| blkno     | uint32 | ID of the recycling queue page. This parameter is valid only when <b>type</b> is set to <b>2</b> . The value of <b>blkno</b> ranges from 1 to 4294967294.                                                                                                    |

 **NOTE**

This function is not supported in the distributed version. An error message will be displayed if it is used in the distributed version.

- gs\_stat\_wal\_entrytable(int64 idx)

Description: Exports the content of the write-ahead log insertion status table in the Xlog.

Return type: record

**Table 7-99** gs\_stat\_wal\_entrytable parameters

| Category         | Parameter | Type   | Description                                                                                                                                                              |
|------------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input parameter  | idx       | int64  | <ul style="list-style-type: none"> <li>• <b>-1</b>: queries all elements in an array.</li> <li>• <b>0-Maximum value</b>: content of a specific array element.</li> </ul> |
| Output parameter | idx       | uint64 | Records the indexes in the corresponding array.                                                                                                                          |
| Output parameter | endsln    | uint64 | Records the LSN label.                                                                                                                                                   |
| Output parameter | lrc       | int32  | Records the corresponding LRC.                                                                                                                                           |

| Category         | Parameter | Type   | Description                                                                                                                                                                                        |
|------------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Output parameter | status    | uint32 | Specifies whether the Xlog corresponding to the current entry has been completely copied to the WAL buffer. <ul style="list-style-type: none"> <li>• 0: not copied</li> <li>• 1: copied</li> </ul> |

- `gs_walwriter_flush_position()`  
Description: Outputs the refresh position of write-ahead logs.  
Return type: record

**Table 7-100** `gs_walwriter_flush_position` parameters

| Category         | Parameter               | Type   | Description                                                                                                                                                                |
|------------------|-------------------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Output parameter | last_flush_status_entry | int32  | Index obtained after the Xlog flushes the tblEntry of the last flushed disk.                                                                                               |
| Output parameter | last_scanned_lrc        | int32  | LRC obtained after the Xlog flushes the last tblEntry scanned last time.                                                                                                   |
| Output parameter | curr_lrc                | int32  | Latest LRC usage in the WALInsertStatusEntry status table. The LRC indicates the LRC value corresponding to the WALInsertStatusEntry when the next Xlog record is written. |
| Output parameter | curr_byte_pos           | uint64 | The latest Xlog position after the Xlog is written to the WAL file, which is also the next Xlog insertion point.                                                           |
| Output parameter | prev_byte_size          | uint32 | Length of the previous Xlog record.                                                                                                                                        |
| Output parameter | flush_result            | uint64 | Position of the current global Xlog flush.                                                                                                                                 |

| Category         | Parameter            | Type   | Description                                                                                  |
|------------------|----------------------|--------|----------------------------------------------------------------------------------------------|
| Output parameter | send_result          | uint64 | Xlog sending position on the current host.                                                   |
| Output parameter | shm_rqst_write_pos   | uint64 | The write position of the LogwrtRqst request in the XLogCtl recorded in the shared memory.   |
| Output parameter | shm_rqst_flush_pos   | uint64 | The flush position of the LogwrtRqst request in the XLogCtl recorded in the shared memory.   |
| Output parameter | shm_result_write_pos | uint64 | The write position of the LogwrtResult request in the XLogCtl recorded in the shared memory. |
| Output parameter | shm_result_flush_pos | uint64 | The flush position of the LogwrtResult request in the XLogCtl recorded in the shared memory. |
| Output parameter | curr_time            | text   | Current time.                                                                                |

- gs\_walwriter\_flush\_stat(int operation)**  
 Description: Collects statistics on the frequency of writing and synchronizing write-ahead logs, data volume, and Xlog file information.  
 Return type: record

**Table 7-101** gs\_walwriter\_flush\_stat parameters

| Category        | Parameter | Type | Description                                                                                                                                                                                                                                         |
|-----------------|-----------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input parameter | operation | int  | <ul style="list-style-type: none"> <li>• <b>-1</b>: Disables the statistics function. (Default value)</li> <li>• <b>0</b>: Enable the statistics function.</li> <li>• <b>1</b>: Query statistics.</li> <li>• <b>2</b>: Reset statistics.</li> </ul> |

| Category         | Parameter                    | Type   | Description                                                        |
|------------------|------------------------------|--------|--------------------------------------------------------------------|
| Output parameter | write_times                  | uint64 | Number of times that the Xlog calls the write API.                 |
| Output parameter | sync_times                   | uint64 | Number of times that the Xlog calls the sync API.                  |
| Output parameter | total_xlog_sync_bytes        | uint64 | Total number of backend thread requests for writing data to Xlogs. |
| Output parameter | total_actual_xlog_sync_bytes | uint64 | Total number of Xlogs that call the sync API for disk flushing.    |
| Output parameter | avg_write_bytes              | uint32 | Number of Xlogs written each time the XLogWrite API is called.     |
| Output parameter | avg_actual_write_bytes       | uint32 | Number of Xlogs written each time the write API is called.         |
| Output parameter | avg_sync_bytes               | uint32 | Average number of Xlogs for each synchronization request.          |
| Output parameter | avg_actual_sync_bytes        | uint32 | Actual Xlog amount of disk flushing by calling sync each time.     |
| Output parameter | total_write_time             | uint64 | Total time of calling the write operation (unit: $\mu$ s).         |
| Output parameter | total_sync_time              | uint64 | Total time for calling the sync API (unit: $\mu$ s).               |

| Category         | Parameter            | Type   | Description                                                       |
|------------------|----------------------|--------|-------------------------------------------------------------------|
| Output parameter | avg_write_time       | uint32 | Average time for calling the write API each time (unit: $\mu$ s). |
| Output parameter | avg_sync_time        | uint32 | Average time for calling the sync API each time (unit: $\mu$ s).  |
| Output parameter | curr_init_xlog_segno | uint64 | ID of the latest Xlog segment file.                               |
| Output parameter | curr_open_xlog_segno | uint64 | ID of the Xlog segment file that is being written.                |
| Output parameter | last_reset_time      | text   | Time when statistics were last collected.                         |
| Output parameter | curr_time            | text   | Current time.                                                     |

- pg\_ls\_tmpdir()**  
 Description: Returns the name, size, and last modification time of each file in the temporary directory (**pgsql\_tmp**) of the default tablespace.  
 Parameter: nan  
 Return type: record  
 Note: Only the system administrator or monitor administrator can execute this function.

| Category         | Parameter    | Type       | Description                  |
|------------------|--------------|------------|------------------------------|
| Output parameter | name         | text       | File name.                   |
| Output parameter | size         | int8       | File size (unit: byte).      |
| Output parameter | modification | timestampz | Last file modification time. |

- `pg_ls_tmpdir(oid)`

Description: Returns the name, size, and last modification time of each file in the temporary directory (**pgsql\_tmp**) of the specified tablespace.

Parameter: oid

Return type: record

Note: Only the system administrator or monitor administrator can execute this function.

| Category         | Parameter    | Type        | Description                  |
|------------------|--------------|-------------|------------------------------|
| Input parameter  | oid          | oid         | Tablespace ID.               |
| Output parameter | name         | text        | File name.                   |
| Output parameter | size         | int8        | File size (unit: byte).      |
| Output parameter | modification | timestamptz | Last file modification time. |

- `pg_ls_waldir()`

Description: Returns the name, size, and last modification time of each file in the WAL directory.

Parameter: nan

Return type: record

Note: Only the system administrator or monitor administrator can execute this function.

| Category         | Parameter    | Type        | Description                  |
|------------------|--------------|-------------|------------------------------|
| Output parameter | name         | text        | File name.                   |
| Output parameter | size         | int8        | File size (unit: byte).      |
| Output parameter | modification | timestamptz | Last file modification time. |

- `gs_write_term_log(void)`

Description: Writes a log to record the current **term** value of a DN. The standby DN returns **false**. After the data is successfully written to the primary DN, **true** is returned.

Return type: Boolean

- `gs_stat_space(bool init)`

Description: Queries the status of extended pages when the INSERT operation is performed on the Ustore table.

Return type: record

| Category         | Parameter          | Type | Description                                                                                                    |
|------------------|--------------------|------|----------------------------------------------------------------------------------------------------------------|
| Input parameter  | init               | bool | Specifies whether to reset the statistics.                                                                     |
| Output parameter | access_func        | int8 | Total number of access times of the relation_get_buffer_for_utuple API.                                        |
| Output parameter | cache_blk          | int8 | Number of times that the relation_get_buffer_for_utuple API obtains buffers.                                   |
| Output parameter | cache_succ         | int8 | Number of times that the relation_get_buffer_for_utuple API successfully obtains buffers.                      |
| Output parameter | nblk_first         | int8 | Number of times that relation_get_buffer_for_utuple obtains <b>nblocks-1</b> for the first time.               |
| Output parameter | nblk_first_succ    | int8 | Number of times that relation_get_buffer_for_utuple obtains <b>nblocks-1</b> successfully for the first time.  |
| Output parameter | nblk_second        | int8 | Number of times that relation_get_buffer_for_utuple obtains <b>nblocks-1</b> for the second time.              |
| Output parameter | nblk_second_succ   | int8 | Number of times that relation_get_buffer_for_utuple obtains <b>nblocks-1</b> successfully for the second time. |
| Output parameter | fsm_first          | int8 | Number of times that FSM is accessed for the first time.                                                       |
| Output parameter | fsm_first_success  | int8 | Number of times that FSM is accessed successfully for the first time.                                          |
| Output parameter | fsm_rewrite        | int8 | Number of FSM writeback times.                                                                                 |
| Output parameter | fsm_second         | int8 | Number of times that FSM is accessed for the second time.                                                      |
| Output parameter | fsm_second_success | int8 | Number of times that FSM is accessed successfully for the second time.                                         |

page cleaning mechanism may be faulty. If the value of **con\_extend\_time** is too large, the Ustore concurrent page extension takes a long time.

- `gs_redo_upage(directory_path text, backup_path text, blocknum bigint, relation_type text, xlog_path text, lsn text)`

Description:Redoes a specific Ustore data page that is backed up to a specified LSN and verifies the page in this process. If a damaged page is detected, the page is flushed to the disk and the disk flushing path, page LSN, and damage information is returned; otherwise, the page is redone to the specified LSN and flushed to the disk, and the result is returned. Only system administrators or O&M administrators can execute this function.

Return type: record

| Category         | Parameter       | Type   | Description                                                                                                                                                                                                                                                            |
|------------------|-----------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input parameter  | directory_path  | text   | Specifies the directory for storing the backup file.                                                                                                                                                                                                                   |
| Input parameter  | backup_path     | text   | Relative path of the backup table file, which is combined with the directory where the backup file is located to form the complete path of the table file, for example, <b>base/15635/12488</b> . If the backup file does not exist, set this parameter to null.       |
| Input parameter  | blocknum        | bigint | <b>0</b> to <i>MaxBlockNumber</i> : block number of the corresponding page.                                                                                                                                                                                            |
| Input parameter  | relation_type   | text   | <ul style="list-style-type: none"> <li>• <b>uheap</b>: Ustore data page</li> <li>• <b>ubtree</b>: Ustore index page</li> <li>• <b>indexurq</b>: Urq page</li> <li>• <b>undo_record</b>: Undo record page</li> <li>• <b>undo_slot</b>: Transaction slot page</li> </ul> |
| Input parameter  | xlog_path       | text   | Absolute path of the archive log directory.                                                                                                                                                                                                                            |
| Input parameter  | lsn             | text   | The LSN consists of two hexadecimal numbers (32 bits each), which are separated by a slash (/), for example, 2/962D1DF8. If the value is <b>0</b> , the latest version is used.                                                                                        |
| Output parameter | output_filename | text   | Path and name of the file to be flushed to the disk.                                                                                                                                                                                                                   |
| Output parameter | output_lsn      | text   | LSN of the last page redo.                                                                                                                                                                                                                                             |
| Output parameter | corruption_desc | text   | Page damage description.                                                                                                                                                                                                                                               |

- gs\_xlogdump\_bylastlsn**(last\_lsn text, blocknum bigint, relation\_type text)  
 Description: Inputs a page LSN and block number, parses the WAL corresponding to the LSN, obtains the last LSN of the corresponding block number, continues parsing until the last LSN is 0 or the WAL of an earlier version has been reused and recycled, and flushes the parsed log to a specified path. Only system administrators or O&M administrators can execute this function. This system function cannot be called by the standby node.

Return type: text

| Category         | Parameter       | Type   | Description                                                                                                                                                                                        |
|------------------|-----------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input parameter  | last_lsn        | text   | Parses the LSN of a specified page in hexadecimal notation, for example, 12BA/32CDEDDD. The LSN can be obtained using a page parsing tool (such as <b>gs_parse_page_bypath</b> ).                  |
| Input parameter  | blocknum        | bigint | Specifies the logical block number of a page.<br>Value range: <b>-1</b> to <i>MaxBlockNumber</i> .<br>If the block number is set to <b>-1</b> , the default block number is obtained from the WAL. |
| Input parameter  | relation_type   | text   | Specifies the type of the page to be parsed.<br>Valid value: <b>uheap</b> , <b>ubtree</b> , <b>heap</b> , <b>btree</b> , <b>undo_record</b> , and <b>undo_slot</b> .                               |
| Output parameter | output_filepath | text   | Specifies the path for flushing WAL parsing results to disks.                                                                                                                                      |

**Example:**

```
Obtain the page LSN.
Before calling the function, ensure that the file path exists based on the parameter description.
gaussdb=# select * from gs_parse_page_bypath('base/15833/16768', 0, 'uheap', false);
output_filepath

/data1/database/cluster/primary/data/1663_15833_16768_0.page
(1 row)
gaussdb=# select * from gs_xlogdump_bylastlsn('0/4593570', -1, 'uheap');
output_filepath

/data1/database/cluster/primary/data/pg_log/dump/4593570_-1.xlog
(1 row)
gaussdb=# select * from gs_xlogdump_bylastlsn('0/4593570', 0, 'ubtree');
ERROR: The input lsn 0/4593570 related xlog is not ubtree.
```

- dbe\_perf.get\_full\_sql\_by\_parent\_id\_and\_timestamp**(parent\_id bigint, start\_timestamp timestamp with time zone, end\_timestamp timestamp with time zone)

Description: Obtains the records of database-level full SQL statements and their substatements that execute a stored procedure in a specified period

based on **parent\_id**. The result can be queried only in the system database but cannot be queried in the user database.

Return type: record

| Parameter       | Type                     | Description                                                              |
|-----------------|--------------------------|--------------------------------------------------------------------------|
| parent_id       | bigint                   | Specifies the unique_sql_id of the statement calling a stored procedure. |
| start_timestamp | timestamp with time zone | Start point of the SQL start time range.                                 |
| end_timestamp   | timestamp with time zone | End point of the SQL start time range.                                   |

Example:

```

gaussdb=# CREATE TABLE test(a int,b int);
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'a' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
gaussdb=# INSERT INTO test values(1,1);
INSERT 0 1
gaussdb=# CREATE PROCEDURE mypro1() as num int;
gaussdb$# begin
gaussdb$# INSERT INTO test values(2,2);
gaussdb$# DELETE FROM test where a = 2;
gaussdb$# end;
gaussdb$# /
CREATE PROCEDURE

Enable the parameter to trace the substatements of the stored procedure.
gaussdb=# SET instr_unique_sql_track_type = 'all';
SET

Enable the parameter. Full statement records are generated in the db_perf.statement_history
table.
gaussdb=# SET track_stmt_stat_level = 'L0,L0';
SET

gaussdb=# CALL mypro1();
mypro1

(1 row)

gaussdb=# SET track_stmt_stat_level = 'off,L0';
SET

gaussdb=# SET instr_unique_sql_track_type = 'top';
SET

Query key information, which is used as a function parameter.
gaussdb=# SELECT query,unique_query_id,start_time,finish_time FROM db_perf.statement_history;
 query | unique_query_id | start_time | finish_time
-----+-----+-----+-----
set track_stmt_stat_level = 'L0,L0'; | 636388010 | 2023-06-02 17:40:49.176155+08 | 2023-06-02

17:40:59.031577+08
insert into test values(?,?) | 769279931 | 2023-06-02 17:40:59.029219+08 | 2023-06-02

```

```

17:40:59.029947+08
(4 rows)

Use unique_query_id, start time, and end time of the outer query statement as parameters to query
information about the specified stored procedure and its substatements within the period.
gaussdb=# SELECT query FROM
dbe_perf.get_full_sql_by_parent_id_and_timestamp(536458473,'2023-06-02
17:40:59.028144+08','2023-06-02 17:40:59.032027+08');
query

call mypro1();
delete from test where a = ?
insert into test values(?,?)
(3 rows)

```

- `gs_index_dump_read(int8 reset, text out_type)`

Description: Queries the buffer read information generated in the cyclic queue when an index is used to obtain a new page. The buffer read information traverses leaf pages from left to right using the same key as the index page.

Return type: record

| Category         | Parameter   | Type | Description                                                                                                                                                                                                                                                |
|------------------|-------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input parameter  | reset       | int8 | <ul style="list-style-type: none"> <li>• <b>0</b>: The statistics are reset to the initial value 0 and the statistics are collected again.</li> <li>• <b>1</b>: The current statistics are displayed.</li> </ul>                                           |
| Input parameter  | out_type    | text | <ul style="list-style-type: none"> <li>• <b>urq</b>: outputs statistics about cyclic queues.</li> <li>• <b>ubtree</b>: outputs statistics on index pages.</li> <li>• <b>all</b>: All statistics about cyclic queues and index pages are output.</li> </ul> |
| Output parameter | relfilenode | oid  | Index relfilenode corresponding to the maximum buffer read value.                                                                                                                                                                                          |
| Output parameter | max_count   | int8 | Maximum buffer read value.                                                                                                                                                                                                                                 |
| Output parameter | ave_count   | int8 | Average buffer read value.                                                                                                                                                                                                                                 |

 NOTE

- Currently, this API supports only Ustore index tables.
- When this API is executed, the reset operation is performed to clear all records and set all records to 0. If you query the information again, the query result is always 0 until the information is collected next time. The following are query examples:

```
gaussdb=# SELECT * FROM gs_index_dump_read(0, 'all');
relfilenode | max_count | ave_count
-----+-----+-----
| | |
(1 row)
gaussdb=# SELECT * FROM gs_index_dump_read(1, 'all');
relfilenode | max_count | ave_count
-----+-----+-----
0 | | 0
0 | | 0
(2 rows)
```

### 7.5.25.13 SQL Statement Concurrency Control Function

- `gs_add_workload_rule(rule_type, rule_name, databases, start_time, end_time, max_workload, option_val)`

Description: Creates an SQL statement concurrency control rule. Users must have the `sysadmin` permission. This function can be executed only on the CN.

Parameters: For details, see [Table 7-102](#).

Return type: `int8`

**Table 7-102** `gs_add_workload_rule` parameters

| Parameter              | Type              | Description                                                                                   | Value Range                                                                                                                                                                                                                                                                                                                             |
|------------------------|-------------------|-----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>rule_type</code> | <code>text</code> | Type of the concurrency control rule, which is case insensitive.                              | " <b>sqlid</b> ": Concurrency control is based on the unique SQL ID.<br>" <b>select</b> ", " <b>insert</b> ", " <b>update</b> ", " <b>delete</b> ", and " <b>merge</b> ": Concurrency control is based on the query type and keyword.<br>" <b>resource</b> ": Instance-level concurrency control is based on the system resource usage. |
| <code>rule_name</code> | <code>name</code> | Name of a concurrency control rule, which is used to search for the concurrency control rule. | Any character string or <b>NULL</b> .                                                                                                                                                                                                                                                                                                   |

| Parameter    | Type       | Description                                                                                               | Value Range                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------|------------|-----------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| databases    | name[]     | Array of database names for which the concurrency control rule takes effect. The value is case-sensitive. | List of names of created databases. The value can be <b>NULL</b> , indicating that the configuration takes effect in all databases.<br><br>Currently, the database list takes effect only when <b>rule_type</b> is set to a query type because a unique SQL ID is bound to a database and belongs to only one database. The concurrency control rules based on resource usage take effect for instances, that is, all databases. |
| start_time   | timestampz | Start time of a concurrency control rule.                                                                 | The value can be <b>NULL</b> , indicating that it takes effect from now on.                                                                                                                                                                                                                                                                                                                                                      |
| end_time     | timestampz | End time of a concurrency control rule.                                                                   | The value can be <b>NULL</b> , indicating that the rule is always effective.                                                                                                                                                                                                                                                                                                                                                     |
| max_workload | int8       | Maximum number of concurrent requests set in a concurrency control rule.                                  | -                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Parameter  | Type   | Description                                                   | Value Range                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------|--------|---------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| option_val | text[] | Supplementary information about the concurrency control rule. | <p>It matches <b>rule_type</b>. The matching relationship is as follows:</p> <ul style="list-style-type: none"> <li>• <b>"sqlid"</b>: specifies the unique ID of the SQL statement whose concurrency is to be controlled and slow SQL control rule. The format is '{id=1234, time_limit=100, max_execute_time=500, max_iops=1}', in which <b>id</b> indicates the unique SQL ID and is mandatory. You can obtain it from the <code>dbe_perf.statement</code> or <code>pg_stat_activity</code> view. Others are optional. For details about their meanings, see section "Hint for Setting Slow SQL Control Rules."</li> <li>• <b>"select", "insert", "update", "delete", and "merge"</b>: specifies the keyword sequence for concurrency control, which is case insensitive and can be <b>NULL</b>.</li> <li>• <b>"resource"</b>: specifies the resource threshold for traffic limiting. The format is '{cpu-80, memory-70}'. No matter what the CPU and memory thresholds are set, the value <b>0</b> is used.</li> </ul> |

Example:

```

gaussdb=# select gs_add_workload_rule('sqlid', 'rule for one query', '{}', now(), NULL, 20,
'{id=32413214}');
gs_add_workload_rule

1
(1 row)
gaussdb=# create database db1;
gaussdb=# create database db2;
gaussdb=# select gs_add_workload_rule('select', 'rule for select', '{db1, db2}', NULL, NULL, 100, '{tb1,
tb2}');
gs_add_workload_rule

2
(1 row)
gaussdb=# select gs_add_workload_rule('resource', 'rule for resource', '{}', NULL, NULL, 20, '{cpu-80}');
gs_add_workload_rule

```

(1 row)

- `gs_update_workload_rule(rule_id, rule_name, databases, start_time, end_time, max_workload, option_val)`

Description: To update an SQL statement concurrency control rule, users need to reset all parameters instead of only some parameters. Users must have the `sysadmin` permission. This function can be executed only on the CN.

Parameters: For details, see [Table 7-103](#).

Return type: Boolean

**Table 7-103** `gs_update_workload_rule` parameters

| Parameter               | Type                     | Description                                                                                               | Value Range                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------|--------------------------|-----------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>rule_id</code>    | <code>int8</code>        | ID of the concurrency control rule to be updated.                                                         | -                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>rule_name</code>  | <code>name</code>        | Name of a concurrency control rule, which is used to search for the concurrency control rule.             | Any character string or <b>NULL</b> .                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>databases</code>  | <code>name[]</code>      | Array of database names for which the concurrency control rule takes effect. The value is case-sensitive. | List of names of created databases. The value can be <b>NULL</b> , indicating that the configuration takes effect in all databases.<br><br>Currently, the database list takes effect only when <b>rule_type</b> is set to a query type because a unique SQL ID is bound to a database and belongs to only one database. The concurrency control rules based on resource usage take effect for instances, that is, all databases. |
| <code>start_time</code> | <code>timestamptz</code> | Start time of a concurrency control rule.                                                                 | The value can be <b>NULL</b> , indicating that it takes effect from now on.                                                                                                                                                                                                                                                                                                                                                      |
| <code>end_time</code>   | <code>timestamptz</code> | End time of a concurrency control rule.                                                                   | The value can be <b>NULL</b> , indicating that the rule is always effective.                                                                                                                                                                                                                                                                                                                                                     |

| Parameter    | Type   | Description                                                              | Value Range                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Example:

```
gaussdb=# create database db1;
gaussdb=# select gs_update_workload_rule(2, 'rule for select 2', '{db1}', now(), NULL, 50, '{tb1}');
 gs_update_workload_rule

 t
(1 row)
```

- `gs_delete_workload_rule(rule_id)`

Description: Deletes an SQL statement concurrency control rule. Users must have the `sysadmin` permission. This function can be executed only on the CN.

Parameter: **rule\_id** indicates the ID of the concurrency control rule to be updated. The type is `int8`.

Return type: Boolean

Example:

```
gaussdb=# select gs_delete_workload_rule(3);
 gs_delete_workload_rule

 t
(1 row)
```

- `gs_get_workload_rule_stat(rule_id)`

Description: Queries the number of times that SQL statements are blocked by SQL statement concurrency control rules. Users must have the `sysadmin` permission. This function can be executed only on the CN.

Parameter: **rule\_id** indicates the ID of the concurrency control rule to be queried. The type is `int8`. You can set **rule\_id** to `-1`, indicating that all SQL statement concurrency control rules are queried.

Return type:

| Name                        | Type              | Description                                                                         |
|-----------------------------|-------------------|-------------------------------------------------------------------------------------|
| <code>rule_id</code>        | <code>int8</code> | ID of the SQL statement concurrency control rule.                                   |
| <code>validate_count</code> | <code>int8</code> | Number of SQL statements intercepted by the SQL statement concurrency control rule. |

Example:

```
gaussdb=# select * from gs_get_workload_rule_stat(1);
 rule_id | validate_count
-----+-----
 1 | 0
(1 row)
gaussdb=# select * from gs_get_workload_rule_stat(-1);
 rule_id | validate_count
-----+-----
 1 | 0
 2 | 0
(2 rows)
```

## 7.5.26 Statistics Information Functions

Statistics information functions are divided into the following two categories: functions that access databases, using the OID of each table or index in a

database to mark the database for which statistics are generated; functions that access servers, identified by the server process ID, whose value ranges from 1 to the number of currently active servers.

- `pg_stat_get_db_conflict_tablespace(oid)`  
Description: Specifies the number of queries canceled due to a conflict between the restored tablespace and the deleted tablespace in the database.  
Return type: bigint
- `pg_control_group_config()`  
Description: Prints Cgroup configurations on the current node. Only users with the SYSADMIN permission can execute this function.  
Return type: record
- `pg_stat_get_db_stat_reset_time(oid)`  
Description: Specifies the most recent time when database statistics were reset. It is initialized to the system time during the first connection to each database. The reset time is updated when you call `pg_stat_reset` on the database and execute `pg_stat_reset_single_table_counters` against any table or index in it.  
Return type: timestampz
- `pg_stat_get_function_total_time(oid)`  
Description: Specifies the total wall clock time spent in the function, in microseconds. The time spent on this function calling other functions is included.  
Return type: bigint
- `pg_stat_get_xact_tuples_returned(oid)`  
Description: Specifies the number of rows read through sequential scans when the parameter is a table in the current transaction or the number of index entries returned when the parameter is an index.  
Return type: bigint
- `pg_stat_get_xact_numscans(oid)`  
Description: Specifies the number of sequential scans performed when the parameter is a table in the current transaction or the number of index scans performed when the parameter is an index.  
Return type: bigint
- `pg_stat_get_xact_blocks_fetched(oid)`  
Description: Specifies the number of disk block fetch requests for a table or an index in the current transaction.  
Return type: bigint
- `pg_stat_get_xact_blocks_hit(oid)`  
Description: Specifies the number of disk block fetch requests for tables or indexes found in cache in the current transaction.  
Return type: bigint
- `pg_stat_get_xact_function_calls(oid)`  
Description: Specifies the number of times the function is called in the current transaction.  
Return type: bigint

- pg\_stat\_get\_xact\_function\_self\_time(oid)**  
 Description: Specifies the time spent only on this function in the current transaction. The time spent on other function call inside this function is not included.  
 Return type: bigint
- pg\_stat\_get\_xact\_function\_total\_time(oid)**  
 Description: Specifies the total wall clock time spent on this function in the current transaction, in microseconds. The time spent on other function call inside this function is included.  
 Return type:
- pg\_lock\_status()**  
 Description: Queries information about locks held by open transactions. All users can execute this function.  
 Return type: For details, see the return result of [PG\\_LOCKS](#), which is obtained by querying this function.
- gs\_lwlock\_status()**  
 Description: Queries information about all lightweight locks in the database system, including lock waiting and lock holding information. All users can execute this function.  
 Return type: setofrecord
- pg\_stat\_get\_wal\_senders()**  
 Description: Queries walsender information on the primary node.  
 Return type: setofrecord  
 The following table describes return columns.

**Table 7-104** Return column description

| Column        | Type                     | Description                             |
|---------------|--------------------------|-----------------------------------------|
| pid           | bigint                   | Thread ID of the WAL sender             |
| sender_pid    | integer                  | Lightweight thread ID of the WAL sender |
| local_role    | text                     | Type of the primary node                |
| peer_role     | text                     | Type of the standby node                |
| peer_state    | text                     | Status of the standby node              |
| state         | text                     | Status of the WAL sender                |
| catchup_start | timestamp with time zone | Startup time of a catchup task          |

| Column                     | Type                     | Description                            |
|----------------------------|--------------------------|----------------------------------------|
| catchup_end                | timestamp with time zone | End time of a catchup task             |
| sender_sent_location       | text                     | Sending position of the primary node   |
| sender_write_location      | text                     | Writing position of the primary node   |
| sender_flush_location      | text                     | Flushing position of the primary node  |
| sender_replay_location     | text                     | Redo position of the primary node      |
| receiver_received_location | text                     | Receiving position of the standby node |
| receiver_write_location    | text                     | Writing position of the standby node   |
| receiver_flush_location    | text                     | Flushing position of the standby node  |
| receiver_replay_location   | text                     | Redo position of the standby node      |
| sync_percent               | text                     | Synchronization percentage             |
| sync_state                 | text                     | Synchronization status                 |
| sync_priority              | text                     | Priority of synchronous replication    |
| sync_most_available        | text                     | Maximum availability mode              |
| channel                    | text                     | Channel information of the WAL sender  |

- `pgxc_get_senders_catchup_time()`  
 Description: Queries whether a standby DN in the log catchup state exists in the CN instance query cluster and details about the log catchup state.  
 Return type: setofrecord
- `pg_stat_get_stream_replications()`  
 Description: Queries the primary/standby replication status.  
 Return type: setofrecord  
 The following table describes return values.

**Table 7-105** Return value description

| Return Parameter   | Type    | Description           |
|--------------------|---------|-----------------------|
| local_role         | text    | Local role            |
| static_connections | integer | Connection statistics |
| db_state           | text    | Database status       |
| detail_information | text    | Detailed information  |

- `pg_stat_get_db_numbackends(oid)`  
Description: Specifies the number of active server processes for a database.  
Return type: integer
- `pg_stat_get_db_xact_commit(oid)`  
Description: Specifies the number of transactions committed in a database.  
Return type: bigint
- `pg_stat_get_db_xact_rollback(oid)`  
Description: Specifies the number of transactions rolled back in a database.  
Return type: bigint
- `pg_stat_get_db_blocks_fetched(oid)`  
Description: Specifies the number of disk blocks fetch requests for a database.  
Return type: bigint
- `pg_stat_get_db_blocks_hit(oid)`  
Description: Specifies the number of disk block fetch requests found in cache for a database.  
Return type: bigint
- `pg_stat_get_db_tuples_returned(oid)`  
Description: Specifies the number of tuples returned for a database.  
Return type: bigint
- `pg_stat_get_db_tuples_fetched(oid)`  
Description: Specifies the number of tuples fetched for a database.  
Return type: bigint
- `pg_stat_get_db_tuples_inserted(oid)`  
Description: Specifies the number of tuples inserted in a database.  
Return type: bigint
- `pg_stat_get_db_tuples_updated(oid)`  
Description: Specifies the number of tuples updated in a database.  
Return type: bigint
- `pg_stat_get_db_tuples_deleted(oid)`  
Description: Specifies the number of tuples deleted in a database.  
Return type: bigint
- `pg_stat_get_db_conflict_lock(oid)`

Description: Specifies the number of lock conflicts in a database.

Return type: bigint

- `pg_stat_get_db_deadlocks(oid)`

Description: Specifies the number of deadlocks in a database.

Return type: bigint

- `pg_stat_get_numscans(oid)`

Description: Number of sequential row scans done if parameters are in a table, or the number of index rows if parameters are in an index.

Return type: bigint

- `pg_stat_get_role_name(oid)`

Description: Obtains the username based on the user OID. Only users with the SYSADMIN and MONADMIN permissions can access the information.

Return type: text

Example:

```
gaussdb=# select pg_stat_get_role_name(10);
 pg_stat_get_role_name

 aabbcc
(1 row)
```

- `pg_stat_get_tuples_returned(oid)`

Description: Specifies the number of sequential rows read by sequential scans if parameters are in a table, or the number of index rows if parameters are in an index.

Return type: bigint

- `pg_stat_get_tuples_fetched(oid)`

Description: Specifies the number of table rows fetched by bitmap scans if parameters are in a table, or the number of table rows fetched by simple index scans if parameters are in an index.

Return type: bigint

- `pg_stat_get_tuples_inserted(oid)`

Description: Specifies the number of rows inserted into a table.

Return type: bigint

- `pg_stat_get_tuples_updated(oid)`

Description: Specifies the number of rows updated in a table.

Return type: bigint

- `pg_stat_get_tuples_deleted(oid)`

Description: Specifies the number of rows deleted from a table.

Return type: bigint

- `pg_stat_get_tuples_changed(oid)`

Description: Specifies the total number of inserted, updated, and deleted rows after a table was last analyzed or autoanalyzed.

Return type: bigint

- `pg_stat_get_tuples_hot_updated(oid)`

Description: Specifies the number of rows hot updated in a table.

- Return type: bigint
- `pg_stat_get_live_tuples(oid)`  
Description: Specifies the number of live rows in a table.  
Return type: bigint
  - `pg_stat_get_dead_tuples(oid)`  
Description: Specifies the number of dead rows in a table.  
Return type: bigint
  - `pg_stat_get_blocks_fetched(oid)`  
Description: Specifies the number of disk block fetch requests for a table or an index.  
Return type: bigint
  - `pg_stat_get_blocks_hit(oid)`  
Description: Specifies the number of disk block requests found in cache for a table or an index.  
Return type: bigint
  - `pg_stat_get_xact_tuples_fetched(oid)`  
Description: Specifies the number of tuple rows scanned in a transaction.  
Return type: bigint
  - `pg_stat_get_xact_tuples_inserted(oid)`  
Description: Specifies the number of tuple inserted into the active subtransactions related to a table.  
Return type: bigint
  - `pg_stat_get_xact_tuples_deleted(oid)`  
Description: Specifies the number of deleted tuples in the active subtransactions related to a table.  
Return type: bigint
  - `pg_stat_get_xact_tuples_hot_updated(oid)`  
Description: Specifies the number of hot updated tuples in the active subtransactions related to a table.  
Return type: bigint
  - `pg_stat_get_xact_tuples_updated(oid)`  
Description: Specifies the number of updated tuples in the active subtransactions related to a table.  
Return type: bigint
  - `pg_stat_get_last_vacuum_time(oid)`  
Description: Specifies the most recent time when the autovacuum thread is manually started to clear a table.  
Return type: timestamptz
  - `pg_stat_get_last_autovacuum_time(oid)`  
Description: Specifies the time of the last vacuum initiated by the autovacuum daemon on a table.  
Return type: timestamptz

- `pg_stat_get_vacuum_count(oid)`  
Description: Specifies the number of times a table is manually cleared.  
Return type: `bigint`
- `pg_stat_get_autovacuum_count(oid)`  
Description: Specifies the number of times the autovacuum daemon is started to clear a table.  
Return type: `bigint`
- `pg_stat_get_last_analyze_time(oid)`  
Description: Specifies the last time when a table starts to be analyzed manually or by the autovacuum thread.  
Return type: `timestampz`
- `pg_stat_get_last_autoanalyze_time(oid)`  
Description: Specifies the time when the last analysis initiated by the autovacuum daemon on a table.  
Return type: `timestampz`
- `pg_stat_get_analyze_count(oid)`  
Description: Specifies the number of times a table is manually analyzed.  
Return type: `bigint`
- `pg_stat_get_autoanalyze_count(oid)`  
Description: Specifies the number of times the autovacuum daemon analyzes a table.  
Return type: `bigint`
- `pg_total_autovac_tuples(bool)`  
Description: Returns tuple records related to the total autovac, such as **nodename**, **nspname**, **relname**, and tuple IUDs. The input parameter specifies whether to query the **relation** information.  
Return type: `setofrecord`  
The following table describes return parameters.

**Table 7-106** Return parameter description

| Return Parameter           | Type                | Description                                             |
|----------------------------|---------------------|---------------------------------------------------------|
| <code>nodename</code>      | <code>name</code>   | Node name.                                              |
| <code>nspname</code>       | <code>name</code>   | Name of a namespace                                     |
| <code>relname</code>       | <code>name</code>   | Name of an object, such as a table, an index, or a view |
| <code>partname</code>      | <code>name</code>   | Partition name                                          |
| <code>n_dead_tuples</code> | <code>bigint</code> | Number of dead rows in a table partition                |
| <code>n_live_tuples</code> | <code>bigint</code> | Number of live rows in a table partition                |

| Return Parameter      | Type   | Description                            |
|-----------------------|--------|----------------------------------------|
| changes_since_analyze | bigint | Number of changes generated by ANALYZE |

- pg\_total\_gsi\_autovac\_tuples(bool)**  
 Description: Returns tuple records related to **total autovac**, such as **nodename**, **nspname**, **relname**, and number of GSI records that have changed since the last ANALYZE. The input parameter specifies whether to query relation information. This function assists AUTOVACUUM on GSIs. You are advised not to use this function.  
 Return type: setofrecord
- pg\_autovac\_status(oid)**  
 Description: Returns autovac information, such as **nodename**, **nspname**, **relname**, **analyze**, **vacuum**, thresholds for the ANALYZE and VACUUM operations, and the number of analyzed or vacuumed tuples. Only users with the SYSADMIN permission can use this function.  
 Return type: setofrecord  
 The following table describes return parameters.

**Table 7-107** Return parameter description

| Return Parameter | Type    | Description                                              |
|------------------|---------|----------------------------------------------------------|
| nspname          | text    | Name of a namespace.                                     |
| relname          | text    | Name of an object, such as a table, an index, or a view. |
| nodename         | text    | Node name.                                               |
| doanalyze        | Boolean | Specifies whether to execute <b>ANALYZE</b> .            |
| anltuples        | bigint  | Number of ANALYZE tuples.                                |
| anlthresh        | bigint  | ANALYZE threshold.                                       |
| dovacuum         | Boolean | Specifies whether to execute <b>VACUUM</b> .             |
| vactuples        | bigint  | Number of VACUUM tuples.                                 |
| vacthresh        | bigint  | VACUUM threshold.                                        |

- pg\_autovac\_timeout(oid)**  
 Description: Returns the number of consecutive timeouts during the autovac operation on a table. If the table information is invalid or the node information is abnormal, **NULL** will be returned.

**Table 7-108** Return parameter description

| Return Parameter | Type                     | Description                                                                                                                                                                                                               |
|------------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| datid            | oid                      | OID of the database that the user session connects to in the backend.                                                                                                                                                     |
| pid              | bigint                   | Backend thread ID.                                                                                                                                                                                                        |
| sessionid        | bigint                   | Session ID.                                                                                                                                                                                                               |
| usesysid         | oid                      | OID of the user logged in to the backend.                                                                                                                                                                                 |
| application_name | text                     | Name of the application connected to the backend                                                                                                                                                                          |
| state            | text                     | Overall status of the backend                                                                                                                                                                                             |
| query            | text                     | Latest query at the backend. If <b>state</b> is <b>active</b> , this column shows the ongoing query. In all other states, it shows the last query that was executed.                                                      |
| waiting          | Boolean                  | Specifies whether the backend is currently waiting on a lock. If yes, the value is <b>true</b> .                                                                                                                          |
| xact_start       | timestamp with time zone | Time when current transaction was started (null if no transaction is active).<br><br>If the current query is the first of its transaction, the value of this column is the same as that of the <b>query_start</b> column. |

| Return Parameter | Type                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| query_start      | timestamp with time zone | Time when the currently active query was started, or time when the last query was started if <b>state</b> is not <b>active</b> . For a stored procedure, function, or package, the first query time is queried and does not change with the running of statements in the stored procedure. For a stored procedure or function, the first query time is queried and does not change with the running of statements in the stored procedure. |
| backend_start    | timestamp with time zone | Time when this process was started, that is, when the client connected to the server                                                                                                                                                                                                                                                                                                                                                       |
| state_change     | timestamp with time zone | Time when <b>state</b> was last modified                                                                                                                                                                                                                                                                                                                                                                                                   |
| client_addr      | inet                     | IP address of the client connected to the backend. If this column is <b>NULL</b> , it indicates either the client is connected via a Unix socket on the server or this is an internal process, such as <b>AUTOVACUUM</b> .                                                                                                                                                                                                                 |
| client_hostname  | text                     | Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.                                                                                                                                                                                                                                          |

| Return Parameter | Type    | Description                                                                                            |
|------------------|---------|--------------------------------------------------------------------------------------------------------|
| client_port      | integer | TCP port number that the client uses for communication with this backend (-1 if a Unix socket is used) |
| enqueue          | text    | Unsupported currently.                                                                                 |
| query_id         | bigint  | ID of a query statement.                                                                               |
| srespool         | name    | Name of the resource pool                                                                              |
| global_sessionid | text    | Global session ID                                                                                      |
| unique_sql_id    | bigint  | Unique SQL statement ID                                                                                |
| trace_id         | text    | Driver-specific trace ID, which is associated with an application request                              |

- pg\_stat\_get\_activity\_with\_conninfo(integer)

Description: Returns a record about the backend with the specified PID. A record for each active backend in the system is returned if **NULL** is specified. The initial user, system administrators and users with the MONADMIN permission can view all data. Common users can only query their own results.

Return type: setofrecord

The following table describes return values.

**Table 7-109** Return value description

| Return Parameter | Return Type | Return value description                                              |
|------------------|-------------|-----------------------------------------------------------------------|
| datid            | oid         | OID of the database that the user session connects to in the backend. |
| pid              | bigint      | Backend thread ID.                                                    |
| sessionid        | bigint      | Session ID.                                                           |
| usesysid         | oid         | OID of the user logged in to the backend.                             |
| application_name | text        | Name of the application connected to the backend                      |

| Return Parameter | Return Type              | Return value description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| state            | text                     | Overall status of the backend.                                                                                                                                                                                                                                                                                                                                                                                                             |
| query            | text                     | Latest query at the backend. If <b>state</b> is <b>active</b> , this column shows the ongoing query. In all other states, it shows the last query that was executed.                                                                                                                                                                                                                                                                       |
| waiting          | Boolean                  | Specifies whether the backend is currently waiting on a lock. If yes, the value is <b>true</b> .                                                                                                                                                                                                                                                                                                                                           |
| xact_start       | timestamp with time zone | Time when current transaction was started (null if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the <b>query_start</b> column.                                                                                                                                                                                                                         |
| query_start      | timestamp with time zone | Time when the currently active query was started, or time when the last query was started if <b>state</b> is not <b>active</b> . For a stored procedure, function, or package, the first query time is queried and does not change with the running of statements in the stored procedure. For a stored procedure or function, the first query time is queried and does not change with the running of statements in the stored procedure. |

| Return Parameter | Return Type              | Return value description                                                                                                                                                                                                |
|------------------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| backend_start    | timestamp with time zone | Time when this process was started, that is, when the client connected to the server                                                                                                                                    |
| state_change     | timestamp with time zone | Time when <b>state</b> was last modified                                                                                                                                                                                |
| client_addr      | inet                     | IP address of the client connected to the backend. If this column is <b>NULL</b> , it indicates that either the client is connected via a Unix socket on the server or this is an internal process, such as AUTOVACUUM. |
| client_hostname  | text                     | Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.                       |
| client_port      | integer                  | TCP port number that the client uses for communication with this backend (-1 if a Unix socket is used)                                                                                                                  |
| enqueue          | text                     | Unsupported currently.                                                                                                                                                                                                  |
| query_id         | bigint                   | ID of a query statement.                                                                                                                                                                                                |
| connection_info  | text                     | A string in JSON format recording the driver type, driver version, driver deployment path, and process owner of the connected database.                                                                                 |
| srespool         | name                     | Name of the resource pool                                                                                                                                                                                               |

| Return Parameter | Return Type | Return value description                                                  |
|------------------|-------------|---------------------------------------------------------------------------|
| global_sessionid | text        | Global session ID                                                         |
| unique_sql_id    | bigint      | Unique SQL statement ID                                                   |
| trace_id         | text        | Driver-specific trace ID, which is associated with an application request |

- `gs_get_explain(integer)`

Description: Returns a running plan for the background thread with the specified PID. The PID cannot be empty. This function takes effect only when the GUC parameter **track\_activities** is set to **on**. Only explainable SQL statements whose plans do not contain stream operators are supported. Details are as follows:

- If the GUC parameter **plan\_collect\_thresh** is set to **-1**, the return result of the function is always empty.
- If **plan\_collect\_thresh** is set to **0**, the current SQL execution time is greater than or equal to the value of **log\_min\_duration\_statement**, and the total number of tuples processed by all operators in the plan is greater than or equal to 10000, the system starts to collect plans in running state. Each time the total number of tuples processed by all operators exceeds 10000, a collection is performed.
- If the GUC parameter **plan\_collect\_thresh** is set to a value greater than 0, running plans are collected incrementally based on the threshold specified by this parameter.
- In addition, this function can view only the plans generated on CNs. To view the plans generated on DN, see the `gs_get_dn_explain` function.

The return value type is text. The types and meanings of the fields are as follows:

| Return Value                                       | Return Type | Return value description                                                                             |
|----------------------------------------------------|-------------|------------------------------------------------------------------------------------------------------|
| Character string of the plans in the running state | text        | <b>A-rows</b> in the plan string indicates the number of rows returned by the operator in real time. |

- `gs_get_dn_explain(text, bigint)`

Description: Returns a running plan for the background thread of the DN with the specified node name (from the **node\_name** field in the **pgxc\_node** system catalog) and global session ID. The global session ID cannot be empty. This function takes effect only when the GUC parameter **track\_activities** is set to **on**. Only explainable SQL statements whose plans do not contain stream operators are supported. Details are as follows:

- Same as the `gs_get_explain` function. The global session ID is calculated based on the **global\_sessionid** field in **pg\_stat\_activity**. The format of

**global\_sessionid** is  $\{\text{number1}\}:\{\text{number2}\}\#\{\text{number3}\}$ , for example, 1938253334:1#0. Therefore, the parameter value of the `gs_get_dn_explain` function is  $\{\text{number2}\} \times 10000000000 + \{\text{number1}\}$ .

- In addition, this function can be executed only with the ADMIN or MONADMIN permission.

The return value type is text. The types and meanings of the fields are as follows:

| Return Value                                       | Return Type | Return value description                                                                             |
|----------------------------------------------------|-------------|------------------------------------------------------------------------------------------------------|
| Character string of the plans in the running state | text        | <b>A-rows</b> in the plan string indicates the number of rows returned by the operator in real time. |

- `pg_stat_get_activity_ng(integer)`

Description: Returns a record about the active background thread with the specified PID. A record for each active background thread is returned if **NULL** is specified. System administrators and users with the MONADMIN permission can view all data. Common users can query only their own data.

Return type: setofrecord

The following table describes return fields.

| Name      | Type   | Description       |
|-----------|--------|-------------------|
| datid     | oid    | Database OID      |
| pid       | bigint | Backend thread ID |
| sessionid | bigint | Session ID        |

- `pg_stat_get_function_calls(oid)`

Description: Specifies the number of times the function has been called.

Return type: bigint

- `pg_stat_get_function_self_time(oid)`

Description: Specifies the time spent on only this function. The time spent on nested functions to call other functions is excluded.

Return type: bigint

- `pg_stat_get_backend_idset()`

Description: Sets the number of currently active server processes (from 1 to the number of active server processes).

Return type: setofinteger

- `pg_stat_get_backend_pid(integer)`

Description: Specifies the ID of the given server thread.

Return type: bigint

- `pg_stat_get_backend_dbid(integer)`  
Description: Specifies the ID of the database connected to the given server process.  
Return type: oid
- `pg_stat_get_backend_userid(integer)`  
Description: Specifies the user ID of the given server process. This function can be called only by the system administrator.  
Return type: oid
- `pg_stat_get_backend_activity(integer)`  
Description: Active command of the given server process, but only if the current user is a system administrator or the same user as that of the session being queried and **track\_activities** is on  
Return type: text
- `pg_stat_get_backend_waiting(integer)`  
Description: True if the given server process is waiting for a lock, but only if the current user is a system administrator or the same user as that of the session being queried and **track\_activities** is on  
Return type: Boolean
- `pg_stat_get_backend_activity_start(integer)`  
Description: Specifies the time when the given server process's currently executing query is started only if the current user is the system administrator or the user of the session being queried and **track\_activities** is enabled.  
Return type: timestamp with time zone
- `pg_stat_get_backend_xact_start(integer)`  
Description: Specifies the time when the given server process's currently executing transaction is started only if the current user is the system administrator or the user of the session being queried and **track\_activities** is enabled.  
Return type: timestamp with time zone
- `pg_stat_get_backend_start(integer)`  
Description: Specifies the time when the given server process is started. If the current user is neither the system administrator nor the user of the session being queried, **NULL** is **returned**.  
Return type: timestamp with time zone
- `pg_stat_get_backend_client_addr(integer)`  
Description: Specifies the IP address of the client connected to the given server process. If the connection is over a Unix domain socket, or if the current user is neither a system administrator nor the same user as that of the session being queried, **NULL** will be returned.  
Return type: inet
- `pg_stat_get_backend_client_port(integer)`  
Description: Specifies the TCP port number of the client connected to the given server process. If the connection is over a Unix domain socket, **-1** will be returned. If the current user is neither a system administrator nor the same user as that of the session being queried, **NULL** will be returned.

- Return type: integer
- `pg_stat_get_bgwriter_timed_checkpoints()`  
Description: Specifies the time when the background writer starts scheduled checkpoints (because the **checkpoint\_timeout** time has expired).  
Return type: bigint
  - `pg_stat_get_bgwriter_requested_checkpoints()`  
Description: Specifies the time when the background writer starts checkpoints based on requests from the backend because **checkpoint\_segments** has been exceeded or the **CHECKPOINT** command has been executed.  
Return type: bigint
  - `pg_stat_get_bgwriter_buf_written_checkpoints()`  
Description: Specifies the number of buffers written by the background writer during checkpoints.  
Return type: bigint
  - `pg_stat_get_bgwriter_buf_written_clean()`  
Description: Specifies the number of buffers written by the background writer for routine cleaning of dirty pages.  
Return type: bigint
  - `pg_stat_get_bgwriter_maxwritten_clean()`  
Description: Specifies the time when the background writer stops its cleaning scan because it has written more buffers than specified in the **bgwriter\_lru\_maxpages** parameter.  
Return type: bigint
  - `pg_stat_get_buf_written_backend()`  
Description: Specifies the number of buffers written by the backend because they need to allocate a new buffer.  
Return type: bigint
  - `pg_stat_get_buf_alloc()`  
Description: Specifies the total number of the allocated buffers.  
Return type: bigint
  - `pg_stat_clear_snapshot()`  
Description: Discards the current statistics snapshot. Only users with the SYSADMIN or MONADMIN permission can execute this function.  
Return type: void
  - `pg_stat_reset()`  
Description: Resets all statistics counters for the current database to zero (requires system administrator permissions).  
Return type: void
  - `gs_stat_reset()`  
Description: Resets all statistics counters for the current database on each node to zero (requiring system administrator permissions).  
Return type: void
  - `pg_stat_reset_shared(text)`

Description: Resets all statistics counters for the current database in each node in a shared cluster to zero (requires system administrator permissions).

Return type: void

- `pg_stat_reset_single_table_counters(oid)`  
Description: Resets statistics for a single table or index in the current database to zero (requires system administrator permissions).  
Return type: void
- `pg_stat_reset_single_function_counters(oid)`  
Description: Resets statistics for a single function in the current database to zero (requires system administrator permissions).  
Return type: void
- `pgxc_get_wlm_current_instance_info(text, int default null)`  
Description: Queries the current resource usage of each node in a cluster on a CN and reads the data that is not stored in the **GS\_WLM\_INSTANCE\_HISTORY** system catalog in the memory. The input parameters are the node name (**ALL**, **C**, **D**, or *Instance name*) and the maximum number of records returned by each node. The returned value is **GS\_WLM\_INSTANCE\_HISTORY**.  
Return type: setofrecord
- `pgxc_get_wlm_history_instance_info(text, TIMESTAMP, TIMESTAMP, int default null)`  
Description: Queries the historical resource usage in a cluster on a CN and reads data from the **GS\_WLM\_INSTANCE\_HISTORY** system catalog. The input parameters are the node name (**ALL**, **C**, **D**, or *Instance name*), start time, end time, and maximum number of records returned by each instance. The return value is **GS\_WLM\_INSTANCE\_HISTORY**.  
Return type: setofrecord
- `pgxc_fenced_udf_process(integer)`  
Description: Displays the number of UDF master and worker processes. Only users with the SYSADMIN or MONADMIN permission can execute this function. If the input parameter is set to **1**, the number of Master processes is queried. If the input parameter is set to **2**, the number of Worker processes is queried. If the input parameter is set to **3**, all Worker processes are killed.  
Return type: text
- `fenced_udf_process(integer)`  
Description: Shows the number of local UDF Master and Work threads. If the input parameter is set to **1**, the number of Master threads is queried. If the input parameter is set to **2**, the number of Worker threads is queried. If the input parameter is set to **3**, all Worker threads are terminated.  
Return type: text
- `total_cpu()`  
Description: Obtains the CPU time used by the current node, in jiffies.  
Return type: bigint
- `total_memory()`  
Description: Obtains the size of the virtual memory used by the current node, in KB.

Return type: bigint

- `pgxc_terminate_all_fenced_udf_process()`  
Description: Kills all UDF worker processes. Only users with the SYSADMIN or MONADMIN permission can execute this function.  
Return type: Boolean
- `gs_check_tables_distribution()`  
Description: Checks whether the user table distribution in the system is consistent. If no record is returned, table distribution is consistent. This function cannot be called during redistribution in scale-in or scale-out.  
Return type: record
- `pg_stat_bad_block(text, int, int, int, int, int, timestamp with time zone, timestamp with time zone)`  
Description: Obtains damage information about pages after the current node is started.  
Return type: record
- `pgxc_stat_bad_block(text, int, int, int, int, int, timestamp with time zone, timestamp with time zone)`  
Description: Obtains damage information about pages after all nodes in the cluster are started.  
Return type: record
- `pg_stat_bad_block_clear()`  
Description: Deletes the page damage information that is read and recorded on the node (requires system administrator permissions).  
Return type: void
- `pgxc_stat_bad_block_clear`  
Description: Deletes the page damage information that is read and recorded on all nodes in the cluster (requiring system administrator permissions).  
Return type: void
- `gs_respool_exception_info(pool text)`  
Description: Queries the query rule of a specified resource pool.  
Return type: record
- `gs_control_group_info(pool text)`  
Description: Queries information about Cgroups associated with a resource pool. Only users with the SYSADMIN permission can execute this function.  
Return type: record

The command output is as follows:

| Attribute | Value               | Description                  |
|-----------|---------------------|------------------------------|
| name      | class_a:workload_a1 | Class name and workload name |
| class     | class_a             | Class Cgroup name            |
| workload  | workload_a1         | Workload Cgroup name         |

| Attribute | Value | Description                                                                              |
|-----------|-------|------------------------------------------------------------------------------------------|
| type      | DEFWD | Cgroup type ( <b>Top</b> , <b>CLASS</b> , <b>BAKWD</b> , <b>DEFWD</b> , or <b>TSWD</b> ) |
| gid       | 87    | Cgroup ID                                                                                |
| shares    | 30    | Percentage of CPU resources to those on the parent node                                  |
| limits    | 0     | Percentage of CPU cores to those on the parent node                                      |
| rate      | 0     | Allocation ratio in Timeshare                                                            |
| cpucores  | 0-3   | Number of CPU cores                                                                      |

- `gs_all_control_group_info()`  
 Description: Collects information about all Cgroups in the database. For details about the columns returned by the function, see [16.3.48 GS\\_ALL\\_CONTROL\\_GROUP\\_INFO](#).  
 Return type: record
- `gs_get_control_group_info()`  
 Description: Collects information about all Cgroups. For details about the columns returned by the function, see [16.3.53 GS\\_GET\\_CONTROL\\_GROUP\\_INFO](#). Only users with the SYSADMIN permission can execute this function.  
 Return type: record
- `get_instr_workload_info(integer)`  
 Description: Obtains the transaction volume and time information on the current CN.  
 Return type: record

| Attribute        | Value  | Description                                                    |
|------------------|--------|----------------------------------------------------------------|
| user_oid         | 10     | User ID                                                        |
| commit_counter   | 4      | Number of frontend transactions that were committed            |
| rollback_counter | 1      | Number of frontend transactions that were rolled back          |
| resp_min         | 949    | Minimum response time of frontend transactions (unit: $\mu$ s) |
| resp_max         | 201891 | Maximum response time of frontend transactions (unit: $\mu$ s) |
| resp_avg         | 43564  | Average response time of frontend transactions (unit: $\mu$ s) |

| Attribute           | Value        | Description                                                      |
|---------------------|--------------|------------------------------------------------------------------|
| resp_total          | 217822       | Total response time of frontend transactions (unit: $\mu$ s)     |
| bg_commit_counter   | 910          | Number of background transactions that were committed            |
| bg_rollback_counter | 0            | Number of background transactions that were rolled back          |
| bg_resp_min         | 97           | Minimum response time of background transactions (unit: $\mu$ s) |
| bg_resp_max         | 678080687    | Maximum response time of background transactions (unit: $\mu$ s) |
| bg_resp_avg         | 327847884    | Average response time of background transactions (unit: $\mu$ s) |
| bg_resp_total       | 298341575300 | Total response time of background transactions (unit: $\mu$ s)   |

- `pv_instance_time()`  
Description: Obtains the time consumed in each execution phase on the current node.

Return type: record

| Stat_name Attribute | Value   | Description                                                          |
|---------------------|---------|----------------------------------------------------------------------|
| DB_TIME             | 1062385 | Total end-to-end wall time consumed by all threads (unit: $\mu$ s)   |
| CPU_TIME            | 311777  | Total CPU time consumed by all threads (unit: $\mu$ s)               |
| EXECUTION_TIME      | 380037  | Total time consumed on the executor (unit: $\mu$ s)                  |
| PARSE_TIME          | 6033    | Total time consumed for parsing SQL statements (unit: $\mu$ s)       |
| PLAN_TIME           | 173356  | Total time consumed for generating an execution plan (unit: $\mu$ s) |
| REWRITE_TIME        | 2274    | Total time consumed for rewriting queries (unit: $\mu$ s)            |

| Stat_name Attribute | Value  | Description                                                           |
|---------------------|--------|-----------------------------------------------------------------------|
| PL_EXECUTION_TIME   | 0      | Total time consumed for executing PL/SQL statements (unit: $\mu$ s)   |
| PL_COMPILATION_TIME | 557    | Total time consumed for compiling SQL statements (unit: $\mu$ s)      |
| NET_SEND_TIME       | 1673   | Total time consumed for sending data over the network (unit: $\mu$ s) |
| DATA_IO_TIME        | 426622 | Total time consumed for reading and writing data (unit: $\mu$ s)      |

- DBE\_PERF.get\_global\_instance\_time()**  
 Description: Provides the time consumed in each key phase in the entire cluster. The time consumed can be queried only on the CN. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
 Return type: record
- get\_instr\_unique\_sql()**  
 Description: Obtains information about execution statements (normalized SQL statements) on the current node. Only users with the SYSADMIN or MONADMIN permission can query this function.  
 Return type: record
- get\_instr\_wait\_event(integer)**  
 Description: Obtains the statistics on wait events of the current node.  
 Return type: record
- get\_instr\_user\_login()**  
 Description: Obtains the number of user login and logout times on the current node. Only users with the SYSADMIN or MONADMIN permission can execute this function.  
 Return type: record
- get\_instr\_rt\_percentile(integer)**  
 Description: Obtains the response time distribution for 80% and 95% SQL statements in the CCN. The unified cluster information is stored on the CCN. The query result from other nodes is **0**.  
 Return type: record
- get\_node\_stat\_reset\_time()**  
 Description: Obtains statistics about reset (restart, primary/standby switchover, and database deletion) time of the current node.  
 Return type: record
- create\_wlm\_operator\_info(int flag)**  
 Description: Clears top SQL operator-level statistics recorded in the current memory. If the input parameter is greater than 0, the information is archived to `gs_wlm_operator_info`. Otherwise, the information is not archived. Only users with the SYSADMIN permission can execute this function.

Return type: int

- `create_wlm_session_info(int flag)`

Description: Clears top SQL query statement-level statistics recorded in the current memory. If the input parameter is greater than 0, the information is archived to **gs\_wlm\_session\_query\_info\_all**. Otherwise, the information is not archived. Only users with the SYSADMIN permission can execute this function.

Return type: int

- `pg_stat_get_wlm_session_info(int flag)`

Description: Obtains top SQL query statement-level statistics recorded in the current memory. If the input parameter is not 0, the information is cleared from the memory. Only users with the SYSADMIN and MONADMIN permission can execute this function.

Return type: record

- `gs_paxos_stat_replication()`

Description: Queries the standby node information on the primary node.

Return type: setofrecord

The following table describes return columns.

| Column                   | Type | Description                                                               |
|--------------------------|------|---------------------------------------------------------------------------|
| local_role               | text | Role of the node that sends logs                                          |
| peer_role                | text | Role of the node that receives logs                                       |
| local_dcf_role           | text | DCF role of the node that sends logs                                      |
| peer_dcf_role            | text | DCF role of the node that receives logs                                   |
| peer_state               | text | Status of the node that receives logs                                     |
| sender_write_location    | text | Location in the Xlog buffer where the node that sends logs is written     |
| sender_commit_location   | text | Consistency point reached for the DCF logs of the node that sends logs    |
| sender_flush_location    | text | Location in the Xlog disk where the node that sends logs is written       |
| sender_replay_location   | text | Location where the node that sends logs replays logs                      |
| receiver_write_location  | text | Location in the Xlog buffer where the node that receives logs is written  |
| receiver_commit_location | text | Consistency point reached for the DCF logs of the node that receives logs |
| receiver_flush_location  | text | Location in the Xlog disk where the node that receives logs is written    |
| receiver_replay_location | text | Location where the node that receives logs replays Xlogs                  |

| Column       | Type | Description                |
|--------------|------|----------------------------|
| sync_percent | text | Synchronization percentage |
| dcf_run_mode | int4 | DCF synchronization mode   |
| channel      | text | Channel information        |

- `get_paxos_replication_info()`  
Description: Queries the primary/standby replication status in Paxos mode.  
Return type: setofrecord

The following table describes return columns.

| Column                | Type | Description                                                                            |
|-----------------------|------|----------------------------------------------------------------------------------------|
| paxos_write_location  | text | Location of the Xlog that has been written to the Distribute Consensus Framework (DCF) |
| paxos_commit_location | text | Location of the Xlog agreed in the DCF                                                 |
| local_write_location  | text | Writing position of a node                                                             |
| local_flush_location  | text | Flushing position of a node                                                            |
| local_replay_location | text | Redo position of a node                                                                |
| dcf_replication_info  | text | DCF module information of a node                                                       |

- `gs_wlm_get_resource_pool_info(int)`  
Description: Obtains the resource usage statistics of all users. The input parameter is of the int type and can be any int value or **NULL**.  
Return type: record
- `gs_wlm_get_all_user_resource_info()`  
Description: Obtains resource usage statistics of all users. Only users with the SYSADMIN permission can execute this function.  
Return type: record
- `gs_wlm_get_user_info(int)`  
Description: Obtains information about all users. The input parameter is of the int type and can be any int value or **NULL**. Only users with the SYSADMIN permission can execute this function.  
Return type: record
- `gs_wlm_persistent_user_resource_info()`

Description: Archives all user resource usage statistics to the `gs_wlm_user_resource_history` system catalog. Only users with the `SYSADMIN` permission can execute this function.

Return type: record

- `gs_wlm_readjust_user_space(oid)`

Description: Corrects the storage space usage of all users. Only the administrator can execute this function.

Return type: record

- `gs_wlm_readjust_user_space_through_username(text name)`

Description: Corrects the storage space usage of a specified user. Common users can use this function to modify only their own usage. Only the administrator can modify the usage of all users. If the value of **name** is **0000**, the usage of all users needs to be modified.

Return type: record

- `gs_wlm_readjust_user_space_with_reset_flag(text name, boolean isfirst)`

Description: Corrects the storage space usage of a specified user. If the input parameter **isfirst** is set to **true**, statistics are collected from 0. Otherwise, statistics are collected from the previous result. Common users can use this function to modify only their own usage. Only the administrator can modify the usage of all users. If the value of **name** is **0000**, the usage of all users needs to be modified.

Return type: record

- `gs_wlm_session_respool(bigint)`

Description: Obtains the session resource pool information about all background threads. The input parameter is of the `bigint` type and can be set to any `bigint` value or **NULL**.

Return type: record

- `gs_io_wait_status()`

Description: Returns the real-time statistics on I/O control on the current node.

Return type: SETOF record

| Name                          | Type  | Description                                                  |
|-------------------------------|-------|--------------------------------------------------------------|
| <code>node_name</code>        | text  | Node name                                                    |
| <code>device_name</code>      | text  | Name of the data disk mounted to the node.                   |
| <code>read_per_second</code>  | float | Number of read completions per second.                       |
| <code>write_per_second</code> | float | Number of write completions per second.                      |
| <code>write_ratio</code>      | float | Ratio of the disk write I/Os to the total I/Os.              |
| <code>io_util</code>          | float | Percentage of the I/O time to the total CPU time per second. |

| Name                | Type    | Description                                                                                                                     |
|---------------------|---------|---------------------------------------------------------------------------------------------------------------------------------|
| total_io_util       | integer | Level of the CPU time occupied by the last three I/Os. The value ranges from 0 to 6.                                            |
| tick_count          | integer | Interval for updating disk I/O information. The value is fixed to 1 second. The value is cleared each time before data is read. |
| io_wait_list_length | integer | Size of the I/O request thread wait queue. If the value is <b>0</b> , no I/O is under control.                                  |

- `gs_get_shared_memctx_detail(text)`

Description: Returns the memory application details of the specified memory context, including the file, line number, and size of each memory application (the size of the same line in the same file is accumulated). Only the memory context queried through the `pg_shared_memory_detail` view can be queried. The input parameter is the memory context name (that is, the **contextname** column in the result returned by the `pg_shared_memory_detail` view). To query this function, you must have the SYSADMIN or MONADMIN permission.

Return type: SETOF record

| Name | Type | Description                                                                                                                             |
|------|------|-----------------------------------------------------------------------------------------------------------------------------------------|
| file | text | Name of the file where the memory is applied for.                                                                                       |
| line | int8 | Line number of the code in the file where the requested memory is located.                                                              |
| size | int8 | Size of the allocated memory. The value is accumulated if the memory is allocated for multiple times to the same line in the same file. |

 **NOTE**

This view is not supported in the Lite release version.

- `gs_get_session_memctx_detail(text)`

Description: Returns the memory application details of the specified memory context, including the file, line number, and size of each memory application (the size of the same line in the same file is accumulated). This parameter is valid only in thread pool mode. Only the memory context queried through the `pv_session_memory_context` view can be queried. The input parameter is the memory context name (that is, the **contextname** column in the result returned by the `pv_session_memory_context` view). To query this function, you must have the SYSADMIN or MONADMIN permission.

Return type: SETOF record

| Name | Type | Description                                                                                                                                       |
|------|------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| file | text | Name of the file where the memory is applied for.                                                                                                 |
| line | int8 | Line number of the code in the file where the requested memory is located.                                                                        |
| size | int8 | Size of the allocated memory, in bytes. The value is accumulated if the memory is allocated for multiple times to the same line of the same file. |

 **NOTE**

This view takes effect only in thread pool mode and is not supported in the Lite release version.

- `gs_get_thread_memctx_detail(tid,text)`

Description: Returns the memory application details of the specified memory context, including the file, line number, and size of each memory application (the size of the same line in the same file is accumulated). Only the memory context queried through the `pv_thread_memory_context` view can be queried. The first input parameter is the thread ID (the **tid** column of the data returned by `pv_thread_memory_context`), and the second parameter is the memory context name (the **contextname** column of the data returned by `pv_thread_memory_context`). To query this function, you must have the `SYSADMIN` or `MONADMIN` permission.

Return type: SETOF record

| Name | Type | Description                                                                                                                                       |
|------|------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| file | text | Name of the file where the memory is applied for.                                                                                                 |
| line | int8 | Line number of the code in the file where the requested memory is located.                                                                        |
| size | int8 | Size of the allocated memory, in bytes. The value is accumulated if the memory is allocated for multiple times to the same line of the same file. |

 **NOTE**

This view is not supported in the Lite release version.

- `gs_get_history_memory_detail(cstring)`

Description: Queries historical memory snapshot information. The input parameter type is `cstring`. The value can be **NULL** or the name of the memory snapshot log file.

- If the value of the input parameter is **NULL**, the list of all memory snapshot log files on the current node is displayed.

- b. If the value of the input parameter is the name of the memory snapshot log file in the list queried in [a](#), the detailed information about the memory snapshot recorded in the log file is displayed.
- c. If you enter any other input parameter, the system displays a message indicating that the input parameter is incorrect or the file fails to be opened.

To query this function, you must have the SYSADMIN or MONADMIN permission.

Return type: text

| Name        | Type | Description                                                                                                                                                                                                                                 |
|-------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| memory_info | text | Memory information. If the input parameter of the function is set to <b>NULL</b> , the memory snapshot file list is displayed. If the input parameter is set to the name of the memory snapshot file, the content of the file is displayed. |

- `gs_stat_get_hotkeys_info()`

 **NOTE**

If the GUC parameter `enable_hotkeys_collection` is set to `off`, the `gs_stat_get_hotkeys_info` and `global_stat_get_hotkeys_info` functions as well as the `global_stat_hotkeys_info` view cannot be queried. The use of the `gs_stat_clean_hotkeys` and `global_stat_clean_hotkeys` APIs is not affected.

Description: Obtains the hotspot key statistics on the current node.

Return type: record

```
gaussdb=# select * from gs_stat_get_hotkeys_info() order by count, hash_value;
database_name | schema_name | table_name | key_value | hash_value | count
-----+-----+-----+-----+-----+-----
regression | public | hotkey_single_col | {22} | 1858004829 | 2
regression | public | hotkey_single_col | {11} | 2011968649 | 2
(2 rows)
```

Table 1 Return value description

| Name          | Type   | Description                                                                                                                              |
|---------------|--------|------------------------------------------------------------------------------------------------------------------------------------------|
| database_name | text   | Name of the database where the hotspot key is located                                                                                    |
| schema_name   | text   | Name of the schema where the hotspot key is located                                                                                      |
| table_name    | text   | Name of the table where the hotspot key is located                                                                                       |
| key_value     | text   | Value of the hotspot key                                                                                                                 |
| hash_value    | bigint | Hash value of the hotspot key in the database. If the table is a list or range distribution table, the value of this field is <b>0</b> . |
| count         | bigint | Frequency of accessing the hotspot key                                                                                                   |

- `gs_stat_clean_hotkeys()`

 **NOTE**

- Hot key detection is designed for high-concurrency and heavy-traffic scenarios. In the scenario where the access is performed for several times, the query result may be inaccurate.
- The clearing API is designed to clear only the statistics in the LRU queue but not the historical data in the FIFO. Therefore, if the historical key value in the FIFO is accessed again after the clearing, the historical key value is still processed as a hotspot key. This rule also applies to **`global_stat_clean_hotkeys`**.

Description: Clears statistics on hotspot keys on the current node.

Return type: Boolean

```
gaussdb=# select * from gs_stat_clean_hotkeys();
gs_stat_clean_hotkeys

t
(1 row)
```

- `global_stat_get_hotkeys_info()`

 **NOTE**

Run the **`select * from global_stat_hotkeys_info minus select * from global_stat_get_hotkeys_info()`** command during service execution. The value may not be **0** due to time difference.

Description: Obtains statistics on hotspot keys in the entire cluster.

Return type: record

```
gaussdb=# select * from global_stat_get_hotkeys_info() order by count, hash_value;
database_name | schema_name | table_name | key_value | hash_value | count
-----+-----+-----+-----+-----+-----
regression | public | hotkey_single_col | {22} | 1858004829 | 2
regression | public | hotkey_single_col | {11} | 2011968649 | 2
(2 rows)
```

- `global_stat_clean_hotkeys()`

Description: Clears statistics on hotspot keys in the entire cluster.

Return type: Boolean

```
gaussdb=# select * from global_stat_clean_hotkeys();
global_stat_clean_hotkeys

t
(1 row)
```

- `global_comm_get_rcv_stream()`

Description: Obtains the status of the stream received by all communications libraries on all DNs. For details about the columns returned by the function, see [PG\\_COMM\\_RECV\\_STREAM](#).

Return type: record

- `global_comm_get_send_stream()`

Description: Obtains the status of the stream sent by all communications libraries on all DNs. For details about the columns returned by the function, see [PG\\_COMM\\_SEND\\_STREAM](#).

Return type: record

- `global_comm_get_status()`

Description: Obtains the communications library status on all DNs. For details about the columns returned by the function, see [PG\\_COMM\\_STATUS](#).

- Return type: record
- `global_comm_client_info()`

Description: Obtains information about active client connections of global nodes. For details about the columns returned by the function, see [COMM\\_CLIENT\\_INFO](#).

Return type: record
  - `global_comm_get_client_info()`

Description: Obtains information about client connections of global nodes. For details about the columns returned by the function, see [COMM\\_CLIENT\\_INFO](#).

Return type: record
  - `pgxc_get_wlm_operator_history()`

Description: Displays the operator information when the execution of jobs cached on all CNs is complete. The information is cleared every 3 minutes. Only users with the SYSADMIN permission can execute this function.

Return type: record
  - `pgxc_get_wlm_operator_info()`

Description: Displays the operator information when the execution of jobs on all CNs is complete. Only users with the SYSADMIN permission can execute this function.

Return type: record
  - `pgxc_get_wlm_operator_statistics()`

Description: Displays the operator information when jobs on all CNs are being executed. Only users with the SYSADMIN permission can execute this function.

Return type: record
  - `pgxc_stat_activity()`

Description: Displays information about all CNs in the current cluster queried by the current user. Only users with the SYSADMIN or MONADMIN permission can execute this function, and common users can view only their own information.

Return type: record

| Name      | Type   | Description                                                           |
|-----------|--------|-----------------------------------------------------------------------|
| coorname  | text   | Name of a CN in the current cluster                                   |
| datid     | oid    | OID of the database that the user session connects to in the backend  |
| datname   | text   | Name of the database that the user session connects to in the backend |
| pid       | bigint | Backend thread ID                                                     |
| sessionid | bigint | Session ID                                                            |
| usesysid  | oid    | OID of the user logged in to the backend                              |

| Name             | Type                     | Description                                                                                                                                                                                                                |
|------------------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username         | text                     | Name of the user logged in to the backend                                                                                                                                                                                  |
| application_name | text                     | Name of the application connected to the backend                                                                                                                                                                           |
| client_addr      | inet                     | IP address of the client connected to the backend. If this column is <b>NULL</b> , it indicates either the client is connected via a Unix socket on the server or this is an internal process, such as <b>AUTOVACUUM</b> . |
| client_hostname  | text                     | Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.                          |
| client_port      | integer                  | TCP port number that the client uses for communication with this backend (-1 if a Unix socket is used)                                                                                                                     |
| backend_start    | timestamp with time zone | Time when this process was started, that is, when the client connected to the server                                                                                                                                       |
| xact_start       | timestamp with time zone | Time when current transaction was started (null if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the <b>query_start</b> column.         |
| query_start      | timestamp with time zone | Time when the currently active query was started, or time when the last query was started if <b>state</b> is not <b>active</b>                                                                                             |
| state_change     | timestamp with time zone | Time when <b>state</b> was last modified                                                                                                                                                                                   |
| waiting          | Boolean                  | Specifies whether the backend is currently waiting for a lock. If yes, the value is <b>true</b> .                                                                                                                          |
| enqueue          | text                     | Queuing status of a statement. Its value can be: <ul style="list-style-type: none"><li>• <b>waiting in queue</b>: The statement is in the queue.</li><li>• <b>Empty</b>: The statement is running.</li></ul>               |

|------------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| query            | text   | Latest query at the backend. If <b>state</b> is <b>active</b> , this column shows the ongoing query. In all other states, it shows the last query that was executed. |
| global_sessionid | text   | Global session ID                                                                                                                                                    |
| unique_sql_id    | bigint | Unique SQL statement ID                                                                                                                                              |
| trace_id         | text   | Driver-specific trace ID, which is associated with an application request                                                                                            |

- pgxc\_stat\_activity\_with\_conninfo()**

Description: Displays query information about the current user on all CNs in the current cluster. For details, see the **pgxc\_stat\_activity** view. Only users with the SYSADMIN or MONADMIN permission can execute this function, and common users can view only their own information.

Return type: record
- pgxc\_stat\_all\_tables()**

Description: Displays statistics on a row in each table (including TOAST tables) on each node. Only users with the SYSADMIN or MONADMIN permission can execute this function.

Return type: record
- pgxc\_get\_thread\_wait\_status()**

Description: Queries the call hierarchy between threads generated by all SQL statements on each node in a cluster and the block waiting status of each thread.

Return type: record
- pgxc\_wlm\_get\_workload\_records()**

Description: Displays the status information when jobs on all CNs are being executed. Only the system administrator can execute this function.

Return type: record
- pv\_session\_memory**

Description: Collects statistics on memory usage at the session level, including all the memory allocated to Postgres and stream threads on DNs for jobs currently executed by users.

 **NOTE**

If the GUC parameter **enable\_memory\_limit** is set to **off**, this function cannot be used.

Return type: record

**Table 7-110** Return value description

| Name     | Type    | Description                                                                           |
|----------|---------|---------------------------------------------------------------------------------------|
| sessid   | text    | Thread start time and ID                                                              |
| init_mem | integer | Memory allocated to the currently executed jobs before they enter the executor, in MB |
| used_mem | integer | Memory allocated to the currently executed jobs, in MB                                |
| peak_mem | integer | Peak memory allocated to the currently executed jobs, in MB                           |

- DBE\_PERF.gs\_stat\_activity\_timeout(int)

Description: Obtains information about query jobs whose execution time exceeds the timeout threshold on the current node. The correct result can be returned only when the GUC parameter **track\_activities** is set to **on**. The timeout threshold ranges from 0 to 2147483. After a cluster is created, by default, you must have the MONADMIN permission to query this function.

Return type: SETOF record

| Name             | Type       | Description                                               |
|------------------|------------|-----------------------------------------------------------|
| database         | name       | Name of the database to which a user session is connected |

| xact_start       | timestampz | Time when the current transaction is started              |
| query_start      | timestampz | Time when the current query starts                        |
| query_id         | bigint     | Query statement ID.                                       |

- DBE\_PERF.get\_global\_active\_session()**

Description: Displays a summary of samples in the ACTIVE SESSION PROFILE memory on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.

Return type: record
- DBE\_PERF.get\_global\_os\_runtime()**

Description: Displays the running status of the current OS. This function can be queried only on CNs. After a cluster is created, by default, you must have the MONADMIN permission to query this function.

Return type: record
- DBE\_PERF.get\_global\_os\_threads()**

Description: Provides thread status information on all normal nodes in the entire cluster. The information can be queried only on CNs. After a cluster is created, by default, you must have the MONADMIN permission to query this function.

Return type: record
- DBE\_PERF.get\_global\_os\_threads()**

Description: Provides thread status information on all normal nodes in the entire cluster. The information can be queried only on CNs. After a cluster is created, by default, you must have the MONADMIN permission to query this function.

Return type: record
- DBE\_PERF.get\_summary\_workload\_sql\_count()**

Description: Provides the count information of SELECT, UPDATE, INSERT, DELETE, DDL, DML, and DCL in different loads in the entire cluster. After a

cluster is created, by default, you must have the MONADMIN permission to query this function.

Return type: record

- `DBE_PERF.get_summary_workload_sql_elapse_time()`  
Description: Provides SELECT, UPDATE, INSERT, DELETE, and response time information (TOTAL, AVG, MIN, and MAX) in different loads in the entire cluster. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_global_workload_transaction()`  
Description: Obtains the transaction volume and time information on all nodes in the cluster. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_global_session_stat()`  
Description: Obtains the session status information on all nodes in the cluster. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record

 **NOTE**

The status information contains the following 14 items:

commit,rollback,sql,table\_scan,blocks\_fetched,physical\_read\_operation,shared\_blocks\_dirtied,local\_blocks\_dirtied,shared\_blocks\_read,local\_blocks\_read,blocks\_read\_time,blocks\_write\_time,sort\_imemory,sort\_idisk

- `DBE_PERF.get_global_session_time()`  
Description: Provides the time consumed in each key phase on each node in the entire cluster. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_global_session_memory()`  
Description: Aggregates statistics on memory usage at the session level on each node in the unit of MB, including all the memory allocated to Postgres and stream threads on DNs for jobs currently executed by users. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_global_session_memory_detail()`  
Description: Aggregates statistics on thread memory usage on each node by the MemoryContext node. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_global_session_stat_activity()`  
Description: Aggregates information about running threads on each node in the cluster. After a cluster is created, by default, you must have the MONADMIN permission to query this function.

- Return type: record
- `DBE_PERF.get_global_thread_wait_status()`  
Description: Aggregates the blocking waiting status of the backend thread and auxiliary thread on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_wlm_controlgroup_ng_config()`  
Description: Collects information about all Cgroups in the database. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_wlm_workload_runtime()`  
Description: Aggregates the status information about jobs executed by the current user on each CN. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_operator_history_table()`  
Description: Aggregates the operator records (persistent) after jobs are executed by the current user on all CNs. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_operator_history()`  
Description: Aggregates the operator records after jobs are executed by the current user on all CNs. After a cluster is created, by default, you must have the MONADMIN or SYSADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_operator_runtime()`  
Description: Aggregates real-time operator records of jobs executed by the current user on all CNs. After a cluster is created, by default, you must have the MONADMIN or SYSADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_statement_complex_history()`  
Description: Aggregates the historical records of complex queries executed by the current user on all CNs. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_statement_complex_history_table()`  
Description: Aggregates the historical records of complex queries (persistent) executed by the current user on all CNs. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_statement_complex_runtime()`  
Description: Aggregates real-time information about complex queries executed by the current user on all CNs. After a cluster is created, by default, you must have the MONADMIN or SYSADMIN permission to query this function.

- Return type: record
- `DBE_PERF.get_global_memory_node_detail()`  
Description: Aggregates the memory usage of a database on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_shared_memory_detail()`  
Description: Aggregates the usage information about the shared memory contexts on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_comm_delay()`  
Description: Aggregates the communications library delay status on all DNs. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_comm_rcv_stream()`  
Description: Aggregates the status of the stream received by the communications library on all DNs. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_comm_send_stream()`  
Description: Aggregates the status of the stream sent by the communications library on all DNs. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_comm_status()`  
Description: Aggregates the status of the communications library on all DNs. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_statio_all_indexes()`  
Description: Aggregates index information and I/O statistics in the current database on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_local_toastname_and_toastindexname()`  
Description: Provides the mapping between the name and index of the local TOAST table and its associated tables. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_summary_statio_all_indexes()`  
Description: Collects I/O statistics on specific indexes, covering all index lines in the current database on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.

- Return type: record
- `DBE_PERF.get_global_statio_all_sequences()`  
Description: Provides I/O status information about all sequences in the namespace. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_statio_all_tables()`  
Description: Aggregates I/O statistics on each table in the database on each node. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_summary_statio_all_tables()`  
Description: Collects statistics on I/Os of each table in the cluster. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_local_toast_relation()`  
Description: Provides the mapping between the name of the local TOAST table and its associated tables. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_statio_sys_indexes()`  
Description: Aggregates I/O status information about all system catalog indexes in namespaces on each node. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_summary_statio_sys_indexes()`  
Description: Collects statistics on I/O status information about all system catalog indexes in namespaces on each node. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_statio_sys_sequences()`  
Description: Provides I/O status information about all system catalog sequences in namespaces. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_statio_sys_tables()`  
Description: Provides I/O status information about all system catalogs in the namespaces on each node. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_summary_statio_sys_tables()`  
Description: Aggregates I/O status information about all system catalogs in the namespaces of the cluster. After a cluster is created, by default, you must have the MONADMIN permission to query this function.

- Return type: record
- `DBE_PERF.get_global_statio_user_indexes()`  
Description: Provides I/O status information about all user relationship table indexes in the namespaces on each node. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_summary_statio_user_indexes()`  
Description: Aggregates I/O status information about all user relationship table indexes in the namespaces of the cluster. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_statio_user_sequences()`  
Description: Provides I/O status information about all user sequences in the namespaces on each node. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_statio_user_tables()`  
Description: Provides I/O status information about all user relationship tables in the namespaces on each node. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_summary_statio_user_tables()`  
Description: Aggregates I/O status information about all user relationship tables in the namespaces of the cluster. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_dn_stat_all_tables()`  
Description: Aggregates statistics on all tables in the database on each DN. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_cn_stat_all_tables()`  
Description: Aggregates statistics on all tables in the database on each CN. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_summary_dn_stat_all_tables()`  
Description: Collects statistics on all tables in the database on each DN. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_summary_cn_stat_all_tables()`  
Description: Collects statistics on all tables in the database on each CN. After a cluster is created, by default, you must have the MONADMIN permission to query this function.

- Return type: record
- `DBE_PERF.get_global_stat_all_indexes()`  
Description: Aggregates statistics on all indexes in the database on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_summary_stat_all_indexes()`  
Description: Collects statistics on all indexes in the database on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_stat_sys_tables()`  
Description: Aggregates statistics on the system catalogs of all the namespaces in the `pg_catalog` or `information_schema` schema on each node. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_summary_stat_sys_tables()`  
Description: Collects statistics on the system catalogs of all the namespaces in the `pg_catalog` or `information_schema` schema on each node. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_stat_sys_indexes()`  
Description: Aggregates index status information about all system catalogs in the `pg_catalog` or `information_schema` schema on each node. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_summary_stat_sys_indexes()`  
Description: Collects index status information about all system catalogs in the `pg_catalog` or `information_schema` schema on each node. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_stat_user_tables()`  
Description: Aggregates status information about user-defined ordinary tables in all namespaces. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_summary_stat_user_tables()`  
Description: Collects status information about user-defined ordinary tables in all namespaces. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record

- `DBE_PERF.get_global_stat_user_indexes()`  
Description: Aggregates status information about the indexes of user-defined ordinary tables in all databases. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_summary_stat_user_indexes()`  
Description: Collects status information about the indexes of user-defined ordinary tables in all databases. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_global_stat_database()`  
Description: Aggregates statistics on databases on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_global_stat_database_conflicts()`  
Description: Collects statistics on databases on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_global_stat_xact_all_tables()`  
Description: Aggregates transaction status information about all ordinary tables and TOAST tables in namespaces. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_summary_stat_xact_all_tables()`  
Description: Collects transaction status information about all ordinary tables and TOAST tables in the namespace. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_global_stat_xact_sys_tables()`  
Description: Aggregates transaction status information about system catalogs in namespaces on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_summary_stat_xact_sys_tables()`  
Description: Collects transaction status information about system catalogs in namespaces on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_global_stat_xact_user_tables()`  
Description: Aggregates transaction status information about user tables in namespaces on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record

- `DBE_PERF.get_summary_stat_xact_user_tables()`  
Description: Collects transaction status information about user tables in namespaces on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_global_stat_user_functions()`  
Description: Aggregates transaction status information about user-defined functions in namespaces on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_global_stat_xact_user_functions()`  
Description: Collects transaction status information about user-defined functions in namespaces on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_global_stat_bad_block()`  
Description: Aggregates information about the failure to read files such as tables and indexes on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_global_file_redo_iostat()`  
Description: Collects information about the failure to read files such as tables and indexes on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_global_file_iostat()`  
Description: Collects I/O statistics of data files on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_global_locks()`  
Description: Aggregates lock information on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_global_replication_slots()`  
Description: Aggregates logical replication information on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.GET_GLOBAL_PARALLEL_DECODE_STATUS()`  
Description: Displays the parallel decoding information of replication slots on all primary DNs in a cluster. After a cluster is created, by default, you must have the MONADMIN permission to query this function. This function can be executed only on CNs. An error is reported when it is executed on DNs. The

returned value is the same as that of the [GLOBAL\\_PARALLEL\\_DECODE\\_STATUS](#) view.

Return type: record

- `DBE_PERF.GET_GLOBAL_PARALLEL_DECODE_THREAD_INFO()`  
Description: Displays the parallel decoding thread information of replication slots on all primary DNs in a cluster. After a cluster is created, by default, you must have the MONADMIN permission to query this function. This function can be executed only on CNs. An error is reported when it is executed on DNs. The returned value is the same as that of the [GLOBAL\\_PARALLEL\\_DECODE\\_THREAD\\_INFO](#) view.  
Return type: record
- `DBE_PERF.get_global_bgwriter_stat()`  
Description: Aggregates statistics on the backend write process activities on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_global_replication_stat()`  
Description: Aggregates status information about log synchronization on all nodes, such as the location where the sender sends logs and the location where the receiver receives logs. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_global_pooler_status()`  
Description: Aggregates cache connection status in the pooler on all CNs. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_global_transactions_running_xacts()`  
Description: Aggregates information about running transactions on each node. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_summary_transactions_running_xacts()`  
Description: Collects information about running transactions on each node. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_global_transactions_prepared_xacts()`  
Description: Aggregates information about transactions that are currently prepared for two-phase commit on each node. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `DBE_PERF.get_summary_transactions_prepared_xacts()`  
Description: Collects information about transactions that are currently prepared for two-phase commit on each node. After a cluster is created, by default, you must have the MONADMIN permission to query this function.

- Return type: record
- `DBE_PERF.get_summary_statement()`  
Description: Aggregates the status of historical statements executed on each node. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_statement_count()`  
Description: Aggregates SELECT, UPDATE, INSERT, DELETE, and response time information (TOTAL, AVG, MIN, and MAX) on each node. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_config_settings()`  
Description: Aggregates GUC parameter settings on each node. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_wait_events()`  
Description: Aggregates status information about the wait events on each node. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_statement_responsetime_percentile()`  
Description: Obtains the response time distribution for 80% and 95% SQL statements in the cluster. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_summary_user_login()`  
Description: Collects statistics on the number of user login and logout times on each node in the cluster. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.get_global_record_reset_time()`  
Description: Aggregates statistics on reset (restart, primary-standby switchover, and database deletion) time in the cluster. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
  - `DBE_PERF.standby_statement_history(only_slow[, time1, time2])`  
Description: Queries full SQL statements on the standby node. The primary node queries full SQL statements using the `statement_history` table, while the standby node queries using this function. To query this function, you must have the MONADMIN permission.  
For details, see [Table 7-111](#).  
Return type: record, which is the same as that in `statement_history`.

**Table 7-111** standby\_statement\_history parameters

| Parameter | Type       | Description                                                                                                                                                                                                                                                                                                                                                |
|-----------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| only_slow | Boolean    | Specifies whether to query only slow SQL statements. <ul style="list-style-type: none"> <li>• <b>true</b>: yes, which is equivalent to <code>select .. where is_slow_sql = true</code>.</li> <li>• <b>false</b> or <b>NULL</b> indicates that all SQL statements are queried, that is, <b>is_slow_sql</b> is not used as a filtering condition.</li> </ul> |
| time1     | timestampz | Minimum time specified by <b>finish_time</b> for querying SQL statements. This parameter is optional.                                                                                                                                                                                                                                                      |
| time2     | timestampz | Maximum time specified by <b>finish_time</b> for querying SQL statements. This parameter is optional.                                                                                                                                                                                                                                                      |

 **NOTE**

- The two time parameters **time1** and **time2** indicate the time segment to which **finish\_time** of the queried SQL statement belongs. They indicate the start time and end time respectively. If **NULL** or no value is entered, there is no limit. The function of **time1** and **time2** is the same as that of **select .. where finish\_time between time1 and time2**.
- The data generated from this function on the standby node is not stored in a table, and there is no index on the **start\_time** column. You are advised to use the parameter to search for **finish\_time**.
- Full/Slow SQL statements on the standby node are written to disks asynchronously. Therefore, the storage of user SQL information may be delayed. You are advised to query this API to expand the query time range.

- `DBE_PERF.track_memory_context(context_list text)`

Description: Sets the memory context whose memory application details need to be collected. The input parameter is the memory context names, which are separated by commas (,), for example, **ThreadTopMemoryContext**, **SessionCacheMemoryContext**. Note that the memory context names are context-sensitive. In addition, the length of a single memory context is 63, and the excess part is truncated. The maximum number of memory contexts that can be collected at a time is 16. If the number of memory contexts exceeds 16, the setting fails. Each time this function is called, the previous statistics result is cleared. When the input parameter is set to "", the statistics function is disabled. After a cluster is created, by default, you must have the MONADMIN permission to query this function.

Return type: Boolean

- `DBE_PERF.track_memory_context_detail()`

Description: Obtains the memory application details of the memory context specified by the **DBE\_PERF.track\_memory\_context** function. For details, see the `DBE_PERF.track_memory_context_detail` view. After a cluster is created, by default, you must have the MONADMIN permission to query this function.

Return type: record

- `DBE_PERF.global_io_wait_info()`  
Description: Queries real-time I/O control statistics on all CNs and DN. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `pg_stat_get_mem_mbytes_reserved(tid)`  
Description: Collects statistics on variables related to resource management, which is used only for fault locating.  
Parameter: thread ID  
Return type: text
- `gs_wlm_user_resource_info(name text)`  
Description: Queries a user's resource quota and resource usage. Common users can query only their own information. Administrators can query information about all users.  
Return type: record
- `pg_stat_get_file_stat()`  
Description: Records statistics about data file I/Os to indicate I/O performance and detect performance problems such as abnormal I/O operations.  
Return type: record
- `pg_stat_get_redo_stat()`  
Description: Displays statistics on the replay of session thread logs.  
Return type: record
- `pg_stat_get_status(int8)`  
Description: Tests the block waiting status about the backend thread and auxiliary thread of the current instance.  
Return type: record
- `get_local_rel_iostat()`  
Description: Queries the accumulated I/O status of data files on the current node.  
Return type: record
- `DBE_PERF.get_global_rel_iostat()`  
Description: Collects I/O statistics of data files on all nodes. After a cluster is created, by default, you must have the MONADMIN permission to query this function.  
Return type: record
- `pg_catalog.plancache_status()`  
Description: Displays status information about the global plan cache on the current node. The information returned by the function is the same as that in [GLOBAL\\_PLANCACHE\\_STATUS](#).  
Return type: record
- `DBE_PERF.global_plancache_status()`  
Description: Displays status information about the global plan cache on all nodes. For details about the information returned by the function, see [GLOBAL\\_PLANCACHE\\_STATUS](#). After a cluster is created, by default, you must have the MONADMIN permission to query this function.

Return type: record

- Pg\_catalog.prepare\_statement\_status() (Discarded)

Description: Displays the PREPARE statement status information on the current node. The information returned by the function is the same as that in [GLOBAL\\_PREPARE\\_STATEMENT\\_STATUS](#).

Return type: record

- DBE\_PERF.global\_prepare\_statement\_status() (Discarded)

Description: Displays status information about the PREPARE statement on all nodes. For details about the information returned by the function, see [GLOBAL\\_PREPARE\\_STATEMENT\\_STATUS](#). After a cluster is created, by default, you must have the MONADMIN permission to query this function.

Return type: record

- DBE\_PERF.global\_threadpool\_status()

Description: Displays the status of worker threads and sessions in thread pools on all nodes. For details about the information returned by the function, see [18.7.14-Table GLOBAL\\_THREADPOOL\\_STATUS](#). After a cluster is created, by default, you must have the MONADMIN permission to query this function.

Return type: record

- comm\_check\_connection\_status

Description: Returns the connection status between the CN and all active nodes (CNs and primary DNs). This function can be queried only on CNs and can be used by common users.

Parameter: nan

Return type: node\_name text, remote\_name text, remote\_host text, remote\_port integer, is\_connected boolean, and no\_error\_occur boolean

- DBE\_PERF.global\_comm\_check\_connection\_status()

Description: Returns the connection status between all CNs and all active nodes (CNs and primary DNs). This function can be queried only on CNs. Permission control is inherited from the **DBE\_PERF** schema. After a cluster is created, by default, you must have the MONADMIN permission to query this function.

Parameter: nan

Return type: node\_name text, remote\_name text, remote\_host text, remote\_port integer, is\_connected boolean, and no\_error\_occur boolean

- create\_wlm\_instance\_statistics\_info

Description: Saves the historical monitoring data of the current instance persistently.

Parameter: nan

Return type: integer

- remote\_candidate\_stat()

Description: Displays the number of pages in the candidate buffer chain of this instance and buffer elimination information, including the normal buffer pool and segment buffer pool.

Return type: record

**Table 7-112** remote\_candidate\_stat parameter description

| Name                    | Type    | Description                                                                                                                           |
|-------------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------|
| node_name               | text    | Node name                                                                                                                             |
| candidate_slots         | integer | Number of pages in the candidate buffer chain of the current normal buffer pool                                                       |
| get_buf_from_list       | bigint  | Number of times that pages are obtained from the candidate buffer chain during buffer eviction in the current normal buffer pool      |
| get_buf_clock_sweep     | bigint  | Number of times that pages are obtained from the original eviction solution during buffer eviction in the current normal buffer pool  |
| seg_candidate_slots     | integer | Number of pages in the candidate buffer chain of the current segment buffer pool                                                      |
| seg_get_buf_from_list   | bigint  | Number of times that pages are obtained from the candidate buffer chain during buffer eviction in the current segment buffer pool     |
| seg_get_buf_clock_sweep | bigint  | Number of times that pages are obtained from the original eviction solution during buffer eviction in the current segment buffer pool |

- remote\_ckpt\_stat()

Description: Displays the checkpoint information and log flushing information about all instances in the cluster (unavailable on DNs, except for the current node).

Return type: record

**Table 7-113** remote\_ckpt\_stat parameter description

| Parameter             | Type | Description                                                                |
|-----------------------|------|----------------------------------------------------------------------------|
| node_name             | text | Instance name                                                              |
| ckpt_redo_point       | text | Checkpoint of the current instance                                         |
| ckpt_clog_flush_num   | int8 | Number of Clog flushing pages from the startup time to the current time    |
| ckpt_csnlog_flush_num | int8 | Number of CSN log flushing pages from the startup time to the current time |

| Parameter                | Type | Description                                                                  |
|--------------------------|------|------------------------------------------------------------------------------|
| ckpt_multixact_flush_num | int8 | Number of MultiXact flushing pages from the startup time to the current time |
| ckpt_predicate_flush_num | int8 | Number of predicate flushing pages from the startup time to the current time |
| ckpt_twophase_flush_num  | int8 | Number of two-phase flushing pages from the startup time to the current time |

- remote\_double\_write\_stat()

Description: Displays doublewrite file status of all instances in the cluster (unavailable on DNs, except for the current node).

Return type: record

**Table 7-114** remote\_double\_write\_stat parameter description

| Parameter             | Type | Description                                                                                                                          |
|-----------------------|------|--------------------------------------------------------------------------------------------------------------------------------------|
| node_name             | text | Instance name                                                                                                                        |
| curr_dwn              | int8 | Sequence number of the doublewrite file.                                                                                             |
| curr_start_page       | int8 | Start page for restoring the doublewrite file                                                                                        |
| file_trunc_num        | int8 | Number of times that the doublewrite file is reused.                                                                                 |
| file_reset_num        | int8 | Number of reset times after the doublewrite file is full.                                                                            |
| total_writes          | int8 | Total number of I/Os of the doublewrite file                                                                                         |
| low_threshold_writes  | int8 | Number of I/Os for writing the doublewrite files with low efficiency (the number of I/O flushing pages at a time is less than 16.)   |
| high_threshold_writes | int8 | Number of I/Os for writing the doublewrite files with high efficiency (the number of I/O flushing pages at a time is more than 421.) |
| total_pages           | int8 | Total number of pages that are flushed to the doublewrite file area                                                                  |
| low_threshold_pages   | int8 | Number of pages that are flushed with low efficiency                                                                                 |
| high_threshold_pages  | int8 | Number of pages that are flushed with high efficiency                                                                                |

| Parameter | Type | Description                        |
|-----------|------|------------------------------------|
| file_id   | int8 | ID of the current doublewrite file |

- remote\_single\_flush\_dw\_stat()

Description: Displays the single-page doublewrite file eviction status of all instances in the cluster (unavailable on DNs, except for the current node).

Return type: record

**Table 7-115** remote\_single\_flush\_dw\_stat parameter description

| Parameter       | Type    | Description                                                       |
|-----------------|---------|-------------------------------------------------------------------|
| node_name       | text    | Instance name                                                     |
| curr_dwn        | integer | Sequence number of the doublewrite file.                          |
| curr_start_page | integer | Start position of the current doublewrite file.                   |
| total_writes    | bigint  | Total number of data write pages in the current doublewrite file. |
| file_trunc_num  | bigint  | Number of times that the doublewrite file is reused.              |
| file_reset_num  | bigint  | Number of reset times after the doublewrite file is full.         |

- remote\_pagewriter\_stat()

Description: Displays the page flushing information and checkpoint information about all instances in the cluster (unavailable on DNs, except for the current node).

Return type: record

**Table 7-116** remote\_pagewriter\_stat parameter description

| Parameter                   | Type | Description                                                                   |
|-----------------------------|------|-------------------------------------------------------------------------------|
| node_name                   | text | Instance name                                                                 |
| pgwr_actual_flush_total_num | int8 | Total number of dirty pages flushed from the startup time to the current time |
| pgwr_last_flush_num         | int4 | Number of dirty pages flushed in the previous batch                           |
| remain_dirty_page_num       | int8 | Estimated number of dirty pages that are not flushed                          |

| Parameter               | Type | Description                                                                                 |
|-------------------------|------|---------------------------------------------------------------------------------------------|
| queue_head_page_rec_lsn | text | <b>recovery_lsn</b> of the first dirty page in the dirty page queue of the current instance |
| queue_rec_lsn           | text | <b>recovery_lsn</b> of the dirty page queue of the current instance                         |
| current_xlog_insert_lsn | text | Write position of Xlogs in the current instance                                             |
| ckpt_redo_point         | text | Checkpoint of the current instance                                                          |

- remote\_recovery\_status()

Description: Displays log flow control information about the primary and standby nodes (except the current node and DNs).

Return type: record

**Table 7-117** remote\_recovery\_status parameter description

| Parameter          | Type | Description                                                                                           |
|--------------------|------|-------------------------------------------------------------------------------------------------------|
| node_name          | text | Node name (including the primary and standby nodes)                                                   |
| standby_node_name  | text | Name of the standby node                                                                              |
| source_ip          | text | IP address of the primary node                                                                        |
| source_port        | int4 | Port number of the primary node                                                                       |
| dest_ip            | text | IP address of the standby node                                                                        |
| dest_port          | int4 | Port number of the standby node                                                                       |
| current_rto        | int8 | Current log flow control time of the standby node (unit: s)                                           |
| target_rto         | int8 | Expected flow control time of the standby node specified by the corresponding GUC parameter (unit: s) |
| current_sleep_time | int8 | Sleep time required to achieve the expected flow control time (unit: $\mu$ s)                         |

- remote\_rto\_stat()

Description: Displays log flow control information about the primary and standby nodes (except the current node and DNs).

Return type: record

**Table 7-118** remote\_rto\_stat parameters

| Parameter | Type | Description                                                                                                                                                                                                                                                                   |
|-----------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node_name | text | Node name (including the primary and standby nodes)                                                                                                                                                                                                                           |
| rto_info  | text | Flow control information, including the current log flow control time (unit: second) of the standby server, the expected flow control time (unit: second) specified by the GUC parameter, and the primary server sleep time (unit: $\mu$ s) required to reach the expectation |

- remote\_redo\_stat()

Description: Displays the log replay status of all instances in the cluster (unavailable on DNs, except for the current node).

Return type: record

**Table 7-119** remote\_redo\_stat parameter description

| Parameter              | Type | Description                                                     |
|------------------------|------|-----------------------------------------------------------------|
| node_name              | text | Instance name                                                   |
| redo_start_ptr         | int8 | Start point for replaying the instance logs                     |
| redo_start_time        | int8 | Start time (UTC) when the instance logs are replayed            |
| redo_done_time         | int8 | End time (UTC) when the instance logs are replayed              |
| curr_time              | int8 | Current time (UTC) of the instance                              |
| min_recovery_point     | int8 | Position of the minimum consistency point for the instance logs |
| read_ptr               | int8 | Position for reading the instance logs                          |
| last_replayed_read_ptr | int8 | Position for replaying the instance logs                        |
| recovery_done_ptr      | int8 | Replay position after the instance is started                   |
| read_xlog_io_counter   | int8 | Number of I/Os when the instance reads and replays logs         |

| Parameter                 | Type | Description                                                                                                |
|---------------------------|------|------------------------------------------------------------------------------------------------------------|
| read_xlog_io_total_dur    | int8 | Total I/O latency when the instance reads and replays logs                                                 |
| read_data_io_counter      | int8 | Number of data page I/O reads during replay in the instance                                                |
| read_data_io_total_dur    | int8 | Total I/O latency of data page reads during replay in the instance                                         |
| write_data_io_counter     | int8 | Number of data page I/O writes during replay in the instance                                               |
| write_data_io_total_dur   | int8 | Total I/O latency of data page writes during replay in the instance                                        |
| process_pending_counter   | int8 | Number of synchronization times of log distribution threads during replay in the instance                  |
| process_pending_total_dur | int8 | Total synchronization latency of log distribution threads during replay in the instance                    |
| apply_counter             | int8 | Number of synchronization times of replay threads during replay in the instance                            |
| apply_total_dur           | int8 | Total synchronization latency of replay threads during replay in the instance                              |
| speed                     | int8 | Log replay rate of the current instance                                                                    |
| local_max_ptr             | int8 | Maximum number of replay logs received by the local host after the instance is started                     |
| primary_flush_ptr         | int8 | Log point where the host flushes logs to a disk                                                            |
| worker_info               | text | Replay thread information of the instance. If concurrent replay is not enabled, the value is <b>NULL</b> . |

- pgxc\_gtm\_snapshot\_status()

Description: Queries for transaction information on the current GTM. This function is supported only in GTM mode, and is not supported in GTM-LITE or GTM-FREE mode.

Return type: record

The following table describes return parameters.

**Table 7-120** PGXC\_GTM\_SNAPSHOT\_STATUS return parameters

| Name         | Type    | Description                                                                  |
|--------------|---------|------------------------------------------------------------------------------|
| xmin         | xid     | Minimum XID of the running transactions                                      |
| xmax         | xid     | XID of the transaction next to the executed transaction with the maximum XID |
| csn          | integer | Specifies the sequence number of the transaction to be committed.            |
| oldestxmin   | xid     | Minimum XID of the executed transactions                                     |
| xcnt         | integer | Number of the running transactions                                           |
| running_xids | text    | XID of the running transaction                                               |

- pv\_os\_run\_info()**

Description: Displays the running status of the current OS. For details about the columns, see [PV\\_OS\\_RUN\\_INFO](#).

Parameter: nan

Return type: SETOF record
- pv\_session\_stat()**

Description: Collects session status information by session thread or AutoVacuum thread. For details about the columns, see [PV\\_SESSION\\_STAT](#).

Parameter: nan

Return type: SETOF record
- pv\_session\_time()**

Description: Collects statistics on the running time of session threads and the time consumed in each execution phase. For details about the columns, see [PV\\_SESSION\\_TIME](#).

Parameter: nan

Return type: SETOF record
- pg\_stat\_get\_db\_temp\_bytes()**

Description: Collects statistics on the total amount of data written to temporary files through database query. All temporary files are counted, regardless of why the temporary file was created, and regardless of the **log\_temp\_files** setting.

Parameter: **oid**

Return type: bigint

- `pg_stat_get_db_temp_files()`

Description: Queries the number of temporary files created in the database. All temporary files are counted, regardless of why the temporary file was created (for example, sorting or hashing), and regardless of the **log\_temp\_files** setting.

Parameter: **oid**

Return type: bigint

- `gs_prepared_statements()`

Description: Displays prepared statements that are available in all sessions. Only users with the SYSADMIN permission can execute this function. The columns in the information returned by the function are the same as those in [GS\\_ALL\\_PREPARED\\_STATEMENTS](#).

Return type: record

- `local_redo_time_count()`

Description: Returns the time consumption statistics on each process of each replayer thread on the current node (valid data exists only on the standby node).

The return values are as follows:

**Table 7-121** local\_redo\_time\_count return parameters

| Column      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| thread_name | Thread name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| step1_total | Total duration of step 1. The process of each thread is as follows: <ul style="list-style-type: none"> <li>• Ultimate RTO:                             <ul style="list-style-type: none"> <li><b>redo batch</b>: obtains a log from a queue.</li> <li><b>redo manager</b>: obtains a log from a queue.</li> <li><b>redo worker</b>: obtains a log from a queue.</li> <li><b>txn manager</b>: reads a log from a queue.</li> <li><b>txn worker</b>: reads a log from a queue.</li> <li><b>read worker</b>: reads an Xlog page (overall) from a file.</li> <li><b>read page worker</b>: obtains a log from a queue.</li> <li><b>startup</b>: obtains a log from a queue.</li> </ul> </li> <li>• Parallel replay:                             <ul style="list-style-type: none"> <li><b>page redo</b>: obtains a log from a queue.</li> <li><b>startup</b>: reads a log.</li> </ul> </li> </ul> |
| step1_count | Number of accumulated execution times of step 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

- `local_xlog_redo_statics()`  
Description: Returns the statistics on each type of logs that have been replayed on the current node (valid data exists only on the standby node).  
The return values are as follows:

**Table 7-122** `local_xlog_redo_statics` parameters

| Column                 | Description                                                                                                                                                                                                                                              |

- `remote_bgwriter_stat()`  
Description: Displays the information about pages flushed by the bgwriter threads of all instances in the entire cluster, number of pages in the candidate buffer chain, and buffer elimination information. (The query result does not contain the information about the current node and cannot be used on DNs.)  
Return type: record

**Table 7-123** `remote_bgwriter_stat` parameter description

| Parameter                                | Type    | Description                                                                                          |
|------------------------------------------|---------|------------------------------------------------------------------------------------------------------|
| <code>node_name</code>                   | text    | Instance name                                                                                        |
| <code>bgwr_actual_flush_total_num</code> | bigint  | Total number of dirty pages flushed by the bgwriter thread from the startup time to the current time |
| <code>bgwr_last_flush_num</code>         | integer | Number of dirty pages flushed by the bgwriter thread in the previous batch                           |
| <code>candidate_slots</code>             | integer | Number of pages in the current candidate buffer chain                                                |
| <code>get_buffer_from_list</code>        | bigint  | Number of times that pages are obtained from the candidate buffer chain during buffer eviction       |

| Parameter           | Type   | Description                                                                                        |
|---------------------|--------|----------------------------------------------------------------------------------------------------|
| get_buf_clock_sweep | bigint | Number of times that pages are obtained from the original eviction solution during buffer eviction |

Example:

The remote\_bgwriter\_stat function is used to query the page refreshing information of the bgwriter thread.

```
gaussdb=# SELECT * FROM remote_bgwriter_stat();
 node_name | bgwr_actual_flush_total_num | bgwr_last_flush_num | candidate_slots |
 get_buffer_from_list | get_buf_clock_sweep
-----+-----+-----+-----+-----+-----
 datanode3 | 0 | 0 | 266232 | 404 | 0
 datanode2 | 0 | 0 | 266232 | 424 | 0
 datanode1 | 0 | 0 | 266232 | 393 | 0
(3 rows)
```

- gs\_stack()

Description: Displays the call stack of a thread. To query this function, you must have the SYSADMIN or MONADMIN permission.

Parameter: tid, which indicates the thread ID. **tid** is an optional parameter. If it is specified, the function returns the call stack of the thread corresponding to **tid**. If it is not specified, the function returns the call stacks of all threads.

Return value: If **tid** is specified, the return value is of the TEXT type. If **tid** is not specified, the return value is a SETOF record.

Example:

Run **select \* from gs\_stack(pid)** to obtain the call stack of a specified thread.

```
gaussdb=# select * from gs_stack(139663481165568);
 gs_stack

 __poll + 0x2d

| worker_status     | varchar | Current thread status: <ul style="list-style-type: none"> <li>• <b>Waiting:</b> The session access is successful but it is not executed by the thread.</li> <li>• <b>Running:</b> The current statement is executed properly.</li> <li>• <b>Control:</b> The current statement enters the resource control phase.</li> </ul> |
| served_query_id   | bigint  | ID of the SQL statement that is being executed                                                                                                                                                                                                                                                                               |
| served_query_text | text    | Content of the SQL statement that is being executed                                                                                                                                                                                                                                                                          |

- `gs_session_all_settings(sessionid bigint)`

Description: Queries the full GUC parameter settings of the session corresponding to the session ID on the local node. To execute this function, you must have the SYSADMIN or MONADMIN permission.

Input parameter description: **sessionid** indicates the session ID.

Return type: SETOF record

The following table describes return fields.

| Name    | Type | Description                  |
|---------|------|------------------------------|
| name    | text | Parameter name               |
| setting | text | Current parameter value      |
| unit    | text | Implicit unit of a parameter |

Example:

```
gaussdb=# select sessionid from pg_stat_activity where username = 'testuser';
sessionid

 788861
(1 row)

gaussdb=# select * from gs_session_all_settings(788861) where name = 'work_mem';
 name | setting | unit
-----+-----+-----
work_mem | 131072 | kB
(1 row)
```

- `gs_session_all_settings()`

Description: Queries full GUC parameter settings of all sessions on the local node. To execute this function, you must have the SYSADMIN or MONADMIN permission.

Return type: SETOF record

| Name      | Type   | Description                  |
|-----------|--------|------------------------------|
| sessionid | bigint | Session ID                   |
| pid       | bigint | Backend thread ID            |
| name      | text   | Parameter name               |
| setting   | text   | Current parameter value      |
| unit      | text   | Implicit unit of a parameter |

Example:

```
gaussdb=# select * from gs_session_all_settings() where name = 'work_mem';
 sessionid | pid | name | setting | unit
-----+-----+-----+-----+-----
140550214145792 | 96974 | work_mem | 65536 | kB
140550214145792 | 96971 | work_mem | 65536 | kB
140549731735296 | 140549731735296 | work_mem | 65536 | kB
140549764413184 | 140549764413184 | work_mem | 65536 | kB
(4 rows)
```

- `gs_local_wal_preparse_statistics()`

Description: Queries the latest startup of the log pre-parsing thread on the local node as well as the pre-parsing logs. Only the user with the SYSADMIN permission can execute this function.

Return type: SETOF record

| Name                     | Type        | Description                                                                       |
|--------------------------|-------------|-----------------------------------------------------------------------------------|
| preparser_term           | text        | Maximum term value obtained from the latest pre-parsing log.                      |
| preparser_start_time     | timestamptz | Time when the latest pre-parsing is started.                                      |
| preparser_end_time       | timestamptz | End time of the latest pre-parsing.                                               |
| preparser_start_location | text        | Start position of the latest pre-parsing log.                                     |
| preparser_end_location   | text        | End position of the latest pre-parsing log.                                       |
| preparser_total_bytes    | int8        | Number of latest pre-parsed logs, in bytes.                                       |
| preparser_speed          | int8        | Latest pre-parsing speed, in bytes/ms.                                            |
| is_valid                 | bool        | Specifies whether the latest pre-parsing result can be used for leader selection. |

Example:

```
gaussdb=# select * from gs_local_wal_preparse_statistics();
preparser_term | preparser_start_time | preparser_end_time | preparser_start_location |
preparser_end_location | preparser_total_bytes | preparser_speed | is_valid
-----+-----+-----+-----+-----+-----+-----+-----
3107 | 2023-02-01 17:04:23.367946+08 | 2023-02-01 17:04:25.354434+08 | 00000003/
C3EEA660 | 00000004/0BE60738 | 1207394520 | 1207394520 | f
(1 row)
```

- gs\_hot\_standby\_space\_info()

Description: Queries the total number and total size of files in the **standby\_read/base\_page**, **standby\_read/block\_info\_meta** and **standby\_read/lsn\_info\_meta** folders.

Return type: SETOF record

| Name                       | Type | Description                              |
|----------------------------|------|------------------------------------------|
| base_page_file_num         | xid  | Total number of bage_page_files.         |
| base_page_total_size       | xid  | Total size of bage_page_files.           |
| lsn_info_meta_file_num     | xid  | Total number of lsn_info_meta_files.     |
| lsn_info_meta_total_size   | xid  | Total size of the lsn_info_meta_files.   |
| block_info_meta_file_num   | xid  | Total number of block_info_meta_files.   |
| block_info_meta_total_size | xid  | Total size of the block_info_meta_files. |

Example:

```
gaussdb=# select * from gs_hot_standby_space_info();
base_page_file_num | base_page_total_size | lsn_info_meta_file_num | lsn_info_meta_total_size |
block_info_meta_file_num | block_info_meta_total_size
-----+-----+-----+-----+-----+-----
6 | 163840 | 6 | 3136 | 16
| 147456
(1 row)
```

- exrto\_file\_read\_stat()

Description: Queries the number of disk access times and total access latency of new **base page files**, **lsn info meta files**, and **block info meta files** read by the standby node. Connect to the standby DN for query. In other cases, the query result is 0.

Return type: SETOF record

| Name                            | Type | Description                                               |
|---------------------------------|------|-----------------------------------------------------------|
| lsn_info_page_disk_read_counter | int8 | Number of disk access times of <b>lsn info meta files</b> |

| Name                            | Type | Description                                                   |
|---------------------------------|------|---------------------------------------------------------------|
| lsn_info_page_disk_read_dur     | int8 | Total latency of <b>lsn info meta file</b> access to disks.   |
| blk_info_meta_disk_read_counter | int8 | Number of disk access times of <b>block info meta files</b>   |
| blk_info_meta_disk_read_dur     | int8 | Total latency of <b>block info meta file</b> access to disks. |
| base_page_read_disk_counter     | int8 | Number of disk access times of <b>base page files</b>         |
| base_page_read_disk_dur         | int8 | Total latency of <b>base page file</b> access to disks.       |

Example:

```
gaussdb=# SELECT * FROM exrto_file_read_stat();
lsn_info_page_disk_read_counter | lsn_info_page_disk_read_dur | blk_info_meta_disk_read_counter |
blk_info_meta_disk_read_dur | base_page_read_disk_counter | base_page_read_disk_dur
-----+-----+-----+-----+-----+-----
 14987 | 92313 | 23879 | 129811
| 0 | 0
(1 row)
```

- `gs_exrto_recycle_info()`

Description: Queries the resource reclamation location, including the reclamation LSN of each thread, global reclamation LSN, and the earliest snapshot LSN of a query thread. Connect to the standby DN for query. In other cases, the query result is 0.

Return type: SETOF record

| Name                       | Type | Description                                                                             |
|----------------------------|------|-----------------------------------------------------------------------------------------|
| page_redo_worker_thread_id | text | Reclamation LSN location of redo thread. <b>thread_id</b> indicates the redo thread ID. |
| global_recycle_lsn         | text | LSN of global reclamation location                                                      |
| exrto_snapshot_oldest_lsn  | text | The earliest snapshot LSN of a query thread                                             |

Example:

```
gaussdb=# SELECT * FROM gs_exrto_recycle_info();
thread_id | recycle_lsn
-----+-----
page_redo_worker_140148895381248 | 0/7B4552E0
page_redo_worker_140148872312576 | 0/7B4535B8
```

```
global_recycle_lsn | 0/7B4535B8
exrto_snapshot_oldest_lsn | 0/8488E6D0
(4 rows)
```

- `gs_stat_get_db_conflict_all(oid)`

Input parameter: **dbid(oid)** indicates the database OID.

Description: Queries the number of sent replay conflict signals of different types.

Return type: SETOF record

| Name                                        | Type | Description                                                                     |
|---------------------------------------------|------|---------------------------------------------------------------------------------|
| <code>conflict_all</code>                   | int8 | Number of sent replay conflict signals                                          |
| <code>conflict_tablespace</code>            | int8 | Number of sent replay conflict signals of the <b>tablespace</b> type            |
| <code>conflict_lock</code>                  | int8 | Number of sent replay conflict signals of the <b>lock</b> type                  |
| <code>conflict_snapshot</code>              | int8 | Number of sent replay conflict signals of the <b>snapshot</b> type              |
| <code>conflict_bufferpin</code>             | int8 | Number of sent replay conflict signals of the <b>bufferpin</b> type             |
| <code>conflict_startup_deadlock</code>      | int8 | Number of sent replay conflict signals of the <b>startup_deadlock</b> type      |
| <code>conflict_truncate</code>              | int8 | Number of sent replay conflict signals of the <b>truncate</b> type              |
| <code>conflict_standby_query_timeout</code> | int8 | Number of sent replay conflict signals of the <b>standby_query_timeout</b> type |
| <code>conflict_force_recycle</code>         | int8 | Number of sent replay conflict signals of the <b>force_recycle</b> type         |

Example:

```
gaussdb=# SELECT * FROM gs_stat_get_db_conflict_all(12738);
 conflict_all | conflict_tablespace | conflict_lock | conflict_snapshot | conflict_bufferpin |
 conflict_startup_deadlock | conflict_truncate | conflict_standby_query_timeout | conflict_force_recycle
-----+-----+-----+-----+-----+-----+-----+-----+-----
 0 | 0 | 0 | 0 | 0 |
 0 | 0 | 0 | 0 | 0 |
(1 row)
```

- `gs_redo_stat_info()`

Description: Queries redo information, including the buffer hit ratio of the redo thread, number of unlink\_rels files executed, wait event information of I/O operations generated when the redo thread reads the buffer in the ultimate RTO scenario, and wait event information of **wal\_read\_from\_write\_buffer**. The query must be executed by connecting to the standby DN.

Return type: SETOF record

| Name                     | Type   | Description                                                                                                                 |
|--------------------------|--------|-----------------------------------------------------------------------------------------------------------------------------|
| buffer_hit_rate          | float8 | Buffer hit ratio of the redo thread.                                                                                        |
| ddl_unlink_nrels_count   | int8   | Number of unlink rel files executed during the redo process of DDL statements.                                              |
| read_buffer_io_counter   | int8   | Number of wait events of I/O operations generated when the redo thread reads the buffer in the ultimate RTO scenario.       |
| read_buffer_io_total_dur | int8   | Total wait event duration of I/O operations generated when the redo thread reads the buffer in the ultimate RTO scenario.   |
| read_buffer_io_avg_dur   | int8   | Average wait event duration of I/O operations generated when the redo thread reads the buffer in the ultimate RTO scenario. |
| read_buffer_io_min_dur   | int8   | Minimum wait event duration of I/O operations generated when the redo thread reads the buffer in the ultimate RTO scenario. |
| read_buffer_io_max_dur   | int8   | Maximum wait event duration of I/O operations generated when the redo thread reads the buffer in the ultimate RTO scenario. |
| read_wal_buf_counter     | int8   | Number of wait events triggered by <b>wal_read_from_write_buffer</b> in the ultimate RTO scenario.                          |
| read_wal_buf_total_dur   | int8   | Total wait event duration of <b>wal_read_from_write_buffer</b> in the ultimate RTO scenario.                                |
| read_wal_buf_avg_dur     | int8   | Average wait event duration of <b>wal_read_from_write_buffer</b> in the ultimate RTO scenario.                              |
| read_wal_buf_min_dur     | int8   | Minimum wait event duration of <b>wal_read_from_write_buffer</b> in the ultimate RTO scenario.                              |
| read_wal_buf_max_dur     | int8   | Maximum wait event duration of <b>wal_read_from_write_buffer</b> in the ultimate RTO scenario.                              |

Example:

```
gaussdb=# SELECT * FROM gs_redo_stat_info();
-[RECORD 1]-----+-----
buffer_hit_rate | 70.5707
ddl_unlink_nrels_count | 3
read_buffer_io_counter | 1732
read_buffer_io_total_dur | 2850806
```

```
read_buffer_io_avg_dur | 1645
read_buffer_io_min_dur | 3
read_buffer_io_max_dur | 981639
read_wal_buf_counter | 9779
read_wal_buf_total_dur | 193612470
read_wal_buf_avg_dur | 19798
read_wal_buf_min_dur | 3
read_wal_buf_max_dur | 1914777
```

- `gs_recovery_conflict_waitevent_info()`

Description: Queries wait event information about the function that processes redo conflicts. The query must be executed by connecting to the standby DN.

Return type: SETOF record

| Name                                       | Type | Description                                                   |
|--------------------------------------------|------|---------------------------------------------------------------|
| <code>conflict_lock_counter</code>         | int8 | Number of times that LOCK redo conflicts are triggered.       |
| <code>conflict_lock_total_dur</code>       | int8 | Total duration for processing LOCK redo conflicts.            |
| <code>conflict_lock_avg_dur</code>         | int8 | Average duration for processing LOCK redo conflicts.          |
| <code>conflict_lock_min_dur</code>         | int8 | Minimum duration for processing LOCK redo conflicts.          |
| <code>conflict_lock_max_dur</code>         | int8 | Maximum duration for processing LOCK redo conflicts.          |
| <code>conflict_snapshot_counter</code>     | int8 | Number of times that SNAPSHOT redo conflicts are triggered.   |
| <code>conflict_snapshot_total_dur</code>   | int8 | Total duration for processing SNAPSHOT redo conflicts.        |
| <code>conflict_snapshot_avg_dur</code>     | int8 | Average duration for processing SNAPSHOT redo conflicts.      |
| <code>conflict_snapshot_min_dur</code>     | int8 | Minimum duration for processing SNAPSHOT redo conflicts.      |
| <code>conflict_snapshot_max_dur</code>     | int8 | Maximum duration for processing SNAPSHOT redo conflicts.      |
| <code>conflict_tablespace_counter</code>   | int8 | Number of times that TABLESPACE redo conflicts are triggered. |
| <code>conflict_tablespace_total_dur</code> | int8 | Total duration for processing TABLESPACE redo conflicts.      |
| <code>conflict_tablespace_avg_dur</code>   | int8 | Average duration for processing TABLESPACE redo conflicts.    |
| <code>conflict_tablespace_min_dur</code>   | int8 | Minimum duration for processing TABLESPACE redo conflicts.    |

| Name                                     | Type | Description                                                              |
|------------------------------------------|------|--------------------------------------------------------------------------|
| conflict_tablespace_max_dur              | int8 | Maximum duration for processing TABLESPACE redo conflicts.               |
| conflict_database_counter                | int8 | Number of times that DATABASE redo conflicts are triggered.              |
| conflict_database_total_dur              | int8 | Total duration for processing DATABASE redo conflicts.                   |
| conflict_database_avg_dur                | int8 | Average duration for processing DATABASE redo conflicts.                 |
| conflict_database_min_dur                | int8 | Minimum duration for processing DATABASE redo conflicts.                 |
| conflict_database_max_dur                | int8 | Maximum duration for processing DATABASE redo conflicts.                 |
| conflict_truncate_counter                | int8 | Number of times that TRUNCATE redo conflicts are triggered.              |
| conflict_truncate_total_dur              | int8 | Total duration for processing TRUNCATE redo conflicts.                   |
| conflict_truncate_avg_dur                | int8 | Average duration for processing TRUNCATE redo conflicts.                 |
| conflict_truncate_min_dur                | int8 | Minimum duration for processing TRUNCATE redo conflicts.                 |
| conflict_truncate_max_dur                | int8 | Maximum duration for processing TRUNCATE redo conflicts.                 |
| conflict_standby_query_timeout_counter   | int8 | Number of times that STANDBY_QUERY_TIMEOUT redo conflicts are triggered. |
| conflict_standby_query_timeout_total_dur | int8 | Total duration for processing STANDBY_QUERY_TIMEOUT redo conflicts.      |
| conflict_standby_query_timeout_avg_dur   | int8 | Average duration for processing STANDBY_QUERY_TIMEOUT redo conflicts.    |
| conflict_standby_query_timeout_min_dur   | int8 | Minimum duration for processing STANDBY_QUERY_TIMEOUT redo conflicts.    |
| conflict_standby_query_timeout_max_dur   | int8 | Maximum duration for processing STANDBY_QUERY_TIMEOUT redo conflicts.    |

| Name                             | Type | Description                                                      |
|----------------------------------|------|------------------------------------------------------------------|
| conflict_force_recycle_counter   | int8 | Number of times that FORCE_RECYCLE redo conflicts are triggered. |
| conflict_force_recycle_total_dur | int8 | Total duration for processing FORCE_RECYCLE redo conflicts.      |
| conflict_force_recycle_avg_dur   | int8 | Average duration for processing FORCE_RECYCLE redo conflicts.    |
| conflict_force_recycle_min_dur   | int8 | Minimum duration for processing FORCE_RECYCLE redo conflicts.    |
| conflict_force_recycle_max_dur   | int8 | Maximum duration for processing FORCE_RECYCLE redo conflicts.    |

Example:

```
gaussdb=# SELECT * FROM gs_recovery_conflict_waitevent_info();
-[RECORD 1]-----+-----
conflict_lock_counter | 0
conflict_lock_total_dur | 0
conflict_lock_avg_dur | 0

```

- gs\_display\_delay\_ddl\_info()**

Description: Views information about files that are delayed for deletion on the standby node.

Return type: SETOF record

| Name       | Type | Description                                                                                                                |
|------------|------|----------------------------------------------------------------------------------------------------------------------------|
| type       | INT4 | Indicates that the deleted object is a table or database.                                                                  |
| lsn        | TEXT | Marks the location of a particular log file.                                                                               |
| tablespace | INT4 | Indicates the physical space for storing tables and indexes in a database.                                                 |
| database   | INT4 | Indicates the physical storage location of a database.                                                                     |
| relation   | INT4 | Indicates the object in a database, which can be the physical location of a table, view, or index.                         |
| bucketid   | INT4 | Specifies the bucket to which the relationship object belongs.                                                             |
| opt        | INT4 | Indicates the attribute of a compressed table.                                                                             |
| forknum    | INT4 | Specifies a suffix name for a subject name. You can find a unique physical file based on the subject name and suffix name. |

Example:

```
gaussdb=# SELECT * FROM gs_display_delay_ddl_info();
 type | lsn | tablespace | database | relation | bucketid | opt | forknum
-----+-----+-----+-----+-----+-----+-----+-----
(0 rows)
```

## Functions for Collecting Statistics in Partitioned Tables

- gs\_stat\_get\_partition\_stats(oid)**  
 Description: Obtains the statistics of a specific partition.  
 Return type: record
- gs\_stat\_get\_xact\_partition\_stats(oid)**  
 Description: Obtains transaction statistics of a specific partition.  
 Return type: record
- gs\_stat\_get\_all\_partitions\_stats()**  
 Description: Obtains the statistics of all partitions.  
 Return type: SETOF record
- gs\_stat\_get\_xact\_all\_partitions\_stats()**  
 Description: Obtains transaction statistics of all partitions.  
 Return type: SETOF record
- gs\_statio\_get\_all\_partitions\_stats()**  
 Description: Obtains the I/O statistics of all partitions.

Return type: SETOF record

Examples of the preceding five functions

---

**⚠ CAUTION**

Statistics are reported asynchronously during execution. Based on UDP, delay and packet loss may occur during background thread processing. The following example is for reference only.

---

### Querying out-of-transaction statistics

```

- gs\_stat\_get\_partition\_analyze\_count(oid)**

Description: Specifies the number of times that a user starts analysis on a partition.

Return type: bigint
- gs\_stat\_get\_partition\_autoanalyze\_count(oid)**

Description: Specifies the number of times that the autovacuum daemon starts analysis in a partition.

Return type: bigint
- gs\_stat\_get\_partition\_autovacuum\_count(oid)**

Description: Specifies the number of times that the autovacuum daemon starts vacuum in a partition.

Return type: bigint
- gs\_stat\_get\_partition\_last\_analyze\_time(oid)**

Description: Specifies the last time when a partition starts to be analyzed manually or by the autovacuum thread.

Return type: timestampz

- `gs_stat_get_partition_last_autoanalyze_time(oid)`  
Description: Specifies the time when the last analysis initiated by the autovacuum daemon in a partition.  
Return type: `timestampz`
- `gs_stat_get_partition_last_autovacuum_time(oid)`  
Description: Specifies the time of the last vacuum initiated by the autovacuum daemon in a partition.  
Return type: `timestampz`
- `gs_stat_get_partition_last_data_changed_time(oid)`  
Description: Specifies the last time of a modification in a partition, such as insert, update, delete, and truncate. Currently, this parameter is not supported.  
Return type: `timestampz`
- `gs_stat_get_partition_last_vacuum_time(oid)`  
Description: Specifies the most recent time when the user manually cleared a table or when the autovacuum thread was started to clear a partition.  
Return type: `timestampz`
- `gs_stat_get_partition_numscans(oid)`  
Description: Specifies the number of rows scanned and read in partition order.  
Return type: `bigint`
- `gs_stat_get_partition_tuples_returned(oid)`  
Description: Specifies the number of sequential row scans in a partition.  
Return type: `bigint`
- `gs_stat_get_partition_tuples_fetched(oid)`  
Description: Specifies the number of rows fetched by bitmap scans in a partition.  
Return type: `bigint`
- `gs_stat_get_partition_vacuum_count(oid)`  
Description: Specifies the number of times that a user starts vacuum in a partition.  
Return type: `bigint`
- `gs_stat_get_xact_partition_tuples_fetched(oid)`  
Description: Specifies the number of tuple rows scanned in a transaction.  
Return type: `bigint`
- `gs_stat_get_xact_partition_numscans(oid)`  
Description: Specifies the number of sequential scans performed on a partition in the current transaction.  
Return type: `bigint`
- `gs_stat_get_xact_partition_tuples_returned(oid)`  
Description: Specifies the number of rows read through sequential scans in a partition in the current transaction.  
Return type: `bigint`

- `gs_stat_get_partition_blocks_fetched(oid)`  
Description: Specifies the number of disk block fetch requests for a partition.  
Return type: `bigint`
- `gs_stat_get_partition_blocks_hit(oid)`  
Description: Specifies the number of disk block requests found in cache for a partition.  
Return type: `bigint`
- `pg_stat_get_partition_tuples_inserted(oid)`  
Description: Specifies the number of rows in the corresponding table partition.  
Return type: `bigint`
- `pg_stat_get_partition_tuples_updated(oid)`  
Description: Specifies the number of rows that have been updated in the corresponding table partition.  
Return type: `bigint`
- `pg_stat_get_partition_tuples_deleted(oid)`  
Description: Specifies the number of rows deleted from the corresponding table partition.  
Return type: `bigint`
- `pg_stat_get_partition_tuples_changed(oid)`  
Description: Specifies the total number of inserted, updated, and deleted rows after a table partition was last analyzed or autoanalyzed.  
Return type: `bigint`
- `pg_stat_get_partition_live_tuples(oid)`  
Description: Specifies the number of live rows in a partitioned table.  
Return type: `bigint`
- `pg_stat_get_partition_dead_tuples(oid)`  
Description: Specifies the number of dead rows in a partitioned table.  
Return type: `bigint`
- `pg_stat_get_xact_partition_tuples_inserted(oid)`  
Description: Specifies the number of inserted tuples in the active sub-transactions related to a table partition.  
Return type: `bigint`
- `pg_stat_get_xact_partition_tuples_deleted(oid)`  
Description: Specifies the number of deleted tuples in the active sub-transactions related to a table partition.  
Return type: `bigint`
- `pg_stat_get_xact_partition_tuples_hot_updated(oid)`  
Description: Specifies the number of hot updated tuples in the active sub-transactions related to a table partition.  
Return type: `bigint`
- `pg_stat_get_xact_partition_tuples_updated(oid)`  
Description: Specifies the number of updated tuples in the active sub-transactions related to a table partition.

Return type: bigint

- `pg_stat_get_partition_tuples_hot_updated(oid)`

Description: Returns statistics on the number of hot updated tuples in a partition with a specified partition ID.

Parameter: oid

Return type: bigint

## 7.5.27 Trigger Functions

- `pg_get_triggerdef(oid)`

Description: Obtains the definition information of a trigger.

Parameter: OID of the trigger to be queried

Return type: text

```
-- Create the tri_insert table.
gaussdb=# CREATE TABLE tri_insert (a int, b int) distribute by hash(a);
CREATE TABLE
-- Create the trigger_func function.
gaussdb=# CREATE FUNCTION trigger_func() RETURNS trigger LANGUAGE plpgsql AS '
BEGIN
RAISE NOTICE "trigger_func(%) called: action = %, when = %, level = %", TG_ARGV[0], TG_OP,
TG_WHEN, TG_LEVEL;
RETURN NULL;
END;';
CREATE FUNCTION
-- Create the before_ins_stmt_trig trigger.
gaussdb=# CREATE TRIGGER before_ins_stmt_trig BEFORE INSERT ON tri_insert FOR EACH
STATEMENT EXECUTE PROCEDURE trigger_func('before_ins_stmt');
CREATE TRIGGER
-- Create the after_ins_when_trig trigger.
gaussdb=# CREATE TRIGGER after_ins_when_trig AFTER INSERT ON tri_insert FOR EACH ROW WHEN
(new.a IS NOT NULL) EXECUTE PROCEDURE trigger_func('after_ins_when');
CREATE TRIGGER
-- View the trigger definition information of the tri_insert table.
gaussdb=# SELECT pg_get_triggerdef(oid) FROM pg_trigger WHERE tgrelid = 'tri_insert'::regclass;

pg_get_triggerdef

CREATE TRIGGER after_ins_when_trig AFTER INSERT ON tri_insert FOR EACH ROW WHEN ((new.a IS
NOT NULL)) EXECUTE PROCEDURE trigger_func('after_ins_when')
CREATE TRIGGER before_ins_stmt_trig BEFORE INSERT ON tri_insert FOR EACH STATEMENT
EXECUTE PROCEDURE trigger_func('before_ins_stmt')
(2 rows)
```

- `pg_get_triggerdef(oid, boolean)`

Description: Obtains the definition information of a trigger.

Parameter: OID of the trigger to be queried and whether it is displayed in pretty mode

### NOTE

Boolean parameters take effect only when the WHEN condition is specified during trigger creation.

Return type: text

Example:

```
-- View the trigger definition information of the tri_insert table in non-pretty mode.
gaussdb=# SELECT pg_get_triggerdef(oid, false) FROM pg_trigger WHERE tgrelid = 'tri_insert'::regclass;

pg_get_triggerdef
```

```

CREATE TRIGGER after_ins_when_trig AFTER INSERT ON tri_insert FOR EACH ROW WHEN ((new.a IS
NOT NULL)) EXECUTE PROCEDURE trigger_func('after_ins_when')
CREATE TRIGGER before_ins_stmt_trig BEFORE INSERT ON tri_insert FOR EACH STATEMENT
EXECUTE PROCEDURE trigger_func('before_ins_stmt')
(2 rows)

-- View the trigger definition information of the tri_insert table in pretty mode.
gaussdb=# SELECT pg_get_triggerdef(oid, true) FROM pg_trigger WHERE tgrelid = 'tri_insert'::regclass;

pg_get_triggerdef

CREATE TRIGGER after_ins_when_trig AFTER INSERT ON tri_insert FOR EACH ROW WHEN (new.a IS
NOT NULL) EXECUTE PROCEDURE trigger_func('after_ins_when')
CREATE TRIGGER before_ins_stmt_trig BEFORE INSERT ON tri_insert FOR EACH STATEMENT
EXECUTE PROCEDURE trigger_func('before_ins_stmt')
(2 rows)

-- Clear the tri_insert table.
gaussdb=# DROP TABLE tri_insert CASCADE;
DROP TABLE
-- Clear the trigger_func function.
gaussdb=# DROP FUNCTION trigger_func;
DROP FUNCTION
```

## 7.5.28 Hash Function

- bucketabstime (value, flag)  
Description: Hashes the value in the abstime format and finds the corresponding hash bucket.  
Parameter: **value** indicates the value to be converted, which is of the abstime type. **flag** is of the int type, indicating the data distribution mode. The value **0** indicates hash distribution.

Return type: int32

Example:

```
gaussdb=# select bucketabstime('2011-10-01 10:10:10.112',1);
bucketabstime

13954
(1 row)
```

- bucketbool (value, flag)  
Description: Hashes the value in the bool format and finds the corresponding hash bucket.  
Parameter: **value** indicates the value to be converted, which is of the bool type. **flag** is of the int type, indicating the data distribution mode. The value **0** indicates hash distribution.

Return type: int32

Example:

```
gaussdb=# select bucketbool(true,1);
bucketbool

1
(1 row)
gaussdb=# select bucketbool(false,1);
bucketbool

0
(1 row)
```

- bucketbpchar(value, flag)

Description: Hashes the value in the bpchar format and finds the corresponding hash bucket.

Parameter: **value** indicates the value to be converted, which is of the bpchar type. **flag** is of the int type, indicating the data distribution mode. The value **0** indicates hash distribution.

Return type: int32

Example:

```
gaussdb=# select bucketbpchar('test',1);
 bucketbpchar

 9761
(1 row)
```

- bucketbytea (value, flag)

Description: Hashes the value in the bytea format and finds the corresponding hash bucket.

Parameter: **value** indicates the value to be converted, which is of the bytea type. **flag** is of the int type, indicating the data distribution mode. The value **0** indicates hash distribution.

Return type: int32

Example:

```
gaussdb=# select bucketbytea('test',1);
 bucketbytea

 9761
(1 row)
```

- bucketcash (value, flag)

Description: Hashes the value in the money format and finds the corresponding hash bucket.

Parameter: **value** indicates the value to be converted, which is of the money type. **flag** is of the int type, indicating the data distribution mode. The value **0** indicates hash distribution.

Return type: int32

Example:

```
gaussdb=# select bucketcash(10::money,1);
 bucketcash

 8468
(1 row)
```

- getbucket (value, flag)

Description: Obtains the hash bucket from the distribution column.

**value** indicates the value to be entered, which can be of the following types:

"char", abstime, bigint, boolean,bytea, character varying, character, date, double precision, int2vector, integer, interval, money, name, numeric, nvarchar2, oid, oidvector, raw, real, record, reltime, smalldatetime, smallint,text, time with time zone, time without time zone, timestamp with time zone, timestamp without time zone, tinyint, uuid

**flag** is of the int type, indicating the data distribution mode.

Return type: integer

Example:

```
gaussdb=# select getbucket(10,'H');
getbucket

 14535
(1 row)

gaussdb=# select getbucket(11,'H');
getbucket

 13449
(1 row)

gaussdb=# select getbucket(11,'R');
getbucket

 13449
(1 row)

gaussdb=# select getbucket(12,'R');
getbucket

 9412
(1 row)
```

- ora\_hash(expression,[seed])

Description: Calculates the hash value of a given expression. **expression**: The value can be a character string, time, or number. The hash value is calculated based on the expression. **seed**: an int8 value that can return different results for the same input value. This parameter is optional and is used to calculate the hash value with a random number.

Return type: hash value of the int8 type.

Example:

```
gaussdb=# select ora_hash(123);
ora_hash

 4089882933
(1 row)
gaussdb=# select ora_hash('123');
ora_hash

 2034089965
(1 row)
gaussdb=# select ora_hash('sample');
ora_hash

 1573005290
(1 row)
gaussdb=# select ora_hash(to_date('2012-1-2','yyyy-mm-dd'));
ora_hash

 1171473495
(1 row)
gaussdb=# select ora_hash(123,234);
ora_hash

-9089505052966355682
(1 row)
gaussdb=# select ora_hash('123',234);
ora_hash

 5742589019960764616
(1 row)
gaussdb=# select ora_hash('sample',234);
ora_hash

```

```
-1747984408055821656
(1 row)
gaussdb=# select ora_hash(to_date('2012-1-2','yyyy-mm-dd'),234);
ora_hash

-3306025179710572679
(1 row)
```

**NOTE**

This function is valid only when **a\_format\_version** is set to **10c** and **a\_format\_dev\_version** is set to **s2**.

- **hash\_array(anyarray)**

Description: Hashes an array, obtains the result of an array element using the hash function, and returns the combination result.

Parameter: data of the anyrange type.

Return type: integer

Example:

```
gaussdb=# select hash_array(ARRAY[[1,2,3],[1,2,3]]);
hash_array

-382888479
(1 row)
```

- **hash\_numeric(numeric)**

Description: Calculates the hash value of numeric data.

Parameter: data of the numeric type.

Return type: integer

Example:

```
gaussdb=# select hash_numeric(30);
hash_numeric

-282860963
(1 row)
```

- **hash\_range(anyrange)**

Description: Calculates the hash value of a range.

Parameter: data of the anyrange type.

Return type: integer

Example:

```
gaussdb=# select hash_range(numrange(1.1,2.2));
hash_range

683508754
(1 row)
```

- **hashbpchar(character)**

Description: Calculates the hash value of bpchar.

Parameter: data of the character type.

Return type: integer

Example:

```
gaussdb=# select hashbpchar('hello');
hashbpchar

-1870292951
(1 row)
```

- **hashchar(char)**  
Description: Converts char and Boolean data into hash values.  
Parameter: data of the char or bool type.  
Return type: integer  
Example:

```
gaussdb=# select hashbpchar('hello');
 hashbpchar

-1870292951
(1 row)

gaussdb=# select hashchar('true');
 hashchar

1686226652
(1 row)
```
- **hashenum(anyenum)**  
Description: Converts enumerated values to hash values.  
Parameter: data of the anyenum type.  
Return type: integer  
Example:

```
gaussdb=# CREATE TYPE b1 AS ENUM('good', 'bad', 'ugly');
CREATE TYPE
gaussdb=# call hashenum('good'::b1);
 hashenum

1821213359
(1 row)
```
- **hashfloat4(real)**  
Description: Converts float4 values to hash values.  
Parameter: data of the real type.  
Return type: integer  
Example:

```
gaussdb=# select hashfloat4(12.1234);
 hashfloat4

1398514061
(1 row)
```
- **hashfloat8(double precision)**  
Description: Converts float8 values to hash values.  
Parameter: data of the double precision type.  
Return type: integer  
Example:

```
gaussdb=# select hashfloat8(123456.1234);
 hashfloat8

1673665593
(1 row)
```
- **hashinet(inet)**  
Description: Converts inet or cidr values to hash values.  
Parameter: data of the inet type.  
Return type: integer

Example:

```
gaussdb=# select hashinet('127.0.0.1'::inet);
 hashinet

-1435793109
(1 row)
```

- hashint1(tinyint)

Description: Converts INT1 values to hash values.

Parameter: data of the tinyint type.

Return type: uint32

Example:

```
gaussdb=# select hashint1(20);
 hashint1

-2014641093
(1 row)
```

- hashint2(smallint)

Description: Converts INT2 values to hash values.

Parameter: data of the smallint type.

Return type: uint32

Example:

```
gaussdb=# select hashint2(20000);
 hashint2

-863179081
(1 row)
```

- bucketchar

Description: Calculates the hash value of the input parameter.

Parameter: char, integer

Return type: integer

- bucketdate

Description: Calculates the hash value of the input parameter.

Parameter: date, integer

Return type: integer

- bucketfloat4

Description: Calculates the hash value of the input parameter.

Parameter: real, integer

Return type: integer

- bucketfloat8

Description: Calculates the hash value of the input parameter.

Parameters: double precision, integer

Return type: integer

- bucketint1

Description: Calculates the hash value of the input parameter.

Parameter: tinyint, integer

Return type: integer

- bucketint2  
Description: Calculates the hash value of the input parameter.  
Parameter: smallint, integer  
Return type: integer
- bucketint2vector  
Description: Calculates the hash value of the input parameter.  
Parameter: int2vector, integer  
Return type: integer
- bucketint4  
Description: Calculates the hash value of the input parameter.  
Parameter: integer, integer  
Return type: integer
- bucketint8  
Description: Calculates the hash value of the input parameter.  
Parameter: bigint, integer  
Return type: integer
- bucketinterval  
Description: Calculates the hash value of the input parameter.  
Parameter: interval, integer  
Return type: integer
- bucketname  
Description: Calculates the hash value of the input parameter.  
Parameter: name, integer  
Return type: integer
- bucketnumeric  
Description: Calculates the hash value of the input parameter.  
Parameter: numeric, integer  
Return type: integer
- bucketnvarchar2  
Description: Calculates the hash value of the input parameter.  
Parameter: nvarchar2, integer  
Return type: integer
- bucketoid  
Description: Calculates the hash value of the input parameter.  
Parameters: oid, integer  
Return type: integer
- bucketoidvector  
Description: Calculates the hash value of the input parameter.  
Parameter: oidvector, integer  
Return type: integer

- bucketraw  
Description: Calculates the hash value of the input parameter.  
Parameter: raw, integer  
Return type: integer
- bucketreltime  
Description: Calculates the hash value of the input parameter.  
Parameter: reltime, integer  
Return type: integer
- bucketsmalldatetime  
Description: Calculates the hash value of the input parameter.  
Parameter: smalldatetime, integer  
Return type: integer
- buckettext  
Description: Calculates the hash value of the input parameter.  
Parameter: text, integer  
Return type: integer
- buckettime  
Description: Calculates the hash value of the input parameter.  
Parameter: time without time zone, integer  
Return type: integer
- buckettimestamp  
Description: Calculates the hash value of the input parameter.  
Parameter: timestamp without time zone, integer  
Return type: integer
- buckettimestamptz  
Description: Calculates the hash value of the input parameter.  
Parameter: timestamp with time zone, integer  
Return type: integer
- buckettimetz  
Description: Calculates the hash value of the input parameter.  
Parameter: time with time zone, integer  
Return type: integer
- bucketuuid  
Description: Calculates the hash value of the input parameter.  
Parameter: uuid, integer  
Return type: integer
- bucketvarchar  
Description: Calculates the hash value of the input parameter.  
Parameter: character varying, integer  
Return type: integer

## 7.5.29 Prompt Message Function

- `report_application_error()`  
Description: This function can be used to throw errors during PL execution.  
Return type: void

**Table 7-124** `report_application_error` parameter description

| Parameter | Type | Description                                                                           | Mandatory or Not |
|-----------|------|---------------------------------------------------------------------------------------|------------------|
| log       | text | Content of an error message.                                                          | Yes              |
| code      | int4 | Error code corresponding to an error message. The value ranges from -20999 to -20000. | No               |

## 7.5.30 Fault Injection System Function

`gs_fault_inject(int64, text, text, text, text, text)`

Description: This function cannot be called. WARNING information "unsupported fault injection" is reported when this function is called, which does not affect or change the database.

Parameter: fault injection of the int64 type (**0**: CLOG extended page; **1**: CLOG page reading; **2**: forcible deadlock)

- If the first input parameter of text is set to **2** and the second input parameter of text is set to **1**, the second input parameter deadlock occurs. Other input parameters are not deadlocked. When the first input parameter is **0** or **1**, the second input parameter indicates the number of the start page from which the CLOG starts to be extended or read.
- The third input parameter of text indicates the number of extended or read pages when the first input parameter is **0** or **1**.
- The fourth to sixth input parameters of text are reserved.

Return type: int64

## 7.5.31 Redistribution Parameters

The following functions are system functions used by `gs_redis` during redistribution. Do not call them unless absolutely necessary.

- `pg_get_redis_rel_end_ctid(text, name, int, int)`
- `pg_get_redis_rel_start_ctid(text, name, int, int)`
- `pg_enable_redis_proc_cancelable()`
- `pg_disable_redis_proc_cancelable()`
- `pg_tupleid_get_blocknum(tid)`
- `pg_tupleid_get_offset(tid)`
- `pg_tupleid_get_ctid_to_bigint(ctid)`

## 7.5.32 Distribution Key Recommendation Functions

Distribution key recommendation is used to recommend distribution keys and distribution modes in a distributed database. The purpose is to reduce the labor cost of selecting distribution keys during service migration or rollout.

- `sqladvisor.init(char, boolean, boolean, boolean, int, int)`

Description: Initializes parameters.

Return type: Boolean

**Table 7-125** Parameter description of `init`

| Parameter                                | Type                 | Description                                                                                                                             | Mandatory or Not |
|------------------------------------------|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <code>kind</code>                        | <code>char</code>    | Recommendation type. Currently, this parameter can only be set to <b>D</b> .                                                            | Yes              |
| <code>isUseCost</code>                   | <code>boolean</code> | Indicates whether optimizers are used. If data is available, optimizers are used.                                                       | Yes              |
| <code>isUseCollect</code>                | <code>boolean</code> | Indicates whether the analysis is started from the collected load. The default value is <b>false</b> .                                  | No               |
| <code>isConstraint<br/>PrimaryKey</code> | <code>boolean</code> | Indicates whether primary key constraints are retained. The default value is <b>true</b> .                                              | No               |
| <code>sqlCount</code>                    | <code>int</code>     | Number of collected SQL statements. The default value is <b>10000</b> . The value ranges from 1 to 100000.                              | No               |
| <code>maxMemory</code>                   | <code>int</code>     | Maximum memory occupied by distribution key recommendation. The default value is <b>1024</b> . The value ranges from 1 to 10240, in MB. | No               |

- `sqladvisor.set_weight_params(real, real, real)`

Description: Sets the weight of different components in heuristic rules. A default parameter is set when the `init` function is invoked. This function does not need to be invoked during analysis.

Return type: Boolean

**Table 7-126** Parameter description of set\_weight\_params

| Parameter    | Type | Description                                           | Mandatory or Not |
|--------------|------|-------------------------------------------------------|------------------|
| joinWeight   | real | Weight of JOIN. The value ranges from 0 to 1000.      | Yes              |
| goupbyWeight | real | Weight of GROUP BY. The value ranges from 0 to 1000.  | Yes              |
| qualWeight   | real | Weight of predicate. The value ranges from 0 to 1000. | Yes              |

 **NOTE**

This function is optional. When the init function is executed, the default weights of JOIN, GROUP BY, and predicate are preset to 1.0, 0.1, and 0.05, respectively.

- sqladvisor.set\_cost\_params(bigint, boolean, text)

Description: Parameter that can be set in the Whtif cost model.

Return type: Boolean

**Table 7-127** Parameter description of set\_cost\_params

| Parameter     | Type    | Description                                                                                                                                                                                                                                                                       | Mandatory or Not |
|---------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| maxTime       | bigint  | Maximum recommendation duration, in minutes. If the value is less than or equal to <b>0</b> , the duration is not limited by default.                                                                                                                                             | Yes              |
| isTotalSQL    | boolean | Indicates whether all SQL statements are used for calculation. The value <b>true</b> indicates that all SQL statements are used for calculation. The value <b>false</b> indicates that SQL statements whose cost is too high or too low are filtered out based on the percentile. | Yes              |
| compressLevel | text    | Search space size of the recommendation algorithm. The options are <b>low</b> , <b>med</b> , and <b>high</b> .                                                                                                                                                                    | Yes              |

 **NOTE**

- This function is optional. When the init function is executed, **maxTime** is preset to **-1**, **isTotalSQL** is preset to **true**, and **compressLevel** is preset to **high**.
- A lower compression level indicates longer time, and it is more likely that a better result can be achieved.

- `sqladvisor.assign_table_type(text)`

Description: Specifies a table as a replication table.

Parameter: table name

Return type: Boolean

 **NOTE**

The specified replication table must be used before **analyze\_query** and **analyze\_workload** are invoked.

- `sqladvisor.analyze_query(text, int)`

Description: Imports SQL statements to be recommended and analyzes the components of the statements.

Return type: Boolean

**Table 7-128** Parameter description of `analyze_query`

| Parameter | Type | Description                                                                                                  | Mandatory or Not |
|-----------|------|--------------------------------------------------------------------------------------------------------------|------------------|
| query     | text | SQL statement                                                                                                | Yes              |
| frequency | int  | Frequency of a statement in the load. The default value is <b>1</b> . The value ranges from 1 to 2147483647. | No               |

 **NOTE**

- If the value of the **query** parameter contains special characters, such as single quotation marks ('), you can use single quotation marks (') to escape the special characters.
- This function is not supported in semi-online mode.
- `sqladvisor.analyze_workload()`

Description: Analyzes the load information collected online.

Return type: Boolean

- `sqladvisor.get_analyzed_result(text)`

Description: Obtains beneficial components extracted from the current table.

Parameter: text

Return type: record

The following table describes return fields.

| Name        | Type | Description |
|-------------|------|-------------|
| schema_name | text | Schema name |

| Name       | Type | Description                              |
|------------|------|------------------------------------------|
| table_name | text | Table name                               |
| col_name   | text | Column name                              |
| operator   | text | Operator type                            |
| count      | int  | Number of times that an operator is used |

- `sqladvisor.run()`

Description: Performs calculation and analysis based on the specified schema and input SQL statements.

Return type: Boolean

- `sqladvisor.get_distribution_key()`

Description: Obtains the recommendation result.

 **NOTE**

The analysis result is saved in a session. If the session disconnects, the result will be lost.

Return type: record

The following table describes return fields.

| Name              | Type      | Description                   |
|-------------------|-----------|-------------------------------|
| db_name           | text      | Database name                 |
| schema_name       | text      | Schema name                   |
| table_name        | text      | Table name                    |
| distribution_type | text      | Recommended distribution type |
| distribution_key  | text      | Recommended distribution key  |
| start_time        | timestamp | Recommended start time        |
| end_time          | timestamp | Recommended end time          |

| Name         | Type | Description                                        |
|--------------|------|----------------------------------------------------|
| cost_improve | text | Cost increase brought by the recommendation result |
| comment      | text | Comment                                            |

- `sqladvisor.clean()`

Description: Clears all the memory in the recommendation process of a session.

Return type: Boolean

- `sqladvisor.start_collect_workload(int, int)`

Description: Starts online load collection.

Return type: Boolean

**Table 7-129** Parameter description of `start_collect_workload`

| Parameter | Type | Description                                                                                                                            | Mandatory or Not |
|-----------|------|----------------------------------------------------------------------------------------------------------------------------------------|------------------|
| sqlCount  | int  | Maximum number of SQL statements for online load collection. The value ranges from 1 to 100000 and the default value is <b>10000</b> . | Yes              |
| maxMemory | int  | Maximum memory occupied by online load collection. The default value is <b>1024</b> . The value ranges from 1 to 10240, in MB.         | Yes              |

#### NOTICE

- The online collection function can be invoked only by the system administrator.
- The load of only one database can be collected at a time.
- Currently, only common SQL statements as well as DML and DQL statements in stored procedures are supported.

- `sqladvisor.end_collect_workload()`

Description: Disables online load collection.

Return type: Boolean

**NOTICE**

- The online collection function can be disabled only by the system administrator.

- `sqladvisor.clean_workload()`

Description: Clears the memory in the load.

Return type: Boolean

**NOTICE**

- The function of clearing memory in the load can be invoked only by the system administrator.
- You must manually execute the cleanup function.

### Suggestions

- Invoke state machines in the heuristic or WhatIf cost recommendation mode.

- Invoke state machines in semi-online recommendation mode.

### 7.5.33 Other System Functions

- Built-in functions and operators of GaussDB are compatible with PostgreSQL.

|                                          |                                   |                                     |                              |                                 |                                |                                    |

The following table lists the functions used by GaussDB to implement internal system functions. You are advised not to use these functions. If you need to use them, contact Huawei technical support.

- **spread\_collect**

Description: Calculates the difference between the maximum and minimum values in a certain period of time. This function is used for data collection of aggregate functions.

Parameters: s real[], v real[]

Return type: real[]
- **spread\_final**

Description: Calculates the difference between the maximum and minimum values in a certain period of time. This function is used for the final data processing of the aggregate function.

Parameter: s real[]

Return type: real
- **spread\_internal**

Description: Calculates the difference between the maximum and minimum values in a certain period of time. This function is used for the process of aggregate functions.

Parameters: s real[], v real

Return type: real[]
- **xidin4**

Description: Inputs a 4-byte xid.

Parameter:cstring

Return type: xid32
- **set\_hashbucket\_info**

Description: Sets hash bucket information.

Parameter: text

Return type: Boolean
- **gap\_fill\_internal**

Description: Returns the first non-NULL value in the parameter list.

Parameter: s anyelement, v anyelement

Return type: anyelement
- **int1send**

Description: Packs unsigned 1-byte integers into the internal data buffer stream.

Parameter: tinyint

Return type: bytea

- is\_contain\_namespace

Description: Searches for the table name and namespace split location. If no namespace exists, 0 is returned.

Parameter: relationname name

Return type: integer

- is\_oid\_in\_group\_members

Description: Not supported

Parameter: node\_oid oid, group\_members oidvector\_extend

Return type: Boolean

- isubmit\_on\_nodes\_internal

Description: Not supported

Parameter: job bigint, node\_name name, database name, what text, next\_date timestamp without time zone, job\_interval text

Return type: integer

- listagg

Description: Specifies aggregate functions of the list type.

Parameters: smallint, text

Return type: text

- log\_fdw\_validator

Description: Specifies validation functions.

Parameters: text[], oid

Return type: void

- nvarchar2typmodin

Description: Obtains the typmod information of the varchar type.

Parameter:cstring[]

Return type: integer

- nvarchar2typmodout

Description: Obtains the typmod information of the varchar type, constructs a character string, and returns the character string.

Parameter: integer

Return type:cstring

- pg\_nodes\_memmon

Description: Not supported

Parameter: nan

Return type: innernname text, innerusedmem bigint, innertopctxt bigint, nname text, usedmem text, sharedbuffercache text, topcontext text

- read\_disable\_conn\_file

Description: Reads forbidden connection files.

Parameter: nan

Return type: disconn\_mode text, disconn\_host text, disconn\_port text, local\_host text, local\_port text, redo\_finished text

- regex\_like\_m

Description: Specifies the regular expression match, which is used to determine whether a character string complies with a specified regular expression.

Parameters: text, text

Return type: Boolean

- update\_pgjob

Description: Updates a job.

Parameters: bigint, "char", bigint, timestamp without time zone, timestamp without time zone, timestamp without time zone, timestamp without time zone, timestamp without time zone, smallint, text

Return type: void

- enum\_cmp

Description: Specifies the enumeration comparison function, which is used to determine whether two enumeration classes are equal and determine their relative sizes.

Parameters: anyenum, anyenum

Return type: integer

- enum\_eq

Description: Specifies the enumeration comparison function, which is used to implement the equal sign (=).

Parameters: anyenum, anyenum

Return type: Boolean

- enum\_first

Description: Returns the first element in the enumeration class.

Parameter: anyenum

Return type: anyenum

- enum\_ge

Description: Specifies the enumeration comparison function, which is used to implement the greater-than sign (>) and equal sign (=).

Parameters: anyenum, anyenum

Return type: Boolean

- enum\_gt

Description: Specifies the enumeration comparison function, which is used to implement the greater-than sign (>).

Parameters: anyenum, anyenum

Return type: Boolean

- enum\_in

Description: Specifies the enumeration comparison function, which is used to determine whether an element is in an enumeration class.

- Parameters: cstring, OID  
Return type: anyenum
- enum\_larger  
Description: Specifies the enumeration comparison function, which is used to implement the greater-than sign (>).  
Parameters: anyenum, anyenum  
Return type: anyenum
  - enum\_last  
Description: Returns the last element in the enumeration class.  
Parameter: anyenum  
Return type: anyenum
  - enum\_le  
Description: Specifies the enumeration comparison function, which is used to implement the less-than sign (<) and equal sign (=).  
Parameters: anyenum, anyenum  
Return type: Boolean
  - enum\_lt  
Description: Specifies the enumeration comparison function, which is used to implement the less-than sign (<).  
Parameters: anyenum, anyenum  
Return type: Boolean
  - enum\_smaller  
Description: Specifies the enumeration comparison function, which is used to implement the less-than sign (<).  
Parameters: anyenum, anyenum  
Return type: Boolean
  - node\_oid\_name  
Description: Not supported  
Parameter: oid  
Return type: cstring
  - pg\_buffercache\_pages  
Description: Reads data from the shared buffer.  
Parameter: nan  
Return type: bufferid integer, relfilenode oid, bucketid smallint, storage\_type oid, reltablespace oid, reldatabase oid, relforknumber smallint, relblocknumber bigint, isdirty boolean, usage\_count smallint
  - pg\_check\_xidlimit  
Description: Checks whether nextxid is greater than or equal to xidwarnlimit.  
Parameter: nan  
Return type: Boolean
  - pg\_comm\_delay  
Description: Displays the delay status of the communications library of a single DN.

- Parameter: nan  
Return type: text, text, integer, integer, integer, integer
- `pg_comm_rcv_stream`  
Description: Displays the receiving stream status of all communication libraries on a single DN.  
Parameter: nan  
Return type: text, bigint, text, bigint, integer, integer, integer, text, bigint, integer, integer, integer, bigint, bigint, bigint, bigint, bigint
  - `pg_comm_send_stream`  
Description: Displays the sending stream status of all communication libraries on a single DN.  
Parameter: nan  
Return type: text, bigint, text, bigint, integer, integer, integer, text, bigint, integer, integer, integer, bigint, bigint, bigint, bigint, bigint
  - `pg_comm_status`  
Description: Displays the communication status of a single DN.  
Parameter: nan  
Return type: text, integer, integer, bigint, bigint, bigint, bigint, bigint, integer, integer, integer, integer, integer
  - `pg_log_comm_status`  
Description: Prints some logs on the DN.  
Parameter: nan  
Return type: Boolean
  - `pg_parse_clog`  
Description: Parses clog to obtain the status of xid.  
Parameter: nan  
Return type: xid xid, status text
  - `pg_pool_ping`  
Description: Sets PoolerPing.  
Parameter: Boolean  
Return type: SETOF boolean
  - `pg_pool_validate`  
Description: Compares fields in the **pgxc\_node** system catalog to check whether a connection is available.  
Parameter: clear boolean, co\_node\_name cstring  
Return type: pid bigint, node\_name text
  - `pg_resume_bkp_flag`  
Description: Obtains the delay xlong flag for backup and restoration.  
Parameter: slot\_name name  
Return type: start\_backup\_flag boolean, to\_delay boolean, ddl\_delay\_recycle\_ptr text, rewind\_time text
  - `pg_stat_get_pooler_status`

Description: Queries the cache connection status in the pooler.

Parameter: nan

Return type: text, text, bigint, text, bigint, boolean, text, bigint, bigint, bigint, bigint, bigint

**Table 7-130** PG\_STAT\_GET\_POOLER\_STATUS columns

| Name           | Type           | Description                                                                                                                                                                                                   |
|----------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database_name  | OUT text       | Database name.                                                                                                                                                                                                |
| user_name      | OUT text       | Username.                                                                                                                                                                                                     |
| tid            | OUT<br>bigint  | In non-thread pool logic, this parameter indicates the ID of the thread connected to the CN. In thread pool logic, this parameter indicates the ID of the session connected to the CN.                        |
| pgoptions      | OUT text       | Database connection option. For details, see the <b>options</b> column in <a href="#">Connection Parameters</a> .                                                                                             |
| node_oid       | OUT<br>bigint  | OID of the node connected.                                                                                                                                                                                    |
| in_use         | OUT<br>boolean | Specifies whether the connection is currently used. <ul style="list-style-type: none"> <li>• <b>t</b> (true): The connection is in use.</li> <li>• <b>f</b> (false): The connection is not in use.</li> </ul> |
| session_params | OUT text       | GUC session parameter delivered by the connection.                                                                                                                                                            |
| fdsock         | OUT<br>bigint  | Local socket.                                                                                                                                                                                                 |
| remote_pid     | OUT<br>bigint  | Peer thread ID                                                                                                                                                                                                |
| used_count     | OUT<br>bigint  | Number of reuse times of a connection.                                                                                                                                                                        |
| idx            | OUT<br>bigint  | Peer DN ID in the local CN.                                                                                                                                                                                   |
| streamid       | OUT<br>bigint  | Stream ID in the physical connection.                                                                                                                                                                         |

- **gs\_validate\_ext\_listen\_ip**  
Description: Connects to DNs, queries invalid service threads on DNs connected to the original extended IP address, and clears the threads.  
Parameter: For details, see [Table 7-131](#).  
Return value: bigint pid, text node\_name

Note: This function is used only when old connections still exist on the original extended IP address after the extended IP address is reloaded. This function clears the threads where the original IP connections are located. Executing this function will clear communication listening on the extended IP address. Exercise caution when performing O&M operations. Currently, this command can be executed only by connecting to DNs and delivered by the administrator.

**Table 7-131** GS\_VALIDATE\_EXT\_LISTEN\_IP columns

| Name               | Type       | Description                                                                                             |
|--------------------|------------|---------------------------------------------------------------------------------------------------------|
| clear              | IN cstring | Specifies whether to clear data. The options are as follows: <b>on</b> : clear; <b>off</b> : not clear. |
| validate_node_name | IN cstring | Name of the DN where the extended IP address connections to be cleared are located.                     |
| validate_ip        | IN cstring | Extended IP address whose connections are to be cleared.                                                |
| pid                | OUT bigint | ID of the service thread where the extended IP address connections to be cleared are located.           |
| node_name          | OUT text   | Name of the instance to which the extended IP address connections to be cleared belong.                 |

- gs\_comm\_listen\_address\_ext\_info

Description: Displays the DFX information about the extended IP address configured for **listen\_address\_ext** connected to the current instance.

Parameter: nan

Return type: text node\_name, text app, bigint tid, integer lwtid, bigint query\_id, integer socket, text remote\_ip, text remote\_port, text local\_ip, text local\_port

**Table 7-132** GS\_COMM\_LISTEN\_ADDRESS\_EXT\_INFO columns

| Name      | Type        | Description                                  |
|-----------|-------------|----------------------------------------------|
| node_name | OUT text    | Name of the current instance.                |
| app       | OUT text    | Client connected to the DN.                  |
| tid       | OUT bigint  | Thread ID of the current thread.             |
| lwtid     | OUT integer | Lightweight thread ID of the current thread. |
| query_id  | OUT bigint  | Query ID of the current thread.              |

| Name        | Type        | Description                                   |
|-------------|-------------|-----------------------------------------------|
| socket      | OUT integer | Socket FD of the current physical connection. |
| remote_ip   | OUT text    | Peer IP address of the current connection.    |
| remote_port | OUT text    | Peer port of the current connection.          |
| local_ip    | OUT text    | Local IP address of the current connection.   |
| local_port  | OUT text    | Local port of the current connection.         |

- `gs_get_global_listen_address_ext_info()`  
 Description: Queries the global extended IP address configuration on the CN.  
 Parameter: For details, see [Table 7-133](#).  
 Return type: text node\_name, text host, text port, text ext\_listen\_ip  
 Note: If the input parameter of the function is **all**, the function depends on the **ext\_ip\_info** static configuration file. If the file is abnormal, use the CM/OM tool to rectify the fault. In this case, the configuration cannot be updated in real time. You can set the input parameter to **primary** to obtain the configuration information about all primary DNs.

**Table 7-133** GS\_GET\_GLOBAL\_LISTEN\_ADDRESS\_EXT\_INFO columns

| Name          | Type       | Description                                                                                                           |
|---------------|------------|-----------------------------------------------------------------------------------------------------------------------|
| dn_mode       | IN cstring | Specifies the range of DNs to be displayed. If this parameter is set to <b>null</b> , all DNs are queried by default. |
| node_name     | OUT text   | DN name.                                                                                                              |
| host          | OUT text   | Listening IP address of the DN.                                                                                       |
| port          | OUT text   | Listening port of the DN.                                                                                             |
| ext_listen_ip | OUT text   | Extended listening IP address of the DN.                                                                              |

- `gs_get_listen_address_ext_info()`  
 Description: Queries the extended IP address configuration of the current instance.  
 Parameter: nan  
 Return type: text node\_name, text host, bigint port, text ext\_listen\_ip

**Table 7-134** GS\_GET\_LISTEN\_ADDRESS\_EXT\_INFO

| Name          | Type       | Description                              |
|---------------|------------|------------------------------------------|
| node_name     | OUT text   | DN name.                                 |
| host          | OUT text   | Listening IP address of the DN.          |
| port          | OUT bigint | Listening port of the DN.                |
| ext_listen_ip | OUT text   | Extended listening IP address of the DN. |

- psortoptions  
Description: Returns the psort attribute.  
Parameters: text[], Boolean  
Return type: bytea
- remove\_job\_class\_depend  
Description: Removes the job dependency.  
Parameter: oid  
Return type: void
- xideq4  
Description: Compares two xids to check whether they are the same.  
Parameters: xid32, xid32  
Return type: Boolean
- xideqint8  
Description: Compares two xids to check whether they are the same.  
Parameters: xid, bigint  
Return type: Boolean
- xidlt  
Description: Returns whether xid1 < xid2 is true.  
Parameters: xid, xid  
Return type: Boolean
- xidlt4  
Description: Returns whether xid1 < xid2 is true.  
Parameters: xid32, xid32  
Return type: Boolean
- get\_local\_cont\_query\_stat  
Description: Obtains the statistics of a specified continuous computing view on the local node.  
Parameter: cq\_id oid  
Return value type: cq oid, w\_in\_rows int8, w\_in\_bytes int8, w\_out\_rows int8, w\_out\_bytes int8, w\_pendings int8, w\_errors int8, r\_in\_rows int8, r\_in\_bytes int8, r\_out\_rows int8, r\_out\_bytes int8, r\_errors int8, c\_in\_rows int8, c\_in\_bytes int8, c\_out\_rows int8, c\_out\_bytes int8, c\_pendings int8, c\_errors int8

- `get_local_cont_query_stats`  
Description: Obtains all continuous computing view statistics of the local node.  
Parameter: nan  
Return value type: cq oid, w\_in\_rows int8, w\_in\_bytes int8, w\_out\_rows int8, w\_out\_bytes int8, w\_pendings int8, w\_errors int8, r\_in\_rows int8, r\_in\_bytes int8, r\_out\_rows int8, r\_out\_bytes int8, r\_errors int8, c\_in\_rows int8, c\_in\_bytes int8, c\_out\_rows int8, c\_out\_bytes int8, c\_pendings int8, c\_errors int8
- `get_cont_query_stats`  
Description: Obtains statistics about all continuous computing views on each DN.  
Parameter: nan  
Return value type: node name, cq oid, w\_in\_rows int8, w\_in\_bytes int8, w\_out\_rows int8, w\_out\_bytes int8, w\_pendings int8, w\_errors int8, r\_in\_rows int8, r\_in\_bytes int8, r\_out\_rows int8, r\_out\_bytes int8, r\_errors int8, c\_in\_rows int8, c\_in\_bytes int8, c\_out\_rows int8, c\_out\_bytes int8, c\_pendings int8, c\_errors int8
- `reset_local_cont_query_stat`  
Description: Resets the statistics of a specified continuous computation view on the local node.  
Parameter: cq\_id oid  
Return type: Boolean
- `reset_local_cont_query_stats`  
Description: Resets association statistics on the specified continuous computation view of the local node.  
Parameter: cq\_id oid  
Return type: Boolean
- `reset_cont_query_stats`  
Description: Resets the continuous computation view statistics corresponding to the STREAM object on each DN.  
Parameter: stream\_id oid  
Return type: Boolean
- `check_cont_query_schema_changed`  
Description: Determines the schema change status of a specified continuous computation view.  
Parameter: cq\_id oid  
Return type: Boolean
- `gs_get_standby_cluster_barrier_status`  
Description: Queries the barrier log replay information of the standby CN or DN, including the latest received barrier, LSN of the latest received barrier, barrier played back last time, and target barrier to be played back.  
Parameter: nan  
Return type: barrier\_id text, barrier\_lsn text, recovery\_id text, target\_id text

Note: To call this function, the user must have the SYSADMIN or OPRADMIN permission, and **operate\_mode** must be enabled for the O&M administrator role.

- gs\_set\_standby\_cluster\_target\_barrier\_id**  
 Description: Sets the target barrier to be played back.  
 Parameter: barrier\_id  
 Return type: target\_id text  
 Note: To call this function, the user must have the SYSADMIN or OPRADMIN permission, and **operate\_mode** must be enabled for the O&M administrator role.
- gs\_query\_standby\_cluster\_barrier\_id\_exist**  
 Description: Queries whether the specified barrier is received by the standby node.  
 Parameter: barrier\_id  
 Return type: Boolean  
 Note: To call this function, the user must have the SYSADMIN or OPRADMIN permission, and **operate\_mode** must be enabled for the O&M administrator role.
- standby\_read\_status**  
 Description: Obtains the CSN snapshot information of all DNs in a cluster, the difference between the primary and standby DNs, and the CSN snapshot information used for the last read query on the standby node.  
 Parameter: nan  
 Return type: text, text, text, integer, bigint, bigint, bigint

**Table 7-135** standby\_read\_status columns

| Name          | Type    | Description                                                                                                                                             |
|---------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | text    | DN name                                                                                                                                                 |
| type          | text    | DN type ( <b>primary</b> for the primary node and <b>standby</b> for the standby node)                                                                  |
| host          | text    | IP address used by the DN                                                                                                                               |
| port          | integer | Port used by the DN                                                                                                                                     |
| collected_csn | bigint  | CSN snapshot information of the DN (For the primary node, the value is <b>0</b> . For the standby node, the value is the collected CSN.)                |
| delay         | bigint  | Difference between the primary and standby DNs. The unit is ms.                                                                                         |
| visited_csn   | bigint  | CSN information used for the last read query on the standby node. (This parameter is valid only for the standby node where the last query is executed.) |

- gs\_shutdown\_cross\_region\_walsenders**  
 Description: Interrupts cross-cluster streaming replication.  
 Parameter: nan  
 Return type: void  
 Note: To call this function, the user must have the SYSADMIN or OPRADMIN permission, and **operate\_mode** must be enabled for the O&M administrator role.  
 The following stream functions exist but are not supported. You are advised not to use them.  
 streaming\_int8\_avg\_gather, streaming\_numeric\_avg\_gather, streaming\_float8\_avg\_gather, streaming\_interval\_avg\_gather, streaming\_int8\_sum\_gather, and streaming\_int2\_int4\_sum\_gather
- is\_dblink\_in\_transaction**  
 Description: Checks whether a database link corresponding to an OID is used in the current transaction.  
 Parameter: oid  
 Return type: Boolean
- dblink\_has\_updatesent**  
 Description: Checks whether DML statements are sent using a database link corresponding to an OID in the current transaction and are not committed.  
 Parameter: oid  
 Return type: Boolean
- get\_last\_xmin\_by\_oid**  
 Description: Obtains the maximum **xmin** value of all columns in a table based on the table OID.  
 Parameter: oid  
 Return type: xid
- get\_relid\_by\_relname**  
 Description: Obtains the OID of a table based on the table name and renamespace.  
 Parameter: cstring, oid  
 Return type: oid

### 7.5.34 Internal Functions

The following functions of GaussDB use internal data types, which cannot be directly called by users.

- Selectivity calculation functions

|                |                   |                          |                    |                |                          |                  |

- Functions for reading data remotely

gs\_read\_block\_from\_remote is used to read the pages of a table file. By default, only the initial user can view the data. Other users can use the data only after being granted with permissions.

- Function for reading files remotely

gs\_read\_file\_size\_from\_remote is used to read the size of a specified file. Before using the gs\_repair\_file function to repair a file, you need to obtain the size of the file from the remote end to verify the missing file information and repair the missing files one by one. By default, only the initial user can view the data. Other users can use the data only after being granted with permissions.

gs\_read\_file\_from\_remote is used to read a specified file. After obtaining the file size by using the gs\_read\_file\_size\_from\_remote function, gs\_repair\_file reads the remote file segment by segment using this function. By default, only the initial user can view the data. Other users can use the data only after being granted with permissions.

- Auxiliary functions for incrementally rebuilding other standby or cascaded standby DNs using the standby DN.

gs\_standby\_incremental\_filemap\_create is used to create a temporary filemap file for incremental rebuilding on the standby DN. The filemap file is used to store the path and size of the data to be transferred during the incremental rebuilding. This API can be called only when the initial user is used and **application** is **gs\_rewind**.

gs\_standby\_incremental\_filemap\_insert is used to insert file information into a specified temporary filemap file. The file information includes the file path, transfer start point, length of data to be transferred at a time, and rebuild flag bit. This API can be called only when the initial user is used and **application** is **gs\_rewind**.

gs\_standby\_incremental\_filemap\_execute is used to obtain file information stored in a specified temporary filemap file and delete the specified filemap file for data transmission during incremental standby DN rebuilding. This API can be called only when the initial user is used and **application** is **gs\_rewind**.

- View-related reference functions

adm\_hist\_sqlstat\_func

adm\_hist\_sqlstat\_idlog\_func

adm\_hist\_sqltext\_func

- gs\_txn\_snapshot system catalog maintenance function

gs\_insert\_delete\_txn\_snapshot is used to maintain the gs\_txn\_snapshot system catalog of each node in distributed GTM-Lite mode. Only the system administrator can call gs\_insert\_delete\_txn\_snapshot.

- XMLType functions  
isschemavalid (unavailable)

## 7.5.35 AI Feature Functions

- `gs_index_advise(text)`  
Description: Recommends an index for a single query statement.  
Parameter: SQL statement string  
Return type: record  
For details, see section "Index-advisor: Index Recommendation > Single-Query Index Recommendation" in *Feature Guide*.
- `hypopg_create_index(text, [text])`  
Description: Creates a virtual index.  
Parameter: character string of the statement for creating an index, level of the created virtual index (optional)  
Return type: record  
For details, see section "Index-advisor: Index Recommendation > Virtual Index" in *Feature Guide*.
- `hypopg_display_index([text])`  
Description: Displays information about all created virtual indexes.  
Parameter: level of the virtual index to be displayed (optional)  
Return type: record  
For details, see section "Index-advisor: Index Recommendation > Virtual Index" in *Feature Guide*.
- `hypopg_drop_index(oid)`  
Description: Deletes a specified virtual index.  
Parameter: OID of the index  
Return type: Boolean  
For details, see section "Index-advisor: Index Recommendation > Virtual Index" in *Feature Guide*.
- `hypopg_reset_index([text])`  
Description: Clears all virtual indexes.  
Parameter: level of the virtual index to be cleared (optional)  
Return type: none  
For details, see section "Index-advisor: Index Recommendation > Virtual Index" in *Feature Guide*.
- `hypopg_estimate_size(oid)`  
Description: Estimates the space required for creating a specified index.  
Parameter: OID of the index  
Return type: int8  
For details, see section "Index-advisor: Index Recommendation > Virtual Index" in *Feature Guide*.
- `db4ai_predict_by_bool (text, VARIADIC "any")`

Description: Obtains a model whose return value is of the Boolean type for model inference. This function is an internal function. You are advised to use the **PREDICT BY** syntax for inference.

Parameter: model name and input column name of the inference task

Return type: Boolean

- `db4ai_predict_by_float4(text, VARIADIC "any")`

Description: Obtains a model whose return value is of the float4 type for model inference. This function is an internal function. You are advised to use the **PREDICT BY** syntax for inference.

Parameter: model name and input column name of the inference task

Return type: float

- `db4ai_predict_by_float8(text, VARIADIC "any")`

Description: Obtains a model whose return value is of the float8 type for model inference. This function is an internal function. You are advised to use the **PREDICT BY** syntax for inference.

Parameter: model name and input column name of the inference task

Return type: float

- `db4ai_predict_by_int32(text, VARIADIC "any")`

Description: Obtains a model whose return value is of the int32 type for model inference. This function is an internal function. You are advised to use the **PREDICT BY** syntax for inference.

Parameter: model name and input column name of the inference task

Return type: int

- `db4ai_predict_by_int64(text, VARIADIC "any")`

Description: Obtains a model whose return value is of the int64 type for model inference. This function is an internal function. You are advised to use the **PREDICT BY** syntax for inference.

Parameter: model name and input column name of the inference task

Return type: int

- `db4ai_predict_by_numeric(text, VARIADIC "any")`

Description: Obtains a model whose return value is of the numeric type for model inference. This function is an internal function. You are advised to use the **PREDICT BY** syntax for inference.

Parameter: model name and input column name of the inference task

Return type: numeric

- `db4ai_predict_by_text(text, VARIADIC "any")`

Description: Obtains a model whose return value is of the character type for model inference. This function is an internal function. You are advised to use the **PREDICT BY** syntax for inference.

Parameter: model name and input column name of the inference task

Return type: text

- `db4ai_predict_by_float8_array(text, VARIADIC "any")`

Description: Obtains a model whose return value is of the character type for model inference. This function is an internal function. You are advised to use the **PREDICT BY** syntax for inference.

Parameter: model name and input column name of the inference task

Return type: text

- `gs_explain_model(text)`

Description: Obtains the model whose return value is of the character type for text-based model parsing.

Parameter: model name

Return type: text

- `gs_ai_stats_explain(text, text[])`

Description: Prints the intelligent statistics of multiple columns in the corresponding table and columns on the current node.

Parameters: table name and column name collection.

Return type: text

- `ai_watchdog_detection_warnings()`

Description: Obtains the risk alarm information of the AI watchdog.

Parameter: none

Return type: record

- `ai_watchdog_monitor_status(int)`

Description: Obtains the monitoring information of the AI watchdog.

Parameter: Returns the upper limit of the length of the monitored sequence.

Return type: record

- `ai_watchdog_parameters()`

Description: Obtains the internal parameters or status information of the AI watchdog.

Parameter: none

Return type: record

## 7.5.36 Dynamic Data Masking Functions

### NOTE

This function is an internal function.

- `creditcardmasking(col text, letter char default 'x')`

Description: Replaces the digits before the last four bits following the col string with letters.

Parameter: Character string to be replaced or character string used for replacement

Return type: text

- `basicmailmasking(col text, letter char default 'x')`

Description: Replaces the characters before the first at sign (@) in the col string with letters.

Parameter: Character string to be replaced or character string used for replacement

Return type: text

- `fullmailmasking(col text, letter char default 'x')`  
 Description: Replaces the characters (except `@`) before the last period (`.`) in the col string with letters.  
 Parameter: Character string to be replaced or character string used for replacement  
 Return type: text
- `alldigitsmasking(col text, letter char default '0')`  
 Description: Replaces the digits in the col string with letters.  
 Parameter: Character string to be replaced or character string used for replacement  
 Return type: text
- `shufflemasking(col text)`  
 Description: Sorts the characters in the col string out of order.  
 Parameter: Character string to be replaced or character string used for replacement  
 Return type: text
- `randommasking(col text)`  
 Description: Randomizes the characters in the col string.  
 Parameter: Character string to be replaced or character string used for replacement  
 Return type: text
- `regexprmasking(col text, reg text, replace_text text, pos INTEGER default 0, reg_len INTEGER default -1)`  
 Description: Replaces the col string with a regular expression.  
 Parameters: Character string to be replaced, regular expression, replacement start position, and replacement length.  
 Return type: text

## 7.5.37 Hotkey Feature Functions

- `gs_stat_get_hotkeys_info()`  
 Description: Obtains hotkey information queried on the local node.  
 Return type: Tuple  
 Example:  

```
gaussdb=# select * from gs_stat_get_hotkeys_info() order by count, hash_value;
database_name | schema_name | table_name | key_value | hash_value | count
-----+-----+-----+-----+-----+-----
regression | public | hotkey_single_col | {22} | 1858004829 | 2
regression | public | hotkey_single_col | {11} | 2011968649 | 2
(2 rows)
```
- `gs_stat_clean_hotkeys()`  
 Description: Clears hotkey cache and resets hotkey status information.  
 Return type: bool, and the return value is always **true**.  
 Example:  

```
gaussdb=# select * from gs_stat_clean_hotkeys();
gs_stat_clean_hotkeys

```

```

-----+-----
| 0 | | 300 | 235 | 31 | 22 | 2 | 9752 | 598 | 108
| 1
8 | 18 | 0 | 77720 | 0 | 0 | 0 | 0 | 0 | 0 | 752912 |
| 0 | 0
 16574 | testdb | 3368 | 2289 | 329 | 273 | 0 | 92593 | 1113 |
524 | 4
8 | 48 | 0 | 340456 | 0 | 0 | 0 | 0 | 0 | 0 | 4124792 |
| 0 | 10
(2 rows)

```

### 7.5.39 Data Damage Detection and Repair Functions

- The restrictions for repairing file or page of the primary node are as follows.

| File Type                                                                                  | File/ Page    | Prim ary/ Stan dby | Detection and Repair                                    |
|--------------------------------------------------------------------------------------------|---------------|--------------------|---------------------------------------------------------|
| Common row-store tables (Astore and Ustore, including compressed tables), excluding index. | File and page | Prima ry           | Manual detection and repair.                            |
| Undo files (excluding undo meta)                                                           | Page          | Prima ry           | Manual detection and repair (excluding analyse verify). |
| <b>init fork</b> file for unlogged tables                                                  | File          | Prima ry           | Manual detection and repair.                            |

- `gs_verify_data_file(verify_segment bool)`  
Description: Checks whether files in the current database of the current instance are lost. The verification only checks whether intermediate segments are lost in the main file of the data table. The default value is **false**. If this parameter is set to **true**, it is a reserved parameter and not supported currently. By default, only initial users, users with the sysadmin permission, and users with the O&M administrator permission in the O&M mode can view the information. Other users can view the information only after being granted with permissions.

The returned result is as follows:

- rel\_oid** and **rel\_name** indicate the table OID and table name of the corresponding file, and **miss\_file\_path** indicates the relative path of the lost file.

Parameter description:

- verify\_segment**  
Specifies the range of files to be checked.  
The value can be **true** or **false** (default value). **true** is a reserved parameter and is not supported currently.

Return type: record

Example (The abnormal line is displayed only when an exception is detected. Otherwise, no line is displayed.):

```
gaussdb=# select * from gs_verify_data_file();
node_name | rel_oid | rel_name | miss_file_path
-----+-----+-----+-----
dn_6001_6002_6003 | 16554 | test | base/16552/24745
```

- `gs_repair_file(tableoid Oid, path text, timeout int)`

Description: Repairs the file based on the input parameters. Only the primary DN with normal primary/standby connection is supported. The parameter is set based on the OID and path returned by the `gs_verify_data_file` function. If the repair is successful, **true** is returned. If the repair fails, the failure cause is displayed. By default, only initial users, users with the sysadmin permission, and users with the O&M administrator permission in the O&M mode on the primary DN can view the information. Other users can view the information only after being granted with permissions.

---

**CAUTION**

1. If a file on a DN is damaged, a verification error at the PANIC level is reported when the DN is promoted to primary. The DN cannot be promoted to primary, which is normal.
2. If a file exists but its size is 0, the file will not be repaired. To repair the file, you need to delete the file whose size is 0 and then repair it.
3. You can delete a file only after the file descriptor is automatically closed. You can manually restart the process or perform a primary/standby switchover.

---

Parameter description:

- `tableoid`

OID of the table corresponding to the file to be repaired. Set this parameter based on the **rel\_oid** column in the list returned by the **gs\_verify\_data\_file** function.

Value range: OID ranging from 0 to 4294967295. Note: A negative value will be forcibly converted to a non-negative integer.

- `path`

Path of the file to be repaired. Set this parameter based on the **miss\_file\_path** column in the list returned by the **gs\_verify\_data\_file** function.

Value range: a string

- `timeout`

Specifies the duration for waiting for the standby DN to replay. The repair file needs to wait for the standby DN to be put back to the corresponding location on the current primary DN. Set this parameter based on the replay duration of the standby DN.

Value range: 60s to 3600s.

Return type: Boolean

Example (Set **tablespace** and **path** based on the output of `gs_verify_data_file`):

```
gaussdb=# select * from gs_repair_file(16554,'base/16552/24745',360);
gs_repair_file
```

t

- `local_bad_block_info()`

Description: Displays the page damage of the instance. You can read the page from the disk and record the page CRC failure. By default, only initial users, users with the sysadmin permission, users with the monitor administrator permission, users with the O&M administrator permission in the O&M mode, and monitor users can view the information. Other users can view the information only after being granted with permissions. **file\_path** indicates the relative path of the damaged file. **block\_num** indicates the number of the page where the file is damaged. The page number starts from 0. **check\_time** indicates the time when the page damage is detected. **repair\_time** indicates the time when the page is repaired.

Return type: record

Example (Related entries are displayed only when there are damaged records. Otherwise, no log is displayed.):

```
gaussdb=# select * from local_bad_block_info();
node_name | spc_node | db_node | rel_node | bucket_node | fork_num | block_num | file_path |
check_time | repair_time
-----+-----+-----+-----+-----+-----+-----+-----+
dn_6001_6002_6003| 1663 | 16552 | 24745 | -1 | 0 | 0 | base/16552/24745 |
2022-01-13 20:19:08.385004+08 | 2022-01-13 20:19:08.407314+08
```

- `remote_bad_block_info()`

Description: Queries the page damage of other instances except the current instance when a query is performed on the CN. The recorded data is the same as that of the **local\_bad\_block\_info** function executed on other instances. The execution result on the DN is empty. By default, only initial users, users with the sysadmin permission, users with the monitor administrator permission, users with the O&M administrator permission in the O&M mode, and monitor users can view the information. Other users can view the information only after being granted with permissions.

Return type: record

- `local_clear_bad_block_info()`

Description: Deletes data of repaired pages from **local\_bad\_block\_info**, that is, information whose **repair\_time** is not empty. By default, only initial users, users with the sysadmin permission, users with the O&M administrator permission in the O&M mode, and monitor users can view the information. Other users can view the information only after being granted with permissions.

Return type: bool

Example:

```
gaussdb=# select * from local_clear_bad_block_info();
result

t
```

- `remote_clear_bad_block_info()`

Description: Clears the data of the repaired pages of other instances except the current instance when this function is executed on the CN, that is, information whose **repair\_time** is not empty. The execution result on the DN is empty. By default, only initial users, users with the sysadmin permission,

users with the O&M administrator permission in the O&M mode, and monitor users can view the information. Other users can view the information only after being granted with permissions.

Return type: record

- `gs_verify_and_tryrepair_page` (path text, blocknum Oid, verify\_mem bool, is\_segment bool)

Description: Verifies the page specified by the instance. By default, only initial users, users with the sysadmin permission, and users with the O&M administrator permission in the O&M mode on the primary DN can view the information. Other users can view the information only after being granted with permissions. In the command output, **disk\_page\_res** indicates the verification result of the page on the disk, **mem\_page\_res** indicates the verification result of the page in the memory, and **is\_repair** specifies whether the repair function is triggered during the verification. **t** indicates that the page is repaired, and **f** indicates that the page is not repaired.

Note:

- a. If a page on a DN is damaged, a verification error at the PANIC level is reported when the DN is promoted to primary. The DN cannot be promoted to primary, which is normal. Damaged pages of hash bucket tables cannot be repaired.
- b. The repair triggered by this function can only repair pages in the memory. The repair takes effect only after the memory pages are flushed to disks.

Parameter description:

- path

Path of the damaged file. Set this parameter based on the **file\_path** column in `local_bad_block_info`. To verify the undo pages of the Ustore table, enter the path of the undo pages to be verified.

Value range: a string

- blocknum

Page number of the damaged file. Set this parameter based on the **block\_num** column in `local_bad_block_info`. To verify the undo pages of the Ustore table, enter the path of the undo pages to be verified.

Value range: OID ranging from 0 to 4294967295. Note: A negative value will be forcibly converted to a non-negative integer.

- verify\_mem

Specifies whether to verify a specified page in the memory. If this parameter is set to **false**, only pages on the disk are verified. If this parameter is set to **true**, pages in the memory and on the disk are verified. If a page on the disk is damaged, the system verifies the basic information of the page in the memory and flushes the page to the disk to restore the page. If a page is not found in the memory during memory page verification, the page on the disk is read through the memory API. During this process, if the disk page is faulty, the remote read automatic repair function is triggered.

Value range: The value is of a Boolean type and can be **true** or **false**.

- is\_segment

Determines whether the table is a segment-page table. **false** indicates that the table is not a segment-page table. **true** indicates a reserved parameter value, which is not supported currently.

Value range: The value is of a Boolean type and can be **true** or **false**.

Return type: record

Examples (Transfer parameters based on the output of `local_bad_block_info`. Otherwise, an error is reported.):

```
gaussdb=# select * from gs_verify_and_tryrepair_page('base/16552/24745',0,false,false);
node_name | path | blocknum | disk_page_res | mem_page_res | is_repair
-----+-----+-----+-----+-----+-----
dn_6001_6002_6003 | base/16552/24745 | 0 | page verification succeeded. | | f
```

- `gs_repair_page(path text, blocknum oid is_segment bool, timeout int)`

Description: Restores the specified page of the instance. This function can be used only by the primary DN that is properly connected to the primary and standby DNs. By default, only initial users, users with the sysadmin permission, and users with the O&M administrator permission in the O&M mode on the primary DN can view the information. Other users can view the information only after being granted with permissions.

Note: If a page on a DN is damaged, a verification error at the PANIC level is reported when the DN is promoted to primary. The DN cannot be promoted to primary, which is normal. Damaged pages of hash bucket tables cannot be repaired.

Parameter description:

- path

Path of the damaged page. Set this parameter based on the **file\_path** column in **local\_bad\_block\_info** or the **path** column in the **gs\_verify\_and\_tryrepair\_page** function.

Value range: a string

- blocknum

Number of the damaged page. Set this parameter based on the **block\_num** column in **local\_bad\_block\_info** or the **blocknum** column in the **gs\_verify\_and\_tryrepair\_page** function.

Value range: OID ranging from 0 to 4294967295. Note: A negative value will be forcibly converted to a non-negative integer.

- is\_segment

Determines whether the table is a segment-page table. **false** indicates that the table is not a segment-page table. **true** indicates a reserved parameter value, which is not supported currently.

Value range: The value is of a Boolean type and can be **true** or **false**.

- timeout

Duration of waiting for standby DN replay. The page to be repaired needs to wait for the standby DN to be played back to the location of the current primary DN. Set this parameter based on the replay duration of the standby DN.

Value range: 60s to 3600s.

Return type: Boolean

Examples (Transfer parameters based on the output of `local_bad_block_info`. Otherwise, an error is reported.):

```
gaussdb=# select * from gs_repair_page('base/16552/24745',0,false,60);
result

t
```

- `gs_edit_page_bypath`(path text, blocknum int64, offset int, data text, data\_size int, read\_backup bool, storage\_type text)

Description: Transfers the path, block number, offset, target data to be modified, and length of the target table file, and modifies the target data to the corresponding fields on the page. The **read\_backup** column determines the file reading mode, and the **storage\_type** column indicates the file storage mode (for example, page storage). To prevent incorrect modification, this function does not directly modify the original page but modifies the copied page and flushes the modified page to the specified path. Only the system administrator or O&M administrator in O&M mode can execute this function. In a distributed environment, this function must be executed on DNs.

Return type: text

**Table 7-136** `gs_edit_page_bypath` parameters

| Category        | Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input parameter | path      | text   | Physical file path of the file to be modified, which is related to the <b>read_backup</b> field. The value can be the relative path of the file in the database directory or the absolute path of files such as the backup file. If the target file does not exist or fails to be read, an error message is displayed. <ul style="list-style-type: none"> <li>• If <b>read_backup</b> is <b>false</b>, the path format is <i>tablespace name/database oid/table relfilenode (physical file name)</i>. For example, <b>base/16603/16394</b>.</li> <li>• If <b>read_backup</b> is <b>true</b>, <b>path</b> is a valid path. In this case, because other information about the input file cannot be obtained, you need to ensure that the input data is correct.</li> </ul> Note: Only U-page and UB-tree data pages can be edited and modified in page mode. Tables with tablespaces are not supported. Other information about the input file cannot be obtained. Therefore, you need to ensure that the input data type is correct. |
| Input parameter | blocknum  | bigint | Block number of the page to be repaired.<br>Value range: 0 to <i>MaxBlockNumber</i> .<br>Reads the page corresponding to the specified physical or logical block number based on the <b>read_backup</b> field. If the specified block number is out of range, an error message is returned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Category         | Parameter    | Type | Description                                                                                                                                                                                                                                                                                                |
|------------------|--------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input parameter  | offset       | int  | In-page offset of the field to be modified.<br>Value range: 0 to <i>BLCKSZ</i> .<br>If the specified value is less than 0 or greater than that of <b>BLCKSZ</b> , the system view is used to return the corresponding error information.                                                                   |
| Input parameter  | data         | text | Type of the target value to be modified.<br>Type: <ul style="list-style-type: none"> <li>• '0x': hexadecimal.</li> <li>• '0b': binary.</li> <li>• '0s': character string.</li> </ul> Others: If the value of the data parameter is not one of the preceding types, the data is a decimal character string. |
| Input parameter  | data_size    | int  | Length of the written data, in bytes.<br>Value range: 1 to 8.<br>If the specified write length is less than 1 byte or greater than 8 bytes, or the sum of offset and data_size is greater than the value of <b>BLCKSZ</b> , the system view is used to return the corresponding error information.         |
| Input parameter  | read_backup  | bool | Specifies whether to read pages from the backup directory. If this parameter is set to <b>false</b> , the target page is read based on the logical block number. Otherwise, the page is read based on the physical block number.                                                                           |
| Input parameter  | storage_type | text | File storage mode. Currently, only the page storage mode is supported. This parameter is optional. <ul style="list-style-type: none"> <li>• 'page': page mode.</li> <li>• 'segment': segment-page mode. This parameter is reserved and is not supported currently.</li> </ul>                              |
| Output parameter | output_msg   | text | If the modification is successful, the absolute path of the modified file is returned. The modified file is stored in the <b>pg_log/dump</b> directory. If the modification fails, a failure message is returned.                                                                                          |

Note: In the example, transfer parameters based on the parameter description and use the actual physical path.

Example 1: Overwrite the data whose value is **0X1FFF** at the offset of 16 bytes on page 0 in the **base/15808/25075** table.

```
gaussdb=# select gs_edit_page_bypath('base/15808/25075',0,16,'0x1FFF', 2, false, 'page');
 gs_edit_page_bypath
```

```

/pg_log_dir/dump/1663_15808_25075_0.editpage
(1 rows)
```

Example 2: If the input parameter does not comply with the specifications, an error message is returned.

```
gaussdb=# select gs_edit_page_bypath('base/15808/25075', 0,16,'@1231!', 8, false, 'page');
 gs_edit_page_bypath
```

```

Error: the parameter 'data' decode failed.
(1 row)
```

Example 3: When the data to be written is the same as the original value, an alarm is returned.

```
gaussdb=# select gs_edit_page_bypath('/pg_log_dir/dump/1663_15808_25075_0.editpage',
 0,16,'0x1FFF', 2, true, 'page');
 gs_edit_page_bypath
```

```

Warning: source buffer is consistent with target buffer.
(1 row)
```

- `gs_repair_page_bypath(src_path text, src_blkno int64, dest_path text, dest_blkno int64, storage_type text)`

Description: Transfers the path and page number of the source file, and writes the page to the specified page number of the target file. You can repair the pages of the primary node through the standby node. In addition, you can initialize bad blocks in this view. In a distributed environment, this function must be executed on DNs.

- a. The target page is overwritten and synchronized to the standby node. The page-based modification object supports the U-heap and UB-tree pages. The Undo Record page, Undo Slot page, compressed table, and Astore page will be supported later. System catalog files and data sections cannot be modified.
- b. With this function, you can overwrite target pages during the write operation. Before overwriting, the target page is backed up and flushed to a specified directory. The backup page can be rewritten back to the target page. If an ordinary table is modified on the primary node, a new WAL is generated and synchronized to the standby node. If an ordinary table is modified on the standby node, no WAL is recorded.
- c. The repair view applies only to the primary node in a centralized or distributed system or the standby node when the read function is enabled on the standby node. Only the system administrator or O&M administrator in O&M mode can use this function. All modifications will be recorded in database logs. In addition, you are advised to enable the audit logging function of system functions before using this function to record audit information.
- d. The LSNs of the source and target pages must be the same. Otherwise, the repair fails.

Return type: text

**CAUTION**

Calling this system function is a high-risk operation. Exercise caution when performing this operation.

---

| Category         | Parameter    | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|--------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input parameter  | src_path     | text   | <p>Path of the source file. The following types of paths are supported:</p> <ul style="list-style-type: none"> <li>• Data files and index files: <b>pg_log/dump/1663_15808_25075_0.editpage</b>.</li> <li>• <b>src_path</b> is set to <b>'standby'</b> on the primary node. That is, pages are read from the standby node to repair the primary node.</li> <li>• <b>src_path</b> is set to <b>init_block</b> on the primary node to allow skipping bad blocks in extreme scenarios.</li> </ul> |
| Input parameter  | src_blkno    | bigint | <p>Physical block number of the source page.<br/>Value range: 0 to <i>MaxBlockNumber</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                  |
| Input parameter  | dest_path    | text   | <p>Relative path of the target file. | Input parameter  | dest_blkno   | bigint | <p>Logical block number of the target page.<br/>Value range: 0 to <i>MaxBlockNumber</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                   |
| Input parameter  | storage_type | text   | <p>Storage mode of the target file. Currently, only the page storage mode is supported. This parameter is optional.</p> <ul style="list-style-type: none"> <li>• <b>'page'</b>: page mode.</li> <li>• <b>'segment'</b>: segment-page. This parameter is reserved and is not supported currently.</li> </ul>                                                                                                                                                                                    |
| Output parameter | output_msg   | text   | <p>If the write overwrite operation is successful, the backup path of the target page is returned. If the write overwrite operation fails, an error message is returned. The format of the flushed file name is <i>relfilepath_blocknum_timestamp.repairpage</i>.</p>                                                                                                                                                                                                                          |

Note: Transfer parameters based on the preceding table and ensure that the physical file exists. If the input parameter is abnormal or the restoration fails, an error is reported.

Example 1: Enter a file in a specified path to overwrite the target file.

```
gaussdb=# select * from gs_repair_page_bypath('pg_log/dump/1663_15991_16767_0.editpage', 0,
'base/15991/16767', 0, 'page');
 output_msg

/pg_log_dir/dump/1663_15991_16767_0_738039702421788.repairpage
(1 row)
```

Example 2: Read pages from the standby node to repair the primary node.

```
gaussdb=# select * from gs_repair_page_bypath('standby', 0, 'base/15990/16768', 0, 'page');
 output_msg

/pg_log_dir/dump/1663_15990_16768_0_738040397197907.repairpage
(1 row)
```

Example 3: Initialize the target page and skip bad blocks.

```
gaussdb=# select * from gs_repair_page_bypath('init_block', 0, 'base/15990/16768', 0, 'page');
 output_msg

/pg_log_dir/dump/1663_15990_16768_0_738040768010281.repairpage
(1 row)
```

- `gs_repair_undo_byzone(zone_id int)`

Description: Transfers the ID of the undo zone to be repaired, repairs the metadata of the target undo zone, and returns the repair result details. If the undo zone is not repaired, no information is output.

Return type: record

Note: Currently, the function can be called only on the primary node. After the repair is successful, the repair will be synchronized to the standby node by recording Xlogs. The caller must be a system administrator or an O&M administrator in O&M mode. You are advised to enable the audit logging function before using the function to record audit information.

 **CAUTION**

Calling this system function is a high-risk operation. Exercise caution when performing this operation.

**Table 7-137** `gs_repair_undo_byzone` parameters

| Category         | Parameter | Type | Description                                                                                                                                                                                                              |
|------------------|-----------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input parameter  | zone_id   | int  | Undo zone ID: <ul style="list-style-type: none"> <li>• <b>-1</b>: repairs the metadata of all undo zones.</li> <li>• <b>0 to 1048575</b>: repairs the metadata of the undo zone corresponding to the zone ID.</li> </ul> |
| Output parameter | zone_id   | int  | Undo zone ID.                                                                                                                                                                                                            |

| Category         | Parameter     | Type | Description                                                                                                                                                                                                                               |
|------------------|---------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Output parameter | repair_detail | text | Repair result of the undo zone metadata corresponding to the zone ID. If the repair is successful, "rebuild undo meta succeed." is displayed. If the repair fails, "rebuild undo meta failed." as well as the failure cause is displayed. |

Note: The output is one of the three cases based on the repair result.

Example 1: If the undo zone meta information corresponding to the entered **zone\_id** is not damaged, no output is expected.

```
gaussdb=# select * from gs_repair_undo_byzone(4);
zone_id | repair_detail
-----+-----
(0 rows)
```

Example 2: If the undo zone metadata corresponding to the entered **zone\_id** is successfully restored, the system displays a message indicating that the restoration is successful.

```
gaussdb=# select * from gs_repair_undo_byzone(78);
zone_id | repair_detail
-----+-----
 78 | rebuild undo meta succeed.
(1 row)
```

Example 3: If the undo zone metadata corresponding to the entered zone ID fails to be repaired, the detailed information about the repair failure is displayed.

```
gaussdb=# select * from gs_repair_undo_byzone(0);
zone_id | repair_detail
-----+-----
 0 | rebuild undo meta failed. try lock undo zone_id failed.
(1 row)
```

#### NOTE

If the undo zone to be repaired is damaged and the zone ID is occupied by another active thread, calling this repair function will end the thread that occupies the zone ID and forcibly repair the damaged undo zone metadata.

- `gs_verify_urq(index_oid oid, partindex_oid oid, blocknum bigint, queue_type text)`

Description: Verifies the correctness of the index recycling queue (potential queue/available queue/single page).

Parameter description: See [Table 7-138](#).

Return type: record

**Table 7-138** gs\_verify\_urq parameters

| Category         | Parameter     | Type   | Description                                                                                                                                                                                                                                                                                                                 |
|------------------|---------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input parameter  | index_oid     | oid    | UB-tree index OID.<br><ul style="list-style-type: none"> <li>Common index: index OID.</li> <li>Global index: GPI OID.</li> <li>Local index: OID of the primary index.</li> </ul>                                                                                                                                            |
| Input parameter  | partindex_oid | oid    | UB-Tree partitioned index OID:<br><ul style="list-style-type: none"> <li>Common index: 0.</li> <li>Global index: 0.</li> <li>Local index: OID of the partitioned index (primary or secondary).</li> </ul>                                                                                                                   |
| Input parameter  | blocknum      | bigint | Specifies the page number:<br><ul style="list-style-type: none"> <li>If the queue type is single page, the correctness of all tuples of <b>blocknum</b> on a single page is verified. The value range is [0, Queue file size/8192).</li> <li>If the queue is empty or free, <b>blocknum</b> is an invalid value.</li> </ul> |
| Input parameter  | queue_type    | text   | Specifies the queue type:<br><ul style="list-style-type: none"> <li><b>empty queue</b>: potential queue</li> <li><b>free queue</b>: available queue</li> <li><b>single page</b>: single-page queue</li> </ul>                                                                                                               |
| Output parameter | error_code    | text   | Error code                                                                                                                                                                                                                                                                                                                  |
| Output parameter | detail        | text   | Detailed error information and other key information.                                                                                                                                                                                                                                                                       |

Example 1: When using the example, transfer parameters based on the parameter description and use the actual OID and **blocknum**. Otherwise, an error is reported.

```
gaussdb=# select * from gs_verify_urq(16387, 0, 1, 'free queue');
error_code | detail
-----+-----
(0 rows)
```

Example 2: When using the example, transfer parameters based on the parameter description and use the actual OID and **blocknum**. Otherwise, an error is reported.

```
gaussdb=# select * from gs_verify_urq(16387, 0, 1, 'empty queue');
error_code |
```

```

detail

+-----+
VERIFY_URQ_PAGE_ERROR | invalid urq meta: oid 16387, blkno 1, head_blkno = 1, tail_blkno = 3,
nblocks_upper = 4294967295, nblocks_lower = 1; urq_blocks = 6, index_blocks = 12
(1 row)

```

 **NOTE**

Currently, this API supports only Ustore index tables. If the verification of the index recycling queue is normal, the view does not display the error code and error details. Otherwise, the view displays the error code and error details. The error codes include "VERIFY\_URQ\_PAGE\_ERROR", "VERIFY\_URQ\_LINK\_ERROR", "VERIFY\_URQ\_HEAD\_MISSED\_ERROR", and "VERIFY\_URQ\_TAIL\_MISSED\_ERROR". If any of the preceding error codes is displayed, contact Huawei engineers to locate the fault.

- `gs_urq_dump_stat(index_oid oid, partindex_oid oid)`

Description: Queries information about a specified index recycling queue.

In the return result, **recentGlobalDataXmin** and **globalFrozenXid** are two oldestxmins used by the recycling queue to determine whether the index page can be recycled, **next\_xid** is the XID of the next latest transaction, **urq\_blocks** indicates the total number of pages in the recycling queue and information about valid pages in the free queue (available queue) and empty queue (potential queue).

Parameter description: See [Table 7-139](#).

**Table 7-139** `gs_urq_dump_stat` parameters

| Category         | Parameter                  | Type | Description                                                                                                                                                                                                     |
|------------------|----------------------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input parameter  | <code>index_oid</code>     | oid  | UB-tree index OID.<br><ul style="list-style-type: none"> <li>• Common index: index OID.</li> <li>• Global index: GPI OID.</li> <li>• Local index: OID of the primary index.</li> </ul>                          |
| Input parameter  | <code>partindex_oid</code> | oid  | UB-Tree partitioned index OID:<br><ul style="list-style-type: none"> <li>• Common index: 0.</li> <li>• Global index: 0.</li> <li>• Local index: OID of the partitioned index (primary or secondary).</li> </ul> |
| Output parameter | <code>result</code>        | text | Detailed statistics about the index recycling queue.                                                                                                                                                            |

Note: When using the example, transfer parameters based on the parameter description and use the actual OID. Otherwise, an error is reported.

Example:

```

gaussdb=# select * from gs_urq_dump_stat(16387, 0);
 result

```

```

urq stat info: recentGlobalDataXmin = 213156, globalFrozenXid = 213156, next_xid = 214157,
urq_blocks = 6,
free queue: head page blkno = 0 min_xid = 211187 max_xid = 214157, tail page blkno = 0
min_xid = 211187 max_xid = 214157,+
middle page min_xid = 1152921504606846975 max_xid = 0, valid_pages = 1, valid_items =
6, can_use_item = 3
empty queue: head page blkno = 1 min_xid = 212160 max_xid = 213160, tail page blkno = 3
min_xid = 213162 max_xid = 214156,+
middle page min_xid = 1152921504606846975 max_xid = 0, valid_pages = 2, valid_items =
999, can_use_item = 498
(1 row)
```

 **NOTE**

Currently, this API supports only Ustore index tables.

- gs\_repair\_urq(index\_oid oid, partindex\_oid oid)**  
 Description: Repairs (with loss) index recycling queues (potential and available queues). The recycling queue file of the current index is deleted and an empty recycling queue file is created. If the repair is successful, **reinitial the recycle queue of index relation successfully** is displayed.  
 Parameter description: See [Table 7-140](#).  
 Note: The current function can be called only on the primary node.

**Table 7-140** gs\_repair\_urq parameters

| Category         | Parameter     | Type | Description                                                                                                                                                                                               |
|------------------|---------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input parameter  | index_oid     | oid  | UB-tree index OID.<br><ul style="list-style-type: none"> <li>Common index: index OID.</li> <li>Global index: GPI OID.</li> <li>Local index: OID of the primary index.</li> </ul>                          |
| Input parameter  | partindex_oid | oid  | UB-Tree partitioned index OID:<br><ul style="list-style-type: none"> <li>Common index: 0.</li> <li>Global index: 0.</li> <li>Local index: OID of the partitioned index (primary or secondary).</li> </ul> |
| Output parameter | result        | text | If the repair is successful, <b>reinitial the recycle queue of index relation successfully</b> is displayed.                                                                                              |

Example: When using the example, transfer parameters based on the parameter description and use the actual OID and **blocknum**. Otherwise, an error is reported.

```
gaussdb=# select * from gs_repair_urq(16387, 0);
result
```

```
reinitial the recycle queue of index relation sucessfully.
(1 row)
```

 **NOTE**

Currently, this API supports only Ustore index tables.

- `gs_get_standby_bad_block_info()`

Description: Displays the pages that have been detected on the standby node but have not been repaired. By default, only initial users, users with the sysadmin permission, users with the O&M administrator permission in the O&M mode, and users with the monitor administrator permission on the standby DN can view the information. Other users can view the information only after being granted with permissions. There are four return values in the **invalid\_type** column: **NOT\_PRESENT** (the page does not exist), **NOT\_INITIALIZED** (the page initialization fails), **LSN\_CHECK\_ERROR** (the LSN check fails), and **CRC\_CHECK\_ERROR** (the CRC check fails).

Return type: record

Example: If no page is detected but not repaired, no line is displayed.

```
gaussdb=# select * from gs_get_standby_bad_block_info();
 spc_node | db_node | rel_node | bucket_node | fork_num | block_num | invalid_type |
master_page_lsn
-----+-----+-----+-----+-----+-----+-----+-----
 1663 | 16552 | 24745 | -1 | 0 | 0 | CRC_CHECK_ERROR | 0/B2009E8
(1 rows)
```

## 7.5.40 Functions of the XML Type

- `xmlparse ( { DOCUMENT | CONTENT } value [wellformed])`

Description: Generates XML values from character data.

Parameter: data of the TEXT type

Return type: XML

Example:

```
gaussdb=# SELECT XMLPARSE (DOCUMENT '<?xml version="1.0"?><book><title>Manual/<
title><chapter>...</chapter></book>');
 xmlparse

<book><title>Manual</title><chapter>...</chapter></book>
(1 row)
gaussdb=# SELECT XMLPARSE (CONTENT 'abc<foo>bar</foo><bar>foo</bar>');
 xmlparse

abc<foo>bar</foo><bar>foo</bar>
(1 row)
gaussdb=# SELECT XMLPARSE (CONTENT 'abc<foo>bar</foo>' wellformed);
 xmlparse

abc<foo>bar</foo>
(1 row)
```

- `xmlserialize( { DOCUMENT | CONTENT } value AS type )`

Description: Generates a string from an XML file.

Parameter: The type can be character, character varying, text, or any variant of them.

Return type: XML

Example:

```
gaussdb=# SELECT XMLSERIALIZE(CONTENT 'good' AS CHAR(10));
xmlserialize
```

```

good
(1 row)
gaussdb=# SELECT xmlserialize(DOCUMENT '<head>bad</head>' as text);
xmlserialize

<head>bad</head>
(1 row)

```

### NOTE

If a string value is converted to XML without using the XMLPARSE or XMLSERIALIZE function, the **XML OPTION** session parameter determines the value: **DOCUMENT** or **CONTENT**. The **XML OPTION** session parameter can be set by the standard command.

```
SET XML OPTION { DOCUMENT | CONTENT };
```

Or use similar syntax to set this parameter.

```
SET xmloption TO { DOCUMENT | CONTENT };
```

- **xmlcomment(text)**

Description: Creates an XML value that contains an XML comment with the specified text as the content. The text does not contain the "--" character and does not end with a "-" character. Besides, the text should meet the format requirements of XML comments. If the parameter is empty, the result is also empty.

Parameter: data of the TEXT type

Return type: XML

Example:

```

gaussdb=# SELECT xmlcomment('hello');
xmlcomment

<!--hello-->

```

- **xmlconcat(xml[, ...])**

Description: Concatenates a list of single XML values into a single value that contains an XML content fragment. Null values are ignored, and the result is null only when all parameters are null. In ORA-compatible mode, you can set **a\_format\_version** to **10c** and **a\_format\_dev\_version** to **s2** to check whether the input segment is well-formed XML text.

Parameter: data of the XML type.

Return type: XML

Example 1:

```

gaussdb=# SET xmloption=content;
SET
gaussdb=# SELECT XMLCONCAT(('<?xml version="1.0" encoding="GB2312" standalone="no"?
><bar>foo</bar>'),('<?xml version="1.0" encoding="GB2312" standalone="no" ?><bar>foo</bar>'));
xmlconcat

<?xml version="1.0" standalone="no"?><bar>foo</bar><bar>foo</bar>
(1 row)
gaussdb=# SELECT XMLCONCAT('abc');
xmlconcat

abc>
(1 row)

```

Example 2: Syntax of the ORA-compatible database

```

gaussdb=# CREATE DATABASE gaussdb_ora DBCOMPATIBILITY='ORA';
CREATE DATABASE
gaussdb=# \c gaussdb_ora

```

```
gaussdb_ora=# SET a_format_version='10c';
SET
gaussdb_ora=# SET a_format_dev_version=s2;
SET
gaussdb_ora=# SET xmloption=content;
SET
gaussdb_ora=# SELECT XMLCONCAT(('<?xml version="1.0" encoding="GB2312" standalone="no"?
><bar>foo</bar>'),('<?xml version="1.0" encoding="GB2312" standalone="no" ?><bar>foo</bar>')) ;
 xmlconcat

<?xml version="1.0" standalone="no"?><bar>foo</bar><bar>foo</bar>
(1 row)

gaussdb_ora=# SELECT XMLCONCAT('abc>');
ERROR: invalid XML document
DETAIL: line 1: Start tag expected, '<' not found
abc>
^
CONTEXT: referenced column: xmlconcat
gaussdb_ora=# \c postgres
gaussdb=# DROP DATABASE gaussdb_ora;
DROP DATABASE
```

- `xmlagg(xml [order_by_clause])`

Description: Concatenates the input values called by the aggregate function. Cross-line concatenation is supported. For details about **order\_by\_clause**, see [SELECT](#). In ORA-compatible database mode, you can set **a\_format\_version** to **10c** and **a\_format\_dev\_version** to **s2**. The **xmloption** parameter of the database is set to **content** by default. When **xmloption** is set to **document**, newline characters are used to concatenate multiple XML lines. If the encoding attribute value in the XML declaration is not the default UTF-8, the aggregation result contains the XML declaration.

Parameter: XML

Return type: XML

Example 1:

```
gaussdb=# CREATE TABLE xmltest (
 id int,
 data xml
);
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'id' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
gaussdb=# INSERT INTO xmltest VALUES (1, '<value>one</value>');
INSERT 0 1
gaussdb=# INSERT INTO xmltest VALUES (2, '<value>two</value>');
INSERT 0 1
gaussdb=# SELECT xmlagg(data) FROM xmltest;
 xmlagg

<value>one</value><value>two</value>
(1 row)
```

Example 2: Syntax of the ORA-compatible database

```
gaussdb=# SET xmloption=document;
SET
gaussdb=# SELECT xmlagg(data) FROM xmltest;
 xmlagg

<value>one</value>+
<value>two</value>
(1 row)
gaussdb=# DELETE FROM XMLTEST;
DELETE 2
gaussdb=# INSERT INTO xmltest VALUES (1, '<?xml version="1.0" encoding="GBK"?><value>one</
value>');
INSERT 0 1
```

```
gaussdb=# INSERT INTO xmltest VALUES (2, '<?xml version="1.0" encoding="GBK"?><value>two</value>');
INSERT 0 1
gaussdb=# SELECT xmlagg(data) FROM xmltest;
 xmlagg

<?xml version="1.0" encoding="GBK"?><value>one</value>+
<value>two</value>
(1 row)
gaussdb=# SELECT xmlagg(data order by id desc) FROM xmltest;
 xmlagg

<?xml version="1.0" encoding="GBK"?><value>two</value>+
<value>one</value>
(1 row)

gaussdb=# DROP TABLE xmltest;
```

- xmlelement**( [ ENTITYESCAPING | NOENTITYESCAPING ] { [ NAME ] element\_name | EVALNAME element\_name } [ , xmlattributes( [ ENTITYESCAPING | NOENTITYESCAPING ] value [ [ AS ] attrname | AS EVALNAME attrname ] [ , ... ] ) ] [ , content [ [ AS ] alias ] [ , ... ] ] )

Description: Generates an XML element with the given name, attribute, and content.

Return type: XML

Example:

```
gaussdb=# SELECT xmlelement(name foo);
xmlelement

<foo/>

-- In ORA-compatible mode:
gaussdb=# CREATE DATABASE gaussdb_ora DBCOMPATIBILITY='ORA';
CREATE DATABASE
gaussdb=# \c gaussdb_ora
gaussdb_ora=# SET a_format_version='10c';
SET
gaussdb_ora=# SET a_format_dev_version=s2;
SET
-- If the keyword ENTITYESCAPING is not set in XMLElement by default or is set, the reserved
characters in the content of XMLElement are escaped.
gaussdb_ora=# SELECT xmlelement("entityescaping<>", 'a$<&"b');

 xmlelement

<entityescaping<>><abc/></entityescaping<>>
(1 row)

gaussdb_ora=# SELECT xmlelement("entityescaping<>", xml('<abc/>') as b);
 xmlelement

<entityescaping<>><abc/></entityescaping<>>
(1 row)

-- If the keyword ENTITYESCAPING is not set in XMLAttributes by default or is set, the reserved
characters in XMLAttributes are escaped.
gaussdb_ora=# SELECT xmlelement("entityescaping<>", xmlattributes('entityescaping<>'
"entityescaping<>"));
 xmlelement

<entityescaping<> entityescaping<>="entityescaping<>"/>
(1 row)

gaussdb_ora=# SELECT xmlelement(name "entityescaping<>", xmlattributes(entityescaping
'entityescaping<>' "entityescaping<>"));
 xmlelement

<entityescaping<> entityescaping<>="entityescaping<>"/>
(1 row)

-- When the NOENTITYESCAPING keyword is set in XMLAttributes, the reserved characters in
XMLAttributes will not be escaped.
gaussdb_ora=# SELECT xmlelement("entityescaping<>", xmlattributes(noentityescaping
'entityescaping<>' "entityescaping<>"));
 xmlelement

<entityescaping<> entityescaping<>="entityescaping<>"/>
(1 row)

gaussdb_ora=# \c postgres
gaussdb=# DROP DATABASE gaussdb_ora;
DROP DATABASE

```

#### NOTE

1. For **xmlelement** and **xmlattributes**, when the value of **name** is **NULL**, the database behavior is different from that of the O database. When the **name** field of **xmlelement** is set to **NULL**, the name information is empty and the attribute information is not displayed. When the **name** field of **xmlattributes** is set to **NULL**, the attribute information is not displayed.
  2. After the following two parameters are set, the content escape rule of **xmlelement** is ORA compatible. If the two parameters are not set, the content escape rule of **xmlelement** is PG compatible.

```

SET a_format_version='10c';
SET a_format_dev_version=s2;

```
- **xmlforest**(content [AS name] [, ...])  
Description: Generates an XML sequence of elements using the given name and content.

Return type: XML

Example:

```
gaussdb=# SELECT xmlforest('abc' AS foo, 123 AS bar);
xmlforest

<foo>abc</foo><bar>123</bar>
```

- `xmlpi(name target [, content])`

Description: Creates an XML processing instruction. If the content is not empty, the content cannot contain character collations.

Return type: XML

Example:

```
gaussdb=# SELECT xmlpi(name php, 'echo "hello world";');
xmlpi

<?php echo "hello world";?>
```

- `xmlroot(xml, version text | no value [, standalone yes|no|no value])`

Description: Modifies the attributes of the root node of an XML value. If a version is specified, it replaces the value in the version declaration of the root node. If a standalone property is specified, it replaces the value of standalone declaration in the root node.

Example:

```
gaussdb=# SELECT xmlroot('<?xml version="1.1"?><content>abc</content>',version '1.0', standalone yes);
xmlroot

<?xml version="1.0" standalone="yes"?><content>abc</content>
(1 row)
```

- `xmlexists(text passing [BY REF] xml [BY REF])`

Description: Evaluates an XPath 1.0 expression (the first parameter) with the passed XML value as its context item. If the evaluation result generates an empty set of nodes, the function returns **false**. If any other value is generated, the function returns **true**. If the value of any parameter is null, the function returns **Null**. The non-null value passed as a context item must be an XML document, not a content fragment or any non-XML value.

Parameter: XML

Return type: Boolean

Example:

```
gaussdb=# SELECT xmlexists('/town[text() = "Toronto"]' PASSING BY REF '<towns><town>Toronto</town><town>Ottawa</town></towns>');
xmlexists

t
(1 row)
```

- `xml_is_well_formed(text)`

Description: Checks whether the text is in the correct XML format and returns a Boolean value.

Parameter: text

Return type: Boolean

Example:

```
gaussdb=# SELECT xml_is_well_formed('<>');
xml_is_well_formed

f
(1 row)
```

- `xml_is_well_formed_document(text)`

Description: Checks whether the text is in the correct XML format and returns a Boolean value.

Parameter: text

Return type: Boolean

Example:

```
gaussdb=# SELECT xml_is_well_formed_document('<pg:foo xmlns:pg="http://postgresql.org/stuff">bar</pg:foo>');
xml_is_well_formed_document

t
(1 row)
```
- `xml_is_well_formed_content(text)`

Description: Checks whether the text is in the correct XML format and returns a Boolean value.

Parameter: text

Return type: Boolean

Example:

```
gaussdb=# SELECT xml_is_well_formed_content('k');
xml_is_well_formed_content

t
(1 row)
```
- `xpath(xpath, xml [, nsarray])`

Description: Calculates an XPath 1.0 expression, for example, xpath (a text value), on XML data. It returns an array of XML values corresponding to the node set generated by the XPath expression. If the XPath expression returns a scalar value rather than a node set, a single-element array is returned.

The second parameter must be a well formed XML document. Note that it must have a single root node element.

The optional third parameter of the function is an array of namespace mappings. This array should be a two-dimensional text array with the length of the second axis being equal to 2 (that is, it should be an array of arrays, each of which consists of exactly 2 elements). The first element of each array entry is the namespace name (alias), and the second the namespace URI. It is not required that aliases provided in this array be the same as those being used in the XML document itself (that is, both in the XML document and in the XPath function context, aliases are local).

Return type: XML

Example:

```
gaussdb=# SELECT xpath('/my:a/text()', '<my:a xmlns:my="http://example.com">test</my:a>', ARRAY[ARRAY['my', 'http://example.com']]);
xpath

{test}
(1 row)
```
- `xpath_exists(xpath, xml [, nsarray])`

Description: This function is a special form of the xpath function. It returns a Boolean indicating whether the query is satisfied or not (that is, whether it produces any value other than an empty node set), instead of returning the individual XML values that satisfy the XPath 1.0 expression. This function is

equivalent to the standard XMLEXISTS predicate, but it also provides support for a namespace mapping parameter.

Return type: Boolean

Example:

```
gaussdb=# SELECT xpath_exists('/my:a/text()', '<my:a xmlns:my="http://example.com">test</my:a>', ARRAY[ARRAY['my', 'http://example.com']]);
xpath_exists

t
(1 row)
```

 **NOTE**

The following XML function examples show the data you need to prepare:

```
gaussdb=# CREATE SCHEMA testxmlschema;
CREATE SCHEMA
gaussdb=# CREATE TABLE testxmlschema.test1 (a int, b text);
CREATE TABLE
gaussdb=# INSERT INTO testxmlschema.test1 VALUES (1, 'one'), (2, 'two'), (-1, null);
INSERT 0 3
gaussdb=# CREATE DATABASE test;
CREATE DATABASE
```

-- After the example is executed, run the following commands to delete the preceding data:

```
gaussdb=# DROP DATABASE test;
DROP DATABASE
gaussdb=# DROP TABLE testxmlschema.test1;
DROP TABLE
gaussdb=# DROP SCHEMA testxmlschema;
DROP SCHEMA
```

- `query_to_xml(query text, nulls boolean, tableforest boolean, targetns text)`

Description: This function maps the contents of a query to an XML schema document.

Return type: XML

Example:

```
gaussdb=# SELECT query_to_xml('SELECT * FROM testxmlschema.test1', false, false, '');
query_to_xml

<table xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">+
+
<row>+
+
+
<a>1+
+
one+
+
</row>+
+
+
<row>+
+
+
<a>2+
+
two+
+
</row>+
+
+
<row>+
+
+
<a>-1+
+
</row>+
+
+
</table>+
(1 row)
```

- `query_to_xmlschema(query text, nulls boolean, tableforest boolean, targetns text)`

Description: This function maps the contents of a query to an XML document and an XML schema document, and joins the two documents together.

Return type: XML

**Example:**

```
gaussdb=# SELECT query_to_xmlschema('SELECT * FROM testxmlschema.test1', false, false, '');
 query_to_xmlschema
```

```

<xsd:schema +
 xmlns:xsd="http://www.w3.org/2001/XMLSchema">
 +
 <xsd:simpleType name="INTEGER"> +

</row>
(1 row)

```

- `cursor_to_xml(cursor refcursor, count int, nulls boolean, tableforest boolean, targetns text)`

Description: This function maps the contents of a cursor to an XML document.

Return type: XML

Example:

```

gaussdb=# CURSOR xc WITH HOLD FOR SELECT * FROM testxmlschema.test1 ORDER BY 1, 2;
DECLARE CURSOR
gaussdb=# SELECT cursor_to_xml('xc':refcursor, 5, false, true, '');
 cursor_to_xml

```

xsd:element>
+
</xsd:sequence>
+
</xsd:complexType>
+
+
<xsd:complexType name="TableType.regression.testxmlschema.test1">

```

 NOTE

- Different from that in database A, in PL/SQL, createxml allows input parameters to be empty strings and returns **NULL**.
- For character encoding, only UTF-8, GBK, and LATIN1 to LATIN10 are supported, and the **version** field can only be set to **1.x**.
- The createxml function can be called using the xmltype.createxml() syntax.

Example:

```
gaussdb=# SELECT xmltype.createxml('<a>123');
createxml

<a>123
(1 row)
```

- In this chapter, the function whose input parameter is xmltype() can be called in xmltype().func() mode. The XMLType type returned by a function is transferred to the next function as the input parameter. This syntax supports multi-layer nesting. (If the input parameter is defined as XMLType by a user, this syntax is not supported.)

Example:

```
gaussdb=# select xmltype('<a>123456').extract('/a/b').getstringval();
xmltypefunc

456
(1 row)
```

The actual effect of the preceding example is the same as that of the following function nesting:

```
gaussdb=# select getstringval(extractxml(xmltype('<a>123456'),'a/b'));
getstringval

456
(1 row)
```

- In a stored procedure, variables of the XMLType type can call functions in a.func() mode. This syntax supports one-layer nesting.

Example:

```
gaussdb=# declare
a xmltype;
b varchar2;
begin
a:=xmltype('<a>123456');
b:=a.getstringval();
RAISE NOTICE 'xmltype_str is : %',b;
end;
/
NOTICE: xmltype_str is : <a>123456
```

- createxml(clob [,varchar2,numeric ,numeric])

Description: Statically creates the XMLType type. The input parameters are of the CLOB type.

Parameters: The first parameter is the CLOB to be converted to XMLType (mandatory column). The second parameter is the optional schema URL used to make the input comply with the specified schema (optional column, which is empty by default and does not take effect currently). The third parameter is the flag indicating whether the instance is valid according to the given XML schema (optional column, which is **0** by default and does not take effect currently). The fourth parameter is the flag indicating whether the instance is well-formed (optional column, which is **0** by default and does not take effect currently).

Return type: XMLType

**Example:**

```
gaussdb=# declare
xmltype_clob clob;
xmltype_obj xmltype;
xmltype_str varchar2(1000);
begin
xmltype_clob := '<a>123';
xmltype_obj := createxml(xmltype_clob);
xmltype_str := xmltype_obj.getstringval();
RAISE NOTICE 'xmltype_str is : %',xmltype_str;
end;
/
NOTICE: xmltype_str is : <a>123
```

 **NOTE**

The maximum size of the input parameter of the CLOB type is 1 GB minus 1 byte.

- `createxml(blob, numeric [,varchar2,numeric ,numeric])`

Description: Statically creates the XMLType type. The input parameters are of the BLOB type.

Parameters: The first parameter is the BLOB to be converted to XMLType (mandatory column). The second parameter is the character set ID of the input XML data (mandatory column). The third parameter is the optional schema URL used to make the input comply with the specified schema (optional column, which is empty by default and does not take effect currently). The fourth parameter is the flag indicating whether the instance is valid according to the given XML schema (optional column, which is **0** by default and does not take effect currently). The fifth parameter is the flag indicating whether the instance is well-formed (optional column, which is **0** by default and does not take effect currently).

Return type: XMLType

**Example:**

```
gaussdb=# declare
xmltype_blob blob;
xmltype_obj xmltype;
xmltype_str varchar2(1000);
begin
xmltype_blob := xmltype('<a>123').getblobval(7);
xmltype_obj := createxml(xmltype_blob,7);
xmltype_str := xmltype_obj.getstringval();
RAISE NOTICE 'xmltype_str is : %',xmltype_str;
end;
/
NOTICE: xmltype_str is : <?xml version="1.0" encoding="UTF8"?>
<a>123
```

 **NOTE**

- The maximum size of input parameters of the BLOB type is 256 MB minus 1 byte.
- The character set ID ranges from 1 to 41.
- `getblobval(xmltype, numeric)`

Description: Converts the XMLType type to the BLOB type. The `xmltype().func()` method can be called.

Parameters: The first parameter is of the XMLType type, and the second parameter is the ID of the target character set to be converted.

Return type: BLOB

Example:

```
gaussdb=# SELECT getblobval(xmltype('<asd/>'),7);
 getblobval

3C3F786D6C2076657273696F6E3D22312E302220656E636F64696E673D2255544638223F3E0A3C6173
642F3E
(1 row)
```

**xmltype ().func ():**

```
gaussdb=# select xmltype('<asd/>').getblobVal(7);
 xmltypefunc

3C3F786D6C2076657273696F6E3D22312E302220656E636F64696E673D2255544638223F3E0A3C6173
642F3E
(1 row)
```

 **NOTE**

The maximum length of the input parameter of the XMLType type is 256 MB minus 1 byte.

- **getclobval(xmltype)**

Description: Converts the XMLType type to the CLOB type. The xmltype().func() method can be called.

Parameter: The input parameter is of the XMLType type.

Return type: CLOB

Example:

```
gaussdb=# SELECT getclobval(xmltype('<a>123'));
 getclobval

<a>123
(1 row)
```

**xmltype ().func ():**

```
gaussdb=# SELECT xmltype('<a>123').getclobval();
 xmltypefunc

<a>123
(1 row)
```

- **getnumberval(xmltype)**

Description: Converts the XMLType type to the numeric type. The xmltype().func() method can be called.

Parameter: The input parameter is of the XMLType type.

Return type: numeric

Example:

```
gaussdb=# SELECT getnumberval(xmltype('<a>123').extract('/a/text()));
 getnumberval

123
(1 row)
```

**xmltype ().func ():**

```
gaussdb=# SELECT xmltype('<a>123').extract('/a/text()').getnumberval();
 xmltypefunc

123
(1 row)
```

- **isfragment(xmltype)**

Description: Returns a result indicating whether the XMLType type is fragment (1) or document (0). The xmltype().func() method can be called.

Parameter: The input parameter is of the XMLType type.

Return type: numeric

Example:

```
gaussdb=# SELECT isfragment(xmltype('<a>123'));
isfragment

 0
(1 row)
```

xmltype ().func ():

```
gaussdb=# SELECT xmltype('<a>123').isfragment();
xmltypefunc

 0
(1 row)
```

- xmltype(varchar2[,varchar2,numeric ,numeric])

Description: Creates the XMLType type from the varchar2 type.

Parameters: The first parameter is the character string to be converted to XMLType (mandatory column). The second parameter is the optional schema URL used to make the input comply with the specified schema (optional column, which is empty by default and does not take effect currently). The third parameter is the flag indicating whether the instance is valid according to the given XML schema (optional column, which is **0** by default and does not take effect currently). The fourth parameter is the flag indicating whether the instance is well-formed (optional column, which is **0** by default and does not take effect currently).

Return type: XMLType

Example:

```
gaussdb=# SELECT xmltype('<a>123');
xmltype

<a>123
(1 row)
```

#### NOTE

- Different from that in database A, in PL/SQL, XMLType allows input parameters to be empty strings and returns **NULL**.
- For character encoding, only UTF-8, GBK, and LATIN1 to LATIN10 are supported, and the **version** field can only be set to **1.x**.
- xmltype(clob [,varchar2,numeric ,numeric])

Description: Creates the XMLType type from the CLOB type.

Parameters: The first parameter is the CLOB to be converted to XMLType (mandatory column). The second parameter is the optional schema URL used to make the input comply with the specified schema (optional column, which is empty by default and does not take effect currently). The third parameter is the flag indicating whether the instance is valid according to the given XML schema (optional column, which is **0** by default and does not take effect currently). The fourth parameter is the flag indicating whether the instance is well-formed (optional column, which is **0** by default and does not take effect currently).

Return type: XMLType

Example:

```
gaussdb=# declare
xmltype_clob clob;
```

```
xmltype_obj xmltype;
xmltype_str varchar2(1000);
begin
xmltype_clob := '<a>123';
xmltype_obj := xmltype(xmltype_clob);
xmltype_str := xmltype_obj.getstringval();
RAISE NOTICE 'xmltype_str is : %',xmltype_str;
end;
/
NOTICE: xmltype_str is : <a>123
```

** NOTE**

The maximum size of the input parameter of the CLOB type is 1 GB minus 1 byte.

- `xmltype(blob, numeric [,varchar2,numeric ,numeric])`

Description: Creates the XMLType type from the BLOB type.

Parameters: The first parameter is the BLOB to be converted to XMLType (mandatory column). The second parameter is the character set ID of the input XML data. The third parameter is the optional schema URL used to make the input comply with the specified schema (optional column, which is empty by default and does not take effect currently). The fourth parameter is the flag indicating whether the instance is valid according to the given XML schema (optional column, which is **0** by default and does not take effect currently). The fifth parameter is the flag indicating whether the instance is well-formed (optional column, which is **0** by default and does not take effect currently).

Return type: XMLType

Example:

```
gaussdb=# declare
xmltype_blob blob;
xmltype_obj xmltype;
xmltype_str varchar2(1000);
begin
xmltype_blob := getblobval(createxml('<a>123'),7);
xmltype_obj := xmltype(xmltype_blob,7);
xmltype_str := xmltype_obj.getstringval();
RAISE NOTICE 'xmltype_str is : %',xmltype_str;
end;
/
NOTICE: xmltype_str is : <?xml version="1.0" encoding="UTF8"?>
<a>123
```

** NOTE**

- The maximum size of input parameters of the BLOB type is 256 MB minus 1 byte.
- The character set ID ranges from 1 to 41.
- `getstringval(xmltype)`

Description: Converts the XMLType to a string.

Parameter: XMLType to be converted.

Return type: varchar2

The getstringval function can be called in either of the following ways:

Example 1:

```
gaussdb=# SELECT getstringval('<a>123456');
getstringval

<a>123456
(1 row)
```

Example 2: The calling mode is compatible with the ORA syntax.

```
gaussdb=# SELECT xmltype('<a>123456').getstringval();
xmltypefunc

<a>123456
(1 row)
```

- **getrootelement(xmltype)**

Description: Gets the root element of the XMLType type.

Parameter: XMLType whose root element is to be obtained.

Return type: varchar2

The getrootelement function can be called in either of the following ways:

Example 1:

```
gaussdb=# SELECT getrootelement('<a>123456');
getrootelement

a
(1 row)
```

Example 2: The calling mode is compatible with the ORA syntax.

```
gaussdb=# SELECT xmltype('<a>123456').getrootelement();
xmltypefunc

a
(1 row)
```

- **getnamespace(xmltype)**

Description: Gets the namespace of the XMLType top-level element.

Parameter: XMLType whose namespace is to be obtained.

Return type: varchar2

The getnamespace function can be called in either of the following ways:

Example 1:

```
gaussdb=# SELECT getnamespace('<c:a xmlns:c="asd">123<d:b xmlns:d="qwe">456</d:b></c:a>');
getnamespace

asd
(1 row)
```

Example 2: The calling mode is compatible with the ORA syntax.

```
gaussdb=# SELECT xmltype('<c:a xmlns:c="asd">123<d:b xmlns:d="qwe">456</d:b></c:a>').getnamespace();
xmltypefunc

asd
(1 row)
```

- **existsnode(xmltype, varchar2[, varchar2])**

Description: Determines whether the XML node exists in XMLType based on the XPath expression. If the XML node exists, **1** is returned. Otherwise, **0** is returned.

Parameters: XMLType to be queried, path of the XPath node to be queried, and namespace of the XPath path (If the input parameter has a namespace, aliases must be defined for both the XPath and namespace, as shown in example 3.)

Return type: numeric

The existsnode function can be called in either of the following ways:

Example 1:

```
gaussdb=# SELECT existsnode('<a>123456', '/a/b');
existsnode

 1
(1 row)
```

Example 2: The calling mode is compatible with the ORA syntax.

```
gaussdb=# SELECT xmltype('<a>123456').existsnode('/a/b');
xmltypefunc

 1
(1 row)
```

Example 3:

```
gaussdb=# SELECT existsnode('<a:b xmlns:a="asd">123<c>456</c></a:b>', '/a:b/c', 'xmlns:a="asd"');
existsnode

 1
(1 row)
```

Example 4: The calling mode is compatible with the ORA syntax.

```
gaussdb=# SELECT xmltype('<a:b xmlns:a="asd">123<c>456</c></a:b>').existsnode('/a:b/c', 'xmlns:a="asd"');
xmltypefunc

 1
(1 row)
```

- `extractxml(xmltype, varchar2[, varchar2])`

Description: Checks whether an XML node exists in the given XMLType based on the XPath expression. If yes, the XMLType containing the node is returned. If no, **NULL** is returned. The return value can be inserted into a table of the XMLType type.

Parameters: XMLType to be queried, path of the XPath node to be queried, and namespace of the XPath path (If the input parameter has a namespace, aliases must be defined for both the XPath and namespace, as shown in example 3.)

Return type: XMLType

The `extractxml` function can be called in either of the following ways:

Example 1:

```
gaussdb=# SELECT extractxml('<a>123456', '/a/b');
extractxml

456
(1 row)
```

Example 2: The calling mode is compatible with the ORA syntax.

```
gaussdb=# SELECT xmltype('<a>123456').extract('/a/b');
xmltypefunc

456
(1 row)
```

```
gaussdb=# SELECT xmltype('<a>123456').extractxml('/a/b');
xmltypefunc

456
(1 row)
```

Example 3:

```
gaussdb=# SELECT extractxml('<a:b xmlns:a="asd">123<c>456</c></a:b>', '/a:b', 'xmlns:a="asd"');
extractxml

```

```
<a:b xmlns:a="asd">123<c>456</c></a:b>
(1 row)
```

Example 4: The calling mode is compatible with the ORA syntax.

```
gaussdb=# SELECT xmltype('<a:b xmlns:a="asd">123<c>456</c></a:b>').extract('/a:b','xmlns:a="asd"');
xmltypefunc
```

```

<a:b xmlns:a="asd">123<c>456</c></a:b>
(1 row)
```

```
gaussdb=# SELECT xmltype('<a:b xmlns:a="asd">123<c>456</c></a:b>').extractxml('/
a:b','xmlns:a="asd"');
xmltypefunc
```

```

<a:b xmlns:a="asd">123<c>456</c></a:b>
(1 row)
```

## 7.5.42 Obsolete Functions

The following functions in GaussDB have been discarded in the latest version:

- `gs_wlm_get_session_info`
- `gs_wlm_get_user_session_info`
- `check_engine_status`
- `encode_plan_node`
- `model_train_opt`
- `gs_stat_get_wlm_plan_operator_info`
- `track_model_train_opt`
- `array_extend`
- `dbe_perf.global_slow_query_info`
- `dbe_perf.global_slow_query_info_bytime`
- `dbe_perf.global_slow_query_history`
- `pg_reload_conf`
- `pg_rotate_logfile`
- `gs_stat_ustore`
- `pv_compute_pool_workload()`
- `pgxc_log_comm_status(void)`

## 7.6 Expressions

### 7.6.1 Simple Expressions

#### Logical Expressions

[Logical Operators](#) lists the operators and calculation rules of logical expressions.

#### Comparative Expressions

[Comparison Operators](#) lists the common comparative operators.

In addition to comparative operators, you can also use the following sentence structure:

- BETWEEN operator  
**a BETWEEN x AND y** is equivalent to **a >= x AND a <= y**.  
**a NOT BETWEEN x AND y** is equivalent to **a < x OR a > y**.
- To check whether a value is null, use:  
expression IS NULL  
expression IS NOT NULL  
or an equivalent (non-standard) sentence structure:  
expression ISNULL  
expression NOTNULL

---

#### NOTICE

- Do not write **expression=NULL** or **expression<>(=)NULL**, because **NULL** represents an unknown value, and these expressions cannot determine whether two unknown values are equal.
  - Only the comparative expressions IS NULL and IS NOT NULL support data of XML type.
- 
- is distinct from/is not distinct from
    - is distinct from  
If the data types and values of A and B are different, the value is **true**.  
If the data types and values of A and B are the same, the value is **false**.  
Empty values are considered the same.
    - is not distinct from  
If the data types and values of A and B are different, the value is **false**.  
If the data types and values of A and B are the same, the value is **true**.  
Empty values are considered the same.
  - <=> NULL-safe equal operator  
The comparison of NULL values is added on the basis of the comparison of '='. If neither the left nor right value of the operator is NULL, the result is the same as that of '='.  
If the data types and values of A and B are different, the value is **false**.  
If the data types and values of A and B are the same, the value is **true**.  
Empty values are considered the same.

#### NOTE

- The usage of the <=> operator is the same as that of IS NOT DISTINCT FROM.
- This operator is valid only when the database is compatible with the MySQL type (that is, **sql\_compatibility** is set to 'MYSQL'). Other types do not support this operator.

## Examples

```
gaussdb=# SELECT 2 BETWEEN 1 AND 3 AS RESULT;
result

t
(1 row)

gaussdb=# SELECT 2 >= 1 AND 2 <= 3 AS RESULT;
result

t
(1 row)

gaussdb=# SELECT 2 NOT BETWEEN 1 AND 3 AS RESULT;
result

f
(1 row)

gaussdb=# SELECT 2 < 1 OR 2 > 3 AS RESULT;
result

f
(1 row)

gaussdb=# SELECT 2+2 IS NULL AS RESULT;
result

f
(1 row)

gaussdb=# SELECT 2+2 IS NOT NULL AS RESULT;
result

t
(1 row)

gaussdb=# SELECT 2+2 ISNULL AS RESULT;
result

f
(1 row)

gaussdb=# SELECT 2+2 NOTNULL AS RESULT;
result

t
(1 row)

gaussdb=# SELECT 2+2 IS DISTINCT FROM NULL AS RESULT;
result

t
(1 row)

gaussdb=# SELECT 2+2 IS NOT DISTINCT FROM NULL AS RESULT;
result

f
(1 row)

gaussdb=# SELECT 1 <=> 1 AS RESULT;
result

t
(1 row)

gaussdb=# SELECT NULL <=> 1 AS RESULT;
result
```

```

f
(1 row)

gaussdb=# SELECT NULL <=> NULL AS RESULT;
result

t
(1 row)
```

## 7.6.2 Condition Expressions

Data that meets the requirements specified by conditional expressions are filtered during SQL statement execution.

Conditional expressions include the following types:

- CASE

**CASE** expressions are similar to the **CASE** statements in other coding languages.

**Figure 7-1** shows the syntax of a **CASE** expression.

**Figure 7-1** case::=

A **CASE** clause can be used in a valid expression. **condition** is an expression that returns a value of Boolean type.

- If the result is **true**, the result of the **CASE** expression is the required result.
- If the result is false, the following **WHEN** or **ELSE** clauses are processed in the same way.
- If every **WHEN condition** is false, the result of the expression is the result of the **ELSE** clause. If the **ELSE** clause is omitted and has no match condition, the result is NULL.
- Operations on XML data are supported.

For example:

```
gaussdb=# CREATE TABLE case_when_t1(CW_COL1 INT) DISTRIBUTE BY HASH (CW_COL1);
gaussdb=# INSERT INTO case_when_t1 VALUES (1), (2), (3);

gaussdb=# SELECT * FROM case_when_t1;
a

1
2
3
(3 rows)

gaussdb=# SELECT CW_COL1, CASE WHEN CW_COL1=1 THEN 'one' WHEN CW_COL1=2 THEN 'two'
ELSE 'other' END FROM case_when_t1 ORDER BY 1;
cw_col1 | case
```

```
-----+-----
1 | one
2 | two
3 | other
(3 rows)

gaussdb=# DROP TABLE case_when_t1;
```

- DECODE

**Figure 7-2** shows the syntax of a **DECODE** expression.

**Figure 7-2** decode::=

Compare each following **compare(n)** with **base\_expr**, **value(n)** is returned if a **compare(n)** matches the **base\_expr** expression. If **base\_expr** does not match each **compare(n)**, the default value is returned.

Operations on XML data are supported.

**Conditional Expression Functions** describes the examples.

```
gaussdb=# SELECT DECODE('A','A',1,'B',2,0);
case

1
(1 row)
```

- COALESCE

**Figure 7-3** shows the syntax of a **COALESCE** expression.

**Figure 7-3** coalesce::=

**COALESCE** returns its first not-**NULL** value. If all the parameters are **NULL**, **COALESCE** will return **NULL**. This value is replaced by the default value when data is displayed. Like a **CASE** expression, **COALESCE** only evaluates the parameters that are needed to determine the result. That is, parameters to the right of the first not-**NULL** parameter are not evaluated.

Operations on XML data are supported.

Example:

```
gaussdb=# CREATE TABLE c_tabl(description varchar(10), short_description varchar(10), last_value
varchar(10))
DISTRIBUTE BY HASH (last_value);

gaussdb=# INSERT INTO c_tabl VALUES('abc', 'efg', '123');
gaussdb=# INSERT INTO c_tabl VALUES(NULL, 'efg', '123');

gaussdb=# INSERT INTO c_tabl VALUES(NULL, NULL, '123');
```

```
gaussdb=# SELECT description, short_description, last_value, COALESCE(description, short_description,
last_value) FROM c_tabl ORDER BY 1, 2, 3, 4;
description | short_description | last_value | coalesce
-----+-----+-----+-----
abc | efg | 123 | abc
 | efg | 123 | efg
 | | 123 | 123
(3 rows)

gaussdb=# DROP TABLE c_tabl;
```

If **description** is not **NULL**, the value of **description** is returned. Otherwise, parameter **short\_description** is calculated. If **short\_description** is not **NULL**, the value of **short\_description** is returned. Otherwise, parameter **last\_value** is calculated. If **last\_value** is not **NULL**, the value of **last\_value** is returned. Otherwise, **none** is returned.

```
gaussdb=# SELECT COALESCE(NULL,'Hello World');
 coalesce

Hello World
(1 row)
```

- **NULLIF**

**Figure 7-4** shows the syntax of a **NULLIF** expression.

**Figure 7-4** nullif::=

Only if **value1** is equal to **value2** can **NULLIF** return the **NULL** value. Otherwise, **value1** is returned. Operations on XML data are supported.

Example:

```
gaussdb=# CREATE TABLE null_if_t1 (
NI_VALUE1 VARCHAR(10),
NI_VALUE2 VARCHAR(10)
)DISTRIBUTE BY HASH (NI_VALUE1);

gaussdb=# INSERT INTO null_if_t1 VALUES('abc', 'abc');
gaussdb=# INSERT INTO null_if_t1 VALUES('abc', 'efg');

gaussdb=# SELECT NI_VALUE1, NI_VALUE2, NULLIF(NI_VALUE1, NI_VALUE2) FROM null_if_t1 ORDER
BY 1, 2, 3;

ni_value1 | ni_value2 | nullif
-----+-----+-----
abc | abc |
abc | efg | abc
(2 rows)

gaussdb=# DROP TABLE null_if_t1;
```

If **value1** is equal to **value2**, **NULL** is returned. Otherwise, **value1** is returned.

```
gaussdb=# SELECT NULLIF('Hello','Hello World');
 nullif

Hello
(1 row)
```

- **GREATEST** (maximum value) and **LEAST** (minimum value)

**Figure 7-5** shows the syntax of a **GREATEST** expression.

**Figure 7-5** greatest::=

You can select the maximum value from any numerical expression list. Operations on XML data are supported.

```

gaussdb=# SELECT greatest(9000,15555,2.01);
greatest

15555
(1 row)

```

**Figure 7-6** shows the syntax of a **LEAST** expression.

**Figure 7-6** least::=

You can select the minimum value from any numerical expression list. Each of the preceding numeric expressions can be converted into a common data type, which will be the data type of the result.

The NULL values in the list will be ignored. The result is **NULL** only if the results of all expressions are **NULL**.

Operations on XML data are supported.

```

gaussdb=# SELECT least(9000,2);
least

2
(1 row)

```

**Conditional Expression Functions** describes the examples.

- NVL

**Figure 7-7** shows the syntax of an **NVL** expression.

**Figure 7-7** nvl::=

If the value of **value1** is **NULL**, **value2** is returned. Otherwise, **value1** is returned. Operations on XML data are supported.

For example:

```

gaussdb=# SELECT nvl(null,1);
nvl

```

```

1
(1 row)
gaussdb=# SELECT nvl ('Hello World',1);
 nvl

Hello World
(1 row)

```

### 7.6.3 Subquery Expressions

Subquery expressions include the following types:

- EXISTS/NOT EXISTS

**Figure 7-8** shows the syntax of an **EXISTS/NOT EXISTS** expression.

**Figure 7-8** EXISTS/NOT EXISTS::=

The parameter of an **EXISTS** expression is an arbitrary **SELECT** statement, that is, subquery. The subquery is evaluated to determine whether it returns any rows. If it returns at least one row, the result of **EXISTS** is true. If the subquery returns no rows, the result of **EXISTS** is false.

The subquery will generally only be executed long enough to determine whether at least one row is returned, not all the way to completion.

Operations on XML data are not supported.

For example:

```

gaussdb=# CREATE TABLE exists_t1(a int, b int);
gaussdb=# INSERT INTO exists_t1 VALUES(1, 2),(2, 3),(3, 4),(4, 5);

gaussdb=# CREATE TABLE exists_t2(a int, c int);
gaussdb=# INSERT INTO exists_t2 VALUES(3, 4),(4, 5),(5, 6),(6, 7);

gaussdb=# SELECT * FROM exists_t1 t1 WHERE EXISTS (SELECT * FROM exists_t2 t2 WHERE t2.a =
t1.a);
 a | b
---+---
 3 | 4
 4 | 5
(2 rows)

gaussdb=# DROP TABLE exists_t1, exists_t2;

```

- IN/NOT IN

**Figure 7-9** shows the syntax of an **IN/NOT IN** expression.

**Figure 7-9** IN/NOT IN::=

The right-hand side is a parenthesized subquery, which must return exactly one column. The left-hand expression is evaluated and compared to each row of the subquery result. The result of **IN** is true if any equal subquery row is found. The result is false if no equal row is found (including the case where the subquery returns no rows).

This is in accordance with SQL normal rules for Boolean combinations of null values. If the columns corresponding to two rows equal and are not empty, the two rows are equal to each other. If any columns corresponding to the two rows do not equal and are not empty, the two rows are not equal to each other. Otherwise, the result is **NULL**. If there are no equal right-hand values and at least one right-hand row yields null, the result of **IN** will be null, not false.

Operations on XML data are not supported.

For example:

```
gaussdb=# CREATE TABLE in_t1(a int, b int);
gaussdb=# INSERT INTO in_t1 VALUES(1, 2),(2, 3),(3, 4),(4, 5);

gaussdb=# CREATE TABLE in_t2(a int, c int);
gaussdb=# INSERT INTO in_t2 VALUES(3, 4),(4, 5),(5, 6),(6, 7);

gaussdb=# SELECT * FROM in_t1 t1 WHERE t1.a IN (SELECT t2.a FROM in_t2 t2);
 a | b
----+----
 3 | 4
 4 | 5
(2 rows)

gaussdb=# DROP TABLE in_t1, in_t2;
```

- ANY/SOME

**Figure 7-10** shows the syntax of an **ANY/SOME** expression.

**Figure 7-10** any/some::=

The right-hand side is a parenthesized subquery, which must return exactly one column. The left-hand expression is evaluated and compared to each row of the subquery result using the given operator, which must yield a Boolean result. The result of **ANY** is "true" if any true result is obtained. The result is "false" if no true result is found (including the case where the subquery returns no rows). **SOME** is a synonym of **ANY**. **IN** can be equivalently replaced with **ANY**.

Operations on XML data are not supported.

For example:

```
gaussdb=# CREATE TABLE any_t1(a int, b int);
gaussdb=# INSERT INTO any_t1 VALUES(1, 2),(2, 3),(3, 4),(4, 5);

gaussdb=# CREATE TABLE any_t2(a int, c int);
gaussdb=# INSERT INTO any_t2 VALUES(3, 4),(4, 5),(5, 6),(6, 7);

gaussdb=# SELECT * FROM any_t1 t1 WHERE t1.a < ANY(SELECT t2.a FROM any_t2 t2 where t2.a = 3
or t2.a = 4);
```

```

a | b
---+---
1 | 2
2 | 3
3 | 4
(3 rows)

gaussdb=# DROP TABLE any_t1, any_t2;

```

- ALL

**Figure 7-11** shows the syntax of an **ALL** expression.

**Figure 7-11** all::=

The right-hand side is a parenthesized subquery, which must return exactly one column. The left-hand expression is evaluated and compared to each row of the subquery result using the given operator, which must yield a Boolean result. The result of ALL is true if all values are true (including the case where the subquery returns no rows). The result is false if any false result is found.

Operations on XML data are not supported.

Example:

```

gaussdb=# CREATE TABLE all_t1(a int, b int);
gaussdb=# INSERT INTO all_t1 VALUES(1, 2),(2, 3),(3, 4),(4, 5);

gaussdb=# CREATE TABLE all_t2(a int, c int);
gaussdb=# INSERT INTO all_t2 VALUES(3, 4),(4, 5),(5, 6),(6, 7);

gaussdb=# SELECT * FROM all_t1 t1 WHERE t1.a < ALL(SELECT t2.a FROM all_t2 t2 where t2.a = 3 or
t2.a = 4);
a | b
---+---
1 | 2
2 | 3
(2 rows)

gaussdb=# DROP TABLE all_t1, all_t2;

```

## 7.6.4 Array Expressions

### IN

*expression* **IN** (*value* [, ...])

The parentheses on the right contain an expression list. The expression result on the left is compared with the content in the expression list. If the content in the list meets the expression result on the left, the result of **IN** is **true**. If no result meets the requirements, the result of **IN** is **false**.

For example:

```

gaussdb=# SELECT 8000+500 IN (10000, 9000) AS RESULT;
result

f
(1 row)

```

 **NOTE**

- If the expression result is null or the expression list does not meet the expression conditions and at least one empty value is returned for the expression list on the right, the result of **IN** is **null** rather than **false**. This method is consistent with the Boolean rules used when SQL statements return empty values.
- Operations on XML data are not supported.

## NOT IN

*expression* **NOT IN** (*value* [, ...])

The parentheses on the right contain an expression list. The expression result on the left is compared with the content in the expression list. If the content in the list does not meet the expression result on the left, the result of **NOT IN** is **true**. If any content meets the expression result, the result of **NOT IN** is **false**.

For example:

```
gaussdb=# SELECT 8000+500 NOT IN (10000, 9000) AS RESULT;
result

t
(1 row)
```

 **NOTE**

- If the query statement result is null or the expression list does not meet the expression conditions and at least one empty value is returned for the expression list on the right, the result of **NOT IN** is null rather than false. This method is consistent with the Boolean rules used when SQL statements return empty values.
- In all situations, X **NOT IN** Y equals to **NOT**(X **IN** Y).
- Operations on XML data are not supported.

## ANY/SOME (array)

*expression operator* **ANY** (*array expression*)

*expression operator* **SOME** (*array expression*)

The right side is a parenthesized expression, which must yield an array value. The result of the expression on the left uses operators to compute and compare the results in each row of the array expression. The comparison result must be a Boolean value.

Example:

```
gaussdb=# SELECT 8000+500 < SOME (array[10000,9000]) AS RESULT;
result

t
(1 row)
gaussdb=# SELECT 8000+500 < ANY (array[10000,9000]) AS RESULT;
result

t
(1 row)
```

**NOTE**

- If at least one comparison result is true, the result of ANY is true.
- If no comparison result is true, the result of ANY is false.
- If no comparison result is true and the array expression generates at least one null value, the value of **ANY** is **NULL** rather than **false**. This method is consistent with the Boolean rules used when SQL statements return empty values.
- SOME is a synonym of ANY.
- Operations on XML data are not supported.

**ALL (array)**

*expression operator ALL (array expression)*

The right-hand side is a parenthesized expression, which must yield an array value. The result of the expression on the left uses operators to compute and compare the results in each row of the array expression. The comparison result must be a Boolean value.

- The result of **ALL** is **true** if all comparisons yield **true** (including the case where the array has zero elements).
- If one or more comparison results are false, the result of **ALL** is false.
- If the array expression yields a null array, the result of ALL will be null. If the expression on the left yields **NULL**, the result of ALL is generally **NULL** (though a non-strict comparison operator could possibly yield a different result). If the array on the right contains any null elements and no false comparison result is found, the result of **ALL** is **NULL**, not true (again, assuming a strict comparison operator). This method is consistent with the Boolean rules used when SQL statements return empty values.
- Operations on XML data are not supported.

```
gaussdb=# SELECT 8000+500 < ALL (array[10000,9000]) AS RESULT;
result

t
(1 row)
```

**7.6.5 Row Expressions**

Syntax:

*row\_constructor operator row\_constructor*

Both sides of the row expression are row constructors. The values of both rows must have the same number of columns and they are compared with each other. The row comparison allows operators including =, <>, <, <=, and >= or a similar operator.

For operators <, <=, >, and >=, the columns in rows are compared from left to right until a pair of columns that are not equal or are empty are detected. If the pair of columns contains at least one null value, the comparison result is null. Otherwise, the comparison result of this pair of columns is the final result. If no unequal or empty column is found, the values in the two rows are equal. The final result is determined based on the operator meaning.

Operations on XML data are not supported.

For example:

```
gaussdb=# SELECT ROW(1,2,NULL) < ROW(1,3,0) AS RESULT;
result

t
(1 row)

gaussdb=# SELECT (4,5,6) > (3,2,1) AS result;
result

t
(1 row)

gaussdb=# SELECT (4,1,1) > (3,2,1) AS result;
result

t
(1 row)

gaussdb=# SELECT ('test','data') > ('data','data') AS result;
result

t
(1 row)

gaussdb=# SELECT (4,1,1) > (3,2,null) AS result;
result

t
(1 row)

gaussdb=# SELECT (null,1,1) > (3,2,1) AS result;
result

(1 row)

gaussdb=# SELECT (null,5,6) > (null,5,6) AS result;
result

(1 row)

gaussdb=# SELECT (4,5,6) > (4,5,6) AS result;
result

f
(1 row)

gaussdb=# SELECT (2,2,5) >= (2,2,3) AS result;
result

t
(1 row)

gaussdb=# SELECT (2,2,1) <= (2,2,3) AS result;
result

t
(1 row)
```

The use of operators = and <> is slightly different from other operators. If all columns in the two rows are not empty and meet the operator condition, the two rows meet the operator condition. If any column in the two rows is not empty and does not meet the operator condition, the two rows do not meet the operator condition. If any column in the two rows is empty, the comparison result is null.

For example:

```
gaussdb=# SELECT (1,2,3) = (1,2,3) AS result;
result

t
(1 row)

gaussdb=# SELECT (1,2,3) <> (2,2,3) AS result;
result

t
(1 row)

gaussdb=# SELECT (2,2,3) <> (2,2,null) AS result;
result

(1 row)

gaussdb=# SELECT (null,5,6) <> (null,5,6) AS result;
result

(1 row)
```

## 7.7 Pseudocolumn

**ROWNUM** is a pseudocolumn that returns a number indicating the row number of the obtained query result. The value of **ROWNUM** in the first row is **1**, the value of **ROWNUM** in the second row is **2**, and so on.

**ROWNUM** can be used to limit the number of rows returned by a query, as shown in the following example:

```
gaussdb=# CREATE TABLE Students (name varchar(20), id int) with (STORAGE_TYPE = USTORE);
gaussdb=# INSERT INTO Students VALUES ('Jack', 35);
gaussdb=# INSERT INTO Students VALUES ('Leon', 15);
gaussdb=# INSERT INTO Students VALUES ('James', 24);
gaussdb=# INSERT INTO Students VALUES ('Taker', 81);
gaussdb=# INSERT INTO Students VALUES ('Mary', 25);
gaussdb=# INSERT INTO Students VALUES ('Rose', 64);
gaussdb=# INSERT INTO Students VALUES ('Perl', 18);
gaussdb=# INSERT INTO Students VALUES ('Under', 57);
gaussdb=# INSERT INTO Students VALUES ('Angel', 101);
gaussdb=# INSERT INTO Students VALUES ('Frank', 20);
gaussdb=# INSERT INTO Students VALUES ('Charlie', 40);

-- Output the first 10 rows of data records in the Students table.
gaussdb=# SELECT * FROM Students WHERE rownum <= 10;
name | id
-----+-----
Jack | 35
Leon | 15
James | 24
Taker | 81
Mary | 25
Rose | 64
Perl | 18
Under | 57
Angel | 101
Frank | 20
(10 rows)
```

If the statement has a clause, the output rows are reordered according to the clause.

```
gaussdb=# SELECT * FROM Students WHERE rownum < 5 order by 1;
name | id
-----+-----
Jack | 35
James | 24
Leon | 15
Taker | 81
(4 rows)
```

If a subquery has a clause but the condition is placed in the top-level query, you can use the **ROWNUM** condition after sorting.

```
gaussdb=# SELECT rownum, * FROM (SELECT * FROM Students order by 1) WHERE rownum <= 2;
rownum | name | id
-----+-----+-----
1 | Angel | 101
2 | Charlie | 40
(2 rows)
```

As long as **ROWNUM** is greater than a specific positive integer, the condition is always false. As shown in the following example, the statement does not return any result in the table.

```
gaussdb=# SELECT * FROM Students WHERE rownum > 1;
name | id
-----+-----
(0 rows)
```

Use **ROWNUM** to assign a value to each row within a certain range of the table.

```
gaussdb=# SELECT * FROM Students;
name | id
-----+-----
Jack | 35
Leon | 15
James | 24
Taker | 81
Mary | 25
Rose | 64
Perl | 18
Under | 57
Angel | 101
Frank | 20
Charlie | 40
(11 rows)

gaussdb=# UPDATE Students set id = id + 5 WHERE rownum < 4;
UPDATE 3
gaussdb=# SELECT * FROM Students;
name | id
-----+-----
Jack | 40
Leon | 20
James | 29
Taker | 81
Mary | 25
Rose | 64
Perl | 18
Under | 57
Angel | 101
Frank | 20
Charlie | 40
(11 rows)

gaussdb=# DROP TABLE Students;
DROP TABLE
```

The restrictions on using **ROWNUM** are as follows:

- Do not use **ROWNUM** as an alias to avoid ambiguity in SQL statements.
- Do not use **ROWNUM** when creating an index.

- Do not use ROWNUM as the default value when creating a table.
- Do not use ROWNUM as an alias in the WHERE clause.
- Do not use ROWNUM when inserting data.
- Do not use ROWNUM in a tableless query.
- Do not use ROWNUM in the LIMIT clause.
- Do not use ROWNUM as a parameter of the EXECUTE statement.
- Do not use ROWNUM to update a clause in the UPSERT statement.
- Do not use ROWNUM as a projection column or WHERE condition in the SELECT ... FOR UPDATE statement.
- If the HAVING clause contains ROWNUM (not in an aggregate function), the GROUP BY clause must also contain ROWNUM (not in an aggregate function), unless the GROUP BY clause contains an expression, for example, **SELECT a + a FROM t group by a + a having rownum < 5**.
- If the ROWNUM condition exists in the HAVING clause, the HAVING clause cannot be pushed down to any scan node.

```
gaussdb=# CREATE TABLE test (a int, b int);
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'a' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
gaussdb=# INSERT INTO test SELECT generate_series, generate_series FROM generate_series(1, 10);
INSERT 0 10
```

```
-- The rownum condition cannot be pushed down to seqscan.
gaussdb=# EXPLAIN SELECT a,rownum FROM test group by a,rownum having rownum < 5;
QUERY PLAN
```

```

HashAggregate (cost=3.45..3.49 rows=3 width=4)
 Group By Key: a, ROWNUM
 Filter: ((ROWNUM) < 5::numeric)
 -> Rownum (cost=0.19..3.40 rows=10 width=4)
 -> Streaming (type: GATHER) (cost=0.19..3.40 rows=10 width=4)
 Node/s: All datanodes
 -> Seq Scan on test (cost=0.00..3.03 rows=10 width=4)
(7 rows)
```

- If a subquery contains the ROWNUM condition, the predicate cannot be pushed down to any scan node.

```
gaussdb=# EXPLAIN SELECT * FROM (SELECT * FROM test WHERE rownum < 5) WHERE b < 5; -- The b<5 WHERE clause cannot be pushed down to Seq Scan.
```

```
QUERY PLAN

Streaming (type: GATHER) (cost=0.06..0.76 rows=2 width=8)
 Node/s: All datanodes
 -> Subquery Scan on __unnamed_subquery__ (cost=0.00..0.63 rows=2 width=8)
 Filter: (__unnamed_subquery__.b < 5)
 -> Rownum (cost=0.00..0.57 rows=5 width=8)
 StopKey: (ROWNUM < 5::numeric)
 -> Streaming (type: BROADCAST) (cost=0.00..1.71 rows=15 width=8)
 Spawn on: All datanodes
 -> Rownum (cost=0.00..1.68 rows=5 width=8)
 StopKey: (ROWNUM < 5::numeric)
 -> Seq Scan on test (cost=0.00..3.03 rows=10 width=8)
(11 rows)
```

```
gaussdb=# DROP TABLE test;
DROP TABLE
```

**CAUTION**

- The query result of **ROWNUM** may be unstable due to the sequence in which the CN receives DN data.

```
gaussdb=# CREATE TABLE test(a int, b int);
gaussdb=# INSERT INTO test VALUES(generate_series(1,10),generate_series(1,10));
```

```
-- Output the first 10 rows of data records in the Students table.
```

```
gaussdb=# SELECT rownum,* FROM test;
rownum | a | b
```

```
-----+-----+-----
1 | 1 | 1
2 | 2 | 2
3 | 5 | 5
4 | 6 | 6
5 | 8 | 8
6 | 9 | 9
7 | 3 | 3
8 | 4 | 4
9 | 7 | 7
10 | 10 | 10
(10 rows)
```

```
-- The CN receives data from DN2 and then from DN1.
```

```
gaussdb=# SELECT rownum,* FROM test;
rownum | a | b
```

```
-----+-----+-----
1 | 3 | 3
2 | 4 | 4
3 | 7 | 7
4 | 10 | 10
5 | 1 | 1
6 | 2 | 2
7 | 5 | 5
8 | 6 | 6
9 | 8 | 8
10 | 9 | 9
(10 rows)
```

- It is not recommended that the **ROWNUM** condition be used in the **JOIN ON** clause. In GaussDB, when the **ROWNUM** condition is used in the **JOIN ON** clause, the behavior in the **LEFT JOIN**, **RIGHT JOIN**, **FULL JOIN**, and **MERGE INTO** scenarios is different from that in other databases, causing risks in service migration.

## 7.8 Type Conversion

### 7.8.1 Overview

#### Context

SQL is a typed language. That is, every data item has an associated data type which determines its behavior and allowed usage. GaussDB has an extensible type system that is more general and flexible than other SQL implementations. Hence, most type conversion behaviors in GaussDB are governed by general rules. This allows the use of mixed-type expressions.

The GaussDB scanner/parser divides lexical elements into five fundamental categories: integers, floating-point numbers, strings, identifiers, and keywords.

Constants of most non-numeric types are first classified as strings. The SQL language definition allows specifying type names with constant strings. The following is an example:

```
gaussdb=# SELECT text 'Origin' AS "label", point '(0,0)' AS "value";
label | value
-----+-----
Origin | (0,0)
(1 row)
```

has two literal constants, of type **text** and **point**. If a type is not specified for a string literal, then the placeholder type **unknown** is assigned initially.

There are four fundamental SQL constructs requiring distinct type conversion rules in GaussDB parser:

- **Function calls**  
Much of the SQL type system is built around a rich set of functions. Functions can have one or more arguments. Since SQL permits function overloading, the function name alone does not uniquely identify the function to be called. The parser must select the right function based on the data types of the supplied arguments.
- **Operators**  
SQL allows expressions with prefix and postfix unary (one-argument) operators, as well as binary (two-argument) operators. Like functions, operators can be overloaded, so the same problem of selecting the right operator exists.
- **Value storage**  
SQL **INSERT** and **UPDATE** statements place the results of expressions into a table. The expressions in the statement must be matched up with, and perhaps converted to, the types of the target columns.
- **UNION, CASE, and Related Constructs**  
Since all query results from a unionized **SELECT** statement must appear in a single set of columns, the types of the results of each **SELECT** clause must be matched up and converted to a uniform set. Similarly, the result expressions of a **CASE** construct must be converted to a common type so that the **CASE** expression as a whole has a known output type. The same holds for **ARRAY** constructs, and for the **GREATEST** and **LEAST** functions.

The system catalog `pg_cast` stores information about which conversions, or casts, exist between which data types, and how to perform those conversions. For details, see [PG\\_CAST](#).

The return type and conversion behavior of an expression are determined during semantic analysis. Data types are divided into several basic type categories, including **Boolean**, **numeric**, **string**, **bitstring**, **datetime**, **timespan**, **geometric**, and **network**. Within each category there can be one or more preferred types, which are preferred when there is a choice of possible types. With careful selection of preferred types and available implicit casts, it is possible to ensure that ambiguous expressions (those with multiple candidate parsing solutions) can be resolved in a useful way.

All type conversion rules are designed based on the following principles:

- Implicit conversions should never have surprising or unpredictable outcomes.

- There should be no extra overhead in the parser or executor if a query does not need implicit type conversion. That is, if a query is well-formed and the types already match, then the query should execute without spending extra time in the parser and without introducing unnecessary implicit conversion calls in the query.
- Additionally, if a query usually requires an implicit conversion for a function, and if then the user defines a new function with the correct argument types, the parser should use this new function.
- XML data does not support implicit type conversion, including implicit conversion between strings and XML types.

## 7.8.2 Operators

### Operator Type Resolution

1. Select the operators to be considered from the **pg\_operator** system catalog. Considered operators are those with the matching name and argument count. If the search path finds multiple available operators, only the most suitable one is considered.
2. Look for the best match.
  - a. Discard candidate operators for which the input types do not match and cannot be converted (using an implicit conversion) to match. **unknown** literals are assumed to be convertible to anything for this purpose. If only one candidate remains, use it; else continue to the next step.
  - b. Run through all candidates and keep those with the most exact matches on input types. Domains are considered the same as their base type for this purpose. Keep all candidates if none survives these tests. If only one candidate remains, use it; else continue to the next step.
  - c. Run through all candidates and keep those that accept preferred types (of the input data type's type category) at the most positions where type conversion will be required. Keep all candidates if none accepts preferred types. If only one candidate remains, use it; else continue to the next step.
  - d. If any input arguments are of **unknown** types, check the type categories accepted at those argument positions by the remaining candidates. At each position, select the string category if any candidate accepts that category. (This bias towards string is appropriate since an unknown-type literal looks like a string.) Otherwise, if all the remaining candidates accept the same type category, select that category; otherwise fail because the correct choice cannot be deduced without more clues. Now discard candidates that do not accept the selected type category. Furthermore, if any candidate accepts a preferred type in that category, discard candidates that accept non-preferred types for that argument. Keep all candidates if none survives these tests. If only one candidate remains, use it; else continue to the next step.
  - e. If there are both **unknown** and known-type arguments, and all the known-type arguments have the same type, assume that the **unknown** arguments are also of that type, and check which candidates can accept that type at the unknown-argument positions. If exactly one candidate passes this test, use it. Otherwise, fail.

## Examples

Example 1: Use factorial operator type resolution. There is only one factorial operator (postfix !) defined in the system catalog, and it takes an argument of type **bigint**. The scanner assigns an initial type of **bigint** to the argument in this query expression:

```
gaussdb=# SELECT 40 ! AS "40 factorial";
 40 factorial

815915283247897734345611269596115894272000000000
(1 row)
```

So the parser does a type conversion on the operand and the query is equivalent to:

```
gaussdb=# SELECT CAST(40 AS bigint) ! AS "40 factorial";
```

Example 2: String concatenation operator type resolution. A string-like syntax is used for working with string types and for working with complex extension types. Strings with unspecified type are matched with likely operator candidates. An example with one unspecified argument:

```
gaussdb=# SELECT text 'abc' || 'def' AS "text and unknown";
text and unknown

abcdef
(1 row)
```

In this example, the parser looks for an operator whose parameters are of the text type. Such an operator is found.

Here is a concatenation of two values of unspecified types:

```
gaussdb=# SELECT 'abc' || 'def' AS "unspecified";
unspecified

abcdef
(1 row)
```

### NOTE

In this case there is no initial hint for which type to use, since no types are specified in the query. So, the parser looks for all candidate operators and finds that there are candidates accepting both string-category and bit-string-category inputs. Since string category is preferred when available, that category is selected, and then the preferred type for strings, **text**, is used as the specific type to resolve the unknown-type literals as.

Example 3: Absolute-value and negation operator type resolution. The GaussDB operator catalog has several entries for the prefix operator @. All the entries implement absolute-value operations for various numeric data types. One of these entries is for type **float8**, which is the preferred type in the numeric category. Therefore, GaussDB will use that entry when faced with an unknown input:

```
gaussdb=# SELECT @ '-4.5' AS "abs";
abs

4.5
(1 row)
```

Here the system has implicitly resolved the unknown-type literal as type **float8** before applying the chosen operator.

Example 4: Use the array inclusion operator type resolution as an example. Here is another example of resolving an operator with one known and one unknown input:

```
gaussdb=# SELECT array[1,2] <@ '{1,2,3}' as "is subset";
is subset

t
(1 row)
```

#### NOTE

The GaussDB operator catalog has several entries for the infix operator <@, but the only two that could possibly accept an integer array on the left side are array inclusion (anyarray <@ anyarray) and range inclusion (anyelement <@ anyrange). Since none of these polymorphic pseudo-types (see section [Pseudo-Types](#)) is considered preferred, the parser cannot resolve the ambiguity on that basis. However, the last resolution rule tells it to assume that the unknown-type literal is of the same type as the other input, that is, integer array. Now only one of the two operators can match, so array inclusion is selected. (Had range inclusion been selected, we would have gotten an error, because the string does not have the right format to be a range literal.)

## 7.8.3 Functions

### Function Type Resolution

1. Select the functions to be considered from the **pg\_proc** system catalog. If a non-schema-qualified function name was used, the functions in the current search path are considered. If a qualified function name was given, only functions in the specified schema are considered.  
If the search path finds multiple functions of different argument types, a proper function in the path is considered.
2. Check for a function accepting exactly the input argument types. If the function exists, use it. Cases involving **unknown** will never find a match at this step.
3. If no exact match is found, see if the function call appears to be a special type conversion request.
4. Look for the best match.
  - a. Discard candidate functions for which the input types do not match and cannot be converted (using an implicit conversion) to match. **unknown** literals are assumed to be convertible to anything for this purpose. If only one candidate remains, use it; else continue to the next step.
  - b. Run through all candidates and keep those with the most exact matches on input types. Domains are considered the same as their base type for this purpose. Keep all candidates if none has exact matches. If only one candidate remains, use it; else continue to the next step.
  - c. Run through all candidates and keep those that accept preferred types at the most positions where type conversion will be required. Keep all candidates if none accepts preferred types. If only one candidate remains, use it; else continue to the next step.
  - d. If any input arguments are of **unknown** types, check the type categories accepted at those argument positions by the remaining candidates. At each position, select the string category if any candidate accepts that category. (This bias towards string is appropriate since an unknown-type

literal looks like a string.) Otherwise, if all the remaining candidates accept the same type category, select that category; otherwise fail because the correct choice cannot be deduced without more clues. Now discard candidates that do not accept the selected type category. Furthermore, if any candidate accepts a preferred type in that category, discard candidates that accept non-preferred types for that argument. Keep all candidates if none survives these tests. If only one candidate remains, use it; else continue to the next step.

- e. If there are both **unknown** and known-type arguments, and all the known-type arguments have the same type, assume that the **unknown** arguments are also of that type, and check which candidates can accept that type at the **unknown**-argument positions. If exactly one candidate passes this test, use it. Otherwise, fail.

## Examples

Example 1: Use the rounding function argument type resolution as the first example. There is only one **round** function that takes two arguments; it takes a first argument of type **numeric** and a second argument of type **integer**. So the following query automatically converts the first argument of type **integer** to **numeric**:

```
gaussdb=# SELECT round(4, 4);
round

4.0000
(1 row)
```

That query is actually transformed by the parser to:

```
gaussdb=# SELECT round(CAST (4 AS numeric), 4);
```

Since numeric constants with decimal points are initially assigned the type **numeric**, the following query will require no type conversion and therefore might be slightly more efficient:

```
gaussdb=# SELECT round(4.0, 4);
```

Example 2: Use the substring function type resolution as the second example. There are several **substr** functions, one of which takes types **text** and **integer**. If the function is called with a string constant of unspecified type, the system chooses the candidate function that accepts an argument of the preferred category **string** (namely of type **text**).

```
gaussdb=# SELECT substr('1234', 3);
substr

34
(1 row)
```

If the string is declared to be of type **varchar**, as might be the case if it comes from a table, then the parser will try to convert it to become **text**:

```
gaussdb=# SELECT substr(varchar '1234', 3);
substr

34
(1 row)
```

This is transformed by the parser to effectively become:

```
gaussdb=# SELECT substr(CAST (varchar '1234' AS text), 3);
```

 **NOTE**

The parser learns from the **pg\_cast** catalog that **text** and **varchar** are binary-compatible, meaning that one can be passed to a function that accepts the other without doing any physical conversion. Therefore, no type conversion is really inserted in this case.

And, if the function is called with an argument of type **integer**, the parser will try to convert that to **text**:

```
gaussdb=# SELECT substr(1234, 3);
substr

34
(1 row)
```

This is transformed by the parser to effectively become:

```
gaussdb=# SELECT substr(CAST (1234 AS text), 3);
substr

34
(1 row)
```

## 7.8.4 Value Storage

### Value Storage Type Resolution

1. Search for an exact match with the target column.
2. Try to convert the expression to the target type. This will succeed if there is a registered cast between the two types. If the expression is an unknown-type literal, the content of the literal string will be fed to the input conversion routine for the target type.
3. Check to see if there is a sizing cast for the target type. A sizing cast is a cast from that type to itself. If one is found in the **pg\_cast** catalog, apply it to the expression before storing into the destination column. The implementation function for such a cast always takes an extra parameter of type **integer**. The parameter receives the destination column's **atttypmod** value (typically its declared length, although the interpretation of **atttypmod** varies for different data types), and may take a third Boolean parameter that says whether the cast is explicit or implicit. The cast function is responsible for applying any length-dependent semantics such as size checking or truncation.

### Examples

Use the **character** storage type conversion as an example. For a target column declared as **character(20)**, the following statement shows that the stored value is sized correctly:

```
gaussdb=# CREATE TABLE tpcds.value_storage_t1 (
VS_COL1 CHARACTER(20)
)DISTRIBUTE BY HASH (VS_COL1);
gaussdb=# INSERT INTO tpcds.value_storage_t1 VALUES('abcdef');
gaussdb=# SELECT VS_COL1, octet_length(VS_COL1) FROM tpcds.value_storage_t1;
vs_col1 | octet_length
-----+-----
abcdef | 20
(1 row)
)
```

```
gaussdb=# DROP TABLE tpceds.value_storage_t1;
```

#### NOTE

What has happened here is that the two unknown literals are resolved to **text** by default, allowing the || operator to be resolved as **text** concatenation. Then the **text** result of the operator is converted to **bpchar** ("blank-padded char", the internal name of the **character** data type) to match the target column type. Since the conversion from **text** to **bpchar** is binary-coercible, this conversion does not insert any real function call. Finally, the sizing function **bpchar(bpchar, integer, Boolean)** is found in the system catalog and used for the operator's result and the stored column length. This type-specific function performs the required length check and addition of padding spaces.

## 7.8.5 UNION, CASE, and Related Constructs

SQL UNION constructs must match up possibly dissimilar types to become a single result set. The resolution algorithm is applied separately to each output column of a union query. INTERSECT and EXCEPT construct resolve dissimilar types in the same way as UNION. The CASE, ARRAY, VALUES, GREATEST and LEAST constructs use the identical algorithm to match up their component expressions and select a result data type.

### Type Resolution for UNION, CASE, and Related Constructs

- If all inputs are of the same type and are not unknown, resolve them as the unknown type.
- If all inputs are of the unknown type, resolve them as the text type (the preferred type of the string category). Otherwise, unknown inputs are ignored. (Exception: The UNION operation resolves a group of two unknown types into the text type, and then continues to match the type with other groups.)
- If the inputs are not all of the same type category, a failure will be resulted. (The unknown type is not included in this case.)
- If the inputs are all of the same type category, choose the top preferred type in that category. (Exception: The UNION operation regards the type of the first branch as the selected type.)

#### NOTE

**typcategory** in the pg\_type system catalog indicates the data type category.  
**typispreferred** indicates whether a type is preferred in **typcategory**.

- Convert all inputs to the selected type. (Retain the original lengths of strings). Fail if there is not an implicit conversion from a given input to the selected type.
- If the input contains the json, txid\_snapshot, sys\_refcursor, or geometry type, UNION cannot be performed.

### Type Resolution for CASE and COALESCE in TD Compatibility Type

- If all inputs are of the same type and are not unknown, resolve them as the unknown type.
- If all inputs are of the unknown type, resolve them as the text type.

- If inputs are of the string type (including unknown which is resolved as text) and digit type, resolve them as the string type. If the inputs are not of the two types, an error will be reported.
- If the inputs are all of the same type category, choose the top preferred type in that category.
- Convert all inputs to the selected type. Fail if there is not an implicit conversion from a given input to the selected type.

## Type Resolution for CASE in ORA Compatibility Mode

**decode(expr, search1, result1, search2, result2, ..., defresult):** When the **sql\_beta\_feature** is set to **a\_style\_coerce**, the final return value type of the expression is set to the data type of result1 or a higher-precision data type in the same type as result1, as that in ORA-compatible mode. (For example, numeric and int are both numeric data types, but numeric has higher precision and priority than int.) For CASE WHEN, the behavior is the same as the default behavior in ORA-compatible mode.

- If all inputs are of the same type and are not unknown, resolve them as the unknown type. Otherwise, proceed to the next step.
- Set the data type of result1 to the final return value type **preferType**, which belongs to **preferCategory**.
- Consider the data types of result2, result3, and defresult in sequence. If the type category is also **preferCategory**, which is the same as that of result1, check whether the precision (priority) is higher than that of **preferType**. If it is, update **preferType** to a data type with higher precision. If the type category is not **preferCategory**, check whether the category can be implicitly converted to **preferType**. If it cannot, an error is reported.
- Uses the data type recorded by **preferType** as the return value type of the expression. The expression result is implicitly converted to this data type.

Note 1:

There is a special case where the character type of a super-large number is converted to the numeric type, for example, **select decode(1, 2, 2, '53465465676465454657567678676')**, in which the large number exceeds the range of the bigint and double types. If result1 is of the numeric type and does not meet the condition that all inputs are of the same type, the type of the return value is set to numeric to be compatible with this special case.

Note 2:

Priority of the numeric types: numeric > float8 > float4 > int8 > int4 > int2 > int1

Priority of the character types: text > varchar (nvarchar2) > bpchar > char

Priority of date types: timestampz > timestamp > smalldatetime > date > abstime > timetz > time

Priority of date span types: interval > tinterval > reltime

Note 3:

The following figure shows the supported implicit type conversion when **set sql\_beta\_feature** is set to **'a\_style\_coerce'** in ORA-compatible mode. \ indicates

that conversion is not required, **yes** indicates that conversion is supported, and the null value indicates that conversion is not supported.

	bool	int1	int2	int4	int8	float4	float8	numeric	money	char	bpchar	varchar2	nvarchar2	text/clob	raw	blob	date	time	timetz	timestamp	timestampz	smalldatetime	interval	reftime	abstime
bool	\																								
int1		\	yes	yes	yes	yes	yes	yes	yes	yes	yes	yes	yes	yes											
int2			\	yes	yes	yes	yes	yes	yes	yes	yes	yes	yes	yes											
int4				\	yes	yes	yes	yes	yes	yes	yes	yes	yes	yes											
int8					\	yes	yes	yes	yes	yes	yes	yes	yes	yes											
float4						\	yes	yes	yes	yes	yes	yes	yes	yes											
float8							\	yes	yes	yes	yes	yes	yes	yes											
numeric								\		yes	yes	yes	yes	yes											
money									\																
char		yes	yes	yes	yes	yes	yes	yes		\	yes	yes	yes	yes											
bpchar		yes	yes	yes	yes	yes	yes	yes		yes	\	yes	yes	yes											
varchar2		yes	yes	yes	yes	yes	yes	yes		yes	yes	\	yes	yes	yes										
nvarchar2		yes	yes	yes	yes	yes	yes	yes		yes	yes	yes	\	yes											
text/clob		yes	yes	yes	yes	yes	yes	yes		yes	yes	yes	yes	\											
raw												yes	yes	\	yes										
blob														yes	\										
date												yes	yes	yes			\			yes	yes	yes			yes
time														yes			\	yes							
timetz														yes			yes	\							
timestamp												yes	yes	yes		yes		\		yes	yes	yes			yes
timestampz														yes			yes		\		yes	yes			yes
smalldatetime												yes		yes			yes			yes	yes	\			yes
interval												yes	yes	yes									\	yes	
reftime														yes									yes	\	
abstime														yes		yes				yes	yes	yes			\

## Examples

Example 1: Use type resolution with underspecified types in a union as the first example. Here, the unknown-type literal **'b'** will be resolved to the text type.

```
gaussdb=# SELECT text 'a' AS "text" UNION SELECT 'b';
text

a
b
(2 rows)
```

Example 2: Use type resolution in a simple union as the second example. The literal **1.2** is of numeric type, and the integer value **1** can be cast implicitly to numeric type, so that type is used.

```
gaussdb=# SELECT 1.2 AS "numeric" UNION SELECT 1;
numeric

1
1.2
(2 rows)
```

Example 3: Use type resolution in a transposed union as the third example. Since the real type cannot be implicitly cast to integer, but integer can be implicitly cast to real, the union result type is resolved as real.

```
gaussdb=# SELECT 1 AS "real" UNION SELECT CAST('2.2' AS REAL);
real

1
2.2
(2 rows)
```

Example 4: In the **TD** type, if input parameters for **COALESCE** are of int and varchar types, resolve them as the varchar type. In ORA mode, an error is reported.

```
-- In Oracle mode, create the oracle_1 database compatible with Oracle.
gaussdb=# CREATE DATABASE oracle_1 dbcompatibility = 'ORA';

-- Switch to the oracle_1 database.
gaussdb=# \c oracle_1

-- Create the t1 table.
oracle_1=# CREATE TABLE t1(a int, b varchar(10));
-- View the execution plan of the query statement whose coalesce parameter is of the int or varchar type.
a_1=# EXPLAIN SELECT coalesce(a, b) FROM t1;
ERROR: COALESCE types integer and character varying cannot be matched
LINE 1: EXPLAIN SELECT coalesce(a, b) FROM t1;
 ^
CONTEXT: referenced column: coalesce
```

```
-- Delete the table.
oracle_1=# DROP TABLE t1;

-- Switch to the testdb database.
oracle_1=# \c testdb

-- In TD mode, create the td_1 database compatible with Teradata.
gaussdb=# CREATE DATABASE td_1 dbcompatibility = 'TD';

-- Switch to the td_1 database.
gaussdb=# \c td_1

-- Create the t2 table.
td_1=# CREATE TABLE t2(a int, b varchar(10));

-- View the execution plan of the query statement whose coalesce parameter is of the int or varchar type.
td_1=# EXPLAIN VERBOSE select coalesce(a, b) from t2;
 QUERY PLAN

Data Node Scan (cost=0.00..0.00 rows=0 width=0)
 Output: (COALESCE((t2.a)::character varying, t2.b))
 Node/s: All DNS
 Remote query: SELECT COALESCE(a::character varying, b) AS "coalesce" FROM public.t2
(4 rows)

-- Delete the table.
td_1=# DROP TABLE t2;

-- Switch to the testdb database.
td_1=# \c testdb

-- Delete databases in Oracle and TD mode.
gaussdb=# DROP DATABASE oracle_1;
gaussdb=# DROP DATABASE td_1;
```

Example 5: In **ORA** mode, set the final return value type of the expression to the data type of result1 or a higher-precision data type whose category is the same as that of the data type of result1.

```
-- In ORA mode, create the ora_1 database compatible with ORA.
gaussdb=# CREATE DATABASE ora_1 dbcompatibility = 'A';

-- Switch to the ora_1 database.
gaussdb=# \c ora_1

-- Enable the decode compatibility parameters.
set sql_beta_feature='a_style_coerce';

-- Create the t1 table.
ora_1=# CREATE TABLE t1(c_int int, c_float8 float8, c_char char(10), c_text text, c_date date);

-- Insert data.
ora_1=# INSERT INTO t1 VALUES(1, 2, '3', '4', date '12-10-2010');
```

```
-- The data type of result1 is char and that of defresult is text. The precision of text is higher, and the type
of the return value is changed to text from char.
ora_1=# SELECT decode(1, 2, c_char, c_text) AS result, pg_typeof(result) FROM t1;
result | pg_typeof
-----+-----
4 | text
(1 row)

-- The data type of result1 is int, which is a numeric type. The type of the return value is set to numeric.
ora_1=# SELECT decode(1, 2, c_int, c_float8) AS result, pg_typeof(result) FROM t1;
result | pg_typeof
-----+-----
2 | numeric
(1 row)

-- The implicit conversion from the data type of defresult to that of result1 does not exist. If it is performed,
an error is reported.
ora_1=# SELECT decode(1, 2, c_int, c_date) FROM t1;
ERROR: CASE types integer and timestamp without time zone cannot be matched
LINE 1: SELECT decode(1, 2, c_int, c_date) FROM t1;
 ^
CONTEXT: referenced column: c_date

-- Disable the decode compatibility parameters.
set sql_beta_feature='none';

-- Delete the table.
ora_1=# DROP TABLE t1;
DROP TABLE

-- Switch to the testdb database.
ora_1=# \c testdb

-- Delete the database in ORA mode.
gaussdb=# DROP DATABASE ora_1;
DROP DATABASE
```

Example 6: The UNION operation resolves a group of two unknown types into the text type, and then continues to match the type with other groups.

```
-- Resolve the first two NULL values of the unknown type as the text type. Then, match the text type with
the third element of the varchar2 type, and select the text type.
gaussdb=# SELECT "text", pg_typeof("text") as type from (SELECT NULL AS "text" UNION ALL SELECT
NULL AS "text" UNION ALL SELECT 'a'::varchar2 as "text");
text | type
-----+-----
| text
| text
a | text
(3 rows)
```

## 7.9 System Operation

GaussDB text runs SQL statements to perform different system operations, such as setting variables, displaying the execution plan, and collecting garbage data.

### Setting Variables

For details about how to set various parameters for a session or transaction, see [SET](#).

## Displaying the Execution Plan

For details about how to display the execution plan that GaussDB makes for SQL statements, see [EXPLAIN](#).

## Specifying a Checkpoint in Transaction Logs

By default, WALs periodically specify checkpoints in a transaction log. **CHECKPOINT** forces an immediate checkpoint when the related command is issued, without waiting for a regular checkpoint scheduled by the system. For details, see [CHECKPOINT](#).

## Collecting Unnecessary Data

For details about how to collect garbage data and analyze a database as required, For details, see [VACUUM](#).

## Collecting Statistics

For details about how to collect statistics on tables in databases, see [ANALYZE | ANALYZE](#).

## Setting the Constraint Check Mode for the Current Transaction

For details about how to set the constraint check mode for the current transaction, see [SET CONSTRAINTS](#).

# 7.10 Controlling Transactions

A transaction is a user-defined sequence of database operations, which form an integral unit of work.

## Starting a Transaction

GaussDB starts a transaction using **START TRANSACTION** and **BEGIN**. For details, see [START TRANSACTION](#) and [BEGIN](#).

## Setting a Transaction

GaussDB sets a transaction using **SET TRANSACTION** or **SET LOCAL TRANSACTION**. For details, see [SET TRANSACTION](#).

## Committing a Transaction

GaussDB commits all operations of a transaction using **COMMIT** or **END**. For details, see [COMMIT | END](#).

## Rolling Back a Transaction

If a fault occurs during a transaction and the transaction cannot proceed, the system performs rollback to cancel all the completed database operations related to the transaction. For details, see [ROLLBACK](#).

 **NOTE**

If an execution request (not in a transaction block) received in the database contains multiple statements, the request is packed into a transaction. If one of the statements fails, the entire request will be rolled back.

## 7.11 DDL Syntax Overview

Data definition language (DDL) is used to define or modify an object in a database, such as a table, an index, or a view.

 **NOTE**

GaussDB does not support DDL if its CN is unavailable. For example, if a CN in cluster is faulty, creating a database or a table will fail.

### Defining a CMK

Client master keys (CMKs) are used to encrypt column encryption keys (CEKs) for the encrypted database feature. CMK definition includes creating and deleting a CMK. For details about related SQL statements, see [Table 7-141](#).

**Table 7-141** SQL statements for defining a CMK

Function	SQL Statement
Creating a CMK	<a href="#">CREATE CLIENT MASTER KEY</a>
Deleting a CMK	<a href="#">DROP CLIENT MASTER KEY</a>

### Defining a CEK

CEKs are used to encrypt data for the encrypted database feature. You can create a CEK, change the client master key specified by a CEK, and delete a CEK. For details about related SQL statements, see [Table 7-141](#).

**Table 7-142** SQL statements for defining a CEK

Function	SQL Statement
Creating a CEK	<a href="#">CREATE COLUMN ENCRYPTION KEY</a>
Changing the client master key specified by a CEK	<a href="#">7.14.173-ALTER COLUMN ENCRYPTION KEY</a>
Deleting a CEK	<a href="#">DROP COLUMN ENCRYPTION KEY</a>

## Defining a Database

A database is the warehouse for organizing, storing, and managing data. Defining a database includes: creating a database, altering the database attributes, and dropping the database. For details about related SQL statements, see [Table 7-143](#).

**Table 7-143** SQL statements for defining a database

Function	SQL Statement
Creating a database	<a href="#">CREATE DATABASE</a>
Altering database attributes	<a href="#">ALTER DATABASE</a>
Dropping a Database	<a href="#">DROP DATABASE</a>

## Defining a Schema

A schema is the set of a group of database objects and is used to control the access to the database objects. For details about related SQL statements, see [Table 7-144](#).

**Table 7-144** SQL statements for defining a schema

Function	SQL Statement
Creating a schema	<a href="#">CREATE SCHEMA</a>
Altering schema attributes	<a href="#">ALTER SCHEMA</a>
Dropping a schema	<a href="#">DROP SCHEMA</a>

## Defining a Tablespace

A tablespace is used to manage data objects and corresponds to a catalog on a disk. For details about related SQL statements, see [Table 7-145](#).

**Table 7-145** SQL statements for defining a tablespace

Function	SQL Statement
Creating a tablespace	<a href="#">CREATE TABLESPACE</a>
Altering tablespace attributes	<a href="#">ALTER TABLESPACE</a>
Dropping a tablespace	<a href="#">DROP TABLESPACE</a>

## Defining a Table

A table is a special data structure in a database and is used to store data objects and relationship between data objects. For details about related SQL statements, see [Table 7-146](#).

**Table 7-146** SQL statements for defining a table

Function	SQL Statement
Creating a table	<a href="#">CREATE TABLE</a>
Altering table attributes	<a href="#">ALTER TABLE</a>
Dropping a table	<a href="#">DROP TABLE</a>

## Defining a Partitioned Table

A partitioned table is a logical table used to improve query performance and does not store data (data is stored in common tables). For details about related SQL statements, see [Table 7-147](#).

**Table 7-147** SQL statements for defining a partitioned table

Function	SQL Statement
Creating a partitioned table	<a href="#">CREATE TABLE PARTITION</a>
Create a partition	<a href="#">ALTER TABLE PARTITION</a>
Altering partitioned table attributes	<a href="#">ALTER TABLE PARTITION</a>
Deleting a partition	<a href="#">ALTER TABLE PARTITION</a>
Dropping a partitioned table	<a href="#">DROP TABLE</a>

## Defining an Index

An index indicates the sequence of values in one or more columns in a database table. It is a data structure that improves the speed of data access to specific information in a database table. For details about related SQL statements, see [Table 7-148](#).

**Table 7-148** SQL statements for defining an index

Function	SQL Statement
Creating an index	<a href="#">CREATE INDEX</a>
Altering index attributes	<a href="#">ALTER INDEX</a>
Dropping an index	<a href="#">DROP INDEX</a>

Function	SQL Statement
Rebuilding an index	<b>REINDEX</b>

## Defining a Stored Procedure

A stored procedure is a set of SQL statements for achieving specific functions and is stored in the database after compiling. Users can specify a name and provide parameters (if necessary) to execute the stored procedure. For details about related SQL statements, see [Table 7-149](#).

**Table 7-149** SQL statements for defining a stored procedure

Function	SQL Statement
Creating a stored procedure	<b>CREATE PROCEDURE</b>
Dropping a stored procedure	<b>DROP PROCEDURE</b>

## Defining a Function

In GaussDB, a function is similar to a stored procedure, which is a set of SQL statements. The function and stored procedure are used the same. For details about related SQL statements, see [Table 7-150](#).

**Table 7-150** SQL statements for defining a function

Function	SQL Statement
Creating a function	<b>CREATE FUNCTION</b>
Modifying attributes of a function or recompiling the function	<b>ALTER FUNCTION</b>
Dropping a function	<b>DROP FUNCTION</b>

## Defining a View

A view is a virtual table exported from one or more basic tables. It is used to control data accesses of users. [Table 7-151](#) lists the related SQL statements.

**Table 7-151** SQL statements for defining a view

Function	SQL Statement
Creating a view	<b>CREATE VIEW</b>
Dropping a view	<b>DROP VIEW</b>

## Defining a Cursor

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers to context regions. With a cursor, the stored procedure can control alterations in context areas. For details, see [Table 7-152](#).

**Table 7-152** SQL statements for defining a cursor

Function	SQL Statement
Creating a cursor	<a href="#">CURSOR</a>
Moving a cursor	<a href="#">MOVE</a>
Fetching data from a cursor	<a href="#">FETCH</a>
Closing a cursor	<a href="#">CLOSE</a>

## Defining a Database Link

A database link can be used to remotely operate a database object. For details about corresponding SQL statements, see [Table 7-153](#).

**Table 7-153** Database link-related SQL statements

Function	SQL Statement
Creating a database link	<a href="#">CREATE DATABASE LINK</a>
Modifying a database link	<a href="#">ALTER DATABASE LINK</a>
Deleting a database link	<a href="#">DROP DATABASE LINK</a>

## Defining a Foreign Data Wrapper

**Table 7-154** SQL statements related to the foreign data wrapper

Function	SQL Statement
Creating a foreign data wrapper	<a href="#">CREATE FOREIGN DATA WRAPPER</a>
Modifying a foreign data wrapper	<a href="#">ALTER FOREIGN DATA WRAPPER</a>
Deleting a foreign data wrapper	<a href="#">DROP FOREIGN DATA WRAPPER</a>

## 7.12 DML Syntax Overview

Data manipulation language (DML) is used to perform operations on data in database tables, such as inserting, updating, querying, or deleting data.

## Inserting Data

Inserting data refers to adding one or multiple records to a database table. For details, see [INSERT](#).

## Updating Data

Updating data refers to modifying one or multiple records in a database table. For details, see [UPDATE](#).

## Querying Data

The database query statement **SELECT** is used to search required information in a database. For details, see [SELECT](#).

## Deleting Data

GaussDB provides two statements for deleting data from database tables. To delete data meeting specified conditions from a database table, see [DELETE](#). To delete all data from a database table, see [TRUNCATE](#).

**TRUNCATE** can quickly delete all data from a database table, which achieves the effect same as that running **DELETE** to delete data without specifying conditions from each table. Deletion efficiency using **TRUNCATE** is faster because **TRUNCATE** does not scan tables. Therefore, **TRUNCATE** is useful in large tables.

## Copying Data

GaussDB provides a statement for copying data between tables and files. For details, see [COPY](#).

## Locking a Table

GaussDB provides multiple lock modes to control concurrent accesses to table data. For details, see [LOCK](#).

## Calling a Function

GaussDB provides three statements for calling functions. These statements are the same in the syntax structure. For details, see [CALL](#).

## Session Management

A session is a connection established between the user and the database. [Table 7-155](#) lists the related SQL statements.

**Table 7-155** SQL statements related to sessions

Function	SQL Statement
Altering a session	<a href="#">ALTER SESSION</a>
Killing a session	<a href="#">ALTER SYSTEM KILL SESSION</a>

## 7.13 DCL Syntax Overview

Data control language (DCL) is used to create users and roles and set or modify database users or role rights.

### Defining a Role

A role is used to manage permissions. For database security, management and operation permissions can be granted to different roles. For details about related SQL statements, see [Table 7-156](#).

**Table 7-156** SQL statements for defining a role

Function	SQL Statement
Creating a role	<a href="#">CREATE ROLE</a>
Altering role attributes	<a href="#">ALTER ROLE</a>
Dropping a role	<a href="#">DROP ROLE</a>

### Defining a User

A user is used to log in to a database. Different permissions can be granted to users for managing data accesses and operations of the users. For details about related SQL statements, see [Table 7-157](#).

**Table 7-157** SQL statements for defining a user

Function	SQL Statement
Creating a user	<a href="#">CREATE USER</a>
Altering user attributes	<a href="#">ALTER USER</a>
Dropping a user	<a href="#">DROP USER</a>

### Granting Rights

GaussDB provides a statement for granting rights to data objects and roles. For details, see [GRANT](#).

### Revoking Rights

GaussDB provides a statement for revoking rights. For details, see [REVOKE](#).

## Setting Default Rights

GaussDB allows users to set rights for objects that will be created in the future. For details, see [ALTER DEFAULT PRIVILEGES](#).

## 7.14 SQL Syntax

### 7.14.1 SQL Syntax

Table 7-158 SQL syntax

Format	Description
[ ]	The part enclosed in brackets ([]) is optional.
...	Preceding elements can appear repeatedly.
[ x   y   ... ]	One item is selected from two or more options or no item is selected.
{ x   y   ... }	One item is selected from two or more options.
[ x   y   ... ] [ ... ]	Multiple parameters or no parameter can be selected. If multiple parameters are selected, separate them with spaces.
[ x   y   ... ] [ ,... ]	Multiple parameters or no parameter can be selected. If multiple parameters are selected, separate them with commas (,).
{ x   y   ... } [ ... ]	At least one parameter can be selected. If multiple parameters are selected, separate them with spaces.
{ x   y   ... } [ ,... ]	At least one parameter can be selected. If multiple parameters are selected, separate them with commas (,).

### 7.14.2 ABORT

#### Description

Rolls back the current transaction and cancels the changes in the transaction.

It is equivalent to [ROLLBACK](#), and is present only for historical reasons. Now ROLLBACK is recommended.

#### Precautions

ABORT has no impact outside a transaction, but will provoke a warning.

#### Syntax

```
ABORT [WORK | TRANSACTION] ;
```

- The unified audit policy takes effect only after **enable\_security\_policy** is set to **on**.

## Syntax

Add or delete an operation type in the audit policy.

```
ALTER AUDIT POLICY [IF EXISTS] policy_name { ADD | REMOVE } { privilege_audit_clause | access_audit_clause };
```

Modify the filter criteria in the audit policy.

```
ALTER AUDIT POLICY [IF EXISTS] policy_name MODIFY (filter_group_clause);
```

Delete the filter criteria from the audit policy.

```
ALTER AUDIT POLICY [IF EXISTS] policy_name DROP FILTER;
```

Modify the description of the audit policy.

```
ALTER AUDIT POLICY [IF EXISTS] policy_name COMMENTS policy_comments;
```

Enable or disable the audit policy.

```
ALTER AUDIT POLICY [IF EXISTS] policy_name { ENABLE | DISABLE };
```

- **privilege\_audit\_clause**  
DDL operation type and target resource label in the audit policy.  
`PRIVILEGES ( { DDL | ALL } [ ON LABEL ( resource_label_name [, ... ] ) ] )`
- **access\_audit\_clause**  
DML operation type and target resource label in the audit policy.  
`ACCESS ( { DML | ALL } [ ON LABEL ( resource_label_name [, ... ] ) ] )`
- **filter\_group\_clause**  
Filter criteria in the audit policy.  
`FILTER ON { filter_type ( filter_value [, ... ] ) } [, ... ]`

## Parameters

- **policy\_name**  
Specifies the audit policy name, which must be unique.  
Value range: a string. It must comply with the [naming convention](#).
- **DDL**  
Specifies the operations that will be audited within the database: ALTER, ANALYZE, COMMENT, CREATE, DROP, GRANT, REVOKE, SET, and SHOW.
- **ALL**  
Indicates all operations supported by the specified DDL statements in the database.
- **DML**  
Specifies the operations that are audited within the database: COPY, DEALLOCATE, DELETE\_P, EXECUTE, REINDEX, INSERT, PREPARE, SELECT, TRUNCATE, and UPDATE.
- **FILTER\_TYPE**  
Specifies a type of information to be filtered by the audit policy. The value can be **IP**, **ROLES**, or **APP**.

- **filter\_value**  
Indicates the detailed information to be filtered.
- **policy\_comments**  
Records description information of audit policies.
- **ENABLE|DISABLE**  
Enables or disables the unified audit policy.

## Examples

See [Examples](#) in section "CREATE AUDIT POLICY."

## Helpful Links

[CREATE AUDIT POLICY](#) and [DROP AUDIT POLICY](#)

## 7.14.4 ALTER COLUMN ENCRYPTION KEY

### Function

Encrypts the CMKs of CEKs in round robin (RR) mode and encrypts the plaintext of CEKs.

### Precautions

- This syntax is specific to the fully-encrypted database. When connecting to the database server, enable the fully-encrypted database before using this syntax.
- This syntax takes effect on CMKs only. Encrypting the plaintext of CEKs does not change the ciphertext of the encrypted columns.

### Syntax

```
ALTER COLUMN ENCRYPTION KEY column_encryption_key_name WITH VALUES (CLIENT_MASTER_KEY = client_master_key_name);
```

### Parameter Description

- **column\_encryption\_key\_name**  
Specifies the key name. In the same namespace, the value of this parameter must be unique.  
Value range: a string. It must comply with the [naming convention](#).
- **client\_master\_key\_name**  
Specifies the CMK used to encrypt the CEK. The value is the CMK name, which is created using the CREATE CLIENT MASTER KEY syntax. The encrypted CMKs are different from those specified before RR encryption.

#### NOTICE

The constraints of using Chinese cryptographic algorithms are as follows:  
SM2, SM3, and SM4 are Chinese cryptographic algorithms. To avoid legal risks, these algorithms must be used together. The Chinese cryptographic algorithms used for the RR encryption must be the same as those used before RR encryption.

## Examples

See [7.15.58 - Examples](#).

## 7.14.5 ALTER COORDINATOR

### Function

**ALTER COORDINATOR** changes the value of **nodeis\_active** on a specified node in the **pgxc\_node** system catalog. This operation can be performed on any normal CN in the cluster and also specifies the node on which the system catalog is to be modified.

### Precautions

- **ALTER COORDINATOR** is a statement used to modify the system catalog. Only the administrator and users in internal maintenance mode (for example, CM) can execute this statement. This statement is dedicated for the CN removal feature and must be used together with other operations. You are advised not to run it by yourself.
- After this statement is executed, **select reload\_active\_coordinator()** needs to be called to update the connection pool information of the node on which the system catalog is modified.

### Syntax

```
ALTER COORDINATOR nodename SET status
WITH (nodename1[, nodename2, nodename3 ...]);
```

### Parameter Description

- **nodename**  
Specifies the node name corresponding to a row of records in the **pgxc\_node** system catalog. After the node name is specified, the value of **nodeis\_active** in the record is changed.  
Value range: a string. Only CNs are supported. Ensure that the node name has a corresponding record in the **pgxc\_node** system catalog.
- **status**  
Specifies the updated value of **nodeis\_active** in the **pgxc\_node** system catalog.  
Value range:  
- FALSE

- TRUE
- **nodename1[, nodename2, nodename3 ...]**

Specifies the range of nodes on which the SQL statement is executed. When **ALTER COORDINATOR** is executed, the SQL statement is automatically delivered to all nodes in the range. The current execution node must be included.

Value range: a string. Only CNs are supported. Ensure that the node name has a corresponding record in the **pgxc\_node** system catalog and the node state is normal. Otherwise, the SQL statement fails to be executed.

## Examples

The cluster has three CNs, namely, cn\_5001, cn\_5002, and cn\_5003, which are running properly.

If cn\_5001 is faulty and needs to be removed from the cluster within the specified time, run the following SQL statement on cn\_5002 and cn\_5003 to change the value of **nodeis\_active** corresponding to cn\_5001 in the **pgxc\_node** system catalog to **false**:

```
ALTER COORDINATOR cn_5001 SET False WITH (cn_5002,cn_5003);
```

After cn\_5001 is recovered, run the following SQL statement on cn\_5002 and cn\_5003 to change the value of **nodeis\_active** corresponding to cn\_5001 in the **pgxc\_node** system catalog to **true**:

```
ALTER COORDINATOR cn_5001 SET True WITH (cn_5002,cn_5003);
```

## 7.14.6 ALTER DATABASE

### Description

Modifies a database, including its name, owner, connection limitation, and object isolation.

### Precautions

- Only the database owner or a user granted with the ALTER permission can run the **ALTER DATABASE** command. The system administrator has this permission by default. The following are permission constraints depending on attributes to be modified:
  - To modify the database name, you must have the CREATEDB permission.
  - To modify a database owner, you must be a database owner or system administrator and a member of the new owner role, with the CREATEDB permission.
  - To modify the default tablespace of the database, the user must have the CREATE permission on the tablespace. This statement physically migrates tables and indexes in a default tablespace to a new tablespace. Note that tables and indexes outside the default tablespace are not affected.
- You are not allowed to rename a database in use. To rename it, connect to another database.

## Syntax

- Modify the maximum number of connections to the database.

```
ALTER DATABASE database_name
[[WITH] CONNECTION LIMIT connlimit];
```

- Rename the database.

```
ALTER DATABASE database_name
RENAME TO new_name;
```

- Change the database owner.

```
ALTER DATABASE database_name
OWNER TO new_owner;
```

- Modify the object isolation attribute of the database.

```
ALTER DATABASE database_name [WITH] { ENABLE | DISABLE } PRIVATE OBJECT;
```

### NOTE

- To modify the object isolation attribute of a database, the database must be connected. Otherwise, the modification will fail.
- For a new database, the object isolation attribute is disabled by default. After the database object isolation attribute is enabled, the database automatically adds row-level security policies to the system catalogs PG\_CLASS, PG\_ATTRIBUTE, PG\_PROC, PG\_NAMESPACE, PGXC\_SLICE, and PG\_PARTITION. Common users can only view the objects (tables, functions, views, and columns) that they have the permission to access. This attribute does not take effect for administrators. After this attribute is enabled, administrators can still view all database objects.

- Change the database time zone.

```
ALTER DATABASE database_name SET DBTIMEZONE = time_zone;
```

- Change the default tablespace of the database.

```
ALTER DATABASE database_name
SET TABLESPACE new_tablespace;
```

### NOTE

If some tables or objects in the database have been created in `new_tablespace`, the default tablespace of the database cannot be changed to **new\_tablespace**. An error will be reported during the execution.

- Modify the session parameter value of the database.

```
ALTER DATABASE database_name
SET configuration_parameter { { TO | = } { value | DEFAULT } | FROM CURRENT };
```

- Reset the database configuration parameter.

```
ALTER DATABASE database_name RESET
{ configuration_parameter | ALL };
```

## Parameters

- **database\_name**

Specifies the name of the database whose attributes are to be modified.

Value range: a string. It must comply with the [naming convention](#).

- **connlimit**

Specifies the maximum number of concurrent connections that can be made to this database (excluding administrators' connections).

Value range: an integer ranging from  $-1$  to  $2^{31} - 1$ . You are advised to set this parameter to an integer ranging from 1 to 50. The default value **-1** indicates that there is no restriction on the number of concurrent connections.

- **new\_name**

Specifies the new name of a database.

Value range: a string. It must comply with the [naming convention](#).

- **new\_owner**

Specifies the new owner of a database.

Value range: a string. It must be a valid username.

- **new\_tablespace**

Specifies the new default tablespace of a database. The tablespace exists in the database. The default tablespace is **pg\_default**.

Value range: a string. It must be a valid tablespace name.

- **configuration\_parameter**

**value**

Sets a specified database session parameter to a specified value. If the value is **DEFAULT** or **RESET**, the default setting is used in the new session. **OFF** closes the setting.

---

**NOTICE**

The current version does not support setting database-level parameters.

---

Value range: a string

- **DEFAULT**
- **OFF**
- **RESET**

- **time\_zone**

Sets the time zone of the database specified by **database\_name**. You must have the permission on the corresponding database.

Value range: a string

- Time zones supported by the system and their abbreviations
- From - 15:59 to + 15:00

- **FROM CURRENT**

Sets the value of the database based on the current connected session.

- **RESET configuration\_parameter**

Resets the specified database session parameter.

---

**NOTICE**

The current version does not support resetting database-level parameters.

---

- **RESET ALL**

Resets all database session parameters.

### NOTICE

The current version does not support resetting database-level parameters.

### NOTE

- Modify the default tablespace of a database by moving the table or index in the old tablespace into the new tablespace. This operation does not affect the tables or indexes in other non-default tablespaces.
- The modified database session parameter values will take effect in the next session.
- After setting the parameters, you need to manually run the **CLEAN CONNECTION** command to clear the old connections. Otherwise, the parameter values between cluster nodes may be inconsistent.

## Examples

See [Examples](#) in section "CREATE DATABASE."

## Helpful Links

[CREATE DATABASE](#) and [DROP DATABASE](#)

## 7.14.7 ALTER DATABASE LINK

### Description

Modifies database link objects. For details about database links, see [DATABASE LINK](#).

### Precautions

Currently, only the username and password can be modified for database links.

### Syntax

```
ALTER [PUBLIC] DATABASE LINK dblink
{ CONNECT TO user IDENTIFIED BY password };
```

### Parameters

- **dblink**  
Name of a connection.
- **user**  
Username for connecting to a remote database.
- **password**  
Password for connecting to a remote database.
- **PUBLIC**  
Connection type. If **PUBLIC** is not specified, the database link is private by default.

## 7.14.8 ALTER DEFAULT PRIVILEGES

### Function

Allows you to set the permissions that will be applied to objects created in the future. (It does not affect permissions granted to existing objects.)

### Precautions

Currently, you can change only the permissions for tables (including views), sequences, functions, client master keys of encrypted databases, column encryption keys, and types.

### Syntax

```
ALTER DEFAULT PRIVILEGES
 [FOR { ROLE | USER } target_role [, ...]]
 [IN SCHEMA schema_name [, ...]]
 abbreviated_grant_or_revoke;
```

- **abbreviated\_grant\_or\_revoke** grants or revokes permissions on some objects.  
grant\_on\_tables\_clause  
| grant\_on\_sequences\_clause  
| grant\_on\_functions\_clause  
| grant\_on\_types\_clause  
| grant\_on\_client\_master\_keys\_clause  
| grant\_on\_column\_encryption\_keys\_clause  
| revoke\_on\_tables\_clause  
| revoke\_on\_sequences\_clause  
| revoke\_on\_functions\_clause  
| revoke\_on\_types\_clause  
| revoke\_on\_client\_master\_keys\_clause  
| revoke\_on\_column\_encryption\_keys\_clause
- **grant\_on\_tables\_clause** grants permissions on tables.  
GRANT { { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | ALTER | DROP |  
COMMENT | INDEX | VACUUM }  
[, ...] | ALL [ PRIVILEGES ] }  
ON TABLES  
TO { [ GROUP ] role\_name | PUBLIC } [, ...]  
[ WITH GRANT OPTION ]
- **grant\_on\_sequences\_clause** grants permissions on sequences.  
GRANT { { SELECT | UPDATE | USAGE | ALTER | DROP | COMMENT }  
[, ...] | ALL [ PRIVILEGES ] }  
ON SEQUENCES  
TO { [ GROUP ] role\_name | PUBLIC } [, ...]  
[ WITH GRANT OPTION ]
- **grant\_on\_functions\_clause** grants permissions on functions.  
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }  
ON FUNCTIONS  
TO { [ GROUP ] role\_name | PUBLIC } [, ...]  
[ WITH GRANT OPTION ]
- **grant\_on\_types\_clause** grants permissions on types.  
GRANT { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }  
ON TYPES  
TO { [ GROUP ] role\_name | PUBLIC } [, ...]  
[ WITH GRANT OPTION ]
- **grant\_on\_client\_master\_keys\_clause** grants permissions on CMKs.  
GRANT { { USAGE | DROP } [, ...] | ALL [ PRIVILEGES ] }  
ON CLIENT\_MASTER\_KEYS  
TO { [ GROUP ] role\_name | PUBLIC } [, ...]  
[ WITH GRANT OPTION ]

- **grant\_on\_column\_encryption\_keys\_clause** grants permissions on column encryption keys.

```
GRANT { { USAGE | DROP } [, ...] | ALL [PRIVILEGES] }
ON COLUMN_ENCRYPTION_KEYS
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION]
```

- **revoke\_on\_tables\_clause** revokes permissions on tables.

```
REVOKE [GRANT OPTION FOR]
{ { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | ALTER | DROP | COMMENT |
INDEX | VACUUM }
[, ...] | ALL [PRIVILEGES] }
ON TABLES
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT | CASCADE CONSTRAINTS]
```

- **revoke\_on\_sequences\_clause** revokes permissions on sequences.

```
REVOKE [GRANT OPTION FOR]
{ { SELECT | UPDATE | USAGE | ALTER | DROP | COMMENT }
[, ...] | ALL [PRIVILEGES] }
ON SEQUENCES
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT | CASCADE CONSTRAINTS]
```

- **revoke\_on\_functions\_clause** revokes permissions on functions.

```
REVOKE [GRANT OPTION FOR]
{ { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON FUNCTIONS
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT | CASCADE CONSTRAINTS]
```

- **revoke\_on\_types\_clause** revokes permissions on types.

```
REVOKE [GRANT OPTION FOR]
{ { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON TYPES
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT | CASCADE CONSTRAINTS]
```

- **revoke\_on\_client\_master\_keys\_clause** revokes permissions on CMKs.

```
REVOKE [GRANT OPTION FOR]
{ { USAGE | DROP } [, ...] | ALL [PRIVILEGES] }
ON CLIENT_MASTER_KEYS
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT | CASCADE CONSTRAINTS]
```

- **revoke\_on\_column\_encryption\_keys\_clause** revokes permissions on CEKs.

```
REVOKE [GRANT OPTION FOR]
{ { USAGE | DROP } [, ...] | ALL [PRIVILEGES] }
ON COLUMN_ENCRYPTION_KEYS
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT | CASCADE CONSTRAINTS]
```

## Parameter Description

- **target\_role**  
Specifies the name of an existing role. If **FOR ROLE/USER** is omitted, the current role is assumed.  
Value range: an existing role name
- **schema\_name**  
Specifies the name of an existing schema.  
**target\_role** must have the **CREATE** permission for **schema\_name**.  
Value range: an existing schema name
- **role\_name**  
Specifies the name of an existing role to grant or revoke permissions for.

Value range: an existing role name

#### NOTICE

To drop a role for which the default permissions have been granted, reverse the changes in its default permissions or use **DROP OWNED BY** to get rid of the default permission entry for the role.

## Examples

```
-- Grant the SELECT permission on all the tables (and views) in tpcds to every user.
gaussdb=# ALTER DEFAULT PRIVILEGES IN SCHEMA tpcds GRANT SELECT ON TABLES TO PUBLIC;

-- Create a common user jack.
gaussdb=# CREATE USER jack PASSWORD '*****';

-- Grant the INSERT permission on all the tables in tpcds to the user jack.
gaussdb=# ALTER DEFAULT PRIVILEGES IN SCHEMA tpcds GRANT INSERT ON TABLES TO jack;

-- Revoke the preceding permissions.
gaussdb=# ALTER DEFAULT PRIVILEGES IN SCHEMA tpcds REVOKE SELECT ON TABLES FROM PUBLIC;
gaussdb=# ALTER DEFAULT PRIVILEGES IN SCHEMA tpcds REVOKE INSERT ON TABLES FROM jack;

-- Delete user jack.
gaussdb=# DROP USER jack;
```

## Helpful Links

[GRANT](#) and [REVOKE](#)

## 7.14.9 ALTER DIRECTORY

### Function

**ALTER DIRECTORY** modifies a directory.

### Precautions

- Currently, only the directory owner can be changed.
- When **enable\_access\_server\_directory** is set to **off**, only the initial user is allowed to change the directory owner. When **enable\_access\_server\_directory** is set to **on**, users with the **SYSADMIN** permission and the directory object owner can change the directory object owner, and the user who changes the owner is required to be a member of the new owner.

### Syntax

```
ALTER DIRECTORY directory_name
OWNER TO new_owner;
```

### Parameter Description

**directory\_name**

Specifies the name of a directory to be modified. The value must be an existing directory name.

## Examples

```
-- Create a directory.
gaussdb=# CREATE OR REPLACE DIRECTORY dir as '/tmp/';

-- Change the owner of the directory.
gaussdb=# ALTER DIRECTORY dir OWNER TO system;

-- Delete the foreign table.
gaussdb=# DROP DIRECTORY dir;
```

## Helpful Links

[CREATE DIRECTORY](#) and [DROP DIRECTORY](#)

## 7.14.10 ALTER FOREIGN DATA WRAPPER

### Description

Modifies the definition of a foreign data wrapper.

### Precautions

- Only initial users and system administrators can modify the foreign data wrapper.
- The alter statement can be successfully executed only when **support\_extended\_features** is set to **on**.

### Syntax

- Set the attributes of the foreign data wrapper.  
ALTER FOREIGN DATA WRAPPER name  
[ HANDLER handler\_function | NO HANDLER ]  
[ VALIDATOR validator\_function | NO VALIDATOR ]  
[ OPTIONS ( [ ADD | SET | DROP ] option ['value'] [, ... ] ) ];
- Set a new owner.  
ALTER FOREIGN DATA WRAPPER name OWNER TO new\_owner;
- Set a new name.  
ALTER FOREIGN DATA WRAPPER name RENAME TO new\_name;

### Parameters

- **name**  
Specifies a name of an existing foreign data wrapper.
- **HANDLER handler\_function**  
Specifies a new handler function for a foreign data wrapper.
- **NO HANDLER**  
Specifies that the foreign data wrapper no longer has the handler function.

---

 **CAUTION**

Foreign tables that use foreign data wrapper but do not have handlers cannot be accessed.

---

- **VALIDATOR validator\_function**

Specifies a new validator function for a foreign data wrapper.

---

 **CAUTION**

Depending on the new validator, an existing option for the foreign data wrapper or dependent server, user mapping, or foreign table may be invalid. Before using foreign data wrapper, ensure that these options are correct. However, any options specified in the **ALTER FOREIGN DATA WRAPPER** command will be checked using the new validator function.

---

- **NO VALIDATOR**

Specifies that the foreign data wrapper no longer has the validator function.

- **OPTIONS ( [ ADD | SET | DROP ] option ['value'] [, ... ] )**

Modifies the options of a foreign data wrapper. ADD, SET, and DROP specify the actions to be performed. If no operation is specified, the default operation is ADD. The option name must be unique. When foreign data is used to wrap validator functions, names and values are also validated.

- **new\_owner**

Specifies the username of the new owner for a foreign data wrapper.

- **new\_name**

Specifies the new name of a foreign data wrapper.

## Example

```
-- Modify a foreign data wrapper dbi, add the foo option, and delete bar.
gaussdb=# ALTER FOREIGN DATA WRAPPER dbi OPTIONS (ADD foo '1', DROP 'bar');

-- Change the validator of the foreign data wrapper dbi to bob.myvalidator.
gaussdb=# ALTER FOREIGN DATA WRAPPER dbi VALIDATOR bob.myvalidator;
```

## Helpful Links

[CREATE FOREIGN DATA WRAPPER](#) and [DROP FOREIGN DATA WRAPPER](#)

## 7.14.11 ALTER FUNCTION

### Function

Modifies the attributes of a user-defined function or recompiles a function.

### Precautions

- Only the function owner or a user granted with the ALTER permission can run the **ALTER FUNCTION** command. A system administrator has this permission

by default. The following is permission constraints depending on attributes to be modified:

- If a function involves operations on temporary tables, ALTER FUNCTION cannot be used.
  - To modify the owner or schema of a function, you must be a function owner or system administrator and a member of the new owner role.
  - Only the system administrator and initial user can change the schema of a function to public.
- The **plpgsql\_dependency** parameter must be set for function recompilation.
  - When separation-of-duties is enabled, to modify the owner of a function, users must have the user group permission, even a system administrator.
  - Only the initial user can change the owner of a function to the initial user.

## Syntax

- Modify the additional parameters of the customized function.  
ALTER FUNCTION function\_name ( [ { [ argname ] [ argmode ] argtype } [, ...] ] )  
action [ ... ] [ RESTRICT ];

The syntax of the **action** clause is as follows:

```
{CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT}
| {IMMUTABLE | STABLE | VOLATILE}
| {SHIPPABLE | NOT SHIPPABLE}
| {NOT FENCED | FENCED}
| [NOT] LEAKPROOF
| { [EXTERNAL] SECURITY INVOKER | [EXTERNAL] SECURITY DEFINER }
| AUTHID { DEFINER | CURRENT_USER }
| COST execution_cost
| ROWS result_rows
| SET configuration_parameter { { TO | = } { value | DEFAULT } } FROM CURRENT}
| RESET {configuration_parameter | ALL}
```

- Rename the customized function.  
ALTER FUNCTION funname ( [ { [ argname ] [ argmode ] argtype } [, ...] ] )  
RENAME TO new\_name;
- Change the owner of the customized function.  
ALTER FUNCTION funname ( [ { [ argname ] [ argmode ] argtype } [, ...] ] )  
OWNER TO new\_owner;
- Modify the schema of the customized function.  
ALTER FUNCTION funname ( [ { [ argname ] [ argmode ] argtype } [, ...] ] )  
SET SCHEMA new\_schema;
- Recompile the function.  
ALTER FUNCTION **function\_name** COMPILE;

## Parameter Description

- **function\_name**  
Specifies the name of the function to be modified.  
Value range: an existing function name
- **argmode**  
Specifies whether a parameter is an input or output parameter.  
Value range: **IN**, **OUT**, and **IN OUT**
- **argname**  
Parameter name.

Value range: a string. It must comply with the [naming convention](#).

- **argtype**  
Specifies the parameter type.  
Value range: a valid type. For details, see [Data Type](#).
- **CALLED ON NULL INPUT**  
Declares that some parameters of the function can be called in normal mode if the parameter values are null. Omitting this parameter is the same as specifying it.
- **RETURNS NULL ON NULL INPUT**  
**STRICT**  
Specifies that the function always returns **NULL** whenever any of its parameters is **NULL**. If **STRICT** is specified, the function will not be executed when there are null parameters; instead a null result is assumed automatically.  
**RETURNS NULL ON NULL INPUT** and **STRICT** have the same functions.
- **IMMUTABLE**  
Specifies that the function always returns the same result if the parameter values are the same.
- **STABLE**  
Specifies that the function cannot modify the database, and that within a single table scan it will consistently return the same result for the same parameter value, but its result varies by SQL statements.
- **VOLATILE**  
Specifies that the function value can change in a single table scan and no optimization is performed.
- **SHIPPABLE**
- **NOT SHIPPABLE**  
Specifies whether the function can be pushed down to DN for execution.  
Functions of the **IMMUTABLE** type can always be pushed down to DN.  
Functions of the **STABLE** or **VOLATILE** type can be pushed down to DN only if their attribute is **SHIPPABLE**.
- **LEAKPROOF**  
Specifies that the function has no side effect and the parameter contains only the return value. **LEAKPROOF** can be set only by the system administrator.
- **EXTERNAL**  
(Optional) The purpose is to be compatible with SQL. This feature applies to all functions, not only external functions.
- **SECURITY INVOKER**  
**AUTHID CURREN\_USER**  
Specifies that the function will be executed with the permissions of the user who calls it. Omitting this parameter is the same as specifying it.  
**SECURITY INVOKER** and **AUTHID CURREN\_USER** have the same functions.
- **SECURITY DEFINER**  
**AUTHID DEFINER**

Specifies that the function will be executed with the permissions of the user who created it.

**AUTHID DEFINER** and **SECURITY DEFINER** have the same functions.

- **COST execution\_cost**

Estimates the execution cost of a function.

The unit of **execution\_cost** is **cpu\_operator\_cost**.

Value range: a positive integer

- **ROWS result\_rows**

Estimates the number of rows returned by the function. This is only allowed when the function is declared to return a set.

Value range: a positive number. The default value is **1000**.

- **configuration\_parameter**

- **value**

Sets a specified database session parameter to a specified value. If the value is **DEFAULT** or **RESET**, the default setting is used in the new session. **OFF** closes the setting.

Value range: a string

- **DEFAULT**
- **OFF**
- **RESET**

Specifies the default value.

- **from current**

Uses the value of **configuration\_parameter** of the current session.

- **new\_name**

Specifies the new name of a function. To change the schema of a function, you must have the **CREATE** permission on the new schema.

Value range: a string. It must comply with the [naming convention](#).

- **new\_owner**

Specifies the new owner of a function. To change the owner of a function, the new owner must have the **CREATE** permission on the schema to which the function belongs. Note that only the initial user can set the function owner to another initial user.

Value range: an existing user role

- **new\_schema**

Specifies the new schema of a function.

Value range: an existing schema

## Examples

See [Examples](#) in section "CREATE FUNCTION."

Recompilation examples:

```
-- Enable the dependency function.
gaussdb=# set behavior_compat_options ='plpgsql_dependency';
```

```
-- Create a function.
gaussdb=# create or replace function test_func(a int) return int
is
 proc_var int;
begin
 proc_var := a;
 return 1;
end;
/
-- Recompile the function with a function name.
gaussdb=# alter procedure test_func compile;
-- Recompile the stored procedure with a signed int type function.
gaussdb=# alter procedure test_func(int) compile;
```

## Helpful Links

[CREATE FUNCTION](#) and [DROP FUNCTION](#)

## 7.14.12 ALTER GLOBAL CONFIGURATION

### Description

Adds or modifies the key-value of the `gs_global_config` system catalog. You can modify an existing parameter or add a new one.

### Precautions

- Only the initial database user can run this command.
- The keyword cannot be changed to **weak\_password**.

### Syntax

```
ALTER GLOBAL CONFIGURATION with(paraname=value, paraname=value...);
```

### Parameters

- **name**  
Parameter name, which is of the text type. The value cannot be **weak\_password** or **undostoragetype**.
- **value**  
Parameter value, which is of the text type.

### Examples

```
-- Insert.
gaussdb=# ALTER GLOBAL CONFIGURATION with(redis_is_ok = true);
-- Query.
gaussdb=# SELECT * FROM gs_global_config;
 name | value
-----+-----
 buckets_len | 16384
 undostoragetype | page
 redis_is_ok | true
(3 rows)

-- Modify.
gaussdb=# ALTER GLOBAL CONFIGURATION with(redis_is_ok = false);
-- Query.
gaussdb=# SELECT * FROM gs_global_config;
 name | value
```

```
-----+-----
buckets_len | 16384
undostorage | page
redis_is_ok | false
(3 rows)

-- Delete.
gaussdb=# DROP GLOBAL CONFIGURATION redis_is_ok;
-- Query.
gaussdb=# SELECT * FROM gs_global_config;
 name | value
-----+-----
buckets_len | 16384
undostorage | page
(2 rows)
```

## Helpful Links

[DROP GLOBAL CONFIGURATION](#)

## 7.14.13 ALTER GROUP

### Function

**ALTER GROUP** modifies the attributes of a user group.

### Precautions

**ALTER GROUP** is an alias for **ALTER ROLE**, and it is not a standard SQL syntax and not recommended. Users can use **ALTER ROLE** directly.

### Syntax

- Add users to a group.  
ALTER GROUP group\_name  
ADD USER user\_name [, ... ];
- Remove users from a group.  
ALTER GROUP group\_name  
DROP USER user\_name [, ... ];
- Change the name of the group.  
ALTER GROUP group\_name  
RENAME TO new\_name;

### Parameter Description

See [Parameters](#) in section "ALTER ROLE."

### Examples

```
-- Create a user group.
gaussdb=# CREATE GROUP super_users WITH PASSWORD '*****';

-- Create a user.
gaussdb=# CREATE ROLE lche WITH PASSWORD '*****';

-- Create a user.
gaussdb=# CREATE ROLE jim WITH PASSWORD '*****';

-- Add users to a user group.
gaussdb=# ALTER GROUP super_users ADD USER lche, jim;
```

```
-- Remove users from a user group.
gaussdb=# ALTER GROUP super_users DROP USER jim;

-- Change the name of a user group.
gaussdb=# ALTER GROUP super_users RENAME TO normal_users;

-- Delete the user.
gaussdb=# DROP ROLE lche, jim;

-- Delete the user group.
gaussdb=# DROP GROUP normal_users;
```

## Helpful Links

[CREATE GROUP](#), [DROP GROUP](#), and [ALTER ROLE](#)

## 7.14.14 ALTER INDEX

### Description

ALTER INDEX modifies the definition of an existing index.

It has the following forms:

- **IF EXISTS**  
Sends a notice instead of an error if the specified index does not exist.
- **RENAME TO**  
Changes only the name of the index. The stored data is not affected.
- **SET TABLESPACE**  
Changes the index tablespace to the specified tablespace and moves index-related data files to the new tablespace.
- **SET ( { STORAGE\_PARAMETER = value } [, ...] )**  
Changes one or more index-method-specific storage parameters of an index. Note that the index content will not be modified immediately by this statement. You may need to use REINDEX to rebuild the index based on different parameters to achieve the expected effect.
- **RESET ( { storage\_parameter } [, ...] )**  
Resets one or more index-method-specific storage parameters of an index to the default value. Similar to the SET statement, REINDEX may be used to completely update the index.
- **[ MODIFY PARTITION index\_partition\_name ] UNUSABLE**  
Sets the indexes on a table or index partition to be unavailable.
- **REBUILD [ PARTITION index\_partition\_name ]**  
Rebuilds indexes on a table or an index partition.
- **RENAME PARTITION**  
Renames an index partition.
- **MOVE PARTITION**  
Modifies the tablespace to which an index partition belongs.

## Precautions

Only the index owner, a user who has the INDEX permission on the table where the index resides, or a user who has the ALTER ANY INDEX permission can run the **ALTER INDEX** command. The system administrator has this permission by default.

## Syntax

- Rename a table index.  

```
ALTER INDEX [IF EXISTS] index_name
 RENAME TO new_name;
```
- Change the tablespace to which a table index belongs.  

```
ALTER INDEX [IF EXISTS] index_name
 SET TABLESPACE tablespace_name;
```
- Modify the storage parameter of a table index.  

```
ALTER INDEX [IF EXISTS] index_name
 SET ({storage_parameter = value} [, ...]);
```
- Reset the storage parameter of a table index.  

```
ALTER INDEX [IF EXISTS] index_name
 RESET (storage_parameter [, ...]);
```
- Set a table index or an index partition to be unavailable.  

```
ALTER INDEX [IF EXISTS] index_name
 [MODIFY PARTITION index_partition_name] UNUSABLE;
```
- Rebuild a table index or index partition.  

```
ALTER INDEX index_name
 REBUILD [PARTITION index_partition_name];
```
- Rename an index partition.  

```
ALTER INDEX [IF EXISTS] index_name
 RENAME PARTITION index_partition_name TO new_index_partition_name;
```
- Modify the tablespace to which an index partition belongs.  

```
ALTER INDEX [IF EXISTS] index_name
 MOVE PARTITION index_partition_name TABLESPACE new_tablespace;
```

## Parameters

- **index\_name**  
Specifies the index name to be modified.
- **new\_name**  
Specifies the new name of the index.  
Value range: a string. It must comply with the [naming convention](#).
- **tablespace\_name**  
Specifies the tablespace name.  
Value range: an existing tablespace name.
- **storage\_parameter**  
Specifies the name of an index-method-specific parameter. **ACTIVE\_PAGES** indicates the number of index pages, which may be less than the actual number of physical file pages and can be used for optimization. Currently, this parameter is valid only for the local index of the Ustore partitioned table and will be updated by VACUUM and ANALYZE (including AUTOVACUUM). You are not advised to manually set this parameter because it is invalid in distributed mode.
- **value**

Specifies the new value for an index-method-specific storage parameter. This might be a number or a word depending on the parameter.

- **new\_index\_partition\_name**  
Specifies the new name of the index partition.
- **index\_partition\_name**  
Specifies the name of an index partition.
- **new\_tablespace**  
Specifies a new tablespace.

## Examples

See [Examples](#) in section "CREATE INDEX."

## Helpful Links

[CREATE INDEX](#), [DROP INDEX](#), and [REINDEX](#)

## 7.14.15 ALTER LANGUAGE

This version does not support this syntax.

## 7.14.16 ALTER MASKING POLICY

### Function

Modifies a masking policy.

### Precautions

- Only user **poladmin**, user **sysadmin**, or the initial user can perform this operation.
- The masking policy takes effect only after **enable\_security\_policy** is set to **on**.

### Syntax

- Modify the policy description.  
`ALTER MASKING POLICY policy_name COMMENTS policy_comments;`
- Modify the masking method.  
`ALTER MASKING POLICY policy_name [ADD | REMOVE | MODIFY] masking_actions[, ...];`  
The syntax of **masking\_action**.  
`masking_function ON LABEL(label_name[, ...])`
- Modify the scenarios where the masking policies take effect.  
`ALTER MASKING POLICY policy_name MODIFY(FILTER ON FILTER_TYPE(filter_value[, ...])[, ...]);`
- Remove the filters of the masking policies.  
`ALTER MASKING POLICY policy_name DROP FILTER;`
- Enable or disable the masking policies.  
`ALTER MASKING POLICY policy_name [ENABLE | DISABLE];`

### Parameter Description

- **policy\_name**  
Specifies the masking policy name, which must be unique.

Value range: a string. It must comply with the [naming convention](#).

- **policy\_comments**  
Adds or modifies description of masking policies.
- **masking\_function**  
Specifies eight preset masking methods or user-defined functions. Schema is supported.  
**maskall** is not a preset function. It is hard-coded and cannot be displayed by running `\df`.  
The preset masking methods are as follows:  
`maskall | randommasking | creditcardmasking | basicemailmasking | fullemailmasking | shufflemasking | alldigitsmasking | regepmasking`
- **label\_name**  
Specifies the resource label name.
- **FILTER\_TYPE**  
Specifies the types of information to be filtered by the policies: **IP**, **ROLES**, and **APP**.
- **filter\_value**  
Indicates the detailed information to be filtered, such as the IP address, app name, and username.
- **ENABLE|DISABLE**  
Enables or disables the masking policy. If **ENABLE|DISABLE** is not specified, **ENABLE** is used by default.

## Examples

```
-- Create users dev_mask and bob_mask.
gaussdb=# CREATE USER dev_mask PASSWORD '*****';
gaussdb=# CREATE USER bob_mask PASSWORD '*****';

-- Create table tb_for_masking.
gaussdb=# CREATE TABLE tb_for_masking(col1 text, col2 text, col3 text);

-- Create a resource label for sensitive column col1.
gaussdb=# CREATE RESOURCE LABEL mask_lb1 ADD COLUMN(tb_for_masking.col1);

-- Create a resource label for sensitive column col2.
gaussdb=# CREATE RESOURCE LABEL mask_lb2 ADD COLUMN(tb_for_masking.col2);

-- Create a masking policy for the operation of accessing sensitive column col1.
gaussdb=# CREATE MASKING POLICY maskpol1 maskall ON LABEL(mask_lb1);

-- Add description for masking policy maskpol1.
gaussdb=# ALTER MASKING POLICY maskpol1 COMMENTS 'masking policy for tb_for_masking.col1';

-- Modify masking policy maskpol1 to add a masking method.
gaussdb=# ALTER MASKING POLICY maskpol1 ADD randommasking ON LABEL(mask_lb2);

-- Modify masking policy maskpol1 to remove a masking method.
gaussdb=# ALTER MASKING POLICY maskpol1 REMOVE randommasking ON LABEL(mask_lb2);

-- Modify masking policy maskpol1 to modify a masking method.
gaussdb=# ALTER MASKING POLICY maskpol1 MODIFY randommasking ON LABEL(mask_lb1);

-- Modify masking policy maskpol1 so that it takes effect only for scenarios where users are dev_mask and bob_mask, the client tool is gsq, and the IP addresses are 10.20.30.40 and 127.0.0.0/24.
gaussdb=# ALTER MASKING POLICY maskpol1 MODIFY (FILTER ON ROLES(dev_mask, bob_mask), APP(gsql), IP('10.20.30.40', '127.0.0.0/24'));
```

```
-- Modify masking policy maskpol1 so that it takes effect for all user scenarios.
gaussdb=# ALTER MASKING POLICY maskpol1 DROP FILTER;

-- Disable masking policy maskpol1.
gaussdb=# ALTER MASKING POLICY maskpol1 DISABLE;

-- Delete a masking policy.
gaussdb=# DROP MASKING POLICY maskpol1;

-- Delete the resource label.
gaussdb=# DROP RESOURCE LABEL mask_lb1, mask_lb2;

-- Delete the tb_for_masking table.
gaussdb=# DROP TABLE tb_for_masking;

-- Delete the dev_mask and bob_mask users.
gaussdb=# DROP USER dev_mask, bob_mask;
```

## 7.14.17 ALTER MATERIALIZED VIEW

### Function

**ALTER MATERIALIZED VIEW** changes multiple auxiliary attributes of an existing materialized view.

Statements and actions that can be used for **ALTER MATERIALIZED VIEW** are a subset of **ALTER TABLE** and have the same meaning when used for materialized views. For details, see [ALTER TABLE](#).

### Precautions

- Only the owner of a materialized view or a system administrator has the **ALTER TMATERIALIZED VIEW** permission.
- The materialized view structure cannot be modified.

### Syntax

- Change the owner of a materialized view.  
ALTER MATERIALIZED VIEW [ IF EXISTS ] mv\_name  
OWNER TO new\_owner;
- Modify the column of a materialized view.  
ALTER MATERIALIZED VIEW [ IF EXISTS ] mv\_name  
RENAME [ COLUMN ] column\_name TO new\_column\_name;
- Rename a materialized view.  
ALTER MATERIALIZED VIEW [ IF EXISTS ] mv\_name  
RENAME TO new\_name;

### Parameter Description

- **mv\_name**  
Specifies the name of an existing materialized view, which can be schema-qualified.

Value range: a string. It must comply with the [naming convention](#).

- **column\_name**

Specifies the name of a new or existing column.

Value range: a string. It must comply with the [naming convention](#).

- **new\_column\_name**

Specifies the new name of an existing column.

- **new\_owner**

Specifies the username of the new owner of a materialized view.

- **new\_name**

Specifies the new name of a materialized view.

## Examples

```
-- Create a table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int) WITH(STORAGE_TYPE=ASTORE);

-- Create a complete-refresh materialized view.
gaussdb=# CREATE MATERIALIZED VIEW foo AS SELECT * FROM my_table;

-- Rename the materialized view foo to bar.
gaussdb=# ALTER MATERIALIZED VIEW foo RENAME TO bar;

-- Delete a complete-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW bar;

-- Delete the my_table table.
gaussdb=# DROP TABLE my_table;
```

[DROP MATERIALIZED VIEW](#), [REFRESH INCREMENTAL MATERIALIZED VIEW](#),  
and [REFRESH MATERIALIZED VIEW](#)

## 7.14.18 ALTER NODE

### Function

**ALTER NODE** modifies the definition of an existing node.

### Precautions

**ALTER NODE** is an interface of the cluster management tool and is used to manage clusters. Only administrators have the permission to use this interface. You are not advised to use this interface, because doing so affects the cluster.

### Syntax

```
ALTER NODE nodename WITH
(
 [TYPE = nodetype,]
 [HOST = hostname,]
 [PORT = portnum,]
 [HOST1 = 'hostname',]
 [PORT1 = portnum,]
 [HOSTPRIMARY [= boolean],]
```

```
[PRIMARY [= boolean],]
[PREFERRED [= boolean],]
[Sctp_PORT = portnum,]
[CONTROL_PORT = portnum,]
[Sctp_PORT1 = portnum,]
[CONTROL_PORT1 = portnum,]
[NODEIS_CENTRAL [= boolean]]
);
```

#### NOTE

The port whose number is specified by **PORT** is used for internal communications between nodes. Unlike the port connecting to an external client, it can be queried in the **pgxc\_node** table.

## Parameter Description

See [Parameters](#) in **CREATE NODE**.

## Helpful Links

[CREATE NODE](#) and [DROP NODE](#)

## 7.14.19 ALTER NODE GROUP

### Description

Modifies information about a node group.

### Precautions

- Only the system administrator or a user who has the ALTER permission of a node group can modify the information about the node group.
- Node group modification is an internal operation of the system. Except SET DEFAULT, other operations must be performed in maintenance mode (by invoking **set xc\_maintenance\_mode=on;**).
- ALTER NODE GROUP can be used only within a database. To avoid data inconsistency in DBMS, do not manually run this SQL statement.

### Syntax

```
ALTER NODE GROUP groupname
| SET DEFAULT
| RENAME TO new_group_name
| SET VCGROUP RENAME TO new_group_name
| SET NOT VCGROUP
| SET TABLE GROUP new_group_name
| COPY BUCKETS FROM src_group_name
| ADD NODE (nodename [, ...])
| DELETE NODE (nodename [, ...])
| RESIZE TO dest_group_name
| SET VCGROUP WITH GROUP new_group_name
```

### Parameters

- **groupname**  
Specifies the name of the node group to be modified.  
Value range: a string. It must comply with the [naming convention](#).

- **SET DEFAULT**  
Sets **in\_redistribution** to 'y' for all node groups excluding the one specified by **groupname**. To be compatible with earlier versions, this syntax is retained and does not need to be executed in maintenance mode.
- **RENAME TO new\_group\_name**  
Renames the node group specified by **groupname** to **new\_group\_name**.
- **SET TABLE GROUP new\_group\_name**  
Changes all the **group\_names** in the **pggroup** columns of the **pgxc\_class** tables on all CNs to **new\_group\_name**.
- **COPY BUCKETS FROM src\_group\_name**  
Copies values in the **group\_members** and **group\_buckets** columns from the node group specified by **src\_group\_name** to the node group specified by **groupname**.
- **ADD NODE ( nodename [, ... ] )**  
Adds nodes from the node group specified by **groupname**. After the statement execution, the new nodes are registered with the **PGXC\_NODE** system catalog. This statement only modifies the system catalog and does not add nodes or redistribute data. Do not invoke this statement.
- **DELETE NODE ( nodename [, ... ] )**  
Deletes nodes from the node group specified by **groupname**. The deleted nodes still exist in the **PGXC\_NODE** system catalog. This statement only modifies the system catalog and does not delete nodes or redistribute data. Do not invoke this statement.
- **RESIZE TO dest\_group\_name**  
Specifies a resize flag for the cluster. Set **groupname** to the source node group before data redistribution and **is\_installation** of the node group to **FALSE**. Set **desst\_group\_name** to the destination node group and **is\_installation** of the node group to **TRUE**.

## 7.14.20 ALTER RESOURCE LABEL

### Function

Modifies resource labels.

### Precautions

Only users with the poladmin or sysadmin permission, or the initial user can perform this operation.

### Syntax

```
ALTER RESOURCE LABEL label_name (ADD|REMOVE)
label_item_list[, ...];
```

- **label\_item\_list**  
resource\_type(resource\_path[, ...])
- **resource\_type**  
TABLE | COLUMN | SCHEMA | VIEW | FUNCTION

## Parameter Description

- **label\_name**  
Specifies the resource label name.  
Value range: a string. It must comply with the [naming convention](#).
- **resource\_type**  
Specifies the type of database resources to be labeled.
- **resource\_path**  
Specifies the path of database resources.

## Examples

```
-- Create basic table table_for_label.
gaussdb=# CREATE TABLE table_for_label(col1 int, col2 text);

-- Create resource label table_label.
gaussdb=# CREATE RESOURCE LABEL table_label ADD COLUMN(table_for_label.col1);

-- Attach resource label table_label to col2.
gaussdb=# ALTER RESOURCE LABEL table_label ADD COLUMN(table_for_label.col2)

-- Remove table_label from an item.
gaussdb=# ALTER RESOURCE LABEL table_label REMOVE COLUMN(table_for_label.col1);

-- Delete the resource label table_label.
gaussdb=# DROP RESOURCE LABEL table_label;

-- Delete the base table table_for_label.
gaussdb=# DROP TABLE table_for_label;
```

## Helpful Links

[CREATE RESOURCE LABEL](#) and [DROP RESOURCE LABEL](#)

## 7.14.21 ALTER ROLE

### Description

Modifies role attributes.

### Precautions

None

### Syntax

- Modify the permissions of a role.  
ALTER ROLE role\_name [ [ WITH ] option [ ... ] ];

The option clause for granting permissions is as follows:

```
{CREATEDB | NOCREATEDB}
| {CREATEROLE | NOCREATEROLE}
| {INHERIT | NOINHERIT}
| {AUDITADMIN | NOAUDITADMIN}
| {SYSADMIN | NOSYSADMIN}
| {MONADMIN | NOMONADMIN}
| {OPRADMIN | NOOPRADMIN}
| {POLADMIN | NOPOLADMIN}
| {USEFT | NOUSEFT}
```

```
| {LOGIN | NOLOGIN}
| {REPLICATION | NOREPLICATION}
| {VCADMIN | NOVCADMIN}
| {PERSISTENCE | NOPERSISTENCE}
| CONNECTION LIMIT connlimit
| [ENCRYPTED | UNENCRYPTED] PASSWORD 'password'[EXPIRED]
| [ENCRYPTED | UNENCRYPTED] IDENTIFIED BY 'password' [REPLACE 'old_password' | EXPIRED]
| [ENCRYPTED | UNENCRYPTED] PASSWORD { 'password' | DISABLE | EXPIRED }
| [ENCRYPTED | UNENCRYPTED] IDENTIFIED BY { 'password' [REPLACE 'old_password'] |
DISABLE }
| VALID BEGIN 'timestamp'
| VALID UNTIL 'timestamp'

| USER GROUP 'groupuser'
| PERM SPACE 'spacelimit'
| TEMP SPACE 'tmpspacelimit'
| SPILL SPACE 'spillspacelimit'
| NODE GROUP logic_cluster_name
| PGUSER
```

- Rename a role.

```
ALTER ROLE role_name
 RENAME TO new_name;
```

- Lock or unlock.

```
ALTER ROLE role_name
 ACCOUNT { LOCK | UNLOCK };
```

- Set parameters for a role.

```
ALTER ROLE role_name [IN DATABASE database_name]
 SET configuration_parameter {{ TO | = } { value | DEFAULT } | FROM CURRENT};
```

- Reset parameters for a role.

```
ALTER ROLE role_name
 [IN DATABASE database_name] RESET {configuration_parameter|ALL};
```

## Parameters

- **role\_name**

Specifies a role name.

Value range: an existing role name. If a role name contains uppercase letters, enclose the name with double quotation marks ("").

- **IN DATABASE database\_name**

Modifies the parameters of a role in a specified database.

- **SET configuration\_parameter**

Sets parameters for a role. Session parameters modified by ALTER ROLE apply to a specified role and take effect in the next session triggered by the role.

---

### NOTICE

The current version does not support setting user-level parameters.

---

Value range:

For details about the values of **configuration\_parameter** and **value**, see [SET](#).

**DEFAULT**: clears the value of **configuration\_parameter**.

**configuration\_parameter** will inherit the default value of the new session generated for the role.

**FROM CURRENT**: uses the value of **configuration\_parameter** of the current session.

- **RESET configuration\_parameter/ALL**  
Clears the value of **configuration\_parameter**. The statement has the same effect as that of **SET configuration\_parameter TO DEFAULT**.

---

**NOTICE**

The current version does not support the resetting of user-level parameters.

---

Value range: **ALL** indicates that the values of all parameters are cleared.

- **ACCOUNT LOCK | ACCOUNT UNLOCK**
  - **ACCOUNT LOCK**: locks an account to forbid login to databases.
  - **ACCOUNT UNLOCK**: unlocks an account to allow login to databases.
- **PGUSER**  
In the current version, the PGUSER permission of a role cannot be modified.
- **PASSWORD/IDENTIFIED BY 'password'**  
Resets or changes the user password. Except the initial user, other administrators and common users need to enter the correct old password when changing their own passwords. Only the initial user, the system administrator (**sysadmin**), or users who have the permission to create users (CREATEROLE) can reset the password of a common user without entering the old password. The initial user can reset passwords of system administrators. System administrators cannot reset passwords of other system administrators.
- **EXPIRED**  
Invalidates the password. Only initial users, system administrators (**sysadmin**), and users who have the permission to create users (CREATEROLE) can invalidate user passwords. System administrators can invalidate their own passwords or the passwords of other system administrators. The password of the initial user cannot be invalidated.  
The user whose password is invalid can log in to the database but cannot perform the query operation. The query operation can be performed only after the password is changed or the administrator resets the password.

For details about other parameters, see [Parameters](#) in section "CREATE ROLE."

## Examples

See [Examples](#) in section "CREATE ROLE."

## Helpful Links

[CREATE ROLE](#), [DROP ROLE](#), and [SET](#)

## 7.14.22 ALTER ROW LEVEL SECURITY POLICY

### Function

Modifies an existing row-level security policy, including the policy name and the users and expressions affected by the policy.

## Precautions

Only the table owner or a system administrator can perform this operation.

## Syntax

Change the name of an existing row-level security policy.

```
ALTER [ROW LEVEL SECURITY] POLICY policy_name ON table_name RENAME TO new_policy_name;
```

Change the specified user and policy expression of an existing row-level security policy.

```
ALTER [ROW LEVEL SECURITY] POLICY policy_name ON table_name
[TO { role_name | PUBLIC } [, ...]]
[USING (using_expression)];
```

## Parameter Description

- policy\_name**  
Specifies the name of a row-level access control policy.
- table\_name**  
Specifies the name of a table to which a row-level access control policy is applied.
- new\_policy\_name**  
Specifies the new name of a row-level access control policy.
- role\_name**  
Specifies names of users affected by a row-level access control policy. PUBLIC indicates that the row-level access control policy will affect all users.
- using\_expression**  
Specifies a row-level security policy, which is similar to a Boolean expression in the WHERE clause.

## Examples

```
-- Create the data table all_data.
gaussdb=# CREATE TABLE all_data(id int, role varchar(100), data varchar(100));

-- Create a row-level security policy to specify that the current user can view only their own data.
gaussdb=# CREATE ROW LEVEL SECURITY POLICY all_data_rls ON all_data USING(role = CURRENT_USER);
gaussdb=# \d+ all_data
```

Column	Type	Modifiers	Storage	Stats target	Description
id	integer	plain			
role	character varying(100)		extended		
data	character varying(100)		extended		

```
Row Level Security Policies:
POLICY "all_data_rls" FOR ALL
 TO public
 USING (((role)::name = "current_user"()))
Has OIDs: no
Distribute By: HASH(id)
Location Nodes: ALL DATANODES
Options: orientation=row, compression=no

-- Create users alice and bob.
gaussdb=# CREATE ROLE alice WITH PASSWORD "*****";
gaussdb=# CREATE ROLE bob WITH PASSWORD "*****";
```

```
-- Change the name of the all_data_rls policy.
gaussdb=# ALTER ROW LEVEL SECURITY POLICY all_data_rls ON all_data RENAME TO all_data_new_rls;

-- Change the users affected by the row-level security policy.
gaussdb=# ALTER ROW LEVEL SECURITY POLICY all_data_new_rls ON all_data TO alice, bob;
gaussdb=# \d+ all_data
 Table "public.all_data"
 Column | Type | Modifiers | Storage | Stats target | Description
-----+-----+-----+-----+-----+-----
 id | integer | | | |
 role | character varying(100) | | extended | |
 data | character varying(100) | | extended | |
Row Level Security Policies:
 POLICY "all_data_new_rls" FOR ALL
 TO alice,bob
 USING (((role)::name = "current_user"()))
Has OIDs: no
Distribute By: HASH(id)
Location Nodes: ALL DATANODES
Options: orientation=row, compression=no, enable_rowsecurity=true

-- Modify the expression defined for the row-level security policy.
gaussdb=# ALTER ROW LEVEL SECURITY POLICY all_data_new_rls ON all_data USING (id > 100 AND role =
current_user);
gaussdb=# \d+ all_data
 Table "public.all_data"
 Column | Type | Modifiers | Storage | Stats target | Description
-----+-----+-----+-----+-----+-----
 id | integer | | | |
 role | character varying(100) | | extended | |
 data | character varying(100) | | extended | |
Row Level Security Policies:
 POLICY "all_data_new_rls" FOR ALL
 TO alice,bob
 USING (((id > 100) AND ((role)::name = "current_user"()))))
Has OIDs: no
Distribute By: HASH(id)
Location Nodes: ALL DATANODES
Options: orientation=row, compression=no, enable_rowsecurity=true

-- Delete users alice and bob.
gaussdb=# DROP ROLE alice, bob;

-- Delete the policy.
gaussdb=# DROP ROW LEVEL SECURITY POLICY all_data_new_rls ON all_data;

-- Delete the all_data table.
gaussdb=# DROP TABLE all_data;
```

## Helpful Links

[CREATE ROW LEVEL SECURITY POLICY](#) and [DROP ROW LEVEL SECURITY POLICY](#)

## 7.14.23 ALTER SCHEMA

### Description

Modifies schema attributes.

### Precautions

- Only the owner of a schema or users granted with the ALTER permission on the schema can run the **ALTER SCHEMA** command. The system administrator has this permission by default. To change the owner of a schema, you must

be the owner of the schema or system administrator and a member of the new owner role.

- For system schemas other than public, such as pg\_catalog and sys, only the initial user is allowed to change the owner of a schema. Changing the names of the built-in system schemas may make some functions unavailable or even affect the normal running of the database. By default, the names of the built-in system schemas cannot be changed. To ensure forward compatibility, you can change the names of the built-in system schemas only when the system is being started or upgraded or when **allow\_system\_table\_mods** is set to **on**.
- Only the initial user can change the owner of a schema to an O&M administrator. Other users cannot change the owner of a schema to an O&M administrator.

## Syntax

- Rename a schema.  

```
ALTER SCHEMA schema_name
 RENAME TO new_name;
```
- Change the owner of a schema.  

```
ALTER SCHEMA schema_name
 OWNER TO new_owner;
```

## Parameters

- **schema\_name**  
Specifies the name of an existing schema.  
Value range: an existing schema name.
- **RENAME TO new\_name**  
Rename a schema.  
**new\_name**: new name of the schema.

---

### NOTICE

- The schema name must be unique in the current database.
- The schema name cannot be the same as the initial username of the current database.
- The schema name cannot start with pg\_.
- The schema name cannot start with gs\_role\_.

---

Value range: a string. It must comply with the [naming convention](#).

- **OWNER TO new\_owner**  
Change the owner of a schema. To do this as a non-administrator, you must be a direct or indirect member of the new owner role, and that role must have the CREATE permission on the database.  
**new\_owner**: new owner of the schema.  
Value range: an existing username or role name.

## Examples

```
-- Create the ds schema.
gaussdb=# CREATE SCHEMA ds;

-- Rename the current schema ds to ds_new.
gaussdb=# ALTER SCHEMA ds RENAME TO ds_new;

-- Create user jack.
gaussdb=# CREATE USER jack PASSWORD '*****';

-- Change the owner of ds_new to jack.
gaussdb=# ALTER SCHEMA ds_new OWNER TO jack;

-- Delete user jack and schema ds_new.
gaussdb=# DROP SCHEMA ds_new;
gaussdb=# DROP USER jack;
```

## Helpful Links

[CREATE SCHEMA](#) and [DROP SCHEMA](#)

## 7.14.24 ALTER SEQUENCE

### Function

Modifies the parameters of an existing sequence.

### Precautions

- Only the owner of a sequence, a user granted the ALTER permission on a sequence, or a user granted the ALTER ANY SEQUENCE permission on a sequence can run the **ALTER SEQUENCE** command. The system administrator has this permission by default. To modify a sequence owner, you must be the sequence owner or system administrator and a member of the new owner role.
- In the current version, you can modify only the owner, owning column, and maximum value. To modify other parameters, delete the sequence and create it again. Then, use the **Setval** function to restore parameter values.
- **ALTER SEQUENCE MAXVALUE** cannot be used in transactions, functions, and stored procedures.
- After the maximum value of a sequence is changed, the cache of the sequence in all sessions is cleared.
- The **ALTER SEQUENCE** statement blocks the calling of **nextval**, **setval**, **currval**, and **lastval**.

### Syntax

- Change the owning column of a sequence.

```
ALTER SEQUENCE [IF EXISTS] name
 [MAXVALUE maxvalue | NO MAXVALUE | NOMAXVALUE]
 [OWNED BY { table_name.column_name | NONE }] ;
```

- Change the owner of a sequence.

```
ALTER SEQUENCE [IF EXISTS] name OWNER TO new_owner;
```

## Parameter Description

- **name**  
Specifies the name of the sequence to be modified.
- **IF EXISTS**  
Sends a notice instead of an error when you are modifying a nonexisting sequence.
- **OWNED BY**  
Associates a sequence with a specified column included in a table. In this way, the sequence will be deleted when you delete its associated column or the table where the column belongs to.  
If the sequence has been associated with another table before you use this option, the new association will overwrite the old one.  
The associated table and sequence must be owned by the same user and in the same schema.  
If **OWNED BY NONE** is used, all existing associations will be deleted.
- **new\_owner**  
Specifies the username of the new owner of the sequence. To change the owner, you must also be a direct or indirect member of the new role, and this role must have **CREATE** permission on the sequence's schema.

## Examples

```
-- Create an ascending sequence named serial, which starts from 101.
gaussdb=# CREATE SEQUENCE serial START 101;

-- Create a table and specify default values for the sequence.
gaussdb=# CREATE TABLE T1(C1 bigint default nextval('serial'));

-- Change the owning column of serial to T1.C1.
gaussdb=# ALTER SEQUENCE serial OWNED BY T1.C1;

-- Delete the sequence.
gaussdb=# DROP SEQUENCE serial cascade;
gaussdb=# DROP TABLE T1;
```

## Helpful Links

[CREATE SEQUENCE](#) and [DROP SEQUENCE](#)

## 7.14.25 ALTER SERVER

### Function

**ALTER SERVER** adds, modifies, or deletes the parameters of an existing server. You can query existing servers from the `pg_foreign_server` system catalog.

### Precautions

Only the server owner or a user granted with the **ALTER** permission can run the **ALTER SERVER** command. The system administrator has this permission by default. To change the owner of a server, the current user must be the owner of the server or the system administrator, and the user must be a member of the new owner role.

When multi-layer quotation marks are used for sensitive columns (such as **password** and **secret\_access\_key**) in **OPTIONS**, the semantics is different from that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.

## Syntax

- Change the parameters for a foreign server.

```
ALTER SERVER server_name [VERSION 'new_version']
[OPTIONS ({[ADD | SET | DROP] option ['value']} [, ...])];
```

In **OPTIONS**, **ADD**, **SET**, and **DROP** are operations to be performed. If these operations are not specified, **ADD** operations will be performed by default. **option** and **value** are the parameters of the corresponding operation.

- Change the owner of a foreign server.

```
ALTER SERVER server_name
OWNER TO new_owner;
```

- Change the name of a foreign server.

```
ALTER SERVER server_name
RENAME TO new_name;
```

## Parameter Description

The parameters for modifying the server are as follows:

- **server\_name**  
Specifies the name of the server to be modified.
- **new\_version**  
Specifies the new version of the server.
- The server parameters in **OPTIONS** are as follows:
  - **encrypt**  
Specifies whether to encrypt data. This parameter can be set only when **type** is set to **OBS**. The default value is **off**.  
Value range:
    - **on** indicates that data is encrypted.
    - **off** indicates that data is not encrypted.
  - **access\_key**  
Specifies the access key (AK) (obtained by users from the OBS console) used for the OBS access protocol. When you create a foreign table. This parameter is available only when **type** is set to **OBS**.
  - **secret\_access\_key**  
Specifies the secret key (SK) value (obtained by users from the OBS console) used for the OBS access protocol. This parameter is available only when **type** is set to **OBS**.
- **new\_owner**  
Specifies the new owner of the server. To change the owner, you must be the owner of the foreign server and a direct or indirect member of the new owner

role, and must have the **USAGE** permission on the encapsulator of the foreign server.

- **new\_name**  
Specifies the new name of the server.

## Examples

```
-- Create my_server.
gaussdb=# CREATE SERVER my_server FOREIGN DATA WRAPPER log_fdw;

-- Change the name of an external service.
gaussdb=# ALTER SERVER my_server
 RENAME TO my_server_1;

-- Delete my_server_1.
gaussdb=# DROP SERVER my_server_1;
```

## 7.14.26 ALTER SESSION

### Description

ALTER SESSION defines or modifies the conditions or parameters that affect the current session. Modified session parameters are kept until the current session is disconnected.

### Precautions

- If the **START TRANSACTION** statement is not executed before the **SET TRANSACTION** statement, the transaction is ended instantly and the statement does not take effect.
- You can use the **transaction\_mode(s)** method declared in the **START TRANSACTION** statement to avoid using the **SET TRANSACTION** statement.

### Syntax

- Set transaction parameters of a session.  

```
ALTER SESSION SET [SESSION CHARACTERISTICS AS] TRANSACTION
 { ISOLATION LEVEL { READ COMMITTED } | { READ ONLY | READ WRITE } } [, ...] ;
```
- Set other GUC parameters of a session.  

```
ALTER SESSION SET
 {{config_parameter { { TO | = } { value | DEFAULT }
 | FROM CURRENT }} | CURRENT_SCHEMA [TO | =] { schema | DEFAULT }
 | TIME_ZONE time_zone
 | SCHEMA schema
 | NAMES encoding_name
 | ROLE role_name PASSWORD 'password'
 | SESSION AUTHORIZATION { role_name PASSWORD 'password' | DEFAULT }
 | XML OPTION { DOCUMENT | CONTENT }
 } ;
```

### Parameters

For details about the parameters involved in modifying a session, see [Parameter Description](#) of the SET syntax.

## Examples

```
-- Create the ds schema.
gaussdb=# CREATE SCHEMA ds;

-- Set the search path of a schema.
gaussdb=# SET SEARCH_PATH TO ds, public;

-- Set the time/date type to the traditional postgres format (date before month).
gaussdb=# SET DATESTYLE TO postgres, dmy;

-- Set the character code of the current session to UTF8.
gaussdb=# ALTER SESSION SET NAMES 'UTF8';

-- Set the time zone to Berkeley of California.
gaussdb=# SET TIME ZONE 'PST8PDT';

-- Set the time zone to Italy.
gaussdb=# SET TIME ZONE 'Europe/Rome';

-- Set the current schema.
gaussdb=# ALTER SESSION SET CURRENT_SCHEMA TO tpceds;

-- Set XML OPTION to DOCUMENT.
gaussdb=# ALTER SESSION SET XML OPTION DOCUMENT;

-- Create the role joe, and set the session role to joe.
gaussdb=# CREATE ROLE joe WITH PASSWORD '*****';
gaussdb=# ALTER SESSION SET SESSION AUTHORIZATION joe PASSWORD '*****';

-- Switch to the default user.
gaussdb=> ALTER SESSION SET SESSION AUTHORIZATION default;

-- Delete the ds schema.
gaussdb=# DROP SCHEMA ds;

-- Delete the role joe.
gaussdb=# DROP ROLE joe;
```

[SET](#)

## 7.14.27 ALTER SYNONYM

### Description

Modifies the attributes of the SYNONYM object.

### Precautions

- Currently, only the owner of the SYNONYM object can be changed.
- Only the system administrator has the permission to modify the owner of the SYNONYM object.
- The new owner must have the CREATE permission on the schema where the SYNONYM object resides.

### Syntax

```
ALTER SYNONYM synonym_name
OWNER TO new_owner;
```

## Parameters

- **synonym**  
Specifies the name of the synonym to be modified, which can contain the schema name.  
Value range: a string. It must comply with the [naming convention](#).
- **new\_owner**  
Specifies the new owner of the SYNONYM object.  
Value range: a string. It must be a valid username.

## Examples

```
-- Create a system administrator.
gaussdb=# CREATE USER sysadmin WITH SYSADMIN PASSWORD '*****';

-- Switch the system administrator.
gaussdb=# \c - sysadmin

-- Create synonym t1.
gaussdb=# CREATE OR REPLACE SYNONYM t1 FOR ot.t1;

-- Create user u1.
gaussdb=# CREATE USER u1 PASSWORD '*****';

-- Assign permissions to the new system administrator.
gaussdb=# GRANT ALL ON SCHEMA sysadmin TO u1;

-- Change the owner of synonym t1 to u1.
gaussdb=# ALTER SYNONYM t1 OWNER TO u1;

-- Delete synonym t1.
gaussdb=# DROP SYNONYM t1;

-- Revoke permissions from user u1.
gaussdb=# REVOKE ALL ON SCHEMA sysadmin FROM u1;

-- Delete user u1.
gaussdb=# DROP USER u1;

-- Switch to the initial user init_user. Replace init_user with the actual initial user name.
gaussdb=# \c - init_user

-- Delete user sysadmin.
gaussdb=# DROP USER sysadmin;
```

## Helpful Links

[CREATE SYNONYM](#) and [DROP SYNONYM](#)

## 7.14.28 ALTER SYSTEM KILL SESSION

### Description

ALTER SYSTEM KILL SESSION ends a session.

### Precautions

None

## Syntax

```
ALTER SYSTEM KILL SESSION 'session_sid, serial' [IMMEDIATE];
```

## Parameters

- **session\_sid, serial**

Specifies **SID** and **SERIAL** of a session (see examples for format). You can use the `pg_stat_activity` system catalog to query the current active threads (see the examples). However, when you run the **ALTER SYSTEM KILL SESSION** command, the threads may have ended.

Value range: SIDs and SERIALs of all sessions that can be queried from the system catalog `dv_sessions`

- **IMMEDIATE**

Specifies that a session will be ended instantly after the statement is executed.

## Examples

```
-- Query session information.
gaussdb=# SELECT sid,serial#,username FROM dv_sessions;

 sid | serial# | username
-----+-----+-----
140131075880720 | 0 | omm
140131025549072 | 0 | omm
140131073779472 | 0 | omm
140131071678224 | 0 | omm
140131125774096 | 0 |
140131127875344 | 0 |
140131113629456 | 0 |
140131094742800 | 0 |
(8 rows)

-- End the session whose SID is 140131075880720.
gaussdb=# ALTER SYSTEM KILL SESSION '140131075880720,0' IMMEDIATE;
```

## 7.14.29 ALTER TABLE

### Description

Modifies tables, including modifying table definitions, renaming tables, renaming specified columns in tables, renaming table constraints, setting table schemas, enabling or disabling row-level security policies, and adding or updating multiple columns.

### Precautions

- If the base table is a hash-distributed table, to create a primary key or unique index that does not contain the distribution key of the base table, use a GSI (by specifying the **BY GLOBAL INDEX** column); to create a primary key or unique index that contains the distribution key of the base table, use a common index (without specifying the **BY GLOBAL INDEX** column). In single-DN deployment mode, both the GSI and common index can be successfully created. If the base table is a non-hash-distributed table, you can only create the primary key or unique index as a common index. That is, the index key must contain the distribution key of the base table.

- The owner of a table, users granted with the ALTER permission on the table, or users granted with the ALTER ANY TABLE permission can run the **ALTER TABLE** command. The system administrator has the permission to run the command by default. To modify the owner or schema of a table, you must be the table owner or system administrator and a member of the new owner role.
- The tablespace of a partitioned table cannot be modified, but the tablespace of the partition can be modified.
- The storage parameter **ORIENTATION** cannot be modified.
- Currently, SET SCHEMA can only set schemas to user schemas. It cannot set a schema to a system internal schema.
- The distribution key (or column) of a table cannot be modified.
- Auto-increment columns cannot be added, or a column whose **DEFAULT** value contains the nextval() expression cannot be added.
- Row-level security cannot be enabled for foreign tables and temporary tables.
- When you delete a PRIMARY KEY constraint by constraint name, the NOT NULL constraint is not deleted. If necessary, manually delete the NOT NULL constraint.
- When JDBC is used, the **DEFAULT** value can be set through PreparedStatement.
- If you add a column using ADD COLUMN, all existing rows in the table are initialized to the column's default value (**NULL** if no **DEFAULT** value is specified).

If no **DEFAULT** value is specified for the new column, **NULL** is used, and no full table update is triggered.

If the new column has the **DEFAULT** value, the column must meet all the following requirements. Otherwise, the entire table is updated, leading to additional overheads and affecting online services.

1. The data type is BOOL, BYTEA, SMALLINT, BIGINT, SMALLINT, INTEGER, NUMERIC, FLOAT, DOUBLE PRECISION, CHAR, VARCHAR, TEXT, TIMESTAMPTZ, TIMESTAMP, DATE, TIME, TIMETZ, or INTERVAL.

2. The length of the **DEFAULT** value of the added column cannot exceed 128 bytes.

3. The **DEFAULT** value of the added column does not contain the volatile function.

4. The **DEFAULT** value is required and cannot be **NULL**.

If you are not sure whether condition 3 is met, check whether the **provolatile** attribute of the function in the PG\_RPOC system catalog is **v**.

- The number of table constraints cannot exceed 32,767.

## Syntax

- Modify the definition of a table.

```
ALTER TABLE [IF EXISTS] { table_name [*] | ONLY table_name | ONLY (table_name) }
 action [, ...];
ALTER TABLE [IF EXISTS] table_name
 ADD ({ column_name data_type [compress_mode] [COLLATE collation] [column_constraint
[...] } } [, ...]);
ALTER TABLE [IF EXISTS] table_name
 MODIFY ({ column_name data_type | column_name [CONSTRAINT constraint_name] NOT NULL
[ENABLE] | column_name [CONSTRAINT constraint_name] NULL } [, ...]);
```

```
ALTER TABLE [IF EXISTS] table_name
 RENAME TO new_table_name;
ALTER TABLE [IF EXISTS] { table_name [*] | ONLY table_name | ONLY (table_name) }
 RENAME [COLUMN] column_name TO new_column_name;
ALTER TABLE [IF EXISTS] { table_name [*] | ONLY table_name | ONLY (table_name) }
 RENAME CONSTRAINT constraint_name TO new_constraint_name;
ALTER TABLE [IF EXISTS] table_name
 SET SCHEMA new_schema;
```

There are several clauses of **action**:

```
column_clause
| ADD table_constraint [NOT VALID]
| ADD table_constraint_using_index
| VALIDATE CONSTRAINT constraint_name
| DROP CONSTRAINT [IF EXISTS] constraint_name [RESTRICT | CASCADE]
| CLUSTER ON index_name
| SET WITHOUT CLUSTER
| SET ({storage_parameter = value} [, ...])
| RESET (storage_parameter [, ...])
| OWNER TO new_owner
| SET TABLESPACE new_tablespace
| SET {COMPRESS|NOCOMPRESS}
| TO { GROUP groupname | NODE (nodename [, ...]) }
| ADD NODE (nodename [, ...])
| DELETE NODE (nodename [, ...])
| UPDATE SLICE LIKE table_name
| DISABLE TRIGGER [trigger_name | ALL | USER]
| ENABLE TRIGGER [trigger_name | ALL | USER]
| ENABLE REPLICA TRIGGER trigger_name
| ENABLE ALWAYS TRIGGER trigger_name
| ENABLE ROW LEVEL SECURITY
| DISABLE ROW LEVEL SECURITY

| FORCE ROW LEVEL SECURITY
| NO FORCE ROW LEVEL SECURITY
| ENCRYPTION KEY ROTATION
| REPLICATION IDENTITY { DEFAULT | USING INDEX index_name | FULL | NOTHING }
| AUTO_INCREMENT [=] value
| [[DEFAULT] CHARACTER SET | CHARSET [=] default_charset] [[DEFAULT] COLLATE [=]
default_collation]
```

 NOTE

- **ADD table\_constraint [ NOT VALID ]**  
Adds a table constraint.
- **ADD table\_constraint\_using\_index**  
Adds a primary key constraint or unique constraint to a table based on the existing unique index. If the specified index is a GSI, an error is reported. In this case, you need to use the BY GLOBAL INDEX syntax to add a GSI index constraint.
- **VALIDATE CONSTRAINT constraint\_name**  
Validates a check-class constraint created with the **NOT VALID** option, and scans the entire table to ensure that all rows meet the constraint. Nothing happens if the constraint is already marked valid.
- **DROP CONSTRAINT [ IF EXISTS ] constraint\_name [ RESTRICT | CASCADE ]**  
Deletes a table constraint.
- **CLUSTER ON index\_name**  
Selects the default index for future CLUSTER operations. Actually, the table is not re-clustered.
- **SET WITHOUT CLUSTER**  
Deletes the most recently used CLUSTER index from the table. Deletes the most recently used CLUSTER index from the table.
- **SET ( {storage\_parameter = value} [, ... ] )**  
Changes one or more storage parameters for the table. If the value of **table\_name** is an index name, **ACTIVE\_PAGES** specifies the number of index pages, which may be less than the actual number of physical file pages and can be used for optimizer optimization. Currently, this parameter is valid only for the local index of the Ustore partitioned table and will be updated by VACUUM and ANALYZE (including AUTOVACUUM). You are advised not to manually set this parameter because it is invalid in distributed mode.
- **RESET ( storage\_parameter [, ... ] )**  
Resets one or more storage parameters to their defaults. As with SET, a table rewrite might be needed to update the table entirely.
- **OWNER TO new\_owner**  
Changes the owner of a table, sequence, or view to the specified user.
- **SET TABLESPACE new\_tablespace**  
Changes the table's tablespace to the specified tablespace and moves the data files associated with the table to the new tablespace. Indexes on the table, if any, are not moved; but they can be moved separately with additional **SET TABLESPACE** option in ALTER INDEX.
- **SET {COMPRESS|NOCOMPRESS}**  
Sets the compression feature of a table. The table compression feature affects only the storage mode of data inserted in a batch subsequently and does not affect storage of existing data. Setting the table compression feature will result in the fact that there are both compressed and uncompressed data in the table. Row-store tables do not support compression.
- **TO { GROUP groupname | NODE ( nodename [, ... ] ) }**  
The syntax is only available in extended mode (when GUC parameter **support\_extended\_features** is on). Exercise caution when enabling the mode. It is mainly used for tools like internal dilatation tools. Common users should not use the mode. This command only modifies the logical mapping relationship of the table distribution nodes and does not migrate the table's metadata and data on the DN.
- **ADD NODE ( nodename [, ... ] )**

It is only available for internal scale-out tools. Common users should not use the syntax.

- **DELETE NODE ( nodename [, ... ] )**

It is only available for internal scale-in tools. Common users should not use the syntax.

- **UPDATE SLICE LIKE table\_name**

This syntax is used by internal scaling tools and cannot be used by common users.

- **DISABLE TRIGGER [ trigger\_name | ALL | USER ]**

Disables a single trigger specified by **trigger\_name**, disables all triggers, or disables only user triggers (excluding internally generated constraint triggers, for example, deferrable unique constraint triggers and exclusion constraints triggers).

Exercise caution when using this function because data integrity cannot be ensured as expected if the triggers are not executed.

- **| ENABLE TRIGGER [ trigger\_name | ALL | USER ]**

Enables a single trigger specified by **trigger\_name**, enables all triggers, or enables only user triggers.

- **| ENABLE REPLICA TRIGGER trigger\_name**

Determines that the trigger firing mechanism is affected by the configuration variable *session\_replication\_role*. When the replication role is **origin** (default value) or **local**, a simple trigger is fired.

When **ENABLE REPLICA** is configured for a trigger, it is triggered only when the session is in replica mode.

- **| ENABLE ALWAYS TRIGGER trigger\_name**

Determines that all triggers are fired regardless of the current replica mode.

- **| DISABLE/ENABLE ROW LEVEL SECURITY**

Enables or disables row-level security for a table.

If row-level security is enabled for a data table but no row-level security policy is defined, the row-level access to the data table is not affected. If row-level security for a table is disabled, the row-level access to the table is not affected even if a row-level security policy has been defined. For details, see [CREATE ROW LEVEL SECURITY POLICY](#).

- **| NO FORCE/FORCE ROW LEVEL SECURITY**

Forcibly enables or disables row-level security for a table.

By default, the table owner is not affected by the row-level security feature. However, if row-level security is forcibly enabled, the table owner (excluding system administrators) will be affected. System administrators are not affected by any row-level security policies.

- **| ENCRYPTION KEY ROTATION**

Rotation of the transparent data encryption key.

The data encryption key rotation of a table can be performed only when the TDE function is enabled for the database and **enable\_tde** of the table is set to **on**. After the key rotation operation is performed, the system automatically applies for a new KMS key. After the key rotation, the data encrypted using the old key is decrypted using the old key, and the newly written data is encrypted using the new key. To ensure the security of encrypted data, you can periodically update the key based on the amount of new data in the encrypted table. It is recommended that the key be updated every two to three years.

- **REPLICA IDENTITY { DEFAULT | USING INDEX index\_name | FULL | NOTHING }**

Specifies the record level of old tuples in UPDATE and DELETE statements on a table in logical replication scenarios.

- **DEFAULT** records the old value of the primary key column. If there is no primary key, **DEFAULT** does not record the old value.

- **USING INDEX** records the old values of columns covered by the named indexes. These values must be unique, non-local, and non-deferrable, and contain the values of columns marked **NOT NULL**.
- **FULL** records the old values of all columns in the row.
- **NOTHING** does not record information in old rows.

In logical replication scenarios, when the UPDATE and DELETE statements of a table are parsed, the parsed old tuples consist of the information recorded in this method. For tables with primary keys, this option can be set to **DEFAULT** or **FULL**. For a table without a primary key, set this parameter to **FULL**. Otherwise, the old tuple will be parsed as empty during decoding. You are advised not to set this parameter to **NOTHING** in common scenarios because old tuples are always parsed as empty.

- **AUTO\_INCREMENT [ = ] value**

Sets the next auto-increment value of the auto-increment column. The configured value takes effect only when it is greater than the current auto-increment counter.

The value must be a non-negative integer and cannot be greater than  $2^{127} - 1$ .

This clause takes effect only when **sql\_compatibility** is set to 'B'.

- **[ [ DEFAULT ] CHARACTER SET | CHARSET [ = ] default\_charset ] [ [ DEFAULT ] COLLATE [ = ] default\_collation ]**

Modifies the default character set and default collation of a table to the specified values. The modification does not affect the existing columns in the table.

This clause takes effect only when **sql\_compatibility** is set to 'B'.

- **CONVERT TO CHARACTER SET | CHARSET charset [ COLLATE collation ]**

Modifies the default character set and default collation of a table to the specified values, sets the character set and collation of all columns with character type to the specified value and converts the data in the column to new character set encoding.

- The **column\_clause** can be one of the following clauses:

```

ADD [COLUMN] column_name data_type [CHARACTER SET | CHARSET charset]
[compress_mode] [COLLATE collation] [column_constraint [...]]
| MODIFY column_name data_type
| MODIFY column_name [CONSTRAINT constraint_name] NOT NULL [ENABLE]
| MODIFY column_name [CONSTRAINT constraint_name] NULL
| DROP [COLUMN] [IF EXISTS] column_name [RESTRICT | CASCADE]
| ALTER [COLUMN] column_name [SET DATA] TYPE data_type [COLLATE collation] [USING
expression]
| ALTER [COLUMN] column_name { SET DEFAULT expression | DROP DEFAULT }
| ALTER [COLUMN] column_name { SET | DROP } NOT NULL
| ALTER [COLUMN] column_name SET STATISTICS [PERCENT] integer
ADD STATISTICS ((column_1_name, column_2_name [, ...]))
DELETE STATISTICS ((column_1_name, column_2_name [, ...]))
| ALTER [COLUMN] column_name SET ({attribute_option = value} [, ...])
| ALTER [COLUMN] column_name RESET (attribute_option [, ...])
| ALTER [COLUMN] column_name SET STORAGE { PLAIN | EXTERNAL | EXTENDED | MAIN }

```

 NOTE

- **ADD [ COLUMN ] column\_name data\_type [ compress\_mode ] [ COLLATE collation ] [ column\_constraint [ ... ] ]**  
Adds a column to a table. If a column is added using ADD COLUMN, all existing rows in the table are initialized with the column's default value (NULL if no DEFAULT clause is specified).
- **ADD ( { column\_name data\_type [ compress\_mode ] } [, ...] )**  
Adds columns in the table.
- **MODIFY ( { column\_name data\_type | column\_name [ CONSTRAINT constraint\_name ] NOT NULL [ ENABLE ] | column\_name [ CONSTRAINT constraint\_name ] NULL } [, ...] )**  
Modifies the data type of an existing column in the table. Running this command will clear the statistics of this column. You are advised to collect the statistics of this column again after the modification.
- **DROP [ COLUMN ] [ IF EXISTS ] column\_name [ RESTRICT | CASCADE ]**  
Drops a column from a table. Indexes and constraints related to the column are automatically dropped. If an object not belonging to the table depends on the column (for example, view), CASCADE must be specified.  
  
The DROP COLUMN statement does not physically remove the column, but simply makes it invisible to SQL operations. Subsequent INSERT and UPDATE operations in the table will store a **NULL** value for the column. Therefore, column deletion takes a short period of time but does not immediately release the tablespace on the disks, because the space occupied by the deleted column is not recycled. The space will be recycled when VACUUM is executed.
- **ALTER [ COLUMN ] column\_name [ SET DATA ] TYPE data\_type [ COLLATE collation ] [ USING expression ]**  
Modifies the type of a column in a table. Indexes and simple table constraints on the column will automatically use the new data type by reparsing the originally supplied expression.  
  
If the original data type of a column and the modified data type are binary compatible, you do not need to rewrite the entire table when running this statement. In other scenarios, the entire table is rewritten. You can check whether the original type and target type are binary compatible in the PG\_CAST system catalog. If **castmethod** is 'b', they are binary compatible. For example, if the data type of the source table is text and is converted to int, table rewriting is triggered. If it is converted to clob, table rewriting is not triggered. If table rewriting is triggered, the deleted space on the table is recycled immediately.  
  
Running this command will clear the statistics of this column. You are advised to collect the statistics of this column again after the modification.
- **ALTER [ COLUMN ] column\_name { SET DEFAULT expression | DROP DEFAULT }**  
Sets or removes the default value for a column. The default values only apply to subsequent INSERT operations; they do not cause rows already in the table to change. Defaults can also be created for views, in which case they are inserted into INSERT statements on the view before the view's ON INSERT rule is applied.
- **ALTER [ COLUMN ] column\_name { SET | DROP } NOT NULL**  
Changes whether a column is marked to allow null values or to reject null values. You can only use SET NOT NULL when the column contains no null values.
- **ALTER [ COLUMN ] column\_name SET STATISTICS [PERCENT] integer**

Specifies the per-column statistics-gathering target for subsequent ANALYZE operations. The target can be set in the range from 0 to 10000. Set it to **-1** to revert to using the default system statistics target.

- **{ADD | DELETE} STATISTICS ((column\_1\_name, column\_2\_name [, ...]))**  
Adds or deletes the declaration of collecting multi-column statistics to collect multi-column statistics as needed when ANALYZE is performed for a table or a database. The statistics about a maximum of 32 columns can be collected at a time. You are not allowed to add or delete such declaration for system catalogs or foreign tables.
- **{ENABLE | DISABLE } STATISTICS ((column\_1\_name, column\_2\_name [, ...]))**  
Enables or disables multi-column statistics. When automatic statistics creation is enabled (the GUC parameter **auto\_statistic\_ext\_columns** is required), you can disable specific multi-column combinations to prevent them from being automatically created and used.
- **ALTER [ COLUMN ] column\_name SET ( {attribute\_option = value} [, ... ] )**  
**ALTER [ COLUMN ] column\_name RESET ( attribute\_option [, ... ] )**  
Sets or resets per-attribute options.  
Currently, the only defined per-attribute options are **n\_distinct** and **n\_distinct\_inherited**. **n\_distinct** affects statistics of a table, while **n\_distinct\_inherited** affects the statistics of the table and its subtables. Currently, only **SET/RESET n\_distinct** is supported, and **SET/RESET n\_distinct\_inherited** is forbidden.
- **ALTER [ COLUMN ] column\_name SET STORAGE { PLAIN | EXTERNAL | EXTENDED | MAIN }**  
Sets the storage mode for a column. It specifies whether this column is held inline or in an attached table, and whether the data should be compressed. **SET STORAGE** does not change a table. It only specifies the recommended strategy for future table updates.

▪ **column\_constraint** is as follows:

```
[CONSTRAINT constraint_name]
{ NOT NULL |
 NULL |
 CHECK (expression) |
 DEFAULT default_expr |
 GENERATED ALWAYS AS (generation_expr) [STORED] |
 AUTO_INCREMENT |
 UNIQUE [KEY] index_parameters |
 PRIMARY KEY index_parameters |
 ENCRYPTED WITH (COLUMN_ENCRYPTION_KEY = column_encryption_key,
 ENCRYPTION_TYPE = encryption_type_value) |
 REFERENCES reftable [(refcolumn)] [MATCH FULL | MATCH PARTIAL | MATCH
SIMPLE]
 [ON DELETE action] [ON UPDATE action] }
[DEFERRABLE | NOT DEFERRABLE][INITIALLY DEFERRED | INITIALLY IMMEDIATE]
```

○ **index\_parameters** is as follows:

```
[WITH ({storage_parameter = value} [, ...])]
[USING INDEX TABLESPACE tablespace_name]
```

▪ **compress\_mode** of a column is as follows:

```
{ DELTA | PREFIX | DICTIONARY | NUMSTR | NOCOMPRESS }
```

- **table\_constraint\_using\_index** used to add the primary key constraint or unique constraint based on the unique index is as follows:

```
[CONSTRAINT constraint_name]
{ UNIQUE | PRIMARY KEY } USING INDEX index_name
[DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE]
```

- **table\_constraint** is as follows:

```
[CONSTRAINT constraint_name]
{ CHECK (expression) }
```

```
UNIQUE (column_name [, ...]) index_parameters |
PRIMARY KEY (column_name [, ...]) index_parameters
}
[DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE]
```

- **index\_parameters** is as follows:

```
[WITH ({storage_parameter = value} [, ...])]
[USING INDEX TABLESPACE tablespace_name][BY GLOBAL INDEX]
```

#### NOTE

If **index\_parameters** is set to **BY GLOBAL INDEX**, the global secondary index is used to create constraints.

- Rename a table. The renaming does not affect stored data.

```
ALTER TABLE [IF EXISTS] table_name
RENAME TO new_table_name;
```

- Rename the specified column in the table.

```
ALTER TABLE [IF EXISTS] { table_name [*] | ONLY table_name | ONLY (table_name) }
RENAME [COLUMN] column_name TO new_column_name;
```

- Rename the constraint of the table.

```
ALTER TABLE [IF EXISTS] { table_name [*] | ONLY table_name | ONLY (table_name) }
RENAME CONSTRAINT constraint_name TO new_constraint_name;
```

- Set the schema of the table.

```
ALTER TABLE [IF EXISTS] table_name
SET SCHEMA new_schema;
```

#### NOTE

- The schema setting moves the table into another schema. Associated indexes and constraints owned by table columns are migrated as well. Currently, the schema for sequences cannot be changed. If the table has sequences, delete the sequences, and create them again or delete the ownership between the table and sequences. In this way, the table schema can be changed.
- To change the schema of a table, you must also have the CREATE permission on the new schema. To add the table as a new child of a parent table, you must own the parent table as well. To alter the owner, you must also be a direct or indirect member of the new owning role, and that role must have the CREATE permission on the table's schema. These restrictions enforce that the user can only re-create and delete the table. However, a system administrator can alter the ownership of any table anyway.
- All the actions except for RENAME and SET SCHEMA can be combined into a list of multiple alterations to apply in parallel. For example, it is possible to add several columns or alter the type of several columns in a single statement. This is useful with large tables, since only one pass over the tables need be made.
- Adding a CHECK or NOT NULL constraint will scan the table to validate that existing rows meet the constraint.
- Adding a column with a non-NULL default or changing the type of an existing column will rewrite the entire table. Rewriting a large table may take much time and temporarily needs doubled disk space.
- Add columns.  

```
ALTER TABLE [IF EXISTS] table_name
ADD ({ column_name data_type [compress_mode] [COLLATE collation] [column_constraint
[...] } } [, ...]);
```
- Update columns.  

```
ALTER TABLE [IF EXISTS] table_name
MODIFY ({ column_name data_type | column_name [CONSTRAINT constraint_name] NOT
NULL [ENABLE] | column_name [CONSTRAINT constraint_name] NULL } [, ...]);
```

## Parameters

- **IF EXISTS**  
Sends a notice instead of an error if no tables have identical names. The notice prompts that the table you are querying does not exist.
- **table\_name [\*] | ONLY table\_name | ONLY ( table\_name )**  
**table\_name** is the name of the table that you need to modify.  
If **ONLY** is specified, only the table is modified. If **ONLY** is not specified, the table and all subtables are modified. You can add the asterisk (\*) option following the table name to specify that all subtables are scanned, which is the default operation.
- **constraint\_name**  
Specifies the name of an existing constraint to drop.
- **index\_name**  
Specifies the index name.

---

### NOTICE

In the ADD CONSTRAINT operation:

- **index\_name** is supported only in B-compatible databases (that is, **sql\_compatibility** set to 'B').
- For foreign key constraints, if **constraint\_name** and **index\_name** are specified at the same time, **constraint\_name** is used as the index name.
- For a unique key constraint, if both **constraint\_name** and **index\_name** are specified, **index\_name** is used as the index name.

- 
- **USING method**  
Specifies the name of the index method to be used.  
For details about the value range, see [USING method](#).

---

### NOTICE

In the ADD CONSTRAINT operation:

- The USING method is supported only in B-compatible databases (that is, **sql\_compatibility** set to 'B').
- In B-compatible mode, if USING method is not specified, the default index method is btree for Astore or UB-tree for Ustore.

- 
- **ASC | DESC**  
**ASC** specifies an ascending (default) sort order. **DESC** specifies a descending sort order.

---

### NOTICE

In ADD CONSTRAINT, ASC|DESC is supported only in B-compatible databases (that is, **sql\_compatibility** set to 'B').

---

- **expression**  
Specifies an expression index constraint based on one or more columns of the table. It must be written in parentheses.

---

**NOTICE**

Expression indexes in the UNIQUE constraint are supported only in B-compatible databases (that is, **sql\_compatibility** set to 'B').

- **storage\_parameter**  
Specifies the name of a storage parameter.  
The following options are added for online scaling:
  - **append\_mode** (enumerated type)  
Scales out a table online or offline, or stops scaling it. You can modify certain content in the table during online scaling but cannot do so during offline scaling.  
To modify a table that is being scaled, append new data so that they can be recorded as incremental data.
    - **on**: scales out a table online. New data will be appended.
    - **off**: stops scaling. New data will be written in normal mode, and options for online scaling will not be displayed in **pg\_class.reloptions**.
    - **read\_only**: scales a table offline, during which no other operations can be performed on the table.
    - **end\_catchup**: reports errors for the write service in the last round of data increment. The read service is executed normally.
  - **rel\_cn\_oid** (OID type)  
Records the OID of tables on the current CN to generate **delete\_delta** on the DNs.  
If **append\_mode** is set to **on**, **rel\_cn\_oid** must be specified.  
The **append\_mode** and **rel\_cn\_oid** options are used only for online scale-out tools.
  - **exec\_step** (integer)  
Records resumable transmission steps in **relOptions** of the temporary table.  
Value range: [1,4]  
It can be used only for data redistribution.
  - **create\_time** (long integer)  
Records the time when the temporary table is created during resumable transmission in **relOptions** of the temporary table.  
Only the data redistribution tool is supported.
  - **wait\_clean\_cbi** (string type)  
Specifies whether the current global index contains the residual tuple generated during bucket migration for scaling. After scaling,

**wait\_clean\_cbi** is set to **y**. After the residual tuple is cleared in the vacuum process, **wait\_clean\_cbi** is set to **n**.

This option is used only in scaling tools.

The following option is added for creating an index:

- **parallel\_workers** (int type)

Number of bgworker threads started when an index is created. For example, value **2** indicates that two bgworker threads are started to create indexes concurrently.

Value range: [0,32]. The value 0 indicates that concurrent index creation is disabled.

Default value: If this parameter is not set, the concurrent index creation function is disabled.

The following option is added to the replication table:

- **primarynode** (Boolean type)

Default value: **off**

When **primarynode** is set to **on**, the primary node is selected for the replication table. Generally, the primary node is the first node recorded in the **nodeoids** column in the **pgxc\_class** table. When the IUD operation is performed on the replication table, the operation is delivered to the primary node first. After the result is received, the operation is delivered to other DNs.

- **logical\_repl\_node** (string type)

Name of the DN that returns logical logs to the CN during logical decoding of a distributed replication table. For the replication table, if this parameter is not specified, the first node in the node group where the current table is located is used by default. When the RESET operation is performed on this option, **logical\_repl\_node** is reset to the first node of current table.

Value range: a string

Default value: For the non-replication table, this parameter is empty by default. For the replication table, this parameter is set to the name of the first node by default.

TDE options:

- **enable\_tde** (bool type)

Specifies whether transparent data encryption is enabled for a table. Before enabling this function, ensure that the GUC parameter **enable\_tde** has been enabled, the KMS has been enabled, and the cluster master key ID in the GUC parameter **tde\_cmk\_id** has been correctly configured.

This parameter does not support temporary tables. The Ustore storage engine is not supported. The Ustore storage engine is not supported. This parameter can be modified only when **enable\_tde** is specified during table creation. Switching the encryption switch status does not change the encryption algorithm and key information.

Value range: **on** and **off**. **on** indicates that transparent data encryption is enabled. After the value is switched from **off** to **on**, new data is automatically encrypted when being written to the data page, and old data is automatically encrypted when the data page is updated. **off**

indicates that transparent data encryption is disabled. After the value is switched from **on** to **off**, newly written data is not encrypted, old encrypted data can be automatically decrypted when being read, and data is not encrypted when being written back to the data page.

Default value: **off**

- **hasuids** (Boolean type)

Default value: **off**

If this parameter is set to **on**, a unique table-level ID is allocated to a tuple when the tuple is updated.

- **new\_owner**  
Specifies the name of the new table owner.
- **new\_tablespace**  
Specifies the new name of the tablespace to which the table belongs.
- **column\_name, column\_1\_name, column\_2\_name**  
Specifies the name of a new or existing column.
- **data\_type**  
Specifies the type of a new column or a new type of an existing column.
- **compress\_mode**  
Specifies whether to compress a table column. The clause specifies the compression algorithm preferentially used by the column. Row-store tables do not support compression.
- **collation**  
Specifies the collation rule name of a column. The optional COLLATE clause specifies a collation for the new column; if omitted, the collation is the default for the new column. You can run the **select \* from pg\_collation** command to query collation rules from the **pg\_collation** system catalog. The default collation rule is the row starting with **default** in the query result.
- **USING expression**  
Specifies how to compute the new column value from the old; if omitted, the default conversion is an assignment cast from old data type to new. A USING clause must be provided if there is no implicit or assignment cast from the old to new type.

#### NOTE

USING in ALTER TYPE can specify any expression involving the old values of the row; that is, it can refer to any columns other than the one being cast. This allows general casting to be done with the ALTER TYPE syntax. Because of this flexibility, the USING expression is not applied to the column's default value (if any); the result might not be a constant expression as required for a default. This means that when there is no implicit or assignment cast from old to new type, ALTER TYPE might fail to convert the default even though a USING clause is supplied. In such cases, drop the default with DROP DEFAULT, perform ALTER TYPE, and then use SET DEFAULT to add a suitable new default. Similar considerations apply to indexes and constraints involving the column.

- **NOT NULL | NULL**  
Sets whether the column allows null values.
- **ENABLE**  
Specifies that the constraint is enabled. By default, the constraint is enabled.

- **integer**  
Specifies the constant value of a signed integer. When using **PERCENT**, the range of **integer** is from 0 to 100.
- **attribute\_option**  
Specifies an attribute option.
- **PLAIN | EXTERNAL | EXTENDED | MAIN**  
Specifies a column-store mode.
  - **PLAIN** must be used for fixed-length values (such as integers). It must be inline and uncompressed.
  - **MAIN** is for inline, compressible data.
  - **EXTERNAL** is for external, uncompressed data. Use of **EXTERNAL** will make substring operations on **text** and **bytea** values run faster, at the penalty of increased storage space.
  - **EXTENDED** is for external, compressed data. **EXTENDED** is the default for most data types that support non-**PLAIN** storage.
- **CHECK ( expression )**  
New rows or rows to be updated must satisfy for an expression to be true. If any row produces a false result, an error is raised and the database is not modified.  
  
A check constraint specified as a column constraint should reference only the column's values, while an expression in a table constraint can reference multiple columns.  
  
Currently, **CHECK ( expression )** does not include subqueries and cannot use variables apart from the current column.
- **DEFAULT default\_expr**  
Assigns a default data value to a column.  
  
The data type of the default expression must match the data type of the column.  
  
The default expression will be used in any insert operation that does not specify a value for the column. If there is no default value for a column, then the default value is **NULL**.
- **COLUMN\_ENCRYPTION\_KEY = column\_encryption\_key**  
Specifies the name of the column encryption key in the ENCRYPTED WITH constraint.  
  
Value range: a string. It must comply with the naming convention.
- **ENCRYPTION\_TYPE = encryption\_type\_value**  
For the encryption type in the ENCRYPTED WITH constraint, the value of **encryption\_type\_value** is **DETERMINISTIC** or **RANDOMIZED**.
- **UNIQUE [KEY] index\_parameters**  
**UNIQUE ( column\_name [, ... ] ) index\_parameters**  
UNIQUE specifies that a group of one or more columns of a table can contain only unique values.  
  
UNIQUE KEY can be used only when **sql\_compatibility** is set to '**MYSQL**', which has the same semantics as UNIQUE.

- **PRIMARY KEY index\_parameters**  
**PRIMARY KEY ( column\_name [ , ... ] ) index\_parameters**  
Specifies that a column or columns of a table can contain only unique (non-duplicate) and non-null values.
- **DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE**  
Sets whether the constraint can be deferrable.
  - **DEFERRABLE**: deferrable to the end of the transaction and checked using **SET CONSTRAINTS**.
  - **NOT DEFERRABLE**: checks immediately after the execution of each command.
  - **INITIALLY IMMEDIATE**: checks immediately after the execution of each statement.
  - **INITIALLY DEFERRED**: checks when the transaction ends.
- **WITH ( {storage\_parameter = value} [ , ... ] )**  
Specifies an optional storage parameter for a table or an index.
- **tablespace\_name**  
Specifies the name of the tablespace where the index locates.
- **COMPRESS|NOCOMPRESS**
  - **NOCOMPRESS**: If the **NOCOMPRESS** keyword is specified, the existing compression feature of the table will not be changed.
  - **COMPRESS**: If the **COMPRESS** keyword is specified, the table compression feature will be triggered by batch tuple insertion. Row-store tables do not support compression.
- **new\_table\_name**  
Specifies the new table name.
- **new\_column\_name**  
Specifies the new name of a specific column in a table.
- **new\_constraint\_name**  
Specifies the new name of a table constraint.
- **new\_schema**  
Specifies the new schema name.
- **CASCADE**  
Automatically drops objects that depend on the dropped column or constraint (for example, views referencing the column).
- **RESTRICT**  
Refuses to drop the column if the column is referenced by other columns or constraints. **RESTRICT** is the default option. If **CASCADE** is not specified, the value is **RESTRICT**. An example of the statement is as follows:  

```
alter table <Table name>[drop [column] <Column name> [cascade | restrict]];
```
- **schema\_name**  
Specifies the schema name of a table.

## Examples of Modifying a Table

- Rename a table.

```
gaussdb=# CREATE TABLE aa(c1 int, c2 int);
gaussdb=# ALTER TABLE IF EXISTS aa RENAME TO test_alt1;
```
- Modify the schema of a table.

```
-- Create the test_schema schema.
gaussdb=# CREATE SCHEMA test_schema;

-- Change the schema of the test_alt1 table to test_schema.
gaussdb=# ALTER TABLE test_alt1 SET SCHEMA test_schema;

-- Query table information.
gaussdb=# SELECT schemaname,tablename FROM pg_tables WHERE tablename = 'test_alt1';
schemaname | tablename
-----+-----
test_schema | test_alt1
(1 row)
```
- Change the owner of a table.

```
-- Create user test_user.
gaussdb=# CREATE USER test_user PASSWORD 'XXXXXXXXXX';

-- Change the owner of the test_alt1 table to test_user.
gaussdb=# ALTER TABLE IF EXISTS test_schema.test_alt1 OWNER TO test_user;

-- Query.
gaussdb=# SELECT tablename, schemaname, tableowner FROM pg_tables WHERE tablename = 'test_alt1';
tablename | schemaname | tableowner
-----+-----+-----
test_alt1 | test_schema | test_user
(1 row)
```
- Modify the tablespace of a table.

```
-- Create the tbs_data1 tablespace.
gaussdb=# CREATE TABLESPACE tbs_data1 RELATIVE LOCATION 'tablespace1/tbs_data1';

-- Change the tablespace of the test_alt1 table to tbs_data1.
gaussdb=# ALTER TABLE test_schema.test_alt1 SET TABLESPACE tbs_data1;

-- Query.
gaussdb=# SELECT tablename, tablespace FROM pg_tables WHERE tablename = 'test_alt1';
tablename | tablespace
-----+-----
test_alt1 | tbs_data1
(1 row)

-- Delete.
gaussdb=# DROP TABLE test_schema.test_alt1;
gaussdb=# DROP TABLESPACE tbs_data1;
gaussdb=# DROP SCHEMA test_schema;
gaussdb=# DROP USER test_user;
```

## Examples of Modifying a Column

- Change column names.

```
-- Create a table.
gaussdb=# CREATE TABLE test_alt2(c1 INT,c2 INT);

-- Change column names.
gaussdb=# ALTER TABLE test_alt2 RENAME c1 TO id;
gaussdb=# ALTER TABLE test_alt2 RENAME COLUMN c2 to areaid;

-- Query.
\d test_alt1
Table "public.test_alt1"
Column | Type | Modifiers
-----+-----+-----
```

- ```

id | integer |
areaid | integer |

```
- Add columns.**

-- Add a column to the **test_alt1** table.
gaussdb=# ALTER TABLE IF EXISTS test_alt2 ADD COLUMN name VARCHAR(20);

-- Query.
gaussdb=# \d test_alt2
Table "public.test_alt1"
Column | Type | Modifiers
-----+-----+-----
id | integer |
areacode | integer |
name | character varying(20) |
 - Modify the data type of a column.**

-- Change the type of the **name** column in the **test_alt1** table.
gaussdb=# ALTER TABLE test_alt1 MODIFY name VARCHAR(50);

-- Query.
gaussdb=# \d test_alt1
Table "public.test_alt2"
Column | Type | Modifiers
-----+-----+-----
id | integer |
areaid | integer |
name | character varying(50) |

-- Change the type of the **name** column in the **test_alt1** table.
gaussdb=# ALTER TABLE test_alt2 ALTER COLUMN name TYPE VARCHAR(25);

-- Query.
gaussdb=# \d test_alt2
Table "public.test_alt2"
Column | Type | Modifiers
-----+-----+-----
id | integer |
areaid | integer |
name | character varying(25) |
 - Delete a column.**

-- Delete the **areaid** column from **test_alt1**.
gaussdb=# ALTER TABLE test_alt2 DROP COLUMN areaid;

-- Query.
gaussdb=# \d test_alt2
Table "public.test_alt2"
Column | Type | Modifiers
-----+-----+-----
id | integer |
name | character varying(25) |
 - Modify the column-store mode.**

-- View table details.
gaussdb=# \d+ test_alt2
Table "public.test_alt2"
Column | Type | Modifiers | Storage | Stats target | Description
-----+-----+-----+-----+-----+-----
id | integer | | plain | |
name | character varying(25) | | extended | |
Has OIDs: no
Options: orientation=row, compression=no, storage_type=USTORE

-- Change the storage mode of the **name** column in the **test_alt2** table.
gaussdb=# ALTER TABLE test_alt2 ALTER COLUMN name SET STORAGE PLAIN;

-- Query.
gaussdb=# \d+ test_alt2
Table "public.test_alt2"
Column | Type | Modifiers | Storage | Stats target | Description
-----+-----+-----+-----+-----+-----

```

id | integer | | plain | |
name | character varying(25) | | plain | |
Has OIDs: no
Options: orientation=row, compression=no, storage_type=USTORE

-- Delete.
gaussdb=# DROP TABLE test_alt2;

```

Examples of Modifying a Constraint

- Add a not-null constraint to a column.

```

-- Create a table.
gaussdb=# CREATE TABLE test_alt3(pid INT, areaid CHAR(5), name VARCHAR(20));

```

Add a not-null constraint to **pid**.

```

gaussdb=# ALTER TABLE test_alt3 MODIFY pid NOT NULL;

```

-- Query.

```

gaussdb=# \d test_alt3
      Table "public.test_alt3"
Column |      Type      | Modifiers
-----+-----+-----
pid    | integer        | not null
areaid | character(5)   |
name   | character varying(20) |

```

- Cancel the not-null constraint on a column.

```

gaussdb=# ALTER TABLE test_alt3 MODIFY pid NULL;

```

-- Query.

```

gaussdb=# \d test_alt3
      Table "public.test_alt3"
Column |      Type      | Modifiers
-----+-----+-----
pid    | integer        |
areaid | character(5)   |
name   | character varying(20) |

```

- Modify the default value of a column.

-- Modify the default value of **id** in the **test_alt1** table.

```

gaussdb=# ALTER TABLE test_alt3 ALTER COLUMN areaid SET DEFAULT '00000';

```

-- Query.

```

gaussdb=# \d test_alt3
      Table "public.test_alt3"
Column |      Type      | Modifiers
-----+-----+-----
pid    | integer        |
areaid | character(5)   | default '00000'::bpchar
name   | character varying(20) |

```

-- Delete the default value of **id**.

```

gaussdb=# ALTER TABLE test_alt3 ALTER COLUMN areaid DROP DEFAULT;

```

-- Query.

```

gaussdb=# \d test_alt3
      Table "public.test_alt3"
Column |      Type      | Modifiers
-----+-----+-----
pid    | integer        |
areaid | character(5)   |
name   | character varying(20) |

```

- Add a table-level constraint.

- Directly add a constraint.

-- Add a primary key constraint to the table.

```

gaussdb=# ALTER TABLE test_alt3 ADD CONSTRAINT pk_test3_pid PRIMARY KEY (pid);

```

-- Query.

```

gaussdb=# \d test_alt3
      Table "public.test_alt3"

```

```

Column |      Type      | Modifiers
-----+-----+-----
pid    | integer        | not null
areaid | integer        |
name   | character varying(20) |
Indexes:
"pk_test3_pid" PRIMARY KEY, btree (pid) TABLESPACE pg_default

```

– Create an index and then add constraints.

```

-- Create a table.
gaussdb=# CREATE TABLE test_alt4(c1 INT, c2 INT);

-- Create an index.
gaussdb=# CREATE UNIQUE INDEX pk_test4_c1 ON test_alt4(c1);

-- Associate the created index when adding a constraint.
gaussdb=# ALTER TABLE test_alt4 ADD CONSTRAINT pk_test4_c1 PRIMARY KEY USING INDEX
pk_test4_c1;

-- Query.
gaussdb=# \d test_alt4
      Table "public.test_alt4"
Column |      Type      | Modifiers
-----+-----+-----
c1     | integer        | not null
c2     | integer        |
Indexes:
"pk_test4_c1" PRIMARY KEY, btree (c1) TABLESPACE pg_default

-- Delete.
gaussdb=# DROP TABLE test_alt4;

```

• Delete a table-level constraint.

```

-- Delete a constraint.
gaussdb=# ALTER TABLE test_alt3 DROP CONSTRAINT IF EXISTS pk_test3_pid;

-- Query.
gaussdb=# \d test_alt3
      Table "public.test_alt3"
Column |      Type      | Modifiers
-----+-----+-----
pid    | integer        | not null
areaid | integer        |
name   | character varying(20) |

-- Delete.
gaussdb=# DROP TABLE test_alt3;

```

[CREATE TABLE](#) and [DROP TABLE](#)

7.14.30 ALTER TABLE PARTITION

Description

Modifies table partitions, including adding, deleting, splitting, merging, clearing, swapping, and renaming partitions, moving partition tablespaces, and modifying partition attributes.

Precautions

- The tablespace of the added partition cannot be PG_GLOBAL.
- The name of the added partition must be different from names of existing partitions in the partitioned table.

- The key value of the added partition must be consistent with the type of partition keys in the partitioned table.
- If a range partition is added, the key value of the added partition must be greater than the upper limit of the last range partition in the partitioned table.
- If a list partition is added, the key value of the added partition cannot be the same as that of an existing partition.
- Hash partitions cannot be added.
- If the number of partitions in the target partitioned table has reached the maximum (**1048575**), partitions cannot be added.
- If a partitioned table has only one partition, the partition cannot be deleted.
- Use `PARTITION FOR()` to choose partitions. The number of specified values in the brackets should be the same as the column number in customized partition, and they must be consistent.
- The **Value** partitioned table does not support the `ALTER PARTITION` operation.
- Hash partitioned tables do not support splitting, combination, addition, and deletion of partitions.
- Only the partitioned table owner or a user granted with the `ALTER` permission can run the **ALTER TABLE PARTITION** command. The system administrator has this permission by default.
- Deleting, splitting, merging, clearing, and exchanging partitions will invalidate global indexes. The `UPDATE GLOBAL INDEX` clause can be used to update the indexes synchronously.
- If the `UPDATE GLOBAL INDEX` clause is not used when you delete, split, merge, clear, or exchange partitions, concurrent DML services may report errors due to invalidated indexes.
- Deleting, splitting, merging, clearing, and exchanging partitions will invalidate global secondary indexes in partitioned tables. For exchanging partitions, all global secondary indexes in ordinary tables will also become invalid. Concurrent DML services may report errors due to unavailable indexes.
- If `enable_gpi_auto_update` is set to **on**, the global index is automatically updated even if the `UPDATE GLOBAL INDEX` clause is not declared.

Syntax

Modifying a partition in a partitioned table includes modifying the table partition itself and the table partition name, and resetting the partition ID.

- Modify the syntax of the table partition.

```
ALTER TABLE [ IF EXISTS ] { table_name [*] | ONLY table_name | ONLY ( table_name ) }  
action [, ... ];
```

action indicates the following clauses for maintaining partitions. For the partition continuity when multiple clauses are used for partition maintenance, GaussDB executes `DROP PARTITION` and `ADD PARTITION` first, and then the rest clauses in sequence.

```
move_clause |  
exchange_clause |  
row_clause |  
merge_clause |  
modify_clause |
```

```
split_clause |  
add_clause |  
drop_clause
```

- The `move_clause` syntax is used to move the partition to a new tablespace.

```
MOVE PARTITION { partition_name | FOR ( partition_value [, ...] ) } TABLESPACE tablespacename
```

- The `exchange_clause` syntax is used to move the data from an ordinary table to a specified partition.

```
EXCHANGE PARTITION { ( partition_name ) | FOR ( partition_value [, ...] ) }  
WITH TABLE {[ ONLY ] ordinary_table_name | ordinary_table_name * | ONLY  
( ordinary_table_name )}  
[ { WITH | WITHOUT } VALIDATION ] [ VERBOSE ] [ UPDATE GLOBAL INDEX ]
```

The ordinary table and partition whose data is to be exchanged must meet the following requirements:

- The number of columns of the ordinary table is the same as that of the partition, and their information should be consistent, including: column name, data type, constraint, collation information, storage parameter, and compression information.
- The compression information of the ordinary table and partition should be consistent.
- The distribution key information of the ordinary table and partition should be consistent.
- The number of ordinary table indexes is the same as that of local indexes of the partition, and the index information is the same.
- The number and information of constraints of the ordinary table and partition should be consistent.
- The ordinary table cannot be a temporary table.
- When the built-in security policy is enabled, an ordinary table cannot contain columns bound to a dynamic data anonymization policy.

NOTICE

- When the exchange is done, the data and tablespace of the ordinary table and partition are exchanged. The statistics of the ordinary table and partition are no longer inaccurate after the exchange, and they should be analyzed again.
- A non-partition key cannot be used to create a local unique index. Therefore, if an ordinary table contains a unique index, data cannot be exchanged.

To exchange data, you can create an intermediate table, insert partition data into the intermediate table, truncate partitions, insert ordinary table data into the partitioned table, drop the ordinary table, and rename the intermediate table.

- If the `DROP COLUMN` operation is performed on an ordinary or partitioned table, the deleted column still exists physically. Therefore, you need to ensure that the deleted column of the ordinary table is strictly aligned with that of the partition.
-

- The `row_clause` syntax is used to set row movement of a partitioned table.
`{ ENABLE | DISABLE } ROW MOVEMENT`
- The `merge_clause` syntax is used to merge partitions into one. The maximum number of source partitions that can be merged in a command is 300.
`MERGE PARTITIONS { partition_name } [, ...] INTO PARTITION partition_name
[TABLESPACE tablespacename] [UPDATE GLOBAL INDEX]`

NOTICE

For range partitioning and interval partitioning, the ranges of the source partitions must increase continuously, and the partition name after MERGE can be the same as the name of the last source partition. For list partitioning, there is no such range requirement on the source partitions, and the partition name after MERGE can be the same as that of any source partition. If the partition name after MERGE is the same as that of a source partition, they are considered as the same partition.

CAUTION

Ustore tables do not support ALTER TABLE MERGE PARTITIONS in transaction blocks and stored procedures.

- The `modify_clause` syntax is used to set whether a partitioned index is usable.
`MODIFY PARTITION partition_name { UNUSABLE LOCAL INDEXES | REBUILD UNUSABLE LOCAL INDEXES }`
- The `split_clause` syntax is used to split one partition into partitions.
`SPLIT PARTITION { partition_name | FOR (partition_value [, ...]) } { split_point_clause | no_split_point_clause } [UPDATE GLOBAL INDEX]`

NOTICE

- The partition name after SPLIT can be the same as the source partition name, but they are regarded as different partitions.
- The `split_point_clause` syntax for specifying the split point for a range partitioned table is as follows:
`AT (partition_value) INTO (PARTITION partition_name [TABLESPACE tablespacename] , PARTITION partition_name [TABLESPACE tablespacename])`

NOTICE

The size of the split point should be in the range of partition keys of the partition of to be split. The split point can only split one partition into two new partitions.

- The `no_split_point_clause` syntax without specifying a split point for a range partitioned table is as follows:
`INTO ((partition_less_than_item [, ...]) | (partition_start_end_item [, ...]))`

NOTICE

- The first new partition key specified by **partition_less_than_item** should be greater than that of the previously split partition (if any), and the last partition key specified by **partition_less_than_item** should equal that of the partition being split.
- The first new partition key specified by **partition_start_end_item** should equal that of the former partition (if any), and the last partition key specified by **partition_start_end_item** should equal that of the partition being split.
- **partition_less_than_item** supports a maximum of 16 partition keys, while **partition_start_end_item** supports only one partition key. For details about the supported data types, see [PARTITION BY RANGE\(part...](#)
- **partition_less_than_item** and **partition_start_end_item** cannot be used in the same statement. There is no restriction on different SPLIT statements.

- The `partition_less_than_item` syntax is as follows:
`PARTITION partition_name VALUES LESS THAN ({ partition_value | MAXVALUE } [, ...]) [TABLESPACE tablespacename]`

- The `partition_start_end_item` syntax is as follows. For details about the constraints, see [START END](#).

```
PARTITION partition_name {
  {START(partition_value) END (partition_value) EVERY (interval_value)} |
  {START(partition_value) END ({partition_value | MAXVALUE})} |
  {START(partition_value)} |
  {END({partition_value | MAXVALUE})}
} [TABLESPACE tablespacename]
```

- The syntax for specifying the split point for a list partitioned table is as follows:

```
VALUES ( partition_value_list ) INTO ( PARTITION partition_name [ TABLESPACE tablespacename ] , PARTITION partition_name [ TABLESPACE tablespacename ] )
```

NOTICE

The split point must be a non-empty true subset of the source partition. Specifying a split point can only split one partition into two partitions.

- The syntax for not specifying the split point for a list partitioned table is as follows:

```
INTO ( PARTITION partition_name VALUES (partition_value_list) [ TABLESPACE tablespacename ] [, ...] )
```

NOTICE

- The range of the last partition is not defined, that is, the VALUES (partition_value_list) part is not defined; the partition range is equal to the remaining set of the source partition excluding other level-2 partitions.
- If no split point is specified, each new partition must be a non-empty true subset of the source partition and does not overlap with each other.

- The add_clause syntax is used to add one or more partitions to a specified partitioned table.

```
ADD {partition_less_than_item | partition_start_end_item}
```

The partition_list_item syntax is as follows:

```
PARTITION partition_name VALUES (list_values_clause)  
[ TABLESPACE tablespacename ]
```

NOTICE

- **partition_list_item** supports a maximum of 16 partition keys. For details about the supported data types, see [PARTITION BY LIST \[COLU...](#)
- Partitions cannot be added to a hash partitioned table.

- The drop_clause syntax is used to remove a partition from a specified partitioned table.

```
DROP PARTITION { partition_name | FOR ( partition_value [, ...] ) } [ UPDATE GLOBAL INDEX ]
```

NOTICE

- Hash partitioned table does not support partition deletion.
- If a partitioned table has only one partition, the partition cannot be deleted.

- The truncate_clause syntax is used to remove a specified partition from a partitioned table.

```
TRUNCATE PARTITION { partition_name | FOR ( partition_value [, ...] ) } [ UPDATE GLOBAL INDEX ]
```

- The syntax for modifying the name of a partition is as follows:
ALTER TABLE [IF EXISTS] { table_name [*] | ONLY table_name | ONLY (table_name) }
RENAME PARTITION { partion_name | FOR (partition_value [, ...]) } TO partition_new_name;

- Reset a partition ID.
ALTER TABLE [IF EXISTS] { table_name [*] | ONLY table_name | ONLY (table_name) } RESET PARTITION;

Parameters

- **table_name**
Specifies the name of a partitioned table.
Value range: an existing table name

- **partition_name**
Specifies the name of a partition.
Value range: an existing partition name
- **tablespacename**
Specifies which tablespace the partition moves to.
Value range: an existing tablespace name
- **partition_value**
Specifies the key value of a partition.
The value specified by **PARTITION FOR (partition_value [, ...])** can uniquely identify a partition.
Value range: partition keys for the partition to be operated.
- **UNUSABLE LOCAL INDEXES**
Sets all the indexes unusable in the partition.
- **REBUILD UNUSABLE LOCAL INDEXES**
Rebuilds all the indexes in the partition.
- **ENABLE/DISABLE ROW MOVEMENT**
Sets row movement.
If the tuple value is updated on the partition key during the **UPDATE** action, the partition where the tuple is located is altered. Setting this parameter enables error messages to be reported or movement of the tuple between partitions.
Value range:
 - **ENABLE**: Row movement is enabled.
 - **DISABLE**: Row movement is disabled.By default, this parameter is disabled.
- **ordinary_table_name**
Specifies the name of the ordinary table whose data is to be migrated.
Value range: an existing table name
- **{ WITH | WITHOUT } VALIDATION**
Checks whether the ordinary table data meets the specified partition key range of the partition to be migrated.
Value range:
 - **WITH**: checks whether the ordinary table data meets the partition key range of the partition to be migrated. If any data does not meet the required range, an error is reported.
 - **WITHOUT**: does not check whether the ordinary table data meets the partition key range of the partition to be migrated.The default value is **WITH**.
The check is time consuming, especially when the data volume is large. Therefore, use **WITHOUT** when you are sure that the current ordinary table data meets the partition key range of the partition to be migrated.
- **VERBOSE**

When **VALIDATION** is **WITH**, if the ordinary table contains data that is out of the partition key range, insert the data to the correct partition. If there is no correct partition where the data can be inserted to, an error is reported.

NOTICE

Only when **VALIDATION** is **WITH**, **VERBOSE** can be specified.

- **partition_new_name**
Specifies the new name of a partition.
Value range: a string. It must comply with the [naming convention](#).
- **UPDATE GLOBAL INDEX**
If this parameter is used, all global indexes in a partitioned table are updated to ensure that correct data can be queried using global indexes.
If this parameter is not used, all global indexes in a partitioned table will become invalid.

Examples

See [Examples](#) in section "CREATE TABLE PARTITION."

Helpful Links

[CREATE TABLE PARTITION](#) and [DROP TABLE](#)

7.14.31 ALTER TABLESPACE

Description

Modifies the attributes of a tablespace.

Precautions

- The ALTER TABLESPACE syntax cannot be used in the current version.
- Only the tablespace owner or a user granted with the ALTER permission can run the **ALTER TABLESPACE** command. The system administrator has this permission by default. To modify a tablespace owner, you must be the tablespace owner or system administrator and a member of the new owner role.
- The ALTER TABLESPACE operation on a row-store table cannot be performed in a transaction block.
- To change the owner, you must also be a direct or indirect member of the new owning role.

 **NOTE**

If **new_owner** is the same as **old_owner**, the current user will not be verified. A message indicating successful ALTER execution is displayed.

Syntax

- The syntax of renaming a tablespace is as follows:

```
ALTER TABLESPACE tablespace_name  
  RENAME TO new_tablespace_name;
```
- The syntax of setting the owner of a tablespace is as follows:

```
ALTER TABLESPACE tablespace_name  
  OWNER TO new_owner;
```
- The syntax of setting the attributes of a tablespace is as follows:

```
ALTER TABLESPACE tablespace_name  
  SET ( { tablespace_option = value } [, ... ] );
```
- The syntax of resetting the attributes of a tablespace is as follows:

```
ALTER TABLESPACE tablespace_name  
  RESET ( { tablespace_option } [, ... ] );
```
- The syntax of setting the quota of a tablespace is as follows:

```
ALTER TABLESPACE tablespace_name  
  RESIZE MAXSIZE { UNLIMITED | 'space_size'};
```

Parameters

- **tablespace_name**
Specifies the tablespace to be modified.
Value range: an existing table name
- **new_tablespace_name**
Specifies the new name of a tablespace.
The new name cannot start with PG_.
Value range: a string. It must comply with the [naming convention](#).
- **new_owner**
Specifies the new owner of the tablespace.
Value range: an existing username
- **tablespace_option**
Sets or resets the parameters of a tablespace.
Value range:
 - **seq_page_cost**: sets the optimizer to calculate the cost of obtaining disk pages in sequence. The default value is **1.0**.
 - **random_page_cost**: sets the optimizer to calculate the cost of obtaining disk pages in a non-sequential manner. The default value is **4.0**.

NOTE

- The value of **random_page_cost** is relative to that of **seq_page_cost**. It is meaningless when the value is equal to or less than the value of **seq_page_cost**.
- The prerequisite for the default value **4.0** is that the optimizer uses indexes to scan table data and the hit ratio of table data in the cache is about 90%.
- If the size of the table data space is smaller than that of the physical memory, decrease the value to a proper level. On the contrary, if the hit ratio of table data in the cache is lower than 90%, increase the value.
- If random-access memory like SSD is adopted, the value can be decreased to a certain degree to reflect the cost of true random scan.

Value range: a positive floating-point number

- **RESIZE MAXSIZE**

Resets the maximum size of tablespace.

Value range:

- **UNLIMITED**: No limit is set for the tablespace.
- Determined by **space_size**. For details about the format, see [CREATE TABLESPACE](#).

 **NOTE**

- If the adjusted quota is smaller than the current tablespace usage, the adjustment is successful. You need to decrease the tablespace usage to a value less than the new quota before writing data to the tablespace.
- You can also use the following statement to change the value of **MAXSIZE**:

```
ALTER TABLESPACE tablespace_name RESIZE MAXSIZE  
{ 'UNLIMITED' | 'space_size'};
```

Examples

See [Examples](#) in section "CREATE TABLESPACE."

Helpful Links

[CREATE TABLESPACE](#) and [DROP TABLESPACE](#)

7.14.32 ALTER TRIGGER

Description

Renames a trigger.

 **NOTE**

Currently, only the name can be modified.

Precautions

The owner of the table where a trigger resides or a user granted the ALTER ANY TRIGGER permission can perform the ALTER TRIGGER operation. A system administrator has this permission by default.

Syntax

```
ALTER TRIGGER trigger_name ON table_name RENAME TO new_name;
```

Parameters

- **trigger_name**
Specifies the name of the trigger to be modified.
Value range: an existing trigger
- **table_name**
Specifies the name of the table where the trigger to be modified is located.
Value range: an existing table having a trigger

- **new_name**
Specifies the new name after modification.
Value range: a string, which complies with the [naming convention](#). A value contains a maximum of 63 characters and cannot be the same as other triggers on the same table.

Examples

For details, see [CREATE TRIGGER](#).

Helpful Links

[CREATE TRIGGER](#), [DROP TRIGGER](#), and [ALTER TABLE](#)

7.14.33 ALTER TYPE

Description

Modifies the definition of a type.

Precautions

Only the owner of a type, a user granted the ALTER permission on a type, or a user granted the ALTER ANY TYPE permission on a sequence can run the **ALTER TYPE** command. The system administrator has this permission by default. To modify the owner or schema of a type, you must be a type owner or system administrator and a member of the new owner role.

Syntax

- **Modify a type.**

```
ALTER TYPE name action [, ... ]  
ALTER TYPE name OWNER TO { new_owner | CURRENT_USER | SESSION_USER }  
ALTER TYPE name RENAME ATTRIBUTE attribute_name TO new_attribute_name [ CASCADE | RESTRICT ]  
ALTER TYPE name RENAME TO new_name  
ALTER TYPE name SET SCHEMA new_schema  
ALTER TYPE name ADD VALUE [ IF NOT EXISTS ] new_enum_value [ { BEFORE | AFTER } neighbor_enum_value ]  
ALTER TYPE name RENAME VALUE existing_enum_value TO new_enum_value
```

where action is one of:

```
ADD ATTRIBUTE attribute_name data_type [ COLLATE collation ] [ CASCADE | RESTRICT ]  
DROP ATTRIBUTE [ IF EXISTS ] attribute_name [ CASCADE | RESTRICT ]  
ALTER ATTRIBUTE attribute_name [ SET DATA ] TYPE data_type [ COLLATE collation ] [ CASCADE | RESTRICT ]
```
- **Change the owner of a type.**

```
ALTER TYPE name OWNER TO { new_owner | CURRENT_USER | SESSION_USER }
```
- **Change the name of a type.**

```
ALTER TYPE name RENAME TO new_name  
ALTER TYPE name RENAME ATTRIBUTE attribute_name TO new_attribute_name [ CASCADE | RESTRICT ]
```
- **Move a type to a new schema.**

```
ALTER TYPE name SET SCHEMA new_schema
```
- **Add a new value to an enumerated type.**

```
ALTER TYPE name ADD VALUE [ IF NOT EXISTS ] new_enum_value [ { BEFORE | AFTER }  
neighbor_enum_value ]
```

- Change an enumerated value in the value list.
ALTER TYPE name RENAME VALUE existing_enum_value TO new_enum_value

Parameters

- **name**
Specifies the name of an existing type that needs to be modified (optionally schema-qualified).
- **new_name**
Specifies the new name of the type.
- **new_owner**
Specifies the new owner of the type.
- **new_schema**
Specifies the new schema of the type.
- **attribute_name**
Specifies the name of the attribute to be added, modified, or deleted.
- **new_attribute_name**
Specifies the new name of the attribute to be renamed.
- **data_type**
Specifies the data type of the attribute to be added, or the new type of the attribute to be modified.
- **new_enum_value**
Specifies a new enumerated value. It is a non-null string with a maximum length of 64 bytes.
- **neighbor_enum_value**
Specifies an existing enumerated value before or after which a new enumerated value will be added.
- **existing_enum_value**
Specifies an enumerated value to be changed. It is a non-null string with a maximum length of 64 bytes.
- **CASCADE**
Determines that the type to be modified, its associated records, and subtables that inherit the type will all be updated.
- **RESTRICT**
Refuses to update the associated records of the modified type. This is the default action.

NOTICE

- **ADD ATTRIBUTE**, **DROP ATTRIBUTE**, and **ALTER ATTRIBUTE** can be combined for processing. For example, it is possible to add several attributes or change the types of several attributes at the same time in one command.
- To modify a schema of a type, you must have the **CREATE** permission on the new schema. To alter the owner, you must be a direct or indirect member of the new owner role, and that member must have **CREATE** permission on the schema of this type (these restrictions enforce that the alter owner will not do anything that cannot be done by deleting and rebuilding the type). However, the system administrator can modify the rights of any type in any way. To add an attribute or modify the type of an attribute, you must also have the **USAGE** permission of this type.

- **CURRENT_USER**
Specifies the current user.
- **SESSION_USER**
Specifies the current system user.
- **COLLATE collation**
Assigns a collation to the column, which must be a sortable data type. If the collation is not specified, the default collation for the column's data type is used.

Examples

See [Examples](#) in section "CREATE TYPE."

Helpful Links

[CREATE TYPE](#) and [DROP TYPE](#)

7.14.34 ALTER USER

Description

Modifies the attributes of a database user.

Precautions

Session parameters modified by ALTER USER apply to a specified user and take effect in the next session.

Syntax

- Modify user permissions or other information.

```
ALTER USER user_name [ [ WITH ] option [ ... ] ];
```

The **option** clause is as follows:

```
{ CREATEDB | NOCREATEDB }  
| { CREATEROLE | NOCREATEROLE }
```

```

| { INHERIT | NOINHERIT }
| { AUDITADMIN | NOAUDITADMIN }
| { SYSADMIN | NOSYSADMIN }
| { MONADMIN | NOMONADMIN }
| { OPRADMIN | NOOPRADMIN }
| { POLADMIN | NOPOLADMIN }
| { USEFT | NOUSEFT }
| { LOGIN | NOLOGIN }
| { REPLICATION | NOREPLICATION }
| { VCADMIN | NOVCADMIN }
| { PERSISTENCE | NOPERSISTENCE }
| CONNECTION LIMIT connlimit
| [ ENCRYPTED | UNENCRYPTED ] PASSWORD { 'password' [ EXPIRED ] | DISABLE | EXPIRED }
| [ ENCRYPTED | UNENCRYPTED ] IDENTIFIED BY { 'password' [ REPLACE 'old_password' |
EXPIRED ] | DISABLE }
| VALID BEGIN 'timestamp'
| VALID UNTIL 'timestamp'

| USER GROUP 'groupuser'
| PERM SPACE 'spacelimit'
| TEMP SPACE 'tmpspacelimit'
| SPILL SPACE 'spillspacelimit'
| NODE GROUP logic_cluster_name
| PGUSER

```

- Change the username.

```

ALTER USER user_name
  RENAME TO new_name;

```

- Lock or unlock.

```

ALTER USER user_name
  ACCOUNT { LOCK | UNLOCK };

```

Parameters

- **user_name**

Specifies the current username.

Value range: an existing username. If a username contains uppercase letters, enclose the name with double quotation marks ("").

- **new_password**

Specifies a new password.

The new password must:

- Differ from the old password.
- Contain at least eight characters. This is the default length.
- Differ from the username or the username spelled backward.
- Contain at least three types of the following four types of characters: uppercase characters (A to Z), lowercase characters (a to z), digits (0 to 9), and special characters, including: ~!@#\$%^&*()-_+=\|[]{};,:<.>/?. If the password contains characters other than the preceding characters, an error will be reported during statement execution.

Value range: a string

- **old_password**

Specifies the old password.

- **ACCOUNT LOCK | ACCOUNT UNLOCK**

- **ACCOUNT LOCK:** locks an account to forbid login to databases.
- **ACCOUNT UNLOCK:** unlocks an account to allow login to databases.

- **PGUSER**

In the current version, the **PGUSER** attribute of a user cannot be modified.

For details about other parameters, see "Parameters" in [CREATE ROLE](#) and [ALTER ROLE](#).

NOTICE

The current version does not support the setting of user-level parameters.

Examples

```
-- Create user jim whose login password is *****.  
gaussdb=# CREATE USER jim PASSWORD '*****';  
  
-- Change the login password of user jim.  
gaussdb=# ALTER USER jim IDENTIFIED BY '*****' REPLACE '*****';  
  
-- Lock jim.  
gaussdb=# ALTER USER jim ACCOUNT LOCK;  
  
-- Unlock jim.  
gaussdb=# ALTER USER jim ACCOUNT UNLOCK;  
  
-- Change the username.  
gaussdb=# ALTER USER jim RENAME TO lisa;  
  
-- Delete the user.  
gaussdb=# DROP USER lisa CASCADE;
```

Helpful Links

[CREATE ROLE](#), [CREATE USER](#), and [DROP USER](#)

7.14.35 ALTER VIEW

Function

ALTER VIEW modifies all auxiliary attributes of a view. (To modify the query definition of a view, use **CREATE OR REPLACE VIEW**.)

Precautions

Only the view owner or a user granted with the ALTER permission can run the **ALTER VIEW** command. The system administrator has this permission by default. The following is permission constraints depending on attributes to be modified:

- To modify the schema of a view, you must be the owner of the view or system administrator and have the CREATE permission on the new schema.
- To modify the owner of a view, you must be the owner of the view or system administrator and a member of the new owner role, with the CREATE permission on the schema of the view.
- Do not change the type of a column in a view.

Syntax

- Set the default value of a view column.

```
ALTER VIEW [ IF EXISTS ] view_name  
ALTER [ COLUMN ] column_name SET DEFAULT expression;
```
- Remove the default value of a view column.

```
ALTER VIEW [ IF EXISTS ] view_name  
ALTER [ COLUMN ] column_name DROP DEFAULT;
```
- Change the owner of a view.

```
ALTER VIEW [ IF EXISTS ] view_name  
OWNER TO new_owner;
```
- Rename a view.

```
ALTER VIEW [ IF EXISTS ] view_name  
RENAME TO new_name;
```
- Set the schema of a view.

```
ALTER VIEW [ IF EXISTS ] view_name  
SET SCHEMA new_schema;
```
- Set the options of a view.

```
ALTER VIEW [ IF EXISTS ] view_name  
SET ( { view_option_name [ = view_option_value ] } [, ... ] );
```
- Reset the options of a view.

```
ALTER VIEW [ IF EXISTS ] view_name  
RESET ( view_option_name [, ... ] );
```

Parameter Description

- **IF EXISTS**
If this option is used, no error is generated when the view does not exist, and only a message is displayed.
- **view_name**
Specifies the view name, which can be schema-qualified.
Value range: a string. It must comply with the [naming convention](#).
- **column_name**
Specifies an optional list of names to be used for columns of the view. If not given, the column names are deduced from the query.
Value range: a string. It must comply with the [naming convention](#).
- **SET/DROP DEFAULT**
Sets or deletes the default value of a column. This parameter does not take effect.
- **new_owner**
Specifies the new owner of a view.
- **new_name**
Specifies the new view name.
- **new_schema**
Specifies the new schema of the view.
- **view_option_name [= view_option_value]**
Specifies an optional parameter for a view.
 - **security_barrier**: specifies whether the view provides row-level security. The value is of the Boolean type. The default value is **true**.

- **expression**
Specifies constants, functions, or SQL expressions.

Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer table.
gaussdb=# CREATE TABLE tpcds.customer
(
  c_customer_sk      INTEGER      NOT NULL,
  c_customer_id     CHARACTER(16) NOT NULL
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.customer VALUES (1, 'AAAAAAAAABAAAAAA'),(100,
'AAAAAAAAACAAAAAA'),(150, 'AAAAAADAAAAAA');

-- Create a view consisting of rows with c_customer_sk less than 150.
gaussdb=# CREATE VIEW tpcds.customer_details_view_v1 AS
  SELECT * FROM tpcds.customer
  WHERE c_customer_sk < 150;

-- Rename a view.
gaussdb=# ALTER VIEW tpcds.customer_details_view_v1 RENAME TO customer_details_view_v2;

-- Change the schema of a view.
gaussdb=# ALTER VIEW tpcds.customer_details_view_v2 SET schema public;

-- Delete a view.
gaussdb=# DROP VIEW public.customer_details_view_v2;

-- Delete the tpcds.customer table.
gaussdb=# DROP TABLE tpcds.customer;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

Helpful Links

[CREATE VIEW](#) and [DROP VIEW](#)

7.14.36 ANALYZE | ANALYSE

Description

ANALYZE collects statistics about ordinary tables in a database and stores the results in the `PG_STATISTIC` and `PG_STATISTIC_EXT` system catalogs. After you run the **ANALYZE** command, you can query the collected statistics in the preceding system catalogs or system views `PG_STATS` and `PG_EXT_STATS`. The execution plan generator uses these statistics to generate the most effective execution plan.

If no parameters are specified, **ANALYZE** analyzes each table and partitioned table in the database. You can also specify the **table_name**, **column**, and **partition_name** parameters to restrict the analysis to a specific table, column, or partitioned table.

ANALYZE | ANALYSE VERIFY checks whether data files of ordinary tables in a database are damaged.

Precautions

Non-temporary tables cannot be analyzed in an anonymous block, transaction block, function, or stored procedure. Temporary tables in a stored procedure can be analyzed but their statistics updates cannot be rolled back.

Remote read is not involved in the ANALYZE VERIFY scenario. Therefore, the remote read parameter does not take effect. If the system detects that a page is damaged due to an error in a key system table, the system directly reports an error and does not continue the detection.

With no table specified, ANALYZE processes all the tables that the current user has permission to analyze in the current database. With a table specified, ANALYZE processes only that table.

To perform ANALYZE operation to a table, you must be a table owner or a user granted the VACUUM permission on the table. By default, the system administrator has this permission. However, database owners are allowed to analyze all tables in their databases, except shared catalogs. (The restriction for shared catalogs means that a true database-wide analyze operation can only be executed by the system administrator). ANALYZE skips tables on which users do not have permissions.

ANALYZE does not collect columns for which comparison or equivalent operations cannot be performed, for example, columns of the cursor type.

Syntax

- Collect statistics information about a table.

```
{ ANALYZE | ANALYSE } [ VERBOSE ]  
  [ table_name [ ( column_name [, ...] ) ] ] ;
```

- Collect partition statistics on a partitioned table. This syntax is not supported currently.

```
{ ANALYZE | ANALYSE } [ VERBOSE ]  
  table_name [ ( column_name [, ...] ) ] PARTITION ( partition_name ) ;
```

NOTE

An ordinary partitioned table supports the syntax but not the function of collecting statistics about specified partitions.

- Collect statistics about global secondary indexes.

```
{ ANALYZE | ANALYSE } GLOBAL INDEX index_name FOR TABLE table_name;
```

NOTE

- Before performing ANALYZE on the global secondary index, you need to perform ANALYZE on the base table to ensure the accuracy of global secondary indexes.
- After performing the REINDEX/REBUILD operation on the global secondary indexes, you need to perform ANALYZE on the base table first before the global secondary indexes to ensure the accuracy of global secondary indexes.
- To collect statistics from global secondary indexes, you must specify **index_name** and **table_name**, and **index_name** must be the name of a global secondary index.
- The global secondary indexes include only the statistics (reltuple and relpages) in the pg_class system catalog.
- Collect statistics about multiple columns manually.

```
{ ANALYZE | ANALYSE } [ VERBOSE ]  
  table_name (( column_1_name, column_2_name [, ...] ));
```

 NOTE

- The statistics about a maximum of 32 columns can be collected at a time.
- You are not allowed to collect statistics about multiple columns in system catalogs.
- Collect statistics about multiple columns automatically.

After the **auto_statistic_ext_columns** parameter is enabled and analyzed, multi-column statistics are automatically created based on the index prefix of the table. The number of columns in the multi-column statistics cannot exceed the value of **auto_statistic_ext_columns**.

For example, if index (a, b, c, d) exists in table **t** and **auto_statistic_ext_columns** is set to **4**, multi-column statistics about (a, b), (a, b, c), and (a, b, c, d) are created after table **t** is analyzed.

```
{ ANALYZE | ANALYSE } [ VERBOSE ] table_name;
```

- Check the data files in the current database.

```
{ ANALYZE | ANALYSE } VERIFY { FAST | COMPLETE };
```

 NOTE

- In fast mode, DML operations need to be performed on the tables to be verified concurrently. As a result, an error is reported during the verification. In the current fast mode, data is directly read from the disk. When other threads modify files concurrently, the obtained data is incorrect. Therefore, you are advised to perform the verification offline.
- You can perform operations on the entire database. Because a large number of tables are involved, you are advised to save the results in redirection mode.

```
gsql -d database -p port -f sqlfile> sqllog.txt 2>&1
```
- Temporary tables and unlogged tables are not supported.
- NOTICE is used to check only tables that are visible to external systems. The detection of internal tables is included in the external tables on which NOTICE depends and is not displayed externally.
- This statement can be executed with error tolerance.
- If a key system table is damaged during a full database operation, an error is reported and the operation stops.
- Check data files of tables and indexes.

```
{ ANALYZE | ANALYSE } VERIFY { FAST | COMPLETE } { table_name | index_name } [ CASCADE ];
```

 NOTE

- Operations on ordinary tables and index tables are supported, but CASCADE operations on indexes of index tables are not supported. The CASCADE mode is used to process all index tables of the main table. When the index tables are checked separately, the CASCADE mode is not required.
- Temporary tables and unlogged tables are not supported.
- When the main table is checked, the internal tables of the main table, such as the toast table, are also checked.
- When the system displays a message indicating that the index table is damaged, you are advised to run the **reindex** command to re-create the index.
- Check the data files of the table partition.

```
{ ANALYZE | ANALYSE } VERIFY { FAST | COMPLETE } table_name PARTITION (partition_name) [ CASCADE ];
```

 **NOTE**

- You can check a single partition of a table, but cannot perform the **CASCADE** operation on the indexes of an index table.
- Temporary tables and unlogged tables are not supported.

Parameters

- **VERBOSE**

Enables the display of progress messages.

 **NOTE**

If **VERBOSE** is specified, **ANALYZE** displays the progress information, indicating the table that is being processed. Statistics about tables are also displayed.

- **table_name**

Specifies the name (possibly schema-qualified) of a specific table to analyze. If omitted, all regular tables (but not foreign tables) in the current database are analyzed.

Currently, you can use **ANALYZE** to collect statistics on foreign tables of column-store tables.

Value range: an existing table name.

- **column_name**, **column_1_name**, **column_2_name**

Specifies the name of a specific column to analyze. All columns are analyzed by default.

Value range: an existing column name

- **partition_name**

Assumes the table is a partitioned table. You can specify **partition_name** following the keyword **PARTITION** to analyze the statistics of this table. Currently, **ANALYZE** can be performed on partitioned tables, but statistics of specified partitions cannot be analyzed.

Value range: a partition name of a table

- **index_name**

Specifies the name of the specific index table to be analyzed (possibly schema-qualified).

Value range: an existing table name

- **FAST|COMPLETE**

The **FAST** mode verifies the CRC and page header of the table. If the verification fails, an alarm is generated. In **COMPLETE** mode, the pointer and tuple of the table are parsed and verified.

- **CASCADE**

In **CASCADE** mode, all indexes of the current table are verified.

Examples

```
-- Create a table.
gaussdb=# CREATE TABLE customer_info
(
  WR_RETURNED_DATE_SK    INTEGER
```

```
WR_RETURNED_TIME_SK    INTEGER    ,
WR_ITEM_SK             INTEGER    NOT NULL,
WR_REFUNDED_CUSTOMER_SK INTEGER
)
DISTRIBUTE BY HASH (WR_ITEM_SK);
```

```
-- Create a partitioned table.
gaussdb=# CREATE TABLE customer_par
(
WR_RETURNED_DATE_SK    INTEGER    ,
WR_RETURNED_TIME_SK    INTEGER    ,
WR_ITEM_SK             INTEGER    NOT NULL,
WR_REFUNDED_CUSTOMER_SK INTEGER
)
DISTRIBUTE BY HASH (WR_ITEM_SK)
PARTITION BY RANGE(WR_RETURNED_DATE_SK)
(
PARTITION P1 VALUES LESS THAN(2452275),
PARTITION P2 VALUES LESS THAN(2452640),
PARTITION P3 VALUES LESS THAN(2453000),
PARTITION P4 VALUES LESS THAN(MAXVALUE)
)
ENABLE ROW MOVEMENT;
```

```
-- Run the ANALYZE statement to update statistics.
gaussdb=# ANALYZE customer_info;
```

```
-- Run the ANALYZE VERBOSE statement to update statistics and display table information.
gaussdb=# ANALYZE VERBOSE customer_info;
INFO: analyzing "public.customer_info"(cn_5002 pid=53078)
INFO: analyzing "public.customer_info" inheritance tree(cn_5002 pid=53078)
ANALYZE
```

NOTE

If any environment-related fault occurs, check the logs of CN.

```
-- Delete the tables.
gaussdb=# DROP TABLE customer_info;
gaussdb=# DROP TABLE customer_par;
```

7.14.37 BEGIN

Description

BEGIN may be used to initiate an anonymous block or a single transaction. This section describes the syntax of BEGIN used to initiate an anonymous block. For details about the BEGIN syntax that initiates transactions, see [START TRANSACTION](#).

An anonymous block is a structure that can dynamically create and execute stored procedure code instead of permanently storing code as a database object in the database.

Precautions

None

Syntax

- Enable an anonymous block.

```
[DECLARE [declare_statements]]  
BEGIN  
execution_statements  
END;  
/
```
- Start a transaction.

```
BEGIN [ WORK | TRANSACTION ]  
 [  
  {  
    ISOLATION LEVEL { READ COMMITTED | SERIALIZABLE | REPEATABLE READ }  
    | { READ WRITE | READ ONLY }  
  } [, ...]  
];
```

Parameters

- **declare_statements**
Declares a variable, including its name and type, for example, **sales_cnt int**.
- **execution_statements**
Specifies the statement to be executed in an anonymous block.
Value range: an existing function name

Examples

```
-- Generate a string using an anonymous block.  
gaussdb=# BEGIN  
dbe_output.print_line('Hello');  
END;  
/
```

Helpful Links

[START TRANSACTION](#)

7.14.38 CALL

Description

Calls defined functions and stored procedures.

Precautions

The owner of a function or stored procedure, users granted with the EXECUTE permission on the function or stored procedure, or users granted with the EXECUTE ANY FUNCTION permission can call the function or stored procedure. The system administrator has the permission to call the function or stored procedure by default.

Syntax

```
CALL [ schema.] { func_name | procedure_name } ( param_expr );
```

Parameters

- **schema**
Specifies the name of the schema where a function or stored procedure is located.
- **func_name**
Specifies the name of the function or stored procedure to be called.
Value range: an existing function name

NOTE

You can use database links to perform operations on remote functions or stored procedures. For details, see [DATABASE LINK](#).

- **param_expr**
Specifies a list of parameters in the function. Use := or => to separate a parameter name and its value. This method allows parameters to be placed in any order. If only parameter values are in the list, the value order must be the same as that defined in the function or stored procedure.
Value range: an existing function parameter name or stored procedure parameter name

NOTE

- The parameters include input parameters (whose name and type are separated by **IN**) and output parameters (whose name and type are separated by **OUT**). When you run the **CALL** command to call a function or stored procedure, the parameter list must contain an output parameter for non-overloaded functions. You can set the output parameter to a variable or any constant. For details, see [Examples](#). If an output parameter is contained, it must be a constant.

Examples

```
-- Create a function func_add_sql, calculate the sum of two integers, and return the result.
gaussdb=# CREATE FUNCTION func_add_sql(num1 integer, num2 integer) RETURN integer
AS
BEGIN
RETURN num1 + num2;
END;
/

-- Transfer by parameter value.
gaussdb=# CALL func_add_sql(1, 3);

-- Transfer by naming tag method.
gaussdb=# CALL func_add_sql(num1 => 1,num2 => 3);
gaussdb=# CALL func_add_sql(num2 := 2, num1 := 3);

-- Delete the function.
gaussdb=# DROP FUNCTION func_add_sql;

-- Create a function with output parameters.
gaussdb=# CREATE FUNCTION func_increment_sql(num1 IN integer, num2 IN integer, res OUT integer)
RETURN integer
AS
BEGIN
res := num1 + num2;
END;
/

-- Transfer a constant as an output parameter.
gaussdb=# CALL func_increment_sql(1,2,1);
```

```
-- Transfer a variable as an output parameter.
gaussdb=# DECLARE
res int;
BEGIN
func_increment_sql(1, 2, res);
dbe_output.print_line(res);
END;
/

-- Delete the function.
gaussdb=# DROP FUNCTION func_increment_sql;
```

7.14.39 CHECKPOINT

Function

A checkpoint is a point in the transaction log sequence at which all data files have been updated to reflect the information in the log. All data files will be flushed to a disk.

CHECKPOINT forces a transaction log checkpoint. By default, WALs periodically specify checkpoints in a transaction log. You may use **gs_guc** to specify run-time parameters **checkpoint_segments**, **checkpoint_timeout**, and **incremental_checkpoint_timeout** to adjust the atomized checkpoint intervals.

Precautions

- Only the system administrator and O&M administrator can invoke **CHECKPOINT**.
- **CHECKPOINT** forces an immediate checkpoint when the related command is issued, without waiting for a regular checkpoint scheduled by the system.

Syntax

```
CHECKPOINT;
```

Parameter Description

None

Examples

```
-- Set a checkpoint.
gaussdb=# CHECKPOINT;
```

7.14.40 CLEAN CONNECTION

Function

Clear idle or invalid network connections between the current CN and other specified CNs or DNs. This statement is used to clear the specified database and idle or invalid connections of a specified user cached in the current CN on a specified CN.

Precautions

1. In non-force mode, this function only clears connections between database cluster nodes (CNs/DNs) and does not affect client connections.
2. This function clears only idle and invalid connections cached on the CN. Normal connections that are being used are not cleared.
3. This function takes effect only on CNs and does not take effect on DNs.
4. You can query the **PG_STAT_GET_POOLER_STATUS()** function to check the cache connection and verify the clearing effect.
5. You are advised to perform this operation only when the network connection of the database is abnormal.

Syntax

```
CLEAN CONNECTION  
TO { COORDINATOR ( nodename [, ... ] ) | NODE ( nodename [, ... ] ) | ALL [ CHECK ] [ FORCE ] }  
{ FOR DATABASE dbname | TO USER username | FOR DATABASE dbname TO USER username };
```

Parameter Description

- **CHECK**

This parameter can be specified only when the node list is specified as **TO ALL**. Setting this parameter will check whether a database is accessed by other sessions before its connections are cleared. If any sessions are detected before **DROP DATABASE** is executed, an error will be reported and the database will not be deleted.

- **FORCE**

This parameter can be specified only when the node list is **TO ALL**. If this parameter is specified, all threads related to the specified dbname and username in the current CN receive the SIGTERM signal, the corresponding session is forcibly closed, the transaction is terminated, and the network connection is cleared.

- **COORDINATOR (nodename ,nodename ... }) | NODE (nodename , nodename ...) | ALL**

This command is used to delete the idle or invalid connections between the current CN node and a specified node. There are three scenarios:

- **COORDINATOR**: Delete the idle or invalid connections from the current CN to a specified CN.
- **NODE**: Delete the idle or invalid connections from the current CN to a specified DN.
- **ALL**: Delete the idle or invalid connections from the current CN to all nodes, including CNs and DNs.

Value range: **nodename** is an existing node name.

- **dbname**

Deletes connections to a specified database from the current CN. If this parameter is not specified, connections to all databases will be deleted.

Value range: an existing database name

- **username**

Deletes connections to a specified user from the current CN. If this parameter is not specified, connections of all users will be deleted.

Value range: an existing username

Examples

```
-- Create user jack.
gaussdb=# CREATE USER jack PASSWORD '*****';

-- Delete the idle and invalid connections between the current CN and dn1 and dn2 in the template1
database.
gaussdb=# CLEAN CONNECTION TO NODE (dn_6001_6002,dn_6003_6004) FOR DATABASE template1;

-- Delete the idle and invalid connections between the current CN and dn1 that are related to user jack.
gaussdb=# CLEAN CONNECTION TO NODE (dn_6001_6002) TO USER jack;

-- Delete the connections between the current CN and all nodes related to the testdb database.
gaussdb=# CLEAN CONNECTION TO ALL FORCE FOR DATABASE testdb;

-- Delete user jack.
gaussdb=# DROP USER jack;
```

7.14.41 CLOSE

Function

CLOSE frees the resources associated with an open cursor.

Precautions

- After a cursor is closed, no subsequent operations are allowed on it.
- A cursor should be closed when it is no longer needed.
- Every non-holdable open cursor is implicitly closed when a transaction is terminated by **COMMIT** or **ROLLBACK**.
- A holdable cursor is implicitly closed if the transaction that created it aborts by **ROLLBACK**.
- If the cursor creation transaction is successfully committed, the holdable cursor remains open until an explicit **CLOSE** operation is executed, or the client disconnects.
- GaussDB does not have an explicit **OPEN** cursor statement. A cursor is considered open when it is declared. You can view all available cursors by querying the **pg_cursors** system view.

Syntax

```
CLOSE { cursor_name | ALL } ;
```

Parameter Description

- **cursor_name**
Specifies the name of a cursor to be closed.
- **ALL**
Closes all open cursors.

Examples

See [Examples](#) in **FETCH**.

Helpful Links

[FETCH](#) and [MOVE](#)

7.14.42 CLUSTER

Description

- Clusters a table based on an index.
- CLUSTER instructs GaussDB to cluster the table specified by **table_name** based on the index specified by **index_name**. The index must have been defined by **table_name**.
- When a table is clustered, it is physically reordered based on the index information. Clustering is a one-time operation. When the table is subsequently updated, the changes are not clustered. That is, no attempt is made to store new or updated rows according to their index order.
- When a table is clustered, GaussDB records which index the table was clustered by. CLUSTER table_name reclusters the clustered index that was previously recorded in the table. You can also use ALTER TABLE table_name CLUSTER on index_name to set the index of a specified table for subsequent cluster operations, or use ALTER TABLE table_name SET WITHOUT CLUSTER to clear the previously clustered index of a specified table.
- If CLUSTER does not contain parameters, all tables that have been clustered in the database owned by the current user will be reprocessed. If a system administrator uses this command, all clustered tables are reclustered.
- When a table is being clustered, an ACCESS EXCLUSIVE lock is acquired on it. This prevents any other database operations (both read and write) from being performed on the table until the CLUSTER operation is finished.

Precautions

- Only row-store B-tree indexes support CLUSTER.
- In the case where you are accessing single rows randomly within a table, the actual order of the data in the table is unimportant. However, if there are many accesses to some data and an index groups the data, using the CLUSTER index improves performance.
- If an index you request from a table is a range, or a single indexed value that has multiple rows that match, CLUSTER will help because once the index identifies the table page for the first row that matches, all other rows that match are probably already on the same table page, and so you save disk accesses and speed up the query.
- During clustering, the system creates a temporary backup of the table created in the index sequence and a temporary backup of each index in the table. Therefore, ensure that the disk has sufficient free space during clustering, which is at least the sum of the table size and all index sizes.
- CLUSTER records which indexes have been used for clustering. Therefore, you can manually specify indexes for the first time, cluster specified tables, and set a maintenance script that will be executed periodically. You only need to run the **CLUSTER** command without parameters. In this way, tables that you want to periodically cluster can be automatically updated.

- The optimizer records table clustering statistics. After clustering a table, you need to execute the ANALYZE operation to ensure that the optimizer has the latest clustering information. Otherwise, the optimizer may select a non-optimal query plan.
- CLUSTER cannot be executed in transactions.
- If the **xc_maintenance_mode** parameter is not enabled, CLUSTER skips all system catalogs.

Syntax

- Cluster a table.
CLUSTER [VERBOSE] table_name [USING index_name];
- Cluster a partition.
CLUSTER [VERBOSE] table_name PARTITION (partition_name) [USING index_name];
- Recluster a table.
CLUSTER [VERBOSE];

Parameters

- **VERBOSE**
Enables the display of progress messages.
- **table_name**
Specifies the table name.
Value range: an existing table name
- **index_name**
Specifies the index name.
Value range: an existing index name
- **partition_name**
Specifies the partition name.
Value range: an existing partition name

Examples

```
-- Create a partitioned table.
gaussdb=# CREATE TABLE tpcds.inventory_p1
(
  INV_DATE_SK          INTEGER          NOT NULL,
  INV_ITEM_SK          INTEGER          NOT NULL,
  INV_WAREHOUSE_SK    INTEGER          NOT NULL,
  INV_QUANTITY_ON_HAND INTEGER
)
DISTRIBUTE BY HASH(INV_ITEM_SK)
PARTITION BY RANGE(INV_DATE_SK)
(
  PARTITION P1 VALUES LESS THAN(2451179),
  PARTITION P2 VALUES LESS THAN(2451544),
  PARTITION P3 VALUES LESS THAN(2451910),
  PARTITION P4 VALUES LESS THAN(2452275),
  PARTITION P5 VALUES LESS THAN(2452640),
  PARTITION P6 VALUES LESS THAN(2453005),
  PARTITION P7 VALUES LESS THAN(MAXVALUE)
);

-- Create an index named ds_inventory_p1_index1.
gaussdb=# CREATE INDEX ds_inventory_p1_index1 ON tpcds.inventory_p1 (INV_ITEM_SK) LOCAL;
```

```
-- Cluster the tpcds.inventory_p1 table.
gaussdb=# CLUSTER tpcds.inventory_p1 USING ds_inventory_p1_index1;

-- Cluster the p3 partition.
gaussdb=# CLUSTER tpcds.inventory_p1 PARTITION (p3) USING ds_inventory_p1_index1;

-- Cluster the tables that can be clustered in the database.
gaussdb=# CLUSTER;

-- Delete the index.
gaussdb=# DROP INDEX tpcds.ds_inventory_p1_index1;

-- Drop the partitioned table.
gaussdb=# DROP TABLE tpcds.inventory_p1;
```

7.14.43 COMMENT

Description

Defines or changes the comment of an object.

Precautions

- Each object stores only one comment. Therefore, you need to modify a comment and issue a new **COMMENT** command to the same object. To delete the comment, write **NULL** at the position of the text string. When an object is deleted, the comment is automatically deleted.
- Currently, there is no security protection for viewing comments. Any user connected to a database can view all the comments for objects in the database. For shared objects such as databases, roles, and tablespaces, comments are stored globally so any user connected to any database in the cluster can see all the comments for shared objects. Therefore, do not put security-critical information in comments.
- To comment objects, you must be an object owner or user granted the **COMMENT** permission. The system administrator has this permission by default.
- Roles do not have owners, so the rule for **COMMENT ON ROLE** is that you must be an administrator to comment on an administrator role, or have the **CREATEROLE** permission to comment on non-administrator roles. A system administrator can comment on all objects.

Syntax

```
COMMENT ON
{
  AGGREGATE agg_name (agg_type [, ...] ) |
  CAST (source_type AS target_type) |
  COLLATION object_name |
  COLUMN { table_name.column_name | view_name.column_name } |
  CONSTRAINT constraint_name ON table_name |
  CONVERSION object_name |
  DATABASE object_name |
  DOMAIN object_name |
  EXTENSION object_name |
  FOREIGN DATA WRAPPER object_name |

  FUNCTION function_name ( [ [ argname ] [ argmode ] argtype] [, ...] ) |
  INDEX object_name |
  LARGE OBJECT large_object_oid |
  OPERATOR operator_name (left_type, right_type) |
```

```
OPERATOR CLASS object_name USING index_method |
OPERATOR FAMILY object_name USING index_method |
[ PROCEDURAL ] LANGUAGE object_name |
ROLE object_name |
SCHEMA object_name |
SERVER object_name |
TABLE object_name |
TABLESPACE object_name |
TEXT SEARCH CONFIGURATION object_name |
TEXT SEARCH DICTIONARY object_name |
TEXT SEARCH PARSER object_name |
TEXT SEARCH TEMPLATE object_name |
TYPE object_name |
VIEW object_name |
TRIGGER trigger_name ON table_name
}
IS 'text';
```

Parameters

- **agg_name**
Specifies the new name of an aggregation function.
- **agg_type**
Specifies the type of the aggregation function parameters.
- **source_type**
Specifies the source data type of the cast.
- **target_type**
Specifies the target data type of the cast.
- **object_name**
Specifies the name of an object.
- **table_name.column_name**
view_name.column_name
Specifies the column whose comment is defined or modified. You can add the table name or view name as the prefix.
- **constraint_name**
Specifies the table constraint whose comment is defined or modified.
- **table_name**
Specifies the name of a table.
- **function_name**
Specifies the function whose comment is defined or modified.
- **argmode,argname,argtype**
Specifies the schema, name, and type of the function parameters.
- **large_object_oid**
Specifies the OID of the large object whose comment is defined or modified.
- **operator_name**
Specifies the name of the operator.
- **left_type,right_type**
Specifies the data type of the operator parameters (optionally schema-qualified). If the prefix or suffix operator does not exist, the **NONE** option can be added.

- **text**
Specifies the comment content.

Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer table.
gaussdb=# CREATE TABLE tpcds.customer
(
c_customer_sk      INTEGER      NOT NULL,
c_customer_id      CHAR(16)     NOT NULL
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.customer VALUES (50, 'AAAAAAAAABAAAAAAA'),(100,
'AAAAAAAAACAAAAAAA'),(150, 'AAAAAAAADAAAAAAA');

gaussdb=# CREATE TABLE tpcds.customer_demographics_t2.
(
  CD_DEMO_SK          INTEGER          NOT NULL,
  CD_GENDER           CHAR(1)          ,
  CD_MARITAL_STATUS  CHAR(1)          ,
  CD_EDUCATION_STATUS CHAR(20)         ,
  CD_PURCHASE_ESTIMATE INTEGER         ,
  CD_CREDIT_RATING   CHAR(10)         ,
  CD_DEP_COUNT       INTEGER          ,
  CD_DEP_EMPLOYED_COUNT INTEGER        ,
  CD_DEP_COLLEGE_COUNT INTEGER
)
DISTRIBUTE BY HASH (CD_DEMO_SK);

-- Comment out the tpcds.customer_demographics_t2.cd_demo_sk column.
gaussdb=# COMMENT ON COLUMN tpcds.customer_demographics_t2.cd_demo_sk IS 'Primary key of
customer demographics table.';

-- Create a view consisting of rows with c_customer_sk less than 150.
gaussdb=# CREATE VIEW tpcds.customer_details_view_v2 AS
SELECT *
FROM tpcds.customer
WHERE c_customer_sk < 150;

-- Comment out the tpcds.customer_details_view_v2 view.
gaussdb=# COMMENT ON VIEW tpcds.customer_details_view_v2 IS 'View of customer detail';

-- Delete the view.
gaussdb=# DROP VIEW tpcds.customer_details_view_v2;

-- Delete tpcds.customer_demographics_t2.
gaussdb=# DROP TABLE tpcds.customer_demographics_t2;

-- Delete the tpcds.customer table.
gaussdb=# DROP TABLE tpcds.customer;

-- Delete the schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

7.14.44 COMMIT | END

Description

COMMIT or END commits all operations of a transaction.

Precautions

Only the creator of a transaction or a system administrator can run the **COMMIT** command. The creation and commit operations must be in different sessions.

Syntax

```
{ COMMIT | END } [ WORK | TRANSACTION ] ;
```

Parameters

- **COMMIT | END**
Commits the current transaction and makes all changes made by the transaction become visible to others.
- **WORK | TRANSACTION**
Specifies an optional keyword, which has no effect except increasing readability.

Examples

```
-- Create a table.
gaussdb=# CREATE TABLE tpceds.customer_demographics_t2
(
  CD_DEMO_SK          INTEGER          NOT NULL,
  CD_GENDER           CHAR(1)         ,
  CD_MARITAL_STATUS  CHAR(1)         ,
  CD_EDUCATION_STATUS CHAR(20)       ,
  CD_PURCHASE_ESTIMATE INTEGER        ,
  CD_CREDIT_RATING   CHAR(10)        ,
  CD_DEP_COUNT        INTEGER         ,
  CD_DEP_EMPLOYED_COUNT INTEGER       ,
  CD_DEP_COLLEGE_COUNT INTEGER
)
DISTRIBUTE BY HASH (CD_DEMO_SK);

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Insert data.
gaussdb=# INSERT INTO tpceds.customer_demographics_t2 VALUES(1,'M', 'U', 'DOCTOR DEGREE', 1200,
'GOOD', 1, 0, 0);
gaussdb=# INSERT INTO tpceds.customer_demographics_t2 VALUES(2,'F', 'U', 'MASTER DEGREE', 300, 'BAD',
1, 0, 0);

-- Commit the transaction to make all changes permanent.
gaussdb=# COMMIT;

-- Query data.
gaussdb=# SELECT * FROM tpceds.customer_demographics_t2;

-- Delete the tpceds.customer_demographics_t2 table.
gaussdb=# DROP TABLE tpceds.customer_demographics_t2;
```

Helpful Links

[ROLLBACK](#)

7.14.45 COMMIT PREPARED

Description

Commits a prepared two-phase transaction. This function is for internal use only. You are advised not to use it.

Precautions

- The function is only available in maintenance mode (when GUC parameter **xc_maintenance_mode** is **on**). Exercise caution when enabling the mode. It is used by maintenance engineers for troubleshooting. Common users should not use the mode.
- Only the transaction creators or system administrators can run the **COMMIT PREPARED** command. The creation and commit operations must be in different sessions.
- The transaction function is maintained automatically by the database, and should be not visible to users.

Syntax

```
COMMIT PREPARED transaction_id [ WITH commit_sequence_number ];
```

Parameters

- **transaction_id**
Specifies the identifier of the transaction to be committed. The identifier must be different from those for current prepared transactions.
- **commit_sequence_number**
Specifies the sequence number of the transaction to be committed. It is a 64-bit, incremental, unsigned number.

Examples

```
-- Start.  
gaussdb=# BEGIN;  
  
-- Prepare a transaction whose identifier is trans_test.  
gaussdb=# PREPARE TRANSACTION 'trans_test';  
  
-- Create a table.  
gaussdb=# CREATE TABLE item1(id int);  
  
--Commit the transaction whose identifier is trans_test.  
gaussdb=# COMMIT PREPARED 'trans_test';  
  
-- Delete the table.  
gaussdb=# DROP TABLE item1;
```

Helpful Links

[PREPARE TRANSACTION](#) and [ROLLBACK PREPARED](#)

7.14.46 COPY

Description

Copies data between tables and files.

COPY FROM copies data from a file to a table, and COPY TO copies data from a table to a file.

Precautions

- When the **enable_copy_server_files** parameter is disabled, only the initial user is allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME** statement. When the **enable_copy_server_files** parameter is enabled, users with the **SYSADMIN** permission or users who inherit the built-in role permission **gs_role_copy_files** are allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME** statement. By default, database configuration files and key files are not allowed, and you can run **COPY FROM FILENAME** or **COPY TO FILENAME** for certificate files and audit logs to prevent unauthorized users from viewing or modifying sensitive files. When **enable_copy_server_files** is enabled, the administrator can use the GUC parameter **safe_data_path** to set the path for common users to import and export to the subpath of the set path. If this GUC parameter is not set (by default), the path used by common users is not blocked. This parameter reports an error for ... in the path of the COPY statement.
- COPY applies only to tables but not views.
- COPY TO requires the select permission on the table to be read, and COPY FROM requires the insert permission on the table to be inserted.
- If a list of columns is specified, COPY copies only the data of the specified columns between the file and the table. If a table has any columns that are not in the column list, COPY FROM inserts default values for those columns.
- If a data source file is specified, the server must be able to access the file. If **STDIN** is specified, data flows between the client and the server. When entering data, use the **TAB** key to separate the columns of the table and use a backslash and a period (\.) in a new row to indicate the end of the input.
- COPY FROM throws an error if any row in the data file contains more or fewer columns than expected.
- The end of the data can be represented by a line that contains only backslashes and periods (\.). If data is read from a file, the end flag is unnecessary. If data is copied between client applications, an end tag must be provided.
- In COPY FROM, **\N** is an empty string. To enter the actual value **\N**, use **\\N**.
- COPY FROM can preprocess data using column expressions, but column expressions do not support subqueries.
- When a data format error occurs during COPY FROM execution, the transaction is rolled back. However, the error information is insufficient, making it difficult to locate the error data from a large amount of raw data.
- COPY FROM and COPY TO apply to low concurrency and local import and export of a small amount of data.

- When COPY is used in binary format, transcoding in distributed mode is not supported.
- **COPY** is a server command and its execution environment is the same as that of the database server process. **\COPY** is a client meta-command and its execution environment is the same as that of `gsql` on the client. Note that when the database and `gsql` are used in the sandbox environment, the **COPY** and **\COPY** commands both use the paths in the sandbox. When the database is used in the sandbox environment and `gsql` is used outside the sandbox, the **COPY** command uses the path inside the sandbox, and the **\COPY** command uses the path outside the sandbox.
- During the export using COPY TO, if the column data in the table contains the '\0' character, the column data will be truncated during the export. Only the data before '\0' will be exported.

Syntax

- Copy data from a file to a table.

```
COPY table_name [ ( column_name [, ...] ) ]
FROM { 'filename' | STDIN }
[ [ USING ] DELIMITERS 'delimiters' ]
[ WITHOUT ESCAPING ]
[ LOG ERRORS ]
[ LOG ERRORS DATA ]
[ REJECT LIMIT 'limit' ]
[ [ WITH ] ( option [, ...] ) ]
| copy_option
| [ TRANSFORM ( { column_name [ data_type ] [ AS transform_expr ] } [, ...] ) ]
| [ FIXED FORMATTER ( { column_name( offset, length ) } [, ...] ) [ ( option [, ...] ) | copy_option
[ ...] ] ];
```

NOTE

The fixed formatter syntax is compatible with `copy_option` but incompatible with `option`. `copy_option` is incompatible with `option`. `transform` is compatible with `copy_option` and fixed formatter.

- Copy data from a table to a file.

```
COPY table_name [ ( column_name [, ...] ) ]
TO { 'filename' | STDOUT }
[ [ USING ] DELIMITERS 'delimiters' ]
[ WITHOUT ESCAPING ]
[ [ WITH ] ( option [, ...] ) ]
| copy_option
| [ FIXED FORMATTER ( { column_name( offset, length ) } [, ...] ) [ ( option [, ...] ) | copy_option
[ ...] ] ];
```

COPY query

```
TO { 'filename' | STDOUT }
[ WITHOUT ESCAPING ]
[ [ WITH ] ( option [, ...] ) ]
| copy_option
| [ FIXED FORMATTER ( { column_name( offset, length ) } [, ...] ) [ ( option [, ...] ) | copy_option
[ ...] ] ];
```

NOTE

- The syntax constraints of COPY TO are as follows:
(query) is incompatible with [USING] DELIMITERS. If the data comes from a query result, COPY TO cannot specify [USING] DELIMITERS.
- Use spaces to separate **copy_option** following FIXED FORMATTER.
- **copy_option** is the native parameter, while **option** is the parameter imported by a compatible foreign table.

The syntax of the optional parameter **option** is as follows:

```
FORMAT 'format_name'  
| FORMAT binary  
| OIDS [ boolean ]  
| DELIMITER 'delimiter_character'  
| NULL 'null_string'  
| HEADER [ boolean ]  
| USEEOF [ boolean ]  
| FILEHEADER 'header_file_string'  
| FREEZE [ boolean ]  
| QUOTE 'quote_character'  
| ESCAPE 'escape_character'  
| EOL 'newline_character'  
| NOESCAPING [ boolean ]  
| FORCE_QUOTE { ( column_name [, ...] ) | * }  
| FORCE_NOT_NULL ( column_name [, ...] )  
| ENCODING 'encoding_name'  
| IGNORE_EXTRA_DATA [ boolean ]  
| FILL_MISSING_FIELDS [ boolean ]  
| COMPATIBLE_ILLEGAL_CHARS [ boolean ]  
| DATE_FORMAT 'date_format_string'  
| TIME_FORMAT 'time_format_string'  
| TIMESTAMP_FORMAT 'timestamp_format_string'  
| SMALLDATETIME_FORMAT 'smalldatetime_format_string'
```

The syntax of the optional parameter **copy_option** is as follows:

```
oids  
| NULL 'null_string'  
| HEADER  
| USEEOF  
| FILEHEADER 'header_file_string'  
| FREEZE  
| FORCE_NOT_NULL column_name [, ...]  
| FORCE_QUOTE { column_name [, ...] | * }  
| BINARY  
| CSV  
| QUOTE [ AS ] 'quote_character'  
| ESCAPE [ AS ] 'escape_character'  
| EOL 'newline_character'  
| ENCODING 'encoding_name'  
| IGNORE_EXTRA_DATA  
| FILL_MISSING_FIELDS  
| COMPATIBLE_ILLEGAL_CHARS  
| DATE_FORMAT 'date_format_string'  
| TIME_FORMAT 'time_format_string'  
| TIMESTAMP_FORMAT 'timestamp_format_string'  
| SMALLDATETIME_FORMAT 'smalldatetime_format_string'
```

Parameters

- **query**
Specifies that the results are to be copied.
Valid value: a **SELECT** or **VALUES** command in parentheses
- **table_name**
Specifies the name (possibly schema-qualified) of an existing table.
Value range: an existing table name
- **column_name**
Specifies an optional list of columns to be copied.
Value range: any columns. All columns will be copied if no column list is specified.
- **STDIN**
Specifies that input comes from the standard input.

- **STDOUT**
Specifies that output goes to the standard output.
- **FIXED**
Fixes column length. When the column length is fixed, **DELIMITER**, **NULL**, and **CSV** cannot be specified. When **FIXED** is specified, **BINARY**, **CSV**, and **TEXT** cannot be specified by **option** or **copy_option**.

 **NOTE**

The definition of fixed length is as follows:

- The column length of each record is the same.
 - Spaces are used for column padding. Columns of the numeric type are left-aligned and columns of the string type are right-aligned.
 - No delimiters are used between columns.
- **[USING] DELIMITERS 'delimiters'**

String that separates columns within each row (line) of the file. It cannot be larger than 10 bytes.

Value range: The delimiter in text format cannot include any of the following characters: \.abcdefghijklmnopqrstuvwxyz0123456789, but has no restriction for the CSV format.

Value range: The default value is a tab character in text format and a comma in CSV format.

 **NOTE**

Both **DELIMITER** and **DELIMITERS** can specify separators. However, **DELIMITERS** can be followed by syntax with bracket, but **DELIMITER** cannot be directly followed by bracket. Otherwise, a syntax error is reported.

- **WITHOUT ESCAPING**
Specifies, in the **TEXT** format, whether to escape the backslash (\) and its following characters.
Value range: text only
- **LOG ERRORS**
If this parameter is specified, the error tolerance mechanism for data type errors in the **COPY FROM** statement is enabled. Row errors are recorded in the **public.pgxc_copy_error_log** table in the database for future reference.
Value range: a value set while data is imported using **COPY FROM**.

 NOTE

The restrictions of this error tolerance parameter are as follows:

- This error tolerance mechanism captures only the data type errors (**DATA_EXCEPTION**) that occur during data parsing of **COPY FROM** on a CN. Other errors, such as network errors between CNs and DN or expression conversion errors on DNs, are not captured.
 - Before enabling error tolerance for **COPY FROM** for the first time in a database, check whether the **public.pgxc_copy_error_log** table exists. If it does not, call the `copy_error_log_create()` function to create it. If it does, copy its data elsewhere, delete it, and call the `copy_error_log_create()` function to create the table. For details about columns in the **public.pgxc_copy_error_log** table, see [Table 7-86](#).
 - While a **COPY FROM** statement with specified **LOG ERRORS** is being executed, if **public.pgxc_copy_error_log** does not exist or does not have the table definitions compliant with those predefined in `copy_error_log_create()`, an error will be reported. Ensure that the error table is created using the `copy_error_log_create()` function. Otherwise, **COPY FROM** statements with error tolerance may fail to be run.
 - If existing error tolerance parameters (for example, **IGNORE_EXTRA_DATA**) of the **COPY** statement are enabled, the error of the corresponding type will be processed as specified by the parameters and no error will be reported. Therefore, the error table does not contain such error data.
- **LOG ERRORS DATA**

The differences between **LOG ERRORS DATA** and **LOG ERRORS** are as follows:

- a. **LOG ERRORS DATA** fills the **rawrecord** column in the error tolerance table.
- b. Only users with the **super** permission can use the **LOG ERRORS DATA** parameter.

 CAUTION

- If error content is too complex, it may fail to be written to the error tolerance table by using **LOG ERRORS DATA**, causing the task failure.
- For errors that cannot be read in certain code, the error codes are **ERRCODE_CHARACTER_NOT_IN_REPERTOIRE** and **ERRCODE_UNTRANSLATABLE_CHARACTER**. The **rawrecord** column is not recorded.

-
- **REJECT LIMIT 'limit'**

Used with the **LOG ERROR** parameter to set the upper limit of the tolerated errors in the **COPY FROM** statement. If the number of errors exceeds the limit, later errors will be reported based on the original mechanism.

Value range: a positive integer (1 to 2147483647) or **unlimited**

Default value: If **LOG ERRORS** is not specified, an error will be reported. If **LOG ERRORS** is specified, the default value is **0**.

 NOTE

Different from the GDS error tolerance mechanism, in the error tolerance mechanism described in **LOG ERRORS**, the count of **REJECT LIMIT** is calculated based on the number of data parsing errors on the CN where the **COPY FROM** statement is run, not based on the number of errors on each DN.

- **FORMATTER**

Defines the place of each column in the data file in fixed length mode.
Defines the place of each column in the data file in the **column(offset,length)** format.

Value range:

- The value of **offset** must be larger than 0. The unit is byte.
- The value of **length** must be larger than 0. The unit is byte.

The total length of all columns must be less than 1 GB.

Replace columns that are not in the file with null.

- **OPTION { option_name ' value ' }**

Specifies all types of parameters of a compatible foreign table.

- **FORMAT**

Specifies the format of the source data file in the foreign table.

Value range: **CSV**, **TEXT**, **FIXED**, and **BINARY**

- The CSV file can process newline characters efficiently, but cannot process certain special characters well.
- The TEXT file can process certain special characters efficiently, but cannot process newline characters well.
- In FIXED files, the column length of each record is the same. Spaces are used for padding, and the excessive part will be truncated.
- All data in the BINARY file is stored/read as binary format rather than as text. It is faster than the text and CSV formats, but a binary-format file is less portable.

Default value: **TEXT**

- **OIDS**

Specifies the internal OID to be copied for each row.

 **NOTE**

An error is raised if OIDs are specified for a table that does not have OIDs, or in the case of copying a query.

Value range: **true/on** and **false/off**.

Default value: **false**

- **DELIMITER**

Specifies the character that separates columns within each row (line) of the file.

 NOTE

- The value of **delimiter** cannot be `\r` or `\n`.
- A delimiter cannot be the same as the null value. The delimiter for the CSV format cannot be same as the **quote** value.
- The delimiter for the TEXT format data cannot contain lowercase letters, digits, or special characters (`.``\`).
- The data length of a single row should be less than 1 GB. A row that has many columns using long delimiters cannot contain much valid data.
- You are advised to use multi-character delimiters or invisible delimiters. For example, you can use multi-characters (such as `$^&`) and invisible characters (such as `0x07`, `0x08`, and `0x1b`).
- To use a tab to isolate CSV data, set **delimiter** to `E't'`.

Value range: a multi-character delimiter within 10 bytes

Default value:

- A tab character in text format
- A comma (`,`) in CSV format
- No delimiter in FIXED format

– NULL

Specifies the string that represents a null value.

Value range:

- A null value cannot be `\r` or `\n`. The maximum length is 100 characters.
- A null value cannot be the same as the **delimiter** or **quote** value.

Default value:

- The default value for the CSV format is an empty string without quotation marks.
- The default value for the TEXT format is `\N`.

– HEADER

Specifies whether a file contains a header with the names of each column in the file. **header** is available only for CSV and FIXED files.

When data is imported, if **header** is **on**, the first row of the data file will be identified as the header and ignored. If **header** is **off**, the first row will be identified as a data row.

When data is exported, if header is **on**, **fileheader** must be specified. If **header** is **off**, an exported file does not contain a header.

Value range: **true/on** and **false/off**.

Default value: **false**

– USEEOF

The system does not report an error for `\"` in the imported data.

Value range: **true/on** and **false/off**.

Default value: **false**

– QUOTE

Specifies a quoted character string for a CSV file.

Default value: double quotation marks (""")

 NOTE

- The value of **quote** cannot be the same as that of the **delimiter** or **null** parameter.
- The value of **quote** must be a single-byte character.
- You are advised to set **quote** to an invisible character, such as **0x07**, **0x08**, or **0x1b**.

– ESCAPE

Specifies an escape character for a CSV file. The value must be a single-byte character.

Default value: quotation mark ("). If the value is the same as that of **quote**, it will be replaced by '\0'.

– EOL 'newline_character'

Specifies the newline character style of the imported or exported data file.

Value range: multi-character newline characters within 10 bytes.

Common newline characters include **\r** (0x0D), **\n** (0x0A), and **\r\n** (0x0D0A). Special newline characters include **\$** and **#**.

 NOTE

- The EOL parameter supports only the TEXT format for data import and export and does not support the CSV or FIXED format for data import. For forward compatibility, the EOL parameter can be set to **0x0D** or **0x0D0A** for data export in the CSV or FIXED format.
- The value of **EOL** cannot be the same as that of the **delimiter** or **null** parameter.
- The EOL parameter value cannot contain the following characters: .abcdefghijklmnopqrstuvwxyz0123456789.

– FORCE_QUOTE { (column_name [, ...]) | * }

In **CSV COPY TO** mode, forces quotation marks to be used for all non-null values in each specified column. Null values are not quoted.

Value range: an existing column name

– FORCE_NOT_NULL (column_name [, ...])

Assigns a value to a specified column in **CSV COPY FROM** mode.

Value range: an existing column name

– ENCODING

Specifies the encoding format of a data file. The default value is the current database encoding format.

 CAUTION

When COPY FROM is executed, **ENCODING** in the control file must be the same as the encoding format of the file. Otherwise, an error is reported or garbled characters are displayed in the imported data.

- IGNORE_EXTRA_DATA
Specifies whether to ignore excessive columns when the number of data source files exceeds the number of foreign table columns. This parameter is used only during data import.
Value range: **true/on** or **false/off**
 - **true/on**: If the number of columns in a data source file is greater than that defined by the foreign table, the extra columns at the end of a row are ignored.
 - **false/off**: If the number of columns in a data source file is greater than that defined by the foreign table, the following error message is reported:
extra data after last expected columnDefault value: **false**

NOTICE

If a newline character at the end of a row is missing and the row and another row are integrated into one, data in another row is ignored after the parameter is set to **true**.

- COMPATIBLE_ILLEGAL_CHARS
Specifies whether to tolerate invalid characters during data import. The parameter is valid only for data import using **COPY FROM**.
Value range: **true/on** and **false/off**.
 - **true/on**: No error message is reported and data import is not interrupted when there are invalid characters. Invalid characters are converted into valid ones, and then imported to the database.
 - **false/off**: An error occurs when there are invalid characters, and the import stops.Default value: **false/off**

NOTE

The rules for converting invalid characters are as follows:

1. '\0' is converted to a space.
 2. Other invalid characters are converted to question marks.
 3. When **compatible_illegal_chars** is set to **true/on**, after invalid characters such as **NULL**, **DELIMITER**, **QUOTE**, and **ESCAPE** are converted to spaces or question marks, an error message stating "illegal chars conversion may confuse COPY escape 0x20" will be displayed to remind you of possible parameter confusion caused by the conversion.
- FILL_MISSING_FIELDS
Specifies how to handle the problem that the last column of a row in a source data file is lost during data import.
Value range: **true/on** and **false/off**.
Default value: **false/off**

- **DATE_FORMAT**
Specifies the DATE format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.
Value range: a valid DATE value. For details, see [Date and Time Processing Functions and Operators](#).
-  **NOTE**
If Oracle is specified as the compatible database, the DATE format is **TIMESTAMP**. For details, see **timestamp_format** below.
- **TIME_FORMAT**
Specifies the TIME format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.
Value range: a valid TIME value. Time zones cannot be used. For details, see [Date and Time Processing Functions and Operators](#).
- **TIMESTAMP_FORMAT**
Specifies the TIMESTAMP format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.
Value range: a valid TIMESTAMP value. Time zones cannot be used. For details, see [Date and Time Processing Functions and Operators](#).
- **SMALLDATETIME_FORMAT**
Specifies the SMALLDATETIME format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.
Value range: a valid SMALLDATETIME value. For details, see [Date and Time Processing Functions and Operators](#).
- **COPY_OPTION { option_name ' value ' }**
Specifies all types of native parameters of **COPY**.
 - **OIDS**
Specifies the internal OID to be copied for each row.
 **NOTE**
An error is raised if OIDs are specified for a table that does not have OIDs, or in the case of copying a query.
 - **NULL null_string**
Specifies the string that represents a null value.

NOTICE

When using **COPY FROM**, any data item that matches this string will be stored as a null value, so make sure that you use the same string as you used with **COPY TO**.

Value range:

- A null value cannot be `\r` or `\n`. The maximum length is 100 characters.
- A null value cannot be the same as the **delimiter** or **quote** value.

Default value:

- The default value for the TEXT format is `\N`.
- The default value for the CSV format is an empty string without quotation marks.

– **HEADER**

Specifies whether a file contains a header with the names of each column in the file. **header** is available only for CSV and FIXED files.

When data is imported, if **header** is **on**, the first row of the data file will be identified as the header and ignored. If **header** is **off**, the first row will be identified as a data row.

When data is exported, if header is **on**, **fileheader** must be specified. If **header** is **off**, an exported file does not contain a header.

– **USEEOF**

The system does not report an error for `"\."` in the imported data.

– **FILEHEADER**

Specifies a file that defines the content in the header for exported data. The file contains data description of each column.

NOTICE

- This parameter is available only when **header** is **on** or **true**.
- **fileheader** specifies an absolute path.
- The file can contain only one row of header information, and ends with a newline character. Excess rows will be discarded. (Header information cannot contain newline characters.)
- The length of the file including the newline character cannot exceed 1 MB.

– **FREEZE**

Sets the **COPY** loaded data row as **frozen**, like these data have executed **VACUUM FREEZE**.

This is a performance option of initial data loading. The data will be frozen only when the following three requirements are met:

- The table being loaded has been created or truncated in the same transaction before copying.
- There are no cursors open in the current transaction.
- There are no original snapshots in the current transaction.

 **NOTE**

When **COPY** is completed, all the other sessions will see the data immediately. However, this violates the general principle of MVCC visibility, and users should understand that this may cause potential risks.

- **FORCE NOT NULL** column_name [, ...]
Assigns a value to a specified column in **CSV COPY FROM** mode.
Value range: an existing column
 - **FORCE QUOTE** { column_name [, ...] | * }
In **CSV COPY TO** mode, forces quotation marks to be used for all non-null values in each specified column. Null values are not quoted.
Value range: an existing column name
 - **BINARY**
Specifies that data is stored and read in binary mode instead of text mode. In binary mode, you cannot declare **DELIMITER**, **NULL**, or **CSV**. When **BINARY** is specified, **CSV**, **FIXED**, and **TEXT** cannot be specified through **option** or **copy_option**.
 - **CSV**
Enables the CSV mode. When **CSV** is specified, **BINARY**, **FIXED**, and **TEXT** cannot be specified through **option** or **copy_option**.
 - **QUOTE** [AS] 'quote_character'
Specifies a quoted character string for a CSV file.
Default value: quotation mark (").
-  **NOTE**
- The value of **quote** cannot be the same as that of the **delimiter** or **null** parameter.
 - The value of **quote** must be a single-byte character.
 - You are advised to set **quote** to an invisible character, such as **0x07**, **0x08**, or **0x1b**.
- **ESCAPE** [AS] 'escape_character'
Specifies an escape character for a CSV file. The value must be a single-byte character.
Default value: quotation mark ("). If the value is the same as that of **quote**, it will be replaced by '\0'.
 - **EOL** 'newline_character'
Specifies the newline character style of the imported or exported data file.
Value range: multi-character newline characters within 10 bytes. Common newline characters include **\r** (0x0D), **\n** (0x0A), and **\r\n** (0x0D0A). Special newline characters include **\$** and **#**.

 NOTE

- The **EOL** parameter supports only the TEXT format for data import and export and does not support the CSV or FIXED format. For forward compatibility, the **EOL** parameter can be set to **0x0D** or **0x0D0A** for data export in the CSV or FIXED format.
 - The value of **EOL** cannot be the same as that of the **delimiter** or **null** parameter.
 - The EOL parameter value cannot contain the following characters: .abcdefghijklmnopqrstuvwxyz0123456789.
- ENCODING 'encoding_name'
Specifies the name of a file encoding format.
Value range: a valid encoding format
Default value: current encoding format

 CAUTION

When COPY FROM is executed, **ENCODING** in the control file must be the same as the encoding format of the file. Otherwise, an error is reported or garbled characters are displayed in the imported data.

-
- IGNORE_EXTRA_DATA
Specifies that when the number of data source files exceeds the number of foreign table columns, excess columns at the end of the row are ignored. This parameter is used only during data import.
If this parameter is not used and the number of columns in the data source file is greater than that defined in the foreign table, the following error information is displayed:
extra data after last expected column
- COMPATIBLE_ILLEGAL_CHARS
Specifies that invalid characters are tolerated during data import. Invalid characters are converted and then imported to the database. No error is reported and the import is not interrupted. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.
If this parameter is not used, an error is reported when invalid characters are encountered during the import, and the import is interrupted.

 NOTE

The rules for converting invalid characters are as follows:

1. '\0' is converted to a space.
 2. Other invalid characters are converted to question marks.
 3. When **compatible_illegal_chars** is set to **true/on**, after invalid characters such as **NULL**, **DELIMITER**, **QUOTE**, and **ESCAPE** are converted to spaces or question marks, an error message stating "illegal chars conversion may confuse COPY escape 0x20" will be displayed to remind you of possible parameter confusion caused by the conversion.
- FILL_MISSING_FIELDS

Specifies how to handle the problem that the last column of a row in a source data file is lost during data import.

Value range: **true/on** and **false/off**.

Default value: **false** or **off**

NOTICE

Do not specify this option. Currently, it does not enable error tolerance, but will make the parser ignore the said errors during data parsing on the CN. Such errors will not be recorded in the **COPY** error table (enabled using **LOG ERRORS REJECT LIMIT**) but will be reported later by DNs. Therefore, do not specify this option.

-
- **DATE_FORMAT** 'date_format_string'
Specifies the DATE format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.
Value range: a valid DATE value For details, see [Date and Time Processing Functions and Operators](#).

NOTE

If Oracle is specified as the compatible database, the DATE format is **TIMESTAMP**. For details, see **timestamp_format** below.

- **TIME_FORMAT** 'time_format_string'
Specifies the TIME format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.
Value range: a valid TIME value. Time zones cannot be used. For details, see [Date and Time Processing Functions and Operators](#).
- **TIMESTAMP_FORMAT** 'timestamp_format_string'
Specifies the **TIMESTAMP** format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.
Value range: a valid **TIMESTAMP** value. Time zones cannot be used. For details, see [Date and Time Processing Functions and Operators](#).
- **SMALLDATETIME_FORMAT** 'smalldatetime_format_string'
Specifies the **SMALLDATETIME** format for data import. The BINARY format is not supported. When data of such format is imported, error "cannot specify bulkload compatibility options in BINARY mode" will occur. The parameter is valid only for data import using **COPY FROM**.
Value range: a valid **SMALLDATETIME** value. For details, see [Date and Time Processing Functions and Operators](#).
- **TRANSFORM** ({ column_name [data_type] [AS transform_expr] } [, ...])

Specify the conversion expression of each column in the table. **data_type** specifies the data type of the column in the expression parameter. **transform_expr** is the target expression that returns the result value whose data type is the same as that of the target column in the table. For details about the expression, see [Expressions](#).

NOTE

COPY FROM does not support expression conversion for distribution columns. The following special backslash sequences are recognized by **COPY FROM**:

- **\b**: Backslash (ASCII 8)
- **\f**: Form feed (ASCII 12)
- **\n**: Newline character (ASCII 10)
- **\r**: Carriage return character (ASCII 13)
- **\t**: Tab (ASCII 9)
- **\v**: Vertical tab (ASCII 11)
- **\digits**: Backslash followed by one to three octal digits specifies that the ASCII value is the character with that numeric code.
- **\xdigits**: Backslash followed by an x and one or two hex digits specifies the character with that numeric code.

Permission Control Examples

```
gaussdb=> copy t1 from '/home/xy/t1.csv';
ERROR: COPY to or from a file is prohibited for security concerns
HINT: Anyone can COPY to stdout or from stdin. gsql's \copy command also works for anyone.
gaussdb=> grant gs_role_copy_files to xxx;
```

This error occurs because a non-initial user does not have the COPY permission. To solve this problem, enable the **enable_copy_server_files** parameter. Then, the administrator can use the COPY function, and common users need to join the **gs_role_copy_files** group.

Examples

```
-- Copy the data from tpcds.ship_mode to the /home/omm/ds_ship_mode.dat file:
gaussdb=# COPY tpcds.ship_mode TO '/home/omm/ds_ship_mode.dat';

-- Output tpcds.ship_mode to stdout.
gaussdb=# COPY tpcds.ship_mode TO stdout;

-- Create the tpcds.ship_mode_t1 table.
gaussdb=# CREATE TABLE tpcds.ship_mode_t1
(
  SM_SHIP_MODE_SK      INTEGER      NOT NULL,
  SM_SHIP_MODE_ID     CHAR(16)     NOT NULL,
  SM_TYPE              CHAR(30)     ,
  SM_CODE              CHAR(10)     ,
  SM_CARRIER          CHAR(20)     ,
  SM_CONTRACT          CHAR(20)     ,
)
DISTRIBUTE BY HASH(SM_SHIP_MODE_SK);

-- Copy data from stdin to the tpcds.ship_mode_t1.
gaussdb=# COPY tpcds.ship_mode_t1 FROM stdin;

-- Copy data from the /home/omm/ds_ship_mode.dat file to the tpcds.ship_mode_t1 table.
gaussdb=# COPY tpcds.ship_mode_t1 FROM '/home/omm/ds_ship_mode.dat';
```

```
-- Copy data from the /home/omm/ds_ship_mode.dat file to the tpcds.ship_mode_t1 table, convert the
data using the TRANSFORM expression, and insert the 10 characters on the left of the SM_TYPE column
into the table.
gaussdb=# COPY tpcds.ship_mode_t1 FROM '/home/omm/ds_ship_mode.dat' TRANSFORM (SM_TYPE AS
LEFT(SM_TYPE, 10));

-- Copy data from the /home/omm/ds_ship_mode.dat file to the tpcds.ship_mode_t1 table, with the
import format set to TEXT (format 'text'), the delimiter set to \t (delimiter E'\t'), excessive columns
ignored (ignore_extra_data 'true'), and characters not escaped (noescaping 'true').
gaussdb=# COPY tpcds.ship_mode_t1 FROM '/home/omm/ds_ship_mode.dat' WITH(format 'text', delimiter
E'\t', ignore_extra_data 'true', noescaping 'true');

-- Copy data from the /home/omm/ds_ship_mode.dat file to the tpcds.ship_mode_t1 table, with the
import format set to FIXED, fixed-length format specified (FORMATTER(SM_SHIP_MODE_SK(0, 2),
SM_SHIP_MODE_ID(2,16), SM_TYPE(18,30), SM_CODE(50,10), SM_CARRIER(61,20),
SM_CONTRACT(82,20))), excessive columns ignored (ignore_extra_data), and headers included (header).
gaussdb=# COPY tpcds.ship_mode_t1 FROM '/home/omm/ds_ship_mode.dat' FIXED
FORMATTER(SM_SHIP_MODE_SK(0, 2), SM_SHIP_MODE_ID(2,16), SM_TYPE(18,30), SM_CODE(50,10),
SM_CARRIER(61,20), SM_CONTRACT(82,20)) header ignore_extra_data;

-- Delete tpcds.ship_mode_t1.
gaussdb=# DROP TABLE tpcds.ship_mode_t1;
```

7.14.47 CREATE AUDIT POLICY

Description

Creates a unified audit policy.

Precautions

Only users with the poladmin or sysadmin permission, or the initial user can perform this operation.

The masking policy takes effect only after the security policy is enabled, that is, **enable_security_policy** is set to **on**.

CAUTION

When you use database links to perform operations on remote objects, the client initiates a database link request. The actual sender is the server, and the attributes such as the IP address of the sender are the values of the server. For details, see [DATABASE LINK](#).

Syntax

```
CREATE AUDIT POLICY [ IF NOT EXISTS ] policy_name { { privilege_audit_clause | access_audit_clause }
[ filter_group_clause ] [ ENABLE | DISABLE ] };
```

- **privilege_audit_clause**
PRIVILEGES { DDL | ALL } [ON LABEL (resource_label_name [, ...])]
- **access_audit_clause**
ACCESS { DML | ALL } [ON LABEL (resource_label_name [, ...])]
- **filter_group_clause**
FILTER ON { FILTER_TYPE (filter_value [, ...]) } [, ...]

Parameters

- **policy_name**
Specifies the audit policy name, which must be unique.
Value range: a string. It must comply with the [naming convention](#).
- **DDL**
Specifies the operations that are audited in the database: **CREATE, ALTER, DROP, ANALYZE, COMMENT, GRANT, REVOKE, SET, and SHOW**.
If this parameter is set to **ANALYZE**, both ANALYZE and VACCUM operations are audited.
- **ALL**
Indicates all operations supported by the specified DDL statements in the database.
- **resource_label_name**
Specifies the resource label name.
- **DML**
Specifies the operations that are audited within the database: **SELECT, COPY, DEALLOCATE, DELETE, EXECUTE, INSERT, PREPARE, REINDEX, TRUNCATE, and UPDATE**.
- **FILTER_TYPE**
Specifies the types of information to be filtered by the policy, including **APP, ROLES, and IP**.
- **filter_value**
Indicates the detailed information to be filtered.
- **ENABLE|DISABLE**
Enables or disables the unified audit policy. If **ENABLE|DISABLE** is not specified, **ENABLE** is used by default.

Examples

```
-- Create users dev_audit and bob_audit.
gaussdb=# CREATE USER dev_audit PASSWORD '*****';
gaussdb=# CREATE USER bob_audit password '*****';

-- Create table tb_for_audit.
gaussdb=# CREATE TABLE tb_for_audit(col1 text, col2 text, col3 text);

-- Create a resource label.
gaussdb=# CREATE RESOURCE LABEL adt_lb0 add TABLE(tb_for_audit);

-- Perform the CREATE operation on the database to create an audit policy.
gaussdb=# CREATE AUDIT POLICY adt1 PRIVILEGES CREATE;

-- Perform the SELECT operation on the database to create an audit policy.
gaussdb=# CREATE AUDIT POLICY adt2 ACCESS SELECT;

-- Create an audit policy to audit only the CREATE operations performed on the adt_lb0 resource by users dev_audit and bob_audit.
gaussdb=# CREATE AUDIT POLICY adt3 PRIVILEGES CREATE ON LABEL(adt_lb0) FILTER ON ROLES(dev_audit, bob_audit);

-- Create an audit policy to audit only the SELECT, INSERT, and DELETE operations performed on the adt_lb0 resource by users dev_audit and bob_audit using client tool gsql on the servers whose IP addresses are 10.20.30.40 and 127.0.0.0/24.
```

```
gaussdb=# CREATE AUDIT POLICY adt4 ACCESS SELECT ON LABEL(adt_lb0), INSERT ON LABEL(adt_lb0),  
DELETE FILTER ON ROLES(dev_audit, bob_audit), APP(gsql), IP('10.20.30.40', '127.0.0.0/24');  
  
-- Delete the audit policy.  
gaussdb=# DROP AUDIT POLICY adt1, adt2, adt3, adt4;  
  
-- Delete the resource label.  
gaussdb=# DROP RESOURCE LABEL adt_lb0;  
  
-- Delete the tb_for_audit table.  
gaussdb=# DROP TABLE tb_for_audit;  
  
-- Delete the dev_audit and bob_audit users.  
gaussdb=# DROP USER dev_audit, bob_audit;
```

Helpful Links

[ALTER AUDIT POLICY](#) and [DROP AUDIT POLICY](#)

7.14.48 CREATE BARRIER

Description

Creates a barrier for cluster nodes. The barrier can be used for data restoration. This function is for internal use only. You are advised not to use it.

Precautions

Generally, CREATE BARRIER is used only for backup and restoration. Therefore, CREATE BARRIER can be executed only in the following scenarios:

- The database initial user can run this command.
- If the backup and restoration mode is enabled on the CN, that is, the GUC parameter **operation_mode** is set to **on**, users with the OPRADMIN permission can run this command.

Syntax

```
CREATE BARRIER [ barrier_name ] ;
```

Parameters

barrier_name

(Optional) Specifies the name of a barrier.

Value range: a string. It must comply with the [naming convention](#).

Examples

```
-- Specify the barrier name.  
gaussdb=# CREATE BARRIER 'barrier1';
```

7.14.49 CREATE CLIENT MASTER KEY

Description

The encrypted equality query feature adopts a multi-level encryption model. The master key encrypts the column key, and the column key encrypts data. This syntax is used to create a master key object.

Precautions

- This syntax is specific to a fully-encrypted database.
- When connecting to the database, you need to enable the connection parameters of the encrypted equality query feature on the database driver side before running this syntax.
- The master key is provided by an external key manager. This syntax processes only information such as the key source and key ID. The following external key managers are supported:
 - a. Huawei Cloud KMS huawei_kms
- Before using this syntax, set environment variables for the external key manager on the database driver side. For details, see section "Setting Encrypted Equality Query" in *Feature Guide*.

Syntax

```
CREATE CLIENT MASTER KEY client_master_key_name WITH (KEY_STORE = key_store_name, KEY_PATH = "key_path_value", ALGORITHM = algorithm_type);
```

Parameters

- **client_master_key_name**
This parameter is used as the name of a key object. In the same namespace, the value of this parameter must be unique.
Value range: a string. It must comply with the [naming convention](#).
- **KEY_STORE**
External key manager. For details about the value, see [Table 7-159](#).
- **KEY_PATH**
Each key is managed by an external key manager and the key path format varies depending on the key manager. The value is a character string. For details, see [Table 7-159](#). A character string is enclosed in single or double quotation marks. If the length of a character string exceeds 64 characters, only single quotation marks can be used.
- **ALGORITHM**
Encryption algorithm used by the key. For details about the value, see [Table 7-159](#).

Table 7-159 Parameter values for different key managers

| KEY_STORE | KEY_PATH | ALGORITHM |
|------------|---|-----------|
| huawei_kms | Format: '{KmsApiUrl}/{Key ID}'
Reference: 'https://kms.{Project}.myhuaweicloud.com/v1.0/{Project ID}/kms/{Key ID}'
Example: 'https://kms.cn-north-4.myhuaweicloud.com/v1.0/00000000000000000000000000000000/kms/00000000-0000-0000-0000-000000000000' | AES_256 |

Example (Using gsql to Connect to the Database Server)

Before using this syntax, you need to enable KMS and configure parameters for accessing KMS. For details, see "Setting Encrypted Equality Queries" in *Feature Guide*.

7.14.50 CREATE COLUMN ENCRYPTION KEY

Description

Creates a CEK that can be used to encrypt a specified column in a table.

Precautions

This syntax is specific to a fully-encrypted database.

When using **gsql** to connect to a database server, you need to use the **-C** parameter to enable the fully-encrypted database.

The CEK object created using this syntax can be used for column-level encryption. When defining a column in a table, you can specify a CEK object to encrypt the column.

Syntax

```
CREATE COLUMN ENCRYPTION KEY column_encryption_key_name WITH VALUES(CLIENT_MASTER_KEY = client_master_key_name, ALGORITHM = algorithm_type, ENCRYPTED_VALUE = encrypted_value);
```

Parameters

- column_encryption_key_name**
 This parameter is used as the name of a key object. In the same namespace, the value of this parameter must be unique.
 Value range: a string. It must comply with the [naming convention](#).

- **CLIENT_MASTER_KEY**
Specifies the CMK used to encrypt the CEK. The value is the CMK object name, which is created using the CREATE CLIENT MASTER KEY syntax.
- **ALGORITHM**
Encryption algorithm to be used by the CEK. The value can be **AEAD_AES_256_CBC_HMAC_SHA256**, **AEAD_AES_128_CBC_HMAC_SHA256**, **AEAD_AES_256_CTR_HMAC_SHA256**, **AES_256_GCM**, or **SM4_SM3**.
The data expansion rates of different encryption algorithms are sorted as follows: **AEAD_AES_256_CTR_HMAC_SHA256** < **AES_256_GCM** < **AEAD_AES_256_CBC_HMAC_SHA256** = **AEAD_AES_128_CBC_HMAC_SHA256** = **SM4_SM3**. The **AEAD_AES_256_CTR_HMAC_SHA256** and **AES_256_GCM** encryption algorithms are recommended.
- **ENCRYPTED_VALUE (optional)**
Specifies the key password defined by the user. The key password contains 28 to 256 characters. The security strength of a key containing 28 characters complies with AES128. If AES256 is used, the key password must contain 39 characters. If this parameter is not specified, a 256-bit key is automatically generated.

NOTICE

- SM algorithm constraints: SM2, SM3, and SM4 are Chinese national cryptography standards. To avoid legal risks, these algorithms must be used together. If you specify the SM4 algorithm to encrypt CEKs when creating a CMK, you must specify the SM3 and SM4 algorithms (**SM4_SM3**) to encrypt data when creating CEKs.
 - Constraints on the **ENCRYPTED_VALUE** column: If the CMK generated by Huawei KMS is used to encrypt the CEK and the **ENCRYPTED_VALUE** column is used to transfer the key in the **CREATE COLUMN ENCRYPTION KEY** syntax, the length of the input key must be an integer multiple of 16 bytes.
-

Example (Using gsql to Connect to the Database Server)

Before using this syntax, you need to enable KMS and configure parameters for accessing KMS. For details, see "Setting Encrypted Equality Queries" in *Feature Guide*.

7.14.51 CREATE CONVERSION

Description

Defines a new conversion between two character set encodings. This function is for internal use only. You are advised not to use it.

Precautions

- The **DEFAULT** parameter indicates that the conversion between the source encoding and the target encoding is executed by default between the client

and the server. To support this usage, bidirectional conversion must be defined, that is, both conversion from A to B and conversion from B to A are supported.

- To perform conversion, you must have the EXECUTE permission on function and the CREATE permission on the target schema.
- SQL_ASCII cannot be used for either source encoding or target encoding because the server behavior is hardwired when SQL_ASCII "encoding" is involved.
- You can remove user-defined conversions using DROP CONVERSION.

Syntax

```
CREATE [ DEFAULT ] CONVERSION name  
FOR 'source_encoding' TO 'dest_encoding' FROM function_name
```

Parameters

- **DEFAULT**
Specifies that the conversion is the default conversion from the source encoding to the target encoding. There should be only one default conversion for each encoding pair in a schema.
- **name**
Specifies the name of the conversion, which can be restricted by the schema. If not restricted by a schema, the conversion is defined in the current schema. The conversion name must be unique in a schema.
- **source_encoding**
Source encoding name.
- **dest_encoding**
Target encoding name.
- **function_name**
Function used for conversion. A function name can be restricted by a schema. If not, the function is found in the path.

The function must be in the following format:

```
conv_proc(  
    integer, -- Source encoding ID  
    integer, -- Target encoding ID  
    cstring, -- Source character string (C character string ending with a null value)  
    internal, -- Target (filled with a null-terminated C character string)  
    integer -- Length of the source string  
) RETURNS void;
```

CAUTION

Currently, only internal creation is supported.

7.14.52 CREATE DATABASE

Function

Creates a database. By default, the new database will be created only by cloning the standard system database **template0**.

Precautions

- A user that has the CREATEDB permission or a system administrator can create a database.
- It cannot be executed inside a transaction block.
- If an error message similar to "could not initialize database directory" is displayed during database creation, the possible cause is that the permission on the data directory in the file system is insufficient or the disk is full.

Syntax

```
CREATE DATABASE database_name
  [ [ WITH ] { [ OWNER [=] user_name ] |
    [ TEMPLATE [=] template ] |
    [ ENCODING [=] 'encoding' ] |
    [ LC_COLLATE [=] 'lc_collate' ] |
    [ LC_CTYPE [=] 'lc_ctype' ] |
    [ DBCOMPATIBILITY [=] 'compatibility_type' ] |
    [ TABLESPACE [=] tablespace_name ] |
    [ CONNECTION LIMIT [=] conlimit ] |
    [ DBTIMEZONE [=] 'time_zone' ] }[...] ];
```

Parameter Description

- **database_name**
Specifies the database name.
Value range: a string. It must comply with the [naming convention](#).
- **OWNER [=] user_name**
Specifies the owner of the new database. If omitted, the default owner is the current user.
Value range: an existing username
- **TEMPLATE [=] template**
Specifies a template name. That is, the template from which the database is created. GaussDB creates a database by copying data from a template database. GaussDB has two default template databases **template0** and **template1** and a default user database **postgres**.
Value range: **template0**
- **ENCODING [=] 'encoding'**
Specifies the character encoding used by the database. The value can be a string (for example, **SQL_ASCII**) or an integer.
If this parameter is not specified, the encoding of the template database is used by default. By default, the codes of the template databases **template0** and **template1** are related to the operating system environment. The character encoding of **template1** cannot be changed. To change the encoding, use **template0** to create a database.

Common values are **GBK**, **UTF8**, **Latin1**, and **GB18030**. The supported character sets are as follows:

Table 7-160 Supported character sets

| Name | Description | Language | Server-side Encoding | ICU Support | Number of Bytes/Characters | Alias |
|--------------|-----------------------------------|---------------------|----------------------|-------------|----------------------------|--------------------|
| BIG5 | Big Five | Traditional Chinese | No | No | 1-2 | WIN950, Windows950 |
| EUC_CN | Extended Unix Code-CN | Simplified Chinese | Yes | Yes | 1-3 | - |
| EUC_JP | Extended Unix Code-JP | Japanese | Yes | Yes | 1-3 | - |
| EUC_JIS_2004 | Extended Unix Code-JP, JIS X 0213 | Japanese | Yes | No | 1-3 | - |
| EUC_KR | Extended Unix Code-KR | Korean | Yes | Yes | 1-3 | - |
| EUC_TW | Extended Unix Code-Taiwan, China | Traditional Chinese | Yes | Yes | 1-3 | - |
| GB18030 | National standards | Chinese | Yes | No | 1-4 | - |
| GB18030_2022 | National standards | Chinese | Yes | No | 1-4 | - |
| GBK | Extended national standards | Simplified Chinese | Yes | No | 1-2 | WIN936, Windows936 |

| Name | Description | Language | Server-side Encoding | ICU Support | Number of Bytes/Characters | Alias |
|------------|----------------------|----------------------------|----------------------|-------------|----------------------------|----------|
| ISO_8859_5 | ISO 8859-5, ECMA 113 | Latin/Cyrillic | Yes | Yes | 1 | - |
| ISO_8859_6 | ISO 8859-6, ECMA 114 | Latin/Arabic | Yes | Yes | 1 | - |
| ISO_8859_7 | ISO 8859-7, ECMA 118 | Latin/Greek | Yes | Yes | 1 | - |
| ISO_8859_8 | ISO 8859-8, ECMA 121 | Latin/Hebrew | Yes | Yes | 1 | - |
| JOHAB | JOHAB | Korean | No | No | 1-3 | - |
| KOI8R | KOI8-R | Cyrillic (Russian) | Yes | Yes | 1 | KOI8 |
| KOI8U | KOI8-U | Cyrillic (Ukrainian) | Yes | Yes | 1 | - |
| LATIN1 | ISO 8859-1, ECMA 94 | Western European languages | Yes | Yes | 1 | ISO88591 |
| LATIN2 | ISO 8859-2, ECMA 94 | Central European languages | Yes | Yes | 1 | ISO88592 |
| LATIN3 | ISO 8859-3, ECMA 94 | South European languages | Yes | Yes | 1 | ISO88593 |

| Name | Description | Language | Server-side Encoding | ICU Support | Number of Bytes/Characters | Alias |
|----------------|----------------------------|------------------------------|----------------------|-------------|----------------------------|---------------------------------------|
| LATIN4 | ISO 8859-4, ECMA 94 | North European languages | Yes | Yes | 1 | ISO88594 |
| LATIN5 | ISO 8859-9, ECMA 128 | Turkish | Yes | Yes | 1 | ISO88599 |
| LATIN6 | ISO 8859-10, ECMA 144 | Germanic languages | Yes | Yes | 1 | ISO885910 |
| LATIN7 | ISO 8859-13 | Baltic languages | Yes | Yes | 1 | ISO885913 |
| LATIN8 | ISO 8859-14 | Celtic languages | Yes | Yes | 1 | ISO885914 |
| LATIN9 | ISO 8859-15 | LATIN1 with Euro and accents | Yes | Yes | 1 | ISO885915 |
| LATIN10 | ISO 8859-16, ASRO SR 14111 | Romanian | Yes | No | 1 | ISO885916 |
| MULE_INTERNAL | Mule internal code | Multilingual Emacs | Yes | No | 1-4 | - |
| SJIS | Shift JIS | Japanese | No | No | 1-2 | Mskanji, ShiftJIS, WIN932, Windows932 |
| SHIFT_JIS_2004 | Shift JIS, JIS X 0213 | Japanese | No | No | 1-2 | - |

| Name | Description | Language | Server-side Encoding | ICU Support | Number of Bytes/Characters | Alias |
|-----------|----------------------------|----------------------------|----------------------|-------------|----------------------------|--------------------|
| SQL_ASCII | Unspecified (see the text) | <i>Any</i> | Yes | No | 1 | - |
| UHC | Unified Hangul Code | Korean | No | No | 1–2 | WIN949, Windows949 |
| UTF8 | Unicode, 8-bit | All | Yes | Yes | 1–4 | Unicode |
| WIN866 | Windows CP866 | Cyrillic | Yes | Yes | 1 | ALT |
| WIN874 | Windows CP874 | Thai | Yes | No | 1 | - |
| WIN1250 | Windows CP1250 | Central European languages | Yes | Yes | 1 | - |
| WIN1251 | Windows CP1251 | Cyrillic | Yes | Yes | 1 | WIN |
| WIN1252 | Windows CP1252 | Western European languages | Yes | Yes | 1 | - |
| WIN1253 | Windows CP1253 | Greek | Yes | Yes | 1 | - |
| WIN1254 | Windows CP1254 | Turkish | Yes | Yes | 1 | - |
| WIN1255 | Windows CP1255 | Hebrew | Yes | Yes | 1 | - |
| WIN1256 | Windows CP1256 | Arabic | Yes | Yes | 1 | - |

| Name | Description | Language | Server-side Encoding | ICU Support | Number of Bytes/Characters | Alias |
|---------|----------------|------------------|----------------------|-------------|----------------------------|----------------------------|
| WIN1257 | Windows CP1257 | Baltic languages | Yes | Yes | 1 | - |
| WIN1258 | Windows CP1258 | Vietnamese | Yes | Yes | 1 | ABC, TCVN, TCVN5712, VSCII |

 **CAUTION**

- Note that not all client APIs support the preceding character sets.
 - The SQL_ASCII setting performs quite differently from other settings. If the character set of the server is SQL_ASCII, the server interprets the byte values 0 to 127 according to the ASCII standard. The byte values 128 to 255 are regarded as the characters that cannot be parsed. If this parameter is set to SQL_ASCII, no code conversion occurs. Therefore, this setting is not basically used to declare the specified encoding used, because this declaration ignores the encoding. In most cases, if you use any non-ASCII data, it is unwise to use the SQL_ASCII setting because the database will not be able to help you convert or verify non-ASCII characters.
-

NOTICE

- The character set encoding of the new database must be compatible with the local settings (**LC_COLLATE** and **LC_CTYPE**).
 - When the specified character encoding set is **GBK**, some uncommon Chinese characters cannot be directly used as object names. This is because the byte encoding overlaps with the ASCII characters `@A-Z[\]^_`a-z{}` when the second byte of the GBK ranges from 0x40 to 0x7E. `@[\]^_{'}` is an operator in the database. If it is directly used as an object name, a syntax error will be reported. For example, the GBK hexadecimal code is **0x8240**, and the second byte is **0x40**, which is the same as the ASCII character `@`. Therefore, the character cannot be used as an object name. If you need to use this function, you can add double quotation marks ("") to avoid this problem when creating and accessing objects.
 - If the client code is A and the server code is B, the conversion between encoding formats A and B must exist in the database. For details about encoding format conversion supported by the database, see the system catalog **PG_CONVERSION**. (If the encoding format cannot be converted, it is recommended that the encoding format on the client be the same as that on the server. You can change the encoding format on the client by setting the **client_encoding** parameter.)
 - If you want to set the database character set encoding to **GB18030_2022** and the client encoding to **GB18030**, ensure that the client OS supports **GB18030_2022**. If the **GB18030** character set versions are incompatible with each other, data inconsistency may occur. In addition, if historical data needs to be switched to the **GB18030_2022** database, follow the database switching process to migrate data.
-
- **LC_COLLATE [=] 'lc_collate'**
Specifies the character set used by the new database. For example, set this parameter by using **lc_collate = 'zh_CN.gbk'**.
The use of this parameter affects the sort order of strings (for example, the order of using **ORDER BY** for execution and the order of using indexes on text columns). By default, the sorting order of the template database is used.
Value range: character sets supported by the OS.
 - **LC_CTYPE [=] 'lc_ctype'**
Specifies the character class used by the new database. For example, set this parameter by using **lc_ctype = 'zh_CN.gbk'**. The use of this parameter affects the classification of characters, such as uppercase letters, lowercase letters, and digits. By default, the character classification of the template database is used.
Value range: character classes supported by the OS.

 **NOTE**

- The value ranges of **lc_collate** and **lc_ctype** depend on the character sets supported by the local environment. For example, in the Linux operating system, you can run the **locale -a** command to obtain the list of character sets supported by the operating system. When using the **lc_collate** and **lc_ctype** parameters, you can select the required character sets and character classes.
- If the specified character encoding set is **GB18030_2022**, the value ranges of **LC_COLLATE** and **LC_CTYPE** are the same as those of **GB18030**.

- **DBCMPATIBILITY [=] 'compatilby_type'**

Specifies the compatible database type. The default value is **MySQL**.

Value range: **MYSQL**, **TD**, **ORA**, and **PG**. MySQL, Teradata, Oracle and PostgreSQL are compatible, respectively.

 **NOTE**

- For ORA compatibility, the database treats empty strings as **NULL** and replaces **DATE** with **TIMESTAMP(0) WITHOUT TIME ZONE**.
 - When a character string is converted to an integer, if the input is invalid, the input will be converted to 0 due to **MYSQL** compatibility, and an error will be reported due to other compatibility issues.
 - For PG compatibility, **CHAR** and **VARCHAR** are counted by character. For other compatibility types, they are counted by byte. For example, for the UTF-8 character set, **CHAR(3)** can store three Chinese characters in PG compatibility scenarios, but can store only one Chinese character in other compatibility scenarios.
 - If an error is reported during statement execution, A-format or B-format is displayed in some error information. A-format indicates ORA-format, and B-format indicates **MYSQL**-format.
- **TABLESPACE [=] tablespace_name**
Specifies the tablespace of the database.
Value range: an existing tablespace name
 - **CONNECTION LIMIT [=] connlimit**
Specifies the maximum number of concurrent connections that can be made to the new database.

NOTICE

- The system administrator is not restricted by this parameter.
- **connlimit** is calculated for each each CN. The number of connections in a cluster is calculated using the following formula: Number of connections in a cluster = **connlimit** x Number of normal CNs.

Value range: an integer in the range $[-1, 2^{31} - 1]$. The default value is **-1**, indicating that there is no limit.

The restrictions on character encoding are as follows:

- If the locale is set to **C** (or **POSIX**), all encoding types are allowed. For other locale settings, the character encoding must be the same as that of the locale.
- The encoding and region settings must match the template database, except that **template0** is used as a template. This is because other databases may contain data that does not match the specified encoding, or may contain indexes whose sorting order is affected by **LC_COLLATE** and **LC_CTYPE**. Copying this data will invalidate the indexes in the new database. **template0** does not contain any data or indexes that may be affected.
- **DBTIMEZONE [=] 'time_zone'**
Specifies the time zone of the new database. For example, you can set this parameter by setting **DBTIMEZONE** to **'+00:00'**. This parameter affects the time zone of the new database. The **PRC** is used by default.

Value range: name and abbreviation of the time zone supported by the OS, or the timestamp ranges from -15:59 to +15:00.

Examples

```
-- Create users jim and tom.
gaussdb=# CREATE USER jim PASSWORD '*****';
gaussdb=# CREATE USER tom PASSWORD '*****';

-- Create database music using GBK (the local encoding type is also GBK).
gaussdb=# CREATE DATABASE music ENCODING 'GBK' template = template0;

-- Create database music2 and specify user jim as its owner.
gaussdb=# CREATE DATABASE music2 OWNER jim;

-- Create database music3 using template template0 and specify user jim as its owner.
gaussdb=# CREATE DATABASE music3 OWNER jim TEMPLATE template0;

-- Set the maximum number of connections to database music to 10.
gaussdb=# ALTER DATABASE music CONNECTION LIMIT= 10;

-- Rename database music to music4.
gaussdb=# ALTER DATABASE music RENAME TO music4;

-- Change the owner of database music2 to user tom.
gaussdb=# ALTER DATABASE music2 OWNER TO tom;

-- Delete the database.
gaussdb=# DROP DATABASE music2;
gaussdb=# DROP DATABASE music3;
gaussdb=# DROP DATABASE music4;

-- Delete the jim and tom users.
gaussdb=# DROP USER jim;
gaussdb=# DROP USER tom;

-- Create a database compatible with the TD format.
gaussdb=# CREATE DATABASE td_compatible_db DBCOMPATIBILITY 'TD';

-- Create a database compatible with the ORA format.
gaussdb=# CREATE DATABASE ora_compatible_db DBCOMPATIBILITY 'ORA';

-- Delete the databases that are compatible with the TD and ORA formats.
gaussdb=# DROP DATABASE td_compatible_db;
gaussdb=# DROP DATABASE ora_compatible_db;
```

Helpful Links

[ALTER DATABASE](#) and [DROP DATABASE](#)

Suggestions

- **create database**
Database cannot be created in a transaction.
- **ENCODING**
If the new database Encoding does not match the template database (SQL_ASCII) ('GBK', 'UTF8', 'LATIN1', 'GB18030', or 'GB18030_2022'), **template [=] template0** must be specified.

7.14.53 CREATE DATABASE LINK

Function

Creates a database link object. For details about database links, see [DATABASE LINK](#).

Syntax

```
CREATE [ PUBLIC ] DATABASE LINK dblink  
[ CONNECT TO { CURRENT_USER | user IDENTIFIED BY password } ] [ USING ( option 'value' [...] ) ];
```

Parameter Description

- **PUBLIC**
Creates a public database link visible to all users. If this clause is omitted, the database link is private and available only to the current user.
- **dblink**
Indicates the name of the database link to be created.
- **user**
Indicates the name of the user for connecting to the remote end of the created database link.
- **password**
Indicates the password of the user for connecting to the remote end of the created database link.
- **CURRENT_USER**
Uses the initial username and empty password of the current database for connection.
- **USING (option 'value' [, ...])**
Specifies parameters such as the IP address, port number, and remote database name of the database to be connected. The supported options are as follows:
 - **host**: specifies the IP addresses to be connected. IPv6 addresses are not supported. Multiple IP addresses can be specified using character strings separated by commas (,). Currently, SSL settings, encrypted databases, and certificate authentication are not supported. If no IP address is specified, this parameter is left empty by default.
 - **port**: specifies the port number for connection. If this parameter is not specified, the default value **5432** is used.
 - **dbname**: specifies the name of the database to be connected. If this parameter is not specified, the username used for connecting to the remote end is used by default.
 - **fetch_size**: specifies the amount of data obtained from the remote end each time. The value of **fetch_size** ranges from 0 to 2147483647. The default value is **100**.

NOTICE

- You can write only part of the preceding options in the brackets after USING.
- If the keyword USING is not written, the content in the brackets is not written as well.
- When a database link is created, the system does not check whether the connection is successful. If related keywords are missing, an error may be reported.

Example

```
-- Create a user with the system administrator permission.
gaussdb=# CREATE USER user01 WITH SYSADMIN PASSWORD '*****';
gaussdb=# SET ROLE user01 PASSWORD '*****';

-- Create a private database link.
gaussdb=# CREATE DATABASE LINK private_dblink CONNECT TO 'user1' IDENTIFIED BY '*****' USING
(host '192.168.11.11',port '54399',dbname 'db01');

-- Delete the private database link.
gaussdb=# DROP DATABASE LINK private_dblink;

-- Create a public database link.
gaussdb=# CREATE PUBLIC DATABASE LINK public_dblink CONNECT TO 'user1' IDENTIFIED BY '*****'
USING (host '192.168.11.11',port '54399',dbname 'db01');

-- Delete the public database link.
gaussdb=# DROP PUBLIC DATABASE LINK public_dblink;

-- Delete the created user.
gaussdb=# RESET ROLE;
gaussdb=# DROP USER user01 CASCADE;
```

NOTICE

- Do not use database links to connect to the initial user.
- Initial users are not allowed to create, modify, or delete database links.
- If the upgrade is not committed, the database link cannot be created.
- Do not use 127.0.0.1 or local host for the **host** parameter. Otherwise, the connection fails.
- If CURRENT_USER is used or the CONNECT TO connection string is omitted, the initial username and empty password of the current database are used for connection, resulting in connection failure.

7.14.54 CREATE DIRECTORY

Function

CREATE DIRECTORY creates a directory. The directory defines an alias for a path in the server file system and is used to store data files used by users. Users can read and write these files through the **dbe_file** advanced package.

The read and write permissions for the directory can be granted to specified users to provide permission control for **db_file**.

Precautions

- When **enable_access_server_directory** is set to **off**, only the initial user is allowed to create directory objects. When **enable_access_server_directory** is set to **on**, the user with the SYSADMIN permission and the user who inherits the **gs_role_directory_create** permission of the built-in role can create directory objects.
- By default, the user who creates a directory has the read and write permissions on the directory.
- The default owner of a directory is the user who creates the directory.
- A directory cannot be created for the following paths:
 - The path contains special characters.
 - The path is a relative path.
- The following validity check is performed during directory creation:
 - Check whether the path exists in the OS. If it does not exist, a message is displayed, indicating the potential risks.
 - Check whether the database initial user **omm** has the read, write, and execution permissions on the created directory. If the user does not have all the permissions, a message is displayed, indicating the potential risks.
- In a cluster, ensure that the path is the same on all the nodes. Otherwise, the path may fail to be found on some nodes when the directory is used.

Syntax

```
CREATE [OR REPLACE] DIRECTORY directory_name  
AS 'path_name';
```

Parameter Description

- **directory_name**
Specifies name of a directory.
Value range: a string. It must comply with the naming convention.
- **path_name**
Specifies the OS path for which a directory is to be created.
Value range: a valid OS path

Examples

```
-- Create a directory.  
gaussdb=# CREATE OR REPLACE DIRECTORY dir AS '/tmp/';  
  
-- Delete the directory.  
gaussdb=# DROP DIRECTORY dir;
```

Helpful Links

[ALTER DIRECTORY](#) and [DROP DIRECTORY](#)

7.14.55 CREATE FOREIGN DATA WRAPPER

Description

Creates a foreign data wrapper. The user who created the foreign data wrapper becomes its owner.

Precautions

- The name of the foreign data wrapper must be unique in the database.
- Only initial users and system administrators can create foreign data wrappers.

Syntax

```
CREATE FOREIGN DATA WRAPPER name  
[ HANDLER handler_function | NO HANDLER ]  
[ VALIDATOR validator_function | NO VALIDATOR ]  
[ OPTIONS ( option 'value' [, ... ] ) ];
```

Parameters

- **name**
Specifies the name of the foreign data wrapper to be created.
- **HADNLER handler_function**
handler_function is the name of a registered function used to retrieve execution functions for foreign tables. The handler function must have no arguments, and its return type must be `fdw_handler`.
It is possible to create foreign data wrappers without processor functions, but foreign tables that use such wrappers can only be declared and cannot be accessed.
- **VALIDATOR validator_function**
validator_function is the name of a registered function used to check the common options provided to the foreign data wrapper, as well as the options for the foreign server, user mapping, and foreign table that use the foreign data wrapper. If there is no validator function or **NO VALIDATOR** is declared, the option is not checked during creation. (The foreign data wrapper may ignore or reject invalid option descriptions at runtime, depending on the implementation.) The validator function must accept two arguments: one is of `text[]` type, which will contain an array of options stored in the system directory, and the other is of `OID` type, which will be the `OID` of the system directory that contains the options. The return type is ignored. The function should report invalid options using the `ereport(ERROR)` function.
- **OPTIONS (option 'value' [, ...])**
This clause declares options for the new foreign data wrapper. The allowed option names and values are specific to each foreign data wrapper and are validated by the validator function of the foreign data wrapper. The option name must be unique.

Example

```
-- Create a useless foreign-data wrapper dummy.  
gaussdb=# CREATE FOREIGN DATA WRAPPER dummy;
```

```
-- Create a foreign data wrapper file with the handler function file_fdw_handler.  
gaussdb=# CREATE FOREIGN DATA WRAPPER file HANDLER file_fdw_handler;  
  
-- Create a foreign data wrapper mywrapper with some options.  
gaussdb=# CREATE FOREIGN DATA WRAPPER mywrapper OPTIONS (debug 'true');
```

Helpful Links

[ALTER FOREIGN DATA WRAPPER](#) and [DROP FOREIGN DATA WRAPPER](#)

7.14.56 CREATE FUNCTION

Description

Creates a function.

Precautions

- If the parameters or return values of a function have precision, the precision is not checked.
- When creating a function, you are advised to explicitly specify the schemas of tables in the function definition. Otherwise, the function may fail to be executed.
- **current_schema** and **search_path** specified by SET during function creation are invalid. **search_path** and **current_schema** before and after function execution should be the same.
- If a function has output parameters, the GUC parameter **set behavior_compat_options** must be set to '**proc_outparam_override**' for the output parameters to take effect. When the function is called using SELECT or CALL, an actual parameter must be provided in the position of the output parameter. Otherwise, the function fails to be called.
- After **REPLACE** is specified, a new function is created instead of replacing a function if the number of parameters, parameter type, or return value is different.
- You cannot create overloaded functions with different formal parameter names (the function name and parameter list type are the same).
- You cannot create a function that has the same name and parameter list as a stored procedure.
- Formal parameters cannot be overloaded if only the custom ref cursor type is different from the sys_refcursor type.
- Function overloading is not supported if only the returned data types are different.
- Function overloading is not supported if only the default values are different.
- When an overloaded function is called, the variable type must be specified.
- If an undeclared variable is used in a function, an error is reported when the function is called.
- You can use the SELECT statement to specify different parameters using identical functions.
- When you create a function, you cannot insert other agg functions out of the avg function or other functions.

- In common cluster mode, return values, parameters, and variables cannot be set to the tables of the node groups that are not installed in the system by default. The internal statements of SQL functions cannot be executed on such tables.
- By default, the permissions to execute new functions are granted to PUBLIC users. For details, see [GRANT](#). By default, a user inherits the permissions of the PUBLIC role. Therefore, the user has the permission to execute a function and view the definition of the function. In addition, to execute the function, the user must have the USAGE permission on the schema to which the function locates. You can revoke the default execution permissions from the PUBLIC role when creating a function and grant the function execution permission to users as needed. To avoid the time window during which new functions can be accessed by all users, create functions and set function execution permissions in a transaction. After the database object isolation attribute is enabled, common users can view only the definitions of functions that they have permission to execute.
- If a function is defined as **IMMUTABLE** or **SHIPPABLE**, avoid **INSERT**, **UPDATE**, **DELETE**, **MERGE**, and **DDL** operations in the function because the CN needs to determine the execution node for these operations. Otherwise, an error may occur. If DDL operations are performed on a function of the IMMUTABLE or SHIPPABLE type, database objects on each node may be inconsistent. To resolve this problem, create the VOLATILE PL/SQL function on the CN, run the EXECUTE statement in the function definition to dynamically execute the DDL operation for repairing system objects, and then use the EXECUTE DIRECT ON syntax to call the repair function on the specified DN.
- When functions without parameters are called inside another function, you can omit brackets and call functions using their names directly.
- If the parameter **set behavior_compat_options** is not set to **proc_outparam_override**, the **OUT** output parameter of the function is directly called by an anonymous block or stored procedure, and the return value is used as the first value of the **OUT** output parameter. As a result, the calling fails. To correctly use the **OUT** and **IN OUT** output parameters, set the parameter **set behavior_compat_options** to **proc_outparam_override**. For details, see the example.
- When other functions with output parameters are called in a function and an assignment expression, set the GUC parameter **set behavior_compat_options** to '**proc_outparam_override**', define variables of the same type as the output parameters in advance, and use the variables as output parameters to call other functions with output parameters for the output parameters to take effect. Otherwise, the output parameters of the called functions will be ignored.
- After the GUC parameter **behavior_compat_options** is set to '**proc_outparam_override**', if the return type of the function is setof, the output parameter will not take effect.
- Oracle-compatible functions support viewing, exporting, and importing parameter comments.
- Oracle-compatible functions support viewing, exporting, and importing comments between IS/AS and plsql_body.
- Users granted with the CREATE ANY FUNCTION permission can create or replace functions in the user schemas.

- The default permission on a function is SECURITY INVOKER. To change the permission to SECURITY DEFINER, set the GUC parameter **behavior_compat_options** to **'plsql_security_definer'**.
- When a function is created, it depends on an undefined object. If **behavior_compat_options** is set to **'plpgsql_dependency'**, the creation can be executed and a warning message is displayed. If **behavior_compat_options** is not set to **'plpgsql_dependency'**, the creation cannot be executed.
- When **behavior_compat_options** is set to **'plpgsql_dependency'**, if function A is called in the function and function B is contained in the input and output parameters of function A, function B will not establish a dependency. For example, **functionA(functionB())**. **gs_dependencies** only creates dependency with function A.
- If a view directly depends on an O-style function and the **behavior_compat_options** parameter is set to **'plpgsql_dependency'**, the view can be accessed when the function is created again. However, if the **behavior_compat_options** parameter is not set to **'plpgsql_dependency'**, the view cannot be accessed.
- When creating a function, you cannot use the function itself as the default value of input parameter.
- The function with **OUT** parameter cannot be called by SQL statement.
- The function with **OUT** parameter cannot be called by SELECT INTO syntax.
- Functions with **OUT** parameters cannot be called in nested mode.

Example:

```
b := func(a,func(c,1));
```

Should be changed to:

```
tmp := func(c,1); b := func(a,tmp);
```

- When a function is created, the type of the return value of the function is not checked.
- If a function with the definer specified is created in a schema of another user, the function will be executed by another user, which may cause unauthorized operations. Therefore, exercise caution when performing this operation.
- In the schema of the O&M administrator, only the initial user and schema owner can create objects. The schema that does not allow other users to create and modify objects is the schema of the O&M administrator.
- If the **out** parameter is used as the output parameter in an expression, the expression does not take effect in the following scenarios: (a) The execute immediate sqlv using func syntax is used to execute a function. (b) The select func into syntax is used to execute a function. (c) DML statements such as INSERT and UPDATE are used to execute a function. (d) The select where a=func() statement is used. (e) When a function with the **out** output parameter is used as an input parameter, that is, **fun (func (out b), a)**, the **out b** parameter does not take effect.
- When a stored procedure with the out parameter is called, you can set the GUC parameter **set behavior_compat_options** to **'proc_outparam_transfer_length'** to transfer the parameter length. The specifications and constraints are as follows:

- a. The following types are supported: CHAR(n), CHARACTER(n), NCHAR(n), VARCHAR(n), VARYING(n), VARCHAR2(n), and NVARCHAR2(n).
- b. If the out parameter does not take effect (for example, **perform**), the length does not need to be transferred.
- c. The following types do not support precision transfer: NUMERIC, DECIMAL, NUMBER, FLOAT, DEC, INTEGER, TIME, TIMESTAMP, INTERVAL, TIME WITH TIME ZONE, TIMESTAMP WITH TIME ZONE, TIME WITHOUT TIME ZONE, and TIMESTAMP WITHOUT TIME ZONE.
- d. The parameter length can be transferred regardless of whether the GUC parameter **set behavior_compat_options** is set to **proc_outparam_override**.

Syntax

- Syntax (compatible with PostgreSQL) for creating a user-defined function:

```
CREATE [ OR REPLACE ] FUNCTION function_name
( [ { argname [ argmode ] argtype [ { DEFAULT | := | = } expression ] } [, ...] ] )
[ RETURNS rettype [ DETERMINISTIC ] | RETURNS TABLE ( { column_name column_type }
[, ...] ) ]
LANGUAGE lang_name
[
  {IMMUTABLE | STABLE | VOLATILE }
  | {SHIPPABLE | NOT SHIPPABLE}
  | WINDOW
  | [ NOT ] LEAKPROOF
  | {CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }
  | [ {EXTERNAL } SECURITY INVOKER | [ EXTERNAL ] SECURITY DEFINER | AUTHID DEFINER |
AUTHID CURRENT_USER}
  | {fenced | not fenced}

  | COST execution_cost
  | ROWS result_rows
  | SET configuration_parameter { {TO | =} value | FROM CURRENT } }
][...]
{
  AS 'definition'
  | AS 'obj_file', 'link_symbol'
};
```

- ORA-compatible syntax for creating a user-defined function:

```
CREATE [ OR REPLACE ] FUNCTION function_name
( [ { argname [ argmode ] argtype [ { DEFAULT | := | = } expression ] } [, ...] ] )
RETURN rettype [ DETERMINISTIC ]
[
  {IMMUTABLE | STABLE | VOLATILE }
  | {SHIPPABLE | NOT SHIPPABLE}

  | {FENCED | NOT FENCED}
  | [ NOT ] LEAKPROOF
  | {CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }
  | [ {EXTERNAL } SECURITY INVOKER | [ EXTERNAL ] SECURITY DEFINER |
AUTHID DEFINER | AUTHID CURRENT_USER
}
]
| COST execution_cost
| ROWS result_rows
| SET configuration_parameter { {TO | =} value | FROM CURRENT
| LANGUAGE lang_name
][...]
{
  IS | AS
} plsql_body
/
```

Parameters

- **function_name**

Specifies the name of the function to be created (optionally schema-qualified).

Value range: a string. It must comply with the [naming convention](#). The value contains a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the function name.

- **argname**

Specifies the parameter name of the function.

Value range: a string. It must comply with the [naming convention](#). The value contains a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the function parameter name.

- **argmode**

Specifies the parameter mode of the function.

Value range: **IN**, **OUT**, **INOUT**, and **VARIADIC**. The default value is **IN**. Only the parameter of the **OUT** mode can be followed by **VARIADIC**. The parameters of **OUT** and **INOUT** cannot be used in the function definition of RETURNS TABLE.

 **NOTE**

VARIADIC specifies parameters of the array type.

- **argtype**

Specifies the data type of a function parameter. You can use **%ROWTYPE** to indirectly reference the type of a table. For details, see [Variable Definition Statements](#).

- **expression**

Specifies the default expression of a parameter.

 **NOTE**

- If **a_format_version** is set to **10c** and **a_format_dev_version** is set to **s2**, the default expression is not supported when the parameter is in INOUT mode.
 - It is recommended that you define all default parameters after all non-default parameters.
 - If a function with default parameters is called, input parameters are added to the function from left to right. If inputs of non-default parameters are missing, an error is reported.
 - If **proc_uncheck_default_param** is enabled and a function with default parameters is called, input parameters are added to the function from left to right. The number of defaulted inputs depends on the number of default parameters. If an input of a non-default parameter is missing, the previous default value is used to fill this parameter.
 - When **a_format_version** is set to **10c**, **a_format_dev_version** is set to **s1**, **proc_outparam_override** is disabled, and the function parameters include the output parameter **out** and **default**, the default value cannot be used.
- **rettype**
Specifies the return data type. Same as **argtype**, **%TYPE** or **%ROWTYPE** can also be used to indirectly reference types.

When there is **OUT** or **IN OUT** parameter, the **RETURNS** clause can be omitted. If the clause is not omitted, the result type of the clause must be the same as that of the output parameter. The result type of the clause is the same as that of a single output parameter.

The **SETOF** modifier indicates that the function will return a set of items, rather than a single item.

- **column_name**
Specifies the column name.
- **column_type**
Specifies the column type.
- **definition**
Specifies a string constant defining a function. Its meaning depends on the language. It can be an internal function name, a path pointing to a target file, a SQL query, or text in a procedural language.
- **DETERMINISTIC**
Specifies an API compatible with the SQL syntax. You are advised not to use it.
- **LANGUAGE lang_name**
Specifies the name of the language that is used to implement the function. It can be **SQL**, **C**, **internal**, or the name of a customized process language. To ensure downward compatibility, the name can use single quotation marks. Contents in single quotation marks must be capitalized.
Due to compatibility issues, no matter which language is specified when an ORA-style database is created, the language used is plpgsql.

 **NOTE**

- When an internal function is defined, if AS specifies the function as an internal system function, the parameter type, number of parameters, and return value type of the new function must be the same as those of the internal system function, and the user who creates the internal function must have the permission to execute the internal system function.
- Only users with the sysadmin permission can create internal functions.
- **WINDOW**
Specifies that the function is a window function. This is currently only useful for functions written in C. The **WINDOW** attribute cannot be changed when replacing an existing function definition.

NOTICE

For a customized window function, the value of **LANGUAGE** can only be **internal**, and the referenced internal function must be a window function.

- **IMMUTABLE**
Specifies that the function always returns the same result if the parameter values are the same.
- **STABLE**

Specifies that the function cannot modify the database, and that within a single table scan it will consistently return the same result for the same parameter value, but its result varies by SQL statements.

- **VOLATILE**

Specifies that the function value can change in a single table scan and no optimization is performed.

- **SHIPPABLE**

NOT SHIPPABLE

Specifies whether the function can be pushed down to DNs for execution.

- Functions of the IMMUTABLE type can always be pushed down to DNs.
- Functions of the STABLE or VOLATILE type can be pushed down to DNs only if their attribute is **SHIPPABLE**.

NOTICE

The function or stored procedure of the SHIPPABLE/IMMUTABLE type cannot contain EXCEPTION or call functions or stored procedures that contain EXCEPTION.

- **LEAKPROOF**

Specifies that the function has no side effects. **LEAKPROOF** can be set only by the system administrator.

- **CALLED ON NULL INPUT**

Declares that some parameters of the function can be called in normal mode if the parameter values are null. This parameter can be omitted.

- **RETURNS NULL ON NULL INPUT**

STRICT

Specifies that the function always returns null whenever any of its parameters is null. If this parameter is specified, the function is not executed when there are null parameters; instead a null result is returned automatically.

RETURNS NULL ON NULL INPUT and **STRICT** have the same functions.

- **EXTERNAL**

The purpose is to be compatible with SQL statements and it is optional. This feature applies to all functions, not only external functions.

- **SECURITY INVOKER**

AUTHID CURRENT_USER

Specifies that the function will be executed with the permissions of the user who calls it. This parameter can be omitted.

SECURITY INVOKER and **AUTHID CURRENT_USER** have the same functions.

- **SECURITY DEFINER**

AUTHID DEFINER

Specifies that the function will be executed with the permissions of the user who created it.

AUTHID DEFINER and **SECURITY DEFINER** have the same functions.

- **FENCED**
NOT FENCED
Specifies whether the function is executed in fenced mode or not fenced mode. In **NOT FENCED** mode, a function is executed in a CN or DN process. In **FENCED** mode, a function is executed in a new fork process, which does not affect CN or DN processes.
Application scenarios:
 - Develop or debug a function in **FENCED** mode and execute it in **NOT FENCED** mode. This reduces the overhead of the fork process and communication.
 - Perform complex OS operations, such as opening a file, and processing signals and threads in **FENCED** mode; otherwise, the GaussDB database execution may be affected.
 - Customize PL/SQL functions. If this parameter is not specified, the default value **NOT FENCED** is used and the **FENCED** execution mode is not supported.
- **COST execution_cost**
Estimates the execution cost of a function.
The unit of **execution_cost** is **cpu_operator_cost**.
Value range: ≥ 0
- **ROWS result_rows**
Estimates the number of rows returned by the function. This is only allowed when the function is declared to return a set.
Value range: ≥ 0 . The default value is **1000**.
- **configuration_parameter**
 - **value**
Sets a specified database session parameter to a specified value. If the value is **DEFAULT** or **RESET**, the default setting is used in the new session. **OFF** disables the setting.
Value range: a string
 - **DEFAULT**
 - **OFF**
 - **RESET**Specifies the default value.
 - **from current**
Uses the value of **configuration_parameter** of the current session.
- **plsql_body**
Specifies the PL/SQL stored procedure body.

NOTICE

When you perform password-related operations, such as user creation, password change, and encryption/decryption, in a function body, the password will be recorded in the system catalogs and logs in plaintext. To prevent sensitive information leakage, you are advised not to perform operations on the function body related to sensitive information, such as passwords or keys.

Examples

```
-- Create an ORA-compatible database.
gaussdb=# CREATE DATABASE ora_compatible_db DBCOMPATIBILITY 'ORA';
CREATE DATABASE
-- Switch to another database.
gaussdb=# \c ora_compatible_db
-- Define a function as SQL query.
gaussdb=# CREATE FUNCTION func_add_sql(integer, integer) RETURNS integer
  AS 'select $1 + $2;'
  LANGUAGE SQL
  IMMUTABLE
  RETURNS NULL ON NULL INPUT;

-- Add an integer by parameter name using PL/pgSQL.
gaussdb=# CREATE OR REPLACE FUNCTION func_increment_plsql(i integer) RETURNS integer AS $$
  BEGIN
    RETURN i + 1;
  END;
$$ LANGUAGE plpgsql;

-- Return a record containing multiple output parameters.
gaussdb=# CREATE FUNCTION func_dup_sql(in int, out f1 int, out f2 text)
  AS $$ SELECT $1, CAST($1 AS text) || ' is text' $$
  LANGUAGE SQL;

gaussdb=# SELECT * FROM func_dup_sql(42);

-- Compute the sum of two integers and returning the result (if the input is null, the returned result is null):
gaussdb=# CREATE FUNCTION func_add_sql2(num1 integer, num2 integer) RETURN integer
AS
BEGIN
RETURN num1 + num2;
END;
/

-- Alter the execution rule of function add to IMMUTABLE (that is, the same result is returned if the
parameter remains unchanged).
gaussdb=# ALTER FUNCTION func_add_sql2(INTEGER, INTEGER) IMMUTABLE;

-- Alter the name of function add to add_two_number.
gaussdb=# ALTER FUNCTION func_add_sql2(INTEGER, INTEGER) RENAME TO add_two_number;

-- Change the owner of function add to omm.
gaussdb=# ALTER FUNCTION add_two_number(INTEGER, INTEGER) OWNER TO omm;

-- Delete the function.
gaussdb=# DROP FUNCTION add_two_number;
gaussdb=# DROP FUNCTION func_increment_sql;
gaussdb=# DROP FUNCTION func_dup_sql;
gaussdb=# DROP FUNCTION func_increment_plsql;
gaussdb=# DROP FUNCTION func_add_sql;

-- If the parameter set behavior_compat_options is not set to proc_outparam_override, the OUT output
parameter of the function is directly called by an anonymous block or stored procedure, and the return
```

value is used as the first value of the **OUT** output parameter. As a result, the call fails.

```
gaussdb=# create type rec as(c1 int, c2 int);
gaussdb=# create or replace function func(a in out rec, b in out int) return int
as
begin
  a.c1:=100;
  a.c2:=200;
  b:=300;
  return 1;
end;
/
declare
  r rec;
  b int;
begin
  func(r,b); -- Not supported.
end;

[ALTER FUNCTION](#) and [DROP FUNCTION](#)

Suggestions

- analyse | analyze
 - Do not run **ANALYZE** in a transaction or anonymous block.
 - Do not run **ANALYZE** in a function or stored procedure.

7.14.57 CREATE GLOBAL INDEX

Description

Creates a global secondary index (GSI) on a specified table.

The GSIs allow users to define indexes that are inconsistent with the distribution of base tables. In this way, single-node plans for querying non-distributed columns of base tables and unique/primary key constraints on non-distributed columns of base tables are achieved.

NOTE

1. GSI creation is not allowed during the upgrade uncommitted observation.
2. You are advised to create a NOT NULL constraint on the index key of at least one column of GSI to improve IUD performance.
3. You are advised to create common indexes in the GSI base table to improve IUD execution efficiency.
4. The execution plan generated when a GSI is created is to pull the base table data back to the CN and then deliver the data to the DN where the GSI is located. Therefore, the performance of a large-scale cluster with a large amount of data is much worse than that of using a common index. For example, it may take about one hour to create a GSI with tens of millions of data records on six SSDs. The GSI creation mechanism will be optimized in later versions and the current single point will be changed to parallel DNs to improve the creation efficiency.

Precautions

- Similar to the base table constraints, the distribution keys of GSIs do not support the UPDATE operation.
- The GSI can be created only in GTM-LITE mode. If a GSI is created in other GTM modes, an error is reported.
- Common UB-tree indexes can be created. Expression indexes and some other indexes are not supported. Astore does not support UB-tree indexes other than GSIs and does not support partition creation for GSIs.
- The GSI whose distribution is the same as that of the base table cannot be created. Otherwise, an error will be reported during the execution.
- Online GSI creation or rebuild is not supported and a syntax error will be reported. PARALLEL is not supported, and **parallel_workers** will be set to **0** on the DN.
- Hash-distributed GSIs can be created for row-store Astore tables and partitioned tables whose base tables are hash-distributed. The base tables cannot be replicate, hash bucket, list/range distribution, or Ustore table. GSIs of these tables do not support distribution other than hash distribution.
- If the base table is a partitioned table, the GSI supports a maximum of 27 columns. If the base table is not a partitioned table, the GSI supports a maximum of 28 columns (including the index key and distribution key).

- UPSERT, IUD returning on base tables with GSIs, TABLE ACCESS BY INDEX ROWID, MERGE INTO, CLUSTER, and SQL PATCH are not supported.
- Operations that will invalidate the GSIs in the current version:
 - VACUUM FULL
 - VACUUM FULL on a single table: All GSIs on the table are invalidated.
 - VACUUM FULL on a database: All GSIs in the database are invalidated.
 - REINDEX
 - REINDEX on a single table (offline): All GSIs on the table are invalidated.
 - REINDEX on a database (offline): All GSIs in the database are invalidated.
 - CLUSTER
 - CLUSTER on a single table using a common index: All GSIs on the table are invalidated.
 - CLUSTER on a single table: All GSIs on the table are invalidated.
 - CLUSTER on a database: All GSIs on the tables that have been clustered in the database are invalidated.
 - COPY/GDS
All GSIs on the table are invalidated.
 - PARTITION
MERGE PARTITION, EXCHANGE PARTITION, TRUNCATE PARTITION, DROP PARTITION and SPLIT PARTITION invalidate all GSIs on a partitioned table. EXCHANGE PARTITION invalidates all GSIs on an ordinary table.
- For batch scenarios such as INSERT INTO SELECT and UPDATE/DELETE, the execution plan goes back to the CN, and the performance is poor (similar to the performance of GSI creation).
- For INSERT, UPDATE, and DELETE, distributed execution plans are used, which may cause performance loss.
- If `_new$$` or `_NEW$$` is added to a column name or `ctid`, `xc_node_hash`, `xmin`, `xmax` or `tableoid` (when the base table is a partitioned table), a GSI fails to be created for the base table whose column names are repeated.
- If the VACUUM FULL, CLUSTER, or REINDEX operation on a table is interrupted, the GSI on the table may turn to the **UNUSABLE** state. In this case, an error will be reported when the GSI is queried. You are advised to run **REINDEX INDEX** to rebuild the GSI.

Syntax

```
CREATE GLOBAL [ UNIQUE ] INDEX [ [schema_name.]index_name ] ON table_name [ USING method ]
({ column_name [ COLLATE collation ] [ opclass ] [ ASC | DESC ] [ NULLS { FIRST | LAST } ] }, ...) )
[CONTAINING (containing_colname)] [DISTRIBUTE BY hash(dist_colnames)]
[ TABLESPACE tablespace_name ];
```

Parameters

- **UNIQUE**
Creates a unique index. In this way, the system checks whether new values are unique in the index column. If the inserted or updated value causes duplicate records, an error is reported.
- **schema_name**
Specifies the schema name.
Value range: an existing schema name
- **index_name**
Specifies the name of the index to be created. No schema name can be included here; the index is always created in the same schema as its parent table.
Value range: a string. It must comply with the [naming convention](#).
- **table_name**
Specifies the name of the table to be indexed (optionally schema-qualified).
Value range: an existing table name
- **USING method**
Specifies the name of the index method to be used.
Value range: UB-tree. The multi-version B-tree index is provided. The index page contains transaction information.
- **column_name**
Specifies the name of the column on which an index is to be created.
If the index mode supports multi-column indexes, multiple columns can be declared. A maximum of 28 columns can be declared for a non-partitioned base table, and a maximum of 27 columns can be declared for a partitioned base table.
- **COLLATE collation**
Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **select * from pg_collation** command to query collation rules from the **pg_collation** system catalog. The default collation rule is the row starting with **default** in the query result.
- **opclass**
Specifies the name of an operator class. An operator class can be specified for each column of an index. The operator class identifies the operators to be used by the index for that column.
- **ASC**
Specifies an ascending (default) sort order.
- **DESC**
Specifies a descending sort order.
- **NULLS FIRST**
Specifies that null values appear before non-null values in the sort ordering. This is the default when **DESC** is specified.
- **NULLS LAST**

Specifies that null values appear after non-null values in the sort ordering. This is the default when **DESC** is not specified.

- **CONTAINING**
Specifies the base table attributes other than index keys contained in the GSI.
- **containing_colname**
Specifies the base table attributes other than the index keys contained in the GSI.
- **DISTRIBUTE BY**
Specifies the distribution key of the GSI, which is different from that of the base table, and only the hash distribution can be used.
- **dist_colnames**
Specifies the distribution key of the GSI.
It must be contained in **column_name**.
- **TABLESPACE tablespace_name**
Specifies the tablespace for an index. If no tablespace is specified, the default tablespace is used.
Value range: an existing table name

Example

```
-- Create a base table test that contains three columns.
gaussdb=# CREATE TABLE test(c1 int, c2 int, c3 int);

-- Create a GSI on the c2 column of the test table containing the c3 column based on the hash distribution
of the c2 column.
gaussdb=# CREATE GLOBAL INDEX idx_gsi_1 ON test(c2) CONTAINING(c3) DISTRIBUTE BY HASH(c2);

-- Create a base table test2 that contains three columns.
gaussdb=# CREATE TABLE test2(c1 int, c2 int, c3 int);

-- Create a GSI on the c2 column of the test2 table containing the c3 column based on the hash
distribution of the c2 column.
gaussdb=# CREATE GLOBAL INDEX idx_gsi_2 ON test2(c2) CONTAINING(c3) ;

-- Create a base table test3 that contains three columns.
gaussdb=# CREATE TABLE test3(c1 int, c2 int, c3 int);

-- Create a GSI in UNIQUE form on the c2 column of the test3 table, which is based on the hash
distribution of the c2 column by default.
gaussdb=# CREATE GLOBAL UNIQUE INDEX idx_gsi_3 ON test3(c2) DISTRIBUTE BY HASH(c2);
```

7.14.58 CREATE GROUP

Description

Creates a user group.

Precautions

CREATE GROUP is an alias for CREATE ROLE, and it is not a standard SQL syntax and not recommended. Users can use CREATE ROLE directly.

Syntax

```
CREATE GROUP group_name [ [ WITH ] option [ ... ] ]  
[ ENCRYPTED | UNENCRYPTED ] { PASSWORD | IDENTIFIED BY } { 'password' [ EXPIRED ] | DISABLE };
```

The syntax of the optional action clause is as follows:

```
{SYSADMIN | NOSYSADMIN}  
| {MONADMIN | NOMONADMIN}  
| {OPRADMIN | NOOPRADMIN}  
| {POLADMIN | NOPOLADMIN}  
| {AUDITADMIN | NOAUDITADMIN}  
| {CREATEDB | NOCREATEDB}  
| {USEFT | NOUSEFT}  
| {CREATEROLE | NOCREATEROLE}  
| {INHERIT | NOINHERIT}  
| {LOGIN | NOLOGIN}  
| {REPLICATION | NOREPLICATION}  
| {VCADMIN | NOVCADMIN}  
| {PERSISTENCE | NOPERSISTENCE}  
| CONNECTION LIMIT connlimit  
| VALID BEGIN 'timestamp'  
| VALID UNTIL 'timestamp'  
  
| USER GROUP 'groupuser'  
| PERM SPACE 'spacelimit'  
| NODE GROUP logic_group_name  
| IN ROLE role_name [, ...]  
| IN GROUP role_name [, ...]  
| ROLE role_name [, ...]  
| ADMIN role_name [, ...]  
| USER role_name [, ...]  
| SYSID uid  
| DEFAULT TABLESPACE tablespace_name  
| PROFILE DEFAULT  
| PROFILE profile_name  
| PGUSER
```

Parameters

See [Parameters](#) in section "CREATE ROLE."

Examples

```
-- Create group my_group.  
gaussdb=# CREATE GROUP my_group PASSWORD '*****';  
  
-- Delete the group.  
gaussdb=# DROP GROUP my_group;
```

7.14.59 CREATE INCREMENTAL MATERIALIZED VIEW

Description

CREATE INCREMENTAL MATERIALIZED VIEW creates a fast-refresh materialized view, and you can refresh the data of the materialized view by using REFRESH MATERIALIZED VIEW (complete-refresh) and REFRESH INCREMENTAL MATERIALIZED VIEW (fast-refresh).

CREATE INCREMENTAL MATERIALIZED VIEW is similar to CREATE TABLE AS, but it remembers the query used to initialize the view, so it can refresh data later. A materialized view has many attributes that are the same as those of a table, but does not support temporary materialized views.

Precautions

- Incremental materialized views cannot be created on database link tables, temporary tables, or global temporary tables.
- Fast-refresh materialized views support only simple filter queries and UNION ALL queries of base tables.
- The distribution column cannot be specified when a fast-refresh materialized view is created.
- After a fast-refresh materialized view is created, most DDL operations in the base table are no longer supported.
- The IUD operation cannot be performed on fast-refresh materialized views.
- After a fast-refresh materialized view is created, you need to run the **REFRESH** command to synchronize the materialized view with the base table when the base table data changes.
- The Ustore engine does not support the creation and use of materialized views.

Syntax

```
CREATE INCREMENTAL MATERIALIZED VIEW mv_name  
  [ (column_name [, ...] ) ]  
  [ TABLESPACE tablespace_name ]  
  AS query;
```

Parameter Description

- **mv_name**
Name (optionally schema-qualified) of the materialized view to be created.
Value range: a string. It must comply with the [naming convention](#).
- **column_name**
Column name in the new materialized view. The materialized view supports specified columns. The number of specified columns must be the same as the number of columns in the result of the subsequent query statement. If no column name is provided, the column name is obtained from the output column name of the query.
Value range: a string. It must comply with the [naming convention](#).
- **TABLESPACE tablespace_name**
Tablespace to which the new materialized view belongs. If the tablespace is not specified, the default tablespace is used.
- **AS query**
SELECT or **TABLE** command. This query will be run in a security-constrained operation.

Examples

```
-- Create an ordinary table.  
gaussdb=# CREATE TABLE my_table (c1 int, c2 int);
```

```
-- Create a fast-refresh materialized view.
gaussdb=# CREATE INCREMENTAL MATERIALIZED VIEW my_imv AS SELECT * FROM my_table;

-- Write data to the base table.
gaussdb=# INSERT INTO my_table VALUES(1,1),(2,2);

-- Fast refresh the fast-refresh materialized view my_imv.
gaussdb=# REFRESH INCREMENTAL MATERIALIZED VIEW my_imv;

-- Delete a fast-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_imv;

-- Delete the ordinary table my_table.
gaussdb=# DROP TABLE my_table;
```

7.14.60 CREATE INDEX

Description

Defines a new index.

Indexes are primarily used to enhance database performance (though inappropriate use can result in database performance deterioration). You are advised to create indexes on:

- Columns that are often queried
- Join conditions. For a query on joined columns, you are advised to create a composite index on the columns. For example, for **select * from t1 join t2 on t1.a=t2.a and t1.b=t2.b**, you can create a composite index on columns **a** and **b** in table **t1**.
- Columns having filter criteria (especially scope criteria) of a **where** clause
- Columns that appear after **order by**, **group by**, and **distinct**

Partitioned tables do not support partial index creation (when indexes contain the GLOBAL or LOCAL keyword or the created index is a GLOBAL index).

Precautions

- If the base table is a hash-distributed table, to create a primary key or unique index that does not contain the distribution key of the base table, use a GSI (using CREATE GLOBAL INDEX); to create a primary key or unique index that contains the distribution key of the base table, use a common index (using CREATE INDEX). In single-DN deployment mode, both the GSI and common index can be successfully created. If the base table is a non-hash-distributed table, you can only create the primary key or unique index as a common index (using CREATE INDEX). That is, the index key must contain the distribution key of the base table.
- Indexes consume storage and computing resources. Creating too many indexes has negative impact on database performance (especially the performance of data import). Therefore, you are advised to import the data

before creating indexes). Therefore, create indexes only when they are necessary.

- All functions and operators used in an index definition must be immutable, that is, their results must depend only on their parameters and never on any outside influence (such as the contents of another table or the current time). This restriction ensures that the behavior of the index is well-defined. To use a user-defined function in an index or WHERE clause, mark it as an immutable function.
- A user granted with the CREATE ANY INDEX permission can create indexes in both the public and user schemas.
- If a user-defined function is called in the expression index, the expression index function is executed based on the permission of the function creator.
- Data of the XML type cannot be used as common indexes, unique indexes, global indexes, local indexes, or partial indexes.
- Only B-tree and UB-tree indexes can be created online. Only common indexes of non-partitioned tables, as well as global and local indexes of partitioned tables can be created. Online index column addition, deletion, and modification, PCR UB-tree indexes, level-2 partitions, and GSIs are not supported. Online concurrent index creation supports only Astore common indexes, global indexes, and local indexes. Ustore indexes are not supported.

Syntax

- **Create an index on a table.**

```
CREATE [ UNIQUE ] INDEX [ CONCURRENTLY ] [ [schema_name.] index_name ] ON table_name
[ USING method ]
    ( ( { column_name | ( expression ) } [ COLLATE collation ] [ opclass ] [ ASC | DESC ] [ NULLS
{ FIRST | LAST } ] }, ... )
    [ INCLUDE ( column_name [, ... ] ) ]
    [ WITH ( { storage_parameter = value } [, ... ] ) ]
    [ TABLESPACE tablespace_name ]
    [ WHERE predicate ];
```
- **Create an index on a partitioned table.**

```
CREATE [ UNIQUE ] INDEX [ CONCURRENTLY ] [ [schema_name.] index_name ] ON table_name
[ USING method ]
    ( ( { column_name | ( expression ) } [ COLLATE collation ] [ opclass ] [ ASC | DESC ] [ NULLS
LAST ] }, ... )
    [ LOCAL [ ( { PARTITION index_partition_name [ TABLESPACE index_partition_tablespace ] }
[, ... ] ) ] | GLOBAL ]
    [ INCLUDE ( column_name [, ... ] ) ]
    [ WITH ( { storage_parameter = value } [, ... ] ) ]
    [ TABLESPACE tablespace_name ];
```

Parameters

- **UNIQUE**

Creates a unique index. In this way, the system checks whether new values are unique in the index column. Attempts to insert or update data which would result in duplicate entries will generate an error.

Currently, only B-tree indexes and UB-tree indexes in row-store tables support unique indexes.
- **CONCURRENTLY**

Creates an index (with ShareUpdateExclusiveLock) in a mode that does not block DML statements. When an index is created, other statements cannot

access the table on which the index depends. If this keyword is specified, DML is not blocked during the creation.

- This option can only specify a name of one index.
- The CREATE INDEX statement can be run within a transaction, but CREATE INDEX CONCURRENTLY cannot.
- For temporary tables, you can use CONCURRENTLY to create indexes. However, indexes are created in blocking mode because no other sessions concurrently access the temporary tables and the blocking mode is more cost-effective.

 NOTE

- This keyword is specified when an index is created. The entire table needs to be scanned twice and built. When the table is scanned for the first time, an index is created and the read and write operations are not blocked. During the second scan, changes that have occurred since the first scan are merged and updated.
- The table needs to be scanned and built twice, and all existing transactions that may modify the table must be completed. This means that the creation of the index takes a longer time than normal. In addition, the CPU and I/O consumption also affects other services.
- If an index build fails, it leaves an "unusable" index. This index is ignored by queries, but it still consumes the update overhead. In this case, you are advised to run the **DROP INDEX IF EXISTS** statement to delete the index and run the **CONCURRENTLY** statement to create the index again. Note that when indexes are rebuilt by using **CLUSTER**, **TRUNCATE**, **VACUUM FULL**, or **REINDEX TABLE**, the residual "unusable" indexes are skipped. If **ALTER TABLE** involves table and index rebuild, residual "unusable" indexes will be automatically cleared.
- After the second scan, index creation must wait for any transaction that holds a snapshot earlier than the snapshot taken by the second scan to terminate. In addition, the **ShareUpdateExclusiveLock** (level 4) added during index creation conflicts with a lock whose level is greater than or equal to 4. Therefore, when such an index is created, the system is prone to hang or deadlock. Example:
 - If two sessions create an index by using **CONCURRENTLY** for the same table, a deadlock occurs.
 - If a session creates an index by using **CONCURRENTLY** for a table and another session drops a table, a deadlock occurs.
 - There are three sessions. Session 1 locks table **a** and does not commit it. Session 2 creates an index by using **CONCURRENTLY** for table **b**. Session 3 writes data to table **a**. Before the transaction of session 1 is committed, session 2 is blocked.
 - When an index is created by using **CONCURRENTLY** for a table concurrently with the **TRUNCATE** operation on the same table, a deadlock occurs.
 - The transaction isolation level is set to repeatable read (read committed by default). Two sessions are started. Session 1 writes data to table **a** and does not commit it. Session 2 creates an index by using **CONCURRENTLY** for table **b**. Before the transaction of session 1 is committed, session 2 is blocked.
- When an index is being created or fails to be created, you need to check the index progress or status. You can query the **gs_get_index_status('schema_name', 'index_name')** function to check the index status on all nodes. The input parameters **schema_name** and **index_name** are used to specify the index schema name and index name, respectively. The return values are **node_name**, **indisready**, and **indisvalid**, indicating the node name, whether the index can be inserted on the node, and whether the index is available on the node. The index is available only when **indisready** and **indisvalid** on all nodes are set to **true**; otherwise, wait until the index creation is complete. If the index fails to be created, delete the index and create it again.
- When the I/O and CPU resources are not limited, the service performance deterioration caused by online index creation can be controlled within 10%. However, in special scenarios, the service performance deterioration may exceed 10%. This is because online index creation is a long transaction that consumes a large number of I/O and CPU resources. It consumes more resources than offline index creation. The longer the online index creation transaction lasts, the greater the impact on service performance. The time for creating indexes online is positively correlated with the data volume of base tables and the data volume generated by concurrent DMLs. When the I/O and CPU resources are not limited, the time for creating indexes online is about two to six times that for creating indexes offline. However, when the number of concurrent transactions is large (> 10000 TPS) or resource contention occurs, the time may be even longer. In Astore

mode, you can create indexes in parallel to shorten the index creation time. The performance of online parallel index creation increases to a certain value and becomes stable as the number of parallel worker threads increases. Compared with the performance of creating indexes in serial mode, the performance of creating indexes in parallel online is improved by about 30%. You are advised to create indexes online during off-peak hours to avoid great impact on services. Although online index creation provides the capability of uninterrupted services to some extent, it still needs to be implemented with caution.

- **schema_name**

Specifies the schema name.

Value range: an existing schema name

- **index_name**

Specifies the name of the index to be created. No schema name can be included here; the index is always created in the same schema as its parent table.

Value range: a string. It must comply with the [naming convention](#).

- **table_name**

Specifies the name of the table to be indexed (optionally schema-qualified).

Value range: an existing table name

- **USING method**

Specifies the name of the index method to be used.

Value range:

- **btree**: B-tree indexes store key values of data in a B+ tree structure. This structure helps users to quickly search for indexes. B-tree supports comparison query and query range. When an index is created in a Ustore table, the index is automatically changed to UB-tree.
- **ubtree**: Multi-version B-tree index used only for Ustore tables. The index page contains transaction information and can be recycled. By default, the INSERTPT function is enabled for UB-tree indexes.

Row-store tables support the following index types: **ubtree** (default). Row-store tables (Ustore storage engine) support the following index type: UB-tree.

- **column_name**

Specifies the name of the column on which an index is to be created.

Multiple columns can be specified if the index method supports multi-column indexes. A global index supports a maximum of 31 columns, and other indexes support a maximum of 32 columns.

- **expression**

Specifies an expression based on one or more columns of the table. The expression usually must be written with surrounding parentheses, as shown in the syntax. However, the parentheses can be omitted if the expression has the form of a function call.

Expression can be used to obtain fast access to data based on some transformation of the basic data. For example, an index computed on **upper(col)** would allow the clause **WHERE upper(col) = 'JIM'** to use an index.

If an expression contains **IS NULL**, the index for this expression is invalid. In this case, you are advised to create a partial index.

- **COLLATE collation**

Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **select * from pg_collation** command to query collation rules from the pg_collation system catalog. The default collation rule is the row starting with **default** in the query result.
- **opclass**

Specifies the name of an operator class. An operator class can be specified for each column of an index. The operator class identifies the operators to be used by the index for that column. For example, a B-tree index on the type int4 would use the **int4_ops** class; this operator class includes comparison functions for values of type int4. In practice, the default operator class for the column's data type is sufficient. The operator class applies to data with multiple sorts. For example, users might want to sort a complex-number data type either by absolute value or by real part. They could do this by defining two operator classes for the data type and then selecting the proper class when making an index.
- **ASC**

Specifies an ascending (default) sort order.
- **DESC**

Specifies a descending sort order.
- **NULLS FIRST**

Specifies that null values appear before non-null values in the sort ordering. This is the default when **DESC** is specified.
- **NULLS LAST**

Specifies that null values appear after non-null values in the sort ordering. This is the default when **DESC** is not specified.
- **WITH ({storage_parameter = value} [, ...])**

Specifies the storage parameter used for an index.

Value range:

For indexes other than Psort, you can also set it to **FILLFACTOR**. Only non-partitioned B-tree indexes support the **DEDUPLICATION** parameter.

 - **FILLFACTOR**

The fill factor of an index is a percentage from 10 to 100. In the scenario where a large number of concurrent insertions are performed and the key value range is dense, select a smaller fill factor when the contention of the same index page is high during the insertion.

Value range: 10–100
 - **ACTIVE_PAGES**

Specifies the number of index pages, which may be less than the actual number of physical file pages and can be used for optimization. Currently, this parameter is valid only for the local index of the Ustore partitioned table and will be updated by VACUUM and ANALYZE (including AUTOVACUUM). You are not advised to manually set this parameter because it is invalid in distributed mode.
 - **DEDUPLICATION**

Specifies whether to deduplicate and compress tuples with duplicate key values. This is an index parameter. When there are a large number of indexes with duplicate key values, enabling this parameter can effectively reduce the space occupied by indexes. This parameter does not take effect for primary key indexes and unique indexes. If non-unique indexes are used and the index key value duplication rate is low or the index key values are unique, enabling this parameter will slightly deteriorate the index insertion performance. Currently, local and global indexes of partitioned tables are not supported.

Value range: Boolean value. The default value is the value of the **enable_default_index_deduplication** GUC parameter (the default value is **off**).

- **TABLESPACE tablespace_name**

Specifies the tablespace for an index. If no tablespace is specified, the default tablespace is used.

Value range: an existing table name

- **WHERE predicate**

Creates a partial index. A partial index is an index that contains entries for only a portion of a table, usually a portion that is more useful for indexing than the rest of the table. For example, if you have a table that contains both billed and unbilled orders where the unbilled orders take up a small fraction of the total table and yet that is an often used portion, you can improve performance by creating an index on just that portion. In addition, **WHERE** with **UNIQUE** can be used to enforce uniqueness over a subset for a table.

Value range: The predicate expression can only refer to columns of the underlying table, but it can use all columns, not just the ones being indexed. Currently, subqueries and aggregate expressions are forbidden in **WHERE**. You are advised not to use numeric types such as int for predicate, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

For a partitioned table index, if the created index contains the GLOBAL or LOCAL keyword or the created index is a GLOBAL index, the WHERE clause cannot be used to create an index.

- **PARTITION index_partition_name**

Specifies the name of an index partition.

Value range: a string. It must comply with the [naming convention](#).

- **TABLESPACE index_partition_tablespace**

Specifies the tablespace of an index partition.

Value range: If this parameter is not specified, the value of **index_tablespace** is used.

Examples

```
-- Create the tpcds.ship_mode_t1 table.
gaussdb=# create schema tpcds;
gaussdb=# CREATE TABLE tpcds.ship_mode_t1
(
  SM_SHIP_MODE_SK      INTEGER      NOT NULL,
  SM_SHIP_MODE_ID     CHAR(16)     NOT NULL,
  SM_TYPE              CHAR(30)    ,
```

```
SM_CODE          CHAR(10)          ,
SM_CARRIER      CHAR(20)          ,
SM_CONTRACT     CHAR(20)
)
DISTRIBUTE BY HASH(SM_SHIP_MODE_SK);

-- Create a common unique index on the SM_SHIP_MODE_SK column in the tpcds.ship_mode_t1 table.
gaussdb=# CREATE UNIQUE INDEX ds_ship_mode_t1_index1 ON tpcds.ship_mode_t1(SM_SHIP_MODE_SK);

-- Create a B-tree index on the SM_SHIP_MODE_SK column in the tpcds.ship_mode_t1 table.
gaussdb=# CREATE INDEX ds_ship_mode_t1_index4 ON tpcds.ship_mode_t1 USING
btree(SM_SHIP_MODE_SK);

-- Create an expression index on the SM_CODE column in the tpcds.ship_mode_t1 table:
gaussdb=# CREATE INDEX ds_ship_mode_t1_index2 ON tpcds.ship_mode_t1(SUBSTR(SM_CODE,1,4));

-- Create a partial index on the SM_SHIP_MODE_SK column where SM_SHIP_MODE_SK is greater than 10
in the tpcds.ship_mode_t1 table.
gaussdb=# CREATE UNIQUE INDEX ds_ship_mode_t1_index3 ON tpcds.ship_mode_t1(SM_SHIP_MODE_SK)
WHERE SM_SHIP_MODE_SK>10;

-- Create an index on the SM_SHIP_MODE_SK column of table tpcds.ship_mode_t1 in a mode that does
not block DML.
gaussdb=# CREATE INDEX CONCURRENTLY ds_ship_mode_t1_index4 ON
tpcds.ship_mode_t1(SM_SHIP_MODE_SK);

-- Rename an existing index.
gaussdb=# ALTER INDEX tpcds.ds_ship_mode_t1_index1 RENAME TO ds_ship_mode_t1_index5;

-- Set the index as unusable.
gaussdb=# ALTER INDEX tpcds.ds_ship_mode_t1_index2 UNUSABLE;

-- Rebuild an index.
gaussdb=# ALTER INDEX tpcds.ds_ship_mode_t1_index2 REBUILD;

-- Delete an existing index.
gaussdb=# DROP INDEX tpcds.ds_ship_mode_t1_index2;

-- Delete the table.
gaussdb=# DROP TABLE tpcds.ship_mode_t1;

-- Create a tablespace.
gaussdb=# CREATE TABLESPACE example1 RELATIVE LOCATION 'tablespace1/tablespace_1';
gaussdb=# CREATE TABLESPACE example2 RELATIVE LOCATION 'tablespace2/tablespace_2';
gaussdb=# CREATE TABLESPACE example3 RELATIVE LOCATION 'tablespace3/tablespace_3';
gaussdb=# CREATE TABLESPACE example4 RELATIVE LOCATION 'tablespace4/tablespace_4';
-- Create the tpcds.customer_address_p1 table.
gaussdb=# CREATE TABLE tpcds.customer_address_p1
(
CA_ADDRESS_SK      INTEGER          NOT NULL,
CA_ADDRESS_ID     CHAR(16)         NOT NULL,
CA_STREET_NUMBER  CHAR(10)

gaussdb=# DROP TABLESPACE example4;
```

Helpful Links

[ALTER INDEX](#) and [DROP INDEX](#)

Suggestions

- create index

You are advised to create indexes on:

- Columns that are often queried
- Join conditions. For a query on joined columns, you are advised to create a composite index on the columns. For example, for **select * from t1 join t2 on t1.a=t2.a and t1.b=t2.b**, you can create a composite index on columns **a** and **b** in table **t1**.
- Columns having filter criteria (especially scope criteria) of a **where** clause

- Columns that appear after **order by**, **group by**, and **distinct**

Constraints:

- An index of an ordinary table supports a maximum of 32 columns. A GLOBAL index of a partitioned table supports a maximum of 31 columns.
- The size of a single index cannot exceed the size of the index page (8 KB). The size of a B-tree or UB-tree index cannot exceed one-third of the page size.
- Partial indexes cannot be created in a partitioned table.

7.14.61 CREATE LANGUAGE

This version does not support this syntax.

7.14.62 CREATE MASKING POLICY

Description

Creates a masking policy.

Precautions

Only users with the poladmin or sysadmin permission, or the initial user can perform this operation.

The masking policy takes effect only after the security policy is enabled, that is, **enable_security_policy** is set to **on**.

CAUTION

When you use database links to perform operations on remote objects, the client initiates a database link request. The actual sender is the server, and the attributes such as the IP address of the sender are the values of the server. For details, see [DATABASE LINK](#).

Syntax

```
CREATE MASKING POLICY policy_name masking_clause[, ...] [ policy_filter_clause ] [ENABLE | DISABLE];
```

- **masking_clause**
masking_function ON LABEL(label_name[, ...])

- **masking_function**

maskall is not a preset function. It is hard-coded and cannot be displayed by running **\df**.

Eight preset masking methods or user-defined functions

```
{ maskall | randommasking | creditcardmasking | basicemailmasking | fullemailmasking |  
shufflemasking | alldigitsmasking | regexmasking }
```

- **policy_filter_clause**:
FILTER ON { FILTER_TYPE (filter_value [, ...]) } [, ...]

- **FILTER_TYPE**:
IP | APP | ROLES

Parameters

- **policy_name**
Specifies the audit policy name, which must be unique.
Value range: a string. It must comply with the [naming convention](#).
- **label_name**
Specifies the resource label name.
- **masking_clause**
Specifies the masking function to be used to anonymize database resources labeled by **label_name**. **schema.function** can be used to specify the masking function.
- **policy_filter**
Specifies the users for which the masking policy takes effect. If this parameter is left empty, the masking policy takes effect for all users.
- **FILTER_TYPE**
Specifies the types of information to be filtered by the policy, including **IP**, **APP**, and **ROLES**.
- **filter_value**
Indicates the detailed information to be filtered, such as the IP address, app name, and username.
- **ENABLE|DISABLE**
Enables or disables the masking policy. If **ENABLE|DISABLE** is not specified, **ENABLE** is used by default.

Examples

```
-- Create users dev_mask and bob_mask.
gaussdb=# CREATE USER dev_mask PASSWORD '*****';
gaussdb=# CREATE USER bob_mask PASSWORD '*****';

-- Create table tb_for_masking.
gaussdb=# CREATE TABLE tb_for_masking(idx int, col1 text, col2 text, col3 text, col4 text, col5 text, col6
text, col7 text,col8 text);
gaussdb=# INSERT INTO tb_for_masking VALUES(1, '9876543210', 'usr321usr', 'abc@huawei.com',

7.14.63 CREATE MATERIALIZED VIEW

CREATE MATERIALIZED VIEW creates a complete-refresh materialized view, and you can use **REFRESH MATERIALIZED VIEW** (full refresh) to refresh the data in the materialized view.

CREATE MATERIALIZED VIEW is similar to **CREATE TABLE AS**, but it remembers the query used to initialize the view, so it can refresh data later. A materialized view has many attributes that are the same as those of a table, but does not support temporary materialized views.

Precautions

- Complete-refresh materialized views cannot be created in temporary tables or global temporary tables.
- Complete-refresh materialized views do not support NodeGroups.
- After a complete-refresh materialized view is created, most DDL operations in the base table are no longer supported.
- IUD operations cannot be performed on complete-refresh materialized views.
- After a complete-refresh materialized view is created, if the base table data changes, you need to run the refresh command to synchronize the materialized view with the base table.
- The Ustore engine does not support the creation and use of materialized views.

Syntax

```
CREATE MATERIALIZED VIEW mv_name  
  [ (column_name [, ...] ) ]  
  [ WITH ( {storage_parameter = value} [, ...] ) ]  
  [ TABLESPACE tablespace_name ]  
  AS query;
```

Parameter Description

- **mv_name**
Name (optionally schema-qualified) of the materialized view to be created.
Value range: a string. It must comply with the [naming convention](#).
- **column_name**
Column name in the new materialized view. The materialized view supports specified columns. The number of specified columns must be the same as the number of columns in the result of the subsequent query statement. If no column name is provided, the column name is obtained from the output column name of the query.
Value range: a string. It must comply with the [naming convention](#).
- **WITH (storage_parameter [= value] [, ...])**
Specifies an optional storage parameter for a table or an index. For details, see [CREATE TABLE](#).
- **TABLESPACE tablespace_name**
Tablespace to which the new materialized view belongs. If the tablespace is not specified, the default tablespace is used.
- **AS query**
SELECT, **TABLE**, or **VALUES** command This query will be run in a security-constrained operation.

Examples

```
-- Create an ordinary table.  
gaussdb=# CREATE TABLE my_table (c1 int, c2 int);  
  
-- Create a complete-refresh materialized view.  
gaussdb=# CREATE MATERIALIZED VIEW my_mv AS SELECT * FROM my_table;
```

```
-- Write data to the base table.
gaussdb=# INSERT INTO my_table VALUES(1,1),(2,2);

-- Completely refresh the complete-refresh materialized view my_mv.
gaussdb=# REFRESH MATERIALIZED VIEW my_mv;

-- Delete a complete-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_mv;

-- Delete the ordinary table my_table.
gaussdb=# DROP TABLE my_table;
```

7.14.64 CREATE MODEL

This syntax is not supported in distributed scenarios.

7.14.65 CREATE NODE

Description

Creates a cluster node.

Precautions

CREATE NODE is an interface of the cluster management tool. You are not advised to use this interface, because doing so affects the cluster. Only the administrator has the permission to use this interface.

Syntax

```
CREATE NODE nodename WITH
(
  [ TYPE = nodetype,]
  [ HOST = hostname,]
  [ PORT = portnum,]
  [ HOST1 = 'hostname',]
  [ PORT1 = portnum,]
  [ HOSTPRIMARY [ = boolean ],]
  [ PRIMARY [ = boolean ],]
  [ PREFERRED [ = boolean ],]
  [ SCTP_PORT = portnum,]
  [ CONTROL_PORT = portnum,]
  [ SCTP_PORT1 = portnum,]
  [ CONTROL_PORT1 = portnum ]
);
```

Parameters

- **nodename**
Specifies the node name.
Value range: a string. It must comply with the [naming convention](#).
- **TYPE = nodetype**

Specifies the type of a node.

Value range:

- 'coordinator'
- 'datanode'

- **HOST = hostname**

Specifies the primary server name or IP address of a node.

- **PORT = portnum**

Specifies the primary server port to which a node is bound.

- **HOST1 = hostname**

Specifies the name or IP address of the standby server of a node.

- **PORT1 = portnum**

Specifies the port number of the standby server to which a node is bound.

- **HOSTPRIMARY**

- **PRIMARY = boolean**

Specifies whether the node is a primary node or not. A primary node allows read/write operations. A non-primary node allows only read operations.

Value range:

- **true**
- **false** (default value)

- **PREFERRED = boolean**

Specifies whether the node is a preferred node for read operations.

Value range:

- **true**
- **false** (default value)

- **SCTP_PORT = portnum**

Specifies the port used by the TCP proxy communications library of the primary node to listen on the data transmission channel. TCP is used to listen on connections.

- **CONTROL_PORT = portnum**

Specifies the port used by the TCP proxy communications library of the primary server to listen on the control channel. It may be a TCP port.

- **SCTP_PORT1 = portnum**

Specifies the port used by the TCP proxy communications library of the standby node to listen on the data transmission channel. TCP is used to listen on connections.

- **CONTROL_PORT 1= portnum**

Specifies the port used by the TCP proxy communications library of the standby server to listen on the control channel. It is a TCP port.

Helpful Links

[ALTER NODE](#) and [DROP NODE](#)

7.14.66 CREATE NODE GROUP

Description

Creates a cluster node group.

Precautions

- CREATE NODE GROUP is an interface of the cluster management tool.
- Only a system administrator has the permission.

Syntax

```
CREATE NODE GROUP groupname  
  WITH ( nodename [, ... ] ) [bucketcnt bucket_cnt]  
  [ BUCKETS [ ( bucketnumber [, ... ] ) ] ] [VCGROUP] [DISTRIBUTE FROM src_group_name] [groupparent  
parent_group_name];
```

Parameters

- **groupname**

Specifies the name of a node group.

Value range: a string. It must comply with the [naming convention](#). A value can contain a maximum of 63 characters.

NOTE

A node group name supports all ASCII characters, but you are advised to name a node group according to the naming convention.

- **nodename**

Specifies the node name.

Value range: a string. It must comply with the [naming convention](#). A value can contain a maximum of 63 characters.

If this parameter is not specified, the value of **bucketcnt** must be specified, indicating that child node groups belonging to the installation node group will be created.

- **bucketcnt bucket_cnt**

bucket_cnt indicates the number of buckets.

The value range is [32,16384) and the value must be a power of 2.

If this parameter is not specified, the value of **WITH** must be specified.

- **BUCKETS [(bucketnumber [, ...])]**

Designed for internal use of the cluster management tool. You are advised not to use it directly. Otherwise, the cluster may be affected.

- **groupparent parent_group_name**

parent_group_name indicates the name of the parent node group to which the current child node group belongs.

Helpful Links

[DROP NODE GROUP](#)

7.14.67 CREATE PROCEDURE

Description

Creates a stored procedure.

Precautions

- If the parameters or return values of a stored procedure have precision, the precision is not checked.
- When creating a stored procedure, you are advised to explicitly specify the schemas of all operations on table objects in the stored procedure definition. Otherwise, the stored procedure may fail to be executed.
- **current_schema** and **search_path** specified by **SET** during stored procedure creation are invalid. **search_path** and **current_schema** before and after function execution should be the same.
- When the function is called by **SELECT** or **CALL**, an argument must be provided in the output parameter. The argument does not take effect.
- Do not create an overloaded stored procedure with different parameter names but same stored procedure name and parameter list type.
- Do not create a stored procedure that has the same name and parameter list as the function.
- Do not overload stored procedures with different default values.
- Only the **IN**, **OUT**, and **INOUT** parameters of the stored procedure cannot be reloaded after the GUC parameter **behavior_compat_options** is set to '**proc_outparam_override**'. They can be reloaded after the parameter is disabled.
- When an overloaded stored procedure is called, the variable type must be specified.
- If an undeclared variable is used in a stored procedure, an error is reported when the stored procedure is called.
- When you create a procedure, you cannot insert aggregate functions or other functions out of the average function.
- If a function is defined as **IMMUTABLE** or **SHIPPABLE**, avoid **INSERT**, **UPDATE**, **DELETE**, **MERGE**, and **DDL** operations in the function because the CN needs to determine the execution node for these operations. Otherwise, an error may occur.
- The stored procedure does not support operations that will return a set.
- When stored procedures without parameters are called in another stored procedure, you can omit brackets and call stored procedures using their names directly.
- When other functions with output parameters are called in a stored procedure and an assignment expression, set the GUC parameter **set behavior_compat_options** to '**proc_outparam_override**', define variables of the same type as the output parameters in advance, and use the variables as output parameters to call other functions with output parameters for the output parameters to take effect. Otherwise, the output parameters of the called function will be ignored.

- The stored procedure supports viewing, exporting, and importing parameter comments.
- The stored procedure supports viewing, exporting, and importing parameter comments between IS/AS and plsql_body.
- Users granted with the CREATE ANY FUNCTION permission can create or replace stored procedures in the user schemas.
- The default permission on a stored procedure is **SECURITY INVOKER**. To change the default permission to **SECURITY DEFINER**, set the GUC parameter **behavior_compat_options** to **plsql_security_definer**.
- When a stored procedure is created, it depends on an undefined object. If **behavior_compat_options** is set to **plpgsql_dependency**, the creation can be executed, and a warning message is displayed. If **behavior_compat_options** is not set to **plpgsql_dependency**, the creation cannot be executed.
- When separation of duties is enabled, stored procedures with the definer specified can be rebuilt only by the current user. Only the initial user can alter the stored procedures to other users.
- If a stored procedure with the definer specified is created in a schema of another user, the stored procedure will be executed by another user, which may cause unauthorized operations. Therefore, exercise caution when performing this operation.
- If the **out** parameter is used as the output parameter in an expression, the expression does not take effect in the following scenarios: (a) The **execute immediate sqlv using func** syntax is used to execute a function. (b) The **select func into** syntax is used to execute a function. (c) DML statements such as INSERT and UPDATE are used to execute a function. (d) The **select where a=func()** statement is used. (e) When a function with the **out** output parameter is used as an input parameter, that is, **fun (func (out b), a)**, the **out b** parameter does not take effect.
- When a stored procedure with the out parameter is called, you can set the GUC parameter **set behavior_compat_options = 'proc_outparam_transfer_length'** to transfer the parameter length. The specifications and constraints are as follows:
 - a. The following types are supported: CHAR(n), CHARACTER(n), NCHAR(n), VARCHAR(n), VARYING(n), VARCHAR2(n), and NVARCHAR2(n).
 - b. If the out parameter does not take effect (for example, **perform**), the length does not need to be transferred.
 - c. The following types do not support precision transfer: NUMERIC, DECIMAL, NUMBER, FLOAT, DEC, INTEGER, TIME, TIMESTAMP, INTERVAL, TIME WITH TIME ZONE, TIMESTAMP WITH TIME ZONE, TIME WITHOUT TIME ZONE, and TIMESTAMP WITHOUT TIME ZONE.
 - d. The parameter length can be transferred regardless of whether the GUC parameter **set behavior_compat_options** is set to **proc_outparam_override**.

Syntax

```
gaussdb=# CREATE [ OR REPLACE ] PROCEDURE procedure_name  
[ ( ( [ argname ] [ argmode ] argtype [ { DEFAULT | := | = } expression ] ) [... ] ) ]  
[
```

```
{ IMMUTABLE | STABLE | VOLATILE }  
| { SHIPPABLE | NOT SHIPPABLE }  
| [ NOT ] LEAKPROOF  
| { CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }  
| {[ EXTERNAL ] SECURITY INVOKER | [ EXTERNAL ] SECURITY DEFINER | AUTHID DEFINER | AUTHID  
CURRENT_USER}  
| COST execution_cost  
| SET configuration_parameter { [ TO | = ] value | FROM CURRENT }  
][ ... ]  
{ IS | AS }  
plsql_body  
/
```

Parameters

- **OR REPLACE**
Replaces the original definition when two stored procedures are with the same name.
- **procedure_name**
Specifies the name of the stored procedure that is created (optionally with schema names).
Value range: a string. It must comply with the [naming convention](#).
- **argmode**
Specifies the mode of an argument.

NOTICE

VARIADIC specifies parameters of the array type.

Value range: **IN**, **OUT**, **INOUT**, and **VARIADIC**. The default value is **IN**. Only the parameter of the **OUT** mode can be followed by **VARIADIC**. The parameters of **OUT** and **INOUT** cannot be used in procedure definition of **RETURNS TABLE**.

- **argname**
Specifies the argument name.
Value range: a string. It must comply with the [naming convention](#).
- **argtype**
Specifies the type of an argument. You can use **%ROWTYPE** to indirectly reference the type of a table.
Value range: a valid data type
- **expression**
Specifies the default expression of a parameter.

 NOTE

- If **a_format_version** is set to **10c** and **a_format_dev_version** is set to **s2**, the default expression is not supported when the parameter is in INOUT mode.
 - It is recommended that you define all default parameters after all non-default parameters.
 - If a function with default parameters is called, input parameters are added to the function from left to right. If inputs of non-default parameters are missing, an error is reported.
 - If **proc_uncheck_default_param** is enabled and a function with default parameters is called, input parameters are added to the function from left to right. The number of defaulted inputs depends on the number of default parameters. If an input of a non-default parameter is missing, the previous default value is used to fill this parameter.
 - When **a_format_version** is set to **10c**, **a_format_dev_version** is set to **s1**, **proc_outparam_override** is disabled, and the function parameters include the output parameter **out** and **default**, the default value cannot be used.
- **IMMUTABLE, STABLE,...**
Specifies a constraint. The function of each parameter is similar to that of CREATE FUNCTION. For details, see [CREATE FUNCTION](#).
 - **plsql_body**
Specifies the PL/SQL stored procedure body.

NOTICE

When you perform password-related operations, such as user creation, password change, and encryption/decryption, in a stored procedure, the password will be recorded in the system catalogs and logs in plaintext. To prevent sensitive information leakage, you are not advised to perform password-related operations in a stored procedure.

 NOTE

No specific order is applied to **argname** and **argmode**. The following order is advised: **argname**, **argmode**, and **argtype**.

Examples

```
-- Create a stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE prc_add
(
    param1 IN INTEGER,
    param2 IN OUT INTEGER
)
AS
BEGIN
    param2:= param1 + param2;
    db_output.print_line('result is: '||to_char(param2));
END;
/

-- Call the stored procedure.
gaussdb=# SELECT prc_add(2,3);

-- Create a stored procedure whose parameter type is VARIADIC.
gaussdb=# CREATE OR REPLACE PROCEDURE pro_variadic (var1 VARCHAR2(10) DEFAULT 'hello!',var4
VARIADIC int4[])
```

```
AS
BEGIN
    dbe_output.print_line(var1);
END;
/

-- Execute the stored procedure.
gaussdb=# SELECT pro_variadic(var1=>'hello', VARIADIC var4=> array[1,2,3,4]);

-- Create a stored procedure with the permission of the user who calls it.
gaussdb=# CREATE TABLE tb1(a integer);
gaussdb=# CREATE PROCEDURE insert_data(v integer)
SECURITY INVOKER
AS
BEGIN
    INSERT INTO tb1 VALUES(v);
END;
/

-- Call the stored procedure.
gaussdb=# CALL insert_data(1);

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE prc_add;
gaussdb=# DROP PROCEDURE pro_variadic;
gaussdb=# DROP PROCEDURE insert_data;
```

[DROP PROCEDURE](#)

Suggestions

- analyse | analyze
 - Do not run **ANALYZE** in a transaction or anonymous block.
 - Do not run **ANALYZE** in a function or stored procedure.

7.14.68 CREATE RESOURCE LABEL

Function

CREATE RESOURCE LABEL creates a resource label.

Precautions

Only user with the POLADMIN or SYSADMIN permission, or the initial user can perform this operation.

Syntax

```
CREATE RESOURCE LABEL [IF NOT EXISTS] label_name ADD label_item_list[, ...];
```

- label_item_list
resource_type(resource_path[, ...])
- resource_type
{ TABLE | COLUMN | SCHEMA | VIEW | FUNCTION }

Parameter Description

- **IF NOT EXISTS**

If a resource label with the same name already exists, no error is generated. Instead, a message is displayed, indicating that the resource label already exists.

- **label_name**
Specifies the resource label name, which must be unique.
Value range: a string. It must comply with the [naming convention](#).
- **resource_type**
Specifies the type of database resources to be labeled.
Value range: **TABLE**, **COLUMN**, **SCHEMA**, **VIEW**, and **FUNCTION**.
- **resource_path**
Specifies the path of database resources.

Examples

```
-- Create table tb_for_label.
gaussdb=# CREATE TABLE tb_for_label(col1 text, col2 text, col3 text);

-- Create schema schema_for_label.
gaussdb=# CREATE SCHEMA schema_for_label;

-- Create view view_for_label.
gaussdb=# CREATE VIEW view_for_label AS SELECT 1;

-- Create function func_for_label.
gaussdb=# CREATE FUNCTION func_for_label RETURNS TEXT AS $$ SELECT col1 FROM tb_for_label; $$
LANGUAGE SQL;

-- Create a resource label based on a table.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS table_label add TABLE(public.tb_for_label);

-- Create a resource label based on columns.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS column_label add COLUMN(public.tb_for_label.col1);

-- Create a resource label based on a schema.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS schema_label add SCHEMA(schema_for_label);

-- Create a resource label based on a view.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS view_label add VIEW(view_for_label);

-- Create a resource label based on a function.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS func_label add FUNCTION(func_for_label);

-- Delete a resource label.
gaussdb=# DROP RESOURCE LABEL func_label, view_label, schema_label, column_label, table_label;

-- Delete the func_for_label function.
gaussdb=# DROP FUNCTION func_for_label;

[ALTER RESOURCE LABEL](#) and [DROP RESOURCE LABEL](#)

7.14.69 CREATE ROLE

Description

Creates a role.

A role is an entity that owns database objects and permissions. In different environments, a role can be considered a user, a group, or both.

Precautions

- If a role is added to the database, the role does not have the login permission.
- Only the user who has the CREATE ROLE permission or a system administrator is allowed to create roles.

Syntax

```
CREATE ROLE role_name [ [ WITH ] option [ ... ] ] [ ENCRYPTED | UNENCRYPTED ] { PASSWORD | IDENTIFIED BY }- { 'password' [EXPIRED] | DISABLE };
```

The syntax of role information configuration clause option is as follows:

```
{SYSADMIN | NOSYSADMIN}  
| {MONADMIN | NOMONADMIN}  
| {OPRADMIN | NOOPRADMIN}  
| {POLADMIN | NOPOLADMIN}  
| {AUDITADMIN | NOAUDITADMIN}  
| {CREATEDB | NOCREATEDB}  
| {USEFT | NOUSEFT}  
| {CREATEROLE | NOCREATEROLE}  
| {INHERIT | NOINHERIT}  
| {LOGIN | NOLOGIN}  
| {REPLICATION | NOREPLICATION}  
| {VCADMIN | NOVCADMIN}  
| {PERSISTENCE | NOPERSISTENCE}  
| CONNECTION LIMIT connlimit  
| VALID BEGIN 'timestamp'  
| VALID UNTIL 'timestamp'  
  
| USER GROUP 'groupuser'  
| PERM SPACE 'spacelimit'  
| TEMP SPACE 'tmpspacelimit'  
| SPILL SPACE 'spillspacelimit'  
| NODE GROUP logic_cluster_name  
| IN ROLE role_name [, ...]  
| IN GROUP role_name [, ...]  
| ROLE role_name [, ...]  
| ADMIN role_name [, ...]  
| USER role_name [, ...]  
| SYSID uid  
| DEFAULT TABLESPACE tablespace_name  
| PROFILE DEFAULT  
| PROFILE profile_name  
| PGUSER
```

Parameters

- **role_name**
Specifies the name of a role.
Value range: a string. It must comply with the [naming convention](#). A value can contain a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the

role name. If a role name contains uppercase letters, the database automatically converts the uppercase letters into lowercase letters. To create a role name that contains uppercase letters, enclose the role name with double quotation marks ("").

- **password**

Specifies the login password.

A new password must:

- Contain at least eight characters. This is the default length.
- Differ from the role name or the role name spelled backward.
- Contain at least three of the following character types: uppercase characters, lowercase characters, digits, and special characters (limited to ~!@#\$%^&*()-_+=\|[{]};:;<.>/?). If the password contains characters other than the preceding characters, an error will be reported during statement execution.
- The password can also be a ciphertext character string that meets the format requirements. This mode is mainly used to import user data. You are advised not to use it directly. If a ciphertext password is used, the user must know the plaintext corresponding to the ciphertext password and ensure that the plaintext password meets the complexity requirements. The database does not verify the complexity of the ciphertext password. Instead, the security of the ciphertext password is ensured by the user.
- Be enclosed by single quotation marks when a role is created.

Value range: a character string that cannot be empty.

- **EXPIRED**

When creating a user, you can select **EXPIRED**. That is, you can create a user whose password is invalid. The user cannot perform simple query or extended query. The statement can be executed only after the password is changed.

- **DISABLE**

By default, you can change your password unless it is disabled. To disable the password of a user, use this parameter. After the password of a user is disabled, the password will be deleted from the system. The user can connect to the database only through external authentication, for example, Kerberos authentication. Only administrators can enable or disable a password. Common users cannot disable the password of an initial user. To enable a password, run **ALTER USER** and specify the password.

- **ENCRYPTED | UNENCRYPTED**

Controls whether the password is stored encrypted in the system catalogs. According to product security requirement, the password must be stored encrypted. Therefore, **UNENCRYPTED** is forbidden in GaussDB. If the password string has already been encrypted in the SHA256 format, it is stored encrypted as it was, regardless of whether **ENCRYPTED** or **UNENCRYPTED** is specified (since the system cannot decrypt the specified encrypted password string). This allows reloading of encrypted passwords during dump/restore.

- **SYSADMIN | NOSYSADMIN**

Specifies whether a new role is a system administrator. Roles with the **SYSADMIN** attribute have the highest permission.

Value range: If not specified, **NOSYSADMIN** is the default.

When separation of duties is enabled, users with the SYSADMIN permission do not have the permission to create users.

- **MONADMIN | NOMONADMIN**
Specifies whether a role is a monitor administrator.
Value range: If not specified, **NOMONADMIN** is the default.
- **OPRADMIN | NOOPRADMIN**
Specifies whether a role is an O&M administrator.
Value range: If not specified, **NOOPRADMIN** is the default.
- **POLADMIN | NOPOLADMIN**
Specifies whether a role is a security policy administrator.
Value range: If not specified, **NOPOLADMIN** is the default.
- **AUDITADMIN | NOAUDITADMIN**
Specifies whether a role has the audit and management attributes.
If not specified, **NOAUDITADMIN** is the default.
- **CREATEDB | NOCREATEDB**
Specifies a role's permission to create databases.
A new role does not have the permission to create databases.
Value range: If not specified, **NOCREATEDB** is the default.
- **USEFT | NOUSEFT**
This parameter is reserved and not used in this version.
- **CREATEROLE | NOCREATEROLE**
Specifies whether a role will be permitted to create new roles (that is, execute **CREATE ROLE** and **CREATE USER**). A role with the CREATEROLE permission can also modify and delete other roles.
Value range: If not specified, **NOCREATEROLE** is the default.
 - When separation of duties is disabled, users with the CREATEROLE permission can create users with the CREATEROLE, AUDITADMIN, MONADMIN, POLADMIN, or CREATEDB permission and common users.
 - When separation of duties is enabled, users with the CREATEROLE permission can create users with the CREATEROLE, MONADMIN, POLADMIN, or CREATEDB permission and common users.
- **INHERIT | NOINHERIT**
Specifies whether a role "inherits" the permissions of roles in the same group. It is not recommended.
- **LOGIN | NOLOGIN**
Specifies whether a role is allowed to log in to a database. A role having the **LOGIN** attribute can be considered as a user.
Value range: If not specified, **NOLOGIN** is the default.
- **REPLICATION | NOREPLICATION**
Specifies whether a role is allowed to initiate streaming replication or put the system in and out of backup mode. A role having the **REPLICATION** attribute is specific to replication.
If not specified, **NOREPLICATION** is the default.

- **PERSISTENCE | NOPERSISTENCE**
Defines a permanent user. Only the initial user is allowed to create, modify, and delete permanent users with the PERSISTENCE attribute.
- **CONNECTION LIMIT**
Specifies how many concurrent connections the role can make.

NOTICE

- The system administrator is not restricted by this parameter.
- **conlimit** is calculated for each CN. The number of connections in a cluster is calculated using the following formula: Number of connections in a cluster = **conlimit** x Number of normal CNs.

Value range: an integer in the range $[-1, 2^{31} - 1]$. The default value is **-1**, which means unlimited.

- **VALID BEGIN**
Sets the timestamp when a role takes effect. If this clause is omitted, the role has no valid start time. **timestamp** indicates the start time. The format is 'YYYY-MM-DD HH:mm:ss'.
- **VALID UNTIL**
Sets a date and time after which the role's password is no longer valid. If this clause is omitted, the role has no valid end time. **timestamp** indicates the end time. The format is 'YYYY-MM-DD HH:mm:ss'.
- **RESOURCE POOL**
Sets the name of resource pool used by the role. The name belongs to the system catalog **pg_resource_pool**.
- **USER GROUP 'groupuser'**
Creates a sub-user.
- **PERM SPACE**
Sets the space available for a user.
- **TEMP SPACE**
Sets the space allocated to the temporary table of a user.
- **SPILL SPACE**
Sets the operator disk flushing space of a user.
- **IN ROLE**
Lists one or more existing roles to which the new role will be immediately added as a new member. It is not recommended.
- **IN GROUP**
Specifies an obsolete spelling of **IN ROLE**. It is not recommended.
- **ROLE**
Lists one or more existing roles which are automatically added as members of the new role.
- **ADMIN**

Similar to **ROLE**. However, **ADMIN** grants permissions of new roles to other roles.

- **USER**
Specifies an obsolete spelling of the **ROLE** clause.
- **SYSID**
The **SYSID** clause is ignored.
- **DEFAULT TABLESPACE**
The **DEFAULT TABLESPACE** clause is ignored.
- **PROFILE**
The **PROFILE** clause is ignored.
- **PGUSER**
In the current version, this attribute is reserved only for forward compatibility.

Examples

```
-- Create a role manager whose password is *****
gaussdb=# CREATE ROLE manager IDENTIFIED BY '*****';

-- Create a role with its validity from January 1, 2015 to January 1, 2026.
gaussdb=# CREATE ROLE miriam WITH LOGIN PASSWORD '*****' VALID BEGIN '2015-01-01' VALID UNTIL
'2026-01-01';

-- Change the password of role manager to *****.
gaussdb=# ALTER ROLE manager IDENTIFIED BY '*****' REPLACE '*****';

-- Change role manager to the system administrator.
gaussdb=# ALTER ROLE manager SYSADMIN;

-- Delete role manager.
gaussdb=# DROP ROLE manager;

-- Delete role miriam.
gaussdb=# DROP ROLE miriam;
```

[SET ROLE](#), [ALTER ROLE](#), [DROP ROLE](#), [GRANT](#), and [REVOKE](#)

7.14.70 CREATE ROW LEVEL SECURITY POLICY

Description

Creates a row-level security policy for a table.

The policy takes effect only after row-level security is enabled (by running **ALTER TABLE... ENABLE ROW LEVEL SECURITY**). Otherwise, this statement does not take effect.

Currently, row-level security affects the read (**SELECT**, **UPDATE**, and **DELETE**) of data tables and does not affect the write (**INSERT** and **MERGE INTO**) of data tables. The table owner or system administrators can create an expression in the **USING** clause. When the client reads the data table, the database server combines the expressions that meet the condition and applies it to the execution plan in the statement rewriting phase of a query. For each tuple in a data table, if the

expression returns **TRUE**, the tuple is visible to the current user; if the expression returns **FALSE** or **NULL**, the tuple is invisible to the current user.

A row-level security policy name is specific to a table. A data table cannot have row-level security policies with the same name. Different data tables can have the same row-level security policy.

Row-level security policies can be applied to specified operations (**SELECT**, **UPDATE**, **DELETE**, and **ALL**). **ALL** indicates that **SELECT**, **UPDATE**, and **DELETE** will be affected. For a new row-level security policy, the default value **ALL** will be used if you do not specify the operations that will be affected.

Row-level security policies can be applied to a specified user (role) or to all users (**PUBLIC**). For a new row-level security policy, the default value **PUBLIC** will be used if you do not specify the user that will be affected.

Precautions

- Row-level security policies can be defined for row-store tables, row-store partitioned tables, replication tables, unlogged tables, and hash tables.
- Row-level security policies cannot be defined for foreign tables and temporary tables.
- Row-level security policies cannot be defined for views.
- A maximum of 100 row-level security policies can be defined for a table.
- System administrators are not affected by row-level security policies and can view all data in a table.
- Tables queried by using SQL statements, views, functions, and stored procedures are affected by row-level security policies.
- The data type of a table column to which a row-level security policy has been added cannot be changed.

Syntax

```
CREATE [ ROW LEVEL SECURITY ] POLICY policy_name ON table_name
[ AS { PERMISSIVE | RESTRICTIVE } ]
[ FOR { ALL | SELECT | UPDATE | DELETE } ]
[ TO { role_name | PUBLIC | CURRENT_USER | SESSION_USER } [, ...] ]
USING ( using_expression )
```

Parameters

- **policy_name**
Specifies the name of a row-level security policy to be created. The names of row-level security policies for a table must be unique.
- **table_name**
Specifies the name of a table to which a row-level security policy is applied.
- **PERMISSIVE | RESTRICTIVE**
PERMISSIVE enables the permissive row-level security policy. The conditions of the permissive policy are joined through the OR expression. **RESTRICTIVE** enables the restrictive row-level security policy. The conditions of the restrictive policy are joined through the AND expression. The join methods are as follows:

(using_expression_permissive_1 OR using_expression_permissive_2 ...) AND
(using_expression_restrictive_1 AND using_expression_restrictive_2 ...)

The default value is **PERMISSIVE**.

- **command**

Specifies the SQL operations affected by a row-level security policy, including **ALL**, **SELECT**, **UPDATE**, and **DELETE**. If this parameter is not specified, the default value **ALL** will be used, covering **SELECT**, **UPDATE**, and **DELETE**.

If **command** is set to **SELECT**, only tuple data that meets the condition (the return value of **using_expression** is **TRUE**) can be queried. The operations that are affected include **SELECT**, **SELECT FOR UPDATE/SHARE**, **UPDATE ... RETURNING**, and **DELETE ... RETURNING**.

If **command** is set to **UPDATE**, only tuple data that meets the condition (the return value of **using_expression** is **TRUE**) can be updated. The operations that are affected include **UPDATE**, **UPDATE ... RETURNING**, and **SELECT ... FOR UPDATE/SHARE**.

If **command** is set to **DELETE**, only tuple data that meets the condition (the return value of **using_expression** is **TRUE**) can be deleted. The operations that are affected include **DELETE** and **DELETE ... RETURNING**.

The following table describes the relationship between row-level security policies and SQL statements.

Table 7-161 Relationship between row-level security policies and SQL statements.

| Command | SELECT/ALL Policy | UPDATE/ALL Policy | DELETE/ALL Policy |
|--------------------------------|-------------------|-------------------|-------------------|
| SELECT | Existing row | No | No |
| SELECT FOR UPDATE/SHARE | Existing row | Existing row | No |
| UPDATE | No | Existing row | No |
| UPDATE RETURNING | Existing row | Existing row | No |
| DELETE | No | No | Existing row |
| DELETE RETURNING | Existing row | No | Existing row |

- **role_name**

Specifies database users affected by a row-level security policy.

CURRENT_USER indicates the username in the current execution environment. **SESSION_USER** indicates the session username. If this parameter is not specified, the default value **PUBLIC** is used, indicating that all database users are affected. You can specify multiple affected database users.

NOTICE

System administrators are not affected by row access control.

- **using_expression**

Specifies an expression defined for a row-level security policy (return type: Boolean).

The expression cannot contain aggregate functions or window functions. In the statement rewriting phase of a query, if row-level security for a data table is enabled, the expressions that meet the specified conditions will be added to the plan tree. The expression is calculated for each tuple in the data table. For **SELECT**, **UPDATE**, and **DELETE**, row data is visible to the current user only when the return value of the expression is **TRUE**. If the expression returns **FALSE**, the tuple is invisible to the current user. In this case, the user cannot view the tuple through the **SELECT** statement, update the tuple through the **UPDATE** statement, or delete the tuple through the **DELETE** statement.

Examples

```
-- Create user alice.
gaussdb=# CREATE USER alice PASSWORD '*****!';

-- Create user bob.
gaussdb=# CREATE USER bob PASSWORD '*****!';

-- Create data table all_data.
gaussdb=# CREATE TABLE public.all_data(id int, role varchar(100), data varchar(100));

-- Insert data into the data table.
gaussdb=# INSERT INTO all_data VALUES(1, 'alice', 'alice data');
gaussdb=# INSERT INTO all_data VALUES(2, 'bob', 'bob data');
gaussdb=# INSERT INTO all_data VALUES(3, 'peter', 'peter data');

-- Grant the read permission on the all_data table to users alice and bob.
gaussdb=# GRANT SELECT ON all_data TO alice, bob;

-- Enable the row-level security policy.
gaussdb=# ALTER TABLE all_data ENABLE ROW LEVEL SECURITY;

-- Create a row-level security policy to specify that the current user can view only their own data.
gaussdb=# CREATE ROW LEVEL SECURITY POLICY all_data_rls ON all_data USING(role = CURRENT_USER);

-- View information about the all_data table.
gaussdb=# \d+ all_data
          Table "public.all_data"
  Column |          Type          | Modifiers | Storage | Stats target | Description
-----+-----+-----+-----+-----+-----
  id     | integer                |           |         |              |
  role   | character varying(100) |           | extended |              |
  data   | character varying(100) |           | extended |              |

-- Delete the all_data table.
gaussdb=# DROP TABLE public.all_data;

-- Delete users alice and bob.
gaussdb=# DROP USER alice, bob;
```

Helpful Links

[DROP ROW LEVEL SECURITY POLICY](#)

7.14.71 CREATE SCHEMA

Description

Creates a schema.

Named objects are accessed either by "qualifying" their names with the schema name as a prefix, or by setting a search path that includes the desired schema. When creating named objects, you can also use the schema name as a prefix.

Optionally, CREATE SCHEMA can include sub-commands to create objects within the new schema. The sub-commands are treated essentially the same as separate commands issued after creating the schema. If the AUTHORIZATION clause is used, all the created objects are owned by this user.

Precautions

- Only a user with the CREATE permission on the current database can perform this operation.
- The owner of an object created by a system administrator in a schema with the same name as a common user is the common user, not the system administrator.

Syntax

- Create a schema based on a specified name.

```
CREATE SCHEMA schema_name  
[ AUTHORIZATION user_name ] [ schema_element [ ... ] ];
```
- Create a schema based on a username.

```
CREATE SCHEMA AUTHORIZATION user_name [ schema_element [ ... ] ];
```

Parameters

- **schema_name**
Specifies the schema name.

NOTICE

- The schema name must be unique in the current database.
- The schema name cannot be the same as the initial username of the current database.
- The schema name cannot start with pg_.
- The schema name cannot start with gs_role_.

Value range: a string. It must comply with the [naming convention](#).

- **AUTHORIZATION user_name**
Specifies the owner of a schema. If **schema_name** is not specified, **user_name** will be used as the schema name. In this case, **user_name** can only be a role name.
Value range: an existing username or role name
- **schema_element**
Specifies an SQL statement defining an object to be created within the schema. Currently, only CREATE TABLE, CREATE VIEW, CREATE INDEX, CREATE PARTITION, and GRANT are supported.
Objects created by sub-commands are owned by the user specified by AUTHORIZATION.

NOTE

If objects in the schema on the current search path are with the same name, specify the schemas for different objects. You can run **SHOW SEARCH_PATH** to check the schemas on the current search path.

Examples

```
-- Create the role1 role.  
gaussdb=# CREATE ROLE role1 IDENTIFIED BY '*****';
```

```
-- Create a schema named role1 for the role1 role. The owner of the films and winners tables created by  
the clause is role1.  
gaussdb=# CREATE SCHEMA AUTHORIZATION role1  
CREATE TABLE films (title text, release date, awards text[])  
CREATE VIEW winners AS  
SELECT title, release FROM films WHERE awards IS NOT NULL;  
  
-- Delete the schema.  
gaussdb=# DROP SCHEMA role1 CASCADE;  
-- Delete the user.  
gaussdb=# DROP USER role1 CASCADE;
```

Helpful Links

[ALTER SCHEMA](#) and [DROP SCHEMA](#)

7.14.72 CREATE SEQUENCE

Function

CREATE SEQUENCE adds a sequence to the current database. The owner of a sequence is the user who creates the sequence.

Precautions

- A sequence is a special table that stores arithmetic columns. Such a table is controlled by DBMS. It has no actual meaning and is usually used to generate unique identifiers for rows or tables.
- If a schema name is given, the sequence is created in the specified schema; otherwise, it is created in the current schema. The sequence name must be different from the names of other sequences, tables, indexes, views in the same schema.
- After the sequence is created, functions **nextval()** and **generate_series(1,N)** insert data to the table. Make sure that the number of times for invoking **nextval** is greater than or equal to N+1. Otherwise, errors will be reported because the number of times for invoking function **generate_series()** is N+1.
- A user granted with the CREATE ANY SEQUENCE permission can create sequences in the public and user schemas.

Syntax

```
CREATE SEQUENCE name [ INCREMENT [ BY ] increment ]  
[ MINVALUE minvalue | NO MINVALUE | NOMINVALUE ] [ MAXVALUE maxvalue | NO MAXVALUE |  
NOMAXVALUE ]  
[ START [ WITH ] start ] [ CACHE cache ] [ [ NO ] CYCLE | NOCYCLE ]  
[ OWNED BY { table_name.column_name | NONE } ];
```

Parameter Description

- **name**
Specifies the name of a sequence to be created.
Value range: a sting containing only lowercase letters, uppercase letters, special characters #_\$, and digits
- **increment**

Specifies the step for a sequence. A positive number generates an ascending sequence, and a negative number generates a decreasing sequence.

The default value is **1**.

 **NOTE**

In MySQL compatibility mode, if the step is a floating point number, the value is automatically converted to an integer. In other modes, this parameter cannot be set to a floating point number.

- **MINVALUE minvalue | NO MINVALUE| NOMINVALUE**

Specifies the minimum value of the sequence. If **MINVALUE** is not declared, or **NO MINVALUE** is declared, the default value of the ascending sequence is **1**, and that of the descending sequence is **-2⁶³-1**. **NOMINVALUE** is equivalent to **NO MINVALUE**.

- **MAXVALUE maxvalue | NO MAXVALUE| NOMAXVALUE**

Specifies the maximum value of the sequence. If **MAXVALUE** is not declared, or **NO MAXVALUE** is declared, the default value of the ascending sequence is **2⁶³-1**, and that of the descending sequence is **-1**. **NOMAXVALUE** is equivalent to **NO MAXVALUE**.

- **start**

Specifies the start value of the sequence. The default value for an ascending sequence is **minvalue** and that for a descending sequence is **maxvalue**.

- **cache**

Specifies the number of sequences stored in the memory for quick access purposes.

Default value **1** indicates that one sequence can be generated each time.

 **NOTE**

- It is not recommended that you define **cache** and **maxvalue** or **minvalue** at the same time. The continuity of sequences cannot be ensured after **cache** is defined because unacknowledged sequences may be generated, causing waste of sequences. If there are requirements on the concurrency performance, see the **session_sequence_cache** parameter.
- **cache** specifies the value that a single CN/DN applies for from the GTM at a time. **session_sequence_cache** specifies the value of the cache that a single session applies for from the CN/DN at a time. The value is automatically discarded after the session ends.
- **CYCLE**
Recycles sequences after the number of sequences reaches **maxvalue** or **minvalue**.
If **NO CYCLE** is specified, any invocation of **nextval** would return an error after the number of sequences reaches **maxvalue** or **minvalue**.
NOCYCLE is equivalent to **NO CYCLE**.
The default value is **NO CYCLE**.
If **CYCLE** is specified, the sequence uniqueness cannot be ensured.
- **OWNED BY-**
Associates a sequence with a specified column included in a table. In this way, the sequence will be deleted when you delete its associated column or the table where the column belongs to. The associated table and sequence must

be owned by the same user and in the same schema. **OWNED BY** only establishes the association between a table column and the sequence. Sequences on the column do not increase automatically when data is inserted.

The default value **OWNED BY NONE** indicates that such association does not exist.

NOTICE

You are not advised to use the sequence created using **OWNED BY** in other tables. If multiple tables need to share a sequence, the sequence must not belong to a specific table.

Examples

Create an ascending sequence named **serial**, which starts from 101.

```
gaussdb=# CREATE SEQUENCE serial
START 101
CACHE 20;
```

Select the next number from the sequence.

```
gaussdb=# SELECT nextval('serial');
nextval
-----
      101
```

Select the next number from the sequence.

```
gaussdb=# SELECT nextval('serial');
nextval
-----
      102
```

Create a sequence associated with the table.

```
gaussdb=# CREATE TABLE customer_address
(
  ca_address_sk      integer      not null,
  ca_address_id     char(16)     not null,
  ca_street_number  char(10)
  ,
  ca_street_name    varchar(60)
  ,
  ca_street_type    char(15)
  ,
  ca_suite_number   char(10)
  ,
  ca_city           varchar(60)
  ,
  ca_county         varchar(30)
  ,
  ca_state          char(2)
  ,
  ca_zip            char(10)
  ,
  ca_country        varchar(20)
  ,
  ca_gmt_offset     decimal(5,2)
  ,
  ca_location_type  char(20)
);

gaussdb=# CREATE SEQUENCE serial1
START 101
CACHE 20
OWNED BY customer_address.ca_address_sk;
-- Delete the sequence.
gaussdb=# DROP TABLE customer_address;
gaussdb=# DROP SEQUENCE serial cascade;
gaussdb=# DROP SEQUENCE serial1 cascade;
```

Helpful Links

[DROP SEQUENCE](#) and [ALTER SEQUENCE](#)

7.14.73 CREATE SERVER

Function

Creates a foreign server.

A foreign server stores other homogeneous cluster information.

Precautions

Only a system administrator and users with permission to use a specified **FOREIGN DATA WRAPPER** can create a foreign server. The authorization syntax is as follows:

```
GRANT USAGE ON FOREIGN DATA WRAPPER fdw_name TO username
```

fdw_name is the name of the FOREIGN DATA WRAPPER, and **username** is the name of the user creating a foreign server.

When multi-layer quotation marks are used for sensitive columns (such as **password**) in **OPTIONS**, the semantics is different from that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.

Syntax

```
CREATE SERVER server_name  
  FOREIGN DATA WRAPPER fdw_name  
  [ OPTIONS ( { option_name ' value ' } [, ...] ) ] ;
```

Parameters

- **server_name**
Specifies the server name.
Value range: a string containing no more than 63 characters
- **FOREIGN DATA WRAPPER fdw_name**
Specifies the name of the foreign data wrapper.
Value range: **fdw_name** is the data wrapper created by the system during database initialization. Currently, **fdw_name** can only be **gc_fdw** for other homogeneous clusters. You can also create **dist_fdw**, **file_fdw**, and **log_fdw**. **log_fdw** is used only for syntax compatibility and can be used to create foreign tables, but it is meaningless. **dist_fdw** is used to import GDS data. You do not need to manually create a server using **dist_fdw** because **gsmpp_server** is already built in.
- **OPTIONS ({ option_name ' value ' } [, ...])**
Specifies the parameters for the foreign server. The detailed parameter description is as follows:
 - address
Address of the foreign server.

- dbname
Database name of the foreign server.
- username
Username of a foreign server.
- password
Password of the foreign server.

Examples

Create **my_server**, in which **dfs_fdw** is the built-in foreign data wrapper.

```
-- Create my_server.  
gaussdb=# CREATE SERVER my_server FOREIGN DATA WRAPPER file_fdw;  
  
-- Delete my_server.  
gaussdb=# DROP SERVER my_server;
```

You are advised to create another server in the homogeneous cluster, where **gc_fdw** is the foreign data wrapper in the database.

```
-- Create a server.  
gaussdb=# CREATE SERVER server_remote FOREIGN DATA WRAPPER GC_FDW OPTIONS  
  (address '10.146.187.231:8000,10.180.157.130:8000' ,  
   dbname 'test',  
   username 'test',  
   password '*****'  
  );  
  
-- Delete the server.  
gaussdb=# DROP SERVER server_remote;
```

[ALTER SERVER](#) and [DROP SERVER](#)

7.14.74 CREATE SYNONYM

Description

Creates a synonym object. A synonym is an alias of a database object and is used to record the mapping between database object names. You can use synonyms to access associated database objects.

Precautions

- The user of a synonym should be its owner.
- If the schema name is specified, create a synonym in the specified schema. Otherwise create a synonym in the current schema.
- Database objects that can be accessed using synonyms include tables, views, types, packages, functions, and stored procedures.
- To use synonyms, you must have the required permissions on associated objects.
- The following DML statements support synonyms: **SELECT**, **INSERT**, **UPDATE**, **DELETE**, **EXPLAIN**, and **CALL**.

- The **CREATE SYNONYM** statement of an associated function or stored procedure cannot be used in a stored procedure. You are advised to use synonyms existing in the pg_synonym system catalog in the stored procedure.
- You are not advised to create synonyms for temporary tables. To create a synonym, you need to specify the schema name of the target temporary table. Otherwise, the synonym cannot be used normally. In addition, you need to run the **DROP SYNONYM** command before the current session ends.
- After an original object is deleted, the synonym associated with the object will not be deleted in cascading mode. If you continue to access the synonym, for tables, a message is displayed indicating that the synonyms have expired; for functions, stored procedures, and packages, a message is displayed indicating that the objects do not exist.
- Users granted the CREATE ANY SYNONYM permission can create synonyms in user schemas.
- Synonyms cannot be created for encrypted tables that contain encrypted columns and views, functions, and stored procedures based on encrypted tables.
- If the schema of a synonym is the schema to which the user belongs, the owner of the synonym is also the owner of the schema. In other scenarios, the owner of the synonym is the creator of the synonym by default.
- If **SEARCH_PATH** is set and no synonym schema is specified, for stored procedures and functions, the PG_PROC table is preferentially searched by name. If no function with the same name exists, synonyms are searched based on **SEARCH_PATH**. For other objects, **SEARCH_PATH** is preferentially searched, if their schemas are the same as that of synonyms, the objects are accessed prior to synonyms.
- Objects associated with synonyms cannot be accessed using DDL statements, such as CREATE, DROP, and ALTER.

Syntax

```
CREATE [ OR REPLACE ] SYNONYM synonym_name  
FOR object_name;
```

Parameters

- **OR REPLACE**
(Optional) Redefines the synonym if it already exists.
- **synonym_name**
Specifies the name of the synonym to be created, which can contain the schema name.
Value range: a string. It must comply with the [naming convention](#).
- **object_name**
Specifies the name of an object that is associated (optionally with schema names).
Value range: a string. It must comply with the [naming convention](#).

 NOTE

- **object_name** can be the name of an object that does not exist.
- **object_name** can be the name of a remote object accessed by using a database link. For details about how to use database links, see [DATABASE LINK](#).

 CAUTION

Do not create aliases for functions that contain passwords and other sensitive information, such as the encryption function `gs_encrypt` and the decryption function `gs_decrypt` or use aliases to call the functions to prevent sensitive information leakage.

Examples

```
-- Create schema ot.
gaussdb=# CREATE SCHEMA ot;

-- Create table ot.t1 and its synonym t1.
gaussdb=# CREATE TABLE ot.t1(id int, name varchar2(10)) DISTRIBUTE BY hash(id);
gaussdb=# CREATE OR REPLACE SYNONYM t1 FOR ot.t1;

-- Use synonym t1.
gaussdb=# SELECT * FROM t1;
gaussdb=# INSERT INTO t1 VALUES (1, 'ada'), (2, 'bob');
gaussdb=# UPDATE t1 SET t1.name = 'cici' WHERE t1.id = 2;

-- Create synonym v1 and its associated view ot.v_t1.
gaussdb=# CREATE SYNONYM v1 FOR ot.v_t1;
gaussdb=# CREATE VIEW ot.v_t1 AS SELECT * FROM ot.t1;

-- Use synonym v1.
gaussdb=# SELECT * FROM v1;

-- Create overloaded function ot.add and its synonym add.
gaussdb=# CREATE OR REPLACE FUNCTION ot.add(a integer, b integer) RETURNS integer AS
$$
SELECT $1 + $2
$$
LANGUAGE sql;

gaussdb=# CREATE OR REPLACE FUNCTION ot.add(a decimal(5,2), b decimal(5,2)) RETURNS decimal(5,2)
AS
$$
SELECT $1 + $2
$$
LANGUAGE sql;

gaussdb=# CREATE OR REPLACE SYNONYM add FOR ot.add;

-- Use synonym add.
gaussdb=# SELECT add(1,2);
gaussdb=# SELECT add(1.2,2.3);

-- Create stored procedure ot.register and its synonym register.
gaussdb=# CREATE PROCEDURE ot.register(n_id integer, n_name varchar2(10))
SECURITY INVOKER
AS
BEGIN
INSERT INTO ot.t1 VALUES(n_id, n_name);
END;
/
```

```
gaussdb=# CREATE OR REPLACE SYNONYM register FOR ot.register;
-- Use synonym register to call the stored procedure.
gaussdb=# CALL register(3,'mia');

-- Delete the synonym.
gaussdb=# DROP SYNONYM t1;
gaussdb=# DROP SYNONYM IF EXISTS v1;
gaussdb=# DROP SYNONYM IF EXISTS add;
gaussdb=# DROP SYNONYM register;
gaussdb=# DROP SCHEMA ot CASCADE;
```

Helpful Links

[ALTER SYNONYM](#) and [DROP SYNONYM](#)

7.14.75 CREATE TABLE

Description

Creates an initially empty table in the current database. The table will be owned by the creator.

Precautions

- If a primary key constraint or unique constraint is added to a non-distribution key, a global secondary index is created by default.
- By default, **HASH(column_name)** is used in a distributed system. **column_name** is the primary key column or unique constraint column (if any) of the table, or the first column of a data type that can be used as the distribution key. The priority is as follows: primary key column > unique constraint column > first column of a data type that can be used as the distribution key. If a primary key column and multiple unique constraint columns exist and the distribution mode of the table is not specified, GSIs are created for other unique constraint columns by default after the distribution key of the table is determined based on the priority.
- Distribution columns do not support the UPDATE operation.
- If an error occurs during table creation, after it is fixed, the system may fail to delete the empty disk files created before the last automatic clearance. This problem seldom occurs and does not affect system running of the database.
- When JDBC is used, the **DEFAULT** value can be set through **PrepareStatement**.
- Row-store tables do not support foreign key as the table-level constraint.
- A user granted with the CREATE ANY TABLE permission can create tables in the public and user schemas. To create a table that contains serial columns, you must also obtain the CREATE ANY SEQUENCE permission to create sequences.
- The XML type cannot be used as a primary key or foreign key.

NOTICE

If GaussDB creates unlimited tables, CNs may be affected as follows:

- **Resource exhaustion:** Each table occupies certain disk space. Unlimited table creation will occupy a large amount of memory and disk space, which may exhaust CN resources. As a result, the system breaks down or becomes unstable.
- **Performance deterioration:** Unlimited table creation causes a large number of I/O operations and CPU computing, and the metadata information of the database becomes large, which may deteriorate the CN performance, including operations such as insert, query, update, and deletion. As a result, the system responds slowly or cannot meet service requirements.
- **Security issues:** Excessive tables make database management and maintenance difficult. Creating unlimited tables may cause security issues such as data leakage or data loss. Database stability decreases, causing immeasurable loss to enterprises.

Therefore, plan the number and size of GaussDB databases properly to avoid unlimited table creation and ensure system stability, reliability, and security.

- The number of table constraints cannot exceed 32,767.

Syntax

- **Create a table.**

```
CREATE [ [ GLOBAL | LOCAL ] { TEMPORARY | TEMP } | UNLOGGED ] TABLE [ IF NOT EXISTS ]
table_name
  ( { column_name data_type [ CHARACTER SET | CHARSET charset ]
    [ compress_mode ] [ COLLATE collation ] [ column_constraint [ ... ] ]
    | table_constraint
    | LIKE source_table [ like_option [...] ] }
  [ , ... ] )
[ WITH ( { storage_parameter = value } [ , ... ] ) ]
[ ON COMMIT { PRESERVE ROWS | DELETE ROWS } ]
[ COMPRESS | NOCOMPRESS ]
[ TABLESPACE tablespace_name ]
[ DISTRIBUTE BY { REPLICATION | HASH ( column_name [ , ... ] )
| RANGE ( column_name [ , ... ] ) { SLICE REFERENCES tablename | ( slice_less_than_item [ , ... ] )
| ( slice_start_end_item [ , ... ] ) }
| LIST ( column_name [ , ... ] ) { SLICE REFERENCES tablename | ( slice_values_item [ , ... ] ) }
} ]
[ TO { GROUP groupname | NODE ( nodename [ , ... ] ) } ];
```

- **column_constraint** is as follows:

```
[ CONSTRAINT constraint_name ]
{ NOT NULL |
  NULL |
  CHECK ( expression ) |
  DEFAULT default_expr |
  GENERATED ALWAYS AS ( generation_expr ) [STORED] |
  AUTO_INCREMENT |
  UNIQUE [KEY] [ index_parameters ] |
  PRIMARY KEY [ index_parameters ] |
  ENCRYPTED WITH ( COLUMN_ENCRYPTION_KEY = column_encryption_key,
  ENCRYPTION_TYPE = encryption_type_value ) }
REFERENCES reftable [ ( refcolumn ) ] [ MATCH FULL | MATCH PARTIAL | MATCH SIMPLE ]
[ ON DELETE action ] [ ON UPDATE action ] }
[ DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
```

- **table_constraint** is as follows:

```
[ CONSTRAINT constraint_name ]
{ CHECK ( expression ) |
```

- ```

UNIQUE (column_name [, ...]) [index_parameters] |
PRIMARY KEY (column_name [, ...]) [index_parameters]
}
[DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE]

```
- **like\_option** is as follows:  
{ INCLUDING | EXCLUDING } { DEFAULTS | GENERATED | CONSTRAINTS | INDEXES | STORAGE | COMMENTS | PARTITION | REOPTIONS | DISTRIBUTION | ALL }
  - Range distribution rules  
For **slice\_less\_than\_item**:  
SLICE slice\_name VALUES LESS THAN ( { expression | MAXVALUE } [, ...] ) [ DATANODE datanode\_name | ( datanode\_name\_list ) ]  
For **slice\_start\_end\_item**:  
SLICE name {  
{ START ( expression ) END ( expression ) EVERY ( expression ) } |  
{ START ( literal ) END ( { literal | MAXVALUE } ) } |  
{ START ( literal ) } |  
{ END ( { literal | MAXVALUE } ) }  
}  
- The LIST distribution rule **slice\_values\_item** is as follows:  
SLICE name VALUES (expression [, ... ]) [DATANODE datanode\_name | ( datanode\_name\_list )] |  
SLICE name VALUES (DEFAULT) [DATANODE datanode\_name | ( datanode\_name\_list )]

**index\_parameters** is as follows:

```

[WITH ({storage_parameter = value} [, ...])]
[USING INDEX TABLESPACE tablespace_name]

```

## Parameters

- **UNLOGGED**

If this keyword is specified, the created table is an unlogged table. Data written to unlogged tables is not written to the WALs, which makes them considerably faster than ordinary tables. However, an unlogged table is automatically truncated after conflicts, OS restart, database restart, switchover, power-off, or abnormal shutdown, incurring data loss risks. Contents of an unlogged table are also not replicated to standby nodes. Any indexes created on an unlogged table are not automatically logged as well.

Usage scenario: Unlogged tables do not ensure data security. Users can back up data before using unlogged tables; for example, users should back up the data before a system upgrade.

Troubleshooting: If data is missing in the indexes of unlogged tables due to some unexpected operations such as an unclean shutdown, users should re-create the indexes with errors.

- **GLOBAL | LOCAL**

When creating a temporary table, you can specify the **GLOBAL** or **LOCAL** keyword before **TEMP** or **TEMPORARY**. Currently, the two keywords are used to be compatible with the SQL standard. A local temporary table will be created by the GaussDB regardless of whether **GLOBAL** or **LOCAL** is specified.

- **TEMPORARY | TEMP**

If **TEMP** or **TEMPORARY** is specified, the created table is a temporary table. A temporary table is automatically dropped at the end of the current session. Therefore, you can create and use temporary tables in the current session as long as the connected CN in the session is normal. Temporary tables are created only in the current session. If a DDL statement involves operations on temporary tables, a DDL error will be generated. Therefore, you are advised not to perform operations on temporary tables in DDL statements. **TEMP** is equivalent to **TEMPORARY**.

---

**NOTICE**

- Temporary tables are visible to the current session through the schema starting with **pg\_temp** start. Users should not delete schema started with **pg\_temp** or **pg\_toast\_temp**.
- If **TEMPORARY** or **TEMP** is not specified when you create a table but its schema is set to that starting with **pg\_temp\_** in the current session, the table will be created as a temporary table.
- A temporary table is visible only to the current session. Therefore, it cannot be used together with **\parallel on**.
- Temporary tables do not support DN faults or primary/standby switchovers.

---

- **IF NOT EXISTS**

Sends a notice, but does not throw an error, if a table with the same name exists.

- **table\_name**

Specifies the name of the table to be created.

---

**NOTICE**

Some processing logic of materialized views determines whether a table is the log table of a materialized view or a table associated with a materialized view based on the table name prefix. Therefore, do not create a table whose name prefix is **mlog\_** or **matviewmap\_**. Otherwise, some functions of the table are affected.

---

- **column\_name**

Specifies the name of a column to be created in the new table.

- **data\_type**

Specifies the data type of the column.

- **compress\_mode**

Specifies whether to compress a table column. The option specifies the algorithm preferentially used by table columns. Row-store tables do not support compression.

Value range: **DELTA**, **PREFIX**, **DICTIONARY**, **NUMSTR**, and **NOCOMPRESS**

- **COLLATE collation**

Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **select \* from pg\_collation** command to query collation rules from the **pg\_collation** system catalog. The default collation rule is the row starting with **default** in the query result.

- **LIKE source\_table [ like\_option ... ]**

Specifies a table from which the new table automatically inherits all column names, their data types, and their not-null constraints, as well as the default expression declared as serial.

The new table and the original table are decoupled after creation is complete. Changes to the original table will not be applied to the new table, and it is not possible to include data of the new table in scans of the original table.

Columns and constraints copied by **LIKE** are not merged with the same name. If the same name is specified explicitly or in another **LIKE** clause, an error is reported.

- The default expressions are copied from the original table to the new table only if **INCLUDING DEFAULTS** is specified. The **serial** column is not copied. The default behavior is to exclude default expressions, resulting in the copied columns in the new table having default values **NULL**.
- The **CHECK** constraints are copied from the original table to the new table only when **INCLUDING CONSTRAINTS** is specified. Other types of constraints are never copied to the new table. Not-null constraints are always copied to the new table. These rules also apply to column constraints and table constraints.
- Any indexes on the original table will not be created on the new table, unless the **INCLUDING INDEXES** clause is specified.
- **STORAGE** settings for the source column definitions are copied only if **INCLUDING STORAGE** is specified. The default behavior is to exclude **STORAGE** settings.
- If **INCLUDING COMMENTS** is specified, comments for the copied columns, constraints, and indexes are copied. The default behavior is to exclude comments.
- If **INCLUDING PARTITION** is specified, the partition definitions of the source table are copied to the new table, and the new table no longer uses the **PARTITION BY** clause. The default behavior is to exclude partition definition of the original table.
- If **INCLUDING REOPTIONS** is specified, the new table will copy the storage parameter (that is, **WITH** clause) of the source table. The default behavior is to exclude partition definition of the storage parameter of the original table.
- If **INCLUDING DISTRIBUTION** is specified, the distribution information of the original table is copied to the new table, including distribution type and key, and the new table no longer use the **DISTRIBUTE BY** clause. The default behavior is to exclude distribution information of the original table.
- **INCLUDING ALL** contains the meaning of **INCLUDING DEFAULTS**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING STORAGE**, **INCLUDING COMMENTS**, **INCLUDING PARTITION**, **INCLUDING REOPTIONS**, and **INCLUDING DISTRIBUTION**.

### NOTICE

- If the original table contains a sequence with the SERIAL, BIGSERIAL, or SMALLSERIAL data type, or a column in the original table is a sequence by default and the sequence is created for this table (created by using **CREATE SEQUENCE ... OWNED BY**), these sequences will not be copied to the new table, and another sequence specific to the new table will be created. This is different from earlier versions. To share a sequence between the source table and new table, create a shared sequence (do not use **OWNED BY**) and set a column in the source table to this sequence.
- You are advised not to set a column in the source table to the sequence specific to another table especially when the table is distributed in specific node groups, because doing so may result in CREATE TABLE ... LIKE execution failures. In addition, doing so may cause the sequence to become invalid in the source sequence because the sequence will also be deleted from the source table when it is deleted from the table that the sequence is specific to. To share a sequence among multiple tables, you are advised to create a shared sequence for them.

- **WITH ( { storage\_parameter = value } [, ... ] )**

Specifies an optional storage parameter for a table or an index. The WITH clause used for tables can also contain **OIDS=FALSE** to specify that rows of the new table should not contain OIDs.

#### NOTE

When using **Numeric** of any precision to define a column, specify precision **p** and scale **s**. When precision and scale are not specified, the input will be displayed.

The description of parameters is as follows:

- **FILLFACTOR**

The fill factor of a table is a percentage from 10 to 100. **100** (complete filling) is the default value. If the Ustore storage engine is used, the default value is **92**. When a smaller fill factor is specified, **INSERT** operations fill table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives **UPDATE** a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate.

Value range: 10–100

- **ORIENTATION**

Specifies the storage mode of table data. This parameter can be set only once.

Value range:

- **ROW** indicates that table data is stored in rows.

**ROW** applies to the OLTP service, which has many interactive transactions. An interaction involves many columns in the table. Using ROW can improve the efficiency.

Default value:

If an ordinary tablespace is specified, the default is **ROW**.

– STORAGE\_TYPE

Specifies the storage engine type. This parameter cannot be modified once it is set.

Value range:

- **USTORE** indicates that tables support the inplace-update storage engine. Note that the **track\_counts** and **track\_activities** parameters must be enabled when the Ustore table is used. Otherwise, space bloating may occur.
- **ASTORE** indicates that tables support the append-only storage engine.

Default value:

If no table is specified, data is stored in Append-Only mode by default.

– INIT\_TD

Specifies the number of TDs to be initialized when an Ustore table is created. This parameter can be modified by running the **ALTER TABLE** command. Note that this parameter affects the maximum size of a single tuple stored on the data page. The conversion method is  $MAX\_TUPLE\_SIZE = BLCKSZ - INIT\_TD * TD\_SIZE$ . For example, if you change the number of INIT\_TD from 4 to 8, the maximum size of a single tuple decreases by 4 x INIT\_TD.

Value ranges: 2–128. The default value is **4**.

– segment

This parameter is reserved and is not supported currently.

– enable\_tde

Creates a TDE table. Before enabling this function, ensure that the GUC parameter **enable\_tde** has been enabled, the KMS service has been enabled, and the cluster master key ID in the GUC parameter **tde\_cmk\_id** has been correctly configured. This parameter supports only row-store tables. Temporary tables are not supported. The Ustore storage engine is not supported.

Value range: **on** and **off** If this parameter is set to **on**, transparent data encryption is enabled. If this parameter is set to **off**, transparent data encryption is disabled but the encryption function will be enabled later. When a table is created, a data encryption key will be applied from KMS.

Default value: **off**

– encrypt\_algo

Specifies the transparent data encryption algorithm. Before enabling this function, ensure that **enable\_tde** must be set for a table. The encryption algorithm can be specified only when a table is created. Different tables support different encryption algorithms. After the table is created, the encryption algorithm cannot be changed.

Value range: a string. The value can be **AES\_128\_CTR** or **SM4\_CTR**.

If **enable\_tde** is not set, the default value is null. If **enable\_tde** is set to **on** or **off** and **encrypt\_algo** is not set, the value is **AES\_128\_CTR**.

- **parallel\_workers**  
Number of bgworker threads started when an index is created. For example, value **2** indicates that two bgworker threads are started to create indexes concurrently.  
Value range: [0,32], int type. If this parameter is not set, concurrent index creation is disabled.  
Default value: If this parameter is not set, the concurrent index creation function is disabled.
- **dek\_cipher**  
Ciphertext of the key used for transparent data encryption. When **enable\_tde** is enabled, the system automatically applies for ciphertext creation. You cannot specify the ciphertext. The key rotation function can be used to update the key.  
Value range: a string.  
If encryption is disabled, the default value is null by default.
- **cmk\_id**  
ID of the cluster master key used for transparent data encryption. When **enable\_tde** is enabled, the value is obtained from the GUC parameter **tde\_cmk\_id** and cannot be specified or modified by users.  
Value range: a string.  
If encryption is disabled, the default value is null by default.
- **hasuids**  
If this parameter is set to **on**, a unique table-level ID is allocated to a tuple when the tuple is updated.  
Value range: **on** and **off**  
Default value: **off**
- **logical\_repl\_node**  
Name of the DN that returns logical logs to the CN during logical decoding of a distributed replication table. For the replication table, if this parameter is not specified, the first node in the node group where the current table is located is used by default. When the RESET operation is performed on this option, **logical\_repl\_node** is reset to the first node of current table.  
Value range: a string.  
Default value: For the non-replication table, this parameter is empty by default. For the replication table, this parameter is set to the name of the first node by default.
- **WITHOUT OIDS**  
It is equivalent to **WITH(OIDS=FALSE)**.
- **ON COMMIT { PRESERVE ROWS | DELETE ROWS }**  
**ON COMMIT** determines what to do when you commit a temporary table creation operation. Currently, the **PRESERVE ROWS** and **DELETE ROWS** options are supported.
  - **PRESERVE ROWS** (default): No special action is taken at the ends of transactions. The temporary table and its table data are unchanged.

- **DELETE ROWS:** All rows in the temporary table will be deleted at the end of each transaction block.
- **COMPRESS | NOCOMPRESS**

If you specify **COMPRESS** in the **CREATE TABLE** statement, the compression feature is triggered in case of a bulk **INSERT** operation. If this feature is enabled, a scan is performed for all tuple data within the page to generate a dictionary and then the tuple data is compressed and stored. If **NOCOMPRESS** is specified, the table is not compressed. Row-store tables do not support compression.

Default value: **NOCOMPRESS**, that is, tuple data is not compressed before storage.
- **TABLESPACE tablespace\_name**

Specifies the tablespace where the new table is created. If not specified, the default tablespace is used.
- **DISTRIBUTE BY**

Specifies how the table is distributed or replicated between DNs.

Value range:

  - **REPLICATION:** Each row in the table exists on all DNs, that is, each DN has complete table data.
  - **HASH (column\_name):** Each row of the table will be placed into specified DNs based on the hash value of the specified column.
  - **RANGE(column\_name):** maps a specified column based on the range and distributes data to the corresponding DNs.
  - **LIST(column\_name):** maps a specified column based on a specific value and distributes data to the corresponding DNs.

 NOTE

- For HASH distribution, the maximum number of distribution keys is the same as that of columns. A maximum of 1600 distribution keys are supported. For RANGE (VALUE LESS THAN) and LIST distributions, a maximum of four distribution key columns are supported. For RANGE (START END) distribution, only one distribution key column is supported.
- For a RANGE distribution policy using the VALUE LESS THAN clause, a maximum of four distribution key columns are supported. The distribution rules are as follows:
  1. The comparison starts from the first column of values to be inserted.
  2. If the value of the inserted first column is smaller than the boundary value of the current column in the local slice, the values are directly inserted.
  3. If the value of the inserted first column is equal to the boundary value of the current column in the local slice, compare the value of the inserted second column with the boundary value of the next column in the local slice. If the value of the inserted second column is smaller than the boundary value of the next column in the local slice, the values are directly inserted. If they are equal, the comparison of the next columns between the source and target continues.
  4. If the value of the inserted first column is greater than the boundary value of the current column in the local slice, compare the value with that in the next slice.
- If the shard of the RANGE distribution table corresponds to multiple DNs, the hash value of the distribution key is calculated to perform modulo operation on the number of DN and map a new DN. For details, see the example.
- If the shard of the list distribution table corresponds to multiple DNs, the hash value of the distribution key is calculated for the default shards. Then, use the calculated hash value to perform modulo operation on the number of DN and map a new DN. For non-default shards, the round robin method is used to map values in the values list to DNs. For details, see the example.
- The RANGE/LIST distribution tables support only scale-out but not scale-in. For details about the slice scale-out rule, contact the administrator.

For the hash distribution, **column\_name** supports the following data types:

- Integer types: **TINYINT**, **SMALLINT**, **INT**, **BIGINT**, and **NUMERIC/DECIMAL**
- Character types: **CHAR**, **BPCHAR**, **VARCHAR**, **VARCHAR2**, **NVARCHAR2**, and **TEXT**
- Date/time types: **DATE**, **TIME**, **TIMETZ**, **TIMESTAMP**, **TIMESTAMPTZ**, **INTERVAL**, and **SMALLDATETIME**

For the range (value less than) or list distribution, **column\_name** supports the following data types:

- Integer types: **SMALLINT**, **INT**, **BIGINT**, **NUMERIC/DECIMAL**
- Character types: **CHAR**, **BPCHAR**, **VARCHAR**, **VARCHAR2**, **NVARCHAR2**, and **TEXT**
- Date/Time types: **DATE**, **TIMESTAMP**, **TIMESTAMPTZ**

For the range (start end) distribution, the data type of **column\_name** must be one of the following:

- Integer types: **SMALLINT**, **INT**, **BIGINT**, **NUMERIC/DECIMAL**
- Date/Time types: **DATE**, **TIMESTAMP**, **TIMESTAMPTZ**

 NOTE

When you create a table, the choices of distribution keys and partition keys have major impact on SQL query performance. Therefore, select appropriate distribution keys and partition keys with strategies.

- Select appropriate distribution keys.

A hash table's distribution key should evenly distribute data on each DN to prevent skewing the data or distributing it unevenly across DNs. Determine appropriate distribution keys based on the following principles:

1. Determine whether data is skewed.

Connect to the database and run the following statement to check the number of tuples on each DN. Replace *tablename* with the actual name of the table to be analyzed.

```
gaussdb=# SELECT a.count,b.node_name FROM (SELECT count(*) AS
count,xc_node_id FROM tablename GROUP BY xc_node_id) a, pgxc_node b WHERE
a.xc_node_id=b.node_id ORDER BY a.count DESC;
```

If tuple numbers vary greatly (several times or tenfold) on each DN, a data skew occurs. Change the data distribution key based on the following principles:

2. Recreate a table to change its distribution keys. **ALTER TABLE** cannot change distribution keys. Therefore, you need to re-create a table when changing its distribution keys.

Principles for selecting distribution keys are as follows:

The value of the distribution key should be discrete so that data can be evenly distributed on each DN. You can select the primary key of the table as the distribution key. For example, for a person information table, choose the ID card number column as the distribution key.

With the above principles are met, you can select join conditions as distribution keys so that join tasks can be pushed down to DNs, reducing the amount of data transferred between the DNs.

- Select appropriate partition keys.

In range partitioning, a table is partitioned based on ranges defined by one or more columns, with no overlap between the ranges of values assigned to different partitions. Each range has a dedicated partition for data storage.

Modify partition keys to make the query result stored in the same or least partitions (partition pruning). Obtain consecutive I/O to improve the query performance.

In actual services, time is used to filter query objects. Therefore, you can use time as a partition key, and change the key value based on the total data volume and data volume of a single query.

- RANGE/LIST distribution

If no DN is specified for the shards of a RANGE/LIST distribution table, the database uses the Round Robin algorithm to allocate DNs to the shards. In addition, if RANGE/LIST distribution is used, you are advised to define as many shards as possible when creating a table for future capacity expansion. If the defined number of shards is less than the number of DNs before scale-out, data redistribution cannot be performed on new DNs. Note that the sharding rules are designed by users. In some extreme cases, scale-out may not solve the problem of insufficient storage space.

- **TO { GROUP groupname | NODE ( nodename [, ... ] ) }**

**TO GROUP** specifies the node group to which the table to be created belongs. **TO NODE** is used for internal scale-out tools.

- **CONSTRAINT constraint\_name**

Specifies the name of a column or table constraint. The optional constraint clauses specify constraints that new or updated rows must satisfy for an INSERT or UPDATE operation to succeed.

There are two ways to define constraints:

- A column constraint is defined as part of a column definition, and it is bound to a particular column.
- A table constraint is not bound to a particular column but can apply to more than one column.

- **NOT NULL**

The column is not allowed to contain null values.

- **NULL**

The column is allowed to contain null values. This is the default setting.

This clause is only provided for compatibility with non-standard SQL databases. It is not recommended.

- **CHECK ( expression )**

Specifies an expression producing a Boolean result where the INSERT or UPDATE operation of new or updated rows can succeed only when the expression result is **TRUE** or **UNKNOWN**; otherwise, an error is thrown and the database is not altered.

A CHECK constraint specified as a column constraint should reference only the column's value, while an expression in a table constraint can reference multiple columns.

 **NOTE**

<>NULL and !=NULL are invalid in an expression. Change them to **IS NOT NULL**.

- **DEFAULT default\_expr**

Assigns a default data value to a column. The value can be any variable-free expressions. (Subqueries and cross-references to other columns in the current table are not allowed.) The data type of the default expression must match the data type of the column.

The default expression will be used in any insert operation that does not specify a value for the column. If there is no default value for a column, then the default value is null.

- **UNIQUE [KEY] index\_parameters**

**UNIQUE ( column\_name [, ... ] ) index\_parameters**

Specifies that a group of one or more columns of a table can contain only unique values.

For the purpose of a unique constraint, null is not considered equal.

UNIQUE KEY can be used only when **sql\_compatibility** is set to 'MYSQL', which has the same semantics as UNIQUE.

- **PRIMARY KEY index\_parameters**

**PRIMARY KEY ( column\_name [, ... ] ) index\_parameters**

Specifies that a column or columns of a table can contain only unique (non-duplicate) and non-null values.

Only one primary key can be specified for a table.

- **REFERENCES**

The distributed database of the current version does not support the REFERENCES clause.

- **DEFERRABLE | NOT DEFERRABLE**

Controls whether the constraint can be deferred. A constraint that is not deferrable will be checked immediately after every command. Checking of constraints that are deferrable can be postponed until the end of the transaction using the **SET CONSTRAINTS** command. **NOT DEFERRABLE** is the default value. Currently, only **UNIQUE** and **PRIMARY KEY** constraints accept this clause. All the other constraints are not deferrable.

- **INITIALLY IMMEDIATE | INITIALLY DEFERRED**

If a constraint is deferrable, this clause specifies the default time to check the constraint.

- If the constraint is **INITIALLY IMMEDIATE** (default value), it is checked after each statement.
- If the constraint is **INITIALLY DEFERRED**, it is checked only at the end of the transaction.

The constraint check time can be altered using the **SET CONSTRAINTS** statement.

- **USING INDEX TABLESPACE tablespace\_name**

Allows selection of the tablespace in which the index associated with a **UNIQUE** or **PRIMARY KEY** constraint will be created. If not specified, the index is created in **default\_tablespace**. If **default\_tablespace** is empty, the default tablespace of the database is used.

- **ENCRYPTION\_TYPE = encryption\_type\_value**

For the encryption type in the ENCRYPTED WITH constraint, the value of **encryption\_type\_value** is **DETERMINISTIC** or **RANDOMIZED**.

## Examples

```
-- Create a simple table.
gaussdb=# CREATE TABLE tpcds.warehouse_t1
(
 W_WAREHOUSE_SK INTEGER NOT NULL,
 W_WAREHOUSE_ID CHAR(16) NOT NULL,

## Helpful Links

[ALTER TABLE](#), [DROP TABLE](#), and [CREATE TABLESPACE](#)

## Suggestions

- UNLOGGED
  - The unlogged table and its indexes do not use the WAL log mechanism during data writing. Their write speed is much higher than that of ordinary tables. Therefore, they can be used for storing intermediate result sets of complex queries to improve query performance.
  - The unlogged table has no primary/standby mechanism. In case of system faults or abnormal breakpoints, data loss may occur. Therefore, the unlogged table cannot be used to store basic data.
- TEMPORARY | TEMP
  - A temporary table is automatically dropped at the end of a session.
  - The temporary table is visible only to the current CN.
- LIKE
  - The new table automatically inherits all column names, data types, and not-null constraints from this table. The new table is irrelevant to the original table after the creation.
- LIKE INCLUDING DEFAULTS
  - The default expressions are copied from the original table to the new table only if **INCLUDING DEFAULTS** is specified. The default behavior is to exclude default expressions, resulting in the copied columns in the new table having default values **NULL**.
- LIKE INCLUDING CONSTRAINTS
  - The **CHECK** constraints are copied from the original table to the new table only when **INCLUDING CONSTRAINTS** is specified. Other types of constraints are never copied to the new table. Not-null constraints are always copied to the new table. These rules also apply to column constraints and table constraints.
- LIKE INCLUDING INDEXES
  - Any indexes on the original table will not be created on the new table, unless the **INCLUDING INDEXES** clause is specified.

- LIKE INCLUDING STORAGE
  - **STORAGE** settings for the copied column definitions are copied only if **INCLUDING STORAGE** is specified. The default behavior is to exclude **STORAGE** settings.
- LIKE INCLUDING COMMENTS
  - If **INCLUDING COMMENTS** is specified, comments for the copied columns, constraints, and indexes are copied. The default behavior is to exclude comments.
- LIKE INCLUDING PARTITION
  - If **INCLUDING PARTITION** is specified, the partition definitions of the source table are copied to the new table, and the new table no longer uses the **PARTITION BY** clause. The default behavior is to exclude partition definition of the original table.
- LIKE INCLUDING REOPTIONS
  - If **INCLUDING REOPTIONS** is specified, the new table will copy the storage parameter (that is, **WITH** clause) of the source table. The default behavior is to exclude partition definition of the storage parameter of the original table.
- LIKE INCLUDING DISTRIBUTION
  - If **INCLUDING DISTRIBUTION** is specified, the distribution information of the original table is copied to the new table, including distribution type and key, and the new table no longer use the **DISTRIBUTE BY** clause. The default behavior is to exclude distribution information of the original table.
- LIKE INCLUDING ALL
  - **INCLUDING ALL** contains the meaning of **INCLUDING DEFAULTS**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING STORAGE**, **INCLUDING COMMENTS**, **INCLUDING PARTITION**, **INCLUDING REOPTIONS**, and **INCLUDING DISTRIBUTION**.
- ORIENTATION ROW
  - Creates a row-store table. Row-store applies to the OLTP service, which has many interactive transactions. An interaction involves many columns in the table. Using row-store can improve the efficiency.
- DISTRIBUTE BY
  - It is recommended that a fact table or dimension table containing a large amount of data be created as a distribution table. Each row of the table will be placed into specified DNs based on the hash value of the specified column. The syntax is **distribute by hash (column\_name)**.
  - It is recommended that a dimension table containing a small amount of data be created as a replication table. Each row in the table exists on all DNs. That is, each DN has complete table data. The syntax is **distribute by replication**.

## 7.14.76 CREATE TABLESPACE

### Description

Creates a tablespace in a database.

## Precautions

- The system administrator or a user who inherits the `gs_role_tablespace` permission of the built-in role can create a tablespace.
- Do not run **CREATE TABLESPACE** in a transaction block.
- If executing **CREATE TABLESPACE** fails but the internal directory (or file) has been created, the directory (or file) will remain. You need to manually clear it before creating the tablespace again. If there are residual files of soft links for the tablespace in the data directory, delete the residual files, and then perform O&M operations.
- **CREATE TABLESPACE** cannot be used for two-phase transactions. If it fails on some nodes, the execution cannot be rolled back.
- You are advised not to use user-defined tablespaces in scenarios such as Huawei Cloud.

This is because user-defined tablespaces are usually used with storage media other than the main storage (storage device where the default tablespace is located, such as a disk) to isolate I/O resources that can be used by different services. Storage devices use standard configurations and do not have other available storage media in scenarios such as Huawei Cloud. If the user-defined tablespace is not properly used, the system cannot run stably for a long time and the overall performance is affected. Therefore, you are advised to use the default tablespace.

## Syntax

```
CREATE TABLESPACE tablespace_name
[OWNER user_name] [RELATIVE] LOCATION 'directory' [MAXSIZE 'space_size']
[with_option_clause];
```

The **with\_option\_clause** syntax for creating a general tablespace is as follows:

```
WITH ({filesystem= { ' general ' | " general " | general } | address = { ' ip:port [, ...] ' | " ip:port [, ...] " } |
cfgpath = { ' path ' | " path " } | storepath = { ' rootpath ' | " rootpath " } | random_page_cost = { ' value ' | " value " | value } |
seq_page_cost = { ' value ' | " value " | value }}, ...)
```

## Parameters

- **tablespace\_name**  
Specifies name of a tablespace to be created.  
The tablespace name must be distinct from the name of any existing tablespace in the cluster and cannot start with "pg", which are reserved for system catalog spaces.  
Value range: a string. It must comply with the [naming convention](#).
- **OWNER user\_name**  
Specifies the name of the user who will own the tablespace. If omitted, the default owner is the current user.  
Only system administrators can create tablespaces, but they can use the **OWNER** clause to assign ownership of tablespaces to non-**Sysadmin** administrators.  
Value range: a string. It must be an existing user.
- **RELATIVE**

If this parameter is specified, a relative path is used. The location directory is relative to each CN/DN data directory.

Directory hierarchy: relative path of the CNs and DNs directory **/pg\_location/**. A relative path contains a maximum of two levels.

If this parameter is not specified, the absolute tablespace path is used. The location directory must be an absolute path.

- **LOCATION directory**

Specifies the directory for the table space. When creating an absolute tablespace path, ensure that the directory meets the following requirements:

- The GaussDB system user must have the read and write permissions on the directory, and the directory must be empty. If the directory does not exist, the system automatically creates it.
- The directory must be an absolute path, and does not contain special characters, such as dollar sign (\$) and greater-than sign (>).
- The directory cannot be specified under the database data directory.
- The directory must be a local path.

Value range: a string. It must be a valid directory.

- **MAXSIZE 'space\_size'**

Specifies the maximum value of the tablespace in a single DN.

Value range: a string consisting of a positive integer and unit. The unit can be KB, MB, GB, TB, or PB currently. The unit of parsed value is KB and cannot exceed the range that can be expressed in 64 bits, which is 1 KB to 9007199254740991 KB.

- **random\_page\_cost**

Specifies the cost of randomly reading the page overhead.

Value range: 0 to 1.79769e+308

Default value: value of the GUC parameter **random\_page\_cost**

- **seq\_page\_cost**

Specifies the cost of reading the page overhead in specified order.

Value range: 0 to 1.79769e+308

Default value: value of GUC parameter **seq\_page\_cost**

## Examples

```
-- Create a tablespace.
gaussdb=# CREATE TABLESPACE ds_location1 RELATIVE LOCATION 'test_tablespace/test_tablespace_1';

-- Create user joe.
gaussdb=# CREATE ROLE joe IDENTIFIED BY '*****';

-- Create user jay.
gaussdb=# CREATE ROLE jay IDENTIFIED BY '*****';

-- Create a tablespace and set its owner to user joe.
gaussdb=# CREATE TABLESPACE ds_location2 OWNER joe RELATIVE LOCATION 'test_tablespace/
test_tablespace_2';

-- Rename the ds_location1 tablespace to ds_location3.
gaussdb=# ALTER TABLESPACE ds_location1 RENAME TO ds_location3;

-- Change the owner of the ds_location2 tablespace.
```

```
gaussdb=# ALTER TABLESPACE ds_location2 OWNER TO jay;
-- Delete the tablespace.
gaussdb=# DROP TABLESPACE ds_location2;
gaussdb=# DROP TABLESPACE ds_location3;

-- Delete users.
gaussdb=# DROP ROLE joe;
gaussdb=# DROP ROLE jay;
```

## Helpful Links

[CREATE DATABASE](#), [CREATE TABLE](#), [CREATE INDEX](#), [DROP TABLESPACE](#), and [ALTER TABLESPACE](#)

## Suggestions

- create tablespace  
You are not advised to create tablespaces in a transaction.

## 7.14.77 CREATE TABLE AS

### Description

Creates a table from the results of a query.

CREATE TABLE AS creates a table and fills it with data obtained using SELECT. The table columns have the names and data types associated with the output columns of SELECT (except that you can override the SELECT output column names by giving an explicit list of new column names).

CREATE TABLE AS queries a source table once and writes the data in a new table. The result in the query view changes with the source table. In contrast, the view re-computes and defines its SELECT statement at each query.

### Precautions

- This statement cannot be used to create a partitioned table.
- If an error occurs during table creation, after it is fixed, the system may fail to delete the disk files that are created before the last automatic clearance and whose size is not 0. This problem seldom occurs and does not affect system running of the database.

### Syntax

```
CREATE [[GLOBAL | LOCAL] [TEMPORARY | TEMP] | UNLOGGED] TABLE [IF NOT EXISTS] table_name
[(column_name [, ...])]
[WITH ({storage_parameter = value} [, ...])]
[COMPRESS | NOCOMPRESS]
[TABLESPACE tablespace_name]
[DISTRIBUTE BY { REPLICATION | HASH (column_name [, ...])
| RANGE (column_name [, ...]) { SLICE REFERENCES tablename | (slice_less_than_item [, ...])
| (slice_start_end_item [, ...]) }
| LIST (column_name [, ...]) { SLICE REFERENCES tablename | (slice_values_item [, ...]) }
}]
[TO { GROUP groupname | NODE (nodename [, ...]) }]
AS query
[WITH [NO] DATA];
```

For details about each field, see [Syntax](#).

## Parameters

- **UNLOGGED**

Specifies that the table is created as an unlogged table. Data written to unlogged tables is not written to the WALs, which makes them considerably faster than ordinary tables. However, they are not crash-safe. An unlogged table is automatically truncated after a crash or unclean shutdown. The contents of an unlogged table are also not replicated to standby servers. Any indexes created on an unlogged table are automatically unlogged as well.

- Usage scenario: Unlogged tables do not ensure data security. Users can back up data before using unlogged tables; for example, users should back up the data before a system upgrade.
- Troubleshooting: If data is missing in the indexes of unlogged tables due to some unexpected operations such as an unclean shutdown, users should rebuild the indexes with errors.

- **GLOBAL | LOCAL**

When creating a temporary table, you can specify the **GLOBAL** or **LOCAL** keyword before **TEMP** or **TEMPORARY**. Currently, the two keywords are used to be compatible with the SQL standard. A local temporary table will be created by the GaussDB regardless of whether **GLOBAL** or **LOCAL** is specified.

- **TEMPORARY | TEMP**

If **TEMP** or **TEMPORARY** is specified, the created table is a temporary table. A temporary table is automatically dropped at the end of the current session. Therefore, you can create and use temporary tables in the current session as long as the connected CN in the session is normal. Temporary tables are created only in the current session. If a DDL statement involves operations on temporary tables, a DDL error will be generated. Therefore, you are advised not to perform operations on temporary tables in DDL statements. **TEMP** is equivalent to **TEMPORARY**.

---

### NOTICE

- Temporary tables are visible to the current session through the schema starting with **pg\_temp** start. Users should not delete schema started with **pg\_temp** or **pg\_toast\_temp**.
- If **TEMPORARY** or **TEMP** is not specified when you create a table but its schema is set to that starting with **pg\_temp\_** in the current session, the table will be created as a temporary table.
- A temporary table is visible only to the current session. Therefore, it cannot be used together with **\parallel on**.
- Temporary tables do not support DN faults or primary/standby switchovers.

- **table\_name**

Specifies the name of the table to be created.

Value range: a string. It must comply with the [naming convention](#).

- **column\_name**

Specifies the name of a column to be created in the new table.

Value range: a string. It must comply with the [naming convention](#).

- **WITH ( storage\_parameter [= value] [, ... ] )**

Specifies an optional storage parameter for a table or an index. See details of parameters below.

- FILLFACTOR

The fill factor of a table is a percentage from 10 to 100. **100** (complete filling) is the default value. If the Ustore storage engine is used, the default value is **92**. When a smaller fill factor is specified, INSERT operations fill table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives **UPDATE** a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate.

Value range: 10–100

- ORIENTATION

Value range:

**ROW** (default value): The data will be stored in rows.

- COMPRESSION

Specifies the compression level of table data. It determines the compression ratio and time. Generally, the higher the level of compression, the higher the ratio, the longer the time; and the lower the level of compression, the lower the ratio, the shorter the time. The actual compression ratio depends on the distribution mode of table data loaded.

Value range:

Row-store tables do not support compression.

- **COMPRESS / NOCOMPRESS**

Specifies keyword **COMPRESS** during the creation of a table, so that the compression feature is triggered in case of bulk **INSERT** operations. If this feature is enabled, a scan is performed for all tuple data within the page to generate a dictionary and then the tuple data is compressed and stored. If **NOCOMPRESS** is specified, the table is not compressed. Row-store tables do not support compression.

Default value: **NOCOMPRESS**, that is, tuple data is not compressed before storage.

- **TABLESPACE tablespace\_name**

Specifies that the new table will be created in the **tablespace\_name** tablespace. If not specified, the default tablespace is used.

- **DISTRIBUTE BY**

For details, see [DISTRIBUTE BY](#).

- **TO { GROUP groupname | NODE ( nodename [, ... ] ) }**

**TO GROUP** specifies the node group to which the table to be created belongs. **TO NODE** is used for internal scale-out tools.

- **AS query**

Specifies a **SELECT** or **VALUES** command, or an **EXECUTE** command that runs a prepared **SELECT** or **VALUES** query.

- **[ WITH [ NO ] DATA ]**

Specifies whether the data produced by the query should be copied to the new table. By default, the data will be copied. If the value **NO** is used, only the table structure will be copied.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.store_returns table.
gaussdb=# CREATE TABLE tpcds.store_returns
(
 W_WAREHOUSE_SK INTEGER NOT NULL,
 W_WAREHOUSE_ID CHAR(16) NOT NULL,
 sr_item_sk VARCHAR(20) ,
 W_WAREHOUSE_SQ_FT INTEGER
);

-- Insert a record into a table:
gaussdb=# INSERT INTO tpcds.store_returns(W_WAREHOUSE_SK, W_WAREHOUSE_ID, sr_item_sk,
W_WAREHOUSE_SQ_FT) VALUES (1, 'AAAAAAAAABAAAAAAA', '4800', '20');

-- Create the tpcds.store_returns_t1 table and insert numbers that are greater than 4795 in the sr_item_sk
column of the tpcds.store_returns table.
gaussdb=# CREATE TABLE tpcds.store_returns_t1 AS SELECT * FROM tpcds.store_returns WHERE sr_item_sk
> '4795';

-- Copy tpcds.store_returns to create the tpcds.store_returns_t2 table.
gaussdb=# CREATE TABLE tpcds.store_returns_t2 AS table tpcds.store_returns;

-- Delete the table.
gaussdb=# DROP TABLE tpcds.store_returns_t1 ;
gaussdb=# DROP TABLE tpcds.store_returns_t2 ;
gaussdb=# DROP TABLE tpcds.store_returns;

-- Delete the schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## Helpful Links

[CREATE TABLE](#) and [SELECT](#)

## 7.14.78 CREATE TABLE PARTITION

### Description

Creates a partitioned table. Partitioning refers to splitting what is logically one large table into smaller physical pieces based on specific schemes. The table based on the logic is called a partitioned table, and each physical piece is called a partition. Data is stored on these physical partitions, instead of the logical partitioned table.

The common forms of partitioning include range partitioning, interval partitioning, hash partitioning, list partitioning, and value partitioning. Currently, row-store tables support range partitioning, hash partitioning, list partitioning.

In range partitioning, a table is partitioned based on ranges defined by one or more columns, with no overlap between the ranges of values assigned to different partitions. Each range has a dedicated partition for data storage.

The partitioning policy for range partitioning refers to how data is inserted into partitions.

In range partitioning, a table is partitioned based on partition key values. If a record can be mapped to a partition, it is inserted into the partition; if it cannot, an error message is returned. Range partitioning is the most commonly used partitioning policy.

In hash partitioning, a modulus and a remainder are specified for each partition based on a column in the table, and records to be inserted into the table are allocated to the corresponding partition, the rows in each partition must meet the following condition: The value of the partition key divided by the specified modulus generates the remainder specified for the partition key.

In hash partitioning, table is partitioned based on partition key values. If a record can be mapped to a partition, it is inserted into the partition; if it cannot, an error message is returned.

List partitioning is to allocate the records to be inserted into a table to the corresponding partition based on the key values in each partition. The key values do not overlap in different partitions. Create a partition for each group of key values to store corresponding data.

In list partitioning, table is partitioned based on partition key values. If a record can be mapped to a partition, it is inserted into the partition; if it cannot, an error message is returned.

Partitioning can provide several benefits:

- Query performance can be improved drastically in certain situations, particularly when most of the heavily accessed rows of the table are in a single partition or a small number of partitions. Partitioning narrows the range of data search and improves data access efficiency.
- In the case of an INSERT or UPDATE operation on most portions of a single partition, performance can be improved by taking advantage of continuous scan of that partition instead of partitions scattered across the whole table.
- Frequent loading or deletion operations on records in a separate partition can be accomplished by reading or removing that partition. It also avoids the VACUUM overload caused by bulk DELETE operations.

## Precautions

- If the constraint key of the unique constraint and primary key constraint contains all partition keys, a local index is created for the constraints. Otherwise, a global index is created.
- Currently, hash partitioning supports only single-column partition keys, and does not support multi-column partition keys.
- In the PARTITION FOR (values) syntax for partitioned tables, values can only be constants.
- In the PARTITION FOR (values) syntax for partitioned tables, if data type conversion is required for values, you are advised to use forcible type conversion to prevent the implicit type conversion result from being inconsistent with the expected result.
- The maximum number of partitions is 1048575. Generally, it is impossible to create so many partitions, because too many partitions may cause insufficient

memory. Create partitions based on the value of **local\_syscache\_threshold**. The memory used by the partitioned tables is about (number of partitions x 3/1024) MB. Theoretically, the memory occupied by the partitions cannot be greater than the value of **local\_syscache\_threshold**. In addition, some space must be reserved for other functions.

- If the memory is insufficient due to too many partitions, the performance deteriorates sharply.
- Currently, the statement specifying a partition cannot perform global index scan.
- Data of the XML type cannot be used as partition keys or level-2 partition keys.
- When UPDATE or DELETE is performed on a partitioned table, if the generated plan is not an FQS or Stream plan, the statement execution efficiency is low. You are advised to check statements and eliminate factors that cannot be pushed down to generate FQS or Stream plans.

## Syntax

```
CREATE TABLE [IF NOT EXISTS] partition_table_name
([
 { column_name data_type [COLLATE collation] [column_constraint [...]]
 | table_constraint
 | LIKE source_table [like_option [...]] }
 [, ...]
])
[WITH ({storage_parameter = value} [, ...])]
[COMPRESS | NOCOMPRESS]
[TABLESPACE tablespace_name]
[DISTRIBUTE BY { REPLICATION | HASH (column_name [, ...])
| RANGE (column_name [, ...]) { SLICE REFERENCES tablename | (slice_less_than_item [, ...])
| (slice_start_end_item [, ...]) }
| LIST (column_name [, ...]) { SLICE REFERENCES tablename | (slice_values_item [, ...]) }
}]
[TO { GROUP groupname | NODE (nodename [, ...]) }]
PARTITION BY {
 {RANGE [COLUMNS] (partition_key) [PARTITIONS integer] (partition_less_than_item [, ...])} |
 {RANGE [COLUMNS] (partition_key) [PARTITIONS integer] (partition_start_end_item [, ...])} |
 {LIST [COLUMNS] (partition_key) [PARTITIONS integer] (PARTITION partition_name VALUES [IN]
(list_values) [TABLESPACE [=] tablespace_name][, ...])} |
 { HASH (partition_key) [PARTITIONS integer] (PARTITION partition_name [TABLESPACE [=]
tablespace_name][, ...])}
} [{ ENABLE | DISABLE } ROW MOVEMENT];
```

- **column\_constraint** is as follows:

```
[CONSTRAINT constraint_name]
{ NOT NULL |
 NULL |
 CHECK (expression) |
 DEFAULT default_expr |
 UNIQUE [KEY] [index_parameters] |
 PRIMARY KEY [index_parameters] }
[DEFERRABLE | NOT DEFERRABLE][INITIALLY DEFERRED | INITIALLY IMMEDIATE]
```

- **table\_constraint** is as follows:

```
[CONSTRAINT constraint_name]
{ CHECK (expression) |
 UNIQUE (column_name [, ...]) [index_parameters] |
 PRIMARY KEY (column_name [, ...]) [index_parameters] }
[DEFERRABLE | NOT DEFERRABLE][INITIALLY DEFERRED | INITIALLY IMMEDIATE]
```

- **like\_option** is as follows:

```
{ INCLUDING | EXCLUDING } { DEFAULTS | CONSTRAINTS | INDEXES | STORAGE | COMMENTS |
REOPTIONS | DISTRIBUTION | ALL }
```

- **index\_parameters** is as follows:  
[ WITH ( {storage\_parameter = value} [, ... ] ) ]  
[ USING INDEX TABLESPACE tablespace\_name ]
- **partition\_less\_than\_item**:  
PARTITION partition\_name VALUES LESS THAN ( { partition\_value | MAXVALUE } ) [TABLESPACE tablespace\_name]
- **partition\_start\_end\_item**:  
PARTITION partition\_name {  
    {START(partition\_value) END (partition\_value) EVERY (interval\_value)} |  
    {START(partition\_value) END ({partition\_value | MAXVALUE})} |  
    {START(partition\_value)} |  
    {END({partition\_value | MAXVALUE})}  
} [TABLESPACE tablespace\_name]

## Parameters

- **IF NOT EXISTS**  
Sends a notice instead of throwing an error, if a table with the same name exists.
- **partition\_table\_name**  
Specifies the name of a partitioned table.  
Value range: a string. It must comply with the [naming convention](#).
- **column\_name**  
Specifies the name of a column to be created in the new table.  
Value range: a string. It must comply with the [naming convention](#).
- **data\_type**  
Specifies the data type of the column.
- **COLLATE collation**  
Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used.
- **CONSTRAINT constraint\_name**  
Specifies the name of a column or table constraint. The optional constraint clauses specify constraints that new or updated rows must satisfy for an INSERT or UPDATE operation to succeed. You can run the **SELECT \* FROM pg\_collation** command to query collation rules from the pg\_collation system catalog. The default collation rule is the row starting with **default** in the query result.  
There are two ways to define constraints:
  - A column constraint is defined as part of a column definition, and it is bound to a particular column.
  - A table constraint is not bound to a particular column but can apply to more than one column.
- **LIKE source\_table [ like\_option ... ]**  
Specifies a table from which the new table automatically copies all column names, their data types, and their not-null constraints.  
Unlike **INHERITS**, the new table and original table are decoupled after creation is complete. Changes to the original table will not be applied to the new table, and it is not possible to include data of the new table in scans of the original table.

Default expressions for the copied column definitions will be copied only if **INCLUDING DEFAULTS** is specified. The default behavior is to exclude default expressions, resulting in the copied columns in the new table having default values **NULL**.

Not-null constraints are always copied to the new table. **CHECK** constraints will only be copied if **INCLUDING CONSTRAINTS** is specified; other types of constraints will never be copied. These rules also apply to column constraints and table constraints.

Unlike those of **INHERITS**, columns and constraints copied by **LIKE** are not merged with similarly named columns and constraints. If the same name is specified explicitly or in another **LIKE** clause, an error is reported.

- Any indexes on the original table will not be created on the new table, unless the **INCLUDING INDEXES** clause is specified.
  - **STORAGE** settings for the original columns are copied only if **INCLUDING STORAGE** is specified. The default behavior is to exclude **STORAGE** settings.
  - If **INCLUDING COMMENTS** is specified, comments for the copied original columns, constraints, and indexes are copied. The default behavior is to exclude comments.
  - If **INCLUDING REOPTIONS** is specified, the new table will copy the storage parameter (that is, **WITH** clause) of the original table. The default behavior is to exclude partition definition of the storage parameter of the original table.
  - If **INCLUDING DISTRIBUTION** is specified, the new table will copy the distribution information of the original table, including distribution type and key, and the new table cannot use the **DISTRIBUTE BY** clause. The default behavior is to exclude distribution information of the original table.
  - **INCLUDING ALL** contains the meaning of **INCLUDING DEFAULTS**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING STORAGE**, **INCLUDING COMMENTS**, **INCLUDING REOPTIONS**, and **INCLUDING DISTRIBUTION**.
- **WITH ( storage\_parameter [= value] [, ... ] )**

Specifies an optional storage parameter for a table or an index. Optional parameters are as follows:

- **FILLFACTOR**

The fill factor of a table is a percentage from 10 to 100. **100** (complete filling) is the default value. When a smaller fill factor is specified, **INSERT** operations pack table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives **UPDATE** a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate.

Value range: 10–100

- **ORIENTATION**

Determines the data storage mode of the table.

Value range:

- **ROW** (default value): The data will be stored in rows.

---

**NOTICE**

**orientation** cannot be modified.

---

– **COMPRESSION**

- Row-store tables do not support compression.

- **COMPRESS / NOCOMPRESS**

Specifies keyword **COMPRESS** during the creation of a table, so that the compression feature is triggered in case of **BULK INSERT** operations. If this feature is enabled, a scan is performed for all tuple data within the page to generate a dictionary and then the tuple data is compressed and stored. If **NOCOMPRESS** is specified, the table is not compressed.

Default value: **NOCOMPRESS**, that is, tuple data is not compressed before storage. Row-store tables do not support compression.

- **TABLESPACE tablespace\_name**

Specifies that the new table will be created in the **tablespace\_name** tablespace. If not specified, the default tablespace is used.

- **DISTRIBUTE BY**

Specifies how the table is distributed or replicated between nodes.

For the value range and details, see [DISTRIBUTE BY](#).

- **TO { GROUP groupname | NODE ( nodename [, ... ] ) }**

**TO GROUP** specifies the node group to which the table to be created belongs. **TO NODE** is used for internal scale-out tools.

- **PARTITION BY RANGE [COLUMNS] (partition\_key)**

Creates a range partition. **partition\_key** is the name of the partition key.

The **COLUMNS** keyword can be used only when **sql\_compatibility** is set to '**MYSQL**'. The semantics of **PARTITION BY RANGE COLUMNS** is the same as that of **PARTITION BY RANGE**.

(1) Assume that the **VALUES LESS THAN** syntax is used.

---

**NOTICE**

If the **VALUE LESS THAN** clause is used, a range partitioning policy supports a partition key with up to 16 columns.

---

Data types supported by the partition keys are as follows: **SMALLINT**, **INTEGER**, **BIGINT**, **DECIMAL**, **NUMERIC**, **REAL**, **FLOAT4**, **FLOAT8**, **DOUBLE PRECISION**, **CHARACTER VARYING(n)**, **VARCHAR(n)**, **CHARACTER(n)**, **CHAR(n)**, **CHARACTER**, **CHAR**, **TEXT**, **NVARCHAR2**, **NAME**, **TIMESTAMP[(p)] [WITHOUT TIME ZONE]**, **TIMESTAMP[(p)] [WITH TIME ZONE]**, and **DATE**.

(2) Assume that the **START END** syntax is used.

---

**NOTICE**

In this case, only one partition key is supported.

---

Data types supported by the partition key are as follows: **SMALLINT**, **INTEGER**, **BIGINT**, **DECIMAL**, **NUMERIC**, **REAL**, **FLOAT4**, **FLOAT8**, **DOUBLE PRECISION**, **TIMESTAMP[(p)] [WITHOUT TIME ZONE]**, **TIMESTAMP[(p)] [WITH TIME ZONE]**, and **DATE**.

- **PARTITION partition\_name VALUES LESS THAN** { ( { partition\_value | MAXVALUE } [,...] ) | MAXVALUE }

Specifies the information of partitions. **partition\_name** is the name of a range partition. **partition\_value** is the upper limit of a range partition, and the value depends on the type of **partition\_key**. **MAXVALUE** usually specifies the upper limit of the last range partition.

---

**NOTICE**

- Each partition requires an upper limit.
  - The data type of the upper limit must be the same as that of the partition key.
  - In a partition list, partitions are arranged in ascending order of upper limits. A partition with a smaller upper limit value is placed before another partition with a larger one.
  - **MAXVALUE** that is not in parentheses can be used only when **sql\_compatibility** is set to **'MYSQL'** and can have only one partition key.
- 
- **PARTITION partition\_name {START (partition\_value) END (partition\_value) EVERY (interval\_value)} | {START (partition\_value) END (partition\_value|MAXVALUE)} | {START(partition\_value)} | {END (partition\_value | MAXVALUE)}**

Specifies the information of partitions.

- **partition\_name**: name or name prefix of a range partition. It is the name prefix only in the following cases (assuming that **partition\_name** is **p1**):
  - If **START+END+EVERY** is used, the names of partitions will be defined as **p1\_1**, **p1\_2**, and the like. For example, if **PARTITION p1 START(1) END(4) EVERY(1)** is defined, the generated partitions are [1, 2), [2, 3), and [3, 4), and their names are **p1\_1**, **p1\_2**, and **p1\_3**. In this case, **p1** is a name prefix.
  - If the defined statement is in the first place and has **START** specified, the range (**MINVALUE**, **START**) will be automatically used as the first actual partition, and its name will be **p1\_0**. The other partitions are then named **p1\_1**, **p1\_2**, and the like. For example, if **PARTITION p1 START(1), PARTITION p2 START(2)** is defined, generated partitions are (**MINVALUE**, 1), [1, 2), and [2, **MAXVALUE**), and their names will be **p1\_0**, **p1\_1**, and **p2**. In this case, **p1** is a name prefix and **p2** is a partition name. **MINVALUE** means the minimum value.
- **partition\_value**: start value or end value of a range partition. The value depends on **partition\_key** and cannot be **MAXVALUE**.

- **interval\_value**: width of each partition for dividing the [START, END) range. It cannot be MAXVALUE. If the value of (END - START) divided by EVERY has a remainder, the width of only the last partition is less than the value of EVERY.
- MAXVALUE usually specifies the upper limit of the last range partition.

---

#### NOTICE

1. If the defined statement is in the first place and has **START** specified, the range (*MINVALUE*, **START**) will be automatically used as the first actual partition.
2. The **START END** syntax must comply with the following rules:
  - The value of **START** (if any, same for the following situations) in each **partition\_start\_end\_item** must be smaller than that of **END**.
  - In two adjacent **partition\_start\_end\_item** statements, the value of the first **END** must be equal to that of the second **START**.
  - The value of **EVERY** in each **partition\_start\_end\_item** must be a positive number (in ascending order) and must be smaller than **END** minus **START**.
  - Each partition includes the start value (unless it is *MINVALUE*) and excludes the end value. The format is as follows: [START, END).
  - Partitions created by the same **partition\_start\_end\_item** belong to the same tablespace.
  - If **partition\_name** is a name prefix of a partition, the length must not exceed 57 bytes. If there are more than 57 bytes, the prefix will be automatically truncated.
  - When creating or modifying a partitioned table, ensure that the total number of partitions in the table does not exceed the maximum value **1048575**.
3. In statements for creating partitioned tables, **START END** and **LESS THAN** cannot be used together.
4. The **START END** syntax in a partitioned table creation SQL statement will be replaced by the **VALUES LESS THAN** syntax when **gs\_dump** is executed.

---

- **PARTITION BY LIST [COLUMNS] (partition\_key)**

Creates a list partition. **partition\_key** is the name of the partition key.

The COLUMNS keyword can be used only when **sql\_compatibility** is set to 'MYSQL'. The semantics of PARTITION BY LIST COLUMNS is the same as that of PARTITION BY LIST.

- A list partitioning policy supports a partition key with up to 16 columns.
- For the clause syntax VALUES [IN] (list\_values), if **list\_values** contains the key values of the corresponding partition, it is recommended that the number of key values of each partition be less than or equal to 64.
- The clause VALUES IN can be used only when **sql\_compatibility** is set to 'MYSQL'. The semantics is the same as that of **VALUES**.

Partition keys support the following data types: INT1, INT2, INT4, INT8, NUMERIC, VARCHAR(*n*), CHAR, BPCHAR, NVARCHAR2, TIMESTAMP[(*p*)]

[WITHOUT TIME ZONE], `TIMESTAMP[(p)] [WITH TIME ZONE]` and `DATE`. The number of partitions cannot exceed 1048575.

- **PARTITION BY HASH(partition\_key)**

Create a hash partition. **partition\_key** is the name of the partition key.

For **partition\_key**, the hash partitioning policy supports only one column of partition keys.

Partition keys support the following data types: `INT1`, `INT2`, `INT4`, `INT8`, `NUMERIC`, `VARCHAR(n)`, `CHAR`, `BPCHAR`, `TEXT`, `NVARCHAR2`, `TIMESTAMP[(p)] [WITHOUT TIME ZONE]`, `TIMESTAMP[(p)] [WITH TIME ZONE]`, and `DATE`. The number of partitions cannot exceed 1048575.

- **PARTITIONS integer**

Specifies the number of partitions.

**integer** indicates the number of partitions. The value must be an integer greater than 0 and cannot be greater than 1048575.

- When this clause is specified after the range and list partitions, each partition must be explicitly defined, and the number of defined partitions must be equal to the integer value. This clause can be specified after the range and list partitions only when **sql\_compatibility** is set to **'MYSQL'**.
- When this clause is specified after the hash and key partitions, if the definition of each partition is not listed, an *integer* number of partitions are automatically generated. The automatically generated partition name is "p+number", and the number ranges from 0 to *integer* minus 1. The tablespace of the partition is the tablespace of the table by default. If each partition definition is explicitly defined, the number of defined partitions must be the same as the value of *integer*. If neither the partition definition nor the number of partitions is specified, a unique partition is created.

- **{ ENABLE | DISABLE } ROW MOVEMENT**

Sets row movement.

If the tuple value is updated on the partition key during the `UPDATE` operation, the partition where the tuple is located is altered. Setting this parameter enables error messages to be reported or movement of the tuple between partitions.

Value range:

- **ENABLE**: Row movement is enabled.
- **DISABLE** (default value): Row movement is disabled.

If the row movement is enabled, an error may be reported when `UPDATE` and `DELETE` operations are performed concurrently. The causes are as follows:

The old data is marked as deleted in the `UPDATE` and `DELETE` operations. If the row movement is enabled, the cross-partition update occurs when the partition key is updated. The kernel marks the old data in the old partition as deleted and adds a data to the new partition. As a result, the new data cannot be found by querying the old data.

If data in the same row is concurrently operated, the cross-partition and non-cross-partition data results have different behaviors in the following three concurrency scenarios: `UPDATE` and `UPDATE` concurrency, `DELETE` and `DELETE` concurrency, as well as `UPDATE` and `DELETE` concurrency.

- a. For non-cross-partition data, no error is reported for the second operation after the first operation is performed.

If the first operation is UPDATE, the latest data can be found and operated after the second operation is performed.

If the first operation is DELETE, the second operation is terminated if the current data is deleted and the latest data cannot be found.

- b. For the cross-partition data result, an error is reported for the second operation after the first operation is performed.

If the first operation is UPDATE, the second operation cannot find the latest data because the new data is in the new partition. Therefore, the second operation fails and an error is reported.

If the first operation is DELETE, performing the second operation can find that the current data is deleted and the latest data cannot be found, but cannot determine whether the operation of deleting the old data is UPDATE or DELETE. If the operation is UPDATE, an error is reported. If the operation is DELETE, the operation is terminated. To ensure the data correctness, an error is reported.

If the UPDATE and UPDATE concurrency, and UPDATE and DELETE concurrency are performed, the error can be solved only when the operations are performed serially. If the DELETE and DELETE concurrency are performed, the error can be solved by disabling the row movement.

- **NOT NULL**

The column is not allowed to contain null values. **ENABLE** can be omitted.

- **NULL**

Specifies that the column is allowed to contain null values. This is the default setting.

This clause is only provided for compatibility with non-standard SQL databases. It is not recommended.

- **CHECK (condition) [ NO INHERIT ]**

Specifies an expression producing a Boolean result where the INSERT or UPDATE operation of new or updated rows can succeed only when the expression result is **TRUE** or **UNKNOWN**; otherwise, an error is thrown and the database is not altered.

A check constraint specified as a column constraint should reference only the column's values, while an expression in a table constraint can reference multiple columns.

A constraint marked with **NO INHERIT** will not propagate to child tables.

**ENABLE** can be omitted.

- **DEFAULT default\_expr**

Assigns a default data value to a column. The value can be any variable-free expressions. (Subqueries and cross-references to other columns in the current table are not allowed.) The data type of the default expression must match the data type of the column.

The default expression will be used in any insert operation that does not specify a value for the column. If there is no default value for a column, then the default value is null.

- **UNIQUE [KEY] index\_parameters**  
**UNIQUE ( column\_name [, ... ] ) index\_parameters**  
Specifies that a group of one or more columns of a table can contain only unique values.  
For the purpose of a unique constraint, null is not considered equal.  
UNIQUE KEY can be used only when **sql\_compatibility** is set to 'MYSQL', which has the same semantics as UNIQUE.
- **PRIMARY KEY index\_parameters**  
**PRIMARY KEY ( column\_name [, ... ] ) index\_parameters**  
Specifies that a column or columns of a table can contain only unique (non-duplicate) and non-null values.  
Only one primary key can be specified for a table.
- **DEFERRABLE | NOT DEFERRABLE**  
Controls whether the constraint can be deferred. A constraint that is not deferrable will be checked immediately after every command. Checking of constraints that are deferrable can be postponed until the end of the transaction using the **SET CONSTRAINTS** command. **NOT DEFERRABLE** is the default value. Currently, only **UNIQUE** and **PRIMARY KEY** constraints accept this clause. All the other constraints are not deferrable.
- **INITIALLY IMMEDIATE | INITIALLY DEFERRED**  
If a constraint is deferrable, this clause specifies the default time to check the constraint.
  - If the constraint is **INITIALLY IMMEDIATE** (default value), it is checked after each statement.
  - If the constraint is **INITIALLY DEFERRED**, it is checked only at the end of the transaction.The constraint check time can be altered using the **SET CONSTRAINTS** statement.
- **USING INDEX TABLESPACE tablespace\_name**  
Allows selection of the tablespace in which the index associated with a **UNIQUE** or **PRIMARY KEY** constraint will be created. If not specified, the index is created in **default\_tablespace**. If **default\_tablespace** is empty, the default tablespace of the database is used.

## Examples

- Example 1: Create a range-partitioned table **tpcds.web\_returns\_p1**. The table has eight partitions and their partition keys are of the integer type. The ranges of the partitions are: **wr\_returned\_date\_sk < 2450815**, **2450815 ≤ wr\_returned\_date\_sk < 2451179**, **2451179 ≤ wr\_returned\_date\_sk < 2451544**, **2451544 ≤ wr\_returned\_date\_sk < 2451910**, **2451910 ≤ wr\_returned\_date\_sk < 2452275**, **2452275 ≤ wr\_returned\_date\_sk < 2452640**, **2452640 ≤ wr\_returned\_date\_sk < 2453005**, and **wr\_returned\_date\_sk ≥ 2453005**.

gaussdb=# DROP SCHEMA tpcds CASCADE;
```

- Example 2: Create a range-partitioned table **tpcds.web\_returns\_p2**. The table has eight partitions and their partition keys are of the integer type. The upper limit of the eighth partition is *MAXVALUE*.

The ranges of the partitions are:  $wr\_returned\_date\_sk < 2450815$ ,  $2450815 \leq wr\_returned\_date\_sk < 2451179$ ,  $2451179 \leq wr\_returned\_date\_sk < 2451544$ ,  $2451544 \leq wr\_returned\_date\_sk < 2451910$ ,  $2451910 \leq wr\_returned\_date\_sk < 2452275$ ,  $2452275 \leq wr\_returned\_date\_sk < 2452640$ ,  $2452640 \leq wr\_returned\_date\_sk < 2453005$ , and  $wr\_returned\_date\_sk \geq 2453005$ .

The tablespace of the **tpcds.web\_returns\_p2** partitioned table is **example1**. Partitions **P1** to **P7** have no specified tablespaces, and use the **example1** tablespace of the **tpcds.web\_returns\_p2** partitioned table. The tablespace of the **P8** partitioned table is **example2**.

Assume that *CN and DN data directory/pg\_location/mount1/path1*, *CN and DN data directory/pg\_location/mount2/path2*, *CN and DN data directory/pg\_location/mount3/path3*, and *CN and DN data directory/pg\_location/mount4/path4* are empty directories for which user **dwsadmin** has read and write permissions.

```
gaussdb=# CREATE TABLESPACE example1 RELATIVE LOCATION 'tablespace1/tablespace_1';

## 7.14.79 CREATE TRIGGER

### Description

Creates a trigger. The trigger will be associated with the specified table or view, and will execute the specified function operations are performed.

### Precautions

- Currently, triggers can be created only on ordinary row-store tables, instead of on temporary tables or unlogged tables.
- If multiple triggers of the same kind are defined for the same event, they will be fired in alphabetical order by name.
- Triggers are usually used for data association and synchronization between multiple tables. SQL execution performance is greatly affected. Therefore, you are advised not to use this statement when a large amount of data needs to be synchronized and performance requirements are high.
- When a trigger meets the following conditions, the trigger statement and trigger itself can be pushed together down to a DN for execution, improving the trigger execution performance:
  - The GUC parameters **enable\_trigger\_shipping** and **enable\_fast\_query\_shipping** are enabled.
  - The trigger function used by the source table is a PL/pgSQL function (recommended).
  - The source and target tables have the same type and number of distribution keys, are both row-store tables, and belong to the same node group.
  - The **INSERT**, **UPDATE**, or **DELETE** statement on the source table contains an expression about equality comparison between all the distribution keys and the *NEW* or *OLD* variable.
  - The **INSERT**, **UPDATE**, or **DELETE** statement on the source table can be pushed down without a trigger.
  - There are only six types of triggers (**INSERT BEFORE FOR EACH ROW**, **INSERT AFTER FOR EACH ROW**, **UPDATE BEFORE FOR EACH ROW**, **UPDATE AFTER FOR EACH ROW**, **DELETE BEFORE FOR EACH ROW**, and **DELETE AFTER FOR EACH ROW**) on the source table, and all the triggers can be pushed down.
- The **INSERT ON DUPLICATE KEY UPDATE** statement cannot fire a trigger.
- When a trigger statement is executed, the permission is determined by the trigger creator.
- To create a trigger, you must have the TRIGGER permission on the specified table or have the CREATE ANY TRIGGER permission.
- A row-level trigger function triggered by BEFORE can return a **NULL** value, indicating that operations on the row are ignored. Subsequent triggers will not be executed and no INSERT, UPDATE, or DELETE action will be generated on the row.
- For a trigger function whose event is INSERT or UPDATE, the normal return value is **NEW**. If a non-NULL row is returned, the inserted or updated row is modified. For a trigger function whose event is DELETE, the normal return

value is **OLD**. Note that in the case of a DELETE BEFORE trigger, the return value **NEW** indicates **NULL**.

- **INSTEAD OF** triggers can only work on views. Their trigger functions can also return **NULL**, indicating that subsequent triggers will not be executed.

## Syntax

```
CREATE [CONSTRAINT] TRIGGER name { BEFORE | AFTER | INSTEAD OF } { event [OR ...] }
ON table_name
[FROM referenced_table_name]
{ NOT DEFERRABLE | [DEFERRABLE] } { INITIALLY IMMEDIATE | INITIALLY DEFERRED } }
[FOR [EACH] { ROW | STATEMENT }]
[WHEN (condition)]
EXECUTE PROCEDURE function_name (arguments);
```

Events include:

```
INSERT
UPDATE [OF column_name [, ...]]
DELETE
TRUNCATE
```

## Parameters

- **CONSTRAINT**  
(Optional) Creates a constraint trigger. That is, the trigger is used as a constraint. This is the same as a regular trigger except that the timing of the trigger firing can be adjusted using **SET CONSTRAINTS**. Constraint triggers must be AFTER ROW triggers.
- **name**  
Specifies the name of the trigger to be created. This must be distinct from the name of any other trigger for the same table. The name cannot be schema-qualified — the trigger inherits the schema of its table. For a constraint trigger, this is also the name to use when modifying the trigger's behavior using **SET CONSTRAINTS**.  
Value range: a string, which complies with the **naming convention**. A value can contain a maximum of 63 characters.
- **BEFORE**  
Specifies that the function is called before the event.
- **AFTER**  
Specifies that the function is called after the event. A constraint trigger can only be specified as **AFTER**.
- **INSTEAD OF**  
Specifies that the function is called instead of the event.
- **event**  
Specifies the event that will fire the trigger. Values are **INSERT**, **UPDATE**, **DELETE**, and **TRUNCATE**. Multiple events can be specified using **OR**.  
For **UPDATE** events, it is possible to specify a list of columns using this syntax:  

```
UPDATE OF column_name1 [, column_name2 ...]
```

  
The trigger will only fire if at least one of the listed columns is mentioned as a target of the **UPDATE** statement. **INSTEAD OF UPDATE** events do not allow a list of columns.

- **table\_name**

Specifies the name of the table for which the trigger is created.  
Value range: name of an existing table in the database
- **referenced\_table\_name**

Specifies the name of another table referenced by the constraint. This option is used for foreign-key constraints. It can only be specified for constraint triggers. Because foreign keys are not supported currently, this option is not recommended for general use.  
Value range: name of an existing table in the database
- **DEFERRABLE | NOT DEFERRABLE**

Specifies the start time of the trigger. It can only be specified for constraint triggers. They determine whether the constraint is deferrable.  
For details, see [CREATE TABLE](#).
- **INITIALLY IMMEDIATE | INITIALLY DEFERRED**

If the constraint is deferrable, the two clauses specify the default time to check the constraint. It can only be specified for constraint triggers.  
For details, see [CREATE TABLE](#).
- **FOR EACH ROW | FOR EACH STATEMENT**

Specifies the frequency of firing the trigger.

  - **FOR EACH ROW** indicates that the trigger should be fired once for every row affected by the trigger event.
  - **FOR EACH STATEMENT** indicates that the trigger should be fired just once per SQL statement.

If neither is specified, the default is **FOR EACH STATEMENT**. Constraint triggers can only be marked as **FOR EACH ROW**.
- **condition**

Specifies whether the trigger function will actually be executed. If **WHEN** is specified, the function will be called only when **condition** returns **true**.  
In **FOR EACH ROW** triggers, the **WHEN** condition can refer to columns of the old and/or new row values by writing **OLD.column name** or **NEW.column name** respectively. In addition, **INSERT** triggers cannot refer to **OLD**, and **DELETE** triggers cannot refer to **NEW**.  
**INSTEAD OF** triggers do not support **WHEN** conditions.  
Currently, **WHEN** expressions cannot contain subqueries.  
Note that for constraint triggers, evaluation of the **WHEN** condition is not deferred, but occurs immediately after the row update operation is performed. If the condition does not evaluate to **true**, then the trigger is not queued for deferred execution.
- **function\_name**

Specifies a user-defined function, which must be declared as taking no parameters and returning type trigger. This is executed when a trigger fires.
- **arguments**

Specifies an optional comma-separated list of parameters to be provided to the function when the trigger is executed. The parameters are literal string constants. Simple names and numeric constants can also be written here, but

they will all be converted to strings. Check the description of the implementation language of the trigger function to find out how these parameters can be accessed within the function.

 **NOTE**

The following details trigger types:

- **INSTEAD OF** triggers must be marked as **FOR EACH ROW** and can be defined only on views.
- **BEFORE** and **AFTER** triggers on a view must be marked as **FOR EACH STATEMENT**.
- **TRUNCATE** triggers must be marked as **FOR EACH STATEMENT**.

**Table 7-162** Types of triggers supported on tables and views

When	Event	Row-Level	Statement-Level
BEFORE	INSERT/UPDATE/DELETE	Tables	Tables and views
	TRUNCATE	Not supported.	Tables
AFTER	INSERT/UPDATE/DELETE	Tables	Tables and views
	TRUNCATE	Not supported.	Tables
INSTEAD OF	INSERT/UPDATE/DELETE	Views	Not supported.
	TRUNCATE	Not supported.	Not supported.

**Table 7-163** Special variables of PL/pgSQL trigger functions

Variable	Description
NEW	New tuple for <b>INSERT</b> and <b>UPDATE</b> operations. This variable is <b>NULL</b> for <b>DELETE</b> operations.
OLD	Old tuple for <b>UPDATE</b> and <b>DELETE</b> operations. This variable is <b>NULL</b> for <b>INSERT</b> operations.
TG_NAME	Trigger name.
TG_WHEN	Trigger timing ( <b>BEFORE</b> , <b>AFTER</b> , or <b>INSTEAD OF</b> ).
TG_LEVEL	Trigger frequency ( <b>ROW</b> or <b>STATEMENT</b> ).
TG_OP	Trigger event ( <b>INSERT</b> , <b>UPDATE</b> , <b>DELETE</b> , or <b>TRUNCATE</b> ).

Variable	Description
TG_RELID	OID of the table where the trigger resides.
TG_RELNAME	Name of the table where the trigger resides. (This variable has been replaced by <b>TG_TABLE_NAME</b> .)
TG_TABLE_NAME	Name of the table where the trigger resides.
TG_TABLE_SCHEMA	Schema of the table where the trigger resides.
TG_NARGS	Number of parameters for the trigger function.
TG_ARGV[]	List of parameters for the trigger function.

## Examples

```
-- Create a source table and a target table.
gaussdb=# CREATE TABLE test_trigger_src_tbl(id1 INT, id2 INT, id3 INT);
gaussdb=# CREATE TABLE test_trigger_des_tbl(id1 INT, id2 INT, id3 INT);

-- Create a trigger function.
gaussdb=# CREATE OR REPLACE FUNCTION tri_insert_func() RETURNS TRIGGER AS
$$
DECLARE
BEGIN

$$
DECLARE
BEGIN
 UPDATE test_trigger_des_tbl SET id3 = NEW.id3 WHERE id1=OLD.id1;
 RETURN OLD;
END
$$ LANGUAGE plpgsql;

gaussdb=# CREATE OR REPLACE FUNCTION TRI_DELETE_FUNC() RETURNS TRIGGER AS
$$
DECLARE
BEGIN
 DELETE FROM test_trigger_des_tbl WHERE id1=OLD.id1;
 RETURN OLD;
END
$$ LANGUAGE plpgsql;

-- Create an INSERT trigger.
gaussdb=# CREATE TRIGGER insert_trigger
BEFORE INSERT ON test_trigger_src_tbl
FOR EACH ROW
EXECUTE PROCEDURE tri_insert_func();

-- Create an UPDATE trigger.
gaussdb=# CREATE TRIGGER update_trigger
```

```
AFTER UPDATE ON test_trigger_src_tbl
FOR EACH ROW
EXECUTE PROCEDURE tri_update_func();

-- Create a DELETE trigger.
gaussdb=# CREATE TRIGGER delete_trigger
BEFORE DELETE ON test_trigger_src_tbl
FOR EACH ROW
EXECUTE PROCEDURE tri_delete_func();

-- Execute the INSERT event and check the trigger results.
gaussdb=# INSERT INTO test_trigger_src_tbl VALUES(100,200,300);
gaussdb=# SELECT * FROM test_trigger_src_tbl;
gaussdb=# SELECT * FROM test_trigger_des_tbl; // Check whether the trigger operation takes effect.

-- Execute the UPDATE event and check the trigger results.
gaussdb=# UPDATE test_trigger_src_tbl SET id3=400 WHERE id1=100;
gaussdb=# SELECT * FROM test_trigger_src_tbl;
gaussdb=# SELECT * FROM test_trigger_des_tbl; // Check whether the trigger operation takes effect.

-- Execute the DELETE event and check the trigger results.
gaussdb=# DELETE FROM test_trigger_src_tbl WHERE id1=100;
gaussdb=# SELECT * FROM test_trigger_src_tbl;
gaussdb=# SELECT * FROM test_trigger_des_tbl; // Check whether the trigger operation takes effect.

-- Modify a trigger.
gaussdb=# ALTER TRIGGER delete_trigger ON test_trigger_src_tbl RENAME TO delete_trigger_renamed;

-- Disable insert_trigger.
gaussdb=# ALTER TABLE test_trigger_src_tbl DISABLE TRIGGER insert_trigger;

-- Disable all triggers on the current table.
gaussdb=# ALTER TABLE test_trigger_src_tbl DISABLE TRIGGER ALL;

-- Delete triggers.
gaussdb=# DROP TRIGGER insert_trigger ON test_trigger_src_tbl;
gaussdb=# DROP TRIGGER update_trigger ON test_trigger_src_tbl;
gaussdb=# DROP TRIGGER delete_trigger_renamed ON test_trigger_src_tbl;
```

## 7.14.80 CREATE TYPE

### Description

Defines a new data type for use in the current database. The user who defines a type becomes its owner. Types are designed only for row-store tables.

The following data types can be created: base type, shell type, enumerated type, and set type.

- **Base type**  
You can create a base type (scalar type). Generally, the functions required by a base type have to be coded in C or another low-level language.
- **Shell type**  
A shell type is simply a placeholder for a type to be defined later; it is created by issuing CREATE TYPE with no parameters except for the type name. Shell types are needed as forward references when base types are created.
- **Enumerated type**

An enumerated type is a list of one or more quoted labels, each of which must be 1 to 64 bytes long.

- A user granted with the CREATE ANY TYPE permission can create types in the public and user schemas.

## Precautions

- If a schema name is given then the type is created in the specified schema. Otherwise, it is created in the current schema. The type name must be distinct from the name of any existing type or domain in the same schema. (Because tables have associated data types, the type name must also be distinct from the name of any existing table in the same schema.)
- When creating a non-system type by associating a function, the user needs to understand the definition of the type and the function associated with the type. If this function is not properly used, permissions may be exploited due to the associated function.

## Syntax

```
CREATE TYPE name AS
 ([attribute_name data_type [COLLATE collation] [, ...]]);

CREATE TYPE name (
 INPUT = input_function,
 OUTPUT = output_function
 [, RECEIVE = receive_function]
 [, SEND = send_function]
 [, TYPMOD_IN = type_modifier_input_function]
 [, TYPMOD_OUT = type_modifier_output_function]
 [, ANALYZE = analyze_function]
 [, INTERNALLENGTH = { internallength | VARIABLE }]
 [, PASSEDBYVALUE]
 [, ALIGNMENT = alignment]
 [, STORAGE = storage]
 [, LIKE = like_type]
 [, CATEGORY = category]
 [, PREFERRED = preferred]
 [, DEFAULT = default]
 [, ELEMENT = element]
 [, DELIMITER = delimiter]
 [, COLLATABLE = collatable]
);

CREATE TYPE name;

CREATE TYPE name AS ENUM
 (['label' [, ...]]);
```

## Parameters

### Base type

When creating a base type, you can place parameters in any order. The **input\_function** and **output\_function** parameters are mandatory, and other parameters are optional.

- **input\_function**  
Specifies the name of a function that converts data from the type's external textual form to its internal form.

The input function may be declared as taking one parameter of type `cstring` or taking three parameters of types `cstring`, `oid`, and `integer`.

- The `cstring`-type parameter is the input text as a C string.
- the second parameter is the type's own `OID`.
- The `integer`-type parameter is `typmod` of the destination column, if known (`-1` will be passed if not known).

The input function must return a value of the data type itself. Usually, an input function should be declared as **STRICT**. Otherwise, when a **NULL** input value is read and the input function is called, the first parameter is **NULL**. The function must still return **NULL** in this case, unless it raises an error. (This case is mainly meant to support domain input functions, which might need to reject **NULL** inputs.)

 **NOTE**

- The input and output functions can be declared to have results or parameters of the new type, when they have to be created before the new type can be created. The type should first be defined as a shell type, which is a placeholder type that has no attributes except a name and an owner. This is done by issuing the **CREATE TYPE *name*** statement, with no additional parameters. Then the I/O functions can be defined referencing the shell type. Finally, **CREATE TYPE** with a full definition replaces the shell entry with a complete, valid type definition, after which the new type can be used normally.
- If the input and output functions are internal functions and are specified as internal system functions, the parameter types of the input and output functions must be the same, and the parameter types of **INTERNALLENGTH** and **PASSEDBYVALUE** of the new type must be the same as those of the input and output functions.

- **output\_function**

Specifies the name of a function that converts data from the type's internal form to its external textual form.

The output function must be declared as taking one parameter of the new data type. The output function must return type `cstring`. Output functions are not called for **NULL** values.

- **receive\_function**

(Optional) Specifies the name of a function that converts data from the type's external binary form to its internal form.

If this function is not supplied, the type cannot participate in binary input. The binary representation should be chosen to be cheap to convert to internal form, while being reasonably portable. (For example, the standard integer data types use network byte order as the external binary representation, while the internal representation is in the machine's native byte order.) The receive function should perform adequate checking to ensure that the value is valid.

The receive function may be declared as taking one parameter of type `internal` or taking three parameters of types `internal`, `oid`, `integer`.

- The first parameter is a pointer to a `StringInfo` buffer holding the received byte string;
- the latter two are the same as for the text input function.

The receive function must return a value of the data type itself. Usually, a receive function should be declared **STRICT**; if it is not, it will be called with a **NULL** first parameter when reading a **NULL** input value. The function must

still return **NULL** in this case, unless it raises an error. (This case is mainly meant to support domain receive functions, which might need to reject **NULL** inputs.)

- **send\_function**

(Optional) Specifies the name of a function that converts data from the type's internal form to its external binary form.

If this function is not supplied, the type cannot participate in binary output. The send function must be declared as taking one parameter of the new data type. The send function must return type bytea. Send functions are not called for **NULL** values.

- **type\_modifier\_input\_function**

(Optional) Specifies the name of a function that converts an array of modifiers for a type to its internal format.

- **type\_modifier\_output\_function**

(Optional) Specifies the name of a function that converts the internal format of modifiers for a type to its external text format.

 **NOTE**

**type\_modifier\_input\_function** and **type\_modifier\_output\_function** are needed if the type supports modifiers, that is optional constraints attached to a type declaration, such as `char(5)` or `numeric(30,2)`. GaussDB allows user-defined types to take one or more simple constants or identifiers as modifiers. However, this information must be capable of being packed into a single non-negative integer value for storage in the system catalogs. Declared modifiers are passed to **type\_modifier\_input\_function** in the cstring array format. It must check the values for validity (throwing an error if they are wrong), and if they are correct, return a single non-negative integer value that will be stored as the column "typmod". Type modifiers will be rejected if the type does not have a **type\_modifier\_input\_function**. The **type\_modifier\_output\_function** converts the internal integer typmod value back to the correct form for user display. It must return a cstring value that is the exact string to append to the type name; for example numeric's function might return `(30,2)`. It is allowed to omit the **type\_modifier\_output\_function**, in which case the default display format is just the stored typmod integer value enclosed in parentheses.

- **analyze\_function**

(Optional) Specifies the name of a function that performs statistical analysis for the data type.

By default, **ANALYZE** will attempt to gather statistics using the type's "equals" and "less-than" operators, if there is a default B-tree operator class for the type. For non-scalar types, this behavior is likely to be unsuitable, so it can be overridden by specifying a custom analysis function. The analysis function must be declared to take one parameter of type internal and return a boolean result.

- **internallength**

(Optional) Specifies the length in bytes of the new type's internal representation. The default assumption is that it is variable-length.

While the details of the new type's internal representation are only known to the I/O functions and other functions you create to work with the type, there are several attributes of the internal representation that must be declared to GaussDB. Foremost of these is **internallength**. Base data types can be fixed-length, in which case **internallength** is a positive integer, or variable length, indicated by setting **internallength** to **VARIABLE**. (Internally, this is

represented by setting **typlen** to -1.) The internal representation of all variable-length types must start with a 4-byte integer giving the total length of this value of the type.

- **PASSEDBYVALUE**

(Optional) Indicates that values of this data type are passed by value, rather than by reference. You cannot pass by value types whose internal representation is larger than the size of the Datum type (4 bytes on most machines, 8 bytes on a few).

- **alignment**

(Optional) Specifies the storage alignment requirement of the data type. If specified, it must be **char**, **int2**, **int4**, or **double**; the default is **int4**.

The allowed values equate to alignment on 1, 2, 4, or 8 byte boundaries. Note that variable-length types must have an alignment of at least 4, since they necessarily contain an int4 as their first component.

- **storage**

(Optional) Specifies the storage strategy for the data type.

If specified, it must be **plain**, **external**, **extended**, or **main**; the default is **plain**.

- **plain** specifies that data of the type will always be stored in-line and not compressed. (Only **plain** is allowed for fixed-length types.)
- **extended** specifies that the system will first try to compress a long data value, and will move the value out of the main table row if it is still too long.
- **external** allows the value to be moved out of the main table, but the system will not try to compress it.
- **main** allows compression, but discourages moving the value out of the main table. (Data items with this storage strategy might still be moved out of the main table if there is no other way to make a row fit, but they will be kept in the main table preferentially over **extended** and **external** items.)

All **storage** values other than **plain** imply that the functions of the data type can handle values that have been toasted. The specific other value given merely determines the default **TOAST** storage strategy for columns of a toastable data type; users can pick other strategies for individual columns using **ALTER TABLE SET STORAGE**.

- **like\_type**

(Optional) Specifies the name of an existing data type that the new type will have the same representation as. The values of **internallength**, **passedbyvalue**, **alignment**, and **storage** are copied from that type, unless overridden by explicit specification elsewhere in this **CREATE TYPE** statement.

Specifying representation in this way is especially useful when the low-level implementation of a new type references an existing type.

- **category**

(Optional) Specifies the category code (a single ASCII character) for this type. The default is **U** for a user-defined type. You may also choose other ASCII characters to create custom categories.

- **preferred**

(Optional) Specifies whether a type is preferred within its type category. If it is, the value will be **TRUE**, else **FALSE**. The default is **FALSE**. Be very careful about creating a preferred type within an existing type category, as this could cause surprising changes in behavior.

 **NOTE**

The **category** and **preferred** parameters can be used to help control which implicit cast will be applied in ambiguous situations. Each data type belongs to a category named by a single ASCII character, and each type is either preferred or not within its category. The parser will prefer casting to preferred types (but only from other types within the same category) when this rule is helpful in resolving overloaded functions or operators. For types that have no implicit casts to or from any other types, it is sufficient to leave these settings at the defaults. However, for a group of related types that have implicit casts, it is often helpful to mark them all as belonging to a category and select one or two of the most general types as being preferred within the category. The **category** parameter is especially useful when adding a user-defined type to an existing built-in category, such as the numeric or string types. However, it is also possible to create entirely-user-defined type categories. Select any ASCII character other than an uppercase letter to name such a category.

- **default**

(Optional) Specifies the default value for the data type. If this is omitted, the default is null.

A default value can be specified, in case a user wants columns of the data type to default to something other than the null value. Specify the default with the **DEFAULT** keyword. (Such a default can be overridden by an explicit **DEFAULT** clause attached to a particular column.)

- **element**

(Optional) Specifies the type of array elements when an array type is created. For example, to define an array of 4-byte integers (int4), specify **ELEMENT = int4**.

- **delimiter**

(Optional) Specifies the delimiter character to be used between values in arrays made of this type.

**delimiter** can be set to a specific character. The default delimiter is the comma (,).

- **collatable**

(Optional) Specifies whether this type's operations can use collation information. If they can, the value will be **TRUE**, else **FALSE** (default).

If **collatable** is **TRUE**, column definitions and expressions of the type may carry collation information through use of the **COLLATE** clause. It is up to the implementations of the functions operating on the type to actually make use of the collation information; this does not happen automatically merely by marking the type collatable.

- **label**

(Optional) Represents the textual label associated with one value of an enumerated type. It is a string of 1 to 63 characters.

## Examples

```
gaussdb=# CREATE TABLE t1_compfoo(a int, b compfoo);
gaussdb=# CREATE TABLE t2_compfoo(a int, b compfoo);
```

```
-- Change the owner of the user-defined type compfoo1 to usr1.
gaussdb=# CREATE USER usr1 PASSWORD '*****';

Delete related tables and users.
gaussdb=# DROP TABLE t1_compfoo;
gaussdb=# DROP TABLE t2_compfoo;
gaussdb=# DROP SCHEMA usr1;
gaussdb=# DROP USER usr1;

-- Create an enumerated type.
gaussdb=# CREATE TYPE bugstatus AS ENUM ('create', 'modify', 'closed');

-- Add a label.
gaussdb=# ALTER TYPE bugstatus ADD VALUE IF NOT EXISTS 'regress' BEFORE 'closed';

-- Rename a label.
gaussdb=# ALTER TYPE bugstatus RENAME VALUE 'create' TO 'new';

-- Compile the .so file and create a shell type.
gaussdb=# CREATE TYPE complex;
-- This statement creates a placeholder for the type to be defined so that the type can be referenced when
its I/O functions are defined. Then, you can define I/O functions. Note that the functions must be declared
to take the NOT FENCED mode during creation.
gaussdb=# CREATE FUNCTION
complex_in(cstring)
 RETURNS complex
 AS 'filename'
 LANGUAGE C IMMUTABLE STRICT not fenced;

gaussdb=# CREATE FUNCTION
complex_out(complex)
 RETURNS cstring
 AS 'filename'
 LANGUAGE C IMMUTABLE STRICT not fenced;

gaussdb=# CREATE FUNCTION
complex_rcv(internal)
 RETURNS complex
 AS 'filename'
 LANGUAGE C IMMUTABLE STRICT not fenced;

gaussdb=# CREATE FUNCTION
complex_send(complex)
 RETURNS bytea
 AS 'filename'
 LANGUAGE C IMMUTABLE STRICT not fenced;
-- Finally, provide a complete definition of the data type.
gaussdb=# CREATE TYPE complex (
 internallength = 16,
 input = complex_in,
 output = complex_out,
 receive = complex_rcv,
 send = complex_send,
 alignment = double
);
```

The C functions corresponding to the input, output, receive, and send functions are defined as follows:

```
-- Define a structure body Complex.
typedef struct Complex {
 double x;
 double y;
} Complex;

-- Define an input function.
PG_FUNCTION_INFO_V1(complex_in);

Datum
complex_in(PG_FUNCTION_ARGS)
{
 char *str = PG_GETARG_CSTRING(0);
 double x,
 y;
 Complex *result;

 if (sscanf(str, " (%lf , %lf)", &x, &y) != 2)
 ereport(ERROR,
 (errcode(ERRCODE_INVALID_TEXT_REPRESENTATION),
 errmsg("invalid input syntax for complex: \"%s\"",
 str)));

 result = (Complex *) palloc(sizeof(Complex));
 result->x = x;
 result->y = y;
 PG_RETURN_POINTER(result);
}

-- Define an output function.
PG_FUNCTION_INFO_V1(complex_out);

Datum
complex_out(PG_FUNCTION_ARGS)
{
 Complex *complex = (Complex *) PG_GETARG_POINTER(0);
 char *result;

 result = (char *) palloc(100);
 snprintf(result, 100, "(%g,%g)", complex->x, complex->y);
 PG_RETURN_CSTRING(result);
}

-- Define a receive function.
PG_FUNCTION_INFO_V1(complex_rcv);

Datum
complex_rcv(PG_FUNCTION_ARGS)
{
 StringInfo buf = (StringInfo) PG_GETARG_POINTER(0);
 Complex *result;

 result = (Complex *) palloc(sizeof(Complex));
 result->x = pq_getmsgfloat8(buf);
 result->y = pq_getmsgfloat8(buf);
 PG_RETURN_POINTER(result);
}

-- Define a send function.
PG_FUNCTION_INFO_V1(complex_send);

Datum
complex_send(PG_FUNCTION_ARGS)
{
 Complex *complex = (Complex *) PG_GETARG_POINTER(0);
 StringInfoData buf;
```

```
 pq_begintypsend(&buf);
 pq_sendfloat8(&buf, complex->x);
 pq_sendfloat8(&buf, complex->y);
 PG_RETURN_BYTEA_P(pq_endtypsend(&buf));
}
```

## Helpful Links

[ALTER TYPE](#) and [DROP TYPE](#)

## 7.14.81 CREATE USER

### Description

Creates a user.

### Precautions

- A user created using the CREATE USER statement has the LOGIN permission by default.
- When you run the **CREATE USER** command to create a user, the system creates a schema with the same name as the user in the database where the command is executed.
- The owner of an object created by a system administrator in a schema with the same name as a common user is the common user, not the system administrator.

### Syntax

```
CREATE USER user_name [[WITH] option [...]] [ENCRYPTED | UNENCRYPTED] { PASSWORD | IDENTIFIED BY } { 'password' [EXPIRED] | DISABLE };
```

The **option** clause is used to configure information, including permissions and properties.

```
{SYSADMIN | NOSYSADMIN}
| {MONADMIN | NOMONADMIN}
| {OPRADMIN | NOOPRADMIN}
| {POLADMIN | NOPOLADMIN}
| {AUDITADMIN | NOAUDITADMIN}
| {CREATEDB | NOCREATEDB}
| {USEFT | NOUSEFT}
| {CREATEROLE | NOCREATEROLE}
| {INHERIT | NOINHERIT}
| {LOGIN | NOLOGIN}
| {REPLICATION | NOREPLICATION}
| {VCADMIN | NOVADMIN}
| {PERSISTENCE | NOPERSISTENCE}
| CONNECTION LIMIT connlimit
| VALID BEGIN 'timestamp'
| VALID UNTIL 'timestamp'

| USER GROUP 'groupuser'
| PERM SPACE 'spacelimit'
| TEMP SPACE 'tmpspacelimit'
| SPILL SPACE 'spillspacelimit'
| NODE GROUP logic_cluster_name
| IN ROLE role_name [, ...]
| IN GROUP role_name [, ...]
| ROLE role_name [, ...]
```

```
| ADMIN role_name [, ...]
| USER role_name [, ...]
| SYSID uid
| DEFAULT TABLESPACE tablespace_name
| PROFILE DEFAULT
| PROFILE profile_name
| PGUSER
```

## Parameters

- **user\_name**

Username.

Value range: a string. It must comply with the [naming convention](#). A value can contain a maximum of 63 characters. If a username contains uppercase letters, the database automatically converts the uppercase letters into lowercase letters. To create a username that contains uppercase letters, enclose the username with double quotation marks ("").

- **password**

Specifies the login password.

The new password must:

- Contain at least eight characters. This is the default length.
- Differ from the username or the username spelled backward.
- Contain at least three of the following character types: uppercase characters, lowercase characters, digits, and special characters (limited to ~!@#\$\$%^&\*()-\_+=\|[]{};,:<.>/?). If the password contains characters other than the preceding characters, an error will be reported during statement execution.
- The password can also be a ciphertext character string that meets the format requirements. This mode is mainly used to import user data. You are advised not to use it directly. If a ciphertext password is used, the user must know the plaintext corresponding to the ciphertext password and ensure that the plaintext password meets the complexity requirements. The database does not verify the complexity of the ciphertext password. Instead, the security of the ciphertext password is ensured by the user.
- Be enclosed by single quotation marks when a user is created.

Value range: a string

For details about other parameters, see [Parameter Description](#) in "CREATE ROLE."

## Examples

```
-- Create user jim whose login password is *****.
gaussdb=# CREATE USER jim PASSWORD '*****';

-- Alternatively, you can run the following statement:
gaussdb=# CREATE USER kim IDENTIFIED BY '*****';

-- To create a user with the CREATEDB permission, add the CREATEDB keyword.
gaussdb=# CREATE USER dim CREATEDB PASSWORD '*****';

-- Change the login password of user jim from ***** to *****.
gaussdb=# ALTER USER jim IDENTIFIED BY '*****' REPLACE '*****';

-- Add the CREATEROLE permission to jim.
gaussdb=# ALTER USER jim CREATEROLE;
```

```
-- Lock jim.
gaussdb=# ALTER USER jim ACCOUNT LOCK;

-- Delete users.
gaussdb=# DROP USER kim CASCADE;
gaussdb=# DROP USER jim CASCADE;
gaussdb=# DROP USER dim CASCADE;
```

## Helpful Links

[ALTER USER](#), [CREATE ROLE](#), and [DROP USER](#)

## 7.14.82 CREATE VIEW

### Description

Creates a view. A view is a virtual table, not a base table. Only view definition is stored in the database and view data is not. The data is stored in a base table. If data in the base table changes, the data in the view changes accordingly. In this sense, a view is like a window through which users can know their interested data and data changes in the database.

### Precautions

A user granted the CREATE ANY TABLE permission can create views in the public and user schemas.

### Syntax

```
CREATE [OR REPLACE] [TEMP | TEMPORARY] VIEW view_name [(column_name [, ...])]
[WITH ({view_option_name [= view_option_value]} [, ...])]
AS query;
```

#### NOTE

You can use **WITH(security\_barrier)** to create a relatively secure view. This prevents attackers from printing base table data by using the **RAISE** statement of low-cost functions. After a view is created, you are not allowed to use REPLACE to modify column names in the view or delete the columns.

### Parameters

- **OR REPLACE**  
Redefines the view if it already exists.
- **TEMP | TEMPORARY**  
Creates a temporary view.
- **view\_name**  
Specifies the name (optionally schema-qualified) of the view to be created.  
Value range: a string. It must comply with the [naming convention](#).
- **column\_name**  
Specifies an optional list of names to be used for columns of the view. If not given, the column names are deduced from the query.  
Value range: a string. It must comply with the [naming convention](#).

- **view\_option\_name [= view\_option\_value]**  
Specifies an optional parameter for a view.  
Currently, **view\_option\_name** supports only the **security\_barrier** parameter. This parameter is used when the view attempts to provide row-level security. Value range: Boolean type. It can be **TRUE** or **FALSE**.
- **query**  
Specifies a **SELECT** or **VALUES** statement that will provide the columns and rows of the view.

---

**NOTICE**

If **query** contains a clause specifying the partition of a partitioned table, the OID of the specified partition is hardcoded to the system catalog when the view is created. If the partition DDL syntax that causes the change in the OID of the specified partition is used, for example, **DROP**, **SPLIT**, or **MERGE**, the view is unavailable. In this case, you need to create a view.

---

## Examples

```
-- Create a view consisting of columns whose spcname is pg_default.
gaussdb=# CREATE VIEW myView AS
 SELECT * FROM pg_tablespace WHERE spcname = 'pg_default';

-- Query the view.
gaussdb=# SELECT * FROM myView ;

-- Delete the view.
gaussdb=# DROP VIEW myView;
```

## Helpful Links

[ALTER VIEW](#) and [DROP VIEW](#)

## 7.14.83 CREATE WEAK PASSWORD DICTIONARY

### Function

**CREATE WEAK PASSWORD DICTIONARY** inserts one or more weak passwords into the **gs\_global\_config** table.

### Precautions

- Only the initial user, system administrator, and security administrator have the permission to execute this syntax.
- Passwords in the weak password dictionary are stored in the **gs\_global\_config** system catalog.
- The weak password dictionary is empty by default. You can use this syntax to add one or more weak passwords.
- When a user attempts to execute this syntax to insert a weak password that already exists in the **gs\_global\_config** table, only one weak password is retained in the table.

## Syntax

```
CREATE WEAK PASSWORD DICTIONARY
[WITH VALUES] ({'weak_password'} [, ...]);
```

## Parameter Description

weak\_password

Weak password

Value range: a character string.

## Example

```
-- Insert a single weak password into the gs_global_config system catalog.
gaussdb=# CREATE WEAK PASSWORD DICTIONARY WITH VALUES ('password1');

-- Insert multiple weak passwords into the gs_global_config system catalog.
gaussdb=# CREATE WEAK PASSWORD DICTIONARY WITH VALUES ('password2'),('password3');

-- Clear all weak passwords in the gs_global_config system catalog.
gaussdb=# DROP WEAK PASSWORD DICTIONARY;

-- View existing weak passwords.
gaussdb=# SELECT * FROM gs_global_config WHERE NAME LIKE 'weak_password';
```

## Helpful Links

[13.14.119-DROP WEAK PASSWORD DICTIONARY](#)

## 7.14.84 CURSOR

### Function

This statement is used to create a cursor and retrieve specified rows of data from a query.

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers pointing to context regions. With cursors, stored procedures can control alterations in context regions.

### Precautions

- **CURSOR** is used only in transaction blocks.
- Generally, **CURSOR** and **SELECT** both have text returns. Since data is stored in binary format in the system, the system needs to convert the data from the binary format to the text format. If data is returned in text format, client applications need to convert the data back to the binary format for processing. **FETCH** implements conversion between binary data and text data.
- Binary cursors should be used carefully. Text usually occupies larger space than binary data. A binary cursor returns internal binary data, which is easier to operate. A text cursor returns text, which is easier to retrieve and therefore reduces workload on the client. As an example, if a query returns a value of one from an integer column, you would get a string of 1 with a default cursor, whereas with a binary cursor you would get a 4-byte field containing the internal representation of the value (in big-endian byte order).

## Syntax

```
CURSOR cursor_name
[BINARY] [NO SCROLL] [{ WITH | WITHOUT } HOLD]
FOR query ;
```

## Parameter Description

- **cursor\_name**  
Specifies the name of the cursor to be created.  
Value range: a string. It must comply with the naming convention.
- **BINARY**  
Causes the cursor to return data in binary rather than in text format.
- **NO SCROLL**  
Specifies how the cursor retrieves rows.
  - **NO SCROLL**: specifies that the cursor cannot be used to retrieve rows in a nonsequential fashion.
  - Unspecified: Based on the query's execution plan, the system automatically determines whether the cursor can be used to retrieve rows in a nonsequential fashion.
- **WITH HOLD | WITHOUT HOLD**  
Specifies whether the cursor can continue to be used after the transaction that created it successfully commits.
  - **WITH HOLD**: The cursor can continue to be used after the transaction that created it successfully commits.
  - **WITHOUT HOLD**: The cursor cannot be used outside of the transaction that created it.
  - If neither **WITH HOLD** nor **WITHOUT HOLD** is specified, the default is **WITHOUT HOLD**.
  - Cross-node transactions (for example, DDL-contained transactions created in a coordinator cluster) do not support **WITH HOLD**.
- **query**  
Uses a **SELECT** or **VALUES** clause to specify the rows to be returned by the cursor.  
Value range: **SELECT** or **VALUES** clause

## Examples

See [Examples](#) in section "FETCH."

## Helpful Links

[FETCH](#)

## 7.14.85 DEALLOCATE

### Function

DEALLOCATE deallocates prepared statements.

## Precautions

- If you do not explicitly deallocate a prepared statement, it is deallocated when the session ends.
- The **PREPARE** keyword is always ignored.

## Syntax

```
DEALLOCATE [PREPARE] { name | ALL };
```

## Parameters

- **name**  
Specifies the name of the prepared statement to be deallocated.
- **ALL**  
Deallocates all prepared statements.

## Examples

None

## 7.14.86 DECLARE

### Function

**DECLARE** defines a cursor to retrieve a small number of rows at a time out of a larger query and can be the start of an anonymous block.

This section describes usage of cursors. The usage of anonymous blocks is available in **BEGIN**.

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers pointing to context regions. With cursors, stored procedures can control alterations in context regions.

Generally, **CURSOR** and **SELECT** both have text returns. Since data is stored in binary format in the system, the system needs to convert the data from the binary format to the text format. If data is returned in text format, client applications need to convert the data back to the binary format for processing. **FETCH** implements conversion between binary data and text data.

### Precautions

- **CURSOR** is used only in transaction blocks.
- Binary cursors should be used carefully. Text usually occupies larger space than binary data. A binary cursor returns internal binary data, which is easier to operate. A text cursor returns text, which is easier to retrieve and therefore reduces workload on the client. As an example, if a query returns a value of one from an integer column, you would get a string of 1 with a default cursor, whereas with a binary cursor you would get a 4-byte field containing the internal representation of the value (in big-endian byte order).

## Syntax

- Define a cursor.  

```
DECLARE cursor_name [BINARY] [NO SCROLL]
CURSOR [{ WITH | WITHOUT } HOLD] FOR query ;
```
- Enable an anonymous block.  

```
[DECLARE [declare_statements]]
BEGIN
execution_statements
END;
/
```

## Parameter Description

- **cursor\_name**  
Specifies the name of the cursor to be created.  
Value range: a string. It must comply with the naming convention.
- **BINARY**  
Causes the cursor to return data in binary rather than in text format.
- **NO SCROLL**  
Specifies how the cursor retrieves rows.
  - **NO SCROLL**: specifies that the cursor cannot be used to retrieve rows in a nonsequential fashion.
  - Unspecified: Based on the query's execution plan, the system automatically determines whether the cursor can be used to retrieve rows in a nonsequential fashion.
- **WITH HOLD**  
**WITHOUT HOLD**  
Specifies whether the cursor can continue to be used after the transaction that created it successfully commits.
  - **WITH HOLD**: The cursor can continue to be used after the transaction that created it successfully commits.
  - **WITHOUT HOLD**: The cursor cannot be used outside of the transaction that created it.
  - If neither **WITH HOLD** nor **WITHOUT HOLD** is specified, the default is **WITHOUT HOLD**.

---

### NOTICE

- For a cursor declared as **WITH HOLD**, all data of the cursor is cached when a transaction ends. If the cursor has a large amount of data, this process may take a long time.

- 
- **query**  
Uses a **SELECT** or **VALUES** clause to specify the rows to be returned by the cursor.  
Value range: **SELECT** or **VALUES** clause
  - **declare\_statements**  
Declares a variable, including its name and type, for example, **sales\_cnt int**.

Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table.

If **RECURSIVE** is specified, it allows a **SELECT** subquery to reference itself by name.

- **with\_query\_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.
- **column\_name** specifies the column name displayed in the subquery result set.
- Each subquery can be a **SELECT**, **VALUES**, **INSERT**, **UPDATE** or **DELETE** statement.
- You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE.
  - If **MATERIALIZED** is specified, the **WITH** query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the **WITH** subquery cannot be jointly optimized with the **SELECT** statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the **WITH** query can be executed as a subquery inline, the preceding optimization can be performed.
  - If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the trunk statement to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.

- **plan\_hint**

Follows the **DELETE** keyword in the */\*+ \*/* format. It is used to optimize the plan of a **DELETE** statement block. For details, see [Hint-based Tuning](#). In each statement, only the first */\*+ plan\_hint \*/* comment block takes effect as a hint. Multiple hints can be written.

- **ONLY**

If **ONLY** is specified before the table name, matching rows are deleted from the named table only. If **ONLY** is not specified, matching rows are also deleted from any tables inheriting from the named table.

- **table\_name**

Specifies the name (optionally schema-qualified) of the table to delete rows from.

Value range: an existing table name

 **NOTE**

You can use database links to perform operations on remote tables. For details, see [DATABASE LINK](#).

- **alias**

Specifies a substitute name for the target table.

Value range: a string. It must comply with the [naming convention](#).

- **using\_list**  
Specifies the **USING** clause.
- **condition**  
Specifies an expression that returns a value of type Boolean. Only rows for which this expression returns **true** will be deleted. You are advised not to use numeric types such as int as conditions, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and 0 is implicitly converted to **false**), which may cause unexpected results.
- **WHERE CURRENT OF cursor\_name**  
When the cursor points to a row in a table, you can use this syntax to delete the row. For details about the restrictions, see [UPDATE](#).
- **ORDER BY**  
For details about the keywords, see [SELECT](#).
- **LIMIT**  
For details about the keywords, see [SELECT](#).
- **output\_expr**  
Specifies an expression to be computed and returned by the **DELETE** statement after each row is deleted. The expression can use any column names of the table. Write \* to return all columns.
- **output\_name**  
Specifies a name to use for a returned column.  
Value range: a string. It must comply with the [naming convention](#).

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer_address table.
gaussdb=# CREATE TABLE tpcds.customer_address
(
ca_address_sk INTEGER NOT NULL,
ca_address_id CHARACTER(16) NOT NULL,
ca_street_number INTEGER
ca_street_name CHARACTER (20)
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.customer_address VALUES (1, 'AAAAAAAAABAAAAAAA', '18', 'Jackson'),
(10000, 'AAAAAAAACAAAAAAA', '362', 'Washington 6th'),(15000, 'AAAAAAAADAAAAAAA', '585', 'Dogwood
Washington');

-- Create the tpcds.customer_address_bak table.
gaussdb=# CREATE TABLE tpcds.customer_address_bak AS TABLE tpcds.customer_address;

-- Delete employees whose ca_address_sk is smaller than 14888 from the tpcds.customer_address_bak
table.
gaussdb=# DELETE FROM tpcds.customer_address_bak WHERE ca_address_sk < 14888;

-- Delete all data from the tpcds.customer_address_bak table.
gaussdb=# DELETE FROM tpcds.customer_address_bak;

-- Delete the tpcds.customer_address_bak table.
gaussdb=# DROP TABLE tpcds.customer_address_bak;

-- Delete the tpcds.customer_address table.
gaussdb=# DROP TABLE tpcds.customer_address;
```

```
-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## Suggestions

- **delete**  
To delete all records in a table, use the TRUNCATE syntax.

## 7.14.88 DO

### Function

Executes an anonymous code block.

The code block is treated as though it were the body of a function with no parameters, returning **void**. It is parsed and executed a single time.

### Precautions

- The procedural language to be used must already have been installed into the current database by means of **CREATE LANGUAGE**. **plpgsql** is installed by default, but other languages are not.
- The user must have the **USAGE** permission on the procedural language, or must be a system administrator if the language is untrusted.

### Syntax

```
DO [LANGUAGE lang_name] code;
```

### Parameter Description

- **lang\_name**  
Specifies the name of the procedural language the code is written in. If omitted, the default is **plpgsql**.
- **code**  
Specifies the procedural language code to be executed. This must be specified as a string literal.

### Examples

```
-- Create the webuser user.
gaussdb=# CREATE USER webuser PASSWORD '*****';

-- Grant all permissions on all views in the tpcds schema to the webuser user.
gaussdb=# DO $$DECLARE r record;
BEGIN
 FOR r IN SELECT c.relname,n.nspname FROM pg_class c,pg_namespace n
 WHERE c.relnamespace = n.oid AND n.nspname = 'tpcds' AND relkind IN ('r','v')
 LOOP
 EXECUTE 'GRANT ALL ON ' || quote_ident(r.table_schema) || '.' || quote_ident(r.table_name) || ' TO
webuser';
 END LOOP;
END$$;

-- Delete the webuser user.
gaussdb=# DROP USER webuser CASCADE;
```

## 7.14.89 DROP AUDIT POLICY

### Description

Deletes an audit policy.

### Precautions

Only users with the poladmin or sysadmin permission, or the initial user can perform this operation.

### Syntax

```
DROP AUDIT POLICY [IF EXISTS] policy_name;
```

### Parameters

#### **policy\_name**

Specifies the audit policy name, which must be unique.

Value range: a string. It must comply with the [naming convention](#).

### Examples

See [Examples](#) in section "CREATE AUDIT POLICY."

### Helpful Links

[CREATE AUDIT POLICY](#) and [ALTER AUDIT POLICY](#)

## 7.14.90 DROP CLIENT MASTER KEY

### Function

**DROP CLIENT MASTER KEY** deletes a CMK.

### Precautions

- Only the CMK owner or a user who has been granted the DROP permission can run this command. By default, the system administrator has this permission.
- This command can only be used to delete the metadata information recorded in the system catalog of the database, but cannot be used to delete the CMK file. You need to use KeyTool to delete the CMK file.

### Syntax

```
DROP CLIENT MASTER KEY [IF EXISTS] client_master_key_name [, ...] [CASCADE | RESTRICT];
```

### Parameter Description

- **IF EXISTS**  
If a specified CMK does not exist, a notice rather than an error is issued.

- **client\_master\_key\_name**  
Name of a CMK to be deleted.  
Value range: a string. It is the name of an existing CMK.
- **CASCADE | RESTRICT**  
Allows/Restricts to delete objects that depend on the CMK.

## Examples

```
-- Delete a CMK object.
gaussdb=> DROP CLIENT MASTER KEY ImgCMK CASCADE;
NOTICE: drop cascades to column setting: imgcek
DROP GLOBAL SETTING
```

## 7.14.91 DROP COLUMN ENCRYPTION KEY

### Function

Deletes a CEK.

### Precautions

Only the CEK owner or a user who has been granted the DROP permission can run this command. By default, the system administrator has this permission.

### Syntax

```
DROP COLUMN ENCRYPTION KEY [IF EXISTS] client_column_key_name [, ...] [CASCADE | RESTRICT];
```

### Parameter Description

- **IF EXISTS**  
If a specified CEK does not exist, a notice rather than an error is issued.
- **client\_column\_key\_name**  
Name of a CEK to be deleted.  
Value range: a string. It is the name of an existing CEK.
- **CASCADE | RESTRICT**  
For fully-encrypted databases, this syntax is high-risk operation. Actually, encrypted columns that depend on CEKs cannot be deleted.

## Examples

```
-- Delete a CEK object.
gaussdb=# DROP COLUMN ENCRYPTION KEY ImgCEK CASCADE;
ERROR: cannot drop column setting: imgcek cascadelly because encrypted column depend on it.
HINT: we have to drop encrypted column: name, ... before drop column setting: imgcek cascadelly.
```

## 7.14.92 DROP DATABASE

### Function

Deletes a database.

## Precautions

- Only the database owner or a user granted with the DROP permission can run the **DROP DATABASE** command. The system administrator has this permission by default.
- The preinstalled POSTGRES, TEMPLATE0, and TEMPLATE1 databases are protected and therefore cannot be deleted. To check databases in the current service, run the gsql statement `\l`.
- If any users are connected to the database, the database cannot be deleted. To check the current database connections, open the `dv_sessions` view.
- DROP DATABASE cannot be executed within a transaction block.
- Before deleting a database, run the **CLEAN CONNECTION TO ALL FORCE FOR DATABASE XXXX** command to forcibly stop the existing user connections and backend threads, preventing database deletion failures caused by running backend threads. Forcibly stopping backend threads may cause data inconsistency in the current database. Therefore, execute this command only when you are sure to delete the database.
- If DROP DATABASE fails and is rolled back, run **DROP DATABASE IF EXISTS** again.

---

### NOTICE

DROP DATABASE cannot be undone.

---

## Syntax

```
DROP DATABASE [IF EXISTS] database_name ;
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified database does not exist.
- **database\_name**  
Specifies the name of the database to be deleted.  
Value range: an existing database name

## Examples

See [Examples](#) in section "CREATE DATABASE."

## Helpful Links

[CREATE DATABASE](#)

## Suggestions

- DROP DATABASE  
Do not delete databases during transactions.

## 7.14.93 DROP DATABASE LINK

### Description

Deletes database link objects.

### Syntax

```
DROP [PUBLIC] DATABASE LINK dblink ;
```

### Parameters

- **dblink**  
Name of a connection object.
- **PUBLIC**  
Specifies the connection type. If **PUBLIC** is not specified, the database link is private by default.

## 7.14.94 DROP DIRECTORY

### Function

Deletes a directory.

### Precautions

- When **enable\_access\_server\_directory** is set to **off**, only the initial user is allowed to delete the directory object.
- When **enable\_access\_server\_directory** is set to **on**, a user with the SYSADMIN permission, a directory object owner, a user granted with the DROP permission for a directory, or a user inherited from the built-in role `gs_role_directory_drop` can delete a directory object.

### Syntax

```
DROP DIRECTORY [IF EXISTS] directory_name;
```

### Parameters

- **directory\_name**  
Specifies the name of the directory to be deleted.  
Value range: an existing directory name

### Examples

```
-- Create a directory.
gaussdb=# CREATE OR REPLACE DIRECTORY dir as '/tmp/';

-- Delete a foreign table.
gaussdb=# DROP DIRECTORY dir;
```

### Helpful Links

[CREATE DIRECTORY](#) and [ALTER DIRECTORY](#)

## 7.14.95 DROP FOREIGN DATA WRAPPER

### Description

Deletes a specified foreign data wrapper.

### Precautions

The DROP statement can be successfully executed only when **support\_extended\_features** is set to **on**.

### Syntax

```
DROP FOREIGN DATA WRAPPER [IF EXISTS] name [CASCADE | RESTRICT];
```

### Parameters

- **IF EXISTS**  
Sends a notification instead of throwing an error if the foreign data wrapper does not exist.
- **name**  
Specifies the name of an existing foreign data wrapper.
- **CASCADE**  
Automatically drops objects (such as servers) that depend on the foreign data wrapper.
- **RESTRICT**  
If there are objects that depend on the foreign data wrapper, the foreign data wrapper cannot be deleted. This is the default behavior.

### Example

```
-- Delete the foreign data wrapper dbi.
gaussdb=# DROP FOREIGN DATA WRAPPER dbi;
```

### Helpful Links

[ALTER FOREIGN DATA WRAPPER](#) and [CREATE FOREIGN DATA WRAPPER](#)

## 7.14.96 DROP FUNCTION

### Function

Deletes a function.

### Precautions

If a function involves operations on temporary tables, **DROP FUNCTION** cannot be used.

Only the function owner or a user granted with the DROP permission can run the **DROP FUNCTION** command. The system administrator has this permission by default.

## Syntax

```
DROP FUNCTION [IF EXISTS] function_name
[([{ [argname] [argmode] argtype} [, ...]]) [CASCADE | RESTRICT]] ;
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified function does not exist.
- **function\_name**  
Specifies the name of the function to be deleted.  
Value range: an existing function name
- **argmode**  
Specifies the parameter mode of the function.
- **argname**  
Specifies the parameter name of the function.
- **argtype**  
Specifies the parameter type of the function.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the function.
  - **RESTRICT**: refuses to delete the function if any objects depend on it. This is the default action.

## Examples

See [Examples](#) in section "CREATE FUNCTION."

## Helpful Links

[ALTER FUNCTION](#) and [CREATE FUNCTION](#)

## 7.14.97 DROP GLOBAL CONFIGURATION

### Function

**DROP GLOBAL CONFIGURATION** deletes parameter values from the **gs\_global\_config** system catalog.

### Precautions

Only the initial database user can run this command.

The **weak\_password** keyword cannot be deleted.

## Syntax

```
DROP GLOBAL CONFIGURATION Parameter name, Parameter name... ;
```

## Parameter Description

The parameter is a parameter that already exists in the **gs\_global\_config** system catalog. If you delete a parameter that does not exist, an error will be reported.

## 7.14.98 DROP GROUP

### Function

**DROP GROUP** deletes a user group. **DROP GROUP** is an alias for **DROP ROLE**.

### Precautions

**DROP GROUP** is available only to users with the **CREATE ROLE** permission granted by the administrator.

### Syntax

```
DROP GROUP [IF EXISTS] group_name [, ...];
```

### Parameter Description

See [Parameter Description](#) in **DROP ROLE**.

### Helpful Links

- [CREATE GROUP](#)
- [ALTER GROUP](#)
- [DROP ROLE](#)

## 7.14.99 DROP INDEX

### Function

Drops an index.

### Precautions

Only the index owner, owner of the schema where the index resides, a user who has the **INDEX** permission on the table where the index resides, or a user who has the **DROP ANY INDEX** permission can run the **DROP INDEX** command. The system administrator has this permission by default.

### Syntax

```
DROP INDEX [IF EXISTS]
index_name [, ...] [CASCADE | RESTRICT];
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified index does not exist.

- **index\_name**  
Specifies the name of the index to be deleted.  
Value range: an existing index
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the index.
  - **RESTRICT**: refuses to delete the index if any objects depend on it. This is the default action.

## Examples

See [Examples](#) in section "CREATE INDEX."

## Helpful Links

[ALTER INDEX](#) and [CREATE INDEX](#)

## 7.14.100 DROP LANGUAGE

This version does not support this syntax.

## 7.14.101 DROP MASKING POLICY

### Description

Deletes a masking policy.

### Precautions

Only users with the POLADMIN or SYSADMIN permission, or the initial user can perform this operation.

### Syntax

```
DROP MASKING POLICY [IF EXISTS] policy_name;
```

### Parameters

#### **policy\_name**

Specifies the audit policy name, which must be unique.

Value range: a string. It must comply with the [naming convention](#).

### Examples

```
-- Delete a masking policy.
gaussdb=# DROP MASKING POLICY IF EXISTS maskpol1;

-- Delete a group of anonymization policies.
gaussdb=# DROP MASKING POLICY IF EXISTS maskpol1, maskpol2, maskpol3;
```

## Helpful Links

[ALTER MASKING POLICY](#) and [CREATE MASKING POLICY](#)

## 7.14.102 DROP MATERIALIZED VIEW

### Function

**DROP MATERIALIZED VIEW** deletes an existing materialized view from the database.

### Precautions

The owner of a materialized view, owner of the schema of the materialized view, users granted with the DROP permission on the materialized view, or users granted with the DROP ANY TABLE permission can run the **DROP MATERIALIZED VIEW** command. By default, the system administrator has the permission to run the command.

### Syntax

```
DROP MATERIALIZED VIEW [IF EXISTS] mv_name [, ...] [CASCADE | RESTRICT];
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified materialized view does not exist.
- **mv\_name**  
Name of the materialized view to be deleted.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on a materialized view.
  - **RESTRICT**: refuses to delete a materialized view if any objects depend on it. This is the default value.

### Examples

```
-- Create a table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int) WITH(STORAGE_TYPE=ASTORE);

-- Create a materialized view named my_mv.
gaussdb=# CREATE MATERIALIZED VIEW my_mv AS SELECT * FROM my_table;

-- Delete the materialized view named my_mv.
gaussdb=# DROP MATERIALIZED VIEW my_mv;

-- Delete the table.
gaussdb=# DROP TABLE my_table;
```

### Helpful Links

[ALTER MATERIALIZED VIEW](#), [CREATE INCREMENTAL MATERIALIZED VIEW](#), [CREATE MATERIALIZED VIEW](#), [CREATE TABLE](#), [REFRESH INCREMENTAL MATERIALIZED VIEW](#), and [REFRESH MATERIALIZED VIEW](#)

## 7.14.103 DROP MODEL

This syntax is not supported in distributed scenarios.

## 7.14.104 DROP NODE

### Function

**DROP NODE** deletes a node.

### Precautions

**CREATE NODE GROUP** is an interface of the cluster management tool. You are not advised to use this interface, because doing so affects the cluster. Only the administrator has the permission to use this interface.

### Syntax

```
DROP NODE [IF EXISTS] nodename [WITH (cnnodename [...])];
```

### Parameter Description

#### **IF EXISTS**

Reports a notice instead of an error if the specified node does not exist.

#### **nodename**

Specifies the name of the node to be deleted.

Value range: an existing node name

#### **cnnodename**

Specifies the CN name. If it is specified, **DROP NODE** will be executed on both the connected CN and the specified CN. If it is not specified, DN deletion must be performed on all CNs, and CN deletion must be performed on all CNs except the CN to be deleted.

Value range: an existing CN name

### Helpful Links

- [CREATE NODE](#)
- [ALTER NODE](#)

## 7.14.105 DROP NODE GROUP

### Description

Deletes a node group.

### Precautions

- **DROP NODE GROUP** is an interface of the cluster management tool.
- Only the system administrator or a user who has the **DROP** permission can perform this operation.

## Syntax

```
DROP NODE GROUP groupname [DISTRIBUTE FROM src_group_name];
```

## Parameters

### groupname

Specifies the name of the node group to be deleted.

Value range: an existing node group name

## Helpful Links

[CREATE NODE GROUP](#)

## 7.14.106 DROP OWNED

### Function

**DROP OWNED** deletes the database objects owned by a database role.

### Precautions

- This interface will revoke the role's permissions on all objects in the current database and shared objects (databases and tablespaces).
- **DROP OWNED** is often used to prepare for removing one or more roles. Because **DROP OWNED** affects only the objects in the current database, you need to run this statement in each database that contains the objects owned by the role to be removed.
- Using the **CASCADE** option may cause this statement to recursively remove objects owned by other users.
- The databases and tablespaces owned by the role will not be removed.

## Syntax

```
DROP OWNED BY name [, ...] [CASCADE | RESTRICT];
```

### Parameter Description

- **name**  
Specifies the role name.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the objects to be deleted.
  - **RESTRICT**: refuses to delete the objects if other objects depend on them. This is the default action.

## Helpful Links

[REASSIGN OWNED](#) and [DROP ROLE](#)

## 7.14.107 DROP PROCEDURE

### Function

**DROP PROCEDURE** deletes a stored procedure.

### Precautions

None

### Syntax

```
DROP PROCEDURE [IF EXISTS] procedure_name ;
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified stored procedure does not exist.
- **procedure\_name**  
Specifies the name of the stored procedure to be deleted.  
Value range: an existing stored procedure name

### Examples

See [Examples](#) in **CREATE PROCEDURE**.

### Helpful Links

[CREATE PROCEDURE](#)

## 7.14.108 DROP RESOURCE LABEL

### Function

Deletes a resource label.

### Precautions

Only users with the POLADMIN or SYSADMIN permission, or the initial user can perform this operation.

### Syntax

```
DROP RESOURCE LABEL [IF EXISTS] label_name[, ...];
```

### Parameter Description

- label\_name**
- Specifies the resource label name.
- Value range: a string. It must comply with the [naming convention](#).

## Examples

```
-- Delete a resource label.
gaussdb=# DROP RESOURCE LABEL IF EXISTS res_label1;

-- Delete a group of resource labels.
gaussdb=# DROP RESOURCE LABEL IF EXISTS res_label1, res_label2, res_label3;
```

## Helpful Links

[ALTER RESOURCE LABEL](#) and [CREATE RESOURCE LABEL](#)

## 7.14.109 DROP ROLE

### Function

**DROP ROLE** deletes a role.

### Precautions

None

### Syntax

```
DROP ROLE [IF EXISTS] role_name [, ...];
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified role does not exist.
- **role\_name**  
Specifies the name of the role to be deleted.  
Value range: an existing role name

### Examples

See [Examples](#) in **CREATE ROLE**.

## Helpful Links

[CREATE ROLE](#), [ALTER ROLE](#), and [SET ROLE](#)

## 7.14.110 DROP ROW LEVEL SECURITY POLICY

### Function

**DROP ROW LEVEL SECURITY POLICY** deletes a row-level access control policy from a table.

### Precautions

Only the owner of a table or a system administrator has the **DROP ROW LEVEL SECURITY POLICY** permission.

## Syntax

```
DROP [ROW LEVEL SECURITY] POLICY [IF EXISTS] policy_name ON table_name [CASCADE | RESTRICT]
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified row-level access control policy does not exist.
- **policy\_name**  
Specifies the name of a row-level access control policy to be deleted.
  - **table\_name**  
Specifies the name of the table containing the row-level access control policy.
  - **CASCADE/RESTRICT**  
Currently, no objects depend on row-level access control policies. Therefore, **CASCADE** is equivalent to **RESTRICT**, and they are reserved to ensure backward compatibility.

## Examples

```
-- Create the data table all_data.
gaussdb=# CREATE TABLE all_data(id int, role varchar(100), data varchar(100));

-- Create a row-level security policy.
gaussdb=# CREATE ROW LEVEL SECURITY POLICY all_data_rls ON all_data USING(role = CURRENT_USER);

-- Delete the row-level security policy.
gaussdb=# DROP ROW LEVEL SECURITY POLICY all_data_rls ON all_data;

-- Delete the all_data table.
gaussdb=# DROP TABLE all_data;
```

## Helpful Links

[ALTER ROW LEVEL SECURITY POLICY](#) and [CREATE ROW LEVEL SECURITY POLICY](#)

## 7.14.111 DROP SCHEMA

### Function

Deletes a schema from the current database.

### Precautions

- Only the schema owner or a user granted with the DROP permission can run the **DROP SCHEMA** command. The system administrator has this permission by default.
- Only initial users and O&M administrators can run the **DROP SCHEMA** command for O&M administrators. Other users cannot run **DROP SCHEMA** for O&M administrators.

## Syntax

```
DROP SCHEMA [IF EXISTS] schema_name [, ...] [CASCADE | RESTRICT];
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified schema does not exist.
- **schema\_name**  
Specifies the name of the schema to be deleted.  
Value range: an existing schema name
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes all the objects contained in the schema.
  - **RESTRICT**: refuses to delete the schema if the schema contains objects. This is the default action.

### NOTICE

Schemas beginning with **pg\_temp** or **pg\_toast\_temp** are for internal use. Do not delete them. Otherwise, unexpected consequences may be incurred.

### NOTE

The schema currently being used cannot be deleted. To delete it, switch to another schema first.

## Examples

See [Examples](#) in section "CREATE SCHEMA."

## Helpful Links

[ALTER SCHEMA](#) and [CREATE SCHEMA](#).

## 7.14.112 DROP SEQUENCE

### Function

Deletes a sequence from the current database.

### Precautions

Only the owner of a sequence, the owner of the schema to which the sequence belongs, or a user granted the DROP permission on a sequence or a user granted the DROP ANY SEQUENCE permission can delete a sequence. A system administrator has this permission by default.

## Syntax

```
DROP SEQUENCE [IF EXISTS] { [schema.] sequence_name } [, ...] [CASCADE | RESTRICT];
```

## Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified sequence does not exist.
- **name**  
Specifies the name of the sequence to be deleted.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the data server.
  - **RESTRICT**: refuses to delete the server if any objects depend on it. This is the default action.

## Examples

```
-- Create an ascending sequence named serial, starting from 101.
gaussdb=# CREATE SEQUENCE serial START 101;

-- Delete a sequence.
gaussdb=# DROP SEQUENCE serial;
```

## Helpful Links

[ALTER SEQUENCE](#) and [DROP SEQUENCE](#)

## 7.14.113 DROP SERVER

### Description

Deletes an existing data server.

### Precautions

Only the server owner or a user granted with the DROP permission can run the **DROP SERVER** command. The system administrator has this permission by default.

### Syntax

```
DROP SERVER [IF EXISTS] server_name [{ CASCADE | RESTRICT }] ;
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified data server does not exist.
- **server\_name**  
Specifies the name of the data server to be deleted.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the data server.
  - **RESTRICT**: refuses to delete the server if any objects depend on it. This is the default action.

## Examples

See [Examples](#) in section "CREATE SERVER."

## Helpful Links

[ALTER SERVER](#) and [CREATE SERVER](#)

## 7.14.114 DROP SYNONYM

### Function

**DROP SYNONYM** deletes a synonym.

### Precautions

Only the synonym owner or a user granted with the DROP ANY SYNONYM permission can run the **DROP SYNONYM** command. The system administrator has this permission by default.

### Syntax

```
DROP SYNONYM [IF EXISTS] synonym_name [CASCADE | RESTRICT];
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified synonym does not exist.
- **synonym\_name**  
Specifies the name (optionally schema-qualified) of the synonym to be deleted.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects (such as views) that depend on the synonym.
  - **RESTRICT**: refuses to delete the synonym if any objects depend on it. This is the default action.

## Examples

See [Examples](#) in [CREATE SYNONYM](#).

## Helpful Links

[ALTER SYNONYM](#) and [CREATE SYNONYM](#)

## 7.14.115 DROP TABLE

### Function

Deletes a table.

## Precautions

- After DROP TABLE deletes the table, the indexes depending on the table are deleted, and the functions and stored procedures that need to use this table cannot be executed. Deleting a partitioned table also deletes all partitions in the table.
- The owner of a table, the owner of the schema of the table, users granted with the DROP permission on the table, or users granted with the DROP ANY TABLE permission can delete the specified table. The system administrator has the permission to delete the specified table by default.

## Syntax

```
DROP TABLE [IF EXISTS]
{ [schema.]table_name } [, ...] [CASCADE | RESTRICT] [PURGE];
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified table does not exist.
- **schema**  
Specifies the schema name.
- **table\_name**  
Specifies the table name.
- **CASCADE | RESTRICT**
  - **CASCADE**: allows to delete the objects (such as views) that depend on the table.
  - **RESTRICT**: refuses to delete the table if any objects depend on it. This is the default action.
- **PURGE**  
Specifies that even if the recycle bin function is enabled, the table is physically dropped instead of being moved to the recycle bin when you use DROP TABLE to delete tables.

## Examples

See [Examples](#) in section "CREATE TABLE."

## Helpful Links

[ALTER TABLE](#) and [CREATE TABLE](#)

## 7.14.116 DROP TABLESPACE

### Function

Deletes a tablespace.

## Precautions

- Only the tablespace owner or a user granted with the DROP permission can run the **DROP TABLESPACE** command. The system administrator has this permission by default.
- The tablespace to be deleted should not contain any database objects. Otherwise, an error will be reported.
- DROP TABLESPACE cannot be rolled back and therefore cannot be run in transaction blocks.
- During execution of DROP TABLESPACE, database queries by other sessions using `\db` may fail and need to be reattempted.
- If DROP TABLESPACE fails to be executed, execute DROP TABLESPACE IF EXISTS.

## Syntax

```
DROP TABLESPACE [IF EXISTS] tablespace_name;
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified tablespace does not exist.
- **tablespace\_name**  
Specifies the name of the tablespace to be deleted.  
Value range: an existing tablespace name

## Examples

See [Examples](#) in section "CREATE TABLESPACE."

## Helpful Links

[ALTER TABLESPACE](#) and [CREATE TABLESPACE](#)

## Suggestions

- DROP TABLESPACE  
Do not delete tablespaces during transactions.

## 7.14.117 DROP TRIGGER

### Function

**DROP TRIGGER** deletes a trigger.

### Precautions

Only the trigger owner or a user granted with the DROP ANY TRIGGER permission can run the **DROP TRIGGER** command. The system administrator has this permission by default.

## Syntax

```
DROP TRIGGER [IF EXISTS] trigger_name ON table_name [CASCADE | RESTRICT];
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified trigger does not exist.
- **trigger\_name**  
Specifies the name of the trigger to be deleted.  
Value range: an existing trigger name
- **table\_name**  
Specifies the name of the table containing the trigger.  
Value range: name of the table containing the trigger
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the trigger.
  - **RESTRICT**: refuses to delete the trigger if any objects depend on it. This is the default action.

## Examples

For details, see [Examples](#) in [CREATE TRIGGER](#).

## Helpful Links

[CREATE TRIGGER](#), [ALTER TRIGGER](#), and [ALTER TABLE](#)

## 7.14.118 DROP TYPE

### Function

**DROP TYPE** deletes a user-defined data type.

### Precautions

Only the owner of a type, a user granted the DROP permission on a type, or a user granted the DROP ANY TYPE permission on a sequence can run the **DROP TYPE** command. The system administrator has this permission by default.

## Syntax

```
DROP TYPE [IF EXISTS] name [, ...] [CASCADE | RESTRICT]
```

## Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified type does not exist.
- **name**  
Specifies the name (optionally schema-qualified) of the type to be deleted.

- **CASCADE**  
Automatically deletes the objects (such as fields, functions, and operators) that depend on the type.
- **RESTRICT**  
Refuses to delete the type if any objects depend on it. This is the default action.

## Examples

See [Examples](#) in **CREATE TYPE**.

## Helpful Links

[CREATE TYPE](#) and [ALTER TYPE](#)

## 7.14.119 DROP USER

### Description

Deletes a user and the schema with the same name as the user.

### Precautions

- **CASCADE** is used to delete the objects (excluding databases) that depend on the user. **CASCADE** cannot delete locked objects unless the objects are unlocked or the processes locking the objects are killed.
- If the dependent objects are other databases or reside in other databases, manually delete them before deleting the user from the current database. **DROP USER** cannot delete objects across databases.
- Before deleting a user, you need to delete all the objects owned by the user and revoke the user's permissions on other objects. Alternatively, you can specify **CASCADE** to delete the objects owned by the user and the granted permissions.
- If the user has an error table specified when the GDS foreign table is created, the user cannot be deleted by specifying the **CASCADE** keyword in the **DROP USER** statement.

### Syntax

```
DROP USER [IF EXISTS] user_name [, ...] [CASCADE | RESTRICT];
```

### Parameters

- **IF EXISTS**  
Reports a notice instead of an error if the specified user does not exist.
- **user\_name**  
Specifies the name of the user to be deleted.  
Value range: an existing username
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes objects that depend on the user and revokes the permissions granted to the user.

- **RESTRICT**: refuses to delete a user if the user has any dependent objects or has been granted permissions on other objects. This is the default value.

 **NOTE**

In GaussDB, the `postgresql.conf` file contains the `enable_kill_query` parameter. This parameter affects **CASCADE**.

- If `enable_kill_query` is **on** and **CASCADE** is used, the statement automatically kills the processes locking dependent objects and then deletes the specified user.
- If `enable_kill_query` is **off** and **CASCADE** is used, the statement waits until the processes locking dependent objects stop and then deletes the specified user.

## Examples

See [Examples](#) in section "CREATE USER."

## Helpful Links

[ALTER USER](#) and [CREATE USER](#)

## 7.14.120 DROP VIEW

### Function

DROP VIEW deletes a view from a database.

### Precautions

The owner of a view, owner of the schema of the view, users granted with the DROP permission on the view, or users granted with the DROP ANY TABLE permission can run the **DROP VIEW** command. By default, the system administrator has the permission to run the command.

### Syntax

```
DROP VIEW [IF EXISTS] view_name [...] [CASCADE | RESTRICT];
```

### Parameter Description

- **IF EXISTS**  
Reports a notice instead of an error if the specified view does not exist.
- **view\_name**  
Specifies the name of the view to be deleted.  
Value range: an existing view name
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects (such as other views) that depend on the view.
  - **RESTRICT**: refuses to delete the view if any objects depend on it. This is the default action.

## Examples

See [Examples](#) in section "CREATE VIEW."

## Helpful Links

[ALTER VIEW](#) and [CREATE VIEW](#)

## 7.14.121 DROP WEAK PASSWORD DICTIONARY

### Function

**DROP WEAK PASSWORD DICTIONARY** clears all weak passwords in `gs_global_config`.

### Precautions

Only the initial user, system administrator, and security administrator have the permission to execute this syntax.

### Syntax

```
DROP WEAK PASSWORD DICTIONARY;
```

### Description

None.

### Example

See [CREATE WEAK PASSWORD DICTIONARY](#).

## Helpful Links

[13.14.82-CREATE WEAK PASSWORD DICTIONARY](#)

## 7.14.122 EXECUTE

### Function

**EXECUTE** executes a prepared statement. Because a prepared statement exists only in the lifetime of the session, the prepared statement must be created earlier in the current session by using the **PREPARE** statement.

### Precautions

If the **PREPARE** statement creating the prepared statement declares some parameters, the parameter set passed to the **EXECUTE** statement must be compatible. Otherwise, an error will occur.

### Syntax

```
EXECUTE name [(parameter [, ...])];
```

## Parameter Description

- **name**  
Specifies the name of the prepared statement to be executed.
- **parameter**  
Specifies a parameter of the prepared statement. It must be an expression that generates a value compatible with the data type of the parameter specified when the prepared statement was created. **ROWNUM** cannot be used as a parameter.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the reason table.
gaussdb=# CREATE TABLE tpcds.reason (
 CD_DEMO_SK INTEGER NOT NULL,
 CD_GENDER character(16) ,
 CD_MARITAL_STATUS character(100)
);

-- Insert data.
gaussdb=# INSERT INTO tpcds.reason VALUES(51, 'AAAAAAAADDAAAAAA', 'reason 51');

-- Create the reason_t1 table.
gaussdb=# CREATE TABLE tpcds.reason_t1 AS TABLE tpcds.reason;

-- Create a prepared statement for an INSERT statement and execute the prepared statement.
gaussdb=# PREPARE insert_reason(integer,character(16),character(100)) AS INSERT INTO tpcds.reason_t1
VALUES($1,$2,$3);

gaussdb=# EXECUTE insert_reason(52, 'AAAAAAAADDAAAAAA', 'reason 52');

-- Delete the reason and reason_t1 tables.
gaussdb=# DROP TABLE tpcds.reason;
gaussdb=# DROP TABLE tpcds.reason_t1;

-- Delete the schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## 7.14.123 EXECUTE DIRECT

### Description

Executes an SQL statement on a specified node. Generally, the execution of SQL statements is automatically allocated to proper nodes by the cluster load. EXECUTE DIRECT is mainly used for database maintenance and testing.

### Precautions

- When **enable\_nonsysadmin\_execute\_direct** is **off**, only a system administrator has the EXECUTE DIRECT permission.
- To ensure data consistency across nodes, only the SELECT statement can be used. Transaction statements, DDL, and DML cannot be used.
- When the stddev aggregation calculation is performed on the specified DN using such statements, the result set is returned in triplet. For example, {3, 8, 30} indicates that the count result is 3, the sum result is 8, and the sum of squares is 30. When the AVG aggregation calculation is performed on the

specified DN using such statements, the result set is returned in a binary tuple, for example, {4,2}. The result of count is 4, and that of sum is 2.

- When multiple nodes are specified, aggregate functions are not supported. If the query contains an aggregate function, the message "EXECUTE DIRECT on multinode not support agg functions." is returned.
- CN nodes do not store user table data. Therefore, do not execute SELECT for querying user tables on a CN.
- If the SQL statement to be executed is also EXECUTE DIRECT, do not nest it into EXECUTE DIRECT; instead, directly execute the inner EXECUTE DIRECT.
- The query result of the **agg** function is inconsistent with that on the CN. Multiple pieces of information are returned. The **array\_avg** function is not supported.
- If the **nodeoid** or **nodeoid list** parameter is specified, this parameter takes effect only when the **enable\_direct\_standby\_datanodes** parameter is successfully set in distributed mode. To query data on a specified DN, invalid or duplicate **nodeoid** values are not supported, and **nodeoid** and **nodename** cannot be used together.

## Syntax

```
EXECUTE DIRECT ON (nodename [, ...]) query ;
EXECUTE DIRECT ON (nodeoid [, ...]) query;
EXECUTE DIRECT ON { COORDINATORS | DATANODES | ALL } query;
```

## Parameters

- **nodename**  
Specifies the node name.  
Value range: an existing node name
- **nodeoid**  
Node OID.  
Value range: an existing DN OID, which can be obtained from the [PGXC\\_NODE](#) system catalog.
- **query**  
Specifies the SQL statement to be executed.
- **COORDINATORS**  
Run the query statement on all CNs.
- **DATANODES**  
Run the query statement on all DNs.
- **ALL**  
Run the query statement on all CNs and DNs.

## Examples

```
-- Query the node distribution status of the current cluster.
gaussdb=# SELECT * FROM pgxc_node;
 node_name | node_type | node_port | node_host | node_port1 | node_host1 | hostis_primary |
nodeis_primary | nodeis_preferred | node_id | sctp_port | control_port | sctp_port1 | control_port1
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
cn_5001 | C | 8050 | 10.180.155.74 | 8050 | 10.180.155.74 | t | f |
```

```
f | 1120683504 | 0 | 0 | 0 | 0
cn_5003 | C | 8050 | 10.180.157.130 | 8050 | 10.180.157.130 | t | f |
f | -125853378 | 0 | 0 | 0 | 0

-1736975100 | 0 | 0 | 0 | 0
(6 rows)

-- Query records in the tpcds.customer_address table on dn_6001_6002.
gaussdb=# EXECUTE DIRECT ON(dn_6001_6002) 'select count(*) from tpcds.customer_address';
count

16922
(1 row)

-- Query records in the tpcds.customer_address table.
gaussdb=# SELECT count(*) FROM tpcds.customer_address;
count

50000
(1 row)
```

## 7.14.124 EXPDP DATABASE

### Function

**EXPDP DATABASE** exports all physical files in a database.

### Syntax

```
EXPDP DATABASE db_name LOCATION = 'directory';
```

### Parameter Description

- **db\_name**: name of the database to be exported.
- **directory**: directory for storing exported files.

### Example

```
expdp database test location = '/data1/expdp/database';
```

## 7.14.125 EXPDP TABLE

### Function

**EXPDP TABLE** exports all table-related index, sequence, partition, toast, and toast index files.

### Syntax

```
EXPDP TABLE table_name LOCATION = 'directory';
```

### Parameter Description

- **table\_name**: name of the table to be exported.

- **directory**: directory for storing exported files.

## Example

```
expdp table test_t location = '/data1/expdp/table0';
```

## 7.14.126 EXPLAIN

### Function

Shows the execution plan of an SQL statement.

The execution plan shows how the tables referenced by the statement will be scanned - by plain sequential scan, index scan, etc. - and if multiple tables are referenced, what join algorithms will be used to bring together the required rows from each input table.

The most critical part of the display is the estimated statement execution cost, which is the planner's guess at how long it will take to run the statement.

The **ANALYZE** option causes the statement to be actually executed, not only planned. The total elapsed time expended within each plan node (in milliseconds) and total number of rows it actually returned are added to the display. This is useful for seeing whether the planner's estimates are close to reality.

### Precautions

The statement is actually executed when ANALYZE is used. If you want to use EXPLAIN ANALYZE on an INSERT, UPDATE, DELETE, CREATE TABLE AS, or EXECUTE statement without letting the statement affect your data, use this approach:

```
START TRANSACTION;
EXPLAIN ANALYZE ...;
ROLLBACK;
```

### Syntax

- Display the execution plan of an SQL statement, which supports multiple options and has no requirements for the order of options.

```
EXPLAIN [(option [, ...])] statement;
```

The syntax of the **option** clause is as follows:

```
ANALYZE [boolean] |
ANALYSE [boolean] |
VERBOSE [boolean] |
COSTS [boolean] |
CPU [boolean] |
DETAIL [boolean] |
NODES [boolean] |
NUM_NODES [boolean] |
BUFFERS [boolean] |
TIMING [boolean] |
PLAN [boolean] |
BLOCKNAME [boolean] |
FORMAT { TEXT | XML | JSON | YAML }
```

- Display the execution plan of an SQL statement, where options are in order.  
EXPLAIN { [ { ANALYZE | ANALYSE } ] [ VERBOSE ] | PERFORMANCE } statement;

## Parameter Description

- **statement**  
Specifies the SQL statement to explain.
- **ANALYZE boolean | ANALYSE boolean**  
Specifies whether to display actual run times and other statistics.  
Value range:
  - **TRUE** (default): displays them.
  - **FALSE**: does not display them.
- **VERBOSE boolean**  
Specifies whether to display additional information regarding the plan.  
Value range:
  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **COSTS boolean**  
Specifies whether to display the estimated total cost of each plan node, estimated number of rows, estimated width of each row.  
Value range:
  - **TRUE** (default): displays them.
  - **FALSE**: does not display them.
- **CPU boolean**  
Specifies whether to display CPU usage. It should be used together with the ANALYZE option.  
Value range:
  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **DETAIL boolean**  
Specifies whether to display DN information. It should be used together with the ANALYZE option.  
Value range:
  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **NODES boolean**  
Specifies whether to display information about the nodes executed by query.  
Value range:
  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **NUM\_NODES boolean**  
Specifies whether to display the number of executing nodes.  
Value range:
  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.

- **BUFFERS boolean**

Specifies whether to display buffer usage. It should be used together with the ANALYZE option.

Value range:

  - **TRUE** (default): displays it.
  - **FALSE**: does not display it.
- **TIMING boolean**

Specifies whether to display the actual startup time and time spent on the output node. It should be used together with the ANALYZE option.

Value range:

  - **TRUE** (default): displays them.
  - **FALSE**: does not display them.
- **PLAN boolean**

Specifies whether to store the execution plan in **PLAN\_TABLE**. If this parameter is set to **on**, the execution plan is stored in **PLAN\_TABLE** and not displayed on the screen. Therefore, this parameter cannot be used together with other parameters when it is set to **on**.

Value range:

  - **TRUE** (default): The execution plan is stored in **PLAN\_TABLE** and not displayed on the screen. If the plan is stored successfully, "EXPLAIN SUCCESS" is returned.
  - **FALSE**: The execution plan is not stored in **PLAN\_TABLE** but is displayed on the screen.
- **BLOCKNAME boolean**

Specifies whether to display the query block where each operation of the plan is located. When this option is enabled, the name of the query block where each operation is performed is displayed in the **Query Block** column. This helps users obtain the query block name and use hints to modify the execution plan.

  - **TRUE** (default value): When the plan is displayed, the name of the query block where each operation is located is displayed in the **Query Block** column. This option must be used in the pretty mode. For details, see [Hint Specifying the Query Block Where the Hint Is Located](#).
  - **FALSE**: The plan display is not affected.
- **FORMAT**

Specifies the output format.

Value range: **TEXT**, **XML**, **JSON**, and **YAML**

Default value: **TEXT**
- **PERFORMANCE**

Prints all relevant information in execution. Some information is described as follows:

  - **ex c/r**: indicates the average number of CPU cycles used by each row, which is equal to **(ex cyc) / (ex row)**.
  - **ex row**: indicates the number of executed rows.

- **ex cyc:** indicates the number of used CPU cycles.
- **inc cyc:** indicates the total number of CPU cycles used by subnodes.
- **shared hit:** indicates the shared buffer hits of the operator.
- **loops:** indicates the number of operator loop execution times.
- **total\_calls:** indicates the total number of generated elements.
- **remote query poll time stream gather:** indicates the operator used to listen to the network poll time when data on each DN reaches the CN.
- **deserialize time:** indicates the time required for deserialization.
- **estimated time:** indicates the estimated time.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer_address table.
gaussdb=# CREATE TABLE tpcds.customer_address(
ca_address_sk INTEGER NOT NULL,
ca_address_id CHARACTER(16) NOT NULL
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.customer_address VALUES (5000, 'AAAAAAAAABAAAAAAA'),(10000,
'AAAAAAAAACAAAAAAA');

-- Create the tpcds.customer_address_p1 table.
gaussdb=# CREATE TABLE tpcds.customer_address_p1 AS TABLE tpcds.customer_address;

-- Change the value of explain_perf_mode to normal.
gaussdb=# SET explain_perf_mode=normal;

-- Display an execution plan for simple queries in the table.
gaussdb=# EXPLAIN SELECT * FROM tpcds.customer_address_p1;
QUERY PLAN

Data Node Scan (cost=0.00..0.00 rows=0 width=0)
Node/s: All DNs
(2 rows)

-- Generate an execution plan in JSON format (with explain_perf_mode being normal).
gaussdb=# EXPLAIN(FORMAT JSON) SELECT * FROM tpcds.customer_address_p1;
QUERY PLAN

[
 {
 "Plan": {
 "Node Type": "Data Node Scan",+
 "Startup Cost": 0.00, +
 "Total Cost": 0.00, +
 "Plan Rows": 0, +
 "Plan Width": 0, +
 "Node/s": "All DNs" +
 }
 }
]
(1 row)

-- If there is an index and we use a query with an indexable WHERE condition, EXPLAIN might show a
different plan.
gaussdb=# EXPLAIN SELECT * FROM tpcds.customer_address_p1 WHERE ca_address_sk=10000;
QUERY PLAN

Data Node Scan (cost=0.00..0.00 rows=0 width=0)
Node/s: dn_6005_6006
```

```
(2 rows)

-- Generate an execution plan in YAML format (with explain_perf_mode being normal).
gaussdb=# EXPLAIN(FORMAT YAML) SELECT * FROM tpcds.customer_address_p1 WHERE
ca_address_sk=10000;
 QUERY PLAN

- Plan: +
 Node Type: "Data Node Scan"+
 Startup Cost: 0.00 +
 Total Cost: 0.00 +
 Plan Rows: 0 +
 Plan Width: 0 +
 Node/s: "dn_6005_6006"
(1 row)

-- Suppress the execution plan of cost estimation.
gaussdb=# EXPLAIN(COSTS FALSE)SELECT * FROM tpcds.customer_address_p1 WHERE
ca_address_sk=10000;
 QUERY PLAN

Data Node Scan
 Node/s: dn_6005_6006

ca_address_sk<10000;
 QUERY PLAN

Aggregate (cost=18.19..14.32 rows=1 width=4)
-> Streaming (type: GATHER) (cost=18.19..14.32 rows=3 width=4)
 Node/s: All DNs
 -> Aggregate (cost=14.19..14.20 rows=3 width=4)
 -> Seq Scan on customer_address_p1 (cost=0.00..14.18 rows=10 width=4)
 Filter: (ca_address_sk < 10000)
(6 rows)

-- Delete the tpcds.customer_address_p1 table.
gaussdb=# DROP TABLE tpcds.customer_address_p1;

-- Delete the tpcds.customer_address table.
gaussdb=# DROP TABLE tpcds.customer_address;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## Helpful Links

[ANALYZE](#) | [ANALYSE](#)

## 7.14.127 EXPLAIN PLAN

### Function

**EXPLAIN PLAN** saves information about an execution plan into the **PLAN\_TABLE** table. Different from the **EXPLAIN** statement, **EXPLAIN PLAN** only saves plan information; it does not print information on the screen.

### Syntax

```
EXPLAIN PLAN
[SET STATEMENT_ID = string]
FOR statement ;
```

## Parameter Description

- **PLAN**: saves plan information into **PLAN\_TABLE**. If information is stored successfully, "EXPLAIN SUCCESS" is returned.
- **STATEMENT\_ID**: tags each query. The tag information will be stored in **PLAN\_TABLE**.

### NOTE

If **SET STATEMENT\_ID** is not specified when the **EXPLAIN PLAN** statement is executed, **STATEMENT\_ID** is left empty by default. In addition, the value of **STATEMENT\_ID** cannot exceed 30 bytes. Otherwise, an error will be reported.

## Precautions

- **EXPLAIN PLAN** cannot be executed on DNs.
- Plan information cannot be collected for SQL statements that failed to be executed.
- Data in **PLAN\_TABLE** is in a session-level lifecycle. Sessions are isolated from users, and therefore users can only view the data of the current session and current user.
- **PLAN\_TABLE** cannot be joined with GDS foreign tables.
- For a query that cannot be pushed down, object information cannot be collected and only such information as **REMOTE\_QUERY** and **CTE** can be collected. For details, see [Example 2](#).

## Example 1

You can perform the following steps to collect execution plans of SQL statements by running **EXPLAIN PLAN**:

**Step 1** Run the **EXPLAIN PLAN** statement.

### NOTE

After the **EXPLAIN PLAN** statement is executed, plan information is automatically stored in **PLAN\_TABLE**. **INSERT**, **UPDATE**, and **ANALYZE** cannot be performed on **PLAN\_TABLE**.

For details about **PLAN\_TABLE**, see [PLAN\\_TABLE](#).

```
explain plan set statement_id='TPCH-Q4' for
select
o_orderpriority,
count(*) as order_count
from
orders
where
o_orderdate >= '1993-07-01'::date
and o_orderdate < '1993-07-01'::date + interval '3 month'
and exists (
select
*
from
lineitem
where
l_orderkey = o_orderkey
and l_commitdate < l_receiptdate
)
group by
o_orderpriority
order by
o_orderpriority;
```

## Step 2 Query PLAN\_TABLE.

```
SELECT * FROM PLAN_TABLE;
```

statement_id	plan_id	id	operation	options	object_name	object_type	object_owner	projection
TPCH-Q4	16781167	1	ROW ADAPTER					ORDERS.O_ORDERPRIORITY, (PG_CATALOG.COUNT(*))
TPCH-Q4	16781167	2	VECTOR SORT					ORDERS.O_ORDERPRIORITY, (PG_CATALOG.COUNT(*))
TPCH-Q4	16781167	3	VECTOR AGGREGATE	HASHED				ORDERS.O_ORDERPRIORITY, PG_CATALOG.COUNT(*)
TPCH-Q4	16781167	4	VECTOR STREAMING	GATHER				ORDERS.O_ORDERPRIORITY, (COUNT(*))
TPCH-Q4	16781167	5	VECTOR AGGREGATE	HASHED				ORDERS.O_ORDERPRIORITY, COUNT(*)
TPCH-Q4	16781167	6	VECTOR NESTED LOOPS	SEMI				ORDERS.O_ORDERPRIORITY
TPCH-Q4	16781167	7	TABLE ACCESS	CSTORE SCAN	ORDERS	TABLE	TPCH	ORDERS.O_ORDERPRIORITY, ORDERS.O_ORDERKEY
TPCH-Q4	16781167	8	VECTOR MATERIALIZE					LINEITEM.L_ORDERKEY
TPCH-Q4	16781167	9	TABLE ACCESS	CSTORE SCAN	LINEITEM	TABLE	TPCH	LINEITEM.L_ORDERKEY

## Step 3 Delete data from PLAN\_TABLE.

```
DELETE FROM PLAN_TABLE WHERE xxx;
```

----End

## Example 2

For a query that cannot be pushed down, only such information as **REMOTE\_QUERY** and **CTE** can be collected from **PLAN\_TABLE** after **EXPLAIN PLAN** is executed.

Scenario 1: The optimizer generates a plan for pushing down statements. In this case, only **REMOTE\_QUERY** can be collected.

```
explain plan set statement_id = 'test remote query' for
select
current_user
from
customer;
```

### Query PLAN\_TABLE.

```
SELECT * FROM PLAN_TABLE;
```

statement_id	plan_id	id	operation	options	object_name	object_type	object_owner	projection
test remote query	29360133	1	NESTED LOOPS	CARTESIAN				'apple'::name
test remote query	29360133	2	DATA NODE SCAN		customer	REMOTE_QUERY		
test remote query	29360133	3	DATA NODE SCAN		customer_address	REMOTE_QUERY		

(3 rows)

Scenario 2: For a query with **WITH RECURSIVE** that cannot be pushed down, only **CTE** can be collected.

Disable **enable\_stream\_recursive** so that the query cannot be pushed down.  

```
set enable_stream_recursive = off;
```

Run the **EXPLAIN PLAN** statement.

```
explain plan set statement_id = 'cte can not be push down'
for
with recursive rq as
(
select id, name from chinamap where id = 11
union all
select origin.id, rq.name || '>' || origin.name
from rq join chinamap origin on origin.pid = rq.id
)
select id, name from rq order by 1;
```

### Query PLAN\_TABLE.

```
SELECT * FROM PLAN_TABLE;
```

statement_id	plan_id	id	operation	options	object_name	object_type	object_owner	projection
cte can not be push down	25166071	1	SORT					rq.id, rq.name
cte can not be push down	25166071	2	CTE SCAN		rq	CTE		rq.id, rq.name

(2 rows)

## 7.14.128 FETCH

### Description

FETCH retrieves rows using a previously created cursor.

A cursor has an associated position, which is used by FETCH. The cursor position can be before the first row of the query result, on any particular row of the result, or after the last row of the result.

- When created, a cursor is positioned before the first row.
- After fetching some rows, the cursor is positioned on the row most recently retrieved.
- If **FETCH** runs off the end of the available rows then the cursor is left positioned after the last row, or before the first row if fetching backward.
- **FETCH ALL** or **FETCH BACKWARD ALL** will always leave the cursor positioned after the last row or before the first row.

### Precautions

- If the cursor is declared with **NO SCROLL**, backward fetches like **FETCH BACKWARD** are not allowed.
- The forms **NEXT**, **PRIOR**, **FIRST**, **LAST**, **ABSOLUTE**, and **RELATIVE** fetch a single row after moving the cursor appropriately. If there is no such row, an empty result is returned, and the cursor is left positioned before the first row (backward fetch) or after the last row (forward fetch) as appropriate.
- The forms using **FORWARD** and **BACKWARD** retrieve the indicated number of rows moving in the forward or backward direction, leaving the cursor positioned on the last-returned row or after (backward fetch)/before (forward fetch) all rows if the **count** exceeds the number of rows available.
- **RELATIVE 0**, **FORWARD 0**, and **BACKWARD 0** all request fetching the current row without moving the cursor, that is, re-fetching the most recently fetched row. This will succeed unless the cursor is positioned before the first row or after the last row; in which case, no row is returned.
- If the cursor of **FETCH** involves a non-system catalog, backward fetches like **BACKWARD**, **PRIOR**, and **FIRST** are not allowed.

### Syntax

```
FETCH [direction { FROM | IN }] cursor_name;
```

The **direction** clause specifies optional parameters.

```
NEXT
| PRIOR
| FIRST
| LAST
| ABSOLUTE count
| RELATIVE count
| count
| ALL
| FORWARD
| FORWARD count
| FORWARD ALL
| BACKWARD
```

| BACKWARD count  
| BACKWARD ALL

## Parameters

- **direction\_clause**

Defines the fetch direction.

Value range:

- **NEXT** (default value)  
Fetches the next row.
- **PRIOR**  
Fetches the prior row.
- **FIRST**  
Fetches the first row of the query (same as **ABSOLUTE 1**).
- **LAST**  
Fetches the last row of the query (same as **ABSOLUTE -1**).
- **ABSOLUTE** *count*  
Fetches the *count*<sup>th</sup> row of the query.  
**ABSOLUTE** fetches are not any faster than navigating to the desired row with a relative move: the underlying implementation must traverse all the intermediate rows anyway.  
Value range: a possibly-signed integer
  - If *count* is positive, the *count*<sup>th</sup> row of the query will be fetched. If *count* is less than the current cursor position, rewind is required, which is currently not supported.
  - If *count* is negative or 0, backward scanning is required, which is currently not supported.
- **RELATIVE** *count*  
Fetches the *count*<sup>th</sup> succeeding row or the *count*<sup>th</sup> prior row if count is negative.  
Value range: a possibly-signed integer
  - If *count* is positive, the *count*<sup>th</sup> succeeding row will be fetched.
  - If *count* is negative or 0, backward scanning is required, which is currently not supported.
  - If the current row contains no data, **RELATIVE 0** returns null.
- **count**  
Fetches the next *count* rows (same as **FORWARD** *count*).
- **ALL**  
Fetches all remaining rows (same as **FORWARD ALL**).
- **FORWARD**  
Fetches the next row (same as **NEXT**).
- **FORWARD** *count*

- Fetches the next or prior *count* rows (same as **RELATIVE count**).
- FORWARD ALL  
Fetches all remaining rows.
- BACKWARD  
Fetches the prior row (same as **PRIOR**).
- BACKWARD count  
Fetches the prior *count* rows (scanning backwards).  
Value range: a possibly-signed integer
  - If *count* is positive, *count* prior rows will be fetched.
  - If *count* is a negative, *count* succeeding rows will be fetched.
  - **BACKWARD 0** re-fetches the current row, if any.
- BACKWARD ALL  
Fetches all prior rows (scanning backwards).
- **{ FROM | IN } cursor\_name**  
Specifies the cursor name using the keyword **FROM** or **IN**.  
Value range: an existing cursor name

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer_address table.
gaussdb=# CREATE TABLE tpcds.customer_address
(
ca_address_sk INTEGER NOT NULL,
ca_address_id CHARACTER(16) NOT NULL,
ca_street_number INTEGER
ca_street_name CHARACTER (20)
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.customer_address VALUES (1, 'AAAAAAAAABAAAAAAA', '18', 'Jackson'),(2,
'AAAAAAAACAAAAAAA', '362', 'Washington 6th'),(3, 'AAAAAAAADAAAAAAA', '585', 'Dogwood Washington');

-- (For the SELECT statement, traverse a table using a cursor.) Start a transaction.
gaussdb=# START TRANSACTION;

-- Set up cursor1.
gaussdb=# CURSOR cursor1 FOR SELECT * FROM tpcds.customer_address ORDER BY 1;

-- Fetch the first three rows in cursor1.
gaussdb=# FETCH FORWARD 3 FROM cursor1;
ca_address_sk | ca_address_id | ca_street_number | ca_street_name
-----+-----+-----+-----
 1 | AAAAAAAAAABAAAAAAA | 18 | Jackson
 2 | AAAAAAACAAAAAAA | 362 | Washington 6th
 3 | AAAAAAADAAAAAAA | 585 | Dogwood Washington
(3 rows)

-- Close the cursor and commit the transaction.
gaussdb=# CLOSE cursor1;

-- End the transaction.
gaussdb=# END;
```

```
-- (For the VALUES clause, traverse the clause using a cursor.) Start a transaction.
gaussdb=# START TRANSACTION;

-- Set up cursor2.
gaussdb=# CURSOR cursor2 FOR VALUES(1,2),(0,3) ORDER BY 1;

-- Fetch the first two rows in cursor2.
gaussdb=# FETCH FORWARD 2 FROM cursor2;
column1 | column2
-----+-----
0 | 3
1 | 2
(2 rows)

-- Close the cursor and commit the transaction.
gaussdb=# CLOSE cursor2;

-- End the transaction.
gaussdb=# END;

-- (WITH HOLD cursor) Start a transaction.
gaussdb=# START TRANSACTION;

-- Set up a WITH HOLD cursor.
gaussdb=# DECLARE cursor1 CURSOR WITH HOLD FOR SELECT * FROM tpcds.customer_address ORDER BY
1;

-- Fetch the first two rows in cursor1.
gaussdb=# FETCH FORWARD 2 FROM cursor1;
 ca_address_sk | ca_address_id | ca_street_number | ca_street_name
-----+-----+-----+-----
 1 | AAAAAAAAAABAAAAAA | 18 | Jackson
 2 | AAAAAAAACAAAAAA | 362 | Washington 6th
(2 rows)

-- End the transaction.
gaussdb=# END;

-- Fetch the next row in cursor1.
gaussdb=# FETCH FORWARD 1 FROM cursor1;
 ca_address_sk | ca_address_id | ca_street_number | ca_street_name
-----+-----+-----+-----
 3 | AAAAAAADAAAAAAA | 585 | Dogwood Washington
(1 row)

-- Close the cursor.
gaussdb=# CLOSE cursor1;

-- Delete the tpcds.customer_address table.
gaussdb=# DROP TABLE tpcds.customer_address;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## 7.14.129 GRANT

### Description

Grants permissions to roles and users.

GRANT is used in the following scenarios:

- **Granting system permissions to roles or users**

System permissions are also called user attributes, including SYSADMIN, CREATEDB, CREATEROLE, AUDITADMIN, MONADMIN, OPRADMIN, POLADMIN, INHERIT, REPLICATION, VCADMIN, and LOGIN.

They can be specified only by the CREATE ROLE or ALTER ROLE statement. The SYSADMIN permissions can be granted and revoked using GRANT ALL PRIVILEGE and REVOKE ALL PRIVILEGE, respectively. System permissions cannot be inherited by a user from a role, and cannot be granted using PUBLIC.

- **Granting database object permissions to roles or users**

Grant permissions on a database object (table, view, column, database, function, schema, or tablespace) to a role or user.

**GRANT** gives specific permissions on a database object to one or more roles. These permissions are added to those already granted, if any.

The keyword **PUBLIC** indicates that the permissions are to be granted to all roles, including those that might be created later. **PUBLIC** can be thought of as an implicitly defined group that always includes all roles. Any particular role will have the sum of permissions granted directly to it, permissions granted to any role it is presently a member of, and permissions granted to **PUBLIC**.

If **WITH GRANT OPTION** is specified, the recipient of the permission can in turn grant it to others. Without a grant option, the recipient cannot do that. This option cannot be granted to **PUBLIC**, which is a unique GaussDB attribute.

GaussDB grants the permissions on certain types of objects to **PUBLIC**. By default, permissions on tables, columns, sequences, foreign data sources, foreign servers, schemas, and tablespaces are not granted to **PUBLIC**, but the following permissions are granted to **PUBLIC**: **CONNECT** and **CREATE TEMP TABLE** permissions on databases, **EXECUTE** permission on functions, and **USAGE** permission on languages and data types (including domains). An object owner can revoke the default permissions granted to **PUBLIC** and grant permissions to other users as needed. For security purposes, you are advised to create an object and set its permissions in the same transaction so that other users do not have time windows to use the object. These default permissions can be modified using the **ALTER DEFAULT PRIVILEGES** command.

By default, an object owner has all permissions on the object. For security purposes, the owner can discard some permissions. However, the **ALTER**, **DROP**, **COMMENT**, **INDEX**, **VACUUM**, and re-grantable permissions of the object are inherent permissions implicitly owned by the owner.

- **Granting the permissions of one role or user to others**

Grant the permissions of one role or user to others. In this case, every role or user can be regarded as a set of one or more database permissions.

If **WITH ADMIN OPTION** is specified, the recipients can in turn grant the permissions to other roles or users or revoke the permissions they have granted to other roles or users. If recipients' permissions are changed or revoked later, the grantees' permissions will also change.

Database administrators can grant or revoke permissions for any roles or users. Roles with the **CREATEROLE** permission can grant or revoke permissions for non-admin roles.

- **Granting ANY permissions to roles or users**

Grant ANY permissions to a specified role or user. For details about the value range of the ANY permissions, see the syntax. If **WITH ADMIN OPTION** is specified, the grantee can grant the ANY permissions to or revoke them from other roles or users. The ANY permissions can be inherited by a role but cannot be granted to **PUBLIC**. An initial user and the system administrator when separation of duties is disabled can grant the ANY permissions to or revoke them from any role or user.

Currently, the following ANY permissions are supported: CREATE ANY TABLE, ALTER ANY TABLE, DROP ANY TABLE, SELECT ANY TABLE, INSERT ANY TABLE, UPDATE ANY TABLE, DELETE ANY TABLE, CREATE ANY SEQUENCE, CREATE ANY INDEX, CREATE ANY FUNCTION, EXECUTE ANY FUNCTION, CREATE ANY TYPE, ALTER ANY TYPE, DROP ANY TYPE, ALTER ANY SEQUENCE, DROP ANY SEQUENCE, SELECT ANY SEQUENCE, ALTER ANY INDEX, DROP ANY INDEX, CREATE ANY SYNONYM, DROP ANY SYNONYM, CREATE ANY TRIGGER, ALTER ANY TRIGGER, and DROP ANY TRIGGER. For details about the ANY permission scope, see [Table 7-164](#).

## Precautions

- It is not allowed to grant the ANY permissions to **PUBLIC** or revoke the ANY permissions from **PUBLIC**.
- The ANY permissions are database permissions and are valid only for database objects that are granted with the permissions. For example, **SELECT ANY TABLE** only allows a user to view all user table data in the current database, but the user does not have the permission to view user tables in other databases.
- The ANY permissions and the original permissions do not affect each other.
- If a user is granted with the **CREATE ANY TABLE** permission, the owner of a table created in a schema with the same name as the user is the creator of the schema. When the user performs other operations on the table, the user needs to be granted with the corresponding operation permission. Similarly, if a user is granted with the CREATE ANY FUNCTION, CREATE ANY TYPE, CREATE ANY SEQUENCE, or CREATE ANY INDEX permission, the owner of an object created in a schema with the same name is the owner of the schema. If a user is granted with the CREATE ANY TRIGGER or CREATE ANY SYNONYM permission, the owner of an object created in a schema with the same name is the creator.
- Exercise caution when granting the CREATE ANY FUNCTION permission to users to prevent other users from using DEFINER functions for privilege escalation.
- When GRANT is used to grant the permission to use a table, if the permission is not properly used, ALTER may be used to add expressions to the default values and constraints of the table, or indexes may be created to add expressions to INDEX. In this case, the permission may be exploited.
- When GRANT is used to grant the TRIGGER permission, if the permission is not properly used, the WHEN condition may be used to create expressions. When the trigger is triggered, the permission may be exploited.

## Syntax

- Grant the table or view access permission to a user or role.

```
GRANT { { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | TRIGGER | ALTER | DROP
| COMMENT | INDEX | VACUUM } [, ...]
| ALL [PRIVILEGES] }
ON { [TABLE] table_name [, ...]
| ALL TABLES IN SCHEMA schema_name [, ...] }
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```
  - Grant the column access permission to a user or role.

```
GRANT { { SELECT | INSERT | UPDATE | REFERENCES | COMMENT } (column_name [, ...]) } [, ...]
| ALL [PRIVILEGES] (column_name [, ...]) }
ON [TABLE] table_name [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```
  - Grant the sequence access permission to a specified user or role.

```
GRANT { { SELECT | UPDATE | USAGE | ALTER | DROP | COMMENT } [, ...]
| ALL [PRIVILEGES] }
ON { [SEQUENCE] sequence_name [, ...]
| ALL SEQUENCES IN SCHEMA schema_name [, ...] }
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```
  - Grant the database access permission to a user or role.

```
GRANT { { CREATE | CONNECT | TEMPORARY | TEMP | ALTER | DROP | COMMENT } [, ...]
| ALL [PRIVILEGES] }
ON DATABASE database_name [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```
  - Grant the domain access permission to a user or role.

```
GRANT { USAGE | ALL [PRIVILEGES] }
ON DOMAIN domain_name [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```
-  **NOTE**
- In the current version, the domain access permission cannot be granted.
- Grant the CMK access permission to a specified user or role.

```
GRANT { { USAGE | DROP } [, ...] | ALL [PRIVILEGES] }
ON { CLIENT_MASTER_KEY client_master_key
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```
  - Grant the column encryption key (CEK) access permission to a specified user or role.

```
GRANT { { USAGE | DROP } [, ...] | ALL [PRIVILEGES] }
ON { COLUMN_ENCRYPTION_KEY column_encryption_key
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```
  - Grant the foreign data source access permission to a user or role.

```
GRANT { USAGE | ALL [PRIVILEGES] }
ON FOREIGN DATA WRAPPER fdw_name [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```
  - Grant the foreign server access permission to a user or role.

```
GRANT { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON FOREIGN SERVER server_name [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```
  - Grant the function access permission to a user or role.

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON { FUNCTION {function_name ([{ [argmode] [arg_name] arg_type } [, ...]) } } [, ...]
| ALL FUNCTIONS IN SCHEMA schema_name [, ...] }
```

```
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```

- Grant the procedural procedure access permission to a user or role.

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON PROCEDURE {proc_name ([{ [argmode] [arg_name] arg_type } [, ...]) } [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```

- Grant the sub-cluster access permission to a user or role.

```
GRANT { { CREATE | USAGE | COMPUTE | ALTER | DROP } [, ...] | ALL [PRIVILEGES] }
ON NODE GROUP group_name [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```

 **NOTE**

When the **create** permission of a sub-cluster is granted to a specified user or role, the **usage** and **compute** permissions are granted to the specified user or role by default.

- Grant the schema access permission to a user or role.

```
GRANT { { CREATE | USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON SCHEMA schema_name [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```

 **NOTE**

When you grant table or view permissions to other users, you also need to grant the **USAGE** permission on the schema that the tables and views belong to. Without the **USAGE** permission, the users with table or view permissions can only see the object names, but cannot access them.

- Grant the large object access permission to a specified user or role.

```
GRANT { { SELECT | UPDATE } [, ...] | ALL [PRIVILEGES] }
ON LARGE OBJECT loid [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```

 **NOTE**

In the current version, the large object access permission cannot be granted.

- Grant the tablespace access permission to a user or role.

```
GRANT { { CREATE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON TABLESPACE tablespace_name [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```

- Grant the type access permission to a user or role.

```
GRANT { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON TYPE type_name [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```

 **NOTE**

In the current version, the type access permission cannot be granted.

- Grant the directory permission to a role.

```
GRANT { { READ | WRITE | ALTER | DROP } [, ...] | ALL [PRIVILEGES] }
ON DIRECTORY directory_name [, ...]
TO { [GROUP] role_name | PUBLIC } [, ...]
[WITH GRANT OPTION];
```

- Grant a role's permissions to another user or role.

```
GRANT role_name [, ...]
TO role_name [, ...]
[WITH ADMIN OPTION];
```

- Grant the **sysadmin** permission to a role.

```
GRANT ALL { PRIVILEGES | PRIVILEGE }
TO role_name;
```

- Grant the ANY permissions to another user or role.

```
GRANT { CREATE ANY TABLE | ALTER ANY TABLE | DROP ANY TABLE | SELECT ANY TABLE |
INSERT ANY TABLE | UPDATE ANY TABLE | DELETE ANY TABLE | CREATE ANY SEQUENCE |
CREATE ANY INDEX | CREATE ANY FUNCTION | EXECUTE ANY FUNCTION | CREATE ANY TYPE |
ALTER ANY TYPE | DROP ANY TYPE |
ALTER ANY SEQUENCE | DROP ANY SEQUENCE | SELECT ANY SEQUENCE | ALTER ANY INDEX |
DROP ANY INDEX | CREATE ANY SYNONYM | DROP ANY SYNONYM | CREATE ANY TRIGGER | ALTER
ANY TRIGGER |
DROP ANY TRIGGER } [, ...]
TO [GROUP] role_name [, ...]
[WITH ADMIN OPTION];
```

- Grant the database link object permission to a specified user.

```
GRANT { CREATE | ALTER | DROP } [PUBLIC] DATABASE LINK TO role_name;
```

#### NOTE

- **PUBLIC**: creates a public database link visible to all users. If this clause is omitted, the database link is private and used only as a compatible API. The data that can be accessed on the remote database depends on the identity used by the database link during connection.
- When the permission to create a database link is granted to a user, the user can remotely access a database by using the IP address of the remote database. Exercise caution when granting this permission to users.
- In addition to the statement for directly granting the database link permission, you can also obtain the database link permission by inheriting permission and granting permission to an administrator.
- For details about database links, see [DATABASE LINK](#).

## Parameters

The possible permissions are:

- **SELECT**  
Allows **SELECT** from any table, view, or sequence. The **SELECT** permission on the corresponding column is also required for **UPDATE** or **DELETE**.
- **INSERT**  
Allows **INSERT** of a new row into a table.
- **UPDATE**  
Allows you to run the **UPDATE** statement on any column in the specified table. The **UPDATE** statement also requires the **SELECT** permission to query which rows need to be updated. **SELECT ... FOR UPDATE** and **SELECT ... FOR SHARE** also require this permission on at least one column, in addition to the **SELECT** permission.
- **DELETE**  
Allows you to run the **DELETE** statement to delete data from a specified table. The **DELETE** statement also requires the **SELECT** permission to query which rows need to be deleted.
- **TRUNCATE**  
Allows **TRUNCATE** on a table.
- **REFERENCES**

Allows to create a foreign key constraint referencing a table. This permission is required on both referencing and referenced tables. This function is not supported in distributed mode.

- **TRIGGER**

Allows the creation of a trigger on the specified table.

- **CREATE**

- For databases, allows new schemas to be created within the database.
- For schemas, allows new objects to be created within the schema. To rename an existing object, you must own the object and have the **CREATE** permission on the schema of the object.
- For tablespaces, allows tables to be created within the tablespace, and allows databases and schemas to be created that have the tablespace as their default tablespace.
- For sub-clusters, allows tables to be created within the sub-cluster.

- **CONNECT**

Allows the grantee to connect to the database.

- **EXECUTE**

Allows calling a function, including use of any operators that are implemented on top of the function.

- **USAGE**

- For procedural languages, allows use of the language for the creation of functions in that language.
- For schemas, allows access to objects contained in the schema. Without this permission, it is still possible to see the object names.
- For sequences, allows use of the **nextval** function.
- For sub-clusters, allows users who can access objects contained in the schema to access tables in the sub-cluster.
- For a key object, **USAGE** is the permission to use the key.

- **COMPUTE**

For computing sub-clusters, allows users to perform elastic computing in the sub-cluster that they have the compute permission on.

- **ALTER**

Allows users to modify the attributes of a specified object, excluding the owner and schema of the object.

- **DROP**

Allows users to delete specified objects.

- **COMMENT**

Allows users to define or modify comments of a specified object.

- **INDEX**

Allows users to create indexes on specified tables, manage indexes on the tables, and perform REINDEX and CLUSTER operations on the tables.

- **VACUUM**

Allows users to perform ANALYZE and VACUUM operations on specified tables.

- **ALL PRIVILEGES**

Grants all available permissions to a user or role at a time. Only a system administrator has the **GRANT ALL PRIVILEGES** permission.

**GRANT** parameters are as follows:

- **role\_name**  
Specifies the username.
- **table\_name**  
Specifies the table name.
- **column\_name**  
Specifies the column name.
- **schema\_name**  
Specifies the schema name.
- **database\_name**  
Specifies the database name.
- **function\_name**  
Specifies the function name.
- **sequence\_name**  
Specifies the sequence name.
- **domain\_name**  
Specifies the domain type name.
- **fdw\_name**  
Specifies the foreign data wrapper name.
- **lang\_name**  
Specifies the language name.
- **type\_name**  
Specifies the type name.
- **group\_name**  
Specifies the sub-cluster name.
- **argmode**  
Specifies the parameter mode.  
Value range: a string. It must comply with the [naming convention](#).
- **arg\_name**  
Specifies the parameter name.  
Value range: a string. It must comply with the [naming convention](#).
- **arg\_type**  
Specifies the parameter type.  
Value range: a string. It must comply with the [naming convention](#).
- **loid**  
Specifies the identifier of the large object that includes this page.  
Value range: a string. It must comply with the [naming convention](#).

- **tablespace\_name**  
Specifies the tablespace name.
- **client\_master\_key**  
Name of the CMK.  
Value range: a string. It must comply with the [naming convention](#).
- **column\_encryption\_key**  
Name of the column encryption key.  
Value range: a string. It must comply with the [naming convention](#).
- **directory\_name**  
Specifies the directory name.  
Value range: a string. It must comply with the [naming convention](#).
- **WITH GRANT OPTION**  
If **WITH GRANT OPTION** is specified, the recipient of the permission can in turn grant it to others. Without a grant option, the recipient cannot do that. Grant options cannot be granted to **PUBLIC**.

When a non-owner of an object attempts to grant permissions on the object:

- The statement will fail outright if the user has no permissions whatsoever on the object.
- As long as some permission is available, the statement will proceed, but it will grant only those permissions for which the user has grant options.
- The **GRANT ALL PRIVILEGES** forms will issue a warning message if no grant options are held, while the other forms will issue a warning if grant options for any of the permissions specifically named in the statement are not held.

 **NOTE**

Database administrators can access all objects, regardless of object permission settings. It is unwise to operate as a system administrator except when necessary.

- **WITH ADMIN OPTION**  
If **WITH ADMIN OPTION** is specified for a role, the grantee can grant the role to other roles or users or revoke the role from other roles or users.  
For the ANY permissions, if **WITH ADMIN OPTION** is specified, the grantee can grant the ANY permissions to or revoke them from other roles or users.

**Table 7-164** ANY permissions

Permission	Description
CREATE ANY TABLE	Users can create tables or views in the public and user schemas. The users must be granted with the permission to create sequences to create a table that contains serial columns.

Permission	Description
ALTER ANY TABLE	Users' <b>ALTER</b> permission on tables or views in the public and user schemas. If the users want to modify the unique index of a table to add a primary key constraint or unique constraint to the table, the users must be granted with the index permission on the table.
DROP ANY TABLE	Users' <b>DROP</b> permission on tables or views in the public and user schemas.
SELECT ANY TABLE	Users' <b>SELECT</b> permission on tables or views in the public and user schemas, which is still subject to row-level security.
UPDATE ANY TABLE	Users' <b>UPDATE</b> permission on tables or views in the public and user schemas, which is still subject to row-level security.
INSERT ANY TABLE	Users' <b>INSERT</b> permission on tables or views in the public and user schemas.
DELETE ANY TABLE	Users' <b>DELETE</b> permission on tables or views in the public and user schemas, which is still subject to row-level security.
CREATE ANY FUNCTION	Users can create functions or stored procedures in the user schemas.
EXECUTE ANY FUNCTION	Users' <b>EXECUTE</b> permission on functions or stored procedures in the public and user schemas.
CREATE ANY TYPE	Users can create types in the public and user schemas.
CREATE ANY SEQUENCE	Users can create sequences in the public and user schemas.
CREATE ANY INDEX	Users can create indexes in the public and user schemas. The users must be granted with the permission to create tablespaces to create a partitioned table index in a tablespace.
ALTER ANY TYPE	Users have the ALTER permission on types in public and user schemas, excluding modifying the owner of a type or modifying the schema of a type.
DROP ANY TYPE	Users' <b>DROP</b> permission on types in the public and user schemas.
ALTER ANY SEQUENCE	Users have the ALTER permission on sequences in public and user schemas, excluding modifying the owner of a sequence.
DROP ANY SEQUENCE	Users' <b>DROP</b> permission on sequences in the public and user schemas.
SELECT ANY SEQUENCE	Users' SELECT, USAGE, and UPDATE permissions on sequences in the public and user schemas.

Permission	Description
ALTER ANY INDEX	Users' <b>ALTER</b> permission on indexes in the public and user schemas. To rename an index, users also need the permission to create objects in the schema where the index is located. If tablespace operations are involved, users need to have the corresponding operation permission on the tablespace. To set an index to <b>UNUSABLE</b> , users must have the DROP ANY INDEX permission.
DROP ANY INDEX	Users' <b>DROP</b> permission on indexes in the public and user schemas.
CREATE ANY TRIGGER	Users can create triggers in the public and user schemas.
ALTER ANY TRIGGER	Users' <b>ALTER</b> permission on triggers in the public and user schemas.
DROP ANY TRIGGER	Users' <b>DROP</b> permission on triggers in the public and user schemas.
CREATE ANY SYNONYM	Users can create synonyms in user schema.
DROP ANY SYNONYM	Users' <b>DROP</b> permission on synonyms in the public and user schemas.

 **NOTE**

If a user is granted with any ANY permission, the user has the USAGE permission on the public and user schemas but does not have the USAGE permission on the system schemas except **public** listed in [Table 13-1](#).

## Examples

### Example: Granting system permissions to a user or role

Create the **joe** user and grant the **sysadmin** permission to it.

```
gaussdb=# CREATE USER joe PASSWORD '*****';
gaussdb=# GRANT ALL PRIVILEGES TO joe;
```

Then **joe** has the **sysadmin** permission.

### Example: Granting object permissions to a user or role

1. Revoke the **sysadmin** permission from the **joe** user. Grant the usage permission of the **tpcds** schema and all permissions on the **tpcds.reason** table to **joe**.

```
gaussdb=# CREATE SCHEMA tpcds;
gaussdb=# CREATE TABLE tpcds.reason(
r_reason_sk INTEGER NOT NULL,
r_reason_id CHAR(16) NOT NULL,
r_reason_desc VARCHAR(20)
);
gaussdb=# REVOKE ALL PRIVILEGES FROM joe;
```

```
gaussdb=# GRANT USAGE ON SCHEMA tpcds TO joe;
gaussdb=# GRANT ALL PRIVILEGES ON tpcds.reason TO joe;
```

Then **joe** has all permissions on the **tpcds.reason** table, including create, retrieve, update, and delete.

- Grant the retrieve permission of **r\_reason\_sk**, **r\_reason\_id**, and **r\_reason\_desc** columns and the update permission of the **r\_reason\_desc** column in the **tpcds.reason** table to **joe**.

```
gaussdb=# GRANT select (r_reason_sk,r_reason_id,r_reason_desc),update (r_reason_desc) ON
tpcds.reason TO joe;
```

Then **joe** has the retrieve permission of **r\_reason\_sk** and **r\_reason\_id** columns in the **tpcds.reason** table. To enable **joe** to grant these permissions to other users, execute the following statement:

```
gaussdb=# GRANT select (r_reason_sk, r_reason_id) ON tpcds.reason TO joe WITH GRANT OPTION;
```

Grant the connection and schema creation permissions of the **testdb** database to **joe**, and allow **joe** to grant these permissions to other users.

```
gaussdb=# GRANT create,connect on database testdb TO joe WITH GRANT OPTION;
```

Create the **tpcds\_manager** role, grant the access and object creation permissions of the **tpcds** schema to **tpcds\_manager**, but do not allow **tpcds\_manager** to grant these permissions to others.

```
gaussdb=# CREATE ROLE tpcds_manager PASSWORD '*****';
gaussdb=# GRANT USAGE,CREATE ON SCHEMA tpcds TO tpcds_manager;
```

Grant all permissions on the **tpcds\_tbsp** tablespace to **joe**, but do not allow **joe** to grant these permissions to others.

```
gaussdb=# CREATE TABLESPACE tpcds_tbsp RELATIVE LOCATION 'tablespace/tablespace_1';
gaussdb=# GRANT ALL ON TABLESPACE tpcds_tbsp TO joe;
```

### Example: Granting the permissions of one user or role to others

- Create the **manager** role, grant **joe**'s permissions to **manager**, and allow **manager** to grant these permissions to others.

```
gaussdb=# CREATE ROLE manager PASSWORD '*****';
gaussdb=# GRANT joe TO manager WITH ADMIN OPTION;
```

- Create the **senior\_manager** user and grant **manager**'s permissions to it.

```
gaussdb=# CREATE ROLE senior_manager PASSWORD '*****';
gaussdb=# GRANT manager TO senior_manager;
```

- Revoke permissions and delete users.

```
gaussdb=# REVOKE manager FROM joe;
gaussdb=# REVOKE senior_manager FROM manager;
gaussdb=# DROP USER manager;
```

### Example: Granting the CMK or CEK permission to other user or role

- Connect to an encrypted database.

Prerequisites: You have set the parameters and used the CREATE CLIENT MASTER KEY syntax to create a master key named **MyCMK1** by referring to "Setting Encrypted Equality Queries" in *Feature Guide*.

```
gaussdb=# CREATE COLUMN ENCRYPTION KEY MyCEK1 WITH VALUES (CLIENT_MASTER_KEY =
MyCMK1, ALGORITHM = AEAD_AES_256_CBC_HMAC_SHA256);
CREATE COLUMN ENCRYPTION KEY
```

- Create a role **newuser** and grant the key permission to **newuser**.

```
gaussdb=# CREATE USER newuser PASSWORD '*****';
CREATE ROLE
gaussdb=# GRANT ALL ON SCHEMA public TO newuser;
GRANT
gaussdb=# GRANT USAGE ON COLUMN_ENCRYPTION_KEY MyCEK1 to newuser;
GRANT
gaussdb=# GRANT USAGE ON CLIENT_MASTER_KEY MyCMK1 to newuser;
GRANT
```

3. Set the user to connect to a database and use a CEK to create an encrypted table.

```
gaussdb=# SET SESSION AUTHORIZATION newuser PASSWORD '*****';
gaussdb=> CREATE TABLE acltest1 (x int, x2 varchar(50) ENCRYPTED WITH
(COLUMN_ENCRYPTION_KEY = MyCEK1, ENCRYPTION_TYPE = DETERMINISTIC));
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'x' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
gaussdb=> SELECT has_cek_privilege('newuser', 'MyCEK1', 'USAGE');
has_cek_privilege

t
(1 row)
```

4. Revoke permissions and delete users.

```
gaussdb=# REVOKE USAGE ON COLUMN_ENCRYPTION_KEY MyCEK1 FROM newuser;
gaussdb=# REVOKE USAGE ON CLIENT_MASTER_KEY MyCMK1 FROM newuser;
gaussdb=# DROP TABLE newuser.acltest1;
gaussdb=# DROP COLUMN ENCRYPTION KEY MyCEK1;
gaussdb=# DROP CLIENT MASTER KEY MyCMK1;
gaussdb=# DROP SCHEMA IF EXISTS newuser CASCADE;
gaussdb=# REVOKE ALL ON SCHEMA public FROM newuser;
gaussdb=# DROP ROLE IF EXISTS newuser;
```

### Example: Revoking permissions and deleting roles and users

```
gaussdb=# REVOKE ALL PRIVILEGES ON tpceds.reason FROM joe;
gaussdb=# REVOKE ALL PRIVILEGES ON SCHEMA tpceds FROM joe;
gaussdb=# REVOKE ALL ON TABLESPACE tpceds_tbsp FROM joe;
gaussdb=# DROP TABLESPACE tpceds_tbsp;
gaussdb=# REVOKE USAGE,CREATE ON SCHEMA tpceds FROM tpceds_manager;
gaussdb=# DROP ROLE tpceds_manager;
gaussdb=# DROP ROLE senior_manager;
gaussdb=# DROP USER joe CASCADE;
gaussdb=# DROP TABLE tpceds.reason;
gaussdb=# DROP SCHEMA tpceds CASCADE;
```

## Helpful Links

[REVOKE](#) and [ALTER DEFAULT PRIVILEGES](#)

## 7.14.130 IMPDP DATABASE CREATE

### Function

**IMPDP DATABASE CREATE** specifies the preparation phase for importing a database.

### Syntax

```
IMPDP DATABASE [db_name] CREATE SOURCE = 'directory' OWNER = user [LOCAL];
```

### Parameter Description

- **db\_name**: name of the new database after the import. If this parameter is not specified, the original database name is retained after the import.
- **directory**: data source directory of the imported database.
- **user**: owner of the imported database.
- **LOCAL**: If this field is specified, data is imported to the original cluster. If this field is not specified, data is imported to a new cluster.

## Example

```
impdp database test create source = '/data1/impdp/database' owner=admin;
```

## 7.14.131 IMPDP RECOVER

### Function

**IMPDP RECOVER** specifies the execution phase of importing a database.

### Syntax

```
IMPDP DATABASE RECOVER SOURCE = 'directory' OWNER = user [LOCAL];
```

### Parameter Description

- **directory**: data source directory of the imported database.
- **user**: owner of the imported database.
- **LOCAL**: If this field is specified, data is imported to the original cluster. If this field is not specified, data is imported to a new cluster.

## Example

```
impdp database recover source = '/data1/impdp/database' owner=admin;
```

## 7.14.132 INSERT

### Description

**INSERT** inserts new rows into a table.

### Precautions

- The owner of a table, users granted with the **INSERT** permission on the table, or users granted with the **INSERT ANY TABLE** permission can insert data into the table. The system administrator has the permission to insert data into the table by default.
- Use of the **RETURNING** clause requires the **SELECT** permission on all columns mentioned in **RETURNING**.
- If **ON DUPLICATE KEY UPDATE** is used, you must have the **INSERT** and **UPDATE** permissions on the table and the **SELECT** permission on the columns of the **UPDATE** clause.
- If you use the **query** clause to insert rows from a query, you need to have the **SELECT** permission on any table or column used in the query.
- If you use the query clause to insert data from the dynamic data anonymization column, the inserted result is the anonymized value and cannot be restored.
- When you connect to a database compatible to Teradata and **td\_compatible\_truncation** is **on**, a long string will be automatically truncated. If later **INSERT** statements (not involving foreign tables) insert long strings to columns of **CHAR**- and **VARCHAR**-typed columns in the target table, the system will truncate the long strings to ensure no strings exceed the maximum length defined in the target table.

 **NOTE**

If inserting multi-byte character data (such as Chinese characters) to a database with the character set byte encoding (SQL\_ASCII, LATIN1), and the character data crosses the truncation position, the string is truncated based on its bytes instead of characters. Unexpected result will occur in tail after the truncation. If you want correct truncation result, you are advised to adopt encoding set such as UTF8, which has no character data crossing the truncation position.

## Syntax

```
[WITH [RECURSIVE] with_query [, ...]]
INSERT [/*+ plan_hint */] INTO table_name [AS alias] [(column_name [, ...])]
 { DEFAULT VALUES
 | VALUES (({ expression | DEFAULT } [, ...]))[, ...]
 | query }
 [ON DUPLICATE KEY UPDATE { NOTHING | { column_name = { expression | DEFAULT } } [, ...] [WHERE
condition] }]
 [RETURNING { * | {output_expression [[AS] output_name] }[, ...] }];
```

## Parameters

- **WITH [ RECURSIVE ] with\_query [, ...]**

Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table.

If **RECURSIVE** is specified, it allows a **SELECT** subquery to reference itself by name.

Format of **with\_query**:

```
with_query_name [(column_name [, ...])] AS [[NOT] MATERIALIZED]
({SELECT | VALUES | INSERT | UPDATE | DELETE})
```

– **with\_query\_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.

-- **column\_name** specifies the column name displayed in the subquery result set.

Each subquery can be a **SELECT**, **VALUES**, **INSERT**, **UPDATE** or **DELETE** statement.

– You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE.

– If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery cannot be jointly optimized with the SELECT statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.

– If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the trunk statement to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.

 **NOTE**

- **INSERT ON DUPLICATE KEY UPDATE** does not support the **WITH** or **WITH RECURSIVE** clauses.
- The output of the **INSERT** statement displays only the number of tuples inserted into the outermost query block. For example:  
with cte as (insert into t1 values(1) returning \* ) insert into t1 select \* from cte;  
Only one tuple is displayed, but two tuples are actually inserted.
- **plan\_hint** clause  
Follows the **INSERT** keyword in the `/*+ */` format. It is used to optimize the plan of an **INSERT** statement block. For details, see [Hint-based Tuning](#). In each statement, only the first `/*+ plan_hint */` comment block takes effect as a hint. Multiple hints can be written.
- **table\_name**  
Specifies the name of the target table where data will be inserted.  
Value range: an existing table name

 **NOTE**

- You can use database links to perform operations on remote tables. For details, see [DATABASE LINK](#).
- **column\_name**  
Specifies the name of a column in a table.
    - The column name can be qualified with a subcolumn name or array index, if needed.
    - Each column not present in the explicit or implicit column list will be filled with a default value, either its declared default value or **NULL** if there is none.
    - The target column names **column\_name** can be listed in any order. If no list of column names is given at all, the default is all the columns of the table in their declared order.
    - The target columns are the first *N* column names, if there are only *N* columns supplied by the **VALUE** clause or query.
    - The values provided by the **VALUE** clause and query are associated with the corresponding columns from left to right in the table.Value range: an existing column
  - **expression**  
Specifies an expression or a value to assign to the corresponding column.
    - In the **INSERT ON DUPLICATE KEY UPDATE** statement, expression can be **VALUES(column\_name)** or **EXCLUDED.column\_name**, indicating that the value of **column\_name** corresponding to the conflict row is referenced. Note that **VALUES(column\_name)** cannot be nested in an expression (for example, **VALUES(column\_name)+1**). **EXCLUDED** is not subject to this restriction.
    - If single-quotation marks are inserted in a column, the single-quotation marks need to be used for escape.
    - If the expression for any column is not of the correct data type, automatic type conversion will be attempted. If the attempt fails, data insertion fails, and the system returns an error message.

- **DEFAULT**  
Specifies the default value of a column. The value is **NULL** if no default value is assigned to it.
- **query**  
Specifies a query statement (SELECT statement) that uses the query result as the inserted data.
- **RETURNING**  
Returns the inserted rows. The syntax of the **RETURNING** list is identical to that of the output list of **SELECT**. Note that **INSERT ON DUPLICATE KEY UPDATE** does not support the **RETURNING** clause.
- **output\_expression**  
Specifies an expression used to calculate the output result of the **INSERT** statement after each row is inserted.  
Value range: The expression can use any column in the table. You can use the asterisk (\*) to return all columns of the inserted row.
- **output\_name**  
Specifies a name to use for a returned column.  
Value range: a string. It must comply with the [naming convention](#).
- **ON DUPLICATE KEY UPDATE**  
For a table with a unique constraint (**UNIQUE INDEX** or **PRIMARY KEY**), if the inserted data violates the unique constraint, the **UPDATE** clause is executed to update the conflicting rows. If the clause of **UPDATE** is **NOTHING**, no operation will be performed.  
For a table without a unique constraint, only insert is performed.
  - Triggers are supported. The execution sequence of triggers is determined by the actual execution process.
    - Run the **INSERT** command to trigger the **before insert** and **after insert** triggers.
    - Executing **UPDATE** will trigger the **BEFORE INSERT**, **BEFORE UPDATE**, and **AFTER UPDATE**.
    - Executing **UPDATE NOTHING** will trigger the **BEFORE INSERT**.
  - The unique constraint or primary key of **DEFERRABLE** is not supported.
  - If a table has multiple unique constraints and the inserted data violates multiple unique constraints, only the first row that has a conflict is updated. (The check sequence is closely related to index maintenance. Generally, the conflict check is performed on the index that is created first.)
  - Distribution columns and unique index columns cannot be updated.
  - The **WHERE** clause of **UPDATE** does not contain sublinks.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
```

```
gaussdb=# CREATE TABLE tpcds.reason(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
);

-- Insert a record into a table:
gaussdb=# INSERT INTO tpcds.reason(r_reason_sk, r_reason_id, r_reason_desc) VALUES (0,
'AAAAAAAAAAAAAAAA', 'reason0');

-- Create the tpcds.reason_t2 table:
gaussdb=# CREATE TABLE tpcds.reason_t2
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
);

-- Insert a record into a table:
gaussdb=# INSERT INTO tpcds.reason_t2(r_reason_sk, r_reason_id, r_reason_desc) VALUES (1,
'AAAAAAAAAAAAAAAA', 'reason1');

-- Insert a record into the table, which is equivalent to the previous syntax:
gaussdb=# INSERT INTO tpcds.reason_t2 VALUES (2, 'AAAAAAAAAAAAAAAA', 'reason2');

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.reason_t2 VALUES (3, 'AAAAAAAACAAAAAAA', 'reason3'),(4,
'AAAAAADAAAAAAA', 'reason4'),(5, 'AAAAAAAEAAAAAAA', 'reason5');

-- Insert records whose r_reason_sk in the tpcds.reason table is less than 5:
gaussdb=# INSERT INTO tpcds.reason_t2 SELECT * FROM tpcds.reason WHERE r_reason_sk <5;

-- Create a unique index for the table:
gaussdb=# CREATE UNIQUE INDEX reason_t2_u_index ON tpcds.reason_t2(r_reason_sk);

-- Insert multiple records into the table. If the records conflict, update the r_reason_id column in the
conflict data row to BBBBBBBCAAAAAA.
gaussdb=# INSERT INTO tpcds.reason_t2 VALUES (5, 'BBBBBBBCAAAAAA', 'reason5'),(6,
'AAAAAADAAAAAAA', 'reason6') ON DUPLICATE KEY UPDATE r_reason_id = 'BBBBBBBCAAAAAA';

-- Delete the tpcds.reason_t2 table.
gaussdb=# DROP TABLE tpcds.reason_t2;

-- Delete the tpcds.reason table.
gaussdb=# DROP TABLE tpcds.reason;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## Suggestions

### VALUES

When you run the INSERT statement to insert data in batches, you are advised to combine multiple records into one statement to improve data loading performance. Example: **INSERT INTO sections VALUES (30, 'Administration', 31, 1900), (40, 'Development', 35, 2000), (50, 'Development', 60, 2001);**

If values of an INSERT statement are distributed on a DN, GaussDB can push the statement down to the corresponding DN for execution. Currently, only constants, simple expressions, and pushdown functions (**provolatile** in **pg\_proc** is set to 'i') are supported. If a column in the table has a default value, the value must be a constant or a simple expression. Neither a single-value statement nor a multi-value statement can be pushed down to a single DN.

## 7.14.133 IMPDP TABLE

### Function

**IMPDP TABLE** specifies the execution phase of importing a table.

### Syntax

```
IMPDP TABLE [AS table_name] SOURCE = 'directory' OWNER = user;
```

### Parameter Description

- **table\_name**: name of the new table after the import. If this parameter is not specified, the original table name is retained after the import.
- **directory**: data source directory of the imported table.
- **user**: owner of the imported table.

### Example

```
impdp table source = '/data1/impdp/table0' owner=admin;
```

## 7.14.134 IMPDP TABLE PREPARE

### Function

**IMPDP TABLE PREPARE** specifies the preparation phase for importing a table.

### Syntax

```
IMPDP TABLE PREPARE SOURCE = 'directory' OWNER = user;
```

### Parameter Description

- **directory**: data source directory of the imported table.
- **user**: owner of the imported table.

### Example

```
impdp table prepare source = '/data1/impdp/table0' owner=admin;
```

## 7.14.135 LOCK

### Function

**LOCK TABLE** obtains a table-level lock.

GaussDB always tries to select the lock mode with minimum constraints when automatically requesting a lock for a statement referenced by a table. Use **LOCK** if users need a more strict lock mode. For example, suppose an application runs a transaction at the Read Committed isolation level and needs to ensure that data in a table remains stable in the duration of the transaction. To achieve this, you could obtain **SHARE** lock mode over the table before the query. This will prevent concurrent data changes and ensure subsequent reads of the table see a stable view of committed data. It is because the **SHARE** lock mode conflicts with the

**ROW EXCLUSIVE** lock acquired by writers, and your **LOCK TABLE name IN SHARE MODE** statement will wait until any concurrent holders of **ROW EXCLUSIVE** mode locks commit or roll back. Therefore, once you obtain the lock, there are no uncommitted writes outstanding; furthermore none can begin until you release the lock.

The kernel can automatically cancel services when the scale-out redistribution tool waits for a lock.

## Precautions

- **LOCK TABLE** is useless outside a transaction block: the lock would remain held only to the completion of the statement. If **LOCK TABLE** is out of any transaction block, an error is reported.
- If no lock mode is specified, then **ACCESS EXCLUSIVE**, the most restrictive mode, is used.
- **LOCK TABLE ... IN ACCESS SHARE MODE** requires the **SELECT** permission on the target table. All other forms of **LOCK** require table-level **UPDATE** and/or the **DELETE** permission.
- There is no **UNLOCK TABLE** statement. Locks are always released at transaction end.
- **LOCK TABLE** only deals with table-level locks, and so the mode names involving **ROW** are all misnomers. These mode names should generally be read as indicating the intention of the user to acquire row-level locks within the locked table. Also, **ROW EXCLUSIVE** mode is a shareable table lock. Note that all lock modes have the same semantics as long as **LOCK TABLE** is involved. The only difference lies in whether locks conflict with each other. For details about the rules, see [Table 7-165](#).
- If the `xc_maintenance_mode` parameter is not enabled, an error is reported when an **ACCESS EXCLUSIVE** lock is applied for a system catalog.
- Only the redistribution tool can use the automatic **CANCEL** service interface.

## Syntax

```
LOCK [TABLE] {[ONLY] name [, ...] | {name [*]} [, ...]}
 [IN {ACCESS SHARE | ROW SHARE | ROW EXCLUSIVE | SHARE UPDATE EXCLUSIVE | SHARE | SHARE
ROW EXCLUSIVE | EXCLUSIVE | ACCESS EXCLUSIVE} MODE]
 [NOWAIT][CANCELABLE];
```

## Parameter Description

**Table 7-165** Lock mode conflicts

Requested Lock Mode/ Current Lock Mode	ACCESS SHARE	ROW SHARE	ROW EXCLUSIVE	SHARE UPDATE EXCLUSIVE	SHARE	SHARE ROW EXCLUSIVE	EXCLUSIVE	ACCESS EXCLUSIVE
ACCESS SHARE	-	-	-	-	-	-	-	X
ROW SHARE	-	-	-	-	-	-	X	X
ROW EXCLUSIVE	-	-	-	-	X	X	X	X
SHARE UPDATE EXCLUSIVE	-	-	-	X	X	X	X	X
SHARE	-	-	X	X	-	X	X	X
SHARE ROW EXCLUSIVE	-	-	X	X	X	X	X	X
EXCLUSIVE	-	X	X	X	X	X	X	X
ACCESS EXCLUSIVE	X	X	X	X	X	X	X	X

**LOCK** parameters are as follows:

- **name**

Specifies the name (optionally schema-qualified) of an existing table to lock.

Tables are locked one-by-one in the order specified in the **LOCK TABLE** statement.

Value range: an existing table name

 **NOTE**

You can use database links to perform operations on remote tables. For details, see [DATABASE LINK](#).

- **ONLY**  
If **ONLY** is specified, only that table is locked. If **ONLY** is not specified, the table and all its sub-tables are locked.
- **ACCESS SHARE**  
Allows only read operations on a table. In general, any SQL statements that only read a table and do not modify it will acquire this lock mode. The **SELECT** statement acquires a lock of this mode on referenced tables.
- **ROW SHARE**  
Allows concurrent read of a table but does not allow any other operations on the table.  
**SELECT FOR UPDATE** and **SELECT FOR SHARE** automatically acquire the **ROW SHARE** lock on the target table and add the **ACCESS SHARE** lock to other referenced tables except **FOR SHARE** and **FOR UPDATE**.  
For a partitioned table, **SELECT FOR SHARE** obtains the **ROW EXCLUSIVE** lock of the partition object on the DN for concurrency control.
- **ROW EXCLUSIVE**  
Allows concurrent read of a table but does not allow modification of data in the table like **ROW SHARE**. **UPDATE**, **DELETE**, and **INSERT** automatically acquire the **ROW SHARE** lock on the target table and add the **ACCESS SHARE** lock to other referenced tables. Generally, all statements that modify table data acquire the **ROW EXCLUSIVE** lock for tables.
- **SHARE UPDATE EXCLUSIVE**  
Protects a table against concurrent schema changes and **VACUUM** runs.  
The **VACUUM** (without **FULL**), **ANALYZE**, and **CREATE INDEX CONCURRENTLY** statements automatically request this lock.
- **SHARE**  
Allows concurrent queries of a table but does not allow modification of the table.  
The **CREATE INDEX** (without **CONCURRENTLY**) statement automatically requests this lock.
- **SHARE ROW EXCLUSIVE**  
Protects a table against concurrent data changes, and is self-exclusive so that only one session can hold it at a time.  
No SQL statements automatically acquire this lock mode.
- **EXCLUSIVE**  
Allows concurrent queries of the target table but does not allow any other operations.  
This mode allows only concurrent **ACCESS SHARE** locks; that is, only reads from the table can proceed in parallel with a transaction holding this lock mode.  
No SQL statements automatically acquire this lock mode on user tables. However, it will be acquired on some system catalogs in case of some operations.

- **ACCESS EXCLUSIVE**

Guarantees that the holder is the only transaction accessing the table in any way.

Acquired by the **ALTER TABLE**, **DROP TABLE**, **TRUNCATE**, **REINDEX**, **CLUSTER**, and **VACUUM FULL** statements.

This is also the default lock mode for **LOCK TABLE** statements that do not specify a mode explicitly.

- **NOWAIT**

Specifies that **LOCK TABLE** does not wait for any conflicting locks to be released. If the lock cannot be obtained immediately, the command exits and an error message is displayed.

If **NOWAIT** is not specified, **LOCK TABLE** obtains a table-level lock, waiting if necessary for any conflicting locks to be released.

- **CANCELABLE**

Allows the waiting thread to send **CANCEL** signals to the holding threads and waiting threads.

Only the redistribution tool can use this parameter. An error message is displayed when the parameter is used by users.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason(
r_reason_sk INTEGER NOT NULL,
r_reason_id CHAR(16) NOT NULL,
r_reason_desc INTEGER
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.reason VALUES (1, 'AAAAAAAAABAAAAAAAA', '18'),(5, 'AAAAAAAAACAAAAAAAA',
'362'),(7, 'AAAAAADAAAAAAAAA', '585');

-- Obtain a SHARE ROW EXCLUSIVE lock on a primary key table when going to perform a delete operation.
gaussdb=# CREATE TABLE tpcds.reason_t1 AS TABLE tpcds.reason;

gaussdb=# START TRANSACTION;

gaussdb=# LOCK TABLE tpcds.reason_t1 IN SHARE ROW EXCLUSIVE MODE;

gaussdb=# DELETE FROM tpcds.reason_t1 WHERE r_reason_desc IN(SELECT r_reason_desc FROM
tpcds.reason_t1 WHERE r_reason_sk < 6);

gaussdb=# DELETE FROM tpcds.reason_t1 WHERE r_reason_sk = 7;

gaussdb=# COMMIT;

-- Delete the tpcds.reason_t1 table.
gaussdb=# DROP TABLE tpcds.reason_t1;

-- Delete the table.
gaussdb=# DROP TABLE tpcds.reason;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## 7.14.136 MOVE

### Function

Repositions a cursor without retrieving any data. MOVE works exactly like the [FETCH](#) statement, except it only repositions the cursor and does not return rows.

### Precautions

None

### Syntax

```
MOVE [direction [FROM | IN]] cursor_name;
```

The **direction** clause specifies optional parameters.

```
NEXT
| PRIOR
| FIRST
| LAST
| ABSOLUTE count
| RELATIVE count
| count
| ALL
| FORWARD
| FORWARD count
| FORWARD ALL
| BACKWARD
| BACKWARD count
| BACKWARD ALL
```

### Parameter Description

The MOVE statement parameters are the same as FETCH statement parameters. For details, see [Parameters](#) in section "FETCH."

#### NOTE

On successful completion, a **MOVE** statement returns a tag of the form **MOVE count**. The **count** is the number of rows that a **FETCH** statement with the same parameters would have returned (possibly zero).

### Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason(
r_reason_sk INTEGER NOT NULL,
r_reason_id CHAR(16) NOT NULL,
r_reason_desc VARCHAR(40)
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.reason VALUES (1, 'AAAAAAAABAAAAAAA', 'XXXXXXXX'),(2,
'AAAAAAAACAAAAAAA', 'XXXXXXXX'),(3, 'AAAAAAAADAAAAAAA', 'XXXXXXXX'),(4, 'AAAAAAAEEAAAAAAA',
'Not the product that was ordered'),(5, 'AAAAAAAFAAAAAAAA', 'Parts missing'),(6, 'AAAAAAAAGAAAAAAA',
'Does not work with a product that I have'),(7, 'AAAAAAAHAAAAAAA', 'Gift exchange');

-- Start a transaction.
```

```
gaussdb=# START TRANSACTION;
-- Define a cursor named cursor1.
gaussdb=# CURSOR cursor1 FOR SELECT * FROM tpcds.reason;

-- Skip the first three rows of cursor1:
gaussdb=# MOVE FORWARD 3 FROM cursor1;

-- Fetch the first four rows from cursor1:
gaussdb=# FETCH 4 FROM cursor1;
 r_reason_sk | r_reason_id | | r_reason_desc
-----+-----
+-----+-----
4 | AAAAAAAAAEAAAAAAAA | Not the product that was
ordred
5 | AAAAAAAAFAAAAAAAA | Parts missing
6 | AAAAAAAGAAAAAAAA | Does not work with a product that I
have
7 | AAAAAAAHAAAAAAAA | Gift
exchange
(4 rows)

-- Close the cursor.
gaussdb=# CLOSE cursor1;

-- End the transaction.
gaussdb=# END;

-- Delete the table.
gaussdb=# DROP TABLE tpcds.reason;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## Helpful Links

[CLOSE](#) and [FETCH](#)

## 7.14.137 MERGE INTO

### Description

**MERGE INTO** conditionally matches data in a target table with that in a source table. If data matches, **UPDATE** is executed on the target table; if data does not match, **INSERT** is executed. You can use this syntax to run **UPDATE** and **INSERT** at a time for convenience

### Precautions

- You have the **INSERT** and **UPDATE** permissions for the target table and the **SELECT** permission for the source table.
- **MERGE INTO** cannot be executed during redistribution.
- If the source table of the **MERGE INTO** operation contains data columns that are dynamically anonymized, the result of inserting data to or updating data in the target table is the anonymized value and cannot be restored.

### Syntax

```
MERGE [/*+ plan_hint */] INTO table_name [[AS] alias]
USING { { table_name | view_name } | subquery } [[AS] alias]
ON (condition)
```

```
[
 WHEN MATCHED THEN
 UPDATE SET { column_name = { expression | subquery | DEFAULT } |
 (column_name [, ...]) = ({ expression | subquery | DEFAULT } [, ...]) } [, ...]
 [WHERE condition]
]
[
 WHEN NOT MATCHED THEN
 INSERT { DEFAULT VALUES |
 [(column_name [, ...])] VALUES ({ expression | subquery | DEFAULT } [, ...]) [, ...] [WHERE condition] }
];
NOTICE: 'subquery' in the UPDATE and INSERT clauses are only available in CENTRALIZED mode!
```

## Parameters

- **plan\_hint** clause  
Follows the MERGE keyword in the */\*+ \*/* format. It is used to optimize the plan of a MERGE statement block. For details, see [Hint-based Tuning](#). In each statement, only the first */\*+ plan\_hint \*/* comment block takes effect as a hint. Multiple hints can be written.
- **INTO** clause  
Specifies the target table that is being updated or has data being inserted. If the target table is a replication table, the default value of a column (such as auto-increment column) in the target table cannot be the volatile function. If **enable\_stream\_operator** is set to **off**, the target table must contain a primary key or UNIQUE and NOT NULL constraints.
  - **table\_name**  
Specifies the name of the target table.
  - **alias**  
Specifies the alias of the target table.  
Value range: a string. It must comply with the [naming convention](#).
- **USING** clause  
Specifies the source table, which can be a table, view, or subquery. If the target table is a replication table, the USING clause cannot contain non-replication tables.
- **ON** clause  
Specifies the condition used to match data between the source and target tables. Columns in the condition cannot be updated.
- **WHEN MATCHED** clause  
Performs UPDATE if data in the source table matches that in the target table based on the condition.  
Distribution keys cannot be updated. System catalogs and system columns cannot be updated.
- **WHEN NOT MATCHED** clause  
Performs INSERT if data in the source table does not match that in the target table based on the condition.  
An INSERT clause cannot contain multiple VALUES.  
The order of WHEN MATCHED and WHEN NOT MATCHED clauses can be reversed. One of them can be used by default, but they cannot be both used at one time. Two WHEN MATCHED or WHEN NOT MATCHED clauses cannot be specified at the same time.

- **DEFAULT**  
Specifies the default value of a column.  
The value is **NULL** if no default value is assigned to it.
- **WHERE** condition  
Specifies the conditions for the UPDATE and INSERT clauses. The two clauses will be executed only when the conditions are met. The default value can be used. System columns cannot be referenced in WHERE condition. You are advised not to use numeric types such as int as conditions, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

## Examples

```
-- Create the target table products and source table newproducts, and insert data to them.
gaussdb=# CREATE TABLE products
(
 product_id INTEGER,
 product_name VARCHAR2(60),
 category VARCHAR2(60)
);

gaussdb=# INSERT INTO products VALUES (1501, 'vivitar 35mm', 'electrncs');
gaussdb=# INSERT INTO products VALUES (1502, 'olympus is50', 'electrncs');
gaussdb=# INSERT INTO products VALUES (1600, 'play gym', 'toys');
gaussdb=# INSERT INTO products VALUES (1601, 'lamaze', 'toys');
gaussdb=# INSERT INTO products VALUES (1666, 'harry potter', 'dvd');

gaussdb=# CREATE TABLE newproducts
(
 product_id INTEGER,
 product_name VARCHAR2(60),
 category VARCHAR2(60)
);

gaussdb=# INSERT INTO newproducts VALUES (1502, 'olympus camera', 'electrncs');
gaussdb=# INSERT INTO newproducts VALUES (1601, 'lamaze', 'toys');
gaussdb=# INSERT INTO newproducts VALUES (1666, 'harry potter', 'toys');
gaussdb=# INSERT INTO newproducts VALUES (1700, 'wait interface', 'books');

-- Run MERGE INTO.
gaussdb=# MERGE INTO products p
USING newproducts np
ON (p.product_id = np.product_id)
WHEN MATCHED THEN
 UPDATE SET p.product_name = np.product_name, p.category = np.category WHERE p.product_name !=
'play gym'
WHEN NOT MATCHED THEN
 INSERT VALUES (np.product_id, np.product_name, np.category) WHERE np.category = 'books';
MERGE 4

-- Query updates.
gaussdb=# SELECT * FROM products ORDER BY product_id;
product_id | product_name | category
-----+-----+-----
1501 | vivitar 35mm | electrncs
1502 | olympus camera | electrncs
1600 | play gym | toys
1601 | lamaze | toys
1666 | harry potter | toys
1700 | wait interface | books
(6 rows)

-- Delete the table.
```

```
gaussdb=# DROP TABLE products;
gaussdb=# DROP TABLE newproducts;
```

## 7.14.138 PREDICT BY

This syntax is not supported in distributed scenarios.

## 7.14.139 PREPARE

### Function

**PREPARE** creates a prepared statement.

A prepared statement is a performance optimizing object on the server. When the **PREPARE** statement is executed, the specified query is parsed, analyzed, and rewritten. When **EXECUTE** is executed, the prepared statement is planned and executed. This avoids repetitive parsing and analysis. After the **PREPARE** statement is created, it exists throughout the database session. Once it is created (even if in a transaction block), it will not be deleted when a transaction is rolled back. It can only be deleted by explicitly calling **DEALLOCATE** or automatically deleted when the session ends.

### Precautions

None

### Syntax

```
PREPARE name [(data_type [, ...])] AS statement;
```

### Parameter Description

- **name**  
Specifies the name of a prepared statement. It must be unique in the session.
- **data\_type**  
Specifies the type of an argument.
- **statement**  
Specifies a SELECT, INSERT, UPDATE, DELETE, MERGE INTO, or VALUES statement.

### Examples

See [Examples](#) in section "EXECUTE."

### Helpful Links

[DEALLOCATE](#)

## 7.14.140 PREPARE TRANSACTION

### Function

Prepares the current transaction for two-phase commit.

After this statement, the transaction is no longer associated with the current session; instead, its state is fully stored on disk, and there is a high probability that it can be committed successfully, even if a database crash occurs before the commit is requested.

Once prepared, a transaction can later be committed or rolled back with **COMMIT PREPARED** or **ROLLBACK PREPARED**, respectively. Those statements can be issued from any session, not only the one that executed the original transaction.

From the point of view of the issuing session, **PREPARE TRANSACTION** is not unlike a **ROLLBACK** statement: after executing it, there is no active current transaction, and the effects of the prepared transaction are no longer visible. (The effects will become visible again if the transaction is committed.)

If the **PREPARE TRANSACTION** statement fails for any reason, it becomes a **ROLLBACK** and the current transaction is canceled.

## Precautions

- The transaction function is maintained automatically by the database, and should be not visible to users.
- The distributed system does not allow users to call the customized **PREPARE TRANSACTION** operation.
- When running the **PREPARE TRANSACTION** statement, increase the value of **max\_prepared\_transactions** in configuration file **postgresql.conf**. You are advised to set **max\_prepared\_transactions** to a value not less than that of **max\_connections** so that one pending prepared transaction is available for each session.

## Syntax

```
PREPARE TRANSACTION transaction_id;
```

## Parameter Description

### **transaction\_id**

Specifies an arbitrary identifier that later identifies this transaction for **COMMIT PREPARED** or **ROLLBACK PREPARED**. The identifier must be different from those for current prepared transactions.

Value range: The identifier must be written as a string literal, and must be less than 200 bytes long.

## Helpful Links

[COMMIT PREPARED](#) and [ROLLBACK PREPARED](#)

## 7.14.141 PURGE

### Description

The **PURGE** statement can be used to:

- Clear tables or indexes from the recycle bin and release all space related to the objects.

- Clear the recycle bin.
- Clear the objects of a specified tablespace in the recycle bin.

## Precautions

- The PURGE operation supports tables (**PURGE TABLE**), indexes (**PURGE INDEX**), and recycle bins (**PURGE RECYCLEBIN**).
- The permission requirements for performing the PURGE operation are as follows:
  - **PURGE TABLE**: The user must be the owner of the table and must have the USAGE permission on the schema to which the table belongs. By default, the system administrator has this permission.
  - **PURGE INDEX**: The user must be the owner of the index and have the USAGE permission on the schema to which the index belongs. By default, the system administrator has this permission.
  - **PURGE RECYCLEBIN**: Common users can clear only the objects owned by themselves in the recycle bin. In addition, the user must have the USAGE permission of the schema to which the objects belong. By default, the system administrator can clear all objects in the recycle bin.

## Prerequisites

- The **enable\_recyclebin** parameter has been enabled to enable the recycle bin. Contact the administrator for details about how to use the parameter.
- The **recyclebin\_retention\_time** parameter has been set for specifying the retention period of objects in the recycle bin. The objects will be automatically deleted after the retention period expires. Contact the administrator for details about how to use the parameter.

## Syntax

```
PURGE { TABLE [schema_name].table_name
| INDEX index_name
| RECYCLEBIN
}
```

## Parameters

- [*schema\_name*.]  
Schema name.
- TABLE [*schema\_name*].*table\_name*  
Clears a specified table in the recycle bin.
- INDEX *index\_name*  
Clears a specified index in the recycle bin.
- RECYCLEBIN  
Clears all objects in the recycle bin.

## Examples

```
-- Create the tpcds role.
gaussdb=# CREATE ROLE tpcds IDENTIFIED BY '*****';
```

```
-- Create the reason_table_space tablespace.
gaussdb=# CREATE TABLESPACE REASON_TABLE_SPACE1 owner tpcds RELATIVE location 'tablespace/
tsp_reason1';

-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason_t1 table in the tablespace.
gaussdb=# CREATE TABLE tpcds.reason_t1
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
) with(storage_type=ustore) tablespace reason_table_space1;
-- Create the tpcds.reason_t2 table in the tablespace.
gaussdb=# CREATE TABLE tpcds.reason_t2
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
) with(storage_type=ustore) tablespace reason_table_space1;
-- Create the tpcds.reason_t3 table in the tablespace.
gaussdb=# CREATE TABLE tpcds.reason_t3
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
) with(storage_type=ustore) tablespace reason_table_space1;
-- Create an index on the tpcds.reason_t1 table.
gaussdb=# CREATE INDEX index_t1 on tpcds.reason_t1(r_reason_id);
gaussdb=# DROP TABLE tpcds.reason_t1;
gaussdb=# DROP TABLE tpcds.reason_t2;
gaussdb=# DROP TABLE tpcds.reason_t3;
-- View the recycle bin.
gaussdb=# SELECT rcyname,rcyoriginname,rcytablespace FROM GS_RECYCLEBIN;
 rcyname | rcyoriginname | rcytablespace
-----+-----+-----
BIN$16409$2CEE988==$0 | reason_t1 | 16408
BIN$16412$2CF2188==$0 | reason_t2 | 16408
BIN$16415$2CF2EC8==$0 | reason_t3 | 16408
BIN$16418$2CF3EC8==$0 | index_t1 | 0
(4 rows)
-- Purge the table.
gaussdb=# PURGE TABLE tpcds.reason_t3;
gaussdb=# SELECT rcyname,rcyoriginname,rcytablespace FROM GS_RECYCLEBIN;
 rcyname | rcyoriginname | rcytablespace
-----+-----+-----
BIN$16409$2CEE988==$0 | reason_t1 | 16408
BIN$16412$2CF2188==$0 | reason_t2 | 16408
BIN$16418$2CF3EC8==$0 | index_t1 | 0
(3 rows)
-- Purge the index.
gaussdb=# PURGE INDEX tpcds.index_t1;
gaussdb=# SELECT rcyname,rcyoriginname,rcytablespace FROM GS_RECYCLEBIN;
 rcyname | rcyoriginname | rcytablespace
-----+-----+-----
BIN$16409$2CEE988==$0 | reason_t1 | 16408
BIN$16412$2CF2188==$0 | reason_t2 | 16408
(2 rows)
-- Purge all objects in the recycle bin.
gaussdb=# PURGE recyclebin;
gaussdb=# SELECT rcyname,rcyoriginname,rcytablespace FROM GS_RECYCLEBIN;
 rcyname | rcyoriginname | rcytablespace
-----+-----+-----
(0 rows)

-- Delete the schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## 7.14.142 REASSIGN OWNED

### Function

Changes the owner of the database object.

REASSIGN OWNED changes the database object owner of an old role to a new role.

### Precautions

- REASSIGN OWNED is often executed before role deletion.
- To run the REASSIGN OWNED statement, you must have the permissions of the original and target roles.

### Syntax

```
REASSIGN OWNED BY old_role [, ...] TO new_role;
```

### Parameter Description

- **old\_role**  
Specifies the role name of the old owner.
- **new\_role**  
Specifies the role name of the new owner. Note: Only the initial user can use the REASSIGN OWNED syntax to change the owner to the initial user.

### Examples

None

## 7.14.143 REINDEX

### Description

Rebuilds an index using the data stored in the index's table, replacing the old copy of the index.

There are several scenarios in which **REINDEX** can be used:

- An index has become corrupted, and no longer contains valid data.
- An index has become "bloated", that is, it contains many empty or nearly-empty pages.
- You have altered a storage parameter (such as a fill factor) for an index, and wish that the change takes full effect.

### Precautions

- **REINDEX DATABASE** and **REINDEX SYSTEM** type cannot be performed in transaction blocks.

## Syntax

- Rebuild a general index.  
`REINDEX { INDEX | TABLE | DATABASE | SYSTEM } [CONCURRENTLY] name [ FORCE ];`
- Rebuild an index partition.  
`REINDEX { INDEX | TABLE} name  
PARTITION partition_name [ FORCE ];`

## Parameters

- **INDEX**  
Rebuilds the specified index.
- **TABLE**  
Recreates all indexes of a specified table. If a table has a TOAST table, the table will also be reindexed. If an index on the table has been invalidated by running **alter unusable**, the index cannot be rebuilt. Indexes in the TOAST table cannot be recreated when specifying the **CONCURRENTLY** option.
- **DATABASE**  
Rebuilds all indexes within the current database. Indexes in the TOAST table within the current database cannot be recreated when specifying the **CONCURRENTLY** option.
- **SYSTEM**  
Rebuilds all indexes on system catalogs within the current database. Indexes on user tables are not processed.
- **CONCURRENTLY**  
Rebuilds an index (with ShareUpdateExclusiveLock) in non-blocking DML mode. When an index is rebuilt, other statements cannot access the table on which the index depends. If this keyword is specified, DML is not blocked during the recreation. Indexes in system catalogs cannot be rebuilt online. `REINDEX INTERNAL TABLE CONCURRENTLY` and `REINDEX SYSTEM CONCURRENTLY` are not supported. When `REINDEX DATABASE CONCURRENTLY` is executed, all indexes on user tables in the current database are rebuilt online (indexes on system catalogs are not processed). `REINDEX CONCURRENTLY` cannot be executed within a transaction. Only B-tree and UB-tree indexes can be created online and only common, global, and local indexes are supported. Online concurrent index rebuilding supports only Astore common indexes, global indexes, and local indexes. Ustore indexes are not supported. If online index recreating fails, invalid new indexes may be left. If the system cannot automatically clear the invalid indexes (for example, the database is shut down), you need to manually clear the invalid indexes (using the `DROP INDEX` statement) as soon as possible to prevent more resources from being occupied. Generally, the extension of an invalid index name is **\_ccnew**. The execution of `REINDEX INDEX CONCURRENTLY` adds a four-level session lock to the table and its first several phases are similar to those of `CREATE INDEX CONCURRENTLY`. Therefore, the execution may be suspended or deadlocked, which is similar to that of `CREATE INDEX CONCURRENTLY`. For example, if two sessions perform the `REINDEX CONCURRENTLY` operation on the same index or table at the same time, a deadlock occurs. For details, see [CONCURRENTLY](#).
- **name**

Specifies the name of the index, table, or database whose index needs to be rebuilt. Tables and indexes can be schema-qualified.

 **NOTE**

REINDEX DATABASE and REINDEX SYSTEM can create indexes for only the current database. Therefore, **name** must be the same as the current database name.

- **FORCE**

Discarded parameter. It is currently reserved for compatibility with earlier versions.

- **partition\_name**

Specifies the name of the partition or index partition to be rebuilt.

Value range:

- If REINDEX INDEX is used, specify the name of an index partition.
- If REINDEX TABLE is used, specify the name of a partition.

---

**NOTICE**

REINDEX DATABASE and REINDEX SYSTEM cannot be performed in transaction blocks.

---

 **CAUTION**

REINDEX and REINDEX CONCURRENTLY do not support separate operations on TOAST tables or TOAST indexes.

---

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer table.
gaussdb=# CREATE TABLE tpcds.customer(
c_customer_sk INTEGER NOT NULL,
c_customer_id CHAR(16) NOT NULL
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.customer VALUES (1, 'AAAAAAAAABAAAAAAA'),(5, 'AAAAAAAACAAAAAAA'),
(10, 'AAAAAAAADAAAAAAA');

-- Create a row-store table tpcds.customer_t1 and create an index on the c_customer_sk column in the table.
gaussdb=# CREATE TABLE tpcds.customer_t1
(
 c_customer_sk integer not null,
 c_customer_id char(16) not null,
 c_current_demo_sk integer ,
 c_current_hdemo_sk integer ,
 c_current_addr_sk integer ,
 c_first_shipto_date_sk integer ,
 c_first_sales_date_sk integer ,
 c_salutation char(10) ,
 c_first_name char(20) ,
 c_last_name char(30) ,
);
```

```
c_preferred_cust_flag char(1) ,
c_birth_day integer ,
c_birth_month integer ,
c_birth_year integer ,
c_birth_country varchar(20) ,
c_login char(13) ,
c_email_address char(50) ,
c_last_review_date char(10)
)
WITH (orientation = row);

gaussdb=# CREATE INDEX tpcds_customer_index1 ON tpcds.customer_t1 (c_customer_sk);

gaussdb=# INSERT INTO tpcds.customer_t1 SELECT * FROM tpcds.customer WHERE c_customer_sk < 10;

-- Rebuild a single index.
gaussdb=# REINDEX INDEX tpcds.tpcds_customer_index1;

-- Rebuild a single index online.
gaussdb=# REINDEX INDEX CONCURRENTLY tpcds.tpcds_customer_index1;

-- Rebuild all indexes in the tpcds.customer_t1 table:
gaussdb=# REINDEX TABLE tpcds.customer_t1;

-- Rebuild all indexes in the tpcds.customer_t1 table online.
gaussdb=# REINDEX TABLE CONCURRENTLY tpcds.customer_t1;

-- Delete the tpcds.customer_t1 table:
gaussdb=# DROP TABLE tpcds.customer_t1;

-- Delete the tpcds.customer table.
gaussdb=# DROP TABLE tpcds.customer;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## Suggestions

- **DATABASE**  
You are advised not to reindex a database in a transaction.
- **SYSTEM**  
You are advised not to reindex system catalogs in transactions.

## 7.14.144 REFRESH INCREMENTAL MATERIALIZED VIEW

### Function

**REFRESH INCREMENTAL MATERIALIZED VIEW** refreshes a materialized view in materialized mode.

### Precautions

- Incremental refresh supports only incremental materialized views.
- To refresh a materialized view, you must have the SELECT permission on the base table.

### Syntax

```
REFRESH INCREMENTAL MATERIALIZED VIEW mv_name;
```

## Parameter Description

- **mv\_name**  
Name of the materialized view to be refreshed.

## Examples

```
-- Create an ordinary table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int);

-- Create a fast-refresh materialized view.
gaussdb=# CREATE INCREMENTAL MATERIALIZED VIEW my_imv AS SELECT * FROM my_table;

-- Write data to the base table.
gaussdb=# INSERT INTO my_table VALUES(1,1),(2,2);

-- Fast refresh the fast-refresh materialized view my_imv.
gaussdb=# REFRESH INCREMENTAL MATERIALIZED VIEW my_imv;

-- Delete the fast-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_imv;

-- Delete the my_table table.
gaussdb=# DROP TABLE my_table;
```

## Helpful Links

## 7.14.145 REFRESH MATERIALIZED VIEW

### Function

**REFRESH MATERIALIZED VIEW** refreshes materialized views in full refresh mode.

### Precautions

- Full refreshing can be performed on both full and incremental materialized views.
- To refresh a materialized view, you must have the SELECT permission on the base table.

### Syntax

```
REFRESH MATERIALIZED VIEW mv_name;
```

## Parameter Description

- **mv\_name**  
Name of the materialized view to be refreshed.

## Examples

```
-- Create an ordinary table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int);

-- Create a complete-refresh materialized view.
```

```
gaussdb=# CREATE MATERIALIZED VIEW my_mv AS SELECT * FROM my_table;
-- Create a fast-refresh materialized view.
gaussdb=# CREATE INCREMENTAL MATERIALIZED VIEW my_imv AS SELECT * FROM my_table;

-- Write data to the base table.
gaussdb=# INSERT INTO my_table VALUES(1,1),(2,2);

-- Completely refresh the complete-refresh materialized view my_mv.
gaussdb=# REFRESH MATERIALIZED VIEW my_mv;

-- Completely refresh the fast-refresh materialized view my_imv.
gaussdb=# REFRESH MATERIALIZED VIEW my_imv;

-- Delete a fast-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_imv;

-- Delete a complete-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_mv;

-- Delete the my_table table.
gaussdb=# DROP TABLE my_table;
```

## Helpful Links

[ALTER MATERIALIZED VIEW](#), [CREATE INCREMENTAL MATERIALIZED VIEW](#), [CREATE MATERIALIZED VIEW](#), [CREATE TABLE](#), [DROP MATERIALIZED VIEW](#), and [REFRESH INCREMENTAL MATERIALIZED VIEW](#)

## 7.14.146 RELEASE SAVEPOINT

### Function

Destroys a savepoint previously defined in the current transaction.

Destroying a savepoint makes it unavailable as a rollback point, but it has no other user visible behavior. It does not undo the effects of statements executed after the savepoint was established. To do that, use **ROLLBACK TO SAVEPOINT**. Destroying a savepoint when it is no longer needed allows the system to reclaim some resources earlier than transaction end.

**RELEASE SAVEPOINT** also destroys all savepoints that were established after the named savepoint was established.

### Precautions

- Specifying a savepoint name that was not previously defined causes an error.
- It is not possible to release a savepoint when the transaction is in an aborted state.
- If multiple savepoints have the same name, only the one that was most recently defined is released.

### Syntax

```
RELEASE [SAVEPOINT] savepoint_name;
```

### Parameter Description

**savepoint\_name**

Specifies the name of the savepoint you want to destroy.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create a table.
gaussdb=# CREATE TABLE tpcds.table1(a int);

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Insert data.
gaussdb=# INSERT INTO tpcds.table1 VALUES (3);

-- Establish a savepoint.
gaussdb=# SAVEPOINT my_savepoint;

-- Insert data.
gaussdb=# INSERT INTO tpcds.table1 VALUES (4);

-- Delete the savepoint.
gaussdb=# RELEASE SAVEPOINT my_savepoint;

-- Commit the transaction.
gaussdb=# COMMIT;

-- Query the table content, which should contain both 3 and 4.
gaussdb=# SELECT * FROM tpcds.table1;

-- Delete the table.
gaussdb=# DROP TABLE tpcds.table1;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## Helpful Links

[SAVEPOINT](#) and [ROLLBACK TO SAVEPOINT](#)

## 7.14.147 RESET

### Description

Restores GUC parameters to their default values. The default values are parameter default values compiled in the **postgresql.conf** configuration file.

**RESET** is an alternative spelling for:

```
SET configuration_parameter TO DEFAULT;
```

### Precautions

**RESET** and **SET** have the same transaction behavior. Their impact will be rolled back.

### Syntax

```
RESET {configuration_parameter | CURRENT_SCHEMA | TIME_ZONE | TRANSACTION ISOLATION LEVEL |
SESSION AUTHORIZATION | ALL };
```

## Parameters

- **configuration\_parameter**  
Specifies the name of a settable GUC parameter.  
Value range: GUC parameters. You can view them by running the **SHOW ALL** statement.  
 **NOTE**  
Some parameters that viewed by **SHOW ALL** cannot be set by **SET**. For example, **max\_datanodes**.
- **CURRENT\_SCHEMA**  
Specifies the current schema.
- **TIME\_ZONE**  
Specifies the time zone.
- **TRANSACTION ISOLATION LEVEL**  
Specifies the transaction isolation level.
- **SESSION AUTHORIZATION**  
Specifies the current user identifier of the current session.
- **ALL**  
Resets all settable GUC parameters to default values.

## Examples

```
-- Reset timezone to the default value.
gaussdb=# RESET timezone;

-- Set all parameters to their default values.
gaussdb=# RESET ALL;
```

## Helpful Links

[SET](#) and [SHOW](#)

## 7.14.148 REVOKE

### Description

Revokes permissions from one or more roles.

### Precautions

If a non-owner user of an object attempts to the REVOKE permission on the object, the statement is executed based on the following rules:

- If the user has no permissions whatsoever on the object, the statement will fail outright.
- If an authorized user has some permissions, only the permissions with authorization options are revoked.
- If the authorized user does not have the authorization option, the **REVOKE ALL PRIVILEGES** form will issue an error message. For other forms of

statements, if the permission specified in the statement does not have the corresponding authorization option, the statement will issue a warning.

## Syntax

- Revoke the permission on a specified table or view.

```
REVOKE [GRANT OPTION FOR]
 { { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | ALTER | DROP | COMMENT |
 INDEX | VACUUM }[, ...]
 | ALL [PRIVILEGES] }
 ON { [TABLE] table_name [, ...]
 | ALL TABLES IN SCHEMA schema_name [, ...] }
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```
- Revoke the permission on a specified field in a table.

```
REVOKE [GRANT OPTION FOR]
 { { SELECT | INSERT | UPDATE | REFERENCES | COMMENT } (column_name [, ...])[, ...]
 | ALL [PRIVILEGES] (column_name [, ...]) }
 ON [TABLE] table_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```
- Revoke the permission on a specified sequence.

```
REVOKE [GRANT OPTION FOR]
 { { SELECT | UPDATE | ALTER | DROP | COMMENT }[, ...]
 | ALL [PRIVILEGES] }
 ON { [SEQUENCE] sequence_name [, ...]
 | ALL SEQUENCES IN SCHEMA schema_name [, ...] }
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```
- Revoke the permission on a specified database.

```
REVOKE [GRANT OPTION FOR]
 { { CREATE | CONNECT | TEMPORARY | TEMP | ALTER | DROP | COMMENT } [, ...]
 | ALL [PRIVILEGES] }
 ON DATABASE database_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```
- Revoke the permission on a specified domain.

```
REVOKE [GRANT OPTION FOR]
 { USAGE | ALL [PRIVILEGES] }
 ON DOMAIN domain_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```
- Revoke the specified CMK permission.

```
REVOKE [GRANT OPTION FOR]
 { { USAGE | DROP } [, ...] | ALL [PRIVILEGES] }
 ON CLIENT_MASTER_KEYS client_master_keys_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```
- Revoke the specified CEK permission.

```
REVOKE [GRANT OPTION FOR]
 { { USAGE | DROP } [, ...] | ALL [PRIVILEGES]}
 ON COLUMN_ENCRYPTION_KEYS column_encryption_keys_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```
- Revoke the permission on a specified directory.

```
REVOKE [GRANT OPTION FOR]
 { { READ | WRITE | ALTER | DROP } [, ...] | ALL [PRIVILEGES] }
 ON DIRECTORY directory_name [, ...]
 FROM { [GROUP] role_name | PUBLIC } [, ...]
 [CASCADE | RESTRICT];
```
- Revoke the permission on a specified external data source.

```
REVOKE [GRANT OPTION FOR]
 { USAGE | ALL [PRIVILEGES] }
```

```
ON FOREIGN DATA WRAPPER fdw_name [, ...]
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT];
```

- Revoke the permission on a specified external server.

```
REVOKE [GRANT OPTION FOR]
{ { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON FOREIGN SERVER server_name [, ...]
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT];
```

- Revoke the permission on a specified function.

```
REVOKE [GRANT OPTION FOR]
{ { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON { FUNCTION {function_name ([{ [argmode] [arg_name] arg_type } [, ...]) } [, ...]
| ALL FUNCTIONS IN SCHEMA schema_name [, ...] }
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT];
```

- Revoke the permission on a specified stored procedure.

```
REVOKE [GRANT OPTION FOR]
{ { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON { PROCEDURE {proc_name ([{ [argmode] [arg_name] arg_type } [, ...]) } [, ...]
| ALL PROCEDURE IN SCHEMA schema_name [, ...] }
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT];
```

- Revoke the permission on a specified procedural language.

```
REVOKE [GRANT OPTION FOR]
{ USAGE | ALL [PRIVILEGES] }
ON LANGUAGE lang_name [, ...]
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT];
```

- Revoke the permission on a specified large object.

```
REVOKE [GRANT OPTION FOR]
{ { SELECT | UPDATE } [, ...] | ALL [PRIVILEGES] }
ON LARGE OBJECT loid [, ...]
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT];
```

- Revoke the permission on a specified schema.

```
REVOKE [GRANT OPTION FOR]
{ { CREATE | USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON SCHEMA schema_name [, ...]
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT];
```

- Revoke the permission on a specified tablespace.

```
REVOKE [GRANT OPTION FOR]
{ { CREATE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON TABLESPACE tablespace_name [, ...]
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT];
```

- Revoke the permission on a specified type.

```
REVOKE [GRANT OPTION FOR]
{ { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
ON TYPE type_name [, ...]
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT];
```

- Revoke the permission on a specified sub-cluster.

```
REVOKE [GRANT OPTION FOR]
{ { CREATE | USAGE | COMPUTE | ALTER | DROP } [, ...] | ALL [PRIVILEGES] }
ON NODE GROUP group_name [, ...]
FROM { [GROUP] role_name | PUBLIC } [, ...]
[CASCADE | RESTRICT];
```

#### NOTE

When the **create** permission on a sub-cluster is revoked, the **usage** and **compute** permissions are revoked by default.

- Revoke the permission on a directory object.  

```
REVOKE [GRANT OPTION FOR]
 { { READ | WRITE } [, ...] | ALL [PRIVILEGES] }
 ON DIRECTORY directory_name [, ...]
 FROM {[GROUP] role_name | PUBLIC} [, ...]
 [CASCADE | RESTRICT];
```
- Revoke permissions from a role.  

```
REVOKE [ADMIN OPTION FOR]
 role_name [, ...] FROM role_name [, ...]
 [CASCADE | RESTRICT];
```
- Revoke the sysadmin permission from a role.  

```
REVOKE ALL { PRIVILEGES | PRIVILEGE } FROM role_name;
```
- Revoke the ANY permissions.  

```
REVOKE [ADMIN OPTION FOR]
 { CREATE ANY TABLE | ALTER ANY TABLE | DROP ANY TABLE | SELECT ANY TABLE | INSERT ANY
 TABLE | UPDATE ANY TABLE |
 DELETE ANY TABLE | CREATE ANY SEQUENCE | CREATE ANY INDEX | CREATE ANY FUNCTION |
 EXECUTE ANY FUNCTION |
 CREATE ANY TYPE | ALTER ANY TYPE | DROP ANY TYPE | ALTER ANY SEQUENCE | DROP ANY
 SEQUENCE |
 SELECT ANY SEQUENCE | ALTER ANY INDEX | DROP ANY INDEX | CREATE ANY SYNONYM | DROP
 ANY SYNONYM | CREATE ANY TRIGGER | ALTER ANY TRIGGER |
 DROP ANY TRIGGER
 } [, ...]
 FROM [GROUP] role_name [, ...];
```
- Revoke the permission on database links.  

```
REVOKE { CREATE | ALTER | DROP } [PUBLIC] DATABASE LINK FROM role_name;
```

 **NOTE**

For details about database links, see [DATABASE LINK](#).

## Parameters

The keyword **PUBLIC** indicates an implicitly defined group that has all roles.

For details about permission types and parameters, see section "GRANT".

Permissions of a role include the permissions directly granted to the role, permissions inherited from the parent role, and permissions granted to **PUBLIC**. Therefore, revoking the **SELECT** permission for an object from **PUBLIC** does not necessarily mean that the **SELECT** permission for the object has been revoked from all roles, because the **SELECT** permission directly granted to roles and inherited from parent roles remains. Similarly, if the **SELECT** permission is revoked from a user but is not revoked from **PUBLIC**, the user can still run the **SELECT** statement.

If **GRANT OPTION FOR** is specified, the permission cannot be granted to others, but permission itself is not revoked.

If user A holds the **UPDATE** permissions on a table and the **WITH GRANT OPTION** and has granted them to user B, the permissions that user B holds are called dependent permissions. If the permissions or the grant option held by user A is revoked, the dependent permissions still exist. Those dependent permissions are also revoked if **CASCADE** is specified.

A user can only revoke permissions that were granted directly by that user. For example, if user A has granted permission with grant option (**WITH ADMIN OPTION**) to user B, and user B has in turn granted it to user C, then user A cannot revoke the permission directly from C. However, user A can revoke the grant

option held by user B and use **CASCADE**. In this way, the permission of user C is automatically revoked. For another example, if both user A and user B have granted the same permission to C, A can revoke his own grant but not B's grant, so C will still effectively have the permission.

If the role executing **REVOKE** holds permissions indirectly via more than one role membership path, it is unspecified which containing role will be used to execute the statement. In such cases, you are advised to use **SET ROLE** to become the specific role you want to do the **REVOKE** as, and then execute **REVOKE**. Failure to do so may lead to deleting permissions not intended to delete, or not deleting any permissions at all.

## Examples

See [Examples](#) in section "GRANT."

[GRANT](#)

## 7.14.149 ROLLBACK

### Function

**ROLLBACK** rolls back the current transaction and backs out all updates in the transaction.

**ROLLBACK** backs out of all changes that a transaction makes to a database if the transaction fails to be executed due to a fault.

### Precautions

If a **ROLLBACK** statement is executed out of a transaction, no error occurs, but a notice is displayed.

### Syntax

```
ROLLBACK [WORK | TRANSACTION];
```

### Parameter Description

#### **WORK | TRANSACTION**

Specifies the optional keyword that more clearly illustrates the syntax.

### Examples

```
-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Roll back all changes.
gaussdb=# ROLLBACK;
```

## Helpful Links

[COMMIT | END](#)

## 7.14.150 ROLLBACK PREPARED

### Function

Cancels a transaction ready for two-phase committing.

### Precautions

- The function is only available in maintenance mode (when the GUC parameter **xc\_maintenance\_mode** is set to **on**). Exercise caution when enabling the mode. It is used by maintenance engineers for troubleshooting. Common users should not use the mode.
- Only the user that initiates a transaction or the system administrator can roll back the transaction.
- The transaction function is maintained automatically by the database, and should be not visible to users.

### Syntax

```
ROLLBACK PREPARED transaction_id ;
```

### Parameter Description

#### **transaction\_id**

Specifies the identifier of the transaction to be committed. The identifier must be different from those for current prepared transactions.

### Helpful Links

[COMMIT PREPARED](#) and [PREPARE TRANSACTION](#)

## 7.14.151 ROLLBACK TO SAVEPOINT

### Function

Rolls back to a savepoint. It implicitly destroys all savepoints that were established after the named savepoint.

Rolls back all statements that were executed after the savepoint was established. The savepoint remains valid and can be rolled back to again later, if needed.

### Precautions

- Specifying a savepoint name that has not been established is an error.
- Cursors have somewhat non-transactional behavior with respect to savepoints. Any cursor that is opened inside a savepoint will be closed when the savepoint is rolled back. If a previously opened cursor is affected by a **FETCH** or **MOVE** statement inside a savepoint that is later rolled back, the cursor remains at the position that **FETCH** left it pointing to (that is, the cursor motion caused by **FETCH** is not rolled back). Closing a cursor is not undone by rolling back, either. A cursor whose execution causes a transaction to abort is put in a cannot-execute state, so while the transaction can be restored using **ROLLBACK TO SAVEPOINT**, the cursor can no longer be used.

- Use `ROLLBACK TO SAVEPOINT` to roll back to a savepoint. Use `RELEASE SAVEPOINT` to destroy a savepoint but keep the effects of the statements executed after the savepoint was established.

## Syntax

```
ROLLBACK [WORK | TRANSACTION] TO [SAVEPOINT] savepoint_name;
```

## Parameters

`savepoint_name`

Rolls back to a savepoint.

## Examples

```
-- Undo the effects of the statements executed after my_savepoint was established:
gaussdb=# START TRANSACTION;
gaussdb=# SAVEPOINT my_savepoint;
gaussdb=# ROLLBACK TO SAVEPOINT my_savepoint;
-- Cursor positions are not affected by savepoint rollback.
gaussdb=# DECLARE foo CURSOR FOR SELECT 1 UNION SELECT 2;
gaussdb=# SAVEPOINT foo;
gaussdb=# FETCH 1 FROM foo;
?column?

1
gaussdb=# ROLLBACK TO SAVEPOINT foo;
gaussdb=# FETCH 1 FROM foo;
?column?

2
gaussdb=# RELEASE SAVEPOINT my_savepoint;
gaussdb=# COMMIT;
```

## 7.14.152 SAVEPOINT

### Function

`SAVEPOINT` establishes a new savepoint in the current transaction.

A savepoint is a special mark inside a transaction. It allows all statements that are executed after it was established to be rolled back, restoring the transaction state to what it was at the time of the savepoint.

### Precautions

- Use `ROLLBACK TO SAVEPOINT` to roll back to a savepoint. Use `RELEASE SAVEPOINT` to destroy a savepoint but keep the effects of the statements executed after the savepoint was established.
- Savepoints can only be established when inside a transaction block. Multiple savepoints can be defined in a transaction.
- In the case of an unexpected termination of a distributed thread or process caused by a node or connection failure, or of an error caused by the

inconsistency between source and destination table structures in a COPY FROM operation, the transaction cannot be rolled back to the established savepoint. Instead, the entire transaction will be rolled back.

- According to the SQL standard, when a savepoint with the same name is created, the previous savepoint with the same name is automatically deleted. In GaussDB, the old savepoint is retained, but only the latest one is used during rollback or release. If the latest savepoint is released, the previous savepoint will again become accessible to ROLLBACK TO SAVEPOINT and RELEASE SAVEPOINT. In addition, SAVEPOINT fully complies with the SQL standard.

## Syntax

```
SAVEPOINT savepoint_name;
```

## Parameters

savepoint\_name

Specifies the name of the new savepoint.

### NOTICE

When using SAVEPOINT, you are advised to release SAVEPOINT promptly to avoid too many nested subtransactions. It is recommended that the number of nested subtransactions be less than or equal to 10,000. If the number of nested subtransactions is too large, the current transaction performance may deteriorate.

## Examples

```
-- Create a table.
gaussdb=# CREATE TABLE table1(a int);

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Insert data.
gaussdb=# INSERT INTO table1 VALUES (1);

-- Create a savepoint.
gaussdb=# SAVEPOINT my_savepoint;

-- Insert data.
gaussdb=# INSERT INTO table1 VALUES (2);

-- Roll back the savepoint.
gaussdb=# ROLLBACK TO SAVEPOINT my_savepoint;

-- Insert data.
gaussdb=# INSERT INTO table1 VALUES (3);

-- Commit the transaction.
gaussdb=# COMMIT;

-- Query the content of the table. You can see 1 and 3 at the same time, but cannot see 2 because 2 is
rolled back.
gaussdb=# SELECT * FROM table1;
```

```
-- Delete the table.
gaussdb=# DROP TABLE table1;

-- Create a table.
gaussdb=# CREATE TABLE table2(a int);

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Insert data.
gaussdb=# INSERT INTO table2 VALUES (3);

-- Create a savepoint.
gaussdb=# SAVEPOINT my_savepoint;

-- Insert data.
gaussdb=# INSERT INTO table2 VALUES (4);

-- Roll back the savepoint.
gaussdb=# RELEASE SAVEPOINT my_savepoint;

-- Commit the transaction.
gaussdb=# COMMIT;

-- Query the table content. You can see 3 and 4 at the same time.
gaussdb=# SELECT * FROM table2;

-- Delete the table.
gaussdb=# DROP TABLE table2;
```

## Helpful Links

## 7.14.153 SELECT

### Description

SELECT retrieves data from tables or views.

Serving as an overlaid filter on database tables, the SELECT statement uses SQL keywords to filter data tables and extract the required data.

### Precautions

- The owner of a table, users granted with the SELECT permission on the table, or users granted with the SELECT ANY TABLE permission can read data in the table or view. The system administrator has the permission to read data in the table or view by default.
- SELECT can join ordinary tables, but cannot join ordinary and GDS foreign tables. That is, the SELECT statement cannot contain both an ordinary table and a GDS foreign table.
- You must have the SELECT permission on each field used in the SELECT statement.
- UPDATE permission is required when FOR UPDATE or FOR SHARE is used.

### Syntax

- Query data.

```
[WITH [RECURSIVE] with_query [, ...]]
SELECT [/*+ plan_hint */] [ALL | DISTINCT [ON (expression [, ...])]]
 { * | {expression [[AS] output_name]} [, ...] }
 [FROM from_item [, ...]]
 [WHERE condition]
 [GROUP BY grouping_element [, ...]]
 [HAVING condition [, ...]]
 [WINDOW {window_name AS (window_definition)} [, ...]]
 [{ UNION | INTERSECT | EXCEPT | MINUS } [ALL | DISTINCT] select]
 [ORDER BY {expression [[ASC | DESC | USING operator] | nlsort_expression_clause } [NULLS { FIRST |
LAST }]} [, ...]]
 [LIMIT { [offset,] count | ALL }]
 [OFFSET start [ROW | ROWS]]
 [FETCH { FIRST | NEXT } [count] { ROW | ROWS } ONLY]
 [{FOR { UPDATE | SHARE } [OF table_name [, ...]] [NOWAIT | WAIT N]} [...]]
TABLE { ONLY { (table_name) | table_name } | table_name [*]};
```

**NOTE**

In condition and expression, you can use the aliases of expressions in **targetlist** in compliance with the following rules:

- Reference only within the same level.
- Reference only the aliases in the target list.
- Reference a prior expression in a subsequent expression.
- Volatile functions cannot be used.
- Window functions cannot be used.
- Aliases cannot be referenced in the condition of JOIN ON.
- An error is reported if the target list contains multiple aliases to be referenced.

**NOTICE**

In the scenario where the SELECT statement plan is cached, the WHERE IN candidate subset cannot be too large. It is recommended that the number of conditions be less than or equal to 100 to prevent high dynamic memory.

- If the WHERE IN candidate subset is too large, the memory usage of the generated plan increases.
- If the WHERE IN subsets constructed by concatenated SQL statements are different, the SQL template of the cache plan cannot be reused. A large number of different plans are generated, and the plans cannot be shared. As a result, a large amount of memory is occupied.

- The subquery **with\_query** is as follows:

```
with_query_name [(column_name [, ...])]
 AS [[NOT] MATERIALIZED] ({select | values | insert | update | delete})
```

- The specified query source **from\_item** is as follows:

```
{[ONLY] table_name [*] [partition_clause] [[AS] alias [(column_alias [, ...])]]
[TABLESAMPLE sampling_method (argument [, ...]) [REPEATABLE (seed)]]
[{select } [AS] alias [(column_alias [, ...])]]
|with_query_name [[AS] alias [(column_alias [, ...])]]
|function_name ([argument [, ...]]) [AS] alias [(column_alias [, ...] | column_definition [, ...])]
|function_name ([argument [, ...]]) AS (column_definition [, ...])
|from_item unpivot_clause
|from_item pivot_clause
|from_item [NATURAL] join_type from_item [ON join_condition | USING (join_column [, ...])]}
```

- The GROUP clause is as follows:

```
()
| expression
```

```
| (expression [, ...])
| ROLLUP ({ expression | (expression [, ...]) } [, ...])
| CUBE ({ expression | (expression [, ...]) } [, ...])
| GROUPING SETS (grouping_element [, ...])
```

- The specified partition **partition\_clause** is as follows:

```
PARTITION { (partition_name) |
FOR (partition_value [, ...]) }
```

#### NOTE

The specified partition applies only to ordinary tables.

- The sorting order **nlsort\_expression\_clause** is as follows:  
NLSSORT ( column\_name, ' NLS\_SORT = { SCHINESE\_PINYIN\_M | generic\_m\_ci } ' )  
The second parameter can be **generic\_m\_ci**, which supports only the case-insensitive order for English characters.
- Simplified query syntax, equivalent to **select \* from table\_name**.  
TABLE { ONLY {(table\_name)| table\_name} | table\_name [ \* ]};

## Parameters

- **WITH [ RECURSIVE ] with\_query [, ...]**

Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table. This subquery statement structure is called the common table expression (CTE) structure. When this structure is used, the execution plan contains the CTE SCAN content.

If **RECURSIVE** is specified, it allows a **SELECT** subquery to reference itself by name.

The detailed format of **with\_query** is as follows: **with\_query\_name**  
[ ( column\_name [, ...] ) ] AS [ [ NOT ] MATERIALIZED ] ( {select | values | insert | update | delete} )

- **with\_query\_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.
- **column\_name** specifies the column name displayed in the subquery result set.
- Each subquery can be a **SELECT**, **VALUES**, **INSERT**, **UPDATE** or **DELETE** statement.
- **RECURSIVE** can appear only after **WITH**. In the case of multiple CTEs, you only need to declare **RECURSIVE** at the first CTE.
- You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE. Currently, only inline execution is supported for stream plans. In this case, this syntax does not take effect.
  - If **MATERIALIZED** is specified, the **WITH** query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the **WITH** subquery cannot be jointly optimized with the **SELECT** statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the **WITH** query can be executed as a subquery inline, the preceding optimization can be performed.
  - If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in

the SELECT statement trunk to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.

- **plan\_hint** clause  
Follows the SELECT keyword in the `/*+<Plan hint> */` format. It is used to optimize the plan of a SELECT statement block. For details, see [Hint-based Tuning](#). In each statement, only the first `/*+ plan_hint */` comment block takes effect as a hint. Multiple hints can be written.
- **ALL**  
Specifies that all rows that meet the conditions are returned. This is the default behavior and can be omitted.
- **DISTINCT [ ON ( expression [, ...] ) ]**  
Removes all duplicate rows from the **SELECT** result set so one row is kept from each group of duplicates.  
Retains only the first row in the set of rows that have the same result calculated on the given expression.

---

**NOTICE**

**DISTINCT ON** expression is explained with the same rule of **ORDER BY**. Unless you use **ORDER BY** to ensure that the required row appears first, you cannot know what the first row is.

- 
- **SELECT list**  
Specifies the name of a column in the table to be queried. The value can be a part of the column name or all of the column names. The wildcard (\*) is used to represent the column name.  
You may use the **AS output\_name** clause to give an alias for an output column. The alias is used for the displaying of the output column. The name, value, and type keywords can be used as column aliases.  
Column names can be expressed in the following formats:
    - Manually input column names which are spaced using commas (,).
    - Columns computed in the **FROM** clause.
  - **FROM clause**  
Specifies one or more source tables for **SELECT**.  
The **FROM** clause can contain the following elements:
    - table\_name  
Specifies the name of a table or view. The schema name can be added before the table name or view name, for example, schema\_name.table\_name.
-  **NOTE**
- You can use database link to perform operations on remote tables and synonyms. For details, see [DATABASE LINK](#).
- alias

Gives a temporary alias to a table to facilitate the quotation by other queries.

An alias is used for brevity or to eliminate ambiguity for self-joins. If an alias is provided, it completely replaces the actual name of the table.

---

**NOTICE**

If an alias is specified for the *joined\_table* table created by JOIN and *joined\_table* is wrapped with "()", that is, (*joined\_table*), non-reserved keywords UNPIVOT and PIVOT cannot be used as aliases.

- 
- TABLESAMPLE *sampling\_method* ( *argument* [, ...] ) [ REPEATABLE ( *seed* ) ]

The **TABLESAMPLE** clause following *table\_name* specifies that the specified *sampling\_method* should be used to retrieve the subset of rows in the table.

The optional **REPEATABLE** clause specifies the number of seeds used to generate random numbers in the sampling method. The seed value can be any non-null constant value. If the table was not changed during the query, the two queries having the same seed and *argument* values will select the same sampling in this table. However, different seed values usually generate different samples. If **REPEATABLE** is not specified, a new random sample will be selected for each query based on the seed generated by the system.

- TIMECAPSULE { TIMESTAMP | CSN } expression

Queries the table data of a specified CSN or at a specified time point.

Currently, the following tables do not support flashback query: system catalogs, DFS tables, global temporary tables, local temporary tables, unlogged tables, views, sequence tables, hash bucket tables, shared tables, and inherited tables.

- TIMECAPSULE TIMESTAMP

Searches for the result set of a specified time point based on the date as the flashback query flag. *date* must be a valid past timestamp

- TIMECAPSULE CSN

Searches for the result set of a specified CSN point based on the CSN flashback of the table as the flashback query flag. The CSN can be obtained from **snpcsn** recorded in **gs\_txn\_snapshot**.

 NOTE

- A flashback query cannot span statements that affect the table structure or physical storage. Otherwise, an error is reported. Between the flashback point and the current point, if a statement (TRUNCATE, DDL, DCL, or VACUUM FULL) has been executed to modify the table structure or affect physical storage, the flashback fails.
  - Flashback query does not support index query. Flashback query supports only seqScan for full table scanning.
  - When the flashback point is too old, the old version cannot be obtained because the flashback version is recycled. As a result, the flashback fails and the error message "Restore point too old" is displayed.
  - The flashback point is specified by time. The maximum difference between the flashback point and the actual time is 3 seconds.
  - After truncating a table, perform a flashback query or flashback on the table. The error message "Snapshot too old" is displayed when a flashback is performed at a specified time point. Data cannot be found or the error message "Snapshot too old" is reported during the CSN-based flashback.
  - In the GTM-Free scenario, each node uses the local CSN and does not have a globally unified CSN. Therefore, flashback in CSN mode is not supported.
- column\_alias  
Specifies the column alias.
  - PARTITION  
Queries data in the specified partition in a partitioned table.
  - partition\_name  
Specifies the name of a partition.
  - partition\_value  
Specifies the value of the specified partition key. If there are many partition keys, use the **PARTITION FOR** clause to specify the value of the only partition key you want to use.
  - subquery  
Performs a subquery in the **FROM** clause. A temporary table is created to save subquery results.
  - with\_query\_name  
Specifies that the **WITH** clause can also be used as the source of the **FROM** clause and can be referenced by the name of the **WITH** query.
  - function\_name  
Function name. Function calls can appear in the **FROM** clause.
  - join\_type  
The options are as follows:
    - [ INNER ] JOIN  
A **JOIN** clause combines two **FROM** items. You can use parentheses to determine the order of nesting. In the absence of parentheses, **JOIN** nests left-to-right.  
  
In any case, **JOIN** binds more tightly than the commas separating **FROM** items.

- **LEFT [ OUTER ] JOIN**  
Returns all rows that meet join conditions in the Cartesian product, plus those rows that do not match the right table rows in the left table by join conditions. This left-hand row is extended to the full width of the joined table by inserting **NULL** values for the right-hand columns. Note that only the **JOIN** clause's own condition is considered while the system decides which rows have matches. Outer conditions are applied afterward.
- **RIGHT [ OUTER ] JOIN**  
Returns all the joined rows, plus one row for each unmatched right-hand row (extended with **NULL** on the left).  
This is just a notational convenience, since you could convert it to a **LEFT OUTER JOIN** by switching the left and right inputs.
- **FULL [ OUTER ] JOIN**  
Returns all the joined rows, pluses one row for each unmatched left-hand row (extended with **NULL** on the right), and pluses one row for each unmatched right-hand row (extended with **NULL** on the left).
- **CROSS JOIN**  
Is equivalent to **INNER JOIN ON (TRUE)**, which means no rows are removed by qualification. These join types are just a notational convenience, since they do nothing you could not do with plain **FROM** and **WHERE**.

 **NOTE**

For the **INNER** and **OUTER** join types, a join condition must be specified, namely exactly one of **NATURAL ON**, **join\_condition**, or **USING (join\_column [, ...])**. For **CROSS JOIN**, none of these clauses can appear.

**CROSS JOIN** and **INNER JOIN** produce a simple Cartesian product, the same result as you get from listing the two items at the top level of **FROM**.

- **ON join\_condition**  
Defines which rows have matches in joins. Example: **ON left\_table.a = right\_table.a** You are advised not to use numeric types such as **int** for **join\_condition**, because such types can be implicitly converted to **bool** values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.
- **USING(join\_column[, ...])**  
**ON left\_table.a = right\_table.a AND left\_table.b = right\_table.b ...** abbreviation. Corresponding columns must have the same name.
- **NATURAL**  
Is a shorthand for a **USING** list that mentions all columns in the two tables that have the same names.
- **from item**  
Specifies the name of the query source object connected.
- **unpivot\_clause**  
Converts a column to a row. The syntax format is as follows:

```
UNPIVOT [{INCLUDE | EXCLUDE} NULLS]
(
 unpivot_col_clause
 unpivot_for_clause
 unpivot_in_clause
)
```

- **{INCLUDE | EXCLUDE} NULLS**  
Controls whether the converted result contains NULL rows. **INCLUDE NULLS** indicates that the converted results contain NULL rows. **EXCLUDE NULLS** indicates that the converted results do not contain NULL rows. If this clause is ignored, the unpivot operation removes NULL rows from the converted results by default.
- **unpivot\_col\_clause**  
unpivot\_col\_element  
**unpivot\_col\_element** specifies the output column names. These columns store the values to be converted.
- **unpivot\_col\_element**  
{ column | ( column [, column]... ) }  
unpivot\_col\_element has two forms: column and ( column [, column]... ).
- **unpivot\_for\_clause**  
FOR { unpivot\_col\_element }  
**unpivot\_col\_element** contained in the **unpivot\_for\_clause** is used to specify the output column names. These columns store the alias and names of the column to be converted.
- **unpivot\_in\_clause**  
IN ( unpivot\_in\_element [,unpivot\_in\_element...] )  
**unpivot\_in\_clause** specifies the columns to be converted. The column names and column values are saved in the previously specified output columns.  
unpivot\_in\_element  
{ unpivot\_col\_element }[ AS { unpivot\_alias\_element } ]  
**unpivot\_col\_element** specifies the column to be converted. If ( column [, column]...) is used to specify the column to be converted, the *column* names are connected by underscores ( \_ ) and saved in the output columns. For example, IN ((col1, col2)) generates the column name **col1\_col2** and saves it in the output column specified by **unpivot\_for\_clause**. In addition, the AS keyword can be used to specify an alias for the column to be converted. Once an alias is specified, the alias is saved in the output column instead of the name of column to be converted.
- **unpivot\_alias\_element**  
{ alias | ( alias [, alias]... ) }  
Similar to **unpivot\_col\_element**, **unpivot\_alias\_element** has two forms. **alias** indicates the specified alias.

**NOTICE**

Currently, **unpivot\_clause** has the following restrictions:

- This parameter can be used only in ORA compatibility mode.
- The **unpivot\_clause** clause cannot be used with hints.
- For **unpivot\_col\_clause**, the number of output columns specified by **unpivot\_col\_element** must be the same as that of **unpivot\_col\_element** contained in **unpivot\_in\_clause**.
- For **unpivot\_for\_clause**, the number of output columns specified by **unpivot\_col\_element** must be the same as the number of aliases specified by **unpivot\_alias\_element** contained in **unpivot\_in\_clause**.
- For **unpivot\_in\_clause**, the alias must be a constant or an expression that can be converted to a constant.
- For **unpivot\_in\_clause**, constant expressions support only IMMUTABLE functions.
- For all **unpivot\_col\_element** parameters contained in **unpivot\_in\_clause**, if the column types in the same position of these **unpivot\_col\_element** parameters are different, UNPIVOT attempts to convert the column types in order to convert the values of columns to be converted to a public type. Similarly, for all **unpivot\_alias\_element** parameters, if the alias types of these **unpivot\_alias\_element** parameters in the same position are different, UNPIVOT attempts to do the similar type conversion.

For example, assume that there is an **unpivot\_in\_clause** in the form of IN (col1, col2), where col1 is of the int type and col2 is of the float type, UNPIVOT attempts to convert the column value of col1 to the public type float during the calculation.

– **pivot\_clause**

Converts a row into column. The syntax format is as follows:

```
PIVOT [XML]
(aggregate_function (expr) [[AS] alias]
 [, aggregate_function (expr) [[AS] alias]]...
 pivot_for_clause
 pivot_in_clause
)
```

- **aggregate\_function ( expr ) [[AS] alias ]**  
Aggregates calculation on a given expression. The calculation result is saved in the output column specified by **pivot\_in\_clause**. [AS] alias (The AS keyword can be omitted.) can be used to specify an alias for **aggregate\_function**. The alias is appended to the output column name specified by **pivot\_in\_clause** in the format of "\_alias".
  - **pivot\_for\_clause**  
FOR { column  
| ( column [, column]... )  
}
- Specifies the row to be converted. The **column** indicates a column of the row to be converted.

- **pivot\_in\_clause**

```
IN ({ { { expr
 | (expr [, expr]...)
 } [[AS] alias]
 }...
 }
)
```

Specifies the name of the output column. The column name can consist of one or more expressions, for example, (expr1, expr2). When a column name consists of multiple expressions, these expressions are connected by underscores (\_) in sequence. That is, the output column name corresponding to (expr1, expr2) is "expr1\_expr2". These expressions not only generate output column names, but also determine the time when the aggregation function is triggered. If the values of row to be converted is the same as the value of these expressions, the results calculated by **aggregate\_function** are saved in the output column names that consist of these expressions. Assume that expr1 is "1" and expr2 is "2". For row "1 2", **aggregate\_function** is used for calculation. For row "1 1", the calculation is not triggered.

---

**NOTICE**

Currently, **pivot\_clause** has the following restrictions:

- This parameter can be used only in ORA compatibility mode.
- The **pivot\_clause** clause cannot be used with hints.
- If more than one **aggregate\_function** is specified, at most one **aggregate\_function** is allowed to have no alias, the rest of the **aggregate\_function** functions are required to specify an alias.
- XML supports only syntax but does not support functions.
- The expression in **pivot\_in\_clause** can be a constant or an expression that can be converted to a constant. If the expression is not a unary expression, specify an alias for the expression.
- For **pivot\_in\_clause**, constant expressions support only IMMUTABLE functions.
- For the expression in **pivot\_in\_clause**, when the keyword AS is used to specify an alias for the expression, only the non-reserved keywords can be used as aliases.
- If the length of an output column name exceeds 63 characters, subsequent characters will not be printed.

---

- **WHERE clause**

Forms an expression for row selection to narrow down the query range of **SELECT**. **condition** indicates any expression that returns a value of Boolean type. Rows that do not meet this condition will not be retrieved. You are advised not to use numeric types such as int for **condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

In the **WHERE** clause, you can use the operator (+) to convert a table join to an outer join. However, this method is not recommended because it is not the standard SQL syntax and may raise syntax compatibility issues during platform migration. There are many restrictions on using the operator (+):

- a. It can appear only in the **WHERE** clause.
- b. If a table join has been specified in the **FROM** clause, the operator (+) cannot be used in the **WHERE** clause.
- c. The operator (+) can work only on columns of tables or views, instead of on expressions.
- d. If table A and table B have multiple join conditions, the operator (+) must be specified in all the conditions. Otherwise, the operator (+) will not take effect, and the table join will be converted into an inner join without any prompt information.
- e. Tables specified in a join condition where the operator (+) works cannot cross queries or subqueries. If tables where the operator (+) works are not in the **FROM** clause of the current query or subquery, an error will be reported. If a peer table for the operator (+) does not exist, no error will be reported and the table join will be converted into an inner join.
- f. Expressions where the operator (+) is used cannot be directly connected through **OR**.
- g. If a column where the operator (+) works is compared with a constant, the expression becomes a part of the join condition.
- h. A table cannot have multiple foreign tables.
- i. The operator (+) can appear only in the following expressions: comparison, NOT, ANY, ALL, IN, NULLIF, IS DISTINCT FROM, and IS OF. It is not allowed in other types of expressions. In addition, these expressions cannot be connected through **AND** or **OR**.
- j. The operator (+) can be used to convert a table join only to a left or right outer join, instead of a full join. That is, the operator (+) cannot be specified on both tables of an expression.

---

**NOTICE**

For the **WHERE** clause, if special character %, \_, or \ is queried in **LIKE**, add the slash \ before each character.

---

**● GROUP BY clause**

Condenses query results into a single row all selected rows that share the same values for the grouped expressions.

- CUBE ( { expression | ( expression [, ...] ) } [, ...] )

A CUBE grouping is an extension to the **GROUP BY** clause that creates subtotals for all of the possible combinations of the given list of grouping columns (or expressions). In terms of multidimensional analysis, CUBE generates all the subtotals that could be calculated for a data cube with the specified dimensions. For example, given three expressions ( $n=3$ ) in the CUBE clause, the operation results in  $2^n = 2^3 = 8$  groupings. Rows grouped on the values of  $n$  expressions are called regular rows, and the rest are called superaggregate rows.

- **GROUPING SETS** ( grouping\_element [, ...] )  
Another extension to the **GROUP BY** clause. It allows users to specify multiple **GROUP BY** clauses. This improves efficiency by trimming away unnecessary data. After you specify the set of groups that you want to create using a **GROUPING SETS** expression within a **GROUP BY** clause, the database does not need to compute a whole **ROLLUP** or **CUBE**.

---

#### NOTICE

- If a **SELECT** list expression references ungrouped columns and no aggregate function is used, an error is reported. This is because multiple values may be returned for ungrouped columns.
- If a **SELECT** list expression references a constant, the **GROUP BY** clause does not need to group the constant. Otherwise, an error is reported.

---

- **HAVING clause**

Selects special groups by working with the **GROUP BY** clause. The **HAVING** clause compares some attributes of groups with a constant. Only groups that matching the logical expression in the **HAVING** clause are extracted.

- **WINDOW clause**

The general format is **WINDOW window\_name AS ( window\_definition )** [, ...]. **window\_name** is a name can be referenced by **window\_definition**. **window\_definition** can be expressed in the following forms:

[ existing\_window\_name ]

[ PARTITION BY expression [, ...] ]

[ ORDER BY expression [ ASC | DESC | USING operator ] [ NULLS { FIRST | LAST } ] [, ...] ]

[ frame\_clause ]

**frame\_clause** defines a **window frame** for the window function. The window function (not all window functions) depends on **window frame** and **window frame** is a set of relevant rows of the current query row. **frame\_clause** can be expressed in the following forms:

[ RANGE | ROWS ] frame\_start

[ RANGE | ROWS ] BETWEEN frame\_start AND frame\_end

**frame\_start** and **frame\_end** can be expressed in the following forms:

UNBOUNDED PRECEDING

value PRECEDING

CURRENT ROW

value FOLLOWING

UNBOUNDED FOLLOWING

- **UNION clause**

Computes the set union of the rows returned by the involved **SELECT** statements.

The **UNION** clause has the following constraints:

- By default, the result of **UNION** does not contain any duplicate rows unless the **ALL** clause is declared.

- Multiple **UNION** operators in the same **SELECT** statement are evaluated left to right, unless otherwise specified by parentheses.
- **FOR UPDATE** cannot be specified either for a **UNION** result or for any input of a **UNION**.

General expression:

select\_statement UNION [ALL] select\_statement

- **select\_statement** can be any **SELECT** statement without an **ORDER BY**, **LIMIT**, or **FOR UPDATE** statement.
- **ORDER BY** and **LIMIT** can be attached to the subexpression if it is enclosed in parentheses.

- **INTERSECT clause**

Computes the set intersection of rows returned by the involved **SELECT** statements. The result of **INTERSECT** does not contain any duplicate rows.

The **INTERSECT** clause has the following constraints:

- Multiple **INTERSECT** operators in the same **SELECT** statement are evaluated left to right, unless otherwise specified by parentheses.
- Processing **INTERSECT** preferentially when **UNION** and **INTERSECT** operations are executed for results of multiple **SELECT** statements.

General format:

select\_statement INTERSECT select\_statement

**select\_statement** can be any **SELECT** statement without a **FOR UPDATE** clause.

- **EXCEPT clause**

Has the following common form:

select\_statement EXCEPT [ ALL ] select\_statement

**select\_statement** can be any **SELECT** statement without a **FOR UPDATE** clause.

The **EXCEPT** operator computes the set of rows that are in the result of the left **SELECT** statement but not in the result of the right one.

The result of **EXCEPT** does not contain any duplicate rows unless the **ALL** clause is declared. To execute **ALL**, a row that has  $m$  duplicates in the left table and  $n$  duplicates in the right table will appear  $\text{MAX}(m-n, 0)$  times in the result set.

Multiple **EXCEPT** operators in the same **SELECT** statement are evaluated left to right, unless parentheses dictate otherwise. **EXCEPT** binds at the same level as **UNION**.

Currently, **FOR UPDATE** cannot be specified either for an **EXCEPT** result or for any input of an **EXCEPT**.

- **MINUS clause**

Has the same function and syntax as **EXCEPT** clause.

- **ORDER BY clause**

Sorts data retrieved by **SELECT** in descending or ascending order. If the **ORDER BY** expression contains multiple columns:

- If two columns are equal according to the leftmost expression, they are compared according to the next expression and so on.

- If they are equal according to all specified expressions, they are returned in an implementation-dependent order.
- When used with the **DISTINCT** keyword, the columns to be sorted in **ORDER BY** must be included in the columns of the result set retrieved by the **SELECT** statement.
- When used with the **GROUP BY** clause, the columns to be sorted in **ORDER BY** must be included in the columns of the result set retrieved by the **SELECT** statement.

---

**NOTICE**

To support Chinese pinyin order, set the encoding format to **UTF-8**, **GB18030**, **GB18030\_2022**, or **GBK** when initializing the database. The statements are as follows:

```
initdb -E UTF8 -D ../data -locale=zh_CN.UTF-8, initdb -E GB18030 -D ../data -locale=zh_CN.GB18030, initdb -E GB18030_2022 -D ../data -locale=zh_CN.GB18030, or initdb -E GBK -D ../data -locale=zh_CN.GBK.
```

---

- **LIMIT clause**

Consists of two independent sub-clauses:

```
LIMIT { count | ALL }
```

**OFFSET start count** specifies the maximum number of rows to return, while **start** specifies the number of rows to skip before starting to return rows. When both are specified, **start** rows are skipped before starting to count the **count** rows to be returned.

ROWNUM cannot be used as count or offset in the **LIMIT** clause.

- **OFFSET clause**

The SQL: 2008 standard has introduced a different clause:

```
OFFSET start { ROW | ROWS }
```

**start** specifies the number of rows to skip before starting to return rows.

- **FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY**

If **count** is omitted in a **FETCH** clause, it defaults to 1.

- **FOR UPDATE clause**

The **FOR UPDATE** clause locks the rows retrieved by **SELECT**. This ensures that the rows cannot be modified or deleted by other transactions until the current transaction ends. That is, other transactions that attempt **UPDATE**, **DELETE**, or **SELECT FOR UPDATE** of these rows will be blocked until the current transaction ends.

To prevent the operation from waiting for the commit of other transactions, you can use **NOWAIT**. If the selected row cannot be locked immediately, an error is reported immediately when you execute **SELECT FOR UPDATE NOWAIT**. If you use **WAIT N** and the selected row cannot be locked immediately, the operation needs to wait for *N* seconds (the value of *N* is of the int type with a range of  $0 \leq N \leq 2147483$ ). If the lock is obtained within *N* seconds, the operation is performed normally. Otherwise, an error is reported.

**FOR SHARE** behaves similarly, except that it acquires a shared rather than exclusive lock on each retrieved row. A share lock blocks other transaction

from performing **UPDATE**, **DELETE**, or **SELECT FOR UPDATE** on these rows, but it does not prevent them from performing **SELECT FOR SHARE**.

If specified tables are named in **FOR UPDATE** or **FOR SHARE**, then only rows coming from those tables are locked. Any other tables used in **SELECT** are simply read as usual. Otherwise, locking all tables in the statement.

If **FOR UPDATE** or **FOR SHARE** is applied to a view or sub-query, it affects all tables used in the view or sub-query.

Multiple **FOR UPDATE** and **FOR SHARE** clauses can be written if it is necessary to specify different locking behaviors for different tables.

If the same table is mentioned (or implicitly affected) by both **FOR UPDATE** and **FOR SHARE** clauses, it is processed as **FOR UPDATE**. Similarly, a table is processed as **NOWAIT** if that is specified in any of the clauses affecting it.

---

#### NOTICE

- For SQL statements containing **FOR UPDATE** or **FOR SHARE**, their execution plans will be pushed down to DNs. If the pushdown fails, an error will be reported.
- The query of row number contained in the projection column or WHERE conditions does not support **for update/share**.
- For the **FOR UPDATE/SHARE** statements whose subquery is a stream plan, the same locked row cannot be concurrently updated.
- For the **ORDER BY FOR UPDATE/SHARE** statement, the execution sequence of the **SORT** and **LOCKROW** operators in the stream plan is different from that in other plans. In the stream plan, **LOCK** is executed before **SORT**. In other plans, **SORT** is executed before **LOCK**. The reason is that if the data in the stream plan is not on the current DN, the data needs to be redistributed and locked on the original DN. After redistribution, data becomes disordered. Therefore, the **SORT** operator needs to be added. If **SORT** is performed before **LOCK**, the original ordered data becomes disordered again. In this case, the **SORT** operator is meaningless and can be eliminated. The final plan execution sequence is changed from **sort > lock > sort** to **lock > sort**.
- In scenarios where **FOR UPDATE/SHARE** statements are concurrently executed, **ORDER BY** is used to sort data to avoid deadlocks. This method is not feasible for distributed systems because the DN lock sequence cannot be ensured by **ORDER BY**. In addition, adding **ORDER BY** causes performance overhead. Therefore, you are advised not to add **ORDER BY** to solve the deadlock problem.

---

- **NLS\_SORT**

Specifies that a field is sorted in a special order. Currently, only Chinese Pinyin and case-insensitive sorting are supported. To support this sorting mode, you need to set the encoding format to **UTF8**, **GB18030**, **GB18030\_2022**, or **GBK** when creating a database. If you set the encoding format to another format, for example, **SQL\_ASCII**, an error may be reported or the sorting mode may be invalid.

Value range:

- **SCHINESE\_PINYIN\_M**, sorted by Pinyin order.
- **generic\_m\_ci**: sorted in case-insensitive order (optional; only English characters are supported in the case-insensitive order.)
- **PARTITION clause**  
Queries data in the specified partition in a partitioned table.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.reason values(3,'AAAAAAAABAAAAAAA','reason 1'),
(10,'AAAAAAAABAAAAAAA','reason 2'),(4,'AAAAAAAABAAAAAAA','reason 3'),
(10,'AAAAAAAABAAAAAAA','reason 4'),(10,'AAAAAAAABAAAAAAA','reason 5'),
(20,'AAAAAAAACAAAAAAA','N%reason 6'),(30,'AAAAAAAACAAAAAAA','W%reason 7');

-- Obtain the temp_t temporary table by a subquery and query all records in this table.
gaussdb=# WITH temp_t(name,isdba) AS (SELECT username,usesuper FROM pg_user) SELECT * FROM
temp_t;

-- Query all r_reason_sk records in the tpcds.reason table and delete duplicate records:
gaussdb=# SELECT DISTINCT(r_reason_sk) FROM tpcds.reason;

-- Example of a LIMIT clause: Obtain a record from the table.
gaussdb=# SELECT * FROM tpcds.reason LIMIT 1;

-- Query all records and sort them in alphabetic order.
gaussdb=# SELECT r_reason_desc FROM tpcds.reason ORDER BY r_reason_desc;

-- Use table aliases to obtain data from the pg_user and pg_user_status tables:
gaussdb=# SELECT a.username,b.locktime FROM pg_user a,pg_user_status b WHERE a.usesysid=b.roloid;

-- Example of the FULL JOIN clause: Join data in the pg_user and pg_user_status tables.
gaussdb=# SELECT a.username,b.locktime,a.usesuper FROM pg_user a FULL JOIN pg_user_status b on
a.usesysid=b.roloid;

-- Example of the GROUP BY clause: Filter data based on query conditions, and group the results.
gaussdb=# SELECT r_reason_id, AVG(r_reason_sk) FROM tpcds.reason GROUP BY r_reason_id HAVING
AVG(r_reason_sk) > 25;

-- Example of the GROUP BY CUBE clause: Filter data based on query conditions, and group the results.
gaussdb=# SELECT r_reason_id,AVG(r_reason_sk) FROM tpcds.reason GROUP BY
CUBE(r_reason_id,r_reason_sk);

-- Example of the GROUP BY GROUPING SETS clause: Filter data based on query conditions, and group the
results.
gaussdb=# SELECT r_reason_id,AVG(r_reason_sk) FROM tpcds.reason GROUP BY GROUPING
SETS((r_reason_id,r_reason_sk),r_reason_sk);

-- Example of the UNION clause: Merge the names started with W and N in the r_reason_desc column in
the tpcds.reason table.
gaussdb=# SELECT r_reason_sk, tpcds.reason.r_reason_desc
FROM tpcds.reason
WHERE tpcds.reason.r_reason_desc LIKE 'W%'
UNION
SELECT r_reason_sk, tpcds.reason.r_reason_desc
FROM tpcds.reason
WHERE tpcds.reason.r_reason_desc LIKE 'N%';
```

```
-- Example of the NLS_SORT clause: Sort by Chinese Pinyin.
gaussdb=# SELECT * FROM tpcds.reason ORDER BY NLSSORT(r_reason_desc, 'NLS_SORT =
SCHINESE_PINYIN_M');

-- sorting by case-insensitive order (optional; only English characters are supported in the case-insensitive
order.)
gaussdb=# SELECT * FROM tpcds.reason ORDER BY NLSSORT(r_reason_desc, 'NLS_SORT = generic_m_ci');

-- Create a partitioned table tpcds.reason_p:
gaussdb=# CREATE TABLE tpcds.reason_p
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
)
PARTITION BY RANGE (r_reason_sk)
(
 partition P_05_BEFORE values less than (05),
 partition P_15 values less than (15),
 partition P_25 values less than (25),
 partition P_35 values less than (35),
 partition P_45_AFTER values less than (MAXVALUE)
)
;

-- Insert data.
gaussdb=# INSERT INTO tpcds.reason_p values(3,'AAAAAAAAABAAAAAAAA','reason 1'),
(10,'AAAAAAAAABAAAAAAAA','reason 2'),(4,'AAAAAAAAABAAAAAAAA','reason 3'),
(10,'AAAAAAAAABAAAAAAAA','reason 4'),(10,'AAAAAAAAABAAAAAAAA','reason 5'),
(20,'AAAAAAAAACAAAAAAAA','reason 6'),(30,'AAAAAAAAACAAAAAAAA','reason 7');

-- Example of the PARTITION clause: Obtain data from the P_05_BEFORE partition in the tpcds.reason_p
table.
gaussdb=# SELECT * FROM tpcds.reason_p PARTITION (P_05_BEFORE);
 r_reason_sk | r_reason_id | r_reason_desc
-----+-----+-----
 3 | AAAAAAAAAABAAAAAAAA | reason 1
 4 | AAAAAAAAAABAAAAAAAA | reason 3
(2 rows)

-- Example of the GROUP BY clause: Group records in the tpcds.reason_p table by r_reason_id, and count
the number of records in each group.
gaussdb=# SELECT COUNT(*),r_reason_id FROM tpcds.reason_p GROUP BY r_reason_id;
 count | r_reason_id
-----+-----
 2 | AAAAAAAAAACAAAAAAAA
 5 | AAAAAAAAAABAAAAAAAA
(2 rows)

-- Example of the GROUP BY CUBE clause: Filter data based on query conditions, and group the results.
gaussdb=# SELECT * FROM tpcds.reason GROUP BY CUBE (r_reason_id,r_reason_sk,r_reason_desc);

-- Example of the GROUP BY GROUPING SETS clause: Filter data based on query conditions, and group the
results.
gaussdb=# SELECT * FROM tpcds.reason GROUP BY GROUPING SETS
((r_reason_id,r_reason_sk),r_reason_desc);

-- Example of the HAVING clause: Group records in the tpcds.reason_p table by r_reason_id, count the
number of records in each group, and display only values whose number of r_reason_id is greater than 2.
gaussdb=# SELECT COUNT(*) c,r_reason_id FROM tpcds.reason_p GROUP BY r_reason_id HAVING c>2;
 c | r_reason_id
---+-----
 5 | AAAAAAAAAABAAAAAAAA
(1 row)

-- Example of the IN clause: Group records in the tpcds.reason_p table by r_reason_id, count the number
of records in each group, and display only the numbers of records whose r_reason_id is
AAAAAAAAABAAAAAAAA or AAAAAAAAADAAAAAAAA.
```

```

gaussdb=# SELECT COUNT(*),r_reason_id FROM tpcds.reason_p GROUP BY r_reason_id HAVING r_reason_id
IN('AAAAAAAABAAAAAAAA','AAAAAAAAADAAAAAAAA');
count | r_reason_id
-----+-----
 5 | AAAAAAAAABAAAAAAAA
(1 row)

-- Example of the INTERSECT clause: Query records whose r_reason_id is AAAAAAAABAAAAAAAA and
whose r_reason_sk is smaller than 5.
gaussdb=# SELECT * FROM tpcds.reason_p WHERE r_reason_id='AAAAAAAABAAAAAAAA' INTERSECT SELECT
* FROM tpcds.reason_p WHERE r_reason_sk<5;
r_reason_sk | r_reason_id | r_reason_desc
-----+-----+-----
 4 | AAAAAAAAABAAAAAAAA | reason 3
 3 | AAAAAAAAABAAAAAAAA | reason 1
(2 rows)

-- Example of the EXCEPT clause: Query records whose r_reason_id is AAAAAAAABAAAAAAAA and whose
r_reason_sk is greater than or equal to 4.
gaussdb=# SELECT * FROM tpcds.reason_p WHERE r_reason_id='AAAAAAAABAAAAAAAA' EXCEPT SELECT *
FROM tpcds.reason_p WHERE r_reason_sk<4;
r_reason_sk | r_reason_id | r_reason_desc
-----+-----+-----
 10 | AAAAAAAAABAAAAAAAA | reason 5
 10 | AAAAAAAAABAAAAAAAA | reason 4
 4 | AAAAAAAAABAAAAAAAA | reason 3
 10 | AAAAAAAAABAAAAAAAA | reason 2
(4 rows)

-- Specify the operator (+) in the WHERE clause to indicate a left join.
gaussdb=# select t1.sr_item_sk ,t2.c_customer_id from store_returns t1, customer t2 where

## 7.14.154 SELECT INTO

### Function

Defines a new table based on a query result and inserts data obtained by query to the new table.

Different from SELECT, data is not returned to the client. The table columns have the same names and data types as the output columns of SELECT.

### Precautions

CREATE TABLE AS provides functions similar to SELECT INTO in functions and provides a superset of functions provided by SELECT INTO. You are advised to use CREATE TABLE AS, because SELECT INTO cannot be used in a stored procedure.

### Syntax

```
[WITH [RECURSIVE] with_query [, ...]]
SELECT [ALL | DISTINCT [ON (expression [, ...])]]
 { * | {expression [[AS] output_name]} [, ...] }
INTO [UNLOGGED] [TABLE] new_table
 [FROM from_item [, ...]]
 [WHERE condition]
 [GROUP BY expression [, ...]]
 [HAVING condition [, ...]]
 [WINDOW {window_name AS (window_definition)} [, ...]]
 [{ UNION | INTERSECT | EXCEPT | MINUS } [ALL | DISTINCT] select]
 [ORDER BY {expression [[ASC | DESC | USING operator] | nlssort_expression_clause] [NULLS { FIRST |
LAST }]} [, ...]]
 [LIMIT { count | ALL }]
 [OFFSET start [ROW | ROWS]]
 [FETCH { FIRST | NEXT } [count] { ROW | ROWS } ONLY]
 [{FOR { UPDATE | SHARE } [OF table_name [, ...]] [NOWAIT | WAIT N]} [...]];
```

### Parameters

- **new\_table**  
Specifies the name of the new table.
- **UNLOGGED**  
Specifies that the table is created as an unlogged table. Data written to unlogged tables is not written to the WALs, which makes them considerably faster than ordinary tables. However, an unlogged table is automatically truncated after a crash or unclean shutdown. The contents of an unlogged table are also not replicated to standby servers. Any indexes created on an unlogged table are automatically unlogged as well.
  - Usage scenario: Unlogged tables do not ensure data security. Users can back up data before using unlogged tables; for example, users should back up the data before a system upgrade.

- Troubleshooting: If data is missing in the indexes of unlogged tables due to some unexpected operations such as an unclean shutdown, users should rebuild the indexes with errors.

**NOTE**

For details about other SELECT INTO parameters, see [Parameters](#) in "SELECT."

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.reason values(1,'AAAAAAAAABAAAAAAA','reason 1'),
(2,'AAAAAAAAABAAAAAAA','reason 2'),(3,'AAAAAAAAABAAAAAAA','reason 3'),
(4,'AAAAAAAAABAAAAAAA','reason 4'),(4,'AAAAAAAAABAAAAAAA','reason 5'),
(4,'AAAAAAAACAAAAAAA','reason 6'),(5,'AAAAAAAACAAAAAAA','reason 7');

-- Add the values that are less than 5 in the r_reason_sk column in the tpcds.reason table to the new table.
gaussdb=# SELECT * INTO tpcds.reason_t1 FROM tpcds.reason WHERE r_reason_sk < 5;
INSERT 0 6

-- Delete the table.
gaussdb=# DROP TABLE tpcds.reason_t1, tpcds.reason;

-- Delete the schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## Helpful Links

[SELECT](#)

## Suggestions

- **DATABASE**  
You are advised not to reindex a database in a transaction.
- **SYSTEM**  
You are advised not to reindex system catalogs in transactions.

## 7.14.155 SET

### Function

Modifies a run-time parameter.

### Precautions

Most run-time parameters can be modified by executing **SET**. Some parameters cannot be modified after a server or session starts.

## Syntax

- Set the system time zone.  
`SET [ SESSION | LOCAL ] TIME ZONE { timezone | LOCAL | DEFAULT };`
- Set the schema of the table.  
`SET [ SESSION | LOCAL ]  
{CURRENT_SCHEMA { TO | = } { schema | DEFAULT }  
| SCHEMA 'schema'};`
- Set client encoding.  
`SET [ SESSION | LOCAL ] NAMES encoding_name;`
- Set XML parsing mode.  
`SET [ SESSION | LOCAL ] XML OPTION { DOCUMENT | CONTENT };`
- Set other running parameters.  
`SET [ LOCAL | SESSION ]  
{ {config_parameter { { TO | = } { value | DEFAULT }  
| FROM CURRENT }}}`

## Parameter Description

- **SESSION**  
Specifies that the specified parameters take effect for the current session. This is the default value if neither **SESSION** nor **LOCAL** appears.  
If **SET** or **SET SESSION** is executed within a transaction that is later aborted, the effects of the **SET** statement disappear when the transaction is rolled back. Once the surrounding transaction is committed, the effects will persist until the end of the session, unless overridden by another **SET**.
- **LOCAL**  
Specifies that the specified parameters take effect for the current transaction. After **COMMIT** or **ROLLBACK**, the session-level setting takes effect again.  
The effects of **SET LOCAL** last only till the end of the current transaction, whether committed or not. A special case is **SET** followed by **SET LOCAL** within a single transaction: the **SET LOCAL** value will be seen until the end of the transaction, but afterward (if the transaction is committed) the **SET** value will take effect.
- **TIME ZONE timezone**  
Specifies the local time zone for the current session.  
Value range: a valid local time zone. The corresponding run-time parameter is **TimeZone**. The default value is **PRC**.
- **CURRENT\_SCHEMA schema**  
Specifies the current schema.  
Value range: an existing schema name
- **SCHEMA schema**  
Specifies the current schema. Here the schema is a string.  
Example: set schema 'public';
- **NAMES encoding\_name**  
Specifies the client character encoding. This statement is equivalent to **set client\_encoding to encoding\_name**.

Value range: a valid character encoding name. The run-time parameter corresponding to this option is **client\_encoding**. The default encoding is **UTF8**.

- **XML OPTION option**

Specifies the XML parsing mode.

Value range: **CONTENT** (default), **DOCUMENT**

- **config\_parameter**

Specifies the name of a configurable run-time parameter. You can use **SHOW ALL** to view available run-time parameters.

 **NOTE**

Some parameters that viewed by **SHOW ALL** cannot be set by **SET**. For example, **max\_datanodes**.

- **value**

Specifies the new value of **config\_parameter**. This parameter can be specified as string constants, identifiers, numbers, or comma-separated lists of these.

**DEFAULT** can be written to indicate resetting the parameter to its default value.

## Examples

```
-- Set the search path of a schema.
gaussdb=# SET search_path TO tpcds, public;

-- Set the date style to the traditional POSTGRES style (date placed before month):
gaussdb=# SET datestyle TO postgres;
```

## 7.14.156 SET CONSTRAINTS

### Function

Sets the behavior of constraint checking within the current transaction.

**IMMEDIATE** constraints are checked at the end of each statement. **DEFERRED** constraints are not checked until transaction commit. Each constraint has its own **IMMEDIATE** or **DEFERRED** mode.

Upon creation, a constraint is given one of three characteristics **DEFERRABLE INITIALLY DEFERRED**, **DEFERRABLE INITIALLY IMMEDIATE**, or **NOT DEFERRABLE**. The third class is always **IMMEDIATE** and is not affected by the **SET CONSTRAINTS** statement. The first two classes start every transaction in specified modes, but its behaviors can be changed within a transaction by **SET CONSTRAINTS**.

**SET CONSTRAINTS** with a list of constraint names changes the mode of just those constraints (which must all be deferrable). If multiple constraints match a name, the name is affected by all of these constraints. **SET CONSTRAINTS ALL** changes the modes of all deferrable constraints.

When **SET CONSTRAINTS** changes the mode of a constraint from **DEFERRED** to **IMMEDIATE**, any data that is modified at the end of the transaction is checked during the execution of the **SET CONSTRAINTS** statement. If any such constraint is violated, the **SET CONSTRAINTS** fails (and does not change the constraint mode). Therefore, **SET CONSTRAINTS** can be used to force checking of constraints to occur at a specific point in a transaction. Check and unique constraints are always checked immediately when a row is inserted or modified.

## Precautions

**SET CONSTRAINTS** sets the behavior of constraint checking only within the current transaction. Therefore, if you execute this statement outside of a transaction block (**START TRANSACTION/COMMIT** pair), it will not appear to have any effect.

## Syntax

```
SET CONSTRAINTS { ALL | { name } [, ...] } { DEFERRED | IMMEDIATE };
```

## Parameter Description

- **name**  
Specifies the constraint name.  
Value range: an existing table name, which can be found in the system catalog **pg\_constraint**.
- **ALL**  
Specifies all constraints.
- **DEFERRED**  
Specifies that constraints are not checked until transaction commit.
- **IMMEDIATE**  
Specifies that constraints are checked at the end of each statement.

## Examples

```
-- Set that constraints are checked when a transaction is committed.
gaussdb=# SET CONSTRAINTS ALL DEFERRED;
```

## 7.14.157 SET ROLE

### Description

Sets the current user identifier of the current session.

### Precautions

- Users of the current session must be members of specified **rolename**, but the system administrator can choose any roles when separation of duties is disabled.
- Executing this statement may add rights of a user or restrict rights of a user. If the role of a session user has the **INHERITS** attribute, it automatically has all rights of roles that **SET ROLE** enables the role to be. In this case, **SET ROLE** physically deletes all rights directly granted to session users and rights of its

belonging roles and only leaves rights of the specified roles. If the role of the session user has the **NOINHERITS** attribute, **SET ROLE** deletes rights directly granted to the session user and obtains rights of the specified role.

## Syntax

- Set the current user identifier of the current session.  
`SET [ SESSION | LOCAL ] ROLE role_name PASSWORD 'password';`
- Reset the current user identifier to that of the current session.  
`RESET ROLE;`

## Parameters

- **SESSION**  
Specifies that the statement takes effect only for the current session. This parameter is used by default.  
Value range: a string. It must comply with the [naming convention](#).
- **LOCALE**  
Specifies that the specified statement takes effect only for the current transaction.
- **role\_name**  
Specifies the role name.  
Value range: a string. It must comply with the [naming convention](#).
- **password**  
Specifies the password of a role. It must comply with the password convention.

### NOTE

The restrictions on using a ciphertext password are as follows:

- An administrator cannot use a ciphertext password to switch to another administrator but to a user with lower permissions.

Ciphertext passwords are usually used in `gs_dump` and `gs_dumpall` export scenarios. In other scenarios, you are advised not to use ciphertext passwords directly.

- **RESET ROLE**  
Resets the current user identifier.

## Examples

```
-- Create a role paul.
gaussdb=# CREATE ROLE paul IDENTIFIED BY '*****';

-- Set the current user to paul.
gaussdb=# SET ROLE paul PASSWORD '*****';

-- View the current session user and the current user.
gaussdb=> SELECT SESSION_USER, CURRENT_USER;

-- Reset the current user.
gaussdb=> RESET ROLE;

-- Delete the user.
gaussdb=# DROP USER paul;
```

## 7.14.158 SET SESSION AUTHORIZATION

### Description

Sets the session user identifier and the current user identifier of the current session to a specified user.

### Precautions

The session identifier can be changed only when the initial session user has the system administrator rights. Otherwise, the system supports the statement only when the authenticated username is specified.

### Syntax

- Set the session user identifier and the current user identifier of the current session.  

```
SET [SESSION | LOCAL] SESSION AUTHORIZATION role_name PASSWORD 'password';
```
- Reset the identifiers of the session and current users to the initially authenticated usernames.  

```
{SET [SESSION | LOCAL] SESSION AUTHORIZATION DEFAULT
| RESET SESSION AUTHORIZATION};
```

### Parameters

- **SESSION**  
Specifies that the specified parameters take effect for the current session.  
Value range: a string. It must comply with the [naming convention](#).
- **LOCALE**  
Specifies that the specified statement takes effect only for the current transaction.
- **role\_name**  
Specifies the username.  
Value range: a string. It must comply with the [naming convention](#).
- **password**  
Specifies the password of a role. It must comply with the password convention.

#### NOTE

The restrictions on using a ciphertext password are as follows:

- An administrator cannot use a ciphertext password to switch to another administrator but to a user with lower permissions.

Ciphertext passwords are usually used in `gs_dump` and `gs_dumpall` export scenarios. In other scenarios, you are advised not to use ciphertext passwords directly.

- **DEFAULT**  
Resets the identifiers of the session and current users to the initially authenticated usernames.

## Examples

```
-- Create a role paul.
gaussdb=# CREATE ROLE paul IDENTIFIED BY '*****';

-- Set the current user to paul.
gaussdb=# SET SESSION AUTHORIZATION paul password '*****';

-- View the current session user and the current user.
gaussdb=> SELECT SESSION_USER, CURRENT_USER;

-- Reset the current user.
gaussdb=> RESET SESSION AUTHORIZATION;

-- Delete the user.
gaussdb=# DROP USER paul;
```

## Reference

### SET ROLE

## 7.14.159 SET TRANSACTION

### Description

Sets the transaction characteristics. Available transaction characteristics include the transaction separation level and transaction access mode (read/write or read only). You can set the current transaction characteristics using **LOCAL** or the default transaction characteristics of a session using **SESSION**.

### Precautions

The current transaction characteristics must be set in a transaction, that is, **START TRANSACTION** or **BEGIN** must be executed before **SET TRANSACTION** is executed. Otherwise, the setting does not take effect.

### Syntax

```
Set the isolation level and access mode of the transaction.
{ SET [LOCAL | SESSION] TRANSACTION|SET SESSION CHARACTERISTICS AS TRANSACTION }
 { ISOLATION LEVEL { READ COMMITTED | SERIALIZABLE | REPEATABLE READ }
 | { READ WRITE | READ ONLY } };
```

### Parameters

- **LOCAL**  
Specifies that the specified statement takes effect only for the current transaction.
- **SESSION**  
Specifies that the specified parameters take effect for the current session.
- **ISOLATION LEVEL**  
Specifies the transaction isolation level that determines the data that a transaction can view if other concurrent transactions exist.

 **NOTE**

- The isolation level cannot be changed after data is modified using **INSERT**, **DELETE**, **UPDATE**, **FETCH**, or **COPY** in the current transaction.

Value range:

- **READ COMMITTED**: Only committed data is read. It is the default value.
- **REPEATABLE READ**: Only the data committed before transaction start is read. Uncommitted data or data committed in other concurrent transactions cannot be read.
- **SERIALIZABLE**: Currently, this isolation level is not supported in GaussDB. It is equivalent to **REPEATABLE READ**.
- **READ WRITE | READ ONLY**  
Specifies the transaction access mode (read/write or read only).

 **NOTE**

The access mode of the default transaction feature of the session can be set only when the database is started or by sending the HUP signal.

## Examples

```
-- Start a transaction and set its isolation level to READ COMMITTED and access mode to READ ONLY.
gaussdb=# START TRANSACTION;
gaussdb=# SET LOCAL TRANSACTION ISOLATION LEVEL READ COMMITTED READ ONLY;
gaussdb=# COMMIT;
```

## 7.14.160 SHOW

### Function

Shows the current value of a run-time parameter.

### Precautions

None

### Syntax

```
SHOW
{
 [VARIABLES LIKE] configuration_parameter |
 CURRENT_SCHEMA |
 TIME_ZONE |
 TRANSACTION ISOLATION LEVEL |
 SESSION AUTHORIZATION |
 ALL
};
```

### Parameter Description

See [Parameters](#) in RESET.

### Examples

```
-- Show the value of timezone.
gaussdb=# SHOW timezone;
```

```
-- Show all parameters.
gaussdb=# SHOW ALL;

-- Show all parameters whose names contain var.
gaussdb=# SHOW VARIABLES LIKE var;
```

## Helpful Links

[SET](#) and [RESET](#)

## 7.14.161 SHUTDOWN

### Function

**SHUTDOWN** shuts down the currently connected database node.

### Precautions

Only the administrator can run this command.

### Syntax

```
SHUTDOWN
{
 |
 fast |
 immediate
};
```

### Parameter Description

- ""  
If the shutdown mode is not specified, the default mode **fast** is used.
- **fast**  
Rolls back all active transactions, forcibly disconnects the client, and shuts down the database node without waiting for the client to disconnect.
- **immediate**  
Shuts down the server forcibly. Fault recovery will occur on the next startup.

### Examples

```
-- Shut down the current database node.

-- Shut down the current database node in fast mode.
```

## 7.14.162 START TRANSACTION

### Description

Starts a transaction. If the isolation level or read/write mode is specified, a new transaction will have those characteristics. You can also specify them using [SET TRANSACTION](#).

## Precautions

None

## Syntax

### Format 1: START TRANSACTION

```
START TRANSACTION
[
 {
 ISOLATION LEVEL { READ COMMITTED | SERIALIZABLE | REPEATABLE READ }
 | { READ WRITE | READ ONLY }
 } [...]
];
```

### Format 2: BEGIN

```
BEGIN [WORK | TRANSACTION]
[
 {
 ISOLATION LEVEL { READ COMMITTED | SERIALIZABLE | REPEATABLE READ }
 | { READ WRITE | READ ONLY }
 } [...]
];
```

## Parameters

- **WORK | TRANSACTION**  
Specifies the optional keyword in BEGIN format without functions.
- **ISOLATION LEVEL**  
Specifies the transaction isolation level that determines the data that a transaction can view if other concurrent transactions exist.

### NOTE

The isolation level of a transaction cannot be reset after the first clause (INSERT, DELETE, UPDATE, FETCH, or COPY) for modifying data is executed in the transaction.

Value range:

- **READ COMMITTED**: Only committed data is read. It is the default value.
- **REPEATABLE READ**: Only the data committed before transaction start is read. Uncommitted data or data committed in other concurrent transactions cannot be read.
- **SERIALIZABLE**: Currently, this isolation level is not supported in GaussDB. It is equivalent to **REPEATABLE READ**.
- **READ WRITE | READ ONLY**  
Specifies the transaction access mode (read/write or read only).

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason (c1 int, c2 int);

-- Start a transaction in default mode.
gaussdb=# START TRANSACTION;
```

```
gaussdb=# SELECT * FROM tpceds.reason;
gaussdb=# END;

-- Start a transaction in default mode.
gaussdb=# BEGIN;
gaussdb=# SELECT * FROM tpceds.reason;
gaussdb=# END;

-- Start a transaction with the isolation level being READ COMMITTED and the access mode being READ WRITE:
gaussdb=# START TRANSACTION ISOLATION LEVEL READ COMMITTED READ WRITE;
gaussdb=# SELECT * FROM tpceds.reason;
gaussdb=# COMMIT;

-- Delete the table.
gaussdb=# DROP TABLE tpceds.reason;

-- Delete the schema.
gaussdb=# DROP SCHEMA tpceds CASCADE;
```

## Helpful Links

[COMMIT | END, ROLLBACK](#), and [SET TRANSACTION](#)

## 7.14.163 TIMECAPSULE TABLE

### Description

The **TIMECAPSULE TABLE** statement restores a table to an earlier state in the event of human or application errors.

The table can flash back to a past point in time, depending on the old version of the data stored in the system. In addition, GaussDB cannot restore a table to an earlier state through DDL operations that has changed the structure of the table.

### Precautions

- The **TIMECAPSULE TABLE** statement can be used to flash back the data of the old version or the data from the recycle bin.
  - **TO TIMECAPSULE** and **TO CSN** can flash back a table to an earlier version.
  - The recycle bin records the objects dropped or truncated by running **DROP** and **TRUNCATE**. **TO BEFORE DROP** and **TO BEFORE TRUNCATE** flash back from the recycle bin.
- The following object types do not support flashback: system catalogs, DFS tables, global temporary tables, local temporary tables, unlogged tables, sequence tables, encrypted tables, and hash bucket tables.
- Between the flashback point and the current point, a statement (DDL, DCL, or VACUUM FULL) that modifies the table structure or affects physical storage has been executed. Therefore, the flashback fails.
- To run **DROP**, you must have the CREATE or USAGE permission on the schema to which the junk object belongs, and you must be the owner of the schema or the owner of the junk object.  
To run **TRUNCATE**, you must have the CREATE or USAGE permission on the schema to which the junk object belongs, and you must be the owner of the schema or the junk object. In addition, you must have the TRUNCATE permission on the junk object.

- Scenarios or tables that do not support DROP or TRUNCATE:
  - Scenario where the recycle bin is disabled (**enable\_recyclebin** is set to **off**)
  - Scenario where the system is being maintained (**xc\_maintenance\_mode** is set to **on**) or is being upgraded
  - Scenario where multiple objects are deleted (The **DROP** or **TRUNCATE TABLE** command is executed to delete multiple objects at the same time.)
  - System catalogs, DFS tables, global temporary tables, local temporary tables, UNLOGGED tables, sequence tables, and hash bucket tables.
  - If the object on which the table depends is an external object, the table is physically deleted and is not moved to the recycle bin.

## Prerequisites

- The **enable\_recyclebin** parameter has been enabled to enable the recycle bin. Contact the administrator for details about how to use the parameter.
- The **recyclebin\_retention\_time** parameter has been set for specifying the retention period of objects in the recycle bin. The objects will be automatically deleted after the retention period expires. Contact the administrator for details about how to use the parameter.

## Syntax

```
TIMECAPSULE TABLE [schema_name.]table_name TO { CSN expr | TIMESTAMP expr | BEFORE { DROP
[RENAME TO table_name] | TRUNCATE } }
```

## Parameters

- **schema\_name**  
Specifies a schema containing the table to be flashed back. If this parameter is not specified, the current schema is used.
- **table\_name**  
Specifies a table name.
- **TO CSN**  
Specifies the CSN corresponding to the time point when the table is to be flashed back. *expr* must be a number representing a valid CSN.  
Note: In the GTM-free scenario, each node uses the local CSN and does not have a globally unified CSN. Therefore, flashback in TO CSN mode is not supported.
- **TO TIMESTAMP**  
Specifies a timestamp value corresponding to the point in time to which you want to flash back the table. The result of *expr* must be a valid past timestamp (convert a string to a time type using the **TO\_TIMESTAMP** function). The table will be flashed back to a time within approximately 3 seconds of the specified timestamp.  
Note: When the flashback point is too old, the old version cannot be obtained because it is recycled. As a result, the flashback fails and the error message "Restore point too old" is displayed.

- **TO BEFORE DROP**

Retrieves dropped tables and their subobjects from the recycle bin.

You can specify either the original user-specified name of the table or the system-generated name assigned to the object when it was deleted.

- System-generated recycle bin object names are unique. Therefore, if you specify the system-generated name, the database retrieves that specified object. To see the content in your recycle bin, run **select \* from gs\_recyclebin;**
- If you specify the user-specified name and the recycle bin contains more than one object of that name, the database retrieves the object that was moved to the recycle bin most recently. If you want to retrieve an older version of the table, then do one of these things:
  - Specify the system-generated recycle bin name of the table you want to retrieve.
  - Run the **TIMECAPSULE TABLE ... TO BEFORE DROP** statement until you retrieve the table you want.
- When a dropped table is restored, only the base table name is restored, and the names of other subobjects remain the same as those in the recycle bin. You can run the DDL command to manually change the names of subobjects as required.
- The recycle bin does not support write operations such as DML, DCL, and DDL, and does not support DQL query operations (supported in later versions).
- The **recyclebin\_retention\_time** parameter has been set for specifying the retention period of objects in the recycle bin. The objects will be automatically deleted after the retention period expires.

- **RENAME TO**

Specifies a new name for the table retrieved from the recycle bin.

- **TRUNCATE**

Flashes back to the point in time before the TRUNCATE operation.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Delete the tpcds.reason_t2 table.
DROP TABLE IF EXISTS tpcds.reason_t2;
-- Create the tpcds.reason_t2 table.
gaussdb=# CREATE TABLE tpcds.reason_t2
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
)with(storage_type = ustore);
-- Insert records into the tpcds.reason_t2 table.
gaussdb=# INSERT INTO tpcds.reason_t2 VALUES (1, 'AA', 'reason1'),(2, 'AB', 'reason2'),(3, 'AC', 'reason3');
INSERT 0 3
-- Delete data from the tpcds.reason_t2 table.
gaussdb=# TRUNCATE TABLE tpcds.reason_t2;
-- Query data in the tpcds.reason_t2 table.
gaussdb=# select * from tpcds.reason_t2;
 r_reason_sk | r_reason_id | r_reason_desc
```

```
-----+-----+-----
(0 rows)
-- Perform the TRUNCATE FLASHBACK operation.
gaussdb=# TIMECAPSULE TABLE tpcds.reason_t2 to BEFORE TRUNCATE;
gaussdb=# select * from tpcds.reason_t2;
 r_reason_sk | r_reason_id | r_reason_desc
-----+-----+-----
+-----+-----+-----
 1 | AA | reason1
 2 | AB | reason2
 3 | AC | reason3
(3 rows)
-- Delete the tpcds.reason_t2 table.
gaussdb=# DROP TABLE tpcds.reason_t2;
-- Perform the DROP FLASHBACK operation.
gaussdb=# TIMECAPSULE TABLE tpcds.reason_t2 to BEFORE DROP;
TimeCapsule Table

-- Clear the recycle bin and delete the schema.
gaussdb=# PURGE RECYCLEBIN;
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## 7.14.164 TRUNCATE

### Function

**TRUNCATE** quickly removes all rows from a database table.

It has the same effect as an unqualified **DELETE** on each table, but it is faster since it does not actually scan the tables. This is most useful on large tables.

### Precautions

- **TRUNCATE TABLE** has the same function as a **DELETE** statement with no **WHERE** clause, emptying a table.
- **TRUNCATE TABLE** uses less system and transaction log resources as compared with **DELETE**.
  - **DELETE** deletes a row each time, and records the deletion of each row in the transaction log.
  - **TRUNCATE TABLE** deletes all rows in a table by releasing the data page storing the table data, and records the releasing of the data page only in the transaction log.
- The differences between **TRUNCATE**, **DELETE**, and **DROP** are as follows:
  - **TRUNCATE TABLE** deletes content, releases space, but does not delete definitions.
  - **DELETE TABLE** deletes content, but does not delete definitions nor release space.
  - **DROP TABLE** deletes content and definitions, and releases space.

### Syntax

- Delete data from a table.

```
TRUNCATE [TABLE] [ONLY] {table_name [*]} [, ...]
[CONTINUE IDENTITY] [CASCADE | RESTRICT] [PURGE];
```

- Truncate the data in a partition.

```
ALTER TABLE [IF EXISTS] { [ONLY] table_name
| table_name *
```

```
| ONLY (table_name) }
TRUNCATE PARTITION { partition_name
| FOR (partition_value [, ...]) } [UPDATE GLOBAL INDEX];
```

## Parameter Description

- **ONLY**  
If **ONLY** is specified, only the specified table is cleared. Otherwise, the table and all its subtables (if any) are cleared.
- **table\_name**  
Specifies the name (optionally schema-qualified) of the target table.  
Value range: an existing table name
- **CONTINUE IDENTITY**  
Does not change the values of sequences. This is the default action.
- **CASCADE | RESTRICT**
  - **CASCADE**: Clears all tables that are added to a group.
  - **RESTRICT** (default): refuses to truncate if any of the tables have foreign-key references from tables that are not listed in the statement (not supported in distributed scenarios).
- **PURGE**  
Purges table data in the recycle bin by default.
- **partition\_name**  
Specifies the partition in the target partitioned table.  
Value range: an existing table name
- **partition\_value**  
Specifies the value of the specified partition key.  
The value specified by **PARTITION FOR** can uniquely identify a partition.  
Value range: value range of the partition key for the partition to be renamed

---

### NOTICE

When the **PARTITION FOR** clause is used, the entire partition where **partition\_value** is located is cleared.

---

- **UPDATE GLOBAL INDEX**  
If this parameter is used, all global indexes in a partitioned table are updated to ensure that correct data can be queried using global indexes.  
If this parameter is not used, all global indexes in a partitioned table will become invalid.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason(
r_reason_sk integer,
```

```
r_reason_id character(16),
r_reason_desc character(100)
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpceds.reason values(1,'AAAAAAAAABAAAAAAA','reason 1'),
(5,'AAAAAAAAABAAAAAAA','reason 2'),(15,'AAAAAAAAABAAAAAAA','reason 3'),
(25,'AAAAAAAAABAAAAAAA','reason 4'),(35,'AAAAAAAAABAAAAAAA','reason 5'),
(45,'AAAAAAAACAAAAAAA','reason 6'),(55,'AAAAAAAACAAAAAAA','reason 7');

-- Create a table.
gaussdb=# CREATE TABLE tpceds.reason_t1 AS TABLE tpceds.reason;

-- Clear the tpceds.reason_t1 table.
gaussdb=# TRUNCATE TABLE tpceds.reason_t1;

-- Delete the table.
gaussdb=# DROP TABLE tpceds.reason_t1;
-- Create a partitioned table.
gaussdb=# CREATE TABLE tpceds.reason_p
(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
)PARTITION BY RANGE (r_reason_sk)
(
 partition p_05_before values less than (05),
 partition p_15 values less than (15),
 partition p_25 values less than (25),
 partition p_35 values less than (35),
 partition p_45_after values less than (MAXVALUE)
);

-- Insert data.
gaussdb=# INSERT INTO tpceds.reason_p SELECT * FROM tpceds.reason;

-- Clear the p_05_before partition.
gaussdb=# ALTER TABLE tpceds.reason_p TRUNCATE PARTITION p_05_before;

-- Clear the p_15 partition.
gaussdb=# ALTER TABLE tpceds.reason_p TRUNCATE PARTITION for (13);

-- Clear the partitioned table.
gaussdb=# TRUNCATE TABLE tpceds.reason_p;

-- Delete the tpceds.reason_p table.
gaussdb=# DROP TABLE tpceds.reason_p;

-- Delete the tpceds.reason table.
gaussdb=# DROP TABLE tpceds.reason;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpceds CASCADE;
```

## 7.14.165 UPDATE

### Description

Updates data in a table. **UPDATE** changes the values of the specified columns in all rows that satisfy the condition. The **WHERE** clause clarifies conditions. The columns to be modified need to be mentioned in the **SET** clause; columns not explicitly modified retain their previous values.

## Precautions

- The owner of a table, users granted with the UPDATE permission on the table, or users granted with the UPDATE ANY TABLE permission can update data in the table. The system administrator has the permission to update data in the table by default.
- **Update..... Limit row\_count** supports only some scenarios of execution plan pushdown. (Table replication is not supported.) The prerequisites are that the filter criteria must contain the equivalent distribution key and the filter criteria should be relatively simple. Do not use forcible type conversion. If the command fails to be executed, simplify the filter criteria.
- You must have the SELECT permission on all tables involved in the expressions or conditions.
- The distribution key (or column) of a table cannot be modified.
- For the UPDATE statement whose subquery is a stream plan, the same row cannot be concurrently updated.
- You are not allowed to change the database encoding format to GB18030\_2022 or change GB18030\_2022 to another character encoding format by updating system catalogs. Otherwise, inventory data and some operations will be abnormal. If you need to change the character set encoding of a database, follow the database switching process to migrate data.

## Syntax

```
[WITH [RECURSIVE] with_query [, ...]]
UPDATE [/*+ plan_hint */] [ONLY] table_name [*] [[AS] alias]
SET {column_name = { expression | DEFAULT }
| (column_name [, ...]) = (({ expression | DEFAULT } [, ...]) |sub_query) }, ...]
[FROM from_list] [WHERE condition | WHERE CURRENT OF cursor_name]
[ORDER BY {expression [[ASC | DESC | USING operator] [LIMIT row_count]
| RETURNING {*
| {output_expression [[AS] output_name } [, ...] } }];
```

where sub\_query can be:

```
SELECT [ALL | DISTINCT [ON (expression [, ...])]]
{ * | {expression [[AS] output_name } [, ...] }
[FROM from_item [, ...]]
[WHERE condition | WHERE CURRENT OF cursor_name]
[GROUP BY grouping_element [, ...]]
[HAVING condition [, ...]]
[ORDER BY {expression [[ASC | DESC | USING operator] | nlsort_expression_clause } [NULLS { FIRST |
LAST } }] [, ...]]
[LIMIT { [offset,] count | ALL }]
```

## Parameters

- **WITH [ RECURSIVE ] with\_query [, ...]**  
Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table. This subquery statement structure is called the common table expression (CTE) structure. When this structure is used, the execution plan contains the CTE SCAN content.  
If **RECURSIVE** is specified, it allows a **SELECT** subquery to reference itself by name.  
The detailed format of **with\_query** is as follows: **with\_query\_name**  
**[ ( column\_name [, ...] ) ] AS [ [ NOT ] MATERIALIZED ] ( {select | values | insert | update | delete} )**

- **with\_query\_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.
- **column\_name** specifies the column name displayed in the subquery result set.
- Each subquery can be a **SELECT**, **VALUES**, **INSERT**, **UPDATE** or **DELETE** statement.
- You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE.
  - If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery cannot be jointly optimized with the SELECT statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.
  - If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the SELECT statement trunk to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.
- **plan\_hint** clause  
Follows the UPDATE keyword in the */\*+ \*/* format. It is used to optimize the plan of an UPDATE statement block. For details, see [Hint-based Tuning](#). In each statement, only the first */\*+ plan\_hint\*/* comment block takes effect as a hint. Multiple hints can be written.
- **table\_name**  
Specifies the name (optionally schema-qualified) of the table to be updated.  
Value range: an existing table name  
  
 **NOTE**  
  
You can use database links to perform operations on remote tables. For details, see [DATABASE LINK](#).
- **alias**  
Specifies a substitute name for the target table.  
Value range: a string. It must comply with the [naming convention](#).
- **column\_name**  
Specifies the name of the column to be modified.  
You can refer to this column by specifying the target table alias and the column name. Example:  

```
UPDATE foo AS f SET f.col_name = namecol;
```

  
Value range: an existing column
- **expression**  
Specifies a value assigned to a column or an expression that assigns the value.

- **DEFAULT**

Specifies the default value of a column.

The value is **NULL** if no specified default value has been assigned to it.

- **sub\_query**

Specifies a subquery.

This statement can be executed to update a table with information for other tables in the same database. For details about clauses in the SELECT statement, see [SELECT](#).

When a single column is updated, the ORDER BY and LIMIT clauses can be used. When multiple columns are updated, the ORDER BY and LIMIT clauses cannot be used.

 **NOTE**

For an UPDATE statement in UPDATE t1 SET (c1,c2) = (SELECT c1, c2 FROM t2...) format, a subplan is generated for each column in the execution plan. When a large number of columns are updated, the number of subplans is large, which greatly affects the performance.

- **from\_list**

Specifies a list of table expressions. You can use columns of other tables in the WHERE condition. This is similar to the list of tables that can be specified in the FROM clause of a SELECT statement.

---

**NOTICE**

Note that the target table cannot appear in **from\_list**, unless you intend a self-join (in which case it must appear with an alias in **from\_list**).

- **condition**

Specifies an expression that returns a value of type Boolean. Only rows for which this expression returns **true** are updated. You are advised not to use numeric types such as int for **condition**, because such types can be implicitly converted to Boolean values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

- **WHERE CURRENT OF cursor\_name**

When the cursor points to a row in a table, you can use this syntax to update the row.

cursor\_name: specifies the name of a cursor.

**NOTICE**

- This syntax is not supported by the database in the MySQL compatibility mode.
- This syntax supports only ordinary tables and does not support partitioned tables or hash bucket tables.
- This syntax can be used only in stored procedures.
- This syntax cannot be used together with other WHERE conditions.
- This syntax cannot be used together with WITH, USING, ORDER BY, or FROM.
- The SELECT statement corresponding to the CURSOR must be declared as FOR UPDATE.
- The SELECT statement corresponding to the CURSOR supports only a single table. It does not support LIMIT/OFFSET, subqueries, or sublinks.
- The CURSOR declared as FOR UPDATE in a stored procedure cannot be used after being committed or rolled back.
- If the row to which the CURSOR points does not exist, an error is reported (only when UPDATE is used instead of DELETE) in the ORA-compatible mode, indicating that the specified row does not exist. In other compatibility modes, no error is reported.

**ORDER BY**

For details about the keywords, see [SELECT](#).

**LIMIT**

For details about the keywords, see [SELECT](#).

**output\_expression**

Specifies an expression to be computed and returned by the **UPDATE** statement after each row is updated.

Value range: The expression can use any column names of the table named by **table\_name** or tables listed in **FROM**. Write \* to return all columns.

**output\_name**

Specifies a name to use for a returned column.

## Examples

```
-- Create the student1 table.
gaussdb=# CREATE TABLE student1
(
 stuno int,
 classno int
)
DISTRIBUTE BY hash(stuno);

-- Insert data.
gaussdb=# INSERT INTO student1 VALUES(1,1);
gaussdb=# INSERT INTO student1 VALUES(2,2);
gaussdb=# INSERT INTO student1 VALUES(3,3);

-- View data.
gaussdb=# SELECT * FROM student1;

-- Update the values of all records.
```

```
gaussdb=# UPDATE student1 SET classno = classno*2;
-- View data.
gaussdb=# SELECT * FROM student1;

-- Delete the table.
gaussdb=# DROP TABLE student1;

-- Example for WHERE CURRENT OF cursor_name
gaussdb=# create table t1(c1 int, c2 varchar2); -- Create a table.
gaussdb=# insert into t1 values(generate_series(1,1000),'abcd'); -- Insert the data.

gaussdb=# declare
gaussdb=# cursor cur1 is select * from t1 where c1 = 1 for update;
gaussdb=# va t1%rowtype;
gaussdb=# begin
gaussdb$# open cur1;
gaussdb$# fetch cur1 into va;
gaussdb$# update t1 set c2 = c2 || c2 where current of cur1; -- Use WHERE CURRENT OF cursor_name to
update data.
gaussdb$# close cur1;
gaussdb$# commit;
gaussdb$# end;
gaussdb$# /

gaussdb=# select * from t1 where c1 = 1; -- Query the data.
```

## 7.14.166 VACUUM

### Description

VACUUM recycles storage space occupied by deleted rows in tables or B-Tree indexes. In normal database operation, rows that have been deleted are not physically removed from their table; they remain present until a VACUUM is done. Therefore, it is necessary to execute VACUUM periodically, especially on frequently-updated tables.

### Precautions

- If no table is specified, VACUUM processes the tables on which the user has the corresponding permission in the current database. With a parameter, VACUUM processes only that table.
- To perform VACUUM operation to a table, you must be a table owner or a user granted the VACUUM permission on the table. By default, the system administrator has this permission. However, database owners are allowed to VACUUM all tables in their databases, except shared catalogs. (The restriction for shared catalogs means that a true database-wide VACUUM can only be executed by the system administrator). VACUUM skips over any tables that the calling user does not have permission to vacuum.
- VACUUM cannot be executed inside a transaction block.
- It is recommended that active production databases be vacuumed frequently (at least nightly), in order to remove dead rows. After adding or deleting a large number of rows, it might be a good idea to run **VACUUM ANALYZE** for the affected table. This will update the system catalogs with the results of all recent changes, and allow the query planner to make better choices in planning queries.
- **FULL** is recommended only in special scenarios. For example, you wish to physically narrow the table to decrease the occupied disk space after deleting

most rows of a table. **VACUUM FULL** usually shrinks a table more than **VACUUM** does. The **FULL** option does not clear indexes. You are advised to periodically run the **REINDEX** statement. If the physical space usage does not decrease after you run the statement, check whether there are other active transactions (that have started before you delete data transactions and not ended before you run **VACUUM FULL**). If there are such transactions, run this statement again when the transactions quit.

- **VACUUM** causes a substantial increase in I/O traffic, which might cause poor performance for other active sessions. Therefore, it is sometimes advisable to use the cost-based **VACUUM** delay feature.
- When **VERBOSE** is specified, **VACUUM** prints progress messages to indicate which table is currently being processed. Various statistics about the tables are printed as well.
- When the option list is surrounded by parentheses, the options can be written in any order. If there are no brackets, the options must be given in the order displayed in the syntax.
- **VACUUM** and **VACUUM FULL** clean up row-store table records with a delay specified by **vacuum\_defer\_cleanup\_age**, that is, tuples that have just been deleted are not cleaned up immediately.
- **VACUUM ANALYZE** executes a **VACUUM** operation and then an **ANALYZE** operation for each selected table. This is a handy combination form for routine maintenance scripts.
- A plain **VACUUM** statement (without the **FULL** option) simply recycles space and makes it available for reuse. This form of statement can operate in parallel with normal reading and writing of the table, as an exclusive lock is not obtained. **VACUUM FULL** executes wider processing, including moving rows across blocks to compress the tables so that they occupy the minimum number of disk blocks. This form is much slower and requires an exclusive lock on each table while it is being processed.
- If the **xc\_maintenance\_mode** parameter is not enabled, **VACUUM FULL** skips all system catalogs.
- If you run **VACUUM FULL** immediately after running **DELETE**, the space will not be reclaimed. After executing **DELETE**, execute 1000 non-**SELECT** transactions, or wait for 1s and then execute one transaction. Then, run **VACUUM FULL** to reclaim the space.
- During **VACUUM FULL**, an exclusive lock is added to the table. Therefore, you are advised not to run **VACUUM FULL** during peak hours. Otherwise, the lock waiting time is too long or a deadlock occurs.
- To ensure performance and statistics accuracy, do not run **ANALYZE**-related commands, such as **vacuum analyze**, **autoanalyze**, and **manual analyze**, at the same time or frequently.

## Syntax

- Reclaim space and update statistics information, no requirements for keyword orders.  

```
VACUUM [({ FULL | FREEZE | VERBOSE | {ANALYZE | ANALYZE } } [,...])]
[table_name [(column_name [, ...])] [PARTITION (partition_name)]];
```
- Reclaim space, without updating statistics information.  

```
VACUUM [FULL [COMPACT]] [FREEZE] [VERBOSE] [table_name [PARTITION
(partition_name)]];
```

- Reclaim space and update statistics information, and require keywords in order.

```
VACUUM [FULL] [FREEZE] [VERBOSE] { ANALYZE | ANALYSE } [VERBOSE]
[table_name [(column_name [, ...])] [PARTITION (partition_name)]];
```

## Parameters

- **FULL**

Selects "FULL" vacuum, which can reclaim more space, but takes much longer and exclusively locks the table.

### NOTE

Using **FULL** will cause statistics missing. To collect statistics, add the keyword **ANALYZE** to **VACUUM FULL**.

- **FREEZE**

Is equivalent to running **VACUUM** with the **vacuum\_freeze\_min\_age** parameter set to **zero**.

- **VERBOSE**

Prints a detailed VACUUM activity report for each table.

- **ANALYZE | ANALYSE**

Updates statistics used by the planner to determine the most efficient way to execute a query.

- **table\_name**

Specifies the name (optionally schema-qualified) of a specific table to vacuum.

Value range: name of a specific table to vacuum Defaults are all tables in the current database.

- **column\_name**

Specifies the name of the column to be analyzed. This parameter must be used together with **ANALYZE**.

Value range: name of a specific column to analyze The default value indicates all columns.

### NOTE

The mechanism of the VACUUM ANALYZE statement is to execute VACUUM and ANALYZE in sequence. Therefore, if **column\_name** is incorrect, VACUUM may be successfully executed but ANALYZE may fail to be executed. For a partitioned table, ANALYZE may fail to be executed after VACUUM is successfully executed on a partition.

- **PARTITION**

**COMPACT** and **PARTITION** cannot be used at the same time.

- **partition\_name**

Specifies the partition name of the table to be cleared. The default value indicates all partitions.

## Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;
```

```
-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason(
 r_reason_sk integer,
 r_reason_id character(16),
 r_reason_desc character(100)
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.reason values(1,'AAAAAAAABAAAAAAA','reason 1'),
(2,'AAAAAAAABAAAAAAA','reason 2');

-- Create an index in the tpcds.reason table.
gaussdb=# CREATE UNIQUE INDEX ds_reason_index1 ON tpcds.reason(r_reason_sk);

-- Perform VACUUM on the tpcds.reason table that has indexes.
gaussdb=# VACUUM (VERBOSE, ANALYZE) tpcds.reason;

-- Delete the index.
gaussdb=# DROP INDEX ds_reason_index1 CASCADE;
gaussdb=# DROP TABLE tpcds.reason;
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

## Suggestions

- VACUUM
  - VACUUM cannot be executed inside a transaction block.
  - It is recommended that active production databases be vacuumed frequently (at least nightly), in order to remove dead rows. It is strongly recommended that you run **VACUUM ANALYZE** after adding or deleting a large number of records.
  - **FULL** is recommended only in special scenarios. For example, you wish to physically narrow the table to decrease the occupied disk space after deleting most rows of a table.

## 7.14.167 VALUES

### Function

Computes a row or a set of rows based on given values. It is most commonly used to generate a constant table within a large statement.

### Precautions

- **VALUES** lists with large numbers of rows should be avoided, as you might encounter out-of-memory failures or poor performance. **VALUES** appearing within **INSERT** is a special case, because the desired column types are known from the **INSERT**'s target table, and need not be inferred by scanning the **VALUES** list. In this case, **VALUE** can handle larger lists than are practical in other contexts.
- If more than one row is specified, all the rows must have the same number of elements.

### Syntax

```
VALUES ((expression [, ...])) [, ...]
 [ORDER BY { sort_expression [ASC | DESC | USING operator] } [, ...]]
 [LIMIT { count | ALL }]
 [OFFSET start [ROW | ROWS]]
 [FETCH { FIRST | NEXT } [count] { ROW | ROWS } ONLY];
```

## Parameter Description

- **expression**  
Specifies a constant or expression to compute and insert at the indicated place in the resulting table or set of rows.  
In a **VALUES** list appearing at the top level of an **INSERT**, an expression can be replaced by **DEFAULT** to indicate that the destination column's default value should be inserted. **DEFAULT** cannot be used when **VALUES** appears in other contexts.
- **sort\_expression**  
Specifies an expression or integer constant indicating how to sort the result rows.
- **ASC**  
Specifies an ascending sort order.
- **DESC**  
Specifies a descending sort order.
- **operator**  
Specifies a sorting operator.
- **count**  
Specifies the maximum number of rows to return.
- **OFFSET start { ROW | ROWS }**  
Specifies the maximum number of returned rows, whereas **start** specifies the number of rows to skip before starting to return rows.
- **FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY**  
The **FETCH** clause restricts the total number of rows starting from the first row of the return query result, and the default value of **count** is **1**.

## Examples

See [Examples](#) in INSERT.

## 7.15 Appendix

### 7.15.1 Extended Functions

The following table lists the extended functions supported by GaussDB and they are for reference only.

Type	Name	Description
Trigger function	pg_get_triggerdef(trigger_oid)	Gets <b>CREATE [ CONSTRAINT ] TRIGGER</b> command for triggers.
	pg_get_triggerdef(trigger_oid, pretty_bool)	Gets <b>CREATE [ CONSTRAINT ] TRIGGER</b> command for triggers.

## 7.15.2 Dollar-Quoted String Constants

If a string sequence contains a single quotation mark ('), double the single quotation mark (') to two single quotation marks ('). Otherwise, the SQL statement may fail to be executed.

If a string contains many single quotation marks (') or backslashes (\), the string may be difficult to understand and error-prone because all the single quotation marks (') are doubled.

To make the query more readable in such situations, dollar quoting is provided to write string constants. A dollar-quoted string constant consists of a dollar sign (\$), a "tag" of zero or more characters, another dollar sign, an arbitrary sequence of characters that make up the string content, a dollar sign, another tag the same as the previous one, and a dollar sign.

```
gaussdb=# SELECT $$it's an example$$;
?column?

it's an example
(1 row)
```

## 7.15.3 DATABASE LINK

### Description

In the local database, a database link is used to connect to and access the remote database.

A database link can be public or private. A private database link can be accessed only by the creator, while a public database link can be accessed by all users.

All created database link information is stored in the system view **gs\_db\_links** of the local database.

### Precautions

- The database link feature can be used only in ORA-compatible versions.
- The remote database connected to database link supports only 503.1 and later versions.
- Ensure that the values of the compatibility parameter **DBCOMPATIBILITY** and GUC parameters **behavior\_compat\_options**, **a\_format\_dev\_version**, and **a\_format\_version** of the local and remote databases are the same.
- When a session is enabled for a database link connection, the following GUC parameters are set:

```
set search_path=pg_catalog, '$user', 'public';
set datestyle=ISO;
set intervalstyle=postgres;
set extra_float_digits=3;
```

Other parameters are set at the remote end. If the remote parameters are different from the local parameters, the data display formats may be different. Therefore, ensure that the remote parameters are the same as the local parameters.

- Preparations: Use **gs\_guc** to add a whitelist to the **pg\_hba.conf** file to allow client connections.

```
Example: gs_guc reload -l all -N all -Z coordinator -Z datanode -h "host all all 192.168.11.11/32 sha256"
```

For details about the parameters, see the description of `gs_guc` client authentication policy settings.

- In some cases, the IP address of the DN also needs to be added to the cluster whitelist.
- The permission to create a database link needs to be granted using the GRANT syntax. By default, a new user does not have the permission, but the system administrator has the permission. For details, see [GRANT](#).
- When a database link is used to perform operations on a remote table, a schema corresponding to the remote table is created locally. If the metadata of the table does not exist locally, the metadata is written to the local system catalog. In this case, a level-7 lock is used to ensure write consistency until the transaction ends. When a database link is deleted, the corresponding metadata is also deleted.
- If a long transaction uses the dblink to operate a remote object for the first time, the lock is held until the transaction ends. Other transactions that use the dblink for the first time are blocked. To avoid this problem, run a quick statement, for example, "select \* from t1@dblink where 1=2;", to query the remote object to be used and flush its metadata to disks. In addition, similar problem also occurs when the structure of the remote table changes and the stored metadata is updated locally.
- When a schema corresponding to the remote end is created locally, "USERNAME (available only for private database link) #remote schema@DBLINK" is used as the schema name. The maximum length of the schema name is 63 characters.
- If the local and remote character sets are different, an error indicating that the conversion fails may be reported. The error information is that the remote end returns an error. If the character encoding of the local database is GB18030\_2022, the character encoding sent to the remote database is converted to GB18030. Therefore, if the character set of the local database is GB18030\_2022, the character set of the remote database can only be GB18030 or GB18030\_2022.
- When a database link is used to perform operations on a remote table, a single-node node group is created and randomly bound to a DN.

---

#### NOTICE

When the permission to create a database link is granted to a user, the user can remotely access a database by using the IP address of the remote database. Exercise caution when granting this permission to users.

---

## Syntax

- Create a database link.

```
CREATE [PUBLIC] DATABASE LINK dblink
[CONNECT TO { CURRENT_USER | user IDENTIFIED BY password }] [USING (option 'value' [...])] ;
```
- Modify the database link information.

```
ALTER [PUBLIC] DATABASE LINK dblink
{ CONNECT TO user IDENTIFIED BY password } ;
```

- Delete a specified database link.  
DROP [ PUBLIC ] DATABASE LINK dblink;

 NOTE

- **PUBLIC**: creates a public database link visible to all users. If this clause is omitted, the database link is private and available only to the current user. The data that can be accessed on the remote database depends on the identity used by the database link during connection.
- If **CONNECT TO user IDENTIFIED BY password** is specified, the database link makes a connection as a user with specified password.
- If **CONNECT TO CURRENT\_USER** is specified, the database link uses the initial username and empty password of the current database to connect to the remote database.
- If the preceding two clauses are omitted, the database link connects to the remote database as a local initial user.
- **dblink**: indicates the name of the database link to be created.
- **user**: indicates the username used by the created database link.
- **password**: indicates the password of the username.
- **USING ( option 'value' [, ... ] )**

Specifies parameters such as the IP address, port number, and remote database name of the database to be connected. The supported options are as follows:

- **host**: specifies the IP addresses to be connected. IPv6 addresses are not supported. Multiple IP addresses can be specified using character strings separated by commas (,). Currently, SSL settings, encrypted databases, and certificate authentication are not supported. If no IP address is specified, this parameter is left empty by default.
- **port**: specifies the port number for connection. If this parameter is not specified, the default value **5432** is used.
- **dbname**: specifies the name of the database to be connected. If this parameter is not specified, the username used for connecting to the remote end is used by default.
- **fetch\_size**: specifies the amount of data obtained from the remote end each time. The value of **fetch\_size** ranges from 0 to 2147483647. The default value is **100**.

**Notes:**

- You can write only part of the preceding options in the brackets after USING.
- If the keyword USING is not written, the content in the brackets is not written as well.
- When a database link is created, the system does not check whether the connection is successful. If related keywords are missing, an error may be reported.

Perform the SELECT operation through a database link.

 NOTE

The syntax for accessing a remote database object by using a created database link is basically the same as that for accessing a local object. The difference is that **@dblink** is added to the end of the remote object descriptor. For details about restrictions on SQL statements, see [Table 7-166](#).

```
[WITH [RECURSIVE] with_query [, ...]]
SELECT [/*+ plan_hint */] [ALL | DISTINCT [ON (expression [, ...])]]
{ * | {expression [[AS] output_name]} [, ...] }
[FROM from_item [, ...]]
[WHERE condition]
[GROUP BY grouping_element [, ...]]
[HAVING condition [, ...]]
```

```
[{ UNION | INTERSECT | EXCEPT | MINUS } [ALL | DISTINCT] select]
[ORDER BY {expression [[ASC | DESC | USING operator] | nlssort_expression_clause] [NULLS
{ FIRST | LAST }]} [, ...]]
[LIMIT { [offset,] count | ALL }]
[OFFSET start [ROW | ROWS]]
[{FOR { UPDATE | SHARE } [OF table_name [, ...]] } [...]];
[[ONLY] table_name [*] @ dblink [[AS] alias [((column_alias [, ...]))]]
[(select) [AS] alias [(column_alias [, ...])]
[with_query_name [[AS] alias [(column_alias [, ...])]]
| [function_name] ([argument [, ...]]) [AS] alias [(column_alias [, ...] | column_definition [, ...])]
| [function_name] ([argument [, ...]]) AS (column_definition [, ...])
|from_item [NATURAL] join_type from_item [ON join_condition | USING (join_column [, ...])]];
```

- Perform the INSERT operation through a database link.

```
[WITH [RECURSIVE] with_query [, ...]]
INSERT [/*+ plan_hint */] INTO table_name @ dblink [(column_name [, ...])]
{ DEFAULT VALUES
| VALUES { ({ expression | DEFAULT } [, ...]) } [, ...]
| query }
[RETURNING { {output_expression [[AS] output_name] } [, ...] }];
```

- Perform the UPDATE operation through a database link.

```
UPDATE [/*+ plan_hint */] [ONLY] table_name @ dblink [[AS] alias]
SET {column_name = { expression | DEFAULT }
| (column_name [, ...]) = { ({ expression | DEFAULT } [, ...]) |sub_query } } [, ...]
[FROM from_list] [WHERE condition]
[ORDER BY {expression [[ASC | DESC | USING operator] | nlssort_expression_clause] [NULLS
{ FIRST | LAST }]} [, ...]]
[LIMIT { [offset,] count | ALL }]
[RETURNING { {output_expression [[AS] output_name] } [, ...] }];
```

where sub\_query can be:

```
SELECT [ALL | DISTINCT [ON (expression [, ...])]]
{ * | {expression [[AS] output_name] } [, ...] }
[FROM from_item [, ...]]
[WHERE condition]
[GROUP BY grouping_element [, ...]]
[HAVING condition [, ...]];
```

- Perform the DELETE operation through a database link.

```
[WITH [RECURSIVE] with_query [, ...]]
DELETE [/*+ plan_hint */] FROM [ONLY] table_name @ dblink [[AS] alias]
[USING using_list]
[WHERE condition]
[ORDER BY {expression [[ASC | DESC | USING operator] | nlssort_expression_clause] [NULLS
{ FIRST | LAST }]} [, ...]]
[LIMIT { [offset,] count | ALL }]
[RETURNING { { output_expr [[AS] output_name] } [, ...] }];
```

- Perform the LOCK TABLE operation through a database link.

```
LOCK [TABLE] { [ONLY] name @ dblink [, ...] }
[IN {ACCESS SHARE | ROW SHARE | ROW EXCLUSIVE | SHARE UPDATE EXCLUSIVE | SHARE |
SHARE ROW EXCLUSIVE | EXCLUSIVE | ACCESS EXCLUSIVE} MODE]
[NOWAIT];
```

- Call a stored procedure or function of the remote database.

```
CALL | SELECT [schema.] { func_name@dblink | procedure_name@dblink } (param_expr);
```

 **CAUTION**

- When a database link calls a remote function or stored procedure, the **out** output parameters, aggregate functions, window functions, and return set functions are not supported. `SELECT * FROM func@dblink()` cannot be used to call the function or stored procedure.
- When a database link calls a remote function or stored procedure, functions under PUBLIC are called by default if no schema is specified.
- When the database link calls a remote function or stored procedure, **param\_expr** does not support the use of ":@" or "=>" to separate parameter names and parameter values.

 **NOTE**

- The meanings of the parameters irrelevant to database link in the preceding SQL statements are the same as those in the original SQL statements.
- When specifying a column name, you can add "@dblink" to the end of the column name to specify the column of the table to which the corresponding database link points.
- When a database link is used to execute an UPDATE or DELETE statement with LIMIT, the statement can be executed regardless of whether the WHERE condition is a distribution key.

## Restrictions

- **Transaction**

When a database link is used, the relationship between local and remote transactions is as follows:

- A local transaction synchronously controls the commit/rollback status of a remote transaction.
- The relationship between isolation levels is as follows.

Local Isolation Level	Remote Isolation Level
Read Uncommitted	Repeatable Read
Read Committed	Repeatable Read
Repeatable Read	Repeatable Read
Serializable	Serializable

**NOTICE**

If you commit a local transaction, a transaction commit request is sent to the remote end. If the local transaction fails to be committed due to an exception (such as a connection exception or a local cluster instance exception) after the remote transaction is successfully committed, the committed remote transaction cannot be withdrawn. As a result, the local transaction may be inconsistent with the remote transaction.

- **Permissions of local users to use database links**
  - a. If the keyword **public** is used, the link is a public database link and can be used by all users or schemas.
  - b. If the keyword **public** is not used, the link is a private database link and can be used only by the current user or schema. (User **sysadmin** cannot use database links across schemas.)
- **Permission to access remote database objects through database links**

The permissions to access remote database objects are the same as those of the remote connection user bound to the database link.
- **Supported SQL statements**
  - For details about the statements supported by database links, see [Table 7-166](#).
  - For details about the table types supported by database links, see [Table 7-167](#).
- **Function call using a database link**
  - When a database link calls a remote function, OUT/INOUT parameters, aggregate functions, window functions, and return set functions are not supported.
  - When a database link calls a stored procedure or function of a remote database in the PLSQL\_BODY, OUT/INOUT parameters, overloaded functions, aggregate functions, window functions, and return set functions are not supported.

---

**NOTICE**

- You can use the following syntax to call stored procedures or functions of a remote database in the PLSQL\_BODY: [CALL | SELECT] [ schema. ] { func\_name@dblink | procedure\_name@dblink } ( param\_expr )
- You can use the following syntax to call parameterless stored procedures or functions of a remote database in the PLSQL\_BODY: [CALL | SELECT] [ schema. ] { func\_name@dblink | procedure\_name@dblink } ( ).

- 
- **Synonyms**
    - The database link name cannot be created as a synonym.
    - Synonyms that point to a database link object in a remote database cannot be called through database link. Example:
      - Step 1: Create table **TABLE1** on **DB1**.
      - Step 2: Create **DBLINK1** on **DB2** for connecting to **DB1**. Create the synonym "CREATE SYNONYM T1 FOR TABLE1@DBLINK1".
      - Step 3: Create **DBLINK2** on **DB3** for connecting to **DB2**. Call the synonym T1 "SELECT \* FROM T1@DBLINK2" on **DB2** through **DBLINK2**.
  - **Table type constraints**

- HASHBUCKET: The query or DML operation cannot be performed on the remote hash bucket table through database link.
- SLICE: The query or DML operation cannot be performed on the remote slice table through database link.
- Replication table: The query or DML operation cannot be performed on the remote replication table through database link.
- TEMPORARY: The query or DML operation cannot be performed on the remote temporary table through database link.
- **Views**
  - Currently, you can create a view for a remote table of a database link. However, when the structure of the remote table changes, an exception may occur when you use the view. Example:
    - Step 1: Create table **TABLE1** on **DB1**.
    - Step 2: Create **DBLINK** on **DB2** for connecting to **DB1**. Create the view "CREATE VIEW V1 AS SELECT \* FROM TABLE1@DBLINK".
    - Step 3: Delete a column from **TABLE1** on **DB1**. An error is reported when you query the view on **DB2**.
- **Other scenarios**
  - The database link table does not support triggers, including the scenarios where a database link is used in the function called by a trigger, the function called by a trigger is a database link function, and the trigger is defined on a database link.
  - The UPSERT and MERGE syntaxes are not supported.
  - The CURRENT CURSOR syntax is not supported.
  - Hidden columns in a table cannot be queried.
- **Dump and backup**

Database objects related to database links cannot be dumped. The standby node cannot be called or connected by database links.
- **Predicate pushdown constraints**

Only the data types, operators, and functions used in the WHERE clause are built-in, and the used functions are of the IMMUTABLE type.
- **Aggregate function pushdown constraints**

Only single tables that do not contain GROUP, ORDER BY, HAVING, and LIMIT clauses in the SELECT statement are supported. Window functions are not supported.
- **Hint pushdown**

Only hints in scan mode can be pushed down based on the hint conditions of database link table objects. The syntax format is as follows:

```
[no] tablescan|indexscan|indexonlyscan(table [index])
```

The table name or table alias in a query block must be unique.

**Table 7-166** Supported SQL statements

SQL Type	Operation Object	Supported Option	Execution Context
Creating a database link	DATABASE LINK	N/A	Common transaction block
Modifying a database link	DATABASE LINK	Only the username and password can be changed.	Common transaction block
Deleting a database link	DATABASE LINK	N/A	Common transaction block
SELECT statement	Ordinary table, common view, and complete-refresh materialized view	<ul style="list-style-type: none"> <li>• WHERE clause</li> <li>• JOIN clause used between a database link table and an internal table</li> <li>• JOIN clause used between database link tables</li> <li>• Aggregate function</li> <li>• LIMIT clause</li> <li>• ORDER BY clause</li> <li>• GROUP BY and HAVING clauses</li> <li>• UNION clause</li> <li>• WITH clause</li> <li>• FOR UPDATE clause</li> <li>• ROWNUM</li> </ul>	Common transaction block, stored procedure, function, advanced package, and logical view
INSERT statement	Ordinary table	<ul style="list-style-type: none"> <li>• Inserting multiple values</li> </ul>	Common transaction block, stored procedure, function, and advanced package
UPDATE statement	Ordinary table	<ul style="list-style-type: none"> <li>• LIMIT clause</li> <li>• ORDER BY clause</li> <li>• WHERE clause</li> </ul>	Common transaction block, stored procedure, function, and advanced package

SQL Type	Operation Object	Supported Option	Execution Context
DELETE statement	Ordinary table	<ul style="list-style-type: none"> <li>LIMIT clause</li> <li>ORDER BY clause</li> <li>WHERE clause</li> </ul>	Common transaction block, stored procedure, function, and advanced package
LOCK TABLE statement	Ordinary table	<ul style="list-style-type: none"> <li>LOCKMODE clause</li> <li>NOWAIT clause</li> </ul>	Common transaction block

**Table 7-167** Supported table types

Dimension	GaussDB Table Type		Database Link Support
TEMP option	Temporary table		Not supported
	Global temporary table		Not supported
UNLOGGED option	Unlogged table		Supported
Storage features	Row store	Astore	Supported
		Ustore	Not supported
	Partitioned table		Not supported
	Level-2 partitioned table		Not supported
Views	Remote view accessed by a database link		DQL statements are supported, but DML statements are not supported.
	Remote table associated with a local view through a database link		DQL statements are supported, but DML statements are not supported.

## Example

```
-- DDL statement. CREATE USER user2 WITH PASSWORD '*****'; -- Create a common user.
GRANT CREATE PUBLIC DATABASE LINK TO user2; -- Grant the permission to create database links to a user.
GRANT DROP PUBLIC DATABASE LINK TO user2; -- Grant the permission to drop database links to a user.
GRANT ALTER PUBLIC DATABASE LINK TO user2; -- Grant the permission to modify database links to a user.
REVOKE CREATE PUBLIC DATABASE LINK FROM user2; -- Revoke the permission to create database links to a user.
REVOKE DROP PUBLIC DATABASE LINK FROM user2; -- Revoke the permission to drop database links to a
```

```
user.
REVOKE ALTER PUBLIC DATABASE LINK FROM user2; -- Revoke the permission to modify database links
to a user.

# 8 Best Practices

## 8.1 Best Practices of Table Design

### 8.1.1 Selecting a Distribution Mode

In replication mode, full data in a table is copied to each DN in the cluster. This mode is used for tables containing a small volume of data. Full data in a table stored on each DN avoids data redistribution during the join operation. This reduces network costs and plan segment (each having a thread), but generates much redundant data. Generally, this mode is only used for small dimension tables.

In hash mode, hash values are generated for one or more columns. You can obtain the storage location of a tuple based on the mapping between DNs and the hash values. In a hash table, I/O resources on each node can be used during data read/write, which improves the read/write speed of a table. Generally, a table containing a large amount data is defined as a hash table.

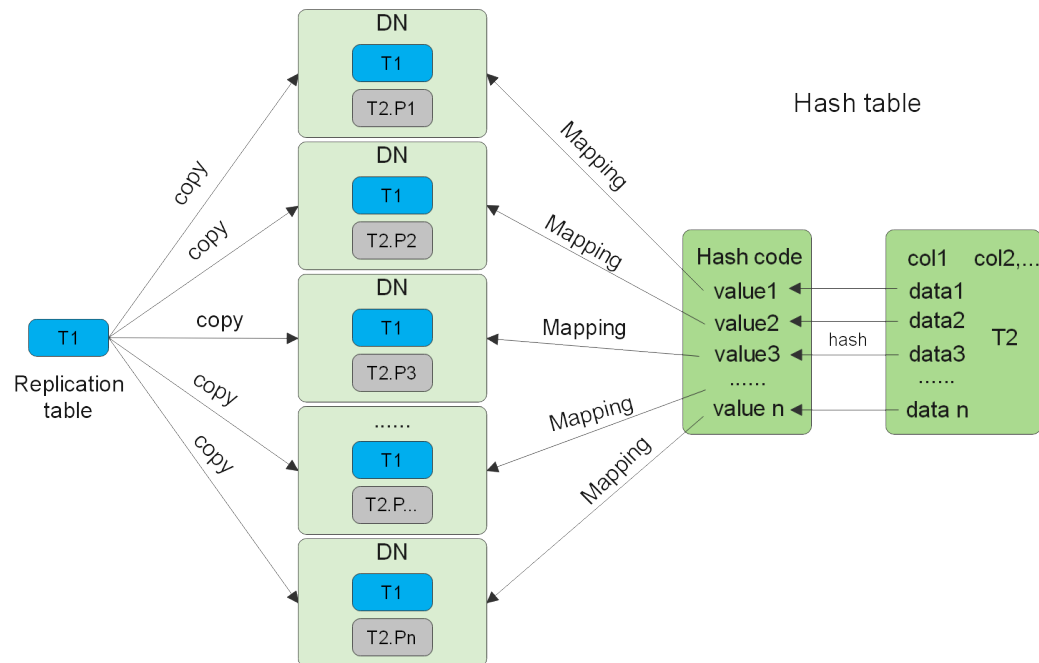

Range distribution and list distribution are user-defined distribution policies. Values in a distribution key are within a certain range or fall into a specific value range of the corresponding target DN. The two distribution modes facilitate flexible data management which, however, requires users equipped with certain data abstraction capability.

Policy	Description	Application Scenario
Hash	Table data is distributed on all DNs in the cluster.	Fact tables containing a large amount of data
Replication	Full data in a table is stored on every DN in the cluster.	Small tables and dimension tables
Range	Table data is mapped to specified columns based on the range and distributed to the corresponding DNs.	Users need to customize distribution rules.

Policy	Description	Application Scenario
List	Table data is mapped to specified columns based on specific values and distributed to corresponding DNs.	Users need to customize distribution rules.

As shown in **Figure 8-1**, T1 is a replication table and T2 is a hash table.

**Figure 8-1** Replication tables and hash tables

**NOTE**

- When you insert, modify, or delete data in a replication table, if you use the shippable or immutable function to encapsulate components that cannot be pushed down, data on different DNs in the replication table may be inconsistent.
- If statements with unstable results, such as window functions, rownum, and limit clauses and user-defined functions, are used to insert or modify data in a replication table, data on different nodes may be different.

### 8.1.2 Selecting Distribution Keys

Selecting a distribution key for a hash table is essential. Details are as follows:

1. **Ensure that the column values are discrete so that data can be evenly distributed to each DN.** You can select the primary key of the table as the distribution key. For example, for a person information table, choose the ID card number column as the distribution key.
2. **With the above principles met, you can select join conditions as distribution keys** so that join tasks can be pushed down to DNs, reducing the amount of data transferred between the DNs.

For a hash table, an improper distribution key may cause data skew or poor I/O performance on certain DNs. Therefore, you need to check the table to ensure that

data is evenly distributed on each DN. You can run the following SQL statements to check data skew:

```
SELECT
xc_node_id, count(1)
FROM tablenameGROUP BY xc_node_id
ORDER BY xc_node_id DESC;
```

**xc\_node\_id** corresponds to a DN. Generally, **over 5% difference between the amount of data on different DNs is regarded as data skew. If the difference is over 10%, choose another distribution key.**

Multiple distribution keys can be selected in GaussDB to evenly distribute data.

You can select the distribution key of the range or list distribution table as required. In addition to selecting a proper distribution key, pay attention to the impact of distribution rules on data distribution.

### 8.1.3 Using Partitioned Tables

Partitioning refers to splitting what is logically one large table into smaller physical pieces based on specific schemes. The table based on the logic is called a partitioned table, and a physical piece is called a partition. Data is stored on these physical partitions, instead of the logical partitioned table. A partitioned table has the following advantages over an ordinary table:

1. High query performance: You can specify partitions when querying partitioned tables, improving query efficiency.
2. High availability: If a certain partition in a partitioned table is faulty, data in the other partitions is still available.
3. Easy maintenance: To fix a partitioned table having a faulty partition, you only need to fix the partition.

GaussDB supports range partitioned tables, list partitioned tables, and hash partitioned tables.

- Range partitioned table: Data in different ranges is mapped to different partitions. The range is determined by the partition key specified during the partitioned table creation. The partition key is usually a date. For example, sales data is partitioned by month.
- List partitioned table: Key values contained in the data are stored in different partitions, and the data is mapped to each partition in sequence. The key values contained in the partitions are specified when the partitioned table is created.
- Hash partitioned table: Data is mapped to each partition based on the internal hash algorithm. The number of partitions is specified when the partitioned table is created.

### 8.1.4 Selecting a Data Type

Use the following principles to select efficient data types:

1. **Select data types that facilitate data calculation.**

Generally, the calculation of integers (including common comparison calculations, such as =, >, <, ≥, ≤, and ≠, and GROUP BY) is more efficient than that of strings and floating point numbers.

2. **Select data types with a short length.**  
Data types with short length reduce both the data file size and the memory used for computing, improving the I/O and computing performance. For example, use **SMALLINT** instead of **INT**, and **INT** instead of **BIGINT**.
3. **Use the same data type for a join.**  
You are advised to use the same data type for a join. To join columns with different data types, the database needs to convert them to the same type, which leads to additional performance overheads.

## 8.1.5 Checking a Node Where a Table Resides

When creating a table, you can specify how the table is distributed or replicated among nodes. For details, see [•DISTRIBUTEBY](#). For details about distribution modes, see [Selecting a Distribution Mode](#).

When creating a table, you can also set **Node Group** to specify a group to which the table belongs. For details, see [•TO{GROUPgroupname}|...](#)

You can also run the following command to view the instance where the table is located.

1. Query the schema to which the table belongs.  

```
select t1.nspname,t2.relname from pg_namespace t1,pg_class t2 where t1.oid = t2.relnamespace and t2.relname = 'table1';
```

In the preceding command, **nspname** indicates the name of a schema, **relname** indicates the name of a table, an index, or a view, **oid** indicates the row identifier, **relnamespace** is the OID of the namespace that contains the relationship, and **table1** indicates a table name.

2. Check **relname** and **nodeoids** of the table.  

```
select t1.relname,t2.nodeoids from pg_class t1, pgxc_class t2, pg_namespace t3 where t1.relfilenode = t2.pcrelid and t1.relnamespace=t3.oid and t1.relname = 'table1' and t3.nspname = 'schema1';
```

In the preceding command, **nodeoids** indicates the OID list of the nodes where the table is distributed, **relfilenode** indicates the name of the file related to the table on the disk, **pcrelid** indicates the OID of the table, and **schema1** indicates the schema of the table queried in step 1.

3. Query the instance where the table is located based on the queried node where the table is distributed.

```
select * from pgxc_node where oid in (nodeoids1, nodeoids2, nodeoids3);
```

In the preceding command, **nodeoids1**, **nodeoids2**, **nodeoids3** indicates the three nodeoids queried in step 2. Use the actual nodeoids and separate them with commas (,).

## 8.2 Best Practices of SQL Queries

Based on the SQL execution mechanism and a large number of practices, SQL statements can be optimized by following certain rules to enable the database to execute SQL statements more quickly and obtain correct results.

- Replace **UNION** with **UNION ALL**.  
**UNION** eliminates duplicate rows while merging two result sets but **UNION ALL** merges the two result sets without deduplication. Therefore, replace **UNION** with **UNION ALL** if you are sure that the two result sets do not contain duplicate rows based on the service logic.

- Add **NOT NULL** to the join columns.

If there are many NULL values in the **JOIN** columns, you can add the filter criterion **IS NOT NULL** to filter data in advance to improve the **JOIN** efficiency.

- Convert **NOT IN** to **NOT EXISTS**.

**nestloop anti join** must be used to implement **NOT IN**, and **hash anti join** is required for **NOT EXISTS**. If no NULL value exists in the **JOIN** columns, **NOT IN** is equivalent to **NOT EXISTS**. Therefore, if you are sure that no NULL value exists, you can convert **NOT IN** to **NOT EXISTS** to generate **hash join** and to improve the query performance.

The statements for creating a foreign table are as follows:

```
DROP SCHEMA IF EXISTS no_in_to_no_exists_test CASCADE;
CREATE SCHEMA no_in_to_no_exists_test;
SET CURRENT_SCHEMA=no_in_to_no_exists_test;
CREATE TABLE t1(c1 int, c2 int, c3 int);
CREATE TABLE t2(d1 int, d2 int NOT NULL, d3 int);
```

The statement for implementing the query using **NOT IN** is as follows:

```
SELECT * FROM t1 WHERE c1 NOT IN (SELECT d2 FROM t2);
```

The plan is as follows:

```
gaussdb=# EXPLAIN SELECT * FROM t1 WHERE c1 NOT IN (SELECT d2 FROM t2);
QUERY PLAN

Streaming (type: GATHER) (cost=0.06..38.57 rows=3 width=12)
Node/s: All datanodes
-> Nested Loop Anti Join (cost=0.00..38.44 rows=3 width=12)
 Join Filter: ((t1.c1 = t2.d2) OR (t1.c1 IS NULL))
 -> Seq Scan on t1 (cost=0.00..14.14 rows=30 width=12)
 -> Materialize (cost=0.00..18.08 rows=90 width=4)
 -> Streaming(type: BROADCAST) (cost=0.00..17.93 rows=90 width=4)
 Spawn on: All datanodes
 -> Seq Scan on t2 (cost=0.00..14.14 rows=30 width=4)
(9 rows)
```

Because there is no null value in the **t2.d2** column (the **t2.d2** column is **NOT NULL** in the table definition), the query can be equivalently modified as follows:

```
SELECT * FROM t1 WHERE NOT EXISTS (SELECT * FROM t2 WHERE t1.c1=t2.d2);
```

The generated plan is as follows:

```
gaussdb=# EXPLAIN SELECT * FROM t1 WHERE NOT EXISTS (SELECT * FROM t2 WHERE t1.c1=t2.d2);
QUERY PLAN

Streaming (type: GATHER) (cost=14.38..29.99 rows=3 width=12)
Node/s: All datanodes
-> Hash Right Anti Join (cost=14.32..29.86 rows=3 width=12)
 Hash Cond: (t2.d2 = t1.c1)
 -> Streaming(type: REDISTRIBUTE) (cost=0.00..15.49 rows=30 width=4)
 Spawn on: All datanodes
 -> Seq Scan on t2 (cost=0.00..14.14 rows=30 width=4)
 -> Hash (cost=14.14..14.14 rows=29 width=12)
 -> Seq Scan on t1 (cost=0.00..14.14 rows=30 width=12)
(9 rows)
```

- Use **hashagg**.

If a plan involving groupAgg and SORT operations generated by the **GROUP BY** statement is poor in performance, you can set **work\_mem** to a larger value to generate a **hashagg** plan, which does not require sorting and improves the performance.

- Replace functions with **CASE** statements.  
The GaussDB performance greatly deteriorates if a large number of functions are called. In this case, you can modify the pushdown functions to **CASE** statements.
- Do not use functions or expressions for indexes.  
Using functions or expressions for indexes stops indexing. Instead, it enables scanning on the full table.
- Do not use **!=** or **<>** operators, **NULL**, **OR**, or implicit parameter conversion in **WHERE** clauses.
- Split complex SQL statements.  
You can split an SQL statement into several ones and save the execution result to a temporary table if the SQL statement is too complex to be tuned using the solutions above, including but not limited to the following scenarios:
  - The same subquery is involved in multiple SQL statements of a job and the subquery contains large amounts of data.
  - Incorrect plan cost causes a small hash bucket of subquery. For example, the actual number of rows is 10 million, but only 1000 rows are in hash bucket.
  - Functions such as `substr` and `to_number` cause incorrect measures for subqueries containing a large amount of data.
  - **BROADCAST** subqueries are performed on large tables in multi-DN environment.

For details about optimization, see [Typical SQL Optimization Methods](#).

## 8.3 Best Practices for Data Skew Query

### 8.3.1 Quickly Locating Tables That Cause Data Skew

Currently, the [table\\_distribution\(schemaname text, tablename text\)](#) and [table\\_distribution\(\)](#) functions as well as the [PGXC\\_GET\\_TABLE\\_SKEWNESS](#) view are provided to query for data skew. You can choose any of them as needed.

#### Scenario 1: Data Skew Caused by a Full Disk

First, use the [pg\\_stat\\_get\\_last\\_data\\_changed\\_time\(oid\)](#) function to query for the tables whose data is changed recently. The last change time of a table is recorded only on the CN where INSERT, UPDATE, and DELETE operations are performed. Therefore, you need to query for tables that are changed within the last day (the period can be changed in the function).

```
CREATE OR REPLACE FUNCTION get_last_changed_table(OUT schemaname text, OUT relname text)
RETURNS setof record
AS $$
DECLARE
 row_data record;
 row_name record;
 query_str text;
 query_str_nodes text;
BEGIN
 query_str_nodes := 'SELECT node_name FROM pgxc_node where node_type = "C"';
```

```
FOR row_name IN EXECUTE(query_str_nodes) LOOP
 query_str := 'EXECUTE DIRECT ON (' || row_name.node_name || ') "SELECT b.nspname,a.relname
FROM pg_class a INNER JOIN pg_namespace b on a.relnamespace = b.oid where
pg_stat_get_last_data_changed_time(a.oid) BETWEEN current_timestamp - 1 AND current_timestamp;";
 FOR row_data IN EXECUTE(query_str) LOOP
 schemaname = row_data.nspname;
 relname = row_data.relname;
 return next;
 END LOOP;
END LOOP;
return;
END; $$
LANGUAGE 'plpgsql';
```

Then, execute the [table\\_distribution\(schemaname text, tablename text\)](#) function to query for the storage space occupied the tables on each DN.

```
SELECT table_distribution(schemaname,relname) FROM get_last_changed_table();
```

## Scenario 2: Routine Data Skew Inspection

- If the number of tables in the database is less than 10,000, use the skew view to query data skew of all tables in the database.
- If the number of tables in the database is no less than 10,000, you are advised to use the **table\_distribution()** function instead of the

[PGXC\\_GET\\_TABLE\\_SKEWNESS](#) view because the view takes a longer time (hours) due to the query of the entire database for skew columns. When you use the **table\_distribution()** function, you can define the output based on [PGXC\\_GET\\_TABLE\\_SKEWNESS](#), optimizing the calculation and reducing the output columns. For example:

```
SELECT schemaname,tablename,max(dnsize) AS maxsize, min(dnsize) AS minsize
FROM pg_catalog.pg_class c
INNER JOIN pg_catalog.pg_namespace n ON n.oid = c.relnamespace
INNER JOIN pg_catalog.table_distribution() s ON s.schemaname = n.nspname AND s.tablename =
c.relname
INNER JOIN pg_catalog.pgxc_class x ON c.oid = x.pcrelid AND x.pclocatortype = 'H'
GROUP BY schemaname,tablename;
```

# 9 User-defined Functions

When the cluster is started, CNs and DN and the UDF master process are also started.

```
[qill@pekphisprb53039 ~]$ ps x
 PID TTY STAT TIME COMMAND
 425297 ? S1 29:19 /data1/qill/gaussdb/gaussdb/bin/etcd -name etcd_7003 --data-dir /data1/qill/data/data/etcd
 425633 ? S1 3:50 /data1/qill/gaussdb/gaussdb/bin/cm_agent
 425662 ? S1 18:01 /data1/qill/gaussdb/gaussdb/bin/cm_server
 425683 ? S1 33:47 /data1/qill/gaussdb/gaussdb/bin/gaussdb -D /data1/qill/data/data/slave12 -M pending
 425694 ? S1 0:00 gaussdb_fenced UDF master process
 513889 ? S1 9:33 /data1/qill/gaussdb/gaussdb/bin/om_monitor -L /data1/qill/log/log/qill/cm/om_monitor
 574990 pts/0 S 0:00 -bash
 923014 pts/0 R+ 0:00 ps x
[qill@pekphisprb53039 ~]$
```

To execute a UDF in fenced mode, the UDF master process forks itself to UDF worker processes, and UDF worker processes execute the UDF in fenced mode.

## 9.1 PL/SQL Functions

PL/SQL is a loadable procedural language.

Functions created using PL/SQL can be used in any place where you can use built-in functions. For example, you can create calculation functions with complex conditions and use them to define operators or use them for index expressions.

SQL is used by most databases as a query language. It is portable and easy to learn. Each SQL statement must be executed independently by a database server.

In this case, when a client application sends a query to the server, it must wait for it to be received, receive and process the results, and then perform some calculation before sending more queries to the server. If the client and server are not on the same machine, all these operations will cause inter-process communication and increase network loads.

PL/SQL enables a whole computing part and a series of queries to be grouped inside a database server. This makes procedural language available and SQL easier to use. In addition, the client/server communication cost is reduced.

- Extra round-trip communication between clients and servers is eliminated.
- Intermediate results that are not required by clients do not need to be sorted or transmitted between the clients and servers.
- Parsing can be skipped in multiple rounds of queries.

PL/SQL can use all data types, operators, and functions in SQL. For details about the PL/SQL syntax for creating functions, see [CREATE FUNCTION](#).

PL/SQL is a loadable procedural language. Its application method is similar to that of [Stored Procedures](#). The difference is that [Stored Procedures](#) has no return value, and PL/SQL functions have return values.

XML data can be used as the input parameter, output parameter, user-defined variable, and return value of a user-defined function.

# 10 Stored Procedures

---

## 10.1 Overview

In GaussDB, business rules and logics are saved as stored procedures.

A stored procedure is a combination of SQL, PL/SQL, and Java statements. Stored procedures can move the code that executes business rules from applications to databases. Therefore, the code storage can be used by multiple programs at a time.

For details about how to create and call a stored procedure, see [CREATE PROCEDURE](#).

The application methods for PL/SQL functions mentioned in [PL/SQL Functions](#) are similar to those for stored procedures. Unless otherwise specified, the following sections apply to stored procedures and PL/SQL functions.

## 10.2 Data Types

A data type refers to a value set and an operation set defined on the value set. GaussDB consists of tables, each of which is defined by its own columns. Each column corresponds to a data type. GaussDB uses corresponding functions to perform operations on data based on data types. For example, GaussDB can perform operations such as addition, subtraction, multiplication, and division on numeric data.

XML data can be used as input parameters, output parameters, user-defined variables, and return values of stored procedures, as well as stored procedures that support autonomous transactions.

## 10.3 Data Type Conversion

Certain data types in the database support implicit data type conversions, such as assignments and parameters called by functions. For other data types (such as int), you can use the type conversion functions provided by GaussDB, such as the CAST function, to forcibly convert them.

**Table 10-1** lists common implicit data type conversions in GaussDB.

**NOTICE**

The valid value range of **DATE** supported by GaussDB is from 4713 B.C. to 294276 A.D.

**Table 10-1** Implicit data type conversions

Raw Data Type	Target Data Type	Remarks
CHAR	VARCHAR2	-
CHAR	NUMBER	Raw data must consist of digits.
CHAR	DATE	Raw data cannot exceed the valid date range.
CHAR	RAW	-
CHAR	CLOB	-
VARCHAR2	CHAR	-
VARCHAR2	NUMBER	Raw data must consist of digits.
VARCHAR2	DATE	Raw data cannot exceed the valid date range.
VARCHAR2	CLOB	-
NUMBER	CHAR	-
NUMBER	VARCHAR2	-
DATE	CHAR	-
DATE	VARCHAR2	-
RAW	CHAR	-
RAW	VARCHAR2	-
CLOB	CHAR	-
CLOB	VARCHAR2	-
CLOB	NUMBER	Raw data must consist of digits.
INT4	CHAR	-

## 10.4 DECLARE Syntax

### 10.4.1 Basic Structure

#### Structure

A PL/SQL block can contain a sub-block which can be placed in any section. The following describes the architecture of a PL/SQL block:

- Declaration section: declares variables, types, cursors, and regional stored procedures and functions used in the PL/SQL block.

DECLARE

#### NOTE

This section is optional if no variables need to be declared.

- An anonymous block may omit the **DECLARE** keyword if no variable needs to be declared.
- For a stored procedure, **AS** is used, which is equivalent to **DECLARE**. The **AS** keyword must be reserved even if there is no variable declaration section.

- Execution section: specifies procedure and SQL statements. It is the main section of a program and is mandatory.

BEGIN

- Exception-handling section: processes errors. It is optional.

EXCEPTION

- End. Mandatory.

END;

/

#### NOTICE

You are not allowed to use consecutive tabs in the PL/SQL block because they may result in an exception when the **gsq** tool is executed with the **-r** parameter specified.

#### Types

PL/SQL blocks are classified into the following types:

- Anonymous block: a dynamic block that can be executed only for once. For details about the syntax, see [Figure 10-1](#).
- Subprogram: a stored procedure, function, operator, or advanced package stored in a database. A subprogram created in a database can be called by other programs.

### 10.4.2 Anonymous Blocks

An anonymous block applies to a script infrequently executed or a one-off activity. An anonymous block is executed in a session and is not stored.

## Syntax

Figure 10-1 shows the syntax diagrams for an anonymous block.

Figure 10-1 anonymous\_block::=

Details about the syntax diagram are as follows:

- The execution section of an anonymous block starts with a **BEGIN** statement, has a break with an **END** statement, and ends with a semicolon (;). Type a slash (/) and press **Enter** to execute the statement.

### NOTICE

The terminator "/" must be written in an independent row.

- The declaration section includes the variable definition, type, and cursor definition.
- A simplest anonymous block does not execute any commands. However, at least one statement, even a **NULL** statement, must be presented in any implementation blocks.

## Examples

The following lists basic anonymous block programs:

```
-- Null statement block
gaussdb=# BEGIN
 NULL;
END;
/

-- Display information on the console.
gaussdb=# BEGIN
 db_output.print_line('hello world!');
END;
/
hello world!
ANONYMOUS BLOCK EXECUTE

-- Display variable content on the console.
gaussdb=# DECLARE
 my_var VARCHAR2(30);
BEGIN
 my_var := 'world';
 db_output.print_line('hello'||my_var);
END;
/
helloworld
ANONYMOUS BLOCK EXECUTE
```

### 10.4.3 Subprograms

A subprogram stores stored procedures, functions, operators, and advanced packages. A subprogram created in a database can be called by other programs.

## 10.5 Basic Statements

During PL/SQL programming, you may define some variables, assign values to variables, and call other stored procedures. The following sections describe basic PL/SQL statements, including variable definition statements, value assignment statements, call statements, and return statements.

#### NOTE

You are not advised to call the SQL statements containing passwords in the stored procedures because authorized users may view the stored procedure file in the database and password information is leaked. If a stored procedure contains other sensitive information, permission to access this procedure must be configured, preventing information leakage.

### 10.5.1 Variable Definition Statements

This section describes the declaration of variables in the PL/SQL and the scope of this variable in codes.

#### Variable Declaration

For details about the variable declaration syntax, see [Figure 10-2](#).

Figure 10-2 declare\_variable::=

The above syntax diagram is explained as follows:

- **variable\_name** indicates the name of a variable.
- **type** indicates the type of a variable.
- **value** indicates the initial value of the variable. (If the initial value is not given, NULL is taken as the initial value.) **value** can also be an expression.

#### Examples

```
gaussdb=# DECLARE
emp_id INTEGER := 7788; -- Define a variable and assign a value to it.
BEGIN
emp_id := 5*7784; -- Assign a value to the variable.
END;
/
```

In addition to the declaration of basic variable types, **%TYPE** and **%ROWTYPE** can be used to declare variables related to table columns or table structures.

### %TYPE Attribute

**%TYPE** declares a variable to be of the same data type as a previously declared variable (for example, a column in a table). For example, if you want to define the **my\_name** variable whose data type is the same as the data type of the **firstname** column in the **employee** table, you can define the variable as follows:

```
my_name employee.firstname%TYPE
```

In this way, you can declare **my\_name** without the need of knowing the data type of **firstname** in **employee**, and the data type of **my\_name** can be automatically updated when the data type of **firstname** changes.

### %ROWTYPE Attribute

**%ROWTYPE** declares data types of a set of data. It stores a row of table data or results fetched from a cursor. For example, if you want to define a set of data with the same column names and column data types as the **employee** table, you can define the data as follows:

```
my_employee employee%ROWTYPE
```

#### NOTE

If multiple CNs are used, the **%ROWTYPE** and **%TYPE** attributes of temporary tables cannot be declared in a stored procedure, because a temporary table is valid only in the current session and is invisible to other CNs in the compilation phase. Therefore, if there are multiple CNs, the system displays a message indicating that the temporary table does not exist.

## Scope of a Variable

The scope of a variable indicates the accessibility and availability of the variable in code block. In other words, a variable takes effect only within its scope.

- To define a function scope, a variable must declare and create a **BEGIN-END** block in the declaration section. The necessity of such declaration is also determined by block structure, which requires that a variable has different scopes and lifetime during a process.
- A variable can be defined multiple times in different scopes, and inner definition can cover outer one.
- A variable defined in an outer block can also be used in a nested block. However, the outer block cannot access variables in the nested block.

### Example

```
gaussdb=# DECLARE
emp_id INTEGER :=7788; -- Define a variable and assign a value to it.
outer_var INTEGER :=6688; -- Define a variable and assign a value to it.
BEGIN
DECLARE
emp_id INTEGER :=7799; -- Define a variable and assign a value to it.
inner_var INTEGER :=6688; -- Define a variable and assign a value to it.
BEGIN
dbe_output.print_line('inner emp_id =||emp_id); -- Display the value 7799.
dbe_output.print_line('outer_var =||outer_var); -- Reference a variable of an outer block.
END;
dbe_output.print_line('outer emp_id =||emp_id); -- Display the value 7788.
END;
/
```

## 10.5.2 Assignment Statements

### Variable Syntax

Figure 10-3 shows the syntax diagram for assigning a value to a variable.

Figure 10-3 assignment\_value::=

The above syntax diagram is explained as follows:

- *variable\_name*: specifies the name of a variable.
- *value* can be a value or an expression. The type of *value* must be compatible with the type of *variable\_name*.

### Variable Value Assignment Example

```
gaussdb=# DECLARE
emp_id INTEGER := 7788; -- Assignment
BEGIN
emp_id := 5; -- Assignment
emp_id := 5*7784;
END;
/
-- The result is as follows:
5
38920
ANONYMOUS BLOCK EXECUTE
```

### INTO/BULK COLLECT INTO

**INTO** and **BULK COLLECT INTO** store values returned by statements in a stored procedure to variables. **BULK COLLECT INTO** allows some or all returned values to be temporarily stored in an array.

### Example

```
gaussdb=# DECLARE
my_id integer;
BEGIN
select id into my_id from customers limit 1; -- Assign a value.
END;
/
ANONYMOUS BLOCK EXECUTE
gaussdb=# DECLARE
type id_list is varray(6) of customers.id%type;
id_arr id_list;
BEGIN
select id bulk collect into id_arr from customers order by id DESC limit 20; -- Assign values in batches.
END;
/
ANONYMOUS BLOCK EXECUTE
```

**NOTICE**

**BULK COLLECT INTO** can only assign values to arrays or collections in batches. The array type uses LIMIT properly to prevent performance deterioration caused by excessive operations on data.

For array variables, elements in parentheses () are preferentially identified as index sets. Therefore, expressions with parentheses cannot be written after array variables. For example, **select (1+3) into va(5)** cannot be written as **select into va(5) (1+3)** or **select into va[5] (1+3)**.

## 10.5.3 Call Statements

### Syntax

Figure 10-4 shows the syntax diagram for calling a clause.

Figure 10-4 call\_clause::=

The above syntax diagram is explained as follows:

- *procedure\_name*: specifies the name of a stored procedure.
- *parameter*: specifies the parameters for the stored procedure. You can set no parameter or multiple parameters.

### Examples

```

-- Create the stored procedure proc_staffs.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_staffs
(
 section NUMBER(6),
 salary_sum out NUMBER(8,2),
 staffs_count out INTEGER
)
IS
BEGIN
SELECT sum(salary), count(*) INTO salary_sum, staffs_count FROM hr.staffs where section_id = section;
END;
/
CREATE PROCEDURE
-- Create the stored procedure proc_return.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_return
AS
v_num NUMBER(8,2);
v_sum INTEGER;
BEGIN
proc_staffs(30, v_sum, v_num); --Call a statement.
dbe_output.print_line(v_sum||'#'||v_num);
RETURN; -- Return a statement.
END;
/

```

```

-- Invoke the stored procedure proc_return.
gaussdb=# CALL proc_return();
30#2.00
proc_return

(1 row)

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE proc_staffs;
gaussdb=# DROP PROCEDURE proc_return;

-- Create the function func_return.
gaussdb=# CREATE OR REPLACE FUNCTION func_return returns void
language plpgsql
AS $$
DECLARE
v_num INTEGER := 1;
BEGIN
dbe_output.print_line(v_num);
RETURN; -- Return a statement.
END $$;
CREATE FUNCTION

-- Call the function func_return.
gaussdb=# CALL func_return();
1
func_return

(1 row)

-- Drop the function.
gaussdb=# DROP FUNCTION func_return;

```

## 10.6 Dynamic Statements

### 10.6.1 Executing Dynamic Query Statements

You can perform dynamic queries using **EXECUTE IMMEDIATE** or **OPEN FOR** in GaussDB. **EXECUTE IMMEDIATE** dynamically executes **SELECT** statements and **OPEN FOR** combines use of cursors. If you need to store query results in a dataset, use **OPEN FOR**.

#### EXECUTE IMMEDIATE

Figure 10-5 shows the syntax diagram.

Figure 10-5 EXECUTE IMMEDIATE dynamic\_select\_clause::=

Figure 10-6 shows the syntax diagram for **using\_clause**.

Figure 10-6 using\_clause::=

The above syntax diagram is explained as follows:

- *define\_variable*: specifies a variable to store single-row query results.
- **USING IN** *bind\_argument*: specifies the variable whose value is passed to the dynamic SQL statement. The variable is used when a dynamic placeholder exists in *dynamic\_select\_string*.
- **USING OUT** *bind\_argument*: specifies the variable that stores a value returned by the dynamic SQL statement.

#### NOTICE

- In query statements, **INTO** and **OUT** cannot coexist.
- A placeholder name starts with a colon (:) followed by digits, characters, or strings, corresponding to *bind\_argument* in the **USING** clause.
- *bind\_argument* can only be a value, variable, or expression. It cannot be a database object such as a table name, column name, and data type. That is, *bind\_argument* cannot be used to transfer schema objects for dynamic SQL statements. If a stored procedure needs to transfer database objects through *bind\_argument* to construct dynamic SQL statements (generally, DDL statements), you are advised to use double vertical bars (||) to concatenate *dynamic\_select\_clause* with a database object.
- A dynamic PL/SQL block allows duplicate placeholders. That is, a placeholder can correspond to only one *bind\_argument* in the **USING** clause. When the GUC parameter **behavior\_compat\_options** is set to **dynamic\_sql\_compat**, the bind arguments in the **USING** clause are matched in sequence based on the placeholder sequence. Duplicate placeholders will not be identified as the same placeholder.

Example:

```
gaussdb=# DROP SCHEMA IF EXISTS hr CASCADE;
gaussdb=# CREATE SCHEMA hr;
gaussdb=# SET CURRENT_SCHEMA = hr;
gaussdb=# CREATE TABLE staffs
(
 staff_id NUMBER,
 first_name VARCHAR2,
 salary NUMBER
);
gaussdb=# INSERT INTO staffs VALUES (200, 'mike', 5800);
```

```

gaussdb=# INSERT INTO staffs VALUES (201, 'lily', 3000);
gaussdb=# INSERT INTO staffs VALUES (202, 'john', 4400);

-- Retrieve values from dynamic statements (INTO clause).
gaussdb=# DECLARE
 staff_count VARCHAR2(20);
BEGIN
 EXECUTE IMMEDIATE 'select count(*) from hr.staffs'
 INTO staff_count;
 db_output.print_line(staff_count);
END;
/
3
ANONYMOUS BLOCK EXECUTE
-- Pass and retrieve values (the INTO clause is used before the USING clause).
gaussdb=# CREATE OR REPLACE PROCEDURE dynamic_proc
AS
 staff_id NUMBER(6) := 200;
 first_name VARCHAR2(20);
 salary NUMBER(8,2);
BEGIN
 EXECUTE IMMEDIATE 'select first_name, salary from hr.staffs where staff_id = :1'
 INTO first_name, salary
 USING IN staff_id;
 db_output.print_line(first_name || ' ' || salary);
END;
/
CREATE PROCEDURE
-- Invoke a stored procedure.
gaussdb=# CALL dynamic_proc();
mike 5800.00
dynamic_proc

(1 row)

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE dynamic_proc;

```

## OPEN FOR

Dynamic query statements can be executed by using **OPEN FOR** to open dynamic cursors.

**Figure 10-7** shows the syntax diagram.

**Figure 10-7** open\_for::=

Parameter description:

- *cursor\_name*: specifies the name of the cursor to be opened.
- *dynamic\_string*: specifies the dynamic query statement.
- **USING** *value*: applies when a placeholder exists in *dynamic\_string*.

For details about use of cursors, see [Cursors](#).

Example:

```
gaussdb=# CREATE SCHEMA hr;
gaussdb=# SET CURRENT_SCHEMA = hr;
gaussdb=# CREATE TABLE staffs
(
 section_id NUMBER,
 first_name VARCHAR2,
 phone_number VARCHAR2,
 salary NUMBER
);
gaussdb=# INSERT INTO staffs VALUES (30, 'mike', '13567829252', 5800);
gaussdb=# INSERT INTO staffs VALUES (40, 'john', '17896354637', 4000);

gaussdb=# DECLARE
 name VARCHAR2(20);
 phone_number VARCHAR2(20);
 salary NUMBER(8,2);
 sqlstr VARCHAR2(1024);

 TYPE app_ref_cur_type IS REF CURSOR; -- Define the cursor type.
 my_cur app_ref_cur_type; -- Define the cursor variable.

BEGIN
 sqlstr := 'select first_name,phone_number,salary from hr.staffs
 where section_id = :1';
 OPEN my_cur FOR sqlstr USING '30'; -- Open the cursor. USING is optional.
 FETCH my_cur INTO name, phone_number, salary; -- Retrieve the data.
 WHILE my_cur%FOUND LOOP
 db_output.print_line(name||' '||phone_number||' '||salary);
 FETCH my_cur INTO name, phone_number, salary;
 END LOOP;
 CLOSE my_cur; -- Close the cursor.
END;
/
mike#13567829252#5800.00
mike#13567829252#5800.00
ANONYMOUS BLOCK EXECUTE
```

## 10.6.2 Executing Dynamic Non-Query Statements

### Syntax

Figure 10-8 shows the syntax diagram.

Figure 10-8 noselect::=

Figure 10-9 shows the syntax diagram for using\_clause.

Figure 10-9 using\_clause::=

The above syntax diagram is explained as follows:

**USING IN** *bind\_argument* is used to specify the variable whose value is passed to the dynamic SQL statement. The variable is used when a placeholder exists in *dynamic\_noselect\_string*. That is, a placeholder is replaced by the corresponding *bind\_argument* when a dynamic SQL statement is executed. Note that *bind\_argument* can only be a value, variable, or expression, and cannot be a database object such as a table name, column name, and data type. If a stored procedure needs to transfer database objects through *bind\_argument* to construct dynamic SQL statements (generally, DDL statements), you are advised to use double vertical bars (||) to concatenate *dynamic\_select\_clause* with a database object. In addition, a dynamic PL/SQL block allows duplicate placeholders. That is, a placeholder can correspond to only one *bind\_argument*. When the GUC parameter **behavior\_compat\_options** is set to **dynamic\_sql\_compat**, the bind arguments in the USING clause are matched in sequence based on the placeholder sequence. Duplicate placeholders will not be identified as the same placeholder.

## Examples

```
-- Create a table.
gaussdb=# CREATE TABLE sections_t1
(
 section NUMBER(4) ,
 section_name VARCHAR2(30),
 manager_id NUMBER(6),
 place_id NUMBER(4)
)
DISTRIBUTE BY hash(manager_id);

-- Declare a variable.
gaussdb=# DECLARE
 section NUMBER(4) := 280;
 section_name VARCHAR2(30) := 'Info support';
 manager_id NUMBER(6) := 103;
 place_id NUMBER(4) := 1400;
 new_colname VARCHAR2(10) := 'sec_name';
BEGIN
-- Execute the query.
 EXECUTE IMMEDIATE 'insert into sections_t1 values(:1, :2, :3, :4)'
 USING section, section_name, manager_id, place_id;
-- Execute the query (duplicate placeholders).
 EXECUTE IMMEDIATE 'insert into sections_t1 values(:1, :2, :3, :1)'
 USING section, section_name, manager_id;
-- Run the ALTER statement. You are advised to use double vertical bars (||) to concatenate the dynamic
DDL statement with a database object.
 EXECUTE IMMEDIATE 'alter table sections_t1 rename section_name to ' || new_colname;
END;
/

-- Query data.
gaussdb=# SELECT * FROM sections_t1;
 section | sec_name | manager_id | place_id
-----+-----+-----+-----
 280 | Info support | 103 | 1400
 280 | Info support | 103 | 280
(2 rows)

-- Delete the table.
gaussdb=# DROP TABLE sections_t1;
```

### 10.6.3 Dynamically Calling Stored Procedures

This section describes how to dynamically call store procedures. You must use anonymous statement blocks to package stored procedures or statement blocks and append **IN** and **OUT** behind the **EXECUTE IMMEDIATE...USING** statement to input and output parameters.

#### Syntax

Figure 10-10 shows the syntax diagram.

Figure 10-10 call\_procedure::=

Figure 10-11 shows the syntax diagram for **using\_clause**.

Figure 10-11 using\_clause::=

The above syntax diagram is explained as follows:

- **CALL procedure\_name**: calls the stored procedure.
- **[;placeholder1;placeholder2,...]**: specifies the placeholder list of the stored procedure parameters. The numbers of the placeholders and parameters are the same.
- **USING [IN|OUT|IN OUT] bind\_argument**: specifies the variable whose value is passed to the stored procedure parameter. The modifiers in front of **bind\_argument** and of the corresponding parameter are the same.
- Overloaded functions or stored procedures with placeholders cannot be called.

## Examples

```
-- Create the stored procedure proc_add.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_add
(
 param1 in INTEGER,
 param2 out INTEGER,
 param3 in INTEGER
)
AS
BEGIN
 param2:= param1 + param3;
END;
/

gaussdb=# DECLARE
input1 INTEGER:=1;
input2 INTEGER:=2;
statement VARCHAR2(200);
param2 INTEGER;
BEGIN
 -- Declare the call statement.
 statement := 'call proc_add(:col_1, :col_2, :col_3)';
 -- Execute the statement.
 EXECUTE IMMEDIATE statement
 USING IN input1, OUT param2, IN input2;
 db_output.print_line('result is: '||to_char(param2));
END;
/
result is: 3
ANONYMOUS BLOCK EXECUTE
-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE proc_add;
```

## 10.6.4 Dynamically Calling Anonymous Blocks

This section describes how to execute anonymous blocks in dynamic statements. Append **IN** and **OUT** behind the **EXECUTE IMMEDIATE...USING** statement to input and output parameters.

### Syntax

Figure 10-12 shows the syntax diagram.

Figure 10-12 call\_anonymous\_block::=

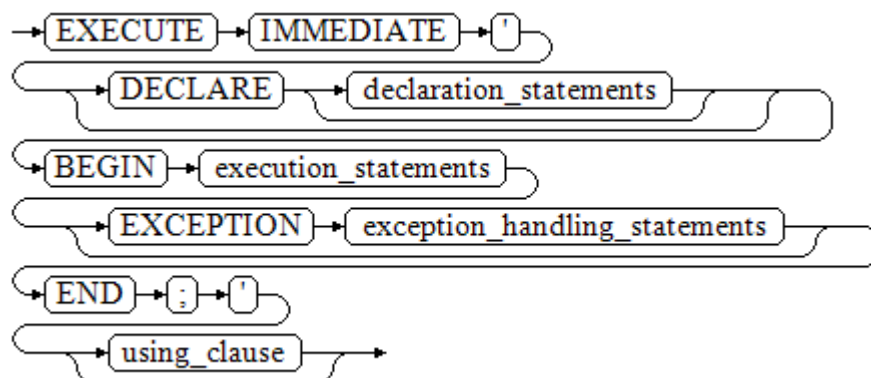

Figure 10-13 shows the syntax diagram for **using\_clause**.

Figure 10-13 using\_clause::=

The above syntax diagram is explained as follows:

- The execute part of an anonymous block starts with a **BEGIN** statement, has a break with an **END** statement, and ends with a semicolon (;).
- **USING [IN|OUT|IN OUT]bind\_argument**: specifies where the variable passed to the stored procedure parameter value is stored. The modifiers in front of **bind\_argument** and of the corresponding parameter are the same.
- The input and output parameters in the middle of an anonymous block are designated by placeholders. The numbers of the placeholders and parameters are the same. The sequences of the parameters corresponding to the placeholders and the USING parameters are the same.
- Currently in GaussDB, when dynamic statements call anonymous blocks, placeholders cannot be used to pass input and output parameters in an **EXCEPTION** statement.
- Overloaded functions with placeholders cannot be called.
- The PERFORM keyword cannot be used to invoke a stored procedure when parameters are bound.
- Variables declared in an anonymous block and binding parameters cannot be used in the same statement at the same time.
- Only SQL statements invoked in anonymous blocks and stored procedures with OUT/INOUT parameters can be bound to parameters. For example, expressions and cursors are used in anonymous blocks, and dynamic statements are invoked in nested mode in anonymous blocks.

## Examples

```
--Create the stored procedure dynamic_proc.
gaussdb=# CREATE OR REPLACE PROCEDURE dynamic_proc
AS
 staff_id NUMBER(6) := 200;
 first_name VARCHAR2(20);
 salary NUMBER(8,2);
BEGIN
 --Execute the anonymous block.
 EXECUTE IMMEDIATE 'begin select first_name, salary into :first_name, :salary from hr.staffs where
staff_id= :dno; end;';
 USING OUT first_name, OUT salary, IN staff_id;
 db_output.print_line(first_name|| ' ' || salary);
END;
/

-- Invoke a stored procedure.
gaussdb=# CALL dynamic_proc();
```

```
mike 5800.00
dynamic_proc

(1 row)
-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE dynamic_proc;
```

## 10.7 Control Statements

### 10.7.1 RETURN Statements

In GaussDB, data can be returned in either of the following ways: **RETURN**, **RETURN NEXT**, or **RETURN QUERY**. **RETURN NEXT** and **RETURN QUERY** are used only for functions and cannot be used for stored procedures.

#### 10.7.1.1 RETURN

##### Syntax

[Figure 10-14](#) shows the syntax diagram for a return statement.

**Figure 10-14** return\_clause::=

The above syntax diagram is explained as follows:

This statement returns control from a stored procedure or function to a caller.

##### Examples

See [Examples](#) for call statement examples.

#### 10.7.1.2 RETURN NEXT and RETURN QUERY

##### Syntax

When creating a function, specify **SETOF** *datatype* for the return values.

return\_next\_clause::=

return\_query\_clause::=

The above syntax diagram is explained as follows:

If a function needs to return a result set, use **RETURN NEXT** or **RETURN QUERY** to add results to the result set, and then continue to execute the next statement of the function. As the **RETURN NEXT** or **RETURN QUERY** statement is executed repeatedly, more and more results will be added to the result set. After the function is executed, all results are returned.

**RETURN NEXT** can be used for scalar and compound data types.

**RETURN QUERY** has a variant **RETURN QUERY EXECUTE**. You can add dynamic queries and add parameters to the queries by **USING**.

## Examples

```
gaussdb=# CREATE TABLE t1(a int);
gaussdb=# INSERT INTO t1 VALUES(1),(10);

--RETURN NEXT
gaussdb=# CREATE OR REPLACE FUNCTION fun_for_return_next() RETURNS SETOF t1 AS $$
DECLARE
 r t1%ROWTYPE;

```

## 10.7.2 Conditional Statements

Conditional statements are used to decide whether given conditions are met. Operations are executed based on the decisions made.

GaussDB supports five usages of **IF**:

- **IF\_THEN**

**Figure 10-15 IF\_THEN::=**

**IF\_THEN** is the simplest form of **IF**. If the condition is true, statements are executed. If it is false, they are skipped.

Example:

```

gaussdb=# IF v_user_id <> 0 THEN
 UPDATE users SET email = v_email WHERE user_id = v_user_id;
END IF;

```

- IF\_THEN\_ELSE

**Figure 10-16 IF\_THEN\_ELSE::=**

**IF-THEN-ELSE** statements add **ELSE** branches and can be executed if the condition is false.

Example:

```

gaussdb=# IF parentid IS NULL OR parentid = ''
 THEN
 RETURN;
 ELSE
 hp_true_filename(parentid); -- Call the stored procedure.
 END IF;

```

- IF\_THEN\_ELSE IF

**IF** statements can be nested in the following way:

```

gaussdb=# IF sex = 'm' THEN
 pretty_sex := 'man';
 ELSE
 IF sex = 'f' THEN
 pretty_sex := 'woman';
 END IF;
 END IF;

```

Actually, this is a way of an **IF** statement nesting in the **ELSE** part of another **IF** statement. Therefore, an **END IF** statement is required for each nesting **IF** statement and another **END IF** statement is required to end the parent **IF-ELSE** statement. To set multiple options, use the following form:

- IF\_THEN\_ELSEIF\_ELSE

**Figure 10-17 IF\_THEN\_ELSIF\_ELSE::=**

Example:

```

IF number_tmp = 0 THEN
 result := 'zero';
ELSIF number_tmp > 0 THEN
 result := 'positive';
ELSIF number_tmp < 0 THEN
 result := 'negative';
ELSE
 result := 'NULL';
END IF;

```

- **IF\_THEN\_ELSEIF\_ELSE**  
**ELSEIF** is an alias of **ELSIF**.

Example:

```

CREATE OR REPLACE PROCEDURE proc_control_structure(i in integer)
AS
BEGIN
 IF i > 0 THEN
 raise info 'i:% is greater than 0. ',i;
 ELSIF i < 0 THEN
 raise info 'i:% is smaller than 0. ',i;
 ELSE
 raise info 'i:% is equal to 0. ',i;
 END IF;
 RETURN;
END;
/

CALL proc_control_structure(3);

-- Delete the stored procedure.
DROP PROCEDURE proc_control_structure;

```

## 10.7.3 Loop Statements

### Simple LOOP Statements

Syntax diagram

**Figure 10-18 loop::=**

Example

```
CREATE OR REPLACE PROCEDURE proc_loop(i in integer, count out integer)
AS
BEGIN
 count:=0;
 LOOP
 IF count > i THEN
 raise info 'count is %.', count;
 EXIT;
 ELSE
 count:=count+1;
 END IF;
 END LOOP;
END;
/

CALL proc_loop(10,5);
```

### NOTICE

The loop must be exploited together with **EXIT**; otherwise, a dead loop occurs.

## WHILE\_LOOP Statements

### Syntax diagram

Figure 10-19 while\_loop::=

If the conditional expression is true, a series of statements in the WHILE statement are repeatedly executed and the condition is decided each time the loop body is executed.

### Example

```
CREATE TABLE integertable(c1 integer) DISTRIBUTE BY hash(c1);
CREATE OR REPLACE PROCEDURE proc_while_loop(maxval in integer)
AS
DECLARE
 i int :=1;
BEGIN
 WHILE i < maxval LOOP
 INSERT INTO integertable VALUES(i);
 i:=i+1;
 END LOOP;
END;
/

-- Invoke a function.
CALL proc_while_loop(10);

-- Delete the stored procedure and table.
DROP PROCEDURE proc_while_loop;
DROP TABLE integertable;
```

## FOR\_LOOP (*Integer variable*) Statement

### Syntax diagram

Figure 10-20 for\_loop::=

### NOTE

- The variable **name** is automatically defined as the **integer** type and exists only in this loop. The variable name falls between **lower\_bound** and **upper\_bound**.
- When the keyword **REVERSE** is used, the lower bound must be greater than or equal to the upper bound; otherwise, the loop body is not executed.

### Example

```
-- Loop from 0 to 5.
CREATE OR REPLACE PROCEDURE proc_for_loop()
AS
 BEGIN
 FOR I IN 0..5 LOOP
 DBE_OUTPUT.PRINT_LINE('It is '||to_char(I) || ' time;');
 END LOOP;
 END;
/

-- Invoke a function.
CALL proc_for_loop();

-- Delete the stored procedure.
DROP PROCEDURE proc_for_loop;
```

## FOR\_LOOP Query Statements

### Syntax diagram

Figure 10-21 for\_loop\_query::=

### NOTE

The variable **target** is automatically defined, its type is the same as that in the **query** result, and it is valid only in this loop. The target value is the query result.

### Example

```
-- Display the query result from the loop.
CREATE OR REPLACE PROCEDURE proc_for_loop_query()
AS
 record VARCHAR2(50);
BEGIN
 FOR record IN SELECT spcname FROM pg_tablespace LOOP
 dbe_output.print_line(record);
 END LOOP;
END;
/

-- Invoke a function.
CALL proc_for_loop_query();

-- Delete the stored procedure.
DROP PROCEDURE proc_for_loop_query;
```

## FORALL Batch Query Statements

### Syntax diagram

Figure 10-22 forall::=

### NOTE

The variable **index** is automatically defined as the **integer** type and exists only in this loop. The index value falls between **low\_bound** and **upper\_bound**.

### Example

```
CREATE TABLE TEST_t1 (
 title NUMBER(6),
 did VARCHAR2(20),
 data_period VARCHAR2(25),
 kind VARCHAR2(25),
 interval VARCHAR2(20),
 time DATE,
 isModified VARCHAR2(10)
)
DISTRIBUTE BY hash(did);

INSERT INTO TEST_t1 VALUES(8, 'Donald', 'OConnell', 'DOCONNEL', '650.507.9833', to_date('21-06-1999',
'dd-mm-yyyy'), 'SH_CLERK');

CREATE OR REPLACE PROCEDURE proc_forall()
AS
BEGIN
 FORALL i IN 100..120
 update TEST_t1 set title = title + 100*i;
END;
/

-- Invoke a function.
```

```
CALL proc_forall();

--Query the invocation result of the stored procedure.
SELECT * FROM TEST_t1 WHERE title BETWEEN 100 AND 120;

-- Delete the stored procedure and table.
DROP PROCEDURE proc_forall;
DROP TABLE TEST_t1;
```

## 10.7.4 Branch Statements

### Syntax

Figure 10-23 shows the syntax diagram for a return statement.

Figure 10-23 case\_when::=

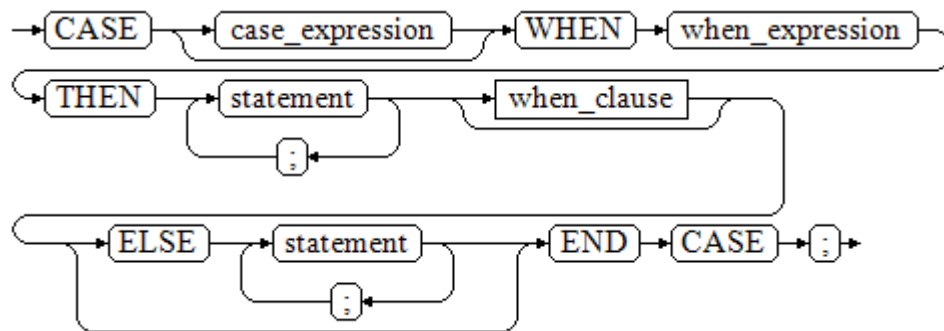

Figure 10-24 shows the syntax diagram for when\_clause.

Figure 10-24 when\_clause::=

Parameter description:

- *case\_expression*: specifies the variable or expression.
- *when\_expression*: specifies the constant or conditional expression.
- *statement*: specifies the statement to be executed.

### Examples

```
CREATE OR REPLACE PROCEDURE proc_case_branch(pi_result in integer, pi_return out integer)
AS
BEGIN
CASE pi_result
WHEN 1 THEN
pi_return := 111;
WHEN 2 THEN
pi_return := 222;
WHEN 3 THEN
pi_return := 333;
WHEN 6 THEN
```

```
 pi_return := 444;
 WHEN 7 THEN
 pi_return := 555;
 WHEN 8 THEN
 pi_return := 666;
 WHEN 9 THEN
 pi_return := 777;
 WHEN 10 THEN
 pi_return := 888;
 ELSE
 pi_return := 999;
 END CASE;
 raise info 'pi_return : %',pi_return ;
END;
/

CALL proc_case_branch(3,0);

-- Delete the stored procedure.
DROP PROCEDURE proc_case_branch;
```

## 10.7.5 NULL Statements

In PL/SQL programs, **NULL** statements are used to indicate "nothing should be done", equal to placeholders. They grant meanings to some statements and improve program readability.

### Syntax

The following shows example use of **NULL** statements.

```
DECLARE
...
BEGIN
...
 IF v_num IS NULL THEN
 NULL; --No data needs to be processed.
 END IF;
END;
/
```

## 10.7.6 Error Trapping Statements

By default, any error occurring in a PL/SQL function aborts execution of the function, and indeed of the surrounding transaction as well. You can trap errors and restore from them by using a **BEGIN** block with an **EXCEPTION** clause. The syntax is an extension of the normal syntax for a **BEGIN** block:

```
[<<label>>]
[DECLARE
 declarations]
BEGIN
 statements
EXCEPTION
 WHEN condition [OR condition ...] THEN
 handler_statements
 [WHEN condition [OR condition ...] THEN
 handler_statements
 ...]
END;
```

If no error occurs, this form of block simply executes all the statements, and then control passes to the next statement after **END**. But if an error occurs within the statements, further processing of the statements is abandoned, and control passes to the **EXCEPTION** list. The list is searched for the first condition matching the

error that occurred. If a match is found, the corresponding **handler\_statements** are executed, and then control passes to the next statement after **END**. If no match is found, the error propagates out as though the **EXCEPTION** clause were not there at all: Error codes can be used to catch other error codes of the same type.

The error can be caught by an enclosing block with **EXCEPTION**, or if there is none it aborts processing of the function.

The condition names can be any of those shown in *Error Code Reference*. The special condition name **OTHERS** matches every error type except **QUERY\_CANCELED**.

If a new error occurs within the selected **handler\_statements**, it cannot be caught by this **EXCEPTION** clause, but is propagated out. A surrounding **EXCEPTION** clause could catch it.

When an error is caught by an **EXCEPTION** clause, the local variables of the PL/SQL function remain as they were when the error occurred, but all changes to persistent database state within the block are rolled back.

Example:

```
CREATE TABLE mytab(id INT,firstname VARCHAR(20),lastname VARCHAR(20)) DISTRIBUTE BY hash(id);
INSERT INTO mytab(firstname, lastname) VALUES('Tom', 'Jones');

CREATE FUNCTION fun_exp() RETURNS INT
AS $$
DECLARE
 x INT :=0;
 y INT;
BEGIN
 UPDATE mytab SET firstname = 'Joe' WHERE lastname = 'Jones';
 x := x + 1;
 y := x / 0;
EXCEPTION
 WHEN division_by_zero THEN
 RAISE NOTICE 'caught division_by_zero';
 RETURN x;
END;$$
LANGUAGE plpgsql;

call fun_exp();
NOTICE: caught division_by_zero
fun_exp

 1
(1 row)

select * from mytab;
 id | firstname | lastname
-----+-----
 | Tom | Jones
(1 row)

DROP FUNCTION fun_exp();
DROP TABLE mytab;
```

When control reaches the assignment to **y**, it will fail with a **division\_by\_zero** error. This will be caught by the **EXCEPTION** clause. The value returned in the **RETURN** statement will be the incremented value of **x**.

 **NOTE**

A block containing an **EXCEPTION** clause is more expensive to enter and exit than a block without one. Therefore, do not use **EXCEPTION** without need.

In the following scenario, an exception cannot be caught, and the entire transaction rolls back. The threads of the nodes participating the stored procedure exit abnormally due to node failure and network fault, or the source data is inconsistent with that of the table structure of the target table during the COPY FROM operation.

**Example: Exceptions with UPDATE/INSERT**

This example uses exception handling to perform either **UPDATE** or **INSERT**, as appropriate:

```
CREATE TABLE db (a INT, b TEXT);

CREATE FUNCTION merge_db(key INT, data TEXT) RETURNS VOID AS
$$
BEGIN
 LOOP
 -- First try to update the key
 UPDATE db SET b = data WHERE a = key;
 IF found THEN
 RETURN;
 END IF;
 -- Not there, so try to insert the key. If someone else inserts the same key concurrently, we could get a
 unique-key failure.
 BEGIN
 INSERT INTO db(a,b) VALUES (key, data);
 RETURN;
 EXCEPTION WHEN unique_violation THEN
 -- Do nothing, and loop to try the UPDATE again.
 END;
 END LOOP;
END;
$$
LANGUAGE plpgsql;

SELECT merge_db(1, 'david');
SELECT merge_db(1, 'dennis');

--Delete FUNCTION and TABLE:
DROP FUNCTION merge_db;
DROP TABLE db ;
```

## 10.7.7 GOTO Statements

A **GOTO** statement unconditionally transfers the control from the current statement to a labeled statement. The **GOTO** statement changes the execution logic. Therefore, use this statement only when necessary. Alternatively, you can use the **EXCEPTION** statement to handle issues in special scenarios. To run a **GOTO** statement, the labeled statement must be unique.

### Syntax

label declaration ::=

goto statement ::=

## Examples

```
gaussdb=# CREATE OR REPLACE PROCEDURE GOTO_test()
AS
DECLARE
 v1 int;
BEGIN
 v1 := 0;
 LOOP
 EXIT WHEN v1 > 100;
 v1 := v1 + 2;
 if v1 > 25 THEN
 GOTO pos1;
 END IF;
 END LOOP;
<<pos1>>
v1 := v1 + 10;
raise info 'v1 is %.', v1;
END;
/

call GOTO_test();
```

## Constraints

Using **GOTO** statements has the following constraints:

- A **GOTO** statement does not allow multiple labeled statements even if the statements are in different blocks.

```
BEGIN
 GOTO pos1;
<<pos1>>
SELECT * FROM ...
<<pos1>>
UPDATE t1 SET ...
END;
```

- A **GOTO** statement cannot transfer control to the **IF**, **CASE**, or **LOOP** statement.

```
BEGIN
 GOTO pos1;
 IF valid THEN
 <<pos1>>
 SELECT * FROM ...
 END IF;
END;
```

- A **GOTO** statement cannot transfer control from one **IF** clause to another, or from one **WHEN** clause in the **CASE** statement to another.

```
BEGIN
 IF valid THEN
 GOTO pos1;
 SELECT * FROM ...
 ELSE
 <<pos1>>
 UPDATE t1 SET ...
 END IF;
END;
```

- A **GOTO** statement cannot transfer control from an outer block to an inner **BEGIN-END** block.

```
BEGIN
 GOTO pos1;
BEGIN
```

```
<<pos1>>
UPDATE t1 SET ...
END;
END;
```

- A **GOTO** statement cannot transfer control from an exception handler to the current **BEGIN-END** block. However, a **GOTO** statement can transfer control to the upper-layer **BEGIN-END** block.

```
BEGIN
<<pos1>>
UPDATE t1 SET ...
EXCEPTION
 WHEN condition THEN
 GOTO pos1;
END;
```

- To branch to a position that does not have an executable statement, add the **NULL** statement.

```
DECLARE
 done BOOLEAN;
BEGIN
 FOR i IN 1..50 LOOP
 IF done THEN
 GOTO end_loop;
 END IF;
 <<end_loop>> -- not allowed unless an executable statement follows
 NULL; -- add NULL statement to avoid error
 END LOOP; -- raises an error without the previous NULL
END;
/
```

## 10.8 Transaction Statements

A stored procedure itself is automatically in a transaction. A transaction is automatically started when the most peripheral stored procedure is called. In addition, the transaction is automatically committed when the calling ends, or is rolled back when an exception occurs during calling. In addition to automatic transaction control, you can also use COMMIT/ROLLBACK to control transactions in stored procedures. Running the COMMIT/ROLLBACK commands in a stored procedure will commit or roll back the current transaction and automatically starts a new transaction. All subsequent operations will be performed in the new transaction.

A savepoint is a special mark inside a transaction. It allows all commands that are executed after it was established to be rolled back, restoring the transaction state to what it was at the time of the savepoint. In a stored procedure, you can use savepoints to manage transactions. Currently, you can create, roll back, and release savepoints. If a savepoint for rollback is used in a stored procedure, only the modification of the current transaction is rolled back. The execution process of the stored procedure is not changed, and the values of local variables in the stored procedure are not rolled back.

## NOTICE

The applicable contexts are as follows:

1. COMMIT, ROLLBACK, and SAVEPOINT can be used in PL/SQL stored procedures/functions.
2. COMMIT, ROLLBACK, and SAVEPOINT can be used in stored procedures and functions that contain EXCEPTION.
3. COMMIT, ROLLBACK, and SAVEPOINT can be used in EXCEPTION statements of stored procedures.
4. A stored procedure that contains COMMIT, ROLLBACK, or SAVEPOINT (which means the stored procedure is controlled by BEGIN, START, or END) can be called in a transaction block.
5. A stored procedure that contains savepoints can be invoked in a subtransaction and an externally defined savepoint is used to roll back the transaction to the savepoint defined outside the stored procedure.
6. A savepoint defined in the stored procedure can be viewed outside the stored procedure. That is, the modification of the transaction can be rolled back to the savepoint defined in the stored procedure.
7. COMMIT, ROLLBACK, and SAVEPOINT, as well as IF, FOR, CURSOR LOOP, and WHILE, can be called in most PL/SQL contexts and statements.

The following content can be submitted or rolled back:

1. DDL statements after COMMIT or ROLLBACK can be submitted or rolled back.
2. DML statements after COMMIT or ROLLBACK can be submitted.
3. GUC parameters in stored procedures can be submitted or rolled back.

## Syntax

```
Define a savepoint.
SAVEPOINT savepoint_name;
Roll back a savepoint.
ROLLBACK TO [SAVEPOINT] savepoint_name;
Release a savepoint.
RELEASE [SAVEPOINT] savepoint_name;
```

## Examples

### NOTE

COMMIT/ROLLBACK can be used in PL/SQL stored procedures.

```
CREATE TABLE EXAMPLE1(COL1 INT);

CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE()
AS
BEGIN
 FOR i IN 0..20 LOOP
 INSERT INTO EXAMPLE1(COL1) VALUES (i);
 IF i % 2 = 0 THEN
 COMMIT;
 ELSE
 ROLLBACK;
 END IF;
 END LOOP;
END;
/
```

 **NOTE**

- COMMIT and ROLLBACK can be used in stored procedures that contain EXCEPTION.
- COMMIT and ROLLBACK can be used in EXCEPTION statements of stored procedures.
- DDL statements after COMMIT or ROLLBACK can be submitted or rolled back.

```
CREATE OR REPLACE PROCEDURE TEST_COMMIT_INSERT_EXCEPTION_ROLLBACK()
AS
BEGIN
 DROP TABLE IF EXISTS TEST_COMMIT;
 CREATE TABLE TEST_COMMIT(A INT, B INT);
 INSERT INTO TEST_COMMIT SELECT 1, 1;
 COMMIT;
 CREATE TABLE TEST_ROLLBACK(A INT, B INT);
 RAISE EXCEPTION 'RAISE EXCEPTION AFTER COMMIT';
EXCEPTION
 WHEN OTHERS THEN
 INSERT INTO TEST_COMMIT SELECT 2, 2;
 ROLLBACK;
END;
/
```

 **NOTE**

A stored procedure that contains COMMIT or ROLLBACK (which means the stored procedure is controlled by BEGIN, START, or END) can be called in a transaction block.

```
BEGIN;
 CALL TEST_COMMIT_INSERT_EXCEPTION_ROLLBACK();
END;
```

 **NOTE**

COMMIT and ROLLBACK, as well as IF, FOR, CURSOR LOOP, and WHILE, can be called in most PL/SQL contexts and statements.

```
CREATE OR REPLACE PROCEDURE TEST_COMMIT2()
IS
BEGIN
 DROP TABLE IF EXISTS TEST_COMMIT;
 CREATE TABLE TEST_COMMIT(A INT);
 FOR I IN REVERSE 3..0 LOOP
 INSERT INTO TEST_COMMIT SELECT I;
 COMMIT;
 END LOOP;
 FOR I IN REVERSE 2..4 LOOP
 UPDATE TEST_COMMIT SET A=I;
 COMMIT;
 END LOOP;
EXCEPTION
 WHEN OTHERS THEN
 INSERT INTO TEST_COMMIT SELECT 4;
 COMMIT;
END;
/
```

 **NOTE**

GUC parameters in stored procedures can be submitted or rolled back.

```
SHOW explain_perf_mode;
SHOW enable_force_vector_engine;

CREATE OR REPLACE PROCEDURE GUC_ROLLBACK()
AS
BEGIN
 SET enable_force_vector_engine = on;
 COMMIT;
 SET explain_perf_mode TO pretty;
```

```
ROLLBACK;
END;
/

call GUC_ROLLBACK();
guc_rollback

(1 row)

SHOW explain_perf_mode;
explain_perf_mode

normal
(1 row)

SHOW enable_force_vector_engine;
enable_force_vector_engine

on
(1 row)

SET enable_force_vector_engine = off;
```

** NOTE**

Savepoints can be used in PL/SQL stored procedures to roll back partial transaction modifications.

```
CREATE OR REPLACE PROCEDURE STP_SAVEPOINT_EXAMPLE1()
AS
BEGIN
 INSERT INTO EXAMPLE1 VALUES(1);
 SAVEPOINT s1;
 INSERT INTO EXAMPLE1 VALUES(2);
 ROLLBACK TO s1; -- Roll back the insertion of record 2.
 INSERT INTO EXAMPLE1 VALUES(3);
END;
/
```

** NOTE**

You can use a savepoint in a PL/SQL stored procedure to roll back to a savepoint defined outside the stored procedure.

```
CREATE OR REPLACE PROCEDURE STP_SAVEPOINT_EXAMPLE2()
AS
BEGIN
 INSERT INTO EXAMPLE1 VALUES(2);
 ROLLBACK TO s1; -- Roll back the insertion of record 2.
 INSERT INTO EXAMPLE1 VALUES(3);
END;
/

BEGIN;
INSERT INTO EXAMPLE1 VALUES(1);
SAVEPOINT s1;
CALL STP_SAVEPOINT_EXAMPLE2();
stp_savepoint_example2

(1 row)

SELECT * FROM EXAMPLE1;
col1

14
```

```
16
18
20
3
3
3
2
6
8
12
1
1
(16 rows)

COMMIT;
```

 **NOTE**

You can use a savepoint defined outside the stored procedure to roll back to a savepoint in a PL/SQL stored procedure.

```
CREATE OR REPLACE PROCEDURE STP_SAVEPOINT_EXAMPLE3()
AS
BEGIN
 INSERT INTO EXAMPLE1 VALUES(1);
 SAVEPOINT s1;
 INSERT INTO EXAMPLE1 VALUES(2);
END;
/
```

```
BEGIN;
INSERT INTO EXAMPLE1 VALUES(3);
CALL STP_SAVEPOINT_EXAMPLE3();
stp_savepoint_example3
```

(1 row)

```
ROLLBACK TO SAVEPOINT s1; -- Roll back the insertion of record 2 to the stored procedure.
SELECT * FROM EXAMPLE1;
col1
```

```

3
3
3
2
6
8
12
1
1
1
(18 rows)

COMMIT;
```

 **NOTE**

The COMMIT and ROLLBACK statements can be invoked in a function.

```
CREATE OR REPLACE FUNCTION FUNCTION_EXAMPLE1() RETURN INT
AS
EXP INT;
```

```
BEGIN
 FOR i IN 0..20 LOOP
 INSERT INTO EXAMPLE1(col1) VALUES (i);
 IF i % 2 = 0 THEN
 COMMIT;
 ELSE
 ROLLBACK;
 END IF;
 END LOOP;
 SELECT COUNT(*) FROM EXAMPLE1 INTO EXP;
 RETURN EXP;
END;
/
```

## Constraints

---

### CAUTION

- The unapplicable contexts are as follows:
  1. COMMIT, ROLLBACK, and SAVEPOINT cannot be called in stored procedures other than PL/SQL, such as PL/Java and PL/Python.
  2. After SAVEPOINT is called in a transaction block, stored procedures that contain COMMIT/ROLLBACK cannot be called.
  3. Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in TRIGGER.
  4. COMMIT, ROLLBACK, and SAVEPOINT cannot be invoked in EXECUTE statements.
  5. Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in CURSOR statements.
  6. Stored procedures that contain IMMUTABLE or SHIPPABLE cannot call COMMIT, ROLLBACK, SAVEPOINT or another stored procedure that contain COMMIT, ROLLBACK, or SAVEPOINT.
  7. Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in SQL statements other than SELECT PROC and CALL PROC.
  8. COMMIT, ROLLBACK, or SAVEPOINT cannot be called in a stored procedure whose header contains GUC parameters.
  9. COMMIT, ROLLBACK, or SAVEPOINT cannot be called in expressions or CURSOR and EXECUTE statements.
  10. Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in the return values and expression calculation of stored procedures.
  11. Savepoints defined outside a stored procedure cannot be released in the stored procedure.
  12. A stored procedure transaction and its autonomous transaction are two independent transactions and cannot use savepoints defined in each other's transaction.
  13. Advanced packages cannot call stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT statements through DBE\_SQL.
- The following content cannot be committed or rolled back:
  1. Variables declared or imported in stored procedures cannot be committed or rolled back.
  2. In stored procedures, GUC parameters that take effect only after a restart cannot be submitted or rolled back.

---

There are the following constraints on the use of COMMIT/ROLLBACK in a stored procedure:

### NOTE

A TRIGGER stored procedure cannot contain COMMIT/ROLLBACK or called another stored procedure that contains COMMIT/ROLLBACK.

```
CREATE OR REPLACE FUNCTION FUNCTION_TRI_EXAMPLE2() RETURN TRIGGER
AS
EXP INT;
BEGIN
 FOR i IN 0..20 LOOP
 INSERT INTO EXAMPLE1(col1) VALUES (i);
 IF i % 2 = 0 THEN
 COMMIT;
 ELSE
 ROLLBACK;
 END IF;
 END LOOP;
 SELECT COUNT(*) FROM EXAMPLE1 INTO EXP;
END;
/

CREATE TRIGGER TRIGGER_EXAMPLE AFTER DELETE ON EXAMPLE1
FOR EACH ROW EXECUTE PROCEDURE FUNCTION_TRI_EXAMPLE2();

DELETE FROM EXAMPLE1;
ERROR: Can not commit/rollback if it's atomic is true: can not use commit rollback in Complex SQL
CONTEXT: PL/pgSQL function function_tri_example2() line 7 at COMMIT
```

** NOTE**

Stored procedures that contain IMMUTABLE or SHIPPABLE cannot call COMMIT/ROLLBACK or another stored procedure that contains COMMIT/ROLLBACK.

```
CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE1()
IMMUTABLE
AS
BEGIN
 FOR i IN 0..20 LOOP
 INSERT INTO EXAMPLE1 (col1) VALUES (i);
 IF i % 2 = 0 THEN
 COMMIT;
 ELSE
 ROLLBACK;
 END IF;
 END LOOP;
END;
/
CALL TRANSACTION_EXAMPLE1();
ERROR: Can not commit/rollback if it's atomic is true: commit/rollback/savepoint is not allowed in a non-volatile function
CONTEXT: PL/pgSQL function transaction_example1() line 7 at COMMIT
```

** NOTE**

Variables declared or imported in stored procedures cannot be committed or rolled back.

```
CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE2(EXP_OUT OUT INT)
AS
EXP INT;
BEGIN
 EXP_OUT := 0;
 COMMIT;
 DBE_OUTPUT.PRINT_LINE('EXP IS:'||EXP);
 EXP_OUT := 1;
 ROLLBACK;
 DBE_OUTPUT.PRINT_LINE('EXP IS:'||EXP);
END;
/
```

** NOTE**

Calling in SQL statements (other than Select Procedure) is not supported.

```
CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE3()
AS
BEGIN
```

```
FOR i IN 0..20 LOOP
 INSERT INTO EXAMPLE1 (col1) VALUES (i);
 IF i % 2 = 0 THEN
 EXECUTE IMMEDIATE 'COMMIT';
 ELSE
 EXECUTE IMMEDIATE 'ROLLBACK';
 END IF;
END LOOP;
END;
/
CALL TRANSACTION_EXAMPLE2(100);
EXP IS:
EXP IS:
exp_out

 1
(1 row)
```

** NOTE**

COMMIT/ROLLBACK cannot be called in a stored procedure whose header contains GUC parameters.

```
CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE4()
SET ARRAY_NULLS TO "ON"
AS
BEGIN
 FOR i IN 0..20 LOOP
 INSERT INTO EXAMPLE1 (col1) VALUES (i);
 IF i % 2 = 0 THEN
 COMMIT;
 ELSE
 ROLLBACK;
 END IF;
 END LOOP;
END;
/
CALL TRANSACTION_EXAMPLE4();
ERROR: Can not commit/rollback if it's atomic is true: transaction statement in store procedure with GUC
setting in option clause is not supported
CONTEXT: PL/pgSQL function transaction_example4() line 6 at COMMIT
```

** NOTE**

A stored procedure object whose cursor is open cannot contain COMMIT/ROLLBACK.

```
CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE5(INTIN IN INT, INTOUT OUT INT)
AS
BEGIN
 INTOUT := INTIN + 1;
 COMMIT;
END;
/

CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE6()
AS
CURSOR CURSOR1(EXPIN INT)
IS SELECT TRANSACTION_EXAMPLE5(EXPIN);
INTEXP INT;
BEGIN
 FOR i IN 0..20 LOOP
 OPEN CURSOR1(i);
 FETCH CURSOR1 INTO INTEXP;
 INSERT INTO EXAMPLE1(COL1) VALUES (INTEXP);
 IF i % 2 = 0 THEN
 COMMIT;
 ELSE

## 10.9 Other Statements

### 10.9.1 Lock Operations

GaussDB provides multiple lock modes to control concurrent accesses to table data. These modes are used when Multi-Version Concurrency Control (MVCC) cannot give expected behaviors. Alike, most GaussDB commands automatically apply appropriate locks to ensure that called tables are not deleted or modified in an incompatible manner during command execution. For example, when concurrent operations exist, **ALTER TABLE** cannot be executed on the same table.

### 10.9.2 Cursor Operations

GaussDB provides cursors as a data buffer for users to store execution results of SQL statements. Each cursor region has a name. Users can use SQL statements to obtain records one by one from cursors and grant the records to master variables, then being processed further by host languages.

Cursor operations include cursor definition, open, fetch, and close operations.

For the complete example of cursor operations, see [Explicit Cursor](#).

## 10.10 Cursors

### 10.10.1 Overview

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers pointing to context regions. With cursors, stored procedures can control alterations in context regions.

**NOTICE**

- If JDBC is used to call a stored procedure whose returned value is a cursor, the returned cursor cannot be used.
- In distributed mode, if the parameter of the stored procedure called in the SQL statement is of the refcursor type or the return value is of the refcursor type, pushdown is not supported.
- When a stored procedure contains COMMIT/ROLLBACK, an explicit cursor caches all data of the cursor to ensure that the cursor is still available after COMMIT/ROLLBACK. If the cursor data volume is large, this process may take a long time.

Cursors are classified into explicit cursors and implicit cursors. [Table 10-2](#) shows the usage conditions of explicit and implicit cursors for different SQL statements.

**Table 10-2** Cursor usage conditions

SQL Statement	Cursor
Non-query statements	Implicit
Query statements with single-line results	Implicit or explicit
Query statements with multi-line results	Explicit

### 10.10.2 Explicit Cursor

An explicit cursor is used to process query statements, particularly when query results are multiple records.

#### Procedure

An explicit cursor performs the following six PL/SQL steps to process query statements:

- Step 1** Define a static cursor: Define a cursor name and its corresponding **SELECT** statement.

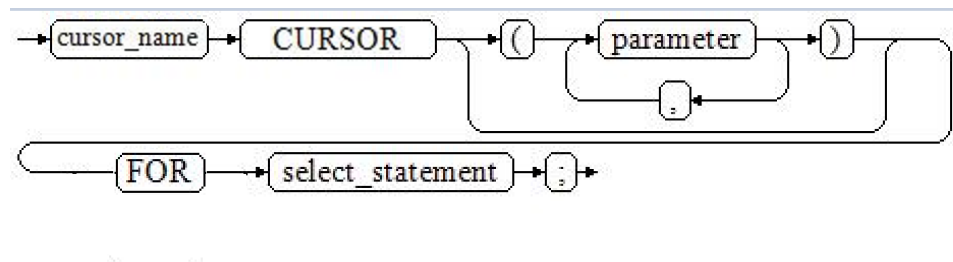

[Figure 10-25](#) shows the syntax diagram for defining a static cursor.

**Figure 10-25** static\_cursor\_define::=

Or

**Figure 10-26** static\_cursor\_define::=

Parameter description:

- *cursor\_name*: defines a cursor name.
- *parameter*: specifies cursor parameters. Only input parameters are allowed. Its format is as follows:  
parameter\_name datatype
- *select\_statement*: specifies a query statement.

**NOTE**

- The system automatically determines whether the cursor can be used for backward fetching based on the execution plan.
- In syntax, **parameter** can be an output parameter, but its behavior is the same as that of an input parameter.

Define a dynamic cursor: Define a **ref** cursor, which means that the cursor can be opened dynamically by a set of static SQL statements. Define the type of the **ref** cursor first, and then the cursor variable of this cursor type. Dynamically bind a **SELECT** statement through **OPEN FOR** when the cursor is opened.

**Figure 10-27** and **Figure 10-28** show the syntax diagrams for defining a dynamic cursor.

**Figure 10-27** cursor\_typename::=

GaussDB supports the dynamic cursor type **sys\_refcursor**. A function or stored procedure can use the **sys\_refcursor** parameter to pass on or pass out the cursor result set. A function can return **sys\_refcursor** to return the cursor result set.

**Figure 10-28** dynamic\_cursor\_define::=

**Step 2** Open the static cursor: Execute the **SELECT** statement corresponding to the cursor. The query result is placed in the workspace and the pointer directs to the head of the workspace to identify the cursor result set. If the cursor query statement

carries the **FOR UPDATE** option, the **OPEN** statement locks the data rows corresponding to the cursor result set in the database table.

**Figure 10-29** shows the syntax diagram for opening a static cursor.

**Figure 10-29** open\_static\_cursor::=

Open the dynamic cursor: Use the **OPEN FOR** statement to open the dynamic cursor and the SQL statement is dynamically bound.

**Figure 10-30** shows the syntax diagrams for opening a dynamic cursor.

**Figure 10-30** open\_dynamic\_cursor::=

A PL/SQL program cannot use the **OPEN** statement to repeatedly open a cursor.

**Step 3** Fetch cursor data: Retrieve data rows in the result set and place them in specified output variables.

**Figure 10-31** shows the syntax diagrams for fetching cursor data.

**Figure 10-31** fetch\_cursor::=

**Step 4** Process the record.

**Step 5** Continue to process until the active set has no record.

**Step 6** Close the cursor: After you fetch and process the data in the cursor result set, close the cursor in time to release system resources used by the cursor and invalidate the workspace of the cursor so that the **FETCH** statement cannot be used to fetch data any more. A closed cursor can be reopened by an **OPEN** statement.

**Figure 10-32** shows the syntax diagram for closing a cursor.

**Figure 10-32** close\_cursor::=

----End

## Attributes

Cursor attributes are used to control program procedures or know program status. When a DML statement is executed, the PL/SQL opens a built-in cursor and processes its result. A cursor is a memory segment for maintaining query results. It is opened when a DML statement is executed and closed when the execution is finished. An explicit cursor has the following attributes:

- **%FOUND**: Boolean attribute, which returns **TRUE** if the last fetch returns a row.
- **%NOTFOUND**: Boolean attribute, which works opposite to the **%FOUND** attribute.
- **%ISOPEN**: Boolean attribute, which returns **TRUE** if the cursor has been opened.
- **%ROWCOUNT**: numeric attribute, which returns the number of records fetched from the cursor.

## Examples

```
-- Specify the method for passing cursor parameters.
CREATE OR REPLACE PROCEDURE cursor_proc1()
AS
DECLARE
 DEPT_NAME VARCHAR(100);
 DEPT_LOC NUMBER(4);
 -- Define a cursor.
 CURSOR C1 IS
 SELECT section_name, place_id FROM hr.sections WHERE section_id <= 50;
 CURSOR C2(sect_id INTEGER) IS
 SELECT section_name, place_id FROM hr.sections WHERE section_id <= sect_id;
 TYPE CURSOR_TYPE IS REF CURSOR;
 C3 CURSOR_TYPE;
 SQL_STR VARCHAR(100);
BEGIN
 OPEN C1;-- Open the cursor.
 LOOP
 -- Fetch data from the cursor.
 FETCH C1 INTO DEPT_NAME, DEPT_LOC;
 EXIT WHEN C1%NOTFOUND;
 DBE_OUTPUT.PRINT_LINE(DEPT_NAME||'---'||DEPT_LOC);
 END LOOP;
 CLOSE C1;-- Close the cursor.

 OPEN C2(10);
 LOOP
 FETCH C2 INTO DEPT_NAME, DEPT_LOC;
 EXIT WHEN C2%NOTFOUND;
 DBE_OUTPUT.PRINT_LINE(DEPT_NAME||'---'||DEPT_LOC);
 END LOOP;
 CLOSE C2;

 SQL_STR := 'SELECT section_name, place_id FROM hr.sections WHERE section_id <= :DEPT_NO;';
 OPEN C3 FOR SQL_STR USING 50;
 LOOP
 FETCH C3 INTO DEPT_NAME, DEPT_LOC;
```

```
EXIT WHEN C3%NOTFOUND;
DBE_OUTPUT.PRINT_LINE(DEPT_NAME||'---'||DEPT_LOC);
END LOOP;
CLOSE C3;
END;
/

CALL cursor_proc1();

hr---1
hr---1
hr---1
cursor_proc1

(1 row)

DROP PROCEDURE cursor_proc1;
-- Give a salary raise to employees whose salary is lower than 3000 by adding 500.
CREATE TABLE hr.staffs_t1 AS TABLE hr.staffs;

CREATE OR REPLACE PROCEDURE cursor_proc2()
AS
DECLARE
V_EMPNO NUMBER(6);
V_SAL NUMBER(8,2);
CURSOR C IS SELECT staff_id, salary FROM hr.staffs_t1;
BEGIN
OPEN C;
LOOP
FETCH C INTO V_EMPNO, V_SAL;
EXIT WHEN C%NOTFOUND;
IF V_SAL<=3000 THEN
UPDATE hr.staffs_t1 SET salary =salary + 500 WHERE staff_id = V_EMPNO;
END IF;
END LOOP;
CLOSE C;
END;
/

CALL cursor_proc2();
cursor_proc2

(1 row)

-- Delete the stored procedure.
DROP PROCEDURE cursor_proc2;
DROP TABLE hr.staffs_t1;
-- Use function parameters of the SYS_REFCURSOR type.
CREATE OR REPLACE PROCEDURE proc_sys_ref(O OUT SYS_REFCURSOR)
IS
C1 SYS_REFCURSOR;
BEGIN
OPEN C1 FOR SELECT section_ID FROM HR.sections ORDER BY section_ID;
O := C1;
END;
/

DECLARE
C1 SYS_REFCURSOR;
TEMP NUMBER(4);
BEGIN
proc_sys_ref(C1);
LOOP
FETCH C1 INTO TEMP;
DBE_OUTPUT.PRINT_LINE(C1%ROWCOUNT);
EXIT WHEN C1%NOTFOUND;
END LOOP;
```

```
END;
/
1
1
ANONYMOUS BLOCK EXECUTE
-- Delete the stored procedure.
DROP PROCEDURE proc_sys_ref;
```

### 10.10.3 Implicit Cursor

Implicit cursors are automatically set by the system for non-query statements such as modify or delete operations, along with their workspace. Implicit cursors are named **SQL**, which is defined by the system.

#### Overview

Implicit cursor operations, such as definition, open, value-grant, and close operations, are automatically performed by the system and do not need users to process. Users can use only attributes related to implicit cursors to complete operations. In workspace of implicit cursors, the data of the latest SQL statement is stored and is not related to explicit cursors defined by users.

Format call: **SQL%**

#### NOTE

**INSERT**, **UPDATE**, **DELETE**, and **SELECT** statements do not need defined cursors.

#### Attributes

An implicit cursor has the following attributes:

- **SQL%FOUND**: Boolean attribute, which returns **TRUE** if the last fetch returns a row.
- **SQL%NOTFOUND**: Boolean attribute, which works opposite to the **SQL%FOUND** attribute.
- **SQL%ROWCOUNT**: numeric attribute, which returns the number of records fetched from the cursor.
- **SQL%ISOPEN**: Boolean attribute, whose value is always **FALSE**. Close implicit cursors immediately after an SQL statement is run.

#### Examples

```
-- Delete all employees in a department from the EMP table. If the department has no employees, delete
the department from the DEPT table.
CREATE TABLE hr.staffs_t1 AS TABLE hr.staffs;
CREATE TABLE hr.sections_t1 AS TABLE hr.sections;

CREATE OR REPLACE PROCEDURE proc_cursor3()
AS
DECLARE
V_DEPTNO NUMBER(4) := 100;
BEGIN
DELETE FROM hr.staffs WHERE section_ID = V_DEPTNO;
-- Proceed based on cursor status.
IF SQL%NOTFOUND THEN
DELETE FROM hr.sections_t1 WHERE section_ID = V_DEPTNO;
END IF;
END;
```

```

/
CALL proc_cursor3();
proc_cursor3

(1 row)

-- Drop the stored procedure and the temporary table.
DROP PROCEDURE proc_cursor3;
DROP TABLE hr.staffs_t1;
DROP TABLE hr.sections_t1;

```

## 10.10.4 Cursor Loop

Use of cursors in **WHILE** and **LOOP** statements is called a cursor loop. Generally, **OPEN**, **FETCH**, and **CLOSE** statements are called in this kind of loop. The following describes a loop that simplifies a cursor loop without the need for these operations. This mode is applicable to a static cursor loop, without executing four steps about a static cursor.

### Syntax

Figure 10-33 shows the syntax diagram of the **FOR AS** loop.

Figure 10-33 FOR\_AS\_loop::=

### Precautions

- The **UPDATE** operation for the queried table is not allowed in the loop statement.
- The variable *loop\_name* is automatically defined and is valid only in this loop. Its type is the same as that in the query result of *select\_statement*. The value of *loop\_name* is the query result of *select\_statement*.
- The specific type of the **loop\_name** variable is not parsed during compilation. If the specific type needs to be parsed (for example, **loop\_name** is used as the input and output parameters of an overloaded function or stored procedure), a compilation error is reported.
- The **%FOUND**, **%NOTFOUND**, and **%ROWCOUNT** attributes access the same internal variable in GaussDB. Transactions and the anonymous block do not support multiple cursor accesses at the same time.

### Examples

```

BEGIN
FOR ROW_TRANS IN
 SELECT first_name FROM hr.staffs
LOOP
 DBE_OUTPUT.PRINT_LINE (ROW_TRANS.first_name);
END LOOP;

```

```

END;
/
Tom
ANONYMOUS BLOCK EXECUTE
-- Create a table.
CREATE TABLE integerTable1(A INTEGER) DISTRIBUTE BY hash(A);
CREATE TABLE integerTable2(B INTEGER) DISTRIBUTE BY hash(B);
INSERT INTO integerTable2 VALUES(2);

-- Multiple cursors share the parameters of cursor attributes.
DECLARE
CURSOR C1 IS SELECT A FROM integerTable1;-- Declare the cursor.
CURSOR C2 IS SELECT B FROM integerTable2;
PI_A INTEGER;
PI_B INTEGER;
BEGIN
OPEN C1;-- Open the cursor.
OPEN C2;
FETCH C1 INTO PI_A; ---- The values of C1%FOUND and C2%FOUND are FALSE.
FETCH C2 INTO PI_B; ---- The values of C1%FOUND and C2%FOUND are TRUE.
-- Determine the cursor status.
IF C1%FOUND THEN
IF C2%FOUND THEN
DBE_OUTPUT.PRINT_LINE('Dual cursor share parameter.');
```

## 10.11 Advanced Packages

Advanced packages have two sets of interfaces. The first set is basic interfaces, and the second set is secondary encapsulation interfaces that are used improve usability. The second set is recommended.

### 10.11.1 Basic APIs

#### 10.11.1.1 PKG\_SERVICE

[Table 10-3](#) lists all APIs supported by the **PKG\_SERVICE** package.

**Table 10-3** PKG\_SERVICE

API	Description
<a href="#">PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE</a>	Checks whether a context is registered.
<a href="#">PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS</a>	Deregisters all registered contexts.
<a href="#">PKG_SERVICE.SQL_REGISTER_CONTEXT</a>	Registers a context.

API	Description
<a href="#">PKG_SERVICE.SQL_UNREGISTER_CONTEXT</a>	Deregisters a context.
<a href="#">PKG_SERVICE.SQL_SET_SQL</a>	Sets a SQL statement for a context. Currently, only the <b>SELECT</b> statement is supported.
<a href="#">PKG_SERVICE.SQL_RUN</a>	Executes the configured SQL statement on a context.
<a href="#">PKG_SERVICE.SQL_NEXT_ROW</a>	Reads the next row of data in a context.
<a href="#">PKG_SERVICE.SQL_GET_VALUE</a>	Reads a dynamically defined column value in a context.
<a href="#">PKG_SERVICE.SQL_SET_RESULT_TYPE</a>	Dynamically defines a column of a context based on the type OID.
<a href="#">PKG_SERVICE.JOB_CANCEL</a>	Removes a scheduled task by task ID.
<a href="#">PKG_SERVICE.JOB_FINISH</a>	Disables or enables scheduled task execution.
<a href="#">PKG_SERVICE.JOB_SUBMIT</a>	Submits a scheduled task. Job ID can be automatically generated by the system or specified manually.
<a href="#">PKG_SERVICE.JOB_UPDATE</a>	Modifies user-definable attributes of a scheduled task, including the task content, next-execution time, and execution interval.
<a href="#">PKG_SERVICE.SUBMIT_ON_NODES</a>	Submits a task to all nodes. The task ID is automatically generated by the system.
<a href="#">PKG_SERVICE.ISUBMIT_ON_NODES</a>	Submits a job to all nodes. The job ID is specified by the user.
<a href="#">PKG_SERVICE.SQL_GET_ARRAY_RESULT</a>	Obtains the array value returned in the context.
<a href="#">PKG_SERVICE.SQL_GET_VARIABLE_RESULT</a>	Obtains the column value returned in the context.

- [PKG\\_SERVICE.SQL\\_IS\\_CONTEXT\\_ACTIVE](#)

This function checks whether a context is registered. This function transfers the ID of the context to be queried. If the context exists, **TRUE** is returned. Otherwise, **FALSE** is returned.

The prototype of the **PKG\_SERVICE.SQL\_IS\_CONTEXT\_ACTIVE** function is as follows:

```
PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE(
context_id IN INTEGER
```

```
)
RETURN BOOLEAN;
```

**Table 10-4** PKG\_SERVICE.SQL\_IS\_CONTEXT\_ACTIVE parameters

Parameter	Description
context_id	ID of the context to be queried

- PKG\_SERVICE.SQL\_CLEAN\_ALL\_CONTEXTS

This function cancels all contexts.

The prototype of the **PKG\_SERVICE.SQL\_CLEAN\_ALL\_CONTEXTS** function is as follows:

```
PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS(
)
RETURN VOID;
```

- PKG\_SERVICE.SQL\_REGISTER\_CONTEXT

This function opens a context, which is the prerequisite for the subsequent operations in the context. This function does not transfer any parameter. It automatically generates context IDs in an ascending order and returns values to integer variables.

The prototype of the **PKG\_SERVICE.SQL\_REGISTER\_CONTEXT** function is as follows:

```
DBE_SQL.REGISTER_CONTEXT(
)
RETURN INTEGER;
```

- PKG\_SERVICE.SQL\_UNREGISTER\_CONTEXT

This function closes a context, which is the end of each operation in the context. If this function is not called when the stored procedure ends, the memory is still occupied by the context. Therefore, remember to close a context when you do not need to use it. If an exception occurs, the stored procedure exits but the context is not closed. Therefore, you are advised to include this interface in the exception handling of the stored procedure.

The prototype of the **PKG\_SERVICE.SQL\_UNREGISTER\_CONTEXT** function is as follows:

```
PKG_SERVICE.SQL_UNREGISTER_CONTEXT(
context_id IN INTEGER
)
RETURN INTEGER;
```

**Table 10-5** PKG\_SERVICE.SQL\_UNREGISTER\_CONTEXT interface parameters

Parameter	Description
context_id	ID of the context to be closed

- PKG\_SERVICE.SQL\_SET\_SQL

This function parses the query statement of a given context. The input query statement is executed immediately. Currently, only the **SELECT** query statement can be parsed. The statement parameters can be transferred only through the **TEXT** type. The length cannot exceed 1 GB.

The prototype of the **PKG\_SERVICE.SQL\_SET\_SQL** function is as follows:

```
PKG_SERVICE.SQL_SET_SQL(
context_id IN INTEGER,
query_string IN TEXT,
language_flag IN INTEGER
)
RETURN BOOLEAN;
```

**Table 10-6** PKG\_SERVICE.SQL\_SET\_SQL interface parameters

Parameter	Description
context_id	ID of the context whose query statement is to be parsed
query_string	Query statement to be parsed
language_flag	Version language number. Currently, only <b>1</b> is supported.

- **PKG\_SERVICE.SQL\_RUN**

This function executes a given context. It receives a context ID first, and the data obtained after execution is used for subsequent operations. Currently, only the **SELECT** query statement can be executed.

The prototype of the **PKG\_SERVICE.SQL\_RUN** function is as follows:

```
PKG_SERVICE.SQL_RUN(
context_id IN INTEGER,
)
RETURN INTEGER;
```

**Table 10-7** PKG\_SERVICE.SQL\_RUN interface parameters

Parameter	Description
context_id	ID of the context whose query statement is to be parsed

- **PKG\_SERVICE.SQL\_NEXT\_ROW**

This function returns the number of data rows returned after the SQL statement is executed. Each time the interface is executed, the system obtains a set of new rows until all data is read.

The prototype of the **PKG\_SERVICE.SQL\_NEXT\_ROW** function is as follows:

```
PKG_SERVICE.SQL_NEXT_ROW(
context_id IN INTEGER,
)
RETURN INTEGER;
```

**Table 10-8** PKG\_SERVICE.SQL\_NEXT\_ROW interface parameters

Parameter	Description
context_id	ID of the context to be executed

- **PKG\_SERVICE.SQL\_GET\_VALUE**

This function returns the context element value in a specified position of a context and accesses the data obtained by **PKG\_SERVICE.SQL\_NEXT\_ROW**.

The prototype of the **PKG\_SERVICE.SQL\_GET\_VALUE** function is as follows:

```
PKG_SERVICE.SQL_GET_VALUE(
context_id IN INTEGER,
pos IN INTEGER,
col_type IN ANYELEMENT
)
RETURN ANYELEMENT;
```

**Table 10-9** PKG\_SERVICE.SQL\_GET\_VALUE interface parameters

Parameter	Description
context_id	ID of the context to be executed
pos	Position of a dynamically defined column in the query
col_type	Variable of any type, which defines the return value type of columns

- **PKG\_SERVICE.SQL\_SET\_RESULT\_TYPE**

This function defines columns returned from a given context and can be used only for contexts defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The prototype of

**PKG\_SERVICE.SQL\_SET\_RESULT\_TYPE** is as follows:

```
PKG_SERVICE.SQL_SET_RESULT_TYPE(
context_id IN INTEGER,
pos IN INTEGER,
coltype_oid IN ANYELEMENT,
maxsize IN INTEGER
)
RETURN INTEGER;
```

**Table 10-10** PKG\_SERVICE.SQL\_SET\_RESULT\_TYPE interface parameters

Parameter	Description
context_id	ID of the context to be executed
pos	Position of a dynamically defined column in the query
coltype_oid	Variable of any type. The OID of the corresponding type can be obtained based on the variable type.
maxsize	Length of a defined column

- **PKG\_SERVICE.JOB\_CANCEL**

The stored procedure **CANCEL** deletes a specified task.

The prototype of the **PKG\_SERVICE.JOB\_CANCEL** function is as follows:

```
PKG_SERVICE.JOB_CANCEL(
job IN INTEGER);
```

**Table 10-11** PKG\_SERVICE.JOB\_CANCEL interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
id	integer	IN	No	Specifies the job ID.

Example:

```
CALL PKG_SERVICE.JOB_CANCEL(101);
```

- **PKG\_SERVICE.JOB\_FINISH**

The stored procedure **FINISH** disables or enables a scheduled task.

The prototype of the **PKG\_SERVICE.JOB\_FINISH** function is as follows:

```
PKG_SERVICE.JOB_FINISH(
id IN INTEGER,
broken IN BOOLEAN,
next_time IN TIMESTAMP DEFAULT sysdate);
```

**Table 10-12** PKG\_SERVICE.JOB\_FINISH interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
id	integer	IN	No	Specifies the job ID.
broken	Boolean	IN	No	Specifies the status flag, <b>true</b> for broken and <b>false</b> for not broken. The current job is updated based on the parameter value <b>true</b> or <b>false</b> . If the parameter is left empty, the job status remains unchanged.
next_time	timestamp	IN	Yes	Specifies the next execution time. The default value is the current system time. If <b>broken</b> is set to <b>true</b> , <b>next_time</b> is updated to '4000-1-1'. If <b>broken</b> is set to <b>false</b> and <b>next_time</b> is not empty, <b>next_time</b> is updated for the job. If <b>next_time</b> is empty, it will not be updated. This parameter can be omitted, and its default value will be used in this case.

- **PKG\_SERVICE.JOB\_SUBMIT**

The stored procedure **JOB\_SUBMIT** submits a scheduled task provided by the system.

The prototype of the **PKG\_SERVICE.JOB\_SUBMIT** function is as follows:

```
PKG_SERVICE.JOB_SUBMIT(
id IN BIGINT,
content IN TEXT,
next_date IN TIMESTAMP DEFAULT sysdate,
interval_time IN TEXT DEFAULT 'null',
job OUT INTEGER);
```

 **NOTE**

When a scheduled task (using **JOB**) is created, the system binds the current database and the username to the task by default. This function can be called by using **call** or **select**. If you call this function by using **select**, there is no need to specify output parameters. To call this function within a stored procedure, use **perform**. If the committed SQL statement task uses a non-public schema, specify the schema to a table schema or a function schema, or add **set current\_schema = xxx** before the SQL statement.

**Table 10-13** PKG\_SERVICE.JOB\_SUBMIT interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
id	bigint	IN	No	Specifies the job ID. If the input ID is <b>NULL</b> , a job ID is generated internally.
context	text	IN	No	Specifies the SQL statement to be executed. One or multiple DMLs, anonymous blocks, and statements for calling stored procedures, or all three combined are supported.
next_time	timestamp	IN	No	Specifies the next time the job will be executed. The default value is the current system time ( <b>sysdate</b> ). If the specified time has past, the job is executed at the time it is submitted.
interval_time	text	IN	Yes	Calculates the next time to execute the job. It can be an interval expression, or <b>sysdate</b> followed by a numeric value, for example, <b>sysdate+1.0/24</b> . If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward.
job	integer	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When <b>pkg_service.job_submit</b> is called using <b>select</b> , this parameter can be omitted.

Example:

```
SELECT PKG_SERVICE.JOB_SUBMIT(NULL, 'call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate
+1');

SELECT PKG_SERVICE.JOB_SUBMIT(NULL, 'call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate
+1.0/24');

CALL PKG_SERVICE.JOB_SUBMIT(NULL, 'INSERT INTO T_JOB VALUES(1); call pro_1(); call pro_2();',
add_months(to_date('201701','yyyymm'),1), 'date_trunc(''day'',SYSDATE) + 1 +(8*60+30.0)/
(24*60)' ,:jobid);

SELECT PKG_SERVICE.JOB_SUBMIT (101, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
```

- **PKG\_SERVICE.JOB\_UPDATE**

The stored procedure **UPDATE** modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

The prototype of the **PKG\_SERVICE.JOB\_UPDATE** function is as follows:

```
PKG_SERVICE.JOB_UPDATE(
id IN BIGINT,
next_time IN TIMESTAMP,
interval_time IN TEXT,
content IN TEXT);
```

**Table 10-14** PKG\_SERVICE.JOB\_UPDATE interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
id	integer	IN	No	Specifies the job ID.
next_time	timestamp	IN	Yes	Specifies the next execution time. If this parameter is left empty, the system does not update the <b>next_time</b> parameter for the specified job. Otherwise, the system updates the <b>next_time</b> parameter for the specified job.
interval_time	text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the <b>interval_time</b> parameter for the specified job. Otherwise, the system updates the <b>interval_time</b> parameter for the specified job after necessary validity check. If this parameter is set to <b>null</b> , the job will be executed only once, and the job status will change to <b>'d'</b> afterward.

Parameter	Type	Input/Output Parameter	Empty or Not	Description
content	text	IN	Yes	Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the <b>content</b> parameter for the specified job. Otherwise, the system updates the <b>content</b> parameter for the specified job.

Example:

```
CALL PKG_SERVICE.JOB_UPDATE(101, sysdate, 'sysdate + 1.0/1440', 'call userproc();');
CALL PKG_SERVICE.JOB_UPDATE(101, sysdate, 'sysdate + 1.0/1440', 'insert into tbl_a values(sysdate);');
```

- **PKG\_SERVICE.SUBMIT\_ON\_NODES**

The stored procedure **SUBMIT\_ON\_NODES** creates a scheduled task on all CNs and DNs. Only users **sysadmin** and **monitor admin** have this permission.

The prototype of the **PKG\_SERVICE.SUBMIT\_ON\_NODES** function is as follows:

```
PKG_SERVICE.SUBMIT_ON_NODES(
node_name IN NAME,
database IN NAME,
what IN TEXT,
next_date IN TIMESTAMP WITHOUT TIME ZONE,
job_interval IN TEXT,
job OUT INTEGER);
```

**Table 10-15** PKG\_SERVICE.SUBMIT\_ON\_NODES interface parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
node_name	text	IN	No	Specifies the job execution node. Currently, the value can only be <b>ALL_NODE</b> (indicating that the job is executed on all nodes) or <b>CCN</b> (indicating that the job is executed on the central coordinator node).
database	text	IN	No	Database used by a cluster job. When the node type is <b>ALL_NODE</b> , the value can only be <b>postgres</b> .

Parameter	Type	Input/Output Parameter	Empty or Not	Description
what	text	IN	No	Specifies the SQL statement to be executed. One or multiple DMLs, anonymous blocks, and statements for calling stored procedures, or all three combined are supported.
nextdate	timestamp	IN	No	Specifies the next time the job will be executed. The default value is the current system time ( <b>sysdate</b> ). If the specified time has past, the job is executed at the time it is submitted.
job_interval	text	IN	No	Calculates the next time to execute the job. It can be an interval expression, or <b>sysdate</b> followed by a numeric value, for example, <b>sysdate+1.0/24</b> . If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward.
job	integer	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When <b>dbms.submit_on_nodes</b> is called using <b>select</b> , this parameter can be omitted.

Example:

```
select pkg_service.submit_on_nodes('ALL_NODE', 'postgres', 'select
capture_view_to_json("dbe_perf.statement", 0);', sysdate, 'interval "60 second"');
select pkg_service.submit_on_nodes('CCN', 'postgres', 'select
capture_view_to_json("dbe_perf.statement", 0);', sysdate, 'interval "60 second"');
```

- **PKG\_SERVICE.ISUBMIT\_ON\_NODES**  
**ISUBMIT\_ON\_NODES** has the same syntax function as **SUBMIT\_ON\_NODES**, but the first parameter of **ISUBMIT\_ON\_NODES** is an input parameter, that is, a specified task ID. In contrast, that last parameter of **ISUBMIT\_ON\_NODES** is an output parameter, indicating the task ID automatically generated by the system. Only users **sysadmin** and **monitor admin** have this permission.

- **PKG\_SERVICE.SQL\_GET\_ARRAY\_RESULT**

This function is used to return the value of the bound OUT parameter of the array type and obtain the OUT parameter in a stored procedure.

The prototype of the **PKG\_SERVICE.SQL\_GET\_ARRAY\_RESULT** function is as follows:

```
PKG_SERVICE.SQL_GET_ARRAY_RESULT(
 context_id in int,
 pos in VARCHAR2,
 column_value inout anyarray,
 result_type in anyelement
);
```

**Table 10-16** PKG\_SERVICE.SQL\_GET\_ARRAY\_RESULT parameters

Parameter	Description
context_id	ID of the context to be queried
pos	Name of the bound parameter
column_value	Return value
result_type	Return type

- PKG\_SERVICE.SQL\_GET\_VARIABLE\_RESULT

This function is used to return the value of the bound OUT parameter of the non-array type and obtain the OUT parameter in a stored procedure.

The prototype of the **PKG\_SERVICE.SQL\_GET\_VARIABLE\_RESULT** function is as follows:

```
PKG_SERVICE.SQL_GET_VARIABLE_RESULT(
 context_id in int,
 pos in VARCHAR2,
 result_type in anyelement
)
RETURNS anyelement;
```

**Table 10-17** PKG\_SERVICE.SQL\_GET\_VARIABLE\_RESULT parameters

Parameter	Description
context_id	ID of the context to be queried
pos	Name of the bound parameter
result_type	Return type

### 10.11.1.2 PKG\_UTIL

**Table 10-18** lists all APIs supported by the PKG\_UTIL package.

**Table 10-18** PKG\_UTIL

API	Description
PKG_UTIL.LOB_GET_LENGTH	Obtains the length of a LOB.
PKG_UTIL.LOB_READ	Reads a part of a LOB.
PKG_UTIL.LOB_WRITE	Writes the source object to the target object in the specified format.
PKG_UTIL.LOB_APPEND	Appends the source LOB to the target LOB.
PKG_UTIL.LOB_COMPARE	Compares two LOBs based on the specified length.

API	Description
PKG_UTIL.LOB_MATCH	Returns the position of the <i>M</i> th occurrence of a character string in a LOB.
PKG_UTIL.LOB_RESET	Resets the character in specified position of a LOB to a specified character.
PKG_UTIL.LOB_GET_LENGTH	Obtains and returns the specified length of a LOB.
PKG_UTIL.LOB_READ_HUGE	Reads a part of the LOB content based on the specified length and initial position offset, and returns the read LOB and length.
PKG_UTIL.LOB_WRITEAPPEND_HUGE	Reads the content of a specified length from the source BLOB or CLOB, appends the content to the target BLOB or CLOB, and returns the target object.
PKG_UTIL.LOB_APPEND_HUGE	Appends the source BLOB or CLOB to the target BLOB/CLOB and returns the target object.
PKG_UTIL.READ_BFILE_TO_BLOB	Loads the source BFILE file to the target BLOB and returns the target object.
PKG_UTIL.LOB_COPY_HUGE	Reads the content of a specified length from the specified offset position of the source BLOB or CLOB, writes the content to the specified offset position of the target BLOB or CLOB, and returns the target object.
PKG_UTIL.BLOB_RESET	Sets a segment of data in a BLOB to the specified value and returns the processed BLOB and the actually processed length.
PKG_UTIL.CLOB_RESET	Sets a segment of data in a CLOB to spaces and returns the processed CLOB and the actually processed length.
PKG_UTIL.LOADBLOBFROMFILE	Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target BLOB, and returns the target object, read position, and write position.

API	Description
PKG_UTIL.LOADCLOBFROMFILE	Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target CLOB, and returns the target object, read position, and write position.
PKG_UTIL.LOB_CONVERTTOBLOB_HUGE	Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a BLOB, and writes the BLOB to the specified position of target LOB. <i>amount</i> indicates the length to be converted.
PKG_UTIL.LOB_CONVERTTOCLOB_HUGE	Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a CLOB, and writes the CLOB to the specified position of target LOB. <i>amount</i> indicates the length to be converted.
PKG_UTIL.BFILE_GET_LENGTH	Obtains and returns the specified length of a BFILE file.
PKG_UTIL.BFILE_OPEN	Opens a BFILE file and returns its file descriptor.
PKG_UTIL.BFILE_CLOSE	Closes a BFILE file.
PKG_UTIL.LOB_WRITE_HUGE	Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.
PKG_UTIL.IO_PRINT	Displays character strings.
PKG_UTIL.RAW_GET_LENGTH	Obtains the length of <b>RAW</b> data.
PKG_UTIL.RAW_CAST_FROM_VARCHAR2	Converts <b>VARCHAR2</b> data to <b>RAW</b> data.
PKG_UTIL.RAW_CAST_FROM_BINARY_INTEGER	Converts binary integers to <b>RAW</b> data.
PKG_UTIL.RAW_CAST_TO_BINARY_INTEGER	Converts <b>RAW</b> data to binary integers.
PKG_UTIL.SET_RANDOM_SEED	Sets a random seed.

API	Description
PKG_UTIL.RANDOM_GET_VALUE	Returns a random value.
PKG_UTIL.FILE_SET_DIRNAME	Sets the directory to be operated.
PKG_UTIL.FILE_OPEN	Opens a file based on the specified file name and directory.
PKG_UTIL.FILE_SET_MAX_LINE_SIZE	Sets the maximum length of a line to be written to a file.
PKG_UTIL.FILE_IS_CLOSE	Checks whether a file handle is closed.
PKG_UTIL.FILE_READ	Reads data of a specified length from an open file handle.
PKG_UTIL.FILE_READLINE	Reads a line of data from an open file handle.
PKG_UTIL.FILE_WRITE	Writes the data specified in the buffer to a file.
PKG_UTIL.FILE_WRITELINE	Writes the buffer to a file and adds newline characters.
PKG_UTIL.FILE_NEWLINE	Adds a line.
PKG_UTIL.FILE_READ_RAW	Reads binary data of a specified length from an open file handle.
PKG_UTIL.FILE_WRITE_RAW	Writes binary data to a file.
PKG_UTIL.FILE_FLUSH	Writes data from a file handle to a physical file.
PKG_UTIL.FILE_CLOSE	Closes an open file handle.
PKG_UTIL.FILE_REMOVE	Deletes a physical file. To do so, you must have the corresponding permission.
PKG_UTIL.FILE_RENAME	Renames a file on the disk, similar to <b>mv</b> in Unix.
PKG_UTIL.FILE_SIZE	Returns the size of a file.
PKG_UTIL.FILE_BLOCK_SIZE	Returns the number of blocks contained in a file.
PKG_UTIL.FILE_EXISTS	Checks whether a file exists.
PKG_UTIL.FILE_GETPOS	Specifies the offset of a returned file, in bytes.
PKG_UTIL.FILE_SEEK	Sets the offset for file position.
PKG_UTIL.FILE_CLOSE_ALL	Closes all file handles opened in a session.

API	Description
PKG_UTIL.EXCEPTION_REPORT_ERROR	Throws an exception.
pkg_util.gs_compile_schema	<p>Recompiles specified schemas, functions, and stored procedures. If an error is reported when compiling a PL/SQL object, the exception is captured and the recompilation continues to compile other objects until all objects are compiled or the number of recompilation attempts reaches the upper limit.</p> <p>When the advanced package is executed through JDBC, the SQLSTATE 00000 is displayed, which indicates that the operation is successful. For details, see "Standard SQL Error Codes" in <i>Error Code Reference</i>.</p>

- PKG\_UTIL.LOB\_GET\_LENGTH

Obtains the length of the input data.

The prototype of the PKG\_UTIL.LOB\_GET\_LENGTH function is as follows:

```

PKG_UTIL.LOB_GET_LENGTH(
lob IN CLOB
)
RETURN INTEGER;

PKG_UTIL.LOB_GET_LENGTH(
lob IN BLOB
)
RETURN INTEGER;

```

**Table 10-19** PKG\_UTIL.LOB\_GET\_LENGTH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	clob / blob	IN	No	Indicates the object whose length is to be obtained.

- PKG\_UTIL.LOB\_READ

Reads an object and returns the specified part.

The prototype of the PKG\_UTIL.LOB\_READ function is as follows:

```

PKG_UTIL.LOB_READ(
lob IN anyelement,
len IN int,
start IN int,
mode IN int
)

```

```
)
RETURN ANYELEMENT
```

**Table 10-20** PKG\_UTIL.LOB\_READ parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	clob/blob	IN	No	Specifies CLOB or BLOB data.
len	int	IN	No	Specifies the length of the returned result.
start	int	IN	No	Specifies the offset to the first character.
mode	int	IN	No	Specifies the type of the read operation. <b>0</b> indicates <b>READ</b> , <b>1</b> indicates <b>TRIM</b> , and <b>2</b> indicates <b>SUBSTR</b> .

- PKG\_UTIL.LOB\_WRITE

This function writes the source object to the target object based on the specified parameters and returns the target object.

The prototype of the PKG\_UTIL.LOB\_WRITE function is as follows:

```
PKG_UTIL.LOB_WRITE(
dest_lob INOUT blob,
src_lob IN raw
len IN int,
start_pos IN bigint
)
RETURN BLOB;
PKG_UTIL.LOB_WRITE(
dest_lob INOUT clob,
src_lob IN varchar2
len IN int,
start_pos IN bigint
)
RETURN CLOB;
```

**Table 10-21** PKG\_UTIL.LOB\_WRITE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	clob/blob	INOUT	No	Specifies the target object that data will be written to.
src_lob	clob/blob	IN	No	Specifies the source object to be written.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
len	int	IN	No	Specifies the write length of the source object.
start_pos	bigint	IN	No	Specifies the write start position of the target object.

- **PKG\_UTIL.LOB\_APPEND**

Appends the source object to the target BLOB/CLOB and returns the target BLOB/CLOB.

The prototype of the PKG\_UTIL.LOB\_APPEND function is as follows:

```

PKG_UTIL.LOB_APPEND(
dest_lob INOUT blob,
src_lob IN blob,
len IN int default NULL
)
RETURN BLOB;

PKG_UTIL.LOB_APPEND(
dest_lob INOUT clob,
src_lob IN clob,
len IN int default NULL
)
RETURN CLOB;

```

**Table 10-22** PKG\_UTIL.LOB\_APPEND parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	blob / clob	INOUT	No	Specifies the target BLOB/CLOB that data will be written to.
src_lob	blob / clob	IN	No	Specifies the source BLOB/CLOB to be written.
len	int	IN	Yes	Length read from <i>src</i> and appended to <i>dest</i> . The default value is null, indicating that all content of <i>src</i> is read and appended to <i>dest</i> .

- **PKG\_UTIL.LOB\_COMPARE**

Checks whether objects are the same based on the specified start position and size. If **lob1** is larger, **1** is returned. If **lob2** is larger, **-1** is returned. If **lob1** is equal to **lob2**, **0** is returned.

The prototype of the PKG\_UTIL.LOB\_COMPARE function is as follows:

```

PKG_UTIL.LOB_COMPARE(
lob1 IN anyelement,
lob2 IN anyelement,
len IN int default 1073741771,
start_pos1 IN int default 1,
start_pos2 IN int default 1
)
RETURN INTEGER;

```

**Table 10-23** PKG\_UTIL.LOB\_COMPARE parameters

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
lob1	clob/blob	IN	No	Indicates the character string for comparison.
lob2	clob/blob	IN	No	Indicates the character string for comparison.
len	int	IN	No	Indicates the length to be compared.
start_pos1	int	IN	No	Specifies the start offset of <b>lob1</b> .
start_pos2	int	IN	No	Specifies the start offset of <b>lob2</b> .

- **PKG\_UTIL.LOB\_MATCH**

Returns the position where a pattern is displayed in a LOB for the *match\_nth* time.

The prototype of the PKG\_UTIL.LOB\_MATCH function is as follows:

```

PKG_UTIL.LOB_MATCH(
lob IN anyelement,
pattern IN anyelement,
start IN int,
match_nth IN int default 1
)
RETURN INTEGER;

```

**Table 10-24** PKG\_UTIL.LOB\_MATCH parameters

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
lob	clob/blob	IN	No	Indicates the character string for comparison.
pattern	clob/blob	IN	No	Specifies the pattern to be matched.
start	int	IN	No	Specifies the start position for LOB comparison.
match_nth	int	IN	No	Specifies the matching times.

- PKG\_UTIL.LOB\_RESET

Clears a character string and resets the string to the value of **value**.

The prototype of the PKG\_UTIL.LOB\_RESET function is as follows:

```
PKG_UTIL.LOB_RESET(
lob IN blob,
len IN int,
start IN int,
value IN int default 0
)
RETURN record;
```

**Table 10-25** PKG\_UTIL.LOB\_RESET parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	blob	IN	No	Indicates the character string for reset.
len	int	IN	No	Specifies the length of the string to be reset.
start	int	IN	No	Specifies the start position for reset.
value	int	IN	Yes	Sets characters. Default value: '0'

- PKG\_UTIL.LOB\_GET\_LENGTH

Obtains and returns the specified length of a LOB.

The prototype of the PKG\_UTIL.LOB\_GET\_LENGTH function is as follows:

```
PKG_UTIL.LOB_GET_LENGTH(
lob IN blob)
RETURN BIGINT;
```

```
PKG_UTIL.LOB_GET_LENGTH(
lob IN clob)
RETURN BIGINT;
```

**Table 10-26** PKG\_UTIL.LOB\_GET\_LENGTH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	BLOB/ CLOB	IN	No	LOB type

**PKG\_UTIL.LOB\_READ\_HUGE**

Reads a part of the LOB content based on the specified length and initial position offset, and returns the read LOB and length.

The prototype of the PKG\_UTIL.LOB\_READ\_HUGE function is as follows:

```
PKG_UTIL.LOB_READ_HUGE(
lob IN CLOB,
len IN BIGINT,
start_pos IN BIGINT,
mode IN INTEGER)
RETURN RECORD;
```

```
PKG_UTIL.LOB_READ_HUGE(
lob IN BLOB,
len IN BIGINT,
start_pos IN BIGINT,
mode IN INTEGER)
RETURN RECORD;
```

```
PKG_UTIL.LOB_READ_HUGE(
fd IN INTEGER,
len IN BIGINT,
start_pos IN BIGINT,
mode IN INTEGER)
RETURN RECORD;
```

**Table 10-27** PKG\_UTIL.LOB\_READ\_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob/fd	BLOB/ CLOB/ INTEGER	IN	No	File descriptor of the specified LOB or BFILE file.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
len	BIGINT	IN	No	Length to read.
start_pos	BIGINT	IN	No	Offset position from which read starts.
mode	INTEGER	IN	No	Read mode ( <b>0</b> : read, <b>1</b> : trim, <b>2</b> : substr).

- **PKG\_UTIL.LOB\_WRITEAPPEND\_HUGE**

Reads the content of a specified length from the source BLOB or CLOB, appends the content to the target BLOB or CLOB, and returns the target object.

The prototype of the PKG\_UTIL.LOB\_WRITEAPPEND\_HUGE function is as follows:

```
PKG_UTIL.LOB_WRITEAPPEND_HUGE(
 dest_lob INOUT CLOB,
 len IN INTEGER,
 src_lob IN VARCHAR2
)RETURN CLOB;

PKG_UTIL.LOB_WRITEAPPEND_HUGE(
 dest_lob INOUT BLOB,
 len IN INTEGER,
 src_lob IN RAW
)RETURN BLOB;
```

**Table 10-28** PKG\_UTIL.LOB\_WRITEAPPEND\_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB/CLOB	INOUT	No	Target BLOB/CLOB to which data is written.
len	INTEGER	IN	Yes	Length of the source object to be written. If the value is <b>NULL</b> , the entire source object is written by default.
src_lob	VARCHAR2/RAW	IN	No	BLOB/CLOB from which data is to be written.

- **PKG\_UTIL.LOB\_APPEND\_HUGE**

Appends the source BLOB or CLOB to the target BLOB/CLOB and returns the target object.

The prototype of the PKG\_UTIL.LOB\_APPEND\_HUGE function is as follows:

```
PKG_UTIL.LOB_APPEND_HUGE(
 dest_lob INOUT BLOB,
 src_lob IN BLOB)
RETURN BLOB;
PKG_UTIL.LOB_APPEND_HUGE(
 dest_lob INOUT CLOB,
 src_lob IN CLOB)
RETURN CLOB;
```

**Table 10-29** PKG\_UTIL.LOB\_APPEND\_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB/CLOB	INOUT	No	Target BLOB/CLOB to which data is written.
src_lob	BLOB/CLOB	IN	No	BLOB/CLOB from which data is to be written.

- **PKG\_UTIL.READ\_BFILE\_TO\_BLOB**

Loads the source BFILE file to the target BLOB and returns the target object.

The prototype of the PKG\_UTIL.READ\_BFILE\_TO\_BLOB function is as follows:

```
PKG_UTIL.READ_BFILE_TO_BLOB(
 fd IN INTEGER)
RETURN BLOB;
```

**Table 10-30** PKG\_UTIL.READ\_BFILE\_TO\_BLOB parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
fd	BFILE	IN	No	Source BFILE file to be read.

- **PKG\_UTIL.LOB\_COPY\_HUGE**

Reads the content of a specified length from the specified offset position of the source BLOB or CLOB, writes the content to the specified offset position of the target BLOB or CLOB, and returns the target object.

The prototype of the PKG\_UTIL.LOB\_COPY\_HUGE function is as follows:

```
PKG_UTIL.LOB_COPY_HUGE(
 lob_obj INOUT BLOB,
```

```

source_obj IN BLOB,
amount IN BIGINT,
dest_offset IN BIGINT DEFAULT 1,
src_offset IN BIGINT DEFAULT 1
)RETURN BLOB;

PKG_UTIL.LOB_COPY_HUGE(
lob_obj INOUT CLOB,
source_obj IN CLOB,
amount IN BIGINT,
dest_offset IN BIGINT DEFAULT 1,
src_offset IN BIGINT DEFAULT 1
)RETURN CLOB;

```

**Table 10-31** PKG\_UTIL.LOB\_COPY\_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob_obj	BLOB/CLOB	INOUT	No	Target BLOB/CLOB.
source_obj	BLOB/CLOB	IN	No	Source BLOB/CLOB.
amount	BIGINT	IN	No	Length of the data to be copied (in bytes for BLOBs or in characters for CLOBs).
dest_offset	BIGINT	IN	No	Offset position of the target LOB to which the data is loaded.
src_offset	BIGINT	IN	No	Offset position of the source LOB from which the data is read.

- **PKG\_UTIL.BLOB\_RESET**

Sets a segment of data in a BLOB to the specified value and returns the processed BLOB and the actually processed length.

The prototype of the PKG\_UTIL.BLOB\_RESET function is as follows:

```

PKG_UTIL.BLOB_RESET(
lob INOUT BLOB,
len INOUT BIGINT,
start_pos IN BIGINT DEFAULT 1,
value IN INTEGER DEFAULT 0
)RETURN RECORD;

```

**Table 10-32** PKG\_UTIL.BLOB\_RESET parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	BLOB	INOUT	No	LOB to be reset.
len	INTEGER	INOUT	No	Length to reset, in bytes.
start	INTEGER	IN	No	Specifies the start position for reset.
value	INTEGER	IN	Yes	Sets characters. Default value: '0'.

- PKG\_UTIL.CLOB\_RESET  
Sets a piece of data to spaces.

The prototype of the PKG\_UTIL.CLOB\_RESET function is as follows:

```
PKG_UTIL.CLOB_RESET(
 lob INOUT CLOB,
 len INOUT BIGINT,
 start_pos IN BIGINT DEFAULT 1
)RETURN RECORD;
```

**Table 10-33** PKG\_UTIL.CLOB\_RESET parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	CLOB	INOUT	No	LOB to be reset.
len	INTEGER	INOUT	No	Length to reset, in characters.
start	INTEGER	IN	No	Reset start position. The default value is 1.

- PKG\_UTIL.LOADBLOBFROMFILE  
Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target BLOB, and returns the target object, read position, and write position.

The prototype of the PKG\_UTIL.LOADBLOBFROMFILE function is as follows:

```
PKG_UTIL.LOADBLOBFROMFILE(
 dest_lob INOUT BLOB,
 fd IN INTEGER,
 amount IN BIGINT,
 dest_offset INOUT BIGINT,
 file_offset INOUT BIGINT
)RETURN RECORD;
```

**Table 10-34** PKG\_UTIL.LOADBLOBFROMFILE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB	INOUT	No	Target BLOB as the INOUT parameter.
fd	INTEGER	IN	No	File descriptor of the source BFILE object.
amount	BIGINT	IN	No	Length of the data to be copied (in bytes for BLOBs or in characters for CLOBs).
dest_offset	BIGINT	INOUT	No	Offset position of the target LOB to which the data is written as the INOUT parameter.
src_offset	BIGINT	INOUT	No	Offset position of the source BFILE file from which the data is read as the INOUT parameter.

- PKG\_UTIL.LOADCLOBFROMFILE

Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target CLOB, and returns the target object, read position, and write position.

The prototype of the PKG\_UTIL.LOADCLOBFROMFILE function is as follows:

```
PKG_UTIL.LOADCLOBFROMFILE(
 dest_lob INOUT CLOB,
 fd IN INTEGER,
 amount IN BIGINT,
 dest_offset INOUT BIGINT,
 file_offset INOUT BIGINT
)RETURN RECORD;
```

**Table 10-35** PKG\_UTIL.LOADCLOBFROMFILE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	CLOB	INOUT	No	Target CLOB as the INOUT parameter.
fd	INTEGER	IN	No	File descriptor of the source BFILE object.
amount	BIGINT	IN	No	Length to copy (in characters for CLOBs).
dest_offset	BIGINT	INOUT	No	Offset position of the target LOB to which the data is written as the INOUT parameter.
src_offset	BIGINT	INOUT	No	Offset position of the source BFILE file from which the data is read as the INOUT parameter.

- PKG\_UTIL.LOB\_CONVERTTOBLOB\_HUGE

Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a BLOB, and writes the BLOB to the specified position of target LOB. *amount* indicates the length to be converted.

The prototype of the PKG\_UTIL.LOB\_CONVERTTOBLOB\_HUGE function is as follows:

```
PKG_UTIL.LOB_CONVERTTOBLOB_HUGE(
 dest_lob INOUT BLOB,
 src_clob IN CLOB,
 amount IN BIGINT,
 dest_offset INOUT BIGINT,
 src_offset INOUT BIGINT)
)RETURN RECORD;
```

**Table 10-36** PKG\_UTIL.LOB\_CONVERTTOBLOB\_HUGE parameters

Parameter	Description
dest_lob	Target LOB.
src_clob	CLOB to be converted.
amount	Length to convert, in characters.
dest_offset	Offset position of the target LOB to which the data is written as the INOUT parameter.
src_offset	Offset position of the source CLOB from which the data is read as the INOUT parameter.

- **PKG\_UTIL.LOB\_CONVERTTOCLOB\_HUGE**  
Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a CLOB, and writes the CLOB to the specified position of target LOB. *amount* indicates the length to be converted.

The prototype of the PKG\_UTIL.LOB\_CONVERTTOCLOB\_HUGE function is as follows:

```
PKG_UTIL.LOB_CONVERTTOCLOB_HUGE(
 dest_lob INOUT CLOB,
 src_blob IN BLOB,
 amount IN BIGINT,
 dest_offset INOUT BIGINT,
 src_offset INOUT BIGINT)
)RETURN RECORD;
```

**Table 10-37** PKG\_UTIL.LOB\_CONVERTTOCLOB\_HUGE parameters

Parameter	Description
dest_lob	Target LOB.
src_blob	BLOB to be converted.
amount	Length to convert, in bytes.
dest_offset	Offset position of the target LOB to which the data is written as the INOUT parameter.
src_offset	Offset position of the source CLOB from which the data is read as the INOUT parameter.

- **PKG\_UTIL.BFILE\_GET\_LENGTH**  
Obtains and returns the specified length of a BFILE file.

The prototype of the PKG\_UTIL.BFILE\_GET\_LENGTH function is as follows:

```
PKG_UTIL.BFILE_GET_LENGTH(
 fd INTEGER
)RETURN BIGINT;
```

**Table 10-38** PKG\_UTIL.LOB\_GET\_LENGTH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
fd	INTEGER	IN	No	File descriptor of the specified BFILE file.

- **PKG\_UTIL.BFILE\_OPEN**  
Opens a BFILE file and returns its file descriptor.

The prototype of the PKG\_UTIL.BFILE\_OPEN function is as follows:

```
PKG_UTIL.BFILE_OPEN(
 file_name TEXT,
```

```
open_mode TEXT)
RETURN INTEGER;
```

**Table 10-39** PKG\_UTIL.BFILE\_OPEN parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file_name	TEXT	IN	No	Name of the specified BFILE file.
open_mode	TEXT	IN	No	Open mode, which can only be set to r, that is, the read mode.

- PKG\_UTIL.BFILE\_CLOSE

Closes a BFILE file.

The prototype of the PKG\_UTIL.BFILE\_CLOSE function is as follows:

```
PKG_UTIL.BFILE_CLOSE(
 fd INTEGER)
RETURN bool;
```

**Table 10-40** PKG\_UTIL.BFILE\_CLOSE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
fd	INTEGER	IN	No	File descriptor of the specified BFILE file.

- PKG\_UTIL.LOB\_WRITE\_HUGE

Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.

The prototype of the PKG\_UTIL.LOB\_WRITE\_HUGE function is as follows:

```
PKG_UTIL.LOB_WRITE_HUGE(
 dest_lob INOUT BLOB,
 len IN INTEGER,
 start_pos IN BIGINT,
 src_lob IN RAW
)RETURN BLOB;

PKG_UTIL.LOB_WRITE_HUGE(
 dest_lob INOUT CLOB,
 len IN INTEGER,
 start_pos IN BIGINT,
 src_lob IN VARCHAR2
)RETURN CLOB;
```

**Table 10-41** PKG\_UTIL.LOB\_WRITE\_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB/CLOB	INOUT	No	Target LOB as the INOUT parameter, to which the content is to be written.
len	INTEGER	IN	No	Length of the data to be written (in bytes for BLOBs or in characters for CLOBs)
start_pos	BIGINT	IN	No	Offset position for writing data to <i>dest_lob</i>
src_lob	RAW/VARCHAR2	IN	No	Source LOB.

- PKG\_UTIL.IO\_PRINT

Outputs a string.

The prototype of the PKG\_UTIL.IO\_PRINT function is as follows:

```
PKG_UTIL.IO_PRINT(
format IN text,
is_one_line IN boolean
)
RETURN void;
```

**Table 10-42** PKG\_UTIL.IO\_PRINT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
format	text	IN	No	Indicates the character string to be output.
is_one_line	boolean	IN	No	Indicates whether to output the string as a line.

- PKG\_UTIL.RAW\_GET\_LENGTH

Obtains the length of RAW data.

The prototype of the PKG\_UTIL.RAW\_GET\_LENGTH function is as follows:

```
PKG_UTIL.RAW_GET_LENGTH(
value IN raw
)
RETURN integer;
```

**Table 10-43** PKG\_UTIL.RAW\_GET\_LENGTH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
raw	raw	IN	No	Indicates the object whose length is to be obtained.

- PKG\_UTIL.RAW\_CAST\_FROM\_VARCHAR2

Converts VARCHAR2 data to RAW data.

The prototype of the PKG\_UTIL.RAW\_CAST\_FROM\_VARCHAR2 function is as follows:

```
PKG_UTIL.RAW_CAST_FROM_VARCHAR2(
str IN varchar2
)
RETURN raw;
```

**Table 10-44** PKG\_UTIL.RAW\_CAST\_FROM\_VARCHAR2 parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
str	varchar2	IN	No	Indicates the source data to be converted

- PKG\_UTIL.RANDOM\_SET\_SEED

Sets a random seed.

The prototype of the **PKG\_UTIL.RANDOM\_SET\_SEED** function is as follows:

```
PKG_UTIL.RANDOM_SET_SEED(
seed IN int
)
RETURN integer;
```

**Table 10-45** PKG\_UTIL.RANDOM\_SET\_SEED parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
seed	int	IN	No	Sets a random seed.

- PKG\_UTIL.RANDOM\_GET\_VALUE

Returns a 15-digit random number ranging from 0 to 1.

The prototype of the PKG\_UTIL.RANDOM\_GET\_VALUE function is as follows:

```
PKG_UTIL.RANDOM_GET_VALUE(
)
RETURN numeric;
```

- **PKG\_UTIL.FILE\_SET\_DIRNAME**  
Sets the directory to be operated. It must be called to set directory for each operation involving a single directory.

The prototype of the **PKG\_UTIL.FILE\_SET\_DIRNAME** function is as follows:

```
PKG_UTIL.FILE_SET_DIRNAME(
dir IN text
)
RETURN bool
```

**Table 10-46** PKG\_UTIL.FILE\_SET\_DIRNAME parameters

Parameter	Description
dirname	Directory of a file. It is a string, indicating an object name. <b>NOTE</b> File directories need to be added to the system catalog <b>PG_DIRECTORY</b> . If the input path does not match the path in <b>PG_DIRECTORY</b> , an error indicating that the path does not exist will be reported. Functions that involve <b>location</b> as parameters also comply with this rule.

- **PKG\_UTIL.FILE\_OPEN**  
Opens a file. A maximum of 50 files can be opened at a time. This function returns a handle of the INTEGER type.

The prototype of the **PKG\_UTIL.FILE\_OPEN** function is as follows:

```
PKG_UTIL.FILE_OPEN(
file_name IN text,
open_mode IN integer)
```

**Table 10-47** PKG\_UTIL.FILE\_OPEN parameters

Parameter	Description
file_name	File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the <b>OPEN</b> function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).
open_mode	File opening mode, including <b>r</b> (read), <b>w</b> (write), and <b>a</b> (append). <b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- **PKG\_UTIL.FILE\_SET\_MAX\_LINE\_SIZE**  
Sets the maximum length of a line to be written to a file.

The prototype of the **PKG\_UTIL.FILE\_SET\_MAX\_LINE\_SIZE** function is as follows:

```
PKG_UTIL.FILE_SET_MAX_LINE_SIZE(
max_line_size in integer)
RETURN BOOL
```

**Table 10-48** PKG\_UTIL.FILE\_SET\_MAX\_LINE\_SIZE parameters

Parameter	Description
max_line_size	Maximum number of characters in each line, including newline characters. The minimum value is <b>1</b> and the maximum is <b>32767</b> . If this parameter is not specified, the default value <b>1024</b> is used.

- PKG\_UTIL.FILE\_IS\_CLOSE

Checks whether a file handle is closed.

The prototype of the PKG\_UTIL.FILE\_IS\_CLOSE function is as follows:

```
PKG_UTIL.FILE_IS_CLOSE(
file IN integer
)
RETURN BOOL
```

**Table 10-49** PKG\_UTIL.FILE\_IS\_CLOSE parameters

Parameter	Description
file	Opened file handle

- PKG\_UTIL.FILE\_READ

Reads a line of data from an open file handle based on the specified length.

The prototype of the PKG\_UTIL.FILE\_READ function is as follows:

```
PKG_UTIL.FILE_READ(
file IN integer,
buffer OUT text,
len IN bigint default 1024)
```

**Table 10-50** PKG\_UTIL.FILE\_READ parameters

Parameter	Description
file	File handle opened by calling the <b>OPEN</b> function. The file must be opened in read mode. Otherwise, the <b>INVALID_OPERATION</b> exception is thrown.
buffer	Buffer used to receive data
len	Number of bytes read from a file

- PKG\_UTIL.FILE\_READLINE

Reads a line of data from an open file handle based on the specified length.

The prototype of the PKG\_UTIL.FILE\_READLINE function is as follows:

```
PKG_UTIL.FILE_READLINE(
file IN integer,
buffer OUT text,
len IN integer default NULL)
```

**Table 10-51** PKG\_UTIL.FILE\_READLINE parameters

Parameter	Description
file	File handle opened by calling the <b>OPEN</b> function. The file must be opened in read mode. Otherwise, the <b>INVALID_OPERATION</b> exception is thrown.
buffer	Buffer used to receive data
len	Number of bytes read from a file. The default value is <b>NULL</b> . If the default value <b>NULL</b> is used, <b>max_line_size</b> is used to specify the line size.

- PKG\_UTIL.FILE\_WRITE

Writes the data specified in the buffer to a file.

The prototype of the PKG\_UTIL.FILE\_WRITE function is as follows:

```
PKG_UTIL.FILE_WRITE(
file in integer,
buffer in text
)
RETURN BOOL
```

**Table 10-52** PKG\_UTIL.FILE\_WRITE parameters

Parameter	Description
file	Opened file handle
buffer	Text data to be written to a file. The maximum buffer size is 32767 bytes. If no value is specified, the default value is 1024 bytes. Before the writing is performed, the buffer occupied by <b>PUT</b> operations cannot exceed 32767 bytes.  <b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- PKG\_UTIL.FILE\_NEWLINE

Writes a line terminator to an open file. The line terminator is related to the platform.

The prototype of the PKG\_UTIL.FILE\_NEWLINE function is as follows:

```
PKG_UTIL.FILE_NEWLINE(
file in integer
)
RETURN BOOL
```

**Table 10-53** PKG\_UTIL.FILE\_NEWLINE parameters

Parameter	Description
file	Opened file handle

- PKG\_UTIL.FILE\_WRITELINE

Writes a line to a file.

The prototype of the PKG\_UTIL.FILE\_WRITELINE function is as follows:

```
PKG_UTIL.FILE_WRITELINE(
file in integer,
buffer in text
)
RETURN BOOL
```

**Table 10-54** PKG\_UTIL.FILE\_WRITELINE parameters

Parameter	Description
file	Opened file handle
buffer	Content to be written

- PKG\_UTIL.FILE\_READ\_RAW

Reads binary data of a specified length from an open file handle and returns the read binary data. The return type is RAW.

The prototype of the PKG\_UTIL.FILE\_READ\_RAW function is as follows:

```
PKG_UTIL.FILE_READ_RAW(
file in integer,
length in integer default NULL
)
RETURN raw
```

**Table 10-55** PKG\_UTIL.FILE\_READ\_RAW parameters

Parameter	Description
file	Opened file handle
length	Length of the data to be read. The default value is <b>NULL</b> . By default, all data in the file is read. The maximum size is 1 GB.

- PKG\_UTIL.FILE\_WRITE\_RAW

Writes the input binary object of the RAW type to an open file. If the insertion is successful, **true** is returned.

The prototype of the PKG\_UTIL.FILE\_WRITE\_RAW function is as follows:

```
PKG_UTIL.FILE_WRITE_RAW(
file in integer,
r in raw
)
RETURN BOOL
```

**Table 10-56** PKG\_UTIL.FILE\_WRITE\_RAW parameters

Parameter	Description
file	Opened file handle

Parameter	Description
r	Data to be written to the file  <b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- **PKG\_UTIL.FILE\_FLUSH**

Data in a file handle must be written into a physical file. Data in the buffer must have a line terminator. Refresh is important if a file must be read when it is opened. For example, debugging information can be refreshed to a file so that it can be read immediately.

The prototype of the PKG\_UTIL.FILE\_FLUSH function is as follows:

```
PKG_UTIL.FILE_FLUSH (
file in integer
)
RETURN VOID
```

**Table 10-57** PKG\_UTIL.FILE\_FLUSH parameters

Parameter	Description
file	Opened file handle

- **PKG\_UTIL.FILE\_CLOSE**

Closes an open file handle.

The prototype of the PKG\_UTIL.FILE\_CLOSE function is as follows:

```
PKG_UTIL.FILE_CLOSE (
file in integer
)
RETURN BOOL
```

**Table 10-58** PKG\_UTIL.FILE\_CLOSE parameters

Parameter	Description
file	Opened file handle

- **PKG\_UTIL.FILE\_REMOVE**

Deletes a disk file. To perform this operation, you must have required permissions.

The prototype of the PKG\_UTIL.FILE\_REMOVE function is as follows:

```
PKG_UTIL.FILE_REMOVE(
file_name in text
)
RETURN VOID
```

**Table 10-59** PKG\_UTIL.FILE\_REMOVE parameters

Parameter	Description
file_name	Name of the file to be deleted

- PKG\_UTIL.FILE\_RENAME

Renames a file on the disk, similar to mv in Unix.

The prototype of the PKG\_UTIL.FILE\_RENAME function is as follows:

```
PKG_UTIL.FILE_RENAME(
src_dir in text,
src_file_name in text,
dest_dir in text,
dest_file_name in text,
overwrite boolean default false)
```

**Table 10-60** PKG\_UTIL.FILE\_RENAME parameters

Parameter	Description
src_dir	Source file directory (case-sensitive) <b>NOTE</b> <ul style="list-style-type: none"> <li>• Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>• When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul>
src_file_name	Source file name
dest_dir	Target file directory (case-sensitive) <b>NOTE</b> <ul style="list-style-type: none"> <li>• Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>• When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul>
dest_file_name	Target file name
overwrite	The default value is <b>false</b> . If a file with the same name exists in the destination directory, the file will not be rewritten.

- PKG\_UTIL.FILE\_SIZE

Returns the size of a specified file.

The prototype of the PKG\_UTIL.FILE\_SIZE function is as follows:

```
bigint PKG_UTIL.FILE_SIZE(
file_name in text
)return bigint
```

**Table 10-61** PKG\_UTIL.FILE\_SIZE parameters

Parameter	Description
file_name	File name

- PKG\_UTIL.FILE\_BLOCK\_SIZE

Returns the number of blocks contained in a specified file.

The prototype of the PKG\_UTIL.FILE\_BLOCK\_SIZE function is as follows:

```
bigint PKG_UTIL.FILE_BLOCK_SIZE(
file_name in text
)return bigint
```

**Table 10-62** PKG\_UTIL.FILE\_BLOCK\_SIZE parameters

Parameter	Description
file_name	File name

- PKG\_UTIL.FILE\_EXISTS

Checks whether a file exists.

The prototype of the PKG\_UTIL.FILE\_EXISTS function is as follows:

```
PKG_UTIL.FILE_EXISTS(
file_name in text
)
RETURN BOOL
```

**Table 10-63** PKG\_UTIL.FILE\_EXISTS parameters

Parameter	Description
file_name	File name

- PKG\_UTIL.FILE\_GETPOS

Specifies the offset of a returned file, in bytes.

The prototype of the PKG\_UTIL.FILE\_GETPOS function is as follows:

```
PKG_UTIL.FILE_GETPOS(
file in integer
)
RETURN BIGINT
```

**Table 10-64** PKG\_UTIL.FILE\_GETPOS parameters

Parameter	Description
file	Opened file handle

- **PKG\_UTIL.FILE\_SEEK**

Adjusts the position of a file pointer forward or backward based on the specified number of bytes.

The prototype of the PKG\_UTIL.FILE\_SEEK function is as follows:

```
void PKG_UTIL.FILE_SEEK(
file in integer,
start in bigint
)
RETURN VOID
```

**Table 10-65** PKG\_UTIL.FILE\_SEEK parameters

Parameter	Description
file	Opened file handle
start	File offset, in bytes.

- **PKG\_UTIL.FILE\_CLOSE\_ALL**

Closes all file handles opened in a session.

The prototype of the PKG\_UTIL.FILE\_CLOSE\_ALL function is as follows:

```
PKG_UTIL.FILE_CLOSE_ALL(
)
RETURN VOID
```

**Table 10-66** PKG\_UTIL.FILE\_CLOSE\_ALL parameters

Parameter	Description
None	None

- **PKG\_UTIL.EXCEPTION\_REPORT\_ERROR**

Throws an exception.

The prototype of the PKG\_UTIL.EXCEPTION\_REPORT\_ERROR function is as follows:

```
PKG_UTIL.EXCEPTION_REPORT_ERROR(
code integer,
log text,
flag boolean DEFAULT false
)
RETURN INTEGER
```

**Table 10-67** PKG\_UTIL.EXCEPTION\_REPORT\_ERROR parameters

Parameter	Description
code	Error code displayed when an exception occurs.
log	Log information displayed when an exception occurs.
flag	Reserved. The default value is <b>false</b> .

- **PKG\_UTIL.app\_read\_client\_info**

Reads the client information.

The prototype of the **PKG\_UTIL.app\_read\_client\_info** function is as follows:

```
PKG_UTIL.app_read_client_info(
OUT buffer text
)return text
```

**Table 10-68** PKG\_UTIL.app\_read\_client\_info parameters

Parameter	Description
buffer	Client information returned

- **PKG\_UTIL.app\_set\_client\_info**

Sets the client information.

The prototype of the **PKG\_UTIL.app\_set\_client\_info** function is as follows:

```
PKG_UTIL.app_set_client_info(
str text
)
```

**Table 10-69** PKG\_UTIL.app\_set\_client\_info parameters

Parameter	Description
str	Client information to be set

- **PKG\_UTIL.lob\_converttoblob**

Converts a CLOB to a BLOB. **amount** indicates the conversion length.

The prototype of the **PKG\_UTIL.lob\_converttoblob** function is as follows:

```
PKG_UTIL.lob_converttoblob(
dest_lob blob,
src_clob clob,
amount integer,
dest_offset integer,
src_offset integer
)return raw
```

**Table 10-70** PKG\_UTIL.lob\_converttoblob parameters

Parameter	Description
dest_lob	Target LOB
src_clob	CLOB to be converted
amount	Conversion length
dest_offset	Start position of the target LOB
src_offset	Start position of the source CLOB

- **PKG\_UTIL.lob\_converttoclob**

Converts a BLOB to a CLOB. **amount** indicates the conversion length.

The prototype of the PKG\_UTIL.lob\_converttoclob function is as follows:

```
PKG_UTIL.lob_converttoclob(
dest_lob clob,
src_blob blob,
amount integer,
dest_offset integer,
src_offset integer
)return text
```

**Table 10-71** PKG\_UTIL.lob\_converttoclob parameters

Parameter	Description
dest_lob	Target LOB
src_blob	BLOB to be converted
amount	Conversion length
dest_offset	Start position of the target LOB
src_offset	Start position of the source CLOB

- PKG\_UTIL.lob\_texttoraw

Converts the text type to the raw type.

The prototype of the PKG\_UTIL.lob\_texttoraw function is as follows:

```
PKG_UTIL.lob_texttoraw(
src_lob clob
)
RETURN raw
```

**Table 10-72** PKG\_UTIL.lob\_texttoraw parameters

Parameter	Description
src_lob	LOB to be converted

- PKG\_UTIL.match\_edit\_distance\_similarity

Calculates the difference between two character strings.

The prototype of the PKG\_UTIL.match\_edit\_distance\_similarity function is as follows:

```
PKG_UTIL.match_edit_distance_similarity(
str1 text,
str2 text
)
RETURN INTEGER
```

**Table 10-73** PKG\_UTIL.match\_edit\_distance\_similarity parameters

Parameter	Description
str1	First character string
str2	Second character string

- **PKG\_UTIL.raw\_cast\_to\_varchar2**

Converts from the raw type to the varchar2 type.

The prototype of the PKG\_UTIL.raw\_cast\_to\_varchar2 function is as follows:

```
PKG_UTIL.raw_cast_to_varchar2(
str raw
)
RETURN varchar2
```

**Table 10-74** PKG\_UTIL.raw\_cast\_to\_varchar2 parameters

Parameter	Description
str	Hexadecimal string

- **PKG\_UTIL.session\_clear\_context**

Clears the session context.

The prototype of the PKG\_UTIL.session\_clear\_context function is as follows:

```
PKG_UTIL.session_clear_context(
namespace text,
client_identifier text,
attribute text
)
RETURN INTEGER
```

**Table 10-75** PKG\_UTIL.session\_clear\_context parameters

Parameter	Description
namespace	Namespace of an attribute.
client_identifier	Usually same as the value of <b>namespace</b> . If this parameter is set to <b>null</b> , all namespaces are modified by default.
attribute	Attribute value to be cleared

- **PKG\_UTIL.session\_search\_context**

Searches for an attribute value.

The prototype of the PKG\_UTIL.session\_clear\_context function is as follows:

```
PKG_UTIL.session_clear_context(
namespace text,
attribute text
)
RETURN INTEGER
```

**Table 10-76** PKG\_UTIL.session\_clear\_context parameters

Parameter	Description
namespace	Namespace of an attribute.
attribute	Attribute value to be cleared

- **PKG\_UTIL.session\_set\_context**

Sets an attribute value.

The prototype of the `PKG_UTIL.session_set_context` function is as follows:

```
PKG_UTIL.session_set_context(
namespace text,
attribute text,
value text
)
RETURN INTEGER
```

**Table 10-77** `PKG_UTIL.session_set_context` parameters

Parameter	Description
namespace	Namespace of an attribute.
attribute	Attribute to be set.
value	Attribute value.

- `PKG_UTIL.utility_get_time`

Prints the Unix timestamp.

The prototype of the `PKG_UTIL.utility_get_time` function is as follows:

```
PKG_UTIL.utility_get_time()
RETURN bigint
```

- `PKG_UTIL.utility_format_error_backtrace`

Displays the error stack of a stored procedure.

The prototype of the `PKG_UTIL.utility_format_error_backtrace` function is as follows:

```
PKG_UTIL.utility_format_error_backtrace()
RETURN text
```

- `PKG_UTIL.utility_format_error_stack`

Displays the error information of a stored procedure.

The prototype of the `PKG_UTIL.utility_format_error_stack` function is as follows:

```
PKG_UTIL.utility_format_error_stack()
RETURN text
```

- `PKG_UTIL.utility_format_call_stack`

Displays the call stack of a stored procedure.

The prototype of the `PKG_UTIL.utility_format_call_stack` function is as follows:

```
PKG_UTIL.utility_format_call_stack()
RETURN text
```

### 10.11.1.3 DBE\_XML

**Table 10-78** lists all interfaces supported by the `DBE_XML` interface.

**Table 10-78** `DBE_XML` parameters

Interface	Description
<a href="#">dbe_xml.xml_free_parser</a>	Frees a parser.

Interface	Description
<a href="#">dbe_xml.xml_parser_get_doc</a>	Obtains the parsed document node.
<a href="#">dbe_xml.xml_get_validation_mode</a>	Obtains the validation attribute.
<a href="#">dbe_xml.xml_new_parser</a>	Creates a parser instance.
<a href="#">dbe_xml.xml_parse_buffer</a>	Parses the VARCHAR string.
<a href="#">dbe_xml.xml_parse_clob</a>	Parses the CLOB string.
<a href="#">dbe_xml.xml_set_validation_mode</a>	Sets the validation attribute.
<a href="#">dbe_xml.xml_dom_append_child</a>	Adds the newchild node to the end of the parent(n) node and returns the newly added node.
<a href="#">dbe_xml.xml_dom_create_element</a>	Returns the DOMELEMENT object with the specified name.
<a href="#">dbe_xml.xml_dom_create_element_ns</a>	Returns the DOMELEMENT object with the specified name and namespace.
<a href="#">dbe_xml.xml_dom_create_text_node</a>	Creates and returns a DOMText object.
<a href="#">dbe_xml.xml_dom_free_document</a>	Frees a specified XML DOM object.
<a href="#">dbe_xml.xml_dom_free_element</a>	Frees a specified XML DOM object.
<a href="#">dbe_xml.xml_dom_free_node</a>	Frees a DOMNode node.
<a href="#">dbe_xml.xml_dom_free_nodelist</a>	Frees a DOMNodeList node.
<a href="#">dbe_xml.xml_dom_get_attribute</a>	Obtains the attributes of a specified XML DOM object.
<a href="#">dbe_xml.xml_dom_get_attributes</a>	Returns the attribute values of a DOMNode node as a map.
<a href="#">dbe_xml.xml_dom_get_child_nodes</a>	Converts several subnodes under a node into a node list.
<a href="#">dbe_xml.xml_dom_get_children_by_tagname</a>	Obtains the list of specified subnodes of a specified XML DOM object.
<a href="#">dbe_xml.xml_dom_get_children_by_tagname_ns</a>	Obtains the list of subnodes in the specified namespace of a specified XML DOM object.
<a href="#">dbe_xml.xml_dom_get_document_element</a>	Returns the first subnode of the specified document.
<a href="#">dbe_xml.xml_dom_get_first_child</a>	Returns the first subnode of a node.

Interface	Description
<a href="#">dbe_xml.xml_dom_get_last_child</a>	Returns the last subnode of a node.
<a href="#">dbe_xml.xml_dom_get_length...</a>	Returns the number of nodes based on the content in the node of the specified type.
<a href="#">dbe_xml.xml_dom_get_local_name...</a>	Returns the local name of the given object.
<a href="#">dbe_xml.xml_dom_get_named_item</a>	Returns the node specified by name.
<a href="#">dbe_xml.xml_dom_get_named_item_ns</a>	Returns the node specified by name and namespace.
<a href="#">dbe_xml.xml_dom_get_next_siblings</a>	Returns the next node of the specified node.
<a href="#">dbe_xml.xml_dom_get_node_name</a>	Returns the name of a node.
<a href="#">dbe_xml.xml_dom_get_node_type</a>	Returns the type of a node.
<a href="#">dbe_xml.xml_dom_get_node_value</a>	Returns the value of a DOMNode node.
<a href="#">dbe_xml.xml_dom_get_parent...</a>	Returns the parent node of the given DOMNode node.
<a href="#">dbe_xml.xml_dom_get_tagname</a>	Obtains the tag name of a specified XML DOM object.
<a href="#">dbe_xml.xml_dom_has_child...</a>	Checks whether the DOMNode object has any subnode.
<a href="#">dbe_xml.xml_dom_import_node</a>	Copies a node to another node and mounts the copied node to a specified document.
<a href="#">dbe_xml.xml_dom_is_null</a>	Checks whether the given object is null.
<a href="#">dbe_xml.xml_dom_item</a>	Returns the element corresponding to the index in a list or map based on the index.
<a href="#">dbe_xml.xml_dom_make_element</a>	Returns the DOMELEMENT object after conversion.
<a href="#">dbe_xml.xml_dom_makenode</a>	Converts the given object to the DOMNode type.
<a href="#">dbe_xml.xml_dom_new_dom_document_empty</a>	Returns a new DOMDocument object.
<a href="#">xml_dom_new_dom_document_clob</a>	Returns a new DOMDocument instance object created from the specified CLOB type.

Interface	Description
<a href="#">dbe_xml.xml_dom_new_document_xmltype</a>	Returns a new DOMDocument instance object created from the specified XMLType type.
<a href="#">dbe_xml.xml_dom_set_attribute</a>	Sets the attributes of a specified XML DOM object.
<a href="#">dbe_xml.xml_dom_set_charset</a>	Sets the character set for a DOMDocument object.
<a href="#">dbe_xml.xml_dom_set_doctype</a>	Sets the external DTD of a DOMDocument object.
<a href="#">dbe_xml.xml_dom_set_node...</a>	Sets the value of a node in the DOMNode object.
<a href="#">dbe_xml.xml_dom_write_to_buffer_doc</a>	Writes the given DOMDocument object to the buffer.
<a href="#">dbe_xml.xml_dom_write_to_buffer_node</a>	Writes the given DOMNode object to the buffer.
<a href="#">dbe_xml.xml_dom_write_to_clob_doc</a>	Writes the given DOMDocument object to a CLOB.
<a href="#">dbe_xml.xml_dom_write_to_clob_node</a>	Writes the given DOMNode object to a CLOB.
<a href="#">dbe_xml.xml_dom_write_to_file_doc</a>	Writes an XML node to a specified file using the database character set.
<a href="#">dbe_xml.xml_dom_write_to_file_node</a>	Writes an XML node to a specified file using the database character set.
<a href="#">dbe_xml.xml_dom_get_session_tree_num</a>	Displays the number of DOM trees of all types in the current session.
<a href="#">dbe_xml.xml_dom_get_doc_trees_info</a>	Displays statistics such as the memory usage and number of nodes of the DOM tree of the document type.
<a href="#">dbe_xml.xml_dom_get_detail_doc_tree_info</a>	Displays the number of nodes of each type for a specific document variable.

- [dbe\\_xml.xml\\_free\\_parser](#)

Frees a given parser object.

The stored procedure prototype of [dbe\\_xml.xml\\_free\\_parser](#) is as follows:

```
dbe_xml.xml_free_parser(
id IN raw(13))
returns void;
```

**Table 10-79** dbexml.xml\_free\_parser parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	Parser object

- `dbexml.xml_parser_get_doc`  
Returns the root node of the DOM tree document constructed by the parser.  
The prototype of the `dbexml.xml_parser_get_doc` function is as follows:

```
dbexml.xml_parser_get_doc(
id IN raw(13))
returns raw(13);
```

**Table 10-80** dbexml.xml\_parser\_get\_doc parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	Parser object

 **NOTE**

- If the `GETDOCUMENT` function is empty, null is returned.
- If the parser input by the `GETDOCUMENT` function has not parsed any document, null is returned.
- `dbexml.xml_get_validation_mode`  
Obtains the parsing validation mode of a specified parser. If DTD validation is enabled, **TRUE** is returned. Otherwise, **FALSE** is returned.

The prototype of the `dbexml.xml_get_validation_mode` function is as follows:

```
dbexml.xml_get_validation_mode(
id raw(13))
returns bool;
```

**Table 10-81** dbexml.xml\_get\_validation\_mode parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	Parser object

- `dbexml.xml_new_parser`  
Creates a parser object and returns a new parser instance.  
The prototype of the `dbexml.xml_new_parser` function is as follows:

```
dbexml.xml_new_parser()
RETURNS RAW(13);
```

- `dbe_xml.xml_parse_buffer`

Parses XML documents stored in strings.

The stored procedure prototype of `dbe_xml.xml_parse_buffer` is as follows:

```
dbe_xml.xml_parse_buffer(
id RAW(13),
xmlstr VARCHAR2)
RETURNS void;
```

**Table 10-82** `dbe_xml.xml_parse_buffer` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	Parser object
xmlstr	VARCHAR2	IN	No	A string that stores XML documents

 **NOTE**

- The maximum length of a character string that can be parsed by the `xml_parse_buffer` function is 32767. If the length exceeds the maximum, an error is reported.
- Different from the ORA database, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsed, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK[check]Check) "Ch..."** reports an error because the default value "Ch..." is not an enumerated value in the brackets. However, the ORA database does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case sensitive. **Baidu** cannot correspond to **baidu**. However, the ORA database does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the ORA database reports an error.
- Difference in parsing XML predefined entities: **&apos;** and **&quot;** are parsed and translated into ' and ". However, predefined entities in database ORA are not translated into characters.

- `dbe_xml.xml_parse_clob`

Parses XML documents stored in a CLOB.

The stored procedure prototype of `dbe_xml.xml_parse_clob` is as follows:

```
dbe_xml.xml_parse_clob(
id IN raw(13),
doc IN CLOB)
returns void;
```

**Table 10-83** dbe\_xml.xml\_parse\_clob parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	Parser object
doc	CLOB	IN	No	A string that stores XML documents

 **NOTE**

- xml\_parse\_clob cannot parse CLOBs larger than 1 GB.
  - Different from the ORA database, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsed, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
  - DTD validation differences:
    - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value "Ch..." is not an enumerated value in the brackets. However, the ORA database does not report this error.
    - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case sensitive. **Baidu** cannot correspond to **baidu**. However, the ORA database does not report this error.
  - Namespace validation difference: Undeclared namespace tags are parsed. However, the ORA database reports an error.
  - Difference in parsing XML predefined entities: **&apos;** and **&quot;** are parsed and translated into ' and ". However, predefined entities in database ORA are not translated into characters.
- dbe\_xml.xml\_set\_validation\_mode

Sets the parsing validation mode of a specified parser.

The stored procedure prototype of dbe\_xml.xml\_set\_validation\_mode is as follows:

```
dbe_xml.xml_set_validation_mode(
id raw(13),
validate boolean)
returns void;
```

**Table 10-84** dbe\_xml.xml\_set\_validation\_mode parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	Parser object

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
validate	boolean	IN	Yes	Mode to be set: <ul style="list-style-type: none"> <li>• <b>TRUE</b>: DTD validation is enabled.</li> <li>• <b>FALSE</b>: DTD validation is disabled.</li> </ul>

 **NOTE**

- If the input parameter **validate** of the `xml_set_validation_mode` function is null, the parsing validation mode of the parser is not changed.
- By default, the DTD validation is enabled during parser initialization.

- `db_xml.xml_dom_append_child`

Adds the newchild node to the end of the parent(n) node and returns the newly added node.

The stored procedure prototype of `db_xml.xml_dom_append_child` is as follows:

```
db_xml.xml_dom_append_child(
 parentId IN RAW(13),
 childId IN RAW(13)
)
RETURNS RAW(13);
```

**Table 10-85** `db_xml.xml_dom_append_child` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
parentId	raw(13)	IN	No	XML DOM object
childId	raw(13)	IN	No	XML DOM object

- `db_xml.xml_dom_create_element`

Returns the `DOMElement` object with the specified name.

The prototype of the `db_xml.xml_dom_create_element` function is as follows:

```
db_xml.xml_dom_create_element(
 id IN RAW(13),
 tagname IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-86** dbexml.xml\_dom\_create\_element parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object
tagname	VARCHAR2	IN	No	Name of the new DOMELEMENT object

- dbexml.xml\_dom\_create\_element\_ns**  
 Returns the DOMELEMENT object with the specified name and namespace.  
 The prototype of the dbexml.xml\_dom\_create\_element\_ns function is as follows:

```

dbexml.xml_dom_create_element_ns(
 id IN RAW(13),
 tagname IN VARCHAR2,
 ns IN VARCHAR2
)
RETURNS RAW(13);

```

**Table 10-87** dbexml.xml\_dom\_create\_element\_ns parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object
tagname	VARCHAR2	IN	No	Name of the new DOMELEMENT object
ns	VARCHAR2	IN	No	Namespace

- dbexml.xml\_dom\_create\_text\_node**  
 Creates and returns a DOMTEXT object.  
 The prototype of the dbexml.xml\_dom\_create\_text\_node function is as follows:

```

dbexml.xml_dom_create_text_node(
 id IN RAW(13),
 data IN VARCHAR2
)
RETURNS RAW(13);

```

**Table 10-88** dbexml.xml\_dom\_create\_text\_node parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object
data	VARCHAR2	IN	No	Content of the new DOMText node

- dbexml.xml\_dom\_free\_document

Frees a specified XML DOM object.

The stored procedure prototype of dbexml.xml\_dom\_free\_document is as follows:

```
dbexml.xml_dom_free_document(
 id RAW(13)
)
RETURNS void;
```

**Table 10-89** dbexml.xml\_dom\_free\_document parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- dbexml.xml\_dom\_free\_element

Frees a specified XML DOM object.

The stored procedure prototype of dbexml.xml\_dom\_free\_element is as follows:

```
dbexml.xml_dom_free_element (
 id RAW(13)
)
RETURNS void;
```

**Table 10-90** dbexml.xml\_dom\_free\_element parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- dbexml.xml\_dom\_free\_node

Frees a DOMNode node.

The prototype of the dbexml.xml\_dom\_free\_node function is as follows:

```
dbexml.xml_dom_free_node (
 id RAW(13)
)
```

```
)
RETURNS void;
```

**Table 10-91** dbexml.xml\_dom\_free\_node parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- dbexml.xml\_dom\_free\_nodelist

Frees a DOMNodeList node.

The stored procedure prototype of dbexml.xml\_dom\_free\_nodelist is as follows:

```
dbexml.xml_dom_free_nodelist(
 id IN RAW(13),
 node_value IN VARCHAR2
)
RETURNS VOID
```

**Table 10-92** dbexml.xml\_dom\_free\_nodelist parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- dbexml.xml\_dom\_get\_attribute

Obtains the attributes of a specified XML DOM object.

The stored procedure prototype of dbexml.xml\_dom\_get\_attribute is as follows:

```
dbexml.xml_dom_get_attribute (
 docid IN RAW(13),
 name IN VARCHAR2
)
RETURNS VARCHAR2;
```

**Table 10-93** dbexml.xml\_dom\_get\_attribute parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
docid	raw(13)	IN	No	XML DOM object
name	VARCHAR2	IN	No	String

- `db_xml.xml_dom_get_attributes`

Returns the attribute values of a DOMNode node as a map.

The prototype of the `db_xml.xml_dom_get_attributes` function is as follows:

```
db_xml.xml_dom_get_attributes (
 id RAW(13)
)
RETURNS RAW(13);
```

**Table 10-94** `db_xml.xml_dom_get_attributes` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- `db_xml.xml_dom_get_child_nodes`

Converts several subnodes under a node into a node list.

The prototype of the `db_xml.xml_dom_get_child_nodes` function is as follows:

```
db_xml.xml_dom_get_child_nodes(
 id IN RAW(13)
)
RETURNS RAW(13);
```

**Table 10-95** `db_xml.xml_dom_get_child_nodes` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- `db_xml.xml_dom_get_children_by_tagname`

Obtains the list of specified subnodes of a specified XML DOM object.

The stored procedure prototype of `db_xml.xml_dom_get_children_by_tagname` is as follows:

```
db_xml.xml_dom_get_children_by_tagname (
 docid IN RAW(13),
 name IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-96** `db_xml.xml_dom_get_children_by_tagname` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
docid	raw(13)	IN	No	XML DOM object

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	VARCHAR2	IN	No	String

- `dbexml.xml_dom_get_children_by_tagname_ns`

Obtains the list of subnodes in the specified namespace of a specified XML DOM object.

The stored procedure prototype of `dbexml.xml_dom_get_children_by_tagname_ns` is as follows:

```
dbexml.xml_dom_get_children_by_tagname_ns (
 docid IN RAW(13),
 name IN VARCHAR2,
 ns IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-97** `dbexml.xml_dom_get_children_by_tagname_ns` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
docid	raw(13)	IN	No	XML DOM object
name	VARCHAR2	IN	No	String
ns	VARCHAR2	IN	Yes	String

- `dbexml.xml_dom_get_document_element`

Returns the first subnode of the specified document.

The stored procedure prototype of `dbexml.xml_dom_get_document_element` is as follows:

```
dbexml.xml_dom_get_document_element(
 id RAW(13)
)
RETURNS RAW(13);
```

**Table 10-98** `dbexml.xml_dom_get_document_element` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- `dbexml.xml_dom_get_first_child`

Returns the first subnode of a node.

The prototype of the `dbexml.xml_dom_get_first_child` function is as follows:

```

dbe_xml.xml_dom_get_first_child(
 id IN RAW(13)
)
RETURNS RAW(13);

```

**Table 10-99** dbe\_xml.xml\_dom\_get\_first\_child parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- dbe\_xml.xml\_dom\_get\_last\_child

Returns the last subnode of a node.

The prototype of the dbe\_xml.xml\_dom\_get\_last\_child function is as follows:

```

dbe_xml.xml_dom_get_last_child(
 id IN RAW(13)
)
RETURNS RAW(13);

```

**Table 10-100** dbe\_xml.xml\_dom\_get\_last\_child parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- dbe\_xml.xml\_dom\_get\_length

Returns the number of nodes based on the content in the node of the specified type.

The stored procedure prototype of dbe\_xml.xml\_dom\_get\_length is as follows:

```

dbe_xml.xml_dom_get_length(
 id RAW(13)
)
RETURNS VOID;

```

**Table 10-101** dbe\_xml.xml\_dom\_get\_length parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object

- dbe\_xml.xml\_dom\_get\_localname

Returns the local name of the given object.

The stored procedure prototype of `dbexml.xml_dom_get_localname` is as follows:

```
dbexml.xml_dom_get_localname (
 id RAW(13)
)
RETURNS VARCHAR2;
```

**Table 10-102** `dbexml.xml_dom_get_localname` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object

- `dbexml.xml_dom_get_named_item`

Returns the node specified by name.

The prototype of the `dbexml.xml_dom_get_named_item` function is as follows:

```
dbexml.xml_dom_get_named_item(
 id IN RAW(13),
 nodeName IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-103** `dbexml.xml_dom_get_named_item` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object
nodeName	VARCHAR2	IN	No	Name of the element to be retrieved

- `dbexml.xml_dom_get_named_item_ns`

Returns the node specified by name and namespace.

The prototype of the `dbexml.xml_dom_get_named_item_ns` function is as follows:

```
dbexml.xml_dom_get_named_item_ns(
 id RAW(13),
 nodeName IN VARCHAR2,
 ns IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-104** dbexml.xml\_dom\_get\_named\_item\_ns parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object
nodeName	VARCHAR2	IN	No	Name of the element to be retrieved
ns	VARCHAR2	IN	Yes	Namespace

- dbexml.xml\_dom\_get\_next\_sibling

Returns the next node of the specified node.

The prototype of the dbexml.xml\_dom\_get\_next\_sibling function is as follows:

```
dbexml.xml_dom_get_next_sibling(
 id IN RAW(13)
)
RETURNS RAW(13);
```

**Table 10-105** dbexml.xml\_dom\_get\_next\_sibling parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- dbexml.xml\_dom\_get\_node\_name

Returns the name of a node.

The prototype of the dbexml.xml\_dom\_get\_node\_name function is as follows:

```
dbexml.xml_dom_get_node_name(
 id IN RAW(13)
)
RETURNS VARCHAR2;
```

**Table 10-106** dbexml.xml\_dom\_get\_node\_name parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- dbexml.xml\_dom\_get\_node\_type

Returns the type of a node.

The prototype of the `db_xml.xml_dom_get_node_type` function is as follows:

```
db_xml.xml_dom_get_node_type(
 id IN RAW(13)
)
RETURNS INTEGER;
```

**Table 10-107** `db_xml.xml_dom_get_node_type` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- `db_xml.xml_dom_get_node_value`

Returns the value of a DOMNode node.

The stored procedure prototype of `db_xml.xml_dom_get_node_value` is as follows:

```
db_xml.xml_dom_get_node_value(
 id IN RAW(13))
RETURNS VARCHAR2;
```

**Table 10-108** `db_xml.xml_dom_get_node_value` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object

- `db_xml.xml_dom_get_parent_node`

Returns the parent node of the given DOMNode node.

The stored procedure prototype of `db_xml.xml_dom_get_parent_node` is as follows:

```
db_xml.xml_dom_get_parent_node(
 id IN RAW(13))
RETURNS RAW(13);
```

**Table 10-109** `db_xml.xml_dom_get_parent_node` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object

- `db_xml.xml_dom_get_tagname`

Obtains the tag name of a specified XML DOM object.

The stored procedure prototype of `dbexml.xml_dom_get_tagname` is as follows:

```
dbexml.xml_dom_get_tagname (
 docid RAW(13)
)
RETURNS VARCHAR2;
```

**Table 10-110** `dbexml.xml_dom_get_tagname` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
docid	raw(13)	IN	Yes	XML DOM object

- `dbexml.xml_dom_has_child_nodes`

Checks whether the DOMNode object has any subnode.

The stored procedure prototype of `dbexml.xml_dom_has_child_nodes` is as follows:

```
dbexml.xml_dom_has_child_nodes(
 id IN RAW(13))
RETURNS BOOLEAN
```

**Table 10-111** `dbexml.xml_dom_has_child_nodes` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object

- `dbexml.xml_dom_import_node`

Copies a node to another node and mounts the copied node to a specified document. If the type of the copied node does not belong to the 12 types specified by constants of XML DOM, an exception indicating that the type is not supported is thrown.

The prototype of the `dbexml.xml_dom_import_node` function is as follows:

```
dbexml.xml_dom_import_node(
 doc_id IN RAW(13),
 node_id IN RAW(13),
 deep IN BOOLEAN
)
RETURNS RAW(13);
```

**Table 10-112** dbexml.xml\_dom\_import\_node parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
doc_id	raw(13)	IN	No	Document to which the node is mounted
node_id	raw(13)	IN	No	Node to be imported
deep	BOOLEAN	IN	No	Specifies whether to perform recursive import. <ul style="list-style-type: none"> <li>If the value is <b>TRUE</b>, the node and all its subnodes are imported.</li> <li>If the value is <b>FALSE</b>, the node itself is imported.</li> </ul>

- dbexml.xml\_dom\_is\_null

Checks whether the given object is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned.

The prototype of the dbexml.xml\_dom\_is\_null function is as follows:

```
dbexml.xml_dom_is_null (
 id RAW(13)
)
RETURNS boolean;
```

**Table 10-113** dbexml.xml\_dom\_is\_null parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object

- dbexml.xml\_dom\_item

Returns the element corresponding to the index in a list or map based on the index.

The prototype of the dbexml.xml\_dom\_item function is as follows:

```
dbexml.xml_dom_item (
 id IN RAW(13),
 index IN INTEGER
)
RETURNS RAW(13);
```

**Table 10-114** dbexml.xml\_dom\_item parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object
index	INTEGER	IN	No	Index of the element to be retrieved

- dbexml.xml\_dom\_make\_element

Returns the DOMELEMENT object after conversion.

The stored procedure prototype of dbexml.xml\_dom\_make\_element is as follows:

```
dbexml.xml_dom_make_element(
id IN RAW(13))
RETURNS RAW(13)
```

**Table 10-115** dbexml.xml\_dom\_make\_element parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

- dbexml.xml\_dom\_makenode

Converts the given object to the DOMNODE type.

The stored procedure prototype of dbexml.xml\_dom\_makenode is as follows:

```
dbexml.xml_dom_makenode(
id RAW(13)
)
RETURNS DOMNODE;
```

**Table 10-116** dbexml.xml\_dom\_makenode parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object

- dbexml.xml\_dom\_new\_dom\_document\_empty

Returns a new DOMDOCUMENT object.

The prototype of the dbexml.xml\_dom\_new\_dom\_document\_empty function is as follows:

```

dbe_xml.xml_dom_new_dom_document_empty()
RETURNS RAW(13);

```

- `xml_dom_new_dom_document_clob`

Returns a new DOMDocument instance object created from the specified CLOB type.

The prototype of the `xml_dom_new_dom_document_clob` function is as follows:

```

dbe_xml.xml_dom_new_dom_document_clob(
 content IN clob
)
RETURNS RAW(13);

```

**Table 10-117** `xml_dom_new_dom_document_clob` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
content	clob	IN	No	Specified CLOB type

- `dbe_xml.xml_dom_new_document_xmltype`

Returns a new DOMDocument instance object created from the specified XMLType type.

The prototype of the `dbe_xml.xml_dom_new_document_xmltype` function is as follows:

```

dbe_xml.xml_dom_new_document_xmltype(
 content IN clob
)
RETURNS RAW(13);

```

**Table 10-118** `dbe_xml.xml_dom_new_document_xmltype` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
content	clob	IN	No	Specified CLOB type

- `dbe_xml.xml_dom_set_attribute`

Sets the attributes of a specified XML DOM object.

The stored procedure prototype of `dbe_xml.xml_dom_set_attribute` is as follows:

```

dbe_xml.xml_dom_set_attribute(
 docid IN RAW(13),
 name IN VARCHAR2,
 value IN VARCHAR2
)
RETURNS void;

```

**Table 10-119** dbexml.xml\_dom\_set\_attribute parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object
name	VARCHAR2	IN	No	String
value	VARCHAR2	IN	No	String

- dbexml.xml\_dom\_set\_charset

Sets the character set for a DOMDocument object.

The prototype of the dbexml.xml\_dom\_set\_charset function is as follows:

```
dbexml.xml_dom_set_charset(
 id IN RAW(13),
 charset IN VARCHAR2
)
RETURNS void;
```

**Table 10-120** dbexml.xml\_dom\_set\_charset parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object
charset	VARCHAR2	IN	No	Character set

- dbexml.xml\_dom\_set\_doctype

Sets the external DTD of a DOMDocument object.

The prototype of the dbexml.xml\_dom\_set\_doctype function is as follows:

```
dbexml.xml_dom_set_doctype(
 id IN RAW(13),
 dtd_name IN VARCHAR2,
 system_id IN VARCHAR2,
 public_id IN VARCHAR2
)
RETURNS void;
```

**Table 10-121** dbexml.xml\_dom\_set\_doctype parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dtd_name	VARCHAR2	IN	No	Name of the DOCType to be initialized
system_id	VARCHAR2	IN	No	ID of the system whose DOCType needs to be initialized
public_id	VARCHAR2	IN	No	Public ID of the DOCType to be initialized

- `dbe_xml.xml_dom_set_node_value`

Sets the value of a node in the DOMNode object.

The stored procedure prototype of `dbe_xml.xml_dom_set_node_value` is as follows:

```
dbe_xml.xml_dom_set_node_value(
id IN RAW(13),
node_value IN VARCHAR2)
RETURNS VOID
```

**Table 10-122** `dbe_xml.xml_dom_set_node_value` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object
node_value	VARCHAR2	IN	No	String to be set in the DOMNode object

- `dbe_xml.xml_dom_write_to_buffer_doc`

Writes the given DOMDocument object to the buffer.

The stored procedure prototype of `dbe_xml.xml_dom_write_to_buffer_doc` is as follows:

```
dbe_xml.dbe_xml.xml_dom_write_to_buffer_doc(
id IN RAW(13))
RETURNS VARCHAR2;
```

**Table 10-123** dbexml.xml\_dom\_write\_to\_buffer\_doc parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object

- dbexml.xml\_dom\_write\_to\_buffer\_node

Writes the given DOMNode object to the buffer.

The stored procedure prototype of dbexml.xml\_dom\_write\_to\_buffer\_node is as follows:

```
dbexml.dbexml.xml_dom_write_to_buffer_node(
id IN RAW(13))
RETURNS VARCHAR2;
```

**Table 10-124** dbexml.xml\_dom\_write\_to\_buffer\_node parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object

- dbexml.xml\_dom\_write\_to\_clob\_doc

Writes the given DOMDocument object to a CLOB.

The stored procedure prototype of dbexml.xml\_dom\_write\_to\_clob\_doc is as follows:

```
dbexml.xml_dom_write_to_clob_doc(
id IN RAW(13)
)
RETURNS VARCHAR2;
```

**Table 10-125** dbexml.xml\_dom\_write\_to\_clob\_doc parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object

- dbexml.xml\_dom\_write\_to\_clob\_node

Writes the given DOMNode object to a CLOB.

The stored procedure prototype of dbexml.xml\_dom\_write\_to\_clob\_node is as follows:

```
dbexml.xml_dom_write_to_clob_node(
id IN RAW(13)
)
RETURNS clob;
```

**Table 10-126** dbexml.xml\_dom\_write\_to\_clob\_node parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object

- dbexml.xml\_dom\_write\_to\_file\_doc

Writes an XML node to a specified file using the database character set.

The stored procedure prototype of dbexml.xml\_dom\_write\_to\_file\_doc is as follows:

```
dbexml.xml_dom_write_to_file_doc(
id IN RAW(13),
file_dir IN VARCHAR2)
RETURNS void

dbexml.xml_dom_write_to_file_doc(
id IN RAW(13),
file_dir IN VARCHAR2,
charset IN VARCHAR2)
RETURNS void PACKAGE
```

**Table 10-127** dbexml.xml\_dom\_write\_to\_file\_doc parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	Yes	XML DOM object
file_dir	VARCHAR2	IN	No	File to be written
charset	VARCHAR2	IN	No	Specified character set

- dbexml.xml\_dom\_write\_to\_file\_node

Writes an XML node to a specified file using the database character set.

The stored procedure prototype of dbexml.xml\_dom\_write\_to\_file\_node is as follows:

```
dbexml.xml_dom_write_to_file_node(
id IN RAW(13),
filename IN VARCHAR2)
RETURNS void
```

**Table 10-128** dbexml.xml\_dom\_write\_to\_file\_node parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
filename	VARCHAR2	IN	No	Specified file address

- dbexml.xml\_dom\_get\_session\_tree\_num**  
Queries the number of DOM trees of all types in the current session.  
The prototype of the `dbexml.xml_dom_get_session_tree_num` function is as follows:

```
dbexml.xml_dom_get_session_tree_num()
RETURNS INTEGER
```
- dbexml.xml\_dom\_get\_doc\_trees\_info**  
Queries the DOM tree information of the document type in the current session, such as the memory usage.  
The prototype of the `dbexml.xml_dom_get_doc_trees_info` function is as follows:

```
dbexml.xml_dom_get_doc_trees_info()
RETURNS VARCHAR2
```
- dbexml.xml\_dom\_get\_detail\_doc\_tree\_info**  
Queries the number of subnodes of each type in the transferred document.  
The prototype of the `dbexml.xml_dom_get_detail_doc_tree_info` function is as follows:

```
dbexml.xml_dom_get_detail_doc_tree_info(
id IN RAW(13))
RETURNS VARCHAR2
```

**Table 10-129** `dbexml.xml_dom_get_detail_doc_tree_info` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	raw(13)	IN	No	XML DOM object

## 10.11.2 Secondary Encapsulation APIs (Recommended)

### 10.11.2.1 DBE\_LOB

#### Interface Description

**Table 10-130** lists all interfaces supported by the DBE\_LOB package.

 NOTE

- In database A, the byte content of the space is 00. However, in GaussDB, the byte content corresponding to the space is ASCII code 32.
- In a distributed environment, the maximum size of a CLOB, BLOB, and BFILE is 1 GB.

**Table 10-130** DBE\_LOB

Interface	Description
<a href="#">DBE_LOB.GET_LENGTH</a>	Obtains and returns the length of a specified LOB. The object cannot be greater than 2 GB.
<a href="#">DBE_LOB.LOB_GET_LENGTH</a>	Obtains and returns the length of a specified LOB or BFILE object.
<a href="#">DBE_LOB.OPEN</a>	Opens a LOB and returns a LOB descriptor.
<a href="#">DBE_LOB.READ</a>	Loads a part of LOB content to the buffer based on the specified length and initial position offset.
<a href="#">DBE_LOB.LOB_READ</a>	Reads a part of LOB (including BFILE) content to the buffer based on the specified length and initial position offset.
<a href="#">DBE_LOB.WRITE</a>	Copies content in the buffer to a LOB based on the specified length and initial position offset.
<a href="#">DBE_LOB.WRITE_APPEND</a>	Copies content in the buffer to the end part of a LOB based on the specified length.
<a href="#">DBE_LOB.LOB_WRITE_APPEND</a>	Copies content in the buffer to the end part of a LOB based on the specified length.
<a href="#">DBE_LOB.COPY</a>	Copies content in a LOB to another LOB based on the specified length and initial position offset.
<a href="#">DBE_LOB.LOB_COPY</a>	Copies content in a LOB to another LOB based on the specified length and initial position offset.
<a href="#">DBE_LOB.ERASE</a>	Deletes content in a LOB (smaller than or equal to 1 GB) based on the specified length and initial position offset.
<a href="#">DBE_LOB.LOB_ERASE</a>	Deletes content in a LOB based on the specified length and initial position offset.
<a href="#">DBE_LOB.CLOSE</a>	Closes a LOB descriptor.
<a href="#">DBE_LOB.MATCH</a>	Returns the position of the <i>M</i> th occurrence of a character string in a LOB.
<a href="#">DBE_LOB.COMPARE</a>	Compares two LOBs (including BFILE objects) or a certain part of two LOBs.
<a href="#">DBE_LOB.SUBSTR</a>	Reads a LOB substring and returns the read substring.
<a href="#">DBE_LOB.LOB_SUBSTR</a>	Reads a LOB substring and returns the read substring.

Interface	Description
<b>DBE_LOB.STRIP</b>	Truncates the LOB of a specified length. After the execution is complete, the length of the LOB is set to the length specified by the <b>newlen</b> parameter.
<b>DBE_LOB.LOB_STRIP</b>	Truncates the LOB of a specified length. After the execution is complete, the length of the LOB is set to the length specified by the <b>newlen</b> parameter.
<b>DBE_LOB.CREATE_TEMPORARY</b>	Creates a temporary BLOB or CLOB.
<b>DBE_LOB.APPEND</b>	Adds the content of a LOB to another LOB.
<b>DBE_LOB.LOB_APPEND</b>	Adds the content of a LOB to another LOB.
<b>DBE_LOB.FREETEMPORARY</b>	Deletes a temporary BLOB or CLOB.
<b>DBE_LOB.FILEOPEN</b>	Opens a database BFILE file and returns its file descriptor.
<b>DBE_LOB.FILECLOSE</b>	Closes a BFILE file that is opened by <b>FILEOPEN</b> .
<b>DBE_LOB.BFILEOPEN</b>	Opens a database BFILE file.
<b>DBE_LOB.BFILECLOSE</b>	Closes a BFILE file that is opened by <b>BFILEOPEN</b> .
<b>DBE_LOB.LOADFROMFILE</b>	Loads the database BFILE file of the specified length in the specified location to the BLOB in the specified location.
<b>DBE_LOB.LOADFROMBFILE</b>	Loads the database BFILE file of the specified length in the specified location to the LOB in the specified location.
<b>DBE_LOB.LOADBLOBFROMFILE</b>	Loads an external database file of the specified length in the specified location to a BLOB (smaller than or equal to 1 GB) in a specified location.
<b>DBE_LOB.LOADBLOBFROMFIL...</b>	Loads the database BFILE file of the specified length in the specified location to the BLOB in the specified location.
<b>DBE_LOB.LOADCLOBFROMFILE</b>	Loads an external database file of the specified length in the specified location to a CLOB (smaller than or equal to 1 GB) in a specified location.
<b>DBE_LOB.LOADCLOBFROMFIL...</b>	Loads the database BFILE file of the specified length in the specified location to the CLOB in the specified location.
<b>DBE_LOB.CONVERTTOBLOB</b>	Converts a CLOB file to a BLOB file (smaller than or equal to 1 GB).
<b>DBE_LOB.CONVERTTOCLOB</b>	Converts a BLOB file to a CLOB file (smaller than or equal to 1 GB).

Interface	Description
<a href="#">DBE_LOB.LOB_CONVERTTOBLOB...</a>	Converts a CLOB file to a BLOB file.
<a href="#">DBE_LOB.LOB_CONVERTTOCLOB...</a>	Converts a BLOB file to a CLOB file.
<a href="#">DBE_LOB.GETCHUNKSIZE</a>	Obtains the maximum size of LOB data that can be stored in the chunk structure in the database.
<a href="#">DBE_LOB.LOB_WRITE</a>	Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.
<a href="#">DBE_LOB.BFILENAME</a>	Constructs and returns the DBE_LOB.BFILE object based on the directory and file name.

- [DBE\\_LOB.GET\\_LENGTH](#)

Obtains and returns the size of a specified LOB. The maximum size of the object is 2 GB.

The prototype of the DBE\_LOB.GET\_LENGTH function is as follows:

```
DBE_LOB.GET_LENGTH (
 blob_obj IN BLOB)
RETURN INTEGER;

DBE_LOB.GET_LENGTH (
 clob_obj IN CLOB)
RETURN INTEGER;
```

**Table 10-131** DBE\_LOB.GET\_LENGTH parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB whose length is to be obtained

- [DBE\\_LOB.LOB\\_GET\\_LENGTH](#)

Obtains and returns the length of a specified LOB or BFILE file. The maximum size of the object is 32 TB.

The prototype of the DBE\_LOB.LOB\_GET\_LENGTH function is as follows:

```
DBE_LOB.LOB_GET_LENGTH (
 blob_obj IN BLOB)
RETURN BIGINT;

DBE_LOB.LOB_GET_LENGTH (
 clob_obj IN CLOB)
RETURN BIGINT;

DBE_LOB.LOB_GET_LENGTH (
 bfile IN DBE_LOB.BFILE)
RETURN BIGINT;
```

**Table 10-132** DBE\_LOB.LOB\_GET\_LENGTH parameters

Parameter	Description
blob_obj/ clob_obj/bfile	BLOB/CLOB/BFILE whose length is to be obtained

- DBE\_LOB.OPEN

Opens a LOB and returns a LOB descriptor. This procedure is meaningless and is used only for compatibility.

The prototype of the DBE\_LOB.OPEN function is as follows:

```
DBE_LOB.OPEN (
 lob INOUT BLOB);

DBE_LOB.OPEN (
 lob INOUT CLOB);

DBE_LOB.OPEN (
 bfile INOUT DBE_LOB.BFILE,
 open_mode IN TEXT DEFAULT 'null');
```

**Table 10-133** DBE\_LOB.OPEN parameters

Parameter	Description
lob/bfile	Opened BLOB, CLOB or BFILE.

- DBE\_LOB.READ

Reads a part of LOB content to the output buffer based on the specified length and initial position offset.

The prototype of the DBE\_LOB.READ function is as follows:

```
DBE_LOB.READ (
 blob_obj IN BLOB,
 amount IN INTEGER,
 off_set IN INTEGER,
 out_put OUT RAW);

DBE_LOB.READ (
 clob_obj IN CLOB,
 amount IN INTEGER,
 off_set IN INTEGER,
 out_put OUT VARCHAR2);
```

**Table 10-134** DBE\_LOB.READ parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to be read
amount	Load data length
off_set	Start position for reading the LOB content, that is, the offset bytes to initial position of the LOB content. If the offset is less than 1 or greater than the LOB length, an error is reported. The initial position is 1.

Parameter	Description
out_put	Target buffer for storing the read LOB content

- DBE\_LOB.LOB\_READ

Reads a part of LOB/BFILE content to the output buffer based on the specified length and initial position offset.

The prototype of the DBE\_LOB.LOB\_READ function is as follows:

```
DBE_LOB.LOB_READ(
 blob_obj IN BLOB,
 amount INOUT BIGINT,
 off_set IN BIGINT,
 out_put OUT RAW);

DBE_LOB.LOB_READ(
 clob_obj IN CLOB,
 amount INOUT BIGINT,
 off_set IN BIGINT,
 out_put OUT VARCHAR2);

DBE_LOB.LOB_READ(
 bfile IN DBE_LOB.BFILE,
 amount INOUT BIGINT,
 off_set IN BIGINT,
 out_put OUT RAW);
```

**Table 10-135** DBE\_LOB.LOB\_READ parameters

Parameter	Description
blob_obj/ clob_obj/bfile	BLOB/CLOB/BFILE object (can be greater than 1 GB) to be read
amount	Length to read as the IN parameter, or actual read length as the OUT parameter. <b>NOTE</b> If the length to read is less than or equal to 0 or exceeds 32767, an error is reported.
off_set	Start position for reading the LOB content, that is, the offset bytes to initial position of the LOB content. If the offset is less than 1 or greater than the LOB length, an error is reported. The initial position is 1.
out_put	Target buffer for storing the read LOB content

- DBE\_LOB.WRITE

Writes content in the source to a LOB based on the specified length and initial position.

The prototype of the DBE\_LOB.WRITE function is as follows:

```
DBE_LOB.WRITE (
 blob_obj INOUT BLOB,
 amount IN INTEGER,
 off_set IN INTEGER,
 source IN RAW);

DBE_LOB.WRITE (
```

```
clob_obj INOUT CLOB,
amount IN INTEGER,
off_set IN INTEGER,
source IN VARCHAR2);
```

**Table 10-136** DBE\_LOB.WRITE parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is written
amount	Length to write, up to 32767 characters. <b>NOTE</b> If the length to write is less than 1 or greater than the length of the content to be written, an error is reported.
off_set	Start position for writing content to the target LOB, that is, the offset bytes to the initial position of LOB content. <b>NOTE</b> If the offset is less than 1 or greater than the value of <b>LOBMAXSIZE</b> , an error is reported. The initial position is 1, and the maximum value is the maximum length of the LOB type.
source	Content to be written

- DBE\_LOB.WRITE\_APPEND

Writes content in the source object to the end part of a LOB based on the specified length.

The prototype of the DBE\_LOB.WRITE\_APPEND function is as follows:

```
DBE_LOB.WRITE_APPEND (
blob_obj INOUT BLOB,
amount IN INTEGER,
source_obj IN RAW);

DBE_LOB.WRITE_APPEND (
clob_obj INOUT CLOB,
amount IN INTEGER,
source_obj IN VARCHAR2);
```

**Table 10-137** DBE\_LOB.WRITE\_APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is written
amount	Length to write, up to 32767 characters.
source_obj	Content to be written

- DBE\_LOB.LOB\_WRITE\_APPEND

Writes content in the source object to the end part of a LOB based on the specified length.

The prototype of the DBE\_LOB.LOB\_WRITE\_APPEND function is as follows:

```
DBE_LOB.LOB_WRITE_APPEND(
blob_obj INOUT BLOB,
```

```

amount IN INTEGER,
source_obj IN RAW);

DBE_LOB.LOB_WRITE_APPEND (
 clob_obj INOUT CLOB,
 amount IN INTEGER,
 source_obj IN VARCHAR2);

```

**Table 10-138** DBE\_LOB.LOB\_WRITE\_APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is written
amount	Length to write, up to 32767 characters. <b>NOTE</b> If the length to write is less than 1 or greater than the length of the content to be written, an error is reported.
source_obj	Content to be written

- DBE\_LOB.COPY

Copies content in a LOB to another LOB based on the specified length and initial position offset.

The prototype of the DBE\_LOB.COPY function is as follows:

```

DBE_LOB.COPY (
 dest_lob INOUT BLOB,
 src_lob IN BLOB,
 len IN INTEGER,
 dest_start IN INTEGER DEFAULT 1,
 src_start IN INTEGER DEFAULT 1);

```

**Table 10-139** DBE\_LOB.COPY parameters

Parameter	Description
dest_lob	LOB to which the buffer content is to be pasted
src_lob	LOB from which the buffer content is to be copied
len	Length to copy
dest_start	Start position for pasting the buffer content to the target LOB ( <b>dest_lob</b> ), that is, the offset bytes to the initial position of LOB content.
src_start	Start position for copying the buffer content from the source LOB ( <b>src_lob</b> ), that is, the offset bytes to the initial position of LOB content.

- DBE\_LOB.LOB\_COPY

Copies content in a LOB to another LOB based on the specified length and initial position offset.

The prototype of the DBE\_LOB.LOB\_COPY function is as follows:

```

DBE_LOB.LOB_COPY(
 blob_obj INOUT BLOB,

```

```

source_obj IN BLOB,
amount IN BIGINT,
dest_offset IN BIGINT DEFAULT 1,
src_offset IN BIGINT DEFAULT 1);

DBE_LOB.LOB_COPY(
clob_obj INOUT CLOB,
source_obj IN CLOB,
amount IN BIGINT,
dest_offset IN BIGINT DEFAULT 1,
src_offset IN BIGINT DEFAULT 1);

```

**Table 10-140** DBE\_LOB.LOB\_COPY parameters

Parameter	Description
blob_obj/ clob_obj	LOB to which the buffer content is to be pasted
source_obj	LOB from which the buffer content is to be copied
amount	Length of the copied data <b>NOTE</b> If the length to copy is less than 1 or greater than the value of <b>LOBMAXSIZE</b> , an error is reported.
dest_offset	Start position for pasting the buffer content to the target LOB, that is, the offset bytes/characters to the initial position of LOB content. <b>NOTE</b> If the offset is less than 1 or greater than the value of <b>LOBMAXSIZE</b> , an error is reported.
src_offset	Start position for copying the content from the source object, that is, the offset bytes to the initial position of LOB content. <b>NOTE</b> If the offset is less than 1, an error is reported.

- DBE\_LOB.ERASE

Deletes the content in a BLOB based on the specified length and initial position offset. The bytes of the deleted part in the BLOB are filled with 0.

The prototype of the DBE\_LOB.ERASE function is as follows:

```

DBE_LOB.ERASE (
blob_obj INOUT BLOB,
amount INOUT INTEGER,
off_set IN INTEGER DEFAULT 1);

```

**Table 10-141** DBE\_LOB.ERASE parameters

Parameter	Description
blob_obj	LOB whose content is to be deleted as the IN parameter, or LOB with specified content deleted as the OUT parameter. If this parameter is left empty, an error is reported.

Parameter	Description
amount	Length (in bytes for BLOBs) to delete as the IN parameter, or actual length deleted as the OUT parameter. <b>NOTE</b> If the length to delete is less than 1 or this parameter is left empty, an error is reported.
off_set	Start position from which LOB content is to be deleted, that is, the number of offset bytes to the initial position of LOB content. <b>NOTE</b> If the offset is less than 1 or this parameter is left empty, an error is reported.

- DBE\_LOB.LOB\_ERASE

Deletes the content in the LOB based on the specified length and initial position offset. The bytes of the deleted part in the BLOB are filled with 0, and the characters of the deleted part in the CLOB are filled with spaces. The LOB can be greater than 1 GB and the maximum size is 32 TB.

The prototype of the DBE\_LOB.LOB\_ERASE function is as follows:

```
DBE_LOB.LOB_ERASE (
 blob_obj INOUT BLOB,
 amount INOUT BIGINT,
 off_set IN BIGINT DEFAULT 1);
```

```
DBE_LOB.LOB_ERASE (
 clob_obj INOUT CLOB,
 amount INOUT BIGINT,
 off_set IN BIGINT DEFAULT 1);
```

**Table 10-142** DBE\_LOB.LOB\_ERASE parameters

Parameter	Description
blob_obj/ clob_obj	LOB whose content is to be deleted as the IN parameter, or LOB with specified content deleted as the OUT parameter. If this parameter is left empty, an error is reported.
amount	Length (BLOB in bytes and CLOB in characters) to delete as the IN parameter, or actual length deleted as the OUT parameter. <b>NOTE</b> If the length to delete is less than 1 or this parameter is left empty, an error is reported.
off_set	Start position from which the LOB content is to be deleted, that is, the number of bytes relative to the start position of the BLOB content or the number of characters relative to the start position of the CLOB content. <b>NOTE</b> If the offset is less than 1 or this parameter is left empty, an error is reported.

- DBE\_LOB.CLOSE

Closes the LOB descriptor that has been opened.

The prototype of the DBE\_LOB.CLOSE function is as follows:

```
DBE_LOB.CLOSE(
 lob IN BLOB);

DBE_LOB.CLOSE (
 lob IN CLOB);

DBE_LOB.CLOSE (
 file IN INTEGER);
```

**Table 10-143** DBE\_LOB.CLOSE parameters

Parameter	Description
lob/file	BLOB/CLOB/File object whose LOB descriptor is to be closed

- DBE\_LOB.MATCH

Returns the *M*th occurrence position of *pattern* in a LOB or BFILE file. **NULL** is returned for any of the following conditions: The LOB or BFILE file can be greater than 1 GB, up to 32 TB.

The prototype of the DBE\_LOB.MATCH function is as follows:

```
DBE_LOB.MATCH(
 blob_obj IN BLOB,
 blob_obj2 IN RAW,
 beg_index IN BIGINT DEFAULT 1,
 occur_index IN BIGINT DEFAULT 1)
RETURN BIGINT;

DBE_LOB.MATCH(
 clob_obj IN CLOB,
 clob_obj2 IN VARCHAR2,
 beg_index IN BIGINT DEFAULT 1,
 occur_index IN BIGINT DEFAULT 1)
RETURN BIGINT;

DBE_LOB.MATCH(
 bfile IN DBE_LOB.BFILE,
 blob_obj2 IN RAW,
 beg_index IN BIGINT DEFAULT 1,
 occur_index IN BIGINT DEFAULT 1)
RETURN BIGINT;
```

**Table 10-144** DBE\_LOB.MATCH parameters

Parameter	Description
blob_obj/ clob_obj/ bfile	BLOB/CLOB descriptor to be searched for, or BFILE (which must be opened using <b>DBE_LOB.BFILEOPEN</b> first). If this parameter is left blank, null is returned.
blob_obj 2/ clob_obj2	Pattern to match. It is RAW for BLOB/BFILE objects and VARCHAR2 for CLOBs. If this parameter is left empty, null is returned.

Parameter	Description
beg_index	Absolute offset (in bytes) for BLOB/BFILE objects, or offset (in characters) for CLOBs. The start position for matching is 1. <b>NOTE</b> The value ranges from 1 to <i>LOBMAXSIZE</i> . If a value out of the range is input, null is returned.
occur_index	Number of pattern matching times. The minimum value is 1. <b>NOTE</b> If the value is greater than the maximum number of times that the pattern string can be matched in the LOB, <b>0</b> is returned. If the value is out of the range from 1 to <i>LOBMAXSIZE</i> , null is returned.

- DBE\_LOB.COMPARE

Compares LOBs or BFILE objects.

- If the compared objects are equal, **0** is returned. Otherwise, a non-zero value is returned.
- If the first LOB is smaller than the second, **-1** is returned. If the first LOB is larger than the second, **1** is returned.
- If any of the *len*, *start1*, and *start2* parameters is invalid, **NULL** is returned. The valid offset range is 1 to *LOBMAXSIZE*.
- If both the values of **start\_pos1** and **start\_pos2** exceed the LOB/BFILE length, **0** is returned.

The prototype of the DBE\_LOB.COMPARE function is as follows:

```
DBE_LOB.COMPARE (
 lob1 IN BLOB,
 lob2 IN BLOB,
 len IN BIGINT DEFAULT 1073741312,
 start_pos1 IN BIGINT DEFAULT 1,
 start_pos2 IN BIGINT DEFAULT 1)
RETURN INTEGER;

DBE_LOB.COMPARE (
 lob1 IN CLOB,
 lob2 IN CLOB,
 len IN BIGINT DEFAULT 1073741312,
 start_pos1 IN BIGINT DEFAULT 1,
 start_pos2 IN BIGINT DEFAULT 1)
RETURN INTEGER;

DBE_LOB.COMPARE (
 file1 IN DBE_LOB.BFILE,
 file2 IN DBE_LOB.BFILE,
 len IN BIGINT DEFAULT 1073741312,
 start_pos1 IN BIGINT DEFAULT 1,
 start_pos2 IN BIGINT DEFAULT 1)
RETURN INTEGER;
```

**Table 10-145** DBE\_LOB.COMPARE parameters

Parameter	Description
lob1/file1	First BLOB/CLOB/BFILE to be compared (which must be opened using <b>DBE_LOB.BFILEOPEN</b> first).

Parameter	Description
lob2/file2	Second BLOB/CLOB/BFILE to be compared (which must be opened using <b>DBE_LOB.BFILEOPEN</b> first).
len	Number of characters or bytes to be compared. The default value is <b>1073741312</b> .
start_pos1	Offset of the first LOB descriptor. The initial position is 1, and the maximum value is the maximum length of the LOB content.
start_pos2	Offset of the second LOB descriptor. The initial position is 1, and the maximum value is the maximum length of the LOB content.

- **DBE\_LOB.SUBSTR**

Reads a LOB or BFILE substring and returns the read substring.

The prototype of the DBE\_LOB.SUBSTR function is as follows:

```
DBE_LOB.SUBSTR(
 lob_loc IN BLOB,
 amount IN INTEGER DEFAULT 32767,
 off_set IN INTEGER DEFAULT 1)
RETURN RAW;

DBE_LOB.SUBSTR(
 lob_loc IN CLOB,
 amount IN INTEGER DEFAULT 32767,
 off_set IN INTEGER DEFAULT 1)
RETURN VARCHAR2;
```

**Table 10-146** DBE\_LOB.SUBSTR parameters

Parameter	Description
lob_loc	LOB descriptor or BFILE file whose substring is to be read. For BLOBs, the return value is of the RAW type. For CLOBs, the return value is of the VARCHAR2 type.
amount	Number of bytes or characters to be read.
off_set	Number of characters or bytes offset from the start position.

- **DBE\_LOB.LOB\_SUBSTR**

Reads a LOB or BFILE substring and returns the read substring. The LOB or BFILE file can be greater than 1 GB, up to 32 TB.

The prototype of the DBE\_LOB.LOB\_SUBSTR function is as follows:

```
DBE_LOB.LOB_SUBSTR(
 lob_loc IN BLOB,
 amount IN INTEGER DEFAULT 32767,
 off_set IN BIGINT DEFAULT 1)
RETURN RAW;

DBE_LOB.LOB_SUBSTR(
 lob_loc IN CLOB,
 amount IN INTEGER DEFAULT 32767,
 off_set IN BIGINT DEFAULT 1)
```

```
RETURN VARCHAR2;

DBE_LOB.LOB_SUBSTR(
 bfile IN DBE_LOB.BFILE,
 amount IN INTEGER DEFAULT 32767,
 off_set IN BIGINT DEFAULT 1)
RETURN RAW;
```

**Table 10-147** DBE\_LOB.LOB\_SUBSTR parameters

Parameter	Description
lob_loc/ bfile	LOB descriptor or BFILE file whose substring is to be read. The file must be opened by DBE_LOB.BFILEOPEN first. For BLOBs/BFILE files, the return value is of the RAW type. For CLOBs, the return value is of the VARCHAR2 type.
amount	Number of bytes or characters to be read. <b>NOTE</b> The value ranges from 1 to 32767. If the value exceeds the range, null is returned.
off_set	Number of characters or bytes offset from the start position. <b>NOTE</b> The value ranges from 1 to <i>LOBMAXSIZE</i> . If the value exceeds the range, null is returned.

- DBE\_LOB.STRIP

This stored procedure truncates the LOB of a specified length. After this stored procedure is executed, the length of the LOB is set to the length specified by the **newlen** parameter.

The prototype of the DBE\_LOB.STRIP function is as follows:

```
DBE_LOB.STRIP(
 lob_loc INOUT BLOB,
 newlen IN INTEGER);

DBE_LOB.STRIP(
 lob_loc INOUT CLOB,
 newlen IN INTEGER);
```

**Table 10-148** DBE\_LOB.STRIP parameters

Parameter	Description
lob_loc	LOB to read as the IN parameter, or truncated object as the OUT parameter. If this parameter is left empty, an error is reported.
newlen	New length after truncation, in bytes for BLOBs or in characters for CLOBs.

- DBE\_LOB.LOB\_STRIP

Truncates a LOB based on a specified length. After this stored procedure is executed, the length of the LOB is set to the length specified by the **newlen** parameter. The LOB can be greater than 1 GB, up to 32 TB.

The prototype of the DBE\_LOB.LOB\_STRIP function is as follows:

```
DBE_LOB.LOB_STRIP(
 lob_loc INOUT BLOB,
 newlen IN BIGINT);

DBE_LOB.LOB_STRIP(
 lob_loc INOUT CLOB,
 newlen IN BIGINT);
```

**Table 10-149** DBE\_LOB.LOB\_STRIP parameters

Parameter	Description
lob_loc	LOB to read as the IN parameter, or truncated object as the OUT parameter. If this parameter is left empty, an error is reported.
newlen	New length after truncation, in bytes for BLOBs or in characters for CLOBs. <b>NOTE</b> If the value is less than 1, null is returned. If the value is greater than the LOB length, an error is reported.

- DBE\_LOB.CREATE\_TEMPORARY

Creates a temporary BLOB or CLOB. This interface is used only for syntax compatibility.

The prototype of the DBE\_LOB.CREATE\_TEMPORARY function is as follows:

```
DBE_LOB.CREATE_TEMPORARY (
 lob_loc INOUT BLOB,
 cache IN BOOLEAN,
 dur IN INTEGER DEFAULT 10);

DBE_LOB.CREATE_TEMPORARY (
 lob_loc INOUT CLOB,
 cache IN BOOLEAN,
 dur IN INTEGER DEFAULT 10);
```

**Table 10-150** DBE\_LOB.CREATE\_TEMPORARY parameters

Parameter	Description
lob_loc	LOB descriptor
cache	Used only for syntax compatibility.
dur	Used only for syntax compatibility.

- DBE\_LOB.APPEND

Appends *source\_obj* to the end of the target LOB.

The prototype of the DBE\_LOB.APPEND function is as follows:

```
DBE_LOB.APPEND (
 blob_obj INOUT BLOB,
 source_obj IN BLOB);

DBE_LOB.APPEND (
 clob_obj INOUT CLOB,
 source_obj IN CLOB);
```

**Table 10-151** DBE\_LOB.APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is to be written
source_obj	BLOB/CLOB from which the buffer content is to be read

- DBE\_LOB.LOB\_APPEND

Appends *source\_obj* to the end of the target LOB.

The prototype of the DBE\_LOB.LOB\_APPEND function is as follows:

```
DBE_LOB.LOB_APPEND(
 blob_obj INOUT BLOB,
 source_obj IN BLOB);

DBE_LOB.LOB_APPEND(
 clob_obj INOUT CLOB,
 source_obj IN CLOB);
```

**Table 10-152** DBE\_LOB.LOB\_APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is to be written
source_obj	BLOB/CLOB from which the buffer content is to be read

- DBE\_LOB.FREETEMPORARY

Frees LOB files created by CREATE\_TEMPORARY.

The prototype of the DBE\_LOB.FREETEMPORARY function is as follows:

```
DBE_LOB.FREETEMPORARY (
 blob INOUT BLOB);

DBE_LOB.FREETEMPORARY (
 clob INOUT CLOB);
```

**Table 10-153** DBE\_LOB.FREETEMPORARY parameters

Parameter	Description
blob/clob	BLOB/CLOB to be freed.

- DBE\_LOB.FILEOPEN

Opens an external database BFILE file and returns its file descriptor. A maximum of 10 BFILE files can be opened in a session.

The BFILE type is defined as follows:

```
DBE_LOB.BFILE (
 directory TEXT,
 filename TEXT,
 fd INTEGER);
```

The prototype of the DBE\_LOB.FILEOPEN function is as follows:

```
DBE_LOB.FILEOPEN (
 bfile IN DBE_LOB.BFILE,
 open_mode IN TEXT)
RETURN INTEGER;
```

**Table 10-154** DBE\_LOB.FILEOPEN parameters

Parameter	Description
bfile	<p>External database file to be opened. For a BFILE file, this parameter specifies the file path, file name, and file descriptor.</p> <p><b>NOTE</b> The <i>file</i> variable contains the location of the file directory <i>directory</i> and the file name <i>filename</i>.</p> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li> <li>File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the <b>OPEN</b> function. In Unix, the file name cannot end with the combination of a slash and a dot (/).</li> </ul>
open_mode	File open mode, which can only be <b>r</b> . An error is reported in other modes.

- DBE\_LOB.FILECLOSE  
Closes an external BFILE file.

The prototype of the DBE\_LOB.FILECLOSE function is as follows:

```
DBE_LOB.FILECLOSE (
 file IN INTEGER);
```

**Table 10-155** DBE\_LOB.FILECLOSE parameters

Parameter	Description
file	External database file to be closed (that is opened by FILEOPEN).

- DBE\_LOB.BFILEOPEN  
Opens an external database BFILE file. A maximum of 10 BFILE files can be opened in a session.

The prototype of DBE\_LOB.BFILEOPEN is as follows:

```
DBE_LOB.BFILEOPEN (
 bfile INOUT DBE_LOB.BFILE,
 open_mode IN TEXT DEFAULT 'R');
```

**Table 10-156** DBE\_LOB.BFILEOPEN parameters

Parameter	Description
bfile	<p>Opened database BFILE file as the INOUT parameter.</p> <p><b>NOTE</b> The <i>bfile</i> variable contains the location of the file directory <i>directory</i> and the file name <i>filename</i>.</p> <ul style="list-style-type: none"> <li>• Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>• When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li> <li>• File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the <b>OPEN</b> function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).</li> </ul>
open_mode	File open mode, which can only be r. An error is reported in other modes.

**Example**

```
-- Obtain the substring of the BFILE.
DECLARE
bfile dbe_lob.bfile;
BEGIN
bfile = DBE_LOB.BFILENAME(dir_name, file_name); -- Obtain the corresponding BFILE.
DBE_LOB.bfileopen(bfile, 'r'); -- Open the BFILE.
RAISE NOTICE 'res:%', DBE_LOB.lob_substr(bfile, 10, 1); -- Obtain and print the substring.
DBE_LOB.bfileclose(bfile);-- Close the BFILE.
END;
/
```

- **DBE\_LOB.BFILECLOSE**

Closes an external database BFILE file.

The prototype of DBE\_LOB.BFILECLOSE is as follows:

```
DBE_LOB.BFILECLOSE (
 bfile INOUT DBE_LOB.BFILE);
```

**Table 10-157** DBE\_LOB.BFILECLOSE parameters

Parameter	Description
bfile	Closed database BFILE file as the INOUT parameter.

- **DBE\_LOB.LOADFROMFILE**

Loads an external BFILE file to a BLOB and returns the object of the RAW type.

The prototype of the DBE\_LOB.LOADFROMFILE function is as follows:

```
DBE_LOB.LOADFROMFILE (
 dest_lob IN BLOB,
 src_file IN INTEGER,
 amount IN INTEGER,
```

```
dest_offset IN INTEGER,
src_offset IN INTEGER)
RETURN RAW;
```

**Table 10-158** DBE\_LOB.LOADFROMFILE parameters

Parameter	Description
dest_lob	Target BLOB. The BFILE file will be loaded to the specified offset position of the BLOB.
src_bfile	Source BFILE file to be read.
amount	Length of the content to be read from the BFILE file. <b>NOTE</b> If the length is less than 1 or greater than 32767, an error is reported.
dest_offset	Offset length of the BLOB. <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
src_offset	Offset length of the BFILE file. <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.

- DBE\_LOB.LOADFROMBFILE

Loads an external BFILE file to a LOB.

The prototype of the DBE\_LOB.LOADFROMBFILE function is as follows:

```
DBE_LOB.LOADFROMBFILE (
 dest_lob INOUT BLOB,
 src_file IN DBE_LOB.BFILE,
 amount IN BIGINT,
 dest_offset IN BIGINT DEFAULT 1,
 src_offset IN BIGINT DEFAULT 1)
RETURN BLOB;
```

```
DBE_LOB.LOADFROMBFILE (
 dest_lob INOUT CLOB,
 src_file IN DBE_LOB.BFILE,
 amount IN BIGINT,
 dest_offset IN BIGINT DEFAULT 1,
 src_offset IN BIGINT DEFAULT 1)
RETURN CLOB;
```

**Table 10-159** DBE\_LOB.LOADFROMBFILE parameters

Parameter	Description
dest_lob	Target LOB as the INOUT parameter, to which the BFILE file will be loaded. The file must be opened by <b>DBE_LOB.BFILEOPEN</b> first. The LOB can be greater than 1 GB, up to 32 TB.

Parameter	Description
src_file	Source BFILE file to be read. The BFILE file can be greater than 1 GB, up to 32 TB.
amount	Length of the content to be read from the BFILE file and to be written to the LOB. <b>NOTE</b> If the length is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
dest_offset	Offset length of the target LOB <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
src_offset	Offset length of the source BFILE file <b>NOTE</b> <ul style="list-style-type: none"> <li>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i>, an error is reported.</li> <li>If the sum of <i>amount</i> and <i>src_offset</i> is greater than the length of <i>src_bfile</i> plus 1, an error is reported.</li> </ul>

- DBE\_LOB.LOADBLOBFROMFILE

Loads an external BFILE file to a BLOB and returns the object of the RAW type.

The prototype of the DBE\_LOB.LOADBLOBFROMFILE function is as follows:

```
DBE_LOB.LOADBLOBFROMFILE (
 dest_lob IN BLOB,
 src_file IN INTEGER,
 amount IN INTEGER,
 dest_offset IN INTEGER,
 src_offset IN INTEGER)
RETURN RAW;
```

**Table 10-160** DBE\_LOB.LOADBLOBFROMFILE parameters

Parameter	Description
dest_lob	Target BLOB, to which the BFILE file will be loaded.
src_file	Source BFILE file to be read.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. <b>NOTE</b> If the length is less than 1 or greater than 32767, an error is reported.
dest_offset	Offset length of the BLOB. <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.

Parameter	Description
src_offset	Offset length of the BFILE file. <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.

- DBE\_LOB.LOADBLOBFROMBFILE

Loads an external BFILE file to a BLOB.

The prototype of the DBE\_LOB.LOADBLOBFROMBFILE function is as follows:

```
DBE_LOB.LOADBLOBFROMBFILE (
 dest_lob INOUT BLOB,
 src_file IN DEB_LOB.BFILE,
 amount IN BIGINT,
 dest_offset INOUT BIGINT,
 src_offset INOUT BIGINT)
```

**Table 10-161** DBE\_LOB.LOADBLOBFROMBFILE parameters

Parameter	Description
dest_lob	Target BLOB as the INOUT parameter, to which the BFILE file (which must be opened using <b>DBE_LOB.BFILEOPEN</b> first) is loaded. The BFILE file can be greater than 1 GB, up to 32 TB.
src_file	Source BFILE file to be read. The BFILE file can be greater than 1 GB, up to 32 TB.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. <b>NOTE</b> If the length is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
dest_offset	Offset length of the BLOB. <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
src_offset	Offset length of the BFILE file. <b>NOTE</b> <ul style="list-style-type: none"> <li>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i>, an error is reported.</li> <li>If the sum of <i>amount</i> and <i>src_offset</i> is greater than the length of <i>src_bfile</i> plus 1, an error is reported.</li> </ul>

- DBE\_LOB.LOADCLOBFROMFILE

Loads an external BFILE file to a CLOB and returns the object of the RAW type.

The prototype of the DBE\_LOB.LOADCLOBFROMFILE function is as follows:

```
DBE_LOB.LOADCLOBFROMFILE (
 dest_lob IN CLOB,
```

```
src_file IN INTEGER,
amount IN INTEGER,
dest_offset IN INTEGER,
src_offset IN INTEGER)
RETURN row;
```

**Table 10-162** DBE\_LOB.LOADCLOBFROMFILE parameters

Parameter	Description
dest_lob	Target CLOB, to which the BFILE file will be loaded.
src_file	Source BFILE file to be read.
amount	Length of the CLOB. <b>NOTE</b> If the length is less than 1 or greater than 32767, an error is reported.
dest_offset	Offset length of the CLOB. <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
src_offset	Offset length of the BFILE file. <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.

- DBE\_LOB.LOADCLOBFROMBFILE

Loads an external BFILE file to a CLOB.

The prototype of the DBE\_LOB.LOADCLOBFROMBFILE function is as follows:

```
DBE_LOB.LOADCLOBFROMBFILE (
dest_lob INOUT CLOB,
src_file IN DEB_LOB.BFILE,
amount IN BIGINT,
dest_offset INOUT BIGINT,
src_offset INOUT BIGINT)
```

**Table 10-163** DBE\_LOB.LOADCLOBFROMBFILE parameters

Parameter	Description
dest_lob	Target CLOB as the INOUT parameter, to which the BFILE file (which must be opened using <b>DBE_LOB.BFILEOPEN</b> first) is loaded. The BFILE file can be greater than 1 GB, up to 32 TB.
src_file	Source BFILE file to be read. The BFILE file can be greater than 1 GB, up to 32 TB.
amount	Length of the target CLOB. If the length of a file exceeds this threshold, the file will not be saved to the CLOB. <b>NOTE</b> If the length is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.

Parameter	Description
dest_offset	Offset length of the CLOB. <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
src_offset	Offset length of the BFILE file. <b>NOTE</b> <ul style="list-style-type: none"> <li>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i>, an error is reported.</li> <li>If the sum of <i>amount</i> and <i>src_offset</i> is greater than the length of <i>src_bfile</i> plus 1, an error is reported.</li> </ul>

- DBE\_LOB.CONVERTTOBLOB

Converts a CLOB to a BLOB. The CLOB cannot be greater than 1 GB.

The prototype of the DBE\_LOB.CONVERTTOBLOB function is as follows:

```
DBE_LOB.CONVERTTOBLOB(
 dest_blob IN BLOB,
 src_clob IN CLOB,
 amount IN INTEGER DEFAULT 32767,
 dest_offset IN INTEGER DEFAULT 1,
 src_offset IN INTEGER DEFAULT 1)
RETURN raw;
```

**Table 10-164** DBE\_LOB.CONVERTTOBLOB parameters

Parameter	Description
dest_blob	Target BLOB, which is converted from a CLOB.
src_clob	Source CLOB to be read.
amount	Length of the target CLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. If the length is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
dest_offset	Offset length of the BLOB. If <b>dest_offset</b> is set to 1, data is loaded from the start position of the file. The rest may be deduced by analogy.
src_offset	Offset length of the CLOB. If <b>src_offset</b> is set to 1, data is read from the start position of the file. The rest may be deduced by analogy.

- DBE\_LOB.LOB\_CONVERTTOBLOB

Converts a CLOB to a BLOB. The LOB can be greater than 1 GB.

The prototype of the DBE\_LOB.LOB\_CONVERTTOBLOB function is as follows:

```
DBE_LOB.LOB_CONVERTTOBLOB(
 dest_blob INOUT BLOB,
 src_clob IN CLOB,
 amount IN BIGINT,
 dest_offset INOUT BIGINT,
 src_offset INOUT BIGINT)
```

**Table 10-165** DBE\_LOB.LOB\_CONVERTTOBLOB parameters

Parameter	Description
dest_blob	Target BLOB, which is converted from a CLOB.
src_clob	Source CLOB to be read.
amount	Length of the target CLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. If the length is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
dest_offset	Offset length of the BLOB. If <b>dest_offset</b> is set to <b>1</b> , data is loaded from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
src_offset	Offset length of the CLOB. If <b>src_offset</b> is set to <b>1</b> , data is read from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.

- DBE\_LOB.CONVERTTOCLOB

Converts a BLOB to a CLOB. The BLOB cannot be greater than 1 GB.

The prototype of the DBE\_LOB.CONVERTTOCLOB function is as follows:

```
DBE_LOB.CONVERTTOCLOB(
 dest_clob IN CLOB,
 src_blob IN BLOB,
 amount IN INTEGER DEFAULT 32767,
 dest_offset IN INTEGER DEFAULT 1,
 src_offset IN INTEGER DEFAULT 1)
RETURN text;
```

**Table 10-166** DBE\_LOB.CONVERTTOCLOB parameters

Parameter	Description
dest_clob	Target CLOB, which is converted from a BLOB.
src_blob	Source BLOB to be read.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the CLOB.
dest_offset	Offset length of the CLOB. If <b>dest_offset</b> is set to <b>1</b> , data is loaded from the start position of the file. The rest may be deduced by analogy.
src_offset	Offset length of the BLOB. If <b>src_offset</b> is set to <b>1</b> , data is read from the start position of the file. The rest may be deduced by analogy.

- DBE\_LOB.LOB\_CONVERTTOCLOB

Converts a BLOB to a CLOB. The LOB can be greater than 1 GB.

The prototype of the DBE\_LOB.LOB\_CONVERTTOCLOB function is as follows:

```
DBE_LOB.LOB_CONVERTTOCLOB(
 dest_clob INOUT CLOB,
 src_blob IN BLOB,
 amount IN BIGINT,
 dest_offset INOUT BIGINT,
 src_offset INOUT BIGINT)
```

**Table 10-167** DBE\_LOB.LOB\_CONVERTTOCLOB parameters

Parameter	Description
dest_clob	Target CLOB, which is converted from a BLOB.
src_blob	Source BLOB to be read.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the CLOB.
dest_offset	Offset length of the CLOB. If <b>dest_offset</b> is set to <b>1</b> , data is loaded from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
src_offset	Offset length of the BLOB. If <b>src_offset</b> is set to <b>1</b> , data is read from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.

- DBE\_LOB.GETCHUNKSIZE

Returns *TOAST\_MAX\_CHUNK\_SIZE*. When LOB data is stored in the database, TOAST is used internally.

The prototype of the DBE\_LOB.GETCHUNKSIZE function is as follows:

```
DBE_LOB.GETCHUNKSIZE(
 lob_loc IN CLOB
)RETURN INTEGER

DBE_LOB.GETCHUNKSIZE(
 lob_loc IN BLOB
)RETURN INTEGER
```

**Table 10-168** DBE\_LOB.GETCHUNKSIZE parameters

Parameter	Description
lob_loc	Target CLOB/BLOB.

- DBE\_LOB.LOB\_WRITE

Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.

The prototype of the DBE\_LOB.LOB\_WRITE function is as follows:

```
DBE_LOB.LOB_WRITE(
 clob_obj INOUT CLOB,
 amount IN INTEGER,
 off_set IN BIGINT,
 source IN VARCHAR2
)
RETURN CLOB;

DBE_LOB.LOB_WRITE(
 blob_obj INOUT BLOB,
 amount IN INTEGER,
 off_set IN BIGINT,
 source IN RAW
)
RETURN BLOB;
```

**Table 10-169** DBE\_LOB.LOB\_WRITE parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
blob_obj / clob_obj	BLOB / CLOB	INOUT	No	Target LOB as the INOUT parameter, to which the content is to be written.
amount	INTEGER	IN	No	Length of the data to be written (in bytes for BLOBs or in characters for CLOBs)
off_set	BIGINT	IN	No	Offset position for writing data to <i>blob_obj/clob_obj</i>
source	RAW / VARCHAR2	IN	No	Source object

- DBE\_LOB.BFILENAME

Constructs a BFILE based on the directory and file name.

The prototype of DBE\_LOB.BFILENAME is as follows:

```
DBE_LOB.BFILENAME(
 directory IN TEXT,
 filename IN TEXT)
RETURN DBE_LOB.BFILE;
```

**Table 10-170** DBE\_LOB.BFILENAME interface parameters

Parameter	Description
directory	<p>File path</p> <p><b>NOTE</b> Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</p> <ul style="list-style-type: none"> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li> <li>File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the <b>OPEN</b> function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).</li> </ul>
filename	File name

## Example

```
-- Obtain the length of a string.
SELECT DBE_LOB.GET_LENGTH('12345678');

DECLARE
myraw RAW(100);
amount INTEGER :=2;
buffer INTEGER :=1;
begin
DBE_LOB.READ('123456789012345',amount,buffer,myraw);
dbe_output.print_line(myraw);
end;
/

CREATE TABLE blob_Table (t1 blob) DISTRIBUTE BY REPLICATION;
CREATE TABLE blob_Table_bak (t2 blob) DISTRIBUTE BY REPLICATION;
INSERT INTO blob_Table VALUES('abcdef');
INSERT INTO blob_Table_bak VALUES('22222');

DECLARE
str varchar2(100) := 'abcdef';
source raw(100);
dest blob;
copyto blob;

DROP TABLE blob_Table_bak;

```

## 10.11.2.2 DBE\_RANDOM

### Interface Description

**Table 10-171** lists all interfaces supported by the **DBE\_RANDOM** package.

**Table 10-171** DBE\_RANDOM interface parameters

Interface	Description
<b>DBE_RANDOM.SET_SEED</b>	Sets a seed for a random number.
<b>DBE_RANDOM.GET_VALUE</b>	Generates a random number between a specified <b>low</b> and a specified <b>high</b> .

- DBE\_RANDOM.SET\_SEED

The stored procedure **SEED** is used to set a seed for a random number. The function prototype of **DBE\_RANDOM.SET\_SEED** is as follows:

```
DBE_RANDOM.SET_SEED (seed IN INTEGER);
```

**Table 10-172** DBE\_RANDOM.SET\_SEED interface parameters

Parameter	Description
seed	Generates a seed for a random number.

- DBE\_RANDOM.GET\_VALUE

The stored procedure **VALUE** generates a random number between a specified **low** and a specified **high**. The function prototype of **DBE\_RANDOM.GET\_VALUE** is as follows:

```

DBE_RANDOM.GET_VALUE(
min IN NUMBER default 0,
max IN NUMBER default 1)
RETURN NUMBER;

```

**Table 10-173** DBE\_RANDOM.GET\_VALUE interface parameters

Parameter	Description
min	Sets the low bound for a random number. The generated random number is greater than or equal to <b>min</b> .
max	Sets the high bound for a random number. The generated random number is less than <b>max</b> .

 **NOTE**

- The only requirement is that the parameter type is **NUMERIC** regardless of the right and left bound values.
- **DBE\_RANDOM** implements pseudo-random numbers. Therefore, if the initial value (seed) remains unchanged, the sequence of the pseudo-random numbers also remains unchanged.
- The generated random number contains 15 valid digits.

## Examples

```
-- Generate a random number between 0 and 1.
SELECT DBE_RANDOM.GET_VALUE(0,1);

-- For integers within a specified range, add the arguments min and max, and truncate the decimals from
the result (the maximum value is not included as a possible value). Therefore, for integers from 0 to 99, you
can use the following code:
SELECT TRUNC(DBE_RANDOM.GET_VALUE(0,100));
```

### 10.11.2.3 DBE\_OUTPUT

 **NOTE**

When DBE\_OUTPUT.PUT\_LINE is used to print the result obtained by the DBE\_FILE.READ\_LINE\_NCHAR API, ensure that the UTF-8 character set encoding can be converted to the current database character set encoding. If the preceding conditions are met, the result can be properly output. DBE\_OUTPUT.PRINT\_LINE does not support this function.

## Interface Description

**Table 10-174** provides all interfaces supported by the **DBE\_OUTPUT** package.

**Table 10-174** DBE\_OUTPUT

Interface	Description
<b>DBE_OUTPUT.PRINT_LINE</b>	Outputs the specified text with newline characters.
<b>DBE_OUTPUT.PRINT</b>	Outputs the specified text without newline characters.

Interface	Description
<a href="#">DBE_OUTPUT.SET_BUFFER_SIZE</a>	Sets the size of the output buffer. If the size is not specified, the buffer can contain a maximum of 20000 bytes. If the size is set to a value less than or equal to 2000 bytes, the buffer can contain a maximum of 2000 bytes.
<a href="#">DBE_OUTPUT.DISABLE</a>	Disables the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE and GET_LINES, and clears the output buffer.
<a href="#">DBE_OUTPUT.ENABLE</a>	Enables the buffer, allows the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES, and sets the buffer size.
<a href="#">DBE_OUTPUT.GET_LINE</a>	Obtains a line of data from the buffer with a newline character as the boundary. The obtained data is not output to the client.
<a href="#">DBE_OUTPUT.GET_LINES</a>	Obtains the character string of a specified number of lines in the buffer as a VARCHAR array. The obtained content is cleared from the buffer and is not output to the client.
<a href="#">DBE_OUTPUT.NEW_LINE</a>	Places a line at the end of the buffer, places an end-of-line marker, and leaves a new line empty.
<a href="#">DBE_OUTPUT.PUT</a>	Places an input string in the buffer without a newline character at the end. When the stored procedure ends, the line ending with the newline character is displayed.
<a href="#">DBE_OUTPUT.PUT_LINE</a>	Places an input string in the buffer with a newline character at the end. When the stored procedure ends, the line ending with the newline character is displayed.

- [DBE\\_OUTPUT.PRINT\\_LINE](#)

The stored procedure **PRINT\_LINE** writes a line of text carrying a line end symbol in the buffer. The function prototype of **DBE\_OUTPUT.PRINT\_LINE** is as follows:

```
DBE_OUTPUT.PRINT_LINE (
format IN VARCHAR2);
```

**Table 10-175** DBE\_OUTPUT.PRINT\_LINE interface parameters

Parameter	Description
format	Specifies the text that was written to the buffer.

- DBE\_OUTPUT.PRINT

The stored procedure **PRINT** outputs the specified text to the front of the specified text without adding a newline character. The function prototype of **DBE\_OUTPUT.PRINT** is as follows:

```
DBE_OUTPUT.PRINT (
format IN VARCHAR2);
```

**Table 10-176** DBE\_OUTPUT.PRINT interface parameters

Parameter	Description
format	Specifies the text that was written to the specified text.

- DBE\_OUTPUT.SET\_BUFFER\_SIZE

The stored procedure **SET\_BUFFER\_SIZE** sets the output buffer size. If the size is not specified, it contains a maximum of 20000 bytes. The function prototype of **DBE\_OUTPUT.SET\_BUFFER\_SIZE** is as follows:

```
DBE_OUTPUT.SET_BUFFER_SIZE (
size IN INTEGER default 20000);
```

**Table 10-177** DBE\_OUTPUT.SET\_BUFFER\_SIZE interface parameters

Parameter	Description
size	Sets the output buffer size.

- DBE\_OUTPUT.DISABLE

The stored procedure **DISABLE** disables the calling of PUT, PUT\_LINE, NEW\_LINE, GET\_LINE and GET\_LINES, and clears the output buffer. The prototype of the DBE\_OUTPUT.DISABLE function is as follows:

```
DBE_OUTPUT.DISABLE;
```

- DBE\_OUTPUT.ENABLE

The stored procedure **ENABLE** enables the buffer, allows the calling of PUT, PUT\_LINE, NEW\_LINE, GET\_LINE, and GET\_LINES, and sets the buffer size. The prototype of the DBE\_OUTPUT.ENABLE function is as follows:

```
DBE_OUTPUT.ENABLE (
buffer_size IN INTEGER DEFAULT 20000
);
```

**Table 10-178** DBE\_OUTPUT.ENABLE parameters

Parameter	Description
buffer_size	Upper limit of the buffer size, in bytes. If <b>buffer_size</b> is set to <b>NULL</b> , the default value is used.

- DBE\_OUTPUT.GET\_LINE

The stored procedure **GET\_LINE** obtains a line of data from the buffer with a newline character as the boundary. The obtained data is not output to the client. The prototype of the DBE\_OUTPUT.GET\_LINE function is as follows:

```
DBE_OUTPUT.GET_LINE (
 line OUT VARCHAR2,
 status OUT INTEGER
);
```

**Table 10-179** DBE\_OUTPUT.GET\_LINE parameters

Parameter	Description
line	Indicates the obtained character string.
status	Indicates whether the calling is normal. If a character string is obtained, the value is <b>0</b> . Otherwise, the value is <b>1</b> .

- DBE\_OUTPUT.GET\_LINES

The stored procedure **GET\_LINES** obtains the character string of a specified number of lines in the buffer as a VARCHAR array. The obtained content is cleared from the buffer and is not output to the client. The prototype of the DBE\_OUTPUT.GET\_LINES function is as follows:

```
DBE_OUTPUT.GET_LINES (
 lines OUT VARCHAR[],
 numlines IN OUT INTEGER
);
```

**Table 10-180** DBE\_OUTPUT.GET\_LINES parameters

Parameter	Description
lines	Outputs an array of multi-line strings read from the buffer.
numlines	Inputs the number of lines to be retrieved from the buffer. The output value is the number of lines actually retrieved. If the output value is less than the input value, there are no more lines in the buffer.

- DBE\_OUTPUT.NEW\_LINE

The stored procedure **NEW\_LINE** places a line at the end of the buffer, places an end-of-line marker, and leaves a new line empty. The prototype of the DBE\_OUTPUT.NEW\_LINE function is as follows:

```
DBE_OUTPUT.NEW_LINE;
```

- DBE\_OUTPUT.PUT

The stored procedure **PUT** places an input string in the buffer without a newline character at the end. When the stored procedure ends, the line ending with the newline character is displayed. The prototype of the DBE\_OUTPUT.PUT function is as follows:

```
DBE_OUTPUT.PUT (
 item IN VARCHAR2);
```

**Table 10-181** DBE\_OUTPUT.PUT parameters

Parameter	Description
item	Character or string item to be placed in the buffer.

- DBE\_OUTPUT.PUT\_LINE

The stored procedure **PUT\_LINE** places an input string in the buffer with a newline character at the end. When the stored procedure ends, the line ending with the newline character is displayed. The prototype of the DBE\_OUTPUT.PUT\_LINE function is as follows:

```
DBE_OUTPUT.PUT_LINE (
 item IN VARCHAR2);
```

**Table 10-182** DBE\_OUTPUT.PUT\_LINE parameters

Parameter	Description
item	Character or string item to be placed in the buffer.

## Examples

```
BEGIN
 DBE_OUTPUT.SET_BUFFER_SIZE(50);
 DBE_OUTPUT.PRINT('hello, ');
 DBE_OUTPUT.PRINT_LINE('database!');-- Output "hello, database!".
END;
/

-- Test DISABLE: Disable the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES. The PUT_LINE
has no output.
BEGIN
 dbe_output.disable();
 dbe_output.put_line('1');
END;
/

-- Test ENABLE: Enable the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES. The output of
PUT_LINE is 1.
BEGIN
 dbe_output.enable();
 dbe_output.put_line('1');
END;
/

-- Test PUT: Place the input character string a in the buffer without adding a newline character at the end.
a has no output.
BEGIN
 dbe_output.enable();
 dbe_output.put('a');
END;
/
```

```

-- Test NEW_LINE. Add a new line. The output is a.
BEGIN
 dbe_output.enable();
 dbe_output.put('a');
 dbe_output.new_line;
END;
/

-- Test GET_LINE: Obtain buffer data and save the data to variables and use PUT_LINE to output the data.
DECLARE
 line VARCHAR(32672);
 status INTEGER := 0;
BEGIN
 dbe_output.put_line('hello');
 dbe_output.get_line(line, status);
 dbe_output.put_line('-----');
 dbe_output.put_line(line);
 dbe_output.put_line(status);
END;
/
The expected result is as follows:

hello
0

-- Test GET_LINES: Obtain multiple lines of content in the buffer and use PUT_LINE to output the content.
DECLARE
 lines dbms_output.chararr;
 numlines integer;
BEGIN
 dbe_output.put_line('output line 1');
 dbe_output.put_line('output line 2');
 dbe_output.put_line('output line 3');
 numlines := 100;
 dbe_output.get_lines(lines, numlines);
 dbe_output.put_line('num: ' || numlines);
 dbe_output.put_line('get line 1: ' || lines(1));
 dbe_output.put_line('get line 2: ' || lines(2));
 dbe_output.put_line('get line 3: ' || lines(3));
END;
/
-- The expected result is as follows:
num: 3
get line 1: output line 1
get line 2: output line 2
get line 3: output line 3

```

### 10.11.2.4 DBE\_RAW

#### Interface Description

[Table 10-183](#) provides all interfaces supported by the **DBE\_RAW** package.

**Table 10-183** DBE\_RAW

Interface	Description
<a href="#">DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW</a>	Converts a value of the <b>INTEGER</b> type to a binary representation ( <b>RAW</b> type).
<a href="#">DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER</a>	Converts a binary representation ( <b>RAW</b> type) to a value of the <b>INTEGER</b> type.

Interface	Description
<a href="#">DBE_RAW.GET_LENGTH</a>	Obtains the length of a <b>RAW</b> object.
<a href="#">DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW</a>	Converts a value of the <b>VARCHAR2</b> type to a binary representation ( <b>RAW</b> type).
<a href="#">DBE_RAW.CAST_TO_VARCHAR2</a>	Converts a value of the <b>RAW</b> type to a value of the <b>VARCHAR2</b> type.
<a href="#">DBE_RAW.SUBSTR</a>	Returns the substring of the <b>RAW</b> type.
<a href="#">DBE_RAW.BIT_OR</a>	Performs the bitwise OR operation on raw data.
<a href="#">DBE_RAW.BIT_AND</a>	Returns a RAW value after bitwise AND calculation.
<a href="#">DBE_RAW.BIT_COMPLEMENT</a>	Returns a RAW value after bitwise complement calculation.
<a href="#">DBE_RAW.BIT_XOR</a>	Returns a RAW value after bitwise XOR calculation.
<a href="#">DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW</a>	Converts a <b>BINARY_DOUBLE</b> value to a RAW value.
<a href="#">DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE</a>	Converts a RAW value to a <b>BINARY_DOUBLE</b> value.
<a href="#">DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT</a>	Converts a RAW value to a <b>FLOAT4</b> value.
<a href="#">DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW</a>	Converts a <b>FLOAT4</b> value to a RAW value.
<a href="#">DBE_RAW.CAST_FROM_RAW_TO_NUMERIC</a>	Converts a RAW value to a <b>NUMERIC</b> value.
<a href="#">DBE_RAW.CAST_FROM_NUMERIC_TO_RAW</a>	Converts a <b>NUMERIC</b> value to a RAW value.
<a href="#">DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2</a>	Converts a RAW value to a <b>NVARCHAR2</b> value.
<a href="#">DBE_RAW.COMPARE</a>	Returns the first different position of two RAW values.
<a href="#">DBE_RAW.CONCAT</a>	Concatenates a maximum of 12 RAW values into a new RAW value and returns the value.
<a href="#">DBE_RAW.CONVERT</a>	Converts a RAW value from the source encoding mode <b>from_charset</b> to the target encoding mode <b>to_charset</b> .
<a href="#">DBE_RAW.COPIES</a>	Copies a RAW value for <i>n</i> times, concatenates the values, and returns the concatenated result.

Interface	Description
<a href="#">DBE_RAW.OVERLAY</a>	Overlays one RAW data with another RAW data by specifying the start position and length to be overlaid.
<a href="#">DBE_RAW.REVERSE</a>	Reverses RAW data by byte.
<a href="#">DBE_RAW.TRANSLATE</a>	Converts or discards a specified byte of a RAW value.
<a href="#">DBE_RAW.TRANSLITERATE</a>	Converts a specified byte of a RAW value.
<a href="#">DBE_RAW.XRANGE</a>	Returns a RAW value containing the succession of one-byte encodings beginning and ending with the specified byte-code.

#### NOTICE

RAW data is represented as hexadecimal characters externally, and stored as binary characters internally. For example, the representation of RAW data 11001011 is 'CB', that is, the input for type conversion is 'CB'.

- [DBE\\_RAW.CAST\\_FROM\\_BINARY\\_INTEGER\\_TO\\_RAW](#)  
The stored procedure **CAST\_FROM\_BINARY\_INTEGER\_TO\_RAW** converts a value of the **INTEGER** type to a binary representation (**RAW** type).

The prototype of the [DBE\\_RAW.CAST\\_FROM\\_BINARY\\_INTEGER\\_TO\\_RAW](#) function is as follows:

```
DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW (
value IN INTEGER,
endianess IN INTEGER DEFAULT 1)
RETURN RAW;
```

**Table 10-184** [DBE\\_RAW.CAST\\_FROM\\_BINARY\\_INTEGER\\_TO\\_RAW](#) parameters

Parameter	Description
value	Specifies the <b>INTEGER</b> value to be converted to the <b>RAW</b> value.
endianess	Specifies the <b>INTEGER</b> value <b>1</b> or <b>2</b> for the byte sequence. ( <b>1</b> indicates <b>BIG_ENDIAN</b> and <b>2</b> indicates <b>LITTLE-ENDIAN</b> .)

- [DBE\\_RAW.CAST\\_FROM\\_RAW\\_TO\\_BINARY\\_INTEGER](#)  
The stored procedure **CAST\_FROM\_RAW\_TO\_BINARY\_INTEGER** converts a binary representation (**RAW** type) to a value of the **INTEGER** type.  
The prototype of the [DBE\\_RAW.CAST\\_FROM\\_RAW\\_TO\\_BINARY\\_INTEGER](#) function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER (
value IN RAW,
endianess IN INTEGER DEFAULT 1)
RETURN BINARY_INTEGER;
```

**Table 10-185** DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_INTEGER parameters

Parameter	Description
value	Specifies an <b>INTEGER</b> value in a binary representation ( <b>RAW</b> type).
endianess	Specifies the <b>INTEGER</b> value <b>1</b> or <b>2</b> for the byte sequence. ( <b>1</b> indicates <b>BIG_ENDIAN</b> and <b>2</b> indicates <b>LITTLE-ENDIAN</b> .)

- DBE\_RAW.GET\_LENGTH

The stored procedure **GET\_LENGTH** returns the length of a **RAW** object.

The prototype of the DBE\_RAW.GET\_LENGTH function is as follows:

```
DBE_RAW.GET_LENGTH(
value IN RAW)
RETURN INTEGER;
```

**Table 10-186** DBE\_RAW.GET\_LENGTH parameters

Parameter	Description
value	Specifies a <b>RAW</b> object.

- DBE\_RAW.CAST\_FROM\_VARCHAR2\_TO\_RAW

The stored procedure **CAST\_FROM\_VARCHAR2\_TO\_RAW** converts a **VARCHAR2** object to a **RAW** object.

The prototype of the DBE\_RAW.CAST\_FROM\_VARCHAR2\_TO\_RAW function is as follows:

```
DBE_RAW.CAST_TO_RAW(
str IN VARCHAR2)
RETURN RAW;
```

**Table 10-187** DBE\_RAW.CAST\_FROM\_VARCHAR2\_TO\_RAW parameters

Parameter	Description
c	Specifies a <b>VARCHAR2</b> object to be converted.

- DBE\_RAW.CAST\_TO\_VARCHAR2

The stored procedure **CAST\_TO\_VARCHAR2** converts a **RAW** object to a **VARCHAR2** object.

The prototype of the DBE\_RAW.CAST\_TO\_VARCHAR2 function is as follows:

```
DBE_RAW.CAST_TO_VARCHAR2(
str IN RAW)
RETURN VARCHAR2;
```

**Table 10-188** DBE\_RAW.CAST\_TO\_VARCHAR2 parameters

Parameter	Description
str	Specifies a <b>RAW</b> object to be converted.

- DBE\_RAW.BIT\_OR

The stored procedure **BIT\_OR** calculates the bitwise OR result of two raw data records.

The prototype of the DBE\_RAW.BIT\_OR function is as follows:

```
DBE_RAW.BIT_OR(
str1 IN RAW,
str2 IN RAW)
RETURN RAW;
```

**Table 10-189** DBE\_RAW.BIT\_OR parameters

Parameter	Description
str1	First character string of the bitwise OR operation
str2	Second character string of the bitwise OR operation

- DBE\_RAW.SUBSTR

The stored procedure **SUBSTR** truncates an object of the **RAW** type based on the start bit and length.

The prototype of the DBE\_RAW.SUBSTR function is as follows:

```
DBE_RAW.SUBSTR(
lob_loc IN RAW,
off_set IN integer default 1,
amount IN integer default 32767)
RETURN RAW;
```

**Table 10-190** DBE\_RAW.SUBSTR parameters

Parameter	Description
lob_loc	Source raw character string
off_set	Start position of a substring. The default value is <b>1</b> .
amount	Length of a substring. The default value is <b>32767</b> .

- DBE\_RAW.BIT\_AND

Obtains the bitwise AND result of two RAW values.

The prototype of the DBE\_RAW.BIT\_AND function is as follows:

```
DBE_RAW.BIT_AND(
r1 IN RAW,
r2 IN RAW)
RETURN RAW;
```

**Table 10-191** DBE\_RAW.BIT\_AND parameters

Parameter	Description
r1	The RAW value for the bitwise AND operation with r2. The maximum length is 32767.
r2	The RAW value for the bitwise AND operation with r1. The maximum length is 32767.

- DBE\_RAW.BIT\_COMPLEMENT

Obtains the bitwise complement result of a RAW value.

The prototype of the DBE\_RAW.BIT\_COMPLEMENT function is as follows:

```
DBE_RAW.BIT_COMPLEMENT(
 r IN RAW)
RETURN RAW;
```

**Table 10-192** DBE\_RAW.BIT\_COMPLEMENT parameters

Parameter	Description
r	The RAW value for the bitwise complement operation. The maximum length is 32767.

- DBE\_RAW.BIT\_XOR

Obtains the bitwise XOR result of two RAW values.

The prototype of the DBE\_RAW.BIT\_XOR function is as follows:

```
DBE_RAW.BIT_XOR(
 r1 IN RAW,
 r2 IN RAW)
RETURN RAW;
```

**Table 10-193** DBE\_RAW.BIT\_XOR parameters

Parameter	Description
r1	The RAW value for the bitwise XOR operation with r2. The maximum length is 32767.
r2	The RAW value for the bitwise XOR operation with r1. The maximum length is 32767.

- DBE\_RAW.CAST\_FROM\_BINARY\_DOUBLE\_TO\_RAW

Converts the BINARY\_DOUBLE type to an INTEGER value in a binary representation (RAW type).

The prototype of the DBE\_RAW.CAST\_FROM\_BINARY\_DOUBLE\_TO\_RAW function is as follows:

```
DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW (
 n IN BINARY_DOUBLE,
 endianness IN INTEGER DEFAULT 1)
RETURN RAW;
```

**Table 10-194** DBE\_RAW.CAST\_FROM\_BINARY\_DOUBLE\_TO\_RAW parameters

Parameter	Description
n	BINARY_DOUBLE value to be converted.
endianess	Endianness, that is, byte order. The value can be <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>1</b> indicates BIG_ENDIAN, <b>2</b> indicates LITTLE_ENDIAN, and <b>3</b> indicates MACHINE_ENDIAN. The default value is <b>1</b> . If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_DOUBLE

Converts an INTEGER value in a binary representation (RAW type) to a BINARY\_DOUBLE type.

The prototype of the DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_DOUBLE function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE(
 r IN RAW,
 endianess IN INTEGER DEFAULT 1)
RETURN BINARY_DOUBLE;
```

**Table 10-195** DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_DOUBLE parameters

Parameter	Description
r	The RAW value to be converted. The value contains 8 to 32767 characters.
endianess	Endianness, that is, byte order. The value can be <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>1</b> indicates BIG_ENDIAN, <b>2</b> indicates LITTLE_ENDIAN, and <b>3</b> indicates MACHINE_ENDIAN. The default value is <b>1</b> . If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_FLOAT

Converts a RAW value to a FLOAT4 value.

The prototype of the DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_FLOAT function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT(
 r IN RAW,
 endianess IN INTEGER DEFAULT 1)
RETURN FLOAT4;
```

**Table 10-196** DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_FLOAT parameters

Parameter	Description
r	The RAW value to be converted. The value contains 4 to 32767 characters.
endianess	Endianness, that is, byte order. The value can be <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>1</b> indicates BIG_ENDIAN, <b>2</b> indicates LITTLE_ENDIAN, and <b>3</b> indicates MACHINE_ENDIAN. The default value is <b>1</b> . If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE\_RAW.CAST\_FROM\_BINARY\_FLOAT\_TO\_RAW

Converts a FLOAT4 value to a RAW value.

The prototype of the DBE\_RAW.CAST\_FROM\_BINARY\_FLOAT\_TO\_RAW function is as follows:

```
DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW(
 n IN FLOAT4,
 endianess IN INTEGER DEFAULT 1)
RETURN RAW;
```

**Table 10-197** DBE\_RAW.CAST\_FROM\_BINARY\_FLOAT\_TO\_RAW parameters

Parameter	Description
n	FLOAT4 value to be converted.
endianess	Endianness, that is, byte order. The value can be <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>1</b> indicates BIG_ENDIAN, <b>2</b> indicates LITTLE_ENDIAN, and <b>3</b> indicates MACHINE_ENDIAN. The default value is <b>1</b> . If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE\_RAW.CAST\_FROM\_RAW\_TO\_NUMBER

Converts a RAW value to a NUMERIC value.

 **NOTE**

The bottom-layer implementation of the number data type in database ORA is different from that in GaussDB, and the raw data type is the hexadecimal representation of the binary stream implemented at the bottom layer. Therefore, the function in database ORA is different from that in GaussDB. You cannot obtain the same number-type data from GaussDB based on the raw data corresponding to the number-type data in database ORA. For details about the number-type data in GaussDB, see the example.

The prototype of the DBE\_RAW.CAST\_FROM\_RAW\_TO\_NUMBER function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_NUMBER(
 r IN RAW)
RETURN NUMERIC;
```

**Table 10-198** DBE\_RAW.CAST\_FROM\_RAW\_TO\_NUMBER parameters

Parameter	Description
r	The RAW value to be converted. The value contains 6 to 32767 characters.

- DBE\_RAW.CAST\_FROM\_NUMBER\_TO\_RAW  
Converts a NUMERIC value to a RAW value.

 **NOTE**

The bottom-layer implementation of the number data type in database ORA is different from that in GaussDB, and the raw data type is the hexadecimal representation of the binary stream implemented at the bottom layer. Therefore, the function in database ORA is different from that in GaussDB. You cannot restore the raw data corresponding to the number-type data in database ORA to the original number type in database ORA in the GaussDB database. For details about the performance of this function in GaussDB, see the example.

The prototype of the DBE\_RAW.CAST\_FROM\_NUMBER\_TO\_RAW function is as follows:

```
DBE_RAW.CAST_FROM_NUMBER_TO_RAW(
 n IN NUMERIC)
RETURN RAW;
```

**Table 10-199** DBE\_RAW.CAST\_FROM\_NUMBER\_TO\_RAW parameters

Parameter	Description
n	NUMERIC value to be converted.

- DBE\_RAW.CAST\_FROM\_RAW\_TO\_NVARCHAR2  
Converts a RAW value to an NVARCHAR2 value.

The prototype of the DBE\_RAW.CAST\_FROM\_RAW\_TO\_NVARCHAR2 function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2(
 r IN RAW)
RETURN NVARCHAR2;
```

**Table 10-200** DBE\_RAW.CAST\_FROM\_RAW\_TO\_NVARCHAR2 parameters

Parameter	Description
r	The RAW value to be converted. The maximum length is 32767.

- DBE\_RAW.COMPARE

Returns the first different position of two RAW values.

The prototype of the DBE\_RAW.COMPARE function is as follows:

```
DBE_RAW.COMPARE(
 r1 IN RAW,
 r2 IN RAW,
 pad IN RAW DEFAULT NULL)
RETURN INTEGER;
```

**Table 10-201** DBE\_RAW.COMPARE parameters

Parameter	Description
r1	First data to be compared. The value can be <b>NULL</b> or the length is 0. The maximum length is 32767.
r2	Second data to be compared. The value can be <b>NULL</b> or the length is 0. The maximum length is 32767.
pad	The first byte of <b>pad</b> is used to extend the shorter one of <b>r1</b> or <b>r2</b> . The maximum length is 32767. If this parameter is set to <b>NULL</b> , the length is 0, or the default value is used, the extended value is <b>0x'00'</b> .

- DBE\_RAW.CONCAT

Concatenates a maximum of 12 RAW values into a new RAW value and returns the value. If the length after concatenation exceeds 32767, an error is reported.

The prototype of the DBE\_RAW.CONCAT function is as follows:

```
DBE_RAW.CONCAT(
 r1 IN RAW DEFAULT NULL,
 r2 IN RAW DEFAULT NULL,
 r3 IN RAW DEFAULT NULL,
 r4 IN RAW DEFAULT NULL,
 r5 IN RAW DEFAULT NULL,
 r6 IN RAW DEFAULT NULL,
 r7 IN RAW DEFAULT NULL,
 r8 IN RAW DEFAULT NULL,
 r9 IN RAW DEFAULT NULL,
 r10 IN RAW DEFAULT NULL,
 r11 IN RAW DEFAULT NULL,
 r12 IN RAW DEFAULT NULL)
RETURN RAW;
```

**Table 10-202** DBE\_RAW.CONCAT parameters

Parameter	Description
r1...r12	The RAW values to be concatenated.

- DBE\_RAW.CONVERT

Converts a RAW value from the source encoding mode **from\_charset** to the target encoding mode **to\_charset**.

If the rule for converting between source and target encoding (for example, GBK and LATIN1) does not exist, the parameter **r** is returned without conversion. See the **pg\_conversion** system catalog for details.

The prototype of the DBE\_RAW.CONVERT function is as follows:

```
DBE_RAW.CONVERT(
 r IN RAW,
 to_charset IN VARCHAR2,
 from_charset IN VARCHAR2)
RETURN RAW;
```

**Table 10-203** DBE\_RAW.CONVERT parameters

Parameter	Description
r	The RAW value to be converted. The maximum length is 32767.
to_charset	Name of the target encoding character set.
from_charset	Name of the source encoding character set. In this encoding, r must be valid.

- DBE\_RAW.COPIES

Copies a RAW value for *n* times, concatenates the values, and returns the concatenated result. If the length after copying exceeds 32767, an error is reported.

The prototype of the DBE\_RAW.COPIES function is as follows:

```
DBE_RAW.COPIES(
 r IN RAW,
 n IN NUMERIC)
RETURN RAW;
```

**Table 10-204** DBE\_RAW.COPIES parameters

Parameter	Description
r	The RAW values to be copied.
n	Number of copy times. The value must be a positive number.

- DBE\_RAW.OVERLAY

Overlays one RAW data with another RAW data by specifying the start position and length to be overlaid.

The prototype of the DBE\_RAW.OVERLAY function is as follows:

```
DBE_RAW.OVERLAY(
 overlay_str IN RAW,
 target IN RAW,
 pos IN BINARY_INTEGER DEFAULT 1,
 len IN BINARY_INTEGER DEFAULT NULL,
 pad IN RAW DEFAULT NULL)
RETURN RAW;
```

**Table 10-205** DBE\_RAW.OVERLAY parameters

Parameter	Description
overlay_str	Byte used for overwriting. The value cannot be <b>NULL</b> .

Parameter	Description
target	Source byte string to be overlaid. The value is of the RAW type and contains a maximum of 32767 bytes. The value cannot be <b>NULL</b> .
pos	Indicates the byte from which the overlay starts. The position of the first byte is 1. The value of <b>pos</b> must be greater than or equal to 1 and the value of <b>len+pos</b> must be less than or equal to 32767. The default value is <b>1</b> .
len	Length to be overlaid. The value of <b>len</b> must be greater than or equal to 0 and the value of <b>len+pos</b> must be less than or equal to 32767. The default value is the length of <b>overlay_str</b> .
pad	Padding byte. Only the first byte is valid. The default value is <b>NULL</b> . If the value is <b>NULL</b> , it is regarded as <b>0x00</b> by default.

- DBE\_RAW.REVERSE

Reverses RAW data by byte.

The prototype of the DBE\_RAW.REVERSE function is as follows:

```
DBE_RAW.REVERSE(
 r IN RAW
)
RETURN RAW;
```

**Table 10-206** DBE\_RAW.REVERSE parameters

Parameter	Description
r	The RAW value to be reversed. The maximum length is 32767. If the value is <b>NULL</b> , <b>NULL</b> is returned.

- DBE\_RAW.TRANSLATE

Converts or discards a specified byte of a RAW value.

The prototype of the DBE\_RAW.TRANSLATE function is as follows:

```
DBE_RAW.TRANSLATE(
 r IN RAW,
 from_set IN RAW,
 to_set IN RAW)
RETURN RAW;
```

**Table 10-207** DBE\_RAW.TRANSLATE parameters

Parameter	Description
r	Source byte string to be converted. The value is of the RAW type and contains a maximum of 32767 bytes. The value cannot be <b>NULL</b> .

Parameter	Description
from_set	Bytecode to be converted in the source byte string. The value is of the RAW type. The value cannot be <b>NULL</b> . The bytes in <b>from_set</b> in the source byte string are replaced with the bytes in the corresponding positions in <b>to_set</b> . If <b>from_set</b> contains multiple identical bytes, only the first byte corresponding to the byte is replaced. For example, if <b>r[x]=from_set[n]</b> , <b>r[x]</b> is replaced with <b>to_set[n]</b> . If <b>to_set[n]</b> corresponding to <b>from_set[n]</b> does not exist (that is, the number of bytes of <b>to_set</b> does not exceed <b>n</b> ), <b>r[x]</b> will be discarded.
to_set	Byte code converted from the <b>from_set</b> byte. The value is of the RAW type. The value cannot be <b>NULL</b> .

- DBE\_RAW.TRANSLITERATE

Converts a RAW value to a NUMERIC value.

The prototype of the DBE\_RAW.TRANSLITERATE function is as follows:

```
DBE_RAW.TRANSLITERATE(
 r IN RAW,
 from_set IN RAW DEFAULT NULL,
 to_set IN RAW DEFAULT NULL,
 pad IN RAW DEFAULT NULL)
RETURN RAW;
```

**Table 10-208** DBE\_RAW.TRANSLITERATE parameters

Parameter	Description
r	Source byte string to be converted. The value is of the RAW type and contains a maximum of 32767 bytes. The value cannot be <b>NULL</b> .
to_set	Byte code converted from the <b>from_set</b> byte. The value is of the RAW type. The default value is <b>NULL</b> . If the value is <b>NULL</b> , all bytes in <b>r</b> that exist in <b>from_set</b> are converted to <b>pad</b> .
from_set	Bytecode to be converted in the source byte string <b>r</b> . The value is of the RAW type. The default value is <b>NULL</b> . If <b>from_set</b> is <b>NULL</b> , all bytes in the source byte string <b>r</b> are converted into equal-length data filled by <b>pad</b> . Otherwise, the bytes in <b>from_set</b> in the source byte string <b>r</b> are replaced with the bytes in the corresponding position in <b>to_set</b> . For example, if <b>r[x]=from_set[n]</b> , <b>r[x]</b> is converted to <b>to_set[n]</b> . If <b>to_set[n]</b> does not exist, <b>r[x]</b> will be converted to <b>pad</b> .
pad	Padding byte. Only the first byte is valid. The default value is <b>NULL</b> . If the value is <b>NULL</b> , it is regarded as <b>0x00</b> by default.

- DBE\_RAW.XRANGE

Returns a RAW value containing the succession of one-byte encodings beginning and ending with the specified byte-code.

The prototype of the DBE\_RAW.XRANGE function is as follows:

```
DBE_RAW.XRANGE(
 start_byte IN RAW,
 end_byte IN RAW)
RETURN RAW;
```

**Table 10-209** DBE\_RAW.XRANGE parameters

Parameter	Description
start_byte	Start byte. Only the first byte is valid. If the value is <b>NULL</b> , it is regarded as <b>0x00</b> by default.
end_byte	End byte. Only the first byte is valid. If the value is <b>NULL</b> , it is regarded as <b>0xFF</b> by default. If <b>end_byte</b> is less than <b>start_byte</b> , <b>end_byte</b> is concatenated to <b>0xFF</b> , and then <b>0x00</b> is concatenated to <b>start_byte</b> .

## Examples

```
--Perform operations on RAW data in a stored procedure.
CREATE OR REPLACE PROCEDURE proc_raw
AS
str varchar2(100) := 'abcdef';
source raw(100);
amount integer;
BEGIN
source := dbe_raw.cast_from_varchar2_to_raw(str);--Convert the type.
amount := dbe_raw.get_length(source);--Obtain the length.
dbe_output.print_line(amount);
END;
/

-- Call the stored procedure.
CALL proc_raw();

-- Delete the stored procedure.
DROP PROCEDURE proc_raw;

DECLARE
v_raw RAW;
v_double BINARY_DOUBLE;
v_float FLOAT4;
v_numeric NUMERIC;
v_nvarchar2 NVARCHAR2;
BEGIN
-- Perform bitwise AND calculation on RAW values.
SELECT DBE_RAW.BIT_AND('AFF', 'FF0B') INTO v_raw; -- 0A0B
-- Perform bitwise complement calculation on RAW values.
SELECT DBE_RAW.BIT_COMPLEMENT('0AFF') INTO v_raw; -- F500
-- Perform bitwise XOR calculation on RAW values.
SELECT DBE_RAW.BIT_XOR('AFF', 'FF0B') INTO v_raw; -- F5F4
-- Convert a BINARY_DOUBLE value to a RAW value.
SELECT DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW(1.0001,1) INTO v_raw; -- 3FF00068DB8BAC71
-- Convert a RAW value to a BINARY_DOUBLE value.
SELECT DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE('3FF00068DB8BAC7',1) INTO v_double; -- 1.0001
-- Convert a RAW value to a FLOAT4 value.
SELECT DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT('40200000',1) INTO v_float; -- 2.5
-- Convert a FLOAT4 value to a RAW value.
SELECT DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW('2.5',1) INTO v_raw; -- 40200000
-- Convert a RAW value to a NUMERIC value.
SELECT DBE_RAW.CAST_FROM_RAW_TO_NUMBER('808002008813') INTO v_numeric; -- 2.5
-- Convert a NUMERIC value to a RAW value.
SELECT DBE_RAW.CAST_FROM_NUMBER_TO_RAW('2.5') INTO v_raw; -- 808002008813
```

```

-- Convert a RAW value to an NVARCHAR2 value.
SELECT DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2('12345678') INTO v_nvarchar2; -- \x124Vx
-- Compare RAW values.
SELECT DBE_RAW.COMPARE('ABCD','AB') INTO v_numeric; -- 2
-- Concatenate RAW values.
SELECT DBE_RAW.CONCAT('ABCD','AB') INTO v_raw; -- ABCDAB
-- Convert RAW values.
SELECT DBE_RAW.CONVERT('E695B0', 'GBK','UTF8') INTO v_raw; -- CAFD
-- Copy RAW values.
SELECT DBE_RAW.COPIES('ABCD',2) INTO v_raw; -- ABCDABCD
-- Specify the start position and length of a RAW value to be overlaid.
SELECT DBE_RAW.OVERLAY('abcef', '12345678123456', 2, 5, '9966') INTO v_raw; -- 120ABCEF999956
-- Reverse a RAW value by byte.
SELECT DBE_RAW.REVERSE('12345678') INTO v_raw; -- 78563412
-- Convert bytes of the RAW type (without padding code)
SELECT DBE_RAW.TRANSLATE('1122112233', '1133','55') INTO v_raw; -- 55225522
-- Convert bytes of the RAW type (with padding code)
SELECT DBE_RAW.TRANSLITERATE('1122112233', '55','1133','FFEE') INTO v_raw; -- 55225522FF
-- All bytes between two bytes of the RAW type.
SELECT DBE_RAW.XRANGE('00','03') INTO v_raw; -- 00010203
END;
/

```

### 10.11.2.5 DBE\_TASK

#### API Description

**Table DBE\_TASK** lists all APIs supported by the **DBE\_TASK** package.

**Table 10-210** DBE\_TASK

API	Description
<b>DBE_TASK.SUBMIT</b>	Submits a scheduled task. The job ID is automatically generated by the system.
<b>DBE_TASK.JOB_SUBMIT</b>	Same as <b>DBE_TASK.SUBMIT</b> . However, It provides syntax compatibility parameters.
<b>DBE_TASK.ID_SUBMIT</b>	Submits a scheduled task. The job ID is specified by the user.
<b>DBE_TASK.CANCEL</b>	Removes a scheduled task by job ID.
<b>DBE_TASK.RUN</b>	Executes a scheduled task.
<b>DBE_TASK.FINISH</b>	Disables or enables scheduled task execution.
<b>DBE_TASK.UPDATE</b>	Modifies user-definable attributes of a scheduled task, including the task content, next-execution time, and execution interval.
<b>DBE_TASK.CHANGE</b>	Same as <b>DBE_TASK.UPDATE</b> . However, It provides syntax compatibility parameters.
<b>DBE_TASK.CONTENT</b>	Modifies the content attribute of a scheduled task.
<b>DBE_TASK.NEXT_TIME</b>	Modifies the next-execution time attribute of a scheduled task.

API	Description
<a href="#">DBE_TASK.INTERVAL</a>	Modifies the execution interval attribute of a scheduled task.

- DBE\_TASK.SUBMIT

The stored procedure SUBMIT submits a scheduled task provided by the system.

The prototype of the DBE\_TASK.SUBMIT function is as follows:

```
DBE_TASK.SUBMIT(
what IN TEXT,
next_time IN TIMESTAMP DEFAULT sysdate,
interval_time IN TEXT DEFAULT 'null',
id OUT INTEGER
)RETURN INTEGER;
```

 **NOTE**

When a scheduled task is created (using **DBE\_TASK**), the system binds the current database and the username to the task by default. The API function can be called using CALL or SELECT. If the API function is called using SELECT, you do not need to set the output parameter. If the API function is called using CALL, you need to set the output parameter. To call this function within a stored procedure, use **perform**. If the committed SQL statement task uses a non-public schema, specify the schema to a table schema or a function schema, or add **set current\_schema = xxx** before the SQL statement.

**Table 10-211** DBE\_TASK.SUBMIT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
what	Text	IN	No	SQL statement to be executed. One or multiple DDLs (excluding database-related operations), DMLs, anonymous blocks, and statements for calling stored procedures, or all four combined are supported.
next_time	Timestamp	IN	No	Specifies the next time the job will be executed. The default value is the current system time ( <b>sysdate</b> ). If the specified time has past, the job is executed at the time it is submitted.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
interval_time	Text	IN	Yes	Calculates the next time to execute the job. It can be an interval expression, or <b>sysdate</b> followed by a numeric value, for example, <b>sysdate+1.0/24</b> . If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward.
id	Integer	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When SELECT is used for calling, this parameter cannot be added. When CALL is used for calling, this parameter must be added.

#### NOTICE

When you create a user using the **what** parameter, the plaintext password of the user is recorded in the log. Therefore, you are advised not to do so. Tasks created using this API may not be highly available. You are advised to use **PKG\_SERVICE.SUBMIT\_ON\_NODES** to create a task and specify the CCN as the job execution node.

#### Example:

```
select DBE_TASK.SUBMIT('call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate+1');

select DBE_TASK.SUBMIT('call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate+1.0/24');

CALL DBE_TASK.SUBMIT('INSERT INTO T_JOB VALUES(1); call pro_1(); call pro_2();',
add_months(to_date('201701','yyyymm'),1), 'date_trunc("day",SYSDATE) + 1 +(8*60+30.0)/(24*60)',:jobid);

DECLARE
 jobid int;
BEGIN
 PERFORM DBE_TASK.SUBMIT('call pro_xxx();', sysdate, 'interval "5 minute"', jobid);
END;
/
```

- **DBE\_TASK.JOB\_SUBMIT**

The stored procedure **SUBMIT** submits a scheduled task provided by the system. In addition, it provides additional compatibility parameters.

The **DBE\_TASK.JOB\_SUBMIT** function prototype is as follows:

```
DBE_TASK.JOB_SUBMIT(
 job OUT INTEGER,
 what IN TEXT,
 next_date IN TIMESTAMP DEFAULT sysdate,
 job_interval IN TEXT DEFAULT 'null',
 no_parse IN BOOLEAN DEFAULT false,
 instance IN INTEGER DEFAULT 0,
```

```
force IN BOOLEAN DEFAULT false
)RETURN INTEGER;
```

**Table 10-212** DBE\_TASK.JOB\_SUBMIT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job	Integer	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When <b>db.job_submit</b> is called using SELECT, this parameter can be omitted.
what	Text	IN	No	SQL statement to be executed. One or multiple DDLs (excluding database-related operations), DMLs, anonymous blocks, and statements for calling stored procedures, or all four combined are supported.
next_date	Timestamp	IN	Yes	Specifies the next time the job will be executed. The default value is the current system time ( <b>sysdate</b> ). If the specified time has past, the job is executed at the time it is submitted.
job_interval	Text	IN	Yes	Calculates the next time to execute the job. It can be an interval expression, or <b>sysdate</b> followed by a numeric value, for example, <b>sysdate+1.0/24</b> . If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward.
no_pare	Boolean	IN	Yes	The default value is <b>false</b> , which is used only for syntax compatibility.
instance	Integer	IN	Yes	The default value is <b>0</b> , which is used only for syntax compatibility.
force	Boolean	IN	Yes	The default value is <b>false</b> , which is used only for syntax compatibility.

**Example:**

```
DECLARE
 id integer;
BEGIN
 id = DBE_TASK.JOB_SUBMIT(
 what => 'insert into t1 values (1, 2)',
 job_interval => 'sysdate + 1' --daily
);
END;
```

- DBE\_TASK.ID\_SUBMIT

ID\_SUBMIT has the same syntax function as SUBMIT, but the first parameter of ID\_SUBMIT is an input parameter, that is, a specified job ID. In contrast, that last parameter of ID\_SUBMIT is an output parameter, indicating the job ID automatically generated by the system.

```
DBE_TASK.ID_SUBMIT(
id IN BIGINT,
what IN TEXT,
next_time IN TIMESTAMP DEFAULT sysdate,
interval_time IN TEXT DEFAULT 'null');
```

Example:

```
CALL dbe_task.id_submit(101, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
```

- DBE\_TASK.CANCEL

The stored procedure **CANCEL** deletes a specified task.

The prototype of the DBE\_TASK.CANCEL function is as follows:

```
CANCEL(id IN INTEGER);
```

**Table 10-213** DBE\_TASK.CANCEL parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	Integer	IN	No	Specifies the job ID.

Example:

```
CALL dbe_task.cancel(101);
```

- DBE\_TASK.RUN

The stored procedure runs a scheduled task.

The prototype of the DBE\_TASK.RUN function is as follows:

```
DBE_TASK.RUN(
job IN BIGINT,
force IN BOOLEAN DEFAULT FALSE);
```

**Table 10-214** DBE\_TASK.RUN parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job	bigint	IN	No	Specifies the job ID.
force	Boolean	IN	Yes	Used only for syntax compatibility.

Example:

```
BEGIN
 DBE_TASK.ID_SUBMIT(12345, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
 DBE_TASK.RUN(12345);
END;
/
```

- DBE\_TASK.FINISH

The stored procedure FINISH disables or enables a scheduled task.

The prototype of the DBE\_TASK.FINISH function is as follows:

```
DBE_TASK.FINISH(
 id IN INTEGER,
 broken IN BOOLEAN,
 next_time IN TIMESTAMP DEFAULT sysdate);
```

**Table 10-215** DBE\_TASK.FINISH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	Integer	IN	No	Specifies the job ID.
broken	Boolean	IN	No	Specifies the status flag, <b>true</b> for broken and <b>false</b> for not broken. The current job is updated based on the parameter value <b>true</b> or <b>false</b> . If the parameter is left empty, the job status remains unchanged.
next_time	Timestamp	IN	Yes	Specifies the next execution time. The default value is the current system time. If <b>broken</b> is set to <b>true</b> , <b>next_time</b> is updated to '4000-1-1'. If <b>broken</b> is set to <b>false</b> and <b>next_time</b> is not empty, <b>next_time</b> is updated for the job. If <b>next_time</b> is empty, it will not be updated. This parameter can be omitted, and its default value will be used in this case.

Example:

```
CALL dbe_task.finish(101, true);
CALL dbe_task.finish(101, false, sysdate);
```

- DBE\_TASK.UPDATE

The stored procedure UPDATE modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

The prototype of the DBE\_TASK.UPDATE function is as follows:

```
dbe_task.UPDATE(
 id IN INTEGER,
 content IN TEXT,
 next_time IN TIMESTAMP,
 interval_time IN TEXT);
```

**Table 10-216** DBE\_TASK.UPDATE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	Integer	IN	No	Specifies the job ID.
content	Text	IN	Yes	Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the <b>content</b> parameter for the specified job. Otherwise, the system updates the <b>content</b> parameter for the specified job.
next_time	Timestamp	IN	Yes	Specifies the next execution time. If this parameter is left empty, the system does not update the <b>next_time</b> parameter for the specified job. Otherwise, the system updates the <b>next_time</b> parameter for the specified job.
interval_time	Text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the <b>interval_time</b> parameter is not updated for the specified job. If not, whether the <b>interval_time</b> parameter is valid time or interval type is checked. If it is, it is updated for the specified job. If this parameter is set to <b>null</b> , the job will be executed only once, and the job status will change to <b>'d'</b> afterward.

Example:

```
CALL dbe_task.update(101, 'call userproc();', sysdate, 'sysdate + 1.0/1440');
CALL dbe_task.update(101, 'insert into tbl_a values(sysdate);', sysdate, 'sysdate + 1.0/1440');
```

- **DBE\_TASK.CHANGE**

The stored procedure **UPDATE** modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

The prototype of the **DBE\_TASK.CHANGE** function is as follows:

```
DBE_TASK.CHANGE(
job IN INTEGER,
what IN TEXT DEFAULT NULL,
next_date IN TIMESTAMP DEFAULT NULL,
job_interval IN TEXT DEFAULT NULL,
```

```
instance IN INTEGER DEFAULT NULL,
force IN BOOLEAN DEFAULT false);
```

**Table 10-217** DBE\_TASK.CHANGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job	Integer	IN	No	Specifies the job ID.
what	Text	IN	Yes	Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the <b>what</b> parameter for the specified job. Otherwise, the system updates the <b>what</b> parameter for the specified job.
next_date	Timestamp	IN	Yes	Specifies the next execution time. If this parameter is left empty, the system does not update the <b>next_time</b> parameter for the specified job. Otherwise, the system updates the <b>next_date</b> parameter for the specified job.
job_interval	Text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the <b>job_interval</b> parameter for the specified job. Otherwise, the system updates the <b>job_interval</b> parameter for the specified job after necessary validity check. If this parameter is set to <b>null</b> , the job will be executed only once, and the job status will change to <b>'d'</b> afterward.
instance	Integer	IN	Yes	Used only for syntax compatibility.
force	Boolean	IN	No	Used only for syntax compatibility.

```
BEGIN
DBE_TASK.CHANGE(
 job => 1234,
 what => 'insert into t2 values (2);'
);
```

```
END;
/
```

- **DBE\_TASK.CONTENT**

The stored procedure **CONTENT** modifies the procedures to be executed by a specified task.

The function prototype of **DBE\_TASK.CONTENT** is as follows:

```
DBE_TASK.CONTENT(
id IN INTEGER,
content IN TEXT);
```

**Table 10-218** DBE\_TASK.CONTENT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	Integer	IN	No	Specifies the job ID.
content	Text	IN	No	Specifies the name of the stored procedure or SQL statement block that is executed.

 **NOTE**

- If the value specified by the **content** parameter is one or multiple executable SQL statements, program blocks, or stored procedures, this procedure can be executed successfully; otherwise, it will fail to be executed.
- If the value specified by the **content** parameter is a simple statement such as **INSERT** and **UPDATE**, a schema name must be added in front of the table name.

Example:

```
CALL dbe_task.content(101, 'call userproc();');
CALL dbe_task.content(101, 'insert into tbl_a values(sysdate);');
```

- **DBE\_TASK.NEXT\_TIME**

The stored procedure **NEXT\_TIME** modifies the next-execution time attribute of a task.

The prototype of the **DBE\_TASK.NEXT\_TIME** function is as follows:

```
DBE_TASK.NEXT_TIME(
id IN BIGINT,
next_time IN TEXT);
```

**Table 10-219** DBE\_TASK.NEXT\_TIME parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	bigint	IN	No	Specifies the job ID.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
next_time	Text	IN	No	Specifies the next execution time.

 **NOTE**

If the specified **next\_time** value is earlier than the current date, the job is executed once immediately.

Example:

```
CALL dbe_task.next_time(101, sysdate);
```

- **DBE\_TASK.INTERVAL**

The stored procedure **INTERVAL** modifies the execution interval attribute of a task.

The prototype of the **DBE\_TASK.INTERVAL** function is as follows:

```
DBE_TASK.INTERVAL(
id IN INTEGER,
interval_time IN TEXT);
```

**Table 10-220** DBE\_TASK.INTERVAL parameters

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
id	Integer	IN	No	Specifies the job ID.
interval_time	Text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to <b>'d'</b> afterward. <b>interval</b> must be a valid time or interval type.

Example:

```
CALL dbe_task.interval(101, 'sysdate + 1.0/1440');
```

 **NOTE**

For a job that is currently running (that is, **job\_status** is **'r'**), it is not allowed to use **cancel**, **update**, **next\_time**, **content**, or **interval** to delete or modify job parameters.

## Constraints

1. After a job is created by using **SUMMIT/ID\_SUBMIT**, the job belongs to the current coordinator (that is, the job is scheduled and executed only on the current coordinator). Other coordinators do not schedule and execute the job. If the coordinator node is faulty, the job cannot be properly executed. You are advised to use the **PKG\_SERVICE.SUBMIT\_ON\_NODES** API to specify the job execution node as CCN to ensure that the job is still available when a node is faulty. Not all coordinators can query, modify, and delete tasks created on other CNs.
2. You can create, update, and delete tasks only using the procedures provided by the **dbe\_task** package. These procedures synchronize task information between different CNs and associate primary keys between `pg_job` and `pg_job_proc`. If you use DML statements to add, delete, or modify records in `pg_job`, task information will become inconsistent between CNs and system catalogs may fail to be associated, compromising internal task management.
3. Each task created by a user is bound to a CN. If the CN fails while a task is being executed, the task status cannot be updated in real time and will stay at 'r'. The task status will be updated to 's' only after the CN recovers. When a CN fails, all tasks on this CN cannot be scheduled or executed until the CN is restored manually, or deleted and then replaced.
4. For each task, the bound CN updates the real-time task information (including the task status, last execution start time, last execution end time, next execution start time, the number of execution failures [if any]) to `pg_job`, and synchronizes the information to other CNs, ensuring consistent task information between different CNs. In the case of faults on other CNs, task information synchronization is reattempted by the bound CN, which increases job execution time. Although task information fails to be synchronized between CNs, task information can still be properly updated in `pg_job` on the bound CN and the task can be executed successfully. After the faulty CN recovers, task information such as task execution time and status in its `pg_job` may be incorrect and will be updated only after the task is executed again on the bound CN.
5. For each job, a thread is established to execute it. If multiple jobs are triggered concurrently as scheduled, the system will need some time to start the required threads, resulting in a latency of 0.1 ms in job execution.

### 10.11.2.6 DBE\_UTILITY

#### API Description

**Table 10-221** provides all APIs supported by the **DBE\_UTILITY** package.

**Table 10-221** DBE\_UTILITY

API	Description
<b>DBE_UTILITY.FORMAT_ERROR_BACKTRACE</b>	Outputs the call stack of an abnormal stored procedure.
<b>DBE_UTILITY.FORMAT_ERROR_STACK</b>	Outputs detailed information about a stored procedure exception.

API	Description
<a href="#">DBE_UTILITY.FORMAT_CALL_STACK</a>	Outputs the call stack of a stored procedure.
<a href="#">DBE_UTILITY.GET_TIME</a>	Outputs the current time, which is used to obtain the execution duration.
<a href="#">DBE_UTILITY.CANONICALIZE</a>	Canonicalizes the character string of a table name.
<a href="#">DBE_UTILITY.COMMA_TO_TABLE</a>	Converts a comma-delimited string of names into a PL/SQL table of names.
<a href="#">DBE_UTILITY.DB_VERSION</a>	Returns the version number and compatibility version number of the database.
<a href="#">DBE_UTILITY.EXEC_DDL_STATEMENT</a>	Executes DDL statements entered by users.
<a href="#">DBE_UTILITY.EXPAND_SQL_TEXT_PROC</a>	Expands the view of the SQL query.
<a href="#">DBE_UTILITY.GET_CPU_TIME</a>	Returns the measured value of the current CPU processing time.
<a href="#">DBE_UTILITY.GET_ENDIANNESS</a>	Obtains the big-endian and little-endian information of the byte order on the platform where the database is located.
<a href="#">DBE_UTILITY.GET_HASH_VALUE</a>	Returns the hash value of a given string.
<a href="#">DBE_UTILITY.GET_SQL_HASH</a>	Outputs the hash value of a given string. This stored procedure is used when <b>proc_outparam_override</b> is not enabled.
<a href="#">DBE_UTILITY.IS_BIT_SET</a>	Checks whether parameter <b>n</b> exists in <b>r</b> .
<a href="#">DBE_UTILITY.IS_CLUSTER_DATABASE</a>	Determines whether the current database is running in database cluster mode.
<a href="#">DBE_UTILITY.NAME_RESOLVE</a>	Parses the given object name, including synonym translation and necessary authorization checks.
<a href="#">DBE_UTILITY.NAME_TOKENIZE</a>	Parses the name in the <b>a [ . b [ . c ] ][@ dblink ]</b> format.
<a href="#">DBE_UTILITY.OLD_CURRENT_SCHEMA</a>	Returns the name of the database schema in the current user environment.
<a href="#">DBE_UTILITY.OLD_CURRENT_USER</a>	Returns the name of the current user.
<a href="#">DBE_UTILITY.TABLE_TO_COMMA</a>	Converts a PL/SQL table of names into a comma-delimited string of names.

API	Description
<a href="#">DBE_UTILITY.GET_SQL_HASH_FUNC</a>	Equivalent to DBE_UTILITY.GET_SQL_HASH. This function is used when <b>proc_outparam_override</b> is enabled.
DBE_UTILITY.EXPAND_SQL_TEXT	This is an internal function and is not recommended.
DBE_UTILITY.CANONICALIZE_RET	This is an internal function and is not recommended.
DBE_UTILITY.COMMATO_TABLE_FUNC	This is an internal function and is not recommended.
DBE_UTILITY.COMPILE_SCHEMA	This is an internal function and is not recommended.
DBE_UTILITY.NAME_SEPARATE	This is an internal function and is not recommended.
DBE_UTILITY.NAME_TO_KENIZE_FUNC	This is an internal function and is not recommended.
DBE_UTILITY.NAME_TO_KENIZE_LOWER	This is an internal function and is not recommended.
DBE_UTILITY.NAME_TO_KENIZE_LOWER_FUNC	This is an internal function and is not recommended.
DBE_UTILITY.PRIVILEGE_CHECK	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_CLASS_WITH_NSPOID_ONAME_TYPE	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_OBJECTS	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_OBJECTS_SYNONYM_FILL_SCHEMA	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_PROCEDURE_WITH_NSPOID_ONAME	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_SYNONYM_WITH_NSPOID_ONAME	This is an internal function and is not recommended.
DBE_UTILITY.TABLE_TO_COMMA_FUNC	This is an internal function and is not recommended.
DBE_UTILITY.USER_NAME	This is an internal function and is not recommended.

- DBE\_UTILITY.FORMAT\_ERROR\_BACKTRACE**

Returns the call stack where an error occurs during execution. The prototype of the DBE\_UTILITY.FORMAT\_ERROR\_BACKTRACE function is as follows:

```
DBE_UTILITY.FORMAT_ERROR_BACKTRACE()
RETURN TEXT;
```
- DBE\_UTILITY.FORMAT\_ERROR\_STACK**

Returns the detailed information about the error location when an error occurs during the execution. The prototype of the DBE\_UTILITY.FORMAT\_ERROR\_STACK function is as follows:

```
DBE_UTILITY.FORMAT_ERROR_STACK()
RETURN TEXT;
```
- DBE\_UTILITY.FORMAT\_CALL\_STACK**

Sets the call stack of the output function. The prototype of the DBE\_UTILITY.FORMAT\_CALL\_STACK function is as follows:

```
DBE_UTILITY.FORMAT_CALL_STACK()
RETURN TEXT;
```
- DBE\_UTILITY.GET\_TIME**

Sets the output time, which is usually used for difference. A separate return value is meaningless. The prototype of the DBE\_UTILITY.GET\_TIME function is as follows:

```
DBE_UTILITY.GET_TIME()
RETURN BIGINT;
```
- DBE\_UTILITY.CANONICALIZE**

Canonicalizes the character string of a table name. The procedure handles a single reserved word or keyword, and removes white spaces for a single identifier so that "table" becomes TABLE. The prototype of the DBE\_UTILITY.CANONICALIZE function is as follows:

```
DBE_UTILITY.CANONICALIZE(
 name IN VARCHAR2,
 canon_name OUT VARCHAR2,
 canon_len IN BINARY_INTEGER
);
```

**Table 10-222** DBE\_UTILITY.CANONICALIZE parameters

Parameter	Description
name	Character string to be canonicalized.
canon_name	Canonicalized character string.
canon_len	Length of the string to be canonicalized, in bytes. If the value of this parameter is less than the actual length (in bytes) of the character string to be standardized, the character string is truncated by byte.

- DBEUTILITY.COMMA\_TO\_TABLE

Converts a comma-delimited string of names into a PL/SQL table of names. The prototype of the DBEUTILITY.COMMA\_TO\_TABLE function is as follows:

```
DBEUTILITY.COMMA_TO_TABLE (
 list IN VARCHAR2,
 tablen OUT BINARY_INTEGER,
 tab OUT uncl_array
);
```

**Table 10-223** DBEUTILITY.COMMA\_TO\_TABLE parameters

Parameter	Description
list	A comma-delimited string of names.
tablen	Number of names in the PL/SQL table.
tab	PL/SQL table which contains the string of names.

- DBEUTILITY.DB\_VERSION

Returns the version number and compatibility version number of the database. The prototype of the DBEUTILITY.DB\_VERSION function is as follows:

```
DBEUTILITY.DB_VERSION (
 version OUT VARCHAR2
);
```

**Table 10-224** DBEUTILITY.DB\_VERSION parameters

Parameter	Description
version	Output parameter, which indicates the internal database software version. The value is a character string.

- DBEUTILITY.EXEC\_DDL\_STATEMENT

Executes DDL statements entered by users. The prototype of the DBEUTILITY.EXEC\_DDL\_STATEMENT function is as follows:

```
DBEUTILITY.EXEC_DDL_STATEMENT (
 parse_string IN VARCHAR2
);
```

**Table 10-225** DBEUTILITY.EXEC\_DDL\_STATEMENT parameters

Parameter	Description
parse_string	DDL statements to be executed.

- DBEUTILITY.EXPAND\_SQL\_TEXT\_PROC

Expands the view of the SQL query. It recursively expands the view objects in the view until a table is displayed. The function prototype of DBE\_UTILITY.EXPAND\_SQL\_TEXT\_PROC is as follows:

```
DBE_UTILITY.EXPAND_SQL_TEXT_PROC (
 input_sql_text IN CLOB,
 output_sql_text OUT NOCOPY CLOB
);
```

**Table 10-226** DBE\_UTILITY.EXPAND\_SQL\_TEXT\_PROC parameters

Parameter	Description
input_sql_text	Input SQL text.
output_sql_text	Output SQL text of the expanded view.

 **NOTE**

In the **input\_sql\_text** parameter entered by a user, a schema prefix must be added to the object in the SQL statement. Otherwise, the function reports an error indicating that no object is found. If **set behavior\_compat\_options** is set to **bind\_procedure\_searchpath**, you do not need to forcibly specify the schema prefix.

- **DBE\_UTILITY.GET\_CPU\_TIME**

Returns the measured value of the current CPU processing time, in hundredths of a second. The prototype of the DBE\_UTILITY.GET\_CPU\_TIME function is as follows:

```
DBE_UTILITY.GET_CPU_TIME()
RETURN NUMBER;
```

- **DBE\_UTILITY.GET\_ENDIANNES**

Obtains the big-endian and little-endian information of the byte order on the platform where the database is located. DBE\_UTILITY. The prototype of the GET\_ENDIANNES function is as follows:

```
DBE_UTILITY.GET_ENDIANNES
RETURN INTEGER;
```

- **DBE\_UTILITY.GET\_HASH\_VALUE**

Returns the hash value of a given string. The prototype of the DBE\_UTILITY.GET\_HASH\_VALUE function is as follows:

```
DBE_UTILITY.GET_HASH_VALUE(
 name IN VARCHAR2(n),
 base IN INTEGER,
 hash_size IN INTEGER)
RETURN INTEGER;
```

**Table 10-227** DBE\_UTILITY.GET\_HASH\_VALUE parameters

Parameter	Description
name	Character string to be hashed.
base	Start value of the returned hash value.

Parameter	Description
hash_size	Size of the hash table to which the hash is mapped.

- DBE\_UTILITY.GET\_SQL\_HASH

Outputs the hash value of a given character string using the MD5 algorithm. The prototype of the DBE\_UTILITY.GET\_SQL\_HASH function is as follows:

```
DBE_UTILITY.GET_SQL_HASH(
 name IN VARCHAR2,
 hash OUT RAW,
 last4bytes OUT BIGINT
);
```

**Table 10-228** DBE\_UTILITY.GET\_SQL\_HASH parameters

Parameter	Description
name	Character string to be hashed.
hash	Complete hexadecimal MD5 hash value.
last4bytes	Last four bytes of the MD5 hash value, which is displayed as an unsigned integer.

 **NOTE**

After setting **set behavior\_compat\_options** to a non-**proc\_outparam\_override** parameter, call the DBE\_UTILITY.GET\_SQL\_HASH function. If DBE\_UTILITY.GET\_SQL\_HASH\_FUNC is called, the value assignment fails.

- DBE\_UTILITY.IS\_BIT\_SET

Checks whether parameter **n** exists in **r**. DBE\_UTILITY. The prototype of the IS\_BIT\_SET function is as follows:

```
DBE_UTILITY.IS_BIT_SET (
 r IN RAW,
 n IN INTEGER)
RETURN INTEGER;
```

**Table 10-229** DBE\_UTILITY.IS\_BIT\_SET parameters

Parameter	Description
r	4 bytes plus the actual hexadecimal string.
n	Determines whether the value exists in the binary system.

- DBE\_UTILITY.IS\_CLUSTER\_DATABASE

Determines whether the current database is running in database cluster mode. The prototype of the DBE\_UTILITY.IS\_CLUSTER\_DATABASE function is as follows:

```
DBE_UTILITY.IS_CLUSTER_DATABASE
RETURN BOOLEAN;
```

- DBE\_UTILITY.NAME\_RESOLVE

Parses the given object name, including synonym translation and necessary authorization checks. The prototype of the DBE\_UTILITY.NAME\_RESOLVE function is as follows:

```
DBE_UTILITY.NAME_RESOLVE (
 name IN VARCHAR2,
 context IN INTEGER,
 schema OUT VARCHAR2,
 part1 OUT VARCHAR2,
 part2 OUT VARCHAR2,
 dblink OUT VARCHAR2,
 part1_type OUT INTEGER,
 object_number OUT OID
);
```

**Table 10-230** DBE\_UTILITY.NAME\_RESOLVE parameters

Parameter	Description
name	Name of the object to be parsed. The structure is [[a.]b.]c[@d].
context	Start value of the returned hash value.
schema	Schema of an object.
part1	First part of the name. The type of this column is specified by <b>part1_type</b> .
part2	If this column is not empty, the value is the subprogram name.
dblink	Database link.
part1_type	Part 1 types: <ul style="list-style-type: none"> <li>• <b>5</b>: synonym</li> <li>• <b>7</b>: procedure (top level)</li> <li>• <b>8</b>: function (top level)</li> </ul>
object_number	Object ID. In database ORA, <b>object_number</b> is of the numeric type, indicating the object ID. In GaussDB, <b>object_number</b> is of the OID type and does not support implicit conversion from a number to an OID.

- DBE\_UTILITY.NAME\_TOKENIZE

Parses names in the **a [. b [. c ]][@ dblink ]** format. If a name contains double quotation marks, the double quotation marks are deleted. Otherwise, the name becomes uppercase letters. The prototype of the DBE\_UTILITY.NAME\_TOKENIZE function is as follows:

```
DBE_UTILITY.NAME_TOKENIZE (
name IN VARCHAR2,
a OUT VARCHAR2,
b OUT VARCHAR2,
c OUT VARCHAR2,
dblink OUT VARCHAR2,
nextpos OUT INTEGER
);
```

**Table 10-231** DBE\_UTILITY.NAME\_TOKENIZE parameters

Parameter	Description
name	Name, consisting of SQL identifiers (for example, <b>scott.foo@dblink</b> ).
a	First token of the name.
b	Second token of the name.
c	Third token of the name.
dblink	Database link.
nextpos	Next position of a parsed character string.

- DBE\_UTILITY.OLD\_CURRENT\_SCHEMA

Returns the name of the database schema in the current user environment. The prototype of the DBE\_UTILITY.OLD\_CURRENT\_SCHEMA function is as follows:

```
DBE_UTILITY.OLD_CURRENT_SCHEMA()
RETURN VARCHAR;
```

- DBE\_UTILITY.OLD\_CURRENT\_USER

Returns the name of the current user. The prototype of the DBE\_UTILITY.OLD\_CURRENT\_USER function is as follows:

```
DBE_UTILITY.OLD_CURRENT_USER()
RETURN VARCHAR2;
```

- DBE\_UTILITY.TABLE\_TO\_COMMA

Converts a PL/SQL table of names into a comma-delimited string of names. The prototype of the DBE\_UTILITY.TABLE\_TO\_COMMA function is as follows:

```
DBE_UTILITY.TABLE_TO_COMMA (
tab IN UNCL_ARRAY,
tablen OUT BINARY_INTEGER,
list OUT VARCHAR2
);
```

**Table 10-232** DBEUTILITY.TABLE\_TO\_COMMA parameters

Parameter	Description
tab	PL/SQL table which contains the string of names.
tablen	Number of names in the PL/SQL table.
list	A comma-delimited string of names.

- DBEUTILITY.GET\_SQL\_HASH\_FUNC

Uses the MD5 algorithm to output the hash value of a given character string. The function prototype of DBEUTILITY.GET\_SQL\_HASH\_FUNC is:

```
DBEUTILITY.GET_SQL_HASH_FUNC(
 name IN VARCHAR2,
 hash OUT RAW,
 last4bytes OUT BIGINT
);
```

**Table 10-233** DBEUTILITY.GET\_SQL\_HASH\_FUNC parameters

Parameter	Description
name	Character string to be hashed.
hash	Complete hexadecimal MD5 hash value.
last4bytes	Last four bytes of the MD5 hash value, which is displayed as an unsigned integer.

 **NOTE**

After setting **set behavior\_compat\_options** to 'proc\_outparam\_override', call the DBEUTILITY.GET\_SQL\_HASH\_FUNC function. If you call the DBEUTILITY.GET\_SQL\_HASH function, a parameter mismatch error is reported.

## Examples

```
CREATE OR REPLACE PROCEDURE test_get_time1()
AS
declare
 start_time bigint;
 end_time bigint;
BEGIN
 start_time:= dbe_utility.get_time ();
 pg_sleep(1);
 end_time:=dbe_utility.get_time ();
 dbe_output.print_line(end_time - start_time);
END;
/
-- Canonicalize the character string of a table name.
declare
 cname varchar2(50);
begin
```

```
 dbe_utility.canonicalize('seg1', cname, 50);
 dbe_output.put_line(cname);
end;
/
-- Convert the input character string into an array of table names.
DECLARE
tab_list VARCHAR2(100) := 't1,t2';
len BINARY_INTEGER;
tab DBMS_UTILITY.LNAME_ARRAY;
BEGIN
dbe_output.put_line('table list is:' || tab_list);
dbe_utility.comma_to_table(tab_list, len, tab);
END;
/
-- Check the version number and compatibility version number of the database.
declare
 v_version varchar2;
begin
 dbe_utility.db_version(v_version);
 v_version:=left(v_version, 8);
 dbe_output.print_line('version:' || v_version);
end;
/
-- Check the measured value of the current CPU processing time.
DECLARE
 cputime NUMBER;
BEGIN
 cputime := dbe_utility.get_cpu_time;
 dbe_output.put_line('cpu time:' || cputime);
END;
/
-- Obtain the big-endian and little-endian information of the byte order on the platform where the
database is located.
BEGIN
 dbe_output.PUT_LINE(dbe_utility.GET_ENDIANNES);
END;
/
-- Obtain the hash value of a given string.
DECLARE
 result NUMBER(28);
BEGIN
 result := dbe_utility.get_hash_value('hello',10,10);
 dbe_output.put_line(result);
END;
/
-- Check whether the current database is in cluster mode.
DECLARE
 is_cluster BOOLEAN;
BEGIN
 is_cluster := dbe_utility.IS_CLUSTER_DATABASE;
 dbe_output.put_line('CLUSTER DATABASE: ' || CASE WHEN is_cluster THEN 'TRUE' ELSE 'FALSE' END);
END;
/
-- Obtain the name of the database schema in the current user environment.
DECLARE
 schm varchar2(100);
BEGIN
 schm := dbe_utility.old_current_schema;
 dbe_output.put_line('current schema: ' || schm);
END;
/
-- Obtain the current username.
select dbe_utility.old_current_user from sys_dummy;
```

## 10.11.2.7 DBE\_SQL

### API Description

**Table 10-234** lists APIs supported by the **DBE\_SQL** package.

**Table 10-234** DBE\_SQL

API	Description
<a href="#">DBE_SQL.REGISTER_CONTEXT</a>	Opens a cursor.
<a href="#">DBE_SQL.SQL_UNREGISTER_CONTEXT</a>	Closes an open cursor.
<a href="#">DBE_SQL.SQL_SET_SQL</a>	Passes a set of SQL statements or anonymous blocks to a cursor.
<a href="#">DBE_SQL.SQL_RUN</a>	Executes SQL statements or anonymous blocks in a given cursor.
<a href="#">DBE_SQL.NEXT_ROW</a>	Reads a row of cursor data.
<a href="#">DBE_SQL.SET_RESULT_TYPE</a>	Dynamically defines a column.
<a href="#">DBE_SQL.SET_RESULT_TYPE_CHAR</a>	Dynamically defines a column of the CHAR type.
<a href="#">DBE_SQL.SET_RESULT_TYPE_INT</a>	Dynamically defines a column of the INT type.
<a href="#">DBE_SQL.SET_RESULT_TYPE_LONG</a>	Dynamically defines a column of the LONG type.
<a href="#">DBE_SQL.SET_RESULT_TYPE_RAW</a>	Dynamically defines a column of the RAW type.
<a href="#">DBE_SQL.SET_RESULT_TYPE_TEXT</a>	Dynamically defines a column of the TEXT type.
<a href="#">DBE_SQL.SET_RESULT_TYPE_UNKNOWN</a>	Dynamically defines a column of an unknown type.
<a href="#">DBE_SQL.GET_RESULT</a>	Reads a dynamically defined column value.
<a href="#">DBE_SQL.GET_RESULT_CHAR</a>	Reads a dynamically defined column value of the CHAR type.
<a href="#">DBE_SQL.GET_RESULT_INT</a>	Reads a dynamically defined column value of the INT type.
<a href="#">DBE_SQL.GET_RESULT_LONG</a>	Reads a dynamically defined column value of the LONG type.
<a href="#">DBE_SQL.GET_RESULT_RAW</a>	Reads a dynamically defined column value of the RAW type.

API	Description
<a href="#">DBE_SQL.GET_RESULT_TEXT</a>	Reads a dynamically defined column value of the <b>TEXT</b> type.
<a href="#">DBE_SQL.GET_RESULT_UNKNOWN</a>	Reads a dynamically defined column value of an unknown type.
<a href="#">DBE_SQL.DBE_SQL_GET_RESULT_CHAR</a>	Reads a dynamically defined column value of the <b>CHAR</b> type.
<a href="#">DBE_SQL.DBE_SQL_GET_RESULT_LONG</a>	Reads a dynamically defined column value of the <b>LONG</b> type.
<a href="#">DBE_SQL.DBE_SQL_GET_RESULT_RAW</a>	Reads a dynamically defined column value of the <b>RAW</b> type.
<a href="#">DBE_SQL.IS_ACTIVE</a>	Checks whether a cursor is opened.
<a href="#">DBE_SQL.LAST_ROW_COUNT</a>	Returns the cumulative count of obtained rows.
<a href="#">DBE_SQL.RUN_AND_NEXT</a>	Reads data of a cursor after a set of dynamically defined operations are performed on the cursor.
<a href="#">DBE_SQL.SQL_BIND_VARIABLE</a>	Binds a value to a variable in a statement.
<a href="#">DBE_SQL.SQL_BIND_ARRAY</a>	Binds a group of values to a variable in a statement.
<a href="#">DBE_SQL.SET_RESULT_TYPE_INTS</a>	Dynamically defines a column of the <b>INT</b> array type.
<a href="#">DBE_SQL.SET_RESULT_TYPE_TEXTS</a>	Dynamically defines a column of the <b>TEXT</b> array type.
<a href="#">DBE_SQL.SET_RESULT_TYPE_RAWS</a>	Dynamically defines a column of the <b>RAW</b> array type.
<a href="#">DBE_SQL.SET_RESULT_TYPE_BYTES</a>	Dynamically defines a column of the <b>BYTEA</b> array type.
<a href="#">DBE_SQL.SET_RESULT_TYPE_CHARS</a>	Dynamically defines a column of the <b>CHAR</b> array type.
<a href="#">DBE_SQL.SET_RESULTS_TYPE</a>	Dynamically defines a column of the array type.
<a href="#">DBE_SQL.GET_RESULTS_INT</a>	Reads a dynamically defined column value of the <b>INT</b> array type.
<a href="#">DBE_SQL.GET_RESULTS_TEXT</a>	Reads a dynamically defined column value of the <b>TEXT</b> array type.
<a href="#">DBE_SQL.GET_RESULTS_RAW</a>	Reads a dynamically defined column value of the <b>RAW</b> array type.

API	Description
<a href="#">DBE_SQL.GET_RESULTS_BYTEA</a>	Reads a dynamically defined column value of the <b>BYTEA</b> array type.
<a href="#">DBE_SQL.GET_RESULTS_CHAR</a>	Reads a dynamically defined column value of the <b>CHAR</b> array type.
<a href="#">DBE_SQL.GET_RESULTS</a>	Reads a dynamically defined column value.
<a href="#">DBE_SQL.DESCRIBE_COLUMNS</a>	Describes the column information read by the cursor.
<a href="#">DBE_SQL.SQL_DESCRIBE_COLUMNS</a>	Describes the column information read by the cursor.
<a href="#">DBE_SQL.BIND_VARIABLE</a>	Binds parameters.
<a href="#">DBE_SQL.SQL_SET_RESULTS_TYPE_C</a>	Dynamically defines a column of the array type.
<a href="#">DBE_SQL.SQL_GET_VALUES_C</a>	Reads a dynamically defined column value.
<a href="#">DBE_SQL.GET_VARIABLE_RESULT</a>	Reads the return value of an SQL statement.
<a href="#">DBE_SQL.GET_VARIABLE_RESULT_CHAR</a>	Reads the return value (of the char type) of an SQL statement.
<a href="#">DBE_SQL.GET_VARIABLE_RESULT_RAW</a>	Reads the return value (of the raw type) of an SQL statement.
<a href="#">DBE_SQL.GET_VARIABLE_RESULT_TEXT</a>	Reads the return value (of the text type) of an SQL statement.
<a href="#">DBE_SQL.GET_VARIABLE_RESULT_INT</a>	Reads the return value (of the int type) of an SQL statement.
<a href="#">DBE_SQL.GET_ARRAY_RESULT_TEXT</a>	Reads the return value (of the text array type) of an SQL statement.
<a href="#">DBE_SQL.GET_ARRAY_RESULT_RAW</a>	Reads the return value (of the raw array type) of an SQL statement.
<a href="#">DBE_SQL.GET_ARRAY_RESULT_CHAR</a>	Reads the return value (of the char array type) of an SQL statement.
<a href="#">DBE_SQL.GET_ARRAY_RESULT_INT</a>	Reads the return value (of the int array type) of an SQL statement.

 NOTE

- You are advised to use **dbe\_sql.set\_result\_type** and **dbe\_sql.get\_result** to define columns.
- If the size of the result set is greater than the value of **work\_mem**, the result set will be spilled to a disk temporarily. The value of **work\_mem** must be no greater than 512 MB.
- **DBE\_SQL.REGISTER\_CONTEXT**  
This function opens a cursor, which is the prerequisite for the subsequent **dbe\_sql** operations. This function does not transfer any parameter. It automatically generates cursor IDs in an ascending order and returns values to integer variables.

 CAUTION

Cursors opened by DBE\_SQL are session-level variables. Cross-session calling of opened cursors (such as autonomous transactions) is not supported. If a cross-session cursor is called, the behavior is unpredictable.

The prototype of the **DBE\_SQL.REGISTER\_CONTEXT** function is as follows:

```
DBE_SQL.REGISTER_CONTEXT(
)
RETURN INTEGER;
```

- **DBE\_SQL.SQL\_UNREGISTER\_CONTEXT**

This function closes a cursor, which is the end of each **dbe\_sql** operation. If this function is not called when the stored procedure ends, the memory is still occupied by the cursor. Therefore, remember to close a cursor when you do not need to use it. If an exception occurs, the stored procedure exits but the cursor is not closed. Therefore, you are advised to include this API in the exception handling of the stored procedure.

The prototype of the **DBE\_SQL.SQL\_UNREGISTER\_CONTEXT** function is as follows:

```
DBE_SQL.SQL_UNREGISTER_CONTEXT(
 context_id IN INTEGER
)
RETURN INTEGER;
```

**Table 10-235** DBE\_SQL.SQL\_UNREGISTER\_CONTEXT parameters

Parameter	Description
context_id	ID of the cursor to be closed

- **DBE\_SQL.SQL\_SET\_SQL**

Parses SQL statements or anonymous blocks in a given cursor. The statement parameters can be transferred only through the **TEXT** type. The length cannot exceed 1 GB.

The prototype of the **DBE\_SQL.SQL\_SET\_SQL** function is as follows:

```
DBE_SQL.SQL_SET_SQL(
 context_id IN INTEGER,
 query_string IN TEXT,
 language_flag IN INTEGER
```

```
)
RETURN BOOLEAN;
```

**Table 10-236** DBE\_SQL.SQL\_SET\_SQL parameters

Parameter	Description
context_id	ID of the cursor whose query statement is to be parsed
query_string	Query statement to be parsed
language_flag	Version language. The value <b>1</b> indicates an incompatible version, and the value <b>2</b> indicates a compatible version.

- DBE\_SQL.SQL\_RUN

This function executes a given cursor. This function receives a cursor ID and executes SQL statements or anonymous blocks in a given cursor.

The prototype of the **DBE\_SQL.SQL\_RUN** function is as follows:

```
DBE_SQL.SQL_RUN(
 context_id IN INTEGER,
)
RETURN INTEGER;
```

**Table 10-237** DBE\_SQL.SQL\_RUN parameters

Parameter	Description
context_id	ID of the cursor whose query statement is to be parsed

- DBE\_SQL.NEXT\_ROW

This function returns the number of data rows that meet query conditions. Each time the API is executed, the system obtains a set of new rows until all data is read.

The prototype of the **DBE\_SQL.NEXT\_ROW** function is as follows:

```
DBE_SQL.NEXT_ROW(
 context_id IN INTEGER,
)
RETURN INTEGER;
```

**Table 10-238** DBE\_SQL.NEXT\_ROW parameters

Parameter	Description
context_id	ID of the cursor to be executed

- DBE\_SQL.SET\_RESULT\_TYPE

This function defines columns returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by

the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE(
 context_id IN INTEGER,
 pos IN INTEGER,
 column_ref IN ANYELEMENT,
 maxsize IN INTEGER default 1024
)
RETURN INTEGER;
```

**Table 10-239** DBE\_SQL.SET\_RESULT\_TYPE parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Relative position of the queried columns in the returned result. The value starts from 1.
column_ref	Variable of any type. You can select an appropriate API to dynamically define columns based on variable types.
maxsize	Length of the defined column return type.

- **DBE\_SQL.SET\_RESULT\_TYPE\_CHAR**

This function defines columns of the **CHAR** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_CHAR** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_CHAR(
 context_id IN INTEGER,
 pos IN INTEGER,
 column_ref IN TEXT,
 column_size IN INTEGER
)
RETURN INTEGER;
```

**Table 10-240** DBE\_SQL.SET\_RESULT\_TYPE\_CHAR parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query.
column_ref	Parameter to be defined
column_size	Length of a dynamically defined column

- **DBE\_SQL.SET\_RESULT\_TYPE\_INT**

This function defines columns of the **INT** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns

are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_INT** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_INT(
 context_id IN INTEGER,
 pos IN INTEGER
)
RETURN INTEGER;
```

**Table 10-241** DBE\_SQL.SET\_RESULT\_TYPE\_INT parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query.

- **DBE\_SQL.SET\_RESULT\_TYPE\_LONG**

This function defines columns of a long type (not **LONG**) returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type. The maximum size of a long column is 1 GB.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_LONG** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_LONG(
 context_id IN INTEGER,
 pos IN INTEGER
)
RETURN INTEGER;
```

**Table 10-242** DBE\_SQL.SET\_RESULT\_TYPE\_LONG parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query

- **DBE\_SQL.SET\_RESULT\_TYPE\_RAW**

This function defines columns of the **RAW** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_RAW** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_RAW(
 context_id IN INTEGER,
 pos IN INTEGER,
 column_ref IN RAW,
 column_size IN INTEGER
)
RETURN INTEGER;
```

**Table 10-243** DBE\_SQL.SET\_RESULT\_TYPE\_RAW parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query.
column_ref	RAW variable
column_size	Column length

- **DBE\_SQL.SET\_RESULT\_TYPE\_TEXT**

This function defines columns of the **TEXT** type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_TEXT** function is as follows:

```
DBE_SQL.DEFINE_COLUMN_CHAR(
 context_id IN INTEGER,
 pos IN INTEGER,
 maxsize IN INTEGER
)
RETURN INTEGER;
```

**Table 10-244** DBE\_SQL.SET\_RESULT\_TYPE\_TEXT parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query.
maxsize	Maximum length of the defined TEXT type

- **DBE\_SQL.SET\_RESULT\_TYPE\_UNKNOWN**

This function processes columns of unknown data types returned from a given cursor. It is used only for the system to report an error and exist when the type cannot be identified.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_UNKNOWN** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_UNKNOWN(
 context_id IN INTEGER,
 pos IN INTEGER,
 col_type IN TEXT
)
RETURN INTEGER;
```

**Table 10-245** DBE\_SQL.SET\_RESULT\_TYPE\_UNKNOWN parameters

Parameter	Description
context_id	ID of the cursor to be executed
posn	Position of a dynamically defined column in the query.
col_type	Dynamically defined parameter

- DBE\_SQL.GET\_RESULT

This function returns the cursor element value in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULT** function is as follows:

```
DBE_SQL.GET_RESULT(
 context_id IN INTEGER,
 pos IN INTEGER,
 column_value INOUT ANYELEMENT
)
RETURN ANYELEMENT;
```

**Table 10-246** DBE\_SQL.GET\_RESULT parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Relative position of the queried columns in the returned result. The value starts from 1.
column_value	Return value of a defined column

- DBE\_SQL.GET\_RESULT\_CHAR

This stored procedure returns the value of the **CHAR** type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULT\_CHAR** function is as follows:

```
DBE_SQL.GET_RESULT_CHAR(
 context_id IN INTEGER,
 pos IN INTEGER,
 tr INOUT CHARACTER,
 err INOUT NUMERIC,
 actual_length INOUT INTEGER
);
```

**Table 10-247** DBE\_SQL.GET\_RESULT\_CHAR parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query.
tr	Return value

Parameter	Description
err	Error No. It is an output parameter. The input parameter must be a variable. Currently, the output value is <b>-1</b> regardless of the input parameter.
actual_length	Length of a return value

The overloaded function of the **DBE\_SQL.GET\_RESULT\_CHAR** function is as follows:

```
DBE_SQL.GET_RESULT_CHAR(
 context_id IN INTEGER,
 pos IN INTEGER,
 tr INOUT CHARACTER
);
```

**Table 10-248** DBE\_SQL.GET\_RESULT\_CHAR parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query.
tr	Return value

- **DBE\_SQL.GET\_RESULT\_INT**

This function returns the value of the **INT** type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**. The prototype of the **DBE\_SQL.GET\_RESULT\_INT** function is as follows:

```
DBE_SQL.GET_RESULT_INT(
 context_id IN INTEGER,
 pos IN INTEGER
)
RETURN INTEGER;
```

**Table 10-249** DBE\_SQL.GET\_RESULT\_INT parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query.

- **DBE\_SQL.GET\_RESULT\_LONG**

This function returns the value of a long type (not **LONG** or **BIGINT**) in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULT\_LONG** function is as follows:

```
DBE_SQL.GET_RESULT_LONG(
 context_id IN INTEGER,
```

```

pos IN INTEGER,
lgth IN INTEGER,
off_set IN INTEGER,
vl INOUT TEXT,
vl_length INOUT INTEGER
)
RETURN RECORD;

```

**Table 10-250** DBE\_SQL.GET\_RESULT\_LONG parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query.
lgth	Length of a return value
off_set	Start position of a return value
vl	Return value
vl_length	Length of a return value

- DBE\_SQL.GET\_RESULT\_RAW

Returns the value of the RAW type in a specified position of a cursor and accesses the data obtained by DBE\_SQL.NEXT\_ROW.

The prototype of the DBE\_SQL.GET\_RESULT\_RAW stored procedure is as follows:

```

DBE_SQL.GET_RESULT_RAW(
context_id IN INTEGER,
pos IN INTEGER,
tr INOUT RAW,
err INOUT NUMERIC,
actual_length INOUT INTEGER
);

```

**Table 10-251** DBE\_SQL.GET\_RESULT\_RAW parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query
tr	Returned column value
err	Error No. It is an output parameter. The input parameter must be a variable. Currently, the output value is <b>-1</b> regardless of the input parameter.
actual_length	Length of a return value. The value longer than this length will be truncated.

The overloaded function of the **DBE\_SQL.GET\_RESULT\_RAW** function is as follows:

```
DBE_SQL.GET_RESULT_RAW(
 context_id IN INTEGER,
 pos IN INTEGER,
 tr INOUT RAW
);
```

**Table 10-252** DBE\_SQL.GET\_RESULT\_RAW parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query
tr	Returned column value

- **DBE\_SQL.GET\_RESULT\_TEXT**

This function returns the value of the **TEXT** type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULT\_TEXT** function is as follows:

```
DBE_SQL.GET_RESULT_TEXT(
 context_id IN INTEGER,
 pos IN INTEGER
)
RETURN TEXT;
```

**Table 10-253** DBE\_SQL.GET\_RESULT\_TEXT parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query

- **DBE\_SQL.GET\_RESULT\_UNKNOWN**

This function returns the value of an unknown type in a specified position of a cursor. It serves as an error handling API when the type is not unknown.

The prototype of the **DBE\_SQL.GET\_RESULT\_UNKNOWN** function is as follows:

```
DBE_SQL.GET_RESULT_UNKNOWN(
 context_id IN INTEGER,
 pos IN INTEGER,
 col_type IN TEXT
)
RETURN TEXT;
```

**Table 10-254** DBE\_SQL.GET\_RESULT\_UNKNOWN parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query.
col_type	Returned parameter type

- DBE\_SQL.DBE\_SQL\_GET\_RESULT\_CHAR

This function returns the value of the **CHAR** type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**. Different from **DBE\_SQL.GET\_RESULT\_CHAR**, the length of the return value is not set and the entire string is returned.

The prototype of the **DBE\_SQL.DBE\_SQL\_GET\_RESULT\_CHAR** function is as follows:

```
DBE_SQL.DBE_SQL_GET_RESULT_CHAR(
 context_id IN INTEGER,
 pos IN INTEGER
)
RETURN CHARACTER;
```

**Table 10-255** DBE\_SQL.DBE\_SQL\_GET\_RESULT\_CHAR parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query

- DBE\_SQL.DBE\_SQL\_GET\_RESULT\_LONG

This function returns the value of a long type (not **LONG** or **BIGINT**) in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

Different from **DBE\_SQL.GET\_RESULT\_LONG**, the length of the return value is not set and the entire **BIGINT** value is returned.

The prototype of the **DBE\_SQL.DBE\_SQL\_GET\_RESULT\_LONG** function is as follows:

```
DBE_SQL.DBE_SQL_GET_RESULT_LONG(
 context_id IN INTEGER,
 pos IN INTEGER
)
RETURN BIGINT;
```

**Table 10-256** DBE\_SQL.DBE\_SQL\_GET\_RESULT\_LONG parameters

Parameter	Description
context_id	ID of the cursor to be executed

Parameter	Description
pos	Position of a dynamically defined column in the query

- DBE\_SQL.DBE\_SQL\_GET\_RESULT\_RAW

This function returns the value of the **RAW** type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

Different from **DBE\_SQL.GET\_RESULT\_RAW**, the length of the return value is not set and the entire string is returned.

The prototype of the **DBE\_SQL.DBE\_SQL\_GET\_RESULT\_RAW** function is as follows:

```
DBE_SQL.GET_RESULT_RAW(
 context_id IN INTEGER,
 pos IN INTEGER,
 tr INOUT RAW
)
RETURN RAW;
```

**Table 10-257** DBE\_SQL.GET\_RESULT\_RAW parameters

Parameter	Description
context_id	ID of the cursor to be executed
pos	Position of a dynamically defined column in the query

- DBE\_SQL.IS\_ACTIVE

This function returns the status of a cursor. The status can be **open**, **parse**, **execute**, or **define**. If the status is **open**, the value is **TRUE**. If the status is unknown, an error is reported. In other cases, the value is **FALSE**.

The prototype of the **DBE\_SQL.IS\_ACTIVE** function is as follows:

```
DBE_SQL.IS_ACTIVE(
 context_id IN INTEGER
)
RETURN BOOLEAN;
```

**Table 10-258** DBE\_SQL.IS\_ACTIVE parameters

Parameter	Description
context_id	ID of the cursor to be queried.

- DBE\_SQL.LAST\_ROW\_COUNT

Returns the accumulated count of data rows obtained after the latest **NEXT\_ROW** execution.

The prototype of the **DBE\_SQL.LAST\_ROW\_COUNT** function is as follows:

```
DBE_SQL.LAST_ROW_COUNT(
)
RETURN INTEGER;
```

- **DBE\_SQL.RUN\_AND\_NEXT**

Equivalent to calling SQL\_RUN and NEXT\_ROW in sequence.

The prototype of the DBE\_SQL.RUN\_AND\_NEXT function is as follows:

```
DBE_SQL.RUN_AND_NEXT(
 context_id IN INTEGER
)
RETURNS INTEGER;
```

**Table 10-259** DBE\_SQL.RUN\_AND\_NEXT parameters

Parameter	Description
context_id	ID of the cursor whose query statement is to be parsed

- **DBE\_SQL.SQL\_BIND\_VARIABLE**

This function is used to bind a parameter to an SQL statement. When an SQL statement is executed, the SQL statement is executed based on the bound value.

The prototype of the **DBE\_SQL.SQL\_BIND\_VARIABLE** function is as follows:

```
DBE_SQL.SQL_BIND_VARIABLE(
 context_id IN int,
 query_string IN text,
 value IN anyelement,
 out_value_size IN int default null
)
RETURNS void;
```

**Table 10-260** DBE\_SQL.SQL\_BIND\_VARIABLE parameters

Parameter	Description
context_id	ID of the cursor to be queried.
query_string	Name of the bound variable
value	Bound value
out_value_size	Size of the return value. Default value: <b>null</b> .

- **DBE\_SQL.SQL\_BIND\_ARRAY**

This function is used to bind a set of parameters to an SQL statement. When an SQL statement is executed, the SQL statement is executed based on the bound array.

The prototype of the **DBE\_SQL.SQL\_BIND\_ARRAY** function is as follows:

```
DBE_SQL.SQL_BIND_ARRAY(
 context_id IN int,
 query_string IN text,
 value IN anyarray
)
RETURNS void;
DBE_SQL.SQL_BIND_ARRAY(
 context_id IN int,
 query_string IN text,
 value IN anyarray,
```

```

lower_index IN int,
higher_index IN int
)
RETURNS void;

```

**Table 10-261** DBE\_SQL.SQL\_BIND\_ARRAY parameters

Parameter	Description
context_id	ID of the cursor to be queried.
query_string	Name of the bound variable.
value	Bound array.
lower_index	Minimum index of the bound array.
higher_index	Maximum index of the bound array.

- **DBE\_SQL.SET\_RESULT\_TYPE\_INTS**

This function defines columns of the **INT** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the DBE\_SQL.SET\_RESULT\_TYPE\_INTS function is as follows:

```

DBE_SQL.SET_RESULT_TYPE_INTS(
context_id IN int,
pos IN int,
column_ref IN anyarray,
cnt IN int,
lower_bnd IN int
)
RETURNS integer;

```

**Table 10-262** DBE\_SQL.SET\_RESULT\_TYPE\_INTS parameters

Parameter	Description
context_id	ID of the cursor to be queried.
pos	Position of a dynamically defined column in the query.
column_ref	Type of the returned array.
cnt	Number of values obtained at a time.
lower_bnd	Start index when an array is returned.

- **DBE\_SQL.SET\_RESULT\_TYPE\_TEXTS**

This function defines columns of the **TEXT** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the DBE\_SQL.SET\_RESULT\_TYPE\_TEXTS function is as follows:

```

DBE_SQL.SET_RESULT_TYPE_TEXTS(
context_id IN int,

```

```

pos IN int,
column_ref IN anyarray,
cnt IN int,
lower_bnd IN int,
maxsize IN int
)
RETURNS integer;

```

**Table 10-263** DBE\_SQL.SET\_RESULT\_TYPE\_TEXTS parameters

Parameter	Description
context_id	ID of the cursor to be queried.
pos	Position of a dynamically defined column in the query.
column_ref	Type of the returned array.
cnt	Number of values obtained at a time.
lower_bnd	Start index when an array is returned.
maxsize	Maximum length of the defined TEXT type

- DBE\_SQL.SET\_RESULT\_TYPE\_RAWS

This function defines columns of the **RAW** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_RAWS** function is as follows:

```

DBE_SQL.set_result_type_raws(
context_id IN int,
pos IN int,
column_ref IN anyarray,
cnt IN int,
lower_bnd IN int,
column_size IN int
)
RETURNS integer;

```

**Table 10-264** DBE\_SQL.SET\_RESULT\_TYPE\_RAWS parameters

Parameter	Description
context_id	ID of the cursor to be queried.
pos	Position of a dynamically defined column in the query.
column_ref	Type of the returned array.
cnt	Number of values obtained at a time.
lower_bnd	Start index when an array is returned.
column_size	Column length

- **DBE\_SQL.SET\_RESULT\_TYPE\_BYTEAS**

This function defines columns of the **BYTEA** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_BYTEAS** function is as follows:

```
DBE_SQL.set_result_type_byteas(
 context_id IN int,
 pos IN int,
 column_ref IN anyarray,
 cnt IN int,
 lower_bnd IN int,
 column_size IN int
)
RETURNS integer;
```

**Table 10-265** DBE\_SQL.SET\_RESULT\_TYPE\_BYTEAS parameters

Parameter	Description
context_id	ID of the cursor to be queried.
pos	Position of a dynamically defined column in the query.
column_ref	Type of the returned array.
cnt	Number of values obtained at a time.
lower_bnd	Start index when an array is returned.
column_size	Column length

- **DBE\_SQL.SET\_RESULT\_TYPE\_CHARS**

This function defines columns of the **CHAR** array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_CHARS** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_CHARS(
 context_id IN int,
 pos IN int,
 column_ref IN anyarray,
 cnt IN int,
 lower_bnd IN int,
 column_size IN int
)
RETURNS integer;
```

**Table 10-266** DBE\_SQL.SET\_RESULT\_TYPE\_CHARS parameters

Parameter	Description
context_id	ID of the cursor to be queried.

Parameter	Description
pos	Position of a dynamically defined column in the query.
column_ref	Type of the returned array.
cnt	Number of values obtained at a time.
lower_bnd	Start index when an array is returned.
column_size	Column length

- DBE\_SQL.SET\_RESULTS\_TYPE

This function defines columns returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULTS\_TYPE** function is as follows:

```
DBE_SQL.SET_RESULTS_TYPE(
 context_id IN int,
 pos IN int,
 column_ref IN anyarray,
 cnt IN int,
 lower_bnd IN int,
 maxsize IN int DEFAULT 1024
) returns void;
```

**Table 10-267** DBE\_SQL.SET\_RESULTS\_TYPE parameters

Parameter	Description
context_id	ID of the cursor to be queried.
pos	Position of a dynamically defined column in the query.
column_ref	Type of the returned array.
cnt	Number of values obtained at a time.
lower_bnd	Start index when an array is returned.
maxsize	Maximum length of the defined type

- DBE\_SQL.GET\_RESULTS\_INT

This function returns the value of the **INT** array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULTS\_INT** function is as follows:

```
DBE_SQL.GET_RESULTS_INT(
 context_id IN int,
 pos IN int,
 column_value INOUT anyarray
);
```

**Table 10-268** DBE\_SQL.GET\_RESULTS\_INT parameters

Parameter	Description
context_id	ID of the cursor to be queried.
pos	Position of a dynamically defined column in the query.
column_value	Return value

- DBE\_SQL.GET\_RESULTS\_TEXT

This function returns the value of the **TEXT** array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULTS\_TEXT** function is as follows:

```
DBE_SQL.GET_RESULTS_TEXT(
 context_id IN int,
 pos IN int,
 column_value INOUT anyarray
);
```

**Table 10-269** DBE\_SQL.GET\_RESULTS\_TEXT parameters

Parameter	Description
context_id	ID of the cursor to be queried.
pos	Position of a dynamically defined column in the query.
column_value	Return value

- DBE\_SQL.GET\_RESULTS\_RAW

This function returns the value of the **RAW** array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULTS\_RAW** function is as follows:

```
DBE_SQL.GET_RESULTS_RAW(
 context_id IN int,
 pos IN int,
 column_value INOUT anyarray
);
```

**Table 10-270** DBE\_SQL.GET\_RESULTS\_RAW parameters

Parameter	Description
context_id	ID of the cursor to be queried.
pos	Position of a dynamically defined column in the query.
column_value	Return value

- DBE\_SQL.GET\_RESULTS\_BYTEA

This function returns the value of the **BYTEA** array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULTS\_BYTEA** function is as follows:

```
DBE_SQL.GET_RESULTS_BYTEA(
 context_id IN int,
 pos IN int,
 column_value INOUT anyarray
);
```

**Table 10-271** DBE\_SQL.GET\_RESULTS\_BYTEA parameters

Parameter	Description
context_id	ID of the cursor to be queried.
pos	Position of a dynamically defined column in the query.
column_value	Return value

- **DBE\_SQL.GET\_RESULTS\_CHAR**

This function returns the value of the **CHAR** array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

The prototype of the **DBE\_SQL.GET\_RESULTS\_CHAR** function is as follows:

```
DBE_SQL.GET_RESULTS_CHAR(
 context_id IN int,
 pos IN int,
 column_value INOUT anyarray
);
```

**Table 10-272** DBE\_SQL.GET\_RESULTS\_CHAR parameters

Parameter	Description
context_id	ID of the cursor to be queried.
pos	Position of a dynamically defined column in the query.
column_value	Return value

- **DBE\_SQL.GET\_RESULTS**

This function returns the value of the array type in a specified position of a cursor and accesses the data obtained by **DBE\_SQL.NEXT\_ROW**.

 **NOTE**

The bottom-layer mechanism of **DBE\_SQL.GET\_RESULTS** is implemented through arrays. When different arrays are used to obtain the return value of the same column, NULL values are filled in the array due to discontinuous internal indexes to ensure the continuity of array indexes. As a result, the length of the returned result array is different from that of the Oracle database.

The prototype of the **DBE\_SQL.GET\_RESULTS** function is as follows:

```
DBE_SQL.GET_RESULTS(
 context_id IN int,
 pos IN int,
 column_value INOUT anyarray
);
```

**Table 10-273** DBE\_SQL.GET\_RESULTS parameters

Parameter	Description
context_id	ID of the cursor to be queried.
pos	Position of a dynamically defined column in the query.
column_value	Return value

- DBE\_SQL.SQL\_DESCRIBE\_COLUMNS

This function is used to describe column information and can be used only for cursors defined by **SELECT**.

The prototype of the **DBE\_SQL.SQL\_DESCRIBE\_COLUMNS** function is as follows:

```
DBE_SQL.SQL_DESCRIBE_COLUMNS(
 context_id IN int,
 col_cnt INOUT int,
 desc_t INOUT dbe_sql.desc_tab
)RETURNS record;
```

**Table 10-274** DBE\_SQL.SQL\_DESCRIBE\_COLUMNS parameters

Parameter	Description
context_id	ID of the cursor to be queried.
col_cnt	Number of columns returned
desc_t	Description of the returned column

- DBE\_SQL.DESCRIBE\_COLUMNS

Describes column information and can be used only for cursors defined by **SELECT**. This API is developed for compatibility purposes.

The prototype of the **DBE\_SQL.DESCRIBE\_COLUMNS** function is as follows:

```
DBE_SQL.DESCRIBE_COLUMNS(
 context_id IN int,
 col_cnt OUT int,
 desc_t OUT dbe_sql.desc_tab
)
```

**Table 10-275** DBE\_SQL.DESCRIBE\_COLUMNS parameters

Parameter	Description
context_id	ID of the cursor to be queried.
col_cnt	Number of columns returned
desc_t	Description of the returned column

- DBE\_SQL.BIND\_VARIABLE

This function is used to bind parameters. You are advised to use **DBE\_SQL.SQL\_BIND\_VARIABLE**.

- **DBE\_SQL.SQL\_SET\_RESULTS\_TYPE\_C**

This function is used to dynamically define a column of the array type. You are advised not to use it.

The prototype of the **DBE\_SQL.SQL\_SET\_RESULTS\_TYPE\_C** function is as follows:

```
DBE_SQL.sql_set_results_type_c(
 context_id IN int,
 pos IN int,
 column_ref IN anyarray,
 cnt IN int,
 lower_bnd IN int,
 col_type IN anyelement,
 maxsize IN int
)return integer;
```

**Table 10-276** DBE\_SQL.SQL\_SET\_RESULTS\_TYPE\_C parameters

Parameter	Description
context_id	ID of the cursor to be queried.
pos	Position of a dynamically defined column in the query.
column_ref	Type of the returned array.
cnt	Number of values obtained at a time.
lower_bnd	Start index when an array is returned.
col_type	Variable type corresponding to the returned array type
maxsize	Maximum length of the defined type

- **DBE\_SQL.SQL\_GET\_VALUES\_C**

This function is used to read a dynamically defined column value. You are advised not to use it.

The prototype of the **DBE\_SQL.SQL\_GET\_VALUES\_C** function is as follows:

```
DBE_SQL.sql_get_values_c(
 context_id IN int,
 pos IN int,
 results_type INOUT anyarray,
 result_type IN anyelement
)return anyarray;
```

**Table 10-277** DBE\_SQL.SQL\_GET\_VALUES\_C parameters

Parameter	Description
context_id	ID of the cursor to be queried.
pos	Parameter position
results_type	Obtained result
result_type	Type of the obtained result

- **DBE\_SQL.GET\_VARIABLE\_RESULT**

This function is used to return the value of the bound OUT parameter and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_VARIABLE\_RESULT** function is as follows:

```
DBE_SQL.get_variable_result(
 context_id IN int,
 pos IN VARCHAR2,
 column_value INOUT anyelement
);
```

**Table 10-278** DBE\_SQL.GET\_VARIABLE\_RESULT parameters

Parameter	Description
context_id	ID of the cursor to be queried.
pos	Name of the bound parameter
column_value	Return value

- **DBE\_SQL.GET\_VARIABLE\_RESULT\_CHAR**

This function is used to return the value of the bound OUT parameter of the **CHAR** type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_VARIABLE\_RESULT\_CHAR** function is as follows:

```
DBE_SQL.get_variable_result_char(
 context_id IN int,
 pos IN VARCHAR2
)
)
RETURNS char
```

**Table 10-279** DBE\_SQL.GET\_VARIABLE\_RESULT\_CHAR parameters

Parameter	Description
context_id	ID of the cursor to be queried.
pos	Name of the bound parameter

- **DBE\_SQL.GET\_VARIABLE\_RESULT\_RAW**

This function is used to return the value of the bound OUT parameter of the **RAW** type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_VARIABLE\_RESULT\_RAW** function is as follows:

```
CREATE OR REPLACE FUNCTION DBE_SQL.get_variable_result_raw(
 context_id IN int,
 pos IN VARCHAR2,
 value INOUT anyelement
)
)
RETURNS anyelement
```

**Table 10-280** DBE\_SQL.GET\_VARIABLE\_RESULT\_RAW parameters

Parameter	Description
context_id	ID of the cursor to be queried.
pos	Name of the bound parameter
value	Return value

- DBE\_SQL.GET\_VARIABLE\_RESULT\_TEXT

This function is used to return the value of the bound OUT parameter of the **TEXT** type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_VARIABLE\_RESULT\_TEXT** function is as follows:

```
CREATE OR REPLACE FUNCTION DBE_SQL.get_variable_result_text(
 context_id IN int,
 pos IN VARCHAR2
)
RETURNS text
```

**Table 10-281** DBE\_SQL.GET\_VARIABLE\_RESULT\_TEXT parameters

Parameter	Description
context_id	ID of the cursor to be queried.
pos	Name of the bound parameter

- DBE\_SQL.GET\_VARIABLE\_RESULT\_INT

This function is used to return the value of the bound OUT parameter of the **INT** type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_VARIABLE\_RESULT\_INT** function is as follows:

```
DBE_SQL.get_variable_result_int(
 context_id IN int,
 pos IN VARCHAR2,
 value INOUT anyelement
)
RETURNS anyelement
```

**Table 10-282** DBE\_SQL.GET\_VARIABLE\_RESULT\_INT parameters

Parameter	Description
context_id	ID of the cursor to be queried.
pos	Name of the bound parameter
value	Return value

- DBE\_SQL.GET\_ARRAY\_RESULT\_TEXT

This function is used to return the value of the bound OUT parameter of the **TEXT** array type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_ARRAY\_RESULT\_TEXT** function is as follows:

```
DBE_SQL.get_array_result_text(
 context_id IN int,
 pos IN VARCHAR2,
 column_value INOUT anyarray
)
```

**Table 10-283** DBE\_SQL.GET\_ARRAY\_RESULT\_TEXT parameters

Parameter	Description
context_id	ID of the cursor to be queried.
pos	Name of the bound parameter
column_value	Return value

- **DBE\_SQL.GET\_ARRAY\_RESULT\_RAW**

This function is used to return the value of the bound OUT parameter of the **RAW** array type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_ARRAY\_RESULT\_RAW** function is as follows:

```
DBE_SQL.get_array_result_raw(
 context_id IN int,
 pos IN VARCHAR2,
 column_value INOUT anyarray
)
```

**Table 10-284** DBE\_SQL.GET\_ARRAY\_RESULT\_RAW parameters

Parameter	Description
context_id	ID of the cursor to be queried.
pos	Name of the bound parameter
column_value	Return value

- **DBE\_SQL.GET\_ARRAY\_RESULT\_CHAR**

This function is used to return the value of the bound OUT parameter of the **CHAR** array type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_ARRAY\_RESULT\_CHAR** function is as follows:

```
DBE_SQL.get_array_result_char(
 context_id IN int,
 pos IN VARCHAR2,
 column_value INOUT anyarray
)
```

**Table 10-285** DBE\_SQL.GET\_ARRAY\_RESULT\_CHAR parameters

Parameter	Description
context_id	ID of the cursor to be queried.

Parameter	Description
pos	Name of the bound parameter
column_value	Return value

- **DBE\_SQL.GET\_ARRAY\_RESULT\_INT**

This function is used to return the value of the bound OUT parameter of the **INT** array type and obtain the OUT parameter in a stored procedure.

The prototype of the **DBE\_SQL.GET\_ARRAY\_RESULT\_INT** function is as follows:

```
DBE_SQL.get_array_result_int(
 context_id IN int,
 pos IN VARCHAR2,
 column_value INOUT anyarray
)
```

**Table 10-286** DBE\_SQL.GET\_ARRAY\_RESULT\_INT parameters

Parameter	Description
context_id	ID of the cursor to be queried.
pos	Name of the bound parameter
column_value	Return value

## Examples

```
-- Example 1
-- Create a table and insert data into the table.
CREATE TABLE test_desc_cols(
 id NUMBER,
 name VARCHAR2(50)
);
INSERT INTO test_desc_cols(id, name) VALUES (1, 'xiaoming');
INSERT INTO test_desc_cols(id, name) VALUES (2, 'xiaohong');
INSERT INTO test_desc_cols(id, name) VALUES (3, 'xiaolan');

DECLARE
context_id INTEGER;
col_cnt INTEGER;
v_id int;
v_name varchar2;
execute_ret INTEGER;
BEGIN
-- Open a cursor.
context_id := DBE_SQL.REGISTER_CONTEXT();
-- Compile the cursor.
DBE_SQL.SQL_SET_SQL(context_id, 'SELECT * FROM test_desc_cols', 2);
-- Set the return value type of a column.
DBE_SQL.SET_RESULT_TYPE(context_id, 1, v_id);
DBE_SQL.SET_RESULT_TYPE(context_id, 2, v_name);
execute_ret := DBE_SQL.SQL_RUN(context_id);

loop
exit when (DBE_SQL.NEXT_ROW(context_id) <= 0);
-- Obtain values.
DBE_SQL.GET_RESULT(context_id, 1, v_id);
DBE_SQL.GET_RESULT(context_id, 2, v_name);
```

```
-- Output the result.
dbe_output.print_line('id:'|| v_id || ' name:' || v_name);
end loop;

DBE_SQL.SQL_UNREGISTER_CONTEXT(context_id);
END;
/

CREATE OR REPLACE PROCEDURE test_square(n NUMBER, square OUT NUMBER) IS
BEGIN
 square := n * n;
END;
/

DECLARE
cur NUMBER;
query varchar(2000);
ret integer;
n NUMBER;
square Integer;
BEGIN
 n := 2;
 cur := DBE_SQL.REGISTER_CONTEXT();
 query := 'BEGIN test_square(:n_bnd, :square_bnd); END;';
 DBE_SQL.SQL_SET_SQL(cur, query, 2);
 DBE_SQL.SQL_BIND_VARIABLE(cur, 'n_bnd', n);
 DBE_SQL.SQL_BIND_VARIABLE(cur, 'square_bnd', square);
 ret := DBE_SQL.SQL_RUN(cur);
 DBE_SQL.GET_VARIABLE_RESULT(cur, 'square_bnd', square);
 DBE_OUTPUT.PRINT_LINE('square = ' || square);
 DBE_SQL.SQL_UNREGISTER_CONTEXT(cur);
END;
/

-- Example 2
-- Examples of executing DESCRIBE_COLUMNS, RUN_AND_NEXT, and LAST_ROW_COUNT
-- Create a stored procedure for printing column description information.
CREATE OR REPLACE PROCEDURE print_rec(
 rec in DBE_SQL.DESC_REC
)package AS
BEGIN
 raise INFO 'col_type = %', rec.col_type;
 raise INFO 'col_name = %', rec.col_name;
 raise INFO 'col_name_len = %', rec.col_name_len;
END;
/

-- Verify functions.
DECLARE
context_id INTEGER;
col_cnt INTEGER;
rec_tab DBE_SQL.DESC_TAB;
excute_ret INTEGER;
nextrow_ret INTEGER;
last_row_count INTEGER;
BEGIN
-- Open a cursor.
context_id := DBE_SQL.REGISTER_CONTEXT();
-- Compile the cursor.
DBE_SQL.SQL_SET_SQL(context_id, 'SELECT * FROM test_desc_cols', 2);
-- Print the column description information.
DBE_SQL.DESCRIBE_COLUMNS(context_id, col_cnt, rec_tab);
FOR var IN 1..col_cnt LOOP
 print_rec(rec_tab(var));
END LOOP;
-- Execute and obtain a row of data.
excute_ret := DBE_SQL.RUN_AND_NEXT(context_id);
-- Obtain a row of data.
nextrow_ret := DBE_SQL.NEXT_ROW(context_id);
```

```
-- Obtain the number of obtained data rows.
last_row_count := DBE_SQL.LAST_ROW_COUNT;
DBE_OUTPUT.PRINT_LINE('last_row_count = ' || last_row_count);
DBE_SQL.SQL_UNREGISTER_CONTEXT(context_id);
END;
/
```

## 10.11.2.8 DBE\_FILE

### Precautions

- DBE\_FILE requires that files opened using DBE\_FILE.FOPEN be encoded using the database character set. If the opened files are not encoded using the expected character set, an encoding verification error occurs when DBE\_FILE.READ\_LINE is used to read files. DBE\_FILE requires that files opened using DBE\_FILE.FOPEN\_NCHAR be encoded using the UTF-8 character set. If the opened files are not encoded using the expected character set, an encoding verification error occurs when DBE\_FILE.READ\_LINE\_NCHAR is used to read files.
- When DBE\_OUTPUT.PUT\_LINE is used to print the result obtained by the DBE\_FILE.READ\_LINE\_NCHAR API, ensure that the UTF-8 character set encoding can be converted to the current database character set encoding. If the preceding conditions are met, the result can be properly output. DBE\_OUTPUT.PRINT\_LINE does not support this function.
- DBE\_FILE requires that the character set encoding of the client be the same as that of the database.
- If the database character set encoding format is ASCII and the client character set encoding format is Chinese, when the client invokes DBE\_FILE.WRITE\_NCHAR or DBE\_FILE.WRITE\_LINE\_NCHAR to write Chinese content, the written content may be in UTF-8 encoding format. An error may be reported when the DBE\_FILE.READ\_LINE\_NCHAR is used.

### Data Types

- DBE\_FILE.FILE\_TYPE  
Defines the representation of files in the DBE\_FILE package. The fields in DBE\_FILE.FILE\_TYPE are private fields of the DBE\_FILE package. Do not change the field value of the type defined in DBE\_FILE.FILE\_TYPE.

```
CREATE TYPE DBE_FILE.FILE_TYPE AS(
 id INTEGER,
 datatype INTEGER,
 byte_mode BOOLEAN
);
```

**Table 10-287** DBE\_FILE.FILE\_TYPE columns

Parameter	Description
id	File handle
datatype	File data type (CHAR, NCHAR, or binary). Currently, only CHAR and NCHAR files are supported. For a CHAR file, <b>1</b> is returned. For an NCHAR file, <b>2</b> is returned.

Parameter	Description
byte_mode	Indicates that the file is opened in binary mode ( <b>TRUE</b> ) or text mode ( <b>FALSE</b> ).

## Interface Description

[Table 10-288](#) lists all interfaces supported by the **DBE\_FILE** package.

**Table 10-288** DBE\_FILE

Interface	Description
<b>DBE_FILE.OPEN</b>	Opens a file based on the specified directory and file name.
<b>DBE_FILE.IS_CLOSE</b>	Checks whether a file handle is opened.
<b>DBE_FILE.READ_LINE</b>	Reads a line of data from an open file handle based on the specified length.
<b>DBE_FILE.WRITE</b>	Writes the data specified in the buffer to a file.
<b>DBE_FILE.NEW_LINE</b>	Writes one or more line terminators to an open file.
<b>DBE_FILE.WRITE_LINE</b>	Writes a string from the buffer to an open file.
<b>DBE_FILE.FORMAT_WRITE</b>	This is a formatted <b>PUT</b> stored procedure similar to <b>printf()</b> .
<b>DBE_FILE.GET_RAW</b>	Reads binary data from an open file handle.
<b>DBE_FILE.PUT_RAW</b>	Writes the input binary data to the file.
<b>DBE_FILE.FLUSH</b>	Writes data from a file handle to a physical file.
<b>DBE_FILE.CLOSE</b>	Closes an open file handle.
<b>DBE_FILE.CLOSE_ALL</b>	Closes all file handles opened in a session.
<b>DBE_FILE.REMOVE</b>	Deletes a disk file. To perform this operation, you must have required permissions.
<b>DBE_FILE.RENAME</b>	Renames files on the disk, similar to <b>mv</b> in Unix.
<b>DBE_FILE.COPY</b>	Copies data in a continuous area to a new file. If <b>start_line</b> and <b>end_line</b> are omitted, the entire file is copied.
<b>DBE_FILE.GET_ATTR</b>	Reads and returns the attributes of a disk file.

Interface	Description
<a href="#">DBE_FILE.SEEK</a>	Adjusts the position of a file pointer forward or backward based on the specified number of bytes.
<a href="#">DBE_FILE.GET_POS</a>	Specifies the offset of a returned file, in bytes.
<a href="#">DBE_FILE.FOPEN_NCHAR</a>	Opens a file based on the specified directory and file name.
<a href="#">DBE_FILE.WRITE_NCHAR</a>	Writes data to an open file.
<a href="#">DBE_FILE.WRITE_LINE_NCHAR</a>	Writes data to an open file and automatically appends a line terminator.
<a href="#">DBE_FILE.FORMAT_WRITE_NCHAR</a>	Writes formatted data to an open file. It is a <a href="#">DBE_FILE.WRITE_NCHAR</a> interface that allows formatting.
<a href="#">DBE_FILE.READ_LINE_NCHAR</a>	Reads a line of a specified length from an open file.

- [DBE\\_FILE.OPEN](#)

This function opens a file. You can specify the maximum number of characters in each line. A maximum of 50 files can be opened at a time. This function returns a handle of the **INTEGER** type.

The prototype of the [DBE\\_FILE.OPEN](#) function is as follows:

```
DBE_FILE.OPEN (
dir IN VARCHAR2,
file_name IN VARCHAR2,
open_mode IN VARCHAR2,
max_line_size IN INTEGER DEFAULT 1024)
RETURN INTEGER;
```

**Table 10-289** [DBE\\_FILE.OPEN](#) interface parameters

Parameter	Description
dir	Directory of a file. It is a string, indicating an object name. <b>NOTE</b> <ul style="list-style-type: none"> <li>• Location of the file directory, which needs to be added to system catalog <a href="#">PG_DIRECTORY</a>. If the input path does not match the path in <a href="#">PG_DIRECTORY</a>, an error indicating that the path does not exist is reported.</li> <li>• When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li> </ul>
file_name	File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the <b>OPEN</b> function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).

Parameter	Description
open_mode	File opening mode, including: <ul style="list-style-type: none"> <li>• <b>r</b>: read text</li> <li>• <b>w</b>: write text</li> <li>• <b>a</b>: append text</li> <li>• <b>rb</b>: read byte</li> <li>• <b>wb</b>: write byte</li> <li>• <b>ab</b>: append byte</li> </ul> <p><b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.</p>
max_line_size	Maximum number of characters in each line, including newline characters. The minimum value is <b>1</b> and the maximum is <b>32767</b> . If this parameter is not specified, the default value <b>1024</b> is used.

- **DBE\_FILE.IS\_CLOSE**

This function detects a file handle to check whether the file is opened. A Boolean value is returned. If an invalid file handle is detected, the **INVALID\_FILEHANDLE** exception is thrown.

The prototype of the **DBE\_FILE.IS\_CLOSE** function is as follows:

```
DBE_FILE.IS_CLOSE (
file IN INTEGER)
RETURN BOOLEAN;
```

**Table 10-290** DBE\_FILE.IS\_CLOSE parameters

Parameter	Description
file IN INTEGER	File handle to be detected

- **DBE\_FILE.READ\_LINE**

This stored procedure reads text from an open file handle and stores the result in the buffer. The procedure reads data until a line end (excluding line terminator), file end, or the value specified by the **len** parameter. The length of the read data cannot exceed the value of the **max\_line\_size** parameter in the **OPEN** function.

The prototype of the **DBE\_FILE.READ\_LINE** function is as follows:

```
DBE_FILE.READ_LINE (
file IN INTEGER,
buffer OUT VARCHAR2,
len IN INTEGER DEFAULT NULL)
```

**Table 10-291** DBE\_FILE.READ\_LINE parameters

Parameter	Description
file	File handle opened by calling the <b>OPEN</b> function. The file must be opened in read mode. Otherwise, the <b>INVALID_OPERATION</b> exception is thrown.
buffer	Buffer used to receive data
len	Number of bytes read from a file. The default value is <b>NULL</b> . If the default value <b>NULL</b> is used, <b>max_linesize</b> is used to specify the line size.

- **DBE\_FILE.WRITE**

This stored procedure writes data in the buffer to a file. The file must be opened in write mode. Line terminators are not written.

The prototype of the **DBE\_FILE.WRITE** function is as follows:

```
DBE_FILE.WRITE (
file IN INTEGER,
buffer IN TEXT);
```

**Table 10-292** DBE\_FILE.WRITE parameters

Parameter	Description
file	This stored procedure writes data in the buffer to a file. The file must be opened in write mode. Line terminators are not written.
buffer	Text data to be written to a file. The maximum buffer size is 32767 bytes. If no value is specified in the open state, the default value is 1024 bytes. Before the writing is performed, the buffer occupied by <b>WRITE</b> operations cannot exceed 32767 bytes. <b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- **DBE\_FILE.NEW\_LINE**

This stored procedure writes one or more line terminators to an open file. The procedure is split from the **WRITE** function because line terminators are related to platforms.

The prototype of the **DBE\_FILE.NEW\_LINE** function is as follows:

```
DBE_FILE.NEW_LINE (
file IN INTEGER,
line_nums IN INTEGER := 1);
```

**Table 10-293** DBE\_FILE.NEW\_LINE parameters

Parameter	Description
file	Opened file handle

Parameter	Description
line_nums	Number of terminators written to a file

- DBE\_FILE.WRITE\_LINE

This stored procedure writes strings in the buffer to an open file. The file must be opened in write mode.

The prototype of the **DBE\_FILE.WRITE\_LINE** function is as follows:

```
DBE_FILE.WRITE_LINE(
file IN INTEGER,
buffer IN TEXT,
flush IN BOOLEAN DEFAULT FALSE);
```

**Table 10-294** DBE\_FILE.WRITE\_LINE parameters

Parameter	Description
file	Opened file handle
buffer	Text data to be written to a file. The maximum buffer size is 32767 bytes. If no value is specified in the open state, the default value is 1024 bytes. Before the writing is performed, the buffer occupied by <b>PUT</b> operations cannot exceed 32767 bytes. <b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
flush	Whether to flush data to the disk after the writing

- DBE\_FILE.FORMAT\_WRITE

This is a formatted **PUT** stored procedure similar to **printf()**.

The prototype of the **DBE\_FILE.FORMAT\_WRITE** function is as follows:

```
DBE_FILE.FORMAT_WRITE (
file IN INTEGER,
format IN VARCHAR2,
arg1 IN VARCHAR2 DEFAULT NULL,
...
arg6 IN VARCHAR2 DEFAULT NULL);
```

**Table 10-295** DBE\_FILE.FORMAT\_WRITE parameters

Parameter	Description
file	Opened file handle
format	A string to be formatted, containing the text and format characters \n and %s

Parameter	Description
[arg1. .arg6]	Six optional parameters. The parameters and the positions of characters to be formatted are in one-to-one correspondence. If the parameter corresponding to a character to be formatted is not provided, an empty string is used to replace %s.

- DBE\_FILE.GET\_RAW

This function reads binary data from the opened file descriptor and returns the data using **r**.

The prototype of the **DBE\_FILE.GET\_RAW** function is as follows:

```
DBE_FILE.GET_RAW (
file IN INTEGER,
r OUT RAW,
length IN INTEGER DEFAULT NULL);
```

**Table 10-296** DBE\_FILE.GET\_RAW parameters

Parameter	Description
file	Opened file handle
r	Output binary data
length	Length of the file to be read. The default value is <b>NULL</b> . All data in the file is read. The maximum length is 1 GB.

- DBE\_FILE.PUT\_RAW

This function writes binary data to a file.

The prototype of the **DBE\_FILE.PUT\_RAW** function is as follows:

```
DBE_FILE.PUT_RAW (
file IN INTEGER,
r IN RAW,
flush IN BOOLEAN DEFAULT FALSE);
```

**Table 10-297** DBE\_FILE.PUT\_RAW parameters

Parameter	Description
file	Opened file handle
r	Output binary data <b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
flush	Specifies whether to flush data to a file. The default value is <b>false</b> .

- DBE\_FILE.FLUSH

Data in a file handle must be written into a physical file. Data in the buffer must have a line terminator. Refresh is important if a file must be read when it is opened. For example, debugging information can be refreshed to a file so that it can be read immediately.

The prototype of the DBE\_FILE.FLUSH function is as follows:

```
DBE_FILE.FLUSH (
file IN INTEGER);
```

**Table 10-298** DBE\_FILE.FLUSH parameters

Parameter	Description
file	Opened file handle

- DBE\_FILE.CLOSE

This stored procedure closes an open file handle. When the stored procedure is called, exception is thrown if there is data to be written into the buffer.

The prototype of the DBE\_FILE.CLOSE function is as follows:

```
DBE_FILE.CLOSE (
file IN INTEGER
)RETURN INTEGER;
```

**Table 10-299** DBE\_FILE.CLOSE parameters

Parameter	Description
file	Opened file handle

- DBE\_FILE.CLOSE\_ALL

This stored procedure closes all file handles opened in a session and can be used for emergency cleanup.

The prototype of the DBE\_FILE.CLOSE\_ALL function is as follows:

```
DBE_FILE.CLOSE_ALL;
```

**Table 10-300** DBE\_FILE.CLOSE\_ALL parameters

Parameter	Description
None	None

- DBE\_FILE.REMOVE

This stored procedure deletes a disk file. To perform this operation, you must have required permissions for the directories and files.

The prototype of the DBE\_FILE.REMOVE function is as follows:

```
DBE_FILE.REMOVE (
dir IN VARCHAR2,
file_name IN VARCHAR2);
```

**Table 10-301** DBE\_FILE.REMOVE parameters

Parameter	Description
dir	File directory <b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul>
file_name	File to be deleted

- DBE\_FILE.RENAME

This function renames files on the disk, similar to **mv** in Unix.

The prototype of the DBE\_FILE.RENAME function is as follows:

```
DBE_FILE.RENAME (
src_dir IN VARCHAR2,
src_file_name IN VARCHAR2,
dest_dir IN VARCHAR2,
dest_file_name IN VARCHAR2,
overwrite IN BOOLEAN DEFAULT FALSE);
```

**Table 10-302** DBE\_FILE.RENAME parameters

Parameter	Description
src_dir	Directory of the original file (case-sensitive) <b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul>
src_file_name	Original file to be renamed
dest_dir	Destination directory (case-sensitive) <b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul>
dest_file_name	New file name

Parameter	Description
overwrite	The default value is <b>false</b> . If a file with the same name exists in the destination directory, the file will not be rewritten.

- DBE\_FILE.COPY

This stored procedure copies data in a continuous area to a new file. If **start\_line** and **end\_line** are omitted, the entire file is copied.

The prototype of the DBE\_FILE.COPY function is as follows:

```
DBE_FILE.COPY (
src_dir IN VARCHAR2,
src_file_name IN VARCHAR2,
dest_dir IN VARCHAR2,
dest_file_name IN VARCHAR2,
start_line IN INTEGER DEFAULT 1,
end_line IN INTEGER DEFAULT NULL);
```

**Table 10-303** DBE\_FILE.COPY parameters

Parameter	Description
src_dir	Directory of the original file <b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul>
src_file_name	File to be copied
dest_dir	Directory of the destination file <b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul>
dest_file_name	Destination file to which data is to be written <b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
start_line	Number of the line where the copy starts. The default value is <b>1</b> .
end_line	Number of the line where the copy ends. The default value is <b>NULL</b> , indicating the end of the file.

- DBE\_FILE.GET\_ATTR

This stored procedure reads and returns the attributes of a disk file.

The prototype of the **DBE\_FILE.GET\_ATTR** function is as follows:

```
DBE_FILE.GET_ATTR(
location IN text,
filename IN text,
OUT fexists boolean,
OUT file_length bigint,
OUT block_size integer);
```

**Table 10-304** DBE\_FILE.GET\_ATTR parameters

Parameter	Description
location	File directory <b>NOTE</b> <ul style="list-style-type: none"> <li>• Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>• When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul>
filename	Name of the file to be checked
fexists	Whether the file exists
file_length	File length (unit: bytes). If the file does not exist, <b>NULL</b> is returned.
block_size	Block size of the file system (unit: byte). If the file does not exist, <b>NULL</b> is returned.

- DBE\_FILE.SEEK

This stored procedure adjusts the position of a file pointer forward or backward based on the specified number of bytes.

The prototype of the **DBE\_FILE.SEEK** function is as follows:

```
DBE_FILE.SEEK (
file IN INTEGER,
absolute_start IN BIGINT DEFAULT NULL,
relative_start IN BIGINT DEFAULT NULL);
```

**Table 10-305** DBE\_FILE.SEEK parameters

Parameter	Description
file	Opened file handle
absolute_start	Absolute offset of a file. The default value is <b>NULL</b> .

Parameter	Description
relative_start	Relative offset of a file. A positive number indicates forward offset and a negative number indicates backward offset. The default value is <b>NULL</b> . If both <b>absolute_start</b> and this parameter are specified, the <b>absolute_start</b> parameter is used.

- DBE\_FILE.GET\_POS

This function returns file offset in bytes.

The prototype of the DBE\_FILE.FGETPOS function is as follows:

```
DBE_FILE.GET_POS (
file IN INTEGER)
RETURN BIGINT;
```

**Table 10-306** DBE\_FILE.GET\_POS parameters

Parameter	Description
file	Opened file handle

- DBE\_FILE.FOPEN\_NCHAR

Opens a file. You can specify the maximum line size. A maximum of 50 files can be opened in a session. This function returns a file handle of the DBE\_FILE.FILE\_TYPE type. This function opens a file in national character set mode for input or output.

The prototype of the DBE\_FILE.FOPEN\_NCHAR function is as follows:

```
DBE_FILE.FOPEN_NCHAR(
dir IN TEXT,
file_name IN TEXT,
open_mode IN TEXT,
max_line_size IN INTEGER DEFAULT 1024)
RETURN DBE_FILE.FILE_TYPE;
```

**Table 10-307** DBE\_FILE.FOPEN\_NCHAR parameters

Parameter	Description
dir	Directory of a file. It is a string, indicating an object name. <b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li> </ul>

Parameter	Description
file_name	File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the <b>FOPEN_NCHAR</b> function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).
open_mode	File opening mode, including: <ul style="list-style-type: none"> <li>• <b>r</b>: read text</li> <li>• <b>w</b>: write text</li> <li>• <b>a</b>: append text</li> <li>• <b>rb</b>: read byte</li> <li>• <b>wb</b>: write byte</li> <li>• <b>ab</b>: append byte</li> </ul> <p><b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.</p>
max_line_size	Maximum number of characters in each line, including newline characters. The minimum value is <b>1</b> and the maximum is <b>32767</b> . If this parameter is not specified, the default value <b>1024</b> is used.

- DBE\_FILE.WRITE\_NCHAR

Writes data in the buffer to a file. The file must be opened in national character set or write mode. This operation does not write a line terminator, and the return value is always **TRUE**. The text string is written in the UTF8 character set format.

The prototype of the DBE\_FILE.WRITE\_NCHAR function is as follows:

```
DBE_FILE.WRITE_NCHAR(
 file IN DBE_FILE.FILE_TYPE,
 buffer IN NVARCHAR2)
RETURN VOID;
```

**Table 10-308** DBE\_FILE.WRITE parameters

Parameter	Description
file	Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR. The file must be opened in write mode. This operation does not write line terminators.
buffer	Text data to be written to the file. The accumulated write length of each line cannot be greater than or equal to the value of <b>max_line_size</b> specified by <b>FOPEN_NCHAR</b> . Otherwise, an error is reported when the file is refreshed. <p><b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.</p>

- **DBE\_FILE.WRITE\_LINE\_NCHAR**  
Writes data in the buffer to a file. The file must be opened in national character set or write mode. This operation automatically appends line terminators, and the return value is always **TRUE**. The text string is written in the UTF8 character set format.

The prototype of the DBE\_FILE.WRITE\_LINE\_NCHAR function is as follows:

```
DBE_FILE.WRITE_LINE_NCHAR(
 file IN DBE_FILE.FILE_TYPE,
 buffer IN NVARCHAR2)
RETURN VOID;
```

**Table 10-309** DBE\_FILE.WRITE\_LINE parameters

Parameter	Description
file	Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR.
buffer	Text data to be written to the file. The length of each line (including the newline character) cannot be greater than the value of <b>max_line_size</b> specified by <b>FOPEN_NCHAR</b> or the default value. Otherwise, an error is reported when the file is refreshed.  <b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- **DBE\_FILE.FORMAT\_WRITE\_NCHAR**  
Writes formatted data to an open file. It is a DBE\_FILE.WRITE\_NCHAR interface that allows formatting. The return value is always **TRUE**.

The prototype of the DBE\_FILE.FORMAT\_WRITE\_NCHAR function is as follows:

```
DBE_FILE.FORMAT_WRITE_NCHAR(
 file IN DBE_FILE.FILE_TYPE,
 format IN NVARCHAR2,
 arg1 IN NVARCHAR2 DEFAULT NULL,
 ...
 arg5 IN NVARCHAR2 DEFAULT NULL)
RETURN VOID;
```

**Table 10-310** DBE\_FILE.FORMAT\_WRITE\_NCHAR parameters

Parameter	Description
file	Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR.
format	Formatted string, containing the text and format characters \n and %s.
[arg1. .arg5]	Five optional parameters. The parameters and the positions of characters to be formatted are in one-to-one correspondence. If the parameter corresponding to a character to be formatted is not provided, an empty string is used to replace %s.

- DBE\_FILE.READ\_LINE\_NCHAR**  
 Reads data from an open file and stores the read result to the buffer. It reads data to the end of each line excluding the line terminator, to the end of the file, or to the size specified by the **len** parameter. The length of the data to be read cannot exceed the value of **max\_line\_size** specified by **FOPEN\_NCHAR**.

The prototype of the DBE\_FILE.READ\_LINE\_NCHAR stored procedure is as follows:

```
DBE_FILE.READ_LINE_NCHAR(
 file IN DBE_FILE.FILE_TYPE,
 buffer OUT NVARCHAR2,
 len IN INTEGER DEFAULT NULL);
```

**Table 10-311** DBE\_FILE.READ\_LINE parameters

Parameter	Description
file	Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR. The file must be opened in read mode. Otherwise, the INVALID_OPERATION exception is thrown.
buffer	Buffer for receiving data.
len	Number of bytes read from the file. The default value is <b>NULL</b> . If the default value <b>NULL</b> is used, <b>max_line_size</b> is used to specify the line size.

## Examples

```
-- Add the /temp/ directory to the PG_DIRECTORY system catalog as a system administrator.
CREATE OR REPLACE DIRECTORY dir AS '/tmp/';
-- Open a file and write data into the file.
DECLARE
 f integer;
 dir text := 'dir';
BEGIN
 f := dbe_file.open(dir, 'sample.txt', 'w');
 PERFORM dbe_file.write_line(f, 'ABC');
 PERFORM dbe_file.write_line(f, '123':numeric);
 PERFORM dbe_file.write_line(f, '----');
 PERFORM dbe_file.new_line(f);
 PERFORM dbe_file.write_line(f, '*****');
 PERFORM dbe_file.new_line(f, 0);
 PERFORM dbe_file.write_line(f, '+++++++');
 PERFORM dbe_file.new_line(f, 2);
 PERFORM dbe_file.write_line(f, '#####');
 PERFORM dbe_file.write(f, 'A');
 PERFORM dbe_file.write(f, 'B');
 PERFORM dbe_file.new_line(f);
 PERFORM dbe_file.format_write(f, '[1 -> %s, 2 -> %s, 3 -> %s, 4 -> %s, 5 -> %s]', 'gaussdb', 'dbe', 'file',
'get', 'line');
 PERFORM dbe_file.new_line(f);
 PERFORM dbe_file.write_line(f, '1234567890');
 f := dbe_file.close(f);
END;
/
-- Read data from the file mentioned above.
DECLARE
 f integer;
 dir text := 'dir';
BEGIN
 f := dbe_file.open(dir, 'sample.txt', 'r');
```

```

FOR i IN 1..11 LOOP
 RAISE INFO '[%] : %', i, dbe_file.read_line(f);
END LOOP;
END;
/
-- Offset the file handle and obtain the current file location.
DECLARE
 l_file integer;
 l_buffer VARCHAR2(32767);
 dir text := 'dir';
 abs_offset number := 100;
 rel_offset number := NULL;
BEGIN
 l_file := dbe_file.open(dir => dir, file_name => 'sample.txt', open_mode => 'R');
 dbe_output.print_line('before seek: current position is ' || dbe_file.get_pos(file => l_file)); -- before seek:
current position is 0
 dbe_file.seek(file => l_file, absolute_start=>abs_offset, relative_start=>rel_offset);
 dbe_output.print_line('fseek: current position is ' || dbe_file.get_pos(file => l_file)); -- seek: current
position is 100
 l_file := dbe_file.close(file => l_file);
END;
/

-- NCHAR read/write API cases
DECLARE
f DBE_FILE.FILE_TYPE;
buffer NVARCHAR2;
BEGIN
-- Write a file.
f := DBE_FILE.FOPEN_NCHAR('dir', 'sample02.txt', 'w');
DBE_FILE.WRITE_NCHAR(f, 'A');
DBE_FILE.WRITE_NCHAR(f, 'B');
DBE_FILE.WRITE_NCHAR(f, 'C');
DBE_FILE.NEW_LINE(f);
DBE_FILE.WRITE_LINE_NCHAR(f, 'ABC');
DBE_FILE.FORMAT_WRITE_NCHAR(f, '[1 -> %s, 2 -> %s]\n', 'GaussDB', 'DBE_FILE');
DBE_FILE.CLOSE(f);
-- Read a file.
f := DBE_FILE.FOPEN_NCHAR('dir', 'sample02.txt', 'r');
DBE_FILE.READ_LINE_NCHAR(f, buffer); -- ABC
DBE_FILE.READ_LINE_NCHAR(f, buffer); -- ABC
DBE_FILE.READ_LINE_NCHAR(f, buffer); -- [1 -> GaussDB, 2 -> DBE_FILE]
DBE_OUTPUT.PRINT_LINE(buffer);
DBE_FILE.CLOSE(f);
END;
/

```

### 10.11.2.9 DBE\_SESSION

#### Interface Description

**Table 10-312** provides all interfaces supported by the **DBE\_SESSION** package. **DBE\_SESSION** takes effect at the session level.

**Table 10-312** DBE\_SESSION

Interface	Description
<b>DBE_SESSION.SET_CONTEXT</b>	Sets the value of an attribute in a specified context.
<b>DBE_SESSION.CLEAR_CONTEXT</b>	Clears the value of an attribute in a specified context.

Interface	Description
<a href="#">DBE_SESSION.SEARCH_CONTEXT</a>	Queries the value of an attribute in a specified context.

- **DBE\_SESSION.SET\_CONTEXT**

Sets the value of an attribute in a specified namespace (context). The **DBE\_SESSION.SET\_CONTEXT** function prototype is as follows:

```
DBE_SESSION.SET_CONTEXT(
 namespace text,
 attribute text,
 value text
)returns void;
```

**Table 10-313** DBE\_SESSION.SET\_CONTEXT interface parameters

Parameter	Description
namespace	Name of the context to be set. If the context does not exist, create a context. The value contains a maximum of 128 bytes. If the value exceeds 128 bytes, it will be truncated.
attribute	Attribute name. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.
value	Name of the value to be set. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.

- **DBE\_SESSION.CLEAR\_CONTEXT**

Clears the value of an attribute in a specified namespace (context). The **DBE\_SESSION.CLEAR\_CONTEXT** function prototype is as follows:

```
DBE_SESSION.CLEAR_CONTEXT (
 namespace text,
 client_identifier text default null,
 attribute text default null
)returns void ;
```

**Table 10-314** DBE\_SESSION.CLEAR\_CONTEXT interface parameters

Parameter	Description
namespace	Context specified by the user. The value contains a maximum of 128 bytes. If the value exceeds 128 bytes, it will be truncated.
client_identifier	Client authentication. The default value is <b>null</b> . Generally, you do not need to manually set this parameter.

Parameter	Description
attribute	Attribute to be cleared. The default value is <b>null</b> , indicating that all attributes of the specified context are cleared. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated. <b>CAUTION</b> To ensure forward compatibility, if the parameter value is ' <b>null</b> ', all attributes of the specified context are cleared.

- DBE\_SESSION.SEARCH\_CONTEXT

Queries the value of an attribute in a specified namespace (context). The **DBE\_SESSION.SEARCH\_CONTEXT** function prototype is:

```
DBE_SESSION.SEARCH_CONTEXT (
 namespace text,
 attribute text
)returns text;
```

**Table 10-315** DBE\_SESSION.SEARCH\_CONTEXT interface parameters

Parameter	Description
namespace	Context specified by the user. The value contains a maximum of 128 bytes. If the value exceeds 128 bytes, it will be truncated.
attribute	Attribute to be searched for. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.

## Example

```
BEGIN
 select DBE_SESSION.set_context('test', 'gaussdb', 'one'); -- Set the gaussdb attribute of the test context
to one.
 select DBE_SESSION.search_context('test', 'gaussdb');
 select DBE_SESSION.clear_context('test', 'test', 'gaussdb');
END;
/
```

### 10.11.2.10 DBE\_MATCH

#### Interface Description

**Table 10-316** provides all interfaces supported by the **DBE\_MATCH** package.

**Table 10-316** DBE\_MATCH

Interface	Description
<a href="#">DBE_MATCH.EDIT_DISTANCE_SIMILARITY</a>	Compares the difference between two character strings (minimum steps of deletion, addition, and conversion) and normalizes the difference to a value ranging from 0 to 100. The value <b>100</b> indicates that the two character strings are the same, and the value <b>0</b> indicates that the two character strings are different.

- [DBE\\_MATCH.EDIT\\_DISTANCE\\_SIMILARITY](#)

Compares the difference between two character strings (minimum steps of deletion, addition, and conversion) and normalizes the difference to a value ranging from 0 to 100. The value **100** indicates that the two character strings are the same, and the value **0** indicates that the two character strings are different. The [DBE\\_MATCH.EDIT\\_DISTANCE\\_SIMILARITY](#) function prototype is as follows:

```
DBE_MATCH.EDIT_DISTANCE_SIMILARITY(
 str1 IN text,
 str2 IN text
)returns integer ;
```

**Table 10-317** DBE\_MATCH.EDIT\_DISTANCE\_SIMILARITY interface parameters

Parameter	Description
str1	First character string. If the value is <b>null</b> , <b>0</b> is returned.
str2	Second character string. If the value is <b>null</b> , <b>0</b> is returned.

### 10.11.2.11 DBE\_SCHEDULER

#### Interface Description

The advanced package **DBE\_SCHEDULER** supports more flexible creation of scheduled tasks through scheduling and programming. For details about all the supported interfaces, see [Table 10-318](#).

#### NOTICE

**DBE\_SCHEDULER** does not support scheduled tasks for synchronizing data between nodes. To create scheduled tasks for multiple nodes, use [DBE\\_TASK](#).

**Table 10-318** DBE\_SCHEDULER

Interface	Description
<a href="#">DBE_SCHEDULER.CREATE_JOB</a>	Creates a scheduled task.
<a href="#">DBE_SCHEDULER.DROP_JOB</a>	Deletes a scheduled task.
<a href="#">DBE_SCHEDULER.DROP_SINGLE_JOB</a>	Deletes a single scheduled task.
<a href="#">DBE_SCHEDULER.SET_ATTRIBUTE</a>	Sets object attributes.
<a href="#">DBE_SCHEDULER.RUN_JOB</a>	Executes a scheduled task.
<a href="#">DBE_SCHEDULER.RUN_BACKGROUND_JOB</a>	Runs a scheduled task in the background.
<a href="#">DBE_SCHEDULER.RUN_FOREGROUND_JOB</a>	Runs a scheduled task in the foreground.
<a href="#">DBE_SCHEDULER.STOP_JOB</a>	Stops a scheduled task.
<a href="#">DBE_SCHEDULER.STOP_SINGLE_JOB</a>	Stops a single scheduled task.
<a href="#">DBE_SCHEDULER.GENERATE_JOB_NAME</a>	Generates the name of a scheduled task.
<a href="#">DBE_SCHEDULER.CREATE_PROGRAM</a>	Creates a program.
<a href="#">DBE_SCHEDULER.DEFINE_PROGRAM_ARGUMENT</a>	Defines program parameters.
<a href="#">DBE_SCHEDULER.DROP_PROGRAM</a>	Deletes a program.
<a href="#">DBE_SCHEDULER.DROP_SINGLE_PROGRAM</a>	Deletes a single program.
<a href="#">DBE_SCHEDULER.SET_JOB_ARGUMENT_VALUE</a>	Sets the parameters of a scheduled task.
<a href="#">DBE_SCHEDULER.CREATE_SCHEDULE</a>	Creates a schedule.
<a href="#">DBE_SCHEDULER.DROP_SCHEDULE</a>	Deletes a schedule.
<a href="#">DBE_SCHEDULER.DROP_SINGLE_SCHEDULE</a>	Deletes a single schedule.

Interface	Description
<a href="#">DBE_SCHEDULER.CREATE_JOB_CLASS</a>	Creates the class of a scheduled task.
<a href="#">DBE_SCHEDULER.DROP_JOB_CLASS</a>	Deletes the class of a scheduled task.
<a href="#">DBE_SCHEDULER.DROP_SINGLE_JOB_CLASS</a>	Deletes the class of a single scheduled task.
<a href="#">DBE_SCHEDULER.GRANT_USER_AUTHORIZATION</a>	Grants special permissions to a user.
<a href="#">DBE_SCHEDULER.REVOKE_USER_AUTHORIZATION</a>	Revokes special permissions from a user.
<a href="#">DBE_SCHEDULER.CREATE_CREDENTIAL</a>	Creates a certificate.
<a href="#">DBE_SCHEDULER.DROP_CREDENTIAL</a>	Destroys a certificate.
<a href="#">DBE_SCHEDULER.ENABLE</a>	Enables an object.
<a href="#">DBE_SCHEDULER.ENABLE_SINGLE</a>	Enables a single object.
<a href="#">DBE_SCHEDULER.DISABLE</a>	Disables an object.
<a href="#">DBE_SCHEDULER.DISABLE_SINGLE</a>	Disables a single object.
<a href="#">DBE_SCHEDULER.EVAL_CALENDAR_STRING</a>	Analyzes character strings in the Calendar format.
<a href="#">DBE_SCHEDULER.EVALUATE_CALENDAR_STRING</a>	Analyzes character strings in the Calendar format.

- [DBE\\_SCHEDULER.CREATE\\_JOB](#)

Creates a scheduled task.

The prototypes of the **DBE\_SCHEDULER.CREATE\_JOB** function are as follows:

```
-- Scheduled tasks of an inline schedule and a program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
job_type TEXT,
job_action TEXT,
number_of_arguments INTEGER DEFAULT 0,
start_date TIMESTAMP WITH TIME ZONE DEFAULT NULL,
repeat_interval TEXT DEFAULT NULL,
end_date TIMESTAMP WITH TIME ZONE DEFAULT NULL,
job_class TEXT DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN DEFAULT FALSE,
auto_drop BOOLEAN DEFAULT TRUE,
comments TEXT DEFAULT NULL,
credential_name TEXT DEFAULT NULL,
destination_name TEXT DEFAULT NULL
)
```

```
-- Reference the created scheduled tasks of the schedule and the program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
program_name TEXT,
schedule_name TEXT,
job_class TEXT DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN DEFAULT FALSE,
auto_drop BOOLEAN DEFAULT TRUE,
comments TEXT DEFAULT NULL,
job_style TEXT DEFAULT 'REGULAR',
credential_name TEXT DEFAULT NULL,
destination_name TEXT DEFAULT NULL
)

-- Reference the created program and the scheduled task of the inline schedule.
DBE_SCHEDULER.CREATE_JOB(
job_name text,
program_name TEXT,
start_date TIMESTAMP WITH TIME ZONE DEFAULT NULL,
repeat_interval TEXT DEFAULT NULL,
end_date TIMESTAMP WITH TIME ZONE DEFAULT NULL,
job_class TEXT DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN DEFAULT FALSE,
auto_drop BOOLEAN DEFAULT TRUE,
comments TEXT DEFAULT NULL,
job_style TEXT DEFAULT 'REGULAR',
credential_name TEXT DEFAULT NULL,
destination_name TEXT DEFAULT NULL
)

-- Reference the created schedule and the scheduled task of the inline program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
schedule_name TEXT,
job_type TEXT,
job_action TEXT,
number_of_arguments INTEGER DEFAULT 0,
job_class TEXT DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN DEFAULT FALSE,
auto_drop BOOLEAN DEFAULT TRUE,
comments TEXT DEFAULT NULL,
credential_name TEXT DEFAULT NULL,
destination_name TEXT DEFAULT NULL
)
```

#### NOTE

The scheduled task created through **DBE\_SCHEDULER** does not conflict with the scheduled task in **DBE\_TASK**.

The scheduled task created by **DBE\_SCHEDULER** generates the corresponding **job\_id**. However, the **job\_id** is meaningless.

**Table 10-319** DBE\_SCHEDULER.CREATE\_JOB interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Name of a scheduled task.
job_type	text	IN	No	Inline program type of a scheduled task. The options are as follows: <ul style="list-style-type: none"> <li>• <b>'PLSQL_BLOCK'</b>: fast anonymous stored procedure.</li> <li>• <b>'STORED_PROCEDURE'</b>: stored procedure that is saved.</li> <li>• <b>'EXTERNAL_SCRIPT'</b>: external script.</li> </ul>
job_action	text	IN	No	Content executed by an inline program of a scheduled task.
number_of_arguments	integer	IN	No	Number of inline program parameters of a scheduled task.
program_name	text	IN	No	Name of the program referenced by a scheduled task.
start_date	timestamp with time zone	IN	Yes	Inline scheduling start time of a scheduled task.
repeat_interval	text	IN	Yes	Inline scheduling period of a scheduled task.
end_date	timestamp with time zone	IN	Yes	Inline scheduling expiration time of a scheduled task.
schedule_name	text	IN	No	Name of the schedule referenced by a scheduled task.
job_class	text	IN	No	Class name of a scheduled task.
enabled	boolean	IN	No	Status of a scheduled task.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
auto_drop	boolean	IN	No	Automatic deletion of a scheduled task.
comments	text	IN	Yes	Comments.
job_style	text	IN	No	Behavior pattern of a scheduled task. Only <b>'REGULAR'</b> is supported.
credential_name	text	IN	Yes	Certificate name of a scheduled task.
destination_name	text	IN	Yes	Target name of a scheduled task.

**Example:**

```
CALL DBE_SCHEDULER.create_job(job_name=>'job1', program_name=>'program1',
schedule_name=>'schedule1');
CALL DBE_SCHEDULER.create_job(job_name=>'job1', job_type=>'STORED_PROCEDURE',
job_action=>'select pg_sleep(1);');
CALL DBE_SCHEDULER.create_job('job1', 'program1', '2021-07-20', 'interval "3 minute"', '2121-07-20',
'DEFAULT_JOB_CLASS', false, false, 'test', 'style', NULL, NULL);
```

**NOTICE**

To create a scheduled task of the EXTERNAL\_SCRIPT type, the administrator must assign related permissions and certificates and the user who starts the database must have the read permission on the external script.

- **DBE\_SCHEDULER.DROP\_JOB**

Deletes a scheduled task.

The prototype of the **DBE\_SCHEDULER.DROP\_JOB** function is as follows:

```
DBE_SCHEDULER.drop_job(
job_name text,
force boolean default false,
defer boolean default false,
commit_semantics text default 'STOP_ON_FIRST_ERROR'
)
```

 **NOTE**

You can specify one or more tasks, or specify a task class in DBE\_SCHEDULER.DROP\_JOB to delete scheduled tasks.

**Table 10-320** DBE\_SCHEDULER.DROP\_JOB interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Name or class of a scheduled task. You can specify one or more scheduled tasks. If you specify multiple scheduled tasks, separate them with commas (,).
force	boolean	IN	No	Specifies whether to delete a scheduled task. <b>true:</b> The current scheduled task is stopped and then deleted. <b>false:</b> The scheduled task fails to be deleted if it is running.
defer	boolean	IN	No	Specifies whether to delete a scheduled task. <b>true:</b> A scheduled task can be deleted after it is complete.
commit_semantics	text	IN	No	Commit rules: <b>STOP_ON_FIRST_ERROR:</b> The deletion operation performed before the first error is reported is committed. <b>TRANSACTIONAL:</b> Transaction-level commit. The deletion operation performed before an error is reported will be rolled back. <b>ABSORB_ERRORS:</b> Attempt to bypass an error and commit the deletion operation that is performed successfully.

Example:

```
CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
```

**NOTICE**

The **TRANSACTIONAL** option in **commit\_semantic** takes effect only when **force** is set to **false**.

- **DBE\_SCHEDULER.DROP\_SINGLE\_JOB**

Deletes a scheduled task.

The prototype of the **DBE\_SCHEDULER.DROP\_SINGLE\_JOB** function is as follows:

```
DBE_SCHEDULER.drop_single_job(
job_name text,
force boolean default false,
defer boolean default false
)
```

- **DBE\_SCHEDULER.SET\_ATTRIBUTE**

Modifies the attributes of a scheduled task.

The prototypes of the **DBE\_SCHEDULER.SET\_ATTRIBUTE** function are as follows:

```
DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value boolean
)

DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value text
)

DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value timestamp
)

DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value timestamp with time zone
)

DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value text,
value2 text default NULL
)
```

 **NOTE**

**name** specifies any object in **DBE\_SCHEDULE**.

**Table 10-321** DBE\_SCHEDULER.SET\_ATTRIBUTE interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	text	IN	No	Object name.
attribute	text	IN	No	Attribute name.
value	boolean/date/timestamp/timestamp with time zone/text	IN	No	Attribute value. The options are as follows: <ul style="list-style-type: none"> <li>Scheduled-task-related: job_type, job_action, number_of_arguments, start_date, repeat_interval, end_date, job_class, enabled, auto_drop, comments, credential_name, destination_name, program_name, schedule_name, and job_style.</li> <li>Program-related: program_action, program_type, number_of_arguments, and comments.</li> <li>Scheduling-related: start_date, repeat_interval, end_date, and comments.</li> </ul>
value2	text	IN	Yes	Additional attribute value. Reserved parameter bit. Currently, the target attribute with extra attribute values is not supported.

Example:

```
CALL DBE_SCHEDULER.set_attribute('program1', 'number_of_arguments', 0);
CALL DBE_SCHEDULER.set_attribute('program1', 'program_type', 'STORED_PROCEDURE');
```

**NOTICE**

Do not use **DBE\_SCHEDULER.SET\_ATTRIBUTE** to leave the parameters empty.

The object name cannot be changed using **DBE\_SCHEDULER.SET\_ATTRIBUTE**.

Inline objects cannot be changed by **DBE\_SCHEDULER.SET\_ATTRIBUTE**.

- DBE\_SCHEDULER.RUN\_JOB

Executes a scheduled task.

The prototype of the **DBE\_SCHEDULER.RUN\_JOB** function is as follows:

```
DBE_SCHEDULER.run_job(
job_name text,
use_current_session boolean default true
)
```

 **NOTE**

**DBE\_SCHEDULER.RUN\_JOB** is used to run scheduled tasks immediately. It is independent of the scheduling of scheduled tasks and can even run at the same time.

**Table 10-322** DBE\_SCHEDULER.RUN\_JOB interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Name of a scheduled task. You can specify one or more scheduled tasks. If you specify multiple scheduled tasks, separate them with commas (,).
use_current_session	boolean	IN	No	Specifies whether to run a scheduled task. <ul style="list-style-type: none"> <li>• <b>true</b>: Use the current session to check whether the scheduled task can run properly.</li> <li>• <b>false</b>: Start the scheduled task in the background. The execution result is recorded in logs.</li> </ul>

Example:

```
CALL DBE_SCHEDULER.run_job('job1', false);
```

**NOTICE**

Currently, **use\_current\_session** applies only to scheduled tasks whose **job\_type** is set to **EXTERNAL\_SCRIPT**.

- DBE\_SCHEDULER.RUN\_BACKEND\_JOB

Runs a scheduled task in the background.

The prototype of the **DBE\_SCHEDULER.RUN\_BACKEND\_JOB** function is as follows:

```
DBE_SCHEDULER.run_backend_job(
job_name text
)
```

- **DBE\_SCHEDULER.RUN\_FOREGROUND\_JOB**

Executes a scheduled task in the current session.

Only external tasks can be executed.

Return value: text

The prototype of the **DBE\_SCHEDULER.RUN\_FOREGROUND\_JOB** function is as follows:

```
DBE_SCHEDULER.run_foreground_job(
job_name text
)return text
```

- **DBE\_SCHEDULER.STOP\_JOB**

Stops a scheduled task.

The prototype of the **DBE\_SCHEDULER.STOP\_JOB** function is as follows:

```
DBE_SCHEDULER.stop_job(
job_name text,
force boolean default false,
commit_semantics text default 'STOP_ON_FIRST_ERROR'
)
```

**Table 10-323** DBE\_SCHEDULER.STOP\_JOB interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Name or class of a scheduled task. You can specify one or more scheduled tasks. If you specify multiple scheduled tasks, separate them with commas (,).
force	boolean	IN	No	Specifies whether to delete a scheduled task. <ul style="list-style-type: none"> <li>• <b>true:</b> The scheduler sends a termination signal to end the task thread immediately.</li> <li>• <b>false:</b> The scheduler attempts to use the interrupt signal to terminate the scheduled task thread.</li> </ul>

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
commit_semantics	text	IN	No	Commit rules: <ul style="list-style-type: none"> <li>'STOP_ON_FIRST_ERROR': The interrupt operation performed before the first error is reported is committed.</li> <li>'ABSORB_ERRORS': The system attempts to bypass an error and commit the interrupt operation that is performed successfully.</li> </ul>

- DBE\_SCHEDULER.STOP\_SINGLE\_JOB

Stops a single scheduled task.

The prototype of the **DBE\_SCHEDULER.STOP\_SINGLE\_JOB** function is as follows:

```
DBE_SCHEDULER.stop_single_job(
job_name text,
force boolean default false
)
```

- DBE\_SCHEDULER.GENERATE\_JOB\_NAME

Generates the name of a scheduled task.

The prototype of the **DBE\_SCHEDULER.GENERATE\_JOB\_NAME** function is as follows:

```
DBE_SCHEDULER.generate_job_name(
prefix text default 'JOB$_'
)return text
```

**Table 10-324** DBE\_SCHEDULER.GENERATE\_JOB\_NAME interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
prefix	text	IN	No	Prefix of the generated name. The default value is 'JOB\$'. Scheduled tasks that are repeatedly executed are named as follows: job\$_1, job\$_2, job\$_3 ...

**NOTICE**

When DBE\_SCHEDULER.GENERATE\_JOB\_NAME is executed for the first time, a temporary sequence is created in **public** to store the sequence number of the current name. A common user does not have the create permission in **public**. Therefore, if a common user calls the function for the first time in the current database, the function fails to be called. In this case, you need to grant the create permission in **public** to the common user or call the API as a user with the create permission to create a temporary sequence.

- DBE\_SCHEDULER.CREATE\_PROGRAM

Creates a program.

The prototype of the **DBE\_SCHEDULER.CREATE\_PROGRAM** function is as follows:

```
DBE_SCHEDULER.create_program(
program_name text,
program_type text,
program_action text,
number_of_arguments integer default 0,
enabled boolean default false,
comments text default NULL
)
```

- DBE\_SCHEDULER.DEFINE\_PROGRAM\_ARGUMENT

Defines program parameters.

An API with the default value **default\_value** will not convert characters to lowercase letters by default. In this version, characters are case sensitive.

The prototype of the **DBE\_SCHEDULER.DEFINE\_PROGRAM\_ARGUMENT** function is as follows:

```
DBE_SCHEDULER.define_program_argument(
program_name text,
argument_position integer,
argument_name text default NULL,
argument_type text,
out_argument boolean default false
)
```

```
)
-- With a default value --
DBE_SCHEDULER.define_program_argument(
program_name text,
argument_position integer,
argument_name text default NULL,
argument_type text,
default_value text,
out_argument boolean default false
)
```

- **DBE\_SCHEDULER.DROP\_PROGRAM**

Deletes a program.

The prototype of the **DBE\_SCHEDULER.DROP\_PROGRAM** function is as follows:

```
DBE_SCHEDULER.drop_program(
program_name text,
force boolean default false
)
```

- **DBE\_SCHEDULER.DROP\_SINGLE\_PROGRAM**

Deletes a single program.

The prototype of the **DBE\_SCHEDULER.DROP\_SINGLE\_PROGRAM** function is as follows:

```
DBE_SCHEDULER.drop_single_program(
program_name text,
force boolean default false
)
```

- **DBE\_SCHEDULER.SET\_JOB\_ARGUMENT\_VALUE**

Sets the parameters of a scheduled task. The **argument\_value** can be left empty.

The prototype of the **DBE\_SCHEDULER.SET\_JOB\_ARGUMENT\_VALUE** function is as follows:

```
DBE_SCHEDULER.set_job_argument_value(
job_name text,
argument_position integer,
argument_value text
)

DBE_SCHEDULER.set_job_argument_value(
job_name text,
argument_name text,
argument_value text
)
```

- **DBE\_SCHEDULER.CREATE\_SCHEDULE**

Creates a schedule.

The prototype of the **DBE\_SCHEDULER.CREATE\_SCHEDULE** function is as follows:

```
DBE_SCHEDULER.create_schedule(
schedule_name text,
start_date timestamp with time zone default NULL,
repeat_interval text,
end_date timestamp with time zone default NULL,
comments text default NULL
)
```

- **DBE\_SCHEDULER.DROP\_SCHEDULE**

Deletes a schedule.

The prototype of the **DBE\_SCHEDULER.DROP\_SCHEDULE** function is as follows:

```
DBE_SCHEDULER.drop_schedule(
 schedule_name text,
 force boolean default false
)
```

- **DBE\_SCHEDULER.DROP\_SINGLE\_SCHEDULE**

Deletes a single schedule.

The prototype of the **DBE\_SCHEDULER.DROP\_SINGLE\_SCHEDULE** function is as follows:

```
DBE_SCHEDULER.drop_single_schedule(
 schedule_name text,
 force boolean default false
)
```

- **DBE\_SCHEDULER.CREATE\_JOB\_CLASS**

Creates the class of a scheduled task.

The prototype of the **DBE\_SCHEDULER.CREATE\_JOB\_CLASS** function is as follows:

```
DBE_SCHEDULER.create_job_class(
 job_class_name text,
 resource_consumer_group text default NULL,
 service text default NULL,
 logging_level integer default 0,
 log_history integer default NULL,
 comments text default NULL
)
```

- **DBE\_SCHEDULER.DROP\_JOB\_CLASS**

Deletes the class of a scheduled task.

The prototype of the **DBE\_SCHEDULER.DROP\_JOB\_CLASS** function is as follows:

```
DBE_SCHEDULER.drop_job_class(
 job_class_name text,
 force boolean default false
)
```

- **DBE\_SCHEDULER.DROP\_SINGLE\_JOB\_CLASS**

Deletes the class of a single scheduled task.

The prototype of the **DBE\_SCHEDULER.DROP\_SINGLE\_JOB\_CLASS** function is as follows:

```
DBE_SCHEDULER.drop_single_job_class(
 job_class_name text,
 force boolean default false
)
```

- **DBE\_SCHEDULER.GRANT\_USER\_AUTHORIZATION**

Grants the scheduled task permissions to the database user. The user who calls this function must have the SYSADMIN permission.

The prototype of the **DBE\_SCHEDULER.GRANT\_USER\_AUTHORIZATION** function is as follows:

```
DBE_SCHEDULER.grant_user_authorization(
 username text,
 privilege text
)
```

- **DBE\_SCHEDULER.REVOKE\_USER\_AUTHORIZATION**

Revokes the scheduled task permissions from the database user. The user who calls this function must have the SYSADMIN permission.

The prototype of the **DBE\_SCHEDULER.REVOKE\_USER\_AUTHORIZATION** function is as follows:

```
DBE_SCHEDULER.revoke_user_authorization(
username text,
privilege text
)
```

- **DBE\_SCHEDULER.CREATE\_CREDENTIAL**

Creates an authorization certificate. The user who calls this function must have the SYSADMIN permission.

The prototype of the **DBE\_SCHEDULER.CREATE\_CREDENTIAL** function is as follows:

```
DBE_SCHEDULER.create_credential(
credential_name text,
username text,
password text default NULL,
database_role text default NULL,
windows_domain text default NULL,
comments text default NULL
)
```

---

### NOTICE

The **password** parameter of **DBE\_SCHEDULER.CREATE\_CREDENTIAL** must be set to **NULL** or **'\*\*\*\*\*'**. This parameter is used only for compatibility and does not indicate any actual meaning. Do not use the OS username corresponding to the installation user to create a certificate.

---

- **DBE\_SCHEDULER.DROP\_CREDENTIAL**

Destroys an authorization certificate. The user who calls this function must have the SYSADMIN permission.

The prototype of the **DBE\_SCHEDULER.DROP\_CREDENTIAL** function is as follows:

```
DBE_SCHEDULER.drop_credential(
credential_name text,
force boolean default false
)
```

- **DBE\_SCHEDULER.ENABLE**

Enables an object.

The prototype of the **DBE\_SCHEDULER.ENABLE** function is as follows:

```
DBE_SCHEDULER.enable(
name text,
commit_semantics text default 'STOP_ON_FIRST_ERROR'
)
```

- **DBE\_SCHEDULER.ENABLE\_SINGLE**

Enables a single object.

The prototype of the **DBE\_SCHEDULER.ENABLE\_SINGLE** function is as follows:

```
DBE_SCHEDULER.enable_single(
name text
)
```

- DBE\_SCHEDULER.DISABLE**

Disables multiple objects. The value of name is a character string separated by commas (,). Each character string separated by commas (,) is an object.

The prototype of the **DBE\_SCHEDULER.DISABLE** function is as follows:

```
DBE_SCHEDULER.disable(
name text,
force boolean default false,
commit_semantics text default 'STOP_ON_FIRST_ERROR'
)
```
- DBE\_SCHEDULER.DISABLE\_SINGLE**

Disables a single object.

The prototype of the **DBE\_SCHEDULER.DISABLE\_SINGLE** function is as follows:

```
DBE_SCHEDULER.disable_single(
name text,
force boolean default false
)
```
- DBE\_SCHEDULER.EVAL\_CALENDAR\_STRING**

Analyzes the scheduling task period.

Return type: timestamp with time zone

The prototype of the **DBE\_SCHEDULER.EVAL\_CALENDAR\_STRING** function is as follows:

```
DBE_SCHEDULER.evaluate_calendar_string(
IN calendar_string text,
IN start_date timestamp with time zone,
IN return_date_after timestamp with time zone
)return timestamp with time zone
```
- DBE\_SCHEDULER.EVALUATE\_CALENDAR\_STRING**

Analyzes the scheduling task period.

The prototype of the **DBE\_SCHEDULER.EVALUATE\_CALENDAR\_STRING** function is as follows:

```
DBE_SCHEDULER.evaluate_calendar_string(
IN calendar_string text,
IN start_date timestamp with time zone,
IN return_date_after timestamp with time zone,
OUT next_run_date timestamp with time zone
)return timestamp with time zone
```

### 10.11.2.12 DBE\_APPLICATION\_INFO

#### Interface Description

[Table 10-325](#) provides all interfaces supported by the **DBE\_APPLICATION\_INFO** package. **DBE\_APPLICATION\_INFO** applies to the current session.

**Table 10-325** DBE\_APPLICATION\_INFO

Interface	Description
<a href="#">DBE_APPLICATION_INFO.SET_CLIENT_INFO</a>	Writes client information.

Interface	Description
<a href="#">DBE_APPLICATION_INFO.READ_CLIENT_INFO</a>	Reads client information.

- [DBE\\_APPLICATION\\_INFO.SET\\_CLIENT\\_INFO](#)

Writes client information. The [DBE\\_APPLICATION\\_INFO.SET\\_CLIENT\\_INFO](#) function prototype is as follows:

```
DBE_APPLICATION_INFO.SET_CLIENT_INFO(
 str text
)returns void;
```

**Table 10-326** DBE\_APPLICATION\_INFO.SET\_CLIENT\_INFO interface parameters

Parameter	Description
str	Writes client information.

- [DBE\\_APPLICATION\\_INFO.READ\\_CLIENT\\_INFO](#)

The [DBE\\_APPLICATION\\_INFO.READ\\_CLIENT\\_INFO](#) function prototype is as follows:

```
DBE_APPLICATION_INFO.READ_CLIENT_INFO(
 OUT client_info text);
```

**Table 10-327** DBE\_APPLICATION\_INFO.READ\_CLIENT\_INFO interface parameters

Parameter	Description
client_info	Client information

### 10.11.2.13 DBE\_XMLDOM

#### API Description

The advanced function package DBE\_XMLDOM is used to access XMLType objects and implement Document Object Model (DOM), which is an API used to access HTML and XML documents. For details about all types supported by the advanced function package DBE\_XMLDOM, see [Table 10-328](#). For details about all APIs supported by DBE\_XMLDOM, see [Table 10-329](#).

#### NOTE

When the DBE\_XMLDOM advanced package is used in the database whose character set is set to **SQL\_ASCII**, an error is reported if characters beyond the ASCII range are input.

**Table 10-328** DBE\_XMLDOM data types

Type	Description
DOMATTR	Implements the DOMAttributes API.
DOMDOCUMENT	Implements the DOMDocument API.
DOMELEMENT	Implements the DOMELEMENT API.
DOMNAMEDNODEMAP	Implements the DOMNamedNodeMap API.
DOMNODELIST	Implements the DOMNodeList API.
DOMNODE	Implements the DOMNode API.
DOMTEXT	Implements the DOMText API.

**Table 10-329** DBE\_XMLDOM parameters

API	Description
<a href="#">DBE_XMLDOM.APPENDCHILD</a>	Adds the newchild node to the end of the parent(n) node and returns the newly added node.
<a href="#">DBE_XMLDOM.CREATEELEMENT</a>	Creates a DOMELEMENT object with the specified name.
<a href="#">DBE_XMLDOM.CREATETEXTNODE</a>	Creates a DOMText node.
<a href="#">DBE_XMLDOM.FREEDOCUMENT</a>	Frees resources related to DOMDocument nodes.
<a href="#">DBE_XMLDOM.FREEELEMENT</a>	Frees resources related to DOMELEMENT nodes.
<a href="#">DBE_XMLDOM.FREENODE</a>	Frees resources related to DOMNode nodes.
<a href="#">DBE_XMLDOM.FREENODELIST</a>	Frees resources related to DOMNodeList nodes.
<a href="#">DBE_XMLDOM.GETATTRIBUTE</a>	Returns the attribute values of a DOMELEMENT object by name.
<a href="#">DBE_XMLDOM.GETATTRIBUTES</a>	Returns the attribute values of a DOMNode node as a map.
<a href="#">DBE_XMLDOM.GETCHILDNODES</a>	Converts several subnodes under a node into a node list.
<a href="#">DBE_XMLDOM.GETCHILDRENBYTAGNAME</a>	Returns the subnodes of a DOMELEMENT node by name.
<a href="#">DBE_XMLDOM.GETDOCUMENTELEMENT</a>	Returns the first subnode of the specified document.

API	Description
<a href="#">DBE_XMLDOM.GETFIRSTCHILD</a>	Returns the first subnode.
<a href="#">DBE_XMLDOM.GETLASTCHILD</a>	Returns the last subnode.
<a href="#">DBE_XMLDOM.GETLENGTH</a>	Obtains the number of subnodes under a specified node.
<a href="#">DBE_XMLDOM.GETLOCALNAME</a>	Returns the local name of a node.
<a href="#">DBE_XMLDOM.GETNAMEDITEM</a>	Returns the node specified by name.
<a href="#">DBE_XMLDOM.GETNEXTSIBLING</a>	Returns the next node of the specified node.
<a href="#">DBE_XMLDOM.GETNODENAME</a>	Returns the name of a node.
<a href="#">DBE_XMLDOM.GETNODETYPE</a>	Returns the type of a node.
<a href="#">DBE_XMLDOM.GETNODEVALUE</a>	Obtains the value of a node, depending on its type.
<a href="#">DBE_XMLDOM.GETPARENTNODE</a>	Returns the parent node of a node.
<a href="#">DBE_XMLDOM.GETTAGNAME</a>	Returns the tag name of the specified DOMElement node.
<a href="#">DBE_XMLDOM.HASCHILDNODES</a>	Checks whether the DOMNode object has any subnode.
<a href="#">DBE_XMLDOM.IMPORTNODE</a>	Copies a node and specifies the document to which the node belongs.
<a href="#">DBE_XMLDOM.ISNULL</a>	Checks whether a node is null.
<a href="#">DBE_XMLDOM.ITEM</a>	Returns the item corresponding to the index parameter in the mapping.
<a href="#">DBE_XMLDOM.MAKEELEMENT</a>	Converts a DOMNode object to the DOMElement type.
<a href="#">DBE_XMLDOM.MAKENODE</a>	Forcibly converts a node to the DOMNode type.
<a href="#">DBE_XMLDOM.NEWDOMDOCUMENT</a>	Returns a new DOMDocument object.
<a href="#">DBE_XMLDOM.SETATTRIBUTE</a>	Sets the value of the DOMElement attribute by name.

API	Description
<a href="#">DBE_XMLDOM.SETCHARSET</a>	Sets the character set for a DOMDocument object.
<a href="#">DBE_XMLDOM.SETDOCTYPE</a>	Sets the external DTD of a DOMDocument object.
<a href="#">DBE_XMLDOM.SETNODEVALUE</a>	Sets the value of a node in the DOMNode object.
<a href="#">DBE_XMLDOM.WRITETOBUFFER</a>	Writes an XML node to a specified buffer.
<a href="#">DBE_XMLDOM.WRITETOCLOB</a>	Writes an XML node to a specified CLOB.
<a href="#">DBE_XMLDOM.WRITETOFILE</a>	Writes an XML node to a specified file.
<a href="#">DBE_XMLDOM.GETSESSIONTREECOUNT</a>	Displays the number of DOM trees of all types in the current session.
<a href="#">DBE_XMLDOM.GETDOCTREEINFO</a>	Displays statistics such as the memory usage and number of nodes of the DOM tree of the document type.
<a href="#">DBE_XMLDOM.GETDETAILEDDOCTREEINFO</a>	Displays the number of nodes of each type for a specific document variable.

- [DBE\\_XMLDOM.APPENDCHILD](#)

Adds the newchild node to the end of the parent(n) node and returns the newly added node. The prototype of the [DBE\\_XMLDOM.APPENDCHILD](#) function is as follows:

```
DBE_XMLDOM.APPENDCHILD(
 n IN DOMNode,
 newchild IN DOMNode)
RETURN DOMNODE;
```

**Table 10-330** [DBE\\_XMLDOM.APPENDCHILD](#) parameters

Parameter	Description
n	Node to be added
newchild	New node added

 **NOTE**

1. The error message "operation not support" is displayed for the APPEND ATTR node under the DOCUMENT node. Database ORA does not report an error in this scenario, but the mounting fails.
2. The error message "operation not support" is displayed for the APPEND ATTR node under the ATTR node. Database ORA does not report an error in this scenario, but the mounting fails.
3. When multiple child nodes of the ATTR type are added to a parent node, the child nodes with the same key value cannot exist under the same parent node.

**Example:**

-- Add a DOMNode node to a specified DOC tree and use DBE\_XMLDOM.HASCHILDNODES() to check whether the subnode is successfully added.

```
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 doc1 DBE_XMLDOM.DOMDocument;
 root DBE_XMLDOM.DOMELEMENT;
 rootnode DBE_XMLDOM.DOMNode;
 child1 DBE_XMLDOM.DOMELEMENT;
 child2 DBE_XMLDOM.DOMELEMENT;
 attr DBE_XMLDOM.DOMAttr;
 text DBE_XMLDOM.DOMTEXT;
 node DBE_XMLDOM.DOMNode;
 child1_node DBE_XMLDOM.DOMNode;
 attr_node DBE_XMLDOM.DOMNode;
 parent DBE_XMLDOM.DOMNode;
 buf varchar2(1000);
BEGIN
 doc := DBE_XMLDOM.newDOMDocument();
 root := DBE_XMLDOM.createElement(doc, 'root');
 rootnode := DBE_xmlDOM.makeNode(root);
 node := DBE_XMLDOM.appendChild(DBE_xmlDOM.makeNode(doc), rootnode);
 child1 := DBE_XMLDOM.createElement(doc, 'child1');
 child1_node := DBE_XMLDOM.makeNode(child1);
 node := DBE_XMLDOM.appendChild(rootnode, child1_node);
 attr := DBE_XMLDOM.createAttribute(doc, 'abc');
 attr_node := DBE_XMLDOM.makeNode(attr);
 node := DBE_XMLDOM.appendChild(child1_node, attr_node);
 IF DBE_XMLDOM.HASCHILDNODES(child1_node) THEN
 DBE_OUTPUT.print_line('HAS CHILD NODES');
 ELSE
 DBE_OUTPUT.print_line('NOT HAS CHILD NODES ');
 END IF;
 parent := DBE_XMLDOM.GETPARENTNODE(attr_node);
 buf := DBE_XMLDOM.GETNODENAME(parent);
 DBE_OUTPUT.print_line(buf);
END;
/
```

- **DBE\_XMLDOM.CREATEELEMENT**

Returns the DOMELEMENT object with the specified name. The prototype of the DBE\_XMLDOM.CREATEELEMENT function is as follows:

```
DBE_XMLDOM.CREATEELEMENT(
 doc IN DOMDOCUMENT,
 tagName IN VARCHAR2)
RETURN DOMELEMENT;
```

Returns the DOMELEMENT object with the specified name and namespace. The prototype of the DBE\_XMLDOM.CREATEELEMENT function is as follows:

```
DBE_XMLDOM.CREATEELEMENT(
 doc IN DOMDOCUMENT,
 tagName IN VARCHAR2,
 ns IN VARCHAR2)
RETURN DOMELEMENT;
```

**Table 10-331** DBE\_XMLDOM.CREATEELEMENT parameters

Parameter	Description
doc	Specified DOMDocument object
tagName	Name of the new DOMELEMENT object
ns	Namespace

 **NOTE**

1. When the **tagName** parameter is set to null or an empty character string, the exception "NULL or invalid TagName argument specified" is thrown.
2. The default maximum length of **tagName** and **ns** is 32767. If the length exceeds 32767, an exception is thrown.

**Example:**

```
--1. Create a DOMELEMENT object with the specified name.
DECLARE
 doc dbexml.domdocument;
 attr DBE_XMLDOM.DOMATTR;
 elem DBE_XMLDOM.DOMELEMENT;
 ans DBE_XMLDOM.DOMATTR;
 buf varchar2(1010);
BEGIN
 doc := dbexml.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>
 <computer size="ITX"><cpu>Ryzen 9 3950X</cpu>

 elem := dbexml.createelement(doc,'elem','http://www.w3.org/TR/html5/');
 ans := DBE_XMLDOM.APPENDCHILD(dbexml.makenode(doc), dbexml.makenode(elem));
 DBE_XMLDOM.WRITETOBUFFER(doc, buf);
 DBE_OUTPUT.print_line(buf);
END;
/
```

- **DBE\_XMLDOM.CREATETEXTNODE**

Creates and returns a DOMText object. The prototype of the DBE\_XMLDOM.CREATETEXTNOD function is as follows:

```
DBE_XMLDOM.CREATETEXTNODE(
 doc IN DOMDocument,
 data IN VARCHAR2)
RETURN DOMTEXT;
```

**Table 10-332** DBE\_XMLDOM.CREATETEXTNODE parameters

Parameter	Description
doc	Specified DOMDocument object
data	Content of the DOMText node

 **NOTE**

1. You can enter an empty string or null value for **data**.
  2. The default maximum length of **data** is 32767. If the length exceeds 32767, an exception is thrown.
- DBE\_XMLDOM.FREEDOCUMENT

Frees a DOMDocument node. The prototype of the DBE\_XMLDOM.FREEDOCUMENT function is as follows:

```
DBE_XMLDOM.FREEDOCUMENT(
 doc IN DOMDOCUMENT);
```

**Table 10-333** DBE\_XMLDOM.FREEDOCUMENT parameters

Parameter	Description
doc	Specified DOMDocument node

**Example:**

```
-- Free the entire DOC tree after the DOMNode node is added to the DOC tree.
DECLARE
 doc dbe_xmldom.domdocument;
 elem dbe_xmldom.domelement;
 doc_node dbe_xmldom.DOMNODE;
 root_elmt dbe_xmldom.DOMELEMENT;
 root_node dbe_xmldom.DOMNODE;
 value varchar(1000);
BEGIN
 doc := dbe_xmldom.newdomdocument();
 doc_node := dbe_xmldom.MAKENODE(doc);
 root_elmt := dbe_xmldom.CREATEELEMENT(doc,'staff');
 root_node:=dbe_xmldom.APPENDCHILD(doc_node, dbe_xmldom.MAKENODE(root_elmt));
 dbe_xmldom.freedocument(doc);
END;
/
```

- DBE\_XMLDOM.FREEELEMENT

Frees a DOMELEMENT node. The prototype of the DBE\_XMLDOM.FREEELEMENT function is as follows:

```
DBE_XMLDOM.FREEELEMENT(
 elem IN DOMELEMENT);
```

**Table 10-334** DBE\_XMLDOM.FREEELEMENT parameters

Parameter	Description
elem	Specified DOMELEMENT node

- DBE\_XMLDOM.FREENODE

Frees a DOMNode node. The prototype of the DBE\_XMLDOM.FREENODE function is as follows:

```
DBE_XMLDOM.FREENODE(
n IN DOMNODE);
```

**Table 10-335** DBE\_XMLDOM.FREENODE parameters

Parameter	Description
n	Specified DOMNode node

 **NOTE**

1. After GaussDB performs the FREENODE operation, the freed node is not available again. After the database ORA performs the FREENODE operation, the freed node is available again and becomes another node.
2. When other APIs call the freed DOMNode node, the calling is different from that in database ORA.

- DBE\_XMLDOM.FREENODELIST

Frees a DOMNodeList node. The prototype of the DBE\_XMLDOM.FREENODE function is as follows:

```
DBE_XMLDOM.GETLENGTH(
nl IN DOMNODELIST);
```

**Table 10-336** DBE\_XMLDOM.FREENODELIST parameters

Parameter	Description
nl	Specified DOMNodeList node

 **NOTE**

1. A DOMNodeList node will be completely freed by FREENODELIST.
2. When other APIs call the freed DOMNodeList node, the calling is different from that in database ORA.
3. The input parameter **freenodelist** cannot be empty.

- DBE\_XMLDOM.GETATTRIBUTE

Returns the attribute values of a DOMELEMENT object by name. The prototype of the DBE\_XMLDOM.GETATTRIBUTE function is as follows:

```
DBE_XMLDOM.GETATTRIBUTE(
elem IN DOMELEMENT,
name IN VARCHAR2)
RETURN VARCHAR2;
```

Returns the attribute values of a DOMELEMENT object by name and namespace URI. The prototype of the DBE\_XMLDOM.GETATTRIBUTE function is as follows:

```
DBE_XMLDOM.GETATTRIBUTE(
 elem IN DOMELEMENT,
 name IN VARCHAR2,
 ns IN VARCHAR2)
RETURN VARCHAR2;
```

**Table 10-337** DBE\_XMLDOM.GETATTRIBUTE parameters

Parameter	Description
elem	Specified DOMELEMENT node
name	Attribute name
ns	Namespace

 **NOTE**

1. The **ns** parameter of the DBE\_XMLDOM.GETATTRIBUTE API does not support the asterisk (\*) parameter.
2. GaussDB does not support the namespace prefix as an attribute, and the value of the prefix cannot be queried through the DBE\_XMLDOM.GETATTRIBUTE API.

**Example:**

```
--1. Return the attribute values of a DOMELEMENT object by name.
DECLARE
 doc dbe_xmldom.domdocument;
 elem dbe_xmldom.domelement;
 docnode DBE_XMLDOM.DOMNode;
 buffer varchar2(1010);
 value varchar2(1000);
BEGIN
 doc := dbe_xmldom.newDOMDocument();
 elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
 DBE_XMLDOM.setattribute(elem, 'len', '50cm');
 docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
 DBE_XMLDOM.makeNode(elem));
 value := DBE_XMLDOM.getattribute(elem, 'len');
 dbe_output.print_line('value: ');
 dbe_output.print_line(value);
 dbe_xmldom.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
END;
/

--2. Return the attribute values of a DOMELEMENT object by name and namespace URI.
DECLARE
 doc dbe_xmldom.domdocument;
 elem dbe_xmldom.domelement;
 docnode DBE_XMLDOM.DOMNode;
 buffer varchar2(1010);
 value varchar(1000);
BEGIN
 doc := dbe_xmldom.newDOMDocument();
 elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
 DBE_XMLDOM.setattribute(elem, 'len', '50cm', 'www.huawei.com');
 docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
 DBE_XMLDOM.makeNode(elem));
```

```
value := DBE_XMLDOM.getattribute(elem, 'len', 'www.huawei.com');
dbe_output.print_line('value: ');
dbe_output.print_line(value);
dbe_xmldom.writetobuffer(doc, buffer);
dbe_output.print_line('buffer: ');
dbe_output.print_line(buffer);
END;
/
```

- **DBE\_XMLDOM.GETATTRIBUTES**

Returns the attribute values of a DOMNode node as a map. The prototype of the DBE\_XMLDOM.GETATTRIBUTES function is as follows:

```
DBE_XMLDOM.GETATTRIBUTES(
 n IN DOMNode)
RETURN DOMNAMEDNODEMAP;
```

**Table 10-338** DBE\_XMLDOM.GETATTRIBUTES parameters

Parameter	Description
n	Specified DOMNode node

- **DBE\_XMLDOM.GETCHILDNODES**

Converts several subnodes under a node into a node list. The prototype of the DBE\_XMLDOM.GETCHILDNODES function is as follows:

```
DBE_XMLDOM.GETCHILDNODES(
 n IN DOMNode)
RETURN DOMNodeList;
```

**Table 10-339** DBE\_XMLDOM.GETCHILDNODES parameters

Parameter	Description
n	Specified DOMNode node

- **DBE\_XMLDOM.GETCHILDRENBYTAGNAME**

Returns the subnodes of a DOMELEMENT node by name. The prototype of the DBE\_XMLDOM.GETCHILDRENBYTAGNAME function is as follows:

```
DBE_XMLDOM.GETCHILDRENBYTAGNAME (
 elem IN DOMELEMENT,
 name IN VARCHAR2)
RETURN DOMNODELIST;
```

Returns the subnodes of a DOMELEMENT node by name and namespace. The prototype of the DBE\_XMLDOM.GETCHILDRENBYTAGNAME function is as follows:

```
DBE_XMLDOM.GETCHILDRENBYTAGNAME (
 elem IN DOMELEMENT,
 name IN VARCHAR2,
 ns IN VARCHAR2)
RETURN DOMNODELIST;
```

**Table 10-340** DBE\_XMLDOM.GETCHILDRENBYTAGNAME parameters

Parameter	Description
elem	Specified DOMELEMENT node

Parameter	Description
name	Attribute name
ns	Namespace

 **NOTE**

The **ns** parameter of the DBE\_XMLDOM.GETCHILDRENBYTAGNAME API does not support the asterisk (\*) parameter. To obtain all attributes of a node, use the DBE\_XMLDOM.GETCHILDNODES API.

**Example:**

--1. Return the subnodes of a DOMELEMENT node by name.

```
DECLARE
 doc dbe_xmldom.domdocument;
 elem dbe_xmldom.domelement;
 docnodelist dbe_xmldom.domnodelist;
 node_elem dbe_xmldom.domelement;
 node dbe_xmldom.domnode;
 buffer varchar2(1010);
 value varchar2(1000);
BEGIN
 doc := dbe_xmldom.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>
 <students age="16" hight="176">
 <student>
 <name>Jerry</name><age>519</age><sex>man</sex><abc>12345</abc>
 </student>
 <student>
 <name>Bob</name><age>245</age><sex>woman</sex><abc>54321</abc>
 </student>
 </students>');
 elem := dbe_xmldom.GETDOCUMENTELEMENT(doc);
 docnodelist := dbe_xmldom.GETCHILDRENBYTAGNAME(elem, 'student');
 node := dbe_xmldom.ITEM(docnodelist, 0);
 node_elem := dbe_xmldom.makeelement(node);
 value := DBE_XMLDOM.gettagname(node_elem);
 dbe_output.print_line('value: ');
 dbe_output.print_line(value);
 dbe_xmldom.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
END;
/
```

- **DBE\_XMLDOM.GETDOCUMENTELEMENT**

Returns the first subnode of the specified document. The prototype of the DBE\_XMLDOM.GETDOCUMENTELEMENT function is as follows:

```
DBE_XMLDOM.GETDOCUMENTELEMENT(
 doc IN DOMDOCUMENT)
RETURN DOMELEMENT;
```

**Table 10-341** DBE\_XMLDOM.GETDOCUMENTELEMENT parameters

Parameter	Description
doc	Specified DOMDocument node

**Example:**

```
-- Obtain the first subnode in the DOC tree and output the node name.
DECLARE
 doc dbe_xmlDOM.domdocument;
 elem dbe_xmlDOM.domelement;
 doc_node dbe_xmlDOM.DOMNODE;
 root_elmt dbe_xmlDOM.DOMELEMENT;
 root_node dbe_xmlDOM.DOMNODE;
 value varchar(1000);
BEGIN
 doc := dbe_xmlDOM.newdomdocument();
 doc_node := dbe_xmlDOM.MAKENODE(doc);
 root_elmt := dbe_xmlDOM.CREATEELEMENT(doc,'staff');
 root_node:=dbe_xmlDOM.APPENDCHILD(doc_node, dbe_xmlDOM.MAKENODE(root_elmt));
 elem := dbe_xmlDOM.GETDOCUMENTELEMENT(doc);
 value := DBE_XMLDOM.gettagname(elem);
 dbe_output.print_line(value);
END;
/
```

- **DBE\_XMLDOM.GETFIRSTCHILD**

Returns the first subnode of a node. The prototype of the DBE\_XMLDOM.GETFIRSTCHILD function is as follows:

```
DBE_XMLDOM.GETFIRSTCHILD(
 n IN DOMNODE)
RETURN DOMNODE;
```

**Table 10-342** DBE\_XMLDOM.GETFIRSTCHILD parameters

Parameter	Description
n	Specified DOMNode node

**Example:**

-- Obtain the name and type of the first subnode after the DOC tree is converted to the DOMNode type, and then obtain the name of the first subnode of the obtained first DOMNode node.

```
DECLARE
 doc dbe_xmlDOM.domdocument;
 doc_node dbe_xmlDOM.domnode;
 root_node dbe_xmlDOM.domnode;
 inside_node dbe_xmlDOM.domnode;
 node_name varchar2(1000);
 node_type integer;
BEGIN
 doc := dbe_xmlDOM.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>
<students age="16" hight="176">
<student1>
 <name>Jerry</name><age>519</age><sex>man</sex><abc>12345</abc>
</student1>
<student2>
 <name>Bob</name><age>245</age><sex>woman</sex><abc>54321</abc>
</student2>
</students>');
 doc_node := DBE_XMLDOM.MAKENODE(doc);
 root_node := DBE_XMLDOM.GETFIRSTCHILD(doc_node);
 node_name := DBE_XMLDOM.GETNODENAME(root_node);
 node_type := DBE_XMLDOM.GETNODETYPE(root_node);
 dbe_output.print_line(node_name);
 dbe_output.print_line(node_type);
 inside_node := DBE_XMLDOM.GETFIRSTCHILD(root_node);
 node_name := DBE_XMLDOM.GETNODENAME(inside_node);
 dbe_output.print_line(node_name);
END;
/
```

- DBE\_XMLDOM.GETLASTCHILD**  
 Returns the last subnode of a node. The prototype of the DBE\_XMLDOM.GETLASTCHILD function is as follows:  
 DBE\_XMLDOM.GETLASTCHILD(  
   n IN DOMNODE)  
 RETURN DOMNODE;

**Table 10-343** DBE\_XMLDOM.GETLASTCHILD parameters

Parameter	Description
n	Specified DOMNode node

**Example:**

-- Obtain the name and type of the last subnode after the DOC tree is converted to the DOMNode type, and then obtain the name of the last subnode of the obtained last DOMNode node.

```

DECLARE
 doc dbe_xmldom.domdocument;
 doc_node dbe_xmldom.domnode;
 root_node dbe_xmldom.domnode;
 inside_node dbe_xmldom.domnode;
 node_name varchar2(1000);
 node_type integer;
BEGIN
 doc := dbe_xmldom.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>
 <students age="16" hight="176">
 <student1>
 <name>Jerry</name><age>519</age><sex>man</sex><abc>12345</abc>
 </student1>
 <student2>
 <name>Bob</name><age>245</age><sex>woman</sex><abc>54321</abc>
 </student2>
 </students>');
 doc_node := DBE_XMLDOM.MAKENODE(doc);
 root_node := DBE_XMLDOM.GETFIRSTCHILD(doc_node);
 node_name := DBE_XMLDOM.GETNODENAME(root_node);
 node_type := DBE_XMLDOM.GETNODETYPE(root_node);
 dbe_output.print_line(node_name);
 dbe_output.print_line(node_type);
 inside_node := DBE_XMLDOM.GETLASTCHILD(root_node);
 node_name := DBE_XMLDOM.GETNODENAME(inside_node);
 dbe_output.print_line(node_name);
END;
/

```

- DBE\_XMLDOM.GETLENGTH**  
 Returns the number of subnodes under a DOMNamedNodeMap node. The prototype of the DBE\_XMLDOM.GETLENGTH function is as follows:  
 DBE\_XMLDOM.GETLENGTH(  
   nnm IN DOMNAMEDNODEMAP)  
 RETURN NUMBER;

Returns the number of subnodes under a DOMNodeList node. The prototype of the DBE\_XMLDOM.GETLENGTH function is as follows:

```

DBE_XMLDOM.GETLENGTH(

 nl IN DOMNODELIST)

RETURN NUMBER;

```

**Table 10-344** DBE\_XMLDOM.GETLENGTH parameters

Parameter	Description
nnm	Specified DOMNamedNodeMap node
nl	Specified DOMNodeList node

**Example:**

--1. Declare a DOMNamedNodeMap parameter in a function.

```
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 elem DBE_XMLDOM.DOMELEMENT;
 map DBE_XMLDOM.DOMNAMEDNODEMAP;
 node DBE_XMLDOM.DOMNODE;
 buf varchar2(10000);
 len INTEGER;
BEGIN
 doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
 <bookstore category="web" cover="paperback">
 <book category="cooking">
 <title lang="en">Everyday Italian</title>
 <author>Giada De Laurentiis</author>
 <year>2005</year>
 <price>30.00</price>
 </book>
 </bookstore>');
 elem := DBE_XMLDOM.GETDOCUMENTELEMENT(doc);
 node := DBE_XMLDOM.MAKENODE(elem);
 map := DBE_XMLDOM.GETATTRIBUTES(node);
 len := DBE_XMLDOM.GETLENGTH(map);
 DBE_OUTPUT.print_line(len);
END;
/
```

--2. Declare a NodeList parameter in a function.

```
DECLARE
 doc dbe_xmldom.domdocument;
 node dbe_xmldom.domnode;
 node1 dbe_xmldom.domnode;
 nodelist DBE_XMLDOM.DOMNODELIST;
 len INTEGER;
 buffer1 varchar2(1010);
BEGIN
 doc := dbe_xmldom.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>
 <students age="16" hight="176">
 <student>
 <name>Jerry</name><age>519</age><sex>man</sex><abc>12345</abc>
 </student>
 <student>
 <name>Jerry</name><age>519</age><sex>man</sex><abc>12345</abc>
 </student>
 </students>');
 node := dbe_xmldom.makenode(doc);
 node := dbe_xmldom.GETFIRSTCHILD(node);
 nodelist := DBE_XMLDOM.GETCHILDNODES(node);
 len := DBE_XMLDOM.GETLENGTH(nodelist);
 RAISE NOTICE 'len : %', len;
END;
/
```

- DBE\_XMLDOM.GETLOCALNAME

Returns the local name of the given DOMAttr node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.GETLOCALNAME(
 a IN DOMATTR)
RETURN VARCHAR2;
```

Returns the local name of the given DOMELEMENT node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.GETLOCALNAME(
 elem IN DOMELEMENT)
RETURN VARCHAR2;
```

Returns the local name of the given DOMNODE node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.GETLOCALNAME(
 n IN DOMNODE,
 data OUT VARCHAR2);
```

**Table 10-345** DBE\_XMLDOM.GETLOCALNAME parameters

Parameter	Description
a	Specified DOMAttr node
elem	Specified DOMELEMENT node
n	Specified DOMNODE node
data	Returned local name

Example:

```
--2. Use the createElement function to generate a DOMELEMENT node and obtain its local name.
```

```
DECLARE
 doc DBE_xmlDOM.domdocument;
 elem DBE_xmlDOM.domelement;
 value varchar2(10000);
BEGIN
 doc := DBE_xmlDOM.newdomdocument();
 elem := DBE_XMLDOM.createElement(doc, 'root');
 value := DBE_XMLDOM.getLocalName(elem);
 DBE_output.print_line('value: ');
 DBE_output.print_line(value);
END;
/
```

```
--3. Convert a DOMELEMENT to a DOMNODE node and obtain its local name.
```

```
DECLARE
 doc DBE_xmlDOM.domdocument;
 elem DBE_xmlDOM.domelement;
 node DBE_xmlDOM.domnode;
 value varchar2(100);
 buf varchar2(100);
BEGIN
 doc := DBE_xmlDOM.newdomdocument();
 elem := DBE_XMLDOM.createElement(doc, 'root');
 node := DBE_xmlDOM.makeNode(elem);
 DBE_XMLDOM.getLocalName(node, buf);
 DBE_output.print_line('buf: ');
 DBE_output.print_line(buf);
END;
/
```

- DBE\_XMLDOM.GETNAMEDITEM

Returns the node specified by name. The prototype of the DBE\_XMLDOM.GETNAMEDITEM function is as follows:

```
DBE_XMLDOM.GETNAMEDITEM(
 nnm IN DOMNAMEDNODEMAP,
 name IN VARCHAR2)
RETURN DOMNODE;
```

Returns the node specified by name and namespace. The prototype of the DBE\_XMLDOM.GETNAMEDITEM function is as follows:

```
DBE_XMLDOM.GETNAMEDITEM(
 nnm IN DOMNAMEDNODEMAP,
 name IN VARCHAR2,
 ns IN VARCHAR2)
RETURN DOMNODE;
```

**Table 10-346** DBE\_XMLDOM.GETNAMEDITEM parameters

Parameter	Description
nnm	Specified DOMNamedNodeMap object.
name	Name of the element to be retrieved.
ns	Namespace.

 **NOTE**

1. The values of **name** and **nnm** can be null, but they are required arguments.
2. The default maximum length of **name** and **ns** is 32767. If the length exceeds 32767, an error is reported.
3. The values of **name** and **ns** can be of the int type and contain more than 127 bits.

**Example:**

```
-- 1. Return the node specified by name.
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 elem DBE_XMLDOM.DOMELEMENT;
 map DBE_XMLDOM.DOMNAMEDNODEMAP;
 node DBE_XMLDOM.DOMNODE;
 node2 DBE_XMLDOM.DOMNODE;
 buf varchar2(1000);
 buf2 varchar2(1000);
BEGIN
 doc := dbe_xmldom.newdomdocument('<bookstore category="web" cover="paperback">
 <book category="cooking"><title lang="en">Everyday Italian</title>
 <author>Giada De Laurentiis</author><year>2005</year>
 <price>30.00</price></book></bookstore>');
 elem := DBE_XMLDOM.GETDOCUMENTELEMENT(doc);
 node := DBE_XMLDOM.MAKENODE(elem);
 map := DBE_XMLDOM.GETATTRIBUTES(node);
 node2:= DBE_XMLDOM.GETNAMEDITEM(map,'category');
 DBE_XMLDOM.writeToBuffer(node2, buf2);
 dbe_output.print_line(buf2);
END;
/

-- 2. Return the node specified by name and namespace.
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 root DBE_XMLDOM.DOMELEMENT;
```

```

elem DBE_XMLDOM.DOMELEMENT;
map DBE_XMLDOM.DOMNAMEDNODEMAP;
node DBE_XMLDOM.DOMNODE;
buf varchar2(1000);
buf2 varchar2(1000);
BEGIN
 doc := dbe_xmldom.newdomdocument('<h:table xmlns:h="http://www.w3.org/TR/html4/">
 <h:tr h:id="10"><h:td >Apples</h:td>
 <h:td>Bananas</h:td></h:tr></h:table>');
 root := DBE_XMLDOM.getDocumentElement(doc);
 node := DBE_XMLDOM.MAKENODE(root);
 node := dbe_xmldom.GETFIRSTCHILD(node);
 map := DBE_XMLDOM.GETATTRIBUTES(node);
 node := DBE_XMLDOM.GETNAMEDITEM(map,'id','http://www.w3.org/TR/html4/');
 DBE_XMLDOM.writeToBuffer(node, buf2);
 dbe_output.print_line(buf2);
END;
/

```

- **DBE\_XMLDOM.GETNEXTSIBLING**

Returns the next node. The prototype of the DBE\_XMLDOM.GETNEXTSIBLING function is as follows:

```

DBE_XMLDOM.GETNEXTSIBLING(
 n IN DOMNODE)
RETURN DOMNODE;

```

**Table 10-347** DBE\_XMLDOM.GETNEXTSIBLING parameters

Parameter	Description
n	Specified DOMNode node

**Example:**

-- Obtain the first subnode after the DOC tree is converted into the DOMNode type, and obtain the name of the first subnode of the obtained first DOMNode node. Then, obtain the name of the next node through DBE\_XMLDOM.GETNEXTSIBLING.

```

DECLARE
 doc dbe_xmldom.domdocument;
 doc_node dbe_xmldom.domnode;
 root_node dbe_xmldom.domnode;
 inside_node dbe_xmldom.domnode;
 node_name varchar2(1000);
 node_type integer;
BEGIN
 doc := dbe_xmldom.newdomdocument('<computer size="ITX">
 <cpu>Ryzen 9 3950X</cpu>
 <ram>32GBx2 DDR4 3200MHz</ram>
 <motherboard>X570i</motherboard>
 </computer>');
 doc_node := DBE_XMLDOM.MAKENODE(doc);
 root_node := DBE_XMLDOM.GETFIRSTCHILD(doc_node);
 node_name := DBE_XMLDOM.GETNODENAME(root_node);
 node_type := DBE_XMLDOM.GETNODETYPE(root_node);
 dbe_output.print_line(node_name);
 dbe_output.print_line(node_type);
 inside_node := DBE_XMLDOM.GETFIRSTCHILD(root_node);
 node_name := DBE_XMLDOM.GETNODENAME(inside_node);
 dbe_output.print_line(node_name);
 inside_node := DBE_XMLDOM.GETNEXTSIBLING(inside_node);
 node_name := DBE_XMLDOM.GETNODENAME(inside_node);
 dbe_output.print_line(node_name);
END;
/

```

- DBE\_XMLDOM.GETNODENAME

Returns the name of a node. The prototype of the DBE\_XMLDOM.GETNODENAME function is as follows:

```
DBE_XMLDOM.GETNODENAME(
 n IN DOMNODE)
RETURN VARCHAR2;
```

**Table 10-348** DBE\_XMLDOM.GETNODENAME parameters

Parameter	Description
n	Specified DOMNode node.

**Example:**

```
-- Obtain the name of the specified DOMNode node from the DOC tree.
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 root DBE_XMLDOM.DOMELEMENT;
 root_node DBE_XMLDOM.DOMNode;
 inside_node DBE_XMLDOM.DOMNode;
 buf VARCHAR2(1000);
BEGIN
 doc := dbe_xmldom.newdomdocument('<bookstore category="web" cover="paperback">
 <book category="cooking"><title lang="en">Everyday Italian</title>
 <author>Giada De Laurentiis</author><year>2005</year>
 <price>30.00</price></book></bookstore>');
 root := DBE_XMLDOM.getDocumentElement(doc);
 root_node := DBE_XMLDOM.MAKENODE(root);
 inside_node := DBE_XMLDOM.GETFIRSTCHILD(root_node);
 buf := DBE_XMLDOM.GETNODENAME(inside_node);
 dbe_output.print_line(buf);
END;
/
```

- DBE\_XMLDOM.GETNODETYPE

Returns the type of a node. The prototype of the DBE\_XMLDOM.GETNODETYPE function is as follows:

```
DBE_XMLDOM.GETNODETYPE(
 n IN DOMNODE)
RETURN NUMBER;
```

**Table 10-349** DBE\_XMLDOM.GETNODETYPE parameters

Parameter	Description
n	Specified DOMNode node

**Example:**

```
-- Obtain the type of the specified DOMNode node from the DOC tree.
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 doc_node DBE_XMLDOM.DOMNode;
 num number;
 buf varchar2(1000);
BEGIN
 doc := dbe_xmldom.newdomdocument('<bookstore category="web" cover="paperback">
 <book category="cooking"><title lang="en">Everyday Italian</title>
 <author>Giada De Laurentiis</author><year>2005</year>
```

```

 <price>30.00</price></book></bookstore>');
 doc_node := DBE_XMLDOM.makeNode(doc);
 num := DBE_XMLDOM.GETNODETYPE(doc_node);
 dbe_output.print_line(num);
 buf := DBE_XMLDOM.GETNODENAME(doc_node);
 dbe_output.print_line(buf);
END;
/

```

- **DBE\_XMLDOM.GETNODEVALUE**

Returns the value of a DOMNode node. The prototype of the DBE\_XMLDOM.GETNODEVALUE function is as follows:

```

DBE_XMLDOM.GETNODEVALUE(
 n IN DOMNODE)
RETURN VARCHAR2;

```

**Table 10-350** DBE\_XMLDOM.GETNODEVALUE parameters

Parameter	Description
n	Specified DOMNode object

**Example:**

```

-- Convert a DOMText node to a DOMNode node and obtain the value of the node.
DECLARE
 buf VARCHAR2(1000);
 doc DBE_XMLDOM.DOMDocument;
 text DBE_XMLDOM.DOMText;
 elem2 DBE_XMLDOM.DOMELEMENT;
 node DBE_XMLDOM.DOMNode;
begin
 doc := DBE_XMLDOM.NEWDOMDOCUMENT();
 text := DBE_XMLDOM.createTextNode(doc, 'aaa');
 DBE_XMLDOM.SETNODEVALUE(DBE_XMLDOM.makeNode(text), 'ccc');
 buf := DBE_XMLDOM.GETNODEVALUE(DBE_XMLDOM.makeNode(text));
 DBE_OUTPUT.print_line(buf);
end;
/

```

- **DBE\_XMLDOM.GETPARENTNODE**

Returns the parent node of the given DOMNode node. The prototype of the DBE\_XMLDOM.GETPARENTNODE function is as follows:

```

DBE_XMLDOM.GETPARENTNODE(
 n IN DOMNODE)
RETURN DOMNODE;

```

**Table 10-351** DBE\_XMLDOM.GETPARENTNODE parameters

Parameter	Description
n	Specified DOMNode object.

**Example:**

```

-- Add a node to the DOC tree and obtain the name of its parent node.
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 doc1 DBE_XMLDOM.DOMDocument;
 root DBE_XMLDOM.DOMELEMENT;
 child1 DBE_XMLDOM.DOMELEMENT;

```

```

child2 DBE_XMLDOM.DOMELEMENT;
attr DBE_XMLDOM.DOMATTR;
text DBE_XMLDOM.DOMTEXT;
node DBE_XMLDOM.DOMNODE;
parent DBE_XMLDOM.DOMNODE;
buf varchar2(1000);
BEGIN
 doc := DBE_XMLDOM.newDOMDocument();
 root := DBE_XMLDOM.createElement(doc, 'root');
 node := DBE_XMLDOM.appendChild(DBE_xmlDOM.makeNode(doc),DBE_xmlDOM.makeNode(root));
 child1 := DBE_XMLDOM.createElement(doc, 'child1');
 node := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(root),
DBE_XMLDOM.makeNode(child1));
 child2 := DBE_XMLDOM.createElement(doc, 'child2');
 node := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(child1),
DBE_XMLDOM.makeNode(child2));
 parent := DBE_XMLDOM.GETPARENTNODE(DBE_XMLDOM.makeNode(child2));
 buf := DBE_XMLDOM.GETNODENAME(parent);
 DBE_OUTPUT.print_line(buf);
END;
/

```

- **DBE\_XMLDOM.GETTAGNAME**

Returns the tag name of the specified DOMELEMENT node. The prototype of the DBE\_XMLDOM.GETTAGNAME function is as follows:

```

DBE_XMLDOM.GETTAGNAME(
 elem IN DOMELEMENT)
RETURN VARCHAR2;

```

**Table 10-352** DBE\_XMLDOM.GETTAGNAME parameters

Parameter	Description
elem	Specified DOMELEMENT node

**Example:**

```

-- Obtain the tag name of a DOMELEMENT node.
DECLARE
 doc dbe_xmlDOM.domdocument;
 elem dbe_xmlDOM.domelement;
 buffer varchar2(1010);
 value varchar(1000);
BEGIN
 doc := dbe_xmlDOM.newDOMDocument();
 elem := DBE_XMLDOM.CREATEELEMENT(DBE_XMLDOM.NEWDOMDOCUMENT(), 'root');
 value := DBE_XMLDOM.gettagname(elem);
 dbe_output.print_line('value: ');
 dbe_output.print_line(value);
 dbe_xmlDOM.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
END;
/

```

- **DBE\_XMLDOM.HASCHILDNODES**

Checks whether the DOMNODE object has any subnode. The prototype of the DBE\_XMLDOM.HASCHILDNODES function is as follows:

```

DBE_XMLDOM.HASCHILDNODES(
 n IN DOMNODE)
RETURN BOOLEAN;

```

**Table 10-353** DBE\_XMLDOM.HASCHILDNODES parameters

Parameter	Description
n	Specified DOMNode object

**Example:**

```
-- Create a node named child1, mount it to the DOC tree, and add a node to child1. Then, check
whether the child1 node has any subnode.
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 doc1 DBE_XMLDOM.DOMDocument;
 root DBE_XMLDOM.DOMELEMENT;
 child1 DBE_XMLDOM.DOMELEMENT;
 child2 DBE_XMLDOM.DOMELEMENT;
 attr DBE_XMLDOM.DOMAttr;
 text DBE_XMLDOM.DOMTEXT;
 node DBE_XMLDOM.DOMNode;
 buf varchar2(1000);
BEGIN
 doc := DBE_XMLDOM.newDOMDocument();
 root := DBE_XMLDOM.createElement(doc, 'root');
 node := DBE_XMLDOM.appendChild(DBE_xmldom.makeNode(doc),DBE_xmldom.makeNode(root));
 child1 := DBE_XMLDOM.createElement(doc, 'child1');
 node := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(root),
DBE_XMLDOM.makeNode(child1));
 child2 := DBE_XMLDOM.createElement(doc, 'child2');
 node := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(child1),
DBE_XMLDOM.makeNode(child2));
 IF DBE_XMLDOM.HASCHILDNODES(DBE_XMLDOM.makeNode(child1)) THEN
 DBE_OUTPUT.print_line('HAS CHILD NODES');
 ELSE
 DBE_OUTPUT.print_line('NOT HAS CHILD NODES ');
 END IF;
END;
/
```

- **DBE\_XMLDOM.IMPORTNODE**

Copies a node to another node and mounts the copied node to a specified document. If the type of the copied node does not belong to the 12 types specified by constants of XML DOM, an exception indicating that the type is not supported is thrown. The prototype of the DBE\_XMLDOM.IMPORTNODE function is as follows:

```
DBE_XMLDOM.IMPORTNODE(
 doc IN DOMDOCUMENT,
 importedNode IN DOMNODE,
 deep IN BOOLEAN)
RETURN DOMNODE;
```

**Table 10-354** DBE\_XMLDOM.IMPORTNODE parameters

Parameter	Description
doc	Document to which the node is mounted.
importedNode	Node to be imported.

Parameter	Description
deep	<p>Specifies whether to perform recursive import.</p> <ul style="list-style-type: none"> <li>If the value is <b>TRUE</b>, the node and all its subnodes are imported.</li> <li>If the value is <b>FALSE</b>, the node itself is imported.</li> </ul>

**Example:**

-- Obtain the **root2\_node** node in the **DOC2** tree, copy it, and mount it to the **DOC** tree.

```
DECLARE
doc dbe_xmlDOM.domdocument;
doc2 dbe_xmlDOM.domdocument;
doc_node dbe_xmlDOM.domnode;
doc2_node dbe_xmlDOM.domnode;
root_node dbe_xmlDOM.domnode;
root2_node dbe_xmlDOM.domnode;
import_node dbe_xmlDOM.domnode;
result_node dbe_xmlDOM.domnode;
buffer varchar2(1010);
BEGIN
doc := dbe_xmlDOM.newdomdocument('<bookstore category="web" cover="paperback">
<book category="cooking"><title lang="en">Everyday Italian</title>
<author>Giada De Laurentiis</author><year>2005</year>
<price>30.00</price></book></bookstore>');
doc2 := dbe_xmlDOM.newdomdocument('<case>LIANLI TU150</case>');
doc_node := DBE_XMLDOM.MAKENODE(doc);
doc2_node := DBE_XMLDOM.MAKENODE(doc2);
root_node := DBE_XMLDOM.GETFIRSTCHILD(doc_node);
root2_node := DBE_XMLDOM.GETFIRSTCHILD(doc2_node);
DBE_XMLDOM.WRITETOBUFFER(doc, buffer);
dbe_output.print_line(buffer);
import_node := DBE_XMLDOM.IMPORTNODE(doc, root2_node, TRUE);
result_node := DBE_XMLDOM.APPENDCHILD(root_node, import_node);
DBE_XMLDOM.WRITETOBUFFER(doc, buffer);
dbe_output.print_line(buffer);
END;
/
```

- **DBE\_XMLDOM.ISNULL**

Checks whether the given DOMAttr node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
a IN DOMATTR)
RETURN BOOLEAN;
```

Checks whether the given DOMDocument node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
doc IN DOMDOCUMENT)
RETURN BOOLEAN;
```

Checks whether the given DOMELEMENT node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
elem IN DOMELEMENT)
RETURN BOOLEAN;
```

Checks whether the given DOMNamedNodeMap node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
 nnm IN DOMNAMEDNODEMAP)
RETURN BOOLEAN;
```

Checks whether the given DOMNode node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
 n IN DOMNODE)
RETURN BOOLEAN;
```

Checks whether the given DOMNodeList node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
 nl IN DOMNODELIST)
RETURN BOOLEAN;
```

Checks whether the given DOMText node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
 t IN DOMTEXT)
RETURN BOOLEAN;
```

**Table 10-355** DBE\_XMLDOM.ISNULL parameters

Parameter	Description
a	Specified DOMAttr node.
doc	Specified DOMDocument node.
elem	Specified DOMELEMENT node.
nnm	Specified DOMNamedNodeMap node.
n	Specified DOMNode node.
nl	Specified DOMNodeList node.
t	Specified DOMText node.

 **NOTE**

Due to the implementation difference of DBE\_XMLDOM.FREEDOCUMENT, an error is reported when the DBE\_XMLDOM.ISNULL API calls the freed DOMDocument node.

Example:

```
--2. Declare (but not initialize) a DOMELEMENT node and check whether the node is empty.
DECLARE
 docelem DBE_XMLDOM.DOMELEMENT;
BEGIN
 if DBE_XMLDOM.ISNULL(docelem) then
 DBE_OUTPUT.print_line('null');
```

```

else
 DBE_OUTPUT.print_line('not null');
end if;
END;
/

```

- DBE\_XMLDOM.ITEM

Returns the element corresponding to the index in a list based on the index. The prototype of the DBE\_XMLDOM.ITEM function is as follows:

```

DBE_XMLDOM.ITEM(
 nl IN DOMNODELIST,
 index IN NUMBER)
RETURN DOMNODE;

```

Returns the element corresponding to the index in a map based on the index. The prototype of the DBE\_XMLDOM.ITEM function is as follows:

```

DBE_XMLDOM.ITEM(
 nnm IN DOMNAMEDNODEMAP,
 index IN NUMBER)
RETURN DOMNODE;

```

**Table 10-356** DBE\_XMLDOM.ITEM parameters

Parameter	Description
nl	Specified DOMNodeList object
nnm	Specified DOMNamedNodeMap object
index	Index of the element to be retrieved

 **NOTE**

For improper input parameters such as Boolean and CLOB, the item function of the map type points to the value of the first index by default.

**Example:**

```

--1. Return the element corresponding to the index in a map based on the index.
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 elem DBE_XMLDOM.DOMELEMENT;
 map DBE_XMLDOM.DOMNAMEDNODEMAP;
 node DBE_XMLDOM.DOMNODE;
 node2 DBE_XMLDOM.DOMNODE;
 buf varchar2(1000);
BEGIN
 doc := dbe_xmldom.newdomdocument('<bookstore category="web" cover="paperback"><book
category="cooking">
 <title lang="en">Everyday Italian</title><author>Giada De Laurentiis</author>
 <year>2005</year><price>30.00</price></book></bookstore>');
 elem := DBE_XMLDOM.GETDOCUMENTELEMENT(doc);
 node := DBE_XMLDOM.MAKENODE(elem);
 map := DBE_XMLDOM.GETATTRIBUTES(DBE_XMLDOM.getFirstChild(node));
 node2:= DBE_XMLDOM.item(map,0);
 DBE_XMLDOM.writeToBuffer(node2, buf);
 dbe_output.print_line(buf);
 dbe_xmldom.freedocument(doc);
 RAISE NOTICE '%', buf;
END;
/
--2. Return the element corresponding to the index in a list based on the index.

```

```

DECLARE
 doc dbe_xmlDOM.domdocument;
 node dbe_xmlDOM.domnode;
 node1 dbe_xmlDOM.domnode;
 nodelist DBE_XMLDOM.DOMNODELIST;
 len INTEGER;
 buffer1 varchar2(1010);
BEGIN
 doc := dbe_xmlDOM.newdomdocument('<bookstore category="web" cover="paperback"><book
category="cooking">
 <title lang="en">Everyday Italian</title><author>Giada De Laurentiis</author>
 <year>2005</year><price>30.00</price></book></bookstore>');
 node := dbe_xmlDOM.makenode(doc);
 node := dbe_xmlDOM.GETFIRSTCHILD(node);
 node := dbe_xmlDOM.GETFIRSTCHILD(node);
 nodelist := DBE_XMLDOM.GETCHILDNODES(node);
 len := DBE_XMLDOM.GETLENGTH(nodelist);
 RAISE NOTICE 'len : %', len;
 node1 := DBE_XMLDOM.ITEM(nodelist, 0);
 IF DBE_XMLDOM.ISNULL(node1) THEN
 dbe_output.print_line('IS NULL');
 ELSE
 dbe_output.print_line('NOT NULL');
 END IF;
 dbe_xmlDOM.writetobuffer(node1, buffer1);
 dbe_output.print_line('buffer1: ');
 dbe_output.print_line(buffer1);
END;
/

```

- **DBE\_XMLDOM.MAKEELEMENT**

Returns the **DOMElement** object after conversion. The prototype of the **DBE\_XMLDOM.MAKEELEMENT** function is as follows:

```

DBE_XMLDOM.MAKEELEMENT(
 n IN DOMNODE)
RETURN DOMELEMENT;

```

**Table 10-357** DBE\_XMLDOM.MAKEELEMENT parameters

Parameter	Description
n	Specified <b>DOMNode</b> object

**Example:**

-- Forcibly convert the **DOMNode** node converted from the **DOMElement** type back to the **DOMElement** type.

```

DECLARE
 buf VARCHAR2(1000);
 doc DBE_XMLDOM.DOMDocument;
 elem DBE_XMLDOM.DOMElement;
 elem2 DBE_XMLDOM.DOMElement;
 node DBE_XMLDOM.DOMNode;
BEGIN
 doc := DBE_XMLDOM.NEWDOMDOCUMENT();
 elem := DBE_XMLDOM.createElement(doc, 'aaa');
 node := DBE_XMLDOM.makeNode(elem);
 elem2 := DBE_XMLDOM.makeElement(node);
 buf := DBE_XMLDOM.GETNODENAME(DBE_XMLDOM.makeNode(elem2));
 DBE_OUTPUT.print_line(buf);
END;
/

```

- **DBE\_XMLDOM.MAKENODE**

Forcibly converts a specified DOMAttr node to a DOMNode node and returns the DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.MAKENODE(
 a IN DOMATTR)
RETURN DOMNODE;
```

Forcibly converts a specified DOMDocument node to a DOMNode node and returns the DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.MAKENODE(
 doc IN DOMDOCUMENT)
RETURN DOMNODE;
```

Forcibly converts a specified DOMELEMENT node to a DOMNode node and returns the DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.MAKENODE(
 elem IN DOMELEMENT)
RETURN DOMNODE;
```

Forcibly converts a specified DOMText node to a DOMNode node and returns the DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.MAKENODE(
 t IN DOMTEXT)
RETURN DOMNODE;
```

**Table 10-358** DBE\_XMLDOM.MAKENODE parameters

Parameter	Description
a	Specified DOMAttr node
doc	Specified DOMDocument node
elem	Specified DOMELEMENT node
t	Specified DOMText node

 **NOTE**

Due to syntax restrictions, when DBE\_XMLDOM.MAKENODE is used as the return value of a function, it cannot be directly implemented by running the following command:

```
return DBE_XMLDOM.MAKENODE(doc);
```

You are advised to run the following command:

```
tmp_node := DBE_XMLDOM.MAKENODE(doc);
return tmp_node;
```

Example:

```
--4. Declare (but not initialize) a DOMText variable, and use it as the input parameter of MAKENODE.
DECLARE
 text DBE_XMLDOM.DOMTEXT;
 buf VARCHAR2(1000);
 dom_node DBE_XMLDOM.DOMNODE;
BEGIN
```

```

dom_node := DBE_XMLDOM.makeNode(text);
buf := DBE_XMLDOM.GETNODENAME(dom_node);
DBE_OUTPUT.print_line(buf);
END;
/

```

- **DBE\_XMLDOM.NEWDOMDOCUMENT**

Returns a new DOMDocument object. The prototype of the DBE\_XMLDOM.NEWDOMDOCUMENT function is as follows:

```

DBE_XMLDOM.NEWDOMDOCUMENT
RETURN DOMDOCUMENT;

```

Returns a new DOMDocument instance object created from the specified XMLType type. The prototype of the DBE\_XMLDOM.NEWDOMDOCUMENT function is as follows:

```

DBE_XMLDOM.NEWDOMDOCUMENT(
xml doc IN SYS.XMLTYPE)
RETURN DOMDOCUMENT;

```

Returns a new DOMDocument instance object created from the specified CLOB type. The prototype of the DBE\_XMLDOM.NEWDOMDOCUMENT function is as follows:

```

DBE_XMLDOM.NEWDOMDOCUMENT(
cl IN CLOB)
RETURN DOMDOCUMENT;

```

**Table 10-359** DBE\_XMLDOM.NEWDOMDOCUMENT parameters

Parameter	Description
xml doc	Specified XMLType type
cl	Specified CLOB type

 **NOTE**

- The size of the input parameter must be less than 1 GB.
- Currently, external DTD parsing is not supported.
- The document created by NEWDOMDOCUMENT uses the UTF-8 character set by default.
- Each document parsed from the same XMLType instance is independent, and the modification of the document does not affect the XMLType.
- For details about the differences between our database ORAnd database ORA, see [DBE\\_XMLPARSER.PARSECLOB](#).

**Example:**

--1. Return a new DOMDocument object.

```

DECLARE
doc dbe_xmldom.domdocument;
buffer varchar2(1010);
BEGIN
doc := dbe_xmldom.newdomdocument();
dbe_xmldom.setdoctype(doc, 'note', 'sysid', 'pubid');
dbe_xmldom.writetobuffer(doc, buffer);
dbe_output.print_line('buffer: ');
dbe_output.print_line(buffer);
dbe_xmldom.freedocument(doc);
END;
/

```

--2. Return a new DOMDocument instance object created from the specified CLOB type.

```

DECLARE
 doc dbexml.domdocument;
 buffer varchar2(1010);
BEGIN
 doc := dbexml.newdomdocument('<?xml version="1.0"?>
 <note><to>test</to><from>Jani</from><heading>Reminder</heading>
 <body>Don't forget me this weekend!</body></note>');
 dbexml.writetobuffer(doc, buffer);
 db_output.print_line('buffer: ');
 db_output.print_line(buffer);
 dbexml.freedocument(doc);
END;
/

--3. Return a new DOMDocument instance object created from the specified XMLType type.
DECLARE
 doc dbexml.domdocument;
 xt xmltype;
 buffer varchar2(1010);
BEGIN
 xt := xmltype('<h:data xmlns:h="http://www.w3.org/TR/html4/">
 <h:da1 len="10">test namespace</h:da1>
 <h:da1>bbbbbbbbbb</h:da1>
 </h:data>');
 doc := dbexml.newdomdocument(xt);
 dbexml.writetobuffer(doc, buffer);
 db_output.print_line('buffer: ');
 db_output.print_line(buffer);
 dbexml.freedocument(doc);
END;
/

```

- **DBE\_XMLDOM.SETATTRIBUTE**

Sets the value of the DOMELEMENT attribute by name. The prototype of the DBE\_XMLDOM.SETATTRIBUTE function is as follows:

```

DBE_XMLDOM.SETATTRIBUTE(
 elem IN DOMELEMENT,
 name IN VARCHAR2,
 value IN VARCHAR2);

```

Sets the attribute values of a DOMELEMENT object by name and namespace URI. The prototype of the DBE\_XMLDOM.SETATTRIBUTE function is as follows:

```

DBE_XMLDOM.SETATTRIBUTE(
 elem IN DOMELEMENT,
 name IN VARCHAR2,
 value IN VARCHAR2,
 ns IN VARCHAR2);

```

**Table 10-360** DBE\_XMLDOM.SETATTRIBUTE parameters

Parameter	Description
elem	Specified DOMELEMENT node
name	Attribute name
value	Attribute value
ns	Namespace

 NOTE

Multiple attributes can be added through the DBE\_XMLDOM.SETATTRIBUTE API. The attribute name cannot be null, and attributes with the same name cannot exist in the same DOMELEMENT node. If you want to add attributes with the same name, you should explicitly set a namespace for each attribute with the same name, but you are advised not to perform such operations. If an attribute exists in a namespace, the specified namespace must be displayed when you modify the attribute. Otherwise, the attribute with the same name is added.

## Example:

```
--1. Set the value of the DOMELEMENT attribute by name.
DECLARE
 doc dbe_xmldom.domdocument;
 elem dbe_xmldom.domelement;
 docnode DBE_XMLDOM.DOMNode;
 buffer varchar2(1010);
 value varchar(1000);
BEGIN
 doc := dbe_xmldom.newDOMDocument();
 elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
 DBE_XMLDOM.setattribute(elem, 'len', '50cm');
 docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
DBE_XMLDOM.makeNode(elem));
 dbe_xmldom.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
END;
/

--2. Set the attribute values of a DOMELEMENT object by name and namespace URI.
DECLARE
 doc dbe_xmldom.domdocument;
 elem dbe_xmldom.domelement;
 docnode DBE_XMLDOM.DOMNode;
 buffer varchar2(1010);
 value varchar(1000);
begin
 doc := dbe_xmldom.newDOMDocument();
 elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
 DBE_XMLDOM.setattribute(elem, 'len', '50cm', 'www.huawei.com');
 docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
DBE_XMLDOM.makeNode(elem));
 dbe_xmldom.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
END;
/

--3. Change the values of the DOMELEMENT attributes by name.
DECLARE
 doc dbe_xmldom.domdocument;
 elem dbe_xmldom.domelement;
 docnode DBE_XMLDOM.DOMNode;
 buffer varchar2(1010);
 value varchar(1000);
BEGIN
 doc := dbe_xmldom.newDOMDocument();
 elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
 DBE_XMLDOM.setattribute(elem, 'len', '50cm');
 DBE_XMLDOM.setattribute(elem, 'len', '55cm');
 docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
DBE_XMLDOM.makeNode(elem));
 dbe_xmldom.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
END;
/
```

```
--4. Change the values of the DOMElement attributes by name and namespace URI.
DECLARE
 doc dbe_xmlDOM.domdocument;
 elem dbe_xmlDOM.domelement;
 docnode DBE_XMLDOM.DOMNode;
 buffer varchar2(1010);
 value varchar(1000);
begin
 doc := dbe_xmlDOM.newDOMDocument();
 elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
 DBE_XMLDOM.setattribute(elem, 'len', '50cm', 'www.huawei.com');
 DBE_XMLDOM.setattribute(elem, 'len', '55cm', 'www.huawei.com');
 docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
DBE_XMLDOM.makeNode(elem));
 dbe_xmlDOM.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
END;
/
```

- DBE\_XMLDOM.SETCHARSET

Sets the character set for a DOMDocument object. The prototype of the DBE\_XMLDOM.SETCHARSET function is as follows:

```
DBE_XMLDOM.SETCHARSET(
 doc IN DOMDocument,
 charset IN VARCHAR2);
```

**Table 10-361** DBE\_XMLDOM.SETCHARSET parameters

Parameter	Description
doc	Specified DOMDocument node
charset	Character set

 **NOTE**

- The value of **charset** contains a maximum of 60 bytes.
- Currently, the following character sets are supported: UTF-8, UTF-16, UCS-4, UCS-2, ISO-8859-1, ISO-8859-2, ISO-8859-3, ISO-8859-4, ISO-8859-5, ISO-8859-6, ISO-8859-7, ISO-8859-8, ISO-8859-9, ISO-2022-JP, Shift\_JIS, EUC-JP and ASCII. If you enter other character sets, an error is reported or garbled characters may be displayed.

**Example:**

```
-- Set the UTF-16 character set for the DOC tree and print the DOC tree to the buffer.
DECLARE
 doc dbe_xmlDOM.domdocument;
 buffer varchar2(1010);
BEGIN
 doc := dbe_xmlDOM.newdomdocument('<?xml version="1.0"?>
<!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)><!ELEMENT heading (#PCDATA)><!ELEMENT body (#PCDATA)>]>
<note><to>test</to><from>Jani</from><heading>Reminder</heading>
<body>Don"t forget me this weekend!</body></note>');
 dbe_xmlDOM.setcharset(doc, 'utf-16');
 dbe_xmlDOM.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
 dbe_xmlDOM.freedocument(doc);
END;
/
```

- DBE\_XMLDOM.SETDOCTYPE

Sets the external DTD of a DOMDocument object. The prototype of the DBE\_XMLDOM.SETDOCTYPE function is as follows:

```
DBE_XMLDOM.SETDOCTYPE(
 doc IN DOMDocument,
 name IN VARCHAR2,
 sysid IN VARCHAR2,
 pubid IN VARCHAR2);
```

**Table 10-362** DBE\_XMLDOM.SETDOCTYPE parameters

Parameter	Description
doc	Specified DOMDocument node
name	Name of the DOCTYPE to be initialized
sysid	ID of the system whose DOCTYPE needs to be initialized
pubid	Public ID of the DOCTYPE to be initialized

 **NOTE**

The total length of **name**, **sysid**, and **pubid** cannot exceed 32500 bytes.

**Example:**

-- After the initial system ID, public ID, and name are set for the external DTD of the DOMDocument, the DOC tree modified each time is output to the buffer.

```
DECLARE
 doc dbexml.domdocument;
 buffer varchar2(1010);
begin
 doc := dbexml.newdomdocument('<?xml version="1.0"?>
 <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>
 <!ELEMENT from (#PCDATA)><!ELEMENT heading (#PCDATA)><!ELEMENT body (#PCDATA)>]>
 <note><to>test</to><from>Jani</from><heading>Reminder</heading>
 <body>Don''t forget me this weekend!</body></note>');
 dbexml.setdoctype(doc, 'note', 'sysid', 'pubid');
 dbexml.writetobuffer(doc, buffer);
 dbexml.output.print_line('buffer: ');
 dbexml.output.print_line(buffer);
 dbexml.output.print_line('-----');
 dbexml.setdoctype(doc, 'note', NULL, '');
 dbexml.setdoctype(doc, 'note1e', NULL, '');
 dbexml.writetobuffer(doc, buffer);
 dbexml.output.print_line('buffer: ');
 dbexml.output.print_line(buffer);
 dbexml.freedocument(doc);
END;
```

- DBE\_XMLDOM.SETNODEVALUE

Sets the value of a node in the DOMNode object. The prototype of the DBE\_XMLDOM.SETNODEVALUE function is as follows:

```
DBE_XMLDOM.SETNODEVALUE(
 n IN DOMNODE,
 nodeValue IN VARCHAR2);
```

**Table 10-363** DBE\_XMLDOM.SETNODEVALUE parameters

Parameter	Description
n	Specified DOMNode object
nodeValue	String to be set in the DOMNode object

 **NOTE**

1. You can enter an empty string or null value for **nodeValue**, but the node value will not be changed.
2. Currently, **nodeValue** does not support the escape character '&'. If the character string contains the escape character, the node value will be cleared.
3. The default maximum length of **nodeValue** is restricted by the VARCHAR2 type and is 32767 bytes. If the length exceeds 32767 bytes, an exception is thrown.

**Example:**

-- After setting a node value different from the initial value for the DOMNode node that is converted from DOMText, obtain and output the node value.

```
DECLARE
 buf VARCHAR2(1000);
 doc DBE_XMLDOM.DOMDocument;
 text DBE_XMLDOM.DOMText;
 elem2 DBE_XMLDOM.DOMELEMENT;
 node DBE_XMLDOM.DOMNode;
BEGIN
 doc := DBE_XMLDOM.NEWDOMDOCUMENT();
 text := DBE_XMLDOM.createTextNode(doc, 'aaa');
 DBE_XMLDOM.SETNODEVALUE(DBE_XMLDOM.makeNode(text), 'ccc');
 buf := DBE_XMLDOM.GETNODEVALUE(DBE_XMLDOM.makeNode(text));
 DBE_OUTPUT.print_line(buf);
END;
/
```

- **DBE\_XMLDOM.WRITETOBUFFER**

Writes an XML node to a specified buffer using the database character set.

The prototype of the DBE\_XMLDOM.WRITETOBUFFER function is as follows:

```
DBE_XMLDOM.WRITETOBUFFER(
 doc IN DOMDOCUMENT,
 buffer INOUT VARCHAR2);
```

Writes an XML document to a specified buffer using the database character set. The prototype of the DBE\_XMLDOM.WRITETOBUFFER function is as follows:

```
DBE_XMLDOM.WRITETOBUFFER(
 n IN DOMNODE,
 buffer INOUT VARCHAR2);
```

**Table 10-364** DBE\_XMLDOM.WRITETOBUFFER parameters

Parameter	Description
doc	Specified DOMDocument node
buffer	Buffer for the write operation
n	Specified DOMNode node

 **NOTE**

- The buffer to which the writetobuffer function writes is less than 1 GB.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- By default, XML files are output in the UTF-8 character set.

**Example:**

```
--1. Enter a parameter of the DOMNode type.
DECLARE
 doc dbe_xmlDOM.domdocument;
 elem DBE_XMLDOM.DOMELEMENT;
 buf varchar2(1000);
BEGIN
 doc := dbe_xmlDOM.newdomdocument();
 elem := dbe_xmlDOM.createelement(doc,'elem');
 DBE_XMLDOM.WRITETOBUFFER(dbe_xmlDOM.makenode(elem), buf);
 DBE_OUTPUT.print_line(buf);
END;
/

--2. Enter a parameter of the DOMDocument type.
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 buf VARCHAR2(1000);
BEGIN
 doc := dbe_xmlDOM.newdomdocument('<?xml version="1.0"?>
 <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>
 <!ELEMENT from (#PCDATA)><!ELEMENT heading (#PCDATA)><!ELEMENT body (#PCDATA)>]>
 <note><to>test</to><from>Jani</from><heading>Reminder</heading>
 <body>Don''t forget me this weekend!</body></note>');
 DBE_XMLDOM.WRITETOBUFFER(doc, buf);
 DBE_OUTPUT.print_line('doc: ');
 DBE_OUTPUT.print_line(buf);
 DBE_XMLDOM.FREEDOCUMENT(doc);
END;
/
```

- **DBE\_XMLDOM.WRITETOCLOB**

Writes an XML node to a specified CLOB using the database character set. The prototype of the DBE\_XMLDOM.WRITETOCLOB function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
 doc IN DOMDOCUMENT,
 cl INOUT CLOB);
```

Writes an XML node to a specified CLOB using the database character set. The prototype of the DBE\_XMLDOM.WRITETOCLOB function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
 n IN DOMNODE,
 cl INOUT CLOB);
```

**Table 10-365** DBE\_XMLDOM.WRITETOCLOB parameters

Parameter	Description
doc	Specified DOMDocument node
cl	CLOB to be written
n	Specified DOMNode node

 NOTE

- The **doc** parameter is an input parameter. The CLOB to which the writetoclob function writes is less than 1 GB.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- By default, XML files are output in the UTF-8 character set.

## Example:

--1. Enter a parameter of the DOMNode type.

```
DECLARE
 CL CLOB;
 N DBE_XMLDOM.DOMNODE;
BEGIN
 DBE_XMLDOM.WRITETOCLOB(N, CL);
 DBE_OUTPUT.PRINT_LINE(CL);
END;
/
```

--2. Enter a parameter of the DOMDocument type.

```
DECLARE
 doc dbe_xmldom.domdocument;
 mclob clob;
BEGIN
 doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
 <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>
 <!ELEMENT from (#PCDATA)><!ELEMENT heading (#PCDATA)><!ELEMENT body (#PCDATA)>]>
 <note><to>test</to><from>Jani</from><heading>Reminder</heading>
 <body>Don't forget me this weekend!</body></note>');
 dbe_xmldom.writetoclob(doc, mclob);
 dbe_output.print_line('mclob: ');
 dbe_output.print_line(mclob);
 dbe_xmldom.freedocument(doc);
END;
/
```

- DBE\_XMLDOM.WRITETOFILE

Writes an XML node to a specified file using the database character set. The prototype of the DBE\_XMLDOM.WRITETOFILE function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
 doc IN DOMDOCUMENT,
 fileName IN VARCHAR2);
```

Writes an XML node to a specified file using the database character set. The prototype of the DBE\_XMLDOM.WRITETOFILE function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
 n IN DOMNODE,
 fileName IN VARCHAR2);
```

Writes an XML document to a specified file using the specified character set.

The prototype of the DBE\_XMLDOM.WRITETOFILE function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
 doc IN DOMDOCUMENT,
 fileName IN VARCHAR2,
 charset IN VARCHAR2);
```

Writes an XML document to a specified file using the specified character set.

The prototype of the DBE\_XMLDOM.WRITETOFILE function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
 n IN DOMNODE,
 fileName IN VARCHAR2,
 charset IN VARCHAR2);
```

**Table 10-366** DBE\_XMLDOM.WRITETOFILE parameters

Parameter	Description
doc	Specified DOMDocument node
fileName	File to be written
n	Specified DOMNode node
charset	Specified character set

 **NOTE**

- The **doc** parameter is an input parameter. The value of **filename** can contain a maximum of 255 bytes, and the value of **charset** can contain a maximum of 60 bytes. For details about the character sets supported by **charset**, see the [DBE\\_XMLDOM.SETCHARSET](#) API.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- If `newdomdocument()` is used to create a document without parameters, no error is reported when **charset** is not specified. The UTF-8 character set is used by default.
- The **filename** must be in the path created in **pg\_directory**. The backslash (\) in the filename will be converted to a slash (/). Only one slash (/) is allowed. The file name must be in the **pg\_directory\_name/file\_name.xml** format. The output file must be in the XML format.
- When the GUC parameter **safe\_data\_path** is enabled, you can only use the advanced package to read and write files in the file path specified by **safe\_data\_path**.
- Before creating a directory, ensure that the directory exists in the operating system and the user has the read and write permissions on the directory. For details about how to create a directory, see [CREATE DIRECTORY](#).

**Example:**

-- Before creating a directory, ensure that the directory exists in the operating system and the user has the read and write permissions on the directory.

create directory dir as '/tmp';

--1. Write an XML node to a specified file using the database character set.

```
DECLARE
 FPATH VARCHAR2(1000);
 DOC DBE_XMLDOM.DOMDOCUMENT;
BEGIN
 DOC := DBE_XMLDOM.NEWDOMDOCUMENT('<ROOT>
 <A ATTR1="A_VALUE">
 <ACHILD>ACHILD TXT</ACHILD>

 B TXT
 <C/>
 </ROOT>');
 FPATH := 'dir/simplexml.xml';
 DBE_XMLDOM.WRITETOFILE(DOC, FPATH);
END;
/
```

--2. Write an XML document to a specified file using the specified character set.

```
DECLARE
 SRC VARCHAR(1000);
 FPATH VARCHAR2(1000);
 DOC DBE_XMLDOM.DOMDOCUMENT;
 ELE DBE_XMLDOM.DOMELEMENT;
```

```
BEGIN
 FPATH := 'dir/simplexml.xml';
 SRC := '<ROOT>
 <A ATTR1="A_VALUE">
 <ACHILD>ACHILD TXT</ACHILD>

 B TXT
 </ROOT>';
 DOC := DBE_XMLDOM.NEWDOMDOCUMENT(SRC);
 ELE := DBE_XMLDOM.GETDOCUMENTELEMENT(DOC);
 DBE_XMLDOM.WRITETOFILE(DBE_XMLDOM.MAKENODE(ELE), FPATH, 'ASCII');
 DBE_XMLDOM.FREEDOCUMENT(DOC);
END;
/
drop directory dir;
```

- **DBE\_XMLDOM.GETSESSIONTREENUM**

Queries the number of DOM trees of all types in the current session. The prototype of the DBE\_XMLDOM.GETSESSIONTREENUM function is as follows:

```
DBE_XMLDOM.GETSESSIONTREENUM()
RETURN INTEGER;
```

 **NOTE**

For DOM trees that have used FREEElement and FREENode, this function still counts them.

**Example:**

-- Create three documents and obtain the number of DOM trees in the current session.

```
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 doc2 DBE_XMLDOM.DOMDocument;
 doc3 DBE_XMLDOM.DOMDocument;

 buffer varchar2(1010);
BEGIN
 -- Create three documents.
 doc := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<root>
 <elem1 attr="attrtest">
 <elem2>Im text</elem2>
 <elem3>Im text too</elem3>
 </elem1>
 <elem4>Text</elem4>
</root>
');
 doc2 := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<computer size="ITX" price="19999">
 <cpu>Ryzen 9 3950X</cpu>
 <ram>32GBx2 DDR4 3200MHz</ram>
 <motherboard>ROG X570i</motherboard>
 <gpu>RTX2070 Super</gpu>
 <ssd>1TB NVMe Toshiba + 2TB NVMe WD Black</ssd>
 <hdd>12TB WD Digital</hdd>
 <psu>CORSAIR SF750</psu>
 <case>LIANLI TU150</case>
</computer>
');
 doc3 := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<bookstore>
 <book genre="autobiography" publicationdate="1981" ISBN="1-861003-11-0">
 <title>The Autobiography of Benjamin Franklin</title>
 <author>
 <first-name>Benjamin</first-name>
 <last-name>Franklin</last-name>
 </author>
 <price>8.99</price>
 </book>
```

```
<book genre="novel" publicationdate="1967" ISBN="0-201-63361-2">
 <title>The Confidence Man</title>
 <author>
 <first-name>Herman</first-name>
 <last-name>Melville</last-name>
 </author>
 <price>11.99</price>

 <name>Plato</name>
 </author>
 <price>9.99</price>
</book>
</bookstore>
');

-- Print IDs.
DBE_OUTPUT.PRINT_LINE(doc.id);
DBE_OUTPUT.PRINT_LINE(doc2.id);
DBE_OUTPUT.PRINT_LINE(doc3.id);
-- Call functions and print them.
DBE_OUTPUT.PRINT_LINE(DBE_XMLDOM.GETSESSIONTREENUM());
-- Release the documents.
DBE_XMLDOM.FREEDOCUMENT(doc);
DBE_XMLDOM.FREEDOCUMENT(doc2);
DBE_XMLDOM.FREEDOCUMENT(doc3);
END;
/
```

- **DBE\_XMLDOM.GETDOCTREESINFO**

Queries the DOM tree information of the document type in the current session, such as the memory usage. The prototype of the DBE\_XMLDOM.GETDOCTREESINFO function is as follows:

```
DBE_XMLDOM.GETDOCTREESINFO()
RETURN VARCHAR2;
```

#### NOTE

This function collects statistics only on DOM tree nodes of the document type.

#### Example:

```
-- Create three documents and obtain the information about the document tree in the current session.
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 doc2 DBE_XMLDOM.DOMDocument;
 doc3 DBE_XMLDOM.DOMDocument;

 buffer varchar2(1010);
BEGIN
 -- Create three documents.

-- Print IDs.
DBE_OUTPUT.PRINT_LINE(doc.id);
DBE_OUTPUT.PRINT_LINE(doc2.id);
DBE_OUTPUT.PRINT_LINE(doc3.id);
-- Call functions and print them.
DBE_OUTPUT.PRINT_LINE(DBE_XMLDOM.GETDOCTREESINFO());
-- Release the documents.
DBE_XMLDOM.FREEDOCUMENT(doc);
DBE_XMLDOM.FREEDOCUMENT(doc2);
DBE_XMLDOM.FREEDOCUMENT(doc3);
END;
/

```

- DBE\_XMLDOM.GETDETAILDOCTREEINFO

Queries the number of subnodes of each type in the transferred document. The prototype of the DBE\_XMLDOM.GETDETAILDOCTREEINFO function is as follows:

```

DBE_XMLDOM.GETDETAILDOCTREEINFO(
 doc IN DOMDOCUMENT
)
RETURN VARCHAR2;

```

**Table 10-367** DBE\_XMLDOM.GETDETAILDOCTREEINFO parameters

Parameter	Description
doc	Specified DOMDocument node

 **NOTE**

This function collects statistics only on DOM tree nodes of the document type.

**Example:**

```
-- Create three documents and use this function to obtain the number of nodes of each type in each document.
DECLARE
doc DBE_XMLDOM.DOMDocument;
doc2 DBE_XMLDOM.DOMDocument;
doc3 DBE_XMLDOM.DOMDocument;

buffer varchar2(1010);
BEGIN
-- Create three documents.
doc := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<root>
 <elem1 attr="attrtest">
 <elem2>Im text</elem2>
 <elem3>Im text too</elem3>
 </elem1>
 <elem4>Text</elem4>
</root>
');
doc2 := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<computer size="ITX" price="19999">

```

### 10.11.2.14 DBE\_XMLPARSER

#### API Description

The DBE\_XMLPARSER API is used to deserialize XML character strings and convert the character strings that store XML documents to document nodes. [Table 10-368](#) lists all APIs supported by the DBE\_XMLPARSER advanced package.

The XMLParser data type can be used to store XMLParser data. The maximum number of XMLParser data records that can be stored is 16777215. The XMLPARSER data type can parse and create the DOMDocument node according to the input character string. The advanced package also provides the corresponding set and get APIs to perform operations on the constraint attributes of the parsing process.

#### NOTE

When the DBE\_XMLPARSER advanced package is used in the database whose character set is set to **SQL\_ASCII**, an error is reported if characters beyond the ASCII range are input.

The DBE\_XMLPARSER advanced package supports only the O-compatible mode.

**Table 10-368** DBE\_XMLPARSER parameters

API	Description
<a href="#">DBE_XMLPARSER.FREEPARSER</a>	Frees a parser.
<a href="#">DBE_XMLPARSER.GETDOCUMENT</a>	Obtains the parsed document node.
<a href="#">DBE_XMLPARSER.GETVALIDATIONMODE</a>	Obtains the validation attribute.
<a href="#">DBE_XMLPARSER.NEWPARSER</a>	Creates a parser instance.
<a href="#">DBE_XMLPARSER.PARSEBUFFER</a>	Parses the VARCHAR string.
<a href="#">DBE_XMLPARSER.PARSECLOB</a>	Parses the CLOB string.
<a href="#">DBE_XMLPARSER.SETVALIDATIONMODE</a>	Sets the validation attribute.

- [DBE\\_XMLPARSER.FREEPARSER](#)  
Frees a given parser object.  
The stored procedure prototype of [DBE\\_XMLPARSER.FREEPARSER](#) is as follows:

```
DBE_XMLPARSER.FREEPARSER (
 p IN parser);
```

**Table 10-369** DBE\_XMLPARSER.FREEPARSER parameters

Parameter	Description
p	Parser object

**Example:**

```
-- Create a parser and then release it.
DECLARE
 l_parser dbe_xmlparser.parser;
BEGIN
 l_parser := dbe_xmlparser.newparser();
-- Directly release the l_parser instance.
 dbe_xmlparser.freeparser(l_parser);
END;
/
```

Result: The operation is successful.

- **DBE\_XMLPARSER.GETDOCUMENT**

Returns the root node of the DOM tree document constructed by the parser. This function can be called only after the document is parsed.

The prototype of the DBE\_XMLPARSER.GETDOCUMENT function is as follows:

```
DBE_XMLPARSER.GETDOCUMENT (
 p IN parser)
RETURN DOMDocument;
```

**Table 10-370** DBE\_XMLPARSER.GETDOCUMENT parameters

Parameter	Description
p	Parser object

 **NOTE**

- If the GETDOCUMENT function has no input parameter, an error is reported.
- If the **parser** parameter of the GETDOCUMENT function is null, **NULL** is returned.
- If the parser input by the GETDOCUMENT function has not parsed any document, **NULL** is returned.

**Example:**

```
-- Create a parser to parse character strings and print the obtained document.
DECLARE
 l_parser dbe_xmlparser.parser;
 l_doc dbe_xmldom.domdocument;
 buffer varchar2 :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>';
buffer2 varchar2;
```

```

BEGIN
 l_parser := dbe_xmlparser.newparser();
 dbe_xmlparser.PARSEBUFFER(l_parser, buffer);
 l_doc := dbe_xmlparser.getdocument(l_parser);
 -- The l_parser parses the character string and obtains the DOMDocument node through
 GETDOCUMENT.
 dbe_xmldom.writetobuffer(l_doc, buffer2);
 RAISE NOTICE '%', buffer2;
 -- Print the content in l_doc.
 dbe_xmlparser.freeparser(l_parser);
 dbe_xmldom.freedocument(l_doc);
END;
/

```

**Execution result:**

```

NOTICE: <?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>

```

- **DBE\_XMLPARSER.GETVALIDATIONMODE**

Obtains the parsing validation mode of a specified parser. If DTD validation is enabled, **TRUE** is returned. Otherwise, **FALSE** is returned.

The prototype of the DBE\_XMLPARSER.GETVALIDATIONMODE function is as follows:

```

DBE_XMLPARSER.GETVALIDATIONMODE (
 p IN parser)
RETURN BOOLEAN;

```

**Table 10-371** DBE\_XMLPARSER.GETVALIDATIONMODE parameters

Parameter	Description
p	Parser object

**Example:**

```

-- Create a parser and use GETVALIDATIONMODE to check whether the parser validation mode is
enabled.

```

```

DECLARE
 l_parser dbe_xmlparser.parser;
BEGIN
 l_parser := dbe_xmlparser.newparser();
 if (dbe_xmlparser.GETVALIDATIONMODE(l_parser) = true) then
 RAISE NOTICE 'validation';
 else
 RAISE NOTICE 'no validation';
 end if;
 dbe_xmlparser.freeparser(l_parser);
END;
/

```

**Execution result:**

```

NOTICE: validation

```

- **DBE\_XMLPARSER.NEWPARSER**

Creates a parser object and returns a new parser instance.

The prototype of the DBE\_XMLPARSER.NEWPARSER function is as follows:

```
DBE_XMLPARSER.NEWPARSER
RETURN Parser;
```

**Example:**

```
-- Create a parser to parse character strings and then free the parser.
DECLARE
-- Create a parser.
l_parser dbe_xmlparser.parser;
l_doc dbe_xmldom.domdocument;
buffer varchar2(1000) :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>';
buffer2 varchar2(1000);
BEGIN
l_parser := dbe_xmlparser.newparser();
-- Parse the document and create a new DOM document.
dbe_xmlparser.PARSEBUFFER(l_parser, buffer);

dbe_xmlparser.freeparser(l_parser);
END;
/
```

Result: The operation is successful.

- **DBE\_XMLPARSER.PARSEBUFFER**

Parses XML documents stored in strings.

The stored procedure prototype of DBE\_XMLPARSER.PARSEBUFFER is as follows:

```
DBE_XMLPARSER.PARSEBUFFER (
p IN parser,
doc IN VARCHAR2);
```

**Table 10-372** DBE\_XMLPARSER.PARSEBUFFER parameters

Parameter	Description
p	Parser object
doc	A string that stores XML documents

 NOTE

- The maximum length of a character string that can be parsed by the PARSEBUFFER function is 32767. If the length exceeds the maximum, an error is reported.
- Different from the ORA database, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsed, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value "Ch..." is not an enumerated value in the brackets. However, the ORA database does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case sensitive. **Baidu** cannot correspond to **baidu**. However, the ORA database does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the ORA database reports an error.
- Difference in parsing XML predefined entities: **&apos;** and **&quot;**; are parsed and translated into ' and ". However, predefined entities in ORA database are not translated into characters.

## Example:

```
-- Create a parser to parse character strings and print the obtained document.
```

```
DECLARE
 l_parser dbexmlparser.parser;
 l_doc dbexmlDOM.domdocument;
 buffer varchar2 :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>';
 buffer2 varchar2;
BEGIN
 l_parser := dbexmlparser.newparser();
 dbexmlparser.PARSEBUFFER(l_parser, buffer);
 l_doc := dbexmlparser.getdocument(l_parser);

 dbexmlDOM.writetobuffer(l_doc, buffer2);
 RAISE NOTICE '%', buffer2;

 dbexmlparser.freeparser(l_parser);
 dbexmlDOM.freedocument(l_doc);
END;
/
```

## Execution result:

```
NOTICE: <?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>
```

- **DBE\_XMLPARSER.PARSECLOB**

Parses XML documents stored in a CLOB.

The stored procedure prototype of **DBE\_XMLPARSER.PARSECLOB** is as follows:

```
DBE_XMLPARSER.PARSECLOB (
 p IN parser,
 doc IN CLOB);
```

**Table 10-373** DBE\_XMLPARSER.PARSECLOB parameters

Parameter	Description
p	Parser object
doc	A CLOB that stores XML documents

 **NOTE**

- PARSECLOB cannot parse CLOBs larger than 1 GB.
- Different from the ORA database, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsed, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value "Ch..." is not an enumerated value in the brackets. However, the ORA database does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case sensitive. **Baidu** cannot correspond to **baidu**. However, the ORA database does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the ORA database reports an error.
- Difference in parsing XML predefined entities: **&apos;** and **&quot;** are parsed and translated into ' and ". However, predefined entities in ORA database are not translated into characters.

**Example:**

```
-- Create a parser to parse character strings and print the obtained document.
DECLARE
L_clob clob :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>this weekend!</body>
</note>';
-- Create a parser.
L_parser dbe_xmlparser.parser;
L_doc dbe_xmldom.domdocument;
buffer varchar2(1000);
BEGIN
L_parser := dbe_xmlparser.newparser();
-- Parse the document and create a new DOM document.
dbe_xmlparser.parseclob(L_parser, L_clob);
L_doc := dbe_xmlparser.getdocument(L_parser);
dbe_xmldom.writetobuffer(L_doc, buffer);
RAISE NOTICE '%',buffer;

dbe_xmlparser.freeparser(L_parser);
dbe_xmldom.freedocument(L_doc);

END;
/
```

**Execution result:**

```
NOTICE: <?xml version="1.0" encoding="UTF-8"?>
<note>
```

```
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>this weekend!</body>
</note>
```

- DBE\_XMLPARSER.SETVALIDATIONMODE

Sets the parsing validation mode of a specified parser.

The stored procedure prototype of DBE\_XMLPARSER.SETVALIDATIONMODE is as follows:

```
DBE_XMLPARSER.SETVALIDATIONMODE(
 p IN parser)
yes IN BOOLEAN);
```

**Table 10-374** DBE\_XMLPARSER.SETVALIDATIONMODE parameters

Parameter	Description
p	Parser object
yes	Mode to be set: <ul style="list-style-type: none"> <li>• <b>TRUE</b>: DTD validation is enabled.</li> <li>• <b>FALSE</b>: DTD validation is disabled.</li> </ul>

 **NOTE**

- If the input parameter **yes** of the SETVALIDATIONMODE function is null, the parsing validation mode of the parser is not changed.
- By default, the DTD validation is enabled during parser initialization.

**Example 1:**

```
-- Create a parser. The XML character string to be parsed does not match the DTD format.
-- If setValidationMode is set to false, the string can be parsed. If setValidationMode is set to true,
an error is reported during parsing.
```

```
DECLARE
 l_clob clob :=
'<!DOCTYPE note [
<!ELEMENT note (to,from,heading,body)>
<!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)>
<!ELEMENT heading (#PCDATA)>
<!ELEMENT body (#PCDATA)>
]>
<table>
<name attr1="WEB" attr2="web2">African Coffee Table</name>
<width>80</width>
<length>120</length>
</table>';
 l_parser dbe_xmlparser.parser;
 l_doc dbe_xmldom.domdocument;
 buffer varchar2(1000);
BEGIN
 l_parser := dbe_xmlparser.newparser();
 -- Set it to false for parsing.
 dbe_xmlparser.setValidationMode(l_parser, false);
 dbe_xmlparser.parseclob(l_parser, l_clob);
 l_doc := dbe_xmlparser.getdocument(l_parser);
 dbe_xmldom.writetobuffer(l_doc, buffer);
 RAISE NOTICE '%', buffer;
 dbe_xmlparser.freeparser(l_parser);
```

```
 dbe_xmlDOM.freedocument(L_doc);
END;
/
```

**Execution result:**

```
NOTICE: <?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE note [
<!ELEMENT note (to , from , heading , body)>
<!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)>
<!ELEMENT heading (#PCDATA)>
<!ELEMENT body (#PCDATA)>
>]
<table>
<name attr1="WEB" attr2="web2">African Coffee Table</name>
<width>80</width>
<length>120</length>
</table>
```

**Example 2:**

```
-- Parse a parser. The XML character string to be parsed does not match the DTD format.
-- An error is reported during parsing after setValidationMode is set to true.
DECLARE
 L_clob clob :=
 '<!DOCTYPE note [
<!ELEMENT note (to,from,heading,body)>
<!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)>
<!ELEMENT heading (#PCDATA)>
<!ELEMENT body (#PCDATA)>
>]
<table>
<name attr1="WEB" attr2="web2">African Coffee Table</name>
<width>80</width>
<length>120</length>
</table>';
 L_parser dbe_xmlparser.parser;
 L_doc dbe_xmlDOM.domdocument;
 buffer varchar2(1000);
BEGIN
 L_parser := dbe_xmlparser.newparser();
 -- Set it to true for parsing.
 --The XML character string does not match the DTD format. An error is expected.
 dbe_xmlparser.setValidationMode(L_parser, true);
 dbe_xmlparser.parseclob(L_parser, L_clob);
 L_doc := dbe_xmlparser.getdocument(L_parser);
 dbe_xmlDOM.writetobuffer(L_doc, buffer);
 dbe_xmlparser.freeparser(L_parser);
 dbe_xmlDOM.freedocument(L_doc);
END;
/
```

**Execution result:**

```
An error is reported during xmlparser parsing.
ERROR: invalid XML document
```

## 10.12 Retry Management

Retry is a process in which the database executes a SQL statement or stored procedure (including anonymous block) again in the case of execution failure, improving the execution success rate and user experience. The database checks the error code and retry configuration to determine whether to retry.

- If the execution fails, the system rolls back the executed statements and executes the stored procedure again.

Example:

```
gaussdb=# CREATE OR REPLACE PROCEDURE retry_basic (IN x INT)
AS
BEGIN
 INSERT INTO t1 (a) VALUES (x);
 INSERT INTO t1 (a) VALUES (x+1);
END;
/
gaussdb=# CALL retry_basic(1);
```

## 10.13 Debugging

### Syntax

RAISE has the following five syntax formats:

Figure 10-34 raise\_format::=

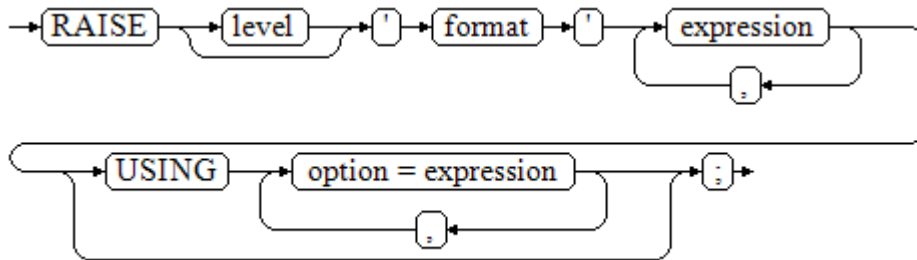

Figure 10-35 raise\_condition::=

Figure 10-36 raise\_sqlstate::=

Figure 10-37 raise\_option::=

Figure 10-38 raise::=

**Parameter description:**

- The **level** option is used to specify the error level, that is, **DEBUG**, **LOG**, **INFO**, **NOTICE**, **WARNING**, or **EXCEPTION** (default). **EXCEPTION** throws an error that normally terminates the current transaction and the others only generate information at their levels. The GUC parameters **log\_min\_messages** and **client\_min\_messages** control whether the error messages of specific levels are reported to the client and are written to the server log.
- **format**: specifies the error message text to be reported, a format string. The format string can be appended with an expression for insertion to the message text. In a format string, **%** is replaced by the parameter value attached to format and **%%** is used to print **%**. For example:  
--v\_job\_id replaces % in the string.  

```
RAISE NOTICE 'Calling cs_create_job(%)',v_job_id;
```
- **option = expression**: inserts additional information to an error report. The **keyword** option can be **MESSAGE**, **DETAIL**, **HINT**, or **ERRCODE**, and each expression can be any string.
  - **MESSAGE**: specifies the error message text. This option cannot be used in a **RAISE** statement that contains a format character string in front of **USING**.
  - **DETAIL**: specifies detailed information of an error.
  - **HINT**: prints hint information.
  - **ERRCODE**: designates an error code (SQLSTATE) to a report. A condition name or a five-character SQLSTATE error code can be used.
- **condition\_name**: specifies the condition name corresponding to the error code.
- **sqlstate**: specifies the error code.

If neither a condition name nor an SQLSTATE is specified in the **RAISE EXCEPTION** command, the **RAISE EXCEPTION (P0001)** is used by default. If no message text is specified, the condition name or SQLSTATE is used as the message text by default.

---

**NOTICE**

- If the SQLSTATE specifies an error code, the error code is not limited to a defined error code. It can be any error code containing five digits or ASCII uppercase rather than **00000**. Do not use an error code ended with three zeros because such error codes are category codes and can be captured by the whole category.
  - In O-compatible mode, SQLCODE is equivalent to SQLSTATE.
-

 NOTE

The syntax described in [Figure 10-38](#) does not append any parameter. This form is used only for the **EXCEPTION** statement in a **BEGIN** block so that the error can be re-processed.

## Examples

Display error and hint information when a transaction terminates:

```
CREATE OR REPLACE PROCEDURE proc_raise1(user_id in integer)
AS
BEGIN
RAISE EXCEPTION 'Noexistence ID --> %',user_id USING HINT = 'Please check your user ID';
END;
/

call proc_raise1(300011);

-- Execution result
ERROR: Noexistence ID --> 300011
HINT: Please check your user ID
```

Two methods are available for setting SQLSTATE:

```
CREATE OR REPLACE PROCEDURE proc_raise2(user_id in integer)
AS
BEGIN
RAISE 'Duplicate user ID: %',user_id USING ERRCODE = 'unique_violation';
END;
/

\set VERBOSITY verbose
call proc_raise2(300011);

-- Execution result
ERROR: Duplicate user ID: 300011
SQLSTATE: 23505
```

If the main parameter is a condition name or SQLSTATE, the following applies:

```
RAISE division_by_zero;

RAISE SQLSTATE '22012';
```

For example:

```
CREATE OR REPLACE PROCEDURE division(div in integer, dividend in integer)
AS
DECLARE
res int;
BEGIN
IF dividend=0 THEN
RAISE division_by_zero;
RETURN;
ELSE
res := div/dividend;
RAISE INFO 'division result: %', res;
RETURN;
END IF;
END;
/

call division(3,0);

-- Execution result
ERROR: division_by_zero
```

Alternatively:

```
RAISE unique_violation USING MESSAGE = 'Duplicate user ID: ' || user_id;
```

# 11 Autonomous Transaction

An autonomous transaction is an independent transaction that is started during the execution of a primary transaction. Committing and rolling back an autonomous transaction does not affect the data that has been committed by the primary transaction. In addition, an autonomous transaction is not affected by the primary transaction.

Autonomous transactions are defined in stored procedures, functions, and anonymous blocks, and are declared using the **PRAGMA AUTONOMOUS\_TRANSACTION** keyword.

## 11.1 Stored Procedure Supporting Autonomous Transaction

An autonomous transaction can be defined in a stored procedure. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS\_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a stored procedure. The following is an example.

```
-- Create a table.
gaussdb=# create table t2(a int, b int);
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'a' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
gaussdb=# insert into t2 values(1,2);
INSERT 0 1
gaussdb=# select * from t2;
 a | b
---+---
 1 | 2
(1 row)

-- Create a stored procedure that contains an autonomous transaction.
gaussdb=# CREATE OR REPLACE PROCEDURE autonomous_4(a int, b int) AS
DECLARE
 num3 int := a;
 num4 int := b;
 PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
 insert into t2 values(num3, num4);
 db_output.print_line('just use call.');
```

```
-- Create a common stored procedure that calls an autonomous transaction stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE autonomous_5(a int, b int) AS
DECLARE
BEGIN
 dbe_output.print_line('just no use call. ');
 insert into t2 values(666, 666);
 autonomous_4(a,b);
 rollback;
END;
/
CREATE PROCEDURE
-- Call a common stored procedure.
gaussdb=# select autonomous_5(11,22);
just no use call.
just use call.
autonomous_5

(1 row)
-- View the table result.
gaussdb=# select * from t2 order by a;
 a | b
----+----
 1 | 2
 11 | 22
(2 rows)
```

In the preceding example, a stored procedure containing an autonomous transaction is finally executed in a transaction block to be rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by the autonomous transaction.

## 11.2 Anonymous Block Supporting Autonomous Transaction

An autonomous transaction can be defined in an anonymous block. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS\_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating an anonymous block. The following is an example.

```
gaussdb=# create table t1(a int ,b text);
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'a' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

gaussdb=# START TRANSACTION;
START TRANSACTION
gaussdb=# DECLARE
 PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
 dbe_output.print_line('just use call. ');
 insert into t1 values(1,'you are so cute,will commit!');
END;
/
just use call.
ANONYMOUS BLOCK EXECUTE
gaussdb=# insert into t1 values(1,'you will rollback!');
INSERT 0 1
gaussdb=# rollback;
ROLLBACK

gaussdb=# select * from t1;
 a | b
```

```
-----+-----
1 | you are so cute,will commit!
(1 row)
```

In the preceding example, an anonymous block containing an autonomous transaction is finally executed before a transaction block to be rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by the autonomous transaction.

## 11.3 Function Supporting Autonomous Transaction

An autonomous transaction can be defined in a function. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS\_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a function. The following is an example.

```
gaussdb=# create table t4(a int, b int, c text);
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'a' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

gaussdb=# CREATE OR REPLACE function autonomous_32(a int ,b int ,c text) RETURN int AS
DECLARE
 PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
 insert into t4 values(a, b, c);
 return 1;
END;
/

gaussdb=# CREATE OR REPLACE function autonomous_33(num1 int) RETURN int AS
DECLARE
 num3 int := 220;
 tmp int;
 PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
 num3 := num3/num1;
 return num3;
EXCEPTION
 WHEN division_by_zero THEN
 select autonomous_32(num3, num1, sqlerrm) into tmp;
 return 0;
END;
/
CREATE FUNCTION

gaussdb=# select autonomous_33(0);
autonomous_33
-----+-----
0
(1 row)

gaussdb=# select * from t4;
a | b | c
-----+-----
220 | 0 | division by zero
(1 row)
```

## 11.4 Restrictions

### CAUTION

- When an autonomous transaction is executed, an autonomous transaction session is started in the background. You can use **max\_concurrent\_autonomous\_transactions** to set the maximum number of concurrent autonomous transactions. The value range is 0 to 10000, and the default value is **10**.
- When **max\_concurrent\_autonomous\_transactions** is set to **0**, autonomous transactions cannot be executed.
- After a new session is started for an autonomous transaction, the default session parameters are used and objects (including session-level variables, local temporary variables, and global temporary table data) of the primary session are not shared.
- Theoretically, the upper limit of autonomous transactions is 10000. Actually, the upper limit is a dynamic value. For details, see the description of the GUC parameter **max\_concurrent\_autonomous\_transactions**.
- Autonomous transactions are affected by the communication buffer. The size of the information returned to the client is limited by the length of the communication buffer. If the size exceeds the length of the communication buffer, an error is reported.

- A trigger function does not support autonomous transactions.

```
gaussdb=# CREATE TABLE test_trigger_des_tbl(id1 int, id2 int, id3 int);
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'id1' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
```

```
gaussdb=# CREATE OR REPLACE FUNCTION tri_insert_func() RETURNS TRIGGER AS
$$
DECLARE
PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
INSERT INTO test_trigger_des_tbl VALUES(new.id1, new.id2, new.id3);
RETURN new;END$$ LANGUAGE plpgsql;
ERROR: Triggers do not support autonomous transactions
DETAIL: N/A
```

```
gaussdb=# DROP TABLE test_trigger_des_tbl;
DROP TABLE
```

- Autonomous transactions cannot be called by non-top-layer anonymous blocks (but can only be called by top-layer autonomous transactions, including stored procedures, functions, and anonymous blocks).

```
gaussdb=# CREATE TABLE t1(a INT ,b TEXT);
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'a' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
```

```
gaussdb=# DECLARE
--PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
DECLARE
PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
```

```

DBE_OUTPUT.PRINT_LINE('JUST USE CALL. ');
INSERT INTO t1 VALUES(1,'CAN YOU ROLLBACK!');
END;
INSERT INTO t1 VALUES(2,'I WILL ROLLBACK!');
ROLLBACK;
END;
/
JUST USE CALL.
ANONYMOUS BLOCK EXECUTE

gaussdb=# SELECT * FROM t1;
 a | b
----+----
(0 rows)

gaussdb=# DROP TABLE t1;
DROP TABLE

```

- Autonomous transactions do not support **ref\_cursor** parameter transfer.

```

gaussdb=# create table sections(section_ID int);
gaussdb=# insert into sections values(1);
gaussdb=# insert into sections values(1);
gaussdb=# insert into sections values(1);
gaussdb=# insert into sections values(1);

gaussdb=# CREATE OR REPLACE function proc_sys_ref()
return SYS_REFCURSOR

# 12 System Catalogs and System Views

---

## 12.1 Overview of System Catalogs and System Views

System catalogs store structured metadata of GaussDB. They are the source of information used by GaussDB to control system running and are a core component of the database system.

System views provide ways to query the system catalogs and internal database status.

System catalogs and views are visible to either system administrators or all users. Some system catalogs and views have marked the need of administrator permissions, so they are accessible only to administrators.

You can delete and re-create system catalogs, add columns to them, and insert and update values in them, but doing so may make system information inconsistent and cause system faults. Generally, users should not modify system catalogs or system views, or rename their schemas. They are automatically maintained by the system.

---

### NOTICE

- You are advised not to modify the permissions on system catalogs or system views.
  - Do not add, delete, or modify system catalogs because doing so will result in exceptions or even cluster unavailability.
  - System catalogs and views do not support foreign key-related columns.
  - For details about column types in system catalogs and system views, see [Data Type](#).
- 

## 12.2 System Catalogs

## 12.2.1 GS\_AUDITING\_POLICY

**GS\_AUDITING\_POLICY** records the main information about the unified audit. Each record corresponds to a design policy. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-1** GS\_AUDITING\_POLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
polname	name	Policy name, which must be unique
polcomments	name	Policy description field, which records policy-related description information and is represented by the <b>COMMENTS</b> keyword
modifydate	timestamp without time zone	The latest timestamp when a policy is created or modified
polenabed	boolean	Specifies whether to enable the policy. <ul style="list-style-type: none"> <li>• <b>t</b> (true): enabled.</li> <li>• <b>f</b> (false): disabled.</li> </ul>

## 12.2.2 GS\_AUDITING\_POLICY\_ACCESS

**GS\_AUDITING\_POLICY\_ACCESS** records the DML database operations about the unified audit. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-2** GS\_AUDITING\_POLICY\_ACCESS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
accesstype	name	DML database operation type. For example, SELECT, INSERT, and DELETE.
labelname	name	Specifies the resource label name. This parameter corresponds to the <b>polname</b> column in the system catalog in <a href="#">GS_AUDITING_POLICY</a> .

Name	Type	Description
policyoid	oid	OID of the audit policy, corresponding to the OID in the <a href="#">12.2.1 GS_AUDITING_POLICY</a> system catalog.
modifydate	timestamp without time zone	Latest creation or modification timestamp.

### 12.2.3 GS\_AUDITING\_POLICY\_FILTERS

**GS\_AUDITING\_POLICY\_FILTERS** records the filtering policies about the unified audit. Each record corresponds to a design policy. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-3** GS\_AUDITING\_POLICY\_FILTERS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
filtertype	name	Filter type. Currently, the value is <b>logical_expr</b> .
labelname	name	Name. Currently, the value is <b>logical_expr</b> .
policyoid	oid	OID of the audit policy, corresponding to the OID in the system catalog in <a href="#">GS_AUDITING_POLICY</a> .
modifydate	timestamp without time zone	Latest creation or modification timestamp.
logicaloperator	text	Logical character string of a filter criterion.

### 12.2.4 GS\_AUDITING\_POLICY\_PRIVILEGES

**GS\_AUDITING\_POLICY\_PRIVILEGES** records the DDL database operations about the unified audit. Each record corresponds to a design policy. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-4** GS\_AUDITING\_POLICY\_PRIVI columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
privilege_type	name	DDL database operation type. For example, CREATE, ALTER, and DROP.
labelname	name	Resource label name. This parameter corresponds to the <b>polname</b> column in the <a href="#">12.2.1 GS_AUDITING_POLICY</a> system catalog.
policyoid	oid	This parameter corresponds to OIDs in the <a href="#">12.2.1 GS_AUDITING_POLICY</a> system catalog.
modifydate	timestamp without time zone	Latest creation or modification timestamp.

## 12.2.5 GS\_ASP

GS\_ASP displays the persistent ACTIVE SESSION PROFILE samples. This system catalog can be queried only in the system library.

**Table 12-5** GS\_ASP columns

Name	Type	Description
sampleid	bigint	Sample ID.
sample_time	timestamp with time zone	Sampling time.
need_flush_sample	Boolean	Specifies whether the sample needs to be flushed to disks. <ul style="list-style-type: none"><li>• <b>t (true)</b>: yes.</li><li>• <b>f (false)</b>: no.</li></ul>
databaseid	oid	Database ID.
thread_id	bigint	Thread ID.
sessionid	bigint	Session ID.
start_time	timestamp with time zone	Start time of a session.
event	text	Specified event name.

Name	Type	Description
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread. The value corresponds to the level (ID) of the execution plan.
smpid	integer	Concurrent thread ID in SMP execution mode.
userid	oid	ID of a session user.
application_name	text	Name of the application.
client_addr	inet	IP address of a client.
client_hostname	text	Name of a client.
client_port	integer	TCP port number used by a client to communicate with the backend.
query_id	bigint	Debug query ID.
unique_query_id	bigint	Unique query ID.
user_id	oid	User ID in the key of the unique query.
cn_id	integer	A CN ID indicates a CN from which the unique SQL statement is obtained. The <b>cn_id</b> is in the key of the unique query.
unique_query	text	Standardized unique SQL text string
locktag	text	Information of a lock that the session waits for. It can be parsed using <b>locktag_decode</b> .
lockmode	text	Mode of a lock that the session waits for. <ul style="list-style-type: none"> <li>● <b>LW_EXCLUSIVE</b>: exclusive lock.</li> <li>● <b>LW_SHARED</b>: shared lock.</li> <li>● <b>LW_WAIT_UNTIL_FREE</b>: waits for the <b>LW_EXCLUSIVE</b> to be available.</li> </ul>

Name	Type	Description
block_sessionid	bigint	Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.
wait_status	text	Provides more details about the event column.
global_sessionid	text	Global session ID.
xact_start_time	timestamp with time zone	Start time of the transaction.
query_start_time	timestamp with time zone	Time when the statement starts to be executed.
state	text	Current statement state. The options are as follows: <ul style="list-style-type: none"> <li>• <b>active</b>: The backend is executing a query.</li> <li>• <b>idle in transaction</b>: The backend is in a transaction. However, no statement is being executed in the transaction.</li> <li>• <b>idle in transaction (aborted)</b>: The backend is in a transaction, but there are statements failed in the transaction.</li> <li>• <b>fastpath function call</b>: The backend is executing a fast-path function.</li> <li>• <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li> </ul>

## 12.2.6 GS\_CLIENT\_GLOBAL\_KEYS

**GS\_CLIENT\_GLOBAL\_KEYS** records information about the CMK in the encrypted equality feature. Each record corresponds to a CMK.

**Table 12-6** GS\_CLIENT\_GLOBAL\_KEYS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
global_key_name	name	CMK name
key_namespace	oid	A namespace OID that contains this CMK

Name	Type	Description
key_owner	oid	CMK owner
key_acl	aclitem[]	Access permissions that this key should have on creation
create_date	timestamp without time zone	Time when a key is created

## 12.2.7 GS\_CLIENT\_GLOBAL\_KEYS\_ARGS

**GS\_CLIENT\_GLOBAL\_KEYS\_ARGS** records the metadata about the CMK in the encrypted equality feature. Each record corresponds to a key-value pair of the CMK.

**Table 12-7** GS\_CLIENT\_GLOBAL\_KEYS\_ARGS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
global_key_id	oid	CMK OID
function_name	name	The value is <b>encryption</b> .
key	name	CMK metadata name
value	bytea	Value of the CMK metadata name

## 12.2.8 GS\_COLUMN\_KEYS

**GS\_COLUMN\_KEYS** records information about the CEK in the encrypted equality feature. Each record corresponds to a CEK.

**Table 12-8** GS\_COLUMN\_KEYS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
column_key_name	name	CEK name
column_key_distributed_id	oid	ID obtained based on the hash value of the fully qualified domain name (FQDN) of the CEK
global_key_id	oid	A foreign key, which is the CMK OID.

Name	Type	Description
key_namespace	oid	A namespace OID that contains this CEK
key_owner	oid	CEK owner
create_date	timestamp without time zone	Time when a CEK is created
key_acl	aclitem[]	Access permissions that this CEK should have on creation

## 12.2.9 GS\_COLUMN\_KEYS\_ARGS

**GS\_COLUMN\_KEYS\_ARGS** records the metadata about the CMK in the encrypted equality feature. Each record corresponds to a key-value pair of the CMK.

**Table 12-9** GS\_COLUMN\_KEYS\_ARGS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
column_key_id	oid	CEK OID
function_name	name	The value is <b>encryption</b> .
key	name	CEK metadata name
value	bytea	Value of the CEK metadata name

## 12.2.10 GS\_DATABASE\_LINK

**GS\_DATABASE\_LINK** stores database link information, mainly recording detailed information about database links. Only sysadmin can read this system catalog. Currently, the database link function is not supported.

**Table 12-10** GS\_DATABASE\_LINK columns

Name	Type	Description
oid	oid	Unique ID of the current database link object (hidden attribute, which must be specified).
dlname	name	Name of the current database link.
downer	oid	ID of the owner of the current database link. If the owner is <b>public</b> , the value is <b>0</b> .

Name	Type	Description
dlfdw	oid	OID of the foreign-data wrapper of the current database link.
dlcreator	oid	ID of the creator of the current database link.
options	text[]	Current database link connection information in the format of "keyword=value".
useroptions	text[]	User information used by the current database link to connect to the remote end, in the format of "keyword=value".
dlacl	aclitem[]	Current database link access permission.

## 12.2.11 GS\_DB\_PRIVILEGE

**GS\_DB\_PRIVILEGE** records the granting of ANY permissions. Each record corresponds to a piece of authorization information.

**Table 12-11** GS\_DB\_PRIVILEGE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
roleid	oid	User ID
privilege_type	text	ANY permission of a user. For details about the value, see <a href="#">Table 7-164</a> .
admin_option	boolean	Whether the ANY permission recorded in the <b>privilege_type</b> column can be re-granted <ul style="list-style-type: none"> <li>• t: yes</li> <li>• f: no</li> </ul>

## 12.2.12 GS\_DEPENDENCIES

**GS\_DEPENDENCIES** records object dependency information and has a one-to-many relationship with [12.2.13 GS\\_DEPENDENCIES\\_OBJ](#).

**Table 12-12** GS\_DEPENDENCIES columns

Name	Type	Description
schemaname	name	Name of a namespace
refobjpos	integer	Position of the referenced object <ul style="list-style-type: none"> <li>• 1: type</li> <li>• 2: package header</li> <li>• 4: function header</li> <li>• 8: function body</li> <li>• 16: package body</li> <li>• 32: view</li> </ul>
refobjoid	oid	OID of the referenced object
objectname	text	Name of the dependent object

### 12.2.13 GS\_DEPENDENCIES\_OBJ

GS\_DEPENDENCIES\_OBJ records the detailed information about the referenced object.

**Table 12-13** GS\_DEPENDENCIES\_OBJ columns

Name	Type	Description
schemaname	name	Name of a namespace.
type	integer	Type of the referenced object. <ul style="list-style-type: none"> <li>• 1: unknown type</li> <li>• 2: variable</li> <li>• 3: type</li> <li>• 4: function</li> <li>• 5: view</li> <li>• 6: function header</li> </ul>
name	text	Name of the referenced object.
objnode	pg_node_tree	Detailed information about the referenced object.

### 12.2.14 GS\_ENCRYPTED\_COLUMNS

GS\_ENCRYPTED\_COLUMNS records information about encrypted columns in the encrypted equality feature. Each record corresponds to an encrypted column.

**Table 12-14** GS\_ENCRYPTED\_COLUMNS columns

Name	Type	Description
rel_id	oid	Table OID
column_name	name	Name of an encrypted column.
column_key_id	oid	A foreign key, which is the CEK OID
encryption_type	tinyint	Encryption type. The value can be <b>2(DETERMINISTIC)</b> or <b>1(RANDOMIZED)</b> .
data_type_original_oid	oid	ID of the original data type of the encrypted column. For details about the values, see the oid columns in the <a href="#">PG_TYPE</a> system catalog.
data_type_original_mod	integer	Modifiers of the original data type of the encrypted column. For details about the values, see the atttypmod columns in the <a href="#">PG_ATTRIBUTE</a> system catalog.
create_date	timestamp without time zone	Time when an encrypted column is created

## 12.2.15 GS\_ENCRYPTED\_PROC

**GS\_ENCRYPTED\_PROC** provides information such as the parameters of encrypted functions and stored procedure functions, original data type of return values, and encrypted columns.

**Table 12-15** GS\_ENCRYPTED\_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
func_id	oid	OID of the function, corresponding to the OID row identifier in the <a href="#">12.2.81 PG_PROC</a> system catalog.
prorettype_orig	integer	Original data type of the return value.
last_change	timestamp without time zone	Last modification time of the encrypted function

Name	Type	Description
proargcachedcol	oidvector	OID of the encrypted column corresponding to the <b>INPUT</b> parameter of the function, corresponding to the OID row identifier in the <a href="#">12.2.14 GS_ENCRYPTED_COLUMNS</a> system catalog.
proallargtypes_ori g	oid[]	Original data type of all function parameters.

## 12.2.16 GS\_GLOBAL\_CONFIG

**GS\_GLOBAL\_CONFIG** records the parameter values specified by users during cluster initialization. In addition, it also stores weak passwords set by users. Initial database users can write, modify, and delete parameters in system catalogs by using **ALTER** and **DROP**. Only the initial user, system administrator, and security administrator can access this system catalog. Other users do not have such permission.

**Table 12-16** GS\_GLOBAL\_CONFIG columns

Name	Type	Description
name	name	Specifies the preset parameter name, weak password name, or parameter required by users during cluster initialization.
value	text	Specifies the preset parameter value, weak password value, or parameter value required by users during cluster initialization.

## 12.2.17 GS\_JOB\_ATTRIBUTE

**GS\_JOB\_ATTRIBUTE** records attributes of DBE\_SCHEDULER scheduled tasks, including basic attributes of scheduled tasks, scheduled task classes, certificates, authorization, programs, and schedules. Common users do not have the permission to access the newly installed database cluster.

**Table 12-17** GS\_JOB\_ATTRIBUTE columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
job_name	text	Names of scheduled tasks, scheduled task classes, certificates, programs, and schedules, and authorized user names.

Name	Type	Description
attribute_name	text	Attribute names of scheduled tasks, scheduled task classes, certificates, programs, and schedules, and authorized content.
attribute_value	text	Attribute values of scheduled tasks, scheduled task classes, certificates, programs, and schedules.

## 12.2.18 GS\_JOB\_ARGUMENT

GS\_JOB\_ARGUMENT provides the parameter attributes of DBE\_SCHEDULER scheduled tasks and programs.

**Table 12-18** GS\_JOB\_ARGUMENT columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
argument_position	integer	Location of a parameter of a scheduled task or program.
argument_type	name	Parameter type of a scheduled task or program.
job_name	text	Name of a scheduled task or program.
argument_name	text	Parameter name of a scheduled task or program. The scheduled task inherits the parameter name of the program. Therefore, this parameter is null.
argument_value	text	Parameter value of a scheduled task. (The program cannot bind a value.)
default_value	text	Default parameter value of a program.

## 12.2.19 GS\_MASKING\_POLICY

GS\_MASKING\_POLICY records the main information about dynamic data masking policies. Each record corresponds to a masking policy. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-19** GS\_MASKING\_POLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
polname	name	Policy name, which must be unique.
polcomments	name	Policy description field, which records policy-related description information and is represented by the <b>COMMENTS</b> keyword
modifydate	timestamp without time zone	Latest timestamp when a policy is created or modified.
polenabled	boolean	Specifies whether to enable the policy. <ul style="list-style-type: none"> <li>• <b>t</b> (true): enabled</li> <li>• <b>f</b> (false): disabled</li> </ul>

## 12.2.20 GS\_MASKING\_POLICY\_ACTIONS

**GS\_MASKING\_POLICY\_ACTIONS** records the masking actions of a masking policy in the dynamic data masking policies. One masking policy corresponds to one or more rows of records in the catalog. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-20** GS\_MASKING\_POLICY\_ACTIONS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
actiontype	name	Name of a masking function used by a masking policy
actparams	name	Parameter information transferred to a masking function
actlabelname	name	Name of a masked label
policyoid	oid	OID of a masking policy to which a record belongs, corresponding to the OID in <a href="#">GS_MASKING_POLICY</a> .
actmodifydate	timestamp without time zone	Latest timestamp when a record is created or modified

## 12.2.21 GS\_MASKING\_POLICY\_FILTERS

**GS\_MASKING\_POLICY\_FILTERS** records the user filtering criteria corresponding to the dynamic data masking policies. The corresponding masking policy takes effect only when the user information meets the filter criteria. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-21** GS\_MASKING\_POLICY\_FILTERS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
filtertype	name	Filter type. Currently, the value is <b>logical_expr</b> .
filterlabelname	name	Filtering range. Currently, the value is <b>logical_expr</b> .
policyoid	oid	OID of a masking policy to which a record belongs, corresponding to the OID in <a href="#">GS_MASKING_POLICY</a> .
modifydate	timestamp without time zone	Latest timestamp when a user filter criterion is created or modified.
logicaloperator	text	Polish notation of the filter criteria.

## 12.2.22 GS\_MATVIEW

**GS\_MATVIEW** provides information about each materialized view in the database.

**Table 12-22** GS\_MATVIEW columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
matviewid	oid	OID of a materialized view.
mapid	oid	OID of a map table associated with a materialized view. Each map table corresponds to one materialized view. If a full materialized view does not correspond to a map table, the value of this column is <b>0</b> .

Name	Type	Description
ivm	boolean	Type of a materialized view. The value <b>t</b> indicates an incremental materialized view, and the value <b>f</b> indicates a full materialized view.
needrefresh	boolean	Reserved column.
refreshtime	timestamp without time zone	Last time when a materialized view was refreshed. If the materialized view is not refreshed, the value is null. This column is maintained only for incremental materialized views on DNs. In other cases, the value is null.

### 12.2.23 GS\_MATVIEW\_DEPENDENCY

**GS\_MATVIEW\_DEPENDENCY** provides association information about each incremental materialized view, base table, and Mlog table in the database. The Mlog table corresponding to the base table does not exist in the full materialized view. Therefore, no record is written into the Mlog table.

**Table 12-23** GS\_MATVIEW\_DEPENDENCY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
matviewid	oid	OID of a materialized view.
reloid	oid	OID of a base table of a materialized view.
mlogid	oid	OID of a Mlog table which is the log table of a materialized view. Each Mlog table corresponds to one base table.
mxmin	integer	Reserved column.

### 12.2.24 GS\_MODEL\_WAREHOUSE

**GS\_MODEL\_WAREHOUSE** stores AI engine training models, including the models and detailed description of the training process.

**Table 12-24** GS\_MODEL\_WAREHOUSE columns

Name	Data Type	Description
oid	oid	Hidden column
modelname	name	Unique constraint
modelowner	oid	OID of a model owner
createtime	timestamp without time zone	Time when a model is created
processedtuples	integer	Number of tuples involved in training
discardedtuples	integer	Number of unqualified tuples not involved in training
preprocesstime	real	Data preprocessing time
exectime	real	Training duration
iterations	integer	Iteration round
outputtype	oid	OID of the output data type
modeltype	text	AI operator type
query	text	Query statement executed to create a model
modeldata	bytea	Stored binary model information
weight	real[]	Currently, this column applies only to GD operator models.
hyperparametersnames	text[]	Involved hyperparameter name
hyperparametersvalues	text[]	Hyperparameter value
hyperparametersoids	oid[]	OID of the data type corresponding to a hyperparameter
coefnames	text[]	Model parameter
coefvalues	text[]	Value of a model parameter
coefoids	oid[]	OID of the data type corresponding to a model parameter

Name	Data Type	Description
trainingscoresname	text[]	Method used to measure model performance
trainingscoresvalue	real[]	Value used to measure model performance
modeldescribe	text[]	Model description

## 12.2.25 GS\_OPT\_MODEL

**GS\_OPT\_MODEL** is a data table used when the AI engine is enabled to predict the planned time. It records the configurations, training results, features, corresponding system functions, and training history of machine learning models.

### NOTE

In the distributed scenario, this system catalog is provided, but the AI capabilities are unavailable.

## 12.2.26 GS\_PLAN\_TRACE

**GS\_PLAN\_TRACE** is used to store plan traces. It records details about the plan generation process of DML statements. Only users with the sysadmin permission can use this system catalog. The plan trace feature is not supported in the distributed scenario. Therefore, no data is displayed in this view in the distributed scenario.

**Table 12-25** GS\_PLAN\_TRACE columns

Name	Type	Description
query_id	text	Unique ID of the current request.
query	text	SQL statement of the current request. The value of this field cannot exceed the value of <b>track_activity_query_size</b> .
unique_sql_id	bigint	Unique ID of the SQL statement of the current request.
plan	text	Query plan text corresponding to the current request SQL statement. The value of this field cannot exceed 10 KB.
plan_trace	text	Details about the query plan generation process corresponding to the SQL statement of the current request. The value of this field cannot exceed 300 MB.
owner	oid	OID of the user who initiates the current SQL request.

Name	Type	Description
modifydate	timestamp with time zone	Time when the current plan trace is updated (that is, time when the plan trace is created).

## 12.2.27 GS\_POLICY\_LABEL

GS\_POLICY\_LABEL records the resource label configuration information. One resource label corresponds to one or more records, and each record identifies the resource label to which a database resource belongs. Only a system administrator or security policy administrator can access this system catalog.

Fully Qualified Domain Name (FQDN) identifies an absolute path of a database resource.

**Table 12-26** GS\_POLICY\_LABEL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
labelname	name	Specifies the resource label name.
labeltype	name	Resource tag type. Currently, the value is <b>RESOURCE</b> .
fqdnnamespace	oid	OID of a namespace to which an identified database resource belongs.
fqdnid	oid	OID of an identified database resource. If the database resource is a column, this column is the OID of the catalog.
relcolumn	name	Column name. If the identified database resource is a column, this column indicates the column name. Otherwise, this column is empty.
fqdntype	name	Type of the identified database resource, for example, schema, table, column, or view.

## 12.2.28 GS\_RECYCLEBIN

GS\_RECYCLEBIN describes details about objects in the recycle bin of the flashback feature.

**Table 12-27** GS\_RECYCLEBIN columns

Name	Type	Description
oid	oid	System column
rcybaseid	oid	Base table object ID, which references <b>gs_recyclebin.oid</b>
rcydbid	oid	OID of the database to which the current object belongs
rcyrelid	oid	OID of the current object
rcyname	name	Name of the object in the recycle bin. The format is BIN\$ <i>unique_id</i> \$ <i>oid</i> \$. <i>unique_id</i> indicates the unique identifier with a maximum of 16 characters, and <i>oid</i> indicates the OID.
rcyoriginname	name	Original object name
rcyoperation	char	Operation type. The options are as follows: <ul style="list-style-type: none"><li>• <b>d</b>: drop</li><li>• <b>t</b>: truncate</li></ul>
rcytype	integer	Object type. The options are as follows: <ul style="list-style-type: none"><li>• <b>0</b>: table</li><li>• <b>1</b>: index</li><li>• <b>2</b>: TOAST table</li><li>• <b>3</b>: TOAST index</li><li>• <b>4</b>: sequence, indicating the sequence object that is automatically associated with the serial, bigserial, smallserial, and largeserial types.</li><li>• <b>5</b>: partition</li><li>• <b>6</b>: global index.</li><li>• <b>7</b>: materialized view.</li></ul>
rcyrecyclecsn	bigint	CSN when an object is dropped or truncated
rcyrecycletime	timestamp with time zone	Time when an object is dropped or truncated
rcycreatecsn	bigint	CSN when an object is created
rcychangeccsn	bigint	SCN when an object definition is modified
rcynamespace	oid	OID of the namespace that contains this relationship
rcyowner	oid	Owner of the relationship

Name	Type	Description
rcytablespace	oid	Tablespace in which this relationship is stored. If the value is <b>0</b> , the default tablespace of the database is used. This column is meaningless if the relationship has no on-disk file.
rcyrelfilenode	oid	File name of the recycle bin object on a disk, or <b>0</b> if none, which is used to restore the physical file when the TRUNCATE object is restored.
rcycanrestore	Boolean	Specifies whether flashback can be performed separately.
rcycanpurge	Boolean	Specifies whether the purge operation can be performed independently.
rcyfrozenxid	xid32	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table.
rcyfrozenxid64	xid	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table.

## 12.2.29 GS\_SQL\_PATCH

**GS\_SQL\_PATCH** records the status information about SQL\_PATCH on the current node.

**Table 12-28** GS\_SQL\_PATCH columns

Name	Type	Description
patch_name	name	Patch name.
unique_sql_id	bigint	Global unique query ID
owner	oid	ID of the user who creates the patch.
enable	boolean	Specifies whether the patch takes effect.
status	"char"	Patch status (reserved column).
abort	boolean	Specifies whether the patch is an abort hint.
hint_string	text	Hint text.
hint_node	pg_node_tree	Hint parsing and serialization result.
original_query	text	Original statement (reserved column).

Name	Type	Description
patched_query	text	Patched statement (reserved column).
original_query_tree	pg_node_tree	Original statement parsing result (reserved column).
patched_query_tree	pg_node_tree	Patched statement parsing result (reserved column).
description	text	Patch description.
parent_unique_sql_id	bigint	Globally unique ID of the outer statement of the SQL statement for which the patch takes effect. The value of this parameter is <b>0</b> for statements outside a stored procedure. For statements inside the stored procedure, and the value of this parameter is the globally unique ID of the statement that invokes the stored procedure.

### 12.2.30 GS\_TXN\_SNAPSHOT

**GS\_TXN\_SNAPSHOT** is a timestamp-CSN mapping table. It periodically samples and maintains an appropriate time range to estimate the CSN corresponding to the timestamp in the range.

**Table 12-29** GS\_TXN\_SNAPSHOT columns

Name	Type	Description
snptime	timestamp with time zone	Snapshot time
snpxmin	bigint	Minimum snapshot ID
snpcsn	bigint	Snapshot CSN
snpsnapshot	text	Serialized snapshot text

### 12.2.31 GS\_UID

**GS\_UID** records the unique identification meta information of the **hasuids** attribute table in the database.

**Table 12-30** GS\_UID columns

Name	Type	Description
relid	oid	OID of a table

Name	Type	Description
uid_backup	bigint	Largest unique identifier that can be assigned to a table

## 12.2.32 GS\_WORKLOAD\_RULE

The `GS_WORKLOAD_RULE` system catalog records information about SQL concurrency control rules. There is no permission restriction on this system catalog. All users can query this system catalog.

**Table 12-31** `GS_WORKLOAD_RULE` columns

Name	Type	Description
rule_id	bigint	Concurrency control rule ID, which is automatically generated by the system.
rule_name	name	Name of the concurrency control rule, which is used for search. The name may not be unique and can be <b>NULL</b> .
databases	name[]	List of databases on which the concurrency control rules take effect. If the value is <b>NULL</b> , the concurrency control rules take effect for all databases.
max_workload	bigint	Maximum number of concurrent rule settings.
is_valid	boolean	Determines whether the concurrency control rules take effect. If the concurrency control rules time out, the value is set to <b>false</b> .
start_time	timestamp with time zone	Start time of the concurrency control rules. The value <b>NULL</b> indicates that the rules take effect from now on.
end_time	timestamp with time zone	End time of the concurrency control rules. The value <b>NULL</b> indicates that the rules are always effective.
rule_type	text	Concurrency control rule type. Currently, only " <b>sqlid</b> ", " <b>select</b> ", " <b>insert</b> ", " <b>update</b> ", " <b>delete</b> ", " <b>merge</b> ", and " <b>resource</b> " are supported. Other values are invalid.
option_val	text[]	Parameter values of concurrency control rules, including SQL ID, keyword list, and resource restriction.  For details, see the description of the <a href="#">gs_add_workload_rule</a> API.

Name	Type	Description
node_names	text[]	List of nodes on which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.
user_names	text[]	List of users for which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.

## 12.2.33 PG\_AGGREGATE

PG\_AGGREGATE records information about aggregate functions. Each entry in **PG\_AGGREGATE** is an extension of an entry in **PG\_PROC**. The **PG\_PROC** entry carries the aggregate's name, input and output data types, and other information that is similar to ordinary functions.

**Table 12-32** PG\_AGGREGATE columns

Name	Type	Reference	Description
aggfnoid	regproc	<a href="#">PG_PROC.proname</a>	<a href="#">PG_PROC</a> proname of the aggregate function
aggtransfn	regproc	<a href="#">PG_PROC.proname</a>	Transition function
aggcollectfn	regproc	<a href="#">PG_PROC.proname</a>	Collect function
aggfinalfn	regproc	<a href="#">PG_PROC.proname</a>	Final function ( <b>0</b> if none)
aggstortop	oid	<a href="#">PG_OPERATOR.oid</a>	Associated sort operator ( <b>0</b> if none)
aggtranstype	oid	<a href="#">PG_TYPE.oid</a>	Data type of the aggregate function's internal transition (state) data  The possible values and their meanings are defined by the types in <a href="#">pg_type.h</a> . The main two types are polymorphic (isPolymorphicType) and non-polymorphic.
agginitval	text	-	Initial value of the transition state. This is a text column containing the initial value in its external string representation. If this column is null, the transition state value starts from null.

Name	Type	Reference	Description
agginitcollect	text	-	Initial value of the collection state. This is a text column containing the initial value in its external string representation. If this column is null, the collection state value starts from null.
aggkind	"char"	-	Type of the aggregate function: <ul style="list-style-type: none"> <li>• <b>n</b>: normal aggregate</li> <li>• <b>o</b>: ordered set aggregate</li> </ul>
aggnumdirect args	smallint	-	Number of direct parameters (non-aggregation-related parameters) of the aggregate function of the ordered set aggregate type. For an aggregate function of the normal aggregate type, the value is <b>0</b> .

## 12.2.34 PG\_AM

PG\_AM records information about index access methods. There is one row for each index access method supported by the system.

**Table 12-33** PG\_AM columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
amname	name	-	Name of the access method.
amstrategies	smallint	-	Number of operator strategies for the access method ( <b>0</b> if the access method does not have a fixed set of operator strategies).
amsupport	smallint	-	Number of support routines for the access method.

Name	Type	Reference	Description
amcanorder	boolean	-	Specifies whether the access method supports ordered scans sorted by the indexed column's value. <ul style="list-style-type: none"> <li>• <b>t</b> (true): supported.</li> <li>• <b>f</b> (false): not supported.</li> </ul>
amcanorderbyop	boolean	-	Specifies whether the access method supports ordered scans sorted by the result of an operator on the indexed column. <b>t</b> (true): supported. <b>f</b> (false): not supported.
amcanbackward	boolean	-	Specifies whether the access method supports backward scanning. <ul style="list-style-type: none"> <li>• <b>t</b> (true): supported.</li> <li>• <b>f</b> (false): not supported.</li> </ul>
amcanunique	boolean	-	Specifies whether the access method supports unique indexes. <ul style="list-style-type: none"> <li>• <b>t</b> (true): supported.</li> <li>• <b>f</b> (false): not supported.</li> </ul>
amcanmulticol	boolean	-	Specifies whether the access method supports multi-column indexes. <ul style="list-style-type: none"> <li>• <b>t</b> (true): supported.</li> <li>• <b>f</b> (false): not supported.</li> </ul>
amoptionalkey	boolean	-	Specifies whether the access method supports scanning without any constraint for the first index column. <ul style="list-style-type: none"> <li>• <b>t</b> (true): supported.</li> <li>• <b>f</b> (false): not supported.</li> </ul>
amsearcharray	boolean	-	Specifies whether the access method supports <b>ScalarArrayOpExpr</b> searches. <b>t</b> (true): supported. <b>f</b> (false): not supported.

Name	Type	Reference	Description
amsearchnulls	boolean	-	Specifies whether the access method supports <b>IS NULL/NOT NULL</b> searches. <ul style="list-style-type: none"> <li>• <b>t</b> (true): supported.</li> <li>• <b>f</b> (false): not supported.</li> </ul>
amstorage	boolean	-	Specifies whether the index storage data type can differ from the column data type. <ul style="list-style-type: none"> <li>• <b>t</b> (true): same.</li> <li>• <b>f</b> (false): different.</li> </ul>
amclusterable	boolean	-	Specifies whether an index of this type can be clustered on. <ul style="list-style-type: none"> <li>• <b>t</b> (true): allowed.</li> <li>• <b>f</b> (false): not allowed.</li> </ul>
ampredlocks	boolean	-	Specifies whether an index of this type manages fine-grained predicate locks. <ul style="list-style-type: none"> <li>• <b>t</b> (true): allowed.</li> <li>• <b>f</b> (false): not allowed.</li> </ul>
amkeytype	oid	<b>oid</b> in <b>PG_TYPE</b>	Type of data stored in index ( <b>0</b> if it is not a fixed type)
aminsert	regproc	<b>prname</b> in <b>PG_PROC</b>	"Insert this tuple" function
ambeginscan	regproc	<b>prname</b> in <b>PG_PROC</b>	"Prepare for index scan" function
amgettupl	regproc	<b>prname</b> in <b>PG_PROC</b>	"Next valid tuple" function ( <b>0</b> if none)
amgetbitmap	regproc	<b>prname</b> in <b>PG_PROC</b>	"Fetch all valid tuples" function ( <b>0</b> if none)
amrescan	regproc	<b>prname</b> in <b>PG_PROC</b>	"(Re)start index scan" function
amendscan	regproc	<b>prname</b> in <b>PG_PROC</b>	"Clean up after index scan" function
ammarkpos	regproc	<b>prname</b> in <b>PG_PROC</b>	"Mark current scan position" function
amrestrpos	regproc	<b>prname</b> in <b>PG_PROC</b>	"Restore marked scan position" function
ammerge	regproc	<b>prname</b> in <b>PG_PROC</b>	"Merge multiple indexes" function

Name	Type	Reference	Description
ambuild	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	"Build new index" function
ambuilde mpty	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	"Build empty index" function
ambulkdel ete	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Bulk-delete function
amvacuum cleanup	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Post-VACUUM cleanup function
amcanretu rn	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Function to check whether the index supports index-only scans ( <b>0</b> if none)
amcostesti mate	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Function to estimate cost of an index scan
amoptions	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Function to parse and validate <b>reloptions</b> for an index

## 12.2.35 PG\_AMOP

PG\_AMOP records information about operators associated with access method operator families. There is one row for each operator that is a member of an operator family. A family member can be either a search operator or an ordering operator. An operator can appear in more than one family, but cannot appear in more than one search position nor more than one ordering position within a family.

**Table 12-34** PG\_AMOP columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
amopfamily	oid	<a href="#">PG_OPFAMILY</a> .oid	Operator family of this entry.
amoplefttype	oid	<b>oid</b> in <a href="#">PG_TYPE</a>	Left-hand input data type of the operator For details about the possible values and their descriptions, see <a href="#">7.3 Data Type</a> .

Name	Type	Reference	Description
amoprighthtype	oid	oid in <a href="#">PG_TYPE</a>	Right-hand input data type of the operator For details about the possible values and their descriptions, see <a href="#">7.3 Data Type</a> .
amopstrategy	smallint	-	Number of operator strategies.
amoppurpose	"char"	-	Purpose of the operator. <ul style="list-style-type: none"> <li>• s: search</li> <li>• o: order</li> </ul>
amopopr	oid	<a href="#">PG_OPERATOR</a> .oid	OID of the operator.
amopmethod	oid	<a href="#">PG_AM</a> .oid	Operator family of the index access method.
amopsortfamily	oid	<a href="#">PG_OPFAMILY</a> .oid	The B-tree operator family according to which this entry sorts for an ordering operator ( <b>0</b> for a search operator).

A search operator entry indicates that an index of this operator family can be searched to find all rows satisfying **WHERE indexed\_column operator constant**. Obviously, such an operator must return a Boolean value, and its left-hand input type must match the index's column data type.

An ordering operator entry indicates that an index of this operator family can be scanned to return rows in the order represented by **ORDER BY indexed\_column operator constant**. Such an operator could return any sortable data type, though again its left-hand input type must match the index's column data type. The exact semantics of **ORDER BY** are specified by the **amopsortfamily** column, which must reference the B-tree operator family for the operator's result type.

## 12.2.36 PG\_AMPROC

**PG\_AMPROC** records information about the support procedures associated with the access method operator families. There is one row for each support procedure that belongs to an operator family.

**Table 12-35** PG\_AMPROC columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)

Name	Type	Reference	Description
amprocfamily	oid	<a href="#">PG_OPFAMILY.oid</a>	Operator family of this entry
amproclefttype	oid	<a href="#">PG_TYPE.oid</a>	Left-hand input data type of the associated operator For details about common data types, see <a href="#">Data Type</a> .
amprocrighttype	oid	<a href="#">PG_TYPE.oid</a>	Right-hand input data type of the associated operator For details about common data types, see <a href="#">Data Type</a> .
amprocnum	smallint	-	Support procedure number
amproc	regproc	<a href="#">PG_PROC.proname</a>	OID of the procedure

The usual interpretation of the **amproclefttype** and **amprocrighttype** columns is that they identify the left and right input types of the operator(s) that a particular support procedure supports. For some access methods, these match the input data type(s) of the support procedure itself; for others not. There is a notion of "default" support procedures for an index, which are those with **amproclefttype** and **amprocrighttype** both equal to the index opclass's **opcintype**.

## 12.2.37 PG\_APP\_WORKLOADGROUP\_MAPPING

**PG\_APP\_WORKLOADGROUP\_MAPPING** provides load mapping group information in the database.

**Table 12-36** PG\_APP\_WORKLOADGROUP\_MAPPING columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
appname	name	Application name
workload_gpname	name	Mapped workload group name

## 12.2.38 PG\_ATTRDEF

**PG\_ATTRDEF** records default values of columns.

**Table 12-37** PG\_ATTRDEF columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
adrelid	oid	Table to which a column belongs
adnum	smallint	Number of columns
adbin	pg_node_tree	Internal representation of the default value of the column
adsrc	text	Internal representation of the human-readable default value
adgencol	"char"	Specifies whether a column is a generated column. The value <b>s</b> indicates that the column is a generated column, and the value '\0' indicates that the column is a common column. The default value is '\0'.

## 12.2.39 PG\_ATTRIBUTE

PG\_ATTRIBUTE records information about table columns.

**Table 12-38** PG\_ATTRIBUTE columns

Name	Type	Description
attrelid	oid	Table to which a column belongs.
attname	name	Column name.
atttypid	oid	Column type.
attstattarget	integer	<p>Level of details of statistics collected for this column by <b>ANALYZE</b>.</p> <ul style="list-style-type: none"> <li>The value <b>0</b> indicates that no statistics should be collected.</li> <li>A negative value indicates that the system default statistic object is used.</li> <li>The exact meaning of positive values is data type-dependent.</li> </ul> <p>For scalar data types, <b>attstattarget</b> is both the target number of "most common values" to collect, and the target number of histogram bins to create.</p>
attlen	smallint	Copy of typlen in <a href="#">12.2.105 PG_TYPE</a> of the column type.

Name	Type	Description
attnum	smallint	Number of the column
attndims	integer	Number of dimensions if the column is an array ( <b>0</b> in other cases)
attcacheoff	integer	This column is always <b>-1</b> on disk. When it is loaded into a row descriptor in the memory, it may be updated to cache the offset of the columns in the row.
atttypmod	integer	Type-specific data supplied at the table creation time (for example, the maximum length of a <b>varchar</b> column). This column is used as the third parameter when passing to type-specific input functions and length coercion functions. The value will generally be <b>-1</b> for types that do not need ATTTYPMOD.
attbyval	boolean	Copy of typbyval in <a href="#">12.2.105 PG_TYPE</a> of the column type.
attstorage	"char"	Copy of typstorage in <a href="#">12.2.105 PG_TYPE</a> of the column type.
attalign	"char"	Copy of typalign in <a href="#">12.2.105 PG_TYPE</a> of the column type.
attnotnull	boolean	A non-null constraint. It is possible to change this column to enable or disable the constraint.
atthasdef	boolean	This column has a default value, in which case there will be a corresponding entry in <a href="#">12.2.45 PG_ATTRDEF</a> that actually defines the value.
attisdropped	boolean	Indicates that this column has been deleted and is no longer valid. A deleted column is still physically present in the table but is ignored by the analyzer, so it cannot be accessed through SQL.
attislocal	boolean	Indicates that this column is locally defined in the relationship. Note that a column can be locally defined and inherited simultaneously.

Name	Type	Description
attcmpr mode	tinyint	Compressed modes for a specific column. The compressed mode includes: <ul style="list-style-type: none"> <li>• <b>0</b>: not compressed (<b>ATT_CMPR_NOCOMPRESS</b>)</li> <li>• <b>1</b>: DELTA compression algorithm (<b>ATT_CMPR_DELTA</b>)</li> <li>• <b>2</b>: dictionary compression algorithm (<b>ATT_CMPR_DICTIONARY</b>)</li> <li>• <b>3</b>: prefix compression algorithm (<b>ATT_CMPR_PREFIX</b>)</li> <li>• <b>4</b>: digital string compression algorithm (<b>ATT_CMPR_NUMSTR</b>)</li> </ul>
attinhcount	integer	Number of direct ancestors that this column has. A column with an ancestor cannot be dropped nor renamed.
attcollation	oid	Defined collation of a column.
attacl	aclitem[]	Permissions for column-level access.
attoptions	text[]	Column attribute. Currently, the following attributes are supported: <ul style="list-style-type: none"> <li>• <b>n_distinct</b>: number of <b>distinct</b> values of a column (excluding subtables).</li> <li>• <b>n_distinct_inherited</b>: number of <b>distinct</b> values of a column (including subtables).</li> </ul>
attfdwoptions	text[]	Column attribute of a foreign table. Currently, <b>dist_fdw</b> , <b>file_fdw</b> , and <b>log_fdw</b> do not use foreign table column attributes.
attinitdefval	bytea	<b>attinitdefval</b> stores the default value expression. <b>ADD COLUMN</b> in the row-store table must use this column.
attkvtype	tinyint	Specifies a key value type for a column. Types include: <ul style="list-style-type: none"> <li><b>0</b>: default value (<b>ATT_KV_UNDEFINED</b>)</li> <li><b>1</b>: dimension (<b>ATT_KV_TAG</b>)</li> <li><b>2</b>: indicator (<b>ATT_KV_FIELD</b>)</li> <li><b>3</b>: time column (<b>ATT_KV_TIMETAG</b>)</li> <li><b>4</b>: hidden distribution key (<b>ATT_KV_HIDETAG</b>)</li> </ul>

## 12.2.40 PG\_AUTHID

**PG\_AUTHID** records information about database authentication identifiers (roles). The concept of users is contained in that of roles. A user is actually a role whose

**rolcanlogin** has been set. Any role, whether its **rolcanlogin** is set or not, can use other roles as members.

For a cluster, only one **PG\_AUTHID** exists, which is not available for every database. This system catalog is accessible only to system administrators.

**Table 12-39** PG\_AUTHID columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
rolname	name	Name of a role
rolsuper	boolean	Whether the role is the initial system administrator with the highest permission <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolinherit	boolean	Whether the role automatically inherits permissions of roles of which it is a member <ul style="list-style-type: none"> <li>• <b>t</b> (true): automatically inherited</li> <li>• <b>f</b> (false): not automatically inherited</li> </ul>
rolcreatorole	boolean	Whether the role can create more roles <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolcreatedb	boolean	Whether the role can create databases <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolcatupdate	boolean	Whether the role can directly update system catalogs Only the initial system administrator whose <b>usesysid</b> is <b>10</b> has this permission. It is unavailable for other users. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolcanlogin	boolean	Whether the role can log in (whether this role can be given as the initial session authorization identifier) <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>

Name	Type	Description
rolreplication	boolean	Specifies whether the role has the replication permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolauditadmin	boolean	Specifies whether the role has the audit administrator permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolsystemadmin	boolean	Specifies whether the role has the system administrator permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolconnlimit	integer	Maximum number of concurrent connections that this role can make (valid for roles that can log in) The value <b>-1</b> indicates there is no limit.
rolpassword	text	Password (possibly encrypted) (null if no password)
rolvalidbegin	timestamp with time zone	Account validity start time ( <b>NULL</b> if no start time)
rolvaliduntil	timestamp with time zone	Password expiry time ( <b>NULL</b> if no expiration)
rolrespool	name	Resource pool that a user can use
roluseft	boolean	Whether the role can perform operations on foreign tables <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolparentid	oid	OID of a group user to which the user belongs
roltabspace	text	Maximum size of a user data table
rolkind	"char"	Type of a user. <ul style="list-style-type: none"> <li>• <b>p</b>: permanent user</li> <li>• <b>n</b>: common user</li> </ul>
roltemp space	text	Maximum size of a user's temporary table, in KB.
rolspillspace	text	Maximum size of data that can be written to disks when a user executes a job, in KB.

Name	Type	Description
rolexpdata	text	Query rules that can be set by users (reserved)
rolmonitoradmin	boolean	Specifies whether the role has the monitor administrator permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
roloperatoradmin	boolean	Specifies whether the role has the O&M administrator permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolpolicyadmin	boolean	Specifies whether the role has the security policy administrator permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>

## 12.2.41 PG\_AUTH\_HISTORY

PG\_AUTH\_HISTORY records the authentication history of a role. This system catalog is accessible only to system administrators.

**Table 12-40** PG\_AUTH\_HISTORY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
roloid	oid	ID of a role.
passwordtime	timestamp with time zone	Time of password creation and change.
rolpassword	text	Ciphertext of the role password. The encryption mode is determined by the GUC parameter <b>password_encryption_type</b> .

## 12.2.42 PG\_AUTH\_MEMBERS

PG\_AUTH\_MEMBERS records the membership between roles.

**Table 12-41** PG\_AUTH\_MEMBERS columns

Name	Type	Description
roleid	oid	ID of a role that has a member.
member	oid	ID of a role that is a member of ROLEID.
grantor	oid	ID of a role that grants this membership.
admin_option	boolean	Specifies whether a member can grant membership in ROLEID to others. The value can be <b>true</b> (yes) and <b>false</b> (no).

## 12.2.43 PG\_CAST

PG\_CAST records the conversion relationship between data types.

**Table 12-42** PG\_CAST columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
castsource	oid	OID of the source data type
casttarget	oid	OID of the target data type
castfunc	oid	OID of the conversion function ( <b>0</b> if no conversion function is required)
castcontext	"char"	Conversion mode between the source and target data types. <ul style="list-style-type: none"><li>• <b>e</b>: Only explicit conversion can be performed (using the CAST or :: syntax).</li><li>• <b>i</b>: Implicit conversion can be performed.</li><li>• <b>a</b>: Both explicit and implicit conversion can be performed between data types.</li></ul>
castmethod	"char"	Conversion method. <ul style="list-style-type: none"><li>• <b>f</b>: Conversion is performed using the specified function in the <b>castfunc</b> column.</li><li>• <b>b</b>: Binary forcible conversion rather than the specified function in the <b>castfunc</b> column is performed between data types.</li></ul>

## 12.2.44 PG\_CLASS

PG\_CLASS records database objects and their relationship.

**Table 12-43** PG\_CLASS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
relname	name	Name of an object, such as a table, index, or view.
relnamespace	oid	OID of the namespace that contains the relationship.
reltype	oid	Data type that corresponds to the table's row type. The index is 0 because the index does not have <b>PG_TYPE</b> records.
relowner	oid	Owner of the relationship.
relam	oid	Access method used, such as B-tree, if the row is an index.
relfilenode	oid	Name of the on-disk file of this relationship ( <b>0</b> if such file does not exist).
reltablespace	oid	Tablespace in which this relationship is stored. If the value is <b>0</b> , the default tablespace in this database is used. This column is meaningless if the relationship has no on-disk file.
relpages	double precision	Size of the on-disk representation of the table in pages (of size BLCKSZ). This is only an estimate used by the optimizer.
reltuples	double precision	Number of rows in the table. This is only an estimate used by the optimizer.
relallvisible	integer	Number of pages marked as all visible in the table. This column is used by the optimizer for optimizing SQL execution. It is updated by <b>VACUUM</b> , <b>ANALYZE</b> , and a few DDL statements such as <b>CREATE INDEX</b> .
reltoastrelid	oid	OID of the TOAST table associated with the table ( <b>0</b> if no TOAST table exists). The TOAST table stores large columns "offline" in a secondary table.
reltoastidxid	oid	OID of the index for a TOAST table ( <b>0</b> for a table other than a TOAST table).

Name	Type	Description
relhasindex	boolean	Its value is <b>true</b> if this column is a table and has (or recently had) at least one index. It is set by CREATE INDEX but is not immediately cleared by DROP INDEX. If the VACUUM process detects that a table has no index, it clears the <b>relhasindex</b> column and sets the value to <b>false</b> .
relisshared	boolean	Its value is <b>true</b> if the table is shared across all databases in the entire cluster. Otherwise, the value is <b>false</b> . Only certain system catalogs (such as PG_DATABASE) are shared.
relpersistence	"char"	<ul style="list-style-type: none"> <li>• <b>p</b>: permanent table.</li> <li>• <b>u</b>: non-log table.</li> <li>• <b>t</b>: temporary table.</li> <li>• <b>g</b>: global temporary table.</li> </ul>
relkind	"char"	<ul style="list-style-type: none"> <li>• <b>r</b>: ordinary table.</li> <li>• <b>i</b>: index.</li> <li>• <b>G</b>: global secondary index.</li> <li>• <b>s</b>: sequence.</li> <li>• <b>v</b>: view.</li> <li>• <b>t</b>: TOAST table.</li> <li>• <b>f</b>: foreign table.</li> <li>• <b>m</b>: materialized view.</li> <li>• <b>e</b>: STREAM object.</li> <li>• <b>o</b>: CONTVIEW object.</li> </ul>
relnatts	smallint	Number of user columns in the relationship (excluding system columns). <a href="#">12.2.46 PG_ATTRIBUTE</a> has the same number of rows as the user columns.
relchecks	smallint	Number of check constraints in the table. For details, see the system catalog <a href="#">12.2.53 PG_CONSTRAINT</a> .
relhasoids	boolean	Its value is <b>true</b> if an OID is generated for each row of the relationship. Otherwise, the value is <b>false</b> .
relhaspkey	boolean	Its value is <b>true</b> if the table has (or once had) a primary key. Otherwise, the value is <b>false</b> .
relhasrules	boolean	Its value is <b>true</b> if the table has rules. For details, see the system catalog <a href="#">12.2.87 PG_REWRITE</a> .
relhastriggers	boolean	The value is <b>true</b> if the table has (or once had) triggers. Triggers of the table and view are recorded in the system catalog <a href="#">12.2.99 PG_TRIGGER</a> .

Name	Type	Description
relhassubclass	boolean	Its value is <b>true</b> if the table has (or once had) any inheritance child table. Otherwise, the value is <b>false</b> .
relcmprs	tinyint	Specifies whether the compression feature is enabled for the table. Note that only batch insertion triggers compression, so ordinary CRUD does not trigger compression. <ul style="list-style-type: none"> <li>• <b>0</b>: Tables that do not support compression (primarily system catalogs, on which the compression attribute cannot be modified).</li> <li>• <b>1</b>: The compression feature of the table data is NOCOMPRESS or has no specified keyword.</li> <li>• <b>2</b>: The compression feature of the table data is COMPRESS.</li> </ul>
relhasclusterkey	boolean	Specifies whether the local cluster storage is used. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>
relrowmovement	boolean	Specifies whether row migration is allowed when the partitioned table is updated. <ul style="list-style-type: none"> <li>• <b>true</b>: Row migration is allowed.</li> <li>• <b>false</b>: Row migration is not allowed.</li> </ul>
parttype	"char"	Specifies whether the table or index has the property of a partitioned table. <ul style="list-style-type: none"> <li>• <b>p</b>: The table or index has the property of a partitioned table.</li> <li>• <b>n</b>: The table or index does not have the property of a partitioned table.</li> </ul>
relfrozenxid	xid32	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table. This column is used to track whether the table needs to be vacuumed to prevent transaction ID wraparound (or to allow PG_CLOG to be shrunk). The value is <b>0 (InvalidTransactionId)</b> if the relationship is not a table.  To ensure forward compatibility, this column is reserved. The <b>relfrozenxid64</b> column is added to record the information.

Name	Type	Description
relacl	aclitem[]	<p>Access permissions. For details about the ACLItem type, see <a href="#">ACLItem</a>.</p> <p>The command output of the query is as follows:  <i>user1=privs/user2</i> indicates that the permission granted by user 2 to user 1 is <b>privs</b>.  <i>=privs/user3</i> indicates that the permission granted to the <b>public</b> role by user 3 is <b>privs</b>.</p> <p>In the preceding command, user 1, user 2, and user 3 are the existing users or roles in the database, and <b>privs</b> indicates the permissions supported by the database. For details on permission descriptions, see <a href="#">Table 12-44</a>.</p>
reloptions	text[]	Table or index access method, using character strings in the format of <i>keyword=value</i> .
relreplident	"char"	<p>Identifier of a decoding column in logical decoding.</p> <ul style="list-style-type: none"> <li>• <b>d</b>: default (primary key, if any).</li> <li>• <b>n</b>: none.</li> <li>• <b>f</b>: all columns.</li> <li>• <b>i</b>: The indisreplident of the index is specified or the default index is used.</li> </ul>
relfrozenxid64	xid	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table. This column is used to track whether the table needs to be vacuumed to prevent transaction ID wraparound (or to allow PG_CLOG to be shrunk). The value is <b>0 (InvalidTransactionId)</b> if the relationship is not a table.
relbucket	oid	Specifies whether the current catalog contains hash bucket shards. A valid OID points to the specific shard information recorded in the <b>PG_HASHBUCKET</b> catalog. <b>NULL</b> indicates that hash bucket shards are not included.
relbucketkey	int2vector	Hash partition column information. <b>NULL</b> indicates that the column information is not included.
relminmxid	xid	All multi-transaction IDs before this one have been replaced with a transaction ID in the table. This column is used to track whether the table needs to be vacuumed in order to prevent multi-transaction IDs wraparound or to allow <b>pg_clog</b> to be shrunk. The value is <b>0 (InvalidTransactionId)</b> if the relationship is not a table.

**Table 12-44** Description of permissions

Parameter	Parameters
r	SELECT (read)
w	UPDATE (write)
a	INSERT (insert)
d	DELETE
D	TRUNCATE
x	REFERENCES
t	TRIGGER
X	EXECUTE
U	USAGE
C	CREATE
c	CONNECT
T	TEMPORARY
A	ALTER
P	DROP
m	COMMENT
i	INDEX
v	VACUUM
*	Authorization options for preceding permissions

## 12.2.45 PG\_COLLATION

PG\_COLLATION describes available collations, which are essentially mappings from an SQL name to OS local categories.

**Table 12-45** PG\_COLLATION columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
collname	name	-	Collation name (unique per namespace and encoding)

Name	Type	Reference	Description
collnamespace	oid	oid in <a href="#">PG_NAMESPACE</a>	OID of the namespace that contains this collation
collowner	oid	oid in <a href="#">PG_AUTHID</a>	Owner of the collation
collencoding	integer	-	Encoding in which the collation is applicable, or <b>-1</b> if it works for any encoding. It is compatible with PostgreSQL.
collcollate	name	-	<b>LC_COLLATE</b> for this collation object
collctype	name	-	<b>LC_CTYPE</b> for this collation object
collpadattr	text	-	Collation padding attribute. <ul style="list-style-type: none"> <li>• <b>NULL</b>: not applicable.</li> <li>• <b>NO PAD</b>: no padding.</li> <li>• <b>PAD SPACE</b>: blank spaces padded at the end.</li> </ul>
collisdef	boolean	-	Determines whether the collation is the default collation of the character set.

## 12.2.46 PG\_CONSTRAINT

PG\_CONSTRAINT records check, primary key, unique, and foreign key constraints on tables.

**Table 12-46** PG\_CONSTRAINT columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
conname	name	Constraint name (not necessarily unique).
connamespace	oid	OID of the namespace that contains the constraint.

Name	Type	Description
contype	"char"	<ul style="list-style-type: none"> <li>• <b>c</b>: check constraint</li> <li>• <b>p</b>: primary key constraint</li> <li>• <b>u</b>: unique constraint</li> <li>• <b>t</b>: trigger constraint</li> <li>• <b>x</b>: mutual exclusion constraint</li> <li>• <b>f</b>: foreign key constraint</li> <li>• <b>s</b>: clustering constraint</li> <li>• <b>i</b>: invalid constraint</li> </ul>
condeferrable	boolean	Specifies whether the constraint is deferrable. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>
condeferred	boolean	Specifies whether the constraint can be deferrable by default. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>
convalidated	boolean	Specifies whether the constraint is valid. Currently, it can be set to <b>false</b> only for foreign key and check constraints. <ul style="list-style-type: none"> <li>• <b>true</b>: valid</li> <li>• <b>false</b>: invalid</li> </ul>
conrelid	oid	Table containing this constraint ( <b>0</b> if it is not a table constraint).
contypid	oid	Domain containing this constraint ( <b>0</b> if it is not a domain constraint).
conindid	oid	ID of the index associated with the constraint.
confrelid	oid	Referenced table if this constraint is a foreign key. Otherwise, the value is <b>0</b> .
confupdtype	"char"	Foreign key update action code. <ul style="list-style-type: none"> <li>• <b>a</b>: no action</li> <li>• <b>r</b>: restriction</li> <li>• <b>c</b>: cascading</li> <li>• <b>n</b>: The parameter is set to null.</li> <li>• <b>d</b>: The default value is used.</li> </ul>

Name	Type	Description
confdeltype	"char"	Foreign key deletion action code. <ul style="list-style-type: none"> <li>• <b>a</b>: no action.</li> <li>• <b>r</b>: restriction.</li> <li>• <b>c</b>: cascading.</li> <li>• <b>n</b>: The parameter is set to null.</li> <li>• <b>d</b>: The default value is used.</li> </ul>
confmatchtype	"char"	Foreign key match type. <ul style="list-style-type: none"> <li>• <b>f</b>: full match</li> <li>• <b>p</b>: partial match</li> <li>• <b>u</b>: unspecified (The NULL value can be matched if <b>f</b> is specified.)</li> </ul>
conislocal	boolean	Specifies whether the constraint is defined locally for the relation. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>
coninhcount	integer	Number of direct inheritance parent tables that this constraint has. When the value is not <b>0</b> , the constraint cannot be deleted or renamed.
connoinherit	boolean	Specifies whether the constraint can be inherited. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>
consoft	boolean	Specifies whether the column indicates an informational constraint. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>
conopt	boolean	Specifies whether you can use the informational constraint to optimize the execution plan. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>
conkey	smallint[]	Column list of the constrained control if this column is a table constraint.
confkey	smallint[]	List of referenced columns if this column is a foreign key.
confpeqop	oid[]	ID list of the equality operators for PK = FK comparisons if this column is a foreign key.

Name	Type	Description
conppeqop	oid[]	ID list of the equality operators for PK = PK comparisons if this column is a foreign key.
conffeqop	oid[]	ID list of the equality operators for FK = FK comparisons if this column is a foreign key.
conexclp	oid[]	ID list of the per-column exclusion operators if this column is an exclusion constraint.
conbin	pg_node_tree	Internal representation of the expression if this column is a check constraint.
consrc	text	Readable representation of the expression if this column is a check constraint.
conincluding	smallint[]	Not for constraint, but will be included in the attribute column of <b>INDEX</b> .

#### NOTICE

- **consrc** is not updated when referenced objects change and does not track new column names. You are advised to use `pg_get_constraintdef()` to extract the definition of a check constraint.
- **relchecks** of [12.2.51 PG\\_CLASS](#) must agree with the number of check-constraint entries found in the table for each relationship.

## 12.2.47 PG\_CONVERSION

**PG\_CONVERSION** describes encoding conversion information.

**Table 12-47** PG\_CONVERSION columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
conname	name	-	Conversion name (unique within a namespace)
connamespace	oid	OID in <a href="#">PG_NAMESPACE</a>	OID of the namespace that contains this conversion
conowner	oid	OID in <a href="#">PG_AUTHID</a>	Owner of the conversion
conforencoding	integer	-	Source encoding ID
contoencoding	integer	-	Destination encoding ID

Name	Type	Reference	Description
conproc	regproc	<b>proname</b> in <b>PG_PROC</b>	Conversion procedure
condefault	boolean	-	If this is the default conversion, the value is <b>true</b> . Otherwise, the value is <b>false</b> .

## 12.2.48 PG\_DATABASE

PG\_DATABASE records information about available databases.

**Table 12-48** PG\_DATABASE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
datname	name	Database name.
datdba	oid	Owner of the database, usually the user who created it.
encoding	integer	Character encoding for the database.
datcollate	name	Sequence used by the database.
datctype	name	Character type used by the database.
datistemplate	boolean	Specifies whether the database can be used as a template database. <ul style="list-style-type: none"><li>• <b>true</b>: allowed.</li><li>• <b>false</b>: not allowed.</li></ul>
datallowconn	boolean	This column is used to protect the <b>template0</b> database from being altered. <ul style="list-style-type: none"><li>• <b>true</b>: Users can connect to the database.</li><li>• <b>false</b>: No user can connect to the database.</li></ul>
datconnlimit	integer	Maximum number of concurrent connections allowed on this database. The value <b>-1</b> indicates no limit.
datlastsysoid	oid	Last system OID in the database.

Name	Type	Description
datfrozenxid	xid32	Tracks whether the database needs to be vacuumed to prevent transaction ID wraparound. This column is discarded in the current version. To ensure forward compatibility, this column is reserved. The <b>datfrozenxid64</b> column is added to record the information.
dattablespace	oid	Default tablespace of the database.
datcompatibility	name	Database compatibility mode. Currently, four compatible modes are supported: PG, ORA, MYSQL, and TD.
datacl	aclitem[]	Access permission.
datfrozenxid64	xid	Tracks whether the database needs to be vacuumed to prevent transaction ID wraparound.
datminmxid	xid	All multi-transaction IDs before this one have been replaced with a transaction ID in the database. This is used to track whether the database needs to be vacuumed in order to prevent transaction IDs wraparound or to allow PG_CLOG to be shrunk. It is the minimum value of <b>relminmxid</b> in <a href="#">12.2.51 PG_CLASS</a> of all tables in the database.
dattimezone	name	Database time zone. The default is PRC.

## 12.2.49 PG\_DB\_ROLE\_SETTING

**PG\_DB\_ROLE\_SETTING** records the default values of configuration items bound to each role and data when the database is running.

**Table 12-49** PG\_DB\_ROLE\_SETTING columns

Name	Type	Description
setdatabase	oid	Database corresponding to the configuration items ( <b>0</b> if no database is specified).
setrole	oid	Role corresponding to the configuration items ( <b>0</b> if no role is specified).
setconfig	text[]	Default value of runtime configuration items. Contact the administrator to configure it.

## 12.2.50 PG\_DEFAULT\_ACL

PG\_DEFAULT\_ACL records initial permissions assigned to newly created objects.

**Table 12-50** PG\_DEFAULT\_ACL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
defaclrole	oid	ID of the role associated with the permission.
defaclnamespace	oid	Namespace associated with the permission ( <b>0</b> if no ID).
defaclobjtype	"char"	Object type of the permission. <ul style="list-style-type: none"> <li>• <b>r</b>: table or view</li> <li>• <b>S</b>: sequence</li> <li>• <b>f</b>: function</li> <li>• <b>T</b>: type</li> <li>• <b>K</b>: client master key</li> <li>• <b>k</b>: column encryption key</li> </ul>
defaclacl	aclitem[]	Access permissions that this type of object should have on creation.

## 12.2.51 PG\_DEPEND

PG\_DEPEND records the dependency between database objects. This information allows **DROP** commands to find which other objects must be dropped by **DROP CASCADE** or prevent dropping in the **DROP RESTRICT** case.

See also [PG\\_SHDEPEND](#), which performs a similar function for dependencies involving objects that are shared across a database cluster.

**Table 12-51** PG\_DEPEND columns

Name	Type	Reference	Description
classid	oid	<b>oid</b> in <a href="#">PG_CLASS</a>	OID of the system catalog where a dependent object resides
objid	oid	Any OID column	OID of the dependent object
objsubid	integer	-	Column number for a table column ( <b>objid</b> and <b>classid</b> refer to the table itself); <b>0</b> for all other object types

Name	Type	Reference	Description
refclassid	oid	oid in <a href="#">PG_CLASS</a>	OID of the system catalog where a referenced object resides
refobjid	oid	Any OID column	OID of the referenced object
refobjsubid	integer	-	Column number for a table column ( <b>refobjid</b> and <b>refclassid</b> refer to the table itself); <b>0</b> for all other object types
deptype	"char"	-	A code defining the specific semantics of this dependency

In all cases, a `PG_DEPEND` entry indicates that the referenced object cannot be dropped without also dropping the dependent object. However, there are several subflavors identified by **deptype**:

- `DEPENDENCY_NORMAL` (n): A normal relationship between separately created objects. The dependent object can be dropped without affecting the referenced object. The referenced object can only be dropped by specifying **CASCADE**, in which case the dependent object is dropped too. Example: a table column has a normal dependency on its data type.
- `DEPENDENCY_AUTO` (a): The dependent object can be dropped separately from the referenced object, and should be automatically dropped (regardless of `RESTRICT` or `CASCADE` mode) if the referenced object is dropped. Example: a named constraint on a table is made autodependent on the table, so that it will go away if the table is dropped.
- `DEPENDENCY_INTERNAL` (i): The dependent object was created as part of creation of the referenced object, and is only a part of its internal implementation. A `DROP` of the dependent object will be disallowed outright (We'll tell the user to issue a `DROP` against the referenced object, instead). A `DROP` of the referenced object will be propagated through to drop the dependent object whether `CASCADE` is specified or not. Example: A trigger created to enforce a foreign-key constraint is made internally dependent on the constraint's [PG\\_CONSTRAINT](#) entry.
- `DEPENDENCY_EXTENSION` (e): The dependent object is a member of the extension of the referenced object. The dependent object can be dropped only via `DROP EXTENSION` on the referenced object. Functionally this dependency type acts the same as an internal dependency, but it is kept separate for clarity and to simplify `GS_DUMP`.

---

**NOTICE**

The extended function is for internal use only. You are advised not to use it.

- `DEPENDENCY_PIN` (p): There is no dependent object; this type of entry is a signal that the system itself depends on the referenced object, and so that object must never be deleted. Entries of this type are created only by **initdb**. The columns for the dependent object contain zeroes.

## 12.2.52 PG\_DESCRIPTION

**PG\_DESCRIPTION** records optional descriptions (comments) for each database object. Descriptions of many built-in system objects are provided in the initial contents of **PG\_DESCRIPTION**.

See also **PG\_SHDESCRIPTION**, which provides a similar function for descriptions involving objects that are shared across a database cluster.

**Table 12-52** PG\_DESCRIPTION columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this description pertains to
classoid	oid	<a href="#">PG_CLASS</a> .oid	OID of the system catalog where the object appears
objsubid	integer	-	Column number for a comment on a table column ( <b>objoid</b> and <b>classoid</b> refer to the table itself); <b>0</b> for all other object types
description	text	-	Arbitrary text that serves as the description of the object

## 12.2.53 PG\_DIRECTORY

**PG\_DIRECTORY** stores directory objects added by users. You can execute the **CREATE DIRECTORY** statement to add records to this system catalog. When **enable\_access\_server\_directory** is set to **off**, only the initial user can create directory objects. When **enable\_access\_server\_directory** is set to **on**, users with the SYSADMIN permission and users inheriting the built-in role permission **gs\_role\_directory\_create** can create directory objects. Common users can access this system catalog only after being authorized.

**Table 12-53** PG\_DIRECTORY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
dirname	name	Name of a directory object
owner	oid	Owner of a directory object
dirpath	text	Directory path.
diracl	aclitem[]	Access permissions.

## 12.2.54 PG\_ENUM

PG\_ENUM contains entries showing the values and labels for each enumerated type. The internal representation of a given enumerated value is actually the OID of its associated row in PG\_ENUM.

**Table 12-54** PG\_ENUM columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
enumtypid	oid	<b>oid in PG_TYPE</b>	OID of <b>12.2.105 PG_TYPE</b> owning this enumerated value.
enumsortorder	real	-	Sort position of this enumerated value within its enumerated type.
enumlabel	name	-	Textual label for this enumerated value.

The OIDs for **PG\_ENUM** rows follow a special rule: even-numbered OIDs are guaranteed to be ordered in the same way as the sort ordering of their enumerated type. If two even OIDs belong to the same enumerated type, the smaller OID must have the smaller **enumsortorder** value. Odd-numbered OID values need bear no relationship to the sort order. This rule allows the enumerated comparison routines to avoid catalog lookups in many common cases. The routines that create and alter enumerated types attempt to assign even OIDs to enumerated values whenever possible.

When an enumerated type is created, its members are assigned sort-order positions from 1 to *n*. However, members added later might be given negative or fractional values of **enumsortorder**. The only requirement on these values is that they be correctly ordered and unique within each enumerated type.

## 12.2.55 PG\_EXTENSION

PG\_EXTENSION records information about the installed extensions. By default, GaussDB provides 18 extensions: PLPGSQL, DIST\_FDW, FILE\_FDW, LOG\_FDW, GC\_FDW, DBLINK\_FDW, ROACH\_API, STREAMING, TSDB, DIMSEARCH, GSREDISTRIBUTE, SECURITY\_PLUGIN, GSSTAT\_PLUGIN, PKG\_DBE\_RAW, PKG\_DBE\_OUTPUT, PKG\_DBE\_UTILITY, and PKG\_DBE\_XML. This is a lab feature. Contact Huawei technical support before using it. This system catalog is for internal use only. You are advised not to use it.

### NOTE

DIMSEARCH is no longer supported in the current version due to specification changes. Do not use it.

**Table 12-55 PG\_EXTENSION**

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
extname	name	Extension name
extowner	oid	Owner of the extension
extnamespace	oid	Namespace containing the extension's exported objects
extrelocatable	boolean	Whether the extension can be relocated to another namespace. <b>true</b> : yes; <b>false</b> : no.
extversion	text	Version number of the extension
extconfig	oid[]	Configuration information about the extension
extcondition	text[]	Filter conditions for the extension's configuration information

## 12.2.56 PG\_FOREIGN\_DATA\_WRAPPER

**PG\_FOREIGN\_DATA\_WRAPPER** records foreign-data wrapper definitions. A foreign-data wrapper is the mechanism by which external data, residing on foreign servers, is accessed.

**Table 12-56 PG\_FOREIGN\_DATA\_WRAPPER columns**

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
fdwnam e	name	-	Name of a foreign-data wrapper
fdwown er	oid	<a href="#">PG_AUTHID.oid</a>	Owner of the foreign-data wrapper
fdwhan dler	oid	<a href="#">PG_PROC.oid</a>	References a handler function that is responsible for supplying execution routines for the foreign-data wrapper ( <b>0</b> if no handler is provided)

Name	Type	Reference	Description
fdwvalidator	oid	<a href="#">PG_PROC.oid</a>	References a validator function that is responsible for checking the validity of the options given to the foreign-data wrapper, as well as options for foreign servers and user mappings using the foreign-data wrapper. (0 if no handler is provided)
fdwacl	aclitem[]	-	Access permissions
fdwoptions	text[]	-	Foreign-data wrapper specific option, expressed in a string in the format of keyword=value

## 12.2.57 PG\_FOREIGN\_SERVER

**PG\_FOREIGN\_SERVER** records foreign server definitions. A foreign server describes a source of external data, such as a remote server. Foreign servers are accessed via foreign-data wrappers.

**Table 12-57** PG\_FOREIGN\_SERVER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
srvname	name	-	Name of a foreign server
srvowner	oid	<a href="#">PG_AUTHID.oid</a>	Owner of the foreign server
srvfdw	oid	<a href="#">PG_FOREIGN_DATA_WRAPPER.oid</a>	OID of the foreign-data wrapper on this foreign server
srvtype	text	-	Type of the server (optional)
srvversion	text	-	Version of the server (optional)
srvacl	aclitem[]	-	Access permissions
srvoptions	text[]	-	Option used for foreign servers, expressed in a string in the format of keyword=value

## 12.2.58 PG\_HASHBUCKET

**PG\_HASHBUCKET** records hash bucket information.

**Table 12-58** PG\_HASHBUCKET columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
bucketid	oid	Hash value calculated for a bucket vector. The hash value can be used to accelerate the search for a bucket vector.
bucketcnt	integer	Number of shards.
bucketmapsize	integer	Total number of shards on all DNs.
bucketref	integer	Reserved column with <b>1</b> as its default value
bucketvector	oidvector_extend	Records all bucket IDs contained in the bucket information in this row. A unique index is created in this column. Tables with the same bucket ID share the <b>PG_HASHBUCKET</b> data in the same row.

## 12.2.59 PG\_INDEX

**PG\_INDEX** records part of index information. The rest is mostly recorded in **PG\_CLASS**.

**Table 12-59** PG\_INDEX columns

Name	Type	Description
indexrelid	oid	OID of the <a href="#">12.2.51 PG_CLASS</a> entry for the index
indrelid	oid	OID of the <a href="#">12.2.51 PG_CLASS</a> entry for the table that uses the index
indnatts	smallint	Number of columns in the index
indisunique	Boolean	Specifies whether the index is unique. <ul style="list-style-type: none"> <li><b>true</b>: The index is unique.</li> <li><b>false</b>: The index is not unique.</li> </ul>

Name	Type	Description
indisprimary	Boolean	Specifies whether the index is the primary key of the table. <ul style="list-style-type: none"> <li>● <b>true</b>: The index is the primary key of the table. <b>indisunique</b> should always be <b>true</b> when the value of this column is <b>true</b>.</li> <li>● <b>false</b>: The index is not the primary key of the table.</li> </ul>
indisexclusion	Boolean	Specifies whether the index supports exclusive constraints. <ul style="list-style-type: none"> <li>● <b>true</b>: The index supports exclusive constraints.</li> <li>● <b>false</b>: The index does not support exclusive constraints.</li> </ul>
indimmediate	Boolean	Specifies whether to check the uniqueness of data to be inserted. <ul style="list-style-type: none"> <li>● <b>true</b>: The uniqueness check is performed immediately when data is inserted.</li> <li>● <b>false</b>: The uniqueness check is not performed when data is inserted.</li> </ul>
indisclustered	Boolean	Specifies whether the table is clustered on the index. <ul style="list-style-type: none"> <li>● <b>true</b>: The table is clustered on the index.</li> <li>● <b>false</b>: The table is not clustered on the index.</li> </ul>
indisusable	Boolean	Specifies whether the index is available for insert and select operations. <ul style="list-style-type: none"> <li>● <b>true</b>: The index is available for insert and select operations.</li> <li>● <b>false</b>: The index is unavailable for insert and select operations.</li> </ul>
indisvalid	Boolean	<ul style="list-style-type: none"> <li>● <b>true</b>: The index can be used for query.</li> <li>● <b>false</b>: The index is possibly incomplete and must still be modified by INSERT or UPDATE operations, but it cannot be securely used for queries. If it is a unique index, the uniqueness property is also not <b>true</b>.</li> </ul>
indcheckxmin	Boolean	<ul style="list-style-type: none"> <li>● <b>true</b>: Queries must not use the index until the xmin of this row in PG_INDEX is lower than their <b>TransactionXmin</b>, because the table may contain broken HOT chains with incompatible rows that they can see.</li> <li>● <b>false</b>: Indexes can be used for query.</li> </ul>

Name	Type	Description
indisready	Boolean	<ul style="list-style-type: none"><li>• <b>true</b>: The index is available for inserting data.</li><li>• <b>false</b>: The index is ignored when data is inserted or modified.</li></ul>
indkey	int2vector	This is an array of <b>indnatts</b> values indicating that this index creates table columns. For example, a value of <b>1 3</b> indicates that the first and the third columns make up the index key. The value <b>0</b> in this array indicates that the corresponding index attribute is an expression over the table columns, rather than a simple column reference.
indcollation	oidvector	OID of the collation corresponding to each index column. For details, see <a href="#">PG_COLLATION</a> .
indclass	oidvector	For each column in the index key, this contains the OID of the operator class to use. See <a href="#">PG_OPCLASS</a> for details.
indoption	int2vector	Array of values that store per-column flag bits. The meaning of the bits is defined by the index's access method.
indexprs	pg_node_tree	Expression trees (in nodeToString() representation) for index attributes that are not simple column references. It is a list with one element for each zero entry in indkey. The value is null if all index attributes are simple references.
indpred	pg_node_tree	Expression tree (in nodeToString() representation) for partial index predicate. If the index is not a partial index, this column is an empty string.
indisreplident	Boolean	Specifies whether the column of this index is a decoded column of logical decoding. <ul style="list-style-type: none"><li>• <b>true</b>: The column of this index is a decoded column of logical decoding.</li><li>• <b>false</b>: The column of this index is not a decoded column of logical decoding.</li></ul>
indnkeyatts	smallint	Total number of columns in the index. The columns that exceed the value of <b>indnatts</b> are not involved in the index query.

## 12.2.60 PG\_INHERITS

**PG\_INHERITS** records information about table inheritance hierarchies. There is one entry for each direct child table in the database. Indirect inheritance can be determined by following chains of entries.

**Table 12-60** PG\_INHERITS columns

Name	Type	Reference	Description
inhrelid	oid	<a href="#">PG_CLASS.oid</a>	OID of a child table
inhparent	oid	<a href="#">PG_CLASS.oid</a>	OID of a parent table
inhseqno	integer	-	If there is more than one direct parent for a child table (multiple inheritances), this number tells the order in which the inherited columns are to be arranged. The count starts at 1.

## 12.2.61 PG\_JOB

PG\_JOB records detailed information about jobs created by users. Dedicated threads poll the system catalog PG\_JOB and trigger jobs based on scheduled job execution time, and update job status in PG\_JOB. This system catalog belongs to the Shared Relation category. All job records are visible to all databases. Common users can access this system catalog only after being authorized.

**Table 12-61** PG\_JOB columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
job_id	bigint	Job ID, which is the primary key and is unique (with a unique index).
current_postgres_pid	bigint	If the current job has been executed, the thread ID of this job is recorded. The default value is <b>-1</b> , indicating that the job has not yet been executed.
log_user	name	Username of the creator.
priv_user	name	Username of the job executor.
dbname	name	Name of the database in which the job will be executed.
node_name	name	CN on which the job will be executed.

Name	Type	Description
job_status	"char"	<p>Execution status of the current task. The default value is 's'. The options are as follows:</p> <ul style="list-style-type: none"> <li>• 'r': running</li> <li>• 's': successfully finished</li> <li>• 'f': job failed</li> <li>• 'd': disable</li> </ul> <p>If a job fails to be executed for 16 consecutive times, <b>job_status</b> is automatically set to 'd', and no more attempt will be made on this job.</p> <p>Note: When you disable a scheduled task (by setting <b>job_queue_processes</b> to 0), the thread that monitors the job execution is not started, and the job status will not be updated. You can ignore this status. Only when the scheduled task function is enabled (<b>job_queue_processes</b> is not 0), the system updates the value of this column based on the real-time job status.</p>
start_date	timestamp without time zone	Start time of the first job execution, accurate to millisecond
next_run_date	timestamp without time zone	Time when a scheduled task is executed next time. The time is accurate to milliseconds.
failure_count	smallint	Number of times the job has started and failed. If a job fails to be executed for 16 consecutive times, no more attempt will be made on it.
interval	text	Job execution interval.
last_start_date	timestamp without time zone	Start time of the last job execution, accurate to millisecond.
last_end_date	timestamp without time zone	End time of the last job execution, accurate to millisecond.
last_suc_date	timestamp without time zone	Start time of the last successful job execution, accurate to millisecond.
this_run_date	timestamp without time zone	Start time of the ongoing job execution, accurate to millisecond.
nspname	name	Name of the schema used for job execution.
job_name	text	Name of the DBE_SCHEDULER scheduled task.

Name	Type	Description
end_date	timestamp without time zone	Expiration time of the DBE_SCHEDULER scheduled task, accurate to millisecond.
enable	Boolean	The DBE_SCHEDULER scheduled task enabling status. The options are as follows: <ul style="list-style-type: none"> <li>• <b>true</b>: enabled</li> <li>• <b>false</b>: disabled</li> </ul>
failure_message	text	Error information about the latest task execution.

## 12.2.62 PG\_JOB\_PROC

PG\_JOB\_PROC records the content of each job in [12.2.69 PG\\_JOB](#), including the PL/SQL code blocks and anonymous blocks. Storing such information in the system catalog PG\_JOB and loading it to the shared memory will result in excessive memory usage. Therefore, such information is stored in a separate table and is retrieved when needed. Common users can access this system catalog only after being authorized.

**Table 12-62** PG\_JOB\_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
job_id	integer	Foreign key, which is associated with job_id in the system catalog <a href="#">12.2.69 PG_JOB</a> .
what	text	Job content, which is the program content in the DBE_SCHEDULER scheduled task.
job_name	text	Name of the DBE_SCHEDULER scheduled task or program.

## 12.2.63 PG\_LANGUAGE

PG\_LANGUAGE registers programming languages. You can use them and APIs to write functions or stored procedures.

**Table 12-63** PG\_LANGUAGE columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
lanname	name	-	Language name.
lanowner	oid	<b>oid</b> in <b>PG_AUTHID</b>	Owner of the language.
lanispl	boolean	-	<ul style="list-style-type: none"><li>• <b>true</b>: user-defined language.</li><li>• <b>false</b>: internal language, for example, SQL.</li></ul> Currently, <code>gs_dump</code> still uses this column to determine which languages need to be dumped, but this might be replaced by a different mechanism in the future.
lanpltrusted	boolean	-	<ul style="list-style-type: none"><li>• <b>true</b>: The language is trusted, which means that it is believed not to grant access to anything outside the normal SQL execution environment.</li><li>• <b>false</b>: The language is untrusted. Only the initial user can create functions in untrusted languages.</li></ul>
lanplcallfoid	oid	<b>oid</b> in <b>PG_PROC</b>	For non-internal languages, this column references the language handler, which is a special function responsible for executing all functions that are written in the particular language.
laninline	oid	<b>oid</b> in <b>PG_PROC</b>	This column references a function responsible for executing "inline" anonymous code blocks (DO blocks). The value is <b>0</b> if inline blocks are not supported.
lanvalidator	oid	<b>oid</b> in <b>PG_PROC</b>	This column references a language validator function responsible for checking the syntax and validity of new functions when they are created. The value is <b>0</b> if no validator is provided.
lanacl	aclitem[]	-	Access permission.

## 12.2.64 PG\_LARGEOBJECT

PG\_LARGEOBJECT records data making up large objects. A large object is identified by an OID assigned when it is created. Each large object is broken into segments or "pages" small enough to be conveniently stored as rows in PG\_LARGEOBJECT. The amount of data per page is defined to be LOBLKSIZE.

This system catalog is accessible only to system administrators.

**Table 12-64** PG\_LARGEOBJECT columns

Name	Type	Reference	Description
loid	oid	oid in <a href="#">PG_LARGEOBJECT_METADATA</a>	Identifier of the large object that includes this page
pageno	integer	-	Page number of this page within its large object (counting from zero).
data	bytea	-	Data stored in the large object. This will never be more than <b>LOBLKSIZE</b> bytes and might be less.

Each row of PG\_LARGEOBJECT holds data for one page of a large object, beginning at byte offset (**pageno \* LOBLKSIZE**) within the object. The implementation allows sparse storage: pages might be missing, and might be shorter than **LOBLKSIZE** bytes even if they are not the last page of the object. Missing regions within a large object read as zeroes.

## 12.2.65 PG\_LARGEOBJECT\_METADATA

PG\_LARGEOBJECT\_METADATA records metadata associated with large objects. The actual large object data is stored in PG\_LARGEOBJECT.

**Table 12-65** PG\_LARGEOBJECT\_METADATA columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
lomowner	oid	<a href="#">PG_AUTHID</a> .oid	Owner of the large object
lomacl	aclitem[]	-	Access permissions

## 12.2.66 PG\_NAMESPACE

PG\_NAMESPACE records namespaces, that is, schema-related information. If the database object isolation attribute is enabled, users can view only the schema information that they have the permission to access.

**Table 12-66** PG\_NAMESPACE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
nspname	name	Name of a namespace
nspowner	oid	Owner of the namespace
nsptimeline	bigint	Timeline when the namespace is created on the DN. This column is for internal use and valid only on the DN.
nspacl	aclitem[]	Access permission. For details, see <a href="#">GRANT</a> and <a href="#">REVOKE</a> .
in_redistribution	"char"	Specifies whether the content is in the redistribution state.
nspcollation	oid	Default collation of the namespace (a value may exist only when <b>sql_compatibility</b> is set to 'MYSQL').

## 12.2.67 PG\_OBJECT

PG\_OBJECT records the creator, creation time, and last modification time of objects of specified types (ordinary tables, indexes, sequences, views, stored procedures, and functions).

**Table 12-67** PG\_OBJECT columns

Name	Type	Description
object_oid	oid	Object identifier.
object_type	"char"	Object type. <ul style="list-style-type: none"> <li>● <b>r</b>: ordinary table</li> <li>● <b>i</b>: index</li> <li>● <b>s</b>: sequence</li> <li>● <b>v</b>: view</li> <li>● <b>p</b>: stored procedure and function</li> <li>● <b>S</b>: package header</li> <li>● <b>B</b>: package body</li> </ul>

Name	Type	Description
creator	oid	ID of a creator.
ctime	timestamp with time zone	Creation time of an object.
mtime	timestamp with time zone	Last modification time of an object. The modification operations include <b>ALTER</b> , <b>GRANT</b> , and <b>REVOKE</b> .
createcsn	bigint	CSN when an object is created
changeocsn	bigint	CSN when DDL operations are performed on a table or an index
valid	Boolean	Validity of an object. <b>t</b> indicates valid, and <b>f</b> indicates invalid.

**NOTICE**

- Objects created or modified during database initialization (initdb) cannot be recorded. **PG\_OBJECT** does not contain these object records.
- A database upgraded to this version cannot record objects created before the upgrade. **PG\_OBJECT** does not contain these object records.
- When the preceding two types of objects are modified again, the modification time (**mtime**) is recorded. Because the creation time of the objects cannot be obtained, **ctime** is empty.
- When an object created before the upgrade is modified again, the modification time (specified by **mtime**) is recorded. When DDL operations are performed on a table or an index, the transaction commit sequence number (specified by **changeocsn**) of the transaction to which the table or index belongs is recorded. Because the creation time of the object cannot be obtained, **ctime** and **createocsn** are empty.
- The time recorded by **ctime** and **mtime** is the start time of the transaction to which the current operation belongs.
- The time of object modification due to capacity expansion is also recorded.
- **createocsn** and **changeocsn** record the transaction commit sequence number of the transaction to which the current operation belongs.
- If the statement for creating an object has an undefined object, or the referenced object is modified or deleted, the object to be created will be invalid.

## 12.2.68 PG\_OPCLASS

**PG\_OPCLASS** defines index access method operator classes.

Each operator class defines semantics for index columns of a particular data type and a particular index access method. An operator class essentially specifies that a particular operator family is applicable to a particular indexable column data type.

The set of operators from the family that are actually usable with the indexed column are whichever ones accept the column's data type as their left-hand input.

**Table 12-68** PG\_OPCLASS columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
opcmethod	oid	OID in <a href="#">PG_AM</a>	Index access method operator class served by an operator class
opcname	name	-	Name of the operator class
opcnamespace	oid	OID in <a href="#">PG_NAMESPACE</a>	Namespace of the operator class
opcowner	oid	OID in <a href="#">PG_AUTHID</a>	Owner of the operator class
opcfamily	oid	OID in <a href="#">PG_OPFAMILY</a>	Operator family containing the operator class
opcintype	oid	OID in <a href="#">PG_TYPE</a>	Data type that the operator class indexes
opcdefault	boolean	-	The value is <b>true</b> if this operator class is the default for <b>opcintype</b> .
opckeytype	oid	OID in <a href="#">PG_TYPE</a>	Type of data stored in index, or zero if same as <b>opcintype</b>

An operator class's **opcmethod** must match the **opfmetho**d of its containing operator family.

## 12.2.69 PG\_OPERATOR

PG\_OPERATOR records information about operators.

**Table 12-69** PG\_OPERATOR columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
oprname	name	-	Name of an operator
oprnamespace	oid	<b>oid</b> in <a href="#">PG_NAMESPACE</a>	OID of the namespace that contains the operator.
oprowner	oid	<b>oid</b> in <a href="#">PG_AUTHID</a>	Owner of the operator.

Name	Type	Reference	Description
oprkind	"char"	-	<ul style="list-style-type: none"> <li>• <b>b</b>: infix (both sides)</li> <li>• <b>l</b>: prefix (left side)</li> <li>• <b>r</b>: suffix (right side)</li> </ul>
oprcanmerge	boolean	-	Whether the operator supports merge joins <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
oprcanhash	boolean	-	Whether the operator supports hash joins <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
oprleft	oid	<b>oid</b> in <b>PG_TYPE</b>	Type of the left operand.
oprright	oid	<b>oid</b> in <b>PG_TYPE</b>	Type of the right operand.
oprresult	oid	<b>oid</b> in <b>PG_TYPE</b>	Type of the result.
oprcom	oid	<b>oid</b> in <b>PG_OPERATOR</b>	<ul style="list-style-type: none"> <li>• If it exists, the value is the exchange character of this operator.</li> <li>• If it does not exist, the value is <b>0</b>.</li> </ul>
oprnegate	oid	<b>oid</b> in <b>PG_OPERATOR</b>	<ul style="list-style-type: none"> <li>• If it exists, the value is the inverter of this operator.</li> <li>• If it does not exist, the value is <b>0</b>.</li> </ul>
oprcode	regproc	<b>prname</b> in <b>PG_PROC</b>	Function that implements the operator.
oprrest	regproc	<b>prname</b> in <b>PG_PROC</b>	Restriction selectivity estimation function for the operator.
oprjoin	regproc	<b>prname</b> in <b>PG_PROC</b>	Join selectivity estimation function for the operator.

## 12.2.70 PG\_OPFAMILY

**PG\_OPFAMILY** defines operator families.

Each operator family is a collection of operators and associated support routines that implement semantics specified for a particular index access method. Furthermore, the operators in a family are all compatible, in a way that is specified by the access method. The operator family allows cross-data-type

operators to be used with indexes and to be reasoned about using knowledge of access method semantics.

**Table 12-70** PG\_OPFAMILY columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
opfmethod	oid	<a href="#">PG_AM.oid</a>	Index access method used by an operator family
opfname	name	-	Name of the operator family
opfnamespace	oid	<a href="#">PG_NAMESPACE.oid</a>	Namespace of the operator family
opfowner	oid	<a href="#">PG_AUTHID.oid</a>	Owner of the operator family

The majority of the information defining an operator family is not in its **PG\_OPFAMILY** row, but in the associated rows in [PG\\_AMOP](#), [PG\\_AMPROC](#), and [PG\\_OPCLASS](#).

## 12.2.71 PG\_PARTITION

PG\_PARTITION records all partitioned tables, table partitions, and index partitions in the database. Partitioned index information is not stored in the system catalog PG\_PARTITION. The partitioned table does not have actual physical files. Therefore, pg\_partition does not record information such as **relfilenode**, **relpages**, **reltuples**, **reltoastrelid**, and **reltoastidxid**.

**Table 12-71** PG\_PARTITION columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
relname	name	Names of the partitioned tables, table partitions, TOAST tables on table partitions, and index partitions.
parttype	"char"	Object type. <ul style="list-style-type: none"> <li>● <b>r</b>: partitioned table</li> <li>● <b>p</b>: table partition</li> <li>● <b>x</b>: index partition</li> </ul>

Name	Type	Description
parentid	oid	OID of the partitioned table in PG_CLASS when the object is a partitioned table or table partition. OID of the partitioned index when the object is an index partition.
rangenum	integer	Reserved column.
intervalnum	integer	Reserved column.
partstrategy	"char"	Partition policy of the partitioned table. <ul style="list-style-type: none"> <li>• 'r': range partition</li> <li>• 'l': list partition</li> <li>• 'h': hash partition</li> </ul>
relfilenode	oid	Physical storage locations of the table partition, index partition, and TOAST table on the table partition.
reltablespace	oid	OID of the tablespace containing the table partition, index partition, and TOAST table on the table partition.
relpages	double precision	Statistics: numbers of data pages of the table partition and index partition.
reltuples	double precision	Statistics: numbers of tuples of the table partition and index partition.
relallvisible	integer	Statistics: number of visible data pages of the table partition and index partition.
reltoastrelid	oid	OID of the TOAST table corresponding to the table partition.
reltoastidxid	oid	OID of the TOAST table index corresponding to the table partition.
indextblid	oid	OID of the table partition corresponding to the index partition.
indisusable	boolean	Specifies whether the index partition is available. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
relfrozenxid	xid32	Frozen transaction ID. To ensure forward compatibility, this column is reserved. The <b>relfrozenxid64</b> column is added to record the information.

Name	Type	Description
intspnum	integer	Number of tablespaces that the interval partition belongs to.
partkey	int2vector	Column number of the partition key.
intervaltablespace	oidvector	Tablespace that the interval partition belongs to. Interval partitions fall in the tablespaces in the round-robin manner.
interval	text[]	Interval value of the interval partition.
boundaries	text[]	Upper boundary of the range partition and interval partition.
transit	text[]	Transit of the interval partition.
reloptions	text[]	Storage property of a partition used for collecting online scale-out information. Same as <b>pg_class.reloptions</b> , it is expressed in a string in the format of keyword=value.
relfrozenxid64	xid	Frozen transaction ID.
relminmxid	xid	Frozen multi-transaction ID.
partitionno	integer	Used for maintaining the partition map of a partitioned table. <ul style="list-style-type: none"> <li>• If the object is a partition, this field indicates the partition ID, which starts from 1 in ascending order.</li> <li>• If the object is a partitioned table, this field indicates the maximum partition ID and a negative value is used for special meaning. The value increases with the DDL syntax of some partitions.</li> <li>• If the object is of other types, this field is null and has no meaning.</li> </ul> <b>partitionno</b> is a permanent auto-increment column, which can be reset or reclaimed by using the syntax ALTER TABLE t_name RESET PARTITION or VACUUM FULL.
subpartitionno	integer	Reserved column.

## 12.2.72 PG\_PLTEMPLATE

**PG\_PLTEMPLATE** records template information for procedural languages.

**Table 12-72** PG\_PLTEMPLATE columns

Name	Type	Description
tmplname	name	Name of the language for which this template is used
tmpltrusted	boolean	The value is <b>true</b> if the language is considered trusted. Otherwise, the value is <b>false</b> .
tmpldbcreate	boolean	The value is <b>true</b> if the language is created by the owner of the database. Otherwise, the value is <b>false</b> .
tmplhandler	text	Name of the call handler function
tmplinline	text	Name of the anonymous block handler ( <b>NULL</b> if no name of the block handler exists)
tmplvalidator	text	Name of the verification function ( <b>NULL</b> if no verification function is available)
tmpllibrary	text	Path of the shared library that implements languages
tmplacl	aclitem[]	Access permissions for template (not yet used)

## 12.2.73 PG\_PROC

PG\_PROC records information about functions or procedures.

**Table 12-73** PG\_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
proname	name	Function name.
pronamespace	oid	OID of the namespace that contains the function.
proowner	oid	Owner of the function.
prolang	oid	Implementation language or call API of the function.
procost	real	Estimated execution cost.
prorows	real	Estimated number of rows that are influenced.

Name	Type	Description
provariadic	oid	Data type of parameter element.
protransform	regproc	Simplified call method for the function.
proisagg	Boolean	Specifies whether the function is an aggregate function. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
proiswindow	Boolean	Specifies whether the function is a window function. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
prosecdef	Boolean	Specifies whether the function is a security definer (or a setuid function). <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
proleakproof	Boolean	Specifies whether the function has side effects. If no leakproof treatment is provided for parameters, the function throws errors. <ul style="list-style-type: none"> <li>• <b>t</b> (true): There is no side effect.</li> <li>• <b>f</b> (false): There are side effects.</li> </ul>
proisstrict	Boolean	<ul style="list-style-type: none"> <li>• <b>t</b> (true): When this function is used, the function does not call the function and returns null if the input parameter is null.</li> <li>• <b>f</b> (false): When this function is used, it is called even if the input parameter is null. Therefore, this function must process null input.</li> </ul>
proretset	Boolean	Specifies whether the return value of the function is a set (that is, multiple values of the specified data type). <ul style="list-style-type: none"> <li>• <b>true</b>: The return value of the function is a set.</li> <li>• <b>false</b>: The return value of the function is not a set.</li> </ul>

Name	Type	Description
provolatile	"char"	Specifies whether the function's result depends only on its input parameters, or is affected by outside factors. <ul style="list-style-type: none"> <li>• <b>i</b>: immutable functions, which always deliver the same result for the same inputs.</li> <li>• <b>s</b>: stable functions, whose results (for fixed inputs) do not change within a scan.</li> <li>• <b>v</b>: volatile functions, whose results may change at any time. Use <b>v</b> also for functions with side-effects, so that the engine cannot get optimized if volatile functions are called.</li> </ul>
pronargs	smallint	Number of parameters.
pronargdefaults	smallint	Number of parameters that have default values.
prorettype	oid	Data type of return values.
proargtypes	oidvector	Array that stores the data types of function parameters. This array includes only input parameters (including <b>INOUT</b> parameters), and indicates the call signature (API) of the function.
proallargtypes	oid[]	Array that contains the data types of function parameters. This array includes all parameter types (including <b>OUT</b> and <b>INOUT</b> parameters); however, if all the parameters are <b>IN</b> parameters, this column is null. Note that array indexing is 1-based, whereas for historical reasons, <b>proargtypes</b> is indexed from 0.
proargmodes	"char"[]	Array with the modes of the function parameters, encoded as follows: <ul style="list-style-type: none"> <li>• <b>i</b> indicates the IN parameter.</li> <li>• <b>o</b> indicates the OUT parameter.</li> <li>• <b>b</b> indicates the INOUT parameter.</li> <li>• <b>v</b> indicates the VARIADIC parameter.</li> </ul> If all the parameters are <b>IN</b> parameters, this column is null. Note that indexes correspond to positions of <b>proallargtypes</b> , not <b>proargtypes</b> .
proargnames	text[]	Array that stores the names of the function parameters. Parameters without a name are set to empty strings in the array. If none of the parameters have a name, this column is null. Note that indexes correspond to positions of <b>proallargtypes</b> , not <b>proargtypes</b> .

Name	Type	Description
proargdefaults	pg_node_tree	Expression tree of the default value. This is the list of <b>pronargdefaults</b> elements.
prosrc	text	A definition that describes a function or stored procedure. In an interpreting language, it is the function source code, a link symbol, a file name, or any body content specified when a function or stored procedure is created, depending on how a language or call is used.
probin	text	Additional information about how to call the function. Again, the interpretation is language-specific.
proconfig	text[]	Function's local settings for run-time configuration variables.
proacl	aclitem[]	Access permission. For details, see <b>GRANT</b> and <b>REVOKE</b> .
prodefaultargpos	int2vector	Position of the input parameter of a function with a default value.
fencedmode	Boolean	Execution mode of a function, indicating whether the function is executed in fence or not fence mode. <ul style="list-style-type: none"> <li>• <b>true</b>: fence mode. In this mode, the function is executed in the fork process.</li> <li>• <b>false</b>: not fence mode.</li> </ul>
proshippable	Boolean	Specifies whether the function can be pushed down to DN for execution. The default value is <b>false</b> . <ul style="list-style-type: none"> <li>• Functions of the <b>IMMUTABLE</b> type can always be pushed down to DN.</li> <li>• Functions of the <b>STABLE</b> or <b>VOLATILE</b> type can be pushed down to DN only if their attribute is <b>SHIPPABLE</b>.</li> </ul>
propackage	Boolean	Specifies whether the function supports overloading. The default value is <b>false</b> . <ul style="list-style-type: none"> <li>• <b>t</b> (true): supported.</li> <li>• <b>f</b> (false): not supported.</li> </ul>
prokind	"char"	Specifies whether the object is a function or a stored procedure. <ul style="list-style-type: none"> <li>• <b>'f'</b>: The object is a function.</li> <li>• <b>'p'</b>: The object is a stored procedure.</li> </ul>

Name	Type	Description
proargsrc	text	Describes the parameter input strings of functions or stored procedures that are compatible with ORA syntax, including parameter comments. The default value is <b>NULL</b> .
proargtypesext	oidvector_ _extend	Data type array used to store function parameters when there are a large number of function parameters. This array includes only input parameters (including <b>INOUT</b> parameters), and indicates the call signature (API) of the function.
prodefaultargpo- sxt	int2vector_ _extend	Position of the input parameter with a default value when the function has a large number of parameters.
allargtypes	oidvector	Array for storing the data types of stored procedure parameters, including all parameters (input parameters, output parameters, and <b>INOUT</b> parameters) of the stored procedure.
allargtypesext	oidvector_ _extend	Array for storing the data types of stored procedure parameters when the number of function parameters is greater than 666. The array contains all parameters (including input parameters, output parameters, and <b>INOUT</b> parameters).

 **NOTE**

When a function is created, data is inserted into the PG\_PROC catalog to update the index. When there are a large number of input and output parameters, the index length may exceed one third of the page length. As a result, the error "Index row size xxx exceeds maximum xxx for index 'pg\_proc\_proname\_all\_args\_nsp\_index'" may be reported as expected. You can reduce the number of parameters to avoid this error.

## 12.2.74 PG\_RANGE

PG\_RANGE records information about range types, except for records of types in [PG\\_TYPE](#).

**Table 12-74** PG\_RANGE columns

Name	Type	Reference	Description
rngtypeid	oid	<b>oid</b> in <a href="#">PG_TYPE</a>	OID of the range type
rngcollation	oid	<b>oid</b> in <a href="#">PG_COLLATION</a>	OID of the collation used for range comparisons ( <b>0</b> if none)

Name	Type	Reference	Description
rngsubopc	oid	oid in <a href="#">PG_OPCLASS</a>	OID of the subtype's operator class used for range comparisons
rngcanonical	regproc	proname in <a href="#">PG_PROC</a>	Name of the function to convert a range value into canonical form ( <b>0</b> if none)
rngsubdiff	regproc	proname in <a href="#">PG_PROC</a>	Name of the function used to calculate the difference between two elements in a range. The return value of the function is of the double-precision type. If the function does not exist, the value of <b>rngsubdiff</b> is <b>0</b> .

**rngsubopc** determines the sort ordering used by the range type. **rngcanonical** is used when the element type is discrete.

## 12.2.75 PG\_REPLICATION\_ORIGIN

PG\_REPLICATION\_ORIGIN contains all created replication sources and is shared among all databases in a cluster. Each cluster has only one copy of PG\_REPLICATION\_ORIGIN, not one copy per database instance.

**Table 12-75** PG\_REPLICATION\_ORIGIN columns

Name	Type	Description
roident	oid	Unique replication source identifier within a cluster.
roname	text	External user-defined replication source name.

## 12.2.76 PG\_RESOURCE\_POOL

PG\_RESOURCE\_POOL provides information about database resource pools.

**Table 12-76** PG\_RESOURCE\_POOL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).

Name	Type	Description
respool_name	name	Name of a resource pool.
mem_percent	integer	Percentage of the memory configuration.
cpu_affinity	bigint	Value of cores bound to the CPU.
control_group	name	Name of the Cgroup where the resource pool is located.
max_dop	integer	Maximum degree of concurrency. This column is used for scaling and indicates the scanning concurrency during data redistribution.
memory_limit	name	Maximum memory of the resource pool.
parentid	oid	OID of the parent resource pool.
io_limits	integer	Upper limit of IOPS. It is counted by 10 thousands per second.
io_priority	name	I/O priority set for jobs that consume many I/O resources. It takes effect when the I/O usage reaches 90%.
max_worker	integer	Concurrency in a table during data redistribution. This column is used only for scaling.
max_connections	integer	Maximum number of connections that can be used by a resource pool.

## 12.2.77 PG\_REWRITE

PG\_REWRITE records rewrite rules defined for tables and views.

**Table 12-77** PG\_REWRITE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
rulename	name	Name of a rule.
ev_class	oid	Name of the table that uses the rule.
ev_attr	smallint	Column to which this rule applies (always <b>0</b> to indicate the entire table).

Name	Type	Description
ev_type	"char"	Event type for the rule. <ul style="list-style-type: none"> <li>• 1: SELECT</li> <li>• 2: UPDATE</li> <li>• 3: INSERT</li> <li>• 4: DELETE</li> </ul>
ev_enabled	"char"	Controls the mode in which the rule is triggered. <ul style="list-style-type: none"> <li>• O: The rule is triggered in origin and local modes.</li> <li>• D: The rule is disabled.</li> <li>• R: The rule is triggered in replica mode.</li> <li>• A: The rule is always triggered.</li> </ul>
is_instead	Boolean	The value is <b>true</b> if the rule is of the <b>INSTEAD</b> type. Otherwise, the value is <b>false</b> .
ev_qual	pg_node_tree	Expression tree (in the form of a <code>nodeToString()</code> representation) for the rule's qualifying condition
ev_action	pg_node_tree	Query tree (in the form of a <code>nodeToString()</code> representation) for the rule's action

## 12.2.78 PG\_RLSPOLICY

PG\_RLSPOLICY records row-level access control policies.

**Table 12-78** PG\_RLSPOLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
polname	name	Name of an access control policy.
polrelid	oid	OID of the table object on which the row-level access control policy takes effect.
polcmd	"char"	SQL operations affected by the row-level access control policy.
polpermissive	Boolean	Attribute of the row-level security policy. <ul style="list-style-type: none"> <li>• t: OR condition concatenation of expressions.</li> <li>• f: AND condition concatenation of expressions.</li> </ul>

Name	Type	Description
polroles	oid[]	OID list of users affected by the row-level access control policy. If this parameter is not specified, all users are affected.
polqual	pg_node_tree	Expression of the row-level access control policy.

## 12.2.79 PG\_SECLABEL

**PG\_SECLABEL** records security labels on database objects.

See also [PG\\_SHSECLABEL](#), which provides a similar function for security labels of database objects that are shared across a database cluster.

**Table 12-79** PG\_SECLABEL columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this security label pertains to
classoid	oid	<a href="#">PG_CLASS</a> .oid	OID of the system catalog where the object appears
objsubid	integer	-	Column number for a security label on a table column
provider	text	-	Label provider associated with the label
label	text	-	Security label applied to the object

## 12.2.80 PG\_SET

**PG\_SET** records metadata defined by the SET data type. Currently, this function is not supported in distributed mode.

## 12.2.81 PG\_SHDEPEND

**PG\_SHDEPEND** records the dependency between database objects and shared objects, such as roles. Based on this information, GaussDB can ensure that those objects are unreferenced before attempting to delete them.

See also [PG\\_DEPEND](#), which provides a similar function for dependencies involving objects within a single database.

**PG\_SHDEPEND** is shared among all databases of cluster. That is, there is only one **PG\_SHDEPEND** for each cluster, not for each database.

**Table 12-80** PG\_SHDEPEND columns

Name	Type	Reference	Description
dbid	oid	<b>oid</b> in <a href="#">PG_DATABASE</a>	OID of the database the dependent object is in, or zero for a shared object.
classid	oid	<b>oid</b> in <a href="#">PG_CLASS</a>	OID of the system catalog where a dependent object resides.
objid	oid	Any OID column	OID of the dependent object
objsubid	integer	-	Column number for a table column ( <b>objid</b> and <b>classid</b> refer to the table itself); <b>0</b> for all other object types
refclassid	oid	<b>oid</b> in <a href="#">PG_CLASS</a>	OID of the system catalog the referenced object is in (must be a shared catalog).
refobjid	oid	Any OID column	OID of the referenced object
deptype	"char"	-	Code segment defining the specific semantics of this dependency relationship. See the following for details.

In all cases, a PG\_SHDEPEND entry indicates that the referenced object cannot be dropped without also dropping the dependent object. However, there are several subflavors identified by **deptype**:

- SHARED\_DEPENDENCY\_OWNER (o)  
The referenced object (which must be a role) is the owner of the dependent object.
- SHARED\_DEPENDENCY\_ACL (a)  
The referenced object (which must be a role) is mentioned in the access control list (ACL) of the dependent object. SHARED\_DEPENDENCY\_ACL does not add a record to the owner of the object because the owner will have a SHARED\_DEPENDENCY\_OWNER record.
- SHARED\_DEPENDENCY\_PIN (p)  
This type of record indicates that the system itself depends on the depended object. Therefore, such an object cannot be deleted. Entries of this type are created only by initdb. The columns for the dependent object contain zeroes.
- SHARED\_DEPENDENCY\_DBPRIV(d)  
The referenced object (must be a role) has the ANY permission on the dependent object (the specified OID of the dependent object corresponds to a row in the [12.2.11 GS\\_DB\\_PRIVILEGE](#) system catalog).

## 12.2.82 PG\_SHDESCRIPTION

PG\_SHDESCRIPTION records optional comments for shared database objects. Descriptions can be manipulated with the **COMMENT** command and viewed with the `\d` command.

See also PG\_DESCRIPTION, which provides a similar function for descriptions involving objects within a single database.

PG\_SHDESCRIPTION is shared among all databases of cluster. That is, there is only one PG\_SHDESCRIPTION for each cluster, not for each database.

**Table 12-81** PG\_SHDESCRIPTION columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the described object.
classoid	oid	<b>oid</b> in <a href="#">PG_CLASS</a>	OID of the system catalog where the object appears.
description	text	-	Description of the object.

## 12.2.83 PG\_SHSECLABEL

PG\_SHSECLABEL records security labels on shared database objects. Security labels can be manipulated with the **SECURITY LABEL** command.

For an easier way to view security labels, see [PG\\_SECLABELS](#).

See also [PG\\_SECLABEL](#), which provides a similar function for security labels involving objects within a single database.

Unlike most system catalogs, **PG\_SHSECLABEL** is shared across all databases of a cluster. There is only one copy of **PG\_SHSECLABEL** per cluster, not one per database.

**Table 12-82** PG\_SHSECLABEL columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this security label pertains to
classoid	oid	<a href="#">PG_CLASS.oid</a>	OID of the system catalog where the object appears
provider	text	-	Label provider associated with the label
label	text	-	Security label applied to the object

## 12.2.84 PG\_STATISTIC

PG\_STATISTIC records statistics about tables and index columns in a database. By default, only the system administrator can access the system catalog. Common users can access the system catalog only after being authorized.

**Table 12-83** PG\_STATISTIC columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.
starelkind	"char"	Type of an object.
staatnum	smallint	Number of the described column in the table, starting from 1.
stainherit	boolean	Specifies whether to collect statistics for objects that have inheritance relationship.
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.
stadistinct	real	Number of distinct, non-null data values in the column for all DNs. <ul style="list-style-type: none"> <li>A value greater than 0 is the actual number of distinct values.</li> <li>A value less than 0 is the ratio of the <b>distinct</b> value to the total number of rows. For example, if <b>stadistinct</b> is <b>-0.5</b>, the actual <b>distinct</b> value is the total number of rows multiplied by 0.5.</li> <li>The value <b>0</b> indicates that the number of distinct values is unknown.</li> </ul>
stakindN	smallint	Code number stating that the type of statistics is stored in slot <i>N</i> of the <i>pg_statistic</i> row. The value of <i>N</i> ranges from 1 to 5.
staopN	oid	Operator used to generate the statistics stored in slot <i>N</i> . For example, a histogram slot shows the < operator that defines the sort order of the data. The value of <i>N</i> ranges from 1 to 5.
stanumbers N	real[]	Numerical statistics of the appropriate type for slot <i>N</i> . The value is <b>NULL</b> if the slot does not involve numerical values. The value of <i>N</i> ranges from 1 to 5.

Name	Type	Description
stavaluesN	anyarray	Column data values of the appropriate type for slot <i>N</i> . The value is <b>NULL</b> if the slot type does not store any data values. Each array's element values are actually of the specific column's data type so there is no way to define these columns' type more specifically than anyarray. The value of <i>N</i> ranges from 1 to 5.
stadndistinct	real	Number of unique non-null data values in the <b>DN1</b> column. <ul style="list-style-type: none"> <li>• A value greater than 0 is the actual number of distinct values.</li> <li>• A value less than 0 is the ratio of the <b>distinct</b> value to the total number of rows. For example, if <b>stadndistinct</b> is <b>-0.5</b>, the actual <b>distinct</b> value is the total number of rows multiplied by 0.5.</li> <li>• The value <b>0</b> indicates that the number of distinct values is unknown.</li> </ul>
staextinfo	text	Information about extension statistics. This is reserved.

**NOTICE**

PG\_STATISTIC stores sensitive information about statistical objects, such as MCVs. The system administrator and authorized users can access the PG\_STATISTIC system catalog to query the sensitive information about the statistical objects.

## 12.2.85 PG\_STATISTIC\_EXT

PG\_STATISTIC\_EXT displays extended statistics of tables in a database, such as statistics of multiple columns. Statistics of expressions will be supported later. You can specify the extended statistics to be collected. This system catalog is accessible only to system administrators.

**Table 12-84** PG\_STATISTIC\_EXT columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.
starelkind	char	Type of an object. 'c' indicates a table, and 'p' indicates a partition.

Name	Type	Description
stainherit	boolean	Specifies whether to collect statistics for objects that have inheritance relationship. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.
stadistinct	real	Number of distinct, non-null data values in the column for all DNs. <ul style="list-style-type: none"> <li>• A value greater than 0 is the actual number of distinct values.</li> <li>• A value less than 0 is the ratio of the <b>distinct</b> value to the total number of rows. For example, if <b>stadistinct</b> is <b>-0.5</b>, the actual <b>distinct</b> value is the total number of rows multiplied by 0.5.</li> <li>• The value <b>0</b> indicates that the number of distinct values is unknown.</li> </ul>
stadndistinct	real	Number of unique non-null data values in the <b>DN1</b> column. <ul style="list-style-type: none"> <li>• A value greater than 0 is the actual number of distinct values.</li> <li>• A value less than 0 is the ratio of the <b>distinct</b> value to the total number of rows. For example, if <b>stadndistinct</b> is <b>-0.5</b>, the actual <b>distinct</b> value is the total number of rows multiplied by 0.5.</li> <li>• The value <b>0</b> indicates that the number of distinct values is unknown.</li> </ul>
stakindN	smallint	Code number stating that the type of statistics is stored in slot <i>N</i> of the <i>pg_statistic</i> row. The value of <i>N</i> ranges from 1 to 5.
staopN	oid	Operator used to generate the statistics stored in slot <i>N</i> . For example, a histogram slot shows the < operator that defines the sort order of the data. The value of <i>N</i> ranges from 1 to 5.
stakey	int2vector	Array of a column ID.
stanumbers N	real[]	Numerical statistics of the appropriate type for slot <i>N</i> . The value is <b>NULL</b> if the slot does not involve numerical values. The value of <i>N</i> ranges from 1 to 5.

Name	Type	Description
stavaluesN	anyarray	Column data values of the appropriate type for slot <i>N</i> . The value is <b>NULL</b> if the slot type does not store any data values. Each array's element values are actually of the specific column's data type so there is no way to define these columns' type more specifically than anyarray. The value of <i>N</i> ranges from 1 to 5.
staexprs	pg_node_tree	Expression corresponding to the extended statistics information.
stasource	char	Source of extended statistics: <ul style="list-style-type: none"> <li>'a': indicates automatic creation. For details, see the GUC parameter <b>auto_statistic_ext_columns</b>.</li> <li>'m': indicates that a user manually creates the statistics data using analyze tablename ((column list)) or alter table tablename add statistics ((column list)).</li> </ul>
stastatus	char	Status of extended statistics: <ul style="list-style-type: none"> <li>'a': active and available.</li> <li>'d': disabled. Related information is not collected, and the optimizer does not use the data when generating a plan. You can use the alter table tablename disable/enable statistics((column list)) syntax to modify the status of extended statistics.</li> </ul>

#### NOTICE

PG\_STATISTIC\_EXT stores sensitive information about statistical objects, such as MCVs. The system administrator and authorized users can access the PG\_STATISTIC\_EXT system catalog to query the sensitive information about the statistical objects.

## 12.2.86 PG\_SYNONYM

PG\_SYNONYM records the mapping between synonym object names and other database object names.

**Table 12-85** PG\_SYNONYM columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
synname	name	Synonym name.

Name	Type	Description
synnamespace	oid	OID of the namespace that contains the synonym.
synowner	oid	Owner of the synonym, usually the OID of the user who created it.
synobjschema	name	Schema name specified by the associated object.
synobjname	name	Name of the associated object.
syndblinkname	name	Database link name.

## 12.2.87 PG\_TABLESPACE

PG\_TABLESPACE records tablespace information.

**Table 12-86** PG\_TABLESPACE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
spcname	name	Tablespace name
spcowner	oid	Owner of the tablespace, usually the user who created it
spcacl	aclitem[]	Access permissions. For details, see <a href="#">GRANT</a> and <a href="#">REVOKE</a> .
spcoptions	text[]	Options of the tablespace
spcmaxsize	text	Maximum size of the available disk space, in bytes
relative	boolean	Whether the storage path specified by the tablespace is a relative path <ul style="list-style-type: none"> <li>• <b>t (true)</b>: yes.</li> <li>• <b>f (false)</b>: no.</li> </ul>

## 12.2.88 PG\_TRIGGER

PG\_TRIGGER records trigger information.

**Table 12-87** PG\_TRIGGER columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
tgrelid	oid	OID of the table where the trigger is located.
tgname	name	Trigger name.
tgfoid	oid	Function to be invoked by a trigger.
tgtype	smallint	Trigger type.
tgenabled	"char"	<b>O</b> : The trigger is triggered in origin or local mode. <b>D</b> : The trigger is disabled. <b>R</b> : The trigger is triggered in replica mode. <b>A</b> : The trigger is always triggered.
tgisinternal	Boolean	Internal trigger ID. If the value is <b>true</b> , it indicates an internal trigger.
tgconstrrelid	oid	Table referenced by the integrity constraint.
tgconstrindid	oid	Index of the integrity constraint.
tgconstraint	oid	OID of the constraint trigger in PG_CONSTRAINT.
tgdeferrable	Boolean	Whether the constraint trigger is of the DEFERRABLE type <ul style="list-style-type: none"><li>• <b>t (true)</b>: yes.</li><li>• <b>f (false)</b>: no.</li></ul>
tginitdeferred	Boolean	Specifies whether the trigger is of the INITIALLY DEFERRED type. <ul style="list-style-type: none"><li>• <b>t (true)</b>: yes</li><li>• <b>f (false)</b>: no</li></ul>
tgargs	smallint	Number of input parameters of the trigger function.
tgattr	int2vector	Column ID specified by the trigger. If no column is specified, an empty array is used.
tgargs	bytea	Parameter transferred to the trigger.
tgqual	pg_node_tree	WHEN condition of the trigger ( <b>NULL</b> if the WHEN condition does not exist).
tgowner	oid	Trigger owner.

## 12.2.89 PG\_TS\_CONFIG

**PG\_TS\_CONFIG** contains entries representing text search configurations. A configuration specifies a particular text search parser and a list of dictionaries to use for each of the parser's output token types.

The parser is shown in the **PG\_TS\_CONFIG** entry, but the token-to-dictionary mapping is defined by subsidiary entries in **PG\_TS\_CONFIG\_MAP**.

**Table 12-88** PG\_TS\_CONFIG columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
cfgname	name	-	Text search configuration name
cfgnamespace	oid	<a href="#">PG_NAMESPACE.oid</a>	OID of the namespace that contains the configuration
cfgowner	oid	<a href="#">PG_AUTHID.oid</a>	Owner of the configuration
cfgparser	oid	<a href="#">PG_TS_PARSER.oid</a>	OID of the text search parser for this configuration
cfoptions	text[]	-	Configuration options

## 12.2.90 PG\_TS\_CONFIG\_MAP

**PG\_TS\_CONFIG\_MAP** contains entries showing which text search dictionaries should be consulted, and in what order, for each output token type of each text search configuration's parser.

**Table 12-89** PG\_TS\_CONFIG\_MAP columns

Name	Type	Reference	Description
mapcfg	oid	<a href="#">PG_TS_CONFIG.oid</a>	OID of the <a href="#">PG_TS_CONFIG</a> entry owning this map entry
maptokentype	integer	-	Token type generated by the configuration's parser
mapseqno	integer	-	Sequence number of a token type when the values of <b>mapcfg</b> or <b>maptokentype</b> are the same.
mapdict	oid	<a href="#">PG_TS_DICT.oid</a>	OID of the text search dictionary to consult

## 12.2.91 PG\_TS\_DICT

**PG\_TS\_DICT** contains entries that define text search dictionaries. A dictionary depends on a text search template, which specifies all the implementation functions needed; the dictionary itself provides values for the user-settable parameters supported by the template.

This division of labor allows dictionaries to be created by unprivileged users. The parameters are specified by a text string **dictinitoption**, whose format and meaning vary depending on the template.

**Table 12-90** PG\_TS\_DICT columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
dictname	name	-	Text search dictionary name
dictnamespace	oid	<a href="#">PG_NAMESPACE.oid</a>	OID of the namespace that contains the dictionary
dictowner	oid	<a href="#">PG_AUTHID.oid</a>	Owner of the dictionary
dicttemplate	oid	<a href="#">PG_TS_TEMPLATE.oid</a>	OID of the text search template for the dictionary
dictinitoption	text	-	Initialization option string for the template

## 12.2.92 PG\_TS\_PARSER

**PG\_TS\_PARSER** contains entries defining text search parsers. A parser is responsible for splitting input text into lexemes and assigning a token type to each lexeme. Since a parser must be implemented by C-language-level functions, creation of new parsers is restricted to database superusers.

**Table 12-91** PG\_TS\_PARSER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
prsname	name	-	Text search parser name
prsnamespace	oid	<a href="#">PG_NAMESPACE.oid</a>	OID of the namespace that contains the parser

Name	Type	Reference	Description
prsstart	regproc	<a href="#">PG_PROC.proname</a>	Name of the parser's startup function
prstoken	regproc	<a href="#">PG_PROC.proname</a>	Name of the parser's next-token function
prsend	regproc	<a href="#">PG_PROC.proname</a>	Name of the parser's shutdown function
prsheadline	regproc	<a href="#">PG_PROC.proname</a>	Name of the parser's headline function
prsllextype	regproc	<a href="#">PG_PROC.proname</a>	Name of the parser's lextype function

## 12.2.93 PG\_TS\_TEMPLATE

**PG\_TS\_TEMPLATE** contains entries defining text search templates. A template provides a framework for text search dictionaries. Since a template must be implemented by C-language-level functions, templates can be created only by database administrators.

**Table 12-92** PG\_TS\_TEMPLATE columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
tmplname	name	-	Text search template name
tmplnamespace	oid	<a href="#">PG_NAMESPACE.oid</a>	OID of the namespace that contains the template
tmplinit	regproc	<a href="#">PG_PROC.proname</a>	Name of the template's initialization function
tmpllexize	regproc	<a href="#">PG_PROC.proname</a>	Name of the template's lexize function

## 12.2.94 PG\_TYPE

**PG\_TYPE** stores information about data types.

**Table 12-93** PG\_TYPE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
typname	name	Data type name
typnamespace	oid	OID of the namespace that contains the type.
typowner	oid	Owner of the type.
typplen	smallint	Number of bytes in the internal representation of the type for a fixed-size type. It is a negative number for a variable-length type. <ul style="list-style-type: none"> <li>• <b>-1</b>: a "varlena" type (one that has a length word).</li> <li>• <b>-2</b>: a null-terminated C string.</li> </ul>
typbyval	Boolean	<ul style="list-style-type: none"> <li>• <b>true</b>: A value of this type is transferred by value internally.</li> <li>• <b>false</b>: A value of this type is transferred by reference internally.</li> </ul> <p>If <b>typplen</b> of this type is not <b>1, 2, 4, or 8</b>, you are advised to transfer a reference value for <b>typbyval</b>. You can also transfer a value for <b>typbyval</b>. Variable-length types are usually passed by reference or by value.</p>
typtype	"char"	<ul style="list-style-type: none"> <li>• <b>b</b>: basic type.</li> <li>• <b>d</b>: domain type.</li> <li>• <b>p</b>: pseudo type.</li> <li>• <b>r</b>: range type.</li> <li>• <b>e</b>: enumeration type.</li> <li>• <b>u</b>: undefined type.</li> <li>• <b>o</b>: set type.</li> </ul> <p>For details, see <b>typrelid</b> and <b>typbasetype</b>.</p>
typcategory	"char"	Fuzzy classification of data types, which can be used by parsers as the basis for data conversion.
typispreferred	Boolean	<p><b>true</b>: Data is converted when it complies with the conversion rule specified by <b>typcategory</b>.</p> <ul style="list-style-type: none"> <li>• <b>false</b>: Data is not converted.</li> </ul>
typisdefined	Boolean	<ul style="list-style-type: none"> <li>• <b>true</b>: The type has been defined.</li> <li>• <b>false</b>: The placeholder of an undefined type is used. In this case, there is no reliable information except the name, namespace, and OID of the type.</li> </ul>

Name	Type	Description
typdelim	"char"	Character that separates two values of this type when parsing an array input. Note that the delimiter is associated with the array element data type, not the array data type.
typrelid	oid	<b>0</b> .
typelem	oid	If <b>typelem</b> is not <b>0</b> , it identifies another row in PG_TYPE. The current type can be described as an array yielding values of type <b>typelem</b> . A "true" array type has a variable length ( <b>typlen</b> = <b>-1</b> ), but some fixed-length types ( <b>typlen</b> > <b>0</b> ) also have non-zero <b>typelem</b> , for example <b>name</b> and <b>point</b> . If a fixed-length type has a <b>typelem</b> , its internal representation must be a number of values of the <b>typelem</b> data type with no other data. Variable-length array types have a header defined by the array subroutines.
typarray	oid	If the value is not <b>0</b> , the corresponding type record is available in PG_TYPE.
typinput	regproc	Input conversion function (text format).
typoutput	regproc	Output conversion function (text format).
typreceive	regproc	Input conversion function (binary format); <b>0</b> for non-input conversion function.
typsend	regproc	Output conversion function (binary format); <b>0</b> for non-output conversion function.
typmodin	regproc	Input type modifier function; <b>0</b> if none.
typmodout	regproc	Output type modifier function; <b>0</b> if none.
typanalyze	regproc	Custom <b>ANALYZE</b> function; <b>0</b> if the standard function is used.

Name	Type	Description
typalign	"char"	<p>Alignment required when storing a value of this type. It applies to storage on disks as well as most representations of the value. When multiple values are stored consecutively, such as in the representation of a complete row on disk, padding is inserted before a data of this type so that it begins on the specified boundary. The alignment reference is the beginning of the first datum in the sequence. Possible values are:</p> <ul style="list-style-type: none"> <li>• <b>c</b>: char alignment, that is, no alignment required</li> <li>• <b>s</b>: short alignment (2 bytes on most machines)</li> <li>• <b>i</b>: integer alignment (4 bytes on most machines)</li> <li>• <b>d</b>: double alignment (8 bytes on many machines, but by no means all)</li> </ul> <p><b>NOTICE</b> For types used in system tables, the size and alignment defined in PG_TYPE must agree with the way that the compiler lays out the column in a structure representing a table row.</p>
typstorage	"char"	<p><b>typstorage</b> tells for varlena types (those with <b>typlen = -1</b>) if the type is prepared for toasting and what the default strategy for attributes of this type should be. Possible values are:</p> <ul style="list-style-type: none"> <li>• <b>p</b>: Values are always stored plain.</li> <li>• <b>e</b>: Value can be stored in a secondary relationship (if the relation has one, see <b>reltoastrelid</b> in <a href="#">12.2.51 PG_CLASS</a>).</li> <li>• <b>m</b>: Values can be stored compressed inline.</li> <li>• <b>x</b>: Values can be stored compressed inline or stored in secondary storage.</li> </ul> <p><b>NOTICE</b> <b>m</b> domains can also be moved out to secondary storage, but only as a last resort (<b>e</b> and <b>x</b> domains are moved first).</p>
typnotnull	Boolean	Whether the type has a NOTNULL constraint. Currently, it is used for domains only.
typbasetype	oid	If this is a domain (see <b>typtype</b> ), then <b>typbasetype</b> identifies the type that this one is based on. The value is <b>0</b> if this type is not a derived type.
tytypmod	integer	<ul style="list-style-type: none"> <li>• Records the <b>tytypmod</b> to be applied to domains' base types by domains (the value is <b>-1</b> if the base type does not use <b>typmod</b>). This is <b>-1</b> if this type is not a domain.</li> </ul>
typndims	integer	If a field is an array, <b>typndims</b> is the number of array dimensions. This is <b>0</b> for types other than domains over array types.

Name	Type	Description
typcollation	oid	Sorting rule of a specified type. For details about the values, see the <a href="#">PG_COLLATION</a> system catalog. (0 if sequencing is not supported.)
typdefaultbin	pg_node_tree	nodeToString() representation of a default expression for the type if the value is non-null. Currently, this column is only used for domains.
typdefault	text	The value is <b>NULL</b> if a type has no associated default value. If <b>typdefaultbin</b> is not set to <b>NULL</b> , <b>typdefault</b> must contain a default expression represented by <b>typdefaultbin</b> . If <b>typdefaultbin</b> is <b>NULL</b> and <b>typdefault</b> is not, then <b>typdefault</b> is the external representation of the type's default value, which can be fed to the type's input converter to produce a constant.
typacl	aclitem[]	Access permission.

## 12.2.95 PG\_USER\_MAPPING

**PG\_USER\_MAPPING** records mappings from local users to remote.

This system catalog is accessible only to system administrators. Common users can query the [PG\\_USER\\_MAPPINGS](#) view.

**Table 12-94** PG\_USER\_MAPPING columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
umuser	oid	<a href="#">PG_AUTHID</a> .oid	OID of the local role being mapped (0 if the user mapping is public)
umserver	oid	<a href="#">PG_FOREIGN_SERVER</a> .oid	OID of the foreign server that contains the mapping
umoptions	text[]	-	User mapping specific options, expressed in a string in the format of keyword=value

## 12.2.96 PG\_USER\_STATUS

**PG\_USER\_STATUS** records the states of users who access the database. This system catalog is accessible only to users with the system administrator permission.

**Table 12-95** PG\_USER\_STATUS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
roloid	oid	ID of a role.
failcount	integer	Number of failed attempts.
locktime	timestamp with time zone	By default, the creation date of the role is displayed. If the role is locked by the administrator or the role is locked because the number of login failures exceeds the threshold, the date when the role is locked is displayed.
rolstatus	smallint	Role state. <ul style="list-style-type: none"> <li>• <b>0</b>: normal</li> <li>• <b>1</b>: The role is locked for a specific period of time because the failed login attempts exceed the threshold.</li> <li>• <b>2</b>: The role is locked by the administrator.</li> </ul>
permspac e	bigint	Size of the permanent table storage space used by a role.
tempspac e	bigint	Size of the temporary table storage space used by a role.
password expired	smallint	Specifies whether a password is valid. <ul style="list-style-type: none"> <li>• <b>0</b>: The password is valid.</li> <li>• <b>1</b>: The password is invalid.</li> </ul>

## 12.2.97 PGXC\_CLASS

PGXC\_CLASS records replicated or distributed information for each table.

**Table 12-96** PGXC\_CLASS columns

Name	Type	Description
pcrelid	oid	OID of the table.

Name	Type	Description
plocator_type	"char"	Locator type. <ul style="list-style-type: none"> <li>• <b>H</b>: Hash</li> <li>• <b>G</b>: Range</li> <li>• <b>L</b>: List</li> <li>• <b>M</b>: Modulo</li> <li>• <b>N</b>: Round Robin</li> <li>• <b>R</b>: Replication</li> </ul>
pchash_algorithm	smallint	Distributed tuple using the hash algorithm. <ul style="list-style-type: none"> <li>• <b>1</b>: default hash algorithm.</li> <li>• <b>2</b>: MURMURHASH algorithm.</li> </ul>
pchash_buckets	smallint	Value of a harsh container.
pgroup	name	Name of the node.
redistributed	"char"	Indicates that a table has been redistributed.
redis_order	integer	Redistribution sequence. Tables whose values are <b>0</b> will not be redistributed in this round of redistribution.
pcattnum	int2vector	Column number used as a distributed key.
nodeoids	oidvector_extend	List of distributed table node OIDs.
options	text	Extension status information. This is a reserved column in the system.

## 12.2.98 PGXC\_GROUP

PGXC\_GROUP records information about storage node groups.

**Table 12-97** PGXC\_GROUP columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
group_name	name	Name of a node group.

Name	Type	Description
