 7');

-- Add the values that are less than 5 in the r_reason_sk column in the tpcds.reason table to the new table.
gaussdb=# SELECT * INTO tpcds.reason_t1 FROM tpcds.reason WHERE r_reason_sk < 5;
INSERT 0 6

-- Delete the table.
gaussdb=# DROP TABLE tpcds.reason_t1, tpcds.reason;

-- Delete the schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

### [SELECT](#)

## Suggestions

- **DATABASE**  
You are advised not to reindex a database in a transaction.
- **SYSTEM**  
You are advised not to reindex system catalogs in transactions.

## 7.15.174 SET

### Function

Modifies a run-time parameter.

### Precautions

Most run-time parameters can be modified by executing **SET**. Some parameters cannot be modified after a server or session starts.

### Syntax

- Set the system time zone.  
SET [ SESSION | LOCAL ] TIME ZONE { timezone | LOCAL | DEFAULT };
- Set the schema of the table.  
SET [ SESSION | LOCAL ]  
  {CURRENT\_SCHEMA { TO | = } { schema | DEFAULT }  
  | SCHEMA 'schema'};
- Set client encoding.  
SET [ SESSION | LOCAL ] NAMES encoding\_name;
- Set XML parsing mode.  
SET [ SESSION | LOCAL ] XML OPTION { DOCUMENT | CONTENT };
- Set other running parameters.  
SET [ LOCAL | SESSION ]  
  { {config\_parameter { { TO | = } { value | DEFAULT }  
  | FROM CURRENT } } };

### Parameter Description

- **SESSION**  
Specifies that the specified parameters take effect for the current session. This is the default value if neither **SESSION** nor **LOCAL** appears.

If **SET** or **SET SESSION** is executed within a transaction that is later aborted, the effects of the **SET** statement disappear when the transaction is rolled back. Once the surrounding transaction is committed, the effects will persist until the end of the session, unless overridden by another **SET**.

- **LOCAL**

Specifies that the specified parameters take effect for the current transaction. After **COMMIT** or **ROLLBACK**, the session-level setting takes effect again.

The effects of **SET LOCAL** last only till the end of the current transaction, whether committed or not. A special case is **SET** followed by **SET LOCAL** within a single transaction: the **SET LOCAL** value will be seen until the end of the transaction, but afterward (if the transaction is committed) the **SET** value will take effect.

- **TIME\_ZONE timezone**

Specifies the local time zone for the current session.

Value range: a valid local time zone. The corresponding run-time parameter is **TimeZone**. The default value is **PRC**.

- **CURRENT\_SCHEMA**

**schema**

Specifies the current schema.

Value range: an existing schema name

- **SCHEMA schema**

Specifies the current schema. Here the schema is a string.

Example: set schema 'public';

- **NAMES encoding\_name**

Specifies the client character encoding. This statement is equivalent to **set client\_encoding to encoding\_name**.

Value range: a valid character encoding name. The run-time parameter corresponding to this option is **client\_encoding**. The default encoding is **UTF8**.

- **XML OPTION option**

Specifies the XML parsing mode.

Value range: **CONTENT** (default), **DOCUMENT**

- **config\_parameter**

Specifies the name of a configurable run-time parameter. You can use **SHOW ALL** to view available run-time parameters.

 **NOTE**

Some parameters that viewed by **SHOW ALL** cannot be set by **SET**. For example, **max\_datanodes**.

- **value**

Specifies the new value of **config\_parameter**. This parameter can be specified as string constants, identifiers, numbers, or comma-separated lists of these.

**DEFAULT** can be written to indicate resetting the parameter to its default value.

## Examples

```
-- Set the search path of a schema.
gaussdb=# SET search_path TO tpcds, public;

-- Set the date style to the traditional POSTGRES style (date placed before month):
gaussdb=# SET datestyle TO postgres;
```

## 7.15.175 SET CONSTRAINTS

### Function

Sets the behavior of constraint checking within the current transaction.

**IMMEDIATE** constraints are checked at the end of each statement. **DEFERRED** constraints are not checked until transaction commit. Each constraint has its own **IMMEDIATE** or **DEFERRED** mode.

Upon creation, a constraint is given one of three characteristics **DEFERRABLE INITIALLY DEFERRED**, **DEFERRABLE INITIALLY IMMEDIATE**, or **NOT DEFERRABLE**. The third class is always **IMMEDIATE** and is not affected by the **SET CONSTRAINTS** statement. The first two classes start every transaction in specified modes, but its behaviors can be changed within a transaction by **SET CONSTRAINTS**.

**SET CONSTRAINTS** with a list of constraint names changes the mode of just those constraints (which must all be deferrable). If multiple constraints match a name, the name is affected by all of these constraints. **SET CONSTRAINTS ALL** changes the modes of all deferrable constraints.

When **SET CONSTRAINTS** changes the mode of a constraint from **DEFERRED** to **IMMEDIATE**, the new mode takes effect retroactively: any outstanding data modifications that would have been checked at the end of the transaction are instead checked during the execution of the **SET CONSTRAINTS** statement. If any such constraint is violated, the **SET CONSTRAINTS** fails (and does not change the constraint mode). Therefore, **SET CONSTRAINTS** can be used to force checking of constraints to occur at a specific point in a transaction.

Check and unique constraints are always checked immediately when a row is inserted or modified.

### Precautions

**SET CONSTRAINTS** sets the behavior of constraint checking only within the current transaction. Therefore, if you execute this statement outside of a transaction block (**START TRANSACTION/COMMIT** pair), it will not appear to have any effect.

### Syntax

```
SET CONSTRAINTS { ALL | { name } [, ...] } { DEFERRED | IMMEDIATE };
```

## Parameter Description

- **name**  
Specifies the constraint name.  
Value range: an existing table name, which can be found in the system catalog **pg\_constraint**.
- **ALL**  
Specifies all constraints.
- **DEFERRED**  
Specifies that constraints are not checked until transaction commit.
- **IMMEDIATE**  
Specifies that constraints are checked at the end of each statement.

## Examples

```
-- Set that constraints are checked when a transaction is committed.
gaussdb=# SET CONSTRAINTS ALL DEFERRED;
```

## 7.15.176 SET ROLE

### Description

Sets the current user identifier of the current session.

### Precautions

- Users of the current session must be members of specified **rolename**, but the system administrator can choose any roles when separation of duties is disabled.
- Executing this statement may add rights of a user or restrict rights of a user. If the role of a session user has the **INHERITS** attribute, it automatically has all rights of roles that **SET ROLE** enables the role to be. In this case, **SET ROLE** physically deletes all rights directly granted to session users and rights of its belonging roles and only leaves rights of the specified roles. If the role of the session user has the **NOINHERITS** attribute, **SET ROLE** deletes rights directly granted to the session user and obtains rights of the specified role.

### Syntax

- Set the current user identifier of the current session.  
`SET [ SESSION | LOCAL ] ROLE role_name PASSWORD 'password';`
- Reset the current user identifier to that of the current session.  
`RESET ROLE;`

### Parameters

- **SESSION**  
Specifies that the statement takes effect only for the current session. This parameter is used by default.  
Value range: a string. It must comply with the [naming convention](#).
- **LOCALE**

Specifies that the specified statement takes effect only for the current transaction.

- **role\_name**  
Specifies the role name.  
Value range: a string. It must comply with the [naming convention](#).
- **password**  
Specifies the password of a role. It must comply with the password convention.

 **NOTE**

The restrictions on using a ciphertext password are as follows:

- An administrator cannot use a ciphertext password to switch to another administrator but to a user with lower permissions.  
Ciphertext passwords are usually used in `gs_dump` and `gs_dumpall` export scenarios. In other scenarios, you are advised not to use ciphertext passwords directly.
- **RESET ROLE**  
Resets the current user identifier.

## Examples

```
-- Create a role paul.
gaussdb=# CREATE ROLE paul IDENTIFIED BY '*****';

-- Set the current user to paul.
gaussdb=# SET ROLE paul PASSWORD '*****';

-- View the current session user and the current user.
gaussdb=# SELECT SESSION_USER, CURRENT_USER;

-- Reset the current user.
gaussdb=# RESET ROLE;

-- Delete the user.
gaussdb=# DROP USER paul;
```

## 7.15.177 SET SESSION AUTHORIZATION

### Description

Sets the session user identifier and the current user identifier of the current session to a specified user.

### Precautions

The session identifier can be changed only when the initial session user has the system administrator rights. Otherwise, the system supports the statement only when the authenticated username is specified.

### Syntax

- Set the session user identifier and the current user identifier of the current session.  
`SET [ SESSION | LOCAL ] SESSION AUTHORIZATION role_name PASSWORD 'password';`
- Reset the identifiers of the session and current users to the initially authenticated usernames.

```
{SET [SESSION | LOCAL] SESSION AUTHORIZATION DEFAULT
| RESET SESSION AUTHORIZATION};
```

## Parameters

- **SESSION**  
Specifies that the specified parameters take effect for the current session.  
Value range: a string. It must comply with the [naming convention](#).
- **LOCALE**  
Specifies that the specified statement takes effect only for the current transaction.
- **role\_name**  
Specifies the username.  
Value range: a string. It must comply with the [naming convention](#).
- **password**  
Specifies the password of a role. It must comply with the password convention.

### NOTE

The restrictions on using a ciphertext password are as follows:

- An administrator cannot use a ciphertext password to switch to another administrator but to a user with lower permissions.

Ciphertext passwords are usually used in `gs_dump` and `gs_dumpall` export scenarios. In other scenarios, you are advised not to use ciphertext passwords directly.

- **DEFAULT**  
Resets the identifiers of the session and current users to the initially authenticated usernames.

## Examples

```
-- Create a role paul.
gaussdb=# CREATE ROLE paul IDENTIFIED BY '*****';

-- Set the current user to paul.
gaussdb=# SET SESSION AUTHORIZATION paul password '*****';

-- View the current session user and the current user.
gaussdb=# SELECT SESSION_USER, CURRENT_USER;

-- Reset the current user.
gaussdb=# RESET SESSION AUTHORIZATION;

-- Delete the user.
gaussdb=# DROP USER paul;
```

## Reference

### [SET ROLE](#)

## 7.15.178 SET TRANSACTION

### Description

Sets the transaction characteristics. Available transaction characteristics include the transaction separation level and transaction access mode (read/write or read

only). You can set the current transaction characteristics using **LOCAL** or the default transaction characteristics of a session using **SESSION**.

## Precautions

The current transaction characteristics must be set in a transaction, that is, **START TRANSACTION** or **BEGIN** must be executed before **SET TRANSACTION** is executed. Otherwise, the setting does not take effect.

## Syntax

Set the isolation level and access mode of the transaction.

```
{ SET [LOCAL | SESSION] TRANSACTION | SET SESSION CHARACTERISTICS AS TRANSACTION }
{ ISOLATION LEVEL { READ COMMITTED | SERIALIZABLE | REPEATABLE READ }
| { READ WRITE | READ ONLY } };
```

## Parameters

- **LOCAL**  
Specifies that the specified statement takes effect only for the current transaction.
- **SESSION**  
Specifies that the specified parameters take effect for the current session.
- **ISOLATION LEVEL**  
Specifies the transaction isolation level that determines the data that a transaction can view if other concurrent transactions exist.

### NOTE

- The isolation level cannot be changed after data is modified using **INSERT**, **DELETE**, **UPDATE**, **FETCH**, or **COPY** in the current transaction.

Value range:

- **READ COMMITTED**: Only committed data is read. It is the default value.
- **REPEATABLE READ**: Only the data committed before transaction start is read. Uncommitted data or data committed in other concurrent transactions cannot be read.
- **SERIALIZABLE**: Currently, this isolation level is not supported in GaussDB. It is equivalent to **REPEATABLE READ**.
- **READ WRITE | READ ONLY**  
Specifies the transaction access mode (read/write or read only).

### NOTE

The access mode of the default transaction feature of the session can be set only when the database is started or by sending the HUP signal.

## Examples

```
-- Start a transaction and set its isolation level to READ COMMITTED and access mode to READ ONLY.
gaussdb=# START TRANSACTION;
gaussdb=# SET LOCAL TRANSACTION ISOLATION LEVEL READ COMMITTED READ ONLY;
gaussdb=# COMMIT;
```

## 7.15.179 SHOW

### Function

Shows the current value of a run-time parameter.

### Precautions

None

### Syntax

```
SHOW
{
 [VARIABLES LIKE] configuration_parameter |
 CURRENT_SCHEMA |
 TIME_ZONE |
 TRANSACTION ISOLATION LEVEL |
 SESSION AUTHORIZATION |
 ALL
};
```

### Parameter Description

See [Parameters](#) in RESET.

### Examples

```
-- Show the value of timezone.
gaussdb=# SHOW timezone;

-- Show all parameters.
gaussdb=# SHOW ALL;

-- Show all parameters whose names contain var.
gaussdb=# SHOW VARIABLES LIKE var;
```

### Helpful Links

[SET](#) and [RESET](#)

## 7.15.180 SHUTDOWN

### Function

**SHUTDOWN** shuts down the currently connected database node.

### Precautions

Only the administrator can run this command.

### Syntax

```
SHUTDOWN
{
 |
 fast |
 immediate
};
```

## Parameter Description

- **""**  
If the shutdown mode is not specified, the default mode **fast** is used.
- **fast**  
Rolls back all active transactions, forcibly disconnects the client, and shuts down the database node without waiting for the client to disconnect.
- **immediate**  
Shuts down the server forcibly. Fault recovery will occur on the next startup.

## Examples

```
-- Shut down the current database node.

-- Shut down the current database node in fast mode.
```

## 7.15.181 START TRANSACTION

### Description

Starts a transaction. If the isolation level or read/write mode is specified, a new transaction will have those characteristics. You can also specify them using [SET TRANSACTION](#).

### Precautions

None

### Syntax

Format 1: START TRANSACTION

```
START TRANSACTION
[
 {
 ISOLATION LEVEL { READ COMMITTED | SERIALIZABLE | REPEATABLE READ }
 | { READ WRITE | READ ONLY }
 } [...]
];
```

Format 2: BEGIN

```
BEGIN [WORK | TRANSACTION]
[
 {
 ISOLATION LEVEL { READ COMMITTED | SERIALIZABLE | REPEATABLE READ }
 | { READ WRITE | READ ONLY }
 } [...]
];
```

### Parameters

- **WORK | TRANSACTION**  
Specifies the optional keyword in BEGIN format without functions.
- **ISOLATION LEVEL**

Specifies the transaction isolation level that determines the data that a transaction can view if other concurrent transactions exist.

#### NOTE

The isolation level of a transaction cannot be reset after the first clause (INSERT, DELETE, UPDATE, FETCH, or COPY) for modifying data is executed in the transaction.

Value range:

- **READ COMMITTED**: Only committed data is read. It is the default value.
  - **REPEATABLE READ**: Only the data committed before transaction start is read. Uncommitted data or data committed in other concurrent transactions cannot be read.
  - **SERIALIZABLE**: Currently, this isolation level is not supported in GaussDB. It is equivalent to **REPEATABLE READ**.
- **READ WRITE | READ ONLY**  
Specifies the transaction access mode (read/write or read only).

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason (c1 int, c2 int);

-- Start a transaction in default mode.
gaussdb=# START TRANSACTION;
gaussdb=# SELECT * FROM tpcds.reason;
gaussdb=# END;

-- Start a transaction in default mode.
gaussdb=# BEGIN;
gaussdb=# SELECT * FROM tpcds.reason;
gaussdb=# END;

-- Start a transaction with the isolation level being READ COMMITTED and the access mode being READ WRITE:
gaussdb=# START TRANSACTION ISOLATION LEVEL READ COMMITTED READ WRITE;
gaussdb=# SELECT * FROM tpcds.reason;
gaussdb=# COMMIT;

-- Delete the table.
gaussdb=# DROP TABLE tpcds.reason;

-- Delete the schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## Helpful Links

[COMMIT | END, ROLLBACK](#), and [SET TRANSACTION](#)

## 7.15.182 TIMECAPSULE TABLE

### Description

The **TIMECAPSULE TABLE** statement restores a table to an earlier state in the event of human or application errors.

The table can flash back to a past point in time, depending on the old version of the data stored in the system. In addition, GaussDB cannot restore a table to an earlier state through DDL operations that has changed the structure of the table.

## Precautions

- The **TIMECAPSULE TABLE** statement can be used to flash back the data of the old version or the data from the recycle bin.
  - **TO TIMECAPSULE** and **TO CSN** can flash back a table to an earlier version.
  - The recycle bin records the objects dropped or truncated by running **DROP** and **TRUNCATE**. **TO BEFORE DROP** and **TO BEFORE TRUNCATE** flash back from the recycle bin.
- The following object types do not support flashback: system catalogs, DFS tables, global temporary tables, local temporary tables, unlogged tables, sequence tables, encrypted tables, and hash bucket tables.
- Between the flashback point and the current point, a statement (DDL, DCL, or VACUUM FULL) that modifies the table structure or affects physical storage has been executed. Therefore, the flashback fails.
- To run **DROP**, you must have the CREATE or USAGE permission on the schema to which the junk object belongs, and you must be the owner of the schema or the owner of the junk object.

To run **TRUNCATE**, you must have the CREATE or USAGE permission on the schema to which the junk object belongs, and you must be the owner of the schema or the junk object. In addition, you must have the TRUNCATE permission on the junk object.

- Scenarios or tables that do not support DROP or TRUNCATE FLASHBACK
  - Scenario where the recycle bin is disabled (**enable\_recyclebin** is set to **off**)
  - Scenario where the system is being maintained (**xc\_maintenance\_mode** is set to **on**) or is being upgraded
  - Scenario where multiple objects are deleted (The **DROP** or **TRUNCATE TABLE** command is executed to delete multiple objects at the same time.)
  - System catalogs, DFS tables, global temporary tables, local temporary tables, UNLOGGED tables, sequence tables, and hash bucket tables.
  - If the object on which the table depends is an external object, the table is physically deleted and is not moved to the recycle bin.

## Prerequisites

- The **enable\_recyclebin** parameter has been enabled to enable the recycle bin. Contact the administrator for details about how to use the parameter.
- The **recyclebin\_retention\_time** parameter has been set for specifying the retention period of objects in the recycle bin. The objects will be automatically deleted after the retention period expires. Contact the administrator for details about how to use the parameter.

## Syntax

```
TIMECAPSULE TABLE [schema_name.]table_name TO { CSN expr | TIMESTAMP expr | BEFORE { DROP
[RENAME TO table_name] | TRUNCATE } }
```

## Parameters

- **schema\_name**  
Specifies a schema containing the table to be flashed back. If this parameter is not specified, the current schema is used.
- **table\_name**  
Specifies a table name.
- **TO CSN**  
Specifies the CSN corresponding to the time point when the table is to be flashed back. *expr* must be a number representing a valid CSN.  
  
Note: In the GTM-free scenario, each node uses the local CSN and does not have a globally unified CSN. Therefore, flashback in TO CSN mode is not supported.
- **TO TIMESTAMP**  
Specifies a timestamp value corresponding to the point in time to which you want to flash back the table. The result of *expr* must be a valid past timestamp (convert a string to a time type using the **TO\_TIMESTAMP** function). The table will be flashed back to a time within approximately 3 seconds of the specified timestamp.  
  
Note: When the flashback point is too old, the old version cannot be obtained because it is recycled. As a result, the flashback fails and the error message "Restore point too old" is displayed.
- **TO BEFORE DROP**  
Retrieves dropped tables and their subobjects from the recycle bin.  
You can specify either the original user-specified name of the table or the system-generated name assigned to the object when it was deleted.
  - System-generated recycle bin object names are unique. Therefore, if you specify the system-generated name, the database retrieves that specified object. To see the content in your recycle bin, run **select \* from gs\_recyclebin;**
  - If you specify the user-specified name and the recycle bin contains more than one object of that name, the database retrieves the object that was moved to the recycle bin most recently. If you want to retrieve an older version of the table, then do one of these things:
    - Specify the system-generated recycle bin name of the table you want to retrieve.
    - Run the **TIMECAPSULE TABLE ... TO BEFORE DROP** statement until you retrieve the table you want.
  - When a dropped table is restored, only the base table name is restored, and the names of other subobjects remain the same as those in the recycle bin. You can run the DDL command to manually change the names of subobjects as required.

- The recycle bin does not support write operations such as DML, DCL, and DDL, and does not support DQL query operations (supported in later versions).
- The **recyclebin\_retention\_time** parameter has been set for specifying the retention period of objects in the recycle bin. The objects will be automatically deleted after the retention period expires.
- **RENAME TO**  
Specifies a new name for the table retrieved from the recycle bin.
- **TRUNCATE**  
Flashes back to the point in time before the TRUNCATE operation.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Delete the tpcds.reason_t2 table.
DROP TABLE IF EXISTS tpcds.reason_t2;
-- Create the tpcds.reason_t2 table.
gaussdb=# CREATE TABLE tpcds.reason_t2
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
)with(storage_type = ustore);
-- Insert records into the tpcds.reason_t2 table.
gaussdb=# INSERT INTO tpcds.reason_t2 VALUES (1, 'AA', 'reason1'),(2, 'AB', 'reason2'),(3, 'AC', 'reason3');
INSERT 0 3
-- Delete data from the tpcds.reason_t2 table.
gaussdb=# TRUNCATE TABLE tpcds.reason_t2;
-- Query data in the tpcds.reason_t2 table.
gaussdb=# select * from tpcds.reason_t2;
 r_reason_sk | r_reason_id | r_reason_desc
-----+-----+-----
(0 rows)
-- Perform the TRUNCATE FLASHBACK operation.
gaussdb=# TIMECAPSULE TABLE tpcds.reason_t2 to BEFORE TRUNCATE;
gaussdb=# select * from tpcds.reason_t2;
 r_reason_sk | r_reason_id | r_reason_desc
-----+-----+-----
1 | AA | reason1
2 | AB | reason2
3 | AC | reason3
(3 rows)
-- Delete the tpcds.reason_t2 table.
gaussdb=# DROP TABLE tpcds.reason_t2;
-- Perform the DROP FLASHBACK operation.
gaussdb=# TIMECAPSULE TABLE tpcds.reason_t2 to BEFORE DROP;
TimeCapsule Table

-- Clear the recycle bin and delete the schema.
gaussdb=# PURGE RECYCLEBIN;
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## 7.15.183 TRUNCATE

### Function

**TRUNCATE** quickly removes all rows from a database table.

It has the same effect as an unqualified **DELETE** on each table, but it is faster since it does not actually scan the tables. This is most useful on large tables.

## Precautions

- **TRUNCATE TABLE** has the same function as a **DELETE** statement with no **WHERE** clause, emptying a table.
- **TRUNCATE TABLE** uses less system and transaction log resources as compared with **DELETE**.
  - **DELETE** deletes a row each time, and records the deletion of each row in the transaction log.
  - **TRUNCATE TABLE** deletes all rows in a table by releasing the data page storing the table data, and records the releasing of the data page only in the transaction log.
- The differences between **TRUNCATE**, **DELETE**, and **DROP** are as follows:
  - **TRUNCATE TABLE** deletes content, releases space, but does not delete definitions.
  - **DELETE TABLE** deletes content, but does not delete definitions nor release space.
  - **DROP TABLE** deletes content and definitions, and releases space.

## Syntax

- Delete data from a table.

```
TRUNCATE [TABLE] [ONLY] { table_name [*] } [, ...]
[CONTINUE IDENTITY] [CASCADE | RESTRICT] [PURGE];
```

- Truncate the data in a partition.

```
ALTER TABLE [IF EXISTS] { [ONLY] table_name
| table_name *
| ONLY (table_name) }
TRUNCATE PARTITION { partition_name
| FOR (partition_value [, ...]) } [UPDATE GLOBAL INDEX];
```

## Parameter Description

- **ONLY**  
If **ONLY** is specified, only the specified table is cleared. Otherwise, the table and all its subtables (if any) are cleared.
- **table\_name**  
Specifies the name (optionally schema-qualified) of the target table.  
Value range: an existing table name
- **CONTINUE IDENTITY**  
Does not change the values of sequences. This is the default action.
- **CASCADE | RESTRICT**
  - **CASCADE**: Clears all tables that are added to a group.
  - **RESTRICT** (default): refuses to truncate if any of the tables have foreign-key references from tables that are not listed in the statement (not supported in distributed scenarios).
- **PURGE**

Purges table data in the recycle bin by default.

- **partition\_name**

Specifies the partition in the target partitioned table.

Value range: an existing table name

- **partition\_value**

Specifies the value of the specified partition key.

The value specified by **PARTITION FOR** can uniquely identify a partition.

Value range: value range of the partition key for the partition to be renamed

---

**NOTICE**

When the **PARTITION FOR** clause is used, the entire partition where **partition\_value** is located is cleared.

---

- **UPDATE GLOBAL INDEX**

If this parameter is used, all global indexes in a partitioned table are updated to ensure that correct data can be queried using global indexes.

If this parameter is not used, all global indexes in a partitioned table will become invalid.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.reason values(1,'AAAAAAAAABAAAAAAA','reason 1'),
(5,'AAAAAAAAABAAAAAAA','reason 2'),(15,'AAAAAAAAABAAAAAAA','reason 3'),
(25,'AAAAAAAAABAAAAAAA','reason 4'),(35,'AAAAAAAAABAAAAAAA','reason 5'),
(45,'AAAAAAAAACAAAAAAA','reason 6'),(55,'AAAAAAAAACAAAAAAA','reason 7');

-- Create a table.
gaussdb=# CREATE TABLE tpcds.reason_t1 AS TABLE tpcds.reason;

-- Clear the tpcds.reason_t1 table.
gaussdb=# TRUNCATE TABLE tpcds.reason_t1;

-- Delete the table.
gaussdb=# DROP TABLE tpcds.reason_t1;
-- Create a partitioned table.
gaussdb=# CREATE TABLE tpcds.reason_p
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
)PARTITION BY RANGE (r_reason_sk)
(
 partition p_05_before values less than (05),
 partition p_15 values less than (15),
 partition p_25 values less than (25),
 partition p_35 values less than (35),
```

```
partition p_45_after values less than (MAXVALUE)
);

-- Insert data.
gaussdb=# INSERT INTO tpceds.reason_p SELECT * FROM tpceds.reason;

-- Clear the p_05_before partition.
gaussdb=# ALTER TABLE tpceds.reason_p TRUNCATE PARTITION p_05_before;

-- Clear the p_15 partition.
gaussdb=# ALTER TABLE tpceds.reason_p TRUNCATE PARTITION for (13);

-- Clear the partitioned table.
gaussdb=# TRUNCATE TABLE tpceds.reason_p;

-- Delete the tpceds.reason_p table.
gaussdb=# DROP TABLE tpceds.reason_p;

-- Delete the tpceds.reason table.
gaussdb=# DROP TABLE tpceds.reason;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpceds CASCADE;
```

## 7.15.184 UPDATE

### Description

Updates data in a table. **UPDATE** changes the values of the specified columns in all rows that satisfy the condition. The **WHERE** clause clarifies conditions. The columns to be modified need to be mentioned in the **SET** clause; columns not explicitly modified retain their previous values.

### Precautions

- The owner of a table, users granted with the UPDATE permission on the table, or users granted with the UPDATE ANY TABLE permission can update data in the table. The system administrator has the permission to update data in the table by default.
- **Update..... Limit row\_count** supports only some scenarios of execution plan pushdown. (Table replication is not supported.) The prerequisites are that the filter criteria must contain the equivalent distribution key and the filter criteria should be relatively simple. Do not use forcible type conversion. If the command fails to be executed, simplify the filter criteria.
- You must have the SELECT permission on all tables involved in the expressions or conditions.
- The distribution key (or column) of a table cannot be modified.
- For the UPDATE statement whose subquery is a stream plan, the same row cannot be concurrently updated.
- You are not allowed to change the database encoding format to GB18030\_2022 or change GB18030\_2022 to another character encoding format by updating system catalogs. Otherwise, inventory data and some operations will be abnormal. If you need to change the character set encoding of a database, follow the database switching process to migrate data.

### Syntax

```
[WITH [RECURSIVE] with_query [, ...]]
UPDATE [/*+ plan_hint */] [ONLY] table_name [*] [[AS] alias]
```

```

SET {column_name = { expression | DEFAULT }
| (column_name [, ...]) = { ({ expression | DEFAULT } [, ...]) |sub_query }} [, ...]
[FROM from_list] [WHERE condition | WHERE CURRENT OF cursor_name]
[ORDER BY {expression [[ASC | DESC | USING operator] [LIMIT row_count]
[RETURNING {*
| {output_expression [[AS] output_name } [, ...] }}];

```

where sub\_query can be:

```

SELECT [ALL | DISTINCT [ON (expression [, ...])]]
{ * | {expression [[AS] output_name } [, ...] }
[FROM from_item [, ...]]
[WHERE condition | WHERE CURRENT OF cursor_name]
[GROUP BY grouping_element [, ...]]
[HAVING condition [, ...]]
[ORDER BY {expression [[ASC | DESC | USING operator] | nlssort_expression_clause } [NULLS { FIRST |
LAST }] } [, ...]]
[LIMIT { [offset,] count | ALL }]

```

## Parameters

- **WITH [ RECURSIVE ] with\_query [, ...]**

Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table. This subquery statement structure is called the common table expression (CTE) structure. When this structure is used, the execution plan contains the CTE SCAN content.

If **RECURSIVE** is specified, it allows a **SELECT** subquery to reference itself by name.

The detailed format of **with\_query** is as follows: **with\_query\_name** [ ( **column\_name** [, ...] ) ] **AS** [ [ **NOT** ] **MATERIALIZED** ] ( {**select** | **values** | **insert** | **update** | **delete** } )

- **with\_query\_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.
- **column\_name** specifies the column name displayed in the subquery result set.
- Each subquery can be a **SELECT**, **VALUES**, **INSERT**, **UPDATE** or **DELETE** statement.
- You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE.
  - If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery cannot be jointly optimized with the SELECT statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.
  - If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the SELECT statement trunk to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.

- **plan\_hint** clause

Follows the UPDATE keyword in the */\*+ \*/* format. It is used to optimize the plan of an UPDATE statement block. For details, see [Hint-based Tuning](#). In each statement, only the first */\*+ plan\_hint \*/* comment block takes effect as a hint. Multiple hints can be written.

- **table\_name**

Specifies the name (optionally schema-qualified) of the table to be updated.  
Value range: an existing table name

 **NOTE**

You can use database links to perform operations on remote tables. For details, see [DATABASE LINK](#).

- **alias**

Specifies a substitute name for the target table.

Value range: a string. It must comply with the [naming convention](#).

- **column\_name**

Specifies the name of the column to be modified.

You can refer to this column by specifying the target table alias and the column name. Example:

```
UPDATE foo AS f SET f.col_name = namecol';
```

Value range: an existing column

- **expression**

Specifies a value assigned to a column or an expression that assigns the value.

- **DEFAULT**

Specifies the default value of a column.

The value is **NULL** if no specified default value has been assigned to it.

- **sub\_query**

Specifies a subquery.

This statement can be executed to update a table with information for other tables in the same database. For details about clauses in the SELECT statement, see [SELECT](#).

When a single column is updated, the ORDER BY and LIMIT clauses can be used. When multiple columns are updated, the ORDER BY and LIMIT clauses cannot be used.

- **from\_list**

Specifies a list of table expressions. You can use columns of other tables in the WHERE condition. This is similar to the list of tables that can be specified in the FROM clause of a SELECT statement.

---

**NOTICE**

Note that the target table cannot appear in **from\_list**, unless you intend a self-join (in which case it must appear with an alias in **from\_list**).

- **condition**

Specifies an expression that returns a value of type Boolean. Only rows for which this expression returns **true** are updated. You are advised not to use

numeric types such as int for **condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

- **WHERE CURRENT OF cursor\_name**

When the cursor points to a row in a table, you can use this syntax to update the row.

cursor\_name: specifies the name of a cursor.

---

**NOTICE**

- This syntax is not supported by the database in the MySQL compatibility mode.
- This syntax supports only ordinary tables and does not support partitioned tables or hash bucket tables.
- This syntax can be used only in stored procedures.
- This syntax cannot be used together with other WHERE conditions.
- This syntax cannot be used together with WITH, USING, ORDER BY, or FROM.
- The SELECT statement corresponding to the cursor must be declared as FOR UPDATE.
- The SELECT statement corresponding to the cursor supports only a single table. It does not support LIMIT/OFFSET, subqueries, or sublinks.
- The cursor declared as FOR UPDATE in a stored procedure cannot be used after being committed or rolled back.
- If the row to which the cursor points does not exist, an error is reported (only when UPDATE is used instead of DELETE) in the ORA compatibility mode, indicating that the specified row does not exist. In other compatibility modes, no error is reported.

---

- **ORDER BY**

For details about the keywords, see [SELECT](#).

- **LIMIT**

For details about the keywords, see [SELECT](#).

- **output\_expression**

Specifies an expression to be computed and returned by the **UPDATE** statement after each row is updated.

Value range: The expression can use any column names of the table named by **table\_name** or tables listed in **FROM**. Write \* to return all columns.

- **output\_name**

Specifies a name to use for a returned column.

## Examples

```
-- Create the student1 table.
gaussdb=# CREATE TABLE student1
(
 stuno int,
 classno int
```

```
)
DISTRIBUTE BY hash(stuno);

-- Insert data.
gaussdb=# INSERT INTO student1 VALUES(1,1);
gaussdb=# INSERT INTO student1 VALUES(2,2);
gaussdb=# INSERT INTO student1 VALUES(3,3);

-- View data.
gaussdb=# SELECT * FROM student1;

-- Update the values of all records.
gaussdb=# UPDATE student1 SET classno = classno*2;

-- View data.
gaussdb=# SELECT * FROM student1;

-- Delete the table.
gaussdb=# DROP TABLE student1;

-- Example for WHERE CURRENT OF cursor_name
gaussdb=# create table t1(c1 int, c2 varchar2); -- Create a table.
gaussdb=# insert into t1 values(generate_series(1,1000),'abcd'); -- Insert the data.

gaussdb=# declare
gaussdb=# cursor cur1 is select * from t1 where c1 = 1 for update;
gaussdb=# va t1%rowtype;
gaussdb=# begin
gaussdb$$# open cur1;
gaussdb$$# fetch cur1 into va;
gaussdb$$# update t1 set c2 = c2 || c2 where current of cur1; -- Use WHERE CURRENT OF cursor_name to
update data.
gaussdb$$# close cur1;
gaussdb$$# commit;
gaussdb$$# end;
gaussdb$$# /

gaussdb=# select * from t1 where c1 = 1; -- Query the data.
```

## 7.15.185 VACUUM

### Description

VACUUM recycles storage space occupied by deleted rows in tables or B-Tree indexes. In normal database operation, rows that have been deleted are not physically removed from their table; they remain present until a VACUUM is done. Therefore, it is necessary to execute VACUUM periodically, especially on frequently-updated tables.

### Precautions

- If no table is specified, VACUUM processes the tables on which the user has the corresponding permission in the current database. With a parameter, VACUUM processes only that table.
- To perform VACUUM operation to a table, you must be a table owner or a user granted the VACUUM permission on the table. By default, the system administrator has this permission. However, database owners are allowed to VACUUM all tables in their databases, except shared catalogs. (The restriction for shared catalogs means that a true database-wide VACUUM can only be executed by the system administrator). VACUUM skips over any tables that the calling user does not have permission to vacuum.

- VACUUM cannot be executed inside a transaction block.
- It is recommended that active production databases be vacuumed frequently (at least nightly), in order to remove dead rows. After adding or deleting a large number of rows, it might be a good idea to run **VACUUM ANALYZE** for the affected table. This will update the system catalogs with the results of all recent changes, and allow the query planner to make better choices in planning queries.
- **FULL** is recommended only in special scenarios. For example, you wish to physically narrow the table to decrease the occupied disk space after deleting most rows of a table. VACUUM FULL usually shrinks a table more than VACUUM does. The **FULL** option does not clear indexes. You are advised to periodically run the **REINDEX** statement. If the physical space usage does not decrease after you run the statement, check whether there are other active transactions (that have started before you delete data transactions and not ended before you run **VACUUM FULL**). If there are such transactions, run this statement again when the transactions quit.
- **VACUUM** causes a substantial increase in I/O traffic, which might cause poor performance for other active sessions. Therefore, it is sometimes advisable to use the cost-based VACUUM delay feature.
- When **VERBOSE** is specified, **VACUUM** prints progress messages to indicate which table is currently being processed. Various statistics about the tables are printed as well.
- When the option list is surrounded by parentheses, the options can be written in any order. If there are no brackets, the options must be given in the order displayed in the syntax.
- VACUUM and VACUUM FULL clean up row-store table records with a delay specified by **vacuum\_defer\_cleanup\_age**, that is, tuples that have just been deleted are not cleaned up immediately.
- VACUUM ANALYZE executes a VACUUM operation and then an ANALYZE operation for each selected table. This is a handy combination form for routine maintenance scripts.
- A plain VACUUM statement (without the FULL option) simply recycles space and makes it available for reuse. This form of statement can operate in parallel with normal reading and writing of the table, as an exclusive lock is not obtained. VACUUM FULL executes wider processing, including moving rows across blocks to compress the tables so that they occupy the minimum number of disk blocks. This form is much slower and requires an exclusive lock on each table while it is being processed.
- If the **xc\_maintenance\_mode** parameter is not enabled, VACUUM FULL skips all system catalogs.
- If you run **VACUUM FULL** immediately after running **DELETE**, the space will not be reclaimed. After executing **DELETE**, execute 1000 non-SELECT transactions, or wait for 1s and then execute one transaction. Then, run **VACUUM FULL** to reclaim the space.
- During VACUUM FULL, an exclusive lock is added to the table. Therefore, you are advised not to run **VACUUM FULL** during peak hours. Otherwise, the lock waiting time is too long or a deadlock occurs.
- To ensure performance and statistics accuracy, do not run ANALYZE-related commands, such as vacuum analyze, autoanalyze, and manual analyze, at the same time or frequently.

## Syntax

- Reclaim space and update statistics information, no requirements for keyword orders.  

```
VACUUM [({ FULL | FREEZE | VERBOSE | {ANALYZE | ANALYSE } } [,...])]
[table_name [(column_name [, ...])] [PARTITION (partition_name)]] ;
```
- Reclaim space, without updating statistics information.  

```
VACUUM [FULL [COMPACT]] [FREEZE] [VERBOSE] [table_name [PARTITION
(partition_name)]] ;
```
- Reclaim space and update statistics information, and require keywords in order.  

```
VACUUM [FULL] [FREEZE] [VERBOSE] { ANALYZE | ANALYSE } [VERBOSE]
[table_name [(column_name [, ...])] [PARTITION (partition_name)]] ;
```

## Parameters

- **FULL**  
Selects "FULL" vacuum, which can reclaim more space, but takes much longer and exclusively locks the table.  
  
 **NOTE**  
Using **FULL** will cause statistics missing. To collect statistics, add the keyword **ANALYZE** to **VACUUM FULL**.
- **FREEZE**  
Is equivalent to running **VACUUM** with the **vacuum\_freeze\_min\_age** parameter set to **zero**.
- **VERBOSE**  
Prints a detailed **VACUUM** activity report for each table.
- **ANALYZE | ANALYSE**  
Updates statistics used by the planner to determine the most efficient way to execute a query.
- **table\_name**  
Specifies the name (optionally schema-qualified) of a specific table to vacuum.  
Value range: name of a specific table to vacuum Defaults are all tables in the current database.
- **column\_name**  
Specifies the name of the column to be analyzed. This parameter must be used together with **ANALYZE**.  
Value range: name of a specific column to analyze The default value indicates all columns.  
  
 **NOTE**  
The mechanism of the **VACUUM ANALYZE** statement is to execute **VACUUM** and **ANALYZE** in sequence. Therefore, if **column\_name** is incorrect, **VACUUM** may be successfully executed but **ANALYZE** may fail to be executed. For a partitioned table, **ANALYZE** may fail to be executed after **VACUUM** is successfully executed on a partition.
- **PARTITION**  
**COMPACT** and **PARTITION** cannot be used at the same time.

- **partition\_name**  
Specifies the partition name of the table to be cleared. The default value indicates all partitions.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.reason values(1,'AAAAAAAAABAAAAAAA','reason 1'),
(2,'AAAAAAAAABAAAAAAA','reason 2');

-- Create an index in the tpcds.reason table.
gaussdb=# CREATE UNIQUE INDEX ds_reason_index1 ON tpcds.reason(r_reason_sk);

-- Perform VACUUM on the tpcds.reason table that has indexes.
gaussdb=# VACUUM (VERBOSE, ANALYZE) tpcds.reason;

-- Delete the index.
gaussdb=# DROP INDEX ds_reason_index1 CASCADE;
gaussdb=# DROP TABLE tpcds.reason;
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## Suggestions

- vacuum
  - VACUUM cannot be executed inside a transaction block.
  - It is recommended that active production databases be vacuumed frequently (at least nightly), in order to remove dead rows. It is strongly recommended that you run **VACUUM ANALYZE** after adding or deleting a large number of records.
  - **FULL** is recommended only in special scenarios. For example, you wish to physically narrow the table to decrease the occupied disk space after deleting most rows of a table.

## 7.15.186 VALUES

### Function

Computes a row or a set of rows based on given values. It is most commonly used to generate a constant table within a large statement.

### Precautions

- **VALUES** lists with large numbers of rows should be avoided, as you might encounter out-of-memory failures or poor performance. **VALUES** appearing within **INSERT** is a special case, because the desired column types are known from the **INSERT**'s target table, and need not be inferred by scanning the **VALUES** list. In this case, **VALUE** can handle larger lists than are practical in other contexts.

- If more than one row is specified, all the rows must have the same number of elements.

## Syntax

```
VALUES {(expression [, ...])} [, ...]
[ORDER BY { sort_expression [ASC | DESC | USING operator] } [, ...]]
[LIMIT { count | ALL }]
[OFFSET start [ROW | ROWS]]
[FETCH { FIRST | NEXT } [count] { ROW | ROWS } ONLY];
```

## Parameter Description

- **expression**  
Specifies a constant or expression to compute and insert at the indicated place in the resulting table or set of rows.  
In a **VALUES** list appearing at the top level of an **INSERT**, an expression can be replaced by **DEFAULT** to indicate that the destination column's default value should be inserted. **DEFAULT** cannot be used when **VALUES** appears in other contexts.
- **sort\_expression**  
Specifies an expression or integer constant indicating how to sort the result rows.
- **ASC**  
Specifies an ascending sort order.
- **DESC**  
Specifies a descending sort order.
- **operator**  
Specifies a sorting operator.
- **count**  
Specifies the maximum number of rows to return.
- **OFFSET start { ROW | ROWS }**  
Specifies the maximum number of returned rows, whereas **start** specifies the number of rows to skip before starting to return rows.
- **FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY**  
The **FETCH** clause restricts the total number of rows starting from the first row of the return query result, and the default value of **count** is **1**.

## Examples

See [Examples](#) in INSERT.

## 7.15.187 ALTER RESOURCE POOL (Lab Feature)

### Description

Modifies the Cgroup of a resource pool.

## Precautions

Only a user with the ALTER permission on the current database can perform this operation.

## Syntax

```
ALTER RESOURCE POOL pool_name
WITH ({MEM_PERCENT= pct | CONTROL_GROUP="group_name" | ACTIVE_STATEMENTS=stmt |
MAX_DOP = dop | MEMORY_LIMIT='memory_size' | io_limits=io_limits | io_priority='io_priority'}[, ...]);
```

## Parameters

- **pool\_name**  
Specifies the name of a resource pool.  
The resource pool must already exist.  
Value range: a string. It must comply with the [naming convention](#).

- **group\_name**  
Specifies the name of a Cgroup.

### NOTE

- You can use either double quotation marks ("" ) or single quotation marks ( ' ' ) in the syntax when setting the name of a Cgroup.
- The value of **group\_name** is case-sensitive.
- If **group\_name** is not specified, the string "Medium" will be used by default in the syntax, indicating the **Medium** Timeshare Cgroup under **DefaultClass**.
- If an administrator specifies a Workload Cgroup under Class, for example, **control\_group** set to **class1:workload1**, the resource pool will be associated with the **workload1** Cgroup under **class1**. The level of **Workload** can also be specified. For example, **control\_group** is set to **class1:workload1:1**.
- If a database user specifies the Timeshare string (**Rush**, **High**, **Medium**, or **Low**) in the syntax, for example, **control\_group** is set to **High**, the resource pool will be associated with the **High** Timeshare Cgroup under **DefaultClass**.
- In multi-tenant scenarios, the Cgroup associated with a group resource pool is a Class Cgroup, and that associated with a service resource pool is a Workload Cgroup. Additionally, switching Cgroups between different resource pools is not allowed.

Value range: an existing Cgroup.

- **stmt**  
Specifies the maximum number of statements that can be concurrently executed in a resource pool.  
Value range: an integer ranging from -1 to 2147483647. The value -1 indicates no limit.
- **dop**  
Specifies the maximum statement concurrency degree for a resource pool, equivalent to the number of threads that can be created for executing a statement.  
Value range: numeric data ranging from 1 to 2147483647
- **memory\_size**  
Specifies the maximum memory size of a resource pool.

Value range: a string of 1 KB to 2047 GB case-sensitive characters.

- **mem\_percent**

Specifies the proportion of available resource pool memory to the total memory or group user memory.

In multi-tenant scenarios, **mem\_percent** of group users or service users ranges from 1 to 100. The default value is **20**.

In common scenarios, **mem\_percent** of common users is an integer ranging from 0 to 100. The default value is **0**.

 **NOTE**

When both of **mem\_percent** and **memory\_limit** are specified, only **mem\_percent** takes effect.

- **io\_limits**

Specifies the upper limit of IOPS in a resource pool.

It is counted by 10 thousands per second.

Value range: numeric data ranging from 0 to 2147483647

- **io\_priority**

Specifies the I/O priority for jobs that consume many I/O resources. It takes effect when the I/O usage reaches 90%.

There are three priorities: **Low**, **Medium**, and **High**. If you do not want to control I/O resources, set this parameter to **None**, which is the default value.

Value range: enumerated type. The options are **None**, **Low**, **Medium**, and **High**.

 **NOTE**

The settings of **io\_limits** and **io\_priority** are valid only for complex jobs, such as batch import (using **INSERT INTO SELECT**, **COPY FROM**, or **CREATE TABLE AS**), complex queries involving over 500 MB data on each DN, and **VACUUM FULL**.

## Examples

The following example assumes that the user has created the **class1** Cgroup and three Workload Cgroups under **class1**: **Low**, **wg1**, and **wg2**.

```
-- Create a resource pool.
gaussdb=# CREATE RESOURCE POOL pool1;

-- Specify the High Timeshare Workload Cgroup under the DefaultClass Cgroup.
gaussdb=# ALTER RESOURCE POOL pool1 WITH (CONTROL_GROUP="High");

-- Specify the Low Timeshare Workload Cgroup under the class1 Cgroup.
gaussdb=# ALTER RESOURCE POOL pool1 WITH (CONTROL_GROUP="class1:Low");

-- Specify the wg1 Workload Cgroup under the class1 Cgroup.
gaussdb=# ALTER RESOURCE POOL pool1 WITH (CONTROL_GROUP="class1:wg1");

-- Specify the wg2 Workload Cgroup under the class1 Cgroup.
gaussdb=# ALTER RESOURCE POOL pool1 WITH (CONTROL_GROUP="class1:wg2:3");
-- Delete the resource pool pool1.
gaussdb=# DROP RESOURCE POOL pool1;
```

## Helpful Links

[CREATE RESOURCE POOL \(Lab Feature\)](#) and [DROP RESOURCE POOL \(Lab Feature\)](#)

## 7.15.188 CREATE RESOURCE POOL (Lab Feature)

### Description

Creates a resource pool and specifies the Cgroup of the resource pool.

### Precautions

Only a user with the CREATE permission on the current database can perform this operation.

### Syntax

```
CREATE RESOURCE POOL pool_name
 [WITH ({MEM_PERCENT=pct | CONTROL_GROUP="group_name" | ACTIVE_STATEMENTS=stmt |
 MAX_DOP = dop | MEMORY_LIMIT='memory_size' | io_limits=io_limits | io_priority='io_priority' |
 nodegroup="nodegroupname" | is_foreign=boolean }[, ...])];
```

### Parameters

- **pool\_name**  
Specifies the name of a resource pool.  
The name of the resource pool cannot be same as that of an existing resource pool.  
Value range: a string. It must comply with the [naming convention](#).
- **group\_name**  
Specifies the name of a Cgroup.

#### NOTE

- You can use either double quotation marks ("" ) or single quotation marks ( ' ' ) in the syntax when setting the name of a Cgroup.
- The value of **group\_name** is case-sensitive.
- If **group\_name** is not specified, the string "Medium" will be used by default in the syntax, indicating the **Medium** Timeshare Cgroup under **DefaultClass**.
- If an administrator specifies a Workload Cgroup under Class, for example, **control\_group** set to **class1:workload1**, the resource pool will be associated with the **workload1** Cgroup under **class1**. The level of **Workload** can also be specified. For example, **control\_group** is set to **class1:workload1:1**.
- If a database user specifies the Timeshare string (**Rush**, **High**, **Medium**, or **Low**) in the syntax, for example, **control\_group** is set to **High**, the resource pool will be associated with the **High** Timeshare Cgroup under **DefaultClass**.
- In multi-tenant scenarios, the Cgroup associated with a group resource pool is a Class Cgroup, and that associated with a service resource pool is a Workload Cgroup. Additionally, switching Cgroups between different resource pools is not allowed.

Value range: a string. It must comply with the rule in the description, which specifies the created Cgroup.

- **stmt**  
Specifies the maximum number of statements that can be concurrently executed in a resource pool.  
Value range: numeric data ranging from -1 to 2147483647
- **dop**  
Specifies the maximum statement concurrency degree for a resource pool, equivalent to the number of threads that can be created for executing a statement.  
Value range: numeric data ranging from 1 to 2147483647
- **memory\_size**  
Specifies the maximum memory size of a resource pool.  
Value range: a string from 1 KB to 2047 GB
- **mem\_percent**  
Specifies the proportion of available resource pool memory to the total memory or group user memory.  
In multi-tenant scenarios, **mem\_percent** of group users or service users ranges from 1 to 100. The default value is **20**.  
In common scenarios, **mem\_percent** of common users ranges from 0 to 100. The default value is **0**.

 **NOTE**

When both of **mem\_percent** and **memory\_limit** are specified, only **mem\_percent** takes effect.

- **io\_limits**  
Specifies the upper limit of IOPS in a resource pool.  
It is counted by 10 thousands per second.
- **io\_priority**  
Specifies the I/O priority for jobs that consume many I/O resources. It takes effect when the I/O usage reaches 90%.  
There are three priorities: **Low**, **Medium**, and **High**. If you do not want to control I/O resources, use the default value **None**.

 **NOTE**

The settings of **io\_limits** and **io\_priority** are valid only for complex jobs, such as batch import (using **INSERT INTO SELECT**, **COPY FROM**, or **CREATE TABLE AS**), complex queries involving over 500 MB data on each DN, and **VACUUM FULL**.

## Examples

This example assumes that Cgroups have been created by users in advance. Contact the administrator create a Cgroup.

```
-- Create a default resource pool, and associate it with the Medium Timeshare Cgroup under Workload under DefaultClass.
gaussdb=# CREATE RESOURCE POOL pool1;

-- Create a resource pool and specify the High Timeshare Workload Cgroup under the DefaultClass Cgroup.
gaussdb=# CREATE RESOURCE POOL pool2 WITH (CONTROL_GROUP="High");

-- Create a resource pool, and associate it with the Low Timeshare Cgroup under Workload under class1.
```

```
gaussdb=# CREATE RESOURCE POOL pool3 WITH (CONTROL_GROUP="class1:Low");
-- Create a resource pool, and associate it with the wg1 Workload Cgroup under class1.
gaussdb=# CREATE RESOURCE POOL pool4 WITH (CONTROL_GROUP="class1:wg1");
-- Create a resource pool, and associate it with the wg2 Workload Cgroup under class1.
gaussdb=# CREATE RESOURCE POOL pool5 WITH (CONTROL_GROUP="class1:wg2:3");
-- Delete the resource pool.
gaussdb=# DROP RESOURCE POOL pool1;
gaussdb=# DROP RESOURCE POOL pool2;
gaussdb=# DROP RESOURCE POOL pool3;
gaussdb=# DROP RESOURCE POOL pool4;
gaussdb=# DROP RESOURCE POOL pool5;
```

## Helpful Links

[ALTER RESOURCE POOL \(Lab Feature\)](#) and [DROP RESOURCE POOL \(Lab Feature\)](#)

## 7.15.189 DROP RESOURCE POOL (Lab Feature)

### Description

Deletes a resource pool.

#### NOTE

The resource pool cannot be deleted if it is associated with a role.

### Precautions

Only a user with the DROP permission on the current database can perform this operation.

### Syntax

```
DROP RESOURCE POOL [IF EXISTS] pool_name;
```

### Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified resource pool does not exist.
- **pool\_name**  
Specifies the name of the resource pool to be deleted.  
Value range: a string. It must comply with the [naming convention](#).

#### NOTE

In a multi-tenant scenario, deleting a group resource pool also deletes the related service resource pools. A resource pool can be deleted only when it is not associated with any users.

### Examples

See [Examples](#) in section "CREATE RESOURCE POOL."

[ALTER RESOURCE POOL \(Lab Feature\)](#) and [CREATE RESOURCE POOL \(Lab Feature\)](#)

# 7.16 Appendix

## 7.16.1 GIN Indexes

### 7.16.1.1 Introduction

Generalized Inverted Index (GIN) is designed for handling cases where the items to be indexed are composite values, and the queries to be handled by the index need to search for element values that appear within the composite items. For example, the items could be documents, and the queries could be searches for documents containing specific words.

We use the word "item" to refer to a composite value that is to be indexed, and the word "key" to refer to an element value. GIN stores and searches for keys, not item values.

A GIN index stores a set of (key, posting list) key-value pairs, where a posting list is a set of row IDs in which the key occurs. The same row ID can appear in multiple posting lists, since an item can contain more than one key. Each key value is stored only once, so a GIN index is very compact for cases where the same key appears many times.

GIN is generalized in the sense that the GIN access method code does not need to know the specific operations that it accelerates. Instead, it uses custom strategies defined for particular data types. The strategy defines how keys are extracted from indexed items and query conditions, and how to determine whether a row that contains some of the key values in a query actually satisfies the query.

### 7.16.1.2 Scalability

The GIN interface has a high level of abstraction, requiring the access method implementer only to implement the semantics of the data type being accessed. The GIN layer itself takes care of concurrency, logging and searching the tree structure.

All it takes to get a GIN access method working is to implement multiple user-defined methods, which define the behavior of keys in the tree and the relationships between keys, indexed items, and indexable queries. In short, GIN combines extensibility with generality, code reuse, and a clean interface.

There are four methods that an operator class for GIN must provide:

- `int compare(Datum a, Datum b)`  
Compares two keys (not indexed items) and returns an integer less than zero, zero, or greater than zero, indicating whether the first key is less than, equal to, or greater than the second. Null keys are never passed to this function.

- Datum \*extractValue(Datum itemValue, int32 \*nkeys, bool \*\*nullFlags)  
Returns an array of keys given an item to be indexed. The number of returned keys must be stored into **\*nkeys**. If any of the keys can be null, also palloc an array of **\*nkeys** bool fields, store its address at **\*nullFlags**, and set these null flags as needed. **\*nullFlags** can be left **NULL** (its initial value) if all keys are not-null. The returned value can be **NULL** if the item contains no keys.
- Datum \*extractQuery(Datum query, int32 \*nkeys, StrategyNumber n, bool \*pmatch, Pointer \*\*extra\_data, bool \*\*nullFlags, int32 \*searchMode)

Returns a palloc'd array of keys given a value to be queried; that is, query is the value on the right-hand side of an indexable operator whose left-hand side is the indexed column. n is the strategy number of the operator within the operator class. Often, **extractQuery** will need to consult n to determine the data type of query and the method it should use to extract key values. The number of returned keys must be stored into **\*nkeys**. If any of the keys can be null, also palloc an array of **\*nkeys** bool fields, store its address at **\*nullFlags**, and set these null flags as needed. **\*nullFlags** can be left **NULL** (its initial value) if all keys are non-null. The returned value can be **NULL** if the query contains no keys.

**searchMode** is an output argument that allows **extractQuery** to specify details about how the search will be done. If **\*searchMode** is set to **GIN\_SEARCH\_MODE\_DEFAULT** (which is the value it is initialized to before call), only items that match at least one of the returned keys are considered candidate matches. If **\*searchMode** is set to **GIN\_SEARCH\_MODE\_INCLUDE\_EMPTY**, then in addition to items containing at least one matching key, items that contain no keys at all are considered candidate matches. (This mode is useful for implementing is-subset-of operators, for example.) If **\*searchMode** is set to **GIN\_SEARCH\_MODE\_ALL**, then all non-null items in the index are considered candidate matches, whether they match any of the returned keys or not.

**pmatch** is an output argument for use when partial match is supported. To use it, **extractQuery** must allocate an array of **\*nkeys** Booleans and store its address at **\*pmatch**. Each element of the array should be set to **TRUE** if the corresponding key requires partial match, **FALSE** if not. If **\*pmatch** is set to **NULL** then GIN assumes partial match is not required. The variable is initialized to **NULL** before call, so this argument can simply be ignored by operator classes that do not support partial match.

**extra\_data** is an output argument that allows **extractQuery** to pass additional data to the **consistent** and **comparePartial** methods. To use it, **extractQuery** must allocate an array of **\*nkeys** pointers and store its address at **\*extra\_data**, then store whatever it wants to into the individual pointers. The variable is initialized to **NULL** before call, so this argument can simply be ignored by operator classes that do not require extra data. If **\*extra\_data** is set, the whole array is passed to the **consistent** method, and the appropriate element to the **comparePartial** method.

- bool consistent(bool check[], StrategyNumber n, Datum query, int32 nkeys, Pointer extra\_data[], bool \*recheck, Datum queryKeys[], bool nullFlags[])  
Returns **TRUE** if an indexed item satisfies the query operator with StrategyNumber **n** (or might satisfy it, if the recheck indication is returned). This function does not have direct access to the indexed item's value, since GIN does not store items explicitly. Rather, what is available is knowledge about which key values extracted from the query appear in a given indexed

item. The check array has length **nkeys**, which is the same as the number of keys previously returned by **extractQuery** for this query datum. Each element of the check array is **TRUE** if the indexed item contains the corresponding query key, for example, if (check[i] == TRUE), the i-th key of the **extractQuery** result array is present in the indexed item. The original query datum is passed in case the **consistent** method needs to consult it, and so are the **queryKeys[]** and **nullFlags[]** arrays previously returned by **extractQuery**. **extra\_data** is the extra-data array returned by **extractQuery**, or **NULL** if none.

When **extractQuery** returns a null key in **queryKeys[]**, the corresponding **check[]** element is **TRUE** if the indexed item contains a null key; that is, the semantics of **check[]** are like **IS NOT DISTINCT FROM**. The **consistent** function can examine the corresponding **nullFlags[]** element if it needs to tell the difference between a regular value match and a null match.

On success, **\*recheck** should be set to **TRUE** if the heap tuple needs to be rechecked against the query operator, or **FALSE** if the index test is exact. That is, a **FALSE** return value guarantees that the heap tuple does not match the query; a **TRUE** return value with **\*recheck** set to **FALSE** guarantees that the heap tuple matches the query; and a **TRUE** return value with **\*recheck** set to **TRUE** means that the heap tuple might match the query, so it needs to be fetched and rechecked by evaluating the query operator directly against the originally indexed item.

Optionally, an operator class for GIN can supply the following method:

- int comparePartial(Datum partial\_key, Datum key, StrategyNumber n, Pointer extra\_data)

Compares a partial-match query key to an index key. Returns an integer whose sign indicates the result: less than zero means the index key does not match the query, but the index scan should continue; zero means that the index key matches the query; greater than zero indicates that the index scan should stop because no more matches are possible. The strategy number **n** of the operator that generated the partial match query is provided, in case its semantics are needed to determine when to end the scan. Also, **extra\_data** is the corresponding element of the extra-data array made by **extractQuery**, or **NULL** if none. Null keys are never passed to this function.

To support "partial match" queries, an operator class must provide the **comparePartial** method, and its **extractQuery** method must set the **pmatch** parameter when a partial-match query is encountered. For details, see [Partial Match Algorithm](#).

The actual data types of the various Datum values mentioned in this section vary depending on the operator class. The item values passed to **extractValue** are always of the operator class's input type, and all key values must be of the class's **STORAGE** type. The type of the query argument passed to **extractQuery**, **consistent** and **triConsistent** is whatever is specified as the right-hand input type of the class member operator identified by the strategy number. This need not be the same as the item type, so long as key values of the correct type can be extracted from it.

### 7.16.1.3 Implementation

Internally, a GIN index contains a B-tree index constructed over keys, where each key is an element of one or more indexed items (a member of an array, for

example) and where each tuple in a leaf page contains either a pointer to a B-tree of heap pointers (a "posting tree"), or a simple list of heap pointers (a "posting list") when the list is small enough to fit into a single index tuple along with the key value.

Multi-column GIN indexes are implemented by building a single B-tree over composite values (column number, key value). The key values for different columns can be of different types.

## GIN Fast Update Technique

Updating a GIN index tends to be slow because of the intrinsic nature of inverted indexes: inserting or updating one heap row can cause many inserts into the index. After the table is vacuumed or if the pending list becomes larger than **work\_mem**, the entries are moved to the main GIN data structure using the same bulk insert techniques used during initial index creation. This greatly increases the GIN index update speed, even counting the additional vacuum overhead. Moreover the overhead work can be done by a background process instead of in foreground query processing.

The main disadvantage of this approach is that searches must scan the list of pending entries in addition to searching the regular index, and so a large list of pending entries will slow searches significantly. Another disadvantage is that, while most updates are fast, an update that causes the pending list to become "too large" will incur an immediate cleanup cycle and be much slower than other updates. Proper use of autovacuum can minimize both of these problems.

If consistent response time (of entity cleanup and of update) is more important than update speed, use of pending entries can be disabled by turning off the **fastupdate** storage parameter for a GIN index. For details, see [CREATE INDEX](#).

## Partial Match Algorithm

GIN can support "partial match" queries, in which the query does not determine an exact match for one or more keys, but the possible matches fall within a narrow range of key values (within the key sorting order determined by the **compare** support method). The **extractQuery** method, instead of returning a key value to be matched exactly, returns a key value that is the lower bound of the range to be searched, and sets the **pmatch** flag true. The key range is then scanned using the **comparePartial** method. **comparePartial** must return zero for a matching index key, less than zero for a non-match that is still within the range to be searched, or greater than zero if the index key is past the range that could match.

### 7.16.1.4 GIN Tips and Tricks

Create vs. Insert

Insertion into a GIN index can be slow due to the likelihood of many keys being inserted for each item. So, for bulk insertions into a table it is advisable to drop the GIN index and recreate it after finishing bulk insertion. GUC parameters related to GIN index creation and query performance as follows:

- `maintenance_work_mem`

Build time for a GIN index is very sensitive to the **maintenance\_work\_mem** setting;

- **work\_mem**

During a series of insertions into an existing GIN index that has **fastupdate** enabled, the system will clean up the pending-entry list whenever the list grows larger than **work\_mem**. To avoid fluctuations in observed response time, it is desirable to have pending-list cleanup occur in the background (that is, via autovacuum). Foreground cleanup operations can be avoided by increasing **work\_mem** or making **autovacuum** more aggressive. However, increasing **work\_mem** means that if a foreground cleanup occurs, it will take even longer.

- **gin\_fuzzy\_search\_limit**

The primary goal of developing GIN indexes was to support highly scalable full-text search in GaussDB. A full-text search often returns a very large set of results. This often happens when the query contains very frequent words, so that the large result set is not even useful. Since reading many tuples from the disk and sorting them could take a lot of time, this is unacceptable for production.

To facilitate controlled execution of such queries, GIN has a configurable soft upper limit on the number of rows returned: the **gin\_fuzzy\_search\_limit** configuration parameter. The default value **0** indicates that there is no limit on the returned set. If a non-zero limit is set, then the returned set is a subset of the whole result set, chosen at random.

## 7.16.2 Extended Functions

The following table lists the extended functions supported by GaussDB and they are for reference only.

| Type             | Name                                                     | Description                                                     |
|------------------|----------------------------------------------------------|-----------------------------------------------------------------|
| Trigger function | <code>pg_get_triggerdef(trigger_oid)</code>              | Gets <b>CREATE [ CONSTRAINT ] TRIGGER</b> command for triggers. |
|                  | <code>pg_get_triggerdef(trigger_oid, pretty_bool)</code> | Gets <b>CREATE [ CONSTRAINT ] TRIGGER</b> command for triggers. |

## 7.16.3 Dollar-Quoted String Constants

If a string sequence contains a single quotation mark (`'`), double the single quotation mark (`'`) to two single quotation marks (`''`). Otherwise, the SQL statement may fail to be executed.

If a string contains many single quotation marks (`'`) or backslashes (`\`), the string may be difficult to understand and error-prone because all the single quotation marks (`'`) are doubled.

To make the query more readable in such situations, dollar quoting is provided to write string constants. A dollar-quoted string constant consists of a dollar sign (`$`), a "tag" of zero or more characters, another dollar sign, an arbitrary sequence of

characters that make up the string content, a dollar sign, another tag the same as the previous one, and a dollar sign.

```
gaussdb=# select $$it's an example$$;
?column?

it's an example
(1 row)
```

## 7.16.4 DATABASE LINK

### Description

In the local database, a database link is used to connect to and access the remote database.

A database link can be public or private. A private database link can be accessed only by the creator, while a public database link can be accessed by all users.

All created database link information is stored in the system view **gs\_db\_links** of the local database.

### Precautions

- The database link feature can be used only in ORA-compatible versions.
- The remote database connected to database link supports only 503.1 and later versions.
- Ensure that the values of the compatibility parameter **DBCOMPATIBILITY** and GUC parameters **behavior\_compat\_options**, **a\_format\_dev\_version**, and **a\_format\_version** of the local and remote databases are the same.
- When a session is enabled for a database link connection, the following GUC parameters are set:

```
set search_path=pg_catalog, '$user', 'public';
set datesyle=ISO;
set intervalstyle=postgres;
set extra_float_digits=3;
```

Other parameters are set at the remote end. If the remote parameters are different from the local parameters, the data display formats may be different. Therefore, ensure that the remote parameters are the same as the local parameters.

- Preparations: Use **gs\_guc** to add a whitelist to the **pg\_hba.conf** file to allow client connections.

```
Example: gs_guc reload -I all -N all -Z coordinator -Z datanode -h "host all all 192.168.11.11/32 sha256"
```

For details about the parameters, see the description of **gs\_guc** client authentication policy settings.

- In some cases, the IP address of the DN also needs to be added to the cluster whitelist.
- The permission to create a database link needs to be granted using the **GRANT** syntax. By default, a new user does not have the permission, but the system administrator has the permission. For details, see [GRANT](#).
- When a database link is used to perform operations on a remote table, a schema corresponding to the remote table is created locally. If the metadata of the table does not exist locally, the metadata is written to the local system

catalog. In this case, a level-7 lock is used to ensure write consistency until the transaction ends. When a database link is deleted, the corresponding metadata is also deleted.

- If a long transaction uses the dblink to operate a remote object for the first time, the lock is held until the transaction ends. Other transactions that use the dblink for the first time are blocked. To avoid this problem, run a quick statement, for example, "select \* from t1@dblink where 1=2;", to query the remote object to be used and flush its metadata to disks. In addition, similar problem also occurs when the structure of the remote table changes and the stored metadata is updated locally.
- When a schema corresponding to the remote end is created locally, "USERNAME (available only for private database link) #remote schema@DBLINK" is used as the schema name. The maximum length of the schema name is 63 characters.
- If the local and remote character sets are different, an error indicating that the conversion fails may be reported. The error information is that the remote end returns an error. If the character encoding of the local database is GB18030\_2022, the character encoding sent to the remote database is converted to GB18030. Therefore, if the character set of the local database is GB18030\_2022, the character set of the remote database can only be GB18030 or GB18030\_2022.
- When a database link is used to perform operations on a remote table, a single-node node group is created and randomly bound to a DN.

---

**NOTICE**

When the permission to create a database link is granted to a user, the user can remotely access a database by using the IP address of the remote database. Exercise caution when granting this permission to users.

---

## Syntax

- Create a database link.  

```
CREATE [PUBLIC] DATABASE LINK dblink
[CONNECT TO { CURRENT_USER | user IDENTIFIED BY password }] [USING (option 'value' [...])] ;
```
- Modify the database link information.  

```
ALTER [PUBLIC] DATABASE LINK dblink
{ CONNECT TO user IDENTIFIED BY password } ;
```
- Delete a specified database link.  

```
DROP [PUBLIC] DATABASE LINK dblink;
```

 NOTE

- **PUBLIC**: creates a public database link visible to all users. If this clause is omitted, the database link is private and available only to the current user. The data that can be accessed on the remote database depends on the identity used by the database link during connection.
- If **CONNECT TO user IDENTIFIED BY password** is specified, the database link makes a connection as a user with specified password.
- If **CONNECT TO CURRENT\_USER** is specified, the database link uses the initial username and empty password of the current database to connect to the remote database.
- If the preceding two clauses are omitted, the database link connects to the remote database as a local initial user.
- **dblink**: indicates the name of the database link to be created.
- **user**: indicates the username used by the created database link.
- **password**: indicates the password of the username.
- **USING ( option 'value' [, ... ] )**

Specifies parameters such as the IP address, port number, and remote database name of the database to be connected. The supported options are as follows:

- **host**: specifies the IP addresses to be connected. IPv6 addresses are not supported. Multiple IP addresses can be specified using character strings separated by commas (.). Currently, encrypted databases, SSL settings, and certificate authentication are not supported. If no IP address is specified, this parameter is left empty by default.
- **port**: specifies the port number for connection. If this parameter is not specified, the default value **5432** is used.
- **dbname**: specifies the name of the database to be connected. If this parameter is not specified, the username used for connecting to the remote end is used by default.
- **fetch\_size**: specifies the amount of data obtained from the remote end each time. The value of **fetch\_size** ranges from 0 to 2147483647. The default value is **100**.

**Notes:**

- You can write only part of the preceding options in the brackets after USING.
- If the keyword USING is not written, the content in the brackets is not written as well.
- When a database link is created, the system does not check whether the connection is successful. If related keywords are missing, an error may be reported.

Perform the SELECT operation through a database link.

 NOTE

The syntax for accessing a remote database object by using a created database link is basically the same as that for accessing a local object. The difference is that **@dblink** is added to the end of the remote object descriptor. For details about restrictions on SQL statements, see [Table 7-168](#).

```
[WITH [RECURSIVE] with_query [, ...]]
SELECT [/*+ plan_hint */] [ALL | DISTINCT [ON (expression [, ...])]]
{ * | {expression [[AS] output_name]} [, ...] }
[FROM from_item [, ...]]
[WHERE condition]
[GROUP BY grouping_element [, ...]]
[HAVING condition [, ...]]
[{ UNION | INTERSECT | EXCEPT | MINUS } [ALL | DISTINCT] select]
[ORDER BY {expression [[ASC | DESC | USING operator] | nlssort_expression_clause } [NULLS
```

```
{ FIRST | LAST } } [, ...]
[LIMIT { [offset,] count | ALL }]
[OFFSET start [ROW | ROWS]]
{ FOR { UPDATE | SHARE } [OF table_name [, ...] } [...] };
{ [ONLY] table_name [*] @ dblink [[AS] alias [(column_alias [, ...])]]
((select) [AS] alias [(column_alias [, ...])]
| with_query_name [[AS] alias [(column_alias [, ...])]]
| [function_name] ([argument [, ...]]) [AS] alias [(column_alias [, ...] | column_definition [, ...])]
| [function_name] ([argument [, ...]]) AS (column_definition [, ...])
| from_item [NATURAL] join_type from_item [ON join_condition | USING (join_column [, ...])]);
```

- Perform the INSERT operation through a database link.

```
[WITH [RECURSIVE] with_query [, ...]]
INSERT [/*+ plan_hint */] INTO table_name @ dblink [(column_name [, ...])]
{ DEFAULT VALUES
| VALUES { ({ expression | DEFAULT } [, ...]) } [, ...]
| query }
[RETURNING { {output_expression [[AS] output_name] } [, ...] }];
```

- Perform the UPDATE operation through a database link.

```
UPDATE [/*+ plan_hint */] [ONLY] table_name @ dblink [[AS] alias]
SET {column_name = { expression | DEFAULT }
| (column_name [, ...]) = { ({ expression | DEFAULT } [, ...]) |sub_query } } [, ...]
[FROM from_list] [WHERE condition]
[ORDER BY {expression [[ASC | DESC | USING operator] | nlssort_expression_clause] [NULLS
{ FIRST | LAST } }] [, ...]]
[LIMIT { [offset,] count | ALL }]
[RETURNING { {output_expression [[AS] output_name] } [, ...] }];
```

where sub\_query can be:

```
SELECT [ALL | DISTINCT [ON (expression [, ...])]]
{ * | {expression [[AS] output_name] } [, ...] }
[FROM from_item [, ...]]
[WHERE condition]
[GROUP BY grouping_element [, ...]]
[HAVING condition [, ...]];
```

- Perform the delete operation through a database link.

```
[WITH [RECURSIVE] with_query [, ...]]
DELETE [/*+ plan_hint */] FROM [ONLY] table_name @ dblink [[AS] alias]
[USING using_list]
[WHERE condition]
[ORDER BY {expression [[ASC | DESC | USING operator] | nlssort_expression_clause] [NULLS
{ FIRST | LAST } }] [, ...]]
[LIMIT { [offset,] count | ALL }]
[RETURNING { { output_expr [[AS] output_name] } [, ...] }];
```

- Perform the lock table operation through a database link.

```
LOCK [TABLE] { [ONLY] name @ dblink [, ...] }
[IN { ACCESS SHARE | ROW SHARE | ROW EXCLUSIVE | SHARE UPDATE EXCLUSIVE | SHARE |
SHARE ROW EXCLUSIVE | EXCLUSIVE | ACCESS EXCLUSIVE } MODE]
[NOWAIT];
```

- Call a stored procedure or function of the remote database.

```
CALL | SELECT [schema.] { func_name@dblink | procedure_name@dblink } (param_expr);
```

**CAUTION**

- When a database link calls a remote function or stored procedure, the **out** output parameters, aggregate functions, window functions, and return set functions are not supported. `SELECT * FROM func@dblink()` cannot be used to call the function or stored procedure.
- When a database link calls a remote function or stored procedure, functions under `PUBLIC` are called by default if no schema is specified.
- When the database link invokes a remote function or stored procedure, **param\_expr** does not support the use of `":="` or `"=>"` to separate parameter names and parameter values.

**NOTE**

- The meanings of the parameters irrelevant to database link in the preceding SQL statements are the same as those in the original SQL statements.
- When specifying a column name, you can add `"@dblink"` to the end of the column name to specify the column of the table to which the corresponding database link points.
- When a database link is used to execute an `UPDATE` or `DELETE` statement with `LIMIT`, the statement can be executed regardless of whether the `WHERE` condition is a distribution column.

## Restrictions

- **Transaction**

When a database link is used, the relationship between local and remote transactions is as follows:

- a. A local transaction synchronously controls the commit/rollback status of a remote transaction.
- b. The relationship between isolation levels is as follows.

| Local Isolation Level | Remote Isolation Level |
|-----------------------|------------------------|
| Read Uncommitted      | Repeatable Read        |
| Read Committed        | Repeatable Read        |
| Repeatable Read       | Repeatable Read        |
| Serializable          | Serializable           |

**NOTICE**

If you commit a local transaction, a transaction commit request is sent to the remote end. If the local transaction fails to be committed due to an exception (such as a connection exception or a local cluster instance exception) after the remote transaction is successfully committed, the committed remote transaction cannot be withdrawn. As a result, the local transaction may be inconsistent with the remote transaction.

- **Permissions of local users to use database links**
  - a. If the keyword **public** is used, the link is a public database link and can be used by all users or schemas.
  - b. If the keyword **public** is not used, the link is a private database link and can be used only by the current user or schema. (User **sys** cannot use database links across schemas.)
- **Permission to access remote database objects through database links**

The permissions to access remote database objects are the same as those of the remote connection user bound to the database link.
- **Supported SQL statements**
  - For details about the statements supported by database links, see [Table 7-168](#).
  - For details about the table types supported by database links, see [Table 7-169](#).
- **Function call using a database link**
  - When a database link calls a remote function, the OUT/INOUT parameters, PACKAGE inner functions, aggregate functions, window functions, and return set functions are not supported.
  - When a database link calls a stored procedure or function of a remote database in the **PLSQL\_BODY**, OUT/INOUT parameters, PACKAGE inner functions, overloaded functions, aggregate functions, window functions, and return set functions are not supported.

---

**NOTICE**

- You can use the following syntax to call stored procedures or functions of a remote database in the **PLSQL\_BODY**: [CALL | SELECT] [ schema. ] { func\_name@dblink | procedure\_name@dblink } ( param\_expr ).
- You can use the following syntax to call parameterless stored procedures or functions of a remote database in the **PLSQL\_BODY**: [CALL | SELECT] [ schema. ] { func\_name@dblink | procedure\_name@dblink } ( ).

- 
- **Synonyms**
    - The database link name cannot be created as a synonym.
    - Synonyms that point to a database link object in a remote database cannot be called through database link. Example:
      - Step 1: Create table **TABLE1** on **DB1**.
      - Step 2: Create **DBLINK1** on **DB2** for connecting to **DB1**. Create the synonym "CREATE SYNONYM T1 FOR TABLE1@DBLINK1".
      - Step 3: Create **DBLINK2** on **DB3** for connecting to **DB2**. Call the synonym T1 "SELECT \* FROM T1@DBLINK2" on **DB2** through **DBLINK2**.
  - **Table type constraints**

- HASHBUCKET: The query or DML operation cannot be performed on the remote hash bucket table through database link.
- SLICE: The query or DML operation cannot be performed on the remote slice table through database link.
- Replication table: The query or DML operation cannot be performed on the remote replication table through database link.
- TEMPORARY: The query or DML operation cannot be performed on the remote temporary table through database link.
- **Views**
  - Currently, you can create a view for a remote table of a database link. However, when the structure of the remote table changes, an exception may occur when you use the view. Example:
    - Step 1: Create table **TABLE1** on **DB1**.
    - Step 2: Create **DBLINK** on **DB2** for connecting to **DB1**. Create the view "CREATE VIEW V1 AS SELECT \* FROM TABLE1@DBLINK".
    - Step 3: Delete a column from **TABLE1** on **DB1**. An error is reported when you query the view on **DB2**.
- **Other scenarios**
  - The database link table does not support triggers, including the scenarios where a database link is used in the function called by a trigger, the function called by a trigger is a database link function, and the trigger is defined on a database link.
  - The UPSERT and MERGE syntaxes are not supported.
  - The CURRENT CURSOR syntax is not supported.
  - Hidden columns in a table cannot be queried.
- **Dump and backup**

Database objects related to database links cannot be dumped. The standby node cannot be called or connected by database links.
- **Predicate pushdown constraints**

Only the data types, operators, and functions used in the WHERE clause are built-in, and the used functions are of the IMMUTABLE type.
- **Aggregate function pushdown constraints**

Only single tables that do not contain GROUP, ORDER BY, HAVING, and LIMIT clauses in the SELECT statement are supported. Window functions are not supported.
- **Hint pushdown**

Only hints in scan mode can be pushed down based on the hint conditions of database link table objects. The syntax format is as follows:

```
[no] tablescan|indexscan|indexonlyscan(table [index])
```

The table name or table alias in a query block must be unique.

**Table 7-168** Supported SQL statements

| SQL Type                  | Operation Object                                                  | Supported Option                                                                                                                                                                                                                                                                                                                                                                                                                | Execution Context                                                                        |
|---------------------------|-------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| Creating a database link  | Database link                                                     | N/A                                                                                                                                                                                                                                                                                                                                                                                                                             | Common transaction block                                                                 |
| Modifying a database link | Database link                                                     | Only the username and password can be changed.                                                                                                                                                                                                                                                                                                                                                                                  | Common transaction block                                                                 |

# 8 Best Practices

## 8.1 Best Practices of Table Design

### 8.1.1 Selecting a Storage Model

This is a lab feature. Contact Huawei technical support before using it.

During database design, some key factors about table design will greatly affect the subsequent query performance of the database. Table design affects data storage as well. Scientific table design reduces I/O operations and minimizes memory usage, improving the query performance.

Selecting a model for table storage is the first step of table definition. Select a proper storage model for your service based on the following table.

| Storage Model  | Application Scenario                                                                                                                                      |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Row storage    | Point queries (simple index-based queries that only return a few records)<br>Scenarios requiring frequent addition, deletion, and modification operations |
| Column storage | Statistics analysis query, in which operations, such as group and join, are performed many times                                                          |

### 8.1.2 Selecting a Distribution Mode

In replication mode, full data in a table is copied to each DN in the cluster. This mode is used for tables containing a small volume of data. Full data in a table stored on each DN avoids data redistribution during the join operation. This reduces network costs and plan segment (each having a thread), but generates much redundant data. Generally, this mode is only used for small dimension tables.

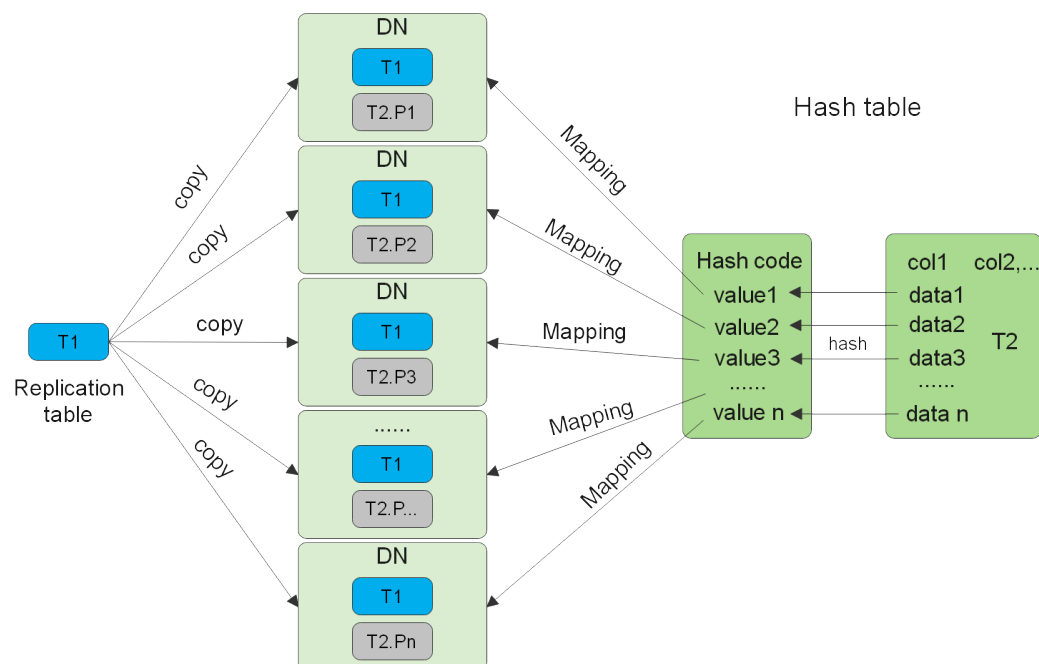

In hash mode, hash values are generated for one or more columns. You can obtain the storage location of a tuple based on the mapping between DNs and the hash values. In a hash table, I/O resources on each node can be used during data read/write, which improves the read/write speed of a table. Generally, a table containing a large amount of data is defined as a hash table.

Range distribution and list distribution are user-defined distribution policies. Values in a distribution key are within a certain range or fall into a specific value range of the corresponding target DN. The two distribution modes facilitate flexible data management which, however, requires users equipped with certain data abstraction capability.

| Policy      | Description                                                                                              | Application Scenario                          |
|-------------|----------------------------------------------------------------------------------------------------------|-----------------------------------------------|
| Hash        | Table data is distributed on all DNs in the cluster.                                                     | Fact tables containing a large amount of data |
| Replication | Full data in a table is stored on every DN in the cluster.                                               | Small tables and dimension tables             |
| Range       | Table data is mapped to specified columns based on the range and distributed to the corresponding DNs.   | Users need to customize distribution rules.   |
| List        | Table data is mapped to specified columns based on specific values and distributed to corresponding DNs. | Users need to customize distribution rules.   |

As shown in [Figure 8-1](#), T1 is a replication table and T2 is a hash table.

**Figure 8-1** Replication tables and hash tables

 NOTE

- When you insert, modify, or delete data in a replication table, if you use the shippable or immutable function to encapsulate components that cannot be pushed down, data on different DNs in the replication table may be inconsistent.
- If statements with unstable results, such as window functions, rownum, and limit clauses and user-defined functions, are used to insert or modify data in a replication table, data on different nodes may be different.

### 8.1.3 Selecting Distribution Keys

Selecting a distribution key for a hash table is essential. Details are as follows:

1. **Ensure that the column values are discrete so that data can be evenly distributed to each DN.** You can select the primary key of the table as the distribution key. For example, for a person information table, choose the ID card number column as the distribution key.
2. **With the above principles met, you can select join conditions as distribution keys** so that join tasks can be pushed down to DNs, reducing the amount of data transferred between the DNs.

For a hash table, an improper distribution key may cause data skew or poor I/O performance on certain DNs. Therefore, you need to check the table to ensure that data is evenly distributed on each DN. You can run the following SQL statement to check for data skew:

```
select
xc_node_id, count(1)
from tablename
group by xc_node_id
order by xc_node_id desc;
```

**xc\_node\_id** corresponds to a DN. Generally, **over 5% difference between the amount of data on different DNs is regarded as data skew. If the difference is over 10%, choose another distribution key.**

Multiple distribution keys can be selected in GaussDB to evenly distribute data.

You can select the distribution key of the range or list distribution table as required. In addition to selecting a proper distribution key, pay attention to the impact of distribution rules on data distribution.

### 8.1.4 Using PCKs

This is a lab feature. Contact Huawei technical support before using it.

The PCK is the column-store-based technology. It can minimize or maximize sparse indexes to quickly filter base tables. You are advised to select a maximum of two columns as PCKs. Use the following principles to specify PCKs:

1. The selected PCKs must be restricted by simple expressions in base tables. Such constraints are usually represented by *col op const*, in which *col* indicates the column name, *op* indicates operators, (including =, >, >=, <=, and <), and *const* indicates constants.
2. Select columns that are frequently selected (to filter much more undesired data) in simple expressions.

3. List the most frequently selected columns at the top.
4. List the columns of the enumerated type at the top.

## 8.1.5 Using Partitioned Tables

Partitioning refers to splitting what is logically one large table into smaller physical pieces based on specific schemes. The table based on the logic is called a partitioned table, and a physical piece is called a partition. Data is stored on these physical partitions, instead of the logical partitioned table. A partitioned table has the following advantages over an ordinary table:

1. High query performance: You can specify partitions when querying partitioned tables, improving query efficiency.
2. High availability: If a certain partition in a partitioned table is faulty, data in the other partitions is still available.
3. Easy maintenance: To fix a partitioned table having a faulty partition, you only need to fix the partition.

GaussDB supports range partitioned tables, list partitioned tables, and hash partitioned tables.

- Range partitioned table: Data in different ranges is mapped to different partitions. The range is determined by the partition key specified during the partitioned table creation. The partition key is usually a date. For example, sales data is partitioned by month.
- List partitioned table: Key values contained in the data are stored in different partitions, and the data is mapped to each partition in sequence. The key values contained in the partitions are specified when the partitioned table is created.
- Hash partitioned table: Data is mapped to each partition based on the internal hash algorithm. The number of partitions is specified when the partitioned table is created.

## 8.1.6 Selecting a Data Type

Use the following principles to select efficient data types:

1. **Select data types that facilitate data calculation.**  
Generally, the calculation of integers (including common comparison calculations, such as =, >, <, ≥, ≤, and ≠, and GROUP BY) is more efficient than that of strings and floating point numbers.
2. **Select data types with a short length.**  
Data types with short length reduce both the data file size and the memory used for computing, improving the I/O and computing performance. For example, use **SMALLINT** instead of **INT**, and **INT** instead of **BIGINT**.
3. **Use the same data type for a join.**  
You are advised to use the same data type for a join. To join columns with different data types, the database needs to convert them to the same type, which leads to additional performance overheads.

## 8.1.7 Checking a Node Where a Table Resides

When creating a table, you can specify how the table is distributed or replicated among nodes. For details, see [•DISTRIBUTEBY](#). For details about distribution modes, see [Selecting a Distribution Mode](#).

When creating a table, you can also set **Node Group** to specify a group to which the table belongs. For details, see [•TO{GROUPgroupname}|...](#)

You can also run the following command to view the instance where the table is located.

1. Query the schema to which the table belongs.

```
select t1.nspname,t2.relname from pg_namespace t1,pg_class t2 where t1.oid = t2.relnamespace and t2.relname = 'table1';
```

In the preceding command, **nspname** indicates the name of a schema, **relname** indicates the name of a table, an index, or a view, **oid** indicates the row identifier, **relnamespace** is the OID of the namespace that contains the relationship, and **table1** indicates a table name.

2. Check **relname** and **nodeoids** of the table.

```
select t1.relname,t2.nodeoids from pg_class t1, pgxc_class t2, pg_namespace t3 where t1.relfilenode = t2.pcrelid and t1.relnamespace=t3.oid and t1.relname = 'table1' and t3.nspname = 'schema1';
```

In the preceding command, **nodeoids** indicates the OID list of the nodes where the table is distributed, **relfilenode** indicates the name of the file related to the table on the disk, **pcrelid** indicates the OID of the table, and **schema1** indicates the schema of the table queried in step 1.

3. Query the instance where the table is located based on the queried node where the table is distributed.

```
select * from pgxc_node where oid in (nodeoids1, nodeoids2, nodeoids3);
```

In the preceding command, **nodeoids1**, **nodeoids2**, **nodeoids3** indicates the three nodeoids queried in step 2. Use the actual nodeoids and separate them with commas (,).

## 8.2 Best Practices of SQL Queries

Based on the SQL execution mechanism and a large number of practices, SQL statements can be optimized by following certain rules to enable the database to execute SQL statements more quickly and obtain correct results.

- Replace **UNION** with **UNION ALL**.

**UNION** eliminates duplicate rows while merging two result sets but **UNION ALL** merges the two result sets without deduplication. Therefore, replace **UNION** with **UNION ALL** if you are sure that the two result sets do not contain duplicate rows based on the service logic.

- Add **NOT NULL** to the join columns.

If there are many NULL values in the **JOIN** columns, you can add the filter criterion **IS NOT NULL** to filter data in advance to improve the **JOIN** efficiency.

- Convert **NOT IN** to **NOT EXISTS**.

**nestloop anti join** must be used to implement **NOT IN**, and **hash anti join** is required for **NOT EXISTS**. If no NULL value exists in the **JOIN** columns, **NOT IN** is equivalent to **NOT EXISTS**. Therefore, if you are sure that no NULL value

exists, you can convert **NOT IN** to **NOT EXISTS** to generate **hash join** and to improve the query performance.

As shown in the following figure, the **t2.d2** column does not contain null values (it is set to **NOT NULL**) and **NOT EXISTS** is used for the query.

```
SELECT * FROM t1 WHERE NOT EXISTS (SELECT * FROM t2 WHERE t1.c1=t2.d2);
```

The generated execution plan is as follows:

**Figure 8-2** NOT EXISTS execution plan

```
id | operation
-----+-----
 1 | -> Streaming (type: GATHER)
 2 | -> Hash Anti Join (3, 4)
 3 | -> Seq Scan on t1
 4 | -> Hash
 5 | -> Streaming (type: REDISTRIBUTE)
 6 | -> Seq Scan on t2
(6 rows)

Predicate Information (identified by plan id)
-----+-----
 2 --Hash Anti Join (3, 4)
 Hash Cond: (t1.c1 = t2.d2)
(2 rows)
```

- Use **hashagg**.

If a plan involving groupAgg and SORT operations generated by the **GROUP BY** statement is poor in performance, you can set **work\_mem** to a larger value to generate a **hashagg** plan, which does not require sorting and improves the performance.

- Replace functions with **CASE** statements.

The GaussDB performance greatly deteriorates if a large number of functions are called. In this case, you can modify the pushdown functions to **CASE** statements.

- Do not use functions or expressions for indexes.

Using functions or expressions for indexes stops indexing. Instead, it enables scanning on the full table.

- Do not use **!=** or **<>** operators, **NULL**, **OR**, or implicit parameter conversion in **WHERE** clauses.

- Split complex SQL statements.

You can split an SQL statement into several ones and save the execution result to a temporary table if the SQL statement is too complex to be tuned using the solutions above, including but not limited to the following scenarios:

- The same subquery is involved in multiple SQL statements of a job and the subquery contains large amounts of data.
- Incorrect plan cost causes a small hash bucket of subquery. For example, the actual number of rows is 10 million, but only 1000 rows are in hash bucket.
- Functions such as **substr** and **to\_number** cause incorrect measures for subqueries containing large amounts of data.

- **BROADCAST** subqueries are performed on large tables in multi-DN environment.

For details about optimization, see [Typical SQL Optimization Methods](#).

## 8.3 Best Practices for Data Skew Query

### 8.3.1 Quickly Locating Tables That Cause Data Skew

Currently, the [table\\_distribution\(schemaname text, tablename text\)](#) and [table\\_distribution\(\)](#) functions as well as the [PGXC\\_GET\\_TABLE\\_SKEWNESS](#) view are provided to query for data skew. You can choose any of them as needed.

#### Scenario 1: Data Skew Caused by a Full Disk

First, use the [pg\\_stat\\_get\\_last\\_data\\_changed\\_time\(oid\)](#) function to query for the tables whose data is changed recently. The last change time of a table is recorded only on the CN where INSERT, UPDATE, and DELETE operations are performed. Therefore, you need to query for tables that are changed within the last day (the period can be changed in the function).

```
CREATE OR REPLACE FUNCTION get_last_changed_table(OUT schemaname text, OUT relname text)
RETURNS setof record
AS $$
DECLARE
 row_data record;
 row_name record;
 query_str text;
 query_str_nodes text;
BEGIN
 query_str_nodes := 'SELECT node_name FROM pgxc_node where node_type = "C"';
 FOR row_name IN EXECUTE(query_str_nodes) LOOP
 query_str := 'EXECUTE DIRECT ON (' || row_name.node_name || ') "SELECT b.nspname,a.relname
FROM pg_class a INNER JOIN pg_namespace b on a.relnamespace = b.oid where
pg_stat_get_last_data_changed_time(a.oid) BETWEEN current_timestamp - 1 AND current_timestamp;"';
 FOR row_data IN EXECUTE(query_str) LOOP
 schemaname = row_data.nspname;
 relname = row_data.relname;
 return next;
 END LOOP;
 END LOOP;
 return;
END; $$
LANGUAGE 'plpgsql';
```

Then, execute the [table\\_distribution\(schemaname text, tablename text\)](#) function to query for the storage space occupied the tables on each DN.

```
SELECT table_distribution(schemaname,relname) FROM get_last_changed_table();
```

#### Scenario 2: Routine Data Skew Inspection

- If the number of tables in the database is less than 10,000, use the skew view to query data skew of all tables in the database.  

```
SELECT * FROM pgxc_get_table_skewness ORDER BY totalsize DESC;
```
- If the number of tables in the database is no less than 10,000, you are advised to use the [table\\_distribution\(\)](#) function instead of the [PGXC\\_GET\\_TABLE\\_SKEWNESS](#) view because the view takes a longer time (hours) due to the query of the entire database for skew columns. When you

use the **table\_distribution()** function, you can define the output based on **PGXC\_GET\_TABLE\_SKEWNESS**, optimizing the calculation and reducing the output columns. For example:

```
SELECT schemaname,tablename,max(dnsize) AS maxsize, min(dnsize) AS minsize
FROM pg_catalog.pg_class c
INNER JOIN pg_catalog.pg_namespace n ON n.oid = c.relnamespace
INNER JOIN pg_catalog.table_distribution() s ON s.schemaname = n.nspname AND s.tablename =
c.relname
INNER JOIN pg_catalog.pgxc_class x ON c.oid = x.pcrelid AND x.pclortype = 'H'
GROUP BY schemaname,tablename;
```

# 9 User-defined Functions

When the cluster is started, CNs and DN and the UDF master process are also started.

```
[qill@pekphisprb53039 ~]$ ps x
 PID TTY STAT TIME COMMAND
 425297 ? S1 29:19 /data1/qill/gaussdb/gaussdb/bin/etcd -name etcd_7003 --data-dir /data1/qill/data/data/etcd
 425633 ? S1 3:50 /data1/qill/gaussdb/gaussdb/bin/cm_agent
 425662 ? S1 18:01 /data1/qill/gaussdb/gaussdb/bin/cm_server
 425683 ? S1 33:47 /data1/qill/gaussdb/gaussdb/bin/gaussdb -D /data1/qill/data/data/slave12 -M pending
 425694 ? S1 0:00 gaussdb fenced UDF master process
 513889 ? S1 9:33 /data1/qill/gaussdb/gaussdb/bin/om_monitor -L /data1/qill/log/log/qill/cm/om_monitor
 574990 pts/0 S 0:00 -bash
 923014 pts/0 R+ 0:00 ps x
[qill@pekphisprb53039 ~]$
```

To execute a UDF in fenced mode, the UDF master process forks itself to UDF worker processes, and UDF worker processes execute the UDF in fenced mode.

## 9.1 PL/SQL Functions

PL/SQL is a loadable procedural language.

Functions created using PL/SQL can be used in any place where you can use built-in functions. For example, you can create calculation functions with complex conditions and use them to define operators or use them for index expressions.

SQL is used by most databases as a query language. It is portable and easy to learn. Each SQL statement must be executed independently by a database server.

In this case, when a client application sends a query to the server, it must wait for it to be processed, receive and process the results, and then perform some calculation before sending more queries to the server. If the client and server are not on the same machine, all these operations will cause inter-process communication and increase network loads.

PL/SQL enables a whole computing part and a series of queries to be grouped inside a database server. This makes procedural language available and SQL easier to use. In addition, the client/server communication cost is reduced.

- Extra round-trip communication between clients and servers is eliminated.
- Intermediate results that are not required by clients do not need to be sorted or transmitted between the clients and servers.
- Parsing can be skipped in multiple rounds of queries.

PL/SQL can use all data types, operators, and functions in SQL.

For details about the PL/SQL syntax for creating functions, see [CREATE FUNCTION](#). As mentioned earlier, PL/SQL is a loadable procedural language. Its application method is similar to that of [Stored Procedures](#). There is only one difference, that is, stored procedures have no return values but the functions have.

XML data can be used as the input parameter, output parameter, user-defined variable, and return value of a user-defined function.

## 9.2 C Language Functions (Lab Feature)

You can use the C language to define functions. These functions are compiled into dynamic libraries and loaded by the server when needed. When a session calls a user-defined function for the first time, the database process loads the dynamic library file to the memory to facilitate later calls. When defining a C function, you must specify the following information: the name of the dynamic library file and the C name of the specific function to be called in the dynamic library. Developers must ensure the correctness and security of user-defined functions. Before the functions are brought online, they must be fully tested to avoid affecting database services.

### Supported Data Types and Interfaces

The database supports various data types, including numerals, strings, and time. The following table lists the data types that can be used for C functions, the mapping between C types and SQL types, parameters receiving data of these types, and interfaces returning results.

**Table 9-1** Mapping between C types and SQL types

| SQL Type  | C Type        | Parameter           | Return Result       |
|-----------|---------------|---------------------|---------------------|
| varchar   | VarChar*      | PG_GETARG_DATUM     | PG_RETURN_VARCHAR_P |
| text      | text*         | PG_GETARG_DATUM     | PG_RETURN_TEXT_P    |
| char      | BpChar*       | PG_GETARG_DATUM     | PG_RETURN_BPCHAR_P  |
| date      | DateADT       | PG_GETARG_DATUM     | PG_RETURN_DATEADT   |
| timestamp | Timestam<br>p | PG_GETARG_TIMESTAMP | PG_RETURN_TIMESTAMP |
| smallint  | int16         | PG_GETARG_INT16     | PG_RETURN_INT16     |
| integer   | int32         | PG_GETARG_INT32     | PG_RETURN_INT32     |
| bigint    | int64         | PG_GETARG_INT64     | PG_RETURN_INT64     |

The following table describes the common functions:

**Table 9-2** Common functions

| Function              | Description                                                                                      |
|-----------------------|--------------------------------------------------------------------------------------------------|
| TextDatumGetCString   | Receives text, varchar, or bpchar data of the datum type and returns a string of the char* type. |
| cstring_to_text       | Converts a string of the char* type to the text or varchar type.                                 |
| date_pl_interval      | Adds an interval to the date type.                                                               |
| timestamp_pl_interval | Adds an interval to the timestamp type.                                                          |
| int4_numeric          | Converts data of the integer type to the numeric type.                                           |
| palloc                | Requests memory.                                                                                 |
| pfree                 | Releases memory.                                                                                 |
| PointerGetDatum       | Forcibly converts the pointer type to the datum type.                                            |
| DirectFunctionCall1   | Specifies a function containing one parameter.                                                   |
| DirectFunctionCall2   | Specifies a function containing two parameters.                                                  |
| DirectFunctionCall3   | Specifies a function containing three parameters.                                                |
| PG_ARGISNULL(N)       | Checks whether the <i>n</i> th parameter of the function is set to <b>NULL</b> .                 |

## Compiling Code

Comply with the following rules when compiling a C function:

1. The function declaration syntax is **Datum funcname(PG\_FUNCTION\_ARGS)**.
2. If the **PG\_FUNCTION\_INFO\_V1(funcname)** macro is called, the function is declared to be version 1. Otherwise, the function is defined as old-style version 0.
3. Declare **PG\_MODULE\_MAGIC** in the C file to mark the database version information so that the dynamic library is not loaded to an incompatible server.
4. Use **palloc** and **pfree**, instead of the C library functions **malloc** and **free**, to allocate memory. When a transaction ends, memory requested using **palloc** will be automatically released to prevent memory leakage.
5. The symbol names defined in the C file should not conflict with each other or with those defined in executable programs on the server. If a message

indicating such a compilation error is displayed, rename your function or variable.

6. Developers must fully understand the functions and input parameter ranges of the kernel function APIs to be called. Before calling the APIs, developers must check the parameter validity to avoid problems such as null pointers that may cause program crashes.
7. User-defined functions must be fully tested before being brought online to prevent problems from affecting database services.

## Examples

Example 1: Return a longer interval of the given two intervals. The file is named **maxtimestamp.cpp** and its content is as follows.

**PG\_GETARG\_TIMESTAMP(0)** and **PG\_GETARG\_TIMESTAMP(1)** obtain the first and second parameters of timestamp type, respectively. **PG\_ARGISNULL(0)** and **PG\_ARGISNULL(1)** return whether the first and second parameters are set to **NULL**. **PG\_RETURN\_TIMESTAMP** returns the result of the timestamp type.

```
#include "postgres.h"
#include "fmgr.h"
#include "utils/timestamp.h"
PG_MODULE_MAGIC;

extern "C" Datum maxdate(PG_FUNCTION_ARGS);
PG_FUNCTION_INFO_V1(maxdate);

Datum
maxdate(PG_FUNCTION_ARGS)
{
 Timestamp para1 = PG_GETARG_TIMESTAMP(0);
 Timestamp para2 = PG_GETARG_TIMESTAMP(1);
 bool arg1_is_null = PG_ARGISNULL(0);
 bool arg2_is_null = PG_ARGISNULL(1);
 Timestamp result;
 if (arg1_is_null == true && arg2_is_null == true)
 {
 PG_RETURN_NULL();
 }
 else if (arg1_is_null == true)
 {
 PG_RETURN_TIMESTAMP(para2);
 }
 else if (arg2_is_null == true)
 {
 PG_RETURN_TIMESTAMP(para1);
 }
 if (para1 < para2)
 {
 result = para2;
 }
 else
 {
 result = para1;
 }
 PG_RETURN_TIMESTAMP(result);
}
```

Example 2: Return the next date. The file is named **nextdate.cpp** and its content is as follows.

**timestamp\_pl\_interval** adds the value of **spanTime** (one day) to the value of **theDate**.

```
#include "postgres.h"
#include "fmgr.h"
#include "utils/timestamp.h"
PG_MODULE_MAGIC;

extern "C" Datum getLatterDate(PG_FUNCTION_ARGS);
PG_FUNCTION_INFO_V1(getLatterDate);

Datum
getLatterDate(PG_FUNCTION_ARGS)
{
 Timestamp theDate = PG_GETARG_TIMESTAMP(0);
 Timestamp result;
 Interval spanTime;
 spanTime.time = 0;
 spanTime.day = 1;
 spanTime.month = 0;

 result = DirectFunctionCall2(timestamp_pl_interval,
 TimestampGetDatum(theDate),
 PointerGetDatum(&spanTime));
 PG_RETURN_TIMESTAMP(result);
}
```

Example 3: Check whether a string consists of only digits. The file is named **isNumber.cpp** and its content is as follows. **PG\_GETARG\_DATUM(0)** obtains the parameter of the text type. **TextDatumGetCString** converts the parameter to a string of the `char*` type.

```
#include "postgres.h"
#include "fmgr.h"
#include "utils/builtins.h"
PG_MODULE_MAGIC;

extern "C" Datum ISNUMBER(PG_FUNCTION_ARGS);
PG_FUNCTION_INFO_V1(ISNUMBER);
Datum
ISNUMBER (PG_FUNCTION_ARGS)
{
 Datum source = PG_GETARG_DATUM(0);
 char *q = TextDatumGetCString(source);

 int len = strlen(q);

 for (int i = 0; i < len; i++)
 {
 if (q[i] >= '0' && q[i] <= '9')
 {
 continue;
 }
 else
 {
 return 0;
 }
 }
 return 1;
}
```

## Compiling and Generating a Dynamic Library

Before using user-defined C code, compile a link and generate a file that can be dynamically loaded by the server, that is, generate a shared library file.

Compile the source file into a destination file and then link to the destination file. The destination file needs to be created as position-independent code (PIC), which means that it can be placed anywhere in the memory when being loaded.

In the following example, the **isNumber.so** shared library is created using the **isNumber.c** file.

The compiler flag for creating a PIC in the Linux OS is **-fpic**. For the flags on other platforms, refer to GNU Compiler Collection (GCC) online documents. The compiler flag for creating a shared library is **-shared**. For example:

```
gcc -fpic -c isNumber.cpp -I include/postgresql/server/
gcc -shared -o isNumber.so isNumber.o
```

You can also combine the preceding commands:

```
gcc -shared -fpic -o isNumber.so isNumber.cpp -I include/postgresql/server/
```

Where **include/postgresql/server/** is the path of the header file released by the server, which is in the installation directory.

The GCC version must be 7.3.0 or later.

---

#### NOTICE

To ensure the compatibility of C functions, if the database needs to be upgraded, you need to recompile the C function shared library based on the upgraded header file.

After a dynamic library is loaded to the server, do not manually modify the dynamic library in the environment. Otherwise, segment errors or other unknown problems may occur.

---

## Creating a C Function

Take **ISNUMBER** as an example:

```
create or replace function isnumber(text)
returns integer
as '...../isNumber.so', 'ISNUMBER'
language c strict fenced IMMUTABLE SHIIPABLE;
```

- **...../isNumber.so** specifies the path of the library file. When **enable\_default\_cfunc\_libpath** is enabled, specify the file name. The database automatically searches for the file in the default directory **\$libdir/proc\_srclib**. When **enable\_default\_cfunc\_libpath** is disabled, specify the absolute path of the library file. The **enable\_default\_cfunc\_libpath** parameter is enabled by default.
- **strict** indicates that the function is not executed and returns a null value if any of its parameters is set to **NULL**. If **strict** was not specified when a function, such as **maxdate**, was created, ensure **NULL** values are correctly processed when you implement the function using C language. Otherwise, processes may crash.
- **fenced** indicates that a function is called in worker processes to prevent the server from crashing due to incorrect C code implementation. The **not fenced** mode is not recommended.
- **IMMUTABLE** indicates that the execution result of a function only depends on the function's input parameters.

- **SHIPPABLE** indicates that a function can be pushed down to DNs. If the return type of an **IMMUTABLE** function is not record, the function can be pushed down to DNs.

Functions of the **STABLE** or **VOLATILE** type can be pushed down to DNs only if their attribute is **SHIPPABLE**.

For details about function attributes, see [CREATE FUNCTION](#).

#### NOTE

- The types of parameters and return values specified for the create function must be the same as those implemented in C code.
- If **strict** was not specified when a function was created, the implementation of the C code must check whether the function parameters are set to **NULL**.
- Any user can be granted the permission for creating C functions, whereas only users having the **sysadmin** permission can create Java and internal functions.
- A user with the **sysadmin** permission can use the **GRANT** syntax to grant the permission for creating C functions to common users.
- The code of a C function created in **not fenced** mode must be correct. Otherwise, the GaussDB process crashes.
- It is recommended that each function use one library file.
- If the **fenced** mode is used, you can use the GUC parameter **fencedUDFMemoryLimit** to control the memory size used by the C function, preventing excessive memory usage or memory leakage.
- For function security purposes, only user **omm** (initial user in the database) is authorized to upload the .so file. In addition, the file source and function source code must be strictly checked.

# 10 Stored Procedures

---

## 10.1 Overview

In GaussDB, business rules and logics are saved as stored procedures.

A stored procedure is a combination of SQL, PL/SQL, and Java statements. Stored procedures can move the code that executes business rules from applications to databases. Therefore, the code storage can be used by multiple programs at a time.

For details about how to create and call a stored procedure, see [CREATE PROCEDURE](#).

The application methods for PL/SQL functions mentioned in [PL/SQL Functions](#) are similar to those for stored procedures. Unless otherwise specified, the following sections apply to stored procedures and PL/SQL functions.

## 10.2 Data Types

A data type refers to a value set and an operation set defined on the value set. GaussDB consists of tables, each of which is defined by its own columns. Each column corresponds to a data type. GaussDB uses corresponding functions to perform operations on data based on data types. For example, GaussDB can perform operations such as addition, subtraction, multiplication, and division on numeric data.

XML data can be used as input parameters, output parameters, user-defined variables, and return values of stored procedures, as well as stored procedures that support autonomous transactions.

## 10.3 Data Type Conversion

Certain data types in the database support implicit data type conversions, such as assignments and parameters called by functions. For other data types (such as int), you can use the type conversion functions provided by GaussDB, such as the CAST function, to forcibly convert them.

**Table 10-1** lists common implicit data type conversions in GaussDB.

**NOTICE**

The valid value range of **DATE** supported by GaussDB is from 4713 B.C. to 294276 A.D.

**Table 10-1** Implicit data type conversions

| Raw Data Type | Target Data Type | Remarks                                      |
|---------------|------------------|----------------------------------------------|
| CHAR          | VARCHAR2         | -                                            |
| CHAR          | NUMBER           | Raw data must consist of digits.             |
| CHAR          | DATE             | Raw data cannot exceed the valid date range. |
| CHAR          | RAW              | -                                            |
| CHAR          | CLOB             | -                                            |
| VARCHAR2      | CHAR             | -                                            |
| VARCHAR2      | NUMBER           | Raw data must consist of digits.             |
| VARCHAR2      | DATE             | Raw data cannot exceed the valid date range. |
| VARCHAR2      | CLOB             | -                                            |
| NUMBER        | CHAR             | -                                            |
| NUMBER        | VARCHAR2         | -                                            |
| DATE          | CHAR             | -                                            |
| DATE          | VARCHAR2         | -                                            |
| RAW           | CHAR             | -                                            |
| RAW           | VARCHAR2         | -                                            |
| CLOB          | CHAR             | -                                            |
| CLOB          | VARCHAR2         | -                                            |
| CLOB          | NUMBER           | Raw data must consist of digits.             |
| INT4          | CHAR             | -                                            |

## 10.4 Arrays, Collections, and Records

### 10.4.1 Arrays

#### Use of Array Types

Before the use of arrays, an array type needs to be defined:

Define an array type immediately after the **AS** keyword in a stored procedure. Run the following statement:

```
TYPE array_type IS VARRAY(size) OF data_type;
```

Related parameters are as follows:

- **array\_type**: indicates the name of the array type to be defined.
- **VARRAY**: indicates the array type to be defined.
- **size**: indicates the maximum number of members in the array type to be defined. The value is a positive integer.
- **data\_type**: indicates the types of members in the array type to be created.

#### NOTE

- In GaussDB, an array automatically increases. If an access violation occurs, a **NULL** value will be returned, and no error message will be reported.
- The scope of an array type defined in a stored procedure takes effect only in this storage process.
- **size** supports only the syntax and does not support the function.
- **data\_type** can also be the set type, but cannot be the array or cursor type defined in the stored procedure.
- When **data\_type** is collection, multi-dimensional arrays are not supported.
- NOT NULL syntax is not supported.
- The constructors of the array type can be used only in ORA-compatible mode.
- The constructor of the array type cannot be used as the default value of a function or stored procedure parameter.
- If an array is an element of the collection type and **data\_type** of the array is set to **varchar** or **numeric** that can define the length and precision, the element length of the array is not verified or the element is not converted to the corresponding precision.

GaussDB supports the access of content in an array by using parentheses, and the extend, count, first, last prior, next, exists, trim, and delete functions.

#### NOTE

If the stored procedure contains DML statements (**SELECT**, **UPDATE**, **INSERT**, or **DELETE**), DML statements can access array elements only using brackets. In this way, it may be separated from the function expression area.

#### Examples

```
-- Perform array operations in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE array_proc AS
DECLARE
TYPE ARRAY_INTEGER IS VARRAY(1024) OF INTEGER;-- Define the array type.
```

```

ARRINT ARRAY_INTEGER := ARRAY_INTEGER(); -- Declare the variable of the array type.
BEGIN
ARRINT.EXTEND(10);
FOR I IN 1..10 LOOP
 ARRINT(I) := I;
END LOOP;
DBE_OUTPUT.PRINT_LINE(ARRINT.COUNT);
DBE_OUTPUT.PRINT_LINE(ARRINT(1));
DBE_OUTPUT.PRINT_LINE(ARRINT(10));
DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.FIRST));
DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.LAST));
DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.NEXT(ARRINT.FIRST)));
DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.PRIOR(ARRINT.LAST)));
ARRINT.TRIM();
IF ARRINT.EXISTS(10) THEN
 DBE_OUTPUT.PRINT_LINE('Exist 10th element');
ELSE
 DBE_OUTPUT.PRINT_LINE('Not exist 10th element');
END IF;
DBE_OUTPUT.PRINT_LINE(ARRINT.COUNT);
DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.FIRST));
DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.LAST));
ARRINT.DELETE();
END;
/

-- Call the stored procedure.
gaussdb=# CALL array_proc();
10
1
10
1
10
2
9
Not exist 10th element
9
1
9
array_proc

(1 row)

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE array_proc;

```

## 10.4.2 Collections

### 10.4.2.1 Use of Collection Types

Before the use of collections, a collection type must be defined.

Define a collection type immediately after the **AS** keyword in a stored procedure. The definition method is as follows:

In the preceding information:

- **table\_type**: indicates the name of the collection type to be defined.
- **TABLE**: indicates the collection type to be defined.

- **data\_type**: indicates the type of members in the collection to be created.
- **indexby\_type**: indicates the type of the index set to be created.

## Nest-Table Collection Type

Members of a specified data type are stored in a variable-length array. You can use the extend function to expand the storage space and use the trim function to release the storage space. For a collection variable *x* with 10 storage units whose member type is int, members are stored as shown in the following figure.

|      |  |      |      |  |      |      |  |      |       |
|------|--|------|------|--|------|------|--|------|-------|
| 12   |  | 64   | 86   |  | 34   | 46   |  | 26   | 10    |
| x(1) |  | x(3) | x(4) |  | x(6) | x(7) |  | x(9) | x(10) |

Members *x*(2), *x*(5), and *x*(8) are invalid, but their storage space is still reserved. You can assign values to them later without re-allocating space.

Note: When a nest-table collection is used as the return value of a function or an input parameter of an autonomous transaction, invalid members will be deleted from the storage space, and the index sets of all members change accordingly.

After a collection type is defined, use *table\_type* as the type name to declare the variable.

```
var_name table_type [:= table_type([v1[,...]])];
```

You can use a type constructor to initialize the variable during or after declaration. If the variable is not initialized, the value of *var\_name* is **NULL**.

After the variable is declared and initialized, you can access collection members through an index or assign values to members. The index range is [1,*upper*]. The value of *upper* is the size of the current space. If you attempt to access a deleted member, the error message "no data found" will be returned.

 NOTE

- In a non-ORA compatible mode (the value of **sql\_compatibility** is not **ORA**), the collection type cannot be created.
- In GaussDB, a nest-table collection does not automatically increase, and an error is reported when you attempt to access the index set out of the specified range.
- **NOT NULL** has no function but only takes effect in the syntax.
- The value of **data\_type** can be a base data type or a collection type or array type defined in a stored procedure. The ref cursor type is not supported.
- Variables of a collection type cannot be assigned a value of another collection type, even if their member types are the same. For example, *t1* and *t2* are of different collection types defined by **TYPE t1 IS TABLE OF int** and **TYPE t2 IS TABLE OF int**, respectively. A value of the collection type defined by **TYPE t1 IS TABLE OF int** cannot be assigned to *t2*, and vice versa. (This restriction may not take effect when the variables are of the member types because the value assignment logic of variables is affected by the parent type.)
- Only the equal (=) and non-equal operations (<> or !=) between collections are supported. Other relational and arithmetic operations are not supported.
- Use IS [ NOT ] NULL to compare a collection type with **NULL**. The result of comparison with **NULL** using the equal operator (=) is inaccurate.
- Variables of the collection type can be used as parameters and return values of functions. In this case, the type of the parameters or return values must have been defined in a schema.
- Operations on XML data are not supported.
- When creating a table, do not use the collection type or any type containing a collection as a column in the table.
- Constructors of the collection type do not support floating point numbers and expressions as indexes.
- For a collection type defined in an anonymous block, after ROLLBACK is executed or EXCEPTION occurs in an anonymous block, the collection type cannot be used.

GaussDB supports access to collection elements by using parentheses, and it also supports the extend, count, first, last, prior, next, and delete functions.

The collection functions support multiset union, intersect, except all, and distinct.

## Index-By Table Collection Type

This collection type stores the index set and corresponding member values in a hash table as key-value pairs. All operations on variables of this type are actually operations on the hash table. Users do not need to expand or release storage space, but only need to assign values or delete members. The operations related to the collection type are described as follows:

### 1. Type definition

When defining the index-by table collection type, specify both the member type **data\_type** and index set type **indexby\_type**. The index set type can only be integer or varchar.

### 2. Variable declaration and initialization

After the index-by table collection type is declared, it can be initialized. There are three initialization scenarios: uninitialized, initialized to null, and initialized to specified index set and member values. The effect of uninitialized variables is the same as that of initializing variables to null. If a variable is not initialized or is initialized to null, the variable is not **NULL**. You can assign a

value to the variable later. Initializing a variable to specified index set and member values will save the specified index set and member values to the variable as key-value pairs.

3. Variable assignment

Assignment to variables of the index-by table collection type is classified into member assignment and group assignment. Member assignment allows to assign a value to a member by specifying the index set. If the member does not have a value, the assigned value is used directly. If the member has a value, the member value is updated. Group assignment will clear the original members in the variable and save the new member values. In the group assignment scenario, **NULL** cannot be assigned to variables. Otherwise, an error is reported.

4. Variable value

You can specify an index set to obtain the member value of the corresponding index in the variable. If the member cannot be found based on the index set, the error message "no data found" is returned.

 NOTE

- In a non-ORA compatible mode (the value of `sql_compatibility` is not **ORA**), no index-by table collection type can be created.
- Index-by table collection types can be defined in anonymous blocks, stored procedures, user-defined functions, and packages, among which the scopes of the collection types vary. Index-by table collection types cannot be defined in schemas.
- **NOT NULL** has no function but only takes effect in the syntax.
- The value of `data_type` can be a base data type or a collection type or array type defined in a stored procedure. The ref cursor type is not supported.
- The value of `indexby_type` can only be integer or varchar. The length of varchar is not restricted.
- An uninitialized variable of the index-by table collection type is not **NULL**.
- **NULL** cannot be assigned to a variable of the index-by table collection type. Otherwise, an error is reported.
- **NULL** and " (single quotation marks) cannot be assigned to a variable of the index-by table collection type.
- Variables of the index-by table collection type cannot be assigned values of another index-by table collection type, even if their member type and index set type are the same. For example, `t1` and `t2` are of different collection types defined by **TYPE t1 IS TABLE OF int index by int** and **TYPE t2 IS TABLE OF int index by int**, respectively. A value of the collection type defined by **TYPE t1 IS TABLE OF int index by int** cannot be assigned to `t2`, and vice versa. (This restriction may not take effect when the variables are of the member types because the value assignment logic of variables is affected by the parent type.)
- An index-by table collection type does not support relational and arithmetic operations.
- When a variable of the index-by table collection type is assigned by executing **select... bulk collect into**, the index set must be of the integer type. The index set type cannot be varchar.
- When an index-by table collection is used as the input parameter of a function, an array with elements of the same type can be transferred as the input parameter. Multi-dimensional arrays are not supported, and the index type cannot be varchar. (This function is outdated and not recommended.) You can run the **set behavior\_compat\_options = 'disable\_rewrite\_nesttable'** command to disable the function.
- Currently, the type constructor supports only the collection type and the maximum number of parameters is the same as that of user-defined function parameters. For the index-by table collection type, the index value can only be a constant when the constructor is used.
- Operations on XML data are not supported.
- When creating a table, do not use the collection type or any type containing a collection as a column in the table.
- Constructors of the collection type do not support floating point numbers and expressions as indexes.
- For a collection type defined in an anonymous block, after **ROLLBACK** is executed or **EXCEPTION** occurs in an anonymous block, the collection type cannot be used.

## Examples

### Example 1: nest-table collection type

```
-- Perform operations on a collection in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE table_proc AS
DECLARE
 TYPE TABLE_INTEGER IS TABLE OF INTEGER;-- Define a collection type.
 TABLEINT TABLE_INTEGER := TABLE_INTEGER(); -- Declare the variable of the collection type.
```

```

BEGIN
 TABLEINT.extend(10);
 FOR I IN 1..10 LOOP
 TABLEINT(I) := I;
 END LOOP;
 DBE_OUTPUT.PRINT_LINE(TABLEINT.COUNT);
 DBE_OUTPUT.PRINT_LINE(TABLEINT(1));
 DBE_OUTPUT.PRINT_LINE(TABLEINT(10));
END;
/

-- Invoke the stored procedure.
gaussdb=# CALL table_proc();
10
1
10
table_proc

(1 row)

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE table_proc;
DROP PROCEDURE
-- Perform operations on a nest-table collection in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE nest_table_proc AS
DECLARE
 TYPE TABLE_INTEGER IS TABLE OF INTEGER;-- Define a collection type.
 TYPE NEST_TABLE_INTEGER IS TABLE OF TABLE_INTEGER;-- Define a collection type.
 NEST_TABLE_VAR NEST_TABLE_INTEGER := NEST_TABLE_INTEGER(); --Declare a variable of the nest-
table collection type.
BEGIN
 NEST_TABLE_VAR.extend(10);
 FOR I IN 1..10 LOOP
 NEST_TABLE_VAR(I) := TABLE_INTEGER();
 NEST_TABLE_VAR(I).extend(10);
 NEST_TABLE_VAR(I)(I) := I;
 END LOOP;
 DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR.COUNT);
 DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR(1)(1));
 DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR(10)(10));
END;
/
CREATE PROCEDURE
-- Invoke the stored procedure.
gaussdb=# CALL nest_table_proc();
10
1
10
nest_table_proc

(1 row)

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE nest_table_proc;
DROP PROCEDURE

```

### Example 2: index-by table collection type

```

-- Perform operations on an index-by table collection in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE index_table_proc AS
DECLARE
 TYPE TABLE_INTEGER IS TABLE OF INTEGER INDEX BY INTEGER; -- Define a collection type.
 TYPE TABLE_VARCHAR IS TABLE OF INTEGER INDEX BY VARCHAR; -- Define a collection type.
 TABLEINT_01 TABLE_INTEGER; -- Declare a variable of the collection type, which is
not initialized.
 TABLEINT_02 TABLE_INTEGER := TABLE_INTEGER(); -- Declare a variable of the collection type.
The initial value is null.
 TABLEINT_03 TABLE_INTEGER := TABLE_INTEGER(2=>3,3=>4); -- Declare a variable of the collection

```

```

type and initialize it to the specified value.
 RES INTEGER;
BEGIN
 FOR I IN 1..10 LOOP
 TABLEINT_01(I) := I; -- Assign values to members.
 TABLEINT_02(I) := I + 1; -- Assign values to members.
 END LOOP;
 TABLEINT_01 := TABLEINT_02; -- Group assignment
 RES := TABLEINT_03(2); -- Return the collection values.
 DBE_OUTPUT.PRINT_LINE(RES);
 DBE_OUTPUT.PRINT_LINE(TABLEINT_01(1));
 DBE_OUTPUT.PRINT_LINE(TABLEINT_01(10));
END;
/
CREATE PROCEDURE
-- Invoke the stored procedure.
gaussdb=# CALL index_table_proc();
3
2
11
index_table_proc

(1 row)

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE index_table_proc;
DROP PROCEDURE
-- Perform operations on a nest-table collection in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE nest_table_proc AS
DECLARE
 TYPE TABLE_INTEGER IS TABLE OF INTEGER INDEX BY INTEGER; -- Define a collection type.
 TYPE NEST_TABLE_INTEGER IS TABLE OF TABLE_INTEGER INDEX BY INTEGER;-- Define a collection
type.
 NEST_TABLE_VAR NEST_TABLE_INTEGER; -- Declare variables of the nest-table
collection type.
BEGIN
 FOR I IN 1..10 LOOP
 NEST_TABLE_VAR(I)(I) := I;
 END LOOP;
 DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR.COUNT);
 DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR(1)(1));
 DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR(10)(10));
END;
/
CREATE PROCEDURE
-- Invoke the stored procedure.
gaussdb=# CALL nest_table_proc();
10
1
10
nest_table_proc

(1 row)

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE nest_table_proc;
DROP PROCEDURE

```

## 10.4.2.2 Collection Functions

### Collection Operators

- =  
Parameter: nesttable  
Return value: true or false, Boolean type

Description: Checks whether two collections are equal.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1,2);
gaussdb-# b nest := nest(1,2);
gaussdb-# flag bool;
gaussdb-# begin
gaussdb$$$ flag := a = b;
gaussdb$$$ raise info '%', flag;
gaussdb$$$ end;
gaussdb$$$ /
INFO: t
ANONYMOUS BLOCK EXECUTE
```

- <>

Parameter: nesttable

Return value: true or false, Boolean type

Description: Checks whether two collections are not equal.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1,2);
gaussdb-# b nest := nest(1,2);
gaussdb-# flag bool;
gaussdb-# begin
gaussdb$$$ flag := a <> b;
gaussdb$$$ raise info '%', flag;
gaussdb$$$ end;
gaussdb$$$ /
INFO: f
ANONYMOUS BLOCK EXECUTE
```

## MULTISET

- MULTISET UNION [ALL | DISTINCT]

Parameter: nesttable

Return value: nesttable

Description: Union of two collection variables. **ALL** indicates that duplicate elements are not removed, and **DISTINCT** indicates that duplicate elements are removed.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1,2);
gaussdb-# b nest := nest(2,3);
gaussdb-# begin
gaussdb$$$ a := a MULTISET UNION ALL b;
gaussdb$$$ raise info '%', a;
gaussdb$$$ end;
gaussdb$$$ /
INFO: {1,2,2,3}
ANONYMOUS BLOCK EXECUTE

gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1,2);
gaussdb-# b nest := nest(2,3);
gaussdb-# begin
gaussdb$$$ a := a MULTISET UNION DISTINCT b;
gaussdb$$$ raise info '%', a;
```

```
gaussdb$# end;
gaussdb$# /
INFO: {1,2,3}
ANONYMOUS BLOCK EXECUTE
```

- **MULTISET EXCEPT [ALL | DISTINCT]**

Parameter: nesttable

Return value: nesttable

Description: Difference of two collection variables. Taking A MULTISET EXCEPT B as an example, **ALL** indicates that elements that are the same as those in B are removed from A. **DISTINCT** indicates that duplicate elements are removed from A first and then elements that are the same as those in B are removed from A.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1,2,2);
gaussdb-# b nest := nest(2,3);
gaussdb-# begin
gaussdb$# a := a MULTISET EXCEPT ALL b;
gaussdb$# raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO: {1,2}
ANONYMOUS BLOCK EXECUTE
```

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1,2,2);
gaussdb-# b nest := nest(2,3);
gaussdb-# begin
gaussdb$# a := a MULTISET EXCEPT DISTINCT b;
gaussdb$# raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO: {1}
ANONYMOUS BLOCK EXECUTE
```

- **MULTISET INTERSECT [ALL | DISTINCT]**

Parameter: nesttable

Return value: nesttable

Description: Intersection of two collection variables. Taking A MULTISET INTERSECT B as an example, **ALL** indicates that all duplicate elements in A and B are obtained, and **DISTINCT** indicates that duplicate elements in A and B are obtained and then duplicate elements in this intersection are removed.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1,2,2);
gaussdb-# b nest := nest(2,2,3);
gaussdb-# begin
gaussdb$# a := a MULTISET INTERSECT ALL b;
gaussdb$# raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO: {2,2}
ANONYMOUS BLOCK EXECUTE
```

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1,2,2);
gaussdb-# b nest := nest(2,2,3);
```

```
gaussdb=# begin
gaussdb$# a := a MULTISSET INTERSECT DISTINCT b;
gaussdb$# raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO: {2}
ANONYMOUS BLOCK EXECUTE
```

## Functions of the Collection Type

- exists(idx)

Parameter: *idx* is of the int4 or varchar type.

Return value: true or false, Boolean type

Description: Checks whether a valid element exists in a specified position.

Example:

```
gaussdb=# declare
gaussdb=# type nest is table of varchar2;
gaussdb=# a nest := nest('happy','?');
gaussdb=# flag bool;
gaussdb=# begin
gaussdb$# flag := a.exists(1);
gaussdb$# raise info '%', flag;
gaussdb$# flag := a.exists(10);
gaussdb$# raise info '%', flag;
gaussdb$# end;
gaussdb$# /
INFO: t
INFO: f
ANONYMOUS BLOCK EXECUTE

gaussdb=# declare
gaussdb=# type nest is table of varchar2 index by varchar2;
gaussdb=# a nest;
gaussdb=# flag bool;
gaussdb=# begin
gaussdb$# a('1') := 'Be';
gaussdb$# a('2') := 'happy';
gaussdb$# a('3') := '!';
gaussdb$# flag := a.exists('1');
gaussdb$# raise info '%', flag;
gaussdb$# flag := a.exists('ddd');
gaussdb$# raise info '%', flag;
gaussdb$# end;
gaussdb$# /
INFO: t
INFO: f
ANONYMOUS BLOCK EXECUTE
```

- extend[(count[, idx])]

Parameters: *idx* and *count* are of the int4 type.

Return value: No value is returned.

Description: Extends one or *count* elements at the end of the nest-table variable. Only the nest-table collection type is supported. If index set element *idx* exists, *count* index elements are copied to the end of the variable.

Example:

```
gaussdb=# declare
gaussdb=# type nest is table of int;
gaussdb=# a nest := nest(1);
gaussdb=# begin
gaussdb$# raise info '%', a;
gaussdb$# a.extend;
gaussdb$# raise info '%', a;
```

```
gaussdb## end;
gaussdb## /
INFO: {1}
INFO: {1,NULL}
ANONYMOUS BLOCK EXECUTE

gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1);
gaussdb-# begin
gaussdb## raise info '%', a;
gaussdb## a.extend(2);
gaussdb## raise info '%', a;
gaussdb## end;
gaussdb## /
INFO: {1}
INFO: {1,NULL,NULL}
ANONYMOUS BLOCK EXECUTE

gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1);
gaussdb-# begin
gaussdb## raise info '%', a;
gaussdb## a.extend(2,1);
gaussdb## raise info '%', a;
gaussdb## end;
gaussdb## /
INFO: {1}
INFO: {1,1,1}
ANONYMOUS BLOCK EXECUTE
```

- delete[(idx1[, idx2])]

Parameter: *idx1* and *idx2* are of the int4 or varchar2 type.

Return value: No value is returned.

Description: Deletes all elements and releases corresponding storage space in a nest-table collection (to use this collection, extend must be executed again), or deletes all elements (including index set elements) in an index-by table collection but does not release corresponding storage space.

Restriction: If an element is deleted but it is not removed from the storage space, the space is invalid and can be assigned a value. Note: When a collection is used as the return value of a function or an input parameter of an autonomous transaction, invalid members will be deleted from the storage space, and the index sets of all members change accordingly.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1,2,3,4,5);
gaussdb-# begin
gaussdb## raise info '%', a;
gaussdb## a.delete;
gaussdb## raise info '%', a;
gaussdb## end;
gaussdb## /
INFO: {1,2,3,4,5}
INFO: {}
ANONYMOUS BLOCK EXECUTE

gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1,2,3,4,5);
gaussdb-# begin
gaussdb## raise info '%', a;
gaussdb## a.delete(3);
```

```
gaussdb$$ raise info '%', a;
gaussdb$$ end;
gaussdb$$ /
INFO: {1,2,3,4,5}
INFO: {1,2,4,5}
ANONYMOUS BLOCK EXECUTE

gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# a nest := nest(1,2,3,4,5);
gaussdb-# begin
gaussdb$$ raise info '%', a;
gaussdb$$ a.delete(2,4);
gaussdb$$ raise info '%', a;
gaussdb$$ end;
gaussdb$$ /
INFO: {1,2,3,4,5}
INFO: {1,5}
ANONYMOUS BLOCK EXECUTE
```

- **trim[(n)]**

Parameter: *n* is of the int4 type.

Return value: No value is returned.

Description: Deletes one or *n* elements and corresponding storage space from a nest-table collection. Only the nest-table collection type is supported.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# aa nest:=nest(11,22,33,44,55);
gaussdb-# begin
gaussdb$$ raise info 'aa:%' ,aa;
gaussdb$$ aa.trim;
gaussdb$$ raise info 'aa:%' ,aa;
gaussdb$$ aa.trim(2);
gaussdb$$ raise info 'aa:%' ,aa;
gaussdb$$ end;
gaussdb$$ /
INFO: aa:{11,22,33,44,55}
INFO: aa:{11,22,33,44}
INFO: aa:{11,22}
ANONYMOUS BLOCK EXECUTE
```

- **count**

Parameter: none

Return value: int type

Description: Returns the number of valid elements in a collection.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# aa nest:=nest(11,22,33,44,55);
gaussdb-# begin
gaussdb$$ raise info 'count:%' ,aa.count;
gaussdb$$ end;
gaussdb$$ /
INFO: count:5
ANONYMOUS BLOCK EXECUTE

gaussdb=# declare
gaussdb-# type nest is table of int index by varchar;
gaussdb-# aa nest;
gaussdb-# begin
gaussdb$$ aa('aaa') := 111;
gaussdb$$ aa('bbb') := 222;
gaussdb$$ aa('ccc') := 333;
```

```
gaussdb$$ raise info 'count:%' ,aa.count;
gaussdb$$ end;
gaussdb$$ /
INFO: count:3
ANONYMOUS BLOCK EXECUTE
```

- first

Parameter: none

Return value: int or varchar

Description: Returns the index of the first valid element in a collection.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# aa nest:=nest(11,22,33,44,55);
gaussdb-# begin
gaussdb$$ raise info 'first:%' ,aa.first;
gaussdb$$ end;
gaussdb$$ /
INFO: first:1
ANONYMOUS BLOCK EXECUTE
```

```
gaussdb=# declare
gaussdb-# type nest is table of int index by varchar;
gaussdb-# aa nest;
gaussdb-# begin
gaussdb$$ aa('aaa') := 111;
gaussdb$$ aa('bbb') := 222;
gaussdb$$ aa('ccc') := 333;
gaussdb$$ raise info 'first:%' ,aa.first;
gaussdb$$ end;
gaussdb$$ /
INFO: first:aaa
ANONYMOUS BLOCK EXECUTE
```

- last

Parameter: none

Return value: int or varchar

Description: Returns the index of the last valid element in a collection.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# aa nest:=nest(11,22,33,44,55);
gaussdb-# begin
gaussdb$$ raise info 'last:%' ,aa.last;
gaussdb$$ end;
gaussdb$$ /
INFO: last:5
ANONYMOUS BLOCK EXECUTE
```

```
gaussdb=# declare
gaussdb-# type nest is table of int index by varchar;
gaussdb-# aa nest;
gaussdb-# begin
gaussdb$$ aa('aaa') := 111;
gaussdb$$ aa('bbb') := 222;
gaussdb$$ aa('ccc') := 333;
gaussdb$$ raise info 'last:%' ,aa.last;
gaussdb$$ end;
gaussdb$$ /
INFO: last:ccc
ANONYMOUS BLOCK EXECUTE
```

- prior(idx)

Parameter: *idx* is of the int or varchar type.

Return value: int or varchar type

Description: Returns the index of a valid element before the current index in a collection.

Example:

```
gaussdb=# declare
gaussdb=# type nest is table of int;
gaussdb=# aa nest:=nest(11,22,33,44,55);
gaussdb=# begin
gaussdb$$ raise info 'prior:%' ,aa.prior(3);
gaussdb$$ end;
gaussdb$$ /
INFO: prior:2
ANONYMOUS BLOCK EXECUTE

gaussdb=# declare
gaussdb=# type nest is table of int index by varchar;
gaussdb=# aa nest;
gaussdb=# begin
gaussdb$$ aa('aaa') := 111;
gaussdb$$ aa('bbb') := 222;
gaussdb$$ aa('ccc') := 333;
gaussdb$$ raise info 'prior:%' ,aa.prior('bbb');
gaussdb$$ end;
gaussdb$$ /
INFO: prior:aaa
ANONYMOUS BLOCK EXECUTE
```

- next(idx)

Parameter: *idx* is of the int or varchar type.

Return value: int or varchar type

Description: Returns the index of a valid element following the current index in a collection.

Example:

```
gaussdb=# declare
gaussdb=# type nest is table of int;
gaussdb=# aa nest:=nest(11,22,33,44,55);
gaussdb=# begin
gaussdb$$ raise info 'next:%' ,aa.next(3);
gaussdb$$ end;
gaussdb$$ /
INFO: next:4
ANONYMOUS BLOCK EXECUTE

gaussdb=# declare
gaussdb=# type nest is table of int index by varchar;
gaussdb=# aa nest;
gaussdb=# begin
gaussdb$$ aa('aaa') := 111;
gaussdb$$ aa('bbb') := 222;
gaussdb$$ aa('ccc') := 333;
gaussdb$$ raise info 'next:%' ,aa.next('bbb');
gaussdb$$ end;
gaussdb$$ /
INFO: next:ccc
ANONYMOUS BLOCK EXECUTE
```

- limit

Parameter: none

Return value: null

Description: Returns the maximum number of elements that can be stored in a nest-table collection. This function applies only to the array type. The return value is null.

Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# aa nest:=nest(11,22,33,44,55);
gaussdb-# begin
gaussdb$$# raise info 'limit:%' ,aa.limit;
gaussdb$$# end;
gaussdb$$# /
INFO: limit:<NULL>
ANONYMOUS BLOCK EXECUTE
```

## Collection-related Functions

- `unnest_table` (anynesttable) or `unnest` (anynesttable)

Description: Returns a collection of elements in a nest-table.

Return type: setof anyelement

Example:

```
create or replace procedure f1()
as
 type t1 is table of int;
 v2 t1 := t1(null, 2, 3, 4, null);
 tmp int;
 cursor c1 is select * from unnest_table(v2);
begin
open c1;
for i in 1 .. v2.count loop
 fetch c1 into tmp;
 if tmp is null then
 db_output.print_line(i || ': is null');
 else
 db_output.print_line(i || ':' || tmp);
 end if;
end loop;
close c1;
end;
/

gaussdb=# call f1();
1: is null
2: 2
3: 3
4: 4
5: is null
f1

(1 row)
```

- `unnest_table`(anyindexbytable)

Description: Returns the collection of elements in an index-by table sorted by index.

Return type: setof anyelement

Constraint: Only the index-by int type is supported. The index-by varchar type is not supported.

Example:

```
create or replace procedure f1()
as
 type t1 is table of int index by int;
 v2 t1 := t1(1=>1, -10=>(-10), 6=>6, 4=>null);
 tmp int;
 cursor c1 is select * from unnest_table(v2);
begin
```

```
open c1;
for i in 1 .. v2.count loop
 fetch c1 into tmp;
 if tmp is null then
 dbe_output.print_line(i || ': is null');
 else
 dbe_output.print_line(i || ':' || tmp);
 end if;
end loop;
close c1;
end;
/

gaussdb=# call f1();
1: -10
2: 1
3: is null
4: 6
f1

(1 row)
```

### 10.4.3 Records

## 10.5 DECLARE Syntax

### 10.5.1 Basic Structure

#### Structure

A PL/SQL block can contain a sub-block which can be placed in any section. The following describes the architecture of a PL/SQL block:

- Declaration section: declares variables, types, cursors, and regional stored procedures and functions used in the PL/SQL block.

DECLARE

#### NOTE

This section is optional if no variables need to be declared.

- An anonymous block may omit the **DECLARE** keyword if no variable needs to be declared.
- For a stored procedure, **AS** is used, which is equivalent to **DECLARE**. The **AS** keyword must be reserved even if there is no variable declaration section.
- Execution section: specifies procedure and SQL statements. It is the main section of a program and is mandatory.

BEGIN

- Exception-handling section: processes errors. It is optional.

EXCEPTION

- End. Mandatory.

END;

/

**NOTICE**

You are not allowed to use consecutive tabs in the PL/SQL block because they may result in an exception when the **gsql** tool is executed with the **-r** parameter specified.

## Types

PL/SQL blocks are classified into the following types:

- Anonymous block: a dynamic block that can be executed only for once. For details about the syntax, see [Figure 10-1](#).
- Subprogram: a stored procedure, function, operator, or advanced package stored in a database. A subprogram created in a database can be called by other programs.

## 10.5.2 Anonymous Blocks

An anonymous block applies to a script infrequently executed or a one-off activity. An anonymous block is executed in a session and is not stored.

## Syntax

[Figure 10-1](#) shows the syntax diagrams for an anonymous block.

**Figure 10-1** anonymous\_block::=

Details about the syntax diagram are as follows:

- The execution section of an anonymous block starts with a **BEGIN** statement, has a break with an **END** statement, and ends with a semicolon (;). Type a slash (/) and press **Enter** to execute the statement.

**NOTICE**

The terminator "/" must be written in an independent row.

- The declaration section includes the variable definition, type, and cursor definition.
- A simplest anonymous block does not execute any commands. However, at least one statement, even a **NULL** statement, must be presented in any implementation blocks.

## Examples

The following lists basic anonymous block programs:

```
-- Null statement block
gaussdb=# BEGIN
 NULL;
END;
/

-- Display information on the console.
gaussdb=# BEGIN
 dbe_output.print_line('hello world!');
END;
/
hello world!
ANONYMOUS BLOCK EXECUTE

-- Display variable content on the console.
gaussdb=# DECLARE
 my_var VARCHAR2(30);
BEGIN
 my_var := 'world';
 dbe_output.print_line('hello'||my_var);
END;
/
helloworld
ANONYMOUS BLOCK EXECUTE
```

### 10.5.3 Subprograms

A subprogram stores stored procedures, functions, operators, and advanced packages. A subprogram created in a database can be called by other programs.

## 10.6 Basic Statements

During PL/SQL programming, you may define some variables, assign values to variables, and call other stored procedures. The following sections describe basic PL/SQL statements, including variable definition statements, value assignment statements, call statements, and return statements.

### NOTE

You are not advised to call the SQL statements containing passwords in the stored procedures because authorized users may view the stored procedure file in the database and password information is leaked. If a stored procedure contains other sensitive information, permission to access this procedure must be configured, preventing information leakage.

### 10.6.1 Variable Definition Statements

This section describes the declaration of variables in the PL/SQL and the scope of this variable in codes.

## Variable Declaration

For details about the variable declaration syntax, see [Figure 10-2](#).

**Figure 10-2** declare\_variable::=

The above syntax diagram is explained as follows:

- **variable\_name** indicates the name of a variable.
- **type** indicates the type of a variable.
- **value** indicates the initial value of the variable. (If the initial value is not given, NULL is taken as the initial value.) **value** can also be an expression.

### Examples

```
gaussdb=# DECLARE
emp_id INTEGER := 7788; -- Define a variable and assign a value to it.
BEGIN
emp_id := 5*7784; -- Assign a value to the variable.
END;
/
```

In addition to the declaration of basic variable types, **%TYPE** and **%ROWTYPE** can be used to declare variables related to table columns or table structures.

#### **%TYPE** Attribute

**%TYPE** declares a variable to be of the same data type as a previously declared variable (for example, a column in a table). For example, if you want to define the **my\_name** variable whose data type is the same as the data type of the **firstname** column in the **employee** table, you can define the variable as follows:

```
my_name employee.firstname%TYPE
```

In this way, you can declare **my\_name** without the need of knowing the data type of **firstname** in **employee**, and the data type of **my\_name** can be automatically updated when the data type of **firstname** changes.

#### **%ROWTYPE** Attribute

**%ROWTYPE** declares data types of a set of data. It stores a row of table data or results fetched from a cursor. For example, if you want to define a set of data with the same column names and column data types as the **employee** table, you can define the data as follows:

```
my_employee employee%ROWTYPE
```

#### NOTE

If multiple CNs are used, the **%ROWTYPE** and **%TYPE** attributes of temporary tables cannot be declared in a stored procedure, because a temporary table is valid only in the current session and is invisible to other CNs in the compilation phase. Therefore, if there are multiple CNs, the system displays a message indicating that the temporary table does not exist.

## Scope of a Variable

The scope of a variable indicates the accessibility and availability of the variable in code block. In other words, a variable takes effect only within its scope.

- To define a function scope, a variable must declare and create a **BEGIN-END** block in the declaration section. The necessity of such declaration is also determined by block structure, which requires that a variable has different scopes and lifetime during a process.
- A variable can be defined multiple times in different scopes, and inner definition can cover outer one.
- A variable defined in an outer block can also be used in a nested block. However, the outer block cannot access variables in the nested block.

### Example

```
gaussdb=# DECLARE
emp_id INTEGER :=7788; -- Define a variable and assign a value to it.
outer_var INTEGER :=6688; -- Define a variable and assign a value to it.
BEGIN
DECLARE
emp_id INTEGER :=7799; -- Define a variable and assign a value to it.
inner_var INTEGER :=6688; -- Define a variable and assign a value to it.
BEGIN
db_output.print_line('inner emp_id ='||emp_id); -- Display the value 7799.
db_output.print_line('outer_var ='||outer_var); -- Reference a variable of an outer block.
END;
db_output.print_line('outer emp_id ='||emp_id); -- Display the value 7788.
END;
/
```

## 10.6.2 Assignment Statements

### Variable Syntax

Figure 10-3 shows the syntax diagram for assigning a value to a variable.

Figure 10-3 assignment\_value::=

The above syntax diagram is explained as follows:

- *variable\_name*: specifies the name of a variable.
- *value* can be a value or an expression. The type of *value* must be compatible with the type of *variable\_name*.

### Variable Value Assignment Example

```
gaussdb=# DECLARE
emp_id INTEGER := 7788; -- Assignment
BEGIN
emp_id := 5; -- Assignment
emp_id := 5*7784;
END;
/
-- The result is as follows:
5
38920
ANONYMOUS BLOCK EXECUTE
```

## INTO/BULK COLLECT INTO

**INTO** and **BULK COLLECT INTO** store values returned by statements in a stored procedure to variables. **BULK COLLECT INTO** allows some or all returned values to be temporarily stored in an array.

### Example

```
gaussdb=# DECLARE
 my_id integer;
BEGIN
 select id into my_id from customers limit 1; -- Assign a value.
END;
/
ANONYMOUS BLOCK EXECUTE
gaussdb=# DECLARE
 type id_list is varray(6) of customers.id%type;
 id_arr id_list;
BEGIN
 select id bulk collect into id_arr from customers order by id DESC limit 20; -- Assign values in batches.
END;
/
ANONYMOUS BLOCK EXECUTE
```

#### NOTICE

**BULK COLLECT INTO** can only assign values to arrays or collections in batches. The array type uses LIMIT properly to prevent performance deterioration caused by excessive operations on data.

For array variables, elements in parentheses () are preferentially identified as index sets. Therefore, expressions with parentheses cannot be written after array variables. For example, **select (1+3) into va(5)** cannot be written as **select into va(5) (1+3)** or **select into va[5] (1+3)**.

## 10.6.3 Call Statements

### Syntax

Figure 10-4 shows the syntax diagram for calling a clause.

Figure 10-4 call\_clause::=

The above syntax diagram is explained as follows:

- *procedure\_name*: specifies the name of a stored procedure.
- *parameter*: specifies the parameters for the stored procedure. You can set no parameter or multiple parameters.

## Examples

```
-- Create the stored procedure proc_staffs.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_staffs
(
 section NUMBER(6),
 salary_sum out NUMBER(8,2),
 staffs_count out INTEGER
)
IS
BEGIN
SELECT sum(salary), count(*) INTO salary_sum, staffs_count FROM hr.staffs where section_id = section;
END;
/
CREATE PROCEDURE
-- Create the stored procedure proc_return.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_return
AS
v_num NUMBER(8,2);
v_sum INTEGER;
BEGIN
proc_staffs(30, v_sum, v_num); --Call a statement.
dbe_output.print_line(v_sum||'#'||v_num);
RETURN; -- Return a statement.
END;
/

-- Invoke the stored procedure proc_return.
gaussdb=# CALL proc_return();
30#2.00
proc_return

(1 row)

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE proc_staffs;
gaussdb=# DROP PROCEDURE proc_return;

-- Create the function func_return.
gaussdb=# CREATE OR REPLACE FUNCTION func_return returns void
language plpgsql
AS $$
DECLARE
v_num INTEGER := 1;
BEGIN
dbe_output.print_line(v_num);
RETURN; -- Return a statement.
END $$;
CREATE FUNCTION

-- Call the function func_return.
gaussdb=# CALL func_return();
1
func_return

(1 row)

-- Drop the function.
gaussdb=# DROP FUNCTION func_return;
```

## 10.7 Dynamic Statements

## 10.7.1 Executing Dynamic Query Statements

You can perform dynamic queries using **EXECUTE IMMEDIATE** or **OPEN FOR** in GaussDB. **EXECUTE IMMEDIATE** dynamically executes **SELECT** statements and **OPEN FOR** combines use of cursors. If you need to store query results in a dataset, use **OPEN FOR**.

### EXECUTE IMMEDIATE

Figure 10-5 shows the syntax diagram.

Figure 10-5 EXECUTE IMMEDIATE dynamic\_select\_clause::=

Figure 10-6 shows the syntax diagram for `using_clause`.

Figure 10-6 using\_clause::=

The above syntax diagram is explained as follows:

- `define_variable`: specifies a variable to store single-row query results.
- **USING IN** `bind_argument`: specifies the variable whose value is passed to the dynamic SQL statement. The variable is used when a dynamic placeholder exists in `dynamic_select_string`.
- **USING OUT** `bind_argument`: specifies the variable that stores a value returned by the dynamic SQL statement.

**NOTICE**

- In query statements, **INTO** and **OUT** cannot coexist.
- A placeholder name starts with a colon (:) followed by digits, characters, or strings, corresponding to *bind\_argument* in the **USING** clause.
- *bind\_argument* can only be a value, variable, or expression. It cannot be a database object such as a table name, column name, and data type. That is, *bind\_argument* cannot be used to transfer schema objects for dynamic SQL statements. If a stored procedure needs to transfer database objects through *bind\_argument* to construct dynamic SQL statements (generally, DDL statements), you are advised to use double vertical bars (||) to concatenate *dynamic\_select\_clause* with a database object.
- A dynamic PL/SQL block allows duplicate placeholders. That is, a placeholder can correspond to only one *bind\_argument* in the **USING** clause. When the GUC parameter **behavior\_compat\_options** is set to **dynamic\_sql\_compat**, the bind arguments in the **USING** clause are matched in sequence based on the placeholder sequence. Duplicate placeholders will not be identified as the same placeholder.

**Example:**

```
gaussdb=# DROP SCHEMA IF EXISTS hr CASCADE;
gaussdb=# CREATE SCHEMA hr;
gaussdb=# SET CURRENT_SCHEMA = hr;
gaussdb=# CREATE TABLE staffs
(
 staff_id NUMBER,
 first_name VARCHAR2,
 salary NUMBER
);
gaussdb=# INSERT INTO staffs VALUES (200, 'mike', 5800);
gaussdb=# INSERT INTO staffs VALUES (201, 'lily', 3000);
gaussdb=# INSERT INTO staffs VALUES (202, 'john', 4400);

-- Retrieve values from dynamic statements (INTO clause).
gaussdb=# DECLARE
 staff_count VARCHAR2(20);
BEGIN
 EXECUTE IMMEDIATE 'select count(*) from hr.staffs'
 INTO staff_count;
 db_output.print_line(staff_count);
END;
/
3
ANONYMOUS BLOCK EXECUTE
-- Pass and retrieve values (the INTO clause is used before the USING clause).
gaussdb=# CREATE OR REPLACE PROCEDURE dynamic_proc
AS
 staff_id NUMBER(6) := 200;
 first_name VARCHAR2(20);
 salary NUMBER(8,2);
BEGIN
 EXECUTE IMMEDIATE 'select first_name, salary from hr.staffs where staff_id = :1'
 INTO first_name, salary
 USING IN staff_id;
 db_output.print_line(first_name || ' ' || salary);
END;
/
CREATE PROCEDURE
-- Invoke a stored procedure.
gaussdb=# CALL dynamic_proc();
mike 5800.00
```

```
dynamic_proc

(1 row)

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE dynamic_proc;
```

## OPEN FOR

Dynamic query statements can be executed by using **OPEN FOR** to open dynamic cursors.

**Figure 10-7** shows the syntax diagram.

**Figure 10-7** open\_for::=

Parameter description:

- *cursor\_name*: specifies the name of the cursor to be opened.
- *dynamic\_string*: specifies the dynamic query statement.
- **USING** *value*: applies when a placeholder exists in *dynamic\_string*.

For details about use of cursors, see [Cursors](#).

Example:

```
gaussdb=# CREATE SCHEMA hr;
gaussdb=# SET CURRENT_SCHEMA = hr;
gaussdb=# CREATE TABLE staffs
(
 section_id NUMBER,
 first_name VARCHAR2,
 phone_number VARCHAR2,
 salary NUMBER
);
gaussdb=# INSERT INTO staffs VALUES (30, 'mike', '13567829252', 5800);
gaussdb=# INSERT INTO staffs VALUES (40, 'john', '17896354637', 4000);

gaussdb=# DECLARE
 name VARCHAR2(20);
 phone_number VARCHAR2(20);
 salary NUMBER(8,2);
 sqlstr VARCHAR2(1024);

 TYPE app_ref_cur_type IS REF CURSOR; -- Define the cursor type.
 my_cur app_ref_cur_type; -- Define the cursor variable.

BEGIN
 sqlstr := 'select first_name,phone_number,salary from hr.staffs
 where section_id = :1';
 OPEN my_cur FOR sqlstr USING '30'; -- Open the cursor. USING is optional.
 FETCH my_cur INTO name, phone_number, salary; -- Retrieve the data.
 WHILE my_cur%FOUND LOOP
 dbe_output.print_line(name||' #'||phone_number||' #'||salary);
```

```

 FETCH my_cur INTO name, phone_number, salary;
 END LOOP;
 CLOSE my_cur; -- Close the cursor.
END;
/
mike#13567829252#5800.00
mike#13567829252#5800.00
ANONYMOUS BLOCK EXECUTE

```

## 10.7.2 Executing Dynamic Non-Query Statements

### Syntax

Figure 10-8 shows the syntax diagram.

Figure 10-8 noselect::=

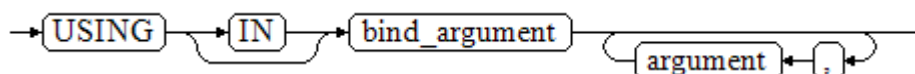

Figure 10-9 shows the syntax diagram for using\_clause.

Figure 10-9 using\_clause::=

The above syntax diagram is explained as follows:

**USING IN** *bind\_argument* is used to specify the variable whose value is passed to the dynamic SQL statement. The variable is used when a placeholder exists in *dynamic\_noselect\_string*. That is, a placeholder is replaced by the corresponding *bind\_argument* when a dynamic SQL statement is executed. Note that *bind\_argument* can only be a value, variable, or expression, and cannot be a database object such as a table name, column name, and data type. If a stored procedure needs to transfer database objects through *bind\_argument* to construct dynamic SQL statements (generally, DDL statements), you are advised to use double vertical bars (||) to concatenate *dynamic\_select\_clause* with a database object. In addition, a dynamic PL/SQL block allows duplicate placeholders. That is, a placeholder can correspond to only one *bind\_argument*. When the GUC parameter **behavior\_compat\_options** is set to **dynamic\_sql\_compat**, the bind arguments in the USING clause are matched in sequence based on the placeholder sequence. Duplicate placeholders will not be identified as the same placeholder.

### Examples

```

-- Create a table.
gaussdb=# CREATE TABLE sections_t1
(
 section NUMBER(4) ,
 section_name VARCHAR2(30),

```

```

manager_id NUMBER(6),
place_id NUMBER(4)
)
DISTRIBUTE BY hash(manager_id);

-- Declare a variable.
gaussdb=# DECLARE
section NUMBER(4) := 280;
section_name VARCHAR2(30) := 'Info support';
manager_id NUMBER(6) := 103;
place_id NUMBER(4) := 1400;
new_colname VARCHAR2(10) := 'sec_name';
BEGIN
-- Execute the query.
EXECUTE IMMEDIATE 'insert into sections_t1 values(:1, :2, :3, :4)'
 USING section, section_name, manager_id, place_id;
-- Execute the query (duplicate placeholders).
EXECUTE IMMEDIATE 'insert into sections_t1 values(:1, :2, :3, :1)'
 USING section, section_name, manager_id;
-- Run the ALTER statement. You are advised to use double vertical bars (||) to concatenate the dynamic
DDL statement with a database object.
EXECUTE IMMEDIATE 'alter table sections_t1 rename section_name to ' || new_colname;
END;
/

-- Query data.
gaussdb=# SELECT * FROM sections_t1;
section | sec_name | manager_id | place_id

 280 | Info support | 103 | 1400
 280 | Info support | 103 | 280
(2 rows)

-- Delete the table.
gaussdb=# DROP TABLE sections_t1;

```

### 10.7.3 Dynamically Calling Stored Procedures

This section describes how to dynamically call store procedures. You must use anonymous statement blocks to package stored procedures or statement blocks and append **IN** and **OUT** behind the **EXECUTE IMMEDIATE...USING** statement to input and output parameters.

#### Syntax

Figure 10-10 shows the syntax diagram.

Figure 10-10 call\_procedure::=

Figure 10-11 shows the syntax diagram for using\_clause.

Figure 10-11 using\_clause::=

The above syntax diagram is explained as follows:

- **CALL *procedure\_name***: calls the stored procedure.
- **[:*placeholder1*,:*placeholder2*,...]**: specifies the placeholder list of the stored procedure parameters. The numbers of the placeholders and parameters are the same.
- **USING [IN|OUT|IN OUT] *bind\_argument***: specifies the variable whose value is passed to the stored procedure parameter. The modifiers in front of **bind\_argument** and of the corresponding parameter are the same.
- Overloaded functions or stored procedures with placeholders cannot be called.

## Examples

```

-- Create the stored procedure proc_add.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_add
(
 param1 in INTEGER,
 param2 out INTEGER,
 param3 in INTEGER
)
AS
BEGIN
 param2:= param1 + param3;
END;
/

gaussdb=# DECLARE
 input1 INTEGER:=1;
 input2 INTEGER:=2;
 statement VARCHAR2(200);
 param2 INTEGER;
BEGIN
 -- Declare the call statement.
 statement := 'call proc_add(:col_1, :col_2, :col_3)';
 -- Execute the statement.
 EXECUTE IMMEDIATE statement
 USING IN input1, OUT param2, IN input2;
 db_output.print_line('result is: '||to_char(param2));
END;
/
result is: 3
ANONYMOUS BLOCK EXECUTE
-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE proc_add;

```

## 10.7.4 Dynamically Calling Anonymous Blocks

This section describes how to execute anonymous blocks in dynamic statements. Append **IN** and **OUT** behind the **EXECUTE IMMEDIATE...USING** statement to input and output parameters.

### Syntax

Figure 10-12 shows the syntax diagram.

Figure 10-12 call\_anonymous\_block::=

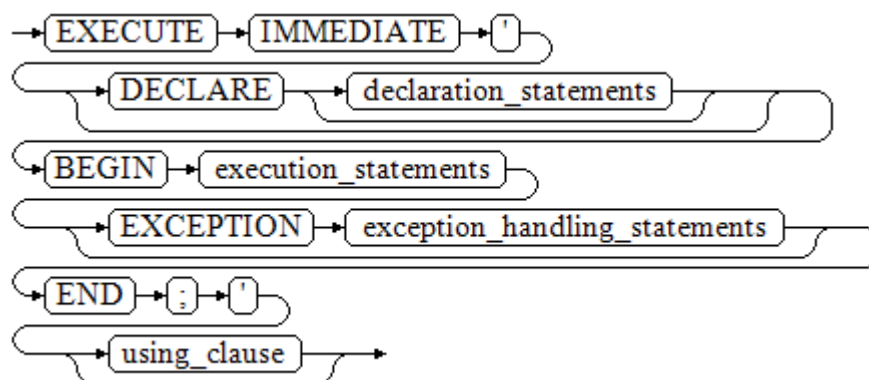

Figure 10-13 shows the syntax diagram for `using_clause`.

Figure 10-13 using\_clause::=

The above syntax diagram is explained as follows:

- The execute part of an anonymous block starts with a **BEGIN** statement, has a break with an **END** statement, and ends with a semicolon (;).
- **USING [IN|OUT|IN OUT]bind\_argument**: specifies where the variable passed to the stored procedure parameter value is stored. The modifiers in front of **bind\_argument** and of the corresponding parameter are the same.
- The input and output parameters in the middle of an anonymous block are designated by placeholders. The numbers of the placeholders and parameters are the same. The sequences of the parameters corresponding to the placeholders and the USING parameters are the same.

- Currently in GaussDB, when dynamic statements call anonymous blocks, placeholders cannot be used to pass input and output parameters in an **EXCEPTION** statement.
- Overloaded functions with placeholders cannot be called.
- The **PERFORM** keyword cannot be used to invoke a stored procedure when parameters are bound.
- Variables declared in an anonymous block and binding parameters cannot be used in the same statement at the same time.
- Only SQL statements invoked in anonymous blocks and stored procedures with **OUT/INOUT** parameters can be bound to parameters. For example, expressions and cursors are used in anonymous blocks, and dynamic statements are invoked in nested mode in anonymous blocks.

## Examples

```
--Create the stored procedure dynamic_proc.
gaussdb=# CREATE OR REPLACE PROCEDURE dynamic_proc
AS
 staff_id NUMBER(6) := 200;
 first_name VARCHAR2(20);
 salary NUMBER(8,2);
BEGIN
 --Execute the anonymous block.
 EXECUTE IMMEDIATE 'begin select first_name, salary into :first_name, :salary from hr.staffs where
staff_id= :dno; end;'
 USING OUT first_name, OUT salary, IN staff_id;
 db_output.print_line(first_name|| ' ' || salary);
END;
/

-- Invoke a stored procedure.
gaussdb=# CALL dynamic_proc();
mike 5800.00
dynamic_proc

(1 row)
-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE dynamic_proc;
```

## 10.8 Control Statements

### 10.8.1 RETURN Statements

In GaussDB, data can be returned in either of the following ways: **RETURN**, **RETURN NEXT**, or **RETURN QUERY**. **RETURN NEXT** and **RETURN QUERY** are used only for functions and cannot be used for stored procedures.

#### 10.8.1.1 RETURN

##### Syntax

**Figure 10-14** shows the syntax diagram for a return statement.

**Figure 10-14** return\_clause::=

The above syntax diagram is explained as follows:

This statement returns control from a stored procedure or function to a caller.

## Examples

See [Examples](#) for call statement examples.

### 10.8.1.2 RETURN NEXT and RETURN QUERY

#### Syntax

When creating a function, specify **SETOF datatype** for the return values.

return\_next\_clause::=

return\_query\_clause::=

The above syntax diagram is explained as follows:

If a function needs to return a result set, use **RETURN NEXT** or **RETURN QUERY** to add results to the result set, and then continue to execute the next statement of the function. As the **RETURN NEXT** or **RETURN QUERY** statement is executed repeatedly, more and more results will be added to the result set. After the function is executed, all results are returned.

**RETURN NEXT** can be used for scalar and compound data types.

**RETURN QUERY** has a variant **RETURN QUERY EXECUTE**. You can add dynamic queries and add parameters to the queries by **USING**.

## Examples

```
gaussdb=# CREATE TABLE t1(a int);
gaussdb=# INSERT INTO t1 VALUES(1),(10);

--RETURN NEXT
gaussdb=# CREATE OR REPLACE FUNCTION fun_for_return_next() RETURNS SETOF t1 AS $$
DECLARE
 r t1%ROWTYPE;
BEGIN
 FOR r IN select * from t1
 LOOP
 RETURN NEXT r;
 END LOOP;
 RETURN;
END;
$$ LANGUAGE plpgsql;
```

```

gaussdb=# call fun_for_return_next();
a

1
10
(2 rows)

-- RETURN QUERY
gaussdb=# CREATE OR REPLACE FUNCTION fun_for_return_query() RETURNS SETOF t1 AS $$
DECLARE
 r t1%ROWTYPE;
BEGIN
 RETURN QUERY select * from t1;
END;
$$
language plpgsql;
gaussdb=# call fun_for_return_query();
a

1
10
(2 rows)

```

## 10.8.2 Conditional Statements

Conditional statements are used to decide whether given conditions are met. Operations are executed based on the decisions made.

GaussDB supports five usages of **IF**:

- **IF\_THEN**

**Figure 10-15** IF\_THEN::=

**IF\_THEN** is the simplest form of **IF**. If the condition is true, statements are executed. If it is false, they are skipped.

Example:

```

gaussdb=# IF v_user_id <> 0 THEN
 UPDATE users SET email = v_email WHERE user_id = v_user_id;
END IF;

```

- **IF\_THEN\_ELSE**

**Figure 10-16** IF\_THEN\_ELSE::=

**IF-THEN-ELSE** statements add **ELSE** branches and can be executed if the condition is false.

Example:

```
gaussdb=# IF parentid IS NULL OR parentid = ''
THEN
RETURN;
ELSE
hp_true_filename(parentid); -- Call the stored procedure.
END IF;
```

- IF\_THEN\_ELSE IF

**IF** statements can be nested in the following way:

```
gaussdb=# IF sex = 'm' THEN
pretty_sex := 'man';
ELSE
IF sex = 'f' THEN
pretty_sex := 'woman';
END IF;
END IF;
```

Actually, this is a way of an **IF** statement nesting in the **ELSE** part of another **IF** statement. Therefore, an **END IF** statement is required for each nesting **IF** statement and another **END IF** statement is required to end the parent **IF-ELSE** statement. To set multiple options, use the following form:

- IF\_THEN\_ELSIF\_ELSE

**Figure 10-17** IF\_THEN\_ELSIF\_ELSE::=

Example:

```
IF number_tmp = 0 THEN
result := 'zero';
ELSIF number_tmp > 0 THEN
result := 'positive';
ELSIF number_tmp < 0 THEN
result := 'negative';
ELSE
result := 'NULL';
END IF;
```

- IF\_THEN\_ELSEIF\_ELSE

**ELSEIF** is an alias of **ELSIF**.

Example:

```
CREATE OR REPLACE PROCEDURE proc_control_structure(i in integer)
AS
BEGIN
IF i > 0 THEN
raise info 'i:% is greater than 0. ',i;
ELSIF i < 0 THEN
raise info 'i:% is smaller than 0. ',i;
ELSE
raise info 'i:% is equal to 0. ',i;
END IF;
RETURN;
END;
/
CALL proc_control_structure(3);
```

```
-- Delete the stored procedure.
DROP PROCEDURE proc_control_structure;
```

## 10.8.3 Loop Statements

### Simple LOOP Statements

#### Syntax diagram

Figure 10-18 loop::=

#### Example

```
CREATE OR REPLACE PROCEDURE proc_loop(i in integer, count out integer)
AS
 BEGIN
 count:=0;
 LOOP
 IF count > i THEN
 raise info 'count is %.', count;
 EXIT;
 ELSE
 count:=count+1;
 END IF;
 END LOOP;
 END;
/
CALL proc_loop(10,5);
```

#### NOTICE

The loop must be exploited together with **EXIT**; otherwise, a dead loop occurs.

### WHILE\_LOOP Statements

#### Syntax diagram

Figure 10-19 while\_loop::=

If the conditional expression is true, a series of statements in the WHILE statement are repeatedly executed and the condition is decided each time the loop body is executed.

### Example

```
CREATE TABLE integertable(c1 integer) DISTRIBUTE BY hash(c1);
CREATE OR REPLACE PROCEDURE proc_while_loop(maxval in integer)
AS
 DECLARE
 i int :=1;
 BEGIN
 WHILE i < maxval LOOP
 INSERT INTO integertable VALUES(i);
 i:=i+1;
 END LOOP;
 END;
/

-- Invoke a function.
CALL proc_while_loop(10);

-- Delete the stored procedure and table.
DROP PROCEDURE proc_while_loop;
DROP TABLE integertable;
```

## FOR\_LOOP (*Integer variable*) Statement

### Syntax diagram

Figure 10-20 for\_loop::=

### NOTE

- The variable **name** is automatically defined as the **integer** type and exists only in this loop. The variable name falls between lower\_bound and upper\_bound.
- When the keyword **REVERSE** is used, the lower bound must be greater than or equal to the upper bound; otherwise, the loop body is not executed.

### Example

```
-- Loop from 0 to 5.
CREATE OR REPLACE PROCEDURE proc_for_loop()
AS
 BEGIN
 FOR I IN 0..5 LOOP
 DBE_OUTPUT.PRINT_LINE('It is '||to_char(I) || ' time;');
 END LOOP;
END;
/

-- Invoke a function.
CALL proc_for_loop();
```

```
-- Delete the stored procedure.
DROP PROCEDURE proc_for_loop;
```

## FOR\_LOOP Query Statements

### Syntax diagram

Figure 10-21 for\_loop\_query::=

### NOTE

The variable **target** is automatically defined, its type is the same as that in the **query** result, and it is valid only in this loop. The target value is the query result.

### Example

```
-- Display the query result from the loop.
CREATE OR REPLACE PROCEDURE proc_for_loop_query()
AS
 record VARCHAR2(50);
BEGIN
 FOR record IN SELECT spcname FROM pg_tablespace LOOP
 dbe_output.print_line(record);
 END LOOP;
END;
/

-- Invoke a function.
CALL proc_for_loop_query();

-- Delete the stored procedure.
DROP PROCEDURE proc_for_loop_query;
```

## FORALL Batch Query Statements

### Syntax diagram

Figure 10-22 forall::=

**NOTE**

The variable **index** is automatically defined as the **integer** type and exists only in this loop. The index value falls between **low\_bound** and **upper\_bound**.

**Example**

```
CREATE TABLE TEST_t1 (
 title NUMBER(6),
 did VARCHAR2(20),
 data_period VARCHAR2(25),
 kind VARCHAR2(25),
 interval VARCHAR2(20),
 time DATE,
 isModified VARCHAR2(10)
)
DISTRIBUTE BY hash(did);

INSERT INTO TEST_t1 VALUES(8, 'Donald', 'OConnell', 'DOCONNEL', '650.507.9833', to_date('21-06-1999',
'dd-mm-yyyy'), 'SH_CLERK');

CREATE OR REPLACE PROCEDURE proc_forall()
AS
BEGIN
 FORALL i IN 100..120
 update TEST_t1 set title = title + 100*i;
END;
/

-- Invoke a function.
CALL proc_forall();

--Query the invocation result of the stored procedure.
SELECT * FROM TEST_t1 WHERE title BETWEEN 100 AND 120;

-- Delete the stored procedure and table.
DROP PROCEDURE proc_forall;
DROP TABLE TEST_t1;
```

## 10.8.4 Branch Statements

### Syntax

Figure 10-23 shows the syntax diagram for a return statement.

Figure 10-23 case\_when::=

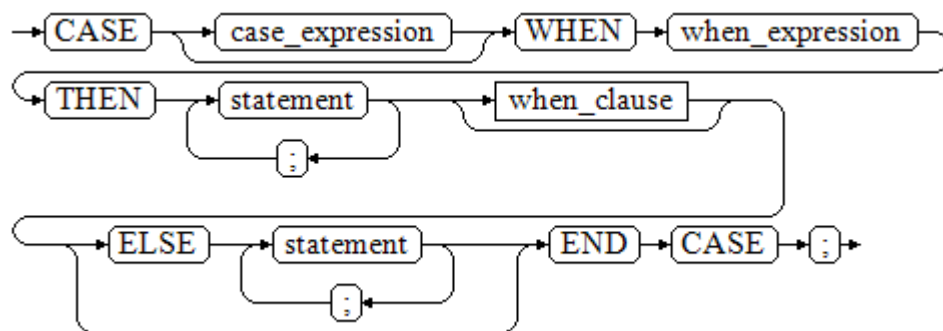

Figure 10-24 shows the syntax diagram for when\_clause.

Figure 10-24 when\_clause::=

Parameter description:

- *case\_expression*: specifies the variable or expression.
- *when\_expression*: specifies the constant or conditional expression.
- *statement*: specifies the statement to be executed.

## Examples

```
CREATE OR REPLACE PROCEDURE proc_case_branch(pi_result in integer, pi_return out integer)
AS
BEGIN
 CASE pi_result
 WHEN 1 THEN
 pi_return := 111;
 WHEN 2 THEN
 pi_return := 222;
 WHEN 3 THEN
 pi_return := 333;
 WHEN 6 THEN
 pi_return := 444;
 WHEN 7 THEN
 pi_return := 555;
 WHEN 8 THEN
 pi_return := 666;
 WHEN 9 THEN
 pi_return := 777;
 WHEN 10 THEN
 pi_return := 888;
 ELSE
 pi_return := 999;
 END CASE;
 raise info 'pi_return : %',pi_return ;
END;
/

CALL proc_case_branch(3,0);

-- Delete the stored procedure.
DROP PROCEDURE proc_case_branch;
```

## 10.8.5 NULL Statements

In PL/SQL programs, **NULL** statements are used to indicate "nothing should be done", equal to placeholders. They grant meanings to some statements and improve program readability.

### Syntax

The following shows example use of **NULL** statements.

```
DECLARE
...
BEGIN
...
```

```
IF v_num IS NULL THEN
 NULL; --No data needs to be processed.
END IF;
END;
/
```

## 10.8.6 Error Trapping Statements

By default, any error occurring in a PL/SQL function aborts execution of the function, and indeed of the surrounding transaction as well. You can trap errors and restore from them by using a **BEGIN** block with an **EXCEPTION** clause. The syntax is an extension of the normal syntax for a **BEGIN** block:

```
[<<label>>]
[DECLARE
 declarations]
BEGIN
 statements
EXCEPTION
 WHEN condition [OR condition ...] THEN
 handler_statements
 [WHEN condition [OR condition ...] THEN
 handler_statements
 ...]
END;
```

If no error occurs, this form of block simply executes all the statements, and then control passes to the next statement after **END**. But if an error occurs within the statements, further processing of the statements is abandoned, and control passes to the **EXCEPTION** list. The list is searched for the first condition matching the error that occurred. If a match is found, the corresponding **handler\_statements** are executed, and then control passes to the next statement after **END**. If no match is found, the error propagates out as though the **EXCEPTION** clause were not there at all: Error codes can be used to catch other error codes of the same type.

The error can be caught by an enclosing block with **EXCEPTION**, or if there is none it aborts processing of the function.

The condition names can be any of those shown in *Error Code Reference*. The special condition name **OTHERS** matches every error type except **QUERY\_CANCELED**.

If a new error occurs within the selected **handler\_statements**, it cannot be caught by this **EXCEPTION** clause, but is propagated out. A surrounding **EXCEPTION** clause could catch it.

When an error is caught by an **EXCEPTION** clause, the local variables of the PL/SQL function remain as they were when the error occurred, but all changes to persistent database state within the block are rolled back.

Example:

```
CREATE TABLE mytab(id INT,firstname VARCHAR(20),lastname VARCHAR(20)) DISTRIBUTE BY hash(id);

INSERT INTO mytab(firstname, lastname) VALUES('Tom', 'Jones');

CREATE FUNCTION fun_exp() RETURNS INT
AS $$
DECLARE
 x INT :=0;
 y INT;
BEGIN
```

```
UPDATE mytab SET firstname = 'Joe' WHERE lastname = 'Jones';
x := x + 1;
y := x / 0;
EXCEPTION
 WHEN division_by_zero THEN
 RAISE NOTICE 'caught division_by_zero';
 RETURN x;
END;$$
LANGUAGE plpgsql;

call fun_exp();
NOTICE: caught division_by_zero
fun_exp

 1
(1 row)

select * from mytab;
id | firstname | lastname
---+-----+-----
 1 | Tom | Jones
(1 row)

DROP FUNCTION fun_exp();
DROP TABLE mytab;
```

When control reaches the assignment to **y**, it will fail with a **division\_by\_zero** error. This will be caught by the **EXCEPTION** clause. The value returned in the **RETURN** statement will be the incremented value of **x**.

#### NOTE

A block containing an **EXCEPTION** clause is more expensive to enter and exit than a block without one. Therefore, do not use **EXCEPTION** without need.

In the following scenario, an exception cannot be caught, and the entire transaction rolls back. The threads of the nodes participating the stored procedure exit abnormally due to node failure and network fault, or the source data is inconsistent with that of the table structure of the target table during the COPY FROM operation.

#### Example: Exceptions with **UPDATE/INSERT**

This example uses exception handling to perform either **UPDATE** or **INSERT**, as appropriate:

```
CREATE TABLE db (a INT, b TEXT);

CREATE FUNCTION merge_db(key INT, data TEXT) RETURNS VOID AS
$$
BEGIN
 LOOP
 -- First try to update the key
 UPDATE db SET b = data WHERE a = key;
 IF found THEN
 RETURN;
 END IF;
 -- Not there, so try to insert the key. If someone else inserts the same key concurrently, we could get a
 unique-key failure.
 BEGIN
 INSERT INTO db(a,b) VALUES (key, data);
 RETURN;
 EXCEPTION WHEN unique_violation THEN
 -- Do nothing, and loop to try the UPDATE again.
 END;
 END LOOP;
END;
$$
```

```
LANGUAGE plpgsql;

SELECT merge_db(1, 'david');
SELECT merge_db(1, 'dennis');

--Delete FUNCTION and TABLE:
DROP FUNCTION merge_db;
DROP TABLE db ;
```

## 10.8.7 GOTO Statements

A **GOTO** statement unconditionally transfers the control from the current statement to a labeled statement. The **GOTO** statement changes the execution logic. Therefore, use this statement only when necessary. Alternatively, you can use the **EXCEPTION** statement to handle issues in special scenarios. To run a **GOTO** statement, the labeled statement must be unique.

### Syntax

label declaration ::=

goto statement ::=

### Examples

```
gaussdb=# CREATE OR REPLACE PROCEDURE GOTO_test()
AS
DECLARE
 v1 int;
BEGIN
 v1 := 0;
 LOOP
 EXIT WHEN v1 > 100;
 v1 := v1 + 2;
 if v1 > 25 THEN
 GOTO pos1;
 END IF;
 END LOOP;
<<pos1>>
v1 := v1 + 10;
raise info 'v1 is %.', v1;
END;
/

call GOTO_test();
```

### Constraints

Using **GOTO** statements has the following constraints:

- A **GOTO** statement does not allow multiple labeled statements even if the statements are in different blocks.

```
BEGIN
 GOTO pos1;
<<pos1>>
SELECT * FROM ...
<<pos1>>
```

```
UPDATE t1 SET ...
END;
```

- A **GOTO** statement cannot transfer control to the **IF**, **CASE**, or **LOOP** statement.

```
BEGIN
 GOTO pos1;
 IF valid THEN
 <<pos1>>
 SELECT * FROM ...
 END IF;
END;
```

- A **GOTO** statement cannot transfer control from one **IF** clause to another, or from one **WHEN** clause in the **CASE** statement to another.

```
BEGIN
 IF valid THEN
 GOTO pos1;
 SELECT * FROM ...
 ELSE
 <<pos1>>
 UPDATE t1 SET ...
 END IF;
END;
```

- A **GOTO** statement cannot transfer control from an outer block to an inner **BEGIN-END** block.

```
BEGIN
 GOTO pos1;
 BEGIN
 <<pos1>>
 UPDATE t1 SET ...
 END;
END;
```

- A **GOTO** statement cannot transfer control from an exception handler to the current **BEGIN-END** block. However, a **GOTO** statement can transfer control to the upper-layer **BEGIN-END** block.

```
BEGIN
 <<pos1>>
 UPDATE t1 SET ...
 EXCEPTION
 WHEN condition THEN
 GOTO pos1;
END;
```

- To branch to a position that does not have an executable statement, add the **NULL** statement.

```
DECLARE
 done BOOLEAN;
BEGIN
 FOR i IN 1..50 LOOP
 IF done THEN
 GOTO end_loop;
 END IF;
 <<end_loop>> -- not allowed unless an executable statement follows
 NULL; -- add NULL statement to avoid error
 END LOOP; -- raises an error without the previous NULL
END;
/
```

## 10.9 Transaction Statements

A stored procedure itself is automatically in a transaction. A transaction is automatically started when the most peripheral stored procedure is called. In addition, the transaction is automatically committed when the calling ends, or is

rolled back when an exception occurs during calling. In addition to automatic transaction control, you can also use COMMIT/ROLLBACK to control transactions in stored procedures. Running the COMMIT/ROLLBACK commands in a stored procedure will commit or roll back the current transaction and automatically starts a new transaction. All subsequent operations will be performed in the new transaction.

A savepoint is a special mark inside a transaction. It allows all commands that are executed after it was established to be rolled back, restoring the transaction state to what it was at the time of the savepoint. In a stored procedure, you can use savepoints to manage transactions. Currently, you can create, roll back, and release savepoints. If a savepoint for rollback is used in a stored procedure, only the modification of the current transaction is rolled back. The execution process of the stored procedure is not changed, and the values of local variables in the stored procedure are not rolled back.

---

**NOTICE**

The applicable contexts are as follows:

1. COMMIT, ROLLBACK, and SAVEPOINT can be used in PL/SQL stored procedures/functions.
2. COMMIT, ROLLBACK, and SAVEPOINT can be used in stored procedures and functions that contain EXCEPTION.
3. COMMIT, ROLLBACK, and SAVEPOINT can be used in EXCEPTION statements of stored procedures.
4. A stored procedure that contains COMMIT, ROLLBACK, or SAVEPOINT (which means the stored procedure is controlled by BEGIN, START, or END) can be called in a transaction block.
5. A stored procedure that contains savepoints can be invoked in a subtransaction and an externally defined savepoint is used to roll back the transaction to the savepoint defined outside the stored procedure.
6. A savepoint defined in the stored procedure can be viewed outside the stored procedure. That is, the modification of the transaction can be rolled back to the savepoint defined in the stored procedure.
7. COMMIT, ROLLBACK, and SAVEPOINT, as well as IF, FOR, CURSOR LOOP, and WHILE, can be called in most PL/SQL contexts and statements.

The following content can be submitted or rolled back:

1. DDL statements after COMMIT or ROLLBACK can be submitted or rolled back.
2. DML statements after COMMIT or ROLLBACK can be submitted.
3. GUC parameters in stored procedures can be submitted or rolled back.

---

## Syntax

```
Define a savepoint.
SAVEPOINT savepoint_name;
Roll back a savepoint.
ROLLBACK TO [SAVEPOINT] savepoint_name;
Release a savepoint.
RELEASE [SAVEPOINT] savepoint_name;
```

## Examples

### NOTE

COMMIT/ROLLBACK can be used in PL/SQL stored procedures.

```
CREATE TABLE EXAMPLE1(COL1 INT);

CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE()
AS
BEGIN
 FOR i IN 0..20 LOOP
 INSERT INTO EXAMPLE1(COL1) VALUES (i);
 IF i % 2 = 0 THEN
 COMMIT;
 ELSE
 ROLLBACK;
 END IF;
 END LOOP;
END;
/
```

### NOTE

- COMMIT and ROLLBACK can be used in stored procedures that contain EXCEPTION.
- COMMIT and ROLLBACK can be used in EXCEPTION statements of stored procedures.
- DDL statements after COMMIT or ROLLBACK can be submitted or rolled back.

```
CREATE OR REPLACE PROCEDURE TEST_COMMIT_INSERT_EXCEPTION_ROLLBACK()
AS
BEGIN
 DROP TABLE IF EXISTS TEST_COMMIT;
 CREATE TABLE TEST_COMMIT(A INT, B INT);
 INSERT INTO TEST_COMMIT SELECT 1, 1;
 COMMIT;
 CREATE TABLE TEST_ROLLBACK(A INT, B INT);
 RAISE EXCEPTION 'RAISE EXCEPTION AFTER COMMIT';
EXCEPTION
 WHEN OTHERS THEN
 INSERT INTO TEST_COMMIT SELECT 2, 2;
 ROLLBACK;
END;
/
```

### NOTE

A stored procedure that contains COMMIT or ROLLBACK (which means the stored procedure is controlled by BEGIN, START, or END) can be called in a transaction block.

```
BEGIN;
 CALL TEST_COMMIT_INSERT_EXCEPTION_ROLLBACK();
END;
```

### NOTE

COMMIT and ROLLBACK, as well as IF, FOR, CURSOR LOOP, and WHILE, can be called in most PL/SQL contexts and statements.

```
CREATE OR REPLACE PROCEDURE TEST_COMMIT2()
IS
BEGIN
 DROP TABLE IF EXISTS TEST_COMMIT;
 CREATE TABLE TEST_COMMIT(A INT);
 FOR I IN REVERSE 3..0 LOOP
 INSERT INTO TEST_COMMIT SELECT I;
 COMMIT;
 END LOOP;
 FOR I IN REVERSE 2..4 LOOP
 UPDATE TEST_COMMIT SET A=I;
```

```
COMMIT;
 END LOOP;
EXCEPTION
WHEN OTHERS THEN
INSERT INTO TEST_COMMIT SELECT 4;
 COMMIT;
END;
/
```

** NOTE**

GUC parameters in stored procedures can be submitted or rolled back.

```
SHOW explain_perf_mode;
SHOW enable_force_vector_engine;

CREATE OR REPLACE PROCEDURE GUC_ROLLBACK()
AS
BEGIN
 SET enable_force_vector_engine = on;
 COMMIT;
 SET explain_perf_mode TO pretty;
 ROLLBACK;
END;
/

call GUC_ROLLBACK();
guc_rollback

(1 row)

SHOW explain_perf_mode;
explain_perf_mode

normal
(1 row)

SHOW enable_force_vector_engine;
enable_force_vector_engine

on
(1 row)

SET enable_force_vector_engine = off;
```

** NOTE**

Savepoints can be used in PL/SQL stored procedures to roll back partial transaction modifications.

```
CREATE OR REPLACE PROCEDURE STP_SAVEPOINT_EXAMPLE1()
AS
BEGIN
 INSERT INTO EXAMPLE1 VALUES(1);
 SAVEPOINT s1;
 INSERT INTO EXAMPLE1 VALUES(2);
 ROLLBACK TO s1; -- Roll back the insertion of record 2.
 INSERT INTO EXAMPLE1 VALUES(3);
END;
/
```

** NOTE**

You can use a savepoint in a PL/SQL stored procedure to roll back to a savepoint defined outside the stored procedure.

```
CREATE OR REPLACE PROCEDURE STP_SAVEPOINT_EXAMPLE2()
AS
BEGIN
```

```
INSERT INTO EXAMPLE1 VALUES(2);
ROLLBACK TO s1; -- Roll back the insertion of record 2.
INSERT INTO EXAMPLE1 VALUES(3);
END;
/

BEGIN;
INSERT INTO EXAMPLE1 VALUES(1);
SAVEPOINT s1;
CALL STP_SAVEPOINT_EXAMPLE2();
 stp_savepoint_example2

(1 row)

SELECT * FROM EXAMPLE1;

```

** NOTE**

You can use a savepoint defined outside the stored procedure to roll back to a savepoint in a PL/SQL stored procedure.

```
CREATE OR REPLACE PROCEDURE STP_SAVEPOINT_EXAMPLE3()
AS
BEGIN
 INSERT INTO EXAMPLE1 VALUES(1);
 SAVEPOINT s1;
 INSERT INTO EXAMPLE1 VALUES(2);
END;
/

BEGIN;
INSERT INTO EXAMPLE1 VALUES(3);
CALL STP_SAVEPOINT_EXAMPLE3();
 stp_savepoint_example3

(1 row)

ROLLBACK TO SAVEPOINT s1; -- Roll back the insertion of record 2 to the stored procedure.
SELECT * FROM EXAMPLE1;
col1

 0
 4
10
14
16
18
```

```
20
3
3
3
3
2
6
8
12
1
1
1
(18 rows)

COMMIT;
```

** NOTE**

The COMMIT and ROLLBACK statements can be invoked in a function.

```
CREATE OR REPLACE FUNCTION FUNCTION_EXAMPLE1() RETURN INT
AS
EXP INT;
BEGIN
 FOR i IN 0..20 LOOP
 INSERT INTO EXAMPLE1(col1) VALUES (i);
 IF i % 2 = 0 THEN
 COMMIT;
 ELSE
 ROLLBACK;
 END IF;
 END LOOP;
 SELECT COUNT(*) FROM EXAMPLE1 INTO EXP;
 RETURN EXP;
END;
/
```

## Constraints

---

**⚠ CAUTION**

- The unapplicable contexts are as follows:
  1. COMMIT, ROLLBACK, and SAVEPOINT cannot be called in stored procedures other than PL/SQL, such as PL/Java and PL/Python.
  2. After SAVEPOINT is called in a transaction block, stored procedures that contain COMMIT/ROLLBACK cannot be called.
  3. Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in TRIGGER.
  4. COMMIT, ROLLBACK, and SAVEPOINT cannot be invoked in EXECUTE statements.
  5. Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in CURSOR statements.
  6. Stored procedures that contain IMMUTABLE or SHIPPABLE cannot call COMMIT, ROLLBACK, SAVEPOINT or another stored procedure that contain COMMIT, ROLLBACK, or SAVEPOINT.
  7. Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in SQL statements other than SELECT PROC and CALL PROC.
  8. COMMIT, ROLLBACK, or SAVEPOINT cannot be called in a stored procedure whose header contains GUC parameters.
  9. COMMIT, ROLLBACK, or SAVEPOINT cannot be called in expressions or CURSOR and EXECUTE statements.
  10. Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in the return values and expression calculation of stored procedures.
  11. Savepoints defined outside a stored procedure cannot be released in the stored procedure.
  12. A stored procedure transaction and its autonomous transaction are two independent transactions and cannot use savepoints defined in each other's transaction.
  13. Advanced packages cannot call stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT statements through DBE\_SQL.
- The following content cannot be committed or rolled back:
  1. Variables declared or imported in stored procedures cannot be committed or rolled back.
  2. In stored procedures, GUC parameters that take effect only after a restart cannot be submitted or rolled back.

---

There are the following constraints on the use of COMMIT/ROLLBACK in a stored procedure:

**📖 NOTE**

A TRIGGER stored procedure cannot contain COMMIT/ROLLBACK or called another stored procedure that contains COMMIT/ROLLBACK.

```
CREATE OR REPLACE FUNCTION FUNCTION_TRI_EXAMPLE2() RETURN TRIGGER
AS
EXP INT;
BEGIN
 FOR i IN 0..20 LOOP
 INSERT INTO EXAMPLE1(col1) VALUES (i);
 IF i % 2 = 0 THEN
 COMMIT;
 ELSE
 ROLLBACK;
 END IF;
 END LOOP;
 SELECT COUNT(*) FROM EXAMPLE1 INTO EXP;
END;
/

CREATE TRIGGER TRIGGER_EXAMPLE AFTER DELETE ON EXAMPLE1
FOR EACH ROW EXECUTE PROCEDURE FUNCTION_TRI_EXAMPLE2();

DELETE FROM EXAMPLE1;
ERROR: Can not commit/rollback if it's atomic is true: can not use commit rollback in Complex SQL
CONTEXT: PL/pgSQL function function_tri_example2() line 7 at COMMIT
```

** NOTE**

Stored procedures that contain IMMUTABLE or SHIPPABLE cannot call COMMIT/ROLLBACK or another stored procedure that contains COMMIT/ROLLBACK.

```
CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE1()
IMMUTABLE
AS
BEGIN
 FOR i IN 0..20 LOOP
 INSERT INTO EXAMPLE1 (col1) VALUES (i);
 IF i % 2 = 0 THEN
 COMMIT;
 ELSE
 ROLLBACK;
 END IF;
 END LOOP;
END;
/
CALL TRANSACTION_EXAMPLE1();
ERROR: Can not commit/rollback if it's atomic is true: commit/rollback/savepoint is not allowed in a non-
volatile function
CONTEXT: PL/pgSQL function transaction_example1() line 7 at COMMIT
```

** NOTE**

Variables declared or imported in stored procedures cannot be committed or rolled back.

```
CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE2(EXP_OUT OUT INT)
AS
EXP INT;
BEGIN
 EXP_OUT := 0;
 COMMIT;
 DBE_OUTPUT.PRINT_LINE('EXP IS:'||EXP);
 EXP_OUT := 1;
 ROLLBACK;
 DBE_OUTPUT.PRINT_LINE('EXP IS:'||EXP);
END;
/
```

** NOTE**

Calling in SQL statements (other than Select Procedure) is not supported.

```
CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE3()
AS
BEGIN
```

```
FOR i IN 0..20 LOOP
 INSERT INTO EXAMPLE1 (col1) VALUES (i);
 IF i % 2 = 0 THEN
 EXECUTE IMMEDIATE 'COMMIT';
 ELSE
 EXECUTE IMMEDIATE 'ROLLBACK';
 END IF;
END LOOP;
END;
/
CALL TRANSACTION_EXAMPLE2(100);
EXP IS:
EXP IS:
exp_out

 1
(1 row)
```

** NOTE**

COMMIT/ROLLBACK cannot be called in a stored procedure whose header contains GUC parameters.

```
CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE4()
SET ARRAY_NULLS TO "ON"
AS
BEGIN
 FOR i IN 0..20 LOOP
 INSERT INTO EXAMPLE1 (col1) VALUES (i);
 IF i % 2 = 0 THEN
 COMMIT;
 ELSE
 ROLLBACK;
 END IF;
 END LOOP;
END;
/
CALL TRANSACTION_EXAMPLE4();
ERROR: Can not commit/rollback if it's atomic is true: transaction statement in store procedure with GUC
setting in option clause is not supported
CONTEXT: PL/pgSQL function transaction_example4() line 6 at COMMIT
```

** NOTE**

A stored procedure object whose cursor is open cannot contain COMMIT/ROLLBACK.

```
CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE5(INTIN IN INT, INTOUT OUT INT)
AS
BEGIN
 INTOUT := INTIN + 1;
 COMMIT;
END;
/

CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE6()
AS
CURSOR CURSOR1(EXPIN INT)
IS SELECT TRANSACTION_EXAMPLE5(EXPIN);
INTEXP INT;
BEGIN
 FOR i IN 0..20 LOOP
 OPEN CURSOR1(i);
 FETCH CURSOR1 INTO INTEXP;
 INSERT INTO EXAMPLE1(COL1) VALUES (INTEXP);
 IF i % 2 = 0 THEN
 COMMIT;
 ELSE
 ROLLBACK;
 END IF;
 CLOSE CURSOR1;
 END LOOP;
```

```
END;
/
CALL TRANSACTION_EXAMPLE6();
ERROR: Can not commit/rollback if it's atomic is true: transaction statement in store procedure used as
cursor is not supported
CONTEXT: PL/pgSQL function transaction_example5(integer) line 4 at COMMIT
referenced column: transaction_example5
PL/pgSQL function transaction_example6() line 8 at FETCH
```

** NOTE**

COMMIT or ROLLBACK cannot be called in expressions or CURSOR and EXECUTE statements.

```
CREATE OR REPLACE PROCEDURE exec_func1()
AS
BEGIN
 CREATE TABLE TEST_exec(A INT);
COMMIT;
END;
/
CREATE OR REPLACE PROCEDURE exec_func2()
AS
BEGIN
EXECUTE exec_func1();
COMMIT;
END;
/
CALL exec_func2();
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'a' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CONTEXT: SQL statement "CREATE TABLE TEST_exec(A INT)"

SAVEPOINT s1;
CALL STP_SAVEPOINT_EXAMPLE3();
COMMIT;
ERROR: cannot release outer savepoint
CONTEXT: PL/pgSQL function stp_savepoint_example3() line 4 at RELEASE SAVEPOINT
```

## 10.10 Other Statements

### 10.10.1 Lock Operations

GaussDB provides multiple lock modes to control concurrent accesses to table data. These modes are used when Multi-Version Concurrency Control (MVCC) cannot give expected behaviors. Alike, most GaussDB commands automatically apply appropriate locks to ensure that called tables are not deleted or modified in an incompatible manner during command execution. For example, when concurrent operations exist, **ALTER TABLE** cannot be executed on the same table.

### 10.10.2 Cursor Operations

GaussDB provides cursors as a data buffer for users to store execution results of SQL statements. Each cursor region has a name. Users can use SQL statements to obtain records one by one from cursors and grant the records to master variables, then being processed further by host languages.

Cursor operations include cursor definition, open, fetch, and close operations.

For the complete example of cursor operations, see [Explicit Cursor](#).

## 10.11 Cursors

### 10.11.1 Overview

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers pointing to context regions. With cursors, stored procedures can control alterations in context regions.

**NOTICE**

- If JDBC is used to call a stored procedure whose returned value is a cursor, the returned cursor cannot be used.
- In distributed mode, if the parameter of the stored procedure invoked in the SQL statement is of the refcursor type or the return value is of the refcursor type, pushdown is not supported.
- When a stored procedure contains COMMIT/ROLLBACK, an explicit cursor caches all data of the cursor to ensure that the cursor is still available after COMMIT/ROLLBACK. If the cursor data volume is large, this process may take a long time.

Cursors are classified into explicit cursors and implicit cursors. [Table 10-2](#) shows the usage conditions of explicit and implicit cursors for different SQL statements.

**Table 10-2** Cursor usage conditions

| SQL Statement                             | Cursor               |
|-------------------------------------------|----------------------|
| Non-query statements                      | Implicit             |
| Query statements with single-line results | Implicit or explicit |
| Query statements with multi-line results  | Explicit             |

### 10.11.2 Explicit Cursor

An explicit cursor is used to process query statements, particularly when query results are multiple records.

#### Procedure

An explicit cursor performs the following six PL/SQL steps to process query statements:

- Step 1** Define a static cursor: Define a cursor name and its corresponding **SELECT** statement.

[Figure 10-25](#) shows the syntax diagram for defining a static cursor.

**Figure 10-25** static\_cursor\_define::=

Or

**Figure 10-26** static\_cursor\_define::=

Parameter description:

- *cursor\_name*: defines a cursor name.
- *parameter*: specifies cursor parameters. Only input parameters are allowed. Its format is as follows:  
parameter\_name datatype
- *select\_statement*: specifies a query statement.

**NOTE**

- The system automatically determines whether the cursor can be used for backward fetching based on the execution plan.
- In syntax, **parameter** can be an output parameter, but its behavior is the same as that of an input parameter.

Define a dynamic cursor: Define a **ref** cursor, which means that the cursor can be opened dynamically by a set of static SQL statements. Define the type of the **ref** cursor first, and then the cursor variable of this cursor type. Dynamically bind a **SELECT** statement through **OPEN FOR** when the cursor is opened.

**Figure 10-27** and **Figure 10-28** show the syntax diagrams for defining a dynamic cursor.

**Figure 10-27** cursor\_typename::=

GaussDB supports the dynamic cursor type **sys\_refcursor**. A function or stored procedure can use the **sys\_refcursor** parameter to pass on or pass out the cursor result set. A function can return **sys\_refcursor** to return the cursor result set.

**Figure 10-28** dynamic\_cursor\_define::=

**Step 2** Open the static cursor: Execute the **SELECT** statement corresponding to the cursor. The query result is placed in the workspace and the pointer directs to the head of the workspace to identify the cursor result set. If the cursor query statement

carries the **FOR UPDATE** option, the **OPEN** statement locks the data rows corresponding to the cursor result set in the database table.

**Figure 10-29** shows the syntax diagram for opening a static cursor.

**Figure 10-29** open\_static\_cursor::=

Open the dynamic cursor: Use the **OPEN FOR** statement to open the dynamic cursor and the SQL statement is dynamically bound.

**Figure 10-30** shows the syntax diagrams for opening a dynamic cursor.

**Figure 10-30** open\_dynamic\_cursor::=

A PL/SQL program cannot use the **OPEN** statement to repeatedly open a cursor.

**Step 3** Fetch cursor data: Retrieve data rows in the result set and place them in specified output variables.

**Figure 10-31** shows the syntax diagrams for fetching cursor data.

**Figure 10-31** fetch\_cursor::=

**Step 4** Process the record.

**Step 5** Continue to process until the active set has no record.

**Step 6** Close the cursor: After you fetch and process the data in the cursor result set, close the cursor in time to release system resources used by the cursor and invalidate the workspace of the cursor so that the **FETCH** statement cannot be used to fetch data any more. A closed cursor can be reopened by an **OPEN** statement.

**Figure 10-32** shows the syntax diagram for closing a cursor.

**Figure 10-32** close\_cursor::=

----End

## Attributes

Cursor attributes are used to control program procedures or know program status. When a DML statement is executed, the PL/SQL opens a built-in cursor and processes its result. A cursor is a memory segment for maintaining query results. It is opened when a DML statement is executed and closed when the execution is finished. An explicit cursor has the following attributes:

- **%FOUND**: Boolean attribute, which returns **TRUE** if the last fetch returns a row.
- **%NOTFOUND**: Boolean attribute, which works opposite to the **%FOUND** attribute.
- **%ISOPEN**: Boolean attribute, which returns **TRUE** if the cursor has been opened.
- **%ROWCOUNT**: numeric attribute, which returns the number of records fetched from the cursor.

## Examples

```

-- Specify the method for passing cursor parameters.
CREATE OR REPLACE PROCEDURE cursor_proc1()
AS
DECLARE
 DEPT_NAME VARCHAR(100);
 DEPT_LOC NUMBER(4);
 -- Define a cursor.
 CURSOR C1 IS
 SELECT section_name, place_id FROM hr.sections WHERE section_id <= 50;
 CURSOR C2(sect_id INTEGER) IS
 SELECT section_name, place_id FROM hr.sections WHERE section_id <= sect_id;
 TYPE CURSOR_TYPE IS REF CURSOR;
 C3 CURSOR_TYPE;
 SQL_STR VARCHAR(100);
BEGIN
 OPEN C1;-- Open the cursor.
 LOOP
 -- Fetch data from the cursor.
 FETCH C1 INTO DEPT_NAME, DEPT_LOC;
 EXIT WHEN C1%NOTFOUND;
 DBE_OUTPUT.PRINT_LINE(DEPT_NAME||'---'||DEPT_LOC);
 END LOOP;
 CLOSE C1;-- Close the cursor.

 OPEN C2(10);
 LOOP
 FETCH C2 INTO DEPT_NAME, DEPT_LOC;
 EXIT WHEN C2%NOTFOUND;
 DBE_OUTPUT.PRINT_LINE(DEPT_NAME||'---'||DEPT_LOC);
 END LOOP;
 CLOSE C2;

 SQL_STR := 'SELECT section_name, place_id FROM hr.sections WHERE section_id <= :DEPT_NO;';
 OPEN C3 FOR SQL_STR USING 50;
 LOOP
 FETCH C3 INTO DEPT_NAME, DEPT_LOC;

```

```
EXIT WHEN C3%NOTFOUND;
DBE_OUTPUT.PRINT_LINE(DEPT_NAME||'---'||DEPT_LOC);
END LOOP;
CLOSE C3;
END;
/

CALL cursor_proc1();

hr---1
hr---1
hr---1
cursor_proc1

(1 row)

DROP PROCEDURE cursor_proc1;
-- Give a salary raise to employees whose salary is lower than 3000 by adding 500.
CREATE TABLE hr.staffs_t1 AS TABLE hr.staffs;

CREATE OR REPLACE PROCEDURE cursor_proc2()
AS
DECLARE
 V_EMPNO NUMBER(6);
 V_SAL NUMBER(8,2);
 CURSOR C IS SELECT staff_id, salary FROM hr.staffs_t1;
BEGIN
 OPEN C;
 LOOP
 FETCH C INTO V_EMPNO, V_SAL;
 EXIT WHEN C%NOTFOUND;
 IF V_SAL<=3000 THEN
 UPDATE hr.staffs_t1 SET salary =salary + 500 WHERE staff_id = V_EMPNO;
 END IF;
 END LOOP;
 CLOSE C;
END;
/

CALL cursor_proc2();
cursor_proc2

(1 row)

-- Delete the stored procedure.
DROP PROCEDURE cursor_proc2;
DROP TABLE hr.staffs_t1;
-- Use function parameters of the SYS_REFCURSOR type.
CREATE OR REPLACE PROCEDURE proc_sys_ref(O OUT SYS_REFCURSOR)
IS
C1 SYS_REFCURSOR;
BEGIN
OPEN C1 FOR SELECT section_ID FROM HR.sections ORDER BY section_ID;
O := C1;
END;
/

DECLARE
C1 SYS_REFCURSOR;
TEMP NUMBER(4);
BEGIN
proc_sys_ref(C1);
LOOP
 FETCH C1 INTO TEMP;
 DBE_OUTPUT.PRINT_LINE(C1%ROWCOUNT);
 EXIT WHEN C1%NOTFOUND;
END LOOP;
```

```
END;
/
1
1
ANONYMOUS BLOCK EXECUTE
-- Delete the stored procedure.
DROP PROCEDURE proc_sys_ref;
```

### 10.11.3 Implicit Cursor

Implicit cursors are automatically set by the system for non-query statements such as modify or delete operations, along with their workspace. Implicit cursors are named **SQL**, which is defined by the system.

#### Overview

Implicit cursor operations, such as definition, open, value-grant, and close operations, are automatically performed by the system and do not need users to process. Users can use only attributes related to implicit cursors to complete operations. In workspace of implicit cursors, the data of the latest SQL statement is stored and is not related to explicit cursors defined by users.

Format call: **SQL%**

#### NOTE

**INSERT**, **UPDATE**, **DELETE**, and **SELECT** statements do not need defined cursors.

#### Attributes

An implicit cursor has the following attributes:

- **SQL%FOUND**: Boolean attribute, which returns **TRUE** if the last fetch returns a row.
- **SQL%NOTFOUND**: Boolean attribute, which works opposite to the **SQL%FOUND** attribute.
- **SQL%ROWCOUNT**: numeric attribute, which returns the number of records fetched from the cursor.
- **SQL%ISOPEN**: Boolean attribute, whose value is always **FALSE**. Close implicit cursors immediately after an SQL statement is run.

#### Examples

```
-- Delete all employees in a department from the EMP table. If the department has no employees, delete
the department from the DEPT table.
CREATE TABLE hr.staffs_t1 AS TABLE hr.staffs;
CREATE TABLE hr.sections_t1 AS TABLE hr.sections;

CREATE OR REPLACE PROCEDURE proc_cursor3()
AS
DECLARE
V_DEPTNO NUMBER(4) := 100;
BEGIN
DELETE FROM hr.staffs WHERE section_ID = V_DEPTNO;
-- Proceed based on cursor status.
IF SQL%NOTFOUND THEN
DELETE FROM hr.sections_t1 WHERE section_ID = V_DEPTNO;
END IF;
END;
```

```
/
CALL proc_cursor3();
proc_cursor3

(1 row)

-- Drop the stored procedure and the temporary table.
DROP PROCEDURE proc_cursor3;
DROP TABLE hr.staffs_t1;
DROP TABLE hr.sections_t1;
```

## 10.11.4 Cursor Loop

Use of cursors in **WHILE** and **LOOP** statements is called a cursor loop. Generally, **OPEN**, **FETCH**, and **CLOSE** statements are called in this kind of loop. The following describes a loop that simplifies a cursor loop without the need for these operations. This mode is applicable to a static cursor loop, without executing four steps about a static cursor.

### Syntax

Figure 10-33 shows the syntax diagram of the **FOR AS** loop.

Figure 10-33 FOR\_AS\_loop::=

### Precautions

- The **UPDATE** operation for the queried table is not allowed in the loop statement.
- The variable *loop\_name* is automatically defined and is valid only in this loop. Its type is the same as that in the query result of *select\_statement*. The value of *loop\_name* is the query result of *select\_statement*.
- The specific type of the **loop\_name** variable is not parsed during compilation. If the specific type needs to be parsed (for example, **loop\_name** is used as the input and output parameters of an overloaded function or stored procedure), a compilation error is reported.
- The **%FOUND**, **%NOTFOUND**, and **%ROWCOUNT** attributes access the same internal variable in GaussDB. Transactions and the anonymous block do not support multiple cursor accesses at the same time.

### Examples

```
BEGIN
FOR ROW_TRANS IN
 SELECT first_name FROM hr.staffs
LOOP
 DBE_OUTPUT.PRINT_LINE (ROW_TRANS.first_name);
END LOOP;
```

```
END;
/
Tom
ANONYMOUS BLOCK EXECUTE
-- Create a table.
CREATE TABLE integerTable1(A INTEGER) DISTRIBUTE BY hash(A);
CREATE TABLE integerTable2(B INTEGER) DISTRIBUTE BY hash(B);
INSERT INTO integerTable2 VALUES(2);

-- Multiple cursors share the parameters of cursor attributes.
DECLARE
CURSOR C1 IS SELECT A FROM integerTable1;-- Declare the cursor.
CURSOR C2 IS SELECT B FROM integerTable2;
PI_A INTEGER;
PI_B INTEGER;
BEGIN
OPEN C1;-- Open the cursor.
OPEN C2;
FETCH C1 INTO PI_A; ---- The values of C1%FOUND and C2%FOUND are FALSE.
FETCH C2 INTO PI_B; ---- The values of C1%FOUND and C2%FOUND are TRUE.
-- Determine the cursor status.
IF C1%FOUND THEN
IF C2%FOUND THEN
DBE_OUTPUT.PRINT_LINE('Dual cursor share parameter.');
```

## 10.12 Advanced Packages

Advanced packages have two sets of interfaces. The first set is basic interfaces, and the second set is secondary encapsulation interfaces that are used improve usability. The second set is recommended.

### 10.12.1 Basic Interfaces

#### 10.12.1.1 PKG\_SERVICE

[Table 10-3](#) lists all interfaces supported by the **PKG\_SERVICE** package.

**Table 10-3** PKG\_SERVICE

| Interface                                          | Description                             |
|----------------------------------------------------|-----------------------------------------|
| <a href="#">PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE</a>  | Checks whether a context is registered. |
| <a href="#">PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS</a> | Deregisters all registered contexts.    |
| <a href="#">PKG_SERVICE.SQL_REGISTER_CONTEXT</a>   | Registers a context.                    |

| Interface                                           | Description                                                                                                                      |
|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">PKG_SERVICE.SQL_UNREGISTER_CONTEXT</a>  | Deregisters a context.                                                                                                           |
| <a href="#">PKG_SERVICE.SQL_SET_SQL</a>             | Sets a SQL statement for a context. Currently, only the <b>SELECT</b> statement is supported.                                    |
| <a href="#">PKG_SERVICE.SQL_RUN</a>                 | Executes the configured SQL statement on a context.                                                                              |
| <a href="#">PKG_SERVICE.SQL_NEXT_ROW</a>            | Reads the next row of data in a context.                                                                                         |
| <a href="#">PKG_SERVICE.SQL_GET_VALUE</a>           | Reads a dynamically defined column value in a context.                                                                           |
| <a href="#">PKG_SERVICE.SQL_SET_RESULT_TYPE</a>     | Dynamically defines a column of a context based on the type OID.                                                                 |
| <a href="#">PKG_SERVICE.JOB_CANCEL</a>              | Removes a scheduled task by task ID.                                                                                             |
| <a href="#">PKG_SERVICE.JOB_FINISH</a>              | Disables or enables scheduled task execution.                                                                                    |
| <a href="#">PKG_SERVICE.JOB_SUBMIT</a>              | Submits a scheduled task. Job ID can be automatically generated by the system or specified manually.                             |
| <a href="#">PKG_SERVICE.JOB_UPDATE</a>              | Modifies user-definable attributes of a scheduled task, including the task content, next-execution time, and execution interval. |
| <a href="#">PKG_SERVICE.SUBMIT_ON_NODES</a>         | Submits a task to all nodes. The task ID is automatically generated by the system.                                               |
| <a href="#">PKG_SERVICE.ISUBMIT_ON_NODES</a>        | Submits a job to all nodes. The job ID is specified by the user.                                                                 |
| <a href="#">PKG_SERVICE.SQL_GET_ARRAY_RESULT</a>    | Obtains the array value returned in the context.                                                                                 |
| <a href="#">PKG_SERVICE.SQL_GET_VARIABLE_RESULT</a> | Obtains the column value returned in the context.                                                                                |

- [PKG\\_SERVICE.SQL\\_IS\\_CONTEXT\\_ACTIVE](#)

This function checks whether a context is registered. This function transfers the ID of the context to be queried. If the context exists, **TRUE** is returned. Otherwise, **FALSE** is returned.

The prototype of the **PKG\_SERVICE.SQL\_IS\_CONTEXT\_ACTIVE** function is as follows:

```
PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE(
context_id IN INTEGER
```

```
)
RETURN BOOLEAN;
```

**Table 10-4** PKG\_SERVICE.SQL\_IS\_CONTEXT\_ACTIVE interface parameters

| Parameter  | Description                     |
|------------|---------------------------------|
| context_id | ID of the context to be queried |

- PKG\_SERVICE.SQL\_CLEAN\_ALL\_CONTEXTS

This function cancels all contexts.

The prototype of the **PKG\_SERVICE.SQL\_CLEAN\_ALL\_CONTEXTS** function is as follows:

```
PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS(
)
RETURN VOID;
```

- PKG\_SERVICE.SQL\_REGISTER\_CONTEXT

This function opens a context, which is the prerequisite for the subsequent operations in the context. This function does not transfer any parameter. It automatically generates context IDs in an ascending order and returns values to integer variables.

The prototype of the **PKG\_SERVICE.SQL\_REGISTER\_CONTEXT** function is as follows:

```
DBE_SQL.REGISTER_CONTEXT(
)
RETURN INTEGER;
```

- PKG\_SERVICE.SQL\_UNREGISTER\_CONTEXT

This function closes a context, which is the end of each operation in the context. If this function is not called when the stored procedure ends, the memory is still occupied by the context. Therefore, remember to close a context when you do not need to use it. If an exception occurs, the stored procedure exits but the context is not closed. Therefore, you are advised to include this interface in the exception handling of the stored procedure.

The prototype of the **PKG\_SERVICE.SQL\_UNREGISTER\_CONTEXT** function is as follows:

```
PKG_SERVICE.SQL_UNREGISTER_CONTEXT(
context_id IN INTEGER
)
RETURN INTEGER;
```

**Table 10-5** PKG\_SERVICE.SQL\_UNREGISTER\_CONTEXT interface parameters

| Parameter  | Description                    |
|------------|--------------------------------|
| context_id | ID of the context to be closed |

- PKG\_SERVICE.SQL\_SET\_SQL

This function parses the query statement of a given context. The input query statement is executed immediately. Currently, only the **SELECT** query statement can be parsed. The statement parameters can be transferred only through the **TEXT** type. The length cannot exceed 1 GB.

The prototype of the **PKG\_SERVICE.SQL\_SET\_SQL** function is as follows:

```
PKG_SERVICE.SQL_SET_SQL(
context_id IN INTEGER,
query_string IN TEXT,
language_flag IN INTEGER
)
RETURN BOOLEAN;
```

**Table 10-6** PKG\_SERVICE.SQL\_SET\_SQL interface parameters

| Parameter     | Description                                                     |
|---------------|-----------------------------------------------------------------|
| context_id    | ID of the context whose query statement is to be parsed         |
| query_string  | Query statement to be parsed                                    |
| language_flag | Version language number. Currently, only <b>1</b> is supported. |

- **PKG\_SERVICE.SQL\_RUN**

This function executes a given context. It receives a context ID first, and the data obtained after execution is used for subsequent operations. Currently, only the **SELECT** query statement can be executed.

The prototype of the **PKG\_SERVICE.SQL\_RUN** function is as follows:

```
PKG_SERVICE.SQL_RUN(
context_id IN INTEGER,
)
RETURN INTEGER;
```

**Table 10-7** PKG\_SERVICE.SQL\_RUN interface parameters

| Parameter  | Description                                             |
|------------|---------------------------------------------------------|
| context_id | ID of the context whose query statement is to be parsed |

- **PKG\_SERVICE.SQL\_NEXT\_ROW**

This function returns the number of data rows returned after the SQL statement is executed. Each time the interface is executed, the system obtains a set of new rows until all data is read.

The prototype of the **PKG\_SERVICE.SQL\_NEXT\_ROW** function is as follows:

```
PKG_SERVICE.SQL_NEXT_ROW(
context_id IN INTEGER,
)
RETURN INTEGER;
```

**Table 10-8** PKG\_SERVICE.SQL\_NEXT\_ROW interface parameters

| Parameter  | Description                      |
|------------|----------------------------------|
| context_id | ID of the context to be executed |

- **PKG\_SERVICE.SQL\_GET\_VALUE**

This function returns the context element value in a specified position of a context and accesses the data obtained by **PKG\_SERVICE.SQL\_NEXT\_ROW**.

The prototype of the **PKG\_SERVICE.SQL\_GET\_VALUE** function is as follows:

```
PKG_SERVICE.SQL_GET_VALUE(
context_id IN INTEGER,
pos IN INTEGER,
col_type IN ANYELEMENT
)
RETURN ANYELEMENT;
```

**Table 10-9** PKG\_SERVICE.SQL\_GET\_VALUE interface parameters

| Parameter  | Description                                                          |
|------------|----------------------------------------------------------------------|
| context_id | ID of the context to be executed                                     |
| pos        | Position of a dynamically defined column in the query                |
| col_type   | Variable of any type, which defines the return value type of columns |

- **PKG\_SERVICE.SQL\_SET\_RESULT\_TYPE**

This function defines columns returned from a given context and can be used only for contexts defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The prototype of

**PKG\_SERVICE.SQL\_SET\_RESULT\_TYPE** is as follows:

```
PKG_SERVICE.SQL_SET_RESULT_TYPE(
context_id IN INTEGER,
pos IN INTEGER,
coltype_oid IN ANYELEMENT,
maxsize IN INTEGER
)
RETURN INTEGER;
```

**Table 10-10** PKG\_SERVICE.SQL\_SET\_RESULT\_TYPE interface parameters

| Parameter   | Description                                                                                         |
|-------------|-----------------------------------------------------------------------------------------------------|
| context_id  | ID of the context to be executed                                                                    |
| pos         | Position of a dynamically defined column in the query                                               |
| coltype_oid | Variable of any type. The OID of the corresponding type can be obtained based on the variable type. |
| maxsize     | Length of a defined column                                                                          |

- **PKG\_SERVICE.JOB\_CANCEL**

The stored procedure **CANCEL** deletes a specified task.

The prototype of the **PKG\_SERVICE.JOB\_CANCEL** function is as follows:

```
PKG_SERVICE.JOB_CANCEL(
job IN INTEGER);
```

**Table 10-11** PKG\_SERVICE.JOB\_CANCEL interface parameters

| Parameter | Type    | Input/Output Parameter | Empty or Not | Description           |
|-----------|---------|------------------------|--------------|-----------------------|
| id        | integer | IN                     | No           | Specifies the job ID. |

Example:

```
CALL PKG_SERVICE.JOB_CANCEL(101);
```

- **PKG\_SERVICE.JOB\_FINISH**

The stored procedure **FINISH** disables or enables a scheduled task.

The prototype of the **PKG\_SERVICE.JOB\_FINISH** function is as follows:

```
PKG_SERVICE.JOB_FINISH(
id IN INTEGER,
broken IN BOOLEAN,
next_time IN TIMESTAMP DEFAULT sysdate);
```

**Table 10-12** PKG\_SERVICE.JOB\_FINISH interface parameters

| Parameter | Type      | Input/Output Parameter | Empty or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|-----------|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | integer   | IN                     | No           | Specifies the job ID.                                                                                                                                                                                                                                                                                                                                                                                                          |
| broken    | Boolean   | IN                     | No           | Specifies the status flag, <b>true</b> for broken and <b>false</b> for not broken. The current job is updated based on the parameter value <b>true</b> or <b>false</b> . If the parameter is left empty, the job status remains unchanged.                                                                                                                                                                                     |
| next_time | timestamp | IN                     | Yes          | Specifies the next execution time. The default value is the current system time. If <b>broken</b> is set to <b>true</b> , <b>next_time</b> is updated to '4000-1-1'. If <b>broken</b> is set to <b>false</b> and <b>next_time</b> is not empty, <b>next_time</b> is updated for the job. If <b>next_time</b> is empty, it will not be updated. This parameter can be omitted, and its default value will be used in this case. |

- **PKG\_SERVICE.JOB\_SUBMIT**

The stored procedure **JOB\_SUBMIT** submits a scheduled task provided by the system.

The prototype of the **PKG\_SERVICE.JOB\_SUBMIT** function is as follows:

```
PKG_SERVICE.JOB_SUBMIT(
id IN BIGINT,
content IN TEXT,
next_date IN TIMESTAMP DEFAULT sysdate,
interval_time IN TEXT DEFAULT 'null',
job OUT INTEGER);
```

 **NOTE**

When a scheduled task (using **JOB**) is created, the system binds the current database and the username to the task by default. This function can be called by using **call** or **select**. If you call this function by using **select**, there is no need to specify output parameters. To call this function within a stored procedure, use **perform**. If the committed SQL statement task uses a non-public schema, specify the schema to a table schema or a function schema, or add **set current\_schema = xxx** before the SQL statement.

**Table 10-13** PKG\_SERVICE.JOB\_SUBMIT interface parameters

| Parameter     | Type      | Input/Output Parameter | Empty or Not | Description                                                                                                                                                                                                                                                                                                     |
|---------------|-----------|------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id            | bigint    | IN                     | No           | Specifies the job ID. If the input ID is <b>NULL</b> , a job ID is generated internally.                                                                                                                                                                                                                        |
| context       | text      | IN                     | No           | Specifies the SQL statement to be executed. One or multiple DMLs, anonymous blocks, and statements for calling stored procedures, or all three combined are supported.                                                                                                                                          |
| next_time     | timestamp | IN                     | No           | Specifies the next time the job will be executed. The default value is the current system time ( <b>sysdate</b> ). If the specified time has past, the job is executed at the time it is submitted.                                                                                                             |
| interval_time | text      | IN                     | Yes          | Calculates the next time to execute the job. It can be an interval expression, or <b>sysdate</b> followed by a numeric value, for example, <b>sysdate+1.0/24</b> . If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward. |
| job           | integer   | OUT                    | No           | Specifies the job ID. The value ranges from 1 to 32767. When <b>pkg_service.job_submit</b> is called using <b>select</b> , this parameter can be omitted.                                                                                                                                                       |

Example:

```
SELECT PKG_SERVICE.JOB_SUBMIT(NULL, 'call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate
+1');

SELECT PKG_SERVICE.JOB_SUBMIT(NULL, 'call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate
+1.0/24');

CALL PKG_SERVICE.JOB_SUBMIT(NULL, 'INSERT INTO T_JOB VALUES(1); call pro_1(); call pro_2();',
add_months(to_date('201701','yyyymm'),1), 'date_trunc(''day'',SYSDATE) + 1 +(8*60+30.0)/
(24*60)' ,:jobid);

SELECT PKG_SERVICE.JOB_SUBMIT (101, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
```

- **PKG\_SERVICE.JOB\_UPDATE**

The stored procedure **UPDATE** modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

The prototype of the **PKG\_SERVICE.JOB\_UPDATE** function is as follows:

```
PKG_SERVICE.JOB_UPDATE(
id IN BIGINT,
next_time IN TIMESTAMP,
interval_time IN TEXT,
content IN TEXT);
```

**Table 10-14** PKG\_SERVICE.JOB\_UPDATE interface parameters

| Parameter     | Type      | Input/Output Parameter | Empty or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|-----------|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id            | integer   | IN                     | No           | Specifies the job ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| next_time     | timestamp | IN                     | Yes          | Specifies the next execution time. If this parameter is left empty, the system does not update the <b>next_time</b> parameter for the specified job. Otherwise, the system updates the <b>next_time</b> parameter for the specified job.                                                                                                                                                                                                                                 |
| interval_time | text      | IN                     | Yes          | Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the <b>interval_time</b> parameter for the specified job. Otherwise, the system updates the <b>interval_time</b> parameter for the specified job after necessary validity check. If this parameter is set to <b>null</b> , the job will be executed only once, and the job status will change to <b>'d'</b> afterward. |

| Parameter | Type | Input/Output Parameter | Empty or Not | Description                                                                                                                                                                                                                                                                           |
|-----------|------|------------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| content   | text | IN                     | Yes          | Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the <b>content</b> parameter for the specified job. Otherwise, the system updates the <b>content</b> parameter for the specified job. |

Example:

```
CALL PKG_SERVICE.JOB_UPDATE(101, sysdate, 'sysdate + 1.0/1440', 'call userproc();');
CALL PKG_SERVICE.JOB_UPDATE(101, sysdate, 'sysdate + 1.0/1440', 'insert into tbl_a values(sysdate);');
```

- **PKG\_SERVICE.SUBMIT\_ON\_NODES**

The stored procedure **SUBMIT\_ON\_NODES** creates a scheduled task on all CNs and DNs. Only users **sysadmin** and **monitor admin** have this permission.

The prototype of the **PKG\_SERVICE.SUBMIT\_ON\_NODES** function is as follows:

```
PKG_SERVICE.SUBMIT_ON_NODES(
node_name IN NAME,
database IN NAME,
what IN TEXT,
next_date IN TIMESTAMP WITHOUT TIME ZONE,
job_interval IN TEXT,
job OUT INTEGER);
```

**Table 10-15** PKG\_SERVICE.SUBMIT\_ON\_NODES interface parameters

| Parameter | Type | Input/Output Parameter | Empty or Not | Description                                                                                                                                                                                                                |
|-----------|------|------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node_name | text | IN                     | No           | Specifies the job execution node. Currently, the value can only be <b>ALL_NODE</b> (indicating that the job is executed on all nodes) or <b>CCN</b> (indicating that the job is executed on the central coordinator node). |
| database  | text | IN                     | No           | Database used by a cluster job. When the node type is <b>ALL_NODE</b> , the value can only be <b>postgres</b> .                                                                                                            |

| Parameter    | Type      | Input/Output Parameter | Empty or Not | Description                                                                                                                                                                                                                                                                                                     |
|--------------|-----------|------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| what         | text      | IN                     | No           | Specifies the SQL statement to be executed. One or multiple DMLs, anonymous blocks, and statements for calling stored procedures, or all three combined are supported.                                                                                                                                          |
| nextdate     | timestamp | IN                     | No           | Specifies the next time the job will be executed. The default value is the current system time ( <b>sysdate</b> ). If the specified time has past, the job is executed at the time it is submitted.                                                                                                             |
| job_interval | text      | IN                     | No           | Calculates the next time to execute the job. It can be an interval expression, or <b>sysdate</b> followed by a numeric value, for example, <b>sysdate+1.0/24</b> . If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward. |
| job          | integer   | OUT                    | No           | Specifies the job ID. The value ranges from 1 to 32767. When <b>dbms.submit_on_nodes</b> is called using <b>select</b> , this parameter can be omitted.                                                                                                                                                         |

Example:

```
select pkg_service.submit_on_nodes('ALL_NODE', 'postgres', 'select
capture_view_to_json("dbe_perf.statement", 0);', sysdate, 'interval "60 second"');
select pkg_service.submit_on_nodes('CCN', 'postgres', 'select
capture_view_to_json("dbe_perf.statement", 0);', sysdate, 'interval "60 second"');
```

- **PKG\_SERVICE.ISUBMIT\_ON\_NODES**  
**ISUBMIT\_ON\_NODES** has the same syntax function as **SUBMIT\_ON\_NODES**, but the first parameter of **ISUBMIT\_ON\_NODES** is an input parameter, that is, a specified task ID. In contrast, that last parameter of **ISUBMIT\_ON\_NODES** is an output parameter, indicating the task ID automatically generated by the system. Only users **sysadmin** and **monitor admin** have this permission.

- **PKG\_SERVICE.SQL\_GET\_ARRAY\_RESULT**

This function is used to return the value of the bound OUT parameter of the array type and obtain the OUT parameter in a stored procedure.

The prototype of the **PKG\_SERVICE.SQL\_GET\_ARRAY\_RESULT** function is as follows:

```
PKG_SERVICE.SQL_GET_ARRAY_RESULT(
 context_id in int,
 pos in VARCHAR2,
 column_value inout anyarray,
 result_type in anyelement
);
```

**Table 10-16** PKG\_SERVICE.SQL\_GET\_ARRAY\_RESULT parameters

| Parameter    | Description                     |
|--------------|---------------------------------|
| context_id   | ID of the context to be queried |
| pos          | Name of the bound parameter     |
| column_value | Return value                    |
| result_type  | Return type                     |

- PKG\_SERVICE.SQL\_GET\_VARIABLE\_RESULT

This function is used to return the value of the bound OUT parameter of the non-array type and obtain the OUT parameter in a stored procedure.

The prototype of the **PKG\_SERVICE.SQL\_GET\_VARIABLE\_RESULT** function is as follows:

```
PKG_SERVICE.SQL_GET_VARIABLE_RESULT(
 context_id in int,
 pos in VARCHAR2,
 result_type in anyelement
)
RETURNS anyelement;
```

**Table 10-17** PKG\_SERVICE.SQL\_GET\_VARIABLE\_RESULT parameters

| Parameter   | Description                     |
|-------------|---------------------------------|
| context_id  | ID of the context to be queried |
| pos         | Name of the bound parameter     |
| result_type | Return type                     |

## 10.12.1.2 PKG\_UTIL

**Table 10-18** lists all interfaces supported by the PKG\_UTIL package.

**Table 10-18** PKG\_UTIL

| Interface               | Description                                                            |
|-------------------------|------------------------------------------------------------------------|
| PKG_UTIL.LOB_GET_LENGTH | Obtains the length of a LOB.                                           |
| PKG_UTIL.LOB_READ       | Reads a part of a LOB.                                                 |
| PKG_UTIL.LOB_WRITE      | Writes the source object to the target object in the specified format. |
| PKG_UTIL.LOB_APPEND     | Appends the source LOB to the target LOB.                              |
| PKG_UTIL.LOB_COMPARE    | Compares two LOBs based on the specified length.                       |

| Interface                     | Description                                                                                                                                                                                                                                      |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PKG_UTIL.LOB_MATCH            | Returns the position of the <i>M</i> th occurrence of a character string in a LOB.                                                                                                                                                               |
| PKG_UTIL.LOB_RESET            | Resets the character in specified position of a LOB to a specified character.                                                                                                                                                                    |
| PKG_UTIL.LOB_GET_LENGTH       | Obtains and returns the specified length of a LOB.                                                                                                                                                                                               |
| PKG_UTIL.LOB_READ_HUGE        | Reads a part of the LOB content based on the specified length and initial position offset, and returns the read LOB and length.                                                                                                                  |
| PKG_UTIL.LOB_WRITEAPPEND_HUGE | Reads the content of a specified length from the source BLOB or CLOB, appends the content to the target BLOB or CLOB, and returns the target object.                                                                                             |
| PKG_UTIL.LOB_APPEND_HUGE      | Appends the source BLOB or CLOB to the target BLOB/CLOB and returns the target object.                                                                                                                                                           |
| PKG_UTIL.READ_BFILE_TO_BLOB   | Loads the source BFILE file to the target BLOB and returns the target object.                                                                                                                                                                    |
| PKG_UTIL.LOB_COPY_HUGE        | Reads the content of a specified length from the specified offset position of the source BLOB or CLOB, writes the content to the specified offset position of the target BLOB or CLOB, and returns the target object.                            |
| PKG_UTIL.BLOB_RESET           | Sets a segment of data in a BLOB to the specified value and returns the processed BLOB and the actually processed length.                                                                                                                        |
| PKG_UTIL.CLOB_RESET           | Sets a segment of data in a CLOB to spaces and returns the processed CLOB and the actually processed length.                                                                                                                                     |
| PKG_UTIL.LOADBLOBFROMFILE     | Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target BLOB, and returns the target object, read position, and write position. |

| Interface                             | Description                                                                                                                                                                                                                                       |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PKG_UTIL.LOADCLOBFROMFILE             | Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target CLOB, and returns the target object, read position, and write position.  |
| PKG_UTIL.LOB_CONVERTTOBLOB_HUGE       | Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a BLOB, and writes the BLOB to the specified position of target LOB. <i>amount</i> indicates the length to be converted. |
| PKG_UTIL.LOB_CONVERTTOCLOB_HUGE       | Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a CLOB, and writes the CLOB to the specified position of target LOB. <i>amount</i> indicates the length to be converted. |
| PKG_UTIL.BFILE_GET_LENGTH             | Obtains and returns the specified length of a BFILE file.                                                                                                                                                                                         |
| PKG_UTIL.BFILE_OPEN                   | Opens a BFILE file and returns its file descriptor.                                                                                                                                                                                               |
| PKG_UTIL.BFILE_CLOSE                  | Closes a BFILE file.                                                                                                                                                                                                                              |
| PKG_UTIL.LOB_WRITE_HUGE               | Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.                                       |
| PKG_UTIL.IO_PRINT                     | Displays character strings.                                                                                                                                                                                                                       |
| PKG_UTIL.RAW_GET_LENGTH               | Obtains the length of <b>RAW</b> data.                                                                                                                                                                                                            |
| PKG_UTIL.RAW_CAST_FROM_VARCHAR2       | Converts <b>VARCHAR2</b> data to <b>RAW</b> data.                                                                                                                                                                                                 |
| PKG_UTIL.RAW_CAST_FROM_BINARY_INTEGER | Converts binary integers to <b>RAW</b> data.                                                                                                                                                                                                      |
| PKG_UTIL.RAW_CAST_TO_BINARY_INTEGER   | Converts <b>RAW</b> data to binary integers.                                                                                                                                                                                                      |
| PKG_UTIL.SET_RANDOM_SEED              | Sets a random seed.                                                                                                                                                                                                                               |

| Interface                       | Description                                                                    |
|---------------------------------|--------------------------------------------------------------------------------|
| PKG_UTIL.RANDOM_GET_VALUE       | Returns a random value.                                                        |
| PKG_UTIL.FILE_SET_DIRNAME       | Sets the directory to be operated.                                             |
| PKG_UTIL.FILE_OPEN              | Opens a file based on the specified file name and directory.                   |
| PKG_UTIL.FILE_SET_MAX_LINE_SIZE | Sets the maximum length of a line to be written to a file.                     |
| PKG_UTIL.FILE_IS_CLOSE          | Checks whether a file handle is closed.                                        |
| PKG_UTIL.FILE_READ              | Reads data of a specified length from an open file handle.                     |
| PKG_UTIL.FILE_READLINE          | Reads a line of data from an open file handle.                                 |
| PKG_UTIL.FILE_WRITE             | Writes the data specified in the buffer to a file.                             |
| PKG_UTIL.FILE_WRITELINE         | Writes the buffer to a file and adds newline characters.                       |
| PKG_UTIL.FILE_NEWLINE           | Adds a line.                                                                   |
| PKG_UTIL.FILE_READ_RAW          | Reads binary data of a specified length from an open file handle.              |
| PKG_UTIL.FILE_WRITE_RAW         | Writes binary data to a file.                                                  |
| PKG_UTIL.FILE_FLUSH             | Writes data from a file handle to a physical file.                             |
| PKG_UTIL.FILE_CLOSE             | Closes an open file handle.                                                    |
| PKG_UTIL.FILE_REMOVE            | Deletes a physical file. To do so, you must have the corresponding permission. |
| PKG_UTIL.FILE_RENAME            | Renames a file on the disk, similar to <b>mv</b> in Unix.                      |
| PKG_UTIL.FILE_SIZE              | Returns the size of a file.                                                    |
| PKG_UTIL.FILE_BLOCK_SIZE        | Returns the number of blocks contained in a file.                              |
| PKG_UTIL.FILE_EXISTS            | Checks whether a file exists.                                                  |
| PKG_UTIL.FILE_GETPOS            | Specifies the offset of a returned file, in bytes.                             |
| PKG_UTIL.FILE_SEEK              | Sets the offset for file position.                                             |
| PKG_UTIL.FILE_CLOSE_ALL         | Closes all file handles opened in a session.                                   |

| Interface                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PKG_UTIL.EXCEPTION_REPORT_ERROR | Throws an exception.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| pkg_util.gs_compile_schema      | <p>Recompiles specified schemas, packages, functions, and stored procedures. If an error is reported when compiling a PL/SQL object, the exception is captured and the recompilation continues to compile other objects until all objects are compiled or the number of recompilation attempts reaches the upper limit.</p> <p>When the advanced package is executed through JDBC, the SQLSTATE 00000 is displayed, which indicates that the operation is successful. For details, see "Standard SQL Error Codes" in <i>Error Code Reference</i>.</p> |

- **PKG\_UTIL.LOB\_GET\_LENGTH**

Obtains the length of the input data.

The prototype of the PKG\_UTIL.LOB\_GET\_LENGTH function is as follows:

```

PKG_UTIL.LOB_GET_LENGTH(
lob IN CLOB
)
RETURN INTEGER;

PKG_UTIL.LOB_GET_LENGTH(
lob IN BLOB
)
RETURN INTEGER;

```

**Table 10-19** PKG\_UTIL.LOB\_GET\_LENGTH parameters

| Parameter | Type        | Input/Output Parameter | Can Be Empty | Description                                          |
|-----------|-------------|------------------------|--------------|------------------------------------------------------|
| lob       | clob / blob | IN                     | No           | Indicates the object whose length is to be obtained. |

- **PKG\_UTIL.LOB\_READ**

Reads an object and returns the specified part.

The prototype of the PKG\_UTIL.LOB\_READ function is as follows:

```

PKG_UTIL.LOB_READ(
lob IN anyelement,
len IN int,
start IN int,
mode IN int
)

```

```
)
RETURN ANYELEMENT
```

**Table 10-20** PKG\_UTIL.LOB\_READ parameters

| Parameter | Type      | Input/Output Parameter | Can Be Empty | Description                                                                                                                                        |
|-----------|-----------|------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| lob       | clob/blob | IN                     | No           | Specifies CLOB or BLOB data.                                                                                                                       |
| len       | int       | IN                     | No           | Specifies the length of the returned result.                                                                                                       |
| start     | int       | IN                     | No           | Specifies the offset to the first character.                                                                                                       |
| mode      | int       | IN                     | No           | Specifies the type of the read operation. <b>0</b> indicates <b>READ</b> , <b>1</b> indicates <b>TRIM</b> , and <b>2</b> indicates <b>SUBSTR</b> . |

- PKG\_UTIL.LOB\_WRITE

This function writes the source object to the target object based on the specified parameters and returns the target object.

The prototype of the PKG\_UTIL.LOB\_WRITE function is as follows:

```
PKG_UTIL.LOB_WRITE(
dest_lob INOUT blob,
src_lob IN raw
len IN int,
start_pos IN bigint
)
RETURN BLOB;
PKG_UTIL.LOB_WRITE(
dest_lob INOUT clob,
src_lob IN varchar2
len IN int,
start_pos IN bigint
)
RETURN CLOB;
```

**Table 10-21** PKG\_UTIL.LOB\_WRITE parameters

| Parameter | Type      | Input/Output Parameter | Can Be Empty | Description                                               |
|-----------|-----------|------------------------|--------------|-----------------------------------------------------------|
| dest_lob  | clob/blob | INOUT                  | No           | Specifies the target object that data will be written to. |
| src_lob   | clob/blob | IN                     | No           | Specifies the source object to be written.                |

| Parameter | Type   | Input/Output Parameter | Can Be Empty | Description                                              |
|-----------|--------|------------------------|--------------|----------------------------------------------------------|
| len       | int    | IN                     | No           | Specifies the write length of the source object.         |
| start_pos | bigint | IN                     | No           | Specifies the write start position of the target object. |

- **PKG\_UTIL.LOB\_APPEND**

Appends the source object to the target BLOB/CLOB and returns the target BLOB/CLOB.

The prototype of the PKG\_UTIL.LOB\_APPEND function is as follows:

```

PKG_UTIL.LOB_APPEND(
dest_lob INOUT blob,
src_lob IN blob,
len IN int default NULL
)
RETURN BLOB;

PKG_UTIL.LOB_APPEND(
dest_lob INOUT clob,
src_lob IN clob,
len IN int default NULL
)
RETURN CLOB;

```

**Table 10-22** PKG\_UTIL.LOB\_APPEND parameters

| Parameter | Type        | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                          |
|-----------|-------------|------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_lob  | blob / clob | INOUT                  | No           | Specifies the target BLOB/CLOB that data will be written to.                                                                                                         |
| src_lob   | blob / clob | IN                     | No           | Specifies the source BLOB/CLOB to be written.                                                                                                                        |
| len       | int         | IN                     | Yes          | Length read from <i>src</i> and appended to <i>dest</i> . The default value is null, indicating that all content of <i>src</i> is read and appended to <i>dest</i> . |

- **PKG\_UTIL.LOB\_COMPARE**

Checks whether objects are the same based on the specified start position and size. If **lob1** is larger, **1** is returned. If **lob2** is larger, **-1** is returned. If **lob1** is equal to **lob2**, **0** is returned.

The prototype of the PKG\_UTIL.LOB\_COMPARE function is as follows:

```

PKG_UTIL.LOB_COMPARE(
lob1 IN anyelement,
lob2 IN anyelement,
len IN int default 1073741771,
start_pos1 IN int default 1,
start_pos2 IN int default 1
)
RETURN INTEGER;

```

**Table 10-23** PKG\_UTIL.LOB\_COMPARE parameters

| Parameter  | Type      | Input / Output Parameter | Can Be Empty | Description                                    |
|------------|-----------|--------------------------|--------------|------------------------------------------------|
| lob1       | clob/blob | IN                       | No           | Indicates the character string for comparison. |
| lob2       | clob/blob | IN                       | No           | Indicates the character string for comparison. |
| len        | int       | IN                       | No           | Indicates the length to be compared.           |
| start_pos1 | int       | IN                       | No           | Specifies the start offset of <b>lob1</b> .    |
| start_pos2 | int       | IN                       | No           | Specifies the start offset of <b>lob2</b> .    |

- **PKG\_UTIL.LOB\_MATCH**

Returns the position where a pattern is displayed in a LOB for the *match\_nth* time.

The prototype of the PKG\_UTIL.LOB\_MATCH function is as follows:

```

PKG_UTIL.LOB_MATCH(
lob IN anyelement,
pattern IN anyelement,
start IN int,
match_nth IN int default 1
)
RETURN INTEGER;

```

**Table 10-24** PKG\_UTIL.LOB\_MATCH parameters

| Parameter | Type      | Input / Output Parameter | Can Be Empty | Description                                      |
|-----------|-----------|--------------------------|--------------|--------------------------------------------------|
| lob       | clob/blob | IN                       | No           | Indicates the character string for comparison.   |
| pattern   | clob/blob | IN                       | No           | Specifies the pattern to be matched.             |
| start     | int       | IN                       | No           | Specifies the start position for LOB comparison. |
| match_nth | int       | IN                       | No           | Specifies the matching times.                    |

- PKG\_UTIL.LOB\_RESET

Clears a character string and resets the string to the value of **value**.

The prototype of the PKG\_UTIL.LOB\_RESET function is as follows:

```
PKG_UTIL.LOB_RESET(
lob IN blob,
len IN int,
start IN int,
value IN int default 0
)
RETURN record;
```

**Table 10-25** PKG\_UTIL.LOB\_RESET parameters

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description                                     |
|-----------|------|------------------------|--------------|-------------------------------------------------|
| lob       | blob | IN                     | No           | Indicates the character string for reset.       |
| len       | int  | IN                     | No           | Specifies the length of the string to be reset. |
| start     | int  | IN                     | No           | Specifies the start position for reset.         |
| value     | int  | IN                     | Yes          | Sets characters. Default value: '0'             |

- PKG\_UTIL.LOB\_GET\_LENGTH

Obtains and returns the specified length of a LOB.

The prototype of the PKG\_UTIL.LOB\_GET\_LENGTH function is as follows:

```
PKG_UTIL.LOB_GET_LENGTH(
lob IN blob)
RETURN BIGINT;
```

```
PKG_UTIL.LOB_GET_LENGTH(
lob IN clob)
RETURN BIGINT;
```

**Table 10-26** PKG\_UTIL.LOB\_GET\_LENGTH parameters

| Parameter | Type          | Input/Output Parameter | Can Be Empty | Description |
|-----------|---------------|------------------------|--------------|-------------|
| lob       | BLOB/<br>CLOB | IN                     | No           | LOB type    |

**PKG\_UTIL.LOB\_READ\_HUGE**

Reads a part of the LOB content based on the specified length and initial position offset, and returns the read LOB and length.

The prototype of the PKG\_UTIL.LOB\_READ\_HUGE function is as follows:

```
PKG_UTIL.LOB_READ_HUGE(
lob IN CLOB,
len IN BIGINT,
start_pos IN BIGINT,
mode IN INTEGER)
RETURN RECORD;
```

```
PKG_UTIL.LOB_READ_HUGE(
lob IN BLOB,
len IN BIGINT,
start_pos IN BIGINT,
mode IN INTEGER)
RETURN RECORD;
```

```
PKG_UTIL.LOB_READ_HUGE(
fd IN INTEGER,
len IN BIGINT,
start_pos IN BIGINT,
mode IN INTEGER)
RETURN RECORD;
```

**Table 10-27** PKG\_UTIL.LOB\_READ\_HUGE parameters

| Parameter | Type                      | Input/Output Parameter | Can Be Empty | Description                                         |
|-----------|---------------------------|------------------------|--------------|-----------------------------------------------------|
| lob/fd    | BLOB/<br>CLOB/<br>INTEGER | IN                     | No           | File descriptor of the specified LOB or BFILE file. |

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                       |
|-----------|---------|------------------------|--------------|-------------------------------------------------------------------|
| len       | BIGINT  | IN                     | No           | Length to read.                                                   |
| start_pos | BIGINT  | IN                     | No           | Offset position from which read starts.                           |
| mode      | INTEGER | IN                     | No           | Read mode ( <b>0</b> : read, <b>1</b> : trim, <b>2</b> : substr). |

- **PKG\_UTIL.LOB\_WRITEAPPEND\_HUGE**

Reads the content of a specified length from the source BLOB or CLOB, appends the content to the target BLOB or CLOB, and returns the target object.

The prototype of the PKG\_UTIL.LOB\_WRITEAPPEND\_HUGE function is as follows:

```
PKG_UTIL.LOB_WRITEAPPEND_HUGE(
 dest_lob INOUT CLOB,
 len IN INTEGER,
 src_lob IN VARCHAR2
)RETURN CLOB;

PKG_UTIL.LOB_WRITEAPPEND_HUGE(
 dest_lob INOUT BLOB,
 len IN INTEGER,
 src_lob IN RAW
)RETURN BLOB;
```

**Table 10-28** PKG\_UTIL.LOB\_WRITEAPPEND\_HUGE parameters

| Parameter | Type         | Input/Output Parameter | Can Be Empty | Description                                                                                                              |
|-----------|--------------|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------|
| dest_lob  | BLOB/CLOB    | INOUT                  | No           | Target BLOB/CLOB to which data is written.                                                                               |
| len       | INTEGER      | IN                     | Yes          | Length of the source object to be written. If the value is <b>NULL</b> , the entire source object is written by default. |
| src_lob   | VARCHAR2/RAW | IN                     | No           | BLOB/CLOB from which data is to be written.                                                                              |

- **PKG\_UTIL.LOB\_APPEND\_HUGE**  
Appends the source BLOB or CLOB to the target BLOB/CLOB and returns the target object.

The prototype of the PKG\_UTIL.LOB\_APPEND\_HUGE function is as follows:

```
PKG_UTIL.LOB_APPEND_HUGE(
 dest_lob INOUT BLOB,
 src_lob IN BLOB)
RETURN BLOB;
PKG_UTIL.LOB_APPEND_HUGE(
 dest_lob INOUT CLOB,
 src_lob IN CLOB)
RETURN CLOB;
```

**Table 10-29** PKG\_UTIL.LOB\_APPEND\_HUGE parameters

| Parameter | Type      | Input/Output Parameter | Can Be Empty | Description                                 |
|-----------|-----------|------------------------|--------------|---------------------------------------------|
| dest_lob  | BLOB/CLOB | INOUT                  | No           | Target BLOB/CLOB to which data is written.  |
| src_lob   | BLOB/CLOB | IN                     | No           | BLOB/CLOB from which data is to be written. |

- **PKG\_UTIL.READ\_BFILE\_TO\_BLOB**  
Loads the source BFILE file to the target BLOB and returns the target object.

The prototype of the PKG\_UTIL.READ\_BFILE\_TO\_BLOB function is as follows:

```
PKG_UTIL.READ_BFILE_TO_BLOB(
 fd IN INTEGER
)RETURN BLOB;
```

**Table 10-30** PKG\_UTIL.READ\_BFILE\_TO\_BLOB parameters

| Parameter | Type  | Input/Output Parameter | Can Be Empty | Description                   |
|-----------|-------|------------------------|--------------|-------------------------------|
| fd        | BFILE | IN                     | No           | Source BFILE file to be read. |

- **PKG\_UTIL.LOB\_COPY\_HUGE**  
Reads the content of a specified length from the specified offset position of the source BLOB or CLOB, writes the content to the specified offset position of the target BLOB or CLOB, and returns the target object.

The prototype of the PKG\_UTIL.LOB\_COPY\_HUGE function is as follows:

```
PKG_UTIL.LOB_COPY_HUGE(
 lob_obj INOUT BLOB,
```

```

source_obj IN BLOB,
amount IN BIGINT,
dest_offset IN BIGINT DEFAULT 1,
src_offset IN BIGINT DEFAULT 1
)RETURN BLOB;

PKG_UTIL.LOB_COPY_HUGE(
lob_obj INOUT CLOB,
source_obj IN CLOB,
amount IN BIGINT,
dest_offset IN BIGINT DEFAULT 1,
src_offset IN BIGINT DEFAULT 1
)RETURN CLOB;

```

**Table 10-31** PKG\_UTIL.LOB\_COPY\_HUGE parameters

| Parameter   | Type      | Input/Output Parameter | Can Be Empty | Description                                                                      |
|-------------|-----------|------------------------|--------------|----------------------------------------------------------------------------------|
| lob_obj     | BLOB/CLOB | INOUT                  | No           | Target BLOB/CLOB.                                                                |
| source_obj  | BLOB/CLOB | IN                     | No           | Source BLOB/CLOB.                                                                |
| amount      | BIGINT    | IN                     | No           | Length of the data to be copied (in bytes for BLOBs or in characters for CLOBs). |
| dest_offset | BIGINT    | IN                     | No           | Offset position of the target LOB to which the data is loaded.                   |
| src_offset  | BIGINT    | IN                     | No           | Offset position of the source LOB from which the data is read.                   |

- **PKG\_UTIL.BLOB\_RESET**

Sets a segment of data in a BLOB to the specified value and returns the processed BLOB and the actually processed length.

The prototype of the PKG\_UTIL.BLOB\_RESET function is as follows:

```

PKG_UTIL.BLOB_RESET(
lob INOUT BLOB,
len INOUT BIGINT,
start_pos IN BIGINT DEFAULT 1,
value IN INTEGER DEFAULT 0
)RETURN RECORD;

```

**Table 10-32** PKG\_UTIL.BLOB\_RESET parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                             |
|-----------|---------|------------------------|--------------|-----------------------------------------|
| lob       | BLOB    | INOUT                  | No           | LOB to be reset.                        |
| len       | INTEGER | INOUT                  | No           | Length to reset, in bytes.              |
| start     | INTEGER | IN                     | No           | Specifies the start position for reset. |
| value     | INTEGER | IN                     | Yes          | Sets characters. Default value: '0'.    |

- PKG\_UTIL.CLOB\_RESET  
Sets a piece of data to spaces.

The prototype of the PKG\_UTIL.CLOB\_RESET function is as follows:

```
PKG_UTIL.CLOB_RESET(
 lob INOUT CLOB,
 len INOUT BIGINT,
 start_pos IN BIGINT DEFAULT 1
)RETURN RECORD;
```

**Table 10-33** PKG\_UTIL.CLOB\_RESET parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                   |
|-----------|---------|------------------------|--------------|-----------------------------------------------|
| lob       | CLOB    | INOUT                  | No           | LOB to be reset.                              |
| len       | INTEGER | INOUT                  | No           | Length to reset, in characters.               |
| start     | INTEGER | IN                     | No           | Reset start position. The default value is 1. |

- PKG\_UTIL.LOADBLOBFROMFILE  
Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target BLOB, and returns the target object, read position, and write position.

The prototype of the PKG\_UTIL.LOADBLOBFROMFILE function is as follows:

```
PKG_UTIL.LOADBLOBFROMFILE(
 dest_lob INOUT BLOB,
 fd IN INTEGER,
 amount IN BIGINT,
 dest_offset INOUT BIGINT,
 file_offset INOUT BIGINT
)RETURN RECORD;
```

**Table 10-34** PKG\_UTIL.LOADBLOBFROMFILE parameters

| Parameter   | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                  |
|-------------|---------|------------------------|--------------|----------------------------------------------------------------------------------------------|
| dest_lob    | BLOB    | INOUT                  | No           | Target BLOB as the INOUT parameter.                                                          |
| fd          | INTEGER | IN                     | No           | File descriptor of the source BFILE object.                                                  |
| amount      | BIGINT  | IN                     | No           | Length of the data to be copied (in bytes for BLOBs or in characters for CLOBs).             |
| dest_offset | BIGINT  | INOUT                  | No           | Offset position of the target LOB to which the data is written as the INOUT parameter.       |
| src_offset  | BIGINT  | INOUT                  | No           | Offset position of the source BFILE file from which the data is read as the INOUT parameter. |

- PKG\_UTIL.LOADCLOBFROMFILE

Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target CLOB, and returns the target object, read position, and write position.

The prototype of the PKG\_UTIL.LOADCLOBFROMFILE function is as follows:

```
PKG_UTIL.LOADCLOBFROMFILE(
 dest_lob INOUT CLOB,
 fd IN INTEGER,
 amount IN BIGINT,
 dest_offset INOUT BIGINT,
 file_offset INOUT BIGINT
)RETURN RECORD;
```

**Table 10-35** PKG\_UTIL.LOADCLOBFROMFILE parameters

| Parameter   | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                  |
|-------------|---------|------------------------|--------------|----------------------------------------------------------------------------------------------|
| dest_lob    | CLOB    | INOUT                  | No           | Target CLOB as the INOUT parameter.                                                          |
| fd          | INTEGER | IN                     | No           | File descriptor of the source BFILE object.                                                  |
| amount      | BIGINT  | IN                     | No           | Length to copy (in characters for CLOBs).                                                    |
| dest_offset | BIGINT  | INOUT                  | No           | Offset position of the target LOB to which the data is written as the INOUT parameter.       |
| src_offset  | BIGINT  | INOUT                  | No           | Offset position of the source BFILE file from which the data is read as the INOUT parameter. |

- PKG\_UTIL.LOB\_CONVERTTOBLOB\_HUGE

Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a BLOB, and writes the BLOB to the specified position of target LOB. *amount* indicates the length to be converted.

The prototype of the PKG\_UTIL.LOB\_CONVERTTOBLOB\_HUGE function is as follows:

```
PKG_UTIL.LOB_CONVERTTOBLOB_HUGE(
 dest_lob INOUT BLOB,
 src_clob IN CLOB,
 amount IN BIGINT,
 dest_offset INOUT BIGINT,
 src_offset INOUT BIGINT)
)RETURN RECORD;
```

**Table 10-36** PKG\_UTIL.LOB\_CONVERTTOBLOB\_HUGE parameters

| Parameter   | Description                                                                            |
|-------------|----------------------------------------------------------------------------------------|
| dest_lob    | Target LOB.                                                                            |
| src_clob    | CLOB to be converted.                                                                  |
| amount      | Length to convert, in characters.                                                      |
| dest_offset | Offset position of the target LOB to which the data is written as the INOUT parameter. |
| src_offset  | Offset position of the source CLOB from which the data is read as the INOUT parameter. |

- **PKG\_UTIL.LOB\_CONVERTTOCLOB\_HUGE**  
Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a CLOB, and writes the CLOB to the specified position of target LOB. *amount* indicates the length to be converted.

The prototype of the PKG\_UTIL.LOB\_CONVERTTOCLOB\_HUGE function is as follows:

```
PKG_UTIL.LOB_CONVERTTOCLOB_HUGE(
 dest_lob INOUT CLOB,
 src_blob IN BLOB,
 amount IN BIGINT,
 dest_offset INOUT BIGINT,
 src_offset INOUT BIGINT)
)RETURN RECORD;
```

**Table 10-37** PKG\_UTIL.LOB\_CONVERTTOCLOB\_HUGE parameters

| Parameter   | Description                                                                            |
|-------------|----------------------------------------------------------------------------------------|
| dest_lob    | Target LOB.                                                                            |
| src_blob    | BLOB to be converted.                                                                  |
| amount      | Length to convert, in bytes.                                                           |
| dest_offset | Offset position of the target LOB to which the data is written as the INOUT parameter. |
| src_offset  | Offset position of the source CLOB from which the data is read as the INOUT parameter. |

- **PKG\_UTIL.BFILE\_GET\_LENGTH**  
Obtains and returns the specified length of a BFILE file.

The prototype of the PKG\_UTIL.BFILE\_GET\_LENGTH function is as follows:

```
PKG_UTIL.BFILE_GET_LENGTH(
 fd INTEGER
)RETURN BIGINT;
```

**Table 10-38** PKG\_UTIL.LOB\_GET\_LENGTH parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                  |
|-----------|---------|------------------------|--------------|----------------------------------------------|
| fd        | INTEGER | IN                     | No           | File descriptor of the specified BFILE file. |

- **PKG\_UTIL.BFILE\_OPEN**  
Opens a BFILE file and returns its file descriptor.

The prototype of the PKG\_UTIL.BFILE\_OPEN function is as follows:

```
PKG_UTIL.BFILE_OPEN(
 file_name TEXT,
```

```
open_mode TEXT)
RETURN INTEGER;
```

**Table 10-39** PKG\_UTIL.BFILE\_OPEN parameters

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description                                                    |
|-----------|------|------------------------|--------------|----------------------------------------------------------------|
| file_name | TEXT | IN                     | No           | Name of the specified BFILE file.                              |
| open_mode | TEXT | IN                     | No           | Open mode, which can only be set to r, that is, the read mode. |

- **PKG\_UTIL.BFILE\_CLOSE**

Closes a BFILE file.

The prototype of the PKG\_UTIL.BFILE\_CLOSE function is as follows:

```
PKG_UTIL.BFILE_CLOSE(
 fd INTEGER)
RETURN bool;
```

**Table 10-40** PKG\_UTIL.BFILE\_CLOSE parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                  |
|-----------|---------|------------------------|--------------|----------------------------------------------|
| fd        | INTEGER | IN                     | No           | File descriptor of the specified BFILE file. |

- **PKG\_UTIL.LOB\_WRITE\_HUGE**

Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.

The prototype of the PKG\_UTIL.LOB\_WRITE\_HUGE function is as follows:

```
PKG_UTIL.LOB_WRITE_HUGE(
 dest_lob INOUT BLOB,
 len IN INTEGER,
 start_pos IN BIGINT,
 src_lob IN RAW)
RETURN BLOB;

PKG_UTIL.LOB_WRITE_HUGE(
 dest_lob INOUT CLOB,
 len IN INTEGER,
 start_pos IN BIGINT,
 src_lob IN VARCHAR2)
RETURN CLOB;
```

**Table 10-41** PKG\_UTIL.LOB\_WRITE\_HUGE parameters

| Parameter | Type         | Input/Output Parameter | Can Be Empty | Description                                                                      |
|-----------|--------------|------------------------|--------------|----------------------------------------------------------------------------------|
| dest_lob  | BLOB/CLOB    | INOUT                  | No           | Target LOB as the INOUT parameter, to which the content is to be written.        |
| len       | INTEGER      | IN                     | No           | Length of the data to be written (in bytes for BLOBs or in characters for CLOBs) |
| start_pos | BIGINT       | IN                     | No           | Offset position for writing data to <i>dest_lob</i>                              |
| src_lob   | RAW/VARCHAR2 | IN                     | No           | Source LOB.                                                                      |

- PKG\_UTIL.IO\_PRINT

Outputs a string.

The prototype of the PKG\_UTIL.IO\_PRINT function is as follows:

```
PKG_UTIL.IO_PRINT(
format IN text,
is_one_line IN boolean
)
RETURN void;
```

**Table 10-42** PKG\_UTIL.IO\_PRINT parameters

| Parameter   | Type    | Input/Output Parameter | Can Be Empty | Description                                       |
|-------------|---------|------------------------|--------------|---------------------------------------------------|
| format      | text    | IN                     | No           | Indicates the character string to be output.      |
| is_one_line | boolean | IN                     | No           | Indicates whether to output the string as a line. |

- PKG\_UTIL.RAW\_GET\_LENGTH

Obtains the length of RAW data.

The prototype of the PKG\_UTIL.RAW\_GET\_LENGTH function is as follows:

```
PKG_UTIL.RAW_GET_LENGTH(
value IN raw
)
RETURN integer;
```

**Table 10-43** PKG\_UTIL.RAW\_GET\_LENGTH parameters

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description                                          |
|-----------|------|------------------------|--------------|------------------------------------------------------|
| raw       | raw  | IN                     | No           | Indicates the object whose length is to be obtained. |

- PKG\_UTIL.RAW\_CAST\_FROM\_VARCHAR2

Converts VARCHAR2 data to RAW data.

The prototype of the PKG\_UTIL.RAW\_CAST\_FROM\_VARCHAR2 function is as follows:

```
PKG_UTIL.RAW_CAST_FROM_VARCHAR2(
str IN varchar2
)
RETURN raw;
```

**Table 10-44** PKG\_UTIL.RAW\_CAST\_FROM\_VARCHAR2 parameters

| Parameter | Type     | Input/Output Parameter | Can Be Empty | Description                               |
|-----------|----------|------------------------|--------------|-------------------------------------------|
| str       | varchar2 | IN                     | No           | Indicates the source data to be converted |

- PKG\_UTIL.RANDOM\_SET\_SEED

Sets a random seed.

The prototype of the **PKG\_UTIL.RANDOM\_SET\_SEED** function is as follows:

```
PKG_UTIL.RANDOM_SET_SEED(
seed IN int
)
RETURN integer;
```

**Table 10-45** PKG\_UTIL.RANDOM\_SET\_SEED parameters

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description         |
|-----------|------|------------------------|--------------|---------------------|
| seed      | int  | IN                     | No           | Sets a random seed. |

- PKG\_UTIL.RANDOM\_GET\_VALUE

Returns a 15-digit random number ranging from 0 to 1.

The prototype of the PKG\_UTIL.RANDOM\_GET\_VALUE function is as follows:

```
PKG_UTIL.RANDOM_GET_VALUE(
)
RETURN numeric;
```

- **PKG\_UTIL.FILE\_SET\_DIRNAME**  
Sets the directory to be operated. It must be called to set directory for each operation involving a single directory.

The prototype of the **PKG\_UTIL.FILE\_SET\_DIRNAME** function is as follows:

```
PKG_UTIL.FILE_SET_DIRNAME(
dir IN text
)
RETURN bool
```

**Table 10-46** PKG\_UTIL.FILE\_SET\_DIRNAME parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dirname   | Directory of a file. It is a string, indicating an object name.<br><b>NOTE</b><br>File directories need to be added to the system catalog <b>PG_DIRECTORY</b> . If the input path does not match the path in <b>PG_DIRECTORY</b> , an error indicating that the path does not exist will be reported. Functions that involve <b>location</b> as parameters also comply with this rule. |

- **PKG\_UTIL.FILE\_OPEN**  
Opens a file. A maximum of 50 files can be opened at a time. This function returns a handle of the INTEGER type.

The prototype of the **PKG\_UTIL.FILE\_OPEN** function is as follows:

```
PKG_UTIL.FILE_OPEN(
file_name IN text,
open_mode IN integer)
```

**Table 10-47** PKG\_UTIL.FILE\_OPEN parameters

| Parameter | Description                                                                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file_name | File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the <b>OPEN</b> function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).               |
| open_mode | File opening mode, including <b>r</b> (read), <b>w</b> (write), and <b>a</b> (append).<br><b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits. |

- **PKG\_UTIL.FILE\_SET\_MAX\_LINE\_SIZE**  
Sets the maximum length of a line to be written to a file.

The prototype of the **PKG\_UTIL.FILE\_SET\_MAX\_LINE\_SIZE** function is as follows:

```
PKG_UTIL.FILE_SET_MAX_LINE_SIZE(
max_line_size in integer)
RETURN BOOL
```

**Table 10-48** PKG\_UTIL.FILE\_SET\_MAX\_LINE\_SIZE parameters

| Parameter     | Description                                                                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| max_line_size | Maximum number of characters in each line, including newline characters. The minimum value is <b>1</b> and the maximum is <b>32767</b> . If this parameter is not specified, the default value <b>1024</b> is used. |

- PKG\_UTIL.FILE\_IS\_CLOSE

Checks whether a file handle is closed.

The prototype of the PKG\_UTIL.FILE\_IS\_CLOSE function is as follows:

```
PKG_UTIL.FILE_IS_CLOSE(
file IN integer
)
RETURN BOOL
```

**Table 10-49** PKG\_UTIL.FILE\_IS\_CLOSE parameters

| Parameter | Description        |
|-----------|--------------------|
| file      | Opened file handle |

- PKG\_UTIL.FILE\_READ

Reads a line of data from an open file handle based on the specified length.

The prototype of the PKG\_UTIL.FILE\_READ function is as follows:

```
PKG_UTIL.FILE_READ(
file IN integer,
buffer OUT text,
len IN bigint default 1024)
```

**Table 10-50** PKG\_UTIL.FILE\_READ parameters

| Parameter | Description                                                                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file      | File handle opened by calling the <b>OPEN</b> function. The file must be opened in read mode. Otherwise, the <b>INVALID_OPERATION</b> exception is thrown. |
| buffer    | Buffer used to receive data                                                                                                                                |
| len       | Number of bytes read from a file                                                                                                                           |

- PKG\_UTIL.FILE\_READLINE

Reads a line of data from an open file handle based on the specified length.

The prototype of the PKG\_UTIL.FILE\_READLINE function is as follows:

```
PKG_UTIL.FILE_READLINE(
file IN integer,
buffer OUT text,
len IN integer default NULL)
```

**Table 10-51** PKG\_UTIL.FILE\_READLINE parameters

| Parameter | Description                                                                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file      | File handle opened by calling the <b>OPEN</b> function. The file must be opened in read mode. Otherwise, the <b>INVALID_OPERATION</b> exception is thrown.            |
| buffer    | Buffer used to receive data                                                                                                                                           |
| len       | Number of bytes read from a file. The default value is <b>NULL</b> . If the default value <b>NULL</b> is used, <b>max_line_size</b> is used to specify the line size. |

- PKG\_UTIL.FILE\_WRITE

Writes the data specified in the buffer to a file.

The prototype of the PKG\_UTIL.FILE\_WRITE function is as follows:

```
PKG_UTIL.FILE_WRITE(
file in integer,
buffer in text
)
RETURN BOOL
```

**Table 10-52** PKG\_UTIL.FILE\_WRITE parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file      | Opened file handle                                                                                                                                                                                                                                                                                                                                                                                    |
| buffer    | Text data to be written to a file. The maximum buffer size is 32767 bytes. If no value is specified, the default value is 1024 bytes. Before the writing is performed, the buffer occupied by <b>PUT</b> operations cannot exceed 32767 bytes.<br><br><b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits. |

- PKG\_UTIL.FILE\_NEWLINE

Writes a line terminator to an open file. The line terminator is related to the platform.

The prototype of the PKG\_UTIL.FILE\_NEWLINE function is as follows:

```
PKG_UTIL.FILE_NEWLINE(
file in integer
)
RETURN BOOL
```

**Table 10-53** PKG\_UTIL.FILE\_NEWLINE parameters

| Parameter | Description        |
|-----------|--------------------|
| file      | Opened file handle |

- PKG\_UTIL.FILE\_WRITELINE

Writes a line to a file.

The prototype of the PKG\_UTIL.FILE\_WRITELINE function is as follows:

```
PKG_UTIL.FILE_WRITELINE(
file in integer,
buffer in text
)
RETURN BOOL
```

**Table 10-54** PKG\_UTIL.FILE\_WRITELINE parameters

| Parameter | Description           |
|-----------|-----------------------|
| file      | Opened file handle    |
| buffer    | Content to be written |

- PKG\_UTIL.FILE\_READ\_RAW

Reads binary data of a specified length from an open file handle and returns the read binary data. The return type is RAW.

The prototype of the PKG\_UTIL.FILE\_READ\_RAW function is as follows:

```
PKG_UTIL.FILE_READ_RAW(
file in integer,
length in integer default NULL
)
RETURN raw
```

**Table 10-55** PKG\_UTIL.FILE\_READ\_RAW parameters

| Parameter | Description                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------|
| file      | Opened file handle                                                                                                                    |
| length    | Length of the data to be read. The default value is <b>NULL</b> . By default, all data in the file is read. The maximum size is 1 GB. |

- PKG\_UTIL.FILE\_WRITE\_RAW

Writes the input binary object of the RAW type to an open file. If the insertion is successful, **true** is returned.

The prototype of the PKG\_UTIL.FILE\_WRITE\_RAW function is as follows:

```
PKG_UTIL.FILE_WRITE_RAW(
file in integer,
r in raw
)
RETURN BOOL
```

**Table 10-56** PKG\_UTIL.FILE\_WRITE\_RAW parameters

| Parameter | Description        |
|-----------|--------------------|
| file      | Opened file handle |

| Parameter | Description                                                                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| r         | Data to be written to the file<br><b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits. |

- **PKG\_UTIL.FILE\_FLUSH**

Data in a file handle must be written into a physical file. Data in the buffer must have a line terminator. Refresh is important if a file must be read when it is opened. For example, debugging information can be refreshed to a file so that it can be read immediately.

The prototype of the PKG\_UTIL.FILE\_FLUSH function is as follows:

```
PKG_UTIL.FILE_FLUSH (
file in integer
)
RETURN VOID
```

**Table 10-57** PKG\_UTIL.FILE\_FLUSH parameters

| Parameter | Description        |
|-----------|--------------------|
| file      | Opened file handle |

- **PKG\_UTIL.FILE\_CLOSE**

Closes an open file handle.

The prototype of the PKG\_UTIL.FILE\_CLOSE function is as follows:

```
PKG_UTIL.FILE_CLOSE (
file in integer
)
RETURN BOOL
```

**Table 10-58** PKG\_UTIL.FILE\_CLOSE parameters

| Parameter | Description        |
|-----------|--------------------|
| file      | Opened file handle |

- **PKG\_UTIL.FILE\_REMOVE**

Deletes a disk file. To perform this operation, you must have required permissions.

The prototype of the PKG\_UTIL.FILE\_REMOVE function is as follows:

```
PKG_UTIL.FILE_REMOVE(
file_name in text
)
RETURN VOID
```

**Table 10-59** PKG\_UTIL.FILE\_REMOVE parameters

| Parameter | Description                    |
|-----------|--------------------------------|
| filen_ame | Name of the file to be deleted |

- PKG\_UTIL.FILE\_RENAME

Renames a file on the disk, similar to mv in Unix.

The prototype of the PKG\_UTIL.FILE\_RENAME function is as follows:

```
PKG_UTIL.FILE_RENAME(
src_dir in text,
src_file_name in text,
dest_dir in text,
dest_file_name in text,
overwrite boolean default false)
```

**Table 10-60** PKG\_UTIL.FILE\_RENAME parameters

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| src_dir        | Source file directory (case-sensitive)<br><b>NOTE</b> <ul style="list-style-type: none"><li>• Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li><li>• When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li></ul> |
| src_file_name  | Source file name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| dest_dir       | Target file directory (case-sensitive)<br><b>NOTE</b> <ul style="list-style-type: none"><li>• Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li><li>• When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li></ul> |
| dest_file_name | Target file name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| overwrite      | The default value is <b>false</b> . If a file with the same name exists in the destination directory, the file will not be rewritten.                                                                                                                                                                                                                                                                                                                                                                                |

- PKG\_UTIL.FILE\_SIZE

Returns the size of a specified file.

The prototype of the PKG\_UTIL.FILE\_SIZE function is as follows:

```
bigint PKG_UTIL.FILE_SIZE(
file_name in text
)return bigint
```

**Table 10-61** PKG\_UTIL.FILE\_SIZE parameters

| Parameter | Description |
|-----------|-------------|
| file_name | File name   |

- PKG\_UTIL.FILE\_BLOCK\_SIZE

Returns the number of blocks contained in a specified file.

The prototype of the PKG\_UTIL.FILE\_BLOCK\_SIZE function is as follows:

```
bigint PKG_UTIL.FILE_BLOCK_SIZE(
file_name in text
)return bigint
```

**Table 10-62** PKG\_UTIL.FILE\_BLOCK\_SIZE parameters

| Parameter | Description |
|-----------|-------------|
| file_name | File name   |

- PKG\_UTIL.FILE\_EXISTS

Checks whether a file exists.

The prototype of the PKG\_UTIL.FILE\_EXISTS function is as follows:

```
PKG_UTIL.FILE_EXISTS(
file_name in text
)
RETURN BOOL
```

**Table 10-63** PKG\_UTIL.FILE\_EXISTS parameters

| Parameter | Description |
|-----------|-------------|
| file_name | File name   |

- PKG\_UTIL.FILE\_GETPOS

Specifies the offset of a returned file, in bytes.

The prototype of the PKG\_UTIL.FILE\_GETPOS function is as follows:

```
PKG_UTIL.FILE_GETPOS(
file in integer
)
RETURN BIGINT
```

**Table 10-64** PKG\_UTIL.FILE\_GETPOS parameters

| Parameter | Description        |
|-----------|--------------------|
| file      | Opened file handle |

- **PKG\_UTIL.FILE\_SEEK**

Adjusts the position of a file pointer forward or backward based on the specified number of bytes.

The prototype of the PKG\_UTIL.FILE\_SEEK function is as follows:

```
void PKG_UTIL.FILE_SEEK(
file in integer,
start in bigint
)
RETURN VOID
```

**Table 10-65** PKG\_UTIL.FILE\_SEEK parameters

| Parameter | Description            |
|-----------|------------------------|
| file      | Opened file handle     |
| start     | File offset, in bytes. |

- **PKG\_UTIL.FILE\_CLOSE\_ALL**

Closes all file handles opened in a session.

The prototype of the PKG\_UTIL.FILE\_CLOSE\_ALL function is as follows:

```
PKG_UTIL.FILE_CLOSE_ALL(
)
RETURN VOID
```

**Table 10-66** PKG\_UTIL.FILE\_CLOSE\_ALL parameters

| Parameter | Description |
|-----------|-------------|
| None      | None        |

- **PKG\_UTIL.EXCEPTION\_REPORT\_ERROR**

Throws an exception.

The prototype of the PKG\_UTIL.EXCEPTION\_REPORT\_ERROR function is as follows:

```
PKG_UTIL.EXCEPTION_REPORT_ERROR(
code integer,
log text,
flag boolean DEFAULT false
)
RETURN INTEGER
```

**Table 10-67** PKG\_UTIL.EXCEPTION\_REPORT\_ERROR parameters

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| code      | Error code displayed when an exception occurs.      |
| log       | Log information displayed when an exception occurs. |
| flag      | Reserved. The default value is <b>false</b> .       |

- **PKG\_UTIL.app\_read\_client\_info**

Reads the client information.

The prototype of the **PKG\_UTIL.app\_read\_client\_info** function is as follows:

```
PKG_UTIL.app_read_client_info(
OUT buffer text
)return text
```

**Table 10-68** PKG\_UTIL.app\_read\_client\_info parameters

| Parameter | Description                 |
|-----------|-----------------------------|
| buffer    | Client information returned |

- **PKG\_UTIL.app\_set\_client\_info**

Sets the client information.

The prototype of the **PKG\_UTIL.app\_set\_client\_info** function is as follows:

```
PKG_UTIL.app_set_client_info(
str text
)
```

**Table 10-69** PKG\_UTIL.app\_set\_client\_info parameters

| Parameter | Description                  |
|-----------|------------------------------|
| str       | Client information to be set |

- **PKG\_UTIL.lob\_converttoblob**

Converts a CLOB to a BLOB. **amount** indicates the conversion length.

The prototype of the **PKG\_UTIL.lob\_converttoblob** function is as follows:

```
PKG_UTIL.lob_converttoblob(
dest_lob blob,
src_clob clob,
amount integer,
dest_offset integer,
src_offset integer
)return raw
```

**Table 10-70** PKG\_UTIL.lob\_converttoblob parameters

| Parameter   | Description                       |
|-------------|-----------------------------------|
| dest_lob    | Target LOB                        |
| src_clob    | CLOB to be converted              |
| amount      | Conversion length                 |
| dest_offset | Start position of the target LOB  |
| src_offset  | Start position of the source CLOB |

- **PKG\_UTIL.lob\_converttoclob**

Converts a BLOB to a CLOB. **amount** indicates the conversion length.

The prototype of the PKG\_UTIL.lob\_converttoclob function is as follows:

```
PKG_UTIL.lob_converttoclob(
dest_lob clob,
src_blob blob,
amount integer,
dest_offset integer,
src_offset integer
)return text
```

**Table 10-71** PKG\_UTIL.lob\_converttoclob parameters

| Parameter   | Description                       |
|-------------|-----------------------------------|
| dest_lob    | Target LOB                        |
| src_blob    | BLOB to be converted              |
| amount      | Conversion length                 |
| dest_offset | Start position of the target LOB  |
| src_offset  | Start position of the source CLOB |

- PKG\_UTIL.lob\_texttoraw

Converts the text type to the raw type.

The prototype of the PKG\_UTIL.lob\_texttoraw function is as follows:

```
PKG_UTIL.lob_texttoraw(
src_lob clob
)
RETURN raw
```

**Table 10-72** PKG\_UTIL.lob\_texttoraw parameters

| Parameter | Description         |
|-----------|---------------------|
| src_lob   | LOB to be converted |

- PKG\_UTIL.match\_edit\_distance\_similarity

Calculates the difference between two character strings.

The prototype of the PKG\_UTIL.match\_edit\_distance\_similarity function is as follows:

```
PKG_UTIL.match_edit_distance_similarity(
str1 text,
str2 text
)
RETURN INTEGER
```

**Table 10-73** PKG\_UTIL.match\_edit\_distance\_similarity parameters

| Parameter | Description             |
|-----------|-------------------------|
| str1      | First character string  |
| str2      | Second character string |

- `PKG_UTIL.raw_cast_to_varchar2`

Converts from the raw type to the varchar2 type.

The prototype of the `PKG_UTIL.raw_cast_to_varchar2` function is as follows:

```
PKG_UTIL.raw_cast_to_varchar2(
str raw
)
RETURN varchar2
```

**Table 10-74** `PKG_UTIL.raw_cast_to_varchar2` parameters

| Parameter | Description        |
|-----------|--------------------|
| str       | Hexadecimal string |

- `PKG_UTIL.session_clear_context`

Clears the session context.

The prototype of the `PKG_UTIL.session_clear_context` function is as follows:

```
PKG_UTIL.session_clear_context(
namespace text,
client_identifier text,
attribute text
)
RETURN INTEGER
```

**Table 10-75** `PKG_UTIL.session_clear_context` parameters

| Parameter         | Description                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| namespace         | Namespace of an attribute.                                                                                                        |
| client_identifier | Usually same as the value of <b>namespace</b> . If this parameter is set to <b>null</b> , all namespaces are modified by default. |
| attribute         | Attribute value to be cleared                                                                                                     |

- `PKG_UTIL.session_search_context`

Searches for an attribute value.

The prototype of the `PKG_UTIL.session_clear_context` function is as follows:

```
PKG_UTIL.session_clear_context(
namespace text,
attribute text
)
RETURN INTEGER
```

**Table 10-76** `PKG_UTIL.session_clear_context` parameters

| Parameter | Description                   |
|-----------|-------------------------------|
| namespace | Namespace of an attribute.    |
| attribute | Attribute value to be cleared |

- `PKG_UTIL.session_set_context`

Sets an attribute value.

The prototype of the `PKG_UTIL.session_set_context` function is as follows:

```
PKG_UTIL.session_set_context(
namespace text,
attribute text,
value text
)
RETURN INTEGER
```

**Table 10-77** `PKG_UTIL.session_set_context` parameters

| Parameter | Description                |
|-----------|----------------------------|
| namespace | Namespace of an attribute. |
| attribute | Attribute to be set.       |
| value     | Attribute value.           |

- `PKG_UTIL.utility_get_time`

Prints the Unix timestamp.

The prototype of the `PKG_UTIL.utility_get_time` function is as follows:

```
PKG_UTIL.utility_get_time()
RETURN bigint
```

- `PKG_UTIL.utility_format_error_backtrace`

Displays the error stack of a stored procedure.

The prototype of the `PKG_UTIL.utility_format_error_backtrace` function is as follows:

```
PKG_UTIL.utility_format_error_backtrace()
RETURN text
```

- `PKG_UTIL.utility_format_error_stack`

Displays the error information of a stored procedure.

The prototype of the `PKG_UTIL.utility_format_error_stack` function is as follows:

```
PKG_UTIL.utility_format_error_stack()
RETURN text
```

- `PKG_UTIL.utility_format_call_stack`

Displays the call stack of a stored procedure.

The prototype of the `PKG_UTIL.utility_format_call_stack` function is as follows:

```
PKG_UTIL.utility_format_call_stack()
RETURN text
```

### 10.12.1.3 DBE\_XML

**Table 10-78** lists all interfaces supported by the **DBE\_XML** interface.

**Table 10-78** `DBE_XML` parameters

| Interface                               | Description     |
|-----------------------------------------|-----------------|
| <a href="#">dbe_xml.xml_free_parser</a> | Frees a parser. |

| Interface                                                  | Description                                                                               |
|------------------------------------------------------------|-------------------------------------------------------------------------------------------|
| <a href="#">dbe_xml.xml_parser_get_doc</a>                 | Obtains the parsed document node.                                                         |
| <a href="#">dbe_xml.xml_get_validation_mode</a>            | Obtains the validation attribute.                                                         |
| <a href="#">dbe_xml.xml_new_parser</a>                     | Creates a parser instance.                                                                |
| <a href="#">dbe_xml.xml_parse_buffer</a>                   | Parses the VARCHAR string.                                                                |
| <a href="#">dbe_xml.xml_parse_clob</a>                     | Parses the CLOB string.                                                                   |
| <a href="#">dbe_xml.xml_set_validation_mode</a>            | Sets the validation attribute.                                                            |
| <a href="#">dbe_xml.xml_dom_append_child</a>               | Adds the newchild node to the end of the parent(n) node and returns the newly added node. |
| <a href="#">dbe_xml.xml_dom_create_element</a>             | Returns the DOMELEMENT object with the specified name.                                    |
| <a href="#">dbe_xml.xml_dom_create_element_ns</a>          | Returns the DOMELEMENT object with the specified name and namespace.                      |
| <a href="#">dbe_xml.xml_dom_create_text_node</a>           | Creates and returns a DOMText object.                                                     |
| <a href="#">dbe_xml.xml_dom_free_document</a>              | Frees a specified XML DOM object.                                                         |
| <a href="#">dbe_xml.xml_dom_free_element</a>               | Frees a specified XML DOM object.                                                         |
| <a href="#">dbe_xml.xml_dom_free_node</a>                  | Frees a DOMNode node.                                                                     |
| <a href="#">dbe_xml.xml_dom_free_nodelist...</a>           | Frees a DOMNodeList node.                                                                 |
| <a href="#">dbe_xml.xml_dom_get_attribute</a>              | Obtains the attributes of a specified XML DOM object.                                     |
| <a href="#">dbe_xml.xml_dom_get_attributes</a>             | Returns the attribute values of a DOMNode node as a map.                                  |
| <a href="#">dbe_xml.xml_dom_get_child_nodes</a>            | Converts several subnodes under a node into a node list.                                  |
| <a href="#">dbe_xml.xml_dom_get_children_by_tagname</a>    | Obtains the list of specified subnodes of a specified XML DOM object.                     |
| <a href="#">dbe_xml.xml_dom_get_children_by_tagname_ns</a> | Obtains the list of subnodes in the specified namespace of a specified XML DOM object.    |
| <a href="#">dbe_xml.xml_dom_get_document_element</a>       | Returns the first subnode of the specified document.                                      |
| <a href="#">dbe_xml.xml_dom_get_first_child</a>            | Returns the first subnode of a node.                                                      |

| Interface                                              | Description                                                                         |
|--------------------------------------------------------|-------------------------------------------------------------------------------------|
| <a href="#">dbe_xml.xml_dom_get_last_child</a>         | Returns the last subnode of a node.                                                 |
| <a href="#">dbe_xml.xml_dom_get_length...</a>          | Returns the number of nodes based on the content in the node of the specified type. |
| <a href="#">dbe_xml.xml_dom_get_local_name...</a>      | Returns the local name of the given object.                                         |
| <a href="#">dbe_xml.xml_dom_get_named_item</a>         | Returns the node specified by name.                                                 |
| <a href="#">dbe_xml.xml_dom_get_named_item_ns</a>      | Returns the node specified by name and namespace.                                   |
| <a href="#">dbe_xml.xml_dom_get_next_siblings</a>      | Returns the next node of the specified node.                                        |
| <a href="#">dbe_xml.xml_dom_get_node_name</a>          | Returns the name of a node.                                                         |
| <a href="#">dbe_xml.xml_dom_get_node_type</a>          | Returns the type of a node.                                                         |
| <a href="#">dbe_xml.xml_dom_get_node_value</a>         | Returns the value of a DOMNode node.                                                |
| <a href="#">dbe_xml.xml_dom_get_parent...</a>          | Returns the parent node of the given DOMNode node.                                  |
| <a href="#">dbe_xml.xml_dom_get_tagname</a>            | Obtains the tag name of a specified XML DOM object.                                 |
| <a href="#">dbe_xml.xml_dom_has_child...</a>           | Checks whether the DOMNode object has any subnode.                                  |
| <a href="#">dbe_xml.xml_dom_import_node</a>            | Copies a node to another node and mounts the copied node to a specified document.   |
| <a href="#">dbe_xml.xml_dom_is_null</a>                | Checks whether the given object is null.                                            |
| <a href="#">dbe_xml.xml_dom_item</a>                   | Returns the element corresponding to the index in a list or map based on the index. |
| <a href="#">dbe_xml.xml_dom_make_element</a>           | Returns the DOMELEMENT object after conversion.                                     |
| <a href="#">dbe_xml.xml_dom_makenode</a>               | Converts the given object to the DOMNode type.                                      |
| <a href="#">dbe_xml.xml_dom_new_dom_document_empty</a> | Returns a new DOMDocument object.                                                   |
| <a href="#">xml_dom_new_dom_document_clob</a>          | Returns a new DOMDocument instance object created from the specified CLOB type.     |

| Interface                                                | Description                                                                                            |
|----------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| <a href="#">dbe_xml.xml_dom_new_document_xmltype</a>     | Returns a new DOMDocument instance object created from the specified XMLType type.                     |
| <a href="#">dbe_xml.xml_dom_set_attribute</a>            | Sets the attributes of a specified XML DOM object.                                                     |
| <a href="#">dbe_xml.xml_dom_set_charset</a>              | Sets the character set for a DOMDocument object.                                                       |
| <a href="#">dbe_xml.xml_dom_set_doctype</a>              | Sets the external DTD of a DOMDocument object.                                                         |
| <a href="#">dbe_xml.xml_dom_set_node...</a>              | Sets the value of a node in the DOMNode object.                                                        |
| <a href="#">dbe_xml.xml_dom_write_to_buffer_doc</a>      | Writes the given DOMDocument object to the buffer.                                                     |
| <a href="#">dbe_xml.xml_dom_write_to_buffer_node</a>     | Writes the given DOMNode object to the buffer.                                                         |
| <a href="#">dbe_xml.xml_dom_write_to_clob_doc</a>        | Writes the given DOMDocument object to a CLOB.                                                         |
| <a href="#">dbe_xml.xml_dom_write_to_clob_node</a>       | Writes the given DOMNode object to a CLOB.                                                             |
| <a href="#">dbe_xml.xml_dom_write_to_file_doc</a>        | Writes an XML node to a specified file using the database character set.                               |
| <a href="#">dbe_xml.xml_dom_write_to_file_node</a>       | Writes an XML node to a specified file using the database character set.                               |
| <a href="#">dbe_xml.xml_dom_get_session_tree_num</a>     | Displays the number of DOM trees of all types in the current session.                                  |
| <a href="#">dbe_xml.xml_dom_get_doc_trees_info</a>       | Displays statistics such as the memory usage and number of nodes of the DOM tree of the document type. |
| <a href="#">dbe_xml.xml_dom_get_detail_doc_tree_info</a> | Displays the number of nodes of each type for a specific document variable.                            |

- [dbe\\_xml.xml\\_free\\_parser](#)

Frees a given parser object.

The stored procedure prototype of [dbe\\_xml.xml\\_free\\_parser](#) is as follows:

```
dbe_xml.xml_free_parser(
id IN raw(13))
returns void;
```

**Table 10-79** dbexml.xml\_free\_parser parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description   |
|-----------|---------|------------------------|--------------|---------------|
| id        | raw(13) | IN                     | Yes          | Parser object |

- **dbexml.xml\_parser\_get\_doc**  
Returns the root node of the DOM tree document constructed by the parser. The prototype of the `dbexml.xml_parser_get_doc` function is as follows:

```
dbexml.xml_parser_get_doc(
id IN raw(13))
returns raw(13);
```

**Table 10-80** dbexml.xml\_parser\_get\_doc parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description   |
|-----------|---------|------------------------|--------------|---------------|
| id        | raw(13) | IN                     | Yes          | Parser object |

 **NOTE**

- If the `GETDOCUMENT` function is empty, null is returned.
- If the parser input by the `GETDOCUMENT` function has not parsed any document, null is returned.
- **dbexml.xml\_get\_validation\_mode**  
Obtains the parsing validation mode of a specified parser. If DTD validation is enabled, **TRUE** is returned. Otherwise, **FALSE** is returned.

The prototype of the `dbexml.xml_get_validation_mode` function is as follows:

```
dbexml.xml_get_validation_mode(
id raw(13))
returns bool;
```

**Table 10-81** dbexml.xml\_get\_validation\_mode parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description   |
|-----------|---------|------------------------|--------------|---------------|
| id        | raw(13) | IN                     | Yes          | Parser object |

- **dbexml.xml\_new\_parser**  
Creates a parser object and returns a new parser instance. The prototype of the `dbexml.xml_new_parser` function is as follows:

```
dbexml.xml_new_parser()
RETURNS RAW(13);
```

- `dbe_xml.xml_parse_buffer`

Parses XML documents stored in strings.

The stored procedure prototype of `dbe_xml.xml_parse_buffer` is as follows:

```
dbe_xml.xml_parse_buffer(
id RAW(13),
xmlstr VARCHAR2)
RETURNS void;
```

**Table 10-82** `dbe_xml.xml_parse_buffer` parameters

| Parameter | Type     | Input/Output Parameter | Can Be Empty | Description                        |
|-----------|----------|------------------------|--------------|------------------------------------|
| id        | raw(13)  | IN                     | Yes          | Parser object                      |
| xmlstr    | VARCHAR2 | IN                     | No           | A string that stores XML documents |

 **NOTE**

- The maximum length of a character string that can be parsed by the `xml_parse_buffer` function is 32767. If the length exceeds the maximum, an error is reported.
- Different from the ORA database, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsed, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK[check]Check) "Ch..."** reports an error because the default value "Ch..." is not an enumerated value in the brackets. However, the ORA database does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case sensitive. **Baidu** cannot correspond to **baidu**. However, the ORA database does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the ORA database reports an error.
- Difference in parsing XML predefined entities: **&apos;** and **&quot;** are parsed and translated into ' and ". However, predefined entities in database ORA are not translated into characters.

- `dbe_xml.xml_parse_clob`

Parses XML documents stored in a CLOB.

The stored procedure prototype of `dbe_xml.xml_parse_clob` is as follows:

```
dbe_xml.xml_parse_clob(
id IN raw(13),
doc IN CLOB)
returns void;
```

**Table 10-83** dbe\_xml.xml\_parse\_clob parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                        |
|-----------|---------|------------------------|--------------|------------------------------------|
| id        | raw(13) | IN                     | Yes          | Parser object                      |
| doc       | CLOB    | IN                     | No           | A string that stores XML documents |

 **NOTE**

- xml\_parse\_clob cannot parse CLOBs larger than 1 GB.
- Different from the ORA database, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsed, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value "Ch..." is not an enumerated value in the brackets. However, the ORA database does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case sensitive. **Baidu** cannot correspond to **baidu**. However, the ORA database does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the ORA database reports an error.
- Difference in parsing XML predefined entities: **&apos;** and **&quot;** are parsed and translated into ' and ". However, predefined entities in database ORA are not translated into characters.

- dbe\_xml.xml\_set\_validation\_mode

Sets the parsing validation mode of a specified parser.

The stored procedure prototype of dbe\_xml.xml\_set\_validation\_mode is as follows:

```
dbe_xml.xml_set_validation_mode(
id raw(13),
validate boolean)
returns void;
```

**Table 10-84** dbe\_xml.xml\_set\_validation\_mode parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description   |
|-----------|---------|------------------------|--------------|---------------|
| id        | raw(13) | IN                     | Yes          | Parser object |

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                      |
|-----------|---------|------------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| validate  | boolean | IN                     | Yes          | Mode to be set: <ul style="list-style-type: none"> <li>• <b>TRUE</b>: DTD validation is enabled.</li> <li>• <b>FALSE</b>: DTD validation is disabled.</li> </ul> |

 **NOTE**

- If the input parameter **validate** of the `xml_set_validation_mode` function is null, the parsing validation mode of the parser is not changed.
- By default, the DTD validation is enabled during parser initialization.

- `dbexml.xml_dom_append_child`

Adds the newchild node to the end of the parent(n) node and returns the newly added node.

The stored procedure prototype of `dbexml.xml_dom_append_child` is as follows:

```
dbexml.xml_dom_append_child(
 parentId IN RAW(13),
 childId IN RAW(13)
)
RETURNS RAW(13);
```

**Table 10-85** `dbexml.xml_dom_append_child` parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| parentId  | raw(13) | IN                     | No           | XML DOM object |
| childId   | raw(13) | IN                     | No           | XML DOM object |

- `dbexml.xml_dom_create_element`

Returns the `DOMElement` object with the specified name.

The prototype of the `dbexml.xml_dom_create_element` function is as follows:

```
dbexml.xml_dom_create_element(
 id IN RAW(13),
 tagname IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-86** dbexml.xml\_dom\_create\_element parameters

| Parameter | Type     | Input/Output Parameter | Can Be Empty | Description                       |
|-----------|----------|------------------------|--------------|-----------------------------------|
| id        | raw(13)  | IN                     | No           | XML DOM object                    |
| tagname   | VARCHAR2 | IN                     | No           | Name of the new DOMELEMENT object |

- dbexml.xml\_dom\_create\_element\_ns**  
 Returns the DOMELEMENT object with the specified name and namespace.  
 The prototype of the dbexml.xml\_dom\_create\_element\_ns function is as follows:

```

dbexml.xml_dom_create_element_ns(
 id IN RAW(13),
 tagname IN VARCHAR2,
 ns IN VARCHAR2
)
RETURNS RAW(13);

```

**Table 10-87** dbexml.xml\_dom\_create\_element\_ns parameters

| Parameter | Type     | Input/Output Parameter | Can Be Empty | Description                       |
|-----------|----------|------------------------|--------------|-----------------------------------|
| id        | raw(13)  | IN                     | No           | XML DOM object                    |
| tagname   | VARCHAR2 | IN                     | No           | Name of the new DOMELEMENT object |
| ns        | VARCHAR2 | IN                     | No           | Namespace                         |

- dbexml.xml\_dom\_create\_text\_node**  
 Creates and returns a DOMTEXT object.  
 The prototype of the dbexml.xml\_dom\_create\_text\_node function is as follows:

```

dbexml.xml_dom_create_text_node(
 id IN RAW(13),
 data IN VARCHAR2
)
RETURNS RAW(13);

```

**Table 10-88** dbexml.xml\_dom\_create\_text\_node parameters

| Parameter | Type     | Input/Output Parameter | Can Be Empty | Description                     |
|-----------|----------|------------------------|--------------|---------------------------------|
| id        | raw(13)  | IN                     | No           | XML DOM object                  |
| data      | VARCHAR2 | IN                     | No           | Content of the new DOMText node |

- dbexml.xml\_dom\_free\_document

Frees a specified XML DOM object.

The stored procedure prototype of dbexml.xml\_dom\_free\_document is as follows:

```
dbexml.xml_dom_free_document(
 id RAW(13)
)
RETURNS void;
```

**Table 10-89** dbexml.xml\_dom\_free\_document parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | No           | XML DOM object |

- dbexml.xml\_dom\_free\_element

Frees a specified XML DOM object.

The stored procedure prototype of dbexml.xml\_dom\_free\_element is as follows:

```
dbexml.xml_dom_free_element (
 id RAW(13)
)
RETURNS void;
```

**Table 10-90** dbexml.xml\_dom\_free\_element parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | No           | XML DOM object |

- dbexml.xml\_dom\_free\_node

Frees a DOMNode node.

The prototype of the dbexml.xml\_dom\_free\_node function is as follows:

```
dbexml.xml_dom_free_node (
 id RAW(13)
```

```
)
RETURNS void;
```

**Table 10-91** dbe\_xml.xml\_dom\_free\_node parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | No           | XML DOM object |

- dbe\_xml.xml\_dom\_free\_nodelist

Frees a DOMNodeList node.

The stored procedure prototype of dbe\_xml.xml\_dom\_free\_nodelist is as follows:

```
dbe_xml.xml_dom_free_nodelist(
 id IN RAW(13),
 node_value IN VARCHAR2
)
RETURNS VOID
```

**Table 10-92** dbe\_xml.xml\_dom\_free\_nodelist parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | No           | XML DOM object |

- dbe\_xml.xml\_dom\_get\_attribute

Obtains the attributes of a specified XML DOM object.

The stored procedure prototype of dbe\_xml.xml\_dom\_get\_attribute is as follows:

```
dbe_xml.xml_dom_get_attribute (
 docid IN RAW(13),
 name IN VARCHAR2
)
RETURNS VARCHAR2;
```

**Table 10-93** dbe\_xml.xml\_dom\_get\_attribute parameters

| Parameter | Type     | Input/Output Parameter | Can Be Empty | Description    |
|-----------|----------|------------------------|--------------|----------------|
| docid     | raw(13)  | IN                     | No           | XML DOM object |
| name      | VARCHAR2 | IN                     | No           | String         |

- `db_xml.xml_dom_get_attributes`

Returns the attribute values of a DOMNode node as a map.

The prototype of the `db_xml.xml_dom_get_attributes` function is as follows:

```
db_xml.xml_dom_get_attributes (
 id RAW(13)
)
RETURNS RAW(13);
```

**Table 10-94** `db_xml.xml_dom_get_attributes` parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | No           | XML DOM object |

- `db_xml.xml_dom_get_child_nodes`

Converts several subnodes under a node into a node list.

The prototype of the `db_xml.xml_dom_get_child_nodes` function is as follows:

```
db_xml.xml_dom_get_child_nodes(
 id IN RAW(13)
)
RETURNS RAW(13);
```

**Table 10-95** `db_xml.xml_dom_get_child_nodes` parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | No           | XML DOM object |

- `db_xml.xml_dom_get_children_by_tagname`

Obtains the list of specified subnodes of a specified XML DOM object.

The stored procedure prototype of `db_xml.xml_dom_get_children_by_tagname` is as follows:

```
db_xml.xml_dom_get_children_by_tagname (
 docid IN RAW(13),
 name IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-96** `db_xml.xml_dom_get_children_by_tagname` parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| docid     | raw(13) | IN                     | No           | XML DOM object |

| Parameter | Type     | Input/Output Parameter | Can Be Empty | Description |
|-----------|----------|------------------------|--------------|-------------|
| name      | VARCHAR2 | IN                     | No           | String      |

- `dbexml.xml_dom_get_children_by_tagname_ns`

Obtains the list of subnodes in the specified namespace of a specified XML DOM object.

The stored procedure prototype of `dbexml.xml_dom_get_children_by_tagname_ns` is as follows:

```
dbexml.xml_dom_get_children_by_tagname_ns (
 docid IN RAW(13),
 name IN VARCHAR2,
 ns IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-97** `dbexml.xml_dom_get_children_by_tagname_ns` parameters

| Parameter | Type     | Input/Output Parameter | Can Be Empty | Description    |
|-----------|----------|------------------------|--------------|----------------|
| docid     | raw(13)  | IN                     | No           | XML DOM object |
| name      | VARCHAR2 | IN                     | No           | String         |
| ns        | VARCHAR2 | IN                     | Yes          | String         |

- `dbexml.xml_dom_get_document_element`

Returns the first subnode of the specified document.

The stored procedure prototype of `dbexml.xml_dom_get_document_element` is as follows:

```
dbexml.xml_dom_get_document_element(
 id RAW(13)
)
RETURNS RAW(13);
```

**Table 10-98** `dbexml.xml_dom_get_document_element` parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | No           | XML DOM object |

- `dbexml.xml_dom_get_first_child`

Returns the first subnode of a node.

The prototype of the `dbexml.xml_dom_get_first_child` function is as follows:

```

dbe_xml.xml_dom_get_first_child(
 id IN RAW(13)
)
RETURNS RAW(13);

```

**Table 10-99** dbexml.xml\_dom\_get\_first\_child parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | No           | XML DOM object |

- dbexml.xml\_dom\_get\_last\_child

Returns the last subnode of a node.

The prototype of the dbexml.xml\_dom\_get\_last\_child function is as follows:

```

dbe_xml.xml_dom_get_last_child(
 id IN RAW(13)
)
RETURNS RAW(13);

```

**Table 10-100** dbexml.xml\_dom\_get\_last\_child parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | No           | XML DOM object |

- dbexml.xml\_dom\_get\_length

Returns the number of nodes based on the content in the node of the specified type.

The stored procedure prototype of dbexml.xml\_dom\_get\_length is as follows:

```

dbe_xml.xml_dom_get_length(
 id RAW(13)
)
RETURNS VOID;

```

**Table 10-101** dbexml.xml\_dom\_get\_length parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | Yes          | XML DOM object |

- dbexml.xml\_dom\_get\_localname

Returns the local name of the given object.

The stored procedure prototype of `dbexml.xml_dom_get_localname` is as follows:

```
dbexml.xml_dom_get_localname (
 id RAW(13)
)
RETURNS VARCHAR2;
```

**Table 10-102** `dbexml.xml_dom_get_localname` parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | Yes          | XML DOM object |

- `dbexml.xml_dom_get_named_item`

Returns the node specified by name.

The prototype of the `dbexml.xml_dom_get_named_item` function is as follows:

```
dbexml.xml_dom_get_named_item(
 id IN RAW(13),
 nodeName IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-103** `dbexml.xml_dom_get_named_item` parameters

| Parameter | Type     | Input/Output Parameter | Can Be Empty | Description                         |
|-----------|----------|------------------------|--------------|-------------------------------------|
| id        | raw(13)  | IN                     | No           | XML DOM object                      |
| nodeName  | VARCHAR2 | IN                     | No           | Name of the element to be retrieved |

- `dbexml.xml_dom_get_named_item_ns`

Returns the node specified by name and namespace.

The prototype of the `dbexml.xml_dom_get_named_item_ns` function is as follows:

```
dbexml.xml_dom_get_named_item_ns(
 id RAW(13),
 nodeName IN VARCHAR2,
 ns IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-104** dbexml.xml\_dom\_get\_named\_item\_ns parameters

| Parameter | Type     | Input/Output Parameter | Can Be Empty | Description                         |
|-----------|----------|------------------------|--------------|-------------------------------------|
| id        | raw(13)  | IN                     | No           | XML DOM object                      |
| nodeName  | VARCHAR2 | IN                     | No           | Name of the element to be retrieved |
| ns        | VARCHAR2 | IN                     | Yes          | Namespace                           |

- dbexml.xml\_dom\_get\_next\_sibling

Returns the next node of the specified node.

The prototype of the dbexml.xml\_dom\_get\_next\_sibling function is as follows:

```
dbexml.xml_dom_get_next_sibling(
 id IN RAW(13)
)
RETURNS RAW(13);
```

**Table 10-105** dbexml.xml\_dom\_get\_next\_sibling parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | No           | XML DOM object |

- dbexml.xml\_dom\_get\_node\_name

Returns the name of a node.

The prototype of the dbexml.xml\_dom\_get\_node\_name function is as follows:

```
dbexml.xml_dom_get_node_name(
 id IN RAW(13)
)
RETURNS VARCHAR2;
```

**Table 10-106** dbexml.xml\_dom\_get\_node\_name parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | No           | XML DOM object |

- dbexml.xml\_dom\_get\_node\_type

Returns the type of a node.

The prototype of the `db_xml.xml_dom_get_node_type` function is as follows:

```
db_xml.xml_dom_get_node_type(
 id IN RAW(13)
)
RETURNS INTEGER;
```

**Table 10-107** `db_xml.xml_dom_get_node_type` parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | No           | XML DOM object |

- `db_xml.xml_dom_get_node_value`

Returns the value of a DOMNode node.

The stored procedure prototype of `db_xml.xml_dom_get_node_value` is as follows:

```
db_xml.xml_dom_get_node_value(
 id IN RAW(13))
RETURNS VARCHAR2;
```

**Table 10-108** `db_xml.xml_dom_get_node_value` parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | Yes          | XML DOM object |

- `db_xml.xml_dom_get_parent_node`

Returns the parent node of the given DOMNode node.

The stored procedure prototype of `db_xml.xml_dom_get_parent_node` is as follows:

```
db_xml.xml_dom_get_parent_node(
 id IN RAW(13))
RETURNS RAW(13);
```

**Table 10-109** `db_xml.xml_dom_get_parent_node` parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | Yes          | XML DOM object |

- `db_xml.xml_dom_get_tagname`

Obtains the tag name of a specified XML DOM object.

The stored procedure prototype of `dbexml.xml_dom_get_tagname` is as follows:

```
dbexml.xml_dom_get_tagname (
 docid RAW(13)
)
RETURNS VARCHAR2;
```

**Table 10-110** `dbexml.xml_dom_get_tagname` parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| docid     | raw(13) | IN                     | Yes          | XML DOM object |

- `dbexml.xml_dom_has_child_nodes`

Checks whether the DOMNode object has any subnode.

The stored procedure prototype of `dbexml.xml_dom_has_child_nodes` is as follows:

```
dbexml.xml_dom_has_child_nodes(
 id IN RAW(13))
RETURNS BOOLEAN
```

**Table 10-111** `dbexml.xml_dom_has_child_nodes` parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | Yes          | XML DOM object |

- `dbexml.xml_dom_import_node`

Copies a node to another node and mounts the copied node to a specified document. If the type of the copied node does not belong to the 12 types specified by constants of XML DOM, an exception indicating that the type is not supported is thrown.

The prototype of the `dbexml.xml_dom_import_node` function is as follows:

```
dbexml.xml_dom_import_node(
 doc_id IN RAW(13),
 node_id IN RAW(13),
 deep IN BOOLEAN
)
RETURNS RAW(13);
```

**Table 10-112** dbe\_xml.xml\_dom\_import\_node parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                       |
|-----------|---------|------------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| doc_id    | raw(13) | IN                     | No           | Document to which the node is mounted                                                                                                                                                                                                             |
| node_id   | raw(13) | IN                     | No           | Node to be imported                                                                                                                                                                                                                               |
| deep      | BOOLEAN | IN                     | No           | Specifies whether to perform recursive import. <ul style="list-style-type: none"> <li>• If the value is <b>TRUE</b>, the node and all its subnodes are imported.</li> <li>• If the value is <b>FALSE</b>, the node itself is imported.</li> </ul> |

- dbe\_xml.xml\_dom\_is\_null

Checks whether the given object is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned.

The prototype of the dbe\_xml.xml\_dom\_is\_null function is as follows:

```
db_e_xml.xml_dom_is_null (
 id RAW(13)
)
RETURNS boolean;
```

**Table 10-113** dbe\_xml.xml\_dom\_is\_null parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | Yes          | XML DOM object |

- dbe\_xml.xml\_dom\_item

Returns the element corresponding to the index in a list or map based on the index.

The prototype of the db\_e\_xml.xml\_dom\_item function is as follows:

```
db_e_xml.xml_dom_item (
 id IN RAW(13),
 index IN INTEGER
)
RETURNS RAW(13);
```

**Table 10-114** dbexml.xml\_dom\_item parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                          |
|-----------|---------|------------------------|--------------|--------------------------------------|
| id        | raw(13) | IN                     | No           | XML DOM object                       |
| index     | INTEGER | IN                     | No           | Index of the element to be retrieved |

- dbexml.xml\_dom\_make\_element

Returns the DOMELEMENT object after conversion.

The stored procedure prototype of dbexml.xml\_dom\_make\_element is as follows:

```
dbexml.xml_dom_make_element(
id IN RAW(13))
RETURNS RAW(13)
```

**Table 10-115** dbexml.xml\_dom\_make\_element parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | No           | XML DOM object |

- dbexml.xml\_dom\_makenode

Converts the given object to the DOMNODE type.

The stored procedure prototype of dbexml.xml\_dom\_makenode is as follows:

```
dbexml.xml_dom_makenode(
id RAW(13)
)
RETURNS DOMNODE;
```

**Table 10-116** dbexml.xml\_dom\_makenode parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | Yes          | XML DOM object |

- dbexml.xml\_dom\_new\_dom\_document\_empty

Returns a new DOMDOCUMENT object.

The prototype of the dbexml.xml\_dom\_new\_dom\_document\_empty function is as follows:

```

dbe_xml.xml_dom_new_dom_document_empty()
RETURNS RAW(13);

```

- **xml\_dom\_new\_dom\_document\_clob**

Returns a new DOMDocument instance object created from the specified CLOB type.

The prototype of the `xml_dom_new_dom_document_clob` function is as follows:

```

dbe_xml.xml_dom_new_dom_document_clob(
 content IN clob
)
RETURNS RAW(13);

```

**Table 10-117** `xml_dom_new_dom_document_clob` parameters

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description         |
|-----------|------|------------------------|--------------|---------------------|
| content   | clob | IN                     | No           | Specified CLOB type |

- **dbe\_xml.xml\_dom\_new\_document\_xmltype**

Returns a new DOMDocument instance object created from the specified XMLType type.

The prototype of the `dbe_xml.xml_dom_new_document_xmltype` function is as follows:

```

dbe_xml.xml_dom_new_document_xmltype(
 content IN clob
)
RETURNS RAW(13);

```

**Table 10-118** `dbe_xml.xml_dom_new_document_xmltype` parameters

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description         |
|-----------|------|------------------------|--------------|---------------------|
| content   | clob | IN                     | No           | Specified CLOB type |

- **dbe\_xml.xml\_dom\_set\_attribute**

Sets the attributes of a specified XML DOM object.

The stored procedure prototype of `dbe_xml.xml_dom_set_attribute` is as follows:

```

dbe_xml.xml_dom_set_attribute(
 docid IN RAW(13),
 name IN VARCHAR2,
 value IN VARCHAR2
)
RETURNS void;

```

**Table 10-119** dbexml.xml\_dom\_set\_attribute parameters

| Parameter | Type     | Input/Output Parameter | Can Be Empty | Description    |
|-----------|----------|------------------------|--------------|----------------|
| id        | raw(13)  | IN                     | No           | XML DOM object |
| name      | VARCHAR2 | IN                     | No           | String         |
| value     | VARCHAR2 | IN                     | No           | String         |

- dbexml.xml\_dom\_set\_charset

Sets the character set for a DOMDocument object.

The prototype of the dbexml.xml\_dom\_set\_charset function is as follows:

```
dbexml.xml_dom_set_charset(
 id IN RAW(13),
 charset IN VARCHAR2
)
RETURNS void;
```

**Table 10-120** dbexml.xml\_dom\_set\_charset parameters

| Parameter | Type     | Input/Output Parameter | Can Be Empty | Description    |
|-----------|----------|------------------------|--------------|----------------|
| id        | raw(13)  | IN                     | No           | XML DOM object |
| charset   | VARCHAR2 | IN                     | No           | Character set  |

- dbexml.xml\_dom\_set\_doctype

Sets the external DTD of a DOMDocument object.

The prototype of the dbexml.xml\_dom\_set\_doctype function is as follows:

```
dbexml.xml_dom_set_doctype(
 id IN RAW(13),
 dtd_name IN VARCHAR2,
 system_id IN VARCHAR2,
 public_id IN VARCHAR2
)
RETURNS void;
```

**Table 10-121** dbexml.xml\_dom\_set\_doctype parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | No           | XML DOM object |

| Parameter | Type     | Input/Output Parameter | Can Be Empty | Description                                            |
|-----------|----------|------------------------|--------------|--------------------------------------------------------|
| dtd_name  | VARCHAR2 | IN                     | No           | Name of the DOCType to be initialized                  |
| system_id | VARCHAR2 | IN                     | No           | ID of the system whose DOCType needs to be initialized |
| public_id | VARCHAR2 | IN                     | No           | Public ID of the DOCType to be initialized             |

- `dbe_xml.xml_dom_set_node_value`

Sets the value of a node in the DOMNode object.

The stored procedure prototype of `dbe_xml.xml_dom_set_node_value` is as follows:

```
dbe_xml.xml_dom_set_node_value(
id IN RAW(13),
node_value IN VARCHAR2)
RETURNS VOID
```

**Table 10-122** `dbe_xml.xml_dom_set_node_value` parameters

| Parameter  | Type     | Input/Output Parameter | Can Be Empty | Description                            |
|------------|----------|------------------------|--------------|----------------------------------------|
| id         | raw(13)  | IN                     | No           | XML DOM object                         |
| node_value | VARCHAR2 | IN                     | No           | String to be set in the DOMNode object |

- `dbe_xml.xml_dom_write_to_buffer_doc`

Writes the given DOMDocument object to the buffer.

The stored procedure prototype of `dbe_xml.xml_dom_write_to_buffer_doc` is as follows:

```
dbe_xml.dbe_xml.xml_dom_write_to_buffer_doc(
id IN RAW(13))
RETURNS VARCHAR2;
```

**Table 10-123** dbexml.xml\_dom\_write\_to\_buffer\_doc parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | Yes          | XML DOM object |

- dbexml.xml\_dom\_write\_to\_buffer\_node

Writes the given DOMNode object to the buffer.

The stored procedure prototype of dbexml.xml\_dom\_write\_to\_buffer\_node is as follows:

```
dbexml.dbexml.xml_dom_write_to_buffer_node(
 id IN RAW(13))
RETURNS VARCHAR2;
```

**Table 10-124** dbexml.xml\_dom\_write\_to\_buffer\_node parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | Yes          | XML DOM object |

- dbexml.xml\_dom\_write\_to\_clob\_doc

Writes the given DOMDocument object to a CLOB.

The stored procedure prototype of dbexml.xml\_dom\_write\_to\_clob\_doc is as follows:

```
dbexml.xml_dom_write_to_clob_doc(
 id IN RAW(13)
)
RETURNS VARCHAR2;
```

**Table 10-125** dbexml.xml\_dom\_write\_to\_clob\_doc parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | Yes          | XML DOM object |

- dbexml.xml\_dom\_write\_to\_clob\_node

Writes the given DOMNode object to a CLOB.

The stored procedure prototype of dbexml.xml\_dom\_write\_to\_clob\_node is as follows:

```
dbexml.xml_dom_write_to_clob_node(
 id IN RAW(13)
)
RETURNS clob;
```

**Table 10-126** dbexml.xml\_dom\_write\_to\_clob\_node parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | Yes          | XML DOM object |

- dbexml.xml\_dom\_write\_to\_file\_doc

Writes an XML node to a specified file using the database character set.

The stored procedure prototype of dbexml.xml\_dom\_write\_to\_file\_doc is as follows:

```
dbexml.xml_dom_write_to_file_doc(
id IN RAW(13),
file_dir IN VARCHAR2)
RETURNS void

dbexml.xml_dom_write_to_file_doc(
id IN RAW(13),
file_dir IN VARCHAR2,
charset IN VARCHAR2)
RETURNS void PACKAGE
```

**Table 10-127** dbexml.xml\_dom\_write\_to\_file\_doc parameters

| Parameter | Type     | Input/Output Parameter | Can Be Empty | Description             |
|-----------|----------|------------------------|--------------|-------------------------|
| id        | raw(13)  | IN                     | Yes          | XML DOM object          |
| file_dir  | VARCHAR2 | IN                     | No           | File to be written      |
| charset   | VARCHAR2 | IN                     | No           | Specified character set |

- dbexml.xml\_dom\_write\_to\_file\_node

Writes an XML node to a specified file using the database character set.

The stored procedure prototype of dbexml.xml\_dom\_write\_to\_file\_node is as follows:

```
dbexml.xml_dom_write_to_file_node(
id IN RAW(13),
filename IN VARCHAR2)
RETURNS void
```

**Table 10-128** dbexml.xml\_dom\_write\_to\_file\_node parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | No           | XML DOM object |

| Parameter | Type     | Input/Output Parameter | Can Be Empty | Description            |
|-----------|----------|------------------------|--------------|------------------------|
| filename  | VARCHAR2 | IN                     | No           | Specified file address |

- dbexml.xml\_dom\_get\_session\_tree\_num**  
Queries the number of DOM trees of all types in the current session.  
The prototype of the `dbexml.xml_dom_get_session_tree_num` function is as follows:

```
dbexml.xml_dom_get_session_tree_num()
RETURNS INTEGER
```
- dbexml.xml\_dom\_get\_doc\_trees\_info**  
Queries the DOM tree information of the document type in the current session, such as the memory usage.  
The prototype of the `dbexml.xml_dom_get_doc_trees_info` function is as follows:

```
dbexml.xml_dom_get_doc_trees_info()
RETURNS VARCHAR2
```
- dbexml.xml\_dom\_get\_detail\_doc\_tree\_info**  
Queries the number of subnodes of each type in the transferred document.  
The prototype of the `dbexml.xml_dom_get_detail_doc_tree_info` function is as follows:

```
dbexml.xml_dom_get_detail_doc_tree_info(
id IN RAW(13))
RETURNS VARCHAR2
```

**Table 10-129** `dbexml.xml_dom_get_detail_doc_tree_info` parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description    |
|-----------|---------|------------------------|--------------|----------------|
| id        | raw(13) | IN                     | No           | XML DOM object |

## 10.12.2 Secondary Encapsulation Interfaces (Recommended)

### 10.12.2.1 DBE\_LOB

#### Interface Description

**Table 10-130** lists all interfaces supported by the DBE\_LOB package.

 NOTE

- In database A, the byte content of the space is 00. However, in GaussDB, the byte content corresponding to the space is ASCII code 32.
- In a distributed environment, the maximum size of a CLOB, BLOB, and BFILE is 1 GB.

**Table 10-130** DBE\_LOB

| Interface                                | Description                                                                                                            |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DBE_LOB.GET_LENGTH</a>       | Obtains and returns the length of a specified LOB. The object cannot be greater than 2 GB.                             |
| <a href="#">DBE_LOB.LOB_GET_LENGTH</a>   | Obtains and returns the length of a specified LOB or BFILE object.                                                     |
| <a href="#">DBE_LOB.OPEN</a>             | Opens a LOB and returns a LOB descriptor.                                                                              |
| <a href="#">DBE_LOB.READ</a>             | Loads a part of LOB content to the buffer based on the specified length and initial position offset.                   |
| <a href="#">DBE_LOB.LOB_READ</a>         | Reads a part of LOB (including BFILE) content to the buffer based on the specified length and initial position offset. |
| <a href="#">DBE_LOB.WRITE</a>            | Copies content in the buffer to a LOB based on the specified length and initial position offset.                       |
| <a href="#">DBE_LOB.WRITE_APPEND</a>     | Copies content in the buffer to the end part of a LOB based on the specified length.                                   |
| <a href="#">DBE_LOB.LOB_WRITE_APPEND</a> | Copies content in the buffer to the end part of a LOB based on the specified length.                                   |
| <a href="#">DBE_LOB.COPY</a>             | Copies content in a LOB to another LOB based on the specified length and initial position offset.                      |
| <a href="#">DBE_LOB.LOB_COPY</a>         | Copies content in a LOB to another LOB based on the specified length and initial position offset.                      |
| <a href="#">DBE_LOB.ERASE</a>            | Deletes content in a LOB (smaller than or equal to 1 GB) based on the specified length and initial position offset.    |
| <a href="#">DBE_LOB.LOB_ERASE</a>        | Deletes content in a LOB based on the specified length and initial position offset.                                    |
| <a href="#">DBE_LOB.CLOSE</a>            | Closes a LOB descriptor.                                                                                               |
| <a href="#">DBE_LOB.MATCH</a>            | Returns the position of the <i>M</i> th occurrence of a character string in a LOB.                                     |
| <a href="#">DBE_LOB.COMPARE</a>          | Compares two LOBs (including BFILE objects) or a certain part of two LOBs.                                             |
| <a href="#">DBE_LOB.SUBSTR</a>           | Reads a LOB substring and returns the read substring.                                                                  |
| <a href="#">DBE_LOB.LOB_SUBSTR</a>       | Reads a LOB substring and returns the read substring.                                                                  |

| Interface                                  | Description                                                                                                                                                    |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DBE_LOB.STRIP</a>              | Truncates the LOB of a specified length. After the execution is complete, the length of the LOB is set to the length specified by the <b>newlen</b> parameter. |
| <a href="#">DBE_LOB.LOB_STRIP</a>          | Truncates the LOB of a specified length. After the execution is complete, the length of the LOB is set to the length specified by the <b>newlen</b> parameter. |
| <a href="#">DBE_LOB.CREATE_TEMPORARY</a>   | Creates a temporary BLOB or CLOB.                                                                                                                              |
| <a href="#">DBE_LOB.APPEND</a>             | Adds the content of a LOB to another LOB.                                                                                                                      |
| <a href="#">DBE_LOB.LOB_APPEND</a>         | Adds the content of a LOB to another LOB.                                                                                                                      |
| <a href="#">DBE_LOB.FREETEMPORARY</a>      | Deletes a temporary BLOB or CLOB.                                                                                                                              |
| <a href="#">DBE_LOB.FILEOPEN</a>           | Opens a database BFILE file and returns its file descriptor.                                                                                                   |
| <a href="#">DBE_LOB.FILECLOSE</a>          | Closes a BFILE file that is opened by <b>FILEOPEN</b> .                                                                                                        |
| <a href="#">DBE_LOB.BFILEOPEN</a>          | Opens a database BFILE file.                                                                                                                                   |
| <a href="#">DBE_LOB.BFILECLOSE</a>         | Closes a BFILE file that is opened by <b>BFILEOPEN</b> .                                                                                                       |
| <a href="#">DBE_LOB.LOADFROMFILE</a>       | Loads the database BFILE file of the specified length in the specified location to the BLOB in the specified location.                                         |
| <a href="#">DBE_LOB.LOADFROMBFILE</a>      | Loads the database BFILE file of the specified length in the specified location to the LOB in the specified location.                                          |
| <a href="#">DBE_LOB.LOADBLOBFROMFILE</a>   | Loads an external database file of the specified length in the specified location to a BLOB (smaller than or equal to 1 GB) in a specified location.           |
| <a href="#">DBE_LOB.LOADBLOBFROMFIL...</a> | Loads the database BFILE file of the specified length in the specified location to the BLOB in the specified location.                                         |
| <a href="#">DBE_LOB.LOADCLOBFROMFILE</a>   | Loads an external database file of the specified length in the specified location to a CLOB (smaller than or equal to 1 GB) in a specified location.           |
| <a href="#">DBE_LOB.LOADCLOBFROMFIL...</a> | Loads the database BFILE file of the specified length in the specified location to the CLOB in the specified location.                                         |
| <a href="#">DBE_LOB.CONVERTTOBLOB</a>      | Converts a CLOB file to a BLOB file (smaller than or equal to 1 GB).                                                                                           |
| <a href="#">DBE_LOB.CONVERTTOCLOB</a>      | Converts a BLOB file to a CLOB file (smaller than or equal to 1 GB).                                                                                           |

| Interface                                    | Description                                                                                                                                                                                                 |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DBE_LOB.LOB_CONVERTTOBLOB...</a> | Converts a CLOB file to a BLOB file.                                                                                                                                                                        |
| <a href="#">DBE_LOB.LOB_CONVERTTOCLOB...</a> | Converts a BLOB file to a CLOB file.                                                                                                                                                                        |
| <a href="#">DBE_LOB.GETCHUNKSIZE</a>         | Obtains the maximum size of LOB data that can be stored in the chunk structure in the database.                                                                                                             |
| <a href="#">DBE_LOB.LOB_WRITE</a>            | Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB. |
| <a href="#">DBE_LOB.BFILENAME</a>            | Constructs and returns the DBE_LOB.BFILE object based on the directory and file name.                                                                                                                       |

- [DBE\\_LOB.GET\\_LENGTH](#)

Obtains and returns the size of a specified LOB. The maximum size of the object is 2 GB.

The prototype of the DBE\_LOB.GET\_LENGTH function is as follows:

```
DBE_LOB.GET_LENGTH (
 blob_obj IN BLOB)
RETURN INTEGER;

DBE_LOB.GET_LENGTH (
 clob_obj IN CLOB)
RETURN INTEGER;
```

**Table 10-131** DBE\_LOB.GET\_LENGTH parameters

| Parameter             | Description                              |
|-----------------------|------------------------------------------|
| blob_obj/<br>clob_obj | BLOB/CLOB whose length is to be obtained |

- [DBE\\_LOB.LOB\\_GET\\_LENGTH](#)

Obtains and returns the length of a specified LOB or BFILE file. The maximum size of the object is 32 TB.

The prototype of the DBE\_LOB.LOB\_GET\_LENGTH function is as follows:

```
DBE_LOB.LOB_GET_LENGTH (
 blob_obj IN BLOB)
RETURN BIGINT;

DBE_LOB.LOB_GET_LENGTH (
 clob_obj IN CLOB)
RETURN BIGINT;

DBE_LOB.LOB_GET_LENGTH (
 bfile IN DBE_LOB.BFILE)
RETURN BIGINT;
```

**Table 10-132** DBE\_LOB.LOB\_GET\_LENGTH parameters

| Parameter                   | Description                                    |
|-----------------------------|------------------------------------------------|
| blob_obj/<br>clob_obj/bfile | BLOB/CLOB/BFILE whose length is to be obtained |

- DBE\_LOB.OPEN

Opens a LOB and returns a LOB descriptor. This procedure is meaningless and is used only for compatibility.

The prototype of the DBE\_LOB.OPEN function is as follows:

```
DBE_LOB.OPEN (
 lob INOUT BLOB);

DBE_LOB.OPEN (
 lob INOUT CLOB);

DBE_LOB.OPEN (
 bfile INOUT DBE_LOB.BFILE,
 open_mode IN TEXT DEFAULT 'null');
```

**Table 10-133** DBE\_LOB.OPEN parameters

| Parameter | Description                 |
|-----------|-----------------------------|
| lob/bfile | Opened BLOB, CLOB or BFILE. |

- DBE\_LOB.READ

Reads a part of LOB content to the output buffer based on the specified length and initial position offset.

The prototype of the DBE\_LOB.READ function is as follows:

```
DBE_LOB.READ (
 blob_obj IN BLOB,
 amount IN INTEGER,
 off_set IN INTEGER,
 out_put OUT RAW);

DBE_LOB.READ (
 clob_obj IN CLOB,
 amount IN INTEGER,
 off_set IN INTEGER,
 out_put OUT VARCHAR2);
```

**Table 10-134** DBE\_LOB.READ parameters

| Parameter             | Description                                                                                                                                                                                                                 |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| blob_obj/<br>clob_obj | BLOB/CLOB to be read                                                                                                                                                                                                        |
| amount                | Load data length                                                                                                                                                                                                            |
| off_set               | Start position for reading the LOB content, that is, the offset bytes to initial position of the LOB content. If the offset is less than 1 or greater than the LOB length, an error is reported. The initial position is 1. |

| Parameter | Description                                    |
|-----------|------------------------------------------------|
| out_put   | Target buffer for storing the read LOB content |

- DBE\_LOB.LOB\_READ

Reads a part of LOB/BFILE content to the output buffer based on the specified length and initial position offset.

The prototype of the DBE\_LOB.LOB\_READ function is as follows:

```
DBE_LOB.LOB_READ(
 blob_obj IN BLOB,
 amount INOUT BIGINT,
 off_set IN BIGINT,
 out_put OUT RAW);

DBE_LOB.LOB_READ(
 clob_obj IN CLOB,
 amount INOUT BIGINT,
 off_set IN BIGINT,
 out_put OUT VARCHAR2);

DBE_LOB.LOB_READ(
 bfile IN DBE_LOB.BFILE,
 amount INOUT BIGINT,
 off_set IN BIGINT,
 out_put OUT RAW);
```

**Table 10-135** DBE\_LOB.LOB\_READ parameters

| Parameter                   | Description                                                                                                                                                                                                                 |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| blob_obj/<br>clob_obj/bfile | BLOB/CLOB/BFILE object (can be greater than 1 GB) to be read                                                                                                                                                                |
| amount                      | Length to read as the IN parameter, or actual read length as the OUT parameter.<br><b>NOTE</b><br>If the length to read is less than or equal to 0 or exceeds 32767, an error is reported.                                  |
| off_set                     | Start position for reading the LOB content, that is, the offset bytes to initial position of the LOB content. If the offset is less than 1 or greater than the LOB length, an error is reported. The initial position is 1. |
| out_put                     | Target buffer for storing the read LOB content                                                                                                                                                                              |

- DBE\_LOB.WRITE

Writes content in the source to a LOB based on the specified length and initial position.

The prototype of the DBE\_LOB.WRITE function is as follows:

```
DBE_LOB.WRITE (
 blob_obj INOUT BLOB,
 amount IN INTEGER,
 off_set IN INTEGER,
 source IN RAW);

DBE_LOB.WRITE (
```

```
clob_obj INOUT CLOB,
amount IN INTEGER,
off_set IN INTEGER,
source IN VARCHAR2);
```

**Table 10-136** DBE\_LOB.WRITE parameters

| Parameter             | Description                                                                                                                                                                                                                                                                                                                           |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| blob_obj/<br>clob_obj | BLOB/CLOB to which the buffer content is written                                                                                                                                                                                                                                                                                      |
| amount                | Length to write, up to 32767 characters.<br><b>NOTE</b><br>If the length to write is less than 1 or greater than the length of the content to be written, an error is reported.                                                                                                                                                       |
| off_set               | Start position for writing content to the target LOB, that is, the offset bytes to the initial position of LOB content.<br><b>NOTE</b><br>If the offset is less than 1 or greater than the value of <b>LOBMAXSIZE</b> , an error is reported. The initial position is 1, and the maximum value is the maximum length of the LOB type. |
| source                | Content to be written                                                                                                                                                                                                                                                                                                                 |

- DBE\_LOB.WRITE\_APPEND

Writes content in the source object to the end part of a LOB based on the specified length.

The prototype of the DBE\_LOB.WRITE\_APPEND function is as follows:

```
DBE_LOB.WRITE_APPEND (
blob_obj INOUT BLOB,
amount IN INTEGER,
source_obj IN RAW);

DBE_LOB.WRITE_APPEND (
clob_obj INOUT CLOB,
amount IN INTEGER,
source_obj IN VARCHAR2);
```

**Table 10-137** DBE\_LOB.WRITE\_APPEND parameters

| Parameter             | Description                                      |
|-----------------------|--------------------------------------------------|
| blob_obj/<br>clob_obj | BLOB/CLOB to which the buffer content is written |
| amount                | Length to write, up to 32767 characters.         |
| source_obj            | Content to be written                            |

- DBE\_LOB.LOB\_WRITE\_APPEND

Writes content in the source object to the end part of a LOB based on the specified length.

The prototype of the DBE\_LOB.LOB\_WRITE\_APPEND function is as follows:

```
DBE_LOB.LOB_WRITE_APPEND(
blob_obj INOUT BLOB,
```

```
amount IN INTEGER,
source_obj IN RAW);

DBE_LOB.LOB_WRITE_APPEND (
 clob_obj INOUT CLOB,
 amount IN INTEGER,
 source_obj IN VARCHAR2);
```

**Table 10-138** DBE\_LOB.LOB\_WRITE\_APPEND parameters

| Parameter             | Description                                                                                                                                                                     |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| blob_obj/<br>clob_obj | BLOB/CLOB to which the buffer content is written                                                                                                                                |
| amount                | Length to write, up to 32767 characters.<br><b>NOTE</b><br>If the length to write is less than 1 or greater than the length of the content to be written, an error is reported. |
| source_obj            | Content to be written                                                                                                                                                           |

- DBE\_LOB.COPY

Copies content in a LOB to another LOB based on the specified length and initial position offset.

The prototype of the DBE\_LOB.COPY function is as follows:

```
DBE_LOB.COPY (
 dest_lob INOUT BLOB,
 src_lob IN BLOB,
 len IN INTEGER,
 dest_start IN INTEGER DEFAULT 1,
 src_start IN INTEGER DEFAULT 1);
```

**Table 10-139** DBE\_LOB.COPY parameters

| Parameter  | Description                                                                                                                                             |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_lob   | LOB to which the buffer content is to be pasted                                                                                                         |
| src_lob    | LOB from which the buffer content is to be copied                                                                                                       |
| len        | Length to copy                                                                                                                                          |
| dest_start | Start position for pasting the buffer content to the target LOB ( <b>dest_lob</b> ), that is, the offset bytes to the initial position of LOB content.  |
| src_start  | Start position for copying the buffer content from the source LOB ( <b>src_lob</b> ), that is, the offset bytes to the initial position of LOB content. |

- DBE\_LOB.LOB\_COPY

Copies content in a LOB to another LOB based on the specified length and initial position offset.

The prototype of the DBE\_LOB.LOB\_COPY function is as follows:

```
DBE_LOB.LOB_COPY(
 blob_obj INOUT BLOB,
```

```

source_obj IN BLOB,
amount IN BIGINT,
dest_offset IN BIGINT DEFAULT 1,
src_offset IN BIGINT DEFAULT 1);

DBE_LOB.LOB_COPY(
clob_obj INOUT CLOB,
source_obj IN CLOB,
amount IN BIGINT,
dest_offset IN BIGINT DEFAULT 1,
src_offset IN BIGINT DEFAULT 1);

```

**Table 10-140** DBE\_LOB.LOB\_COPY parameters

| Parameter             | Description                                                                                                                                                                                                                                                         |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| blob_obj/<br>clob_obj | LOB to which the buffer content is to be pasted                                                                                                                                                                                                                     |
| source_obj            | LOB from which the buffer content is to be copied                                                                                                                                                                                                                   |
| amount                | Length of the copied data<br><b>NOTE</b><br>If the length to copy is less than 1 or greater than the value of <b>LOBMAXSIZE</b> , an error is reported.                                                                                                             |
| dest_offset           | Start position for pasting the buffer content to the target LOB, that is, the offset bytes/characters to the initial position of LOB content.<br><b>NOTE</b><br>If the offset is less than 1 or greater than the value of <b>LOBMAXSIZE</b> , an error is reported. |
| src_offset            | Start position for copying the content from the source object, that is, the offset bytes to the initial position of LOB content.<br><b>NOTE</b><br>If the offset is less than 1, an error is reported.                                                              |

- DBE\_LOB.ERASE

Deletes the content in a BLOB based on the specified length and initial position offset. The bytes of the deleted part in the BLOB are filled with 0.

The prototype of the DBE\_LOB.ERASE function is as follows:

```

DBE_LOB.ERASE (
blob_obj INOUT BLOB,
amount INOUT INTEGER,
off_set IN INTEGER DEFAULT 1);

```

**Table 10-141** DBE\_LOB.ERASE parameters

| Parameter | Description                                                                                                                                                                |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| blob_obj  | LOB whose content is to be deleted as the IN parameter, or LOB with specified content deleted as the OUT parameter. If this parameter is left empty, an error is reported. |

| Parameter | Description                                                                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| amount    | Length (in bytes for BLOBs) to delete as the IN parameter, or actual length deleted as the OUT parameter.<br><b>NOTE</b><br>If the length to delete is less than 1 or this parameter is left empty, an error is reported.                 |
| off_set   | Start position from which LOB content is to be deleted, that is, the number of offset bytes to the initial position of LOB content.<br><b>NOTE</b><br>If the offset is less than 1 or this parameter is left empty, an error is reported. |

- DBE\_LOB.LOB\_ERASE

Deletes the content in the LOB based on the specified length and initial position offset. The bytes of the deleted part in the BLOB are filled with 0, and the characters of the deleted part in the CLOB are filled with spaces. The LOB can be greater than 1 GB and the maximum size is 32 TB.

The prototype of the DBE\_LOB.LOB\_ERASE function is as follows:

```
DBE_LOB.LOB_ERASE (
 blob_obj INOUT BLOB,
 amount INOUT BIGINT,
 off_set IN BIGINT DEFAULT 1);
```

```
DBE_LOB.LOB_ERASE (
 clob_obj INOUT CLOB,
 amount INOUT BIGINT,
 off_set IN BIGINT DEFAULT 1);
```

**Table 10-142** DBE\_LOB.LOB\_ERASE parameters

| Parameter             | Description                                                                                                                                                                                                                                                                                                                       |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| blob_obj/<br>clob_obj | LOB whose content is to be deleted as the IN parameter, or LOB with specified content deleted as the OUT parameter. If this parameter is left empty, an error is reported.                                                                                                                                                        |
| amount                | Length (BLOB in bytes and CLOB in characters) to delete as the IN parameter, or actual length deleted as the OUT parameter.<br><b>NOTE</b><br>If the length to delete is less than 1 or this parameter is left empty, an error is reported.                                                                                       |
| off_set               | Start position from which the LOB content is to be deleted, that is, the number of bytes relative to the start position of the BLOB content or the number of characters relative to the start position of the CLOB content.<br><b>NOTE</b><br>If the offset is less than 1 or this parameter is left empty, an error is reported. |

- DBE\_LOB.CLOSE

Closes the LOB descriptor that has been opened.

The prototype of the DBE\_LOB.CLOSE function is as follows:

```
DBE_LOB.CLOSE(
 lob IN BLOB);

DBE_LOB.CLOSE (
 lob IN CLOB);

DBE_LOB.CLOSE (
 file IN INTEGER);
```

**Table 10-143** DBE\_LOB.CLOSE parameters

| Parameter | Description                                                |
|-----------|------------------------------------------------------------|
| lob/file  | BLOB/CLOB/File object whose LOB descriptor is to be closed |

- DBE\_LOB.MATCH

Returns the *M*th occurrence position of *pattern* in a LOB or BFILE file. **NULL** is returned for any of the following conditions: The LOB or BFILE file can be greater than 1 GB, up to 32 TB.

The prototype of the DBE\_LOB.MATCH function is as follows:

```
DBE_LOB.MATCH(
 blob_obj IN BLOB,
 blob_obj2 IN RAW,
 beg_index IN BIGINT DEFAULT 1,
 occur_index IN BIGINT DEFAULT 1)
RETURN BIGINT;

DBE_LOB.MATCH(
 clob_obj IN CLOB,
 clob_obj2 IN VARCHAR2,
 beg_index IN BIGINT DEFAULT 1,
 occur_index IN BIGINT DEFAULT 1)
RETURN BIGINT;

DBE_LOB.MATCH(
 bfile IN DBE_LOB.BFILE,
 blob_obj2 IN RAW,
 beg_index IN BIGINT DEFAULT 1,
 occur_index IN BIGINT DEFAULT 1)
RETURN BIGINT;
```

**Table 10-144** DBE\_LOB.MATCH parameters

| Parameter                       | Description                                                                                                                                                       |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| blob_obj/<br>clob_obj/<br>bfile | BLOB/CLOB descriptor to be searched for, or BFILE (which must be opened using <b>DBE_LOB.BFILEOPEN</b> first). If this parameter is left blank, null is returned. |
| blob_obj<br>2/<br>clob_obj2     | Pattern to match. It is RAW for BLOB/BFILE objects and VARCHAR2 for CLOBs. If this parameter is left empty, null is returned.                                     |

| Parameter   | Description                                                                                                                                                                                                                                                                                    |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| beg_index   | Absolute offset (in bytes) for BLOB/BFILE objects, or offset (in characters) for CLOBs. The start position for matching is 1.<br><b>NOTE</b><br>The value ranges from 1 to <i>LOBMAXSIZE</i> . If a value out of the range is input, null is returned.                                         |
| occur_index | Number of pattern matching times. The minimum value is 1.<br><b>NOTE</b><br>If the value is greater than the maximum number of times that the pattern string can be matched in the LOB, <b>0</b> is returned. If the value is out of the range from 1 to <i>LOBMAXSIZE</i> , null is returned. |

- DBE\_LOB.COMPARE

Compares LOBs or BFILE objects.

- If the compared objects are equal, **0** is returned. Otherwise, a non-zero value is returned.
- If the first LOB is smaller than the second, **-1** is returned. If the first LOB is larger than the second, **1** is returned.
- If any of the *len*, *start1*, and *start2* parameters is invalid, **NULL** is returned. The valid offset range is 1 to *LOBMAXSIZE*.
- If both the values of **start\_pos1** and **start\_pos2** exceed the LOB/BFILE length, **0** is returned.

The prototype of the DBE\_LOB.COMPARE function is as follows:

```
DBE_LOB.COMPARE (
 lob1 IN BLOB,
 lob2 IN BLOB,
 len IN BIGINT DEFAULT 1073741312,
 start_pos1 IN BIGINT DEFAULT 1,
 start_pos2 IN BIGINT DEFAULT 1)
RETURN INTEGER;

DBE_LOB.COMPARE (
 lob1 IN CLOB,
 lob2 IN CLOB,
 len IN BIGINT DEFAULT 1073741312,
 start_pos1 IN BIGINT DEFAULT 1,
 start_pos2 IN BIGINT DEFAULT 1)
RETURN INTEGER;

DBE_LOB.COMPARE (
 file1 IN DBE_LOB.BFILE,
 file2 IN DBE_LOB.BFILE,
 len IN BIGINT DEFAULT 1073741312,
 start_pos1 IN BIGINT DEFAULT 1,
 start_pos2 IN BIGINT DEFAULT 1)
RETURN INTEGER;
```

**Table 10-145** DBE\_LOB.COMPARE parameters

| Parameter  | Description                                                                                       |
|------------|---------------------------------------------------------------------------------------------------|
| lob1/file1 | First BLOB/CLOB/BFILE to be compared (which must be opened using <b>DBE_LOB.BFILEOPEN</b> first). |

| Parameter  | Description                                                                                                                     |
|------------|---------------------------------------------------------------------------------------------------------------------------------|
| lob2/file2 | Second BLOB/CLOB/BFILE to be compared (which must be opened using <b>DBE_LOB.BFILEOPEN</b> first).                              |
| len        | Number of characters or bytes to be compared. The default value is <b>1073741312</b> .                                          |
| start_pos1 | Offset of the first LOB descriptor. The initial position is 1, and the maximum value is the maximum length of the LOB content.  |
| start_pos2 | Offset of the second LOB descriptor. The initial position is 1, and the maximum value is the maximum length of the LOB content. |

- **DBE\_LOB.SUBSTR**

Reads a LOB or BFILE substring and returns the read substring.

The prototype of the DBE\_LOB.SUBSTR function is as follows:

```
DBE_LOB.SUBSTR(
 lob_loc IN BLOB,
 amount IN INTEGER DEFAULT 32767,
 off_set IN INTEGER DEFAULT 1)
RETURN RAW;

DBE_LOB.SUBSTR(
 lob_loc IN CLOB,
 amount IN INTEGER DEFAULT 32767,
 off_set IN INTEGER DEFAULT 1)
RETURN VARCHAR2;
```

**Table 10-146** DBE\_LOB.SUBSTR parameters

| Parameter | Description                                                                                                                                                      |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lob_loc   | LOB descriptor or BFILE file whose substring is to be read. For BLOBs, the return value is of the RAW type. For CLOBs, the return value is of the VARCHAR2 type. |
| amount    | Number of bytes or characters to be read.                                                                                                                        |
| off_set   | Number of characters or bytes offset from the start position.                                                                                                    |

- **DBE\_LOB.LOB\_SUBSTR**

Reads a LOB or BFILE substring and returns the read substring. The LOB or BFILE file can be greater than 1 GB, up to 32 TB.

The prototype of the DBE\_LOB.LOB\_SUBSTR function is as follows:

```
DBE_LOB.LOB_SUBSTR(
 lob_loc IN BLOB,
 amount IN INTEGER DEFAULT 32767,
 off_set IN BIGINT DEFAULT 1)
RETURN RAW;

DBE_LOB.LOB_SUBSTR(
 lob_loc IN CLOB,
 amount IN INTEGER DEFAULT 32767,
 off_set IN BIGINT DEFAULT 1)
```

```
RETURN VARCHAR2;

DBE_LOB.LOB_SUBSTR(
 bfile IN DBE_LOB.BFILE,
 amount IN INTEGER DEFAULT 32767,
 off_set IN BIGINT DEFAULT 1)
RETURN RAW;
```

**Table 10-147** DBE\_LOB.LOB\_SUBSTR parameters

| Parameter         | Description                                                                                                                                                                                                                      |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lob_loc/<br>bfile | LOB descriptor or BFILE file whose substring is to be read. The file must be opened by DBE_LOB.BFILEOPEN first. For BLOBs/BFILE files, the return value is of the RAW type. For CLOBs, the return value is of the VARCHAR2 type. |
| amount            | Number of bytes or characters to be read.<br><b>NOTE</b><br>The value ranges from 1 to 32767. If the value exceeds the range, null is returned.                                                                                  |
| off_set           | Number of characters or bytes offset from the start position.<br><b>NOTE</b><br>The value ranges from 1 to <i>LOBMAXSIZE</i> . If the value exceeds the range, null is returned.                                                 |

- DBE\_LOB.STRIP

This stored procedure truncates the LOB of a specified length. After this stored procedure is executed, the length of the LOB is set to the length specified by the **newlen** parameter.

The prototype of the DBE\_LOB.STRIP function is as follows:

```
DBE_LOB.STRIP(
 lob_loc INOUT BLOB,
 newlen IN INTEGER);

DBE_LOB.STRIP(
 lob_loc INOUT CLOB,
 newlen IN INTEGER);
```

**Table 10-148** DBE\_LOB.STRIP parameters

| Parameter | Description                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------|
| lob_loc   | LOB to read as the IN parameter, or truncated object as the OUT parameter. If this parameter is left empty, an error is reported. |
| newlen    | New length after truncation, in bytes for BLOBs or in characters for CLOBs.                                                       |

- DBE\_LOB.LOB\_STRIP

Truncates a LOB based on a specified length. After this stored procedure is executed, the length of the LOB is set to the length specified by the **newlen** parameter. The LOB can be greater than 1 GB, up to 32 TB.

The prototype of the DBE\_LOB.LOB\_STRIP function is as follows:

```
DBE_LOB.LOB_STRIP(
 lob_loc INOUT BLOB,
 newlen IN BIGINT);

DBE_LOB.LOB_STRIP(
 lob_loc INOUT CLOB,
 newlen IN BIGINT);
```

**Table 10-149** DBE\_LOB.LOB\_STRIP parameters

| Parameter | Description                                                                                                                                                                                                     |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lob_loc   | LOB to read as the IN parameter, or truncated object as the OUT parameter. If this parameter is left empty, an error is reported.                                                                               |
| newlen    | New length after truncation, in bytes for BLOBs or in characters for CLOBs.<br><b>NOTE</b><br>If the value is less than 1, null is returned. If the value is greater than the LOB length, an error is reported. |

- DBE\_LOB.CREATE\_TEMPORARY

Creates a temporary BLOB or CLOB. This interface is used only for syntax compatibility.

The prototype of the DBE\_LOB.CREATE\_TEMPORARY function is as follows:

```
DBE_LOB.CREATE_TEMPORARY (
 lob_loc INOUT BLOB,
 cache IN BOOLEAN,
 dur IN INTEGER DEFAULT 10);

DBE_LOB.CREATE_TEMPORARY (
 lob_loc INOUT CLOB,
 cache IN BOOLEAN,
 dur IN INTEGER DEFAULT 10);
```

**Table 10-150** DBE\_LOB.CREATE\_TEMPORARY parameters

| Parameter | Description                         |
|-----------|-------------------------------------|
| lob_loc   | LOB descriptor                      |
| cache     | Used only for syntax compatibility. |
| dur       | Used only for syntax compatibility. |

- DBE\_LOB.APPEND

Appends *source\_obj* to the end of the target LOB.

The prototype of the DBE\_LOB.APPEND function is as follows:

```
DBE_LOB.APPEND (
 blob_obj INOUT BLOB,
 source_obj IN BLOB);

DBE_LOB.APPEND (
 clob_obj INOUT CLOB,
 source_obj IN CLOB);
```

**Table 10-151** DBE\_LOB.APPEND parameters

| Parameter             | Description                                            |
|-----------------------|--------------------------------------------------------|
| blob_obj/<br>clob_obj | BLOB/CLOB to which the buffer content is to be written |
| source_obj            | BLOB/CLOB from which the buffer content is to be read  |

- DBE\_LOB.LOB\_APPEND

Appends *source\_obj* to the end of the target LOB.

The prototype of the DBE\_LOB.LOB\_APPEND function is as follows:

```
DBE_LOB.LOB_APPEND(
 blob_obj INOUT BLOB,
 source_obj IN BLOB);

DBE_LOB.LOB_APPEND(
 clob_obj INOUT CLOB,
 source_obj IN CLOB);
```

**Table 10-152** DBE\_LOB.LOB\_APPEND parameters

| Parameter             | Description                                            |
|-----------------------|--------------------------------------------------------|
| blob_obj/<br>clob_obj | BLOB/CLOB to which the buffer content is to be written |
| source_obj            | BLOB/CLOB from which the buffer content is to be read  |

- DBE\_LOB.FREETEMPORARY

Frees LOB files created by CREATE\_TEMPORARY.

The prototype of the DBE\_LOB.FREETEMPORARY function is as follows:

```
DBE_LOB.FREETEMPORARY (
 blob INOUT BLOB);

DBE_LOB.FREETEMPORARY (
 clob INOUT CLOB);
```

**Table 10-153** DBE\_LOB.FREETEMPORARY parameters

| Parameter | Description            |
|-----------|------------------------|
| blob/clob | BLOB/CLOB to be freed. |

- DBE\_LOB.FILEOPEN

Opens an external database BFILE file and returns its file descriptor. A maximum of 10 BFILE files can be opened in a session.

The BFILE type is defined as follows:

```
DBE_LOB.BFILE (
 directory TEXT,
 filename TEXT,
 fd INTEGER);
```

The prototype of the DBE\_LOB.FILEOPEN function is as follows:

```
DBE_LOB.FILEOPEN (
 bfile IN DBE_LOB.BFILE,
 open_mode IN TEXT)
RETURN INTEGER;
```

**Table 10-154** DBE\_LOB.FILEOPEN parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bfile     | <p>External database file to be opened. For a BFILE file, this parameter specifies the file path, file name, and file descriptor.</p> <p><b>NOTE</b><br/>The <i>file</i> variable contains the location of the file directory <i>directory</i> and the file name <i>filename</i>.</p> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li> <li>File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the <b>OPEN</b> function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).</li> </ul> |
| open_mode | File open mode, which can only be <b>r</b> . An error is reported in other modes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

- DBE\_LOB.FILECLOSE

Closes an external BFILE file.

The prototype of the DBE\_LOB.FILECLOSE function is as follows:

```
DBE_LOB.FILECLOSE (
 file IN INTEGER);
```

**Table 10-155** DBE\_LOB.FILECLOSE parameters

| Parameter | Description                                                       |
|-----------|-------------------------------------------------------------------|
| file      | External database file to be closed (that is opened by FILEOPEN). |

- DBE\_LOB.BFILEOPEN

Opens an external database BFILE file. A maximum of 10 BFILE files can be opened in a session.

The prototype of DBE\_LOB.BFILEOPEN is as follows:

```
DBE_LOB.BFILEOPEN (
 bfile INOUT DBE_LOB.BFILE,
 open_mode IN TEXT DEFAULT 'R');
```

**Table 10-156** DBE\_LOB.BFILEOPEN parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bfile     | <p>Opened database BFILE file as the INOUT parameter.</p> <p><b>NOTE</b><br/>The <i>bfile</i> variable contains the location of the file directory <i>directory</i> and the file name <i>filename</i>.</p> <ul style="list-style-type: none"> <li>• Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>• When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li> <li>• File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the <b>OPEN</b> function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).</li> </ul> |
| open_mode | File open mode, which can only be r. An error is reported in other modes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Example**

```
-- Obtain the substring of the BFILE.
DECLARE
bfile dbe_lob.bfile;
BEGIN
bfile = DBE_LOB.BFILENAME(dir_name, file_name); -- Obtain the corresponding BFILE.
DBE_LOB.bfileopen(bfile, 'r'); -- Open the BFILE.
RAISE NOTICE 'res:%', DBE_LOB.lob_substr(bfile, 10, 1); -- Obtain and print the substring.
DBE_LOB.bfileclose(bfile);-- Close the BFILE.
END;
/
```

- **DBE\_LOB.BFILECLOSE**

Closes an external database BFILE file.

The prototype of DBE\_LOB.BFILECLOSE is as follows:

```
DBE_LOB.BFILECLOSE (
 bfile INOUT DBE_LOB.BFILE);
```

**Table 10-157** DBE\_LOB.BFILECLOSE parameters

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| bfile     | Closed database BFILE file as the INOUT parameter. |

- **DBE\_LOB.LOADFROMFILE**

Loads an external BFILE file to a BLOB and returns the object of the RAW type.

The prototype of the DBE\_LOB.LOADFROMFILE function is as follows:

```
DBE_LOB.LOADFROMFILE (
 dest_lob IN BLOB,
 src_file IN INTEGER,
 amount IN INTEGER,
```

```
dest_offset IN INTEGER,
src_offset IN INTEGER)
RETURN RAW;
```

**Table 10-158** DBE\_LOB.LOADFROMFILE parameters

| Parameter   | Description                                                                                                                                            |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_lob    | Target BLOB. The BFILE file will be loaded to the specified offset position of the BLOB.                                                               |
| src_bfile   | Source BFILE file to be read.                                                                                                                          |
| amount      | Length of the content to be read from the BFILE file.<br><b>NOTE</b><br>If the length is less than 1 or greater than 32767, an error is reported.      |
| dest_offset | Offset length of the BLOB.<br><b>NOTE</b><br>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.       |
| src_offset  | Offset length of the BFILE file.<br><b>NOTE</b><br>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported. |

- DBE\_LOB.LOADFROMBFILE

Loads an external BFILE file to a LOB.

The prototype of the DBE\_LOB.LOADFROMBFILE function is as follows:

```
DBE_LOB.LOADFROMBFILE (
 dest_lob INOUT BLOB,
 src_file IN DBE_LOB.BFILE,
 amount IN BIGINT,
 dest_offset IN BIGINT DEFAULT 1,
 src_offset IN BIGINT DEFAULT 1)
RETURN BLOB;
```

```
DBE_LOB.LOADFROMBFILE (
 dest_lob INOUT CLOB,
 src_file IN DBE_LOB.BFILE,
 amount IN BIGINT,
 dest_offset IN BIGINT DEFAULT 1,
 src_offset IN BIGINT DEFAULT 1)
RETURN CLOB;
```

**Table 10-159** DBE\_LOB.LOADFROMBFILE parameters

| Parameter | Description                                                                                                                                                                          |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_lob  | Target LOB as the INOUT parameter, to which the BFILE file will be loaded. The file must be opened by <b>DBE_LOB.BFILEOPEN</b> first. The LOB can be greater than 1 GB, up to 32 TB. |

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| src_file    | Source BFILE file to be read. The BFILE file can be greater than 1 GB, up to 32 TB.                                                                                                                                                                                                                                                                |
| amount      | Length of the content to be read from the BFILE file and to be written to the LOB.<br><b>NOTE</b><br>If the length is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.                                                                                                                                           |
| dest_offset | Offset length of the target LOB<br><b>NOTE</b><br>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.                                                                                                                                                                                              |
| src_offset  | Offset length of the source BFILE file<br><b>NOTE</b> <ul style="list-style-type: none"> <li>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i>, an error is reported.</li> <li>If the sum of <i>amount</i> and <i>src_offset</i> is greater than the length of <i>src_bfile</i> plus 1, an error is reported.</li> </ul> |

- DBE\_LOB.LOADBLOBFROMFILE

Loads an external BFILE file to a BLOB and returns the object of the RAW type.

The prototype of the DBE\_LOB.LOADBLOBFROMFILE function is as follows:

```
DBE_LOB.LOADBLOBFROMFILE (
 dest_lob IN BLOB,
 src_file IN INTEGER,
 amount IN INTEGER,
 dest_offset IN INTEGER,
 src_offset IN INTEGER)
RETURN RAW;
```

**Table 10-160** DBE\_LOB.LOADBLOBFROMFILE parameters

| Parameter   | Description                                                                                                                                                                                                    |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_lob    | Target BLOB, to which the BFILE file will be loaded.                                                                                                                                                           |
| src_file    | Source BFILE file to be read.                                                                                                                                                                                  |
| amount      | Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB.<br><b>NOTE</b><br>If the length is less than 1 or greater than 32767, an error is reported. |
| dest_offset | Offset length of the BLOB.<br><b>NOTE</b><br>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.                                                               |

| Parameter  | Description                                                                                                                                            |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| src_offset | Offset length of the BFILE file.<br><b>NOTE</b><br>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported. |

- DBE\_LOB.LOADBLOBFROMBFILE

Loads an external BFILE file to a BLOB.

The prototype of the DBE\_LOB.LOADBLOBFROMBFILE function is as follows:

```
DBE_LOB.LOADBLOBFROMBFILE (
 dest_lob INOUT BLOB,
 src_file IN DEB_LOB.BFILE,
 amount IN BIGINT,
 dest_offset INOUT BIGINT,
 src_offset INOUT BIGINT)
```

**Table 10-161** DBE\_LOB.LOADBLOBFROMBFILE parameters

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                  |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_lob    | Target BLOB as the INOUT parameter, to which the BFILE file (which must be opened using <b>DBE_LOB.BFILEOPEN</b> first) is loaded. The BFILE file can be greater than 1 GB, up to 32 TB.                                                                                                                                                     |
| src_file    | Source BFILE file to be read. The BFILE file can be greater than 1 GB, up to 32 TB.                                                                                                                                                                                                                                                          |
| amount      | Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB.<br><b>NOTE</b><br>If the length is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.                                                                                                     |
| dest_offset | Offset length of the BLOB.<br><b>NOTE</b><br>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.                                                                                                                                                                                             |
| src_offset  | Offset length of the BFILE file.<br><b>NOTE</b> <ul style="list-style-type: none"> <li>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i>, an error is reported.</li> <li>If the sum of <i>amount</i> and <i>src_offset</i> is greater than the length of <i>src_bfile</i> plus 1, an error is reported.</li> </ul> |

- DBE\_LOB.LOADCLOBFROMFILE

Loads an external BFILE file to a CLOB and returns the object of the RAW type.

The prototype of the DBE\_LOB.LOADCLOBFROMFILE function is as follows:

```
DBE_LOB.LOADCLOBFROMFILE (
 dest_lob IN CLOB,
```

```
src_file IN INTEGER,
amount IN INTEGER,
dest_offset IN INTEGER,
src_offset IN INTEGER)
RETURN raw;
```

**Table 10-162** DBE\_LOB.LOADCLOBFROMFILE parameters

| Parameter   | Description                                                                                                                                            |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_lob    | Target CLOB, to which the BFILE file will be loaded.                                                                                                   |
| src_file    | Source BFILE file to be read.                                                                                                                          |
| amount      | Length of the CLOB.<br><b>NOTE</b><br>If the length is less than 1 or greater than 32767, an error is reported.                                        |
| dest_offset | Offset length of the CLOB.<br><b>NOTE</b><br>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.       |
| src_offset  | Offset length of the BFILE file.<br><b>NOTE</b><br>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported. |

- DBE\_LOB.LOADCLOBFROMBFILE

Loads an external BFILE file to a CLOB.

The prototype of the DBE\_LOB.LOADCLOBFROMBFILE function is as follows:

```
DBE_LOB.LOADCLOBFROMBFILE (
dest_lob INOUT CLOB,
src_file IN DEB_LOB.BFILE,
amount IN BIGINT,
dest_offset INOUT BIGINT,
src_offset INOUT BIGINT)
```

**Table 10-163** DBE\_LOB.LOADCLOBFROMBFILE parameters

| Parameter | Description                                                                                                                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_lob  | Target CLOB as the INOUT parameter, to which the BFILE file (which must be opened using <b>DBE_LOB.BFILEOPEN</b> first) is loaded. The BFILE file can be greater than 1 GB, up to 32 TB.                                                 |
| src_file  | Source BFILE file to be read. The BFILE file can be greater than 1 GB, up to 32 TB.                                                                                                                                                      |
| amount    | Length of the target CLOB. If the length of a file exceeds this threshold, the file will not be saved to the CLOB.<br><b>NOTE</b><br>If the length is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported. |

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                  |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_offset | Offset length of the CLOB.<br><b>NOTE</b><br>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.                                                                                                                                                                                             |
| src_offset  | Offset length of the BFILE file.<br><b>NOTE</b> <ul style="list-style-type: none"> <li>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i>, an error is reported.</li> <li>If the sum of <i>amount</i> and <i>src_offset</i> is greater than the length of <i>src_bfile</i> plus 1, an error is reported.</li> </ul> |

- DBE\_LOB.CONVERTTOBLOB

Converts a CLOB to a BLOB. The CLOB cannot be greater than 1 GB.

The prototype of the DBE\_LOB.CONVERTTOBLOB function is as follows:

```
DBE_LOB.CONVERTTOBLOB(
 dest_blob IN BLOB,
 src_clob IN CLOB,
 amount IN INTEGER DEFAULT 32767,
 dest_offset IN INTEGER DEFAULT 1,
 src_offset IN INTEGER DEFAULT 1)
RETURN raw;
```

**Table 10-164** DBE\_LOB.CONVERTTOBLOB parameters

| Parameter   | Description                                                                                                                                                                                                            |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_blob   | Target BLOB, which is converted from a CLOB.                                                                                                                                                                           |
| src_clob    | Source CLOB to be read.                                                                                                                                                                                                |
| amount      | Length of the target CLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. If the length is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported. |
| dest_offset | Offset length of the BLOB. If <b>dest_offset</b> is set to 1, data is loaded from the start position of the file. The rest may be deduced by analogy.                                                                  |
| src_offset  | Offset length of the CLOB. If <b>src_offset</b> is set to 1, data is read from the start position of the file. The rest may be deduced by analogy.                                                                     |

- DBE\_LOB.LOB\_CONVERTTOBLOB

Converts a CLOB to a BLOB. The LOB can be greater than 1 GB.

The prototype of the DBE\_LOB.LOB\_CONVERTTOBLOB function is as follows:

```
DBE_LOB.LOB_CONVERTTOBLOB(
 dest_blob INOUT BLOB,
 src_clob IN CLOB,
 amount IN BIGINT,
 dest_offset INOUT BIGINT,
 src_offset INOUT BIGINT)
```

**Table 10-165** DBE\_LOB.LOB\_CONVERTTOBLOB parameters

| Parameter   | Description                                                                                                                                                                                                                                                       |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_blob   | Target BLOB, which is converted from a CLOB.                                                                                                                                                                                                                      |
| src_clob    | Source CLOB to be read.                                                                                                                                                                                                                                           |
| amount      | Length of the target CLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. If the length is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.                                            |
| dest_offset | Offset length of the BLOB. If <b>dest_offset</b> is set to <b>1</b> , data is loaded from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported. |
| src_offset  | Offset length of the CLOB. If <b>src_offset</b> is set to <b>1</b> , data is read from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.    |

- DBE\_LOB.CONVERTTOCLOB

Converts a BLOB to a CLOB. The BLOB cannot be greater than 1 GB.

The prototype of the DBE\_LOB.CONVERTTOCLOB function is as follows:

```
DBE_LOB.CONVERTTOCLOB(
 dest_clob IN CLOB,
 src_blob IN BLOB,
 amount IN INTEGER DEFAULT 32767,
 dest_offset IN INTEGER DEFAULT 1,
 src_offset IN INTEGER DEFAULT 1)
RETURN text;
```

**Table 10-166** DBE\_LOB.CONVERTTOCLOB parameters

| Parameter   | Description                                                                                                                                                   |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_clob   | Target CLOB, which is converted from a BLOB.                                                                                                                  |
| src_blob    | Source BLOB to be read.                                                                                                                                       |
| amount      | Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the CLOB.                                            |
| dest_offset | Offset length of the CLOB. If <b>dest_offset</b> is set to <b>1</b> , data is loaded from the start position of the file. The rest may be deduced by analogy. |
| src_offset  | Offset length of the BLOB. If <b>src_offset</b> is set to <b>1</b> , data is read from the start position of the file. The rest may be deduced by analogy.    |

- DBE\_LOB.LOB\_CONVERTTOCLOB

Converts a BLOB to a CLOB. The LOB can be greater than 1 GB.

The prototype of the DBE\_LOB.LOB\_CONVERTTOCLOB function is as follows:

```
DBE_LOB.LOB_CONVERTTOCLOB(
 dest_clob INOUT CLOB,
 src_blob IN BLOB,
 amount IN BIGINT,
 dest_offset INOUT BIGINT,
 src_offset INOUT BIGINT)
```

**Table 10-167** DBE\_LOB.LOB\_CONVERTTOCLOB parameters

| Parameter   | Description                                                                                                                                                                                                                                                       |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_clob   | Target CLOB, which is converted from a BLOB.                                                                                                                                                                                                                      |
| src_blob    | Source BLOB to be read.                                                                                                                                                                                                                                           |
| amount      | Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the CLOB.                                                                                                                                                |
| dest_offset | Offset length of the CLOB. If <b>dest_offset</b> is set to <b>1</b> , data is loaded from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported. |
| src_offset  | Offset length of the BLOB. If <b>src_offset</b> is set to <b>1</b> , data is read from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.    |

- DBE\_LOB.GETCHUNKSIZE

Returns *TOAST\_MAX\_CHUNK\_SIZE*. When LOB data is stored in the database, TOAST is used internally.

The prototype of the DBE\_LOB.GETCHUNKSIZE function is as follows:

```
DBE_LOB.GETCHUNKSIZE(
 lob_loc IN CLOB
)RETURN INTEGER

DBE_LOB.GETCHUNKSIZE(
 lob_loc IN BLOB
)RETURN INTEGER
```

**Table 10-168** DBE\_LOB.GETCHUNKSIZE parameters

| Parameter | Description       |
|-----------|-------------------|
| lob_loc   | Target CLOB/BLOB. |

- DBE\_LOB.LOB\_WRITE

Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.

The prototype of the DBE\_LOB.LOB\_WRITE function is as follows:

```
DBE_LOB.LOB_WRITE(
 clob_obj INOUT CLOB,
 amount IN INTEGER,
 off_set IN BIGINT,
 source IN VARCHAR2
)
RETURN CLOB;

DBE_LOB.LOB_WRITE(
 blob_obj INOUT BLOB,
 amount IN INTEGER,
 off_set IN BIGINT,
 source IN RAW
)
RETURN BLOB;
```

**Table 10-169** DBE\_LOB.LOB\_WRITE parameters

| Parameter           | Type           | Input/Output Parameter | Empty or Not | Description                                                                      |
|---------------------|----------------|------------------------|--------------|----------------------------------------------------------------------------------|
| blob_obj / clob_obj | BLOB / CLOB    | INOUT                  | No           | Target LOB as the INOUT parameter, to which the content is to be written.        |
| amount              | INTEGER        | IN                     | No           | Length of the data to be written (in bytes for BLOBs or in characters for CLOBs) |
| off_set             | BIGINT         | IN                     | No           | Offset position for writing data to <i>blob_obj/clob_obj</i>                     |
| source              | RAW / VARCHAR2 | IN                     | No           | Source object                                                                    |

- DBE\_LOB.BFILENAME

Constructs a BFILE based on the directory and file name.

The prototype of DBE\_LOB.BFILENAME is as follows:

```
DBE_LOB.BFILENAME(
 directory IN TEXT,
 filename IN TEXT)
RETURN DBE_LOB.BFILE;
```

**Table 10-170** DBE\_LOB.BFILENAME interface parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| directory | File path<br><b>NOTE</b><br>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b> . If the input path does not match the path in <b>PG_DIRECTORY</b> , an error indicating that the path does not exist is reported. <ul style="list-style-type: none"><li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li><li>File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the <b>OPEN</b> function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).</li></ul> |
| filename  | File name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Example

```
-- Obtain the length of a string.
SELECT DBE_LOB.GET_LENGTH('12345678');

DECLARE
myraw RAW(100);
amount INTEGER :=2;
buffer INTEGER :=1;
begin
DBE_LOB.READ('123456789012345',amount,buffer,myraw);
dbe_output.print_line(myraw);
end;
/

CREATE TABLE blob_Table (t1 blob) DISTRIBUTE BY REPLICATION;
CREATE TABLE blob_Table_bak (t2 blob) DISTRIBUTE BY REPLICATION;
INSERT INTO blob_Table VALUES('abcdef');
INSERT INTO blob_Table_bak VALUES('22222');

DECLARE
str varchar2(100) := 'abcdef';
source raw(100);
dest blob;
copyto blob;
amount int;
PSV_SQL varchar2(100);
PSV_SQL1 varchar2(100);
a int :=1;
len int;
BEGIN
source := dbe_raw.cast_from_varchar2_to_raw(str);
amount := dbe_raw.get_length(source);

PSV_SQL := 'select * from blob_Table for update';
PSV_SQL1 := 'select * from blob_Table_bak for update';

EXECUTE IMMEDIATE PSV_SQL into dest;
EXECUTE IMMEDIATE PSV_SQL1 into copyto;

DBE_LOB.WRITE(dest, amount, 1, source);
DBE_LOB.WRITE_APPEND(dest, amount, source);
```

```

DBE_LOB.ERASE(dest, a, 1);
DBE_OUTPUT.PRINT_LINE(a);
DBE_LOB.COPY(copyto, dest, amount, 10, 1);
perform DBE_LOB.CLOSE(dest);
RETURN;
END;
/

-- Delete the table.
DROP TABLE blob_Table;
DROP TABLE blob_Table_bak;

```

## 10.12.2.2 DBE\_RANDOM

### Interface Description

**Table 10-171** lists all interfaces supported by the **DBE\_RANDOM** package.

**Table 10-171** DBE\_RANDOM interface parameters

| Interface                   | Description                                                                            |
|-----------------------------|----------------------------------------------------------------------------------------|
| <b>DBE_RANDOM.SET_SEED</b>  | Sets a seed for a random number.                                                       |
| <b>DBE_RANDOM.GET_VALUE</b> | Generates a random number between a specified <b>low</b> and a specified <b>high</b> . |

- DBE\_RANDOM.SET\_SEED

The stored procedure **SEED** is used to set a seed for a random number. The function prototype of **DBE\_RANDOM.SET\_SEED** is as follows:

```
DBE_RANDOM.SET_SEED (seed IN INTEGER);
```

**Table 10-172** DBE\_RANDOM.SET\_SEED interface parameters

| Parameter | Description                           |
|-----------|---------------------------------------|
| seed      | Generates a seed for a random number. |

- DBE\_RANDOM.GET\_VALUE

The stored procedure **VALUE** generates a random number between a specified **low** and a specified **high**. The function prototype of **DBE\_RANDOM.GET\_VALUE** is as follows:

```

DBE_RANDOM.GET_VALUE(
min IN NUMBER default 0,
max IN NUMBER default 1)
RETURN NUMBER;

```

**Table 10-173** DBE\_RANDOM.GET\_VALUE interface parameters

| Parameter | Description                                                                                                  |
|-----------|--------------------------------------------------------------------------------------------------------------|
| min       | Sets the low bound for a random number. The generated random number is greater than or equal to <b>min</b> . |
| max       | Sets the high bound for a random number. The generated random number is less than <b>max</b> .               |

**NOTE**

- The only requirement is that the parameter type is **NUMERIC** regardless of the right and left bound values.
- **DBE\_RANDOM** implements pseudo-random numbers. Therefore, if the initial value (seed) remains unchanged, the sequence of the pseudo-random numbers also remains unchanged.
- The generated random number contains 15 valid digits.

## Examples

```
-- Generate a random number between 0 and 1.
SELECT DBE_RANDOM.GET_VALUE(0,1);

-- For integers within a specified range, add the arguments min and max, and truncate the decimals from
the result (the maximum value is not included as a possible value). Therefore, for integers from 0 to 99, you
can use the following code:
SELECT TRUNC(DBE_RANDOM.GET_VALUE(0,100));
```

### 10.12.2.3 DBE\_OUTPUT

**NOTE**

When DBE\_OUTPUT.PUT\_LINE is used to print the result obtained by the DBE\_FILE.READ\_LINE\_NCHAR API, ensure that the UTF-8 character set encoding can be converted to the current database character set encoding. If the preceding conditions are met, the result can be properly output. DBE\_OUTPUT.PRINT\_LINE does not support this function.

## Interface Description

**Table 10-174** provides all interfaces supported by the **DBE\_OUTPUT** package.

**Table 10-174** DBE\_OUTPUT

| Interface                    | Description                                            |
|------------------------------|--------------------------------------------------------|
| <b>DBE_OUTPUT.PRINT_LINE</b> | Outputs the specified text with newline characters.    |
| <b>DBE_OUTPUT.PRINT</b>      | Outputs the specified text without newline characters. |

| Interface                                  | Description                                                                                                                                                                                                                        |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DBE_OUTPUT.SET_BUFFER_SIZE</a> | Sets the size of the output buffer. If the size is not specified, the buffer can contain a maximum of 20000 bytes. If the size is set to a value less than or equal to 2000 bytes, the buffer can contain a maximum of 2000 bytes. |
| <a href="#">DBE_OUTPUT.DISABLE</a>         | Disables the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE and GET_LINES, and clears the output buffer.                                                                                                                             |
| <a href="#">DBE_OUTPUT.ENABLE</a>          | Enables the buffer, allows the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES, and sets the buffer size.                                                                                                              |
| <a href="#">DBE_OUTPUT.GET_LINE</a>        | Obtains a line of data from the buffer with a newline character as the boundary. The obtained data is not output to the client.                                                                                                    |
| <a href="#">DBE_OUTPUT.GET_LINES</a>       | Obtains the character string of a specified number of lines in the buffer as a VARCHAR array. The obtained content is cleared from the buffer and is not output to the client.                                                     |
| <a href="#">DBE_OUTPUT.NEW_LINE</a>        | Places a line at the end of the buffer, places an end-of-line marker, and leaves a new line empty.                                                                                                                                 |
| <a href="#">DBE_OUTPUT.PUT</a>             | Places an input string in the buffer without a newline character at the end. When the stored procedure ends, the line ending with the newline character is displayed.                                                              |
| <a href="#">DBE_OUTPUT.PUT_LINE</a>        | Places an input string in the buffer with a newline character at the end. When the stored procedure ends, the line ending with the newline character is displayed.                                                                 |

- [DBE\\_OUTPUT.PRINT\\_LINE](#)

The stored procedure **PRINT\_LINE** writes a line of text carrying a line end symbol in the buffer. The function prototype of **DBE\_OUTPUT.PRINT\_LINE** is as follows:

```
DBE_OUTPUT.PRINT_LINE (
format IN VARCHAR2);
```

**Table 10-175** DBE\_OUTPUT.PRINT\_LINE interface parameters

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| format    | Specifies the text that was written to the buffer. |

- DBE\_OUTPUT.PRINT

The stored procedure **PRINT** outputs the specified text to the front of the specified text without adding a newline character. The function prototype of **DBE\_OUTPUT.PRINT** is as follows:

```
DBE_OUTPUT.PRINT (
format IN VARCHAR2);
```

**Table 10-176** DBE\_OUTPUT.PRINT interface parameters

| Parameter | Description                                                |
|-----------|------------------------------------------------------------|
| format    | Specifies the text that was written to the specified text. |

- DBE\_OUTPUT.SET\_BUFFER\_SIZE

The stored procedure **SET\_BUFFER\_SIZE** sets the output buffer size. If the size is not specified, it contains a maximum of 20000 bytes. The function prototype of **DBE\_OUTPUT.SET\_BUFFER\_SIZE** is as follows:

```
DBE_OUTPUT.SET_BUFFER_SIZE (
size IN INTEGER default 20000);
```

**Table 10-177** DBE\_OUTPUT.SET\_BUFFER\_SIZE interface parameters

| Parameter | Description                  |
|-----------|------------------------------|
| size      | Sets the output buffer size. |

- DBE\_OUTPUT.DISABLE

The stored procedure **DISABLE** disables the calling of PUT, PUT\_LINE, NEW\_LINE, GET\_LINE and GET\_LINES, and clears the output buffer. The prototype of the DBE\_OUTPUT.DISABLE function is as follows:

```
DBE_OUTPUT.DISABLE;
```

- DBE\_OUTPUT.ENABLE

The stored procedure **ENABLE** enables the buffer, allows the calling of PUT, PUT\_LINE, NEW\_LINE, GET\_LINE, and GET\_LINES, and sets the buffer size. The prototype of the DBE\_OUTPUT.ENABLE function is as follows:

```
DBE_OUTPUT.ENABLE (
buffer_size IN INTEGER DEFAULT 20000
);
```

**Table 10-178** DBE\_OUTPUT.ENABLE parameters

| Parameter   | Description                                                                                                        |
|-------------|--------------------------------------------------------------------------------------------------------------------|
| buffer_size | Upper limit of the buffer size, in bytes. If <b>buffer_size</b> is set to <b>NULL</b> , the default value is used. |

- DBE\_OUTPUT.GET\_LINE

The stored procedure **GET\_LINE** obtains a line of data from the buffer with a newline character as the boundary. The obtained data is not output to the client. The prototype of the DBE\_OUTPUT.GET\_LINE function is as follows:

```
DBE_OUTPUT.GET_LINE (
 line OUT VARCHAR2,
 status OUT INTEGER
);
```

**Table 10-179** DBE\_OUTPUT.GET\_LINE parameters

| Parameter | Description                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------|
| line      | Indicates the obtained character string.                                                                                               |
| status    | Indicates whether the calling is normal. If a character string is obtained, the value is <b>0</b> . Otherwise, the value is <b>1</b> . |

- DBE\_OUTPUT.GET\_LINES

The stored procedure **GET\_LINES** obtains the character string of a specified number of lines in the buffer as a VARCHAR array. The obtained content is cleared from the buffer and is not output to the client. The prototype of the DBE\_OUTPUT.GET\_LINES function is as follows:

```
DBE_OUTPUT.GET_LINES (
 lines OUT VARCHAR[],
 numlines IN OUT INTEGER
);
```

**Table 10-180** DBE\_OUTPUT.GET\_LINES parameters

| Parameter | Description                                                                                                                                                                                                      |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lines     | Outputs an array of multi-line strings read from the buffer.                                                                                                                                                     |
| numlines  | Inputs the number of lines to be retrieved from the buffer. The output value is the number of lines actually retrieved. If the output value is less than the input value, there are no more lines in the buffer. |

- DBE\_OUTPUT.NEW\_LINE

The stored procedure **NEW\_LINE** places a line at the end of the buffer, places an end-of-line marker, and leaves a new line empty. The prototype of the DBE\_OUTPUT.NEW\_LINE function is as follows:

```
DBE_OUTPUT.NEW_LINE;
```

- DBE\_OUTPUT.PUT

The stored procedure **PUT** places an input string in the buffer without a newline character at the end. When the stored procedure ends, the line ending with the newline character is displayed. The prototype of the DBE\_OUTPUT.PUT function is as follows:

```
DBE_OUTPUT.PUT (
 item IN VARCHAR2);
```

**Table 10-181** DBE\_OUTPUT.PUT parameters

| Parameter | Description                                          |
|-----------|------------------------------------------------------|
| item      | Character or string item to be placed in the buffer. |

- DBE\_OUTPUT.PUT\_LINE

The stored procedure **PUT\_LINE** places an input string in the buffer with a newline character at the end. When the stored procedure ends, the line ending with the newline character is displayed. The prototype of the DBE\_OUTPUT.PUT\_LINE function is as follows:

```
DBE_OUTPUT.PUT_LINE (
 item IN VARCHAR2);
```

**Table 10-182** DBE\_OUTPUT.PUT\_LINE parameters

| Parameter | Description                                          |
|-----------|------------------------------------------------------|
| item      | Character or string item to be placed in the buffer. |

## Examples

```
BEGIN
 DBE_OUTPUT.SET_BUFFER_SIZE(50);
 DBE_OUTPUT.PRINT('hello, ');
 DBE_OUTPUT.PRINT_LINE('database!');-- Output "hello, database!".
END;
/

-- Test DISABLE: Disable the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES. The PUT_LINE
has no output.
BEGIN
 dbe_output.disable();
 dbe_output.put_line('1');
END;
/

-- Test ENABLE: Enable the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES. The output of
PUT_LINE is 1.
BEGIN
 dbe_output.enable();
 dbe_output.put_line('1');
END;
/

-- Test PUT: Place the input character string a in the buffer without adding a newline character at the end.
a has no output.
BEGIN
 dbe_output.enable();
 dbe_output.put('a');
END;
/
```

```
-- Test NEW_LINE. Add a new line. The output is a.
BEGIN
 dbe_output.enable();
 dbe_output.put('a');
 dbe_output.new_line;
END;
/

-- Test GET_LINE: Obtain buffer data and save the data to variables and use PUT_LINE to output the data.
DECLARE
 line VARCHAR(32672);
 status INTEGER := 0;
BEGIN
 dbe_output.put_line('hello');
 dbe_output.get_line(line, status);
 dbe_output.put_line('-----');
 dbe_output.put_line(line);
 dbe_output.put_line(status);
END;
/
The expected result is as follows:

hello
0

-- Test GET_LINES: Obtain multiple lines of content in the buffer and use PUT_LINE to output the content.
DECLARE
 lines dbms_output.chararr;
 numlines integer;
BEGIN
 dbe_output.put_line('output line 1');
 dbe_output.put_line('output line 2');
 dbe_output.put_line('output line 3');
 numlines := 100;
 dbe_output.get_lines(lines, numlines);
 dbe_output.put_line('num: ' || numlines);
 dbe_output.put_line('get line 1: ' || lines(1));
 dbe_output.put_line('get line 2: ' || lines(2));
 dbe_output.put_line('get line 3: ' || lines(3));
END;
/
-- The expected result is as follows:
num: 3
get line 1: output line 1
get line 2: output line 2
get line 3: output line 3
```

### 10.12.2.4 DBE\_RAW

## Interface Description

[Table 10-183](#) provides all interfaces supported by the **DBE\_RAW** package.

**Table 10-183** DBE\_RAW

| Interface                                               | Description                                                                                |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------|
| <a href="#">DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW</a> | Converts a value of the <b>INTEGER</b> type to a binary representation ( <b>RAW</b> type). |
| <a href="#">DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER</a> | Converts a binary representation ( <b>RAW</b> type) to a value of the <b>INTEGER</b> type. |

| Interface                                              | Description                                                                                                            |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DBE_RAW.GET_LENGTH</a>                     | Obtains the length of a <b>RAW</b> object.                                                                             |
| <a href="#">DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW</a>      | Converts a value of the <b>VARCHAR2</b> type to a binary representation ( <b>RAW</b> type).                            |
| <a href="#">DBE_RAW.CAST_TO_VARCHAR2</a>               | Converts a value of the <b>RAW</b> type to a value of the <b>VARCHAR2</b> type.                                        |
| <a href="#">DBE_RAW.SUBSTR</a>                         | Returns the substring of the <b>RAW</b> type.                                                                          |
| <a href="#">DBE_RAW.BIT_OR</a>                         | Performs the bitwise OR operation on raw data.                                                                         |
| <a href="#">DBE_RAW.BIT_AND</a>                        | Returns a RAW value after bitwise AND calculation.                                                                     |
| <a href="#">DBE_RAW.BIT_COMPLEMENT</a>                 | Returns a RAW value after bitwise complement calculation.                                                              |
| <a href="#">DBE_RAW.BIT_XOR</a>                        | Returns a RAW value after bitwise XOR calculation.                                                                     |
| <a href="#">DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW</a> | Converts a <b>BINARY_DOUBLE</b> value to a RAW value.                                                                  |
| <a href="#">DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE</a> | Converts a RAW value to a <b>BINARY_DOUBLE</b> value.                                                                  |
| <a href="#">DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT</a>  | Converts a RAW value to a <b>FLOAT4</b> value.                                                                         |
| <a href="#">DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW</a>  | Converts a <b>FLOAT4</b> value to a RAW value.                                                                         |
| <a href="#">DBE_RAW.CAST_FROM_RAW_TO_NUMERIC</a>       | Converts a RAW value to a <b>NUMERIC</b> value.                                                                        |
| <a href="#">DBE_RAW.CAST_FROM_NUMERIC_TO_RAW</a>       | Converts a <b>NUMERIC</b> value to a RAW value.                                                                        |
| <a href="#">DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2</a>     | Converts a RAW value to a <b>NVARCHAR2</b> value.                                                                      |
| <a href="#">DBE_RAW.COMPARE</a>                        | Returns the first different position of two RAW values.                                                                |
| <a href="#">DBE_RAW.CONCAT</a>                         | Concatenates a maximum of 12 RAW values into a new RAW value and returns the value.                                    |
| <a href="#">DBE_RAW.CONVERT</a>                        | Converts a RAW value from the source encoding mode <b>from_charset</b> to the target encoding mode <b>to_charset</b> . |
| <a href="#">DBE_RAW.COPIES</a>                         | Copies a RAW value for <i>n</i> times, concatenates the values, and returns the concatenated result.                   |

| Interface                             | Description                                                                                                            |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DBE_RAW.OVERLAY</a>       | Overlays one RAW data with another RAW data by specifying the start position and length to be overlaid.                |
| <a href="#">DBE_RAW.REVERSE</a>       | Reverses RAW data by byte.                                                                                             |
| <a href="#">DBE_RAW.TRANSLATE</a>     | Converts or discards a specified byte of a RAW value.                                                                  |
| <a href="#">DBE_RAW.TRANSLITERATE</a> | Converts a specified byte of a RAW value.                                                                              |
| <a href="#">DBE_RAW.XRANGE</a>        | Returns a RAW value containing the succession of one-byte encodings beginning and ending with the specified byte-code. |

#### NOTICE

RAW data is represented as hexadecimal characters externally, and stored as binary characters internally. For example, the representation of RAW data 11001011 is 'CB', that is, the input for type conversion is 'CB'.

- [DBE\\_RAW.CAST\\_FROM\\_BINARY\\_INTEGER\\_TO\\_RAW](#)  
The stored procedure **CAST\_FROM\_BINARY\_INTEGER\_TO\_RAW** converts a value of the **INTEGER** type to a binary representation (**RAW** type).  
The prototype of the [DBE\\_RAW.CAST\\_FROM\\_BINARY\\_INTEGER\\_TO\\_RAW](#) function is as follows:

```
DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW (
value IN INTEGER,
endianess IN INTEGER DEFAULT 1)
RETURN RAW;
```

**Table 10-184** [DBE\\_RAW.CAST\\_FROM\\_BINARY\\_INTEGER\\_TO\\_RAW](#) parameters

| Parameter | Description                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| value     | Specifies the <b>INTEGER</b> value to be converted to the <b>RAW</b> value.                                                                                          |
| endianess | Specifies the <b>INTEGER</b> value <b>1</b> or <b>2</b> for the byte sequence. ( <b>1</b> indicates <b>BIG_ENDIAN</b> and <b>2</b> indicates <b>LITTLE-ENDIAN</b> .) |

- [DBE\\_RAW.CAST\\_FROM\\_RAW\\_TO\\_BINARY\\_INTEGER](#)  
The stored procedure **CAST\_FROM\_RAW\_TO\_BINARY\_INTEGER** converts a binary representation (**RAW** type) to a value of the **INTEGER** type.  
The prototype of the [DBE\\_RAW.CAST\\_FROM\\_RAW\\_TO\\_BINARY\\_INTEGER](#) function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER (
value IN RAW,
endianess IN INTEGER DEFAULT 1)
RETURN BINARY_INTEGER;
```

**Table 10-185** DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_INTEGER parameters

| Parameter | Description                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| value     | Specifies an <b>INTEGER</b> value in a binary representation ( <b>RAW</b> type).                                                                                     |
| endianess | Specifies the <b>INTEGER</b> value <b>1</b> or <b>2</b> for the byte sequence. ( <b>1</b> indicates <b>BIG_ENDIAN</b> and <b>2</b> indicates <b>LITTLE-ENDIAN</b> .) |

- DBE\_RAW.GET\_LENGTH

The stored procedure **GET\_LENGTH** returns the length of a **RAW** object.

The prototype of the DBE\_RAW.GET\_LENGTH function is as follows:

```
DBE_RAW.GET_LENGTH(
value IN RAW)
RETURN INTEGER;
```

**Table 10-186** DBE\_RAW.GET\_LENGTH parameters

| Parameter | Description                    |
|-----------|--------------------------------|
| value     | Specifies a <b>RAW</b> object. |

- DBE\_RAW.CAST\_FROM\_VARCHAR2\_TO\_RAW

The stored procedure **CAST\_FROM\_VARCHAR2\_TO\_RAW** converts a **VARCHAR2** object to a **RAW** object.

The prototype of the DBE\_RAW.CAST\_FROM\_VARCHAR2\_TO\_RAW function is as follows:

```
DBE_RAW.CAST_TO_RAW(
str IN VARCHAR2)
RETURN RAW;
```

**Table 10-187** DBE\_RAW.CAST\_FROM\_VARCHAR2\_TO\_RAW parameters

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| c         | Specifies a <b>VARCHAR2</b> object to be converted. |

- DBE\_RAW.CAST\_TO\_VARCHAR2

The stored procedure **CAST\_TO\_VARCHAR2** converts a **RAW** object to a **VARCHAR2** object.

The prototype of the DBE\_RAW.CAST\_TO\_VARCHAR2 function is as follows:

```
DBE_RAW.CAST_TO_VARCHAR2(
str IN RAW)
RETURN VARCHAR2;
```

**Table 10-188** DBE\_RAW.CAST\_TO\_VARCHAR2 parameters

| Parameter | Description                                    |
|-----------|------------------------------------------------|
| str       | Specifies a <b>RAW</b> object to be converted. |

- DBE\_RAW.BIT\_OR

The stored procedure **BIT\_OR** calculates the bitwise OR result of two raw data records.

The prototype of the DBE\_RAW.BIT\_OR function is as follows:

```
DBE_RAW.BIT_OR(
str1 IN RAW,
str2 IN RAW)
RETURN RAW;
```

**Table 10-189** DBE\_RAW.BIT\_OR parameters

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| str1      | First character string of the bitwise OR operation  |
| str2      | Second character string of the bitwise OR operation |

- DBE\_RAW.SUBSTR

The stored procedure **SUBSTR** truncates an object of the **RAW** type based on the start bit and length.

The prototype of the DBE\_RAW.SUBSTR function is as follows:

```
DBE_RAW.SUBSTR(
IN lob_loc raw,
IN off_set integer default 1,
IN amount integer default 32767)
RETURN RAW;
```

**Table 10-190** DBE\_RAW.SUBSTR parameters

| Parameter | Description                                                    |
|-----------|----------------------------------------------------------------|
| lob_loc   | Source raw character string                                    |
| off_set   | Start position of a substring. The default value is <b>1</b> . |
| amount    | Length of a substring. The default value is <b>32767</b> .     |

- DBE\_RAW.BIT\_AND

Obtains the bitwise AND result of two RAW values.

The prototype of the DBE\_RAW.BIT\_AND function is as follows:

```
DBE_RAW.BIT_AND(
r1 IN RAW,
r2 IN RAW)
RETURN RAW;
```

**Table 10-191** DBE\_RAW.BIT\_AND parameters

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| r1        | The RAW value for the bitwise AND operation with r2. The maximum length is 32767. |
| r2        | The RAW value for the bitwise AND operation with r1. The maximum length is 32767. |

- DBE\_RAW.BIT\_COMPLEMENT

Obtains the bitwise complement result of a RAW value.

The prototype of the DBE\_RAW.BIT\_COMPLEMENT function is as follows:

```
DBE_RAW.BIT_COMPLEMENT(
 r IN RAW)
RETURN RAW;
```

**Table 10-192** DBE\_RAW.BIT\_COMPLEMENT parameters

| Parameter | Description                                                                      |
|-----------|----------------------------------------------------------------------------------|
| r         | The RAW value for the bitwise complement operation. The maximum length is 32767. |

- DBE\_RAW.BIT\_XOR

Obtains the bitwise XOR result of two RAW values.

The prototype of the DBE\_RAW.BIT\_XOR function is as follows:

```
DBE_RAW.BIT_XOR(
 r1 IN RAW,
 r2 IN RAW)
RETURN RAW;
```

**Table 10-193** DBE\_RAW.BIT\_XOR parameters

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| r1        | The RAW value for the bitwise XOR operation with r2. The maximum length is 32767. |
| r2        | The RAW value for the bitwise XOR operation with r1. The maximum length is 32767. |

- DBE\_RAW.CAST\_FROM\_BINARY\_DOUBLE\_TO\_RAW

Converts the BINARY\_DOUBLE type to an INTEGER value in a binary representation (RAW type).

The prototype of the DBE\_RAW.CAST\_FROM\_BINARY\_DOUBLE\_TO\_RAW function is as follows:

```
DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW (
 n IN BINARY_DOUBLE,
 endianness IN INTEGER DEFAULT 1)
RETURN RAW;
```

**Table 10-194** DBE\_RAW.CAST\_FROM\_BINARY\_DOUBLE\_TO\_RAW parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n         | BINARY_DOUBLE value to be converted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| endianess | Endianness, that is, byte order. The value can be <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>1</b> indicates BIG_ENDIAN, <b>2</b> indicates LITTLE_ENDIAN, and <b>3</b> indicates MACHINE_ENDIAN. The default value is <b>1</b> . If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN. |

- DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_DOUBLE

Converts an INTEGER value in a binary representation (RAW type) to a BINARY\_DOUBLE type.

The prototype of the DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_DOUBLE function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE(
r IN RAW,
endianess IN INTEGER DEFAULT 1)
RETURN BINARY_DOUBLE;
```

**Table 10-195** DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_DOUBLE parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| r         | The RAW value to be converted. The value contains 8 to 32767 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| endianess | Endianness, that is, byte order. The value can be <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>1</b> indicates BIG_ENDIAN, <b>2</b> indicates LITTLE_ENDIAN, and <b>3</b> indicates MACHINE_ENDIAN. The default value is <b>1</b> . If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN. |

- DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_FLOAT

Converts a RAW value to a FLOAT4 value.

The prototype of the DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_FLOAT function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT(
r IN RAW,
endianess IN INTEGER DEFAULT 1)
RETURN FLOAT4;
```

**Table 10-196** DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_FLOAT parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| r         | The RAW value to be converted. The value contains 4 to 32767 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| endianess | Endianness, that is, byte order. The value can be <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>1</b> indicates BIG_ENDIAN, <b>2</b> indicates LITTLE_ENDIAN, and <b>3</b> indicates MACHINE_ENDIAN. The default value is <b>1</b> . If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN. |

- DBE\_RAW.CAST\_FROM\_BINARY\_FLOAT\_TO\_RAW

Converts a FLOAT4 value to a RAW value.

The prototype of the DBE\_RAW.CAST\_FROM\_BINARY\_FLOAT\_TO\_RAW function is as follows:

```
DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW(
 n IN FLOAT4,
 endianess IN INTEGER DEFAULT 1)
RETURN RAW;
```

**Table 10-197** DBE\_RAW.CAST\_FROM\_BINARY\_FLOAT\_TO\_RAW parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n         | FLOAT4 value to be converted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| endianess | Endianness, that is, byte order. The value can be <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>1</b> indicates BIG_ENDIAN, <b>2</b> indicates LITTLE_ENDIAN, and <b>3</b> indicates MACHINE_ENDIAN. The default value is <b>1</b> . If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN. |

- DBE\_RAW.CAST\_FROM\_RAW\_TO\_NUMBER

Converts a RAW value to a NUMERIC value.

 **NOTE**

The bottom-layer implementation of the number data type in database ORA is different from that in GaussDB, and the raw data type is the hexadecimal representation of the binary stream implemented at the bottom layer. Therefore, the function in database ORA is different from that in GaussDB. You cannot obtain the same number-type data from GaussDB based on the raw data corresponding to the number-type data in database ORA. For details about the number-type data in GaussDB, see the example.

The prototype of the DBE\_RAW.CAST\_FROM\_RAW\_TO\_NUMBER function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_NUMBER(
 r IN RAW)
RETURN NUMERIC;
```

**Table 10-198** DBE\_RAW.CAST\_FROM\_RAW\_TO\_NUMBER parameters

| Parameter | Description                                                              |
|-----------|--------------------------------------------------------------------------|
| r         | The RAW value to be converted. The value contains 6 to 32767 characters. |

- DBE\_RAW.CAST\_FROM\_NUMBER\_TO\_RAW  
Converts a NUMERIC value to a RAW value.

 **NOTE**

The bottom-layer implementation of the number data type in database ORA is different from that in GaussDB, and the raw data type is the hexadecimal representation of the binary stream implemented at the bottom layer. Therefore, the function in database ORA is different from that in GaussDB. You cannot restore the raw data corresponding to the number-type data in database ORA to the original number type in database ORA in the GaussDB database. For details about the performance of this function in GaussDB, see the example.

The prototype of the DBE\_RAW.CAST\_FROM\_NUMBER\_TO\_RAW function is as follows:

```
DBE_RAW.CAST_FROM_NUMBER_TO_RAW(
 n IN NUMERIC)
RETURN RAW;
```

**Table 10-199** DBE\_RAW.CAST\_FROM\_NUMBER\_TO\_RAW parameters

| Parameter | Description                    |
|-----------|--------------------------------|
| n         | NUMERIC value to be converted. |

- DBE\_RAW.CAST\_FROM\_RAW\_TO\_NVARCHAR2  
Converts a RAW value to an NVARCHAR2 value.

The prototype of the DBE\_RAW.CAST\_FROM\_RAW\_TO\_NVARCHAR2 function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2(
 r IN RAW)
RETURN NVARCHAR2;
```

**Table 10-200** DBE\_RAW.CAST\_FROM\_RAW\_TO\_NVARCHAR2 parameters

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| r         | The RAW value to be converted. The maximum length is 32767. |

- DBE\_RAW.COMPARE

Returns the first different position of two RAW values.

The prototype of the DBE\_RAW.COMPARE function is as follows:

```
DBE_RAW.COMPARE(
 r1 IN RAW,
 r2 IN RAW,
 pad IN RAW DEFAULT NULL)
RETURN INTEGER;
```

**Table 10-201** DBE\_RAW.COMPARE parameters

| Parameter | Description                                                                                                                                                                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| r1        | First data to be compared. The value can be <b>NULL</b> or the length is 0. The maximum length is 32767.                                                                                                                                               |
| r2        | Second data to be compared. The value can be <b>NULL</b> or the length is 0. The maximum length is 32767.                                                                                                                                              |
| pad       | The first byte of <b>pad</b> is used to extend the shorter one of <b>r1</b> or <b>r2</b> . The maximum length is 32767. If this parameter is set to <b>NULL</b> , the length is 0, or the default value is used, the extended value is <b>0x'00'</b> . |

- DBE\_RAW.CONCAT

Concatenates a maximum of 12 RAW values into a new RAW value and returns the value. If the length after concatenation exceeds 32767, an error is reported.

The prototype of the DBE\_RAW.CONCAT function is as follows:

```
DBE_RAW.CONCAT(
 r1 IN RAW DEFAULT NULL,
 r2 IN RAW DEFAULT NULL,
 r3 IN RAW DEFAULT NULL,
 r4 IN RAW DEFAULT NULL,
 r5 IN RAW DEFAULT NULL,
 r6 IN RAW DEFAULT NULL,
 r7 IN RAW DEFAULT NULL,
 r8 IN RAW DEFAULT NULL,
 r9 IN RAW DEFAULT NULL,
 r10 IN RAW DEFAULT NULL,
 r11 IN RAW DEFAULT NULL,
 r12 IN RAW DEFAULT NULL)
RETURN RAW;
```

**Table 10-202** DBE\_RAW.CONCAT parameters

| Parameter | Description                        |
|-----------|------------------------------------|
| r1...r12  | The RAW values to be concatenated. |

- DBE\_RAW.CONVERT

Converts a RAW value from the source encoding mode **from\_charset** to the target encoding mode **to\_charset**.

If the rule for converting between source and target encoding (for example, GBK and LATIN1) does not exist, the parameter **r** is returned without conversion. See the **pg\_conversion** system catalog for details.

The prototype of the DBE\_RAW.CONVERT function is as follows:

```
DBE_RAW.CONVERT(
 r IN RAW,
 to_charset IN VARCHAR2,
 from_charset IN VARCHAR2)
RETURN RAW;
```

**Table 10-203** DBE\_RAW.CONVERT parameters

| Parameter    | Description                                                                   |
|--------------|-------------------------------------------------------------------------------|
| r            | The RAW value to be converted. The maximum length is 32767.                   |
| to_charset   | Name of the target encoding character set.                                    |
| from_charset | Name of the source encoding character set. In this encoding, r must be valid. |

- DBE\_RAW.COPIES

Copies a RAW value for *n* times, concatenates the values, and returns the concatenated result. If the length after copying exceeds 32767, an error is reported.

The prototype of the DBE\_RAW.COPIES function is as follows:

```
DBE_RAW.COPIES(
 r IN RAW,
 n IN NUMERIC)
RETURN RAW;
```

**Table 10-204** DBE\_RAW.COPIES parameters

| Parameter | Description                                                |
|-----------|------------------------------------------------------------|
| r         | The RAW values to be copied.                               |
| n         | Number of copy times. The value must be a positive number. |

- DBE\_RAW.OVERLAY

Overlays one RAW data with another RAW data by specifying the start position and length to be overlaid.

The prototype of the DBE\_RAW.OVERLAY function is as follows:

```
DBE_RAW.OVERLAY(
 overlay_str IN RAW,
 target IN RAW,
 pos IN BINARY_INTEGER DEFAULT 1,
 len IN BINARY_INTEGER DEFAULT NULL,
 pad IN RAW DEFAULT NULL)
RETURN RAW;
```

**Table 10-205** DBE\_RAW.OVERLAY parameters

| Parameter   | Description                                                  |
|-------------|--------------------------------------------------------------|
| overlay_str | Byte used for overwriting. The value cannot be <b>NULL</b> . |

| Parameter | Description                                                                                                                                                                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| target    | Source byte string to be overlaid. The value is of the RAW type and contains a maximum of 32767 bytes. The value cannot be <b>NULL</b> .                                                                                                               |
| pos       | Indicates the byte from which the overlay starts. The position of the first byte is 1. The value of <b>pos</b> must be greater than or equal to 1 and the value of <b>len+pos</b> must be less than or equal to 32767. The default value is <b>1</b> . |
| len       | Length to be overlaid. The value of <b>len</b> must be greater than or equal to 0 and the value of <b>len+pos</b> must be less than or equal to 32767. The default value is the length of <b>overlay_str</b> .                                         |
| pad       | Padding byte. Only the first byte is valid. The default value is <b>NULL</b> . If the value is <b>NULL</b> , it is regarded as <b>0x00</b> by default.                                                                                                 |

- DBE\_RAW.REVERSE

Reverses RAW data by byte.

The prototype of the DBE\_RAW.REVERSE function is as follows:

```
DBE_RAW.REVERSE(
 r IN RAW
)
RETURN RAW;
```

**Table 10-206** DBE\_RAW.REVERSE parameters

| Parameter | Description                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------|
| r         | The RAW value to be reversed. The maximum length is 32767. If the value is <b>NULL</b> , <b>NULL</b> is returned. |

- DBE\_RAW.TRANSLATE

Converts or discards a specified byte of a RAW value.

The prototype of the DBE\_RAW.TRANSLATE function is as follows:

```
DBE_RAW.TRANSLATE(
 r IN RAW,
 from_set IN RAW,
 to_set IN RAW)
RETURN RAW;
```

**Table 10-207** DBE\_RAW.TRANSLATE parameters

| Parameter | Description                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| r         | Source byte string to be converted. The value is of the RAW type and contains a maximum of 32767 bytes. The value cannot be <b>NULL</b> . |

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| from_set  | Bytecode to be converted in the source byte string. The value is of the RAW type. The value cannot be <b>NULL</b> . The bytes in <b>from_set</b> in the source byte string are replaced with the bytes in the corresponding positions in <b>to_set</b> . If <b>from_set</b> contains multiple identical bytes, only the first byte corresponding to the byte is replaced. For example, if <b>r[x]=from_set[n]</b> , <b>r[x]</b> is replaced with <b>to_set[n]</b> . If <b>to_set[n]</b> corresponding to <b>from_set[n]</b> does not exist (that is, the number of bytes of <b>to_set</b> does not exceed <b>n</b> ), <b>r[x]</b> will be discarded. |
| to_set    | Byte code converted from the <b>from_set</b> byte. The value is of the RAW type. The value cannot be <b>NULL</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

- DBE\_RAW.TRANSLITERATE

Converts a RAW value to a NUMERIC value.

The prototype of the DBE\_RAW.TRANSLITERATE function is as follows:

```
DBE_RAW.TRANSLITERATE(
 r IN RAW,
 from_set IN RAW DEFAULT NULL,
 to_set IN RAW DEFAULT NULL,
 pad IN RAW DEFAULT NULL)
RETURN RAW;
```

**Table 10-208** DBE\_RAW.TRANSLITERATE parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| r         | Source byte string to be converted. The value is of the RAW type and contains a maximum of 32767 bytes. The value cannot be <b>NULL</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| to_set    | Byte code converted from the <b>from_set</b> byte. The value is of the RAW type. The default value is <b>NULL</b> . If the value is <b>NULL</b> , all bytes in <b>r</b> that exist in <b>from_set</b> are converted to <b>pad</b> .                                                                                                                                                                                                                                                                                                                                                                            |
| from_set  | Bytecode to be converted in the source byte string <b>r</b> . The value is of the RAW type. The default value is <b>NULL</b> . If <b>from_set</b> is <b>NULL</b> , all bytes in the source byte string <b>r</b> are converted into equal-length data filled by <b>pad</b> . Otherwise, the bytes in <b>from_set</b> in the source byte string <b>r</b> are replaced with the bytes in the corresponding position in <b>to_set</b> . For example, if <b>r[x]=from_set[n]</b> , <b>r[x]</b> is converted to <b>to_set[n]</b> . If <b>to_set[n]</b> does not exist, <b>r[x]</b> will be converted to <b>pad</b> . |
| pad       | Padding byte. Only the first byte is valid. The default value is <b>NULL</b> . If the value is <b>NULL</b> , it is regarded as <b>0x00</b> by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

- DBE\_RAW.XRANGE

Returns a RAW value containing the succession of one-byte encodings beginning and ending with the specified byte-code.

The prototype of the DBE\_RAW.XRANGE function is as follows:

```
DBE_RAW.XRANGE(
 start_byte IN RAW,
 end_byte IN RAW)
RETURN RAW;
```

**Table 10-209** DBE\_RAW.XRANGE parameters

| Parameter  | Description                                                                                                                                                                                                                                                                      |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| start_byte | Start byte. Only the first byte is valid. If the value is <b>NULL</b> , it is regarded as <b>0x00</b> by default.                                                                                                                                                                |
| end_byte   | End byte. Only the first byte is valid. If the value is <b>NULL</b> , it is regarded as <b>0xFF</b> by default. If <b>end_byte</b> is less than <b>start_byte</b> , <b>end_byte</b> is concatenated to <b>0xFF</b> , and then <b>0x00</b> is concatenated to <b>start_byte</b> . |

## Examples

```
--Perform operations on RAW data in a stored procedure.
CREATE OR REPLACE PROCEDURE proc_raw
AS
str varchar2(100) := 'abcdef';
source raw(100);
amount integer;
BEGIN
source := dbe_raw.cast_from_varchar2_to_raw(str);--Convert the type.
amount := dbe_raw.get_length(source);--Obtain the length.
dbe_output.print_line(amount);
END;
/

-- Call the stored procedure.
CALL proc_raw();

-- Delete the stored procedure.
DROP PROCEDURE proc_raw;

DECLARE
v_raw RAW;
v_double BINARY_DOUBLE;
v_float FLOAT4;
v_numeric NUMERIC;
v_nvarchar2 NVARCHAR2;
BEGIN
-- Perform bitwise AND calculation on RAW values.
SELECT DBE_RAW.BIT_AND('AFF', 'FF0B') INTO v_raw; -- 0A0B
-- Perform bitwise complement calculation on RAW values.
SELECT DBE_RAW.BIT_COMPLEMENT('0AFF') INTO v_raw; -- F500
-- Perform bitwise XOR calculation on RAW values.
SELECT DBE_RAW.BIT_XOR('AFF', 'FF0B') INTO v_raw; -- F5F4
-- Convert a BINARY_DOUBLE value to a RAW value.
SELECT DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW(1.0001,1) INTO v_raw; -- 3FF00068DB8BAC71
-- Convert a RAW value to a BINARY_DOUBLE value.
SELECT DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE('3FF00068DB8BAC7',1) INTO v_double; -- 1.0001
-- Convert a RAW value to a FLOAT4 value.
SELECT DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT('40200000',1) INTO v_float; -- 2.5
-- Convert a FLOAT4 value to a RAW value.
SELECT DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW('2.5',1) INTO v_raw; -- 40200000
-- Convert a RAW value to a NUMERIC value.
SELECT DBE_RAW.CAST_FROM_RAW_TO_NUMBER('808002008813') INTO v_numeric; -- 2.5
-- Convert a NUMERIC value to a RAW value.
SELECT DBE_RAW.CAST_FROM_NUMBER_TO_RAW('2.5') INTO v_raw; -- 808002008813
```

```

-- Convert a RAW value to an NVARCHAR2 value.
SELECT DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2('12345678') INTO v_nvarchar2; -- \x124Vx
-- Compare RAW values.
SELECT DBE_RAW.COMPARE('ABCD','AB') INTO v_numeric; -- 2
-- Concatenate RAW values.
SELECT DBE_RAW.CONCAT('ABCD','AB') INTO v_raw; -- ABCDAB
-- Convert RAW values.
SELECT DBE_RAW.CONVERT('E695B0', 'GBK','UTF8') INTO v_raw; -- CAFD
-- Copy RAW values.
SELECT DBE_RAW.COPIES('ABCD',2) INTO v_raw; -- ABCDABCD
-- Specify the start position and length of a RAW value to be overlaid.

-- Reverse a RAW value by byte.
SELECT DBE_RAW.REVERSE('12345678') INTO v_raw; -- 78563412
-- Convert bytes of the RAW type (without padding code)
SELECT DBE_RAW.TRANSLATE('1122112233', '1133','55') INTO v_raw; -- 55225522
-- Convert bytes of the RAW type (with padding code)
SELECT DBE_RAW.TRANSLITERATE('1122112233', '55','1133','FFEE') INTO v_raw; -- 55225522FF
-- All bytes between two bytes of the RAW type.
SELECT DBE_RAW.XRANGE('00','03') INTO v_raw; -- 00010203
END;
/

```

### 10.12.2.5 DBE\_TASK

#### Interface Description

[Table DBE\\_TASK](#) lists all interfaces supported by the **DBE\_TASK** package.

**Table 10-210** DBE\_TASK

| Interface                           | Description                                                                                                                      |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DBE_TASK.SUBMIT</a>     | Submits a scheduled task. The job ID is automatically generated by the system.                                                   |
| <a href="#">DBE_TASK.JOB_SUBMIT</a> | Same as <a href="#">DBE_TASK.SUBMIT</a> . However, It provides syntax compatibility parameters.                                  |
| <a href="#">DBE_TASK.ID_SUBMIT</a>  | Submits a scheduled task. The job ID is specified by the user.                                                                   |
| <a href="#">DBE_TASK.CANCEL</a>     | Removes a scheduled task by job ID.                                                                                              |
| <a href="#">DBE_TASK.RUN</a>        | Executes a scheduled task.                                                                                                       |
| <a href="#">DBE_TASK.FINISH</a>     | Disables or enables scheduled task execution.                                                                                    |
| <a href="#">DBE_TASK.UPDATE</a>     | Modifies user-definable attributes of a scheduled task, including the task content, next-execution time, and execution interval. |
| <a href="#">DBE_TASK.CHANGE</a>     | Same as <a href="#">DBE_TASK.UPDATE</a> . However, It provides syntax compatibility parameters.                                  |
| <a href="#">DBE_TASK.CONTENT</a>    | Modifies the task content attribute of a scheduled task.                                                                         |
| <a href="#">DBE_TASK.NEXT_TIME</a>  | Modifies the next-execution time attribute of a scheduled task.                                                                  |

| Interface                         | Description                                                    |
|-----------------------------------|----------------------------------------------------------------|
| <a href="#">DBE_TASK.INTERVAL</a> | Modifies the execution interval attribute of a scheduled task. |

- DBE\_TASK.SUBMIT

The stored procedure **SUBMIT** submits a scheduled task provided by the system.

The function prototype of **DBE\_TASK.SUBMIT** is as follows:

```
DBE_TASK.SUBMIT(
 what IN TEXT,
 next_time IN TIMESTAMP DEFAULT sysdate,
 interval_time IN TEXT DEFAULT 'null',
 id OUT INTEGER
)RETURN INTEGER;
```

 **NOTE**

When a scheduled task is created (using **DBE\_TASK**), the system binds the current database and the username to the task by default. This function can be called by using **call** or **select**. If you call this function by using **select**, there is no need to specify output parameters. To call this function within a stored procedure, use **perform**. If the committed SQL statement task uses a non-public schema, specify the schema to a table schema or a function schema, or add **set current\_schema = xxx** before the SQL statement.

**Table 10-211** DBE\_TASK.SUBMIT interface parameters

| Parameter | Type      | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                           |
|-----------|-----------|------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| what      | text      | IN                     | No           | SQL statement to be executed. One or multiple DDLs (excluding database-related operations), DMLs, anonymous blocks, and statements for calling stored procedures, or all four combined are supported. |
| next_time | timestamp | IN                     | No           | Specifies the next time the job will be executed. The default value is the current system time ( <b>sysdate</b> ). If the specified time has past, the job is executed at the time it is submitted.   |

| Parameter     | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                     |
|---------------|---------|------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interval_time | text    | IN                     | Yes          | Calculates the next time to execute the job. It can be an interval expression, or <b>sysdate</b> followed by a numeric value, for example, <b>sysdate+1.0/24</b> . If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward. |
| id            | integer | OUT                    | No           | Specifies the job ID. The value ranges from 1 to 32767. When SELECT is used for calling, this parameter cannot be added. When CALL is used for calling, this parameter must be added.                                                                                                                           |

#### NOTICE

When you create a user using the **what** parameter, the plaintext password of the user is recorded in the log. Therefore, you are advised not to do so. Tasks created using this API may not be highly available. You are advised to use **PKG\_SERVICE.SUBMIT\_ON\_NODES** to create a task and specify the CCN as the job execution node.

#### Example:

```
select DBE_TASK.SUBMIT('call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate+1');

select DBE_TASK.SUBMIT('call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate+1.0/24');

CALL DBE_TASK.SUBMIT('INSERT INTO T_JOB VALUES(1); call pro_1(); call pro_2();',
add_months(to_date('201701','yyyymm'),1), 'date_trunc("day",SYSDATE) + 1 +(8*60+30.0)/(24*60)',:jobid);

DECLARE
 jobid int;
BEGIN
 PERFORM DBE_TASK.SUBMIT('call pro_xxx();', sysdate, 'interval "5 minute"', jobid);
END;
/
```

- **DBE\_TASK.JOB\_SUBMIT**

The stored procedure **SUBMIT** submits a scheduled task provided by the system. In addition, it provides additional compatibility parameters.

The **DBE\_TASK.JOB\_SUBMIT** function prototype is as follows:

```
DBE_TASK.JOB_SUBMIT(
job OUT INTEGER,
what IN TEXT,
next_date IN TIMESTAMP DEFAULT sysdate,
job_interval IN TEXT DEFAULT 'null',
no_parse IN BOOLEAN DEFAULT false,
instance IN INTEGER DEFAULT 0,
```

```
force IN BOOLEAN DEFAULT false
)RETURN INTEGER;
```

**Table 10-212** DBE\_TASK.JOB\_SUBMIT interface parameters

| Parameter    | Type      | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                     |
|--------------|-----------|------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job          | integer   | OUT                    | No           | Specifies the job ID. The value ranges from 1 to 32767. When <b>db.job_submit</b> is called using SELECT, this parameter can be omitted.                                                                                                                                                                        |
| what         | text      | IN                     | No           | SQL statement to be executed. One or multiple DDLs (excluding database-related operations), DMLs, anonymous blocks, and statements for calling stored procedures, or all four combined are supported.                                                                                                           |
| next_date    | timestamp | IN                     | Yes          | Specifies the next time the job will be executed. The default value is the current system time ( <b>sysdate</b> ). If the specified time has past, the job is executed at the time it is submitted.                                                                                                             |
| job_interval | text      | IN                     | Yes          | Calculates the next time to execute the job. It can be an interval expression, or <b>sysdate</b> followed by a numeric value, for example, <b>sysdate+1.0/24</b> . If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward. |
| no_pare      | boolean   | IN                     | Yes          | The default value is <b>false</b> , which is used only for syntax compatibility.                                                                                                                                                                                                                                |
| instance     | integer   | IN                     | Yes          | The default value is <b>0</b> , which is used only for syntax compatibility.                                                                                                                                                                                                                                    |
| force        | boolean   | IN                     | Yes          | The default value is <b>false</b> , which is used only for syntax compatibility.                                                                                                                                                                                                                                |

**Example:**

```
DECLARE
 id integer;
BEGIN
 id = DBE_TASK.JOB_SUBMIT(
 what => 'insert into t1 values (1, 2)',
 job_interval => 'sysdate + 1' --daily
);
END;
```

- DBE\_TASK.ID\_SUBMIT

**ID\_SUBMIT** has the same syntax function as **SUBMIT**, but the first parameter of **ID\_SUBMIT** is an input parameter, that is, a specified job ID. In contrast, that last parameter of **ID\_SUBMIT** is an output parameter, indicating the job ID automatically generated by the system.

```
DBE_TASK.ID_SUBMIT(
id IN BIGINT,
what IN TEXT,
next_time IN TIMESTAMP DEFAULT sysdate,
interval_time IN TEXT DEFAULT 'null');
```

Example:

```
CALL dbe_task.id_submit(101, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
```

- DBE\_TASK.CANCEL

The stored procedure **CANCEL** deletes a specified task.

The function prototype of **DBE\_TASK.CANCEL** is as follows:

```
CANCEL(id IN INTEGER);
```

**Table 10-213** DBE\_TASK.CANCEL interface parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description           |
|-----------|---------|------------------------|--------------|-----------------------|
| id        | integer | IN                     | No           | Specifies the job ID. |

Example:

```
CALL dbe_task.cancel(101);
```

- DBE\_TASK.RUN

The stored procedure runs a scheduled task.

The prototype of the **DBE\_TASK.RUN** function is as follows:

```
DBE_TASK.RUN(
job IN BIGINT,
force IN BOOLEAN DEFAULT FALSE);
```

**Table 10-214** DBE\_TASK.RUN interface parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                         |
|-----------|---------|------------------------|--------------|-------------------------------------|
| job       | bigint  | IN                     | No           | Specifies the job ID.               |
| force     | Boolean | IN                     | Yes          | Used only for syntax compatibility. |

Example:

```
BEGIN
 DBE_TASK.ID_SUBMIT(12345, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
 DBE_TASK.RUN(12345);
END;
/
```

- **DBE\_TASK.FINISH**

The stored procedure **FINISH** disables or enables a scheduled task.

The function prototype of **DBE\_TASK.FINISH** is as follows:

```
DBE_TASK.FINISH(
 id IN INTEGER,
 broken IN BOOLEAN,
 next_time IN TIMESTAMP DEFAULT sysdate);
```

**Table 10-215** DBE\_TASK.FINISH interface parameters

| Parameter | Type      | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|-----------|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | integer   | IN                     | No           | Specifies the job ID.                                                                                                                                                                                                                                                                                                                                                                                                          |
| broken    | Boolean   | IN                     | No           | Specifies the status flag, <b>true</b> for broken and <b>false</b> for not broken. The current job is updated based on the parameter value <b>true</b> or <b>false</b> . If the parameter is left empty, the job status remains unchanged.                                                                                                                                                                                     |
| next_time | timestamp | IN                     | Yes          | Specifies the next execution time. The default value is the current system time. If <b>broken</b> is set to <b>true</b> , <b>next_time</b> is updated to '4000-1-1'. If <b>broken</b> is set to <b>false</b> and <b>next_time</b> is not empty, <b>next_time</b> is updated for the job. If <b>next_time</b> is empty, it will not be updated. This parameter can be omitted, and its default value will be used in this case. |

Example:

```
CALL dbe_task.finish(101, true);
CALL dbe_task.finish(101, false, sysdate);
```

- **DBE\_TASK.UPDATE**

The stored procedure **UPDATE** modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

The **DBE\_TASK.UPDATE** function prototype is as follows:

```
dbe_task.UPDATE(
 id IN INTEGER,
 content IN TEXT,
 next_time IN TIMESTAMP,
 interval_time IN TEXT);
```

**Table 10-216** DBE\_TASK.UPDATE interface parameters

| Parameter     | Type      | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|-----------|------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id            | integer   | IN                     | No           | Specifies the job ID.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| content       | text      | IN                     | Yes          | Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the <b>content</b> parameter for the specified job. Otherwise, the system updates the <b>content</b> parameter for the specified job.                                                                                                                                                                             |
| next_time     | timestamp | IN                     | Yes          | Specifies the next execution time. If this parameter is left empty, the system does not update the <b>next_time</b> parameter for the specified job. Otherwise, the system updates the <b>next_time</b> parameter for the specified job.                                                                                                                                                                                                                          |
| interval_time | text      | IN                     | Yes          | Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the <b>interval_time</b> parameter for the specified job. Otherwise, the system updates the <b>interval_time</b> parameter for the specified job after necessary validity check. If this parameter is set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward. |

Example:

```
CALL dbe_task.update(101, 'call userproc();', sysdate, 'sysdate + 1.0/1440');
CALL dbe_task.update(101, 'insert into tbl_a values(sysdate);', sysdate, 'sysdate + 1.0/1440');
```

- **DBE\_TASK.CHANGE**

The stored procedure **UPDATE** modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

The prototype of the **DBE\_TASK.CHANGE** function is as follows:

```
DBE_TASK.CHANGE(
job IN INTEGER,
what IN TEXT DEFAULT NULL,
next_date IN TIMESTAMP DEFAULT NULL,
job_interval IN TEXT DEFAULT NULL,
```

```
instance IN INTEGER DEFAULT NULL,
force IN BOOLEAN DEFAULT false);
```

**Table 10-217** DBE\_TASK.CHANGE interface parameters

| Parameter    | Type      | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|-----------|------------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job          | integer   | IN                     | No           | Specifies the job ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| what         | text      | IN                     | Yes          | Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the <b>what</b> parameter for the specified job. Otherwise, the system updates the <b>what</b> parameter for the specified job.                                                                                                                                                                                        |
| next_date    | timestamp | IN                     | Yes          | Specifies the next execution time. If this parameter is left empty, the system does not update the <b>next_time</b> parameter for the specified job. Otherwise, the system updates the <b>next_date</b> parameter for the specified job.                                                                                                                                                                                                                               |
| job_interval | text      | IN                     | Yes          | Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the <b>job_interval</b> parameter for the specified job. Otherwise, the system updates the <b>job_interval</b> parameter for the specified job after necessary validity check. If this parameter is set to <b>null</b> , the job will be executed only once, and the job status will change to <b>'d'</b> afterward. |
| instance     | integer   | IN                     | Yes          | Used only for syntax compatibility.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| force        | boolean   | IN                     | No           | Used only for syntax compatibility.                                                                                                                                                                                                                                                                                                                                                                                                                                    |

```
BEGIN
DBE_TASK.CHANGE(
 job => 1234,
 what => 'insert into t2 values (2);'
);
```

```
END;
/
```

- **DBE\_TASK.CONTENT**

The stored procedure **CONTENT** modifies the procedures to be executed by a specified task.

The function prototype of **DBE\_TASK.CONTENT** is as follows:

```
DBE_TASK.CONTENT(
id IN INTEGER,
content IN TEXT);
```

**Table 10-218** DBE\_TASK.CONTENT interface parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                         |
|-----------|---------|------------------------|--------------|-------------------------------------------------------------------------------------|
| id        | integer | IN                     | No           | Specifies the job ID.                                                               |
| content   | text    | IN                     | No           | Specifies the name of the stored procedure or SQL statement block that is executed. |

 **NOTE**

- If the value specified by the **content** parameter is one or multiple executable SQL statements, program blocks, or stored procedures, this procedure can be executed successfully; otherwise, it will fail to be executed.
- If the value specified by the **content** parameter is a simple statement such as **INSERT** and **UPDATE**, a schema name must be added in front of the table name.

Example:

```
CALL dbe_task.content(101, 'call userproc();');
CALL dbe_task.content(101, 'insert into tbl_a values(sysdate);');
```

- **DBE\_TASK.NEXT\_TIME**

The stored procedure **NEXT\_TIME** modifies the next-execution time attribute of a task.

The function prototype of **DBE\_TASK.NEXT\_TIME** is as follows:

```
DBE_TASK.NEXT_TIME(
id IN BIGINT,
next_time IN TEXT);
```

**Table 10-219** DBE\_TASK.NEXT\_TIME interface parameters

| Parameter | Type   | Input/Output Parameter | Can Be Empty | Description           |
|-----------|--------|------------------------|--------------|-----------------------|
| id        | bigint | IN                     | No           | Specifies the job ID. |

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description                        |
|-----------|------|------------------------|--------------|------------------------------------|
| next_time | text | IN                     | No           | Specifies the next execution time. |

 **NOTE**

If the specified **next\_time** value is earlier than the current date, the job is executed once immediately.

Example:

```
CALL dbe_task.next_time(101, sysdate);
```

- **DBE\_TASK.INTERVAL**

The stored procedure **INTERVAL** modifies the execution interval attribute of a task.

The function prototype of **DBE\_TASK.INTERVAL** is as follows:

```
DBE_TASK.INTERVAL(
id IN INTEGER,
interval_time IN TEXT);
```

**Table 10-220** DBE\_TASK.INTERVAL interface parameters

| Parameter     | Type    | Input / Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                               |
|---------------|---------|--------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id            | integer | IN                       | No           | Specifies the job ID.                                                                                                                                                                                                                                                                     |
| interval_time | text    | IN                       | Yes          | Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward. <b>interval</b> must be a valid time or interval type. |

Example:

```
CALL dbe_task.interval(101, 'sysdate + 1.0/1440');
```

 **NOTE**

For a job that is currently running (that is, **job\_status** is 'r'), it is not allowed to use **cancel**, **update**, **next\_time**, **content**, or **interval** to delete or modify job parameters.

## Constraints

1. After a job is created by using **SUMMIT/ID\_SUBMIT**, the job belongs to the current coordinator (that is, the job is scheduled and executed only on the current coordinator). Other coordinators do not schedule and execute the job. If the coordinator node is faulty, the job cannot be properly executed. You are advised to use the **PKG\_SERVICE.SUBMIT\_ON\_NODES** API to specify the job execution node as CCN to ensure that the job is still available when a node is faulty. Not all coordinators can query, modify, and delete tasks created on other CNs.
2. You can create, update, and delete tasks only using the procedures provided by the **dbe\_task** package. These procedures synchronize task information between different CNs and associate primary keys between the **pg\_job** and **pg\_job\_proc** catalogs. If you use DML statements to add, delete, or modify records in the **pg\_job** catalog, task information will become inconsistent between CNs and system catalogs may fail to be associated, compromising internal task management.
3. Each task created by a user is bound to a CN. If the CN fails while a task is being executed, the task status cannot be updated in real time and will stay at 'r'. The task status will be updated to 's' only after the CN recovers. When a CN fails, all tasks on this CN cannot be scheduled or executed until the CN is restored manually, or deleted and then replaced.
4. For each task, the bound CN updates the real-time task information (including the task status, last execution start time, last execution end time, next execution start time, the number of execution failures [if any]) to the **pg\_job** catalog, and synchronizes the information to other CNs, ensuring consistent task information between different CNs. In the case of faults on other CNs, task information synchronization is reattempted by the bound CN, which increases task execution time. Although task information fails to be synchronized between CNs, task information can still be properly updated in the **pg\_job** catalog on the bound CN and the task can be executed successfully. After the faulty CN recovers, task information such as task execution time and status in its **pg\_job** catalog may be incorrect and will be updated only after the task is executed again on the bound CN.
5. For each job, a thread is established to execute it. If multiple jobs are triggered concurrently as scheduled, the system will need some time to start the required threads, resulting in a latency of 0.1 ms in job execution.

### 10.12.2.6 DBE\_UTILITY

#### Interface Description

**Table 10-221** provides all interfaces supported by the **DBE\_UTILITY** package.

**Table 10-221** DBE\_UTILITY

| Interface                                 | Description                                             |
|-------------------------------------------|---------------------------------------------------------|
| <b>DBE_UTILITY.FORMAT_ERROR_BACKTRACE</b> | Outputs the call stack of an abnormal stored procedure. |

| Interface                                        | Description                                                                                                                |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DBE_UTILITY.FORMAT_ERROR_STACK</a>   | Outputs detailed information about a stored procedure exception.                                                           |
| <a href="#">DBE_UTILITY.FORMAT_CALL_STACK</a>    | Outputs the call stack of a stored procedure.                                                                              |
| <a href="#">DBE_UTILITY.GET_TIME</a>             | Outputs the current time, which is used to obtain the execution duration.                                                  |
| <a href="#">DBE_UTILITY.CANONICALIZE</a>         | Canonicalizes the character string of a table name.                                                                        |
| <a href="#">DBE_UTILITY.COMMA_TO_TABLE</a>       | Converts a comma-delimited string of names into a PL/SQL table of names.                                                   |
| <a href="#">DBE_UTILITY.DB_VERSION</a>           | Returns the version number and compatibility version number of the database.                                               |
| <a href="#">DBE_UTILITY.EXEC_DDL_STATEMENT</a>   | Executes DDL statements entered by users.                                                                                  |
| <a href="#">DBE_UTILITY.EXPAND_SQL_TEXT_PROC</a> | Expands the view of the SQL query.                                                                                         |
| <a href="#">DBE_UTILITY.GET_CPU_TIME</a>         | Returns the measured value of the current CPU processing time.                                                             |
| <a href="#">DBE_UTILITY.GET_ENDIANNESS</a>       | Obtains the big-endian and little-endian information of the byte order on the platform where the database is located.      |
| <a href="#">DBE_UTILITY.GET_HASH_VALUE</a>       | Returns the hash value of a given string.                                                                                  |
| <a href="#">DBE_UTILITY.GET_SQL_HASH</a>         | Outputs the hash value of a given string. This stored procedure is used when <b>proc_outparam_override</b> is not enabled. |
| <a href="#">DBE_UTILITY.IS_BIT_SET</a>           | Checks whether parameter <b>n</b> exists in <b>r</b> .                                                                     |
| <a href="#">DBE_UTILITY.IS_CLUSTER_DATABASE</a>  | Determines whether the current database is running in database cluster mode.                                               |
| <a href="#">DBE_UTILITY.NAME_REOLVE</a>          | Parses the given object name, including synonym translation and necessary authorization checks.                            |
| <a href="#">DBE_UTILITY.NAME_TOKENIZE</a>        | Parses the name in the <b>a [ . b [ . c ] ] [ @ dblink ]</b> format.                                                       |
| <a href="#">DBE_UTILITY.OLD_CURRENT_SCHEMA</a>   | Returns the name of the database schema in the current user environment.                                                   |
| <a href="#">DBE_UTILITY.OLD_CURRENT_USER</a>     | Returns the name of the current user.                                                                                      |

| Interface                                       | Description                                                                                                  |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <a href="#">DBE_UTILITY.TABLE_TO_COMMA</a>      | Converts a PL/SQL table of names into a comma-delimited string of names.                                     |
| <a href="#">DBE_UTILITY.GET_SQL_HASH_FUNC</a>   | Equivalent to DBE_UTILITY.GET_SQL_HASH. This function is used when <b>proc_outparam_override</b> is enabled. |
| DBE_UTILITY.EXPAND_SQL_TEXT                     | This is an internal function and is not recommended.                                                         |
| DBE_UTILITY.CANONICALIZE_RET                    | This is an internal function and is not recommended.                                                         |
| DBE_UTILITY.COMMA_TO_TABLE_FUNC                 | This is an internal function and is not recommended.                                                         |
| DBE_UTILITY.COMPILE_SCHEMA                      | This is an internal function and is not recommended.                                                         |
| DBE_UTILITY.NAME_SEPARATE                       | This is an internal function and is not recommended.                                                         |
| DBE_UTILITY.NAME_TO_KENIZE_FUNC                 | This is an internal function and is not recommended.                                                         |
| DBE_UTILITY.NAME_TO_KENIZE_LOWER                | This is an internal function and is not recommended.                                                         |
| DBE_UTILITY.NAME_TO_KENIZE_LOWER_FUNC           | This is an internal function and is not recommended.                                                         |
| DBE_UTILITY.PRIVILEGE_CHECK                     | This is an internal function and is not recommended.                                                         |
| DBE_UTILITY.SEARCH_CLASS_WITH_NSPOID_ONAME_TYPE | This is an internal function and is not recommended.                                                         |
| DBE_UTILITY.SEARCH_OBJECTS                      | This is an internal function and is not recommended.                                                         |
| DBE_UTILITY.SEARCH_OBJECTS_SYNONYM_FILL_SCHEMA  | This is an internal function and is not recommended.                                                         |
| DBE_UTILITY.SEARCH_PROCEDURE_WITH_NSPOID_ONAME  | This is an internal function and is not recommended.                                                         |
| DBE_UTILITY.SEARCH_SYNONYM_WITH_NSPOID_ONAME    | This is an internal function and is not recommended.                                                         |
| DBE_UTILITY.TABLE_TO_COMMA_FUNC                 | This is an internal function and is not recommended.                                                         |

| Interface             | Description                                          |
|-----------------------|------------------------------------------------------|
| DBE_UTILITY.USER_NAME | This is an internal function and is not recommended. |

- DBE\_UTILITY.FORMAT\_ERROR\_BACKTRACE**

Returns the call stack where an error occurs during execution. The prototype of the DBE\_UTILITY.FORMAT\_ERROR\_BACKTRACE function is as follows:

```
DBE_UTILITY.FORMAT_ERROR_BACKTRACE()
RETURN TEXT;
```
- DBE\_UTILITY.FORMAT\_ERROR\_STACK**

Returns the detailed information about the error location when an error occurs during the execution. The prototype of the DBE\_UTILITY.FORMAT\_ERROR\_STACK function is as follows:

```
DBE_UTILITY.FORMAT_ERROR_STACK()
RETURN TEXT;
```
- DBE\_UTILITY.FORMAT\_CALL\_STACK**

Sets the call stack of the output function. The prototype of the DBE\_UTILITY.FORMAT\_CALL\_STACK function is as follows:

```
DBE_UTILITY.FORMAT_CALL_STACK()
RETURN TEXT;
```
- DBE\_UTILITY.GET\_TIME**

Sets the output time, which is usually used for difference. A separate return value is meaningless. The prototype of the DBE\_UTILITY.GET\_TIME function is as follows:

```
DBE_UTILITY.GET_TIME()
RETURN BIGINT;
```
- DBE\_UTILITY.CANONICALIZE**

Canonicalizes the character string of a table name. The procedure handles a single reserved word or keyword, and removes white spaces for a single identifier so that "table" becomes TABLE. The prototype of the DBE\_UTILITY.CANONICALIZE function is as follows:

```
DBE_UTILITY.CANONICALIZE(
 name IN VARCHAR2,
 canon_name OUT VARCHAR2,
 canon_len IN BINARY_INTEGER
);
```

**Table 10-222** DBE\_UTILITY.CANONICALIZE parameters

| Parameter  | Description                           |
|------------|---------------------------------------|
| name       | Character string to be canonicalized. |
| canon_name | Canonicalized character string.       |

| Parameter | Description                                                                                                                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| canon_len | Length of the string to be canonicalized, in bytes. If the value of this parameter is less than the actual length (in bytes) of the character string to be standardized, the character string is truncated by byte. |

- DBEUTILITY.COMMA\_TO\_TABLE

Converts a comma-delimited string of names into a PL/SQL table of names. The prototype of the DBEUTILITY.COMMA\_TO\_TABLE function is as follows:

```
DBEUTILITY.COMMA_TO_TABLE (
 list IN VARCHAR2,
 tablen OUT BINARY_INTEGER,
 tab OUT uncl_array
);
```

**Table 10-223** DBEUTILITY.COMMA\_TO\_TABLE parameters

| Parameter | Description                                      |
|-----------|--------------------------------------------------|
| list      | A comma-delimited string of names.               |
| tablen    | Number of names in the PL/SQL table.             |
| tab       | PL/SQL table which contains the string of names. |

- DBEUTILITY.DB\_VERSION

Returns the version number and compatibility version number of the database. The prototype of the DBEUTILITY.DB\_VERSION function is as follows:

```
DBEUTILITY.DB_VERSION (
 version OUT VARCHAR2
);
```

**Table 10-224** DBEUTILITY.DB\_VERSION parameters

| Parameter | Description                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------|
| version   | Output parameter, which indicates the internal database software version. The value is a character string. |

- DBEUTILITY.EXEC\_DDL\_STATEMENT

Executes DDL statements entered by users. The prototype of the DBEUTILITY.EXEC\_DDL\_STATEMENT function is as follows:

```
DBE_UTILITY.EXEC_DDL_STATEMENT (
 parse_string IN VARCHAR2
);
```

**Table 10-225** DBE\_UTILITY.EXEC\_DDL\_STATEMENT parameters

| Parameter    | Description                    |
|--------------|--------------------------------|
| parse_string | DDL statements to be executed. |

- DBE\_UTILITY.EXPAND\_SQL\_TEXT\_PROC

Expands the view of the SQL query. It recursively expands the view objects in the view until a table is displayed. The function prototype of DBE\_UTILITY.EXPAND\_SQL\_TEXT\_PROC is as follows:

```
DBE_UTILITY.EXPAND_SQL_TEXT_PROC (
 input_sql_text IN CLOB,
 output_sql_text OUT NOCOPY CLOB
);
```

**Table 10-226** DBE\_UTILITY.EXPAND\_SQL\_TEXT\_PROC parameters

| Parameter       | Description                           |
|-----------------|---------------------------------------|
| input_sql_text  | Input SQL text.                       |
| output_sql_text | Output SQL text of the expanded view. |

 **NOTE**

In the **input\_sql\_text** parameter entered by a user, a schema prefix must be added to the object in the SQL statement. Otherwise, the function reports an error indicating that no object is found. If **set behavior\_compat\_options** is set to **bind\_procedure\_searchpath**, you do not need to forcibly specify the schema prefix.

- DBE\_UTILITY.GET\_CPU\_TIME

Returns the measured value of the current CPU processing time, in hundredths of a second. The prototype of the DBE\_UTILITY.GET\_CPU\_TIME function is as follows:

```
DBE_UTILITY.GET_CPU_TIME()
RETURN NUMBER;
```

- DBE\_UTILITY.GET\_ENDIANNES

Obtains the big-endian and little-endian information of the byte order on the platform where the database is located. DBE\_UTILITY. The prototype of the GET\_ENDIANNES function is as follows:

```
DBE_UTILITY.GET_ENDIANNES
RETURN INTEGER;
```

- DBE\_UTILITY.GET\_HASH\_VALUE

Returns the hash value of a given string. The prototype of the DBE\_UTILITY.GET\_HASH\_VALUE function is as follows:

```
DBE_UTILITY.GET_HASH_VALUE(
 name IN VARCHAR2(n),
```

```
base IN INTEGER,
hash_size IN INTEGER)
RETURN INTEGER;
```

**Table 10-227** DBE\_UTILITY.GET\_HASH\_VALUE parameters

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| name      | Character string to be hashed.                      |
| base      | Start value of the returned hash value.             |
| hash_size | Size of the hash table to which the hash is mapped. |

- DBE\_UTILITY.GET\_SQL\_HASH

Outputs the hash value of a given character string using the MD5 algorithm. The prototype of the DBE\_UTILITY.GET\_SQL\_HASH function is as follows:

```
DBE_UTILITY.GET_SQL_HASH(
name IN VARCHAR2,
hash OUT RAW,
last4bytes OUT BIGINT
);
```

**Table 10-228** DBE\_UTILITY.GET\_SQL\_HASH parameters

| Parameter  | Description                                                                       |
|------------|-----------------------------------------------------------------------------------|
| name       | Character string to be hashed.                                                    |
| hash       | Complete hexadecimal MD5 hash value.                                              |
| last4bytes | Last four bytes of the MD5 hash value, which is displayed as an unsigned integer. |

 **NOTE**

After setting **set behavior\_compat\_options** to a non-**proc\_outparam\_override** parameter, call the DBE\_UTILITY.GET\_SQL\_HASH function. If DBE\_UTILITY.GET\_SQL\_HASH\_FUNC is called, the value assignment fails.

- DBE\_UTILITY.IS\_BIT\_SET

Checks whether parameter **n** exists in **r**. DBE\_UTILITY. The prototype of the IS\_BIT\_SET function is as follows:

```
DBE_UTILITY.IS_BIT_SET (
r IN RAW,
n IN INTEGER)
RETURN INTEGER;
```

**Table 10-229** DBE\_UTILITY.IS\_BIT\_SET parameters

| Parameter | Description                                               |
|-----------|-----------------------------------------------------------|
| r         | 4 bytes plus the actual hexadecimal string.               |
| n         | Determines whether the value exists in the binary system. |

- DBE\_UTILITY.IS\_CLUSTER\_DATABASE

Determines whether the current database is running in database cluster mode. The prototype of the DBE\_UTILITY.IS\_CLUSTER\_DATABASE function is as follows:

```
DBE_UTILITY.IS_CLUSTER_DATABASE
RETURN BOOLEAN;
```

- DBE\_UTILITY.NAME\_RESOLVE

Parses the given object name, including synonym translation and necessary authorization checks. The prototype of the DBE\_UTILITY.NAME\_RESOLVE function is as follows:

```
DBE_UTILITY.NAME_RESOLVE (
 name IN VARCHAR2,
 context IN INTEGER,
 schema OUT VARCHAR2,
 part1 OUT VARCHAR2,
 part2 OUT VARCHAR2,
 dblink OUT VARCHAR2,
 part1_type OUT INTEGER,
 object_number OUT OID
);
```

**Table 10-230** DBE\_UTILITY.NAME\_RESOLVE parameters

| Parameter | Description                                                                         |
|-----------|-------------------------------------------------------------------------------------|
| name      | Name of the object to be parsed. The structure is [[a.]b.]c[@d].                    |
| context   | Start value of the returned hash value.                                             |
| schema    | Schema of an object.                                                                |
| part1     | First part of the name. The type of this column is specified by <b>part1_type</b> . |
| part2     | If this column is not empty, the value is the subprogram name.                      |
| dblink    | Database link.                                                                      |

| Parameter     | Description                                                                                                                                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| part1_type    | Part 1 types: <ul style="list-style-type: none"> <li>• 5: synonym</li> <li>• 7: procedure (top level)</li> <li>• 8: function (top level)</li> <li>• 9: package</li> </ul>                                                |
| object_number | Object ID. In database ORA, <b>object_number</b> is of the numeric type, indicating the object ID. In GaussDB, <b>object_number</b> is of the OID type and does not support implicit conversion from a number to an OID. |

- DBE\_UTILITY.NAME\_TOKENIZE

Parses names in the **a [. b [. c ]][@ dblink ]** format. If a name contains double quotation marks, the double quotation marks are deleted. Otherwise, the name becomes uppercase letters. The prototype of the DBE\_UTILITY.NAME\_TOKENIZE function is as follows:

```
DBE_UTILITY.NAME_TOKENIZE (
name IN VARCHAR2,
a OUT VARCHAR2,
b OUT VARCHAR2,
c OUT VARCHAR2,
dblink OUT VARCHAR2,
nextpos OUT INTEGER
);
```

**Table 10-231** DBE\_UTILITY.NAME\_TOKENIZE parameters

| Parameter | Description                                                                  |
|-----------|------------------------------------------------------------------------------|
| name      | Name, consisting of SQL identifiers (for example, <b>scott.foo@dblink</b> ). |
| a         | First token of the name.                                                     |
| b         | Second token of the name.                                                    |
| c         | Third token of the name.                                                     |
| dblink    | Database link.                                                               |
| nextpos   | Next position of a parsed character string.                                  |

- DBE\_UTILITY.OLD\_CURRENT\_SCHEMA

Returns the name of the database schema in the current user environment. The prototype of the DBE\_UTILITY.OLD\_CURRENT\_SCHEMA function is as follows:

```
DBE_UTILITY.OLD_CURRENT_SCHEMA()
RETURN VARCHAR;
```

- DBE\_UTILITY.OLD\_CURRENT\_USER

Returns the name of the current user. The prototype of the DBE\_UTILITY.OLD\_CURRENT\_USER function is as follows:

```
DBE_UTILITY.OLD_CURRENT_USER()
RETURN VARCHAR2;
```

- DBE\_UTILITY.TABLE\_TO\_COMMA

Converts a PL/SQL table of names into a comma-delimited string of names. The prototype of the DBE\_UTILITY.TABLE\_TO\_COMMA function is as follows:

```
DBE_UTILITY.TABLE_TO_COMMA (
 tab IN UNCL_ARRAY,
 tablen OUT BINARY_INTEGER,
 list OUT VARCHAR2
);
```

**Table 10-232** DBE\_UTILITY.TABLE\_TO\_COMMA parameters

| Parameter | Description                                      |
|-----------|--------------------------------------------------|
| tab       | PL/SQL table which contains the string of names. |
| tablen    | Number of names in the PL/SQL table.             |
| list      | A comma-delimited string of names.               |

- DBE\_UTILITY.GET\_SQL\_HASH\_FUNC

Uses the MD5 algorithm to output the hash value of a given character string. The function prototype of DBE\_UTILITY.GET\_SQL\_HASH\_FUNC is:

```
DBE_UTILITY.GET_SQL_HASH_FUNC(
 name IN VARCHAR2,
 hash OUT RAW,
 last4bytes OUT BIGINT
);
```

**Table 10-233** DBE\_UTILITY.GET\_SQL\_HASH\_FUNC parameters

| Parameter  | Description                                                                       |
|------------|-----------------------------------------------------------------------------------|
| name       | Character string to be hashed.                                                    |
| hash       | Complete hexadecimal MD5 hash value.                                              |
| last4bytes | Last four bytes of the MD5 hash value, which is displayed as an unsigned integer. |

 **NOTE**

After setting **set behavior\_compat\_options** to 'proc\_outparam\_override', invoke the DBE\_UTILITY.GET\_SQL\_HASH\_FUNC function. If you invoke the DBE\_UTILITY.GET\_SQL\_HASH function, a parameter mismatch error is reported.

## Examples

```
CREATE OR REPLACE PROCEDURE test_get_time1 ()
AS
declare
 start_time bigint;
 end_time bigint;
BEGIN
 start_time:= dbe_utility.get_time ();
 pg_sleep(1);
 end_time:=dbe_utility.get_time ();
 dbe_output.print_line(end_time - start_time);
END;
/
-- Canonicalize the character string of a table name.
declare
 cname varchar2(50);
begin
 dbe_utility.canonicalize('seg1', cname, 50);
 dbe_output.put_line(cname);
end;
/
-- Convert the input character string into an array of table names.
DECLARE
tab_list VARCHAR2(100) := 't1,t2';
len BINARY_INTEGER;
tab DBMS_UTILITY.LNAME_ARRAY;
BEGIN
dbe_output.put_line('table list is : ' || tab_list);
dbe_utility.comma_to_table(tab_list, len, tab);
END;
/
-- Check the version number and compatibility version number of the database.
declare
 v_version varchar2;
begin
 dbe_utility.db_version(v_version);
 v_version:=left(v_version, 8);
 dbe_output.print_line('version:' || v_version);
end;
/
-- Check the measured value of the current CPU processing time.
DECLARE
 cputime NUMBER;
BEGIN
 cputime := dbe_utility.get_cpu_time;
 dbe_output.put_line('cpu time:' || cputime);
END;
/
-- Obtain the big-endian and little-endian information of the byte order on the platform where the
database is located.
BEGIN
 dbe_output.PUT_LINE(dbe_utility.GET_ENDIANNES);
END;
/
-- Obtain the hash value of a given string.
DECLARE
 result NUMBER(28);
BEGIN
 result := dbe_utility.get_hash_value('hello',10,10);
 dbe_output.put_line(result);
END;
/
-- Check whether the current database is in cluster mode.
DECLARE
 is_cluster BOOLEAN;
BEGIN
 is_cluster := dbe_utility.IS_CLUSTER_DATABASE;
 dbe_output.put_line('CLUSTER DATABASE: ' || CASE WHEN is_cluster THEN 'TRUE' ELSE 'FALSE' END);
END;
```

```

/
-- Obtain the name of the database schema in the current user environment.
DECLARE
 schm varchar2(100);
BEGIN
 schm := dbe_utility.old_current_schema;
 dbe_output.put_line('current schema: ' || schm);
END;
/
-- Obtain the current username.
select dbe_utility.old_current_user from sys_dummy;

```

### 10.12.2.7 DBE\_SQL

#### Interface Description

**Table 10-234** lists APIs supported by the **DBE\_SQL** package.

**Table 10-234** DBE\_SQL

| Interface                                       | Description                                                     |
|-------------------------------------------------|-----------------------------------------------------------------|
| <a href="#">DBE_SQL.REGISTER_CONTEXT</a>        | Opens a cursor.                                                 |
| <a href="#">DBE_SQL.SQL_UNREGISTER_CONTEXT</a>  | Closes an open cursor.                                          |
| <a href="#">DBE_SQL.SQL_SET_SQL</a>             | Passes a set of SQL statements or anonymous blocks to a cursor. |
| <a href="#">DBE_SQL.SQL_RUN</a>                 | Executes SQL statements or anonymous blocks in a given cursor.  |
| <a href="#">DBE_SQL.NEXT_ROW</a>                | Reads a row of cursor data.                                     |
| <a href="#">DBE_SQL.SET_RESULT_TYPE</a>         | Dynamically defines a column.                                   |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_CHAR</a>    | Dynamically defines a column of the CHAR type.                  |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_INT</a>     | Dynamically defines a column of the INT type.                   |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_LONG</a>    | Dynamically defines a column of the LONG type.                  |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_RAW</a>     | Dynamically defines a column of the RAW type.                   |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_TEXT</a>    | Dynamically defines a column of the TEXT type.                  |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_UNKNOWN</a> | Dynamically defines a column of an unknown type.                |
| <a href="#">DBE_SQL.GET_RESULT</a>              | Reads a dynamically defined column value.                       |

| Interface                                       | Description                                                                                       |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------|
| <a href="#">DBE_SQL.GET_RESULT_CHAR</a>         | Reads a dynamically defined column value of the CHAR type.                                        |
| <a href="#">DBE_SQL.GET_RESULT_INT</a>          | Reads a dynamically defined column value of the INT type.                                         |
| <a href="#">DBE_SQL.GET_RESULT_LONG</a>         | Reads a dynamically defined column value of the LONG type.                                        |
| <a href="#">DBE_SQL.GET_RESULT_RAW</a>          | Reads a dynamically defined column value of the RAW type.                                         |
| <a href="#">DBE_SQL.GET_RESULT_TEXT</a>         | Reads a dynamically defined column value of the TEXT type.                                        |
| <a href="#">DBE_SQL.GET_RESULT_UNKNOWN</a>      | Reads a dynamically defined column value of an unknown type.                                      |
| <a href="#">DBE_SQL.DBE_SQL_GET_RESULT_CHAR</a> | Reads a dynamically defined column value of the <b>CHAR</b> type.                                 |
| <a href="#">DBE_SQL.DBE_SQL_GET_RESULT_LONG</a> | Reads a dynamically defined column value of the <b>LONG</b> type.                                 |
| <a href="#">DBE_SQL.DBE_SQL_GET_RESULT_RAW</a>  | Reads a dynamically defined column value of the RAW type.                                         |
| <a href="#">DBE_SQL.IS_ACTIVE</a>               | Checks whether a cursor is opened.                                                                |
| <a href="#">DBE_SQL.LAST_ROW_COUNT</a>          | Returns the cumulative count of obtained rows.                                                    |
| <a href="#">DBE_SQL.RUN_AND_NEXT</a>            | Reads data of a cursor after a set of dynamically defined operations are performed on the cursor. |
| <a href="#">DBE_SQL.SQL_BIND_VARIABLE</a>       | Binds a value to a variable in a statement.                                                       |
| <a href="#">DBE_SQL.SQL_BIND_ARRAY</a>          | Binds a group of values to a variable in a statement.                                             |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_INTS</a>    | Dynamically defines a column of the <b>INT</b> array type.                                        |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_TEXTS</a>   | Dynamically defines a column of the <b>TEXT</b> array type.                                       |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_RAWS</a>    | Dynamically defines a column of the <b>RAW</b> array type.                                        |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_BYTES</a>   | Dynamically defines a column of the <b>BYTEA</b> array type.                                      |
| <a href="#">DBE_SQL.SET_RESULT_TYPE_CHARS</a>   | Dynamically defines a column of the <b>CHAR</b> array type.                                       |

| Interface                                        | Description                                                              |
|--------------------------------------------------|--------------------------------------------------------------------------|
| <a href="#">DBE_SQL.SET_RESULTS_TYPE</a>         | Dynamically defines a column of the array type.                          |
| <a href="#">DBE_SQL.GET_RESULTS_INT</a>          | Reads a dynamically defined column value of the <b>INT</b> array type.   |
| <a href="#">DBE_SQL.GET_RESULTS_TEXT</a>         | Reads a dynamically defined column value of the <b>TEXT</b> array type.  |
| <a href="#">DBE_SQL.GET_RESULTS_RAW</a>          | Reads a dynamically defined column value of the <b>RAW</b> array type.   |
| <a href="#">DBE_SQL.GET_RESULTS_BYTEA</a>        | Reads a dynamically defined column value of the <b>BYTEA</b> array type. |
| <a href="#">DBE_SQL.GET_RESULTS_CHAR</a>         | Reads a dynamically defined column value of the <b>CHAR</b> array type.  |
| <a href="#">DBE_SQL.GET_RESULTS</a>              | Reads a dynamically defined column value.                                |
| <a href="#">DBE_SQL.DESCRIBE_COLUMNS</a>         | Describes the column information read by the cursor.                     |
| <a href="#">DBE_SQL.SQL_DESCRIBE_COLUMNS</a>     | Describes the column information read by the cursor.                     |
| <a href="#">DBE_SQL.BIND_VARIABLE</a>            | Binds parameters.                                                        |
| <a href="#">DBE_SQL.SQL_SET_RESULTS_TYPE_C</a>   | Dynamically defines a column of the array type.                          |
| <a href="#">DBE_SQL.SQL_GET_VALUES_C</a>         | Reads a dynamically defined column value.                                |
| <a href="#">DBE_SQL.GET_VARIABLE_RESULT</a>      | Reads the return value of an SQL statement.                              |
| <a href="#">DBE_SQL.GET_VARIABLE_RESULT_CHAR</a> | Reads the return value (of the char type) of an SQL statement.           |
| <a href="#">DBE_SQL.GET_VARIABLE_RESULT_RAW</a>  | Reads the return value (of the raw type) of an SQL statement.            |
| <a href="#">DBE_SQL.GET_VARIABLE_RESULT_TEXT</a> | Reads the return value (of the text type) of an SQL statement.           |
| <a href="#">DBE_SQL.GET_VARIABLE_RESULT_INT</a>  | Reads the return value (of the int type) of an SQL statement.            |
| <a href="#">DBE_SQL.GET_ARRAY_RESULT_TEXT</a>    | Reads the return value (of the text array type) of an SQL statement.     |
| <a href="#">DBE_SQL.GET_ARRAY_RESULT_RAW</a>     | Reads the return value (of the raw array type) of an SQL statement.      |

| Interface                                     | Description                                                          |
|-----------------------------------------------|----------------------------------------------------------------------|
| <a href="#">DBE_SQL.GET_ARRAY_RESULT_CHAR</a> | Reads the return value (of the char array type) of an SQL statement. |
| <a href="#">DBE_SQL.GET_ARRAY_RESULT_INT</a>  | Reads the return value (of the int array type) of an SQL statement.  |

 NOTE

- You are advised to use `dbe_sql.set_result_type` and `dbe_sql.get_result` to define columns.
- If the size of the result set is greater than the value of `work_mem`, the result set will be spilled to a disk temporarily. The value of `work_mem` must be no greater than 512 MB.
- DBE\_SQL.REGISTER\_CONTEXT**  
This function opens a cursor, which is the prerequisite for the subsequent `dbe_sql` operations. This function does not transfer any parameter. It automatically generates cursor IDs in an ascending order and returns values to integer variables.

 CAUTION

Cursors opened by DBE\_SQL are session-level variables. Cross-session invoking of opened cursors (such as autonomous transactions) is not supported. If a cross-session cursor is invoked, the behavior is unpredictable.

The prototype of the DBE\_SQL.REGISTER\_CONTEXT function is as follows:

```
DBE_SQL.REGISTER_CONTEXT(
)
RETURN INTEGER;
```

- DBE\_SQL.SQL\_UNREGISTER\_CONTEXT**  
This function closes a cursor, which is the end of each `dbe_sql` operation. If this function is not called when the stored procedure ends, the memory is still occupied by the cursor. Therefore, remember to close a cursor when you do not need to use it. If an exception occurs, the stored procedure exits but the cursor is not closed. Therefore, you are advised to include this interface in the exception handling of the stored procedure.

The prototype of the **DBE\_SQL.SQL\_UNREGISTER\_CONTEXT** function is as follows:

```
DBE_SQL.SQL_UNREGISTER_CONTEXT(
 context_id IN INTEGER
)
RETURN INTEGER;
```

**Table 10-235** DBE\_SQL.SQL\_UNREGISTER\_CONTEXT interface parameters

| Parameter  | Description                   |
|------------|-------------------------------|
| context_id | ID of the cursor to be closed |

- **DBE\_SQL.SQL\_SET\_SQL**

Parses SQL statements or anonymous blocks in a given cursor. The statement parameters can be transferred only through the **TEXT** type. The length cannot exceed 1 GB.

The prototype of the **DBE\_SQL.SQL\_SET\_SQL** function is as follows:

```
DBE_SQL.SQL_SET_SQL(
 context_id IN INTEGER,
 query_string IN TEXT,
 language_flag IN INTEGER
)
RETURN BOOLEAN;
```

**Table 10-236** DBE\_SQL.SQL\_SET\_SQL interface parameters

| Parameter     | Description                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------------------|
| context_id    | ID of the cursor whose query statement is to be parsed                                                                         |
| query_string  | Query statement to be parsed                                                                                                   |
| language_flag | Version language. The value <b>1</b> indicates an incompatible version, and the value <b>2</b> indicates a compatible version. |

- **DBE\_SQL.SQL\_RUN**

This function executes a given cursor. This function receives a cursor ID and executes SQL statements or anonymous blocks in a given cursor.

The prototype of the **DBE\_SQL.SQL\_RUN** function is as follows:

```
DBE_SQL.SQL_RUN(
 context_id IN INTEGER,
)
RETURN INTEGER;
```

**Table 10-237** DBE\_SQL.SQL\_RUN interface parameters

| Parameter  | Description                                            |
|------------|--------------------------------------------------------|
| context_id | ID of the cursor whose query statement is to be parsed |

- **DBE\_SQL.NEXT\_ROW**

This function returns the number of data rows that meet query conditions. Each time the interface is executed, the system obtains a set of new rows until all data is read.

The prototype of the **DBE\_SQL.NEXT\_ROW** function is as follows:

```
DBE_SQL.NEXT_ROW(
 context_id IN INTEGER,
)
RETURN INTEGER;
```

**Table 10-238** DBE\_SQL.NEXT\_ROW interface parameters

| Parameter  | Description                     |
|------------|---------------------------------|
| context_id | ID of the cursor to be executed |

- **DBE\_SQL.SET\_RESULT\_TYPE**

This function defines columns returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE(
 context_id IN INTEGER,
 pos IN INTEGER,
 column_ref IN ANYELEMENT,
 maxsize IN INTEGER default 1024
)
RETURN INTEGER;
```

**Table 10-239** DBE\_SQL.SET\_RESULT\_TYPE interface parameters

| Parameter  | Description                                                                                                          |
|------------|----------------------------------------------------------------------------------------------------------------------|
| context_id | ID of the cursor to be executed                                                                                      |
| pos        | Relative position of the queried columns in the returned result. The value starts from 1.                            |
| column_ref | Variable of any type. You can select an appropriate interface to dynamically define columns based on variable types. |
| maxsize    | Length of the defined column return type.                                                                            |

- **DBE\_SQL.SET\_RESULT\_TYPE\_CHAR**

This function defines columns of the **CHAR** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_CHAR** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_CHAR(
 context_id IN INTEGER,
 pos IN INTEGER,
 column_ref IN TEXT,
 column_size IN INTEGER
)
RETURN INTEGER;
```

**Table 10-240** DBE\_SQL.SET\_RESULT\_TYPE\_CHAR interface parameters

| Parameter  | Description                     |
|------------|---------------------------------|
| context_id | ID of the cursor to be executed |

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| pos         | Position of a dynamically defined column in the query |
| column_ref  | Parameter to be defined                               |
| column_size | Length of a dynamically defined column                |

- **DBE\_SQL.SET\_RESULT\_TYPE\_INT**

This function defines columns of the **INT** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_INT** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_INT(
 context_id IN INTEGER,
 pos IN INTEGER
)
RETURN INTEGER;
```

**Table 10-241** DBE\_SQL.SET\_RESULT\_TYPE\_INT interface parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

- **DBE\_SQL.SET\_RESULT\_TYPE\_LONG**

This function defines columns of a long type (not **LONG**) returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type. The maximum size of a long column is 1 GB.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_LONG** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_LONG(
 context_id IN INTEGER,
 pos IN INTEGER
)
RETURN INTEGER;
```

**Table 10-242** DBE\_SQL.SET\_RESULT\_TYPE\_LONG interface parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

- DBE\_SQL.SET\_RESULT\_TYPE\_RAW

This function defines columns of the **RAW** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_RAW** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_RAW(
 context_id IN INTEGER,
 pos IN INTEGER,
 column_ref IN RAW,
 column_size IN INTEGER
)
RETURN INTEGER;
```

**Table 10-243** DBE\_SQL.SET\_RESULT\_TYPE\_RAW interface parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| context_id  | ID of the cursor to be executed                       |
| pos         | Position of a dynamically defined column in the query |
| column_ref  | RAW variable                                          |
| column_size | Column length                                         |

- DBE\_SQL.SET\_RESULT\_TYPE\_TEXT

This function defines columns of the **TEXT** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_TEXT** function is as follows:

```
DBE_SQL.DEFINE_COLUMN_CHAR(
 context_id IN INTEGER,
 pos IN INTEGER,
 maxsize IN INTEGER
)
RETURN INTEGER;
```

**Table 10-244** DBE\_SQL.SET\_RESULT\_TYPE\_TEXT interface parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |
| maxsize    | Maximum length of the defined TEXT type               |

- DBE\_SQL.SET\_RESULT\_TYPE\_UNKNOWN

This function processes columns of unknown data types returned from a given cursor. It is used only for the system to report an error and exist when the type cannot be identified.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_UNKNOWN** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_UNKNOWN(
 context_id IN INTEGER,
 pos IN INTEGER,
 col_type IN TEXT
)
RETURN INTEGER;
```

**Table 10-245** DBE\_SQL.SET\_RESULT\_TYPE\_UNKNOWN interface parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| posn       | Position of a dynamically defined column in the query |
| col_type   | Dynamically defined parameter                         |

- **DBE\_SQL.GET\_RESULT**

This function returns the cursor element value in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULT** function is as follows:

```
DBE_SQL.GET_RESULT(
 context_id IN INTEGER,
 pos IN INTEGER,
 column_value INOUT ANYELEMENT
)
RETURN ANYELEMENT;
```

**Table 10-246** DBE\_SQL.GET\_RESULT interface parameters

| Parameter    | Description                                                                               |
|--------------|-------------------------------------------------------------------------------------------|
| context_id   | ID of the cursor to be executed                                                           |
| pos          | Relative position of the queried columns in the returned result. The value starts from 1. |
| column_value | Return value of a defined column                                                          |

- **DBE\_SQL.GET\_RESULT\_CHAR**

This stored procedure returns the value of the **CHAR** type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULT\_CHAR** function is as follows:

```
DBE_SQL.GET_RESULT_CHAR(
 context_id IN INTEGER,
 pos IN INTEGER,
 tr INOUT CHARACTER,
 err INOUT NUMERIC,
 actual_length INOUT INTEGER
);
```

**Table 10-247** DBE\_SQL.GET\_RESULT\_CHAR interface parameters

| Parameter     | Description                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| context_id    | ID of the cursor to be executed                                                                                                                          |
| pos           | Position of a dynamically defined column in the query                                                                                                    |
| tr            | Return value                                                                                                                                             |
| err           | Error No. It is an output parameter. The input parameter must be a variable. Currently, the output value is <b>-1</b> regardless of the input parameter. |
| actual_length | Length of a return value                                                                                                                                 |

The overloaded function of the **DBE\_SQL.GET\_RESULT\_CHAR** function is as follows:

```
DBE_SQL.GET_RESULT_CHAR(
 context_id IN INTEGER,
 pos IN INTEGER,
 tr INOUT CHARACTER
);
```

**Table 10-248** DBE\_SQL.GET\_RESULT\_CHAR interface parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |
| tr         | Return value                                          |

- **DBE\_SQL.GET\_RESULT\_INT**

This function returns the value of the **INT** type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**. The prototype of the **DBE\_SQL.GET\_RESULT\_INT** function is as follows:

```
DBE_SQL.GET_RESULT_INT(
 context_id IN INTEGER,
 pos IN INTEGER
)
RETURN INTEGER;
```

**Table 10-249** DBE\_SQL.GET\_RESULT\_INT interface parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

- **DBE\_SQL.GET\_RESULT\_LONG**

This function returns the value of a long type (not **LONG** or **BIGINT**) in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULT\_LONG** function is as follows:

```
DBE_SQL.GET_RESULT_LONG(
 context_id IN INTEGER,
 pos IN INTEGER,
 lgth IN INTEGER,
 off_set IN INTEGER,
 vl INOUT TEXT,
 vl_length INOUT INTEGER
)
RETURN RECORD;
```

**Table 10-250** DBE\_SQL.GET\_RESULT\_LONG interface parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |
| lgth       | Length of a return value                              |
| off_set    | Start position of a return value                      |
| vl         | Return value                                          |
| vl_length  | Length of a return value                              |

- **DBE\_SQL.GET\_RESULT\_RAW**

Returns the value of the RAW type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULT\_RAW** stored procedure is as follows:

```
DBE_SQL.GET_RESULT_RAW(
 context_id IN INTEGER,
 pos IN INTEGER,
 tr INOUT RAW,
 err INOUT NUMERIC,
 actual_length INOUT INTEGER
);
```

**Table 10-251** DBE\_SQL.GET\_RESULT\_RAW interface parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |
| tr         | Returned column value                                 |

| Parameter     | Description                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| err           | Error No. It is an output parameter. The input parameter must be a variable. Currently, the output value is <b>-1</b> regardless of the input parameter. |
| actual_length | Length of a return value. The value longer than this length will be truncated.                                                                           |

The overloaded function of the **DBE\_SQL.GET\_RESULT\_RAW** function is as follows:

```
DBE_SQL.GET_RESULT_RAW(
 context_id IN INTEGER,
 pos IN INTEGER,
 tr INOUT RAW
);
```

**Table 10-252** DBE\_SQL.GET\_RESULT\_RAW interface parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |
| tr         | Returned column value                                 |

- **DBE\_SQL.GET\_RESULT\_TEXT**

This function returns the value of the **TEXT** type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULT\_TEXT** function is as follows:

```
DBE_SQL.GET_RESULT_TEXT(
 context_id IN INTEGER,
 pos IN INTEGER
)
RETURN TEXT;
```

**Table 10-253** DBE\_SQL.GET\_RESULT\_TEXT interface parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

- **DBE\_SQL.GET\_RESULT\_UNKNOWN**

This function returns the value of an unknown type in a specified position of a cursor. It serves as an error handling interface when the type is not unknown.

The prototype of the **DBE\_SQL.GET\_RESULT\_UNKNOWN** function is as follows:

```
DBE_SQL.GET_RESULT_UNKNOWN(
 context_id IN INTEGER,
 pos IN INTEGER,
 col_type IN TEXT
)
RETURN TEXT;
```

**Table 10-254** DBE\_SQL.GET\_RESULT\_UNKNOWN interface parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |
| col_type   | Returned parameter type                               |

- DBE\_SQL.DBE\_SQL\_GET\_RESULT\_CHAR

This function returns the value of the **CHAR** type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**. Different from **DBE\_SQL.GET\_RESULT\_CHAR**, the length of the return value is not set and the entire string is returned.

The prototype of the **DBE\_SQL.DBE\_SQL\_GET\_RESULT\_CHAR** function is as follows:

```
DBE_SQL.DBE_SQL_GET_RESULT_CHAR(
 context_id IN INTEGER,
 pos IN INTEGER
)
RETURN CHARACTER;
```

**Table 10-255** DBE\_SQL.DBE\_SQL\_GET\_RESULT\_CHAR interface parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

- DBE\_SQL.DBE\_SQL\_GET\_RESULT\_LONG

This function returns the value of a long type (not **LONG** or **BIGINT**) in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

Different from **DBE\_SQL.GET\_RESULT\_LONG**, the length of the return value is not set and the entire **BIGINT** value is returned.

The prototype of the **DBE\_SQL.DBE\_SQL\_GET\_RESULT\_LONG** function is as follows:

```
DBE_SQL.DBE_SQL_GET_RESULT_LONG(
 context_id IN INTEGER,
 pos IN INTEGER
)
RETURN BIGINT;
```

**Table 10-256** DBE\_SQL.DBE\_SQL\_GET\_RESULT\_LONG interface parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

- DBE\_SQL.DBE\_SQL\_GET\_RESULT\_RAW

This function returns the value of the **RAW** type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

Different from **DBE\_SQL.GET\_RESULT\_RAW**, the length of the return value is not set and the entire string is returned.

The prototype of the **DBE\_SQL.DBE\_SQL\_GET\_RESULT\_RAW** function is as follows:

```
DBE_SQL.GET_RESULT_RAW(
 context_id IN INTEGER,
 pos IN INTEGER,
 tr INOUT RAW
)
RETURN RAW;
```

**Table 10-257** DBE\_SQL.GET\_RESULT\_RAW interface parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be executed                       |
| pos        | Position of a dynamically defined column in the query |

- DBE\_SQL.IS\_ACTIVE

This function returns the status of a cursor. The status can be **open**, **parse**, **execute**, or **define**. If the status is **open**, the value is **TRUE**. If the status is unknown, an error is reported. In other cases, the value is **FALSE**.

The prototype of the **DBE\_SQL.IS\_ACTIVE** function is as follows:

```
DBE_SQL.IS_ACTIVE(
 context_id IN INTEGER
)
RETURN BOOLEAN;
```

**Table 10-258** DBE\_SQL.IS\_ACTIVE interface parameters

| Parameter  | Description                    |
|------------|--------------------------------|
| context_id | ID of the cursor to be queried |

- DBE\_SQL.LAST\_ROW\_COUNT

Returns the accumulated count of data rows obtained after the latest **NEXT\_ROW** execution.

The prototype of the **DBE\_SQL.LAST\_ROW\_COUNT** function is as follows:

```
DBE_SQL.LAST_ROW_COUNT(
)
RETURN INTEGER;
```

- **DBE\_SQL.RUN\_AND\_NEXT**

Equivalent to invoking SQL\_RUN and NEXT\_ROW in sequence.

The prototype of the DBE\_SQL.RUN\_AND\_NEXT function is as follows:

```
DBE_SQL.RUN_AND_NEXT(
 context_id IN INTEGER
)
RETURNS INTEGER;
```

**Table 10-259** DBE\_SQL.RUN\_AND\_NEXT parameters

| Parameter  | Description                                            |
|------------|--------------------------------------------------------|
| context_id | ID of the cursor whose query statement is to be parsed |

- **DBE\_SQL.SQL\_BIND\_VARIABLE**

This function is used to bind a parameter to an SQL statement. When an SQL statement is executed, the SQL statement is executed based on the bound value.

The prototype of the **DBE\_SQL.SQL\_BIND\_VARIABLE** function is as follows:

```
DBE_SQL.SQL_BIND_VARIABLE(
 context_id IN int,
 query_string IN text,
 value IN anyelement,
 out_value_size IN int default null
)
RETURNS void;
```

**Table 10-260** DBE\_SQL.SQL\_BIND\_VARIABLE interface parameters

| Parameter      | Description                                            |
|----------------|--------------------------------------------------------|
| context_id     | ID of the cursor to be queried                         |
| query_string   | Name of the bound variable                             |
| value          | Bound value                                            |
| out_value_size | Size of the return value. Default value: <b>null</b> . |

- **DBE\_SQL.SQL\_BIND\_ARRAY**

This function is used to bind a set of parameters to an SQL statement. When an SQL statement is executed, the SQL statement is executed based on the bound array.

The prototype of the **DBE\_SQL.SQL\_BIND\_ARRAY** function is as follows:

```
DBE_SQL.SQL_BIND_ARRAY(
 context_id IN int,
 query_string IN text,
 value IN anyarray
)
RETURNS void;
DBE_SQL.SQL_BIND_ARRAY(
```

```

context_id IN int,
query_string IN text,
value IN anyarray,
lower_index IN int,
higher_index IN int
)
RETURNS void;

```

**Table 10-261** DBE\_SQL.SQL\_BIND\_ARRAY interface parameters

| Parameter    | Description                          |
|--------------|--------------------------------------|
| context_id   | ID of the cursor to be queried       |
| query_string | Name of the bound variable           |
| value        | Bound array                          |
| lower_index  | Minimum subscript of the bound array |
| higher_index | Maximum subscript of the bound array |

- DBE\_SQL.SET\_RESULT\_TYPE\_INTS

This function defines columns of the **INT** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_INTS** function is as follows:

```

DBE_SQL.SET_RESULT_TYPE_INTS(
context_id IN int,
pos IN int,
column_ref IN anyarray,
cnt IN int,
lower_bnd IN int
)
RETURNS integer;

```

**Table 10-262** DBE\_SQL.SET\_RESULT\_TYPE\_INTS interface parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be queried                        |
| pos        | Position of a dynamically defined column in the query |
| column_ref | Type of the returned array                            |
| cnt        | Number of values obtained at a time                   |
| lower_bnd  | Start subscript when an array is returned             |

- DBE\_SQL.SET\_RESULT\_TYPE\_TEXTS

This function defines columns of the **TEXT** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined

columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_TEXTS** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_TEXTS(
 context_id IN int,
 pos IN int,
 column_ref IN anyarray,
 cnt IN int,
 lower_bnd IN int,
 maxsize IN int
)
RETURNS integer;
```

**Table 10-263** DBE\_SQL.SET\_RESULT\_TYPE\_TEXTS interface parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be queried                        |
| pos        | Position of a dynamically defined column in the query |
| column_ref | Type of the returned array                            |
| cnt        | Number of values obtained at a time                   |
| lower_bnd  | Start subscript when an array is returned             |
| maxsize    | Maximum length of the defined TEXT type               |

- **DBE\_SQL.SET\_RESULT\_TYPE\_RAWS**

This function defines columns of the **RAW** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_RAWS** function is as follows:

```
DBE_SQL.set_result_type_raws(
 context_id IN int,
 pos IN int,
 column_ref IN anyarray,
 cnt IN int,
 lower_bnd IN int,
 column_size IN int
)
RETURNS integer;
```

**Table 10-264** DBE\_SQL.SET\_RESULT\_TYPE\_RAWS interface parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be queried                        |
| pos        | Position of a dynamically defined column in the query |
| column_ref | Type of the returned array                            |

| Parameter   | Description                               |
|-------------|-------------------------------------------|
| cnt         | Number of values obtained at a time       |
| lower_bnd   | Start subscript when an array is returned |
| column_size | Column length                             |

- **DBE\_SQL.SET\_RESULT\_TYPE\_BYTEAS**

This function defines columns of the **BYTEA** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_BYTEAS** function is as follows:

```
DBE_SQL.set_result_type_byteas(
 context_id IN int,
 pos IN int,
 column_ref IN anyarray,
 cnt IN int,
 lower_bnd IN int,
 column_size IN int
)
RETURNS integer;
```

**Table 10-265** DBE\_SQL.SET\_RESULT\_TYPE\_BYTEAS interface parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| context_id  | ID of the cursor to be queried                        |
| pos         | Position of a dynamically defined column in the query |
| column_ref  | Type of the returned array                            |
| cnt         | Number of values obtained at a time                   |
| lower_bnd   | Start subscript when an array is returned             |
| column_size | Column length                                         |

- **DBE\_SQL.SET\_RESULT\_TYPE\_CHARS**

This function defines columns of the **CHAR** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_CHARS** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_CHARS(
 context_id IN int,
 pos IN int,
 column_ref IN anyarray,
 cnt IN int,
 lower_bnd IN int,
 column_size IN int
```

```
)
RETURNS integer;
```

**Table 10-266** DBE\_SQL.SET\_RESULT\_TYPE\_CHARS interface parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| context_id  | ID of the cursor to be queried                        |
| pos         | Position of a dynamically defined column in the query |
| column_ref  | Type of the returned array                            |
| cnt         | Number of values obtained at a time                   |
| lower_bnd   | Start subscript when an array is returned             |
| column_size | Column length                                         |

- DBE\_SQL.SET\_RESULTS\_TYPE

This function defines columns returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULTS\_TYPE** function is as follows:

```
DBE_SQL.SET_RESULTS_TYPE(
 context_id IN int,
 pos IN int,
 column_ref IN anyarray,
 cnt IN int,
 lower_bnd IN int,
 maxsize IN int DEFAULT 1024
) returns void;
```

**Table 10-267** DBE\_SQL.SET\_RESULTS\_TYPE interface parameters

| Parameter  | Description                                           |
|------------|-------------------------------------------------------|
| context_id | ID of the cursor to be queried                        |
| pos        | Position of a dynamically defined column in the query |
| column_ref | Type of the returned array                            |
| cnt        | Number of values obtained at a time                   |
| lower_bnd  | Start subscript when an array is returned             |
| maxsize    | Maximum length of the defined type                    |

- DBE\_SQL.GET\_RESULTS\_INT

This function returns the value of the **INT** array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULTS\_INT** function is as follows:

```
DBE_SQL.GET_RESULTS_INT(
 context_id IN int,
 pos IN int,
 column_value INOUT anyarray
);
```

**Table 10-268** DBE\_SQL.GET\_RESULTS\_INT interface parameters

| Parameter    | Description                                           |
|--------------|-------------------------------------------------------|
| context_id   | ID of the cursor to be queried                        |
| pos          | Position of a dynamically defined column in the query |
| column_value | Return value                                          |

- DBE\_SQL.GET\_RESULTS\_TEXT

This function returns the value of the **TEXT** array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULTS\_TEXT** function is as follows:

```
DBE_SQL.GET_RESULTS_TEXT(
 context_id IN int,
 pos IN int,
 column_value INOUT anyarray
);
```

**Table 10-269** DBE\_SQL.GET\_RESULTS\_TEXT interface parameters

| Parameter    | Description                                           |
|--------------|-------------------------------------------------------|
| context_id   | ID of the cursor to be queried                        |
| pos          | Position of a dynamically defined column in the query |
| column_value | Return value                                          |

- DBE\_SQL.GET\_RESULTS\_RAW

This function returns the value of the **RAW** array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULTS\_RAW** function is as follows:

```
DBE_SQL.GET_RESULTS_RAW(
 context_id IN int,
 pos IN int,
 column_value INOUT anyarray
);
```

**Table 10-270** DBE\_SQL.GET\_RESULTS\_RAW interface parameters

| Parameter  | Description                    |
|------------|--------------------------------|
| context_id | ID of the cursor to be queried |

| Parameter    | Description                                           |
|--------------|-------------------------------------------------------|
| pos          | Position of a dynamically defined column in the query |
| column_value | Return value                                          |

- **DBE\_SQL.GET\_RESULTS\_BYTEA**

This function returns the value of the **BYTEA** array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULTS\_BYTEA** function is as follows:

```
DBE_SQL.GET_RESULTS_BYTEA(
 context_id IN int,
 pos IN int,
 column_value INOUT anyarray
);
```

**Table 10-271** DBE\_SQL.GET\_RESULTS\_BYTEA interface parameters

| Parameter    | Description                                           |
|--------------|-------------------------------------------------------|
| context_id   | ID of the cursor to be queried                        |
| pos          | Position of a dynamically defined column in the query |
| column_value | Return value                                          |

- **DBE\_SQL.GET\_RESULTS\_CHAR**

This function returns the value of the **CHAR** array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULTS\_CHAR** function is as follows:

```
DBE_SQL.GET_RESULTS_CHAR(
 context_id IN int,
 pos IN int,
 column_value INOUT anyarray
);
```

**Table 10-272** DBE\_SQL.GET\_RESULTS\_CHAR interface parameters

| Parameter    | Description                                           |
|--------------|-------------------------------------------------------|
| context_id   | ID of the cursor to be queried                        |
| pos          | Position of a dynamically defined column in the query |
| column_value | Return value                                          |

- **DBE\_SQL.GET\_RESULTS**

This function returns the value of the array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

 **NOTE**

The bottom-layer mechanism of `DBE_SQL.GET_RESULTS` is implemented through arrays. When different arrays are used to obtain the return value of the same column, NULL values are filled in the array due to discontinuous internal indexes to ensure the continuity of array indexes. As a result, the length of the returned result array is different from that of the Oracle database.

The prototype of the **DBE\_SQL.GET\_RESULTS** function is as follows:

```
DBE_SQL.GET_RESULTS(
 context_id IN int,
 pos IN int,
 column_value INOUT anyarray
);
```

**Table 10-273** DBE\_SQL.GET\_RESULTS interface parameters

| Parameter    | Description                                           |
|--------------|-------------------------------------------------------|
| context_id   | ID of the cursor to be queried                        |
| pos          | Position of a dynamically defined column in the query |
| column_value | Return value                                          |

- **DBE\_SQL.SQL\_DESCRIBE\_COLUMNS**

This function is used to describe column information and can be used only for cursors defined by **SELECT**.

The prototype of the **DBE\_SQL.SQL\_DESCRIBE\_COLUMNS** function is as follows:

```
DBE_SQL.SQL_DESCRIBE_COLUMNS(
 context_id IN int,
 col_cnt INOUT int,
 desc_t INOUT dbe_sql.desc_tab
)RETURNS record;
```

**Table 10-274** DBE\_SQL.SQL\_DESCRIBE\_COLUMNS interface parameters

| Parameter  | Description                        |
|------------|------------------------------------|
| context_id | ID of the cursor to be queried     |
| col_cnt    | Number of columns returned         |
| desc_t     | Description of the returned column |

- **DBE\_SQL.DESCRIBE\_COLUMNS**

Describes column information and can be used only for cursors defined by **SELECT**. This interface is developed for compatibility purposes.

The prototype of the **DBE\_SQL.DESCRIBE\_COLUMNS** function is as follows:

```
DBE_SQL.DESCRIBE_COLUMNS(
 context_id IN int,
 col_cnt OUT int,
 desc_t OUT dbe_sql.desc_tab
)
```

**Table 10-275** DBE\_SQL.DESCRIBE\_COLUMNS parameters

| Parameter  | Description                        |
|------------|------------------------------------|
| context_id | ID of the cursor to be queried     |
| col_cnt    | Number of columns returned         |
| desc_t     | Description of the returned column |

- **DBE\_SQL.BIND\_VARIABLE**  
This function is used to bind parameters. You are advised to use **DBE\_SQL.SQL\_BIND\_VARIABLE**.
- **DBE\_SQL.SQL\_SET\_RESULTS\_TYPE\_C**  
This function is used to dynamically define a column of the array type. You are advised not to use it.

The prototype of the **DBE\_SQL.SQL\_SET\_RESULTS\_TYPE\_C** function is as follows:

```
DBE_SQL.sql_set_results_type_c(
 context_id IN int,
 pos IN int,
 column_ref IN anyarray,
 cnt IN int,
 lower_bnd IN int,
 col_type IN anyelement,
 maxsize IN int
) return integer;
```

**Table 10-276** DBE\_SQL.SQL\_SET\_RESULTS\_TYPE\_C parameters

| Parameter  | Description                                            |
|------------|--------------------------------------------------------|
| context_id | ID of the cursor to be queried                         |
| pos        | Position of a dynamically defined column in the query  |
| column_ref | Type of the returned array                             |
| cnt        | Number of values obtained at a time                    |
| lower_bnd  | Start subscript when an array is returned              |
| col_type   | Variable type corresponding to the returned array type |
| maxsize    | Maximum length of the defined type                     |

- **DBE\_SQL.SQL\_GET\_VALUES\_C**  
This function is used to read a dynamically defined column value. You are advised not to use it.

The prototype of the **DBE\_SQL.SQL\_GET\_VALUES\_C** function is as follows:

```
DBE_SQL.sql_get_values_c(
 context_id IN int,
 pos IN int,
 results_type INOUT anyarray,
```

```
result_type IN anyelement
)return anyarray;
```

**Table 10-277** DBE\_SQL.SQL\_GET\_VALUES\_C parameters

| Parameter    | Description                    |
|--------------|--------------------------------|
| context_id   | ID of the cursor to be queried |
| pos          | Parameter position             |
| results_type | Obtained result                |
| result_type  | Type of the obtained result    |

- **DBE\_SQL.GET\_VARIABLE\_RESULT**

This function is used to return the value of the bound OUT parameter and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_VARIABLE\_RESULT** function is as follows:

```
DBE_SQL.get_variable_result(
context_id IN int,
pos IN VARCHAR2,
column_value INOUT anyelement
);
```

**Table 10-278** DBE\_SQL.GET\_VARIABLE\_RESULT interface parameters

| Parameter    | Description                    |
|--------------|--------------------------------|
| context_id   | ID of the cursor to be queried |
| pos          | Name of the bound parameter    |
| column_value | Return value                   |

- **DBE\_SQL.GET\_VARIABLE\_RESULT\_CHAR**

This function is used to return the value of the bound OUT parameter of the **CHAR** type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_VARIABLE\_RESULT\_CHAR** function is as follows:

```
DBE_SQL.get_variable_result_char(
context_id IN int,
pos IN VARCHAR2
)
RETURNS char
```

**Table 10-279** DBE\_SQL.GET\_VARIABLE\_RESULT\_CHAR interface parameters

| Parameter  | Description                    |
|------------|--------------------------------|
| context_id | ID of the cursor to be queried |
| pos        | Name of the bound parameter    |

- **DBE\_SQL.GET\_VARIABLE\_RESULT\_RAW**

This function is used to return the value of the bound OUT parameter of the **RAW** type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_VARIABLE\_RESULT\_RAW** function is as follows:

```
CREATE OR REPLACE FUNCTION DBE_SQL.get_variable_result_raw(
 context_id IN int,
 pos IN VARCHAR2,
 value INOUT anyelement
)
RETURNS anyelement
```

**Table 10-280** DBE\_SQL.GET\_VARIABLE\_RESULT\_RAW interface parameters

| Parameter  | Description                    |
|------------|--------------------------------|
| context_id | ID of the cursor to be queried |
| pos        | Name of the bound parameter    |
| value      | Return value                   |

- **DBE\_SQL.GET\_VARIABLE\_RESULT\_TEXT**

This function is used to return the value of the bound OUT parameter of the **TEXT** type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_VARIABLE\_RESULT\_TEXT** function is as follows:

```
CREATE OR REPLACE FUNCTION DBE_SQL.get_variable_result_text(
 context_id IN int,
 pos IN VARCHAR2
)
RETURNS text
```

**Table 10-281** DBE\_SQL.GET\_VARIABLE\_RESULT\_TEXT interface parameters

| Parameter  | Description                    |
|------------|--------------------------------|
| context_id | ID of the cursor to be queried |
| pos        | Name of the bound parameter    |

- **DBE\_SQL.GET\_VARIABLE\_RESULT\_INT**

This function is used to return the value of the bound OUT parameter of the **INT** type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_VARIABLE\_RESULT\_INT** function is as follows:

```
DBE_SQL.get_variable_result_int(
 context_id IN int,
 pos IN VARCHAR2,
 value INOUT anyelement
)
RETURNS anyelement
```

**Table 10-282** DBE\_SQL.GET\_VARIABLE\_RESULT\_INT interface parameters

| Parameter  | Description                    |
|------------|--------------------------------|
| context_id | ID of the cursor to be queried |
| pos        | Name of the bound parameter    |
| value      | Return value                   |

- DBE\_SQL.GET\_ARRAY\_RESULT\_TEXT

This function is used to return the value of the bound OUT parameter of the **TEXT** array type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_ARRAY\_RESULT\_TEXT** function is as follows:

```
DBE_SQL.get_array_result_text(
 context_id IN int,
 pos IN VARCHAR2,
 column_value INOUT anyarray
)
```

**Table 10-283** DBE\_SQL.GET\_ARRAY\_RESULT\_TEXT interface parameters

| Parameter    | Description                    |
|--------------|--------------------------------|
| context_id   | ID of the cursor to be queried |
| pos          | Name of the bound parameter    |
| column_value | Return value                   |

- DBE\_SQL.GET\_ARRAY\_RESULT\_RAW

This function is used to return the value of the bound OUT parameter of the **RAW** array type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_ARRAY\_RESULT\_RAW** function is as follows:

```
DBE_SQL.get_array_result_raw(
 context_id IN int,
 pos IN VARCHAR2,
 column_value INOUT anyarray
)
```

**Table 10-284** DBE\_SQL.GET\_ARRAY\_RESULT\_RAW interface parameters

| Parameter    | Description                    |
|--------------|--------------------------------|
| context_id   | ID of the cursor to be queried |
| pos          | Name of the bound parameter    |
| column_value | Return value                   |

- DBE\_SQL.GET\_ARRAY\_RESULT\_CHAR

This function is used to return the value of the bound OUT parameter of the **CHAR** array type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_ARRAY\_RESULT\_CHAR** function is as follows:

```
DBE_SQL.get_array_result_char(
 context_id IN int,
 pos IN VARCHAR2,
 column_value INOUT anyarray
)
```

**Table 10-285** DBE\_SQL.GET\_ARRAY\_RESULT\_CHAR interface parameters

| Parameter    | Description                    |
|--------------|--------------------------------|
| context_id   | ID of the cursor to be queried |
| pos          | Name of the bound parameter    |
| column_value | Return value                   |

- **DBE\_SQL.GET\_ARRAY\_RESULT\_INT**

This function is used to return the value of the bound OUT parameter of the **INT** array type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_ARRAY\_RESULT\_INT** function is as follows:

```
DBE_SQL.get_array_result_int(
 context_id IN int,
 pos IN VARCHAR2,
 column_value INOUT anyarray
)
```

**Table 10-286** DBE\_SQL.GET\_ARRAY\_RESULT\_INT interface parameters

| Parameter    | Description                    |
|--------------|--------------------------------|
| context_id   | ID of the cursor to be queried |
| pos          | Name of the bound parameter    |
| column_value | Return value                   |

## Examples

```
-- Example 1
-- Create a table and insert data into the table.
CREATE TABLE test_desc_cols(
 id NUMBER,
 name VARCHAR2(50)
);
INSERT INTO test_desc_cols(id, name) VALUES (1, 'xiaoming');
INSERT INTO test_desc_cols(id, name) VALUES (2, 'xiaohong');
INSERT INTO test_desc_cols(id, name) VALUES (3, 'xiaolan');

DECLARE
 context_id INTEGER;
 col_cnt INTEGER;
 v_id int;
 v_name varchar2;
 execute_ret INTEGER;
BEGIN
 -- Open a cursor.
```

```
context_id := DBE_SQL.REGISTER_CONTEXT();
-- Compile the cursor.
DBE_SQL.SQL_SET_SQL(context_id, 'SELECT * FROM test_desc_cols', 2);
-- Set the return value type of a column.
DBE_SQL.SET_RESULT_TYPE(context_id, 1, v_id);
DBE_SQL.SET_RESULT_TYPE(context_id, 2, v_name);
execute_ret := DBE_SQL.SQL_RUN(context_id);

loop
exit when (DBE_SQL.NEXT_ROW(context_id) <= 0);
-- Obtain values.
DBE_SQL.GET_RESULT(context_id, 1, v_id);
DBE_SQL.GET_RESULT(context_id, 2, v_name);
-- Output the result.
dbe_output.print_line('id:' || v_id || ' name:' || v_name);
end loop;

DBE_SQL.SQL_UNREGISTER_CONTEXT(context_id);
END;
/

CREATE OR REPLACE PROCEDURE test_square(n NUMBER, square OUT NUMBER) IS
BEGIN
 square := n * n;
END;
/

DECLARE
cur NUMBER;
query varchar(2000);
ret integer;
n NUMBER;
square Integer;
BEGIN
 n := 2;
 cur := DBE_SQL.REGISTER_CONTEXT();
 query := 'BEGIN test_square(:n_bnd, :square_bnd); END;';
 DBE_SQL.SQL_SET_SQL(cur, query, 2);
 DBE_SQL.SQL_BIND_VARIABLE(cur, 'n_bnd', n);
 DBE_SQL.SQL_BIND_VARIABLE(cur, 'square_bnd', square);
 ret := DBE_SQL.SQL_RUN(cur);
 DBE_SQL.GET_VARIABLE_RESULT(cur, 'square_bnd', square);
 DBE_OUTPUT.PRINT_LINE('square = ' || square);
 DBE_SQL.SQL_UNREGISTER_CONTEXT(cur);
END;
/

-- Example 2
-- Examples of executing DESCRIBE_COLUMNS, RUN_AND_NEXT, and LAST_ROW_COUNT
-- Create a stored procedure for printing column description information.
CREATE OR REPLACE PROCEDURE print_rec(
 rec in DBE_SQL.DESC_REC
)package AS
BEGIN
 raise INFO 'col_type = %', rec.col_type;
 raise INFO 'col_name = %', rec.col_name;
 raise INFO 'col_name_len = %', rec.col_name_len;
END;
/

-- Verify functions.
DECLARE
context_id INTEGER;
col_cnt INTEGER;
rec_tab DBE_SQL.DESC_TAB;
excute_ret INTEGER;
nextrow_ret INTEGER;
last_row_count INTEGER;
BEGIN
```

```
-- Open a cursor.
context_id := DBE_SQL.REGISTER_CONTEXT();
-- Compile the cursor.
DBE_SQL.SQL_SET_SQL(context_id, 'SELECT * FROM test_desc_cols', 2);
-- Print the column description information.
DBE_SQL.DESCRIBE_COLUMNS(context_id, col_cnt, rec_tab);
FOR var IN 1..col_cnt LOOP
 print_rec(rec_tab(var));
END LOOP;
-- Execute and obtain a row of data.
excute_ret := DBE_SQL.RUN_AND_NEXT(context_id);
-- Obtain a row of data.
nextrow_ret := DBE_SQL.NEXT_ROW(context_id);
-- Obtain the number of obtained data rows.
last_row_count := DBE_SQL.LAST_ROW_COUNT;
DBE_OUTPUT.PRINT_LINE('last_row_count = ' || last_row_count);
DBE_SQL.SQL_UNREGISTER_CONTEXT(context_id);
END;
/
```

### 10.12.2.8 DBE\_FILE

#### Precautions

- DBE\_FILE requires that files opened using DBE\_FILE.FOPEN be encoded using the database character set. If the opened files are not encoded using the expected character set, an encoding verification error occurs when DBE\_FILE.READ\_LINE is used to read files. DBE\_FILE requires that files opened using DBE\_FILE.FOPEN\_NCHAR be encoded using the UTF-8 character set. If the opened files are not encoded using the expected character set, an encoding verification error occurs when DBE\_FILE.READ\_LINE\_NCHAR is used to read files.
- When DBE\_OUTPUT.PUT\_LINE is used to print the result obtained by the DBE\_FILE.READ\_LINE\_NCHAR API, ensure that the UTF-8 character set encoding can be converted to the current database character set encoding. If the preceding conditions are met, the result can be properly output. DBE\_OUTPUT.PRINT\_LINE does not support this function.
- DBE\_FILE requires that the character set encoding of the client be the same as that of the database.
- If the database character set encoding format is ASCII and the client character set encoding format is Chinese, when the client invokes DBE\_FILE.WRITE\_NCHAR or DBE\_FILE.WRITE\_LINE\_NCHAR to write Chinese content, the written content may be in UTF-8 encoding format. An error may be reported when the DBE\_FILE.READ\_LINE\_NCHAR is used.

#### Data Types

- DBE\_FILE.FILE\_TYPE

Defines the representation of files in the DBE\_FILE package. The fields in DBE\_FILE.FILE\_TYPE are private fields of the DBE\_FILE package. Do not change the field value of the type defined in DBE\_FILE.FILE\_TYPE.

```
CREATE TYPE DBE_FILE.FILE_TYPE AS(
 id INTEGER,
 datatype INTEGER,
 byte_mode BOOLEAN
);
```

**Table 10-287** DBE\_FILE.FILE\_TYPE columns

| Parameter | Description                                                                                                                                                                  |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | File handle                                                                                                                                                                  |
| datatype  | File data type (CHAR, NCHAR, or binary). Currently, only CHAR and NCHAR files are supported. For a CHAR file, <b>1</b> is returned. For an NCHAR file, <b>2</b> is returned. |
| byte_mode | Indicates that the file is opened in binary mode ( <b>TRUE</b> ) or text mode ( <b>FALSE</b> ).                                                                              |

## Interface Description

**Table 10-288** lists all interfaces supported by the **DBE\_FILE** package.

**Table 10-288** DBE\_FILE

| Interface                    | Description                                                                         |
|------------------------------|-------------------------------------------------------------------------------------|
| <b>DBE_FILE.OPEN</b>         | Opens a file based on the specified directory and file name.                        |
| <b>DBE_FILE.IS_CLOSE</b>     | Checks whether a file handle is opened.                                             |
| <b>DBE_FILE.READ_LINE</b>    | Reads a line of data from an open file handle based on the specified length.        |
| <b>DBE_FILE.WRITE</b>        | Writes the data specified in the buffer to a file.                                  |
| <b>DBE_FILE.NEW_LINE</b>     | Writes one or more line terminators to an open file.                                |
| <b>DBE_FILE.WRITE_LINE</b>   | Writes a string from the buffer to an open file.                                    |
| <b>DBE_FILE.FORMAT_WRITE</b> | This is a formatted <b>PUT</b> stored procedure similar to <b>printf()</b> .        |
| <b>DBE_FILE.GET_RAW</b>      | Reads binary data from an open file handle.                                         |
| <b>DBE_FILE.PUT_RAW</b>      | Writes the input binary data to the file.                                           |
| <b>DBE_FILE.FLUSH</b>        | Writes data from a file handle to a physical file.                                  |
| <b>DBE_FILE.CLOSE</b>        | Closes an open file handle.                                                         |
| <b>DBE_FILE.CLOSE_ALL</b>    | Closes all file handles opened in a session.                                        |
| <b>DBE_FILE.REMOVE</b>       | Deletes a disk file. To perform this operation, you must have required permissions. |

| Interface                                   | Description                                                                                                                      |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DBE_FILE.RENAME</a>             | Renames files on the disk, similar to <b>mv</b> in Unix.                                                                         |
| <a href="#">DBE_FILE.COPY</a>               | Copies data in a continuous area to a new file. If <b>start_line</b> and <b>end_line</b> are omitted, the entire file is copied. |
| <a href="#">DBE_FILE.GET_ATTR</a>           | Reads and returns the attributes of a disk file.                                                                                 |
| <a href="#">DBE_FILE.SEEK</a>               | Adjusts the position of a file pointer forward or backward based on the specified number of bytes.                               |
| <a href="#">DBE_FILE.GET_POS</a>            | Specifies the offset of a returned file, in bytes.                                                                               |
| <a href="#">DBE_FILE.FOPEN_NCHAR</a>        | Opens a file based on the specified directory and file name.                                                                     |
| <a href="#">DBE_FILE.WRITE_NCHAR</a>        | Writes data to an open file.                                                                                                     |
| <a href="#">DBE_FILE.WRITE_LINE_NCHAR</a>   | Writes data to an open file and automatically appends a line terminator.                                                         |
| <a href="#">DBE_FILE.FORMAT_WRITE_NCHAR</a> | Writes formatted data to an open file. It is a <a href="#">DBE_FILE.WRITE_NCHAR</a> interface that allows formatting.            |
| <a href="#">DBE_FILE.READ_LINE_NCHAR</a>    | Reads a line of a specified length from an open file.                                                                            |

- [DBE\\_FILE.OPEN](#)

This function opens a file. You can specify the maximum number of characters in each line. A maximum of 50 files can be opened at a time. This function returns a handle of the **INTEGER** type.

The prototype of the [DBE\\_FILE.OPEN](#) function is as follows:

```
DBE_FILE.OPEN (
 dir IN VARCHAR2,
 file_name IN VARCHAR2,
 open_mode IN VARCHAR2,
 max_line_size IN INTEGER DEFAULT 1024)
RETURN INTEGER;
```

**Table 10-289** DBE\_FILE.OPEN interface parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dir           | Directory of a file. It is a string, indicating an object name.<br><b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li> </ul> |
| file_name     | File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the <b>OPEN</b> function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).                                                                                                                                                                                                                                                                                                                         |
| open_mode     | File opening mode, including: <ul style="list-style-type: none"> <li><b>r</b>: read text</li> <li><b>w</b>: write text</li> <li><b>a</b>: append text</li> <li><b>rb</b>: read byte</li> <li><b>wb</b>: write byte</li> <li><b>ab</b>: append byte</li> </ul> <b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.                                                                                                                                       |
| max_line_size | Maximum number of characters in each line, including newline characters. The minimum value is <b>1</b> and the maximum is <b>32767</b> . If this parameter is not specified, the default value <b>1024</b> is used.                                                                                                                                                                                                                                                                                                                                 |

- **DBE\_FILE.IS\_CLOSE**

This function detects a file handle to check whether the file is opened. A Boolean value is returned. If an invalid file handle is detected, the **INVALID\_FILEHANDLE** exception is thrown.

The prototype of the DBE\_FILE.IS\_CLOSE function is as follows:

```
DBE_FILE.IS_CLOSE (
file IN INTEGER)
RETURN BOOLEAN;
```

**Table 10-290** DBE\_FILE.IS\_CLOSE parameters

| Parameter       | Description                |
|-----------------|----------------------------|
| file IN INTEGER | File handle to be detected |

- DBE\_FILE.READ\_LINE

This stored procedure reads text from an open file handle and stores the result in the buffer. The procedure reads data until a line end (excluding line terminator), file end, or the value specified by the **len** parameter. The length of the read data cannot exceed the value of the **max\_line\_size** parameter in the **OPEN** function.

The prototype of the **DBE\_FILE.READ\_LINE** function is as follows:

```
DBE_FILE.READ_LINE (
file IN INTEGER,
buffer OUT VARCHAR2,
len IN INTEGER DEFAULT NULL)
```

**Table 10-291** DBE\_FILE.READ\_LINE parameters

| Parameter | Description                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file      | File handle opened by calling the <b>OPEN</b> function. The file must be opened in read mode. Otherwise, the <b>INVALID_OPERATION</b> exception is thrown.           |
| buffer    | Buffer used to receive data                                                                                                                                          |
| len       | Number of bytes read from a file. The default value is <b>NULL</b> . If the default value <b>NULL</b> is used, <b>max_linesize</b> is used to specify the line size. |

- DBE\_FILE.WRITE

This stored procedure writes data in the buffer to a file. The file must be opened in write mode. Line terminators are not written.

The prototype of the **DBE\_FILE.WRITE** function is as follows:

```
DBE_FILE.WRITE (
file IN INTEGER,
buffer IN TEXT);
```

**Table 10-292** DBE\_FILE.WRITE parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file      | This stored procedure writes data in the buffer to a file. The file must be opened in write mode. Line terminators are not written.                                                                                                                                                                                                                                                                                   |
| buffer    | Text data to be written to a file. The maximum buffer size is 32767 bytes. If no value is specified in the open state, the default value is 1024 bytes. Before the writing is performed, the buffer occupied by <b>WRITE</b> operations cannot exceed 32767 bytes.<br><b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits. |

- DBE\_FILE.NEW\_LINE

This stored procedure writes one or more line terminators to an open file. The procedure is split from the **WRITE** function because line terminators are related to platforms.

The prototype of the **DBE\_FILE.NEW\_LINE** function is as follows:

```
DBE_FILE.NEW_LINE (
file IN INTEGER,
line_nums IN INTEGER := 1);
```

**Table 10-293** DBE\_FILE.NEW\_LINE parameters

| Parameter | Description                             |
|-----------|-----------------------------------------|
| file      | Opened file handle                      |
| line_nums | Number of terminators written to a file |

- **DBE\_FILE.WRITE\_LINE**

This stored procedure writes strings in the buffer to an open file. The file must be opened in write mode.

The prototype of the **DBE\_FILE.WRITE\_LINE** function is as follows:

```
DBE_FILE.WRITE_LINE(
file IN INTEGER,
buffer IN TEXT,
flush IN BOOLEAN DEFAULT FALSE);
```

**Table 10-294** DBE\_FILE.WRITE\_LINE parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file      | Opened file handle                                                                                                                                                                                                                                                                                                                                                                                                  |
| buffer    | Text data to be written to a file. The maximum buffer size is 32767 bytes. If no value is specified in the open state, the default value is 1024 bytes. Before the writing is performed, the buffer occupied by <b>PUT</b> operations cannot exceed 32767 bytes.<br><b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits. |
| flush     | Whether to flush data to the disk after the writing                                                                                                                                                                                                                                                                                                                                                                 |

- **DBE\_FILE.FORMAT\_WRITE**

This is a formatted **PUT** stored procedure similar to **printf()**.

The prototype of the **DBE\_FILE.FORMAT\_WRITE** function is as follows:

```
DBE_FILE.FORMAT_WRITE (
file IN INTEGER,
format IN VARCHAR2,
arg1 IN VARCHAR2 DEFAULT NULL,
...
arg6 IN VARCHAR2 DEFAULT NULL]);
```

**Table 10-295** DBE\_FILE.FORMAT\_WRITE parameters

| Parameter     | Description                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file          | Opened file handle                                                                                                                                                                                                                              |
| format        | A string to be formatted, containing the text and format characters \n and %s                                                                                                                                                                   |
| [arg1. .arg6] | Six optional parameters. The parameters and the positions of characters to be formatted are in one-to-one correspondence. If the parameter corresponding to a character to be formatted is not provided, an empty string is used to replace %s. |

- DBE\_FILE.GET\_RAW

This function reads binary data from the opened file descriptor and returns the data using **r**.

The prototype of the **DBE\_FILE.GET\_RAW** function is as follows:

```
DBE_FILE.GET_RAW (
file IN INTEGER,
r OUT RAW,
length IN INTEGER DEFAULT NULL);
```

**Table 10-296** DBE\_FILE.GET\_RAW parameters

| Parameter | Description                                                                                                                 |
|-----------|-----------------------------------------------------------------------------------------------------------------------------|
| file      | Opened file handle                                                                                                          |
| r         | Output binary data                                                                                                          |
| length    | Length of the file to be read. The default value is <b>NULL</b> . All data in the file is read. The maximum length is 1 GB. |

- DBE\_FILE.PUT\_RAW

This function writes binary data to a file.

The prototype of the **DBE\_FILE.PUT\_RAW** function is as follows:

```
DBE_FILE.PUT_RAW (
file IN INTEGER,
r IN RAW,
flush IN BOOLEAN DEFAULT FALSE);
```

**Table 10-297** DBE\_FILE.PUT\_RAW parameters

| Parameter | Description        |
|-----------|--------------------|
| file      | Opened file handle |

| Parameter | Description                                                                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| r         | Output binary data<br><b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits. |
| flush     | Specifies whether to flush data to a file. The default value is <b>false</b> .                                                                                        |

- DBE\_FILE.FLUSH

Data in a file handle must be written into a physical file. Data in the buffer must have a line terminator. Refresh is important if a file must be read when it is opened. For example, debugging information can be refreshed to a file so that it can be read immediately.

The prototype of the DBE\_FILE.FLUSH function is as follows:

```
DBE_FILE.FLUSH (
file IN INTEGER);
```

**Table 10-298** DBE\_FILE.FLUSH parameters

| Parameter | Description        |
|-----------|--------------------|
| file      | Opened file handle |

- DBE\_FILE.CLOSE

This stored procedure closes an open file handle. When the stored procedure is called, exception is thrown if there is data to be written into the buffer.

The prototype of the DBE\_FILE.CLOSE function is as follows:

```
DBE_FILE.CLOSE (
file IN INTEGER
)RETURN INTEGER;
```

**Table 10-299** DBE\_FILE.CLOSE parameters

| Parameter | Description        |
|-----------|--------------------|
| file      | Opened file handle |

- DBE\_FILE.CLOSE\_ALL

This stored procedure closes all file handles opened in a session and can be used for emergency cleanup.

The prototype of the DBE\_FILE.CLOSE\_ALL function is as follows:

```
DBE_FILE.CLOSE_ALL;
```

**Table 10-300** DBE\_FILE.CLOSE\_ALL parameters

| Parameter | Description |
|-----------|-------------|
| None      | None        |

- DBE\_FILE.REMOVE

This stored procedure deletes a disk file. To perform this operation, you must have required permissions for the directories and files.

The prototype of the DBE\_FILE.REMOVE function is as follows:

```
DBE_FILE.REMOVE (
dir IN VARCHAR2,
file_name IN VARCHAR2);
```

**Table 10-301** DBE\_FILE.REMOVE parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dir       | File directory<br><b>NOTE</b> <ul style="list-style-type: none"><li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li><li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li></ul> |
| file_name | File to be deleted                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

- DBE\_FILE.RENAME

This function renames files on the disk, similar to **mv** in Unix.

The prototype of the DBE\_FILE.RENAME function is as follows:

```
DBE_FILE.RENAME (
src_dir IN VARCHAR2,
src_file_name IN VARCHAR2,
dest_dir IN VARCHAR2,
dest_file_name IN VARCHAR2,
overwrite IN BOOLEAN DEFAULT FALSE);
```

**Table 10-302** DBE\_FILE.RENAME parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| src_dir       | Directory of the original file (case-sensitive)<br><b>NOTE</b> <ul style="list-style-type: none"><li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li><li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li></ul> |
| src_file_name | Original file to be renamed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_dir       | Destination directory (case-sensitive)<br><b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul> |
| dest_file_name | New file name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| overwrite      | The default value is <b>false</b> . If a file with the same name exists in the destination directory, the file will not be rewritten.                                                                                                                                                                                                                                                                                                                                                                               |

- DBE\_FILE.COPY

This stored procedure copies data in a continuous area to a new file. If **start\_line** and **end\_line** are omitted, the entire file is copied.

The prototype of the DBE\_FILE.COPY function is as follows:

```
DBE_FILE.COPY (
src_dir IN VARCHAR2,
src_file_name IN VARCHAR2,
dest_dir IN VARCHAR2,
dest_file_name IN VARCHAR2,
start_line IN INTEGER DEFAULT 1,
end_line IN INTEGER DEFAULT NULL);
```

**Table 10-303** DBE\_FILE.COPY parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| src_dir       | Directory of the original file<br><b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. | src_file_name | File to be copied                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dest_dir       | Directory of the destination file<br><b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul> |
| dest_file_name | Destination file to which data is to be written<br><b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.                                                                                                                                                                                                                                                                                                             |
| start_line     | Number of the line where the copy starts. The default value is <b>1</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| end_line       | Number of the line where the copy ends. The default value is <b>NULL</b> , indicating the end of the file.                                                                                                                                                                                                                                                                                                                                                                                                     |

- DBE\_FILE.GET\_ATTR  
This stored procedure reads and returns the attributes of a disk file.  
The prototype of the **DBE\_FILE.GET\_ATTR** function is as follows:

```
DBE_FILE.GET_ATTR(
location IN text,
filename IN text,
OUT fexists boolean,
OUT file_length bigint,
OUT block_size integer);
```

**Table 10-304** DBE\_FILE.GET\_ATTR parameters

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location    | File directory<br><b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul> |
| filename    | Name of the file to be checked                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| fexists     | Whether the file exists                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| file_length | File length (unit: bytes). If the file does not exist, <b>NULL</b> is returned.                                                                                                                                                                                                                                                                                                                                                                                                             |

| Parameter  | Description                                                                                      |
|------------|--------------------------------------------------------------------------------------------------|
| block_size | Block size of the file system (unit: byte). If the file does not exist, <b>NULL</b> is returned. |

- DBE\_FILE.SEEK

This stored procedure adjusts the position of a file pointer forward or backward based on the specified number of bytes.

The prototype of the **DBE\_FILE.SEEK** function is as follows:

```
DBE_FILE.SEEK (
file IN INTEGER,
absolute_start IN BIGINT DEFAULT NULL,
relative_start IN BIGINT DEFAULT NULL);
```

**Table 10-305** DBE\_FILE.SEEK parameters

| Parameter      | Description                                                                                                                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file           | Opened file handle                                                                                                                                                                                                                                                     |
| absolute_start | Absolute offset of a file. The default value is <b>NULL</b> .                                                                                                                                                                                                          |
| relative_start | Relative offset of a file. A positive number indicates forward offset and a negative number indicates backward offset. The default value is <b>NULL</b> . If both <b>absolute_start</b> and this parameter are specified, the <b>absolute_start</b> parameter is used. |

- DBE\_FILE.GET\_POS

This function returns file offset in bytes.

The prototype of the DBE\_FILE.FGETPOS function is as follows:

```
DBE_FILE.GET_POS (
file IN INTEGER)
RETURN BIGINT;
```

**Table 10-306** DBE\_FILE.GET\_POS parameters

| Parameter | Description        |
|-----------|--------------------|
| file      | Opened file handle |

- DBE\_FILE.FOPEN\_NCHAR

Opens a file. You can specify the maximum line size. A maximum of 50 files can be opened in a session. This function returns a file handle of the DBE\_FILE.FILE\_TYPE type. This function opens a file in national character set mode for input or output.

The prototype of the DBE\_FILE.FOPEN\_NCHAR function is as follows:

```
DBE_FILE.FOPEN_NCHAR(
dir IN TEXT,
file_name IN TEXT,
open_mode IN TEXT,
max_line_size IN INTEGER DEFAULT 1024)
RETURN DBE_FILE.FILE_TYPE;
```

**Table 10-307** DBE\_FILE.FOPEN\_NCHAR parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dir           | Directory of a file. It is a string, indicating an object name.<br><b>NOTE</b> <ul style="list-style-type: none"><li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li><li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li></ul> |
| file_name     | File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the <b>FOPEN_NCHAR</b> function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).                                                                                                                                                                                                                                                                                                               |
| open_mode     | File opening mode, including: <ul style="list-style-type: none"><li><b>r</b>: read text</li><li><b>w</b>: write text</li><li><b>a</b>: append text</li><li><b>rb</b>: read byte</li><li><b>wb</b>: write byte</li><li><b>ab</b>: append byte</li></ul> <b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.                                                                                                                                           |
| max_line_size | Maximum number of characters in each line, including newline characters. The minimum value is <b>1</b> and the maximum is <b>32767</b> . If this parameter is not specified, the default value <b>1024</b> is used.                                                                                                                                                                                                                                                                                                                              |

- **DBE\_FILE.WRITE\_NCHAR**

Writes data in the buffer to a file. The file must be opened in national character set or write mode. This operation does not write a line terminator, and the return value is always **TRUE**. The text string is written in the UTF8 character set format.

The prototype of the **DBE\_FILE.WRITE\_NCHAR** function is as follows:

```
DBE_FILE.WRITE_NCHAR(
 file IN DBE_FILE.FILE_TYPE,
 buffer IN NVARCHAR2)
RETURN VOID;
```

**Table 10-308** DBE\_FILE.WRITE parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file      | Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR. The file must be opened in write mode. This operation does not write line terminators.                                                                                                                                                                                                                                               |
| buffer    | Text data to be written to the file. The accumulated write length of each line cannot be greater than or equal to the value of <b>max_line_size</b> specified by <b>FOPEN_NCHAR</b> . Otherwise, an error is reported when the file is refreshed.<br><b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits. |

- DBE\_FILE.WRITE\_LINE\_NCHAR

Writes data in the buffer to a file. The file must be opened in national character set or write mode. This operation automatically appends line terminators, and the return value is always **TRUE**. The text string is written in the UTF8 character set format.

The prototype of the DBE\_FILE.WRITE\_LINE\_NCHAR function is as follows:

```
DBE_FILE.WRITE_LINE_NCHAR(
 file IN DBE_FILE.FILE_TYPE,
 buffer IN NVARCHAR2)
RETURN VOID;
```

**Table 10-309** DBE\_FILE.WRITE\_LINE parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file      | Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR.                                                                                                                                                                                                                                                                                                                                                              |
| buffer    | Text data to be written to the file. The length of each line (including the newline character) cannot be greater than the value of <b>max_line_size</b> specified by <b>FOPEN_NCHAR</b> or the default value. Otherwise, an error is reported when the file is refreshed.<br><b>NOTE</b><br>For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits. |

- DBE\_FILE.FORMAT\_WRITE\_NCHAR

Writes formatted data to an open file. It is a DBE\_FILE.WRITE\_NCHAR interface that allows formatting. The return value is always **TRUE**.

The prototype of the DBE\_FILE.FORMAT\_WRITE\_NCHAR function is as follows:

```
DBE_FILE.FORMAT_WRITE_NCHAR(
 file IN DBE_FILE.FILE_TYPE,
 format IN NVARCHAR2,
 arg1 IN NVARCHAR2 DEFAULT NULL,
 ...
 arg5 IN NVARCHAR2 DEFAULT NULL)
RETURN VOID;
```

**Table 10-310** DBE\_FILE.FORMAT\_WRITE\_NCHAR parameters

| Parameter        | Description                                                                                                                                                                                                                                      |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file             | Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR.                                                                                                                                                                                  |
| format           | Formatted string, containing the text and format characters \n and %s.                                                                                                                                                                           |
| [arg1 . . .arg5] | Five optional parameters. The parameters and the positions of characters to be formatted are in one-to-one correspondence. If the parameter corresponding to a character to be formatted is not provided, an empty string is used to replace %s. |

- DBE\_FILE.READ\_LINE\_NCHAR

Reads data from an open file and stores the read result to the buffer. It reads data to the end of each line excluding the line terminator, to the end of the file, or to the size specified by the **len** parameter. The length of the data to be read cannot exceed the value of **max\_line\_size** specified by **FOPEN\_NCHAR**.

The prototype of the DBE\_FILE.READ\_LINE\_NCHAR stored procedure is as follows:

```
DBE_FILE.READ_LINE_NCHAR(
 file IN DBE_FILE.FILE_TYPE,
 buffer OUT NVARCHAR2,
 len IN INTEGER DEFAULT NULL);
```

**Table 10-311** DBE\_FILE.READ\_LINE parameters

| Parameter | Description                                                                                                                                                             |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file      | Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR. The file must be opened in read mode. Otherwise, the INVALID_OPERATION exception is thrown.             |
| buffer    | Buffer for receiving data.                                                                                                                                              |
| len       | Number of bytes read from the file. The default value is <b>NULL</b> . If the default value <b>NULL</b> is used, <b>max_line_size</b> is used to specify the line size. |

## Examples

```
-- Add the /temp/ directory to the PG_DIRECTORY system catalog as a system administrator.
CREATE OR REPLACE DIRECTORY dir AS '/tmp/';
-- Open a file and write data into the file.
DECLARE
 f integer;
 dir text := 'dir';
BEGIN
 f := dbe_file.open(dir, 'sample.txt', 'w');
 PERFORM dbe_file.write_line(f, 'ABC');
 PERFORM dbe_file.write_line(f, '123':numeric);
 PERFORM dbe_file.write_line(f, '-----');
 PERFORM dbe_file.new_line(f);
```

```
PERFORM db_file.write_line(f, '*****');
PERFORM db_file.new_line(f, 0);
PERFORM db_file.write_line(f, '+++++++');
PERFORM db_file.new_line(f, 2);
PERFORM db_file.write_line(f, '#####');
PERFORM db_file.write(f, 'A');
PERFORM db_file.write(f, 'B');
PERFORM db_file.new_line(f);
PERFORM db_file.format_write(f, '[1 -> %s, 2 -> %s, 3 -> %s, 4 -> %s, 5 -> %s]', 'gaussdb', 'dbe', 'file',
'get', 'line');
PERFORM db_file.new_line(f);
PERFORM db_file.write_line(f, '1234567890');
f := db_file.close(f);
END;
/
-- Read data from the file mentioned above.
DECLARE
 f integer;
 dir text := 'dir';
BEGIN
 f := db_file.open(dir, 'sample.txt', 'r');
 FOR i IN 1..11 LOOP
 RAISE INFO '[%] : %', i, db_file.read_line(f);
 END LOOP;
END;
/
-- Offset the file handle and obtain the current file location.
DECLARE
 l_file integer;
 l_buffer VARCHAR2(32767);
 dir text := 'dir';
 abs_offset number := 100;
 rel_offset number := NULL;
BEGIN
 l_file := db_file.open(dir => dir, file_name => 'sample.txt', open_mode => 'R');
 db_output.print_line('before seek: current position is ' || db_file.get_pos(file => l_file)); -- before seek:
current position is 0
 db_file.seek(file => l_file, absolute_start=>abs_offset, relative_start=>rel_offset);
 db_output.print_line('fseek: current position is ' || db_file.get_pos(file => l_file)); -- seek: current
position is 100
 l_file := db_file.close(file => l_file);
END;
/
-- NCHAR read/write API cases
DECLARE
f DBE_FILE.FILE_TYPE;
buffer NVARCHAR2;
BEGIN
-- Write a file.
f := DBE_FILE.FOPEN_NCHAR('dir', 'sample02.txt', 'w');
DBE_FILE.WRITE_NCHAR(f, 'A');
DBE_FILE.WRITE_NCHAR(f, 'B');
DBE_FILE.WRITE_NCHAR(f, 'C');
DBE_FILE.NEW_LINE(f);
DBE_FILE.WRITE_LINE_NCHAR(f, 'ABC');
DBE_FILE.FORMAT_WRITE_NCHAR(f, '[1 -> %s, 2 -> %s]\n', 'GaussDB', 'DBE_FILE');
DBE_FILE.CLOSE(f);
-- Read a file.
f := DBE_FILE.FOPEN_NCHAR('dir', 'sample02.txt', 'r');
DBE_FILE.READ_LINE_NCHAR(f, buffer); -- ABC
DBE_FILE.READ_LINE_NCHAR(f, buffer); -- ABC
DBE_FILE.READ_LINE_NCHAR(f, buffer); -- [1 -> GaussDB, 2 -> DBE_FILE]
DBE_OUTPUT.PRINT_LINE(buffer);
DBE_FILE.CLOSE(f);
END;
/
```

## 10.12.2.9 DBE\_SESSION

### Interface Description

**Table 10-312** provides all interfaces supported by the **DBE\_SESSION** package. **DBE\_SESSION** takes effect at the session level.

**Table 10-312** DBE\_SESSION

| Interface                                  | Description                                               |
|--------------------------------------------|-----------------------------------------------------------|
| <a href="#">DBE_SESSION.SET_CONTEXT</a>    | Sets the value of an attribute in a specified context.    |
| <a href="#">DBE_SESSION.CLEAR_CONTEXT</a>  | Clears the value of an attribute in a specified context.  |
| <a href="#">DBE_SESSION.SEARCH_CONTEXT</a> | Queries the value of an attribute in a specified context. |

- **DBE\_SESSION.SET\_CONTEXT**

Sets the value of an attribute in a specified namespace (context). The **DBE\_SESSION.SET\_CONTEXT** function prototype is as follows:

```
DBE_SESSION.SET_CONTEXT(
 namespace text,
 attribute text,
 value text
)returns void;
```

**Table 10-313** DBE\_SESSION.SET\_CONTEXT interface parameters

| Parameter | Description                                                                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| namespace | Name of the context to be set. If the context does not exist, create a context. The value contains a maximum of 128 bytes. If the value exceeds 128 bytes, it will be truncated. |
| attribute | Attribute name. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.                                                               |
| value     | Name of the value to be set. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.                                                  |

- **DBE\_SESSION.CLEAR\_CONTEXT**

Clears the value of an attribute in a specified namespace (context). The **DBE\_SESSION.CLEAR\_CONTEXT** function prototype is as follows:

```
DBE_SESSION.CLEAR_CONTEXT (
 namespace text,
 client_identifier text default null,
 attribute text default null
)returns void ;
```

**Table 10-314** DBE\_SESSION.CLEAR\_CONTEXT interface parameters

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| namespace         | Context specified by the user. The value contains a maximum of 128 bytes. If the value exceeds 128 bytes, it will be truncated.                                                                                                                                                                                                                                                           |
| client_identifier | Client authentication. The default value is <b>null</b> . Generally, you do not need to manually set this parameter.                                                                                                                                                                                                                                                                      |
| attribute         | Attribute to be cleared. The default value is <b>null</b> , indicating that all attributes of the specified context are cleared. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.<br><b>CAUTION</b><br>To ensure forward compatibility, if the parameter value is ' <b>null</b> ', all attributes of the specified context are cleared. |

- DBE\_SESSION.SEARCH\_CONTEXT

Queries the value of an attribute in a specified namespace (context). The **DBE\_SESSION.SEARCH\_CONTEXT** function prototype is:

```
DBE_SESSION.SEARCH_CONTEXT (
 namespace text,
 attribute text
)returns text;
```

**Table 10-315** DBE\_SESSION.SEARCH\_CONTEXT interface parameters

| Parameter | Description                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------|
| namespace | Context specified by the user. The value contains a maximum of 128 bytes. If the value exceeds 128 bytes, it will be truncated.  |
| attribute | Attribute to be searched for. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated. |

## Example

```
BEGIN
 select DBE_SESSION.set_context('test', 'gaussdb', 'one'); -- Set the gaussdb attribute of the test context to one.
 select DBE_SESSION.search_context('test', 'gaussdb');
 select DBE_SESSION.clear_context('test', 'test','gaussdb');
END;
/
```

### 10.12.2.10 DBE\_MATCH

#### Interface Description

**Table 10-316** provides all interfaces supported by the **DBE\_MATCH** package.

**Table 10-316** DBE\_MATCH

| Interface                                          | Description                                                                                                                                                                                                                                                                                                                            |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DBE_MATCH.EDIT_DISTANCE_SIMILARITY</a> | Compares the difference between two character strings (minimum steps of deletion, addition, and conversion) and normalizes the difference to a value ranging from 0 to 100. The value <b>100</b> indicates that the two character strings are the same, and the value <b>0</b> indicates that the two character strings are different. |

- [DBE\\_MATCH.EDIT\\_DISTANCE\\_SIMILARITY](#)

Compares the difference between two character strings (minimum steps of deletion, addition, and conversion) and normalizes the difference to a value ranging from 0 to 100. The value **100** indicates that the two character strings are the same, and the value **0** indicates that the two character strings are different. The [DBE\\_MATCH.EDIT\\_DISTANCE\\_SIMILARITY](#) function prototype is as follows:

```
DBE_MATCH.EDIT_DISTANCE_SIMILARITY(
 str1 IN text,
 str2 IN text
)returns integer ;
```

**Table 10-317** DBE\_MATCH.EDIT\_DISTANCE\_SIMILARITY interface parameters

| Parameter | Description                                                                  |
|-----------|------------------------------------------------------------------------------|
| str1      | First character string. If the value is <b>null</b> , <b>0</b> is returned.  |
| str2      | Second character string. If the value is <b>null</b> , <b>0</b> is returned. |

## 10.12.2.11 DBE\_SCHEDULER

### Interface Description

The advanced package **DBE\_SCHEDULER** supports more flexible creation of scheduled tasks through scheduling and programming. For details about all the supported interfaces, see [Table 10-318](#).

#### NOTICE

**DBE\_SCHEDULER** does not support scheduled tasks for synchronizing data between nodes. To create scheduled tasks for multiple nodes, use [DBE\\_TASK](#).

**Table 10-318** DBE\_SCHEDULER

| Interface                                             | Description                              |
|-------------------------------------------------------|------------------------------------------|
| <a href="#">DBE_SCHEDULER.CREATE_JOB</a>              | Creates a scheduled task.                |
| <a href="#">DBE_SCHEDULER.DROP_JOB</a>                | Deletes a scheduled task.                |
| <a href="#">DBE_SCHEDULER.DROP_SINGLE_JOB</a>         | Deletes a single scheduled task.         |
| <a href="#">DBE_SCHEDULER.SET_ATTRIBUTE</a>           | Sets object attributes.                  |
| <a href="#">DBE_SCHEDULER.RUN_JOB</a>                 | Executes a scheduled task.               |
| <a href="#">DBE_SCHEDULER.RUN_BACKGROUND_JOB</a>      | Runs a scheduled task in the background. |
| <a href="#">DBE_SCHEDULER.RUN_FOREGROUND_JOB</a>      | Runs a scheduled task in the foreground. |
| <a href="#">DBE_SCHEDULER.STOP_JOB</a>                | Stops a scheduled task.                  |
| <a href="#">DBE_SCHEDULER.STOP_SINGLE_JOB</a>         | Stops a single scheduled task.           |
| <a href="#">DBE_SCHEDULER.GENERATE_JOB_NAME</a>       | Generates the name of a scheduled task.  |
| <a href="#">DBE_SCHEDULER.CREATE_PROGRAM</a>          | Creates a program.                       |
| <a href="#">DBE_SCHEDULER.DEFINE_PROGRAM_ARGUMENT</a> | Defines program parameters.              |
| <a href="#">DBE_SCHEDULER.DROP_PROGRAM</a>            | Deletes a program.                       |
| <a href="#">DBE_SCHEDULER.DROP_SINGLE_PROGRAM</a>     | Deletes a single program.                |
| <a href="#">DBE_SCHEDULER.SET_JOB_ARGUMENT_VALUE</a>  | Sets the parameters of a scheduled task. |
| <a href="#">DBE_SCHEDULER.CREATE_SCHEDULE</a>         | Creates a schedule.                      |
| <a href="#">DBE_SCHEDULER.DROP_SCHEDULE</a>           | Deletes a schedule.                      |
| <a href="#">DBE_SCHEDULER.DROP_SINGLE_SCHEDULE</a>    | Deletes a single schedule.               |

| Interface                                               | Description                                        |
|---------------------------------------------------------|----------------------------------------------------|
| <a href="#">DBE_SCHEDULER.CREATE_JOB_CLASS</a>          | Creates the class of a scheduled task.             |
| <a href="#">DBE_SCHEDULER.DROP_JOB_CLASS</a>            | Deletes the class of a scheduled task.             |
| <a href="#">DBE_SCHEDULER.DROP_SINGLE_JOB_CLASS</a>     | Deletes the class of a single scheduled task.      |
| <a href="#">DBE_SCHEDULER.GRANT_USER_AUTHORIZATION</a>  | Grants special permissions to a user.              |
| <a href="#">DBE_SCHEDULER.REVOKE_USER_AUTHORIZATION</a> | Revokes special permissions from a user.           |
| <a href="#">DBE_SCHEDULER.CREATE_CREDENTIAL</a>         | Creates a certificate.                             |
| <a href="#">DBE_SCHEDULER.DROP_CREDENTIAL</a>           | Destroys a certificate.                            |
| <a href="#">DBE_SCHEDULER.ENABLE</a>                    | Enables an object.                                 |
| <a href="#">DBE_SCHEDULER.ENABLE_SINGLE</a>             | Enables a single object.                           |
| <a href="#">DBE_SCHEDULER.DISABLE</a>                   | Disables an object.                                |
| <a href="#">DBE_SCHEDULER.DISABLE_SINGLE</a>            | Disables a single object.                          |
| <a href="#">DBE_SCHEDULER.EVAL_CALENDAR_STRING</a>      | Analyzes character strings in the Calendar format. |
| <a href="#">DBE_SCHEDULER.EVALUATE_CALENDAR_STRING</a>  | Analyzes character strings in the Calendar format. |

- [DBE\\_SCHEDULER.CREATE\\_JOB](#)

Creates a scheduled task.

The prototypes of the **DBE\_SCHEDULER.CREATE\_JOB** function are as follows:

```
-- Scheduled tasks of an inline schedule and a program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
job_type TEXT,
job_action TEXT,
number_of_arguments INTEGER DEFAULT 0,
start_date TIMESTAMP WITH TIME ZONE DEFAULT NULL,
repeat_interval TEXT DEFAULT NULL,
end_date TIMESTAMP WITH TIME ZONE DEFAULT NULL,
job_class TEXT DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN DEFAULT FALSE,
auto_drop BOOLEAN DEFAULT TRUE,
comments TEXT DEFAULT NULL,
credential_name TEXT DEFAULT NULL,
destination_name TEXT DEFAULT NULL
)
```

```
-- Reference the created scheduled tasks of the schedule and the program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
program_name TEXT,
schedule_name TEXT,
job_class TEXT DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN DEFAULT FALSE,
auto_drop BOOLEAN DEFAULT TRUE,
comments TEXT DEFAULT NULL,
job_style TEXT DEFAULT 'REGULAR',
credential_name TEXT DEFAULT NULL,
destination_name TEXT DEFAULT NULL
)

-- Reference the created program and the scheduled task of the inline schedule.
DBE_SCHEDULER.CREATE_JOB(
job_name text,
program_name TEXT,
start_date TIMESTAMP WITH TIME ZONE DEFAULT NULL,
repeat_interval TEXT DEFAULT NULL,
end_date TIMESTAMP WITH TIME ZONE DEFAULT NULL,
job_class TEXT DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN DEFAULT FALSE,
auto_drop BOOLEAN DEFAULT TRUE,
comments TEXT DEFAULT NULL,
job_style TEXT DEFAULT 'REGULAR',
credential_name TEXT DEFAULT NULL,
destination_name TEXT DEFAULT NULL
)

-- Reference the created schedule and the scheduled task of the inline program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
schedule_name TEXT,
job_type TEXT,
job_action TEXT,
number_of_arguments INTEGER DEFAULT 0,
job_class TEXT DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN DEFAULT FALSE,
auto_drop BOOLEAN DEFAULT TRUE,
comments TEXT DEFAULT NULL,
credential_name TEXT DEFAULT NULL,
destination_name TEXT DEFAULT NULL
)
```

#### NOTE

The scheduled task created through **DBE\_SCHEDULER** does not conflict with the scheduled task in **DBE\_TASK**.

The scheduled task created by **DBE\_SCHEDULER** generates the corresponding **job\_id**. However, the **job\_id** is meaningless.

**Table 10-319** DBE\_SCHEDULER.CREATE\_JOB interface parameters

| Parameter           | Type                     | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                             |
|---------------------|--------------------------|------------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name            | text                     | IN                     | No           | Name of a scheduled task.                                                                                                                                                                                                                                                                               |
| job_type            | text                     | IN                     | No           | Inline program type of a scheduled task. The options are as follows: <ul style="list-style-type: none"><li>• <b>'PLSQL_BLOCK'</b>: fast anonymous stored procedure.</li><li>• <b>'STORED_PROCEDURE'</b>: stored procedure that is saved.</li><li>• <b>'EXTERNAL_SCRIPT'</b>: external script.</li></ul> |

| enabled             | boolean                  | IN                     | No           | Status of a scheduled task.                                                                                                                                                                                                                                                                             |

| Parameter        | Type    | Input/Output Parameter | Can Be Empty | Description                                                               |
|------------------|---------|------------------------|--------------|---------------------------------------------------------------------------|
| auto_drop        | boolean | IN                     | No           | Automatic deletion of a scheduled task.                                   |
| comments         | text    | IN                     | Yes          | Comments.                                                                 |
| job_style        | text    | IN                     | No           | Behavior pattern of a scheduled task. Only <b>'REGULAR'</b> is supported. |
| credential_name  | text    | IN                     | Yes          | Certificate name of a scheduled task.                                     |
| destination_name | text    | IN                     | Yes          | Target name of a scheduled task.                                          |

**Example:**

```
CALL DBE_SCHEDULER.create_job(job_name=>'job1', program_name=>'program1',
schedule_name=>'schedule1');
CALL DBE_SCHEDULER.create_job(job_name=>'job1', job_type=>'STORED_PROCEDURE',
job_action=>'select pg_sleep(1);');
CALL DBE_SCHEDULER.create_job('job1', 'program1', '2021-07-20', 'interval "3 minute"', '2121-07-20',
'DEFAULT_JOB_CLASS', false, false, 'test', 'style', NULL, NULL);
```

**NOTICE**

To create a scheduled task of the EXTERNAL\_SCRIPT type, the administrator must assign related permissions and certificates and the user who starts the database must have the read permission on the external script.

- **DBE\_SCHEDULER.DROP\_JOB**

Deletes a scheduled task.

The prototype of the **DBE\_SCHEDULER.DROP\_JOB** function is as follows:

```
DBE_SCHEDULER.drop_job(
job_name text,
force boolean default false,
defer boolean default false,
commit_semantics text default 'STOP_ON_FIRST_ERROR'
)
```

 **NOTE**

You can specify one or more tasks, or specify a task class in DBE\_SCHEDULER.DROP\_JOB to delete scheduled tasks.

**Table 10-320** DBE\_SCHEDULER.DROP\_JOB interface parameters

| Parameter        | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|---------|------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name         | text    | IN                     | No           | Name or class of a scheduled task. You can specify one or more scheduled tasks. If you specify multiple scheduled tasks, separate them with commas (,).                                                                                                                                                                                                                                      |
| force            | boolean | IN                     | No           | Specifies whether to delete a scheduled task.<br><b>true</b> : The current scheduled task is stopped and then deleted.<br><b>false</b> : The scheduled task fails to be deleted if it is running.                                                                                                                                                                                            |
| defer            | boolean | IN                     | No           | Specifies whether to delete a scheduled task.<br><b>true</b> : A scheduled task can be deleted after it is complete.                                                                                                                                                                                                                                                                         |
| commit_semantics | text    | IN                     | No           | Commit rules:<br><b>STOP_ON_FIRST_ERROR</b> : The deletion operation performed before the first error is reported is committed.<br><b>TRANSACTIONAL</b> : Transaction-level commit. The deletion operation performed before an error is reported will be rolled back.<br><b>ABSORB_ERRORS</b> : Attempt to bypass an error and commit the deletion operation that is performed successfully. |

Example:

```
CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
```

**NOTICE**

The **TRANSACTIONAL** option in **commit\_semantic** takes effect only when **force** is set to **false**.

- **DBE\_SCHEDULER.DROP\_SINGLE\_JOB**

Deletes a scheduled task.

The prototype of the **DBE\_SCHEDULER.DROP\_SINGLE\_JOB** function is as follows:

```
DBE_SCHEDULER.drop_single_job(
job_name text,
force boolean default false,
defer boolean default false
)
```

- **DBE\_SCHEDULER.SET\_ATTRIBUTE**

Modifies the attributes of a scheduled task.

The prototypes of the **DBE\_SCHEDULER.SET\_ATTRIBUTE** function are as follows:

```
DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value boolean
)

DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value text
)

DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value timestamp
)

DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value timestamp with time zone
)

DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value text,
value2 text default NULL
)
```

 **NOTE**

**name** specifies any object in **DBE\_SCHEDULE**.

**Table 10-321** DBE\_SCHEDULER.SET\_ATTRIBUTE interface parameters

| Parameter | Type                                                 | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| value     | boolean/date/timestamp/timestamp with time zone/text | IN                     | No           | Attribute value. The options are as follows: <ul style="list-style-type: none"><li>• Scheduled-task-related: job_type, job_action, number_of_arguments, start_date, repeat_interval, end_date, job_class, enabled, auto_drop, comments, credential_name, destination_name, program_name, schedule_name, and job_style.</li><li>• Program-related: program_action, program_type, number_of_arguments, and comments.</li><li>• Scheduling-related: start_date, repeat_interval, end_date, and comments.</li></ul> |
| value2    | text                                                 | IN                     | Yes          | Additional attribute value. Reserved parameter bit. Currently, the target attribute with extra attribute values is not supported.                                                                                                                                                                                                                                                                                                                                                                               |

Example:

```
CALL DBE_SCHEDULER.set_attribute('program1', 'number_of_arguments', 0);
CALL DBE_SCHEDULER.set_attribute('program1', 'program_type', 'STORED_PROCEDURE');
```

#### NOTICE

Do not use **DBE\_SCHEDULER.SET\_ATTRIBUTE** to leave the parameters empty.

The object name cannot be changed using **DBE\_SCHEDULER.SET\_ATTRIBUTE**.

Inline objects cannot be changed by **DBE\_SCHEDULER.SET\_ATTRIBUTE**.

- DBE\_SCHEDULER.RUN\_JOB

Executes a scheduled task.

The prototype of the **DBE\_SCHEDULER.RUN\_JOB** function is as follows:

```
DBE_SCHEDULER.run_job(
job_name text,
use_current_session boolean default true
)
```

 **NOTE**

**DBE\_SCHEDULER.RUN\_JOB** is used to run scheduled tasks immediately. It is independent of the scheduling of scheduled tasks and can even run at the same time.

**Table 10-322** DBE\_SCHEDULER.RUN\_JOB interface parameters

| Parameter           | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                              |
|---------------------|---------|------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name            | text    | IN                     | No           | Name of a scheduled task. You can specify one or more scheduled tasks. If you specify multiple scheduled tasks, separate them with commas (,).                                                                                                                                                           |
| use_current_session | boolean | IN                     | No           | Specifies whether to run a scheduled task. <ul style="list-style-type: none"> <li>• <b>true</b>: Use the current session to check whether the scheduled task can run properly.</li> <li>• <b>false</b>: Start the scheduled task in the background. The execution result is recorded in logs.</li> </ul> |

Example:

```
CALL DBE_SCHEDULER.run_job('job1', false);
```

**NOTICE**

Currently, **use\_current\_session** applies only to scheduled tasks whose **job\_type** is set to **EXTERNAL\_SCRIPT**.

- DBE\_SCHEDULER.RUN\_BACKEND\_JOB

Runs a scheduled task in the background.

The prototype of the **DBE\_SCHEDULER.RUN\_BACKEND\_JOB** function is as follows:

```
DBE_SCHEDULER.run_backend_job(
job_name text
)
```

- **DBE\_SCHEDULER.RUN\_FOREGROUND\_JOB**

Executes a scheduled task in the current session.

Only external tasks can be executed.

Return value: text

The prototype of the **DBE\_SCHEDULER.RUN\_FOREGROUND\_JOB** function is as follows:

```
DBE_SCHEDULER.run_foreground_job(
job_name text
)return text
```

- **DBE\_SCHEDULER.STOP\_JOB**

Stops a scheduled task.

The prototype of the **DBE\_SCHEDULER.STOP\_JOB** function is as follows:

```
DBE_SCHEDULER.stop_job(
job_name text,
force boolean default false,
commit_semantics text default 'STOP_ON_FIRST_ERROR'
)
```

**Table 10-323** DBE\_SCHEDULER.STOP\_JOB interface parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                     |
|-----------|---------|------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name  | text    | IN                     | No           | Name or class of a scheduled task. You can specify one or more scheduled tasks. If you specify multiple scheduled tasks, separate them with commas (,).                                                                                                                                                         |
| force     | boolean | IN                     | No           | Specifies whether to delete a scheduled task. <ul style="list-style-type: none"> <li>• <b>true:</b> The scheduler sends a termination signal to end the task thread immediately.</li> <li>• <b>false:</b> The scheduler attempts to use the interrupt signal to terminate the scheduled task thread.</li> </ul> |

| Parameter        | Type | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                   |
|------------------|------|------------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| commit_semantics | text | IN                     | No           | Commit rules: <ul style="list-style-type: none"> <li>'STOP_ON_FIRST_ERROR': The interrupt operation performed before the first error is reported is committed.</li> <li>'ABSORB_ERRORS': The system attempts to bypass an error and commit the interrupt operation that is performed successfully.</li> </ul> |

- DBE\_SCHEDULER.STOP\_SINGLE\_JOB

Stops a single scheduled task.

The prototype of the **DBE\_SCHEDULER.STOP\_SINGLE\_JOB** function is as follows:

```
DBE_SCHEDULER.stop_single_job(
 job_name text,
 force boolean default false
)
```

- DBE\_SCHEDULER.GENERATE\_JOB\_NAME

Generates the name of a scheduled task.

The prototype of the **DBE\_SCHEDULER.GENERATE\_JOB\_NAME** function is as follows:

```
DBE_SCHEDULER.generate_job_name(
 prefix text default 'JOB$_'
) return text
```

**Table 10-324** DBE\_SCHEDULER.GENERATE\_JOB\_NAME interface parameters

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                     |
|-----------|------|------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| prefix    | text | IN                     | No           | Prefix of the generated name. The default value is 'JOB\$'. Scheduled tasks that are repeatedly executed are named as follows:<br>job\$_1, job\$_2, job\$_3 ... |

**NOTICE**

When DBE\_SCHEDULER.GENERATE\_JOB\_NAME is executed for the first time, a temporary sequence is created in **public** to store the sequence number of the current name. A common user does not have the create permission in **public**. Therefore, if a common user calls the function for the first time in the current database, the function fails to be called. In this case, you need to grant the create permission in **public** to the common user or call the API as a user with the create permission to create a temporary sequence.

- DBE\_SCHEDULER.CREATE\_PROGRAM

Creates a program.

The prototype of the **DBE\_SCHEDULER.CREATE\_PROGRAM** function is as follows:

```
DBE_SCHEDULER.create_program(
program_name text,
program_type text,
program_action text,
number_of_arguments integer default 0,
enabled boolean default false,
comments text default NULL
)
```

- DBE\_SCHEDULER.DEFINE\_PROGRAM\_ARGUMENT

Defines program parameters.

An API with the default value **default\_value** will not convert characters to lowercase letters by default. In this version, characters are case sensitive.

The prototype of the **DBE\_SCHEDULER.DEFINE\_PROGRAM\_ARGUMENT** function is as follows:

```
DBE_SCHEDULER.define_program_argument(
program_name text,
argument_position integer,
argument_name text default NULL,
argument_type text,
out_argument boolean default false
)
```

```
)
-- With a default value --
DBE_SCHEDULER.define_program_argument(
program_name text,
argument_position integer,
argument_name text default NULL,
argument_type text,
default_value text,
out_argument boolean default false
)
```

- **DBE\_SCHEDULER.DROP\_PROGRAM**

Deletes a program.

The prototype of the **DBE\_SCHEDULER.DROP\_PROGRAM** function is as follows:

```
DBE_SCHEDULER.drop_program(
program_name text,
force boolean default false
)
```

- **DBE\_SCHEDULER.DROP\_SINGLE\_PROGRAM**

Deletes a single program.

The prototype of the **DBE\_SCHEDULER.DROP\_SINGLE\_PROGRAM** function is as follows:

```
DBE_SCHEDULER.drop_single_program(
program_name text,
force boolean default false
)
```

- **DBE\_SCHEDULER.SET\_JOB\_ARGUMENT\_VALUE**

Sets the parameters of a scheduled task. The **argument\_value** can be left empty.

The prototype of the **DBE\_SCHEDULER.SET\_JOB\_ARGUMENT\_VALUE** function is as follows:

```
DBE_SCHEDULER.set_job_argument_value(
job_name text,
argument_position integer,
argument_value text
)

DBE_SCHEDULER.set_job_argument_value(
job_name text,
argument_name text,
argument_value text
)
```

- **DBE\_SCHEDULER.CREATE\_SCHEDULE**

Creates a schedule.

The prototype of the **DBE\_SCHEDULER.CREATE\_SCHEDULE** function is as follows:

```
DBE_SCHEDULER.create_schedule(
schedule_name text,
start_date timestamp with time zone default NULL,
repeat_interval text,
end_date timestamp with time zone default NULL,
comments text default NULL
)
```

- **DBE\_SCHEDULER.DROP\_SCHEDULE**

Deletes a schedule.

The prototype of the **DBE\_SCHEDULER.DROP\_SCHEDULE** function is as follows:

```
DBE_SCHEDULER.drop_schedule(
 schedule_name text,
 force boolean default false
)
```

- **DBE\_SCHEDULER.DROP\_SINGLE\_SCHEDULE**

Deletes a single schedule.

The prototype of the **DBE\_SCHEDULER.DROP\_SINGLE\_SCHEDULE** function is as follows:

```
DBE_SCHEDULER.drop_single_schedule(
 schedule_name text,
 force boolean default false
)
```

- **DBE\_SCHEDULER.CREATE\_JOB\_CLASS**

Creates the class of a scheduled task.

The prototype of the **DBE\_SCHEDULER.CREATE\_JOB\_CLASS** function is as follows:

```
DBE_SCHEDULER.create_job_class(
 job_class_name text,
 resource_consumer_group text default NULL,
 service text default NULL,
 logging_level integer default 0,
 log_history integer default NULL,
 comments text default NULL
)
```

- **DBE\_SCHEDULER.DROP\_JOB\_CLASS**

Deletes the class of a scheduled task.

The prototype of the **DBE\_SCHEDULER.DROP\_JOB\_CLASS** function is as follows:

```
DBE_SCHEDULER.drop_job_class(
 job_class_name text,
 force boolean default false
)
```

- **DBE\_SCHEDULER.DROP\_SINGLE\_JOB\_CLASS**

Deletes the class of a single scheduled task.

The prototype of the **DBE\_SCHEDULER.DROP\_SINGLE\_JOB\_CLASS** function is as follows:

```
DBE_SCHEDULER.drop_single_job_class(
 job_class_name text,
 force boolean default false
)
```

- **DBE\_SCHEDULER.GRANT\_USER\_AUTHORIZATION**

Grants the scheduled task permissions to the database user. The user who calls this function must have the SYSADMIN permission.

The prototype of the **DBE\_SCHEDULER.GRANT\_USER\_AUTHORIZATION** function is as follows:

```
DBE_SCHEDULER.grant_user_authorization(
 username text,
 privilege text
)
```

- **DBE\_SCHEDULER.REVOKE\_USER\_AUTHORIZATION**

Revokes the scheduled task permissions from the database user. The user who calls this function must have the SYSADMIN permission.

The prototype of the **DBE\_SCHEDULER.REVOKE\_USER\_AUTHORIZATION** function is as follows:

```
DBE_SCHEDULER.revoke_user_authorization(
username text,
privilege text
)
```

- **DBE\_SCHEDULER.CREATE\_CREDENTIAL**

Creates an authorization certificate. The user who calls this function must have the SYSADMIN permission.

The prototype of the **DBE\_SCHEDULER.CREATE\_CREDENTIAL** function is as follows:

```
DBE_SCHEDULER.create_credential(
credential_name text,
username text,
password text default NULL,
database_role text default NULL,
windows_domain text default NULL,
comments text default NULL
)
```

---

**NOTICE**

The **password** parameter of **DBE\_SCHEDULER.CREATE\_CREDENTIAL** must be set to **NULL** or **'\*\*\*\*\*'**. This parameter is used only for compatibility and does not indicate any actual meaning. Do not use the OS username corresponding to the installation user to create a certificate.

- **DBE\_SCHEDULER.DROP\_CREDENTIAL**

Destroys an authorization certificate. The user who calls this function must have the SYSADMIN permission.

The prototype of the **DBE\_SCHEDULER.DROP\_CREDENTIAL** function is as follows:

```
DBE_SCHEDULER.drop_credential(
credential_name text,
force boolean default false
)
```

- **DBE\_SCHEDULER.ENABLE**

Enables an object.

The prototype of the **DBE\_SCHEDULER.ENABLE** function is as follows:

```
DBE_SCHEDULER.enable(
name text,
commit_semantics text default 'STOP_ON_FIRST_ERROR'
)
```

- **DBE\_SCHEDULER.ENABLE\_SINGLE**

Enables a single object.

The prototype of the **DBE\_SCHEDULER.ENABLE\_SINGLE** function is as follows:

```
DBE_SCHEDULER.enable_single(
name text
)
```

- **DBE\_SCHEDULER.DISABLE**

Disables multiple objects. The value of name is a character string separated by commas (,). Each character string separated by commas (,) is an object.

The prototype of the **DBE\_SCHEDULER.DISABLE** function is as follows:

```
DBE_SCHEDULER.disable(
name text,
force boolean default false,
commit_semantics text default 'STOP_ON_FIRST_ERROR'
)
```

- **DBE\_SCHEDULER.DISABLE\_SINGLE**

Disables a single object.

The prototype of the **DBE\_SCHEDULER.DISABLE\_SINGLE** function is as follows:

```
DBE_SCHEDULER.disable_single(
name text,
force boolean default false
)
```

- **DBE\_SCHEDULER.EVAL\_CALENDAR\_STRING**

Analyzes the scheduling task period.

Return type: timestamp with time zone

The prototype of the **DBE\_SCHEDULER.EVAL\_CALENDAR\_STRING** function is as follows:

```
DBE_SCHEDULER.evaluate_calendar_string(
IN calendar_string text,
IN start_date timestamp with time zone,
IN return_date_after timestamp with time zone
)return timestamp with time zone
```

- **DBE\_SCHEDULER.EVALUATE\_CALENDAR\_STRING**

Analyzes the scheduling task period.

The prototype of the **DBE\_SCHEDULER.EVALUATE\_CALENDAR\_STRING** function is as follows:

```
DBE_SCHEDULER.evaluate_calendar_string(
IN calendar_string text,
IN start_date timestamp with time zone,
IN return_date_after timestamp with time zone,
OUT next_run_date timestamp with time zone
)return timestamp with time zone
```

## 10.12.2.12 DBE\_APPLICATION\_INFO

### Interface Description

**Table 10-325** provides all interfaces supported by the **DBE\_APPLICATION\_INFO** package. **DBE\_APPLICATION\_INFO** applies to the current session.

**Table 10-325** DBE\_APPLICATION\_INFO

| Interface                                   | Description                |
|---------------------------------------------|----------------------------|
| <b>DBE_APPLICATION_INFO.SET_CLIENT_INFO</b> | Writes client information. |

| Interface                                             | Description               |
|-------------------------------------------------------|---------------------------|
| <a href="#">DBE_APPLICATION_INFO.READ_CLIENT_INFO</a> | Reads client information. |

- [DBE\\_APPLICATION\\_INFO.SET\\_CLIENT\\_INFO](#)

Writes client information. The [DBE\\_APPLICATION\\_INFO.SET\\_CLIENT\\_INFO](#) function prototype is as follows:

```
DBE_APPLICATION_INFO.SET_CLIENT_INFO(
 str text
)returns void;
```

**Table 10-326** DBE\_APPLICATION\_INFO.SET\_CLIENT\_INFO interface parameters

| Parameter | Description                |
|-----------|----------------------------|
| str       | Writes client information. |

- [DBE\\_APPLICATION\\_INFO.READ\\_CLIENT\\_INFO](#)

The [DBE\\_APPLICATION\\_INFO.READ\\_CLIENT\\_INFO](#) function prototype is as follows:

```
DBE_APPLICATION_INFO.READ_CLIENT_INFO(
 OUT client_info text);
```

**Table 10-327** DBE\_APPLICATION\_INFO.READ\_CLIENT\_INFO interface parameters

| Parameter   | Description        |
|-------------|--------------------|
| client_info | Client information |

### 10.12.2.13 DBE\_XMLDOM

#### Interface Description

The advanced function package DBE\_XMLDOM is used to access XMLType objects and implement Document Object Model (DOM), which is an interface used to access HTML and XML documents. For details about all types supported by the advanced function package DBE\_XMLDOM, see [Table 10-328](#). For details about all interfaces supported by DBE\_XMLDOM, see [Table 10-329](#).

#### NOTE

When the DBE\_XMLDOM advanced package is used in the database whose character set is set to **SQL\_ASCII**, an error is reported if characters beyond the ASCII range are input.

**Table 10-328** DBE\_XMLDOM data types

| Type            | Description                               |
|-----------------|-------------------------------------------|
| DOMATTR         | Implements the DOMAttributes interface.   |
| DOMDOCUMENT     | Implements the DOMDocument interface.     |
| DOMELEMENT      | Implements the DOMELEMENT interface.      |
| DOMNAMEDNODEMAP | Implements the DOMNamedNodeMap interface. |
| DOMNODELIST     | Implements the DOMNodeList interface.     |
| DOMNODE         | Implements the DOMNode interface.         |
| DOMTEXT         | Implements the DOMText interface.         |

**Table 10-329** DBE\_XMLDOM parameters

| Interface                                       | Description                                                                               |
|-------------------------------------------------|-------------------------------------------------------------------------------------------|
| <a href="#">DBE_XMLDOM.APPENDCHILD</a>          | Adds the newchild node to the end of the parent(n) node and returns the newly added node. |
| <a href="#">DBE_XMLDOM.CREATEELEMENT</a>        | Creates a DOMELEMENT object with the specified name.                                      |
| <a href="#">DBE_XMLDOM.CREATETEXTNODE</a>       | Creates a DOMText node.                                                                   |
| <a href="#">DBE_XMLDOM.FREEDOCUMENT</a>         | Frees resources related to DOMDocument nodes.                                             |
| <a href="#">DBE_XMLDOM.FREEELEMENT</a>          | Frees resources related to DOMELEMENT nodes.                                              |
| <a href="#">DBE_XMLDOM.FREENODE</a>             | Frees resources related to DOMNode nodes.                                                 |
| <a href="#">DBE_XMLDOM.FREENODELIST</a>         | Frees resources related to DOMNodeList nodes.                                             |
| <a href="#">DBE_XMLDOM.GETATTRIBUTE</a>         | Returns the attribute values of a DOMELEMENT object by name.                              |
| <a href="#">DBE_XMLDOM.GETATTRIBUTES</a>        | Returns the attribute values of a DOMNode node as a map.                                  |
| <a href="#">DBE_XMLDOM.GETCHILDNODES</a>        | Converts several subnodes under a node into a node list.                                  |
| <a href="#">DBE_XMLDOM.GETCHILDRENBYTAGNAME</a> | Returns the subnodes of a DOMELEMENT node by name.                                        |

| Interface                                     | Description                                                           |
|-----------------------------------------------|-----------------------------------------------------------------------|
| <a href="#">DBE_XMLDOM.GETDOCUMENTELEMENT</a> | Returns the first subnode of the specified document.                  |
| <a href="#">DBE_XMLDOM.GETFIRSTCHILD</a>      | Returns the first subnode.                                            |
| <a href="#">DBE_XMLDOM.GETLASTCHILD</a>       | Returns the last subnode.                                             |
| <a href="#">DBE_XMLDOM.GETLENGTH</a>          | Obtains the number of subnodes under a specified node.                |
| <a href="#">DBE_XMLDOM.GETLOCALNAME</a>       | Returns the local name of a node.                                     |
| <a href="#">DBE_XMLDOM.GETNAMEDITEM</a>       | Returns the node specified by name.                                   |
| <a href="#">DBE_XMLDOM.GETNEXTSIBLING</a>     | Returns the next node of the specified node.                          |
| <a href="#">DBE_XMLDOM.GETNODENAME</a>        | Returns the name of a node.                                           |
| <a href="#">DBE_XMLDOM.GETNODETYPE</a>        | Returns the type of a node.                                           |
| <a href="#">DBE_XMLDOM.GETNODEVALUE</a>       | Obtains the value of a node, depending on its type.                   |
| <a href="#">DBE_XMLDOM.GETPARENTNODE</a>      | Returns the parent node of a node.                                    |
| <a href="#">DBE_XMLDOM.GETTAGNAME</a>         | Returns the tag name of the specified DOMElement node.                |
| <a href="#">DBE_XMLDOM.HASCHILDNODES</a>      | Checks whether the DOMNode object has any subnode.                    |
| <a href="#">DBE_XMLDOM.IMPORTNODE</a>         | Copies a node and specifies the document to which the node belongs.   |
| <a href="#">DBE_XMLDOM.ISNULL</a>             | Checks whether a node is null.                                        |
| <a href="#">DBE_XMLDOM.ITEM</a>               | Returns the item corresponding to the index parameter in the mapping. |
| <a href="#">DBE_XMLDOM.MAKEELEMENT</a>        | Converts a DOMNode object to the DOMElement type.                     |
| <a href="#">DBE_XMLDOM.MAKENODE</a>           | Forcibly converts a node to the DOMNode type.                         |
| <a href="#">DBE_XMLDOM.NEWDOMDOCUMENT</a>     | Returns a new DOMDocument object.                                     |

| Interface                                         | Description                                                                                            |
|---------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| <a href="#">DBE_XMLDOM.SETATTRIBUTE</a>           | Sets the value of the DOMELEMENT attribute by name.                                                    |
| <a href="#">DBE_XMLDOM.SETCHARSET</a>             | Sets the character set for a DOMDOCUMENT object.                                                       |
| <a href="#">DBE_XMLDOM.SETDOCTYPE</a>             | Sets the external DTD of a DOMDOCUMENT object.                                                         |
| <a href="#">DBE_XMLDOM.SETNODEVALUE</a>           | Sets the value of a node in the DOMNODE object.                                                        |
| <a href="#">DBE_XMLDOM.WRITETOBUFFER</a>          | Writes an XML node to a specified buffer.                                                              |
| <a href="#">DBE_XMLDOM.WRITETOCLOB</a>            | Writes an XML node to a specified CLOB.                                                                |
| <a href="#">DBE_XMLDOM.WRITETOFILE</a>            | Writes an XML node to a specified file.                                                                |
| <a href="#">DBE_XMLDOM.GETSESSIONTREECOUNT</a>    | Displays the number of DOM trees of all types in the current session.                                  |
| <a href="#">DBE_XMLDOM.GETDOCTREEINFO</a>         | Displays statistics such as the memory usage and number of nodes of the DOM tree of the document type. |
| <a href="#">DBE_XMLDOM.GETDETAILEDDOCTREEINFO</a> | Displays the number of nodes of each type for a specific document variable.                            |

- [DBE\\_XMLDOM.APPENDCHILD](#)

Adds the newchild node to the end of the parent(n) node and returns the newly added node. The prototype of the [DBE\\_XMLDOM.APPENDCHILD](#) function is as follows:

```
DBE_XMLDOM.APPENDCHILD(
 n IN DOMNode,
 newchild IN DOMNode)
RETURN DOMNODE;
```

**Table 10-330** [DBE\\_XMLDOM.APPENDCHILD](#) parameters

| Parameter | Description      |
|-----------|------------------|
| n         | Node to be added |
| newchild  | New node added   |

 NOTE

1. The error message "operation not support" is displayed for the APPEND ATTR node under the DOCUMENT node. Database ORA does not report an error in this scenario, but the mounting fails.
2. The error message "operation not support" is displayed for the APPEND ATTR node under the ATTR node. Database ORA does not report an error in this scenario, but the mounting fails.
3. When multiple child nodes of the ATTR type are added to a parent node, the child nodes with the same key value cannot exist under the same parent node.

## Example:

-- Add a DOMNode node to a specified DOC tree and use DBE\_XMLDOM.HASCHILDNODES() to check whether the subnode is successfully added.

```
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 doc1 DBE_XMLDOM.DOMDocument;
 root DBE_XMLDOM.DOMELEMENT;
 rootnode DBE_XMLDOM.DOMNode;
 child1 DBE_XMLDOM.DOMELEMENT;
 child2 DBE_XMLDOM.DOMELEMENT;
 attr DBE_XMLDOM.DOMAttr;
 text DBE_XMLDOM.DOMTEXT;
 node DBE_XMLDOM.DOMNode;
 child1_node DBE_XMLDOM.DOMNode;
 attr_node DBE_XMLDOM.DOMNode;
 parent DBE_XMLDOM.DOMNode;
 buf varchar2(1000);
BEGIN
 doc := DBE_XMLDOM.newDOMDocument();
 root := DBE_XMLDOM.createElement(doc, 'root');
 rootnode := DBE_xmlldom.makeNode(root);
 node := DBE_XMLDOM.appendChild(DBE_xmlldom.makeNode(doc), rootnode);
 child1 := DBE_XMLDOM.createElement(doc, 'child1');
 child1_node := DBE_XMLDOM.makeNode(child1);
 node := DBE_XMLDOM.appendChild(rootnode, child1_node);
 attr := DBE_XMLDOM.createAttribute(doc, 'abc');
 attr_node := DBE_XMLDOM.makeNode(attr);
 node := DBE_XMLDOM.appendChild(child1_node, attr_node);
 IF DBE_XMLDOM.HASCHILDNODES(child1_node) THEN
 DBE_OUTPUT.print_line('HAS CHILD NODES');
 ELSE
 DBE_OUTPUT.print_line('NOT HAS CHILD NODES ');
 END IF;
 parent := DBE_XMLDOM.GETPARENTNODE(attr_node);
 buf := DBE_XMLDOM.GETNODENAME(parent);
 DBE_OUTPUT.print_line(buf);
END;
/
```

- DBE\_XMLDOM.CREATEELEMENT

Returns the DOMELEMENT object with the specified name. The prototype of the DBE\_XMLDOM.CREATEELEMENT function is as follows:

```
DBE_XMLDOM.CREATEELEMENT(
 doc IN DOMDOCUMENT,
 tagName IN VARCHAR2)
RETURN DOMELEMENT;
```

Returns the DOMELEMENT object with the specified name and namespace. The prototype of the DBE\_XMLDOM.CREATEELEMENT function is as follows:

```
DBE_XMLDOM.CREATEELEMENT(
 doc IN DOMDOCUMENT,
 tagName IN VARCHAR2,
 ns IN VARCHAR2)
RETURN DOMELEMENT;
```

**Table 10-331** DBE\_XMLDOM.CREATEELEMENT parameters

| Parameter | Description                       |
|-----------|-----------------------------------|
| doc       | Specified DOMDocument object      |
| tagName   | Name of the new DOMELEMENT object |
| ns        | Namespace                         |

 **NOTE**

1. When the **tagName** parameter is set to null or an empty character string, the exception "NULL or invalid TagName argument specified" is thrown.
2. The default maximum length of **tagName** and **ns** is 32767. If the length exceeds 32767, an exception is thrown.

**Example:**

```
--1. Create a DOMELEMENT object with the specified name.
DECLARE
 doc db_xmldom.domdocument;
 attr DBE_XMLDOM.DOMATTR;
 elem DBE_XMLDOM.DOMELEMENT;
 ans DBE_XMLDOM.DOMATTR;
 buf varchar2(1010);
BEGIN
 doc := db_xmldom.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>
 <computer size="ITX"><cpu>Ryzen 9 3950X</cpu>
 <ram>32GBx2 DDR4 3200MHz</ram>
 <motherboard>ROG X570i</motherboard>
 <gpu>RTX2070 Super</gpu>
 <ssd>1TB NVMe Toshiba + 2TB NVMe WD Black</ssd>
 <hdd>12TB WD Digital</hdd>
 <psu>CORSAIR SF750</psu>
 <case>LIANLI TU150</case>
 </computer>');
 elem := db_xmldom.createelement(doc,'elem');
 DBE_XMLDOM.WRITETOBUFFER(db_xmldom.makenode(elem), buf);
 DBE_OUTPUT.print_line(buf);
END;
/

--2. Create a DOMELEMENT object with the specified name and namespace.
DECLARE
 doc db_xmldom.domdocument;
 attr DBE_XMLDOM.DOMATTR;
 elem DBE_XMLDOM.DOMELEMENT;
 ans DBE_XMLDOM.DOMNODE;
 buf varchar2(1010);
 list DBE_XMLDOM.DOMNODELIST;
 node DBE_XMLDOM.DOMNODE;
BEGIN
 doc := db_xmldom.newdomdocument('<h:data xmlns:h="http://www.w3.org/TR/html4/">
 <h:da1 len="10">test namespace</h:da1><h:da1>bbbbbbbb</h:da1></h:data>');
 elem := db_xmldom.createelement(doc,'elem','http://www.w3.org/TR/html5/');
 ans := DBE_XMLDOM.APPENDCHILD(db_xmldom.makenode(doc), db_xmldom.makenode(elem));
 DBE_XMLDOM.WRITETOBUFFER(doc, buf);
 DBE_OUTPUT.print_line(buf);
END;
/
```

- **DBE\_XMLDOM.CREATETEXTNODE**

Creates and returns a DOMText object. The prototype of the DBE\_XMLDOM.CREATETEXTNOD function is as follows:

```
DBE_XMLDOM.CREATETEXTNODE(
 doc IN DOMDocument,
 data IN VARCHAR2)
RETURN DOMTEXT;
```

**Table 10-332** DBE\_XMLDOM.CREATETEXTNODE parameters

| Parameter | Description                  |
|-----------|------------------------------|
| doc       | Specified DOMDocument object |
| data      | Content of the DOMText node  |

 **NOTE**

1. You can enter an empty string or null value for **data**.
  2. The default maximum length of **data** is 32767. If the length exceeds 32767, an exception is thrown.
- DBE\_XMLDOM.FREEDOCUMENT

Frees a DOMDocument node. The prototype of the DBE\_XMLDOM.FREEDOCUMENT function is as follows:

```
DBE_XMLDOM.FREEDOCUMENT(
 doc IN DOMDOCUMENT);
```

**Table 10-333** DBE\_XMLDOM.FREEDOCUMENT parameters

| Parameter | Description                |
|-----------|----------------------------|
| doc       | Specified DOMDocument node |

**Example:**

```
-- Free the entire DOC tree after the DOMNode node is added to the DOC tree.
DECLARE
 doc dbe_xmldom.domdocument;
 elem dbe_xmldom.domelement;
 doc_node dbe_xmldom.DOMNODE;
 root_elmt dbe_xmldom.DOMELEMENT;
 root_node dbe_xmldom.DOMNODE;
 value varchar(1000);
BEGIN
 doc := dbe_xmldom.newdomdocument();
 doc_node := dbe_xmldom.MAKENODE(doc);
 root_elmt := dbe_xmldom.CREATEELEMENT(doc,'staff');
 root_node:=dbe_xmldom.APPENDCHILD(doc_node, dbe_xmldom.MAKENODE(root_elmt));
 dbe_xmldom.freedocument(doc);
END;
/
```

- DBE\_XMLDOM.FREEELEMENT

Frees a DOMELEMENT node. The prototype of the DBE\_XMLDOM.FREEELEMENT function is as follows:

```
DBE_XMLDOM.FREEELEMENT(
 elem IN DOMELEMENT);
```

**Table 10-334** DBE\_XMLDOM.FREEELEMENT parameters

| Parameter | Description               |
|-----------|---------------------------|
| elem      | Specified DOMELEMENT node |

- DBE\_XMLDOM.FREENODE

Frees a DOMNode node. The prototype of the DBE\_XMLDOM.FREENODE function is as follows:

```
DBE_XMLDOM.FREENODE(
 n IN DOMNODE);
```

**Table 10-335** DBE\_XMLDOM.FREENODE parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

 **NOTE**

1. After GaussDB performs the FREENODE operation, the freed node is not available again. After the database ORA performs the FREENODE operation, the freed node is available again and becomes another node.
  2. When other interfaces call the freed DOMNode node, the calling is different from that in database ORA.
- DBE\_XMLDOM.FREENODELIST

Frees a DOMNodeList node. The prototype of the DBE\_XMLDOM.FREENODE function is as follows:

```
DBE_XMLDOM.GETLENGTH(
 nl IN DOMNODELIST);
```

**Table 10-336** DBE\_XMLDOM.FREENODELIST parameters

| Parameter | Description                |
|-----------|----------------------------|
| nl        | Specified DOMNodeList node |

 **NOTE**

1. A DOMNodeList node will be completely freed by FREENODELIST.
  2. When other interfaces call the freed DOMNodeList node, the calling is different from that in database ORA.
  3. The input parameter **freenodelist** cannot be empty.
- DBE\_XMLDOM.GETATTRIBUTE
- Returns the attribute values of a DOMELEMENT object by name. The prototype of the DBE\_XMLDOM.GETATTRIBUTE function is as follows:

```
DBE_XMLDOM.GETATTRIBUTE(
 elem IN DOMELEMENT,
 name IN VARCHAR2)
RETURN VARCHAR2;
```

Returns the attribute values of a DOMELEMENT object by name and namespace URI. The prototype of the DBE\_XMLDOM.GETATTRIBUTE function is as follows:

```
DBE_XMLDOM.GETATTRIBUTE(
 elem IN DOMELEMENT,
 name IN VARCHAR2,
 ns IN VARCHAR2)
RETURN VARCHAR2;
```

**Table 10-337** DBE\_XMLDOM.GETATTRIBUTE parameters

| Parameter | Description               |
|-----------|---------------------------|
| elem      | Specified DOMELEMENT node |
| name      | Attribute name            |
| ns        | Namespace                 |

 **NOTE**

1. The **ns** parameter of the DBE\_XMLDOM.GETATTRIBUTE interface does not support the asterisk (\*) parameter.
2. GaussDB does not support the namespace prefix as an attribute, and the value of the prefix cannot be queried through the DBE\_XMLDOM.GETATTRIBUTE interface.

**Example:**

--1. Return the attribute values of a DOMELEMENT object by name.

```
DECLARE
 doc dbe_xmldom.domdocument;
 elem dbe_xmldom.domelement;
 docnode DBE_XMLDOM.DOMNode;
 buffer varchar2(1010);
 value varchar2(1000);
BEGIN
 doc := dbe_xmldom.newDOMDocument();
 elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
 DBE_XMLDOM.setattribute(elem, 'len', '50cm');
 docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
 DBE_XMLDOM.makeNode(elem));
 value := DBE_XMLDOM.getattribute(elem, 'len');
 dbe_output.print_line('value: ');
 dbe_output.print_line(value);
 dbe_xmldom.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
END;
/
```

--2. Return the attribute values of a DOMELEMENT object by name and namespace URI.

```
DECLARE
 doc dbe_xmldom.domdocument;
 elem dbe_xmldom.domelement;
 docnode DBE_XMLDOM.DOMNode;
 buffer varchar2(1010);
 value varchar(1000);
BEGIN
 doc := dbe_xmldom.newDOMDocument();
 elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
 DBE_XMLDOM.setattribute(elem, 'len', '50cm', 'www.huawei.com');
 docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
 DBE_XMLDOM.makeNode(elem));
```

```

value := DBE_XMLDOM.getattribute(elem, 'len', 'www.huawei.com');
dbe_output.print_line('value: ');
dbe_output.print_line(value);
dbe_xmldom.writetobuffer(doc, buffer);
dbe_output.print_line('buffer: ');
dbe_output.print_line(buffer);
END;
/

```

- **DBE\_XMLDOM.GETATTRIBUTES**

Returns the attribute values of a DOMNode node as a map. The prototype of the DBE\_XMLDOM.GETATTRIBUTES function is as follows:

```

DBE_XMLDOM.GETATTRIBUTES(
 n IN DOMNode)
RETURN DOMNAMEDNODEMAP;

```

**Table 10-338** DBE\_XMLDOM.GETATTRIBUTES parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

- **DBE\_XMLDOM.GETCHILDNODES**

Converts several subnodes under a node into a node list. The prototype of the DBE\_XMLDOM.GETCHILDNODES function is as follows:

```

DBE_XMLDOM.GETCHILDNODES(
 n IN DOMNode)
RETURN DOMNodeList;

```

**Table 10-339** DBE\_XMLDOM.GETCHILDNODES parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

- **DBE\_XMLDOM.GETCHILDRENBYTAGNAME**

Returns the subnodes of a DOMELEMENT node by name. The prototype of the DBE\_XMLDOM.GETCHILDRENBYTAGNAME function is as follows:

```

DBE_XMLDOM.GETCHILDRENBYTAGNAME (
 elem IN DOMELEMENT,
 name IN VARCHAR2)
RETURN DOMNODELIST;

```

Returns the subnodes of a DOMELEMENT node by name and namespace. The prototype of the DBE\_XMLDOM.GETCHILDRENBYTAGNAME function is as follows:

```

DBE_XMLDOM.GETCHILDRENBYTAGNAME (
 elem IN DOMELEMENT,
 name IN VARCHAR2,
 ns IN VARCHAR2)
RETURN DOMNODELIST;

```

**Table 10-340** DBE\_XMLDOM.GETCHILDRENBYTAGNAME parameters

| Parameter | Description               |
|-----------|---------------------------|
| elem      | Specified DOMELEMENT node |

| Parameter | Description    |
|-----------|----------------|
| name      | Attribute name |
| ns        | Namespace      |

 **NOTE**

The **ns** parameter of the DBE\_XMLDOM.GETCHILDRENBYTAGNAME interface does not support the asterisk (\*) parameter. To obtain all attributes of a node, use the DBE\_XMLDOM.GETCHILDNODES interface.

**Example:**

--1. Return the subnodes of a DOMELEMENT node by name.

```
DECLARE
 doc dbe_xmldom.domdocument;
 elem dbe_xmldom.domelement;
 docnodelist dbe_xmldom.domnodelist;
 node_elem dbe_xmldom.domelement;
 node dbe_xmldom.domnode;
 buffer varchar2(1010);
 value varchar2(1000);
BEGIN
 doc := dbe_xmldom.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>
 <students age="16" hight="176">
 <student>
 <name>Jerry</name><age>519</age><sex>man</sex><abc>12345</abc>
 </student>
 <student>
 <name>Bob</name><age>245</age><sex>woman</sex><abc>54321</abc>
 </student>
 </students>');
 elem := dbe_xmldom.GETDOCUMENTELEMENT(doc);
 docnodelist := dbe_xmldom.GETCHILDRENBYTAGNAME(elem, 'student');
 node := dbe_xmldom.ITEM(docnodelist, 0);
 node_elem := dbe_xmldom.makeelement(node);
 value := DBE_XMLDOM.gettagname(node_elem);
 dbe_output.print_line('value: ');
 dbe_output.print_line(value);
 dbe_xmldom.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
END;
/
```

- **DBE\_XMLDOM.GETDOCUMENTELEMENT**

Returns the first subnode of the specified document. The prototype of the DBE\_XMLDOM.GETDOCUMENTELEMENT function is as follows:

```
DBE_XMLDOM.GETDOCUMENTELEMENT(
 doc IN DOMDOCUMENT)
RETURN DOMELEMENT;
```

**Table 10-341** DBE\_XMLDOM.GETDOCUMENTELEMENT parameters

| Parameter | Description                |
|-----------|----------------------------|
| doc       | Specified DOMDocument node |

**Example:**

```
-- Obtain the first subnode in the DOC tree and output the node name.
DECLARE
 doc dbe_xmlDOM.domdocument;
 elem dbe_xmlDOM.domelement;
 doc_node dbe_xmlDOM.DOMNODE;
 root_elmt dbe_xmlDOM.DOMELEMENT;
 root_node dbe_xmlDOM.DOMNODE;
 value varchar(1000);
BEGIN
 doc := dbe_xmlDOM.newdomdocument();
 doc_node := dbe_xmlDOM.MAKENODE(doc);
 root_elmt := dbe_xmlDOM.CREATEELEMENT(doc,'staff');
 root_node:=dbe_xmlDOM.APPENDCHILD(doc_node, dbe_xmlDOM.MAKENODE(root_elmt));
 elem := dbe_xmlDOM.GETDOCUMENTELEMENT(doc);
 value := DBE_XMLDOM.gettagname(elem);
 dbe_output.print_line(value);
END;
/
```

- **DBE\_XMLDOM.GETFIRSTCHILD**

Returns the first subnode of a node. The prototype of the DBE\_XMLDOM.GETFIRSTCHILD function is as follows:

```
DBE_XMLDOM.GETFIRSTCHILD(
 n IN DOMNODE)
RETURN DOMNODE;
```

**Table 10-342** DBE\_XMLDOM.GETFIRSTCHILD parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

**Example:**

-- Obtain the name and type of the first subnode after the DOC tree is converted to the DOMNode type, and then obtain the name of the first subnode of the obtained first DOMNode node.

```
DECLARE
 doc dbe_xmlDOM.domdocument;
 doc_node dbe_xmlDOM.domnode;
 root_node dbe_xmlDOM.domnode;
 inside_node dbe_xmlDOM.domnode;
 node_name varchar2(1000);
 node_type integer;
BEGIN
 doc := dbe_xmlDOM.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>
<students age="16" hight="176">
<student1>
 <name>Jerry</name><age>519</age><sex>man</sex><abc>12345</abc>
</student1>
<student2>
 <name>Bob</name><age>245</age><sex>woman</sex><abc>54321</abc>
</student2>
</students>');
 doc_node := DBE_XMLDOM.MAKENODE(doc);
 root_node := DBE_XMLDOM.GETFIRSTCHILD(doc_node);
 node_name := DBE_XMLDOM.GETNODENAME(root_node);
 node_type := DBE_XMLDOM.GETNODETYPE(root_node);
 dbe_output.print_line(node_name);
 dbe_output.print_line(node_type);
 inside_node := DBE_XMLDOM.GETFIRSTCHILD(root_node);
 node_name := DBE_XMLDOM.GETNODENAME(inside_node);
 dbe_output.print_line(node_name);
END;
/
```

- DBE\_XMLDOM.GETLASTCHILD

Returns the last subnode of a node. The prototype of the DBE\_XMLDOM.GETLASTCHILD function is as follows:

```
DBE_XMLDOM.GETLASTCHILD(
 n IN DOMNODE)
RETURN DOMNODE;
```

**Table 10-343** DBE\_XMLDOM.GETLASTCHILD parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

**Example:**

-- Obtain the name and type of the last subnode after the DOC tree is converted to the DOMNode type, and then obtain the name of the last subnode of the obtained last DOMNode node.

```
DECLARE
 doc dbe_xmldom.domdocument;
 doc_node dbe_xmldom.domnode;
 root_node dbe_xmldom.domnode;
 inside_node dbe_xmldom.domnode;
 node_name varchar2(1000);
 node_type integer;
BEGIN
 doc := dbe_xmldom.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>
 <students age="16" hight="176">
 <student1>
 <name>Jerry</name><age>519</age><sex>man</sex><abc>12345</abc>
 </student1>
 <student2>
 <name>Bob</name><age>245</age><sex>woman</sex><abc>54321</abc>
 </student2>
 </students>');
 doc_node := DBE_XMLDOM.MAKENODE(doc);
 root_node := DBE_XMLDOM.GETFIRSTCHILD(doc_node);
 node_name := DBE_XMLDOM.GETNODENAME(root_node);
 node_type := DBE_XMLDOM.GETNODETYPE(root_node);
 dbe_output.print_line(node_name);
 dbe_output.print_line(node_type);
 inside_node := DBE_XMLDOM.GETLASTCHILD(root_node);
 node_name := DBE_XMLDOM.GETNODENAME(inside_node);
 dbe_output.print_line(node_name);
END;
/
```

- DBE\_XMLDOM.GETLENGTH

Returns the number of subnodes under a DOMNamedNodeMap node. The prototype of the DBE\_XMLDOM.GETLENGTH function is as follows:

```
DBE_XMLDOM.GETLENGTH(
 nnm IN DOMNAMEDNODEMAP)
RETURN NUMBER;
```

Returns the number of subnodes under a DOMNodeList node. The prototype of the DBE\_XMLDOM.GETLENGTH function is as follows:

```
DBE_XMLDOM.GETLENGTH(
 nl IN DOMNODELIST)
RETURN NUMBER;
```

**Table 10-344** DBE\_XMLDOM.GETLENGTH parameters

| Parameter | Description                    |
|-----------|--------------------------------|
| nnm       | Specified DOMNamedNodeMap node |
| nl        | Specified DOMNodeList node     |

**Example:**

--1. Declare a DOMNamedNodeMap parameter in a function.

```
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 elem DBE_XMLDOM.DOMELEMENT;
 map DBE_XMLDOM.DOMNAMEDNODEMAP;
 node DBE_XMLDOM.DOMNODE;
 buf varchar2(10000);
 len INTEGER;
BEGIN
 doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
 <bookstore category="web" cover="paperback">
 <book category="cooking">
 <title lang="en">Everyday Italian</title>
 <author>Giada De Laurentiis</author>
 <year>2005</year>
 <price>30.00</price>
 </book>
 </bookstore>');
 elem := DBE_XMLDOM.GETDOCUMENTELEMENT(doc);
 node := DBE_XMLDOM.MAKENODE(elem);
 map := DBE_XMLDOM.GETATTRIBUTES(node);
 len := DBE_XMLDOM.GETLENGTH(map);
 DBE_OUTPUT.print_line(len);
END;
/
```

--2. Declare a NodeList parameter in a function.

```
DECLARE
 doc dbe_xmldom.domdocument;
 node dbe_xmldom.domnode;
 node1 dbe_xmldom.domnode;
 nodelist DBE_XMLDOM.DOMNODELIST;
 len INTEGER;
 buffer1 varchar2(1010);
BEGIN
 doc := dbe_xmldom.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>
 <students age="16" hight="176">
 <student>
 <name>Jerry</name><age>519</age><sex>man</sex><abc>12345</abc>
 </student>
 <student>
 <name>Jerry</name><age>519</age><sex>man</sex><abc>12345</abc>
 </student>
 </students>');
 node := dbe_xmldom.makenode(doc);
 node := dbe_xmldom.GETFIRSTCHILD(node);
 nodelist := DBE_XMLDOM.GETCHILDNODES(node);
 len := DBE_XMLDOM.GETLENGTH(nodelist);
 RAISE NOTICE 'len : %', len;
END;
/
```

- DBE\_XMLDOM.GETLOCALNAME

Returns the local name of the given DOMAttr node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.GETLOCALNAME(
 a IN DOMATTR)
RETURN VARCHAR2;
```

Returns the local name of the given DOMELEMENT node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.GETLOCALNAME(
 elem IN DOMELEMENT)
RETURN VARCHAR2;
```

Returns the local name of the given DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.GETLOCALNAME(
 n IN DOMNODE,
 data OUT VARCHAR2);
```

**Table 10-345** DBE\_XMLDOM.GETLOCALNAME parameters

| Parameter | Description               |
|-----------|---------------------------|
| a         | Specified DOMAttr node    |
| elem      | Specified DOMELEMENT node |
| n         | Specified DOMNode node    |
| data      | Returned local name       |

Example:

--2. Use the createElement function to generate a DOMELEMENT node and obtain its local name.

```
DECLARE
 doc DBE_xmldom.domdocument;
 elem DBE_xmldom.domelement;
 value varchar2(10000);
BEGIN
 doc := DBE_xmldom.newdomdocument();
 elem := DBE_XMLDOM.createELEMENT(doc, 'root');
 value := DBE_XMLDOM.getlocalname(elem);
 DBE_output.print_line('value: ');
 DBE_output.print_line(value);
END;
/
```

--3. Convert a DOMELEMENT to a DOMNode node and obtain its local name.

```
DECLARE
 doc DBE_xmldom.domdocument;
 elem DBE_xmldom.domelement;
 node DBE_xmldom.domnode;
 value varchar2(100);
 buf varchar2(100);
BEGIN
 doc := DBE_xmldom.newdomdocument();
 elem := DBE_XMLDOM.createELEMENT(doc, 'root');
 node := DBE_xmldom.makenode(elem);
 DBE_XMLDOM.getlocalname(node, buf);
 DBE_output.print_line('buf: ');
 DBE_output.print_line(buf);
END;
/
```

- DBE\_XMLDOM.GETNAMEDITEM

Returns the node specified by name. The prototype of the DBE\_XMLDOM.GETNAMEDITEM function is as follows:

```
DBE_XMLDOM.GETNAMEDITEM(
 nnm IN DOMNAMEDNODEMAP,
 name IN VARCHAR2)
RETURN DOMNODE;
```

Returns the node specified by name and namespace. The prototype of the DBE\_XMLDOM.GETNAMEDITEM function is as follows:

```
DBE_XMLDOM.GETNAMEDITEM(
 nnm IN DOMNAMEDNODEMAP,
 name IN VARCHAR2,
 ns IN VARCHAR2)
RETURN DOMNODE;
```

**Table 10-346** DBE\_XMLDOM.GETNAMEDITEM parameters

| Parameter | Description                         |
|-----------|-------------------------------------|
| nnm       | Specified DOMNamedNodeMap object    |
| name      | Name of the element to be retrieved |
| ns        | Namespace                           |

 **NOTE**

1. The values of **name** and **nnm** can be null, but they are required arguments.
2. The default maximum length of **name** and **ns** is 32767. If the length exceeds 32767, an error is reported.
3. The values of **name** and **ns** can be of the int type and contain more than 127 bits.

**Example:**

```
--1. Return the node specified by name.
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 elem DBE_XMLDOM.DOMELEMENT;
 map DBE_XMLDOM.DOMNAMEDNODEMAP;
 node DBE_XMLDOM.DOMNODE;
 node2 DBE_XMLDOM.DOMNODE;
 buf varchar2(1000);
 buf2 varchar2(1000);
BEGIN
 doc := dbe_xmldom.newdomdocument('<bookstore category="web" cover="paperback">
 <book category="cooking"><title lang="en">Everyday Italian</title>
 <author>Giada De Laurentiis</author><year>2005</year>
 <price>30.00</price></book></bookstore>');
 elem := DBE_XMLDOM.GETDOCUMENTELEMENT(doc);
 node := DBE_XMLDOM.MAKENODE(elem);
 map := DBE_XMLDOM.GETATTRIBUTES(node);
 node2:= DBE_XMLDOM.GETNAMEDITEM(map,'category');
 DBE_XMLDOM.writeToBuffer(node2, buf2);
 dbe_output.print_line(buf2);
END;
/

--2. Return the node specified by name and namespace.
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 root DBE_XMLDOM.DOMELEMENT;
 elem DBE_XMLDOM.DOMELEMENT;
```

```

map DBE_XMLDOM.DOMNAMEDNODEMAP;
node DBE_XMLDOM.DOMNODE;
buf varchar2(1000);
buf2 varchar2(1000);
BEGIN
doc := dbe_xmldom.newdomdocument('<h:table xmlns:h="http://www.w3.org/TR/html4/">
 <h:tr h:id="10"><h:td >Apples</h:td>
 <h:td>Bananas</h:td></h:tr></h:table>');
root := DBE_XMLDOM.getDocumentElement(doc);
node := DBE_XMLDOM.MAKENODE(root);
node := dbe_xmldom.GETFIRSTCHILD(node);
map := DBE_XMLDOM.GETATTRIBUTES(node);
node := DBE_XMLDOM.GETNAMEDITEM(map,'id','http://www.w3.org/TR/html4/');
DBE_XMLDOM.writeToBuffer(node, buf2);
dbe_output.print_line(buf2);
END;
/

```

- **DBE\_XMLDOM.GETNEXTSIBLING**

Returns the next node. The prototype of the DBE\_XMLDOM.GETNEXTSIBLING function is as follows:

```

DBE_XMLDOM.GETNEXTSIBLING(
 n IN DOMNODE)
RETURN DOMNODE;

```

**Table 10-347** DBE\_XMLDOM.GETNEXTSIBLING parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

**Example:**

-- Obtain the first subnode after the DOC tree is converted into the DOMNode type, and obtain the name of the first subnode of the obtained first DOMNode node. Then, obtain the name of the next node through DBE\_XMLDOM.GETNEXTSIBLING.

```

DECLARE
doc dbe_xmldom.domdocument;
doc_node dbe_xmldom.domnode;
root_node dbe_xmldom.domnode;
inside_node dbe_xmldom.domnode;
node_name varchar2(1000);
node_type integer;
BEGIN
doc := dbe_xmldom.newdomdocument('<computer size="ITX">

root_node := DBE_XMLDOM.GETFIRSTCHILD(doc_node);
node_name := DBE_XMLDOM.GETNODENAME(root_node);
node_type := DBE_XMLDOM.GETNODETYPE(root_node);
dbe_output.print_line(node_name);
dbe_output.print_line(node_type);
inside_node := DBE_XMLDOM.GETFIRSTCHILD(root_node);
node_name := DBE_XMLDOM.GETNODENAME(inside_node);
dbe_output.print_line(node_name);
inside_node := DBE_XMLDOM.GETNEXTSIBLING(inside_node);
node_name := DBE_XMLDOM.GETNODENAME(inside_node);
dbe_output.print_line(node_name);
END;
/

```

- **DBE\_XMLDOM.GETNODENAME**

Returns the name of a node. The prototype of the DBE\_XMLDOM.GETNODENAME function is as follows:

```
DBE_XMLDOM.GETNODENAME(
 n IN DOMNODE)
RETURN VARCHAR2;
```

**Table 10-348** DBE\_XMLDOM.GETNODENAME parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

Example:

```
-- Obtain the name of the specified DOMNode node from the DOC tree.
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 root DBE_XMLDOM.DOMELEMENT;
 root_node DBE_XMLDOM.DOMNode;
 inside_node DBE_XMLDOM.DOMNode;
 buf VARCHAR2(1000);
BEGIN
 doc := dbe_xmldom.newdomdocument('<bookstore category="web" cover="paperback">
 <book category="cooking"><title lang="en">Everyday Italian</title>
 <author>Giada De Laurentiis</author><year>2005</year>
 <price>30.00</price></book></bookstore>');
 root := DBE_XMLDOM.getDocumentElement(doc);
 root_node := DBE_XMLDOM.MAKENODE(root);
 inside_node := DBE_XMLDOM.GETFIRSTCHILD(root_node);
 buf := DBE_XMLDOM.GETNODENAME(inside_node);
 dbe_output.print_line(buf);
END;
/
```

- **DBE\_XMLDOM.GETNODETYPE**

Returns the type of a node. The prototype of the DBE\_XMLDOM.GETNODETYPE function is as follows:

```
DBE_XMLDOM.GETNODETYPE(
 n IN DOMNODE)
RETURN NUMBER;
```

**Table 10-349** DBE\_XMLDOM.GETNODETYPE parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

Example:

```
-- Obtain the type of the specified DOMNode node from the DOC tree.
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 doc_node DBE_XMLDOM.DOMNode;
 num number;
 buf varchar2(1000);
BEGIN
 doc := dbe_xmldom.newdomdocument('<bookstore category="web" cover="paperback">
 <book category="cooking"><title lang="en">Everyday Italian</title>
 <author>Giada De Laurentiis</author><year>2005</year>
 <price>30.00</price></book></bookstore>');
 doc_node := DBE_XMLDOM.makeNode(doc);
```

```

num := DBE_XMLDOM.GETNODETYPE(doc_node);
dbe_output.print_line(num);
buf := DBE_XMLDOM.GETNODENAME(doc_node);
dbe_output.print_line(buf);
END;
/

```

- **DBE\_XMLDOM.GETNODEVALUE**

Returns the value of a DOMNode node. The prototype of the DBE\_XMLDOM.GETNODEVALUE function is as follows:

```

DBE_XMLDOM.GETNODEVALUE(
 n IN DOMNODE)
RETURN VARCHAR2;

```

**Table 10-350** DBE\_XMLDOM.GETNODEVALUE parameters

| Parameter | Description              |
|-----------|--------------------------|
| n         | Specified DOMNode object |

**Example:**

-- Convert a DOMText node to a DOMNode node and obtain the value of the node.

```

DECLARE
buf VARCHAR2(1000);
doc DBE_XMLDOM.DOMDocument;
text DBE_XMLDOM.DOMText;
elem2 DBE_XMLDOM.DOMEElement;
node DBE_XMLDOM.DOMNode;
begin
doc := DBE_XMLDOM.NEWDOMDOCUMENT();
text := DBE_XMLDOM.createTextNode(doc, 'aaa');
DBE_XMLDOM.SETNODEVALUE(DBE_XMLDOM.makeNode(text), 'ccc');
buf := DBE_XMLDOM.GETNODEVALUE(DBE_XMLDOM.makeNode(text));
DBE_OUTPUT.print_line(buf);
end;
/

```

- **DBE\_XMLDOM.GETPARENTNODE**

Returns the parent node of the given DOMNode node. The prototype of the DBE\_XMLDOM.GETPARENTNODE function is as follows:

```

DBE_XMLDOM.GETPARENTNODE(
 n IN DOMNODE)
RETURN DOMNODE;

```

**Table 10-351** DBE\_XMLDOM.GETPARENTNODE parameters

| Parameter | Description              |
|-----------|--------------------------|
| n         | Specified DOMNode object |

**Example:**

-- Add a node to the DOC tree and obtain the name of its parent node.

```

DECLARE
doc DBE_XMLDOM.DOMDocument;
doc1 DBE_XMLDOM.DOMDocument;
root DBE_XMLDOM.DOMEElement;
child1 DBE_XMLDOM.DOMEElement;
child2 DBE_XMLDOM.DOMEElement;
attr DBE_XMLDOM.DOMAttr;

```

```

text DBE_XMLDOM.DOMTEXT;
node DBE_XMLDOM.DOMNode;
parent DBE_XMLDOM.DOMNode;
buf varchar2(1000);
BEGIN
doc := DBE_XMLDOM.newDOMDocument();
root := DBE_XMLDOM.createElement(doc, 'root');
node := DBE_XMLDOM.appendChild(DBE_xmldom.makeNode(doc),DBE_xmldom.makeNode(root));
child1 := DBE_XMLDOM.createElement(doc, 'child1');
node := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(root),
DBE_XMLDOM.makeNode(child1));
child2 := DBE_XMLDOM.createElement(doc, 'child2');
node := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(child1),
DBE_XMLDOM.makeNode(child2));
parent := DBE_XMLDOM.GETPARENTNODE(DBE_XMLDOM.makeNode(child2));
buf := DBE_XMLDOM.GETNODENAME(parent);
DBE_OUTPUT.print_line(buf);
END;
/

```

- **DBE\_XMLDOM.GETTAGNAME**

Returns the tag name of the specified DOMELEMENT node. The prototype of the DBE\_XMLDOM.GETTAGNAME function is as follows:

```

DBE_XMLDOM.GETTAGNAME(
elem IN DOMELEMENT)
RETURN VARCHAR2;

```

**Table 10-352** DBE\_XMLDOM.GETTAGNAME parameters

| Parameter | Description               |
|-----------|---------------------------|
| elem      | Specified DOMELEMENT node |

**Example:**

```

-- Obtain the tag name of a DOMELEMENT node.
DECLARE
doc dbe_xmldom.domdocument;
elem dbe_xmldom.domelement;
buffer varchar2(1010);
value varchar(1000);
BEGIN
doc := dbe_xmldom.newDOMDocument();
elem := DBE_XMLDOM.CREATEELEMENT(DBE_XMLDOM.NEWDOMDOCUMENT(), 'root');
value := DBE_XMLDOM.gettagname(elem);
dbe_output.print_line('value: ');
dbe_output.print_line(value);
dbe_xmldom.writetobuffer(doc, buffer);
dbe_output.print_line('buffer: ');
dbe_output.print_line(buffer);
END;
/

```

- **DBE\_XMLDOM.HASCHILDNODES**

Checks whether the DOMNode object has any subnode. The prototype of the DBE\_XMLDOM.HASCHILDNODES function is as follows:

```

DBE_XMLDOM.HASCHILDNODES(
n IN DOMNODE)
RETURN BOOLEAN;

```

**Table 10-353** DBE\_XMLDOM.HASCHILDNODES parameters

| Parameter | Description              |
|-----------|--------------------------|
| n         | Specified DOMNode object |

**Example:**

```
-- Create a node named child1, mount it to the DOC tree, and add a node to child1. Then, check
whether the child1 node has any subnode.
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 doc1 DBE_XMLDOM.DOMDocument;
 root DBE_XMLDOM.DOMELEMENT;
 child1 DBE_XMLDOM.DOMELEMENT;
 child2 DBE_XMLDOM.DOMELEMENT;
 attr DBE_XMLDOM.DOMAttr;
 text DBE_XMLDOM.DOMTEXT;
 node DBE_XMLDOM.DOMNode;
 buf varchar2(1000);
BEGIN
 doc := DBE_XMLDOM.newDOMDocument();
 root := DBE_XMLDOM.createElement(doc, 'root');
 node := DBE_XMLDOM.appendChild(DBE_xmldom.makeNode(doc),DBE_xmldom.makeNode(root));
 child1 := DBE_XMLDOM.createElement(doc, 'child1');
 node := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(root),
DBE_XMLDOM.makeNode(child1));
 child2 := DBE_XMLDOM.createElement(doc, 'child2');
 node := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(child1),
DBE_XMLDOM.makeNode(child2));
 IF DBE_XMLDOM.HASCHILDNODES(DBE_XMLDOM.makeNode(child1)) THEN
 DBE_OUTPUT.print_line('HAS CHILD NODES');
 ELSE
 DBE_OUTPUT.print_line('NOT HAS CHILD NODES ');
 END IF;
END;
/
```

- **DBE\_XMLDOM.IMPORTNODE**

Copies a node to another node and mounts the copied node to a specified document. If the type of the copied node does not belong to the 12 types specified by constants of XML DOM, an exception indicating that the type is not supported is thrown. The prototype of the DBE\_XMLDOM.IMPORTNODE function is as follows:

```
DBE_XMLDOM.IMPORTNODE(
 doc IN DOMDOCUMENT,
 importedNode IN DOMNODE,
 deep IN BOOLEAN)
RETURN DOMNODE;
```

**Table 10-354** DBE\_XMLDOM.IMPORTNODE parameters

| Parameter    | Description                           |
|--------------|---------------------------------------|
| doc          | Document to which the node is mounted |
| importedNode | Node to be imported                   |

| Parameter | Description                                                                                                                                                                                                                                   |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deep      | Specifies whether to perform recursive import. <ul style="list-style-type: none"> <li>If the value is <b>TRUE</b>, the node and all its subnodes are imported.</li> <li>If the value is <b>FALSE</b>, the node itself is imported.</li> </ul> |

**Example:**

-- Obtain the **root2\_node** node in the **DOC2** tree, copy it, and mount it to the **DOC** tree.

```
DECLARE
 doc dbe_xmlDOM.domdocument;
 doc2 dbe_xmlDOM.domdocument;
 doc_node dbe_xmlDOM.domnode;
 doc2_node dbe_xmlDOM.domnode;
 root_node dbe_xmlDOM.domnode;
 root2_node dbe_xmlDOM.domnode;
 import_node dbe_xmlDOM.domnode;
 result_node dbe_xmlDOM.domnode;
 buffer varchar2(1010);
BEGIN
 doc := dbe_xmlDOM.newdomdocument('<bookstore category="web" cover="paperback">
 <book category="cooking"><title lang="en">Everyday Italian</title>
 <author>Giada De Laurentiis</author><year>2005</year>
 <price>30.00</price></book></bookstore>');
 doc2 := dbe_xmlDOM.newdomdocument('<case>LIANLI TU150</case>');
 doc_node := DBE_XMLDOM.MAKENODE(doc);
 doc2_node := DBE_XMLDOM.MAKENODE(doc2);
 root_node := DBE_XMLDOM.GETFIRSTCHILD(doc_node);
 root2_node := DBE_XMLDOM.GETFIRSTCHILD(doc2_node);
 DBE_XMLDOM.WRITETOBUFFER(doc, buffer);
 dbe_output.print_line(buffer);
 import_node := DBE_XMLDOM.IMPORTNODE(doc, root2_node, TRUE);
 result_node := DBE_XMLDOM.APPENDCHILD(root_node, import_node);
 DBE_XMLDOM.WRITETOBUFFER(doc, buffer);
 dbe_output.print_line(buffer);
END;
/
```

- **DBE\_XMLDOM.ISNULL**

Checks whether the given DOMAttr node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the **DBE\_XMLDOM.ISNULL** function is as follows:

```
DBE_XMLDOM.ISNULL(
 a IN DOMATTR)
RETURN BOOLEAN;
```

Checks whether the given DOMDocument node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the **DBE\_XMLDOM.ISNULL** function is as follows:

```
DBE_XMLDOM.ISNULL(
 doc IN DOMDOCUMENT)
RETURN BOOLEAN;
```

Checks whether the given DOMELEMENT node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the **DBE\_XMLDOM.ISNULL** function is as follows:

```
DBE_XMLDOM.ISNULL(
 elem IN DOMELEMENT)
RETURN BOOLEAN;
```

Checks whether the given DOMNamedNodeMap node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
 nnm IN DOMNAMEDNODEMAP)
RETURN BOOLEAN;
```

Checks whether the given DOMNode node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
 n IN DOMNODE)
RETURN BOOLEAN;
```

Checks whether the given DOMNodeList node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
 nl IN DOMNODELIST)
RETURN BOOLEAN;
```

Checks whether the given DOMText node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
 t IN DOMTEXT)
RETURN BOOLEAN;
```

**Table 10-355** DBE\_XMLDOM.ISNULL parameters

| Parameter | Description                    |
|-----------|--------------------------------|
| a         | Specified DOMAttr node         |
| doc       | Specified DOMDocument node     |
| elem      | Specified DOMELEMENT node      |
| nnm       | Specified DOMNamedNodeMap node |
| n         | Specified DOMNode node         |
| nl        | Specified DOMNodeList node     |
| t         | Specified DOMText node         |

#### NOTE

Due to the implementation difference of DBE\_XMLDOM.FREEDOCUMENT, an error is reported when the DBE\_XMLDOM.ISNULL interface calls the freed DOMDocument node.

Example:

```
--2. Declare (but not initialize) a DOMELEMENT node and check whether the node is empty.
DECLARE
 docelem DBE_XMLDOM.DOMELEMENT;
BEGIN
 if DBE_XMLDOM.ISNULL(docelem) then
```

```

 DBE_OUTPUT.print_line('null');
 else
 DBE_OUTPUT.print_line('not null');
 end if;
END;
/

```

- **DBE\_XMLDOM.ITEM**

Returns the element corresponding to the index in a list based on the index. The prototype of the DBE\_XMLDOM.ITEM function is as follows:

```

DBE_XMLDOM.ITEM(
 nl IN DOMNODELIST,
 index IN NUMBER)
RETURN DOMNODE;

```

Returns the element corresponding to the index in a map based on the index. The prototype of the DBE\_XMLDOM.ITEM function is as follows:

```

DBE_XMLDOM.ITEM(
 nnm IN DOMNAMEDNODEMAP,
 index IN NUMBER)
RETURN DOMNODE;

```

**Table 10-356** DBE\_XMLDOM.ITEM parameters

| Parameter | Description                          |
|-----------|--------------------------------------|
| nl        | Specified DOMNodeList object         |
| nnm       | Specified DOMNamedNodeMap object     |
| index     | Index of the element to be retrieved |

 **NOTE**

For improper input parameters such as Boolean and CLOB, the item function of the map type points to the value of the first index by default.

**Example:**

```

--1. Return the element corresponding to the index in a map based on the index.
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 elem DBE_XMLDOM.DOMELEMENT;
 map DBE_XMLDOM.DOMNAMEDNODEMAP;
 node DBE_XMLDOM.DOMNODE;
 node2 DBE_XMLDOM.DOMNODE;
 buf varchar2(1000);
BEGIN
 doc := dbe_xmldom.newdomdocument('<bookstore category="web" cover="paperback"><book
category="cooking">
 <title lang="en">Everyday Italian</title><author>Giada De Laurentiis</author>
 <year>2005</year><price>30.00</price></book></bookstore>');
 elem := DBE_XMLDOM.GETDOCUMENTELEMENT(doc);
 node := DBE_XMLDOM.MAKENODE(elem);
 map := DBE_XMLDOM.GETATTRIBUTES(DBE_XMLDOM.getFirstChild(node));
 node2:= DBE_XMLDOM.item(map,0);
 DBE_XMLDOM.writeToBuffer(node2, buf);
 dbe_output.print_line(buf);
 dbe_xmldom.freedocument(doc);
 RAISE NOTICE '%', buf;
END;
/

```

```
--2. Return the element corresponding to the index in a list based on the index.
DECLARE
 doc dbe_xmlDOM.DOMDOCUMENT;
 node dbe_xmlDOM.DOMNODE;
 node1 dbe_xmlDOM.DOMNODE;
 nodelist DBE_XMLDOM.DOMNODELIST;
 len INTEGER;
 buffer1 varchar2(1010);
BEGIN
 doc := dbe_xmlDOM.newDOMDOCUMENT('<bookstore category="web" cover="paperback"><book
category="cooking">
 <title lang="en">Everyday Italian</title><author>Giada De Laurentiis</author>
 <year>2005</year><price>30.00</price></book></bookstore>');
 node := dbe_xmlDOM.makenode(doc);
 node := dbe_xmlDOM.GETFIRSTCHILD(node);
 node := dbe_xmlDOM.GETFIRSTCHILD(node);
 nodelist := DBE_XMLDOM.GETCHILDNODES(node);
 len := DBE_XMLDOM.GETLENGTH(nodelist);
 RAISE NOTICE 'len : %', len;
 node1 := DBE_XMLDOM.ITEM(nodelist, 0);
 IF DBE_XMLDOM.ISNULL(node1) THEN
 dbe_output.print_line('IS NULL');
 ELSE
 dbe_output.print_line('NOT NULL');
 END IF;
 dbe_xmlDOM.writetobuffer(node1, buffer1);
 dbe_output.print_line('buffer1: ');
 dbe_output.print_line(buffer1);
END;
/
```

- **DBE\_XMLDOM.MAKEELEMENT**

Returns the **DOMElement** object after conversion. The prototype of the **DBE\_XMLDOM.MAKEELEMENT** function is as follows:

```
DBE_XMLDOM.MAKEELEMENT(
 n IN DOMNODE)
RETURN DOMELEMENT;
```

**Table 10-357** DBE\_XMLDOM.MAKEELEMENT parameters

Parameter	Description
n	Specified <b>DOMNode</b> object

**Example:**

```
-- Forcibly convert the DOMNode node converted from the DOMElement type back to the
DOMElement type.
DECLARE
 buf VARCHAR2(1000);
 doc DBE_XMLDOM.DOMDOCUMENT;
 elem DBE_XMLDOM.DOMELEMENT;
 elem2 DBE_XMLDOM.DOMELEMENT;
 node DBE_XMLDOM.DOMNODE;
BEGIN
 doc := DBE_XMLDOM.NEWDOMDOCUMENT();
 elem := DBE_XMLDOM.createElement(doc, 'aaa');
 node := DBE_XMLDOM.makeNode(elem);
 elem2 := DBE_XMLDOM.makeElement(node);
 buf := DBE_XMLDOM.GETNODENAME(DBE_XMLDOM.makeNode(elem2));
 DBE_OUTPUT.print_line(buf);
END;
/
```

- **DBE\_XMLDOM.MAKENODE**

Forcibly converts a specified DOMAttr node to a DOMNode node and returns the DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.MAKENODE(
 a IN DOMATTR)
RETURN DOMNODE;
```

Forcibly converts a specified DOMDocument node to a DOMNode node and returns the DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.MAKENODE(
 doc IN DOMDOCUMENT)
RETURN DOMNODE;
```

Forcibly converts a specified DOMELEMENT node to a DOMNode node and returns the DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.MAKENODE(
 elem IN DOMELEMENT)
RETURN DOMNODE;
```

Forcibly converts a specified DOMText node to a DOMNode node and returns the DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.MAKENODE(
 t IN DOMTEXT)
RETURN DOMNODE;
```

**Table 10-358** DBE\_XMLDOM.MAKENODE parameters

Parameter	Description
a	Specified DOMAttr node
doc	Specified DOMDocument node
elem	Specified DOMELEMENT node
t	Specified DOMText node

 **NOTE**

Due to syntax restrictions, when DBE\_XMLDOM.MAKENODE is used as the return value of a function, it cannot be directly implemented by running the following command:

```
return DBE_XMLDOM.MAKENODE(doc);
```

You are advised to run the following command:

```
tmp_node := DBE_XMLDOM.MAKENODE(doc);
return tmp_node;
```

Example:

```
--4. Declare (but not initialize) a DOMText variable, and use it as the input parameter of MAKENODE.
DECLARE
 text DBE_XMLDOM.DOMTEXT;
 buf VARCHAR2(1000);
 dom_node DBE_XMLDOM.DOMNODE;
BEGIN
```

```

dom_node := DBE_XMLDOM.makeNode(text);
buf := DBE_XMLDOM.GETNODENAME(dom_node);
DBE_OUTPUT.print_line(buf);
END;
/

```

- **DBE\_XMLDOM.NEWDOMDOCUMENT**

Returns a new DOMDocument object. The prototype of the DBE\_XMLDOM.NEWDOMDOCUMENT function is as follows:

```

DBE_XMLDOM.NEWDOMDOCUMENT
RETURN DOMDOCUMENT;

```

Returns a new DOMDocument instance object created from the specified XMLType type. The prototype of the DBE\_XMLDOM.NEWDOMDOCUMENT function is as follows:

```

DBE_XMLDOM.NEWDOMDOCUMENT(
xml doc IN SYS.XMLTYPE)
RETURN DOMDOCUMENT;

```

Returns a new DOMDocument instance object created from the specified CLOB type. The prototype of the DBE\_XMLDOM.NEWDOMDOCUMENT function is as follows:

```

DBE_XMLDOM.NEWDOMDOCUMENT(
cl IN CLOB)
RETURN DOMDOCUMENT;

```

**Table 10-359** DBE\_XMLDOM.NEWDOMDOCUMENT parameters

Parameter	Description
xml doc	Specified XMLType type
cl	Specified CLOB type

 **NOTE**

- The size of the input parameter must be less than 1 GB.
- Currently, external DTD parsing is not supported.
- The document created by NEWDOMDOCUMENT uses the UTF-8 character set by default.
- Each document parsed from the same XMLType instance is independent, and the modification of the document does not affect the XMLType.
- For details about the differences between our database ORAnd database ORA, see [DBE\\_XMLPARSER.PARSECLOB](#).

**Example:**

--1. Return a new DOMDocument object.

```

DECLARE
doc dbe_xmldom.domdocument;
buffer varchar2(1010);
BEGIN
doc := dbe_xmldom.newdomdocument();
dbe_xmldom.setdoctype(doc, 'note', 'sysid', 'pubid');
dbe_xmldom.writetobuffer(doc, buffer);
dbe_output.print_line('buffer: ');
dbe_output.print_line(buffer);
dbe_xmldom.freedocument(doc);
END;
/

```

--2. Return a new DOMDocument instance object created from the specified CLOB type.

```

DECLARE
 doc dbexml.domdocument;
 buffer varchar2(1010);
BEGIN
 doc := dbexml.newdomdocument('<?xml version="1.0"?>
 <note><to>test</to><from>Jani</from><heading>Reminder</heading>
 <body>Don't forget me this weekend!</body></note>');
 dbexml.writetobuffer(doc, buffer);
 db_output.print_line('buffer: ');
 db_output.print_line(buffer);
 dbexml.freedocument(doc);
END;
/

--3. Return a new DOMDocument instance object created from the specified XMLType type.
DECLARE
 doc dbexml.domdocument;
 xt xmltype;
 buffer varchar2(1010);
BEGIN
 xt := xmltype('<h:data xmlns:h="http://www.w3.org/TR/html4/">
 <h:da1 len="10">test namespace</h:da1>
 <h:da1>bbbbbbbbbb</h:da1>
 </h:data>');
 doc := dbexml.newdomdocument(xt);
 dbexml.writetobuffer(doc, buffer);
 db_output.print_line('buffer: ');
 db_output.print_line(buffer);
 dbexml.freedocument(doc);
END;
/

```

- **DBE\_XMLDOM.SETATTRIBUTE**

Sets the value of the DOMELEMENT attribute by name. The prototype of the DBE\_XMLDOM.SETATTRIBUTE function is as follows:

```

DBE_XMLDOM.SETATTRIBUTE(
 elem IN DOMELEMENT,
 name IN VARCHAR2,
 value IN VARCHAR2);

```

Sets the attribute values of a DOMELEMENT object by name and namespace URI. The prototype of the DBE\_XMLDOM.SETATTRIBUTE function is as follows:

```

DBE_XMLDOM.SETATTRIBUTE(
 elem IN DOMELEMENT,
 name IN VARCHAR2,
 value IN VARCHAR2,
 ns IN VARCHAR2);

```

**Table 10-360** DBE\_XMLDOM.SETATTRIBUTE parameters

Parameter	Description
elem	Specified DOMELEMENT node
name	Attribute name
value	Attribute value
ns	Namespace

 **NOTE**

Multiple attributes can be added through the DBE\_XMLDOM.SETATTRIBUTE interface. The attribute name cannot be null, and attributes with the same name cannot exist in the same DOMELEMENT node. If you want to add attributes with the same name, you should explicitly set a namespace for each attribute with the same name, but you are advised not to perform such operations. If an attribute exists in a namespace, the specified namespace must be displayed when you modify the attribute. Otherwise, the attribute with the same name is added.

**Example:**

```
--1. Set the value of the DOMELEMENT attribute by name.
DECLARE
 doc dbe_xmldom.domdocument;
 elem dbe_xmldom.domelement;
 docnode DBE_XMLDOM.DOMNode;
 buffer varchar2(1010);
 value varchar(1000);
BEGIN
 doc := dbe_xmldom.newDOMDocument();
 elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
 DBE_XMLDOM.setattribute(elem, 'len', '50cm');
 docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
DBE_XMLDOM.makeNode(elem));
 dbe_xmldom.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
END;
/

--2. Set the attribute values of a DOMELEMENT object by name and namespace URI.
DECLARE
 doc dbe_xmldom.domdocument;
 elem dbe_xmldom.domelement;
 docnode DBE_XMLDOM.DOMNode;
 buffer varchar2(1010);
 value varchar(1000);
begin
 doc := dbe_xmldom.newDOMDocument();
 elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
 DBE_XMLDOM.setattribute(elem, 'len', '50cm', 'www.huawei.com');
 docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
DBE_XMLDOM.makeNode(elem));
 dbe_xmldom.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
END;
/

--3. Change the values of the DOMELEMENT attributes by name.
DECLARE
 doc dbe_xmldom.domdocument;
 elem dbe_xmldom.domelement;
 docnode DBE_XMLDOM.DOMNode;
 buffer varchar2(1010);
 value varchar(1000);
BEGIN
 doc := dbe_xmldom.newDOMDocument();
 elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
 DBE_XMLDOM.setattribute(elem, 'len', '50cm');
 DBE_XMLDOM.setattribute(elem, 'len', '55cm');
 docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
DBE_XMLDOM.makeNode(elem));
 dbe_xmldom.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
END;
/
```

```
--4. Change the values of the DOMElement attributes by name and namespace URI.
DECLARE
 doc dbe_xmlDOM.domdocument;
 elem dbe_xmlDOM.domelement;
 docnode DBE_XMLDOM.DOMNode;
 buffer varchar2(1010);
 value varchar(1000);
begin
 doc := dbe_xmlDOM.newDOMDocument();
 elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
 DBE_XMLDOM.setattribute(elem, 'len', '50cm', 'www.huawei.com');
 DBE_XMLDOM.setattribute(elem, 'len', '55cm', 'www.huawei.com');
 docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
DBE_XMLDOM.makeNode(elem));
 dbe_xmlDOM.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
END;
/
```

- DBE\_XMLDOM.SETCHARSET

Sets the character set for a DOMDocument object. The prototype of the DBE\_XMLDOM.SETCHARSET function is as follows:

```
DBE_XMLDOM.SETCHARSET(
 doc IN DOMDocument,
 charset IN VARCHAR2);
```

**Table 10-361** DBE\_XMLDOM.SETCHARSET parameters

Parameter	Description
doc	Specified DOMDocument node
charset	Character set

 **NOTE**

- The value of **charset** contains a maximum of 60 bytes.
- Currently, the following character sets are supported: UTF-8, UTF-16, UCS-4, UCS-2, ISO-8859-1, ISO-8859-2, ISO-8859-3, ISO-8859-4, ISO-8859-5, ISO-8859-6, ISO-8859-7, ISO-8859-8, ISO-8859-9, ISO-2022-JP, Shift\_JIS, EUC-JP and ASCII. If you enter other character sets, an error is reported or garbled characters may be displayed.

**Example:**

```
-- Set the UTF-16 character set for the DOC tree and print the DOC tree to the buffer.
DECLARE
 doc dbe_xmlDOM.domdocument;
 buffer varchar2(1010);
BEGIN
 doc := dbe_xmlDOM.newdomdocument('<?xml version="1.0"?>
<!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)><!ELEMENT heading (#PCDATA)><!ELEMENT body (#PCDATA)>]>
<note><to>test</to><from>Jani</from><heading>Reminder</heading>
<body>Don"t forget me this weekend!</body></note>');
 dbe_xmlDOM.setcharset(doc, 'utf-16');
 dbe_xmlDOM.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
 dbe_xmlDOM.freedocument(doc);
END;
/
```

- DBE\_XMLDOM.SETDOCTYPE

Sets the external DTD of a DOMDocument object. The prototype of the DBE\_XMLDOM.SETDOCTYPE function is as follows:

```
DBE_XMLDOM.SETDOCTYPE(
 doc IN DOMDocument,
 name IN VARCHAR2,
 sysid IN VARCHAR2,
 pubid IN VARCHAR2);
```

**Table 10-362** DBE\_XMLDOM.SETDOCTYPE parameters

Parameter	Description
doc	Specified DOMDocument node
name	Name of the DOCTYPE to be initialized
sysid	ID of the system whose DOCTYPE needs to be initialized
pubid	Public ID of the DOCTYPE to be initialized

 **NOTE**

The total length of **name**, **sysid**, and **pubid** cannot exceed 32500 bytes.

**Example:**

-- After the initial system ID, public ID, and name are set for the external DTD of the DOMDocument, the DOC tree modified each time is output to the buffer.

```
DECLARE
 doc dbe_xmldom.domdocument;
 buffer varchar2(1010);
begin
 doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
 <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>
 <!ELEMENT from (#PCDATA)><!ELEMENT heading (#PCDATA)><!ELEMENT body (#PCDATA)>]>
 <note><to>test</to><from>Jani</from><heading>Reminder</heading>
 <body>Don''t forget me this weekend!</body></note>');
 dbe_xmldom.setdoctype(doc, 'note', 'sysid', 'pubid');
 dbe_xmldom.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
 dbe_output.print_line('-----');
 dbe_xmldom.setdoctype(doc, 'note', NULL, '');
 dbe_xmldom.setdoctype(doc, 'note', NULL, '');
 dbe_xmldom.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
 dbe_xmldom.freedocument(doc);
END;
```

- DBE\_XMLDOM.SETNODEVALUE

Sets the value of a node in the DOMNode object. The prototype of the DBE\_XMLDOM.SETNODEVALUE function is as follows:

```
DBE_XMLDOM.SETNODEVALUE(
 n IN DOMNODE,
 nodeValue IN VARCHAR2);
```

**Table 10-363** DBE\_XMLDOM.SETNODEVALUE parameters

Parameter	Description
n	Specified DOMNode object
nodeValue	String to be set in the DOMNode object

 **NOTE**

1. You can enter an empty string or null value for **nodeValue**, but the node value will not be changed.
2. Currently, **nodeValue** does not support the escape character '&'. If the character string contains the escape character, the node value will be cleared.
3. The default maximum length of **nodeValue** is restricted by the VARCHAR2 type and is 32767 bytes. If the length exceeds 32767 bytes, an exception is thrown.

**Example:**

-- After setting a node value different from the initial value for the DOMNode node that is converted from DOMText, obtain and output the node value.

```
DECLARE
 buf VARCHAR2(1000);
 doc DBE_XMLDOM.DOMDocument;
 text DBE_XMLDOM.DOMText;
 elem2 DBE_XMLDOM.DOMELEMENT;
 node DBE_XMLDOM.DOMNode;
BEGIN
 doc := DBE_XMLDOM.NEWDOMDOCUMENT();
 text := DBE_XMLDOM.createTextNode(doc, 'aaa');
 DBE_XMLDOM.SETNODEVALUE(DBE_XMLDOM.makeNode(text), 'ccc');
 buf := DBE_XMLDOM.GETNODEVALUE(DBE_XMLDOM.makeNode(text));
 DBE_OUTPUT.print_line(buf);
END;
```

- **DBE\_XMLDOM.WRITETOBUFFER**

Writes an XML node to a specified buffer using the database character set.

The prototype of the DBE\_XMLDOM.WRITETOBUFFER function is as follows:

```
DBE_XMLDOM.WRITETOBUFFER(
 doc IN DOMDOCUMENT,
 buffer INOUT VARCHAR2);
```

Writes an XML document to a specified buffer using the database character set. The prototype of the DBE\_XMLDOM.WRITETOBUFFER function is as follows:

```
DBE_XMLDOM.WRITETOBUFFER(
 n IN DOMNODE,
 buffer INOUT VARCHAR2);
```

**Table 10-364** DBE\_XMLDOM.WRITETOBUFFER parameters

Parameter	Description
doc	Specified DOMDocument node
buffer	Buffer for the write operation
n	Specified DOMNode node

 **NOTE**

- The buffer to which the writetobuffer function writes is less than 1 GB.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- By default, XML files are output in the UTF-8 character set.

**Example:**

--1. Enter a parameter of the DOMNode type.

```
DECLARE
 doc dbe_xmlDOM.domdocument;
 elem DBE_XMLDOM.DOMELEMENT;
 buf varchar2(1000);
BEGIN
 doc := dbe_xmlDOM.newdomdocument();
 elem := dbe_xmlDOM.createelement(doc,'elem');
 DBE_XMLDOM.WRITETOBUFFER(dbe_xmlDOM.makenode(elem), buf);
 DBE_OUTPUT.print_line(buf);
END;
/
```

--2. Enter a parameter of the DOMDocument type.

```
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 buf VARCHAR2(1000);
BEGIN
 doc := dbe_xmlDOM.newdomdocument('<?xml version="1.0"?>
 <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>
 <ELEMENT from (#PCDATA)><ELEMENT heading (#PCDATA)><ELEMENT body (#PCDATA)>]>
 <note><to>test</to><from>Jani</from><heading>Reminder</heading>
 <body>Don''t forget me this weekend!</body></note>');
 DBE_XMLDOM.WRITETOBUFFER(doc, buf);
 DBE_OUTPUT.print_line('doc: ');
 DBE_OUTPUT.print_line(buf);
 DBE_XMLDOM.FREEDOCUMENT(doc);
END;
/
```

- **DBE\_XMLDOM.WRITETOCLOB**

Writes an XML node to a specified CLOB using the database character set. The prototype of the DBE\_XMLDOM.WRITETOCLOB function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
 doc IN DOMDOCUMENT,
 cl INOUT CLOB);
```

Writes an XML node to a specified CLOB using the database character set. The prototype of the DBE\_XMLDOM.WRITETOCLOB function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
 n IN DOMNODE,
 cl INOUT CLOB);
```

**Table 10-365** DBE\_XMLDOM.WRITETOCLOB parameters

Parameter	Description
doc	Specified DOMDocument node
cl	CLOB to be written
n	Specified DOMNode node

 NOTE

- The **doc** parameter is an input parameter. The CLOB to which the writetoclob function writes is less than 1 GB.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- By default, XML files are output in the UTF-8 character set.

## Example:

--1. Enter a parameter of the DOMNode type.

```
DECLARE
 CL CLOB;
 N DBE_XMLDOM.DOMNODE;
BEGIN
 DBE_XMLDOM.WRITETOCLOB(N, CL);
 DBE_OUTPUT.PRINT_LINE(CL);
END;
/
```

--2. Enter a parameter of the DOMDocument type.

```
DECLARE
 doc dbe_xmldom.domdocument;
 mclob clob;
BEGIN
 doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
 <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>
 <!ELEMENT from (#PCDATA)><!ELEMENT heading (#PCDATA)><!ELEMENT body (#PCDATA)>]>
 <note><to>test</to><from>Jani</from><heading>Reminder</heading>
 <body>Don't forget me this weekend!</body></note>');
 dbe_xmldom.writetoclob(doc, mclob);
 dbe_output.print_line('mclob: ');
 dbe_output.print_line(mclob);
 dbe_xmldom.freedocument(doc);
END;
/
```

- DBE\_XMLDOM.WRITETOFILE

Writes an XML node to a specified file using the database character set. The prototype of the DBE\_XMLDOM.WRITETOFILE function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
 doc IN DOMDOCUMENT,
 fileName IN VARCHAR2);
```

Writes an XML node to a specified file using the database character set. The prototype of the DBE\_XMLDOM.WRITETOFILE function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
 n IN DOMNODE,
 fileName IN VARCHAR2);
```

Writes an XML document to a specified file using the specified character set. The prototype of the DBE\_XMLDOM.WRITETOFILE function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
 doc IN DOMDOCUMENT,
 fileName IN VARCHAR2,
 charset IN VARCHAR2);
```

Writes an XML document to a specified file using the specified character set. The prototype of the DBE\_XMLDOM.WRITETOFILE function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
 n IN DOMNODE,
 fileName IN VARCHAR2,
 charset IN VARCHAR2);
```

**Table 10-366** DBE\_XMLDOM.WRITETOFILE parameters

Parameter	Description
doc	Specified DOMDocument node
fileName	File to be written
n	Specified DOMNode node
charset	Specified character set

**NOTE**

- The **doc** parameter is an input parameter. The value of **filename** can contain a maximum of 255 bytes, and the value of **charset** can contain a maximum of 60 bytes. For details about the character sets supported by **charset**, see the [DBE\\_XMLDOM.SETCHARSET](#) interface.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- If `newdomdocument()` is used to create a document without parameters, no error is reported when **charset** is not specified. The UTF-8 character set is used by default.
- The **filename** must be in the path created in **pg\_directory**. The backslash (\) in the filename will be converted to a slash (/). Only one slash (/) is allowed. The file name must be in the **pg\_directory\_name/file\_name.xml** format. The output file must be in the XML format.
- When the GUC parameter **safe\_data\_path** is enabled, you can only use the advanced package to read and write files in the file path specified by **safe\_data\_path**.
- Before creating a directory, ensure that the directory exists in the operating system and the user has the read and write permissions on the directory. For details about how to create a directory, see [CREATE DIRECTORY](#).

**Example:**

-- Before creating a directory, ensure that the directory exists in the operating system and the user has the read and write permissions on the directory.

create directory dir as '/tmp';

--1. Write an XML node to a specified file using the database character set.

```
DECLARE
 FPATH VARCHAR2(1000);
 DOC DBE_XMLDOM.DOMDOCUMENT;
BEGIN
 DOC := DBE_XMLDOM.NEWDOMDOCUMENT('<ROOT>
 <A ATTR1="A_VALUE">
 <ACHILD>ACHILD TXT</ACHILD>

 DBE_XMLDOM.FREEDOCUMENT(DOC);
END;
/
drop directory dir;

```

- **DBE\_XMLDOM.GETSESSIONTREENUM**

Queries the number of DOM trees of all types in the current session. The prototype of the DBE\_XMLDOM.GETSESSIONTREENUM function is as follows:

```

DBE_XMLDOM.GETSESSIONTREENUM()
RETURN INTEGER;

```

 **NOTE**

For DOM trees that have used FREEElement and FREENode, this function still counts them.

**Example:**

-- Create three documents and obtain the number of DOM trees in the current session.

```

DECLARE
 doc DBE_XMLDOM.DOMDocument;
 doc2 DBE_XMLDOM.DOMDocument;
 doc3 DBE_XMLDOM.DOMDocument;

 buffer varchar2(1010);
BEGIN
 -- Create three documents.
 doc := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<root>
 <elem1 attr="attrtest">
 <elem2>Im text</elem2>
 <elem3>Im text too</elem3>
 </elem1>
 <elem4>Text</elem4>
</root>
');
 doc2 := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<computer size="ITX" price="19999">
 <cpu>Ryzen 9 3950X</cpu>
 <ram>32GBx2 DDR4 3200MHz</ram>

DBE_XMLDOM.FREEDOCUMENT(doc2);
DBE_XMLDOM.FREEDOCUMENT(doc3);
END;
/

```

- **DBE\_XMLDOM.GETDOCTREESINFO**

Queries the DOM tree information of the document type in the current session, such as the memory usage. The prototype of the DBE\_XMLDOM.GETDOCTREESINFO function is as follows:

```

DBE_XMLDOM.GETDOCTREESINFO()
RETURN VARCHAR2;

```

#### NOTE

This function collects statistics only on DOM tree nodes of the document type.

#### Example:

```

-- Create three documents and obtain the information about the document tree in the current session.
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 doc2 DBE_XMLDOM.DOMDocument;
 doc3 DBE_XMLDOM.DOMDocument;

DBE_XMLDOM.FREEDOCUMENT(doc2);
DBE_XMLDOM.FREEDOCUMENT(doc3);
END;
/

```

- DBE\_XMLDOM.GETDETAILDOCTREEINFO

Queries the number of subnodes of each type in the transferred document. The prototype of the DBE\_XMLDOM.GETDETAILDOCTREEINFO function is as follows:

```

DBE_XMLDOM.GETDETAILDOCTREEINFO(
 doc IN DOMDOCUMENT
)
RETURN VARCHAR2;

```

**Table 10-367** DBE\_XMLDOM.GETDETAILDOCTREEINFO parameters

Parameter	Description
doc	Specified DOMDocument node

 **NOTE**

This function collects statistics only on DOM tree nodes of the document type.

**Example:**

```
-- Create three documents and use this function to obtain the number of nodes of each type in each document.
DECLARE
doc DBE_XMLDOM.DOMDocument;
doc2 DBE_XMLDOM.DOMDocument;
doc3 DBE_XMLDOM.DOMDocument;

buffer varchar2(1010);
BEGIN
-- Create three documents.
doc := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<root>
 <elem1 attr="attrtest">
 <elem2>Im text</elem2>
 <elem3>Im text too</elem3>
 </elem1>
 <elem4>Text</elem4>
</root>
');
doc2 := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<computer size="ITX" price="19999">

```

### 10.12.2.14 DBE\_XMLPARSER

#### Interface Description

The DBE\_XMLPARSER interface is used to deserialize XML character strings and convert the character strings that store XML documents to document nodes. [Table 10-368](#) lists all interfaces supported by the DBE\_XMLPARSER advanced package.

The XMLParser data type can be used to store XMLParser data. The maximum number of XMLParser data records that can be stored is 16777215. The XMLPARSER data type can parse and create the DOMDocument node according to the input character string. The advanced package also provides the corresponding set and get interfaces to perform operations on the constraint attributes of the parsing process.

#### NOTE

When the DBE\_XMLPARSER advanced package is used in the database whose character set is set to **SQL\_ASCII**, an error is reported if characters beyond the ASCII range are input.

The DBE\_XMLPARSER advanced package supports only the O-compatible mode.

**Table 10-368** DBE\_XMLPARSER parameters

Interface	Description
<a href="#">DBE_XMLPARSER.FREEPARSER</a>	Frees a parser.
<a href="#">DBE_XMLPARSER.GETDOCUMENT</a>	Obtains the parsed document node.
<a href="#">DBE_XMLPARSER.GETVALIDATIONMODE</a>	Obtains the validation attribute.
<a href="#">DBE_XMLPARSER.NEWPARSER</a>	Creates a parser instance.
<a href="#">DBE_XMLPARSER.PARSEBUFFER</a>	Parses the VARCHAR string.
<a href="#">DBE_XMLPARSER.PARSECLOB</a>	Parses the CLOB string.
<a href="#">DBE_XMLPARSER.SETVALIDATIONMODE</a>	Sets the validation attribute.

- [DBE\\_XMLPARSER.FREEPARSER](#)  
Frees a given parser object.  
The stored procedure prototype of [DBE\\_XMLPARSER.FREEPARSER](#) is as follows:

```
DBE_XMLPARSER.FREEPARSER (
 p IN parser);
```

**Table 10-369** DBE\_XMLPARSER.FREEPARSER parameters

Parameter	Description
p	Parser object

**Example:**

```
-- Create a parser and then release it.
DECLARE
 l_parser dbe_xmlparser.parser;
BEGIN
 l_parser := dbe_xmlparser.newparser();
-- Directly release the l_parser instance.
 dbe_xmlparser.freeparser(l_parser);
END;
/
```

Result: The operation is successful.

- **DBE\_XMLPARSER.GETDOCUMENT**

Returns the root node of the DOM tree document constructed by the parser. This function can be called only after the document is parsed.

The prototype of the DBE\_XMLPARSER.GETDOCUMENT function is as follows:

```
DBE_XMLPARSER.GETDOCUMENT (
 p IN parser)
RETURN DOMDocument;
```

**Table 10-370** DBE\_XMLPARSER.GETDOCUMENT parameters

Parameter	Description
p	Parser object

 **NOTE**

- If the GETDOCUMENT function has no input parameter, an error is reported.
- If the **parser** parameter of the GETDOCUMENT function is null, null is returned.
- If the parser input by the GETDOCUMENT function has not parsed any document, null is returned.

**Example:**

```
-- Create a parser to parse character strings and print the obtained document.
DECLARE
 l_parser dbe_xmlparser.parser;
 l_doc dbe_xmldom.domdocument;
 buffer varchar2 :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>';
buffer2 varchar2;
```

```

BEGIN
L_parser := dbe_xmlparser.newparser();
dbe_xmlparser.PARSEBUFFER(L_parser, buffer);
L_doc := dbe_xmlparser.getdocument(L_parser);
-- The L_parser parses the character string and obtains the DOMDocument node through
GETDOCUMENT.
dbe_xmldom.writetobuffer(L_doc, buffer2);
RAISE NOTICE '%', buffer2;
-- Print the content in L_doc.
dbe_xmlparser.freeparser(L_parser);
dbe_xmldom.freedocument(L_doc);
END;
/

```

**Execution result:**

```

NOTICE: <?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>

```

- **DBE\_XMLPARSER.GETVALIDATIONMODE**

Obtains the parsing validation mode of a specified parser. If DTD validation is enabled, **TRUE** is returned. Otherwise, **FALSE** is returned.

The prototype of the DBE\_XMLPARSER.GETVALIDATIONMODE function is as follows:

```

DBE_XMLPARSER.GETVALIDATIONMODE (
p IN parser)
RETURN BOOLEAN;

```

**Table 10-371** DBE\_XMLPARSER.GETVALIDATIONMODE parameters

Parameter	Description
p	Parser object

**Example:**

```

-- Create a parser and use GETVALIDATIONMODE to check whether the parser validation mode is
enabled.
DECLARE
L_parser dbe_xmlparser.parser;
BEGIN
L_parser := dbe_xmlparser.newparser();
if (dbe_xmlparser.GETVALIDATIONMODE(L_parser) = true) then
RAISE NOTICE 'validation';
else
RAISE NOTICE 'no validation';
end if;
dbe_xmlparser.freeparser(L_parser);
END;
/

```

**Execution result:**

```

NOTICE: validation

```

- **DBE\_XMLPARSER.NEWPARSER**

Creates a parser object and returns a new parser instance.

The prototype of the DBE\_XMLPARSER.NEWPARSER function is as follows:

```
DBE_XMLPARSER.NEWPARSER
RETURN Parser;
```

**Example:**

```
-- Create a parser to parse character strings and then free the parser.
DECLARE
-- Create a parser.
l_parser dbe_xmlparser.parser;
l_doc dbe_xmldom.domdocument;
buffer varchar2(1000) :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>';
buffer2 varchar2(1000);
BEGIN
l_parser := dbe_xmlparser.newparser();
-- Parse the document and create a new DOM document.
dbe_xmlparser.PARSEBUFFER(l_parser, buffer);

dbe_xmlparser.freeparser(l_parser);
END;
/
```

Result: The operation is successful.

- **DBE\_XMLPARSER.PARSEBUFFER**

Parses XML documents stored in strings.

The stored procedure prototype of DBE\_XMLPARSER.PARSEBUFFER is as follows:

```
DBE_XMLPARSER.PARSEBUFFER (
p IN parser,
doc IN VARCHAR2);
```

**Table 10-372** DBE\_XMLPARSER.PARSEBUFFER parameters

Parameter	Description
p	Parser object
doc	A string that stores XML documents

 NOTE

- The maximum length of a character string that can be parsed by the PARSEBUFFER function is 32767. If the length exceeds the maximum, an error is reported.
- Different from the ORA database, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsed, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value "Ch..." is not an enumerated value in the brackets. However, the ORA database does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case sensitive. **Baidu** cannot correspond to **baidu**. However, the ORA database does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the ORA database reports an error.
- Difference in parsing XML predefined entities: **&apos;** and **&quot;**; are parsed and translated into ' and ". However, predefined entities in database ORA are not translated into characters.

## Example:

```
-- Create a parser to parse character strings and print the obtained document.
```

```
DECLARE
 l_parser dbexmlparser.parser;
 l_doc dbexmlparser.domdocument;
 buffer varchar2 :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>';
 buffer2 varchar2;
BEGIN
 l_parser := dbexmlparser.newparser();
 dbexmlparser.PARSEBUFFER(l_parser, buffer);
 l_doc := dbexmlparser.getdocument(l_parser);

 dbexmlparser.writetobuffer(l_doc, buffer2);
 RAISE NOTICE '%', buffer2;

 dbexmlparser.freeparser(l_parser);
 dbexmlparser.freedocument(l_doc);
END;
/
```

## Execution result:

```
NOTICE: <?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>
```

- **DBE\_XMLPARSER.PARSECLOB**

Parses XML documents stored in a CLOB.

The stored procedure prototype of DBE\_XMLPARSER.PARSECLOB is as follows:

```
DBE_XMLPARSER.PARSECLOB (
 p IN parser,
 doc IN CLOB);
```

**Table 10-373** DBE\_XMLPARSER.PARSECLOB parameters

Parameter	Description
p	Parser object
doc	A CLOB that stores XML documents

 **NOTE**

- PARSECLOB cannot parse CLOBs larger than 1 GB.
- Different from the ORA database, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsed, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value "Ch..." is not an enumerated value in the brackets. However, the ORA database does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case sensitive. **Baidu** cannot correspond to **baidu**. However, the ORA database does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the ORA database reports an error.
- Difference in parsing XML predefined entities: **&apos;** and **&quot;** are parsed and translated into ' and ". However, predefined entities in database ORA are not translated into characters.

**Example:**

```
-- Create a parser to parse character strings and print the obtained document.
DECLARE
L_clob clob :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>this weekend!</body>
</note>';
-- Create a parser.
L_parser dbe_xmlparser.parser;
L_doc dbe_xmldom.domdocument;
buffer varchar2(1000);
BEGIN
L_parser := dbe_xmlparser.newparser();
-- Parse the document and create a new DOM document.
dbe_xmlparser.parseclob(L_parser, L_clob);
L_doc := dbe_xmlparser.getdocument(L_parser);
dbe_xmldom.writetobuffer(L_doc, buffer);
RAISE NOTICE '%',buffer;

dbe_xmlparser.freeparser(L_parser);
dbe_xmldom.freedocument(L_doc);

END;
/
```

**Execution result:**

```
NOTICE: <?xml version="1.0" encoding="UTF-8"?>
<note>
```

```
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>this weekend!</body>
</note>
```

- DBE\_XMLPARSER.SETVALIDATIONMODE

Sets the parsing validation mode of a specified parser.

The stored procedure prototype of DBE\_XMLPARSER.SETVALIDATIONMODE is as follows:

```
DBE_XMLPARSER.SETVALIDATIONMODE(
 p IN parser)
yes IN BOOLEAN);
```

**Table 10-374** DBE\_XMLPARSER.SETVALIDATIONMODE parameters

Parameter	Description
p	Parser object
yes	Mode to be set: <ul style="list-style-type: none"> <li>• <b>TRUE</b>: DTD validation is enabled.</li> <li>• <b>FALSE</b>: DTD validation is disabled.</li> </ul>

 **NOTE**

- If the input parameter **yes** of the SETVALIDATIONMODE function is null, the parsing validation mode of the parser is not changed.
- By default, the DTD validation is enabled during parser initialization.

**Example 1:**

```
-- Create a parser. The XML character string to be parsed does not match the DTD format.
-- If setValidationMode is set to false, the string can be parsed. If setValidationMode is set to true,
an error is reported during parsing.
DECLARE
 l_clob clob :=
'<!DOCTYPE note [
<!ELEMENT note (to,from,heading,body)>
<!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)>
<!ELEMENT heading (#PCDATA)>
<!ELEMENT body (#PCDATA)>
]>
<table>
<name attr1="WEB" attr2="web2">African Coffee Table</name>
<width>80</width>
<length>120</length>
</table>';
 l_parser dbe_xmlparser.parser;
 l_doc dbe_xmldom.domdocument;
 buffer varchar2(1000);
BEGIN
 l_parser := dbe_xmlparser.newparser();
 -- Set it to false for parsing.
 dbe_xmlparser.setValidationMode(l_parser, false);
 dbe_xmlparser.parseclob(l_parser, l_clob);
 l_doc := dbe_xmlparser.getdocument(l_parser);
 dbe_xmldom.writetobuffer(l_doc, buffer);
 RAISE NOTICE '%', buffer;
 dbe_xmlparser.freeparser(l_parser);
```

```
 dbe_xmlDOM.freedocument(L_doc);
END;
/
```

**Execution result:**

```
NOTICE: <?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE note [
<!ELEMENT note (to , from , heading , body)>
<!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)>
<!ELEMENT heading (#PCDATA)>
<!ELEMENT body (#PCDATA)>
]>
<table>
<name attr1="WEB" attr2="web2">African Coffee Table</name>
<width>80</width>
<length>120</length>
</table>
```

**Example 2:**

```
-- Parse a parser. The XML character string to be parsed does not match the DTD format.
-- An error is reported during parsing after setValidationMode is set to true.
DECLARE
 L_clob clob :=
'<!DOCTYPE note [
<!ELEMENT note (to,from,heading,body)>
<!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)>
<!ELEMENT heading (#PCDATA)>
<!ELEMENT body (#PCDATA)>
]>
<table>
<name attr1="WEB" attr2="web2">African Coffee Table</name>
<width>80</width>
<length>120</length>
</table>';
 L_parser dbe_xmlparser.parser;
 L_doc dbe_xmlDOM.domdocument;
 buffer varchar2(1000);
BEGIN
 L_parser := dbe_xmlparser.newparser();
 -- Set it to true for parsing.
 --The XML character string does not match the DTD format. An error is expected.
 dbe_xmlparser.setValidationMode(L_parser, true);
 dbe_xmlparser.parseclob(L_parser, L_clob);
 L_doc := dbe_xmlparser.getdocument(L_parser);
 dbe_xmlDOM.writetobuffer(L_doc, buffer);
 dbe_xmlparser.freeparser(L_parser);
 dbe_xmlDOM.freedocument(L_doc);
END;
/
```

**Execution result:**

```
An error is reported during xmlparser parsing.
ERROR: invalid XML document
```

## 10.13 Retry Management

Retry is a process in which the database executes a SQL statement or stored procedure (including anonymous block) again in the case of execution failure, improving the execution success rate and user experience. The database checks the error code and retry configuration to determine whether to retry.

- If the execution fails, the system rolls back the executed statements and executes the stored procedure again.

Example:

```
gaussdb=# CREATE OR REPLACE PROCEDURE retry_basic (IN x INT)
AS
BEGIN
 INSERT INTO t1 (a) VALUES (x);
 INSERT INTO t1 (a) VALUES (x+1);
END;
/
gaussdb=# CALL retry_basic(1);
```

## 10.14 PACKAGE

A package is a combination of PL/SQL programs, such as stored procedures, functions, variables, constants, and cursors. It is object-oriented and can encapsulate PL/SQL program design elements. Functions in a package are created, deleted, and modified in a unified manner.

A package contains two parts: package specifications and package body. The declaration contained in the package specifications can be accessed by external functions and anonymous blocks. The declaration contained in the package body cannot be accessed by external functions or anonymous blocks, but can be accessed only by functions and stored procedures in the package body.

For details about how to create a package, see [CREATE PACKAGE](#).

---

### NOTICE

- Cross-package variables cannot be used as control variables in the for loops.
  - Types defined in a package cannot be deleted or modified, and cannot be used to define tables.
  - Cursor variables cannot be referenced in SCHEMA.PACKAGE.CUROSUR mode.
  - A cursor with parameters can be opened only in the current package.
  - In distributed mode, PACKAGE can be used only in an ORA-compatible database.
  - In distributed mode, if an SQL statement contains variables or functions in a package, pushdown is not supported.
  - A package variable cannot be used as the default value of a function or stored procedure parameter.
- 

## 10.15 Debugging

### Syntax

RAISE has the following five syntax formats:

Figure 10-34 raise\_format::=

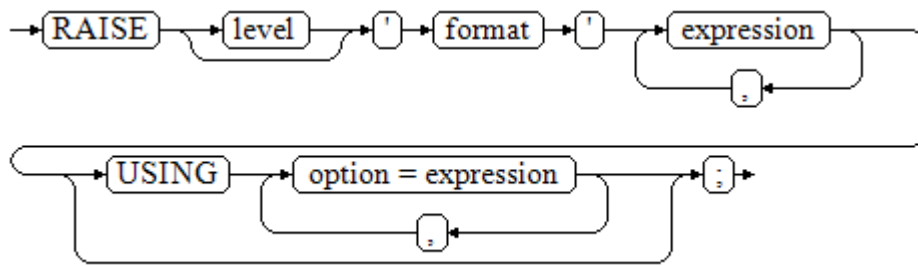

Figure 10-35 raise\_condition::=

Figure 10-36 raise\_sqlstate::=

Figure 10-37 raise\_option::=

Figure 10-38 raise::=

**Parameter description:**

- The **level** option is used to specify the error level, that is, **DEBUG**, **LOG**, **INFO**, **NOTICE**, **WARNING**, or **EXCEPTION** (default). **EXCEPTION** throws an error that normally terminates the current transaction and the others only generate information at their levels. The GUC parameters **log\_min\_messages** and **client\_min\_messages** control whether the error messages of specific levels are reported to the client and are written to the server log.
- **format**: specifies the error message text to be reported, a format string. The format string can be appended with an expression for insertion to the

message text. In a format string, % is replaced by the parameter value attached to format and %% is used to print %. For example:

```
--v_job_id replaces % in the string.
RAISE NOTICE 'Calling cs_create_job(%)',v_job_id;
```

- **option = expression:** inserts additional information to an error report. The **keyword** option can be **MESSAGE**, **DETAIL**, **HINT**, or **ERRCODE**, and each expression can be any string.
  - **MESSAGE:** specifies the error message text. This option cannot be used in a **RAISE** statement that contains a format character string in front of **USING**.
  - **DETAIL:** specifies detailed information of an error.
  - **HINT:** prints hint information.
  - **ERRCODE:** designates an error code (SQLSTATE) to a report. A condition name or a five-character SQLSTATE error code can be used.
- **condition\_name:** specifies the condition name corresponding to the error code.
- **sqlstate:** specifies the error code.

If neither a condition name nor an SQLSTATE is specified in the **RAISE EXCEPTION** command, the **RAISE EXCEPTION (P0001)** is used by default. If no message text is specified, the condition name or SQLSTATE is used as the message text by default.

---

#### NOTICE

- If the SQLSTATE specifies an error code, the error code is not limited to a defined error code. It can be any error code containing five digits or ASCII uppercase rather than **00000**. Do not use an error code ended with three zeros because such error codes are category codes and can be captured by the whole category.
- In O-compatible mode, SQLCODE is equivalent to SQLSTATE.

---

#### NOTE

The syntax described in [Figure 10-38](#) does not append any parameter. This form is used only for the EXCEPTION statement in a BEGIN block so that the error can be re-processed.

## Examples

Display error and hint information when a transaction terminates:

```
CREATE OR REPLACE PROCEDURE proc_raise1(user_id in integer)
AS
BEGIN
RAISE EXCEPTION 'Noexistence ID --> %',user_id USING HINT = 'Please check your user ID';
END;
/

call proc_raise1(300011);

-- Execution result
ERROR: Noexistence ID --> 300011
HINT: Please check your user ID
```

Two methods are available for setting SQLSTATE:

```
CREATE OR REPLACE PROCEDURE proc_raise2(user_id in integer)
AS
BEGIN
RAISE 'Duplicate user ID: %',user_id USING ERRCODE = 'unique_violation';
END;
/

\set VERBOSITY verbose
call proc_raise2(300011);

-- Execution result
ERROR: Duplicate user ID: 300011
SQLSTATE: 23505
```

If the main parameter is a condition name or SQLSTATE, the following applies:

```
RAISE division_by_zero;
```

```
RAISE SQLSTATE '22012';
```

For example:

```
CREATE OR REPLACE PROCEDURE division(div in integer, dividend in integer)
AS
DECLARE
res int;
BEGIN
IF dividend=0 THEN
RAISE division_by_zero;
RETURN;
ELSE
res := div/dividend;
RAISE INFO 'division result: %', res;
RETURN;
END IF;
END;
/
call division(3,0);

-- Execution result
ERROR: division_by_zero
```

Alternatively:

```
RAISE unique_violation USING MESSAGE = 'Duplicate user ID: ' || user_id;
```

# 11 Autonomous Transaction

An autonomous transaction is an independent transaction that is started during the execution of a primary transaction. Committing and rolling back an autonomous transaction does not affect the data that has been committed by the primary transaction. In addition, an autonomous transaction is not affected by the primary transaction.

Autonomous transactions are defined in stored procedures, functions, and anonymous blocks, and are declared using the **PRAGMA AUTONOMOUS\_TRANSACTION** keyword.

## 11.1 Stored Procedure Supporting Autonomous Transaction

An autonomous transaction can be defined in a stored procedure. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS\_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a stored procedure. The following is an example.

```
-- Create a table.
create table t2(a int, b int);
insert into t2 values(1,2);
select * from t2;

-- Create a stored procedure that contains an autonomous transaction.
CREATE OR REPLACE PROCEDURE autonomous_4(a int, b int) AS
DECLARE
 num3 int := a;
 num4 int := b;
 PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
 insert into t2 values(num3, num4);
 db_output.print_line('just use call.');
```

```
END;
/
-- Create a common stored procedure that invokes an autonomous transaction stored procedure.
CREATE OR REPLACE PROCEDURE autonomous_5(a int, b int) AS
DECLARE
BEGIN
 db_output.print_line('just no use call.');
```

```
 insert into t2 values(666, 666);
 autonomous_4(a,b);
 rollback;
END;
```

```
/
-- Invoke a common stored procedure.
select autonomous_5(11,22);
-- View the table result.
select * from t2 order by a;
```

In the preceding example, a stored procedure containing an autonomous transaction is finally executed in a transaction block to be rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by the autonomous transaction.

## 11.2 Anonymous Block Supporting Autonomous Transaction

An autonomous transaction can be defined in an anonymous block. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS\_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating an anonymous block. The following is an example.

```
create table t1(a int ,b text);

START TRANSACTION;
DECLARE
 PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
 db_output.print_line('just use call. ');
 insert into t1 values(1,'you are so cute,will commit!');
END;
/
insert into t1 values(1,'you will rollback!');
rollback;

select * from t1;
```

In the preceding example, an anonymous block containing an autonomous transaction is finally executed before a transaction block to be rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by the autonomous transaction.

## 11.3 Function Supporting Autonomous Transaction

An autonomous transaction can be defined in a function. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS\_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a function. The following is an example.

```
create table t4(a int, b int, c text);

CREATE OR REPLACE function autonomous_32(a int ,b int ,c text) RETURN int AS
DECLARE
 PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
 insert into t4 values(a, b, c);
 return 1;
END;
/
CREATE OR REPLACE function autonomous_33(num1 int) RETURN int AS
```

```
DECLARE
 num3 int := 220;
 tmp int;
 PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
 num3 := num3/num1;
 return num3;
EXCEPTION
 WHEN division_by_zero THEN
 select autonomous_32(num3, num1, sqlerrm) into tmp;
 return 0;
END;
/

select autonomous_33(0);

select * from t4;
```

## 11.4 Package Supporting Autonomous Transaction

An autonomous transaction can be defined in a stored procedure or function in a package. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS\_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a stored procedure or function in a package. The following is an example.

```
-- Create a table.
drop table t2;
create table t2(a int, b int);
insert into t2 values(1,2);
select * from t2;

-- Create a stored procedure or function in a package that contains autonomous transactions.
CREATE OR REPLACE PACKAGE autonomous_pkg AS
 PROCEDURE autonomous_4(a int, b int);
 FUNCTION autonomous_32(a int ,b int) RETURN int;
END autonomous_pkg;
/
CREATE OR REPLACE PACKAGE body autonomous_pkg AS
PROCEDURE autonomous_4(a int, b int) AS
DECLARE
num3 int := a;
num4 int := b;
PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
 insert into t2 values(num3, num4);
END;
FUNCTION autonomous_32(a int ,b int) RETURN int AS
DECLARE
 PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
 insert into t2 values(a, b);
 return 1;
END;
END autonomous_pkg;
/
-- Create a common stored procedure that invokes a stored procedure or function from a package that
contains autonomous transactions.
CREATE OR REPLACE PROCEDURE autonomous_5(a int, b int) AS
DECLARE
va int;
BEGIN
 insert into t2 values(666, 666);
 autonomous_pkg.autonomous_4(a,b);
 va := autonomous_pkg.autonomous_32(a + 1, b + 1);
 rollback;
END;
```

```
/
-- Invoke a common stored procedure.
select autonomous_5(11,22);
-- View the table result.
select * from t2 order by a;
```

In the preceding example, a stored procedure or function in a package containing autonomous transactions is finally executed in a transaction block that is rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by an autonomous transaction.

## 11.5 Restrictions

### CAUTION

- When an autonomous transaction is executed, an autonomous transaction session is started in the background. You can use **max\_concurrent\_autonomous\_transactions** to set the maximum number of concurrent autonomous transactions. The value range is 0 to 10000, and the default value is **10**.
- When **max\_concurrent\_autonomous\_transactions** is set to **0**, autonomous transactions cannot be executed.
- After a new session is started for an autonomous transaction, the default session parameters are used and objects (including session-level variables, local temporary variables, and global temporary table data) of the primary session are not shared.
- Theoretically, the upper limit of autonomous transactions is 10000. Actually, the upper limit is a dynamic value. For details, see the description of the GUC parameter **max\_concurrent\_autonomous\_transactions**.
- Autonomous transactions are affected by the communication buffer. The size of the information returned to the client is limited by the length of the communication buffer. If the size exceeds the length of the communication buffer, an error is reported.

- A trigger function does not support autonomous transactions.  
gaussdb=# CREATE TABLE test\_trigger\_des\_tbl(id1 int, id2 int, id3 int);  
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'id1' as the distribution column by default.  
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.  
CREATE TABLE  
  
gaussdb=# CREATE OR REPLACE FUNCTION tri\_insert\_func() RETURNS TRIGGER AS  
\$\$  
DECLARE  
PRAGMA AUTONOMOUS\_TRANSACTION;  
BEGIN

RETURN new;END\$\$ LANGUAGE plpgsql;  
ERROR: Triggers do not support autonomous transactions  
DETAIL: N/A  
  
gaussdb=# DROP TABLE test\_trigger\_des\_tbl;  
DROP TABLE

- Autonomous transactions cannot be invoked by non-top-layer anonymous blocks (but can only be invoked by top-layer autonomous transactions, including stored procedures, functions, and anonymous blocks).

```
gaussdb=# CREATE TABLE t1(a INT ,b TEXT);
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'a' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
```

```
gaussdb=# DECLARE
--PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
DECLARE
PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
DBE_OUTPUT.PRINT_LINE('JUST USE CALL.');
```

INSERT INTO t1 VALUES(1,'CAN YOU ROLLBACK!');

```
END;
INSERT INTO t1 VALUES(2,'I WILL ROLLBACK!');
ROLLBACK;
END;
/
JUST USE CALL.
ANONYMOUS BLOCK EXECUTE
```

# 12 System Catalogs and System Views

---

## 12.1 Overview of System Catalogs and System Views

System catalogs store structured metadata of GaussDB. They are the source of information used by GaussDB to control system running and are a core component of the database system.

System views provide ways to query the system catalogs and internal database status.

System catalogs and views are visible to either system administrators or all users. Some system catalogs and views have marked the need of administrator permissions, so they are accessible only to administrators.

You can delete and re-create system catalogs, add columns to them, and insert and update values in them, but doing so may make system information inconsistent and cause system faults. Generally, users should not modify system catalogs or system views, or rename their schemas. They are automatically maintained by the system.

---

### NOTICE

- You are advised not to modify the permissions on system catalogs or system views.
  - Do not add, delete, or modify system catalogs because doing so will result in exceptions or even cluster unavailability.
  - System catalogs and views do not support foreign key-related columns.
  - For details about column types in system catalogs and system views, see [Data Type](#).
- 

## 12.2 System Catalogs

## 12.2.1 GS\_AUDITING\_POLICY

**GS\_AUDITING\_POLICY** records the main information about the unified audit. Each record corresponds to a design policy. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-1** GS\_AUDITING\_POLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
polname	name	Policy name, which must be unique
polcomments	name	Policy description field, which records policy-related description information and is represented by the <b>COMMENTS</b> keyword
modifydate	timestamp without time zone	The latest timestamp when a policy is created or modified
polenabed	boolean	Specifies whether to enable the policy. <ul style="list-style-type: none"><li>• <b>t</b> (true): enabled.</li><li>• <b>f</b> (false): disabled.</li></ul>

## 12.2.2 GS\_AUDITING\_POLICY\_ACCESS

**GS\_AUDITING\_POLICY\_ACCESS** records the DML database operations about the unified audit. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-2** GS\_AUDITING\_POLICY\_ACCESS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
accesstype	name	DML database operation type. For example, SELECT, INSERT, and DELETE.
labelname	name	Specifies the resource label name. This parameter corresponds to the <b>polname</b> column in the system catalog in <a href="#">GS_AUDITING_POLICY</a> .

Name	Type	Description
policyoid	oid	OID of the audit policy, corresponding to the OID in the <b>GS_AUDITING_POLICY</b> system catalog.
modifydate	timestamp without time zone	Latest creation or modification timestamp.

### 12.2.3 GS\_AUDITING\_POLICY\_FILTERS

**GS\_AUDITING\_POLICY\_FILTERS** records the filtering policies about the unified audit. Each record corresponds to a design policy. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-3** GS\_AUDITING\_POLICY\_FILTERS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
filtertype	name	Filter type. Currently, the value is <b>logical_expr</b> .
labelname	name	Name. Currently, the value is <b>logical_expr</b> .
policyoid	oid	OID of the audit policy, corresponding to the OID in the system catalog in <b>GS_AUDITING_POLICY</b> .
modifydate	timestamp without time zone	Latest creation or modification timestamp.
logicaloperator	text	Logical character string of a filter criterion.

### 12.2.4 GS\_AUDITING\_POLICY\_PRIVILEGES

**GS\_AUDITING\_POLICY\_PRIVILEGES** records the DDL database operations about the unified audit. Each record corresponds to a design policy. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-4** GS\_AUDITING\_POLICY\_PRIVI columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
privilege_type	name	DDL database operation type. For example, CREATE, ALTER, and DROP.
labelname	name	Specifies the resource label name. This parameter corresponds to the <b>polname</b> column in the <b>GS_AUDITING_POLICY</b> system catalog.
policyoid	oid	This parameter corresponds to OIDs in the <b>GS_AUDITING_POLICY</b> system catalog.
modifydate	timestamp without time zone	Latest creation or modification timestamp.

## 12.2.5 GS\_ASP

**GS\_ASP** displays the persistent ACTIVE SESSION PROFILE samples. This system catalog can be queried only in the system library.

**Table 12-5** GS\_ASP columns

Name	Type	Description
sampleid	bigint	Sample ID.
sample_time	timestamp with time zone	Sampling time.
need_flush_sample	boolean	Specifies whether the sample needs to be flushed to disks. <ul style="list-style-type: none"><li>• <b>t (true)</b>: yes.</li><li>• <b>f (false)</b>: no.</li></ul>
databaseid	oid	Database ID.
thread_id	bigint	Thread ID.
sessionid	bigint	Session ID.
start_time	timestamp with time zone	Start time of a session.
event	text	Specified event name.

Name	Type	Description
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread. The value corresponds to the level (ID) of the execution plan.
smpid	integer	Concurrent thread ID in SMP execution mode.
userid	oid	ID of a session user.
application_name	text	Name of the application.
client_addr	inet	IP address of a client.
client_hostname	text	Name of a client.
client_port	integer	TCP port number used by a client to communicate with the backend.
query_id	bigint	Debug query ID.
unique_query_id	bigint	Unique query ID.
user_id	oid	User ID in the key of the unique query.
cn_id	integer	A CN ID indicates a CN from which the unique SQL statement is obtained. The <b>cn_id</b> is in the key of the unique query.
unique_query	text	Standardized UniqueSQL text string.
locktag	text	Information of a lock that the session waits for. It can be parsed using <b>locktag_decode</b> .
lockmode	text	Mode of a lock that the session waits for. <ul style="list-style-type: none"><li>● <b>LW_EXCLUSIVE</b>: exclusive lock.</li><li>● <b>LW_SHARED</b>: shared lock.</li><li>● <b>LW_WAIT_UNTIL_FREE</b>: waits for the <b>LW_EXCLUSIVE</b> to be available.</li></ul>

Name	Type	Description
block_sessionid	bigint	Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.
wait_status	text	Provides more details about the event column.
global_sessionid	text	Global session ID.
xact_start_time	timestamp with time zone	Start time of the transaction.
query_start_time	timestamp with time zone	Time when the statement starts to be executed.
state	text	Current statement state. The value can be <b>active</b> , <b>idle in transaction</b> , <b>fastpath function call</b> , <b>idle in transaction (aborted)</b> , <b>disabled</b> , or <b>retrying</b> .

## 12.2.6 GS\_CLIENT\_GLOBAL\_KEYS

**GS\_CLIENT\_GLOBAL\_KEYS** records information about the CMK in the encrypted equality feature. Each record corresponds to a CMK.

**Table 12-6** GS\_CLIENT\_GLOBAL\_KEYS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
global_key_name	name	CMK name
key_namespace	oid	A namespace OID that contains this CMK
key_owner	oid	CMK owner
key_acl	aclitem[]	Access permissions that this key should have on creation
create_date	timestamp without time zone	Time when a key is created

## 12.2.7 GS\_CLIENT\_GLOBAL\_KEYS\_ARGS

**GS\_CLIENT\_GLOBAL\_KEYS\_ARGS** records the metadata about the CMK in the encrypted equality feature. Each record corresponds to a key-value pair of the CMK.

**Table 12-7** GS\_CLIENT\_GLOBAL\_KEYS\_ARGS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
global_key_id	oid	CMK OID
function_name	name	The value is <b>encryption</b> .
key	name	CMK metadata name
value	bytea	Value of the CMK metadata name

## 12.2.8 GS\_COLUMN\_KEYS

**GS\_COLUMN\_KEYS** records information about the CEK in the encrypted equality feature. Each record corresponds to a CEK.

**Table 12-8** GS\_COLUMN\_KEYS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
column_key_name	name	CEK name
column_key_distributed_id	oid	ID obtained based on the hash value of the fully qualified domain name (FQDN) of the CEK
global_key_id	oid	A foreign key, which is the CMK OID.
key_namespace	oid	A namespace OID that contains this CEK
key_owner	oid	CEK owner
create_date	timestamp without time zone	Time when a CEK is created
key_acl	aclitem[]	Access permissions that this CEK should have on creation

## 12.2.9 GS\_COLUMN\_KEYS\_ARGS

**GS\_COLUMN\_KEYS\_ARGS** records the metadata about the CMK in the encrypted equality feature. Each record corresponds to a key-value pair of the CMK.

**Table 12-9** GS\_COLUMN\_KEYS\_ARGS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
column_key_id	oid	CEK OID
function_name	name	The value is <b>encryption</b> .
key	name	CEK metadata name
value	bytea	Value of the CEK metadata name

## 12.2.10 GS\_DATABASE\_LINK

GS\_DATABASE\_LINK stores database link information, mainly recording detailed information about database links. Only sysadmin can read this system catalog. Currently, the database link function is not supported.

**Table 12-10** GS\_DATABASE\_LINK columns

Name	Type	Description
oid	oid	Unique ID of the current database link object (hidden attribute, which must be specified).
dlname	name	Name of the current database link.
dlnowner	oid	ID of the owner of the current database link. If the owner is <b>public</b> , the value is <b>0</b> .
dlfdw	oid	OID of the foreign-data wrapper of the current database link.
dlcreator	oid	ID of the creator of the current database link.
options	text[]	Current database link connection information in the format of "keyword=value".
useroptions	text[]	User information used by the current database link to connect to the remote end, in the format of "keyword=value".
dlacl	aclitem[]	Current database link access permission.

## 12.2.11 GS\_DB\_PRIVILEGE

GS\_DB\_PRIVILEGE records the granting of ANY permissions. Each record corresponds to a piece of authorization information.

**Table 12-11** GS\_DB\_PRIVILEGE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
roleid	oid	User ID
privilege_type	text	ANY permission of a user. For details about the value, see <a href="#">Table 7-166</a> .
admin_option	boolean	Whether the ANY permission recorded in the <b>privilege_type</b> column can be re-granted <ul style="list-style-type: none"><li>• t: yes</li><li>• f: no</li></ul>

## 12.2.12 GS\_DEPENDENCIES

**GS\_DEPENDENCIES** records object dependency information and has a one-to-many relationship with the **GS\_DEPENDENCIES\_OBJ** table.

**Table 12-12** GS\_DEPENDENCIES columns

Name	Type	Description
schemaname	name	Name of a namespace
packagename	name	Name of a package
refobjpos	integer	Position of the referenced object <ul style="list-style-type: none"><li>• 1: type</li><li>• 2: package header</li><li>• 4: function header</li><li>• 8: function body</li><li>• 16: package body</li><li>• 32: view</li></ul>
refobjoid	oid	OID of the referenced object
objectname	text	Name of the dependent object

## 12.2.13 GS\_DEPENDENCIES\_OBJ

**GS\_DEPENDENCIES\_OBJ** records the detailed information about the referenced object.

**Table 12-13** GS\_DEPENDENCIES\_OBJ columns

Name	Type	Description
schemaname	name	Name of a namespace
packagename	name	Name of a package
type	integer	Type of the referenced object <ul style="list-style-type: none"><li>• 1: unknown type</li><li>• 2: variable</li><li>• 3: type</li><li>• 4: function</li><li>• 5: view</li><li>• 6: function header</li></ul>
name	text	Name of the referenced object
objnode	pg_node_tree	Detailed information about the referenced object

## 12.2.14 GS\_ENCRYPTED\_COLUMNS

**GS\_ENCRYPTED\_COLUMNS** records information about encrypted columns in the encrypted equality feature. Each record corresponds to an encrypted column.

**Table 12-14** GS\_ENCRYPTED\_COLUMNS columns

Name	Type	Description
rel_id	oid	Table OID
column_name	name	Name of an encrypted column.
column_key_id	oid	A foreign key, which is the CEK OID
encryption_type	tinyint	Encryption type. The value can be <b>2(DETERMINISTIC)</b> or <b>1(RANDOMIZED)</b> .
data_type_original_oid	oid	ID of the original data type of the encrypted column. For details about the values, see the oid columns in the <a href="#">PG_TYPE</a> system catalog.
data_type_original_mod	integer	Modifiers of the original data type of the encrypted column. For details about the values, see the <a href="#">atttypmod</a> columns in the <a href="#">PG_ATTRIBUTE</a> system catalog.

Name	Type	Description
create_date	timestamp without time zone	Time when an encrypted column is created

## 12.2.15 GS\_ENCRYPTED\_PROC

**GS\_ENCRYPTED\_PROC** provides information such as the parameters of encrypted functions and stored procedure functions, original data type of return values, and encrypted columns.

**Table 12-15** GS\_ENCRYPTED\_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
func_id	oid	OID of the function, corresponding to the OID row identifier in the <b>pg_proc</b> system catalog.
prorettype_orig	integer	Original data type of the return value.
last_change	timestamp without time zone	Last modification time of the encrypted function
proargcachedcol	oidvector	OID of the encrypted column corresponding to the <b>INPUT</b> parameter of the function, corresponding to the OID row identifier in the <b>gs_encrypted_columns</b> system catalog.
proallargtypes_orig	oid[]	Original data type of all function parameters.

## 12.2.16 GS\_GLOBAL\_CHAIN

**GS\_GLOBAL\_CHAIN** records information about modification operations performed by users on the tamper-proof user table. (This is a lab feature. Contact Huawei technical support before using it.) Each record corresponds to a table-level modification operation. Users with the audit administrator permission can query this system catalog, but no user is allowed to modify this system catalog.

**Table 12-16** GS\_GLOBAL\_CHAIN columns

Name	Type	Description
blocknum	bigint	Block number, which is the sequence number of the current user operation recorded in the ledger.

Name	Type	Description
dbname	name	Name of the database to which the modified tamper-proof user table belongs.
username	name	Username, which is the name of the user who performs the operation of modifying the user table.
starttime	timestamp with time zone	Time when a user performs an operation.
relid	oid	OID of the modified tamper-proof user table.
relnsp	name	Schema name, which is the name of the schema to which the modified tamper-proof user table belongs.
relname	name	User table name, which is the name of the modified tamper-proof user table.
relhash	hash16	Table-level hash change amount generated by operations.
globalhash	hash32	Global digest, which is calculated based on the information of the current row and the <b>globalhash</b> of the previous row. It connects the entire table to verify the integrity of <b>GS_GLOBAL_CHAIN</b> data.
txcommand	text	SQL statement whose operations are recorded.

## 12.2.17 GS\_GLOBAL\_CONFIG

**GS\_GLOBAL\_CONFIG** records the parameter values specified by users during cluster initialization. In addition, it also stores weak passwords set by users. Initial database users can write, modify, and delete parameters in system catalogs by using **ALTER** and **DROP**. Only the initial user, system administrator, and security administrator can access this system catalog. Other users do not have such permission.

**Table 12-17** GS\_GLOBAL\_CONFIG columns

Name	Type	Description
name	name	Specifies the preset parameter name, weak password name, or parameter required by users during cluster initialization.

Name	Type	Description
value	text	Specifies the preset parameter value, weak password name, or parameter value required by users during cluster initialization.

## 12.2.18 GS\_JOB\_ATTRIBUTE

GS\_JOB\_ATTRIBUTE records attributes of DBE\_SCHEDULER scheduled tasks, including basic attributes of scheduled tasks, scheduled task classes, certificates, authorization, programs, and schedules. Common users do not have the permission to access the newly installed database cluster.

**Table 12-18** GS\_JOB\_ATTRIBUTE columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
job_name	text	Names of scheduled tasks, scheduled task classes, certificates, programs, and schedules, and authorized user names.
attribute_name	text	Attribute names of scheduled tasks, scheduled task classes, certificates, programs, and schedules, and authorized content.
attribute_value	text	Attribute values of scheduled tasks, scheduled task classes, certificates, programs, and schedules.

## 12.2.19 GS\_JOB\_ARGUMENT

GS\_JOB\_ARGUMENT provides the parameter attributes of DBE\_SCHEDULER scheduled tasks and programs.

**Table 12-19** GS\_JOB\_ARGUMENT columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
argument_position	integer	Location of a parameter of a scheduled task or program.
argument_type	name	Parameter type of a scheduled task or program.
job_name	text	Name of a scheduled task or program.

Name	Type	Description
argument_name	text	Parameter name of a scheduled task or program. The scheduled task inherits the parameter name of the program. Therefore, this parameter is null.
argument_value	text	Parameter value of a scheduled task. (The program cannot bind a value.)
default_value	text	Default parameter value of a program.

## 12.2.20 GS\_MASKING\_POLICY

**GS\_MASKING\_POLICY** records the main information about dynamic data masking policies. Each record corresponds to a masking policy. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-20** GS\_MASKING\_POLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
polname	name	Policy name, which must be unique.
polcomments	name	Policy description field, which records policy-related description information and is represented by the <b>COMMENTS</b> keyword
modifydate	timestamp without time zone	Latest timestamp when a policy is created or modified.
polenabled	boolean	Specifies whether to enable the policy. <ul style="list-style-type: none"><li>• <b>t</b> (true): enabled</li><li>• <b>f</b> (false): disabled</li></ul>

## 12.2.21 GS\_MASKING\_POLICY\_ACTIONS

**GS\_MASKING\_POLICY\_ACTIONS** records the masking actions of a masking policy in the dynamic data masking policies. One masking policy corresponds to one or more rows of records in the catalog. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-21** GS\_MASKING\_POLICY\_ACTIONS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
actiontype	name	Name of a masking function used by a masking policy
actparams	name	Parameter information transferred to a masking function
actlabelname	name	Name of a masked label
policyoid	oid	OID of a masking policy to which a record belongs, corresponding to the OID in <a href="#">GS_MASKING_POLICY</a> .
actmodifydate	timestamp without time zone	Latest timestamp when a record is created or modified

## 12.2.22 GS\_MASKING\_POLICY\_FILTERS

**GS\_MASKING\_POLICY\_FILTERS** records the user filtering criteria corresponding to the dynamic data masking policies. The corresponding masking policy takes effect only when the user information meets the filter criteria. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-22** GS\_MASKING\_POLICY\_FILTERS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
filtertype	name	Filter type. Currently, the value is <b>logical_expr</b> .
filterlabelname	name	Filtering range. Currently, the value is <b>logical_expr</b> .
policyoid	oid	OID of a masking policy to which a record belongs, corresponding to the OID in <a href="#">GS_MASKING_POLICY</a> .
modifydate	timestamp without time zone	Latest timestamp when a user filter criterion is created or modified.
logicaloperator	text	Polish notation of the filter criteria.

## 12.2.23 GS\_MATVIEW

**GS\_MATVIEW** provides information about each materialized view in the database.

**Table 12-23** GS\_MATVIEW columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
matviewid	oid	OID of a materialized view.
mapid	oid	OID of a map table associated with a materialized view. Each map table corresponds to one materialized view. If a full materialized view does not correspond to a map table, the value of this column is <b>0</b> .
ivm	boolean	Type of a materialized view. The value <b>t</b> indicates an incremental materialized view, and the value <b>f</b> indicates a full materialized view.
needrefresh	boolean	Reserved column.
refresh_time	timestamp without time zone	Last time when a materialized view was refreshed. If the materialized view is not refreshed, the value is null. This column is maintained only for incremental materialized views on DNs. In other cases, the value is null.

## 12.2.24 GS\_MATVIEW\_DEPENDENCY

**GS\_MATVIEW\_DEPENDENCY** provides association information about each incremental materialized view, base table, and Mlog table in the database. The Mlog table corresponding to the base table does not exist in the full materialized view. Therefore, no record is written into the Mlog table.

**Table 12-24** GS\_MATVIEW\_DEPENDENCY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
matviewid	oid	OID of a materialized view.

Name	Type	Description
relid	oid	OID of a base table of a materialized view.
mlogid	oid	OID of a Mlog table which is the log table of a materialized view. Each Mlog table corresponds to one base table.
mxmin	integer	Reserved column.

## 12.2.25 GS\_MODEL\_WAREHOUSE

**GS\_MODEL\_WAREHOUSE** stores AI engine training models, including the models and detailed description of the training process.

**Table 12-25** GS\_MODEL\_WAREHOUSE columns

Name	Data Type	Description
oid	oid	Hidden column
modelname	name	Unique constraint
modelowner	oid	OID of a model owner
createtime	timestamp without time zone	Time when a model is created
processedtuples	integer	Number of tuples involved in training
discardedtuples	integer	Number of unqualified tuples not involved in training
preprocesstime	real	Data preprocessing time
exectime	real	Training duration
iterations	integer	Iteration round
outputtype	oid	OID of the output data type
modeltype	text	AI operator type
query	text	Query statement executed to create a model
modeldata	bytea	Stored binary model information

Name	Data Type	Description
weight	real[]	Currently, this column applies only to GD operator models.
hyperparametersnames	text[]	Involved hyperparameter name
hyperparametersvalues	text[]	Hyperparameter value
hyperparametersoids	oid[]	OID of the data type corresponding to a hyperparameter
coefnames	text[]	Model parameter
coefvalues	text[]	Value of a model parameter
coefoids	oid[]	OID of the data type corresponding to a model parameter
trainingscoresname	text[]	Method used to measure model performance
trainingscoresvalue	real[]	Value used to measure model performance
modeldescribe	text[]	Model description

## 12.2.26 GS\_OPT\_MODEL

**GS\_OPT\_MODEL** is a data table used when the AI engine is enabled to predict the planned time. It records the configurations, training results, features, corresponding system functions, and training history of machine learning models.

### NOTE

In the distributed scenario, this system catalog is provided, but the AI capabilities are unavailable.

## 12.2.27 GS\_PACKAGE

**GS\_PACKAGE** records package information.

**Table 12-26** GS\_PACKAGE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)

Name	Type	Description
pkgnamespace	oid	Schema to which a package belongs
pkgowner	oid	Owner of a package
pkgname	name	Name of a package
pkgspecsrc	text	Package specification
pkgbodydeclsrc	text	Package body
pkgbodyinitsrc	text	Package initialization source
pkgacl	aclitem[]	Access permission
pkgsecdef	boolean	Specifies whether a user has the definer permission on the package.

## 12.2.28 GS\_PLAN\_TRACE

**GS\_PLAN\_TRACE** is used to store plan traces. It records details about the plan generation process of DML statements. Only users with the sysadmin permission can use this system catalog. The plan trace feature is not supported in the distributed scenario. Therefore, no data is displayed in this view in the distributed scenario.

**Table 12-27** GS\_PLAN\_TRACE columns

Name	Type	Description
query_id	text	Unique ID of the current request
query	text	SQL statement of the current request. The value of this field cannot exceed the value of <b>track_activity_query_size</b> .
unique_sql_id	bigint	Unique ID of the SQL statement of the current request
plan	text	Query plan text corresponding to the SQL statement of the current request. The size of this field cannot exceed 10 KB.
plan_trace	text	Details about the query plan generation process corresponding to the SQL statement of the current request. The value of this field cannot exceed 300 MB.
owner	oid	OID of the user who initiates the current SQL request

Name	Type	Description
modifydate	timestamp with time zone	Time when the current plan trace is updated (that is, time when the plan trace is created)

## 12.2.29 GS\_POLICY\_LABEL

**GS\_POLICY\_LABEL** records the resource label configuration information. One resource label corresponds to one or more records, and each record identifies the resource label to which a database resource belongs. Only the system administrator or security policy administrator can access this system catalog.

Fully Qualified Domain Name (FQDN) identifies an absolute path of a database resource.

**Table 12-28** GS\_POLICY\_LABEL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
labelname	name	Specifies the resource label name.
labeltype	name	Resource tag type. Currently, the value is <b>RESOURCE</b> .
fqdnnamespace	oid	OID of a namespace to which an identified database resource belongs.
fqdnid	oid	OID of an identified database resource. If the database resource is a column, this column is the OID of the catalog.
relcolumn	name	Column name. If the identified database resource is a column, this column indicates the column name. Otherwise, this column is empty.
fqdnstype	name	Type of the identified database resource, for example, schema, table, column, or view.

## 12.2.30 GS\_RECYCLEBIN

**GS\_RECYCLEBIN** describes details about objects in the recycle bin of the flashback feature.

**Table 12-29** GS\_RECYCLEBIN columns

Name	Type	Description
oid	oid	System column
rcybaseid	oid	Base table object ID, which references <b>gs_recyclebin.oid</b>
rcydbid	oid	OID of the database to which the current object belongs
rcyrelid	oid	OID of the current object
rcyname	name	Name of the object in the recycle bin. The format is BIN\$ <i>unique_id</i> \$ <i>oid</i> \$. <i>unique_id</i> indicates the unique identifier with a maximum of 16 characters, and <i>oid</i> indicates the OID.
rcyoriginname	name	Original object name
rcyoperation	char	Operation type. The options are as follows: <ul style="list-style-type: none"><li>● <b>d</b>: drop</li><li>● <b>t</b>: truncate</li></ul>
rcytype	integer	Object type. The options are as follows: <ul style="list-style-type: none"><li>● <b>0</b>: table</li><li>● <b>1</b>: index</li><li>● <b>2</b>: TOAST table</li><li>● <b>3</b>: TOAST index</li><li>● <b>4</b>: sequence, indicating the sequence object that is automatically associated with the serial, bigserial, smallserial, and largeserial types.</li><li>● <b>5</b>: partition</li><li>● <b>6</b>: global index.</li><li>● <b>7</b>: materialized view.</li></ul>
rcyrecyclecsn	bigint	CSN when an object is dropped or truncated
rcyrecycletime	timestamp with time zone	Time when an object is dropped or truncated
rcycreatecsn	bigint	CSN when an object is created
rcychangeccsn	bigint	SCN when an object definition is modified
rcynamespace	oid	OID of the namespace that contains this relationship
rcyowner	oid	Owner of the relationship

Name	Type	Description
rcytablespace	oid	Tablespace in which this relationship is stored. If the value is <b>0</b> , the default tablespace of the database is used. This column is meaningless if the relationship has no on-disk file.
rcyrelfilenode	oid	File name of the recycle bin object on a disk, or <b>0</b> if none, which is used to restore the physical file when the TRUNCATE object is restored.
rcycanrestore	Boolean	Specifies whether flashback can be performed separately.
rcycanpurge	Boolean	Specifies whether the purge operation can be performed independently.
rcyfrozenxid	xid32	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table.
rcyfrozenxid64	xid	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table.

## 12.2.31 GS\_SQL\_PATCH

**GS\_SQL\_PATCH** records the status information about SQL\_PATCH on the current node.

**Table 12-30** GS\_SQL\_PATCH columns

Name	Type	Description
patch_name	name	Patch name.
unique_sql_id	bigint	Global unique query ID
owner	oid	ID of the user who creates the patch.
enable	boolean	Specifies whether the patch takes effect.
status	"char"	Patch status (reserved column).
abort	boolean	Specifies whether the patch is an abort hint.
hint_string	text	Hint text.
hint_node	pg_node_tree	Hint parsing and serialization result.
original_query	text	Original statement (reserved column).

Name	Type	Description
patched_query	text	Patched statement (reserved column).
original_query_tree	pg_node_tree	Original statement parsing result (reserved column).
patched_query_tree	pg_node_tree	Patched statement parsing result (reserved column).
description	text	Patch description.
parent_unique_sql_id	bigint	Globally unique ID of the outer statement of the SQL statement for which the patch takes effect. The value of this parameter is <b>0</b> for statements outside a stored procedure. For statements inside the stored procedure, and the value of this parameter is the globally unique ID of the statement that invokes the stored procedure.

### 12.2.32 GS\_TXN\_SNAPSHOT

**GS\_TXN\_SNAPSHOT** is a timestamp-CSN mapping table. It periodically samples and maintains an appropriate time range to estimate the CSN corresponding to the timestamp in the range.

**Table 12-31** GS\_TXN\_SNAPSHOT columns

Name	Type	Description
snptime	timestamp with time zone	Snapshot time
snpxmin	bigint	Minimum snapshot ID
snpcsn	bigint	Snapshot CSN
snpsnapshot	text	Serialized snapshot text

### 12.2.33 GS\_UID

**GS\_UID** records the unique identification meta information of the **hasuids** attribute table in the database.

**Table 12-32** GS\_UID columns

Name	Type	Description
relid	oid	OID of a table

Name	Type	Description
uid_backup	bigint	Largest unique identifier that can be assigned to a table

## 12.2.34 GS\_WLM\_EC\_OPERATOR\_INFO

**GS\_WLM\_EC\_OPERATOR\_INFO** records operator information after an Extension Connector job ends. If the GUC parameter **enable\_resource\_record** is set to **on**, the system imports records from **GS\_WLM\_EC\_OPERATOR\_HISTORY** to this system catalog every 3 minutes. This operation occupies storage space and affects performance. Only users with the sysadmin permission can query this system catalog. This is a lab feature. Contact Huawei technical support before using it.

### NOTE

If no data is displayed in the queried view, contact Huawei technical support.

**Table 12-33** GS\_WLM\_EC\_OPERATOR\_INFO columns

Name	Data Type	Description
queryid	bigint	Internal query ID used for Extension Connector statement execution.
plan_node_id	integer	Plan node ID of the execution plan of an Extension Connector operator.
start_time	timestamp with time zone	Time when the Extension Connector operator starts to process the first data record.
duration	bigint	Total execution time of the Extension Connector operator (unit: ms).
tuple_processed	bigint	Number of elements returned by the Extension Connector operator.
min_peak_memory	integer	Minimum peak memory used by the Extension Connector operator on all DNs (unit: MB).
max_peak_memory	integer	Maximum peak memory used by the Extension Connector operator on all DNs (unit: MB).
average_peak_memory	integer	Average peak memory used by the Extension Connector operator on all DNs (unit: MB).
ec_status	text	Status of the Extension Connector job.
ec_execute_datanode	text	Name of the DN executing the Extension Connector job.
ec_dsn	text	DSN used by the Extension Connector job.

Name	Data Type	Description
ec_username	text	Username used by the Extension Connector job to access the remote cluster (null if the remote cluster type is SPARK).
ec_query	text	Statement sent by the Extension Connector job to a remote cluster.
ec_libodbc_type	text	Type of the unixODBC driver used by the Extension Connector job.

## 12.2.35 GS\_WLM\_INSTANCE\_HISTORY

**GS\_WLM\_INSTANCE\_HISTORY** stores information about resource usage related to CNs or DN. Each record in this system catalog indicates resource usage of an instance at a specific time point, including the memory, number of CPU cores, disk I/O, physical I/O of the process, and logical I/O of the process. This system catalog can be queried by users with the sysadmin permission only in Postgres. This is a lab feature. Contact Huawei technical support before using it.

### NOTE

If no data is displayed in the queried view, contact Huawei technical support.

**Table 12-34** GS\_WLM\_INSTANCE\_HISTORY columns

Name	Type	Description
instancename	text	Instance name
timestamp	timestamp with time zone	Timestamp
used_cpu	integer	CPU usage of the instance
free_mem	integer	Unused memory of the instance, in MB
used_mem	integer	Used memory of the instance, in MB
io_wait	real	Average wait time for an I/O operation on the disk used by the instance. The average value is within 10 seconds.
io_util	real	io_util value of the disk used by the instance. The average value is within 10 seconds.
disk_read	real	Disk read rate of the instance, in KB/s. The average value is within 10 seconds.
disk_write	real	Disk write rate of the instance, in KB/s. The average value is within 10 seconds.

Name	Type	Description
process_read	bigint	Read rate (excluding the number of bytes read from the disk pagecache) of the corresponding instance process that reads data from a disk within 10 seconds, in KB/s
process_write	bigint	Write rate (excluding the number of bytes written to the disk pagecache) of the corresponding instance process that writes data to a disk within 10 seconds, in KB/s
logical_read	bigint	CN: N/A DN: logical read byte rate of the instance within the statistical interval (10 seconds), in KB/s
logical_write	bigint	CN: N/A DN: logical write byte rate of the instance within the statistical interval (10 seconds), in KB/s
read_counts	bigint	CN: N/A DN: total number of logical read operations of the instance within the statistical interval (10 seconds)
write_counts	bigint	CN: N/A DN: total number of logical write operations of the instance within the statistical interval (10 seconds)

## 12.2.36 GS\_WLM\_OPERATOR\_INFO

**GS\_WLM\_OPERATOR\_INFO** displays records about operators of completed jobs. The data is dumped from the kernel to the system catalog. If the GUC parameter **enable\_resource\_record** is set to **on**, the system imports records from **GS\_WLM\_SESSION\_HISTORY** to this system catalog every 3 minutes. You are not advised to enable this function, because it occupies storage space and affects performance. This system catalog can be queried by users with the **sysadmin** permission only in Postgres. This is a lab feature. Contact Huawei technical support before using it.

### NOTE

If no data is displayed in the queried view, contact Huawei technical support.

**Table 12-35** GS\_WLM\_OPERATOR\_INFO columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution
pid	bigint	Backend thread ID
plan_node_id	integer	Plan node ID of the execution plan of a query
plan_node_name	text	Name of the operator corresponding to the plan node ID
start_time	timestamp with time zone	Time when an operator starts to process the first data record
duration	bigint	Total execution time of the operator, in ms
query_dop	integer	DOP of the operator
estimated_rows	bigint	Number of rows estimated by the optimizer
tuple_processed	bigint	Number of elements returned by the operator
min_peak_memory	integer	Minimum peak memory used by the operator on all DNs, in MB
max_peak_memory	integer	Maximum peak memory used by the operator on all DNs, in MB
average_peak_memory	integer	Average peak memory used by the operator on all DNs, in MB
memory_skew_percent	integer	Memory usage skew of the operator among each DN
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs, in MB (default value: <b>0</b> )
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs, in MB (default value: <b>0</b> )
average_spill_size	integer	Average spilled data among all DNs when a spill occurs, in MB (default value: <b>0</b> )
spill_skew_percent	integer	DN spill skew when a spill occurs
min_cpu_time	bigint	Minimum execution time of the operator on all DNs, in ms
max_cpu_time	bigint	Maximum execution time of the operator on all DNs, in ms
total_cpu_time	bigint	Total execution time of the operator on all DNs, in ms

Name	Type	Description
cpu_skew_percent	integer	Skew of the execution time among DN's
warning	text	The following warnings are displayed: <ul style="list-style-type: none"><li>• Sort/SetOp/HashAgg/HashJoin spill</li><li>• Spill file size large than 256MB</li><li>• Broadcast size large than 100MB</li><li>• Early spill</li><li>• Spill times is greater than 3</li><li>• Spill on memory adaptive</li><li>• Hash table conflict</li></ul>

### 12.2.37 GS\_WLM\_SESSION\_QUERY\_INFO\_ALL

GS\_WLM\_SESSION\_QUERY\_INFO\_ALL records load management information about a completed job executed on the current CN. (This is a lab feature. Contact Huawei technical support before using it.) Data is dumped from the kernel to this system catalog. If the GUC parameter **enable\_resource\_record** is set to **on**, query information in the kernel is imported to the system catalog GS\_WLM\_SESSION\_QUERY\_INFO\_ALL every 3 minutes. This system catalog can be queried by users with the sysadmin permission only in Postgres.

#### NOTE

If no data is displayed in the queried view, contact Huawei technical support.

**Table 12-36** GS\_WLM\_SESSION\_QUERY\_INFO\_ALL columns

Name	Type	Description
datid	oid	OID of the database that the backend is connected to.
dbname	text	Name of the database that the backend is connected to.
schemaname	text	Schema name.
nodename	text	Name of the CN where the statement is executed.
username	text	Username used for connecting to the backend.
application_name	text	Name of the application connected to the backend.

Name	Type	Description
client_addr	inet	IP address of the client connected to the backend. If this column is <b>NULL</b> , it indicates either the client is connected via a Unix socket on the server or this is an internal process, such as <b>AUTOVACUUM</b> .
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.
client_port	integer	TCP port number that the client uses for communication with this backend (-1 if a Unix socket is used).
query_band	text	Job type, which is specified by the GUC parameter <b>query_band</b> . The default value is a null string.
block_time	bigint	Duration that the statement is blocked before being executed, including the statement parsing and optimization duration (unit: ms).
start_time	timestamp with time zone	Time when the statement starts to be executed.
finish_time	timestamp with time zone	Time when the statement execution ends.
duration	bigint	Execution time of the statement, in ms.
estimate_total_time	bigint	Estimated execution time of the statement, in ms.
status	text	Final statement execution status, which can be <b>finished</b> (normal) or <b>aborted</b> (abnormal).
abort_info	text	Exception information displayed if the final statement execution status is <b>aborted</b> .
resource_pool	text	Resource pool used by the user.
control_group	text	Cgroup used by the statement.
estimate_memory	integer	Estimated memory size of the statement.
min_peak_memory	integer	Minimum memory peak of the statement across all DN, in MB.
max_peak_memory	integer	Maximum memory peak of the statement across all DN, in MB.

Name	Type	Description
average_peak_memory	integer	Average memory usage during statement execution, in MB.
memory_skew_percent	integer	Memory usage skew of the statement among each DN.
spill_info	text	Statement spill information on all DNs: <ul style="list-style-type: none"><li>• <b>None</b>: No data is spilled to disks.</li><li>• <b>All</b>: Data is spilled to disks on all DNs.</li><li>• <b>[a:b]</b>: The statement has been spilled to disks on <i>a</i> of <i>b</i> DNs.</li></ul>
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs, in MB (default value: <b>0</b> ).
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs, in MB (default value: <b>0</b> ).
average_spill_size	integer	Average spilled data among all DNs when a spill occurs, in MB (default value: <b>0</b> ).
spill_skew_percent	integer	DN spill skew when a spill occurs.
min_dn_time	bigint	Minimum execution time of the statement across all DNs, in ms.
max_dn_time	bigint	Maximum execution time of the statement across all DNs, in ms.
average_dn_time	bigint	Average execution time of the statement across all DNs, in ms.
dntime_skew_percent	integer	Execution time skew of the statement among each DN.
min_cpu_time	bigint	Minimum CPU time of the statement across all DNs, in ms.
max_cpu_time	bigint	Maximum CPU time of the statement across all DNs, in ms.
total_cpu_time	bigint	Total CPU time of the statement across all DNs, in ms.
cpu_skew_percent	integer	CPU time skew of the statement among DNs.
min_peak_iops	integer	Minimum peak IOPS of the statement across all DNs. It is counted by ten thousands per second.

Name	Type	Description
max_peak_iops	integer	Maximum peak IOPS of the statement across all DNs. It is counted by ten thousands per second.
average_peak_iops	integer	Average peak IOPS of the statement across all DNs. It is counted by ten thousands per second.
iops_skew_percent	integer	I/O skew of the statement among DNs
warning	text	Warning. The following warnings and warnings related to <a href="#">Optimizing SQL Self-Diagnosis</a> are displayed: <ul style="list-style-type: none"><li>• Spill file size large than 256MB</li><li>• Broadcast size large than 100MB</li><li>• Early spill</li><li>• Spill times is greater than 3</li><li>• Spill on memory adaptive</li><li>• Hash table conflict</li></ul>
queryid	bigint	Internal query ID used for statement execution.
query	text	Statement executed.
query_plan	text	Execution plan of the statement.
cpu_top1_node_name	text	Name of the node with the highest CPU usage.
cpu_top2_node_name	text	Name of the node with the second highest CPU usage.
cpu_top3_node_name	text	Name of the node with the third highest CPU usage.
cpu_top4_node_name	text	Name of the node with the fourth highest CPU usage.
cpu_top5_node_name	text	Name of the node with the fifth highest CPU usage.
mem_top1_node_name	text	Name of the node with the highest memory usage.
mem_top2_node_name	text	Name of the node with the second highest memory usage
mem_top3_node_name	text	Name of the node with the third highest memory usage

Name	Type	Description
mem_top4_node_name	text	Name of the node with the fourth highest memory usage
mem_top5_node_name	text	Name of the node with the fifth highest memory usage.
cpu_top1_value	bigint	CPU usage.
cpu_top2_value	bigint	CPU usage.
cpu_top3_value	bigint	CPU usage.
cpu_top4_value	bigint	CPU usage.
cpu_top5_value	bigint	CPU usage.
mem_top1_value	bigint	Memory usage.
mem_top2_value	bigint	Memory usage.
mem_top3_value	bigint	Memory usage.
mem_top4_value	bigint	Memory usage.
mem_top5_value	bigint	Memory usage.
top_mem_dn	text	Top <i>N</i> memory usage.
top_cpu_dn	text	Top <i>N</i> CPU usage.
n_returned_rows	bigint	Number of rows in the result set returned by the <b>SELECT</b> statement.
n_tuples_fetched	bigint	Number of rows randomly scanned.
n_tuples_returned	bigint	Number of rows sequentially scanned.
n_tuples_inserted	bigint	Number of rows inserted.
n_tuples_updated	bigint	Number of rows updated.
n_tuples_deleted	bigint	Number of rows deleted.
n_blocks_fetched	bigint	Number of cache loading times.
n_blocks_hit	bigint	Cache hits.

Name	Type	Description
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: $\mu$ s).
cpu_time	bigint	CPU time (unit: $\mu$ s).
execution_time	bigint	Execution time in the executor (unit: $\mu$ s).
parse_time	bigint	SQL parsing time (unit: $\mu$ s).
plan_time	bigint	SQL plan generation time (unit: $\mu$ s).
rewrite_time	bigint	SQL rewriting time (unit: $\mu$ s).
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: $\mu$ s).
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: $\mu$ s).
net_send_time	bigint	Network time (unit: $\mu$ s).
data_io_time	bigint	I/O time (unit: $\mu$ s).
is_slow_query	bigint	Specifies whether the query is a slow query. The value <b>1</b> indicates a slow query.

## 12.2.38 GS\_WLM\_USER\_RESOURCE\_HISTORY

**GS\_WLM\_USER\_RESOURCE\_HISTORY** stores information about resources used by users and is valid only on CNs. Each record in this table indicates resource usage of a user at a time point, including the memory, number of CPU cores, storage space, temporary space, operator flushing space, logical I/O traffic, number of logical I/O operations, and logical I/O rate. The memory, CPU, and I/O monitoring items record only resource usage of complex jobs. For I/O monitoring items, this parameter is valid only when **enable\_logical\_io\_statistics** is set to **on**. The function of saving user monitoring data is enabled only when **enable\_user\_metric\_persistent** is set to **on**. Data in the system catalog **GS\_WLM\_USER\_RESOURCE\_HISTORY** comes from the **PG\_TOTAL\_USER\_RESOURCE\_INFO** view. This system catalog can be queried by users with the **sysadmin** permission only in Postgres.

This is a lab feature. Contact Huawei technical support before using it.

### NOTE

If no data is displayed in the queried view, contact Huawei technical support.

**Table 12-37** GS\_WLM\_USER\_RESOURCE\_HISTORY

Name	Type	Description
username	text	Username
timestamp	timestamp with time zone	Timestamp
used_memory	integer	Used memory, in MB
total_memory	integer	Available memory, in MB. The value <b>0</b> indicates that the available memory is not limited and depends on the maximum memory available in the database.
used_cpu	real	Number of CPU cores in use
total_cpu	integer	Total number of CPU cores of the Cgroup associated with the user on the node
used_space	bigint	Used storage space, in KB
total_space	bigint	Available storage space, in KB. The value <b>-1</b> indicates that the storage space is not limited.
used_temp_space	bigint	Used temporary storage space, in KB
total_temp_space	bigint	Available temporary storage space, in KB. The value <b>-1</b> indicates that the maximum temporary storage space is not limited.
used_spill_space	bigint	Used space of operator flushing, in KB
total_spill_space	bigint	Available storage space for operator flushing, in KB. The value <b>-1</b> indicates that the maximum operator flushing space is not limited.
read_kbytes	bigint	Byte traffic of read operations in a monitoring period, in KB
write_kbytes	bigint	Byte traffic of write operations in a monitoring period, in KB
read_counts	bigint	Number of read operations in a monitoring period
write_counts	bigint	Number of write operations in a monitoring period
read_speed	real	Byte rate of read operations in a monitoring period, in KB

Name	Type	Description
write_speed	real	Byte rate of write operations in a monitoring period, in KB

## 12.2.39 PG\_AGGREGATE

PG\_AGGREGATE records information about aggregate functions. Each entry in PG\_AGGREGATE is an extension of an entry in PG\_PROC. The PG\_PROC entry carries the aggregate's name, input and output data types, and other information that is similar to ordinary functions.

**Table 12-38** PG\_AGGREGATE columns

Name	Type	Reference	Description
aggfnoid	regproc	<a href="#">PG_PROC.proname</a>	<a href="#">PG_PROC</a> proname of the aggregate function
aggtransfn	regproc	<a href="#">PG_PROC.proname</a>	Transition function
aggcollectfn	regproc	<a href="#">PG_PROC.proname</a>	Collect function
aggfinalfn	regproc	<a href="#">PG_PROC.proname</a>	Final function ( <b>0</b> if none)
aggstortop	oid	<a href="#">PG_OPERATOR.oid</a>	Associated sort operator ( <b>0</b> if none)
aggtranstype	oid	<a href="#">PG_TYPE.oid</a>	Data type of the aggregate function's internal transition (state) data The possible values and their meanings are defined by the types in <a href="#">pg_type.h</a> . The main two types are polymorphic (isPolymorphicType) and non-polymorphic.
agginitval	text	-	Initial value of the transition state. This is a text column containing the initial value in its external string representation. If this column is null, the transition state value starts from null.

Name	Type	Reference	Description
agginitcollect	text	-	Initial value of the collection state. This is a text column containing the initial value in its external string representation. If this column is null, the collection state value starts from null.
aggkind	"char"	-	Type of the aggregate function: <ul style="list-style-type: none"> <li>• <b>n</b>: normal aggregate</li> <li>• <b>o</b>: ordered set aggregate</li> </ul>
aggnumdirect args	smallint	-	Number of direct parameters (non-aggregation-related parameters) of the aggregate function of the ordered set aggregate type. For an aggregate function of the normal aggregate type, the value is <b>0</b> .

## 12.2.40 PG\_AM

**PG\_AM** records information about index access methods. There is one row for each index access method supported by the system.

**Table 12-39** PG\_AM columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
amname	name	-	Name of the access method
amstrategies	smallint	-	Number of operator strategies for the access method ( <b>0</b> if the access method does not have a fixed set of operator strategies)
amsupport	smallint	-	Number of support routines for the access method
amcanorder	boolean	-	Whether the access method supports ordered scans sorted by the indexed column's value <ul style="list-style-type: none"> <li>• <b>t (true)</b>: supported.</li> <li>• <b>f (false)</b>: not supported.</li> </ul>

Name	Type	Reference	Description
amcanorderbyop	boolean	-	Whether the access method supports ordered scans sorted by the result of an operator on the indexed column <b>t (true)</b> : supported. <b>f (false)</b> : not supported.
amcanbackward	boolean	-	Whether the access method supports backward scanning <ul style="list-style-type: none"> <li>• <b>t (true)</b>: supported.</li> <li>• <b>f (false)</b>: not supported.</li> </ul>
amcanunique	boolean	-	Whether the access method supports unique indexes <ul style="list-style-type: none"> <li>• <b>t (true)</b>: supported.</li> <li>• <b>f (false)</b>: not supported.</li> </ul>
amcanmulticol	boolean	-	Whether the access method supports composite indexes <ul style="list-style-type: none"> <li>• <b>t (true)</b>: supported.</li> <li>• <b>f (false)</b>: not supported.</li> </ul>
amoptionalkey	boolean	-	Whether the access method supports scanning without any constraint for the first index column <ul style="list-style-type: none"> <li>• <b>t (true)</b>: supported.</li> <li>• <b>f (false)</b>: not supported.</li> </ul>
amsearcharray	boolean	-	Whether the access method supports <b>ScalarArrayOpExpr</b> searches <b>t (true)</b> : supported. <b>f (false)</b> : not supported.
amsearchnulls	boolean	-	Whether the access method supports <b>IS NULL/NOT NULL</b> searches <ul style="list-style-type: none"> <li>• <b>t (true)</b>: supported.</li> <li>• <b>f (false)</b>: not supported.</li> </ul>
amstorage	boolean	-	Whether the index storage data type can differ from the column data type <ul style="list-style-type: none"> <li>• <b>t (true)</b>: same.</li> <li>• <b>f (false)</b>: different.</li> </ul>

Name	Type	Reference	Description
amclusterable	boolean	-	Whether an index of this type can be clustered on <ul style="list-style-type: none"> <li>• <b>t (true)</b>: allowed.</li> <li>• <b>f (false)</b>: not allowed.</li> </ul>
ampredlocks	boolean	-	Whether an index of this type manages fine-grained predicate locks <ul style="list-style-type: none"> <li>• <b>t (true)</b>: allowed.</li> <li>• <b>f (false)</b>: not allowed.</li> </ul>
amkeytype	oid	OID in <a href="#">PG_TYPE</a>	Type of data stored in index ( <b>0</b> if it is not a fixed type)
aminsert	regproc	<a href="#">proname</a> in <a href="#">PG_PROC</a>	"Insert this tuple" function
ambeginscan	regproc	<a href="#">proname</a> in <a href="#">PG_PROC</a>	"Prepare for index scan" function
amgettupl	regproc	<a href="#">proname</a> in <a href="#">PG_PROC</a>	"Next valid tuple" function ( <b>0</b> if none)
amgetbitmap	regproc	<a href="#">proname</a> in <a href="#">PG_PROC</a>	"Fetch all valid tuples" function ( <b>0</b> if none)
amrescan	regproc	<a href="#">proname</a> in <a href="#">PG_PROC</a>	"(Re)start index scan" function
amendscan	regproc	<a href="#">proname</a> in <a href="#">PG_PROC</a>	"Clean up after index scan" function
ammarkpos	regproc	<a href="#">proname</a> in <a href="#">PG_PROC</a>	"Mark current scan position" function
amrestrpos	regproc	<a href="#">proname</a> in <a href="#">PG_PROC</a>	"Restore marked scan position" function
ammerge	regproc	<a href="#">proname</a> in <a href="#">PG_PROC</a>	"Merge multiple indexes" function
ambuild	regproc	<a href="#">proname</a> in <a href="#">PG_PROC</a>	"Build new index" function
ambuildempty	regproc	<a href="#">proname</a> in <a href="#">PG_PROC</a>	"Build empty index" function
ambulkdelete	regproc	<a href="#">proname</a> in <a href="#">PG_PROC</a>	Bulk-delete function
amvacuumcleanup	regproc	<a href="#">proname</a> in <a href="#">PG_PROC</a>	Post- <b>VACUUM</b> cleanup function

Name	Type	Reference	Description
amcanreturn	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Function to check whether the index supports index-only scans ( <b>0</b> if none)
amcostestimate	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Function to estimate cost of an index scan
amoptions	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Function to parse and validate <b>reloptions</b> for an index

## 12.2.41 PG\_AMOP

**PG\_AMOP** records information about operators associated with access method operator families. There is one row for each operator that is a member of an operator family. A family member can be either a search operator or an ordering operator. An operator can appear in more than one family, but cannot appear in more than one search position nor more than one ordering position within a family.

**Table 12-40** PG\_AMOP columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
amopfamily	oid	<a href="#">PG_OPFAMILY</a> .oid	Operator family of this entry
amoplefttype	oid	<a href="#">PG_TYPE</a> .oid	Left-hand input data type of the operator For details about the possible values and their description, see <a href="#">pg_type.h</a> .
amoprightrighttype	oid	<a href="#">PG_TYPE</a> .oid	Right-hand input data type of the operator For details about the possible values and their description, see <a href="#">pg_type.h</a> .
amopstrategy	smallint	-	Number of operator strategies
amoppurpose	"char"	-	Operator purpose, either <b>s</b> for search or <b>o</b> for ordering

Name	Type	Reference	Description
amopopr	oid	<a href="#">PG_OPERATOR.oid</a>	OID of the operator
amopmethod	oid	<a href="#">PG_AM.oid</a>	Operator family of the index access method
amopsortfamily	oid	<a href="#">PG_OPFAMILY.oid</a>	The B-tree operator family according to which this entry sorts for an ordering operator ( <b>0</b> for a search operator)

A search operator entry indicates that an index of this operator family can be searched to find all rows satisfying **WHERE indexed\_column operator constant**. Obviously, such an operator must return a Boolean value, and its left-hand input type must match the index's column data type.

An ordering operator entry indicates that an index of this operator family can be scanned to return rows in the order represented by **ORDER BY indexed\_column operator constant**. Such an operator could return any sortable data type, though again its left-hand input type must match the index's column data type. The exact semantics of **ORDER BY** are specified by the **amopsortfamily** column, which must reference the B-tree operator family for the operator's result type.

## 12.2.42 PG\_AMPROC

**PG\_AMPROC** records information about the support procedures associated with the access method operator families. There is one row for each support procedure that belongs to an operator family.

**Table 12-41** PG\_AMPROC columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
amprocfamily	oid	<a href="#">PG_OPFAMILY.oid</a>	Operator family of this entry
amproclefttype	oid	<a href="#">PG_TYPE.oid</a>	Left-hand input data type of the associated operator For details about common data types, see <a href="#">Data Type</a> .
amprocrighttype	oid	<a href="#">PG_TYPE.oid</a>	Right-hand input data type of the associated operator For details about common data types, see <a href="#">Data Type</a> .

Name	Type	Reference	Description
amprocnum	smallint	-	Support procedure number
amproc	regproc	<a href="#">PG_PROC</a> .proname	OID of the procedure

The usual interpretation of the **amprocleftype** and **amprocrighttype** columns is that they identify the left and right input types of the operator(s) that a particular support procedure supports. For some access methods, these match the input data type(s) of the support procedure itself; for others not. There is a notion of "default" support procedures for an index, which are those with **amprocleftype** and **amprocrighttype** both equal to the index opclass's **opcintype**.

### 12.2.43 PG\_APP\_WORKLOADGROUP\_MAPPING

**PG\_APP\_WORKLOADGROUP\_MAPPING** provides load mapping group information in the database.

**Table 12-42** PG\_APP\_WORKLOADGROUP\_MAPPING columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
appname	name	Application name
workload_gpname	name	Mapped workload group name

### 12.2.44 PG\_ATTRDEF

**PG\_ATTRDEF** records default values of columns.

**Table 12-43** PG\_ATTRDEF columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
